the king was simple, and led by covetous councillors, and owed more than he was worth. His debts increased daily, but payment was there none, for all the manors and possessions that pertained to the crown he had given away, so that he had almost sought to live on. For these misgovernances the hearts of the people were turned from them that had the land in rule, and their blessing was turned to cursing. The officers of the realm, and especially the earl of Wiltshire the treasurer, for to enrich himself plundered poor people and disinherited rightful heirs, and did many wrongs. The queen was defamed, that he that was called the prince was not the king's son, but a bastard gotten in adultery. When it is added that the Lancastrian party avoided holding a parliament for three years, because they dared not face it, and that the French were allowed to sack Fowy, Sandwich and other places, it is not wonderful that many men thought that the cup of the iniquities of the house of Lancaster was full. In the military classes it was felt that the honour of the realm was lost; in mercantile circles it was thought that the continuance for a few years more of such government would make an end of English trade. Some excuse must be found for getting rid of the queen and her friends, and the doubtful legitimacy of the Lancastrian claim to the crown afforded such an excuse. Hence came the curious paradox, that the party which started as the advocates of the rights of parliament against the incapable ministers appointed by the crown, ended by challenging the right of parliament exercised in 1399, to depose a legitimate king and substitute for him another member of the royal house. For Richard of York in 1440 and Edward IV. in 1461 put in their claim to the throne, not as the elect of the nation, but as the possessors of a divine hereditary right to the succession, there having been no true king of England since the death of Richard II. Hence Edward assumed the royal title in March 1461, was crowned in June, but called no parliament till November. When it met, it acknowledged him as king, but made no pretence of creating or electing him to be sovereign. But putting aside the constitutional aspects of the Wars of the Roses, it is necessary to point out that they had another aspect. From one point of view they were little more than a great faction-fight between two alliances of over-powerful barons. Though the Lancastrians made much play with the watchword of loyalty to the crown, and though the Yorkists never forgot to speak of the need for strong and wise governance, and the welfare of the realm, yet personal and family enmities had in many cases more effect in determining their action than a zeal for King Henry's rights or for the prosperity of England. It is true that some classes were undoubtedly influenced in their choice of sides mainly by the general causes of envy, the citizens of London and the other great towns (for example) inclined to the Yorkist faction simply because they saw that under the Lancastrian rule the foreign trade of England was being ruined, and insufficient security was given for life and property. But the leading men among the baronage were undoubtedly swayed by ambition and resentment, by family ties and family feuds, far more than by enlightened statesmanship or zeal for the king or the commonweal. It would be going too far to seek the origin of the Yorkist party—as some have done—in the old enmity of the houses of March, Norfolk and Salisbury against Henry IV. But it is not so fantastic to ascribe its birth to the personal hatred that existed between Richard of York and Edmund of Somerset, to the old family grudge (going back to 1405) between the Percies and the Nevilles, to the marriage alliance that bound the houses of York and Neville together, and to other less well-remembered quarrels or blood-ties among the lesser baronage. As an example of how such motives worked, it may suffice to quote the case of those old enemies, the Benvilles and Courtenays, in the west country. While Lord Bonville supported the queen, the house of Courtenay was staunch Yorkists, and the earl of Devon joined in the armed demonstration of Duke Richard in 1452. But when the earl changed his politics and fought on the Lancastrian side at St Albans in 1455, the baron at once became a strenuous adherent of the duke, adhered firmly to the white rose and died by the axe for its cause.

Richard of York, in short, was not merely the head of a constitutional opposition to misgovernment by the queen's friends, nor was he merely a legitimist clamant to the crown, he was also the head of a powerful baronial league, of which the most prominent members were his kinsmen, the Nevilles, Mowbray and Bourchiers. The Nevilles alone, enriched with the ancient estates of the Beauchamps and Montagues, and with five of their name in the House of Lords, were a sufficient nucleus for a faction. They were headed by the two most capable politicians and soldiers then alive in England, the two Richards, father and son, who held the earldoms of Salisbury and Warwick, and accordingly bore the title of Earl of Salisbury and Earl of Warwick. It must be remembered that a baron of 1450 was not strong merely by reason of the spears and bows of his household and his tenantry, like a baron of the 13th century. The pernicious practice of "livery and maintenance" was now at its zenith; all over England in times of stress the knighthood and gentry were wont to pledge themselves, by sealed bonds of indenture, to follow the magnate whom they thought best able to protect them. They mounted his badge, and joined his banner when strife broke out, in return for his championship of their private interests and his promise to "maintain" them against all their enemies. Such a man as the Duke of York was, and a prince of his ambition and wealth, was called by his barons, scattered over twenty shires. The system had spread so far that the majority of the smaller tenants-in-chief, and even many of the lesser barons, were the sworn followers of an insignificant number of the greater lords. An alliance of half-a-dozen of these over-powerful subjects was a serious danger to the crown. For the king could no longer count on raising a national army against them; he could only call out the adherents of the lords of his own party. The factions were fairly balanced, for if the majority of the baronage were, on the whole, Lancastrian, the greatest houses stood by the cause of York.

Despite all this, there was still, when the wars began, a very strong feeling in favour of compromise and moderation. For this there can be no doubt that Richard of York was mainly responsible. When he was twice placed in power, during the two protectorates which followed Henry's two long fits of insanity in 1453 and 1455–1456, he carefully avoided any oppression of his enemies, though he naturally took care to put his own friends in office. Most of all did he show his sincere wish for peace by twice laying down the protectorate when the king was restored to sanity. He was undoubtedly galled into his last rebellion of 1459 by the queen's intentions of marrying her son to a French princess, for allowing him. Yet because he struck first, without waiting for a definite casus belli, public opinion declared so much against him that half his followers refused to rally to his banner. The reulsion only came when the queen, victorious after the rout of Ludford, applied to the vanquished Yorkists those penalties of confiscation and attainder which Duke Richard had always refused to employ in his day of power. After the harsh doings at the parliament of Coventry (1459), and the commencement of political executions by the sending of Roger Neville and his fellows to the scaffold, the trend of public opinion veered round, and Margaret and her friends were rightly held responsible for the embittered nature of the strife. Hence came the marvellous success of the Yorkist counterstroke in June 1460, when the exiled Warwick, landing in Kent with a mere handful of men, was suddenly joined by the whole of the south of England and the great bodies of citizens of London, and inflicted a crushing defeat on the Lancastrians at Northampton before he had been fifteen days on shore (July 10, 1460). The growing rancour of the struggle was marked by the fact that the Yorkists, after Northampton, showed themselves by no means so merciful and scrupulous as in their earlier
days. Retaliatory executions began, though on a small scale, and when York reached London he at last began to talk of his rights to the crown, and to propose the deposition of Henry VI. Yet moderation was still so far prevalent in the ranks of his adherents that they refused to follow him to such lengths. Warwick and the other leading men of the party dictated a compromise, by which Henry was to reign for the term of his natural life, but Duke Richard was to be recognized as his heir and to succeed him on the throne. They had obviously borrowed the expedient from the terms of the treaty of Troyes. But the act of parliament which embodied it did not formally disinherit the reigning king's son, as the treaty of Troyes had done, but merely ignored his existence.

It would have been well for England if this agreement had held, and the crown had passed peaceably to the house of York, after the comparatively short and bloodless struggle which had just ended. But Duke Richard had forgotten to reckon with the fierce and unscrupulous energy of Queen Margaret, when she was at bay in defence of her son's rights. Marching with a trilling force to expel her from the north, he was surprised and slain at Wakefield (Dec. 30, 1460). But it was not his death that was the main misfortune, but the fact that he ignored his existence. In the battle the Lancastrians gave no quarter to small or great, and that after it they put to death York's brother-in-law Salisbury and other prisoners. The heads of the duke and the earl were set up over the gates of York. This ferocity was repeated when Margaret and her northern host beat Warwick at the second battle of St Albans (Feb. 17, 1461), where they had the good fortune to recover possession of the person of King Henry. Lord Bonville and the other captives of rank were beheaded next morning.

After this it was but natural that the struggle became a mere record of massacres and executions. The Yorkists proclaimed Edward, Duke Richard's heir, king of England; they took no further heed of the claims of King Henry, that marched in pursuit of the rulers, and, with the help of their adherents, which included his leader, the true successor of Richard II., and stigmatized the whole period of the Lancastrian rule as a mere usurpation. They adopted a strict legitimist theory of the descent of the crown, and denied the right of parliament to deal with the succession. This was the first step in the direction of absolute monarchy which England had seen since the short months of King Richard's tyranny in 1397-1399. It was the first of many encroachments of the new dynasty upon the liberties that had been enjoyed by the nation under the house of Lancaster.

The revenge taken by the new king and his cousin Richard of Warwick for the slaughter at Wakefield and St Albans was prompt and dreadful. They were now well supported by the whole of southern England; for not only had the queen's ferocity shocked the nation, but the reckless plundering of her northern mass-transporters in the home counties had roused the peasantry and townsfolk to an interest in the struggle which they had never before displayed. Up to this moment the civil war had been conducted like a great faction fight; the barons and their liveried retainers had been wont to seek some convenient heath or hill and there to fight out their quarrel with the minimum of damage to the countryside. The deliberate harrying of the Midlands by Margaret's northern levies was a new departure, and one bitterly resented. The house of Lancaster could never for the future count on an adherent south of Trent or east of Chiltern. The Yorkist army was marched in pursuit of the rulers, and won the bloody field of Towton under Warwick's guidance, gave no quarter. Not only was the slaughter in that battle and the pursuit more cruel than anything that had been seen since the day of Evesham, but the executions that followed were ruthless. Ere Edward turned south he had beheaded two earls—Devon and Wiltshire—and forty-two knights, and had hanged many prisoners of lesser estate. The Yorkist parliament of November 1461 carried on the work by attainting 133 persons, ranging from Henry VI. and Queen Margaret down through the peerage and the knighthood to the clerks and household retainers of the late king. All the estates of the Lancastrian lords, living or dead, were confiscated, and their blood was declared corrupted. This brought into the king's hands such a mass of plunder as no one had handled since William the Conqueror. Edward IV. could not only reward his adherents with it, so as to create a whole new court noblesse, but had enough over to fill his exchequer for many years, and to enable him to dispense with parliamentary grants of money for an unexampled period. Between 1461 and 1465 he only asked for £37,000 from the nation—and won no small portion of the people thereby. For, in their joy at being quite free from taxation, men forgot that they were losing the lever by which their fathers had been wont to move the crown to constitutional concessions.

After Towton peace prevailed south of the Tyne and east of the Severn, for it was only in Northumberland and in Wales that the survivors of the Lancastrian faction succeeded in keeping the war alive. King Edward, as indolent and pleasure-loving in times of ease as he was active and ruthless in times of stress and battle, set himself to enjoy life, handing over the suppression of the rebels to his ambitious and unctiring cousin Richard of Warwick. The annals of the Lancastrians are so entirely devoted to the bickering in the extreme north and west, that it is necessary to insist on the fact that from 1461 onwards the civil war was purely local, and nine-tenths of the realm enjoyed what passed for peace in the 15th century. The campaigns of 1462-63-64, though full of incident and bloodshed, were not of first-rate political importance. The cause of Lancaster had been lost at Towton, and all that Queen Margaret succeeded in accomplishing was to keep Northumberland in revolt, mainly by means of French and Scottish succours. Her last English partisans, attainted men who had lost their lands and lived with the shadow of the axe ever before them, fought bitterly enough. But the obstinate and hard-headed Warwick beat them down again and again, and the old Lancastrian party was almost exterminated when the last of its chiefs went to the block in the series of wholesale executions that followed the battle of Hexham (May 15, 1464). A year later Henry VI. himself fell into the hands of his enemies, as he lurked in Lancashire, and with his consignment to the Tower the dynastic question seemed finally solved in favour of the house of York.

The first ten years of the reign of Edward IV. fall into two parts, the dividing point being the avowal of the king's marriage to Elizabeth Woodville in November 1464. During the first of these periods Edward reigned but Warwick governed; he was not only the fighting man, but the statesman and diplomatist of the Yorkist party, and enjoyed a complete ascendancy over his young master, who long preferred thriftless ease to the toils of personal monarchy. Warwick represented the better side of the victorious cause; he was no mere factious king-maker, and his later nickname of "the last of the barons" by no means expresses his character or his position. He was strong, not so much by reason of his vast estates and his numerous retainers, as by reason of the confidence which the greater part of the nation placed in him. He never forgot that the Yorkist party had started as the advocates of sound and strong administration, and the mandatories of the popular will against the queen's incapable and corrupt ministers. "He ever had the goodwill of the people because he knew how to give them fair words, and always spoke not of himself but of the augmentation and good governance of the kingdom, for which he would spend his life; and thus he had the goodwill of England, so that in all the land he was the lord who was held in most esteem and faith and credence." As long as he remained supreme, parliaments were regularly held, and the house of York appeared to be keeping its bargain with the nation. His policy was sound; peace with France, the re-establishment of the dwindling foreign trade of England, and the
maintenance of law and justice by strong-handed governance were his main aims.

But Warwick was one of those ministers who love to do everything for themselves, and chafe at masters and colleagues who presume to check or to criticise their actions. He was surrounded and supported, moreover, by a group of brothers and cousins, to whom he gave most of his confidence, and most of the preferment that came to his hands. England has always chafed against a family oligarchy, however well it may do its work. The Yorkist magnates who did not belong to the clan of the Nevilles were not unnaturally jealous of that house, and Edward IV himself gradually came to realize the ignominious position of a king who is managed and overruled by a strong-willed and arbitrary minister.

Edward IV marries Elizabeth Woodville.

His first sign of revolt was his secret marriage to Elizabeth Woodville, a lady of decidedly Lancastrian connexions, for her father and her first husband were both members of the so-called faction. Warwick was at the moment singular for the band of Louis XI’s sister-in-law in his master’s name, and had to back out of his negotiations in a sudden and somewhat ridiculous fashion. His pride was hurt, but for two years more there was no open breach between him and his master, though their estrangement grew more and more marked when Edward continued to heap titles and estates on his wife’s numerous relatives, and to conclude for them marriage alliances with all the great Yorkist families who were not of the Neville connexion. In this way he built up for himself a personal following within the Yorkist party; but the relative strength of this faction, and of that which still looked upon Warwick as the true representative of the cause had yet to be tried.

The king had in his favour the prestige of the royal name, and a popularity won by his easy-going affability and his liberal gifts. The earl had his established reputation for dishonest devotion to the welfare of the realm, and his brilliant record as a soldier and statesman. In districts as far apart as Kent and Yorkshire, his word counted for a good deal more than that of his sovereign.

Unhappily for England and for himself, Warwick’s loyalty was not sufficient to restrain his ambition and his resentment. He felt the ingratitude of the king, whom he had made, so bitterly that he stooped even to intrigue and treason. Edward in 1467 openly broke with him by dismissing his brother George Neville from the chancellorship, by repudiating a treaty with France which the earl had just negotiated, and by concluding an alliance with Burgundy against which he had always protested. Warwick enlisted in his cause the king’s younger brother George of Clarence, who desired to marry his daughter and heiress Isabella Neville, and with the aid of this unscrupulous but unstable young man began to organize rebellion. His first experiment in treason was the so-called “rising of Robin of Redesdale,” which was ostensibly an armed protest by the gentry and commons of Yorkshire against the maladministration of the realm by the king’s favourites—his wife’s relatives, and the courtiers whom he had lately promoted to high rank and office. The rebellion was headed by well-known adherents of the earl, and the nickname of “Robin of Redesdale” seems to have covered the personality of his kinsman Sir John Conyers. When the rising was well started Warwick declared his sympathy with the aims of the insurgents, wedged his daughter to Clarence despite the king’s prohibition of the match, and joined in personal rebellion with the rebels and his brother.

But his plot was already successful before he reached the scene of operations. The Yorkshire rebels beat the royalist army at the battle of Edgcott (July 6, 1460). A few days later Edward himself was captured at Olney and put into the earl’s hands. Many of his chief supporters, including the queen’s father, Lord Rivers, and her brother, John Woodville, as well as the newly-created earls of Pembroke and Devon, were put to death with Warwick’s connivance, if not by his direct orders. The king was confined for some weeks in the great Neville stronghold of Middleham Castle, but presently released on conditions, being compelled to accept new ministers nominated by Warwick. The earl supposed that his cousin’s spirit was broken and that he would give no further trouble. In this he erred grievously. Warwick vowed revenge for his slaughtered favourites, and waited his opportunity. Warwick had lost credit by using such underhand methods in his attack on his master, and had not taken sufficient care to conciliate public opinion when he reconstructed the government. His conduct had destroyed his old reputation for disinterestedness and honesty.

In March 1470 the king seized the first chance of avenging himself. Some unimportant riots had broken out in Lincolnshire, originating probably in mere local quarrels, but possibly in Lancastrian intrigues. To suppress this rising the king gathered a great force, carefully calling in to his banner all the peers who were offended with Warwick or, at any rate, did not belong to his family alliance. Having scattered the Lincolnshire bands, he suddenly turned upon Warwick with his army, and caught him wholly unprepared. The earl and his son-in-law Clarence were hunted out of the realm before they could collect their partisans, and fled to France; Edward seemed for the first time to be master in his own realm.

But the Wars of the Roses had one more phase to come. Warwick’s name was still a power in the land, and his expulsion had been so sudden that he had not been given an opportunity of trying his strength. His old enmity for the house of Lancaster was completely swallowed up in his new grudge against the king that he had made. He opened negotiations with the exiled Queen Margaret, and offered to place his sword at her disposition for the purpose of overthrowing King Edward and restoring King Henry. The queen had much difficulty in forcing herself to come to terms with the man who had been the bane of her cause, but finally, was induced by Louis XI. to conclude a bargain. Warwick married his younger daughter to her son Edward, prince of Wales, as a pledge of his good faith, and swore allegiance to King Henry in the cathedral of Angers. He then set himself to stir up the Yorkshire adherents of the house of Neville to distract the attention of Edward IV. When the king had gone northward to attack them, the earl landed at Dartmouth (Sept. 1470) with a small force partly composed of Lancastrian exiles, partly of his own men. His appearance had the effect on which he had calculated. Devon rose in the Lancastrian interest; Kent, where the earl’s name had always been popular, took arms a few days later; and London opened its gates. King Edward, hurrying south to oppose the invader, found his army melting away from his hanner, and hastily took ship at Lynn and fled to Holland. He found a refuge with his brother-in-law and ally Charles the Bold, the great duke of Burgundy.

King Henry was released and replaced on the throne, and for six months Warwick ruled England as his lieutenant. But there was bitterness and mistrust between the old Lancastrian faction and the Nevilles, and Queen Margaret refused to cross to England or to trust her son in the king-maker’s hands. Her partisans doubted his sincerity, while many of the Yorkists who had hitherto followed Warwick in blind admiration found it impossible to reconcile themselves to the situation. But the queen was more particularly, discontented at the triumph of Lancaster, betrayed his father-in-law, and opened secret negotiations with his exiled brother. Encouraged by the news of the dissensions among his enemies, Edward IV. resolved to try his fortune once more, and landed near Hull on the 15th of March 1471 with a body of mercenaries lent him by the duke of Burgundy. The campaign that followed was most creditable to Edward’s generalship, but must have been fatal to him if Warwick had been honestly supported by his
lieutenants. But the duke of Clarence betrayed to his brother the army which he had gathered in King Henry's name, and many of the Lancastrians were slow to join the earl, from their distrust of his loyalty. Edward, poaching through the midst of the slowly gathering levies of his opponents, seized London, and two days later defeated and slew Warwick at the battle of Barnet (April 13, 1471).

On that same day Queen Margaret and her son landed at Weymouth, only to hear that the earl was dead and his army scattered. But she refused to consider the struggle ended, and gathered the Lancastrians of the west for a final rally. On the fatal day of Tewkesbury (May 3, 1471) her army was beaten, her son was slain in the fight, and the greater part of her chief captains were taken prisoner. She herself was captured next day. The victorious Edward sent to the block the last Beaufort duke of Somerset, and nearly all the other captains of rank, whether Lancastrians or followers of Warwick. He then moved to London, which was being threatened by Kentish levies raised in Warwick's name, delivered the city, and next day caused the unhappy Henry VI. to be murdered in the Tower (May 21, 1471).

The descendants of Henry IV. were now extinct, and the succession question seemed settled for ever. No one dreamed of raising against King Edward the claims of the remoter heirs of John of Gaunt—the young earl of Richmond, who represented the Beauforts by a female descent, or the king of Portugal, the grandson of Gaunt's eldest daughter. Edward was now king indeed, with no over-powerful cousin at his elbow to curb his will. He had, moreover, at his disposal plunder almost as valuable as that which he had divided up in 1461—the estates of the great Neville clan and their adherents. A great career seemed open before him; he had proved himself a fine soldier and an unscrupulous diplomatist; he was in the very prime of life, having not yet attained his thirty-first year. He might have devoted himself to foreign politics and have rivalled the exploits of Edward III. or Henry V.—for the state of the continent was all in his favour—or might have set himself to organize an absolute monarchy on the ruins of the parliament and the baronage. For the successive attainders of the Lancastrians and the Nevilles had swept away many of the older noble families, and Edward's house of peers consisted for the main part of new men, his own partisans promoted for good service, who had not the grip on the land that their predecessors had possessed.

But Edward either failed to see his opportunity or refused to take it. He did not plunge headlong into the wars of Louis XI. and Charles of Burgundy, nor did he attempt to recast the institutions of the realm. He settled down into inglorious ease, varied at long intervals by outbursts of spasmodic tyranny. It would seem that the key to his conduct was that he hated the hard work without which a despotic king cannot hope to assert his personality, and preferred leisure and vicious self-indulgence. In many ways the later years of his reign were marked with all the signs of absolutism. Between 1475 and 1483 he called only one single parliament, and that was summoned not to give him advice, or raise him money, but purely and solely to attain his brother of Clarence, whom he had resolved to destroy. The duke's fate (Feb. 17, 1478) need provoke no sympathy, he was a detestable intriguer, and had given his brother just offence by a series of deeds of high-handed violence and by personal contumely. But he had committed no act of real treason since his long-pardoned alliance with Warwick, and was not in any way dangerous; so that when the king caused him to be attained, and then privately murdered in the Tower, there was little justification for the fratricide.

Edward was a thrifty king; he was indeed the only medieval monarch of England who succeeded in keeping free of debt and made his revenue suffice for his expenses. But his methods of filling his purse were often unconstitutional and sometimes ignominious. When the resources drawn from confiscations were exhausted, he raised "benevolences"—forced gifts extracted from men of wealth by the unspoken threat of the royal displeasure, instead of applying to parliament for new taxes. But his most profitable source of revenue was drawn from abroad. Having allied himself with his brother-in-law Charles of Burgundy against the king of France, he led an army into Picardy in 1475, and then by the treaty of Picquigny sold peace to Louis XI. for 75,000 gold crowns down, and an annual pension (or tribute as he preferred to call it) of 50,000 crowns more. It was regularly paid up to the last year of his reign. Charles the Bold, whom he had thus deliberately deserted in the middle of their joint campaign, used the strongest language about this mean act of treachery, and with good cause. But the king cared not which his pockets were full. Another device of Edward for filling his exchequer was a very stringent enforcement of justice; small infractions of the laws being made the excuse for exorbitant fines. This was a trick which Henry VII. was to turn to still greater effect. In defence of both it may be pleaded that after the anarchy of the Wars of the Roses a strong hand was needed to restore security for life and property, and that it was better that penalties should be over-heavy rather than that there should be no penalties at all. Another appreciable source of revenue to Edward was his private commercial ventures. He owned many ships, and traded with great profit to himself abroad, because he could promise, as a king, advantages to foreign buyers and sellers with which no merchant could compete.

During the last period of Edward's rule England might have been described as a despotism, if only the king had cared to be a despot. But except on rare occasions he allowed his power to be disguised under the old machinery of the medieval monarchy, and made no parade of his autocracy. Much was pardoned by the nation to one who gave them comparatively efficient and rather cheap government, and who was personally easy of access, affable and humorous. It is with little justification that he has been called the "founder of the new monarchy," and the spiritual ancestor of the Tudor despotism. Another king in his place might have merited such titles, but Edward was too careless, too unsystematic, too lazy, and too fond of self-indulgence to make a real tyrant. He preferred to be a man of pleasure and leisure, only awakening now and then to perpetrate some act of arbitrary cruelty.

England was not unprosperous under him. The lowest point of her fortunes had been reached under the administration of Margaret of Anjou, during the weary years that preceded the outbreak of the civil wars in 1450. At that time the government had been bankrupt, foreign trade had almost disappeared, the French and pirates of all nations had possession of the Channel, and the nation had lost heart, because there seemed no way out of the trouble save domestic strife, to which all looked forward with dismay. The actual war proved less disastrous than had been expected. It fell heavily upon the baronage and their retainers, but passed lightly, for the most part, over the heads of the middle classes. The Yorkists courted the approval of public opinion by their careful avoidance of pillage and requisitions; and the Lancastrians, though less scrupulous, only once launched out into general raiding and devastation, during the advance of the queen's army to St Albans in the early months of 1461. As a rule the towns suffered little or nothing—they submitted to the king of the moment, and were always spared by the victors. It is one of the most curious features of these wars that no town ever fell for a siege, though there were several long and arduous sieges of baronial castles, such as Harlech, Alnwick and Bamborough. Warwick, with his policy of conciliation for the masses and hard blows for the magnates, was mainly responsible for this moderation. In battle he was wont to bid his followers spare the commons in the pursuit, and to smite only the knights and nobles. Towton, where the Yorkist army was infuriated by the harrying of the Midlands by their enemies in the preceding
campaign, was the only fight that ended in a general massacre. There were, of course, many local feuds and riots which led to the destruction of property; well-known instances are the private war about Caister Castle between the duke of Norfolk and the Pastons, and the "battle of Nibley Green," near Bristol, between the Berkeleys and the Talbots. Both of the whole there was no ruinous devastation of the land. Prosperity seems to have revived early during the rule of York; Warwick had cleared the seas of pirates, and both he and King Edward were great patrons of commerce, though the earl's policy was to encourage trade with France, while his master wished to knit up the old alliance with Flanders by adhering to the cause of Charles of Burgundy. Edward did much in his later years to develop interchange of commodities with the Baltic, making treaties with the Hanseatic League which displeased the merchants of London, because of the advantageous terms granted to the foreigner. The east coast ports seem to have thriven under his rule, but Bristol was not less prosperous. On the one side, developing the great salt-fish trade, her vessels were encompassing Iceland, and feeling their way towards the Banks of the West; on the other they were beginning to feel their way into the Mediterranean. The famous William Canynges, the patriarch of Bristol merchants, possessed 2500 tons of shipping, including some ships of 900 tons, and traded in every sea. Yet we still find complaints that too much merchandise reached and left England in foreign bottoms, and King Edward's treaty with the Hansa was censured mainly for this reason. Internal commerce was evidently developing in a satisfactory style, despite of the wars; in especial raw wool was going out of England in less bulk than of old, because cloth woven at home was becoming the staple export. The woollen manufactures which had begun in the eastern counties in the 14th century were now spreading all over the land, taking root especially in Somersetshire, Yorkshire and some districts of the Midlands. Coventry, the centre of a local woollen and dyeing industry, was probably the inland town which grew most rapidly during the 15th century. Yet there was still a large export of wool to Flanders, and the long pack-trains of the Cotswold flockmasters still wound eastward to the sea for the benefit of the merchants of the staple and the continental manufacturer.

As regards domestic agriculture, it has been often stated that the 15th century was the golden age of the English peasant, and that his prosperity was little affected either by the unhappy French wars of Henry VI. or by the Wars of the Roses. There is certainly very little evidence of any general discontent among the rural population, such as had prevailed in the times of Edward III. or Richard II. Insurrections that passed as popular, like the risings of Jack Cade and Robin of Redesdale, produced manifestos that spoke of political grievances but hardly mentioned economic ones. There is a bare mention of the Statute of Labourers in Jack Cade's aly drafted chapter of complaints. It would seem that the manorial grudges between landowner and peasant, which had been so fierce in the 14th century, had died down as the lords abandoned the old system of working their demesne by villein labour. They were now for the most part letting out the soil to tenant-farmers at a moderate rent, and the large class of yeomanry created by this movement seem to have been prosperous. The less popular device of turning old manorial arable land into sheep-runs was also known, but does not yet seem to have grown so common as to provoke the popular discontents which were so frequent under the Tudors. When the Englishman as was thrown out of work by this tendency was easily absorbed by the growing needs of the towns. Some murmurs are heard about "enclosures," but they are incident and not widely spread.

One of the best tests of the prosperity of England under the Yorkist rule seems to be the immense amount of building that was on hand. Despite the needs of civil war, it was not on castles that the builders' energy was spent; the government discouraged fortresses in private hands, and the dwellings of the new nobility of Edward IV. were rather splendid manor-houses, with some slight external protection of moat and gatehouse, than old-fashioned castles. But the church-building of the time is enormous and magnificent.

A very large proportion of the great Perpendicular churches of England date back to this age, and in the cathedrals also much work was going on.

Material prosperity does not imply spiritual development, and it must be confessed that from the intellectual and moral point of view 15th-century England presents an unpleasing picture. The Wycliffite movement, the one phenomenon which at the beginning of the century seemed to give some promise of better things, had died down under persecution. It lingered on in a substratum fashion among a small class in the universities and the minor clergy, and had some adherents among the townsfolk and even among the peasantry. But the Lollards were a feeble and helpless minority; they no longer produced writers, organizers or missionaries. They continued to be burnt, or more frequently to make forced recantations, under the Yorkist rule, though the list of trials is not a long one. Little can be gathered concerning them from chronicles or official records. We only know that they continued to exist, and occasionally produced a martyr. But the governing powers were not fanatics, bent on seeking out victims; the spirit of Henry V. and Archbishop Arundel was dead. The life of the church seems, indeed, to have been in a more stagnant and torpid condition in this age than at any other period of English history. The great prelates from Cardinal Beaufort down to Archbishops Bourchier and Rotherham, and Bishop John Russell—trusted supporters of the Yorkist dynasty—were mere politicians with nothing spiritual about them. Occasionally they appear in odious positions. Rotherham was the ready tool of Edward IV. in the judicial murder of Clarence. Russell became the obsequious chancellor of Richard III. Bourchier made himself responsible in 1483 for the taking of the little duke of York from his mother's arms in order to place him in the power of his murderous uncle. It is difficult to find a single bishop in the whole period who was respected for his piety or virtue. The best of them were capable statesmen, the worst were mean time-servers. Few of the higher clergy were such patrons of learning as many prelates of earlier ages. William Grey of Ely and James Goldwell of Norwich did something for scholars, and there was one bishop in the period who came to sad grief through an intellectual activity which was rare among his contemporaries. This was the eccentric Reginald Pecock of Chichester, who, while setting himself to confute Lollard controversialists, lapsed into heresy by setting "reason" above "authority." He taught that the organization and many of the dogmas of the medieval church should be justified by an appeal to private judgment and the moral law, rather than to the scriptures, the councils, or the fathers. For taking up this dangerous line of defence, and admitting his doubts about several received articles of faith, he was attacked by the Yorkist archbishop Bourchier in 1457, compelled to do penance, and shut up in a monastery for the rest of his life. He seems to have had no school of followers, and his doctrines died with him.

In nothing is the general stagnation of the church in the later 15th century shown better than by the gradual cessation of the monastic chronicles. The stream of narrative was still flowing strongly in 1400; by 1485 it has run dry, even St Albans, the mother of historians, produced no authors after William of Malmesbury, who held the See during the Wars of the Roses. The only monastic chronicler who went on writing for a few years after the extinction of the house of York was the "Croyland continuator." For the last two-thirds of the century the various "London chronicles," the work of laymen, are much more important than anything which was produced in the religious houses. The regular clergy indeed seem to have been sunk in intellectual torpor. Their numbers were falling off, their zeal was gone; there is little good to be said of them save that they were still in some cases enduring
England with splendid architectural decorations. But even in the wealthiest abbey we find traces of thriftless administration, idleness, self-indulgence and occasionally grave moral scandals. The parochial clergy were probably in a healthier condition, but the old abuses of pluralism and non-residence were as rampant as ever, and though their work may have been in many cases honourably carried out, it is certain that energy and intelligence were at a low ebb.

The moral faults of the church only reflected those of the nation. It was a hard and selfish generation which witnessed the Wars of the Roses and the dictatorship of Edward IV. The iniquitous French war, thirty years of plunder and demoralization, had corrupted the minds of the governing classes before the civil strife began. Afterwards the constant and easy changes of allegiance, as one faction or the other was in the ascendant, the wholesale confiscations and attainders, the never-ending executions, the sudden prosperity of adventurers, the premium on time-serving and intrigue, sufficed to make the whole nation cynical and sordid. The claim of the Yorkists to represent constitutional opposition to misgovernment became a mere hypocrisy. The claim of the Lancastrians to represent loyalty soon grew almost as hollow. Edward IV, with his combination of vicious self-indulgence and spasmodic cruelty was no unfit representative of his age. The Paston Letters, that unique collection of the private correspondence of a typical family of nouveau riches, thriftless, pushing, unscrupulous, gives us the true picture of the time. All that can be said in favour of the Yorkists is that they restored a certain measure of national prosperity, and that their leaders had one redeeming virtue in their addiction to literature. The learning which had died out in monasteries began to flourish again in the corrupt soil of the court. Most of Edward’s favourites had literary tastes. His constable Tiptoft, the “butcher earl” of Worcester, was a figure who might have stepped out of the Italian Renaissance.

A graduate of Pavia, a learned lawyer, who translated Caesar and Cicero, composed works both in Latin and English, and habitually impaled his victims, he was a man of a type hitherto unknown in England. Antony, Lord Rivers, the queen’s brother, was a mere adventurer, but a poet of some merit, and a great patron of Caxton. Hastings, the Bourchiers, and other of the king’s friends were minor patrons of literature. It is curious to find that Caxton, an honest man, and an enthusiast as to the future of the art of printing, which he had introduced into England, waxed enthusiastic as to the merits of the intelligent but unscrupulous peers who took an interest in his endeavours. Of the detestable Tiptoft he writes that “there flowered in virtue and cunning none like him among the lords of the temporality in science and moral virtue”! And this is no time-serving praise of a patron, but disinterested tribute to a man who had perished long before on the scaffold.

Death of Edward IV.

He had ruined a splendid constitution by the combination of sloth and evil living, and during his last years had been sinking slowly into his grave, unable to take the field or to discharge the more laborious duties of royalty. Since Clarence’s death he had been gradually falling into the habit of transferring the conduct of great matters of state to his active and hard-working youngest brother, Richard, duke of Gloucester, who had served him well and faithfully ever since he first took the field at Barnet. Gloucester passed as a staid and sober-hearted conservative, but in the same could be said of every statesman of his time. His sudden plunge into crime and usurpation after his brother’s death was wholly unexpected by the nation. Indeed it was his previous reputation for loyalty and moderation which made his scandalous coup d’état of 1483 possible. No prince with a sinister reputation would have had the chance of executing the series of crimes which placed him on the throne. But when Richard declared that he was the victim of plots and intrigues, and was striking down his enemies only to defend his own life and honour, he was for some time believed.

The tragic moment of King Edward’s death his eldest son by Elizabeth Woodville, Edward, prince of Wales, was twelve; his younger son Richard, duke of York, was nine. It was clear that there would be a long minority, and that the only possible claimants for the regency were the queen and Richard of Gloucester. Elizabeth was personally unpopular, and the rapacity and insolence of her family was well known. Hence when Richard of Gloucester seized on the person of the young king, and imprisoned Lord Rivers and Sir Richard Grey, the queen’s brother and son, on the pretence that they were conspiring against him, his action was regarded with equanimity by the people. Nor did the fact that the duke took the title of “protector and defender of the realm” cause any surprise. Suspicious only because it had been the policy of Richard to seize and beheaded without any trial, Lord Hastings, the late king’s most familiar friend, and had arrested at the same moment the archbishop of York, Morton, bishop of Ely, and Lord Stanley, all persons of unimpeachable loyalty to the house of Edward IV. It was not plausible to accuse such persons of plotting with the queen to overthrow the protector, and public opinion began to turn against Gloucester. Nevertheless he went on recklessly with his design, having already enlisted the support of a party of the greater peers, who were ready to follow him to any length of treason. These confidants, the duke of Buckingham, the lords Howard and Lovel, and a few more, must have known from an early date that he was aiming at the crown, though it is improbable that they suspected that his plan involved the murder of the rightful heirs as well as mere usurpation.

On the 16th of June, Richard, using the aged archbishop Bourchier as his tool, got the little duke of York out of his mother’s hands, and sent him to join his brother in the Tower. A few days later, having packed London with his own armed retainers and those of Buckingham and his other confidants, he openly put forward his pretensions to the throne. Edward IV., as he asserted, had been privately contracted to Lady Eleanor Talbot before he ever met Queen Elizabeth. His children therefore were bastards, the offspring of a bigamous union. As to the son and daughter of the duke of Clarence, their blood had been corrupted by their father’s attainer, and they could not be reckoned as heirs to the crown. He himself, therefore, was the legitimate successor of Edward IV. This preposterous theory was set forth by Buckingham, first to the mayor and corporation of London, and next day to an assembly of the estates of the realm held in St Paul’s. Cowed by the show of armed force, and remembering the fate of Hastings, the two assemblies received the claim with silence which gave consent. Richard, after a hypocritical show of reluctance, allowed himself to be saluted as king, and was crowned on the 6th of July 1483. Before the coronation ceremony he had issued orders for the execution of the queen’s relatives, who had been in prison since the beginning of May. He paid his adherents lavishly for their support, making Lord Howard duke of Norfolk, and giving Buckingham enormous grants of estates and offices.

Having accomplished his coup d’état Richard started for a royal progress through the Midlands, and a few days after his departure sent back secret orders to London for the murder of his two nephews in the Tower. There is no reason to doubt that they were secretly smothered in their beds on the 15th of July by his agent Sir James Tyrrell, or that the bones found buried under a staircase in the fortress two hundred years after belonged to the two unhappy lads. But the business was kept dark at the time, and it was long before any one could assert with certainty that they were dead or alive. Richard never published any statement as to their end, though some easy tale of a fever, a conflagration, or an accident might have served him better than the mere silence that he employed. For while many persons believed
that the princes still existed there was room for all manner of impostures and false rumours.

The usurper’s reign was from the first a troubled one. Less than three months after his coronation the first insurrection broke out; it was headed—strangely enough—by the duke of Buckingham, who seems to have been soothed over by the murder of the princes; he must have been one of the few who had certain information of the crime. He did not take arms in his own cause, though after the house of York the house of Buckingham had the best claim to the throne, as representing Thomas of Woodstock, the youngest son of Edward III. His plan was to unite the causes of York and Lancaster by wedding the Lady Elizabeth, the eldest sister of the murdered princes, to Henry Tudor, earl of Richmond, a young exile who represented the very doubtful claim of the Beauforts to the Lancastrian heritage. Henry was the son of Margaret Beaufort, the daughter of John, first duke of Somerset, and the niece of Edmund, second duke, who fell at St. Albans. All her male kinsmen had been exterminated in the Wars of the Roses.

This promising scheme was to be supported by a rising of those Yorkists who rejected the usurpation of Richard III., and by the landing on the south coast of Henry of Richmond with a body of Lancastrian exiles and foreign mercenaries. But good organization was wanting, and chance fought for the king. A number of scattered risings in the south were put down by Richard’s troops, while Buckingham, who had raised his banner in Wales, was prevented from bringing aid by a week of extraordinary rains which made the Severn impassable. Finding that the rest of the plan had miscarried, Buckingham’s retainers melted away from him, and he was forced to fly. A few days later he was betrayed, handed over to the king, and beheaded (Nov. 2, 1483).

Meanwhile Richmond’s little fleet was dispersed by the same storms that scattered Buckingham’s army, and he was forced to return to Brittany without having landed in England.

Here King Richard’s luck ended. Though he called a parliament early in 1484, and made all manner of gracious promises of good government, he felt that his position was insecure. The nation was profoundly disgusted with his unscrupulous policy, and the greater part of the leaders of the late insurrection had escaped abroad and were weaving new plots. Early in the spring he lost his only son and heir, Edward, prince of Wales, and the question of the succession to the crown was opened from a new point of view. After some hesitation Richard named his nephew John de la Pole, earl of Lincoln, a son of his sister, as his heir. But he also betook himself to another and more repulsive plan for strengthening his position. His queen, Anne Neville, the daughter of the kingmaker, was on her death-bed. With indecent haste he began to devise a scheme for marrying his niece Elizabeth, whose brothers he had murdered but a year before. Knowledge of this scheme is said to have shortened the life of the unfortunate Anne, and many did not scruple to say that her husband had made away with her.

When the queen was dead, and some rumours of the king’s intentions got abroad, the public indignation was so great that Richard’s councilors had to warn him to disavow the projected marriage, if he wished to retain a single adherent. He yielded, and made public complaint that he had been slandered—which few believed.

Meanwhile the conspirators of 1483 were busy in organizing another plan of invasion. This time it was successfully carried out, and the earl of Richmond landed at Milford Haven with many exiles, both Yorkists and Lancastrians, and 1000 mercenaries lent him by the princess regent of France. The Welsh joined him in great numbers, not forgetting that by his Tudor descent he was their own kinsman, and when he reached Shrewsbury English adherents also began to flock in to his banner, for the whole country was seething with discontent, and Richard III. had but few loyal adherents. When the rivals met at Bosworth Field (Aug. 22, 1485) the king’s army was far the larger, but the greater part of it was determined not to fight. When battle was joined some left the field and many joined the pretender. Richard, however, refused to fly, and was slain, fighting to the last, along with the duke of Norfolk and a few other of his more desperate partisans. The slaughter was small, for treason, not the sword, had settled the day. The battered crown which had fallen from Richard’s helmet was set on the living head by Lord Stanley, the chief of the Yorkist peers who had joined his standard, and his army hailed him by the new title of Henry VII.

No monarch of England since William the Conqueror, not excluding Stephen and Henry IV., could show such a poor title to the throne as the first of the Tudor kings. His claim to represent the house of Lancaster was of the weakest—when Henry IV. had assented to the legitimating of his brothers the Beauforts, he had attached a clause to the act, to provide that they were given every right save that of counting in the line of succession to the throne. The true foundation of the House of Tudor has been sought among the descendants of his eldest legitimate daughter, not among those of his base-born sons. The earl of Richmond had been selected by the conspirators as their figure-head mainly because he was known as a young man of ability, and because he was unmarried and could therefore take to wife the princess Elizabeth, and so absorb the Yorkist claim in his own. This had been the essential part of the bargain, and Henry was ready to carry it out, but he insisted that he should first be recognized as king in his own right, lest it might be held that he ruled merely as his destined wife’s consort. He was careful to hold his first parliament and get his title acknowledged before he married the princess. When he had done so, he had the triple claim by conquest, by election and by inheritance, safely united. Yet his position was even then insecure; the vicissitudes of the last thirty years had shaken the old prestige of the name of king, and a weaker and less capable man than Henry Tudor might have failed to retain the crown that he had won. There were plenty of possible pretenders in existence; the earl of Lincoln, whom Richard III. had recognized as his heir, was still alive; the two children of the duke of Clarence might be made the tools of conspirators; and there was a widespread doubt as to whether the sons of Edward IV. had actually died in the Tower. The secrecy with which their uncle had carried out their murder was destined to be a sore hindrance to his successor.

Bosworth Field is often treated as the last act of the Wars of the Roses. This is an error; they were protracted for twelve years after the accession of Henry VII., and did not really end till the time of Blackheath Field and the siege of Exeter (1497). The position of the first Tudor king is misconceived if his early years are regarded as a time of strong governance and well-established order. On the contrary he was in continual danger, and was striving with all the resources of a ready and untiring mind to rebuild the kingdom that was absolutely rotten. Phenomena like the Cornish revolt (which recalls Cade’s insurrection) and the Yorkshire rising of 1480, which began with the death of the earl of Northumberland, show that at any moment whole counties might take arms in sheer lawlessness, or for some local grievance. Loyalty was such an uncertain thing that the king might call out great levies yet be forced to doubt whether they would fight for him—at Stoke Field it seems that a large part of Henry’s army misbehaved, much as that of Richard III. had done at Bosworth. The demoralization brought about by the evil years between 1453 and 1483 could not be put down except to the fact that reunion was possible to the generation that had seen the career of Warwick and the usurpation of Gloucester. The survivors of that time were capable of taking arms for any cause that offered a chance of unreasonable profit, and no one’s loyalty could be trusted. Did not Sir William Stanley, the best paid of those who betrayed Richard III., afterwards lose his head for a deliberate plot to betray Henry VII.? The various attempts that were made to overturn the new dynasty seem contemptible to the historian of the 20th century. They were not so contemptible at the time, because England and Ireland were full...
of adventurers who were ready to back any cause, and who looked on the king of the moment as no more than a successful member of their own class—a base-born Welshman who had been lucky enough to become the figurehead of the movement that had overturned an unpopular usurper. The organizing spirits of the early troubles of the reign of Henry VII were irreconcilable Yorkists who had suffered by the change of dynasty; but their hopes of success rested less on their own strength than on the not ill-founded notion that England would tire of any ruler who had to raise taxes and reward his partisans. The position bore a curious resemblance to that of the early years of Henry IV., a king who, like Henry VII., had to vindicate a doubtful elective title to the throne by miracles of cunning and activity. The later representative of the house of Lancaster was fortunate, however, in having less formidable enemies than the earlier; the power of the baronage had been shaken by the Wars of the Roses no less than the power of the crown; so many old estates had passed rapidly from hand to hand, so many old titles were represented by upstarts destitute of local influence, that the feudal danger had become far less. Risings like that of the Percies in 1403 were not the things which the seventh Henry had to fear. He was lucky too in having no adversary of genius of the type of Owen Glendower. Welsh national spirit indeed was enlisted on his own side. Yet leaderless seditions and the plots of obvious impostors sufficed to make his throne tremble, and a ruler less resolute, less wary, and less unscrupulous might have been overthrown.

The first of the king's troubles was an abortive rising in the north riding of Yorkshire, the only district where Richard III. seems to have enjoyed personal popularity. It was led by Lord Lovel, Richard's chamberlain and admiral; but the insurgents dispersed when Henry marched against them with a large force (1486), and Lovel took refuge in Flanders with Margaret of York, the widow of Charles the Bold of Burgundy, whose dower towns were the refuge of all English exiles, and whose cofferers were always open to subsidize plots against her niece's husband. Under the auspices of this rancorous princess the second conspiracy was hatched in the following year (1487). Its leaders were Lovel and John, earl of Lincoln, whom Richard III. had designated as his heir. But the Yorkist banner was to be raised, not in the name of Lincoln, but in that of the boy Edward of Clarence, then a prisoner in the Tower. His absence and captivity might seem a fatal hindrance, but the conspirators had prepared a "double" who was to take his name till he could be released. This was a lad named Lambert Simnel, the son of an Oxford organ-maker, who bore a personal resemblance to the young captive. The conspirators seem to have argued that Henry VII. would not proceed to murder the real Edward, but would rather exhibit him to prove the imposture; if he took the more drastic alternative Lincoln could fall back on his own claim to the crown.

In May 1487, Lincoln and Lovel landed in Ireland accompanied by other exiles and 2000 German mercenaries. The cause of York was popular in the Pale, and the Anglo-Irish barons seem to have conceived the notion that Henry VII. was likely to prove too strong and capable a king to suit their convenience. The invading army was welcomed by almost all the lords, and the spurious Clarence was crowned at Dublin by the name of Edward VI. A few weeks later Lincoln had recruited his army with 4000 or 5000 Irish adventurers under Thomas Fitzgerald, son of the earl of Kildare, and had taken ship for England. He landed in Lancashire, and pushed forward, hoping to gather the English Yorkists; and when Edward, who had joined the English king Henry brought him to action at Stoke, near Newark, on the 17th of July. Despite the doubtful conduct of part of the royal army, and the fierce resistance of the Germans and Irish, the rebel army was routed. Lincoln and Fitzgerald were slain; Lovel disappeared in the rout; the young impostor Simnel was taken prisoner. Henry treated him with polite contempt, and made him a cook boy in his kitchen. He lived for many years after in the royal household. The Irish lords were pardoned on renewing their oaths of fealty; the king did not wish to entangle himself in costly campaigns beyond St George's Channel till he had made his position in England more stable.

The Yorkist cause was crushed for four years, till it was raised again by Margaret of Burgundy, with an imposture even more preposterous than that of Lambert Simnel. In the intervening space, however, while Henry VII. was comparatively undisturbed by domestic rebellion, he found opportunity for a first tentative experiment at interfering in European politics. He allied himself with Ferdinand and Isabella of Spain and with Maximilian of Austria, who was ruling the Netherlands in behalf of his young son, Philip, the heir of the Burgundian inheritance, for the purpose of preventing France from annexing Brittany, the last great fief of the crown which had not yet been absorbed into the Valois royal domain. This struggle, the only continental war in which the first of the Tudors risked his fortunes, was not prosecuted with any great energy, and came to a necessary end when Anne, duchess of Brittany, in whose behalf it was being waged, disappointed her allies by marrying Charles VIII. of her own free will (Dec. 1491). Henry very wisely proceeded to get out of the war on the best terms possible, and, to the disgust of Maximilian, sold peace to the French king for 600,000 crowns, as well as an additional sum representing arrears of the pension which Louis XI. had been bound to pay to Edward IV. This treaty of Étaples was, in short, a repetition of Edward's treaty with France (1470), equally profitable and less disgraceful to Maximilian of Austria, whom Henry thus abandoned, had given more cause of offence than had Charles of Burgundy in 1475. Domestic malcontents did not scruple to hint that the king, like his father-in-law before him, had made war on France, not with any hope of renewing the glories of Crecy or Agincourt, still less with any design of helping his allies, but purely to get first grants from his parliament, and then a war indemnity from his enemies. In any case he was wise to make peace. France was now too strong for England, and both Maximilian and Ferdinand of Spain were selfish and shifty allies. Moreover, it was known that the one dominating desire of Charles VIII. was to conquer Italy, and it was clear that his ambitions in that direction were not likely to prove dangerous to England.

In the year of the treaty of Étaples the Yorkist conspiracies began once more to thicken, and Henry was fortunate to escape with profit from the French war before his domestic troubles recommenced. Ever since 1483 it had been rumoured that one or both of the sons of Edward IV. had escaped, not having been murdered in the Tower. Of this widespread belief the plotters now took advantage; they held that much more could be accomplished with such a claim than by using that of the unfortunate Edward of Clarence, whose chances were so severely handicapped by his being still the prisoner of Henry VII. The scheme for producing a false Plantagenet was first renewed in Ireland, where Simnel's imposture had been so easily taken up a few years before. The tool selected was one Perkin Warbeck, a handsome youth of seventeen or eighteen, the son of a citizen of Tournai, who had lived for some time in London, where Perkin had actually been born. There is a bare possibility that the young adventurer may have been an illegitimate son of Edward IV.; his likeness to the late king was much noticed. When he declared himself to be Richard of York, he obtained some support in Ireland from the earl of Desmond and other lords; but he did not risk open rebellion till he had visited Flanders, and had been acknowledged as an indubitable nephew by Duke Margaret. Maximilian of Austria also took up his cause, as a happy means of revenging himself on Henry VII. for the treaty of Étaples. There can be small doubt that both the duchess and the German King (Maximilian had succeeded to his father's crown in 1493) were perfectly well aware that they were aiding a manifest fraud. But they made much of Perkin, who followed the imperial court for two years, while his patron was intriguing with English malcontents. The emissaries from Flanders got many promises of assistance, and a formidable rising might have taken place had
not Henry VII. been well served by his spies. But in the winter of 1494–1495 the traitors were themselves betrayed, and a large number of arrests were made, including not only Lord Fitzwalter and a number of well-known kith and kin of Yorkist families, but Sir William Stanley, the king’s chamberlain, who had been rewarded with enormous gifts for his good service at Bosworth, and was reckoned one of the chief supports of the throne. Stanley and several others were beheaded, the rest hanged or imprisoned. This vigorous action on the part of the king seems to have cowed all Warbeck’s supporters on English soil. But the pretender nevertheless sailed from Flanders in July 1495 with a following of 2000 exiles and German mercenaries. He attempted to land at Deal, but his vanguard was destroyed by Kentish levies, and he drew off and made for Ireland. Suspecting that there were many traitors among his followers, he set out to strengthen his hold on the Pale, whither he had sent his capable servant Sir Edward Poyning as lord deputy. Already before Warbeck’s arrival Poyning had arrested the earl of Kildare, Simnel’s old supporter, cowed some of the Irish by military force, and bought over others by promises of subsidies and pensions. But his best-remembered achievement was that he had induced the Irish parliament to pass the ordinances known as “Poyning’s Law,” by which it was acknowledged that it could pass no legislation which had not been approved by the king and his council, and agreed that all statutes passed by the English parliament should be in force in Ireland. That such terms could be imposed shows the strength of Poyning’s arm, and his vigour was equally evident when Warbeck came ashore in Munster in July 1495. Few joined the impostor save the earl of Desmond, and he was repulsed from Waterford, and dared not face the army which the lord deputy put into the field against him. Thereupon, abandoning his Irish schemes, Warbeck sailed to Scotland, whose young king James IV. had just been seduced by the emperor Maximilian into declaring war on England. He promised the Scottish king Berwick and 50,000 crowns in return for the aid of an army. James took the offer, gave him the heart of his kinswoman Catherine Gordon, daughter of the earl of Huntly, and took him forth for a raid into Northumberland (1496). But a pretender backed by Scottish spies did not appeal to the sympathies of the English borderers. The expedition fell flat; not a man joined the banner of the white rose, and James became aware that he had set forth on a fool’s errand. But Warbeck soon found other allies of a more unexpected sort. The heavy taxation granted by the English parliament for the Scottish war had provoked discontent and rioting in the south-western counties. In Cornwall especially the disorders grew to such a pitch that local demagogues called out several thousand to resist the collectors, and finally raised open rebellion, proposing to march on London and compel the king to dismiss his ministers. These spiritual heirs of Jack Cade were Flammock, a lawyer of Bodmin, and a farrier named Michael Joseph. Whether they had any communication with Warbeck it is impossible to say; there is no proof of such a connexion, but their acts served him well. A Cornish army marched straight on London, picking up some supporters in Devon and Somerset on their way, including a discontented baron, Lord Audley, whom they made their captain.

So precocious was the hold of Henry VII. on the throne that he was in great danger from this outbreak of mere local turbulence. The rebels swept over five counties unopposed, and were only stopped and beaten in a hard fight on Blackheath, when they had reached the gates of London. Audley, the farrier and the lawyer were all captured and executed (June 18, 1497). But the crisis was not yet at an end. Warbeck, hearing of the rising, but not of its suppression, had left Scotland, and appeared in Devonshire in August. He rallied the wrecks of the west country rebels, and presently appeared before the gates of Exeter with nearly 8000 men. But the citizens held out against him, and presently the approach of the royal army was reported. The pretender led off his borde to meet the relieving force, but when he reached Taunton he found that his followers were so dispirited that disaster was certain. Thereupon he abscended by night, and took sanctuary in the abbey of Beaulieu. He offered to confess his imposture if he were promised his life, and the king accepted the terms. First at Taunton and again at Westminster, Warbeck publicly recited a long narrative of his real parentage, his frauds and his adventures. He was then consigned to no overt strict confinement in the Tower, and might have fared no worse than Lambert Simnel if he had possessed his soul in patience. But in the next year he corrupted his warders, broke out from his prison, and tried to escape beyond seas. He was captured, but the king again spared his life, though he was placed for the future in a dungeon "where he could see neither moon nor sun." Even this did not tame the impostor’s mercurial temperament. In 1499 he again planned an escape, which was to be shared by another prisoner, the unfortunate Edward of Clarence, earl of Warwick, whose cell was in the storey above his own. But there were traitors among the Tower officials whom they suborned to help them, and the king was warned of the plot. He allowed it to proceed to the verge of execution, and then arrested both the false and the true Plantagenet. Evidence of a suspicious character was produced to show that they had planned rebellion as well as mere escape, and both were put to death with some of their accomplices. Warbeck deserved all that he reaped, but the unlucky Clarence’s fate estranged many hearts from the king. The simple and weakly young man, who had spent fifteen of his twenty-five years in confinement, had, in all probability, done no more than scheme for an escape from his dungeon. But as the true male heir of the house of Plantagenet he was too dangerous to be allowed to survive.

The turbulent portion of the reign of Henry VII. came to an end with Blackheath Field and the siege of Exeter. From that time forward the Tudor dynasty was no longer in serious danger; there were still some abortive plots, but none that had any prospect of winning popular support. The chances of Warbeck and Clarence had vanished long before they went to the scaffold. The Yorkist claim, after Clarence’s death, might be supposed to have passed to his cousin Edmund, earl of Suffolk, the younger brother of that John, earl of Lincoln, who had been declared heir to the crown by Richard III., and had fallen at Stoke field. Fully conscious of the danger of his position, Suffolk fled to the continent, and lived for many years as a pensioner of the emperor Maximilian. Apparently he dabbed in treason; it is at any rate certain that in 1501 King Henry executed some, and imprisoned others, of his relatives and retainers. But his plots, such as they were, seem to have been futile. There was no substratum of popular discontent in England upon which a pretension might be built up. It was to be forty years before another outbreak of turbulence against the crown was to break forth.

VI. The Tudor Despotism and the Beginnings of the Reformation (1497–1528)

The last twelve years of the reign of Henry VII. present in most respects a complete contrast to the earlier period, 1485–1497. There were numerous rebellions and attempts at assassination, but none that caused any serious danger. Nor did the king indulge his unruly subjects in foreign wars, though he was constantly engaged in negotiations with France, Scotland, Spain and the emperor, which from time to time took awkward turns. But Henry was determined to win all that he could by diplomacy, and not by force of arms. His cautious, but often unscrupulous, dealings with the rival continental powers had two main ends: the first was to keep his own position safe by playing off France against the Empire and Spain; the second was to get commercial advantages by dangling his alliance before each power in turn. Flanders was still the greatest customer of England, and it was therefore necessary above all things to keep on good terms with the archduke Philip, the son of Maximilian, who on coming of age had taken over the rule of the Netherlands from his father.
The king's great triumphs were the conclusion of the *Intercursus Magnus* of 1496 and the *Intercursus Malus* (so called by the Flemings, not by the English) of 1506. The former provided for a renewal of the old commercial alliance with the house of Burgundy, on the same terms under which it had existed in the time of Edward IV; the rupture which had taken place during the years when Maximilian was backing Perkin Warbeck had been equally injurious to both parties. The *Intercursus Malus* on the other hand gave England some privileges which she had not before enjoyed—exception from local tolls in Antwerp and Holland, and a licence for English merchants to sell cloth retail as well as wholesale—a concession which hit the Netherlands small traders and middlemen very hard. Another great commercial advantage secured by Henry VII, for his subjects was an increased share of the trade to the Scandinavian countries. The old treaties of Edward IV, with the Hanseatic League had left the Germans still in control of the northern seas. Nearly all the Baltic goods, and most of those from Denmark and Norway, had been reaching London or Hull in foreign bottoms. Henry allied himself with John of Denmark, who was chafing under the monopoly of the Hansa, and obtained the right to trade in four ports in the Baltic. The Hansa naturally murmured, but the English shipping in eastern and northern waters continued to multiply. Much the same policy was pursued in the Mediterranean. Southern goods hitherto had come to Southampton or Sandwich invariably in Venetian carracks, which took back in return English wool and metals. Henry concluded a treaty with Florence, by which that republic undertook to receive his ships in its harbours and to allow them to purchase all eastern goods that they might require. From this time forward the Venetian monopoly ceased, and the visits of English merchant vessels to the Mediterranean became frequent and regular.

Nor was it in dealing with old lines of trade alone that Henry Tudor showed himself the watchful guardian of the interests of his subjects. He must take his share of credit for the encouragement of the exploration of the seas of the Far West. The British traders had already pushed far into the Atlantic before Columbus discovered America; fired by the success of the great navigator they continued their adventures, hoping like him to discover a short "north-west passage" to Cathay and Japan. With a charter from the king giving him leave to set up the English banner on all the lands he might discover, the Bristol Genoese trader John Cabot successfully passed the great sea in 1497, and discovered Newfoundland and its rich fishing stations. Henry rewarded him with a pension of £20 a year, and encouraged him to further exploration, in which he discovered all the American coast-line from Labrador to the mouth of the Delaware—a great heritage for England, but one not destined to be taken up for colonization till more than a century had passed.

Henry's services to English commerce were undoubtedly of far more importance to the nation than all the tortuous details of his foreign policy. His chicanery need not, however, he censured over much, for the princes with whom he had to deal, and notably Ferdinand and Maximilian, were as insincere and selfish as himself. Few diplomatic haggling have been so long and intense or so ruinous between England and Spain over the marriage treaty which gave the hand of Catherine of Aragon first to Henry's eldest son Arthur, and then, on his premature death in 1502, to his second son Henry. The English king no doubt imagined that he had secured a good bargain, as he had kept the princess's dowry, and yet never gave Ferdinand any practical assistance in war or peace. It is interesting to find that he had for some time at the end of his reign a second Spanish marriage in view; his wife Elizabeth of York having died in 1503, he seriously proposed himself as a suitor for Joanna of Castile, the elder sister of Catherine, and the widow of the archduke Philip, though she was known to be insane. Apparently he hoped thereby to gain vantage ground for an interference in Spanish politics, which would have been most offensive to Ferdinand. Nothing came of the project, which contrasts strangely with the greater part of Henry's sober and cautious schemes.

On the other hand a third project of marriage alliance which Henry carried out in 1503 was destined to be consummated, and to have momentous, though long-deferred, results. This was the giving of the hand of his daughter Margaret to James IV. of Scotland. Thereby he bought quiet on the Border and alliance with Scotland for no more than some ten years. But—as it chance—the issue of this alliance was destined to unite the English and the Scottish crowns, when the male line of the Tudors died out, and Henry, quite unintentionally, had his share in bringing about the consummation, by peaceful means, of that end which Edward I. had sought for so long to win by the strong hand.

All the foreign politics of the reign of Henry VII. have small importance compared with his work within the realm. The true monument of his ability was that he left England tamed and orderly, with an obedient people and a full exchequer, though he had taken it over wellnigh in a state of anarchy. The mere suppression of insurrection was his, the protection of the commonwealth of England was a small part of his task. The harder part was to recreate a spirit of order and subordination among a nation accustomed to long civil strife. His instruments were ministers of ability chosen from the clergy and the gentry—he seems to have been equally averse to trusting the baronage at the one end of the social scale, or mere upstarts at the other, and it is notable that no one during his reign can be called a court favourite. The best-known names among his servants were his great chancellor, Archbishop Morton, Foxe, bishop of Winchester, Sir Reginald Bray, and the lawyers Empson and Dudley. These last bore the brunt of the unpopularity of the financial policy of the king during the latter half of his reign, and the vice of avarice seems to have grown upon him beyond all reason. But Henry was such a hard-working monarch, and so familiar with all the details of administration, that his ministers cannot be said to have had any independent authority, or to have directed their master's course of action.

The machinery employed by the first of the Tudors for the suppression of domestic disorder is well known. The most important item added by him to the administrative machinery of the realm was the famous Star Chamber, which was licensed by the parliament of 1497. It consisted of a small committee of ministers, privy councillors and judges, which sat to deal with offences that seemed to lie outside the scope of the common law, and more frequently with the misdoings of men who were so powerful that the local courts could not be trusted to execute justice upon them, such as great landowners, sheriffs and other royal officials, or turbulent individuals who were the terror of their native districts. The need for a strong central court directly inspired by the king, which could administer justice without respect of persons, was so great, that the constitutional danger of establishing an autocratic judicial committee, untramelled by the ordinary rules of law, escaped notice at the time. It was not till much later that the nation came to look upon the Star Chamber as the spectre of royal tyranny and to loathe its name. In 1590 it was for the common profit of the realm that there should exist such a court, which could reduce even the most powerful offender to order.

One of the most notable parts of the king's policy was his long-continued and successful assault on the abuse of "livery and maintenance," which had been at its height during the Wars of the Roses. We have seen the part which it had taken in strengthening the influence of those who were already too powerful, and weakening the ordinary operation of the law. Henry put it down with a strong hand, forbidding all liversies entirely, save for the mere domestic retainers of each magnate. His determination to end the system was well shown by the fact that he heavily fined even the earl of Oxford, the companion of his exile, the
victor of Bosworth, and the most notoriously loyal peer in the realm, for an ostentatious violation of the statute. Where Oxford was punished, no less favoured person could hope to escape. By the end of the reign the little hosts of badged adherents which had formed the nucleus for the armies of the Wars of the Roses had ceased to exist.

Edward IV., as has been already remarked, had many of the opportunities of the autocrat, if only he had cared to use them; but his sloth and self-indulgence stood in the way. Henry VII., the most laborious and systematic of men, turned them to account. He formed his administrative opinion on every problem of administration and intervened himself in every detail. In many respects he was his own prime minister, and nothing was done without his knowledge and consent. A consistent policy may be detected in all his acts—that of gathering all the machinery of government into his own hands. Under the later Plantagenets and the Lancastrian kings the great check on the power of the crown had been that financial difficulties were continually compelling the sovereign to summon parliaments. The estates had interfered perpetually in all the details of governance, by means of the power of the purse. Edward IV., first among English sovereigns, had been able to dispense with parliaments for periods of many years, because he did not need their grants save at long intervals.

Henry was in the same position; by strict economy, by the use of foreign subsidies, by the automatic growth of his revenues during a time of peace and returning prosperity, by confiscation and forfeitures, he built himself up a financial position which rendered it unnecessary for him to make frequent appeals to parliament. Not the least fertile of his expedients was that regular exploitation of the law as a source of revenue, which had already been seen in the time of his father-in-law. This part of Henry's policy is connected with the name of his two ex-attorney-general's, "fiscal judges" Empson and Dudley, who "turned law and justice into rapine" by their minute inquisition into all technical breaches of legality, and the nice fashion in which they adapted the fine to the wealth of the misdemeanant, without any reference to his moral guilt or any regard for extenuating circumstances. The king must take the responsibility for their unjust doings; it was his coffers which mainly proflited by their chicanery. In his later years he fell into the vice of hoarding money for its own sake; so necessary was it to his policy that he should be free, as far as possible, from the need for applying to parliament for money, that he became morbidly anxious to have great hoards in readiness for possible days of financial stress. At his death he is said to have had £1,600,000 in hard cash laid by. Hence it is not strange to find that he was able to dispense with parliaments in a fashion that would have seemed incredible to a 14th-century king. In his whole reign he only asked them five times for grants of taxation, and three of the five requests were made during the first seven years of his reign. In the eyes of many men parliament lost the main reason for its existence when it ceased to be the habitual provider of funds for the ordinary expenses of the realm. Those who had a better conception of its proper functions could see that it had at any rate been stripped of its chief power; and possibly day by day this power was forever lost. There are traces of a want of public interest in its proceedings, very different from the anxiety with which they were used to be followed in Plantagenet and Lancastrian times. Legislation, which only incidentally affects him, is very much less exciting to the ordinary citizen than taxation, which aims directly at his pocket. It is at any rate clear that during the latter years of his reign, when the time of impostures and rebellions had ended, Henry was able to dispense with parliaments to a great extent, and incurred no unpopularity by doing so. Indeed he was accepted by the English people as the benefactor who had delivered them from anarchy; and if they murmured at his love of hoarding, and cursed his inquisitors Empson and Dudley, they had no wish to change the Tudor rule, and were far from regarding the times of the "Lancastrian experiment" as a lost golden age. The present king might be unscrupulous and avaricious, but he was cautious, intelligent and economical; no one would have wished to recall the régime of that "crowned saint" Henry VI.

Nevertheless when the first of the Tudors died, on the 21st of April 1509, there were few who regretted him. He was not a monarch to rouse enthusiasm; while much was expected from his brilliant, clever and handsome son Henry VIII., whose magnificent presence and manly vigour recalled the early prime of Edward IV. Some years later England realized that its new king had inherited not only the physical beauty and strength of his grandfather, but also every one of his faults, with the sole exception of his tendency to drink. Henry VIII. indeed may be said, to sum up his character in brief, to have combined his father's brains with his grandfather's passions. Edward IV. was selfish and cruel, but failed to become a tyrant because he lacked the energy for continuous work. Henry VII. was unscrupulous and unintiring, but so cautious and wary that he avoided violent action and dangerous risks. Their descendant had neither Edward's sloth nor Henry's moderation; he was capable of going to almost any lengths in pursuit of the gratification of his ambition, his passions, his resentment or his simple love of self-assertion. Yet, however far he might go on the envenomed tyranny of his father, his power, of sufficient cunning, versatility, and the power of cool reflection, to know exactly when he had reached the edge of the impossible. He had his father's faculty for gauging public opinion, and estimating dangers, and though his more venturous temperament led him to press on far beyond the point at which the seventh Henry would have halted, he always stopped short on the hither side of the gulf. It was the most marvellous proof of his ability that he died on his throne after nearly forty years of autocratic rule, during which he had roused more enmities and done more to change the face of the realm than any of the kings that were before him.

But it was long before the nation could estimate all the features of the magnificent but sinister figure which was to dominate England from 1509 to 1547. At his accession Henry VIII. was only eighteen years of age, and, if his character was already formed, it was only the attractive side of it that was yet visible. His personal beauty, his keen intelligence, his scholarship, his love of music and the arts, his kingly ambition, were all obvious enough. His selfishness, his cruelty, his ingratitude, his fierce hatred of criticism and opposition, his sensuality, had yet to be discovered by his subjects. A suspicious observer might have detected something ominous in the first act of his reign—the arrest and attainer of his father's unpopular ministers, Empson and Dudley, whose heads he flung to the people in order to win a moment's applause. Whatever their faults, they had served the house of Tudor well, and it was a grotesque perversion of justice to send them to the scaffold on a charge of high treason. A similar piece of cruelty was the execution, some time later, of the earl of Suffolk, who had been languishing long years in the Tower; he was destroyed not for any new plots, but simply for his Yorkist descent. But in Henry's earlier years such acts were still unusual; it was not till he had grown older, and had learnt how much the nation would endure, that judicial murder became part of his established policy.

First outward, and then ultimate, self-assertion took the form of reversing his father's thrifty and peaceful policy, by plunging into the midst of the continental wars from which England had been held back by his cautious parent. The adventure was wholly unnecessary, and also unprofitable. But while France was engaged in the "Holy War" against the pope, Venice, the emperor, and Ferdinand of Spain, Henry renewed the old claims of the Plantagenets, and hoped, if not to win back the position of Edward III., at least to recover the duchy of Aquitaine, or some parts of it. He sent an army to Ferndland for the invasion of Gascony, and landed himself at Calais with 25,000 men, to beat upon the northern border of France. Little good came of his efforts. The Spanish king gave no assistance, and the northern campaign, though it included the brilliant battle of the Spurs (August 16th, 1543), accomplished nothing more than the capture of Tournai and Thérouanne. It was soon borne in upon
King Henry that France, even when engaged with other enemies, was too strong to be overrun in the old style. Moreover, his allies were giving him no aid, though they had eagerly accepted his great subsidies. With a sudden revulsion of feeling Henry offered peace to France, which King Louis XII. gladly bought, agreeing to renew the old pension or tribute that Henry VII. had received by the treaty of Étaples.

Their reconciliation and alliance were sealed by the marriage of the French king to Henry's favourite sister Mary, who was the bridgroom's junior by more than thirty years. Their wedlock and the Anglo-French alliance lasted only till the next year, when Louis died, and Mary secretly espoused an old admirer, Charles Brandon, afterwards duke of Suffolk, King Henry's greatest friend and confident.

While the French war was still in progress there had been heavy fighting on the Scottish border. James IV., reverting to the traditional policy of his ancestors, had taken the opportunity of attacking England while her king and his army were over-seas. He suffered a disaster which recalls that of David II. at Neville's Cross—a fight which had taken place under precisely similar political conditions. After taking a few Northumbrian castles, James was brought to action at Flodden Field by the earl of Surrey (September 9th, 1513). After a desperate fight lasting the greater part of a day, the Scots were outmanœuvred and surrounded. James IV.—who had refused to quit the field—was slain in the forefront of the battle, with the greater part of his nobles; with him fell also some 10,000 or 12,000 of his men. Scotland, with her military power brought low, and an infant king on the throne, was a negligible quantity in international politics for some years. The queen dowager, Margaret Tudor, aided by a party that favoured peace and alliance with England, was strong enough to balance the faction under the duke of Albany which wished for perpetual war and asked for aid from France.

With the peace of 1514 ended the first period of King Henry's reign. He was now no longer a boy, but a man of twenty-three, with his character fully developed; he had gradually got rid of his father's old councillors, and had chosen for himself a minister as ambitious and energetic as himself, the celebrated Thomas Wolsey, whom he had just made archbishop of York, and who obtained the rank of cardinal from the pope in the succeeding year. Wolsey was the last of the great clerical ministers of the middle ages, and by no means the worst. Like so many of his predecessors he had risen from the lower middle classes, through the royal road of the church; he had served Henry VII.'s old councillor Foxe, bishop of Winchester, as secretary, and from his household had passed into that of his master. He had been an admirable servant to both, full of zeal, intelligence and energy, and not too much burdened with scruples. The young king found in him an instrument well fitted to his hand, a man fearless, ingenious, and devoted to the furtherance of the power of the crown, by which alone he had reached his present position of authority. For fourteen years he was Henry's master's chief minister—the person responsible in the nation's eyes for all the more unpopulär assertions of the royal prerogative, and for all the heavy taxation and despotic acts which Henry's policy required. It mattered little to Henry that the cardinal was arrogant, tactless and ostentatious; indeed it suited his purpose that Wolsey should be saddled with public opinion with all the blame that ought to have been laid on his own shoulders. It was convenient that the old nobility should detest the upstart, and that the commons should imagine him to be the person responsible for the demands for money required for the royal wars. As long as his minister served his purposes and could execute his behests Henry gave him a free hand, and supported him against all his enemies. It was believed at the time, and is still sometimes maintained by historians, that Wolsey laid down schemes of policy and persuaded his master to adopt them; but the truth would appear to be that Henry was in no wise dominated by the cardinal, but imposed on him his own wishes, merely leaving matters of detail to be settled by his minister. Things indifferent might be trusted to him, but the main lines of English diplomacy and foreign policy show rather the influence of the king's personal desires of the moment than that of a statesman seeking national ends.

It has often been alleged that Henry, under the guidance of Wolsey, followed a consistent scheme for aggrandizing England, by making her the state which kept the balance of power of Europe in her hands. And it is pointed out that during the years of the cardinal's ascendancy the alliance of England was sought in turn by the great princes of the continent, and proved the make-weight in the scales. This is but a superficial view of the situation. Henry, if much courted, was much deceived, by his contemporaries. They borrowed his money and his armies, but fed him with vain promises and illusory treaties. He and his minister were alternately gulled by France and by the emperor, and the net result of all their activity was bankruptcy and discontent at home and ever-frustrated hopes abroad. It is hard to build up a reputation for statecraft for either Henry or Wolsey on the sum total of English political achievement during their collaboration.

During the first few years of the cardinal's ascendancy the elder race of European sovereigns, the kings with whom Henry VII. had been wont to haggle, disappeared one after the other. Louis of France died in 1515, Ferdinand of Aragon in 1516, the emperor Maximilian—the last survivor of his generation—in 1519. Louis was succeeded by the active, warlike and shifty Francis I.; the heritages of both Ferdinand and Maximilian—his maternal and paternal grandfathers—fell to Charles of Habsburg, who already possessed the Netherlands in his father's right and Castile in that of his mother. The enmity of the house of Valois and the house of Habsburg, which had first appeared in the wars of Charles VIII. and Maximilian, took a far more bitter shape under Francis I. and Charles V., two young princes who were rivals from their youth. Their wars were almost perpetual, their peace never honestly carried out. Their powers were very equally balanced; if Charles owned broader lands than Francis, they were more scattered and in some cases less loyal. The solid and wealthy realm of France proved able to make head against Spain and the Netherlands, even when they were backed by the emperor's German vassals. Charles was also distracted by many steps in the back from the Ottoman Turks, who were just beginning their attack on Christendom along the line of the Danube. To each of the combatants it seemed that the English alliance would turn the scale in his own favour. Henry was much courted, and wooed with promises of lands to be won from the other side by his ally of the moment. But neither Charles nor Francis wished him to be a real gainer, and he himself was a most untrustworthy friend, for he was quite ready to turn against his ally if he seemed to be growing too powerful, and threatened to dominate all Europe; the complete success of either party would mean that England would sink once more into a second-rate power. How faithless and insincere was Henry's policy may be gauged from the fact that in 1520, after all the pageantry of the 'Field of the Cloth of Gold' and his vows of undying friendship for Francis, he met Charles a few weeks later at Gravelines, and concluded with him a treaty which pledged England to a defensive alliance against the king's "good brother" of France. Such things happened not once nor twice during the years of Wolsey's ministry. It was hardly to be wondered at, therefore, if Henry's allies regularly endeavoured to cheat him out of his share of their joint profits. What use was there in rewarding a friend who might become an enemy to-morrow? The failure of all was in 1522, when Charles V., who had made the extraordinary promise that he would get Wolsey made pope, and lend Henry an army to conquer northern France, failed to redeem his word in both respects. He caused his own old tutor, Adrian of Utrecht, to be crowned with the papal tiara, and left the English to invade Picardy entirely unassisted. But this was only one of many such disappointments.
The result of some twelve years of abortive alliances and ill-kept treaties was that Henry had obtained no single one of the advantages which he had coveted, and that he had lavished untold wealth and many English lives upon phantom schemes which crumbled between his fingers. His subjects had already begun to murmur; the early parliaments of his reign had been passive and complaisant; but by 1523 the Commons had been goaded into resistance. They granted only half the subsidies asked from them, pleading that three summers more of such taxation as the cardinal demanded for his master would leave the realm drained of its last penny, and reduced to fall back on primitive forms of barter, “clothes for victuals and bread for cheese,” out of mere want of coin. Fortunately for the king his subjects laid all the blame upon his mouth-piece the cardinal, instead of placing it where it was due. On Wolsey’s back also was saddled the most inquietous of Henry’s acts of tyranny against individuals—the judicial murder of the duke of Buckingham, the highest head among the English nobility. For some hasty words, amplified by the double evidence of treacherous retainers, together with a foolish charge of dabbling with astrologers, the heir to the throne had been tried and executed with scandalous haste.

In the later years of Wolsey’s ascendancy, nevertheless, that same question was the subject of many anxious thoughts. From Henry’s own mind it was never long absent; he yearned for a male heir, and he was growing tired of his wife Catherine, who was some years older than himself, had few personal attractions, and was growing somewhat of an invalid. Somewhere about the end of 1526 those who were in the king’s intimate confidence began to be aware that he was meditating a divorce—a thing not lightly to be taken in hand, for the queen was the aunt of the emperor Charles V., who would be very much offended by such a step. But Henry’s doubts had been marvellously stimulated by the fact that he had become enamoured of another lady—the beautiful, ambitious and cunning Anne Boleyn, a niece of the duke of Norfolk, who had no intention of becoming merely the king’s mistress, but aspired to be his consort.

The question of the king’s divorce soon became inextricably confused with another problem, whose first beginnings go back to a slightly earlier date. What was to be the attitude of England towards the Reformation? It was now nearly ten years since Martin Luther had posted his Ninety-Five Theses on the church door at Wittenberg, and since he had testified to his faith before the Diet of Worms. All Germany was now convulsed with the first throes of the revolt against the papacy, and the echoes of the new theological disputes were being heard in England. King Henry himself in 1521 had designed to write an abusive pamphlet against Luther, for which he had been awarded the magnificent title of Fidei Defender by that cultured sceptic Pope Leo X. About the same time we begin to read of orders issued by the bishops for the discovery and burning of all Lutheran books—a clear sign that they were reaching England in appreciable quantities. Hitherto it had been only the works of Wycliffe that had merited this attention on the part of inquisitors. In the Wycliffite remnant, often persecuted but never exterminated, there already existed in England the nucleus of a Protestant party. All through the reign of Henry VII. and the early years of Henry VIII. the intermittent burning of “heretics,” and their far more frequent recantations, had borne witness to the fact that the sect still lingered on. The Wycliffites were a feeble folk, compelled to subterraneous ways, and destitute of learned leaders or powerful supporters. But they survived to see Luther’s day, and to merge themselves in one body with the first English travelling scholars and merchants who brought back from the continent the doctrines of the German Reformation. The origins of a Protestant party, who were not mere Wycliffites, but had been first interested in dogmatic controversy by coming upon the works of Luther, can be traced back to the year 1523 and to the university of Cambridge. There a knot of scholars, some of whom were to perish early at the stake, while others were destined to become the leaders of the English Reformation, came together and encouraged each other to test the received doctrines of contemporary orthodoxy by searching the Scriptures and the works of the Fathers. The sect spread in a few years to London, Oxford and other centres of intellectual life, but for many years its followers were not numerous; like the old Lollardy, Protestantism took root only in certain places and among certain classes—notably the lesser clergy and the merchants of the great towns.

The king of the old Catholic orders attempted to please him profess a great hatred and contempt for the new purveyors of German doctrines as for the belated disciples of Wycliffe. But there was another movement, whose origins went back for many centuries, which they were far from discouraging, and were prepared to utilize when it suited their convenience. This was the purely political feeling against the tyranny of the papacy, and the abuses of the national church, which in early ages had given supporters to William the Conqueror and Henry II., which had dictated the statutes of Mortmain and of Praemunire. Little had been heard of the old anti-clerical party in England since the time of Henry IV.; it had apparently been identified in the eyes of the orthodox with that Lollardy with which it had for a time allied itself, and had shared in its discredit. But it had always continued to exist, and in the early years of Henry VIII. had been showing unmistakable signs of vitality. The papacy of the Renaissance was a fair mark for criticism. It was not hard to attack the system under which Rodrigo Borgia wore the tiara, while Girolamo Savonarola went to the stake; or in which Julius II. exploited the name of Christianity to serve his territorial policy in Italy, and Leo X. hawked his indulgences round Europe to raise funds which would enable him to gratify his artistic tastes. At no period had the official hierarchy of the Church been so much out of line with common righteousness and piety. Moreover, they were situated under the eyes of a laity which was far more intelligent and educated, more able to think and judge for itself, less the slave of imperial tradition, than the old public of the middle ages. In Italy the Renaissance might be purely concerned with things intellectual or artistic, and seem to have little or no touch with things moral. Beyond the Alps it was otherwise; among the Teutonic nations at least the revolt against the scholastic philosophy, the rout of the obscurantists, the eager pursuit of Hellenic culture, had a religious aspect. The same generation which refused to take thrice-translated and thrice-garbled sermons from Aristotle as the sum of human knowledge, and which went back to the original Greek, was also studying the Old and New Testaments in their original tongues, and drawing from them conclusions as unfavourable to the intelligence as to the scholarship of the orthodox medieval divines. Such a discovery as that which showed that the "False Decretals," on which so much of the power of the papacy rested, were mere 9th-century forgeries struck deep at the roots of the whole traditional relation between church and state.

The first English scholars of the Renaissance, like Erasmus on the continent, did not see the logical outcome of their own discoveries, nor realize that the campaign against obscurantism would develop into a campaign against Roman orthodoxy. Sir Thomas More, the greatest of them, was actually driven into action by the violence of Protestant controversialists, and the fear that the new doctrines would rend the church in twain. He became himself a persecutor, and a writer of abusive
ENGLISH HISTORY [1528–1529]

pamphlets unworthy of the author of the Utopia. But to the younger generation the irreconcilability of modern scholarship and medieval formulae of faith became more and more evident. One after another all the cardinal doctrines were challenged by writers who were generally acute, and almost invariably vituperative. For the controversies of the Reformation were conducted by both sides, from kings and prelates down to gutter pamphleteers, in language of the most unseemly violence.

But, as has been already said, the scholars and theologians had less influence in the beginning of the English Reformation than the mere lay politicians, whose anti-clerical tendencies chanced to fit in with King Henry’s convenience when he quarrelled with the papacy. It is well to note that the first attacks of parliament on the church date back to two years before Luther published his famous theses. The contention began in 1515 with the fierce assault by the Commons on the old abuse of benefit of clergy, and the immunity of clerical criminals from due punishment for secular crimes—a question as old as the times of Henry II. and Becket. But the discussion spread in later years from this particular point into a general criticism of the church and its relations to the state, embracing local grievances as well as the questions which turned on the dealings of the papacy with the crown. The old complaints which had been raised against the Church of England in the days of Edward I. or Richard II. had lost none of their force in 1526. The higher clergy were more than ever immersed in affairs of state, "Caesarean" as Wycliffe would have called them. It was only necessary to point to the great cardinal himself, and to ask how far his spiritual duties at York were properly discharged while he was acting as the king’s prime minister. The cases of Foxe and Morton were much the same; the former passed for a well-meaning man, yet had been practically absent from his diocese for twenty years. Pluralism, nepotism, simony and all the other ancient abuses were more rampant than ever. The monasteries had ceased to be even the nurseries of literature; their chronicles had run dry, and secular priests or laymen had taken up the pens that the monks had dropped. They were wealthier than ever, yet did little to justify their existence; indeed the spirit of the age was so much set against them that they found it hard to keep up the numbers of their inmates. Truculent pamphleteers like Simon Fish, who wrote Beggars’ Supplication, were already demanding that these sturdy bodies should be set abroad into the world, as there was a word, to get wives of their own, and earn their living by the sweat of their brows, according to the commandment of God; so might the king be better obeyed, matrimony be better kept, the gospel better preached, and none should rob the poor of his alms.” It must be added that monastic scandals were not rare; though the majority of the houses were decently ordered, yet the unexceptionable testimony of archiepiscopal and episcopal visitations shows that in the years just before the Reformation there was a certain number of them where chastity of life and honesty of administration were equally unknown. But above all things the church was being criticized as an imperium in imperio, a privileged body not amenable to ordinary jurisdiction, and subservient to a family lord—men soon. A big weapon in the hand of the English churchmen might grumble at papal exactions, they were generally ready as a body to support the pope against the crown; the traditions of the medieval church made it impossible for them to do otherwise. That there would in any case have been a new outbreak of anti-clerical and anti-papal agitation in England, under the influence of the Protestant impulse started by Luther in Germany, is certain. But two special causes gave its particular colour to the opening of the English Reformation; the one was that the king fell out with the papacy on the question of his divorce. The other was that the nation at this moment was chafing bitterly against a clerical minister, whom it (very unjustly) believed to be selling its interests. It was an enduring, in consequence of the king’s useless and unsuccessful foreign wars. The irony of the situation lay in the facts that Henry was, so far as dogmatic views were concerned, a perfectly orthodox prince; he had a considerable knowledge of the old theological literature, as he had shown in his pamphlet against Luther, and though he was ready to repress clerical immunities and privileges that were inconvenient to the crown, he had no sympathy whatever with the doctrinal side of the new revolt against the system of the medieval church. Moreover, Wolsey, whose fall was to synchronize with the commencement of the reforming movement, was if anything more in sympathy with change than was his master. He was an enlightened patron of the new learning, and was inclined to take vigorous measures in hand for the pruning away of the abuses of the church. It is significant that his great college at Oxford—“Cardinal’s College” as he designed to call it, “Christ Church” as it is named to-day—was endowed, with the revenues of some score of small monasteries which he had suppressed on the ground that they were useless or ill-conducted. His master turned the lesson to account a few years later; but Henry’s wholesale destruction of religious houses was carried out not in the interests of learning, but mainly in those of the royal exchequer.

(C.W.C.O.)

VII. The Reformation and the Age of Elizabeth (1528–1603)

Wolsey did not fall through any opposition to reform; nor was he opposed to the idea of a divorce. Indeed, both in France and Spain he was credited with the authorship of the project. But he differed from Henry on the question of Catherine’s successor. Wolsey desired a French marriage to consummate the breach upon which he was now bent with the emperor; and war, in fact, was precipitated with Spain in 1528. This is said to have been done without Henry’s consent; he certainly wished to avoid war with Charles V., and peace was made after six months of passive hostility. Nor did Henry want a French princess; his affections were fixed for the time on Anne Boleyn, and she was the hope of the anti-clerical party. The crisis was brought to a head by the failure of Wolsey’s plan to obtain a divorce. Originally it had been suggested that the ecclesiastical courts in England were competent without recourse to Rome. Wolsey deprecated this procedure, and application was made to Clement VII. Wolsey relied upon his French and Italian allies to exert the necessary powers of persuasion; and in 1528 a French army crossed the Alps, marched through Italy and threatened to drive Charles V. out of Naples. Clement VII. was in a position to listen to Henry’s prayer; and Campeggio was commissioned with Wolsey to hear the suit and grant the divorce.

No sooner had Campeggio started than the fortunes of war changed. The French were driven out of Naples, and the Imperialists again dominated Rome; the Church, wrote Clement to Campeggio, was completely in the power of Charles V. The cardinal, therefore, must on no account pronounce against Charles’s aunt; if he could not persuade Henry and Catherine to agree on a mutual separation, he must simply pass the time and come to no conclusion. Hence it was June 1529 before the court got to work at all, and then its proceedings were only preparatory to an adjournment of the case. Clement VII. had, in his own words, made up his mind to live and die an imperialist; the last remnants of the French army in Italy had been routed, and the pope had perforce concluded the treaty of Cambrai, a sort of family compact between himself and Charles, whereby he undertook to protect Charles’s aunt, and the emperor to support the Medici dynasty in Florence. This peace was amplified at the treaty of Cambrai (August 1529) into a general European pacification in which England had no voice. So far had it fallen since 1521.

In every direction Wolsey had failed, and his failure involved the triumph of the forces which he had opposed. The fate of the papal system in England was bound up with his personal fortunes. It was he and he alone who had kept parliament at arm’s length and the enemies of the church at bay. He had interested the king, and to some extent the nation, in a spirited
foreign policy, had diverted their attention from domestic questions, and had staved off that parliamentary attack on the church which had been threatened fifteen years before. Now he was doomed, and both Campoglio and Cardinal de Bella were able to send their governments accurate outlines of the future policy of Henry VIII. The church was to be robbed of its wealth, its power and its privileges, and the papal jurisdiction was to be abolished. In October Wolsey was deprived of the great seal, and surrendered many of his ecclesiastical preferments, though he was allowed to retain his archbishopric of York which he now visited for the first time. The first lay ministry since Edward the Confessor's time came into office; Sir Thomas More became lord chancellor, and Anne Boleyn's father lord privy seal; the only prominent cleric who remained in office was Gardiner, who succeeded Wolsey as bishop of Winchester.

Parliament met in November 1529 and passed many acts against clerical exactions, mortuaries, probate dues and pluralities, which evoked a passionate protest from Bishop Fisher: "Now, with the Commons," he cried in the House of Lords, "is nothing but 'Down with the Church.'" During 1530 Henry's agents were busy abroad making that appeal on the divorce to the universities which Cranmer had suggested. In 1531 the clergy in convocation, terrified by the charge of *praemunire* brought against them for recognizing Wolsey's legatine authority, petitioned Henry a hundred and eighteen thousand pounds and recognized him as supreme head of the church so far as the law of Christ would allow. The details of this surrender were worked out by Wolf and Commons in 1532; but Gardiner and More secured the rejection by the Lords of the bill in which they were embodied, and it was not till 1533, when More had ceased to be chancellor and Gardiner to be secretary, that a parliamentary statute annihilated the independent legislative authority of the church. An act was, however, passed in 1532 empowering the king, if he thought fit, to stop the payment of annates to Rome. Henry suspended his cousin, John Pole, in the pope's court, and went out of his way to grant Cranmer his bulls as archbishop of Canterbury where he succeeded Warham late in 1532. The strategem was successful, and Henry cast off all disguise. The act of annates was confirmed; another prohibiting appeals to Rome and providing for the appointment of bishops without recourse to the papacy was passed; and Cranmer declared Henry's marriage with Catherine null and void and that with Anne Boleyn, which had taken place about January 25, 1533, valid. Anne was crowned in June, and on the 7th of September the future Queen Elizabeth was born. At length in 1534 Cranmer concluded the case at Rome, pronouncing the marriage a nullity and declaring that the king could not be deprived of the sacrament of matrimony, in favour of Catherine's marriage, and drawing up a bull of excommunication against Henry and his abettors. But he did not venture to publish it; public opinion in England, while hostile to the divorce, was not in favour of the clergy or the pope, and the rivalry between Charles V. and Francis I. was too bitter to permit of joint, or even isolated, action against Henry. Charles was only too anxious to avoid the duty of carrying out the pope's commands, and a year later he was once more involved in war with France. Henry was able to deal roughly with such manifestations as Elizabeth Borton's visions, and in the autumn of 1534 to obtain from parliament the Act of Supremacy which transferred to him the juridical, though not the spiritual, powers of the pope. No penalties were attached to this act, but another passed in the same session made it treason to attempt to deprive the king of any of his titles, of which supreme head of the church was one, being incorporated in the royal style by letters patent of January 1535. Fisher and More were executed on this charge; they had been imprisoned in the previous year for objecting to take the form of oath to the succession as vested in Anne Boleyn's children which the commissioners prescribed. But their lives could only be forfeit on the supposition that they sought to deprive the king of his royal supremacy. Many of the friars observant of Greenwich and monks of the Charterhouse were involved in a similar fate, but there was no general resistance, and Henry, now inspired or helped by Thomas Cromwell, was able to proceed with the next step in the Reformation, the dissolution of the monasteries.

It was Cecil's opinion twenty-five years later that, but for the dissolution, the cause of the Reformation could not have succeeded. Such a reason could hardly be avowed, and justification had to be sought in the condition of the monasteries themselves. The action of Wolsey and other bishops before 1520, the report of a commission of cardinals appointed by Paul III. in 1525, the subsequent experience of other, even Catholic, countries gives collateral support to the conclusions of the visitors appointed by Cromwell, although they were dictated by a desire not to deal out impartial justice, and to find a cause for what had been already adopted in principle. That they exaggerated the evils of the monasteries hardly admits of doubt; but even a Henry VIII. and a Thomas Cromwell would not have dared to attack, or succeeded in destroying, the monasteries had they retained their original purity and influence. As it was their doubtful reputation and financial embarrassments enabled Henry to offer them as a gigantic bribe to the upper classes of the laity, and the Reformation parliament met for its last session early in 1536 to give effect to the reports of the visitors and to the king's and their own desires.

But it had barely been dissolved in April when it became necessary to renew it in the same month. In January the death of Catherine had rejoiced the hearts of Henry and Anne Boleyn; but Anne's happiness was short-lived. Two miscarriages and the failure to produce the requisite male heir linked her in Henry's mind and in misfortune to Catherine; unlike Catherine she was unpopular and not above suspicion. The story of her tragedy is still one of the most horrible and mysterious pages in English history. It is certain that Henry was tired and wanted to get rid of her; but if she were innocent, why were charges brought against her which were not brought against Catherine of Aragon and Anne of Cleves? and why were four other victims sacrificed who would have been enough? They wear a year before one could acquit Lord Dacre; would they have condemned the queen without some show of evidence? and unless there was suspicious evidence, her daughter was inhuman in making no effort subsequently to clear her mother's character. However that may be, Anne was not only condemned and executed, but her marriage was declared invalid and her daughter a bastard. Parliament was required to establish the succession on the new basis of Henry's new queen, Jane Seymour. It also empowered the king to leave the crown by will if he had no legitimate issue; but the illegitimate son, the Duke of Richmond, in whose favour this provision is said to have been made shortly after Anne's death, could hardly be linked with the queen's misdemeanours.

Fortunately for Henry, Queen Jane roused no domestic or foreign animosities; Charles V. and Francis I. were at war; and the pope's and Pole's attempt to profit by the Pilgrimage of Grace came too late to produce any effect except the ruin of Pole's family. The two risings of 1536 in Lincolnshire and Yorkshire were provoked partly by the dissolution of the monasteries, partly by the collection of a subsidy and fears of fresh taxation on births, marriages and burials, and partly by the protestantizing Ten Articles of 1536 and Cromwell's *Injunctions*. They were preventive demonstrations in favour of a restoration of the old order by means of a change of ministry, but not a change of dynasty. The Lincolnshire rising was over before the middle of October; the more serious revolt in Yorkshire under Aske lasted through the winter. Henry's Levies were compelled to temporize and make concessions. Aske was invited to come to London and hoodwinked by Henry into believing that the king was really bent on restoration and reform. But an impatient outburst of the insurgents and a foolish attempt to seize Hull and Scarborough gave Henry an excuse for repudiating the concessions made in his name. He could afford to do so because England south of the Trent remained stauncher to him than England north of it did to the Pilgrimage. Aske and other leaders were
tried and executed, and summary vengeance was wreaked on the northern counties, especially on the monasteries. The one satisfactory outcome was the establishment of the Council of the North, which gave the shires between the Border and the Trent a stronger and more efficient government than they had ever had before.

Probably the Pilgrimage had some effect in moderating Henry's progress. The monasteries did not benefit and in 1538-1539 the greater were involved in the fate which had already overtaken the less. But no further advances were made towards Protestantism after the publication and authorization of the "Great" Bible in English. The Lutheran divines who came to England in 1538 with a project for a theological union were rebuffed; the parliament elected in 1539 was Catholic, and only the reforming bishops in the House of Lords offered any resistance to the Six Articles which reaffirmed the chief points in Catholic doctrine and practice. The alliance between pope, emperor and French king induced Henry to acquiesce in Cromwell's scheme for a political understanding with Cleves and the Schmalkaldic League, which might threaten Charles V.'s position in Germany and the Netherlands; but could not be enforced without the king of England. Cromwell rashly sought to wed Henry to this policy, proposed Anna of Cleves as a bride for Henry, now once more a widower, and represented the marriage as England's sole protection against a Catholic league. Henry put his neck under the yoke, but soon discovered that there was no necessity; for Charles and Francis were already beginning to quarrel and had no thought of a joint attack on England. The discovery was fatal to Cromwell; after a severe struggle in the council he was abandoned to his enemies, attainted of treason and executed. Anna's marriage was declared null, and Henry found a fifth queen in Catherine Howard, a niece of Norfolk, a protégée of Gardiner, and a friend of the Catholic church.

Nevertheless there was no reversal of what had been done, only a check to the rate of progress. Cramner remained archbishop and compiled an English Litany, while Catherine Howard soon ceased to be queen; charges of loose conduct, which in her case at any rate were not instigated by the king, were made against her and she was brought to the block; she was succeeded by Catherine Parr, a mild patron of the new learning. The Six Articles were only fitfully put in execution, especially in 1543 and 1546; all the plots against Cramner failed; and before he died Henry was even considering the advisability of further steps in the religious reformation, apart from mere spoliation, like the confiscation of the chantry lands.

But Scotland, Ireland and foreign affairs concerned him most. Something substantial was achieved in Ireland; the papal sovereignty was abolished and Henry received from the Irish parliament the title of king instead of lord of Ireland. The process was begun of converting Irish chieftains into English peers which eventually divorced the Irish people from their natural leaders; and principles of English law and government were spread beyond the Pale. In Scotland Henry was less fortunate. He failed to win over James V. to his anti-papal policy, revived the feudal claim to suzerainty, won the battle of Solway Moss (1542), and then concluded James's death bribed and threatened the Scots estates into concluding a treaty of marriage between their infant queen and Henry's son. The church in Scotland led by Beaton, and the French party led by James V.'s widow, Mary of Guise, soon reversed this decision, and Hertford's heavy hand was (1544) laid on Edinburgh in revenge. France was at the root of the evil, and Henry was thus induced once more to join Charles V. in war (1543). The joint invasion of 1544 led to the capture of Boulogne, but the emperor made peace in order to deal with the Lutherans and left Henry at war with France. The French attempted to retaliate in 1545, and burnt some villages in the Isle of Wight and on the coast of Sussex. But their expedition was a failure, and peace was made in 1546, by which Henry undertook to restore Boulogne in eight years' time on payment of eight hundred thousand crowns. Scotland was not included in the pacification, and when Henry died (January 28, 1547) he was busy preparing to renew his attempt on Scotland's independence.

He left a council of sixteen to rule during his son's minority. The balance of parties which had existed since Cromwell's fall had been destroyed in the last months of the reign by the attainder of Norfolk and his son Surrey, and the exclusion of Gardiner and Thirlby from the council of regency. Men of the new learning prevailed, and Hertford (later duke of Somerset), as uncle to Edward VI., was made protector of the realm and governor of the king's person. He soon succeeded in removing the trammels imposed upon his authority, and made himself king in everything but name. He used his arbitrary power to modify the despotic system of the Tudors; all treason laws since Edward III., all heresy laws, all restrictions upon the publication of the Scriptures were removed in the first parliament of the reign, and various securities for liberty were enacted. The administration of the sacrament of the altar in both elements was permitted, the Catholic interpretation of the mass was rendered optional, images were removed, and English was introduced.

The following session (1548-1549) the first Act of Uniformity authorized the first Book of Common Prayer. It met with strenuous resistance in Devon and in Cornwall, where rebellions added to the thickening troubles of the protector.

His administration was singularly unsuccessful. In 1547 he won the great but barren victory of Pinkie Cleugh over the Scots, and attempted to push on the marriage and union by a mixture of conciliation and coercion. He made genuine and considerable concessions to Scottish feeling, guaranteeing autonomy and freedom of trade, and suggesting that the two realms should adopt the indifferent style of the empire of Great Britain. But he also seized Haddington in 1548, held by force the greater part of the Lowlands, and, when Mary was transported to France, revived the old feudal claims which he had dropped in 1547. France was, as ever, the backbone of the Scots resistance; men and money poured into Edinburgh to assist Mary of Guise and the French faction. The protector's offer to restore Boulogne could not purchase French acquiescence in the union of England and Scotland; and the bickerings on the borders in France and open fighting in Scotland led the French to declare war on England in August 1549. They were encouraged by dissensions in England. Somerset's own brother, Thomas Seymour, jealous of the protector, intrigued against the government; he sought to secure the hand of Elizabeth, the favour of Edward VI. and the support of the Suffolk line, secretly married Catherine Parr, and abused his office as lord high admiral to make friends with pirates and other enemies of order. Foes of the family, such as Warwick and Southampton, saw in his factious conduct the means of ruining both the brothers. Seymour was brought to the block, and the weak consent of the protector seriously damaged him in the public eye. His notorious sympathy with the peasantries further alienated the official classes and landed gentry, and his campaign against enclosures brought him into conflict with the strongest forces of the time. The remedial measures which he favoured failed; and the rising of Ket in Norfolk and others less important in nearly all the counties of England, made Somerset's position impossible. Bedford and Herbert suppressed the rebellion in the west, Warwick that in Norfolk (July-August 1549). They then combined with the majority of the council and the discontented Catholics to remove the protector from office and imprison him in the Tower (October).

The Catholics hoped for reaction, the restoration of the mass, and the release of Gardiner and Bonner, who had been imprisoned for resistance to the protector's ecclesiastical policy. But Warwick meant to rely on the Protestant extremists; by January 1550 the Catholics had been expelled from the council, and the pace of the Reformation increased instead of diminishing. Peace was made with France by the surrender of Boulogne and abandonment...
of the policy of union with Scotland (March 1550); and the approach of war between France and the emperor, coupled with the rising of the princes in Germany, relieved Warwick from foreign apprehensions and gave him a free hand at home. Cornwall, Bonner, Heath, Hyl and Tunstall were one by one deprived of their sees; a new ordinal simplified the ritual of ordination, and a second Act of Uniformity and Book of Common Prayer (1552) repudiated the Catholic interpretation which had been placed on the first and imposed a stricter conformity to the Protestant faith. All impediments to clerical marriage were removed, altars and organs were taken down, old service books destroyed and painted windows broken; it was even proposed to explain away the kneeling at the sacrament. The liberal measures of the protector were repealed, and new treasons were enacted; Somerset himself, who had been released and restored to the council in 1550, became an open man in Warwick's service and was removed by means of a bogus plot, being executed in January 1552; while Warwick had himself made duke of Northumberland, his friend Dorset duke of Suffolk, and Herbert earl of Pembroke.

But his ambition and violence made him deeply unpopular, and the failing health of Edward VI. opened up a serious prospect for Northumberland. He was only safe so long as he controlled the government, and prevented the administration of justice, and the knowledge that not only power but life was at stake drove him into a desperate plot for the retention of both. He could trade upon Edward's precocious hatred of Mary's religion, and he could rely upon French fears of her Spanish inclinations, and the success which had attended his schemes in England deluded him into a belief that he could supplant the Tudor with a Dudley dynasty. His son Guilford Dudley was hastily married to Lady Jane Grey, the eldest granddaughter of Henry VIII.'s younger sister Mary. Henry's two daughters, Mary and Elizabeth, the descendants of his elder sister Margaret, and Lady Jane's mother, the duchess of Suffolk, were all to be passed over, and the succession was to be vested in Lady Jane and her heirs male. Edward was persuaded that he could devise the crown by will, the council and the judges were browbeaten into acquiescence, and three days after Edward's death (July 6, 1553), Lady Jane Grey was proclaimed queen in London. Northumberland had miscalculated the temper of the nation, and failed to kidnap Mary. She gathered her forces in Norfolk and Suffolk, Northumberland rode out from London to oppose her, but defection dogged his steps, and even in London Mary was proclaimed queen behind his back by his fellow-conspirators. Mary entered London amid unparalleled popular rejoicings, and Northumberland was sent to a well-deserved death on the scaffold.

Mary was determined from the first to restore papalism as well as Catholicism, but she had to go slowly. The papacy had few friends in England, and even Charles V., on hearing that his daughter had broken off her marriage, was not eager to see the papal jurisdiction restored. He wanted England to be first firmly tied to the Habsburg interests by Mary's marriage with Philip. Nor was it generally anticipated that Mary would do more than restore religion as it had been left by her father. She did not attempt anything further in 1553 than the repeal of Edward VI.'s legislation and the accomplishment of the Spanish marriage. The latter project provoked fierce resistance; various risings were planned for the opening months of 1554, and Wyatt's nearly proved successful. Only his arrogance and procrastination and Mary's own courage saved her throne. But the failure of this protest enabled Mary to carry through the Spanish marriage, which was consummated in July; and in the ensuing parliament (Oct.-Jan. 1554-1555) all anti-papal legislation was repealed; Pole was received as legate; the realm was reconciled to Rome; and, although the holders of abbey lands were carefully protected against attempts at restitution, the church was empowered to work its will with regard to heresy. The Lollard statutes were revived, and between February 1555 and November 1556 some three hundred Protestants were burnt at the stake. They began with John Rogers and Rowland Taylor, and Bishops Ferrar of St Davids and Hooper of Gloucester. Ridley and Latimer were not burnt until October 1555, and Cranmer not till March 1556.

The Spanish marriage was a failure from every point of view. In spite of Mary's repeated denunciations, she bore no child, and both parliament and people resisted every attempt to deprive Elizabeth of her right to the succession. Philip did all he could to conciliate English affections, but they would not have Spanish control at any price. They knew that his blandishments were dictated by ulterior designs, and that the absorption of England in the Habsburg empire was his ultimate aim. As it was, the Spanish connexion checked England's aspirations; her adventurers were warned off the Spanish Main, and even trade with the colonies of Philip's ally Portugal was prohibited. They had to content themselves with the Arctic Ocean and Muscovy; and they soon found themselves at war in Philip's interests. Philip himself refused to declare war on Scotland on England's behalf, but he induced Mary to declare war on France on his own (1557). The glory of the war fell to the Spaniards at the battle of Tunis (May 8, 1557), but to the shame of Calais (Jan. 1558). Ten months later Mary died (Nov. 17), deserted by her husband and broken-hearted at the loss of Calais and her failure to win English hearts back to Rome.

The Spanish and Venetian ambassadors in London were shocked at what they regarded as the indecent rejoicings over Elizabeth's accession. The nation, indeed, breathed a new life. Papal control of its ecclesiastical, and Spanish control of its foreign policy ceased, and it had a queen who gloried in being "mere English." There was really no possible rival sovereignty, and no possible alternative policy. The English were tugging at the chain and Elizabeth had to follow; her efforts throughout were aimed at keeping the peace at which her people wanted to go. She could not have married Philip had she wished to, and she could not have kept her sea-dogs off the Spanish Main. They were willing to take all the risks and relieve her of all responsibility; they filled her coffers with Spanish gold which they plundered as pirates, knowing that they might be hanged if caught; and they fought Elizabeth's enemies in France and in the Netherlands as irregulars, taking their chance of being shot if taken prisoners. While Elizabeth nursed prosperity in peace, her subjects sapped the strength of England's rivals by attacks which were none the less damaging because they escaped the name of war.

It required all Elizabeth's finesse to run with the hare and hunt with the hounds; but she was, as Henry III. of France said, la plus fine femme du monde, and she was ably seconded by Cecil who had already proved himself an adept in the art of taking cover. Nevertheless, English policy in their hands was essentially aggressive. It could not be otherwise if England was to emerge from the slough in which Mary had left it. The first step was to assert the principle of England for the English; the queen would have no foreign husband, though she found suitors useful as well as attractive. Spanish counsels were applauded and neglected, and the Spaniards soon departed. Elizabeth was glad of Philip's support at the negotiations for peace at Cateau Cambresis (1559), but she took care to assert the independence of her diplomacy and of England's interests. At home the church was made once more English. All foreign jurisdiction was repudiated, and under the style "supreme governor" Elizabeth reclaimed nearly all the power which Henry VIII. had exercised as "supreme head." The Act of Uniformity (1559) restored with a few modifications the second prayer-book of
Edward VI. The bishops almost unanimously refused to conform, and a clean sweep was made of the episcopal bench. An eminently safe and scholarly archbishop was found in Matthew Parker, who had not made himself notorious by resistance to authority even under Mary. The lower clergy were more amenable; the two hundred who alone are said to have been ejected should perhaps be multiplied by five; but even so they were not one in seven, and these seven were clergy who had been promoted in Mary's reign, or who had stood the celibate and other tests of 1553-1554. Into the balance must be thrown the hundreds, if not thousands, of zealots who had fled abroad and returned in 1558-1559. The net result was that a few years later the lower house of convocation only rejected by one vote a very puritanical petition against vestments and other "popish dregs."

The next step was to expand the principle of England for the English into that of Britain for the British, and Knox's reform in 1559-1560 provided an opportunity for its application. By timely and daring intervention in Scotland Elizabeth procured the expulsion of the French bag and baggage from North Britain, and that French aid to England was closed for ever. The logic of this plan was not applied to Ireland; there it was to be Ireland for the English for many a generation yet to come; and so Ireland remained Achilles' heel, the vulnerable part of the United Kingdom. The Protestant religion was forced upon the Irish in a foreign tongue and garb and at the point of foreign pikes; and national sentiment supported the ancient faith and the ancient habits in resistance to the Saxon innovations. In other directions the expansion of England, the third stage in the development of Elizabeth's policy, was more successful. The attractions of the Spanish Main converted the seafaring folk of south-west England into hardy Protestants, who could on conscientious as well as other grounds contest a papal allocation of new worlds to Spain and Portugal. Their monopoly was broken up by Hawkins, Drake, Frobisher, Raleigh, and scores of others who recognized no peace beyond the line; and although, as far as actual colonies went, the results of Elizabeth's reign were singularly meagre, the idea had taken root and the ground had been prepared. In every direction English influence penetrated, and Englishmen before 1603 might be found in every quarter of the globe, following Drake's lead into the Pacific, painfully breaking the ice in search of a north-east or a north-west passage, hunting for slaves in the wildest of Africa, journeying in caravans across the steppes of Russia into central Asia, bargaining with the Turks on the shores of the Caspian, and as well as the Greeks in the Levant, laying the foundations of the East India Company, or of the colonies of Virginia and Newfoundland.

This expansion was mainly at the expense of Spain; but at first Spain was regarded as Elizabeth's friend, not France. France had a rival candidate for Elizabeth's throne in Mary Stuart, the wife of the dauphin who soon (1559) became king as Francis II.; and Spanish favour was sought to neutralize this threat. Fortunately for Elizabeth, Francis died in 1560, and the French government passed into the hands of Catherine de' Medici, who had no cause to love her daughter-in-law and the Guises. France, too, was soon paralysed by the wars of religion, which Elizabeth judiciously fomented with anything but religious motives. Mary Stuart returned to Scotland with nothing but her brains and her charms on which to rely in her struggle with her people and her rival. She was well equipped in both respects, but human passions spoilt her chance; her heart turned her head. Elizabeth's head was stronger and she had no heart at all. When Mary married Darnley she had the ball at her feet; the pair had the best claims to the English succession and enjoyed the united affections of the Catholics. But they soon ceased to love one another, and could not control their jealousies. There followed rapidly the murders of Rizzio and Darnley, the Bothwell marriage, Mary's defeat, captivity, and flight into England (1568). It was a difficult problem for Elizabeth to solve; to let Mary go to France was presenting a good deal more than a pawn to her enemies; to restore her by force to her Scottish throne might have been heroic, but it certainly was not politics; to hand her over to her Scottish foes was too mean even for Elizabeth; and to keep her in England was to nurse a spark in a powder-magazine. Mary was detained in the hope that the spark might be carefully isolated.

But there was too much inflammable material about. The duke of Norfolk was a Protestant, but his convictions were weaker than his ambition, and he fell a victim to Mary's sequestered charms. The Catholic north of England was to rise under the earls of Westmorland and Northumberland, who objected to Elizabeth's seizure of their mines and jurisdictions as well as to her proscription of their faith; and the pope was to assist with a bull of deposition. Norfolk, however, played the coward; the bull came nearly a year too late, and the rebellion of the early (1560) was easily crushed. But the conspiracies did not end, and Spain began to take a hand. Elizabeth, partly in revenge for the treatment of Hawkins and Drake at San Juan de Ulloa, seized some Spanish treasure on its way to the Netherlands (Dec. 1560). Alva's operations were fatally handicapped by Spanish interest, but Philip II. had developed the Netherlands to declare war on England. But his friendship for Elizabeth had received a shock, and henceforth his finger may have been traced in most of the plots against her, of which the Ridolfi conspiracy was the first. It cost Norfolk his head and Mary more of her scantly liberty. Eliza-

Mary had left her claims to the English throne, and he might, now that she was out of his path, hope to treat England like Portugal. Drake's "singeing of Philip's beard" in Cadiz harbour in 1587 delayed the expedition for a year, and another year was again postponed in the early summer of 1588. At length the armada sailed in July under the incompetent duke of Medina Sidonia; its object was to secure command of the narrow seas and facilitate the transport of Parma's army from the Netherlands to England. But Philip after his twenty years' experience in the Netherlands can hardly have hoped to conquer a bigger and richer country with scantier means and forces. He relied in fact upon a domestic explosion, and the armada was only to be the torch. This miscalculation made it a hopeless enterprise from the first. Scarcely an English Catholic would have raised a finger in Philip's favour; and when he could not subdue the two provinces of Holland and Zeeland, it is absurd to suppose that he could have simultaneously subdued them and England as well. English armies were not perhaps very efficient, but they were as good as the material with which William of Orange began his task. Philip, however, was never given the opportunity. His armada was severely handled in a week's fighting on its way up the Channel, and was driven off the English ports into the German Ocean; there a south-west gale drove it far from its rendezvous, and completed the havoc which the English ships had begun. A miserable remnant alone escaped destruction in its perilous flight round the north and west of Scotland.

The defeat of the armada was the beginning and not the end of the war; and there were moments between 1588 and 1603 when England was more seriously alarmed than in 1588. The Spaniards seized Calais in 1596; at another time they threatened England from Breton, and the "invisible" armada of 1599 created a greater panic than the "invincible" armada of 1588. It was not till the very end of the reign that what was in some ways the most dangerous of Spanish aggressions was foiled at Kinsale. Nor were the English counter-attacks very happy; the attempt on Portugal in 1589 under Drake and Norris proved a complete failure. The raid on Cadiz under Essex and Raleigh in 1596 was attended with better results, but the "Islands" voyage to the Azores in 1597 was a very partial success. Still it was now a war upon more or less equal terms, and there was little more likelihood that it would end with England's than with Spain's loss of national independence. The subjection of the Netherlands was now almost out of the question, and although Elizabeth's help had not enabled the Protestant cause to win in France, Henry IV. built up a national monarchy which would be quite as effectual a bar to the ambitions of Spain.

Elizabeth had in fact safely piloted England through the struggle to assert its national independence in religion and politics and its claim to a share in the new inheritance which had been opened up for the nations of Europe; and the passionate loyalty which had supported her as the embodiment of England's aspirations somewhat cooled in her declining years. She herself grew more cautious and conservative than ever, and was regarded as an obstacle by the hotheads in war and religion. She sired with the "scribes," Burghley and Sir Robert Cecil, against the men of war, Essex and Raleigh; and she abetted Whitgift's rigorous persecution of the Puritans whose discontent with her via media was rancourously expressed in the Martin Marprelate tracts. Essex's folly and failure to crush Hugh O'Neill's rebellion (1590), the most serious effort made in the reign to throw off the English yoke in Ireland, involved him in treason and brought him to the block. Parliament was beginning to quarrel with the royal prerogative, particularly when expressed in the grant of monopolies, and even Mountjoy's success in Ireland (1602-1603) failed to revive popular enthusiasm for the dying queen. Strange as it may seem, the accession of James I. was hailed as heralding a new and gladder age by Shakespeare, and minor writers (March 24, 1603). (A. F. P.)

VIII. The Stuart Monarchy, the Great Rebellion and the Restoration (1603-1689)

The defeat of the Spanish armada in 1588 had been the final victory gained on behalf of the independence of the English church and state. The fifteen years which followed had been years of successful war; but they had been also years during which the nation had been preparing itself to conform its institutions to the new circumstances in which it found itself in consequence of the great victory. When James arrived from Scotland to occupy the throne of Elizabeth he found a general desire for change. Especially there was a feeling that there might be some relaxation in the ecclesiastical arrangements. Roman Catholics and Puritans alike wished for a modification of the laws which bore heavily on them. James at first relaxed the penalties under which the Roman Catholics suffered, then he grew frightened by the increase of their numbers and reimposed the penalties. The gunpowder plot (1605) was the result, followed by a sharper persecution than ever (see GUNPOWDER PLOT).

The Puritans were invited to a conference with the king at Hampton Court (1604). They no longer asked, as many of them had asked in the beginning of Elizabeth's reign, to substitute the presbyterian discipline for the episcopal government. All they demanded was to be allowed permission, whilst remaining as ministers in the church, to omit the usage of certain ceremonies to which they objected. It was the opinion of Bacon that it would be wise to grant their request. James thought otherwise, and attempted to carry out the Elizabethan conformity more strictly than it had been carried out in his predecessor's reign.

In 1604 the Commons agreed with Bacon. They declared that they were no Puritans themselves, but that, with such a dearth of able ministers, it was not well to lose the services of any one who was capable of preaching the gospel. By his refusal to entertain their views James placed himself in opposition to the Commons in a matter which touched their deeper feelings. As a necessary consequence every dispute on questions of smaller weight assumed an exaggerated importance. The king had received a scanty revenue with his crown, and he spent freely what little he had. As the Commons offered grudging supplies, the necessity under which he was of filling up the annual deficit led him to an action by which a grave constitutional question was raised.

From the time of Richard II. to the reign of Mary no attempt had been made to raise duties on imports and exports without consent of parliament. But Mary had, under a specious pretext, recommenced to a slight extent the evil practice, and Elizabeth had gone a little further in the same direction. In 1606 a request John Bates (q.v.) resisted the payment of an imposition—as duties levied by the sole authority of the crown were then called. The case was argued in the court of exchequer, and was there decided in favour of the crown. Shortly afterwards new impositions were set to the amount of £70,000 a year. When parliament met in 1610 the whole subject was discussed, and it was conclusively shown that, if the barons of the exchequer had been right in any sense, it was only in that narrow technical sense which is of no value at all. A compromise attempted broke down, and the difficulty was left to plague the next generation. The king was always able to assert that the judges were on his side, and it was as yet an acknowledged principle of the constitution that parliament could not change the law without the express consent of the crown, even if, which was not the case in this matter, the Lords had sided with the Commons. James's attempt to obtain further supplies from the Commons by opening a bargain for the surrender of some of his old feudal prerogatives, such as wardship and marriage, which had no longer any real meaning except as a means of obtaining money in an oppressive way, broke down, and early in 1611 he dissolved his first parliament in anger. A second parliament, summoned in 1614, met with the same fate after a session of a few weeks.

The dissolution of this second parliament was followed by a
short imprisonment of some of the more active members, and by a demand made through England for a benevolence to make up the deficiency which parliament had neglected to meet. The court represented that, as no compulsion was used, there was nothing illegal in this proceeding. But as the names of those who refused to pay were taken down, it cannot be said that there was no indirect pressure.

The most important result of the breach with the parliament of 1614, however, was the resolution taken by James to seek refuge from his financial and other troubles in a close alliance with the king of Spain. His own accession had done much to improve the position of England in its relation with the continental powers. Scotland was no longer available as a possible enemy to England, and though an attempt to bind the union between the two nations by freedom of commercial intercourse had been wrecked upon the jealousy of the English Commons (1607), a legal decision had granted the status of national subjects to all persons born in Scotland after the king's accession in England. Ireland, too, had been thoroughly overpowered at the end of Elizabeth's reign, and the flight of the Catholics and the overthrow of the rebellion in 1607 by which followed the settlement of English and Scottish colonists in Ulster, a measure which, in the way in which it was undertaken, sowed the seeds of future evils, but undoubtedly conducted to increase the immediate strength of the English government in Ireland.

Without fear of danger at home, therefore, James, who as king of Scotland had taken no part in Elizabeth's quarrel with Philip II., not only suspended hostilities immediately on his accession, and signed a peace in the following year, but looked favourably on the project of a Spanish marriage alliance, so that the chief Protestant and the chief Catholic powers might join together to impose peace on Europe, in the place of those hideous relations and wars by which the last century had been disfigured. In 1611 circumstances had disgusted him with his new ally, but in 1614 he courted him again, not only on grounds of general policy, but because he hoped that the large portion which would accompany the hand of an infant would go far to fill the empty treasury.

In this way the Spanish alliance, unpopular in itself, was formed to liberate the king from the shackles imposed on him by the English constitution. Its unpopularity, great from the beginning, became greater when Raleigh's execution (1618) caused the government to appear before the world as 'trucking to Spain.' The obloquy under which James laboured increased when the Thirty Years' War broke out (1618), and when the Bohemian war, in which the Spanish prince, was the unhappy claimant to the Bohemian crown (1619), stood forth as the lovely symbol of the deserted Protestantism of Europe. Yet it was not entirely in pity for German Protestants that the heart of Englishmen beat. Men felt that their own security was at stake. The prospect of a Spanish infanta as the bride of the future king of England filled them with suspcionous terrors. In Elizabeth's time the danger, if not entirely external, did not come from the government itself. Now the favour shown to the Roman Catholics by the king opened up a source of mischief which was to some extent real, if it was to a still greater extent imaginary. Whether the danger were real or imaginary, the consequence of the distrust resulting from the suspicion was the reawakening of the slumbering demand for fresh persecution of the Roman Catholics, a demand which made a complete reconciliation between the crown and the Lower House a matter of the greatest difficulty.

In 1621 the third parliament of James was summoned to provide money for the war in defence of his son-in-law's inheritance, the Palatinate, which he now proposed to undertake. But it soon appeared that he was not prepared immediately to come to blows, and the Commons, voting a small sum as a token of their loyalty, passed to other matters. Indolent in his temper, James had been in the habit of leaving his patronage in the hands of a confidential favourite, and that position was now filled by George Villiers, marquess and afterwards duke of Buckingham. The natural consequence was that men who paid court to him were promoted, and those who kept at a distance from him had no notice taken of their merits. Further, a system of granting monopolies and other privileges had again sprung up. Many of these grants embodied some scheme which was intended to serve the interests of the public, and many actions which appear startling to us were covered by the extreme protectionist theories then in vogue. But abuses of every kind had clustered round them, and in many cases the profits had gone into the pockets of hangers-on of the court, whilst officials had given their assistance to the grantors even beyond their legal powers. James was driven by the outcry raised to abandon these monopolies, and an act of Parliament in 1624 placed the future grant of protections to new inventions under the safeguard of the judges.

The attack on the monopolies was followed by charges brought by the Commons before the Lords against persons implicated in carrying them into execution, and subsequently against Lord Chancellor Bacon as guilty of corruption. The sentence passed by the Lords vindicated the right of parliament to punish all those who had enjoyed the favour of the crown, which had fallen into disuse upon the accession of the house of York. There was no open contest between parliament and king in this matter. But the initiative of demanding justice had passed from the crown to the Commons. It is impossible to overestimate the effect of these proceedings on the position of parliament. The crown could never again be regarded as the sum of the governmental system.

When the Commons met after the summer adjournment a new constitutional question was raised. The king was at last determined to find troops for the defence of the Palatinate, and asked the Commons for money to pay them. They in turn petitioned the crown to abandon the Spanish alliance, which they regarded as the source of all their chief grievances, and told them that they had no right to discuss business on which he had not asked their opinion. They declared that they were privileged to discuss any matter relating to the commonwealth which they chose to take in hand, and embodied their opinion in a protest, which they entered on their journals. The king tore the protest out of the book and dissolved parliament.

Then followed a fresh call for a benevolence, this time more sparingly answered than before. A year of fruitless diplomacy failed to save the Palatinate from total loss. The ill-considered journey to Madrid, in which Prince Charles, accompanied by Buckingham, hoped to wring from the Spanish statesmen a promise of all aid, was to the Palatinate in compliment for his marriage with the infant, ended almost at total failure. In the autumn of 1623 Charles returned to England without a wife, and without hope of regaining the Palatinate with Spanish aid.

He came back resolved to take vengeance upon Spain. The parliament elected in 1624 was ready to send him. It voted some supplies on the understanding that, when the king had matured his plans for carrying on the war, it should come together in the autumn to vote the necessary subsidies. It never met again. Charles had promised that, if he married a Roman Catholic, he would grant no toleration to the English Catholics in consideration of the marriage. In the autumn he had engaged himself to marry Henrietta Maria, the sister of the king of France, and had bound himself to grant the very conditions which he had declared to the Commons that he never would concede. Hence it was that he did not venture to recommend his father to summon parliament till the marriage was over. But though there was but little money to dispose of, he and Buckingham, who, now that James was sick and infirm, were the real leaders of the government, could not endure to abstain from the prosecution of the war. Early in 1625 an expedition, under Count Mansfeld, was sent to Holland that it might ultimately cut its way to the Palatinate. Left without pay and without supplies, the men perished by thousands, and when James died in March the new king had to meet his first parliament burlathed by a broken promise and a disastrous failure.
When parliament met (1623) the Commons at first contented themselves with voting a sum of money far too small to carry out the extensive military and naval operations in which Charles had embarked. When the king explained his necessities, they intimated that they had no confidence in Buckingham, and asked that, before they granted further supply, the king would name counsellors whom they could trust to advise him on its employment. Charles at once dissolved parliament. He knew that the demand for ministerial responsibility would in the end involve his own responsibility, and, believing as he did that Buckingham’s arrangements had been merely unlucky, he declined to sacrifice the minister whom he trusted.

Charles and Buckingham did their best to win back popularity by various exhortations. They attempted to found a great Protestant alliance on the continent, and they sent a great expedition to Cadiz. The Protestant alliance and the expedition to Cadiz ended in equal failure. The second parliament of the reign (1626) impeached Buckingham for crimes against the state. As Charles would not dismiss him simply because the Commons were dissatisfied with him as a minister, they fell back on charging him with criminal designs. Once more Charles dissolved parliament to save Buckingham. Then came fresh enterprises and fresh failures. A fleet under Lord Willoughby (afterwards earl of Lindsey) was almost ruined by a storm. The king of Denmark, trusting to supplies from England which never came, was defeated at Lutter. A new war in addition to the Spanish war, broke out with France. A great expedition to Rouen, under Buckingham’s command (1627), intended to succour the Huguenots of La Rochelle against their sovereign, ended in disaster. In order to enable himself to meet expenditure on so vast a scale, Charles had levied a forced loan from his subjects. Men of high rank in society who refused to pay were imprisoned. Soldiers were billeted by force in private houses, and military officers executed martial law on civilians. When the imprisoned gentlemen appealed to the king’s bench for a writ of habeas corpus, it appeared that no cause of committal had been assigned, and the judges therefore refused to liberate them. Still Charles believed it possible to carry on the war, and especially to send relief to La Rochelle, now strictly blockaded by the forces of the French crown. In order to find the means for this object he summoned his third parliament (1628). The Commons at once proceeded to draw a line which should cut off the possibility of a repetition of the injuries of which they complained. Charles was willing to surrender his claims to billet soldiers by force, to order the execution of martial law in time of peace, and to exact forced loans, benevolences, or any kind of taxation, without consent of parliament; but he protested against the demand that he should surrender the right to imprison without showing cause. It was argued on his behalf that in case of a great conspiracy it would be necessary to trust the crown with unusual powers to enable it to preserve the peace. The Commons, who knew that the crown had used the powers which it claimed, not against conspirators, but against the commonswealth itself, refused to listen to the argument, and insisted on the acceptance of the whole Petition of Right, in which they demanded redress for all their grievances.

The king at last gave his consent to it, as he could obtain money in no other way. In after times, when any real danger occurred which needed a suspension of the ordinary safeguards of liberty, a remedy was found in the suspension of the law by act of parliament; such a remedy, however, only became possible when king and parliament were on good terms of agreement with one another.

That time was as yet far distant. The House of Commons brought fresh charges against Buckingham, whose murder soon after the prorogation removed one subject of dispute. But when they met again (1629) they had two quarrels left over from the preceding session. About a third part of the king’s revenue was derived from customs duties which had for many generations been granted by parliament to each sovereign for life. Charles held that this grant was little more than a matter of form, whilst the Commons held that it was a matter of right. But for the other dispute the difficulty would probably have been got over. The strong Protestantism of Elizabeth’s reign had assumed a distinctly Calvinistic form, and the country gentlemen who formed the majority of the House of Commons were resolutely determined that no other theology than that of Calvin should be taught in England. In the last few years a reaction against it had arisen especially in the universities, and those who adopted an unpopular creed, and who at the same time showed tendencies to a more ceremonial form of worship, naturally fell back on the support of the crown. Charles, who might reasonably have exerted himself to secure a fair liberty for all opinions, promoted the creation of regular dioceses and livings, and the divines in turn exalted the royal prerogative above parliamentary rights. He now proposed that both sides should keep silence on the points in dispute. The Commons rejected his scheme, and prepared to call in question the most obnoxious of the clergy. In this irritated temper they took up the question of tonnage and poundage, and instead of confining themselves to the great public question, they called to the bar some custom-house officers who happened to have seized the goods of one of their members. Charles declared that the seizure had taken place by his orders. When they refused to accept the excuse, he dissolved parliament, but the people then took up the dispute in the House, and the speaker was forcibly held down in his chair, whilst resolutions hostile to the government were put to the vote.

For eleven years no parliament met again. The extreme action of the Lower House was not supported by the people, and the king had the opportunity, if he chose to use it, of putting himself right with the nation after no long delay. But he never understood that power only attends sympathetic leadership. He contented himself with putting himself technically in the right, and with restituting his case on the favourable decisions of the judges. Under any circumstances, neither the training nor the position of judges is such as to make them fit to be the final arbiters of political disputes. They are accustomed to declare what the law is, not what it ought to be. These judges, moreover, were not in the position to be impartial. They had been selected by the king, and were liable to be deprived of their office when he saw fit. In the course of Charles’s reign two chief justices and one chief baron were dismissed or suspended. Besides the ordinary judges there were the extraordinary tribunals, the court of high commission nominated by the crown to punish ecclesiastical offenders, and the court of star chamber, composed of the privy councillors and the chief justices, and therefore also nominated by the crown, to inflict fine, imprisonment, and even corporal mutilation on lay offenders. Those who rose up in any way against the established order were sharply punished.

The harsh treatment of individuals only calls forth resistance when constitutional morality has sunk deeply into the popular mind. The ignoring of the feelings and prejudices of large classes has a deeper effect. Charles’s foreign policy, and his pretentious claim to the sovereignty of the British seas, demanded the support of a fleet, which might indeed be turned to good purpose in offering a counterpoise to the growing navies of France and Holland. The increasing estrangement between him and the nation made him averse from the natural remedy of a parliament, and he reverted to the absolute practices of the middle ages, in order that he might strain them far beyond the warrant of precedent to levy a tax under the name of ship-money, first on the port towns and then on the whole of England. Payment was resisted by John Hampden, a Buckinghamshire squire; but the judges declared that the king was in the right (1638). Yet the arguments used by Hampden’s lawyers sunk deeply into the popular mind, and almost every man in England who was called on to pay the tax looked upon the king as a wrong-doer under the forms of law.

In his ecclesiastical policy Charles was equally out of touch with the feelings of his people. He shared to the full his father’s dislike and distrust of the Puritans, and he supported with the
whole weight of the crown the attempt of William Laud (q.v.), since 1633 archbishop of Canterbury, to enforce conformity to the ritual prescribed by the Prayer Book. At the same time offence was given to the Puritans by an order that every clergyman should read the Declaration of Sports, in which the king directed that no one should be prevented from dancing or shooting at the butts on Sunday afternoon. Many of the clergy were suspended or deprived, many emigrated to Holland or New England, and of those who remained a large part bore the yoke with feelings of ill-concealed dissatisfaction. Suspicion was easily aroused that a deep plot existed, of which Laud was believed to be the centre, for carrying the nation over to the Church of Rome, a suspicion which seemed to be converted into a certainty when it was known that Panzani and Conn, two agents of the pope, had access to Charles, and that in 1637 there was a sudden accession to the number of converts to the Roman Catholic Church amongst the lords and ladies of the court.

In the summer of 1638 Charles had long ceased to reign in the affections of his subjects. But their traditionary loyalty had not yet failed, and if he had not called on them for fresh exertions, it is possible that the coming revolution would have been long delayed. Men were ready to shout applause in honour of Puritan martyrs like Prynne, Burton and Bastwick, whose ears were cut off in 1637, or in honour of the lawyers who argued such a case as that of Hampden. But no signs of active resistance had yet appeared. Unluckily for Charles, he was likely to stand in need of the active co-operation of Englishmen. He had attempted to force a new Prayer Book upon the Scottish nation. A riot at Edinburgh in 1637 quickly led to national resistance, and when in November 1638 the general assembly at Glasgow set Charles's orders at defiance, he was compelled to choose between tame submission and immediate war. In 1639 he gathered an English force, and marched towards the border. But English laymen, though asked to supply the money which he needed for the support of his army, deliberately kept it in their pockets, and the contributions of the clergy and of official persons were not sufficient to enable him to keep his troops long in the field. The king, therefore, thought it best to agree to terms of pacification. Misunderstandings broke out as to the interpretation of the treaty, and Charles having discovered that the Scots were intriguing with France, fancied that England, in course of its ancient foes, would now be ready to rally to his standard. After an interval of eleven years, in April 1640 he once more called a parliament.

The Short Parliament, as it was called, demanded redress of grievances, the abandonment of the claim to levy ship-money, and a complete change in the ecclesiastical system. Charles thought that it would not be worth while even to conquer Scotland on such terms, and dissolved parliament. A fresh war with Scotland followed.

Wentworth, now earl of Strafford, became the leading adviser of the king. With all the energy of his disposition he threw himself into Charles's plans, and left no stone unturned to furnish the new expedition with supplies and men. The king, disconcerted as he was by the obstinacy, a commander can avail when soldiers are determined not to fight.

The Scots crossed the Tweed, and Charles's army was well pleased to fly before them. In a short time the whole of Northumberland and Durham were in the hands of the invaders. Charles was obliged to leave these two counties in their hands as a pledge for the payment of their expenses; and he was also obliged to summon parliament to grant him the supplies which he needed for that object.

When the Long Parliament met in November 1640 it was in a position in which no parliament had been before. Though nominally the Houses did not command a single soldier, they had in reality the whole Scottish army at their back. By refusing supplies they would put it out of the king's power to fulfil his engagements to that army, and it would immediately pursue its onward march to claim its rights. Hence there was scarcely anything which the king could venture to deny the Commons. Under Pym's leadership, they began by asking the head of Strafford. Nominally he was accused of a number of acts of oppression in the north of England and in Ireland. His real offence lay in his attempt to make the king absolute, and in the design with which he was credited of intending to bring over an Irish army to crush the liberties of England. If he had been a man of moderate abilities he might have escaped. But the Commons feared his commanding genius too much to let him go free. They began with an impeachment. Difficulties arose, and the impeachment was turned into a bill of attaint. The king abandoned his minister, and the execution of Strafford left Charles without a single man of supreme ability on his side. Then came rapidly a succession of blows at the supports by which the Tudor monarchy had been upheld. The courts of star chamber and high commission and the council of the north were abolished. The raising of tonnage and poundage without parliamentary grant was declared illegal. The judges who had given obnoxious decisions were called to answer for their fault and were taught that they were responsible to the House of Commons as well as the king. Finally a bill was passed providing that the existing House should not be dissolved without its own consent.

It was clearly a revolutionary position which the House had assumed. But it was assumed because it was impossible to expect that a king who had ruled as Charles had ruled could take up a new position as the exponent of the feelings which were represented in the Commons. As long as Charles lived he could not be otherwise than an object of suspicion; and yet if he were dehorned there was no one available to fill his place. There arose therefore two parties in the House: one ready to trust the king, the other disinclined to put any confidence in him at all. The division was the sharper because it coincided with a difference in matters of religion. Scarcely any one wished to see the Laudian ceremonies upheld. But the members who favoured the king, and who formed a considerable minority, wished to see a certain liberty of religious thought, together with a return under a modified Episcopacy to the forms of worship which prevailed before Laud had taken the church in hand. The other side, which had the majority by a few votes, wished to see the Puritan creed prevail in all its strictness, and were favourable to the establishment of the Presbyterian discipline. The king by his own action threw power into the hands of his opponents. He listened with toleration to Strafford's teaching, but his attempt to seize five members whom he accused of high treason made a good understanding impossible. The Scottish army had been paid off some months before, and civil war was the only means of deciding the quarrel.

At first the fortune of war wavered. Edgehill was a drawn battle (1642), and the campaign of 1643, though it was on the whole favourable to the king, gave no decisive results. Before the year was at an end parliament invited a new Scottish army to intervene in England. As an inducement, the Solemn League and Covenant was signed by all Parliamentarian Englishmen, the terms of which were interpreted by the Scots as inviting England to submit to Presbyterianism, though the most important clauses had been purposely left vague, so as to afford a loophole of escape. The battle of Marston Moor, with the defeat of the Royalist forces in the north, was the result. But the battle did not improve the position of the Scots. They had been repulsed, and the victory was justly ascribed to the English contingent. The composition of that contingent was such as to have a special political significance. Its leader was Oliver Cromwell. It was formed by men who were fierce Puritan enthusiasts, and who for the very reason that the intensity of their religion separated them from the mass of their countrymen, had learnt to uphold with all the energy of zeal the doctrine that by the self-refusing England to submit to Presbyterianism.
The majority of the House of Commons, was liberty of sectarian association. Some years earlier, under the dominion of Laud, another principle had been proclaimed by Chillingworth and Hales, that of liberty of thought within the unity of the church. Both these movements conducted to the ultimate establishment of toleration, but for the present the Independents were to have their way. The Presbyterian leaders, Essex and Manchester, were not successful leaders. The army was remodelled after Cromwell's pattern, and the king was finally crushed at Naseby (1645). The next year (1646) he surrendered to the English parliament, the army took him out of the hands of the parliament, whilst each in turn tried to find some basis of arrangement on which he might reign without ruling. Such a basis could not be found, and when Charles stirred up a fresh civil war and a Scottish invasion (1648) the leaders of the army vowed that, if victory was theirs, they would bring him to justice. To do this it was necessary to drive out a large number of the members of the House of Commons by what was known as the Pride's Purge (1648), see Cromwell, Oliver II., and to force the Commons the dismissal of the House of Lords, and the establishment of a high court of justice, before which the king was brought to trial and sentenced to death. He was beheaded on a scaffold outside the windows of Whitehall (1649).  

The government set up was a government by the committees of a council of state nominally supporting themselves on the House of Commons, though the members who still retained their places were so few that the council of state was sufficiently numerous to form a majority in the House. During eleven years the nation passed through many vicissitudes in its forms of government, and these forms take no place in the gradual development of English institutions, and have never been referred to as preceding precedents to be followed. To the student of political science, however, they have a special interest of their own, as they show that when men had shaken themselves loose from the chain of habit and prejudice, and had set themselves to build up a political shelter under which to dwell, they were irresistibly attracted by that which was permanent in the old constitutional forms of which the special development had of late years been so disastrous. After Cromwell had suppressed resistance in Ireland (1649), he proceeded to the conquest of Scotland (1650), and had the throne of the son of the late king, the future Charles II., at Worcester (1651), the value of government by an assembly was tested and found wanting. After Cromwell had expelled the remains of the Long Parliament (1653), and had set up another assembly of nominated members, that second experiment was found equally wanting. It was necessary to have recourse to one head of the executive government, controlling and directing its actions. Cromwell occupied this position as lord protector. He did all that was in his power to do to prevent his authority from degenerating into tyranny. He summoned two parliaments, of only one House, and with the consent of the second parliament he created a second, Cromwell's protectorate. The House, so that he might have some means of checking the Lower House without constantly coming into personal collision with its authority. As far as form went, the constitution in 1658, so far as it differed from the Stuart constitution, differed for the better. But it suffered from one fatal defect. It was based on the rule of the sword. The only substitute for traditional authority is the clearly expressed expression of the national will, and it is impossible to doubt that if the national will had been expressed it would have swept away Cromwell and all his system. The majority of the upper and middle classes, which had united together against Laud, was now reunited against Cromwell. The Puritans themselves were but a minority, and of that minority considerable numbers disliked the free liberty accorded to the sects. Whilst the worship of the Church of England was proscribed, every illiterate or frenzied enthusiast was allowed to harangue at his pleasure. Those who cared little for religion felt insulted when they saw a government with which they had no sympathy ruling by means of an army which they dreaded and detested. Cromwell did his best to avert a social revolution, and to direct the energies of his supporters into the channels of merely political change. But he could not prevent, and it cannot be said that he wished to prevent, the rise of men of ability from professional of social inferiority. The nation was struggling against the arbitrary government of the king; but it was not prepared to shake off the predominance of that widely spreading aristocracy which, under the name of country gentlemen, had rooted itself too deeply to be easily passed by. Cromwell's rule was covered with military glory, and there can be no doubt that he honestly applied himself to solve domestic difficulties as well. But he reaped the reward of those who strive for something better than the generation in which they live is able to appreciate. His own faults and errors were remembered against him. He tried in vain to establish constitutional government and religious freedom which had possessed (1648) there remained branded on the national mind two strong impressions which it took more than a century to obliterate—the dread of the domination of a standing army, and abhorrence of the very name of religious zeal. The eighteen months which followed deepened the impression thus formed. The army had appeared a hard master when it lent its strength to a wise and sagacious rule. It was worse when it undertook to rule in its own name, to set up and pull down parliaments and governments. The only choice left to the nation seemed to be one between military tyranny and military anarchy. Therefore it was that when More, advanced from Scotland and declared for a free parliament, there was little doubt that the new parliament would recall the exiled king, and seek to build again on the old foundations. The Restoration was effected by a coalition between the Cavaliers, or followers of Charles I., and the Presbyterians who had originally opposed him. It was only after the nature of a great reaction that the latter should for a time be swamped by the former. The Long Parliament of the Restoration met in 1661, and the Act of Uniformity entirely excluded all idea of reform in the Puritan direction, and the government was the government by which Cromwell, Oliver, had brought the nation back to its old chair. The principle by which he had acted in the Charter of I. was that of the powers of government. The new uniformity was imposed by parliament, and parliament had the nation behind it. For the first time, therefore, all those who objected to the established religion sought, not to alter its forms to suit themselves, but to gain permission to worship in separate congregations. Ultimately, the dissenters, as they began to be called, would obtain their object. As soon as it became clear to the mass of the nation that the dissenters were in a decided minority, there would be no reason to fear the utmost they could do even if the present liberty of worship and teaching were conceded to them. For the present, however, they were feared out of all proportion to their numbers. They counted amongst them the old soldiers of the Protectorate, and though that army had been dissolved, it always seemed possible that it might spring to arms once more. A bitter experience had taught men that a hundred of Oliver's Ironsides might easily chase a thousand Cavaliers; and as long
as this danger was believed to exist, every effort would be made to keep dissent from spreading. Hence the Conventicle Act (1664) imposed penalties on those taking part in religious meetings in private houses, and the Five Mile Act (1665), it made an expelled clergyman to come within five miles of a corporate borough, the very place where he was most likely to secure adherence, unless he would swear his adherence to the doctrine of non-resistance.

The doctrine of non-resistance was evidently that by which, at this time, the loyal subject was distinguished from those whom he stigmatized as disloyal. Yet even the most loyal found that, if it was wrong to take up arms against the king, it might be right to oppose him in other ways. Even the Cavaliers did not wish to see Charles II. an absolute sovereign. They wished to reconstruct the system which had been violently interrupted by the events of the autumn of 1644, and to found government on the cooperation between king and parliament, without defining to themselves what was to be done if the king's conduct became insufferable. Openly, indeed, Charles II. did not force them to reconsider their position. He did not thrust members of the Commons into prison, or issue writs for ship-money. He laid no claim to taxation which had not been granted by parliament. But he was extravagant and self-indulgent, and he wanted more money than they were willing to supply. A war with the Dutch broke out, and there were strong suspicions that Charles applied money voted for the fleet to the maintenance of a vicious and luxurious court. Against the Vice and luxury, indeed, little objection was likely to be brought. The over-haste of the Puritans to drill England into ways of morality and virtue had thrown at least the upper classes into a slough of revery and baseness. But if the vice did not appear objectionable the expense did, and a new chapter in the financial history of the government was opened when the Commons, having previously gained control over taxation, proceeded to vindicate their right to control expenditure.

As far, indeed, as taxation was concerned, the Long Parliament had not left its successor much to do. The abolition of feudal tenures and purveyance had long been demanded, and the conclusion of an arrangement which had been mooted in the reign of James I. is only notable as affording one instance out of many of the tendency of a single class to shift burdens off its own shoulders. The predominant landowners preferred the grant of an excise, which would be taken out of all pockets, to a land-tax which would exclusively be felt by those who were relieved by the abolition of the tenures. The question of expenditure was constantly telling on the relations between the king and the House of Commons. After the Puritan army had been disbanded, the king resolved to keep on foot a petty force of 6000 men, and he had much difficulty in providing for it out of a revenue which had not been intended by those who voted it to be used for such a purpose. Then came the Dutch war, bringing with it a suspicion that some at least of the money given for paying sailors and fitting out ships was employed by Charles on very different objects. The Commons accordingly, in 1665, succeeded in enforcing, on precedents derived from the reigns of Richard II. and Henry IV., the right of appropriating the supplies granted to special objects; and with more difficulty they obtained, in 1666, the appointment of a commission empowered to investigate irregularities in the issue of moneys. Such measures were the complement of the control over taxation which they had previously gained, and as far as their power of supervision went, it constituted them and not the king the directors of the course of government. If this result was not immediately felt, it was because the king had a large certain revenue voted to him for life, so that, for the present at least, it was only his extraordinary expenses which could be brought under parliamentary control. Nor did even the renewal of parliamentary impeachment, which ended in the banishment of Lord Chancellor Clarendon (1667), bring on any direct collision with the king. If the Commons wished to be rid of him because he upheld the prerogative, the king was equally desirous to be rid of him because he looked coldly on the looseness of the royal morals.

The great motive power of the later politics of the reign was to be found beyond the Channel. To the men of the days of Charles I., Louis XIV. of France was what Philip II. of Spain had been to the men of the days of Elizabeth. Gradually, in foreign policy, the commercial emulation with the Dutch, which found vent in one war in the time of the Commonwealth, and in two wars in the time of Charles II., gave way to a dread, rising into hatred, of the arrogant potentate who, at the head of the mightiest army in Europe, treated with contempt all rights which came into collision with his own wishes. Louis XIV., moreover, though prepared to quarrel with the pope in the matter of his own authority over the Gallican Church, was a bigoted upholder of Catholic orthodoxy, and Protestants saw in his political ambitions a menace to their religion. In the case of England there seemed a special danger to Protestantism; for whatever religious sympathies Charles II. possessed were with the Roman Catholic faith, and in his annoyance at the interference of the Commons with his expenditure he was not ashamed to stoop to become the pensioner of the French king. In 1670 the secret treaty of Dover was signed. Charles was to receive from Louis £200,000 a year and the aid of 6000 French troops to enable him to declare himself a convert, and to obtain special advantages for his religion, whilst he was also to place the forces of England at Louis's disposal for his purposes of aggression on the continent of Europe. Charles shared in no difficulties arising from the intellectual jealousy of England so as to bring about a second Dutch war (1672).

The next year, unwilling to face the dangers of his larger plan, he issued a declaration of indulgence, which, by a single act of the prerogative, suspended all penal laws against Roman Catholics and dissenters alike. To the country gentlemen who constituted the cavalier parliament, and who had long been drifting into opposition to the crown, this was intolerable. The predominance of the Church of England was the prime article of their political creed; they dreaded the Roman Catholics; they hated and despised the dissenters. Under any circumstances an indulgence would have been most distasteful to them. But the growing belief that the whole scheme was merely intended to serve the purposes of the Roman Catholics converted their dislike into deadly opposition. Yet the parliament resolved to base its opposition upon constitutional grounds. The right claimed by the king to suspend the laws was questioned, and his claim to special authority in ecclesiastical matters was treated with contempt. The king gave way and withdrew his declaration. But no solemn act of parliament declared it to be illegal, and in due course of time it would be heard of again.

The Commons followed up their blow by passing the Test Act, making the reception of the sacrament according to the forms of the Church of England, and the renunciation of the doctrine of transubstantiation, a necessary qualification for office. At once it appeared what a hold the members of the obnoxious church had had upon the administration of the state. The lord high admiral, the lord treasurer, and a secretary of state refused to take the test. The lord high admiral was the heir to the throne, the king's brother, the duke of York.

Charles, as usual, bent before the storm. In Danby (see Leedes, 1st Duke of) he found a minister whose views answered precisely to the views of the existing House of Commons. Like the Commons, Danby wished to silence both Roman Catholics and dissenters. Like the Commons, he wished to embark on a foreign policy hostile to France. But he served a master who regarded Louis less as a possible adversary than as a possible paymaster. Sometimes Danby was allowed to do as he liked, and the marriage of the duke of York's eldest daughter Mary to her cousin the prince of Orange was the most lasting result of his administration. More often he was obliged to follow where Charles led, and Charles was constantly ready to sell the neutrality of England for large sums of money.
of French gold. At last one of these negotiations was detected, and Danby, who was supposed to be the author instead of the unwilling instrument of the intrigue, was impeached. In order to save his minister, Charles dissolved parliament (1678). He could not have chosen a more unlucky time for his own quiet. The strong feeling against the Roman Catholics had been quickened into a flame by a great imposture. The inventors of the so-called popish plot charged the leading English Roman Catholics with a design to murder the king. Judges and juries alike were maddened with excitement, and listened greedily to the lies which poured forth from the lips of profligate informers. Innocent blood was shed in abundance.

The excitement had its root in the uneasy feeling caused by the knowledge that the heir to the throne was a Roman Catholic. Three parliaments were summoned and dissolved. In each parliament the main question at issue between the Commons and the crown was the Exclusion Bill, by which the Commons sought to deprive the duke of York of his inheritance; and it was notorious that the leaders of the movement wished the crown to descend to the king's illegitimate son, the duke of Monmouth. The principles by which the Commons were guided in these parliaments were very different from those which had prevailed in the first parliament of the Restoration. Those principles, to which that party adhered which about this time became known as the Tory party, had been formed under the influence of the terror caused by militant Puritanism. In the state the Tory inherited the ideas of Clarendon, and, without being at all ready to abandon the claims of parliaments, nevertheless somewhat inconsistently spoke of the king as ruling by a divine and indefeasible title, and wielding a power which it was both impious and unconstitutional to resist by force. In the church he inherited the ideas of Laud, and saw in the maintenance of the Act of Uniformity the safeguard of religion. But the hold of these opinions on the nation had been weakened with the cessation of the causes which had produced them. In 1680 twenty years had passed since the Puritan army had been disbanded. Many of Cromwell's soldiers had died, and most of them were growing old. The dissenters had shown no signs of engaging in plots or conspiracies. They were known to be only a comparatively small minority of the population, and though they had been persecuted, they had suffered without a thought of resistance. Dread of the dissenters, therefore, had become a mere chimera, which only those could entertain whose minds were influenced by prejudice. On the other hand, dread of the Roman Catholics was a living force. Unless the law were altered a Roman Catholic would be on the throne, wielding all the resources of the prerogative, and probably supported by all the resources of the king of France. Hence the leading principle of the Whigs, as the predominant party was now called, was in the state to seek for the highest national authority in parliament rather than in the king, and in the church to adopt the rational theology of Chillingworth and Hales, whilst looking to the dissenters as allies against the Roman Catholics, who were the enemies of both.

Events were to show that it was a wise provision which led the Whigs to seek to exclude the duke of York from the throne. But their plan suffered under two faults, the conjunction of which was ruinous to them for the time. In the first place, their choice of Monmouth as the heir was in felicitous. Not only was he under the stain of illegitimacy, but his succession excluded the future succession of Mary, whose husband, the prince of Orange, was the hope of Protestant Europe. In the second place, herpes-like remedies are generally acceptable when the evil to be remedied is still in the future. When, in the third of the short parliaments held at Oxford, the Whigs rode armed into the city, the nation decided that the future danger of a Roman Catholic succession was incomparably less than the immediate danger of another civil war. Loyal addresses poured in to the king. For the four remaining years of his reign he ruled without summoning any parliament. Whigs were brought before prejudiced juries and partial judges. Their blood flowed on the scaffold. The charter of the city of London was confiscated. The reign of the Tories was unquestioned. Yet it was not quite what the reign of the Cavaliers had been in 1660. The violence of the Restoration had been directed primarily against Puritanism, and only against certain forms of government so far as they allowed Puritans to gain the upper hand. The violence of the Tories was directed against rebellion and disorder, and only against dissenters so far as they were believed to be the fomenters of disorder. Religious hatred had less part in the action of the ruling party, and even from its worst actions a wise man might have predicted that the day of toleration was not so far off as it seemed.

The accession of James II. (1685) put the views of the opponents of the Exclusion Bill to the test. A new parliament was elected, almost entirely composed of decided Tories. A rebellion in Scotland, headed by the earl of Argyll, and a rebellion in England, headed by the duke of Monmouth, were easily suppressed. But the inherent difficulties of the king's position were not thereby overcome. It would have been hard, in days in which religious questions occupied so large a space in the field of politics, for a Roman Catholic sovereign to rule successfully over a Protestant nation. James set himself to make it, in his case, impossible. It may be that he did not consciously present to himself any object other than fair treatment for his co-religionists. On the one hand, however, he alienated even reasonable opponents by offering no guarantees that equality so gained would not be converted into superiority by the aid of his own military force and of the assistance of the French king; whilst on the other hand he relied, even more strongly than his father had done, on the technical legality which exalted the prerogative in defiance of the spirit of the law. He began by making use of the necessity of resisting Monmouth to increase his army, under the pretext of the danger of a repetition of the late rebellion; and in the regiments thus levied he appointed many Roman Catholic officers who had refused to comply with the Test Act. Rather than submit to the gentlest remonstrance, he prorogued parliament, and proceeded to obtain from the court of king's bench a judgment in favour of his right to dispense with all penalties due by law, in the same way that his grandfather had appealed to the judges in the matter of the post-nati. But not only was this judgment given; a decree was put through the particular import of the question put by James I., but he deprived the court to which he applied of all moral authority by previously turning out of office the judges who were likely to disagree with him, and by appointing new ones who were likely to agree with him. A court of high commission of doubtful legality was subsequently erected (1686) to deprive or suspend clergymen who made themselves obnoxious to the court, whilst James appointed Roman Catholics to the headship of certain colleges at Oxford. The legal support given him by judges of his own selection was fortified by the military support of an army collected at Hounsdown Heath; and a Roman Catholic, the earl of Tyrconnel, was sent as lord-deputy to Ireland (1687) to organize a Roman Catholic army on which the king might fall back if his English forces proved insufficient for his purpose.

Thus fortified, James issued a declaration of indulgence (1687) granting full religious liberty to all his subjects. The belief, that the grant of liberty to all religions was only intended to serve as a cloak for the ascendency of one, was so strong that the measure ruled the opposition of all those who objected to see the king's will substituted for the law, even if they wished to see the Protestant dissenters protected in other ways. In spite of this opposition, the king thought it possible to obtain a parliamentary sanction for his declaration. The parliament to which he intended to appeal was, however, to be as different a body from the parliament which met in the first year of his reign as the bench of judges which had approved of the dispensing power had been different from the bench which existed at his accession. A large number of the borough members were in those days returned by the corporations, and
the corporations were accordingly changed. But so thoroughly was the spirit of the country roused, that many even of the new corporations were set against James's declaration, and he had therefore to abandon for a time the hope of seeing it accepted even by a packed House of Commons. All, however, that he could do to give it force he did. He ordered the clergy to read it in all pulpits (1688). Seven bishops, who presented a petition asking him to relieve the clergy from the burden of proclaiming what they believed to be illegal, were brought to trial for publishing a seditious libel. Their acquittal by a jury was the first serious blow to the system adopted by the king.

Another event which seemed likely to consolidate his power was in reality the signal of his ruin. The queen bore him a son.

There was thus no longer a strong probability that the king would be succeeded at no great distance of time by a Protestant heir. Popular incredulity expressed itself in the assertion that, as James had attempted to gain his ends by means of a packed bench of judges and a packed House of Commons, he had now capped the series of falsifications by the production of a supposititious heir. The leaders of both parties combined to invite the prince of Orange to come to the rescue of the religion and laws of England. He landed on the 5th of November at Brixham. Before he could reach London every class of English society had declared in his favour. James was deserted even by his army. He fled to France, and a convention parliament, summoned without the royal writ, declared that his flight was equivalent to abdication, and offered the crown in joint sovereignty to William and Mary (1689).

IX. The Revolution and the Age of Anne (1689–1714)

The Revolution, as it was called, was more than a mere change of sovereigns. It finally transferred the ultimate decision in the state from the king to parliament. What parliament had been in the 17th century with the House of Lords predominating, that parliament was to be again in the end of the 17th century with the House of Commons predominating. That House of Commons was far from resting on a wide basis of popular suffrage. The county voters were the freeholders; but in the towns, with some important exceptions, the electors were the richer inhabitants who formed the corporations of the boroughs, or a body of select householders more or less under the control of some neighbouring landowner. A House so chosen was an aristocratic body, but it was aristocratic in a far wider sense than the House of Lords was aristocratic. The trading and legal classes found their representation there by the side of the great owners of land. The House drew its strength from its position as a true representative of the effective strength of the nation in its social and economical organization.

Such was the body which firmly grasped the control over every branch of the administration. Limiting in the Bill of Rights the powers assumed by the crown, the Commons declared that the king could not keep a standing army in time of peace without consent of parliament; and they made that consent effectual, as far as legislation could go, by passing a Mutiny Act year by year for twelve months only, so as to prevent the crown from exercising military discipline without their authority. Behind these legal contrivances stood the fact that the army was organized in the same way as the nation was organized, being officered by gentlemen who had no desire to overthrow a constitution through which the class from which they sprang controlled the government. Strengthened by the cessation of any fear of military violence, the Commons placed the crown in financial dependence on themselves by granting a large part of the revenue only for a limited term of years, and by putting strictly in force their right of appropriating that revenue to special branches of expenditure.

Such a revolution might have ended in the substitution of the despotism of a class for the despotism of a man. Many causes combined to prevent this result. The landowners, who formed the majority of the House, were not elected directly, as was the case with the nobility of the French states-general, by their own class, but by electors who, though generally loyal to them, would have broken off from them if they had attempted to make themselves masters of the following elections. No less important was the almost absolute independence of the judges, begun at the beginning of the reign, by the grant of office to them during good behaviour instead of during the king's pleasure, and finally secured by the clause in the Act of Settlement in 1701, which protected them against dismissal except on the joint address of both Houses of Parliament. Such an improvement, however, finds its full counterpart in another great step already taken. The more representative a government becomes, the more necessity it is for the well-being of the nation that the expression of individual thought should be free in every direction. If it is not so, the government is inclined to prescribe unpopular opinion, and to forget that new opinions by which the greatest benefits are likely to be conferred are certain at first to be entertained by a very few, and are quite certain to be unpopular as soon as they come into collision with the opinions of the majority. In the middle ages the benefits of the liberation of thought from state control had been secured by the antagonism between church and state. The Tudor sovereigns had rightfully asserted the principle that in a well-ordered nation only one supreme power can be allowed to exist; but in so doing they had enslaved religion. It was fortunate that, just at the moment when parliamentary control was established over the state, circumstances should have arisen which made the majority ready to restore to the individual conscience that supremacy over religion which the medieval ecclesiastics had claimed for the corporation of the universal church. Dissenters had, in the main, stood shoulder to shoulder with churchmen in rejecting the suspicious benefits of James, and both gratitude and policy forbade the thought of replacing them under the heavy yoke which had been imposed on them at the Restoration. The exact mode in which relief should be afforded was still an open question. The idea prevalent with the more liberal minds amongst the clergy was that of comprehension—that is to say, of so modifying the prayers and ceremonies of the church as to enable the dissenters cheerfully to enter in. The scheme was one which had approved itself to minds of the highest order—to Sir Thomas More, to Bacon, to Hales and to Jeremy Taylor. It is one which, as long as beliefs are not very divergent, keeps up a sense of brotherhood overruling the diversity of opinion. It broke down, as it always will break down in practice, whenever the difference of belief is so strongly felt as to seek earnestly to embody itself in diversity of outward practice. The greater part of the clergy of the church felt that to surrender their accustomed formularies was to surrender somewhat of the belief which those formularies signified, while the dissenting clergy were equally reluctant to adopt the common prayer book even in a modified form. Hence the Toleration Act, which guaranteed the right of separate assemblies for worship outside the pale of the church, though it embodied the principles of Cromwell and Milton, and not those of Chillingworth and Hales, was carried without difficulty, whilst the proposed scheme of comprehension never had a chance of success (1689). The choice was one which posterity can heartily approve. However wide the limits of toleration be drawn, there will always be those who will be left outside. By religious liberty those inside gain as much as those who are without. From the moment of the passing of the Toleration Act, no Protestant in England performed any act of worship except by his own free and deliberate choice. The Letters concerning Tolerations laid down the principle which had been maintained by Cromwell, with a wider application than was possible in days when the state was in the hands of a mere minority only able to maintain itself in power by constant and suspicious vigilance.

One measure remained to place the dissenters in the position of full membership of the state. The Test Act excluded them from
office. But the memory of the high-handed proceedings of Puritan rulers was still too recent to allow Englishmen to run the risk of a re-imposition of their yoke, and this feeling, fanciful as it was, was sufficient to keep the Test Act in force for years to come.

The complement of the Toleration Act was the abolition of the censorship of the press (1695). The ideas of the author of the

Aepopagitica had at last prevailed. The attempt to fix certain opinions on the nation which were pleasing to those in power was abandoned by king and parliament alike. The nation, or at least so much of it as cared to read books or pamphlets on political subjects, was accustomed to be the supreme judge, which must therefore be allowed to listen to what counsellors it pleased.

This new position of the nation made itself felt in various ways. It was William's merit that, fond as he was of power, he recognized the fact that he could not rule except so far as he carried the goodwill of the nation with him. No doubt he was helped to an intelligent perception of the new situation by the fact that, as a foreigner, he cared far more for carrying on war successfully against France than in inculcating the domestic legislative policy of a country which was not his own, and by the knowledge that the conduct of the struggle which lasted till he was able to treat with France on equal terms at Ryswick (1697) was fairly trusted to his hands. Nevertheless these years of war called for the united action of a national government, and in seeking to gain this support for himself, he hit upon an expedient which opened a new era in constitutional politics.

The supremacy of the House of Commons would have been an evil of no common magnitude, if it had made government impossible. Yet this was precisely what it threatened to do. Sometimes the dominant party in the House was with unseasored rancour upon its opponents.

Sometimes the majority shifted from side to side as the House was influenced by passing gusts of passion or sympathy, so that, as it was said at the time, no man could foretell one day what the House would be pleased to do on the next. Against the first of these dangers William was to a great extent able to guard by the exercise of his right of dissolution, so as to appeal to the constituencies, which did not always share in the passions of their representatives. But the second danger could not be met in this way. The only cure for waywardness is responsibility, and not only was this precisely what the Commons had not learned to feel, but it was not of the character of the Commons to consider that it was impossible to make them feel directly. A body composed of several hundred members cannot carry on government with the requisite steadiness of action and clearness of insight. Such work can only fitly be entrusted to a few, and whenever difficult circumstances arise it is necessary that the action of those few be kept in harmony by the predominance of one. The scheme on which William hit, by the advice of the earl of Sunderland, was that which has since been known as cabinet government. He selected as his ministers the leading members of the two Houses who had the confidence of the majority of the House of Commons. In this way, the influence fell an interest in supporting the men who embodied their own opinions, and fell in turn under the influence of those who held them with greater prudence or ability than fell to the lot of the average members of the House. All that William doubtless intended was to acquire a ready instrument to enable him to carry on the war with success. In reality he had found, on a new basis, the government of England. His own personal qualities were such that he was able to dominate over any set of ministers; but the time would come when there would be a sovereign of inferior powers. Then the body of ministers would step into his place. The old rude arrangements of the middle ages had provided by frequent depositions that an inefficient sovereign should cease to rule, and those arrangements had been imitated in the cases of Charles I. and James II. Still the claim to rule had, at least from the time of Henry III., been derived from hereditary descent, and the interruption, however frequently it might occur, had been regarded as something abnormal, only to be applied where there was an absolute necessity to prevent the wielder of executive authority from setting at defiance the determined purpose of the nation. After the Revolution not only had the king's title been so changed as to make him more directly than ever dependent on the nation, but he now called into existence a body which derived its own strength from its conformity with the wishes of the representatives of the nation.

For the moment it seemed to be but a temporary expedient. When the war came to an end, the Whig party which had sustained William in his struggle with France split up. The dominant feeling of the House of Commons was no longer the desire to support the crown against a foreign enemy, but to make government as cheap as possible, leaving future dangers to the chances of the future. William had not so understood the new invention of a united ministry as binding him to take into his service a united ministry of men whom he regarded as fools and knaves. He allowed the Commons to reduce the army to a skeleton, to question his actions, and to treat him as if he were a cipher. But it was only by slow degrees that he was brought to acknowledge the necessity of choosing his ministers from amongst them who had done these things.

The time came when he needed again the support of the nation. The death of Charles II., the heirless king of the huge Spanish monarchy, had long been expected. Since the peace of Ryswick, William and Louis XIV. had come to terms by two successive partition treaties for a division of those vast territories in such a way that the whole of them should not fall into the hands of a near relation either of the king of France or of the emperor, the head of the house of Austria. When the king of Spain actually died in 1700, William seemed to have no authority in England whatever; and Louis was therefore encouraged to break his engagements, and to accept the whole of the Spanish inheritance for his grandson, who became Philip V. of Spain. William saw clearly that such predominance of France in Europe would lead to the development of pretensions unbearable to other states. But the House of Commons did not see it, even when the Dutch garrisons were driven by French troops out of the posts in the Spanish Netherlands which they had occupied for many years (1701).

William had prudently done all that he could to conciliate the Tory majority. In the preceding year (1700) he had given office to a Tory ministry, and he now (1701) gave his assent to the Act of Settlement, which secured the succession of the Electress of Hanover, daughter of James I.'s daughter Elizabeth, to the exclusion of all Roman Catholic claimants, though it imposed several fresh restrictions on the prerogative. William was indeed wise in keeping his feelings under control. The country sympathized with him more than the Commons did, and when the House imprisoned the gentlemen depayed by the freeholders of Kent to present a petition asking that its loyal addresses might be turned into bills of supply, it simply advertised its weakness to the whole country.

The reception of this Kentish petition was but a foretaste of the difficulties which were to arise between the Commons and the nation, which was to prove the marked feature of the middle of the century now opening. For the present the House was ready to give way. It requested the king to enter into alliance with the Dutch. William went yet further in the direction in which he was urged. He formed an alliance with the emperor, as well as with the Netherlands, to prevent the union of the crowns of France and Spain, and to compel France to evacuate the Netherlands. An unexpected event came to give him all the strength he needed. James II. died, and Louis acknowledged his son as the rightful king of England. Englishmen of both parties were stung to indignation by the insult. William dissolved parliament, and the new House of Commons, Tory as it was by a small majority, was eager to support the king. It voted men and money according to his wishes. England was to be the soul of the Grand Alliance against France. But before a blow was struck William was thrown from his horse. He died on the 8th of March 1702. "The man," as Burke said
of him, "was dead, but the Grand Alliance survived in which King William lived and reigned."

Upon the accession of Anne, war was at once begun. The Grand Alliance became, as William had wished, a league to wrest the whole of the Spanish dominions from Philip, in favour of the Austrian archduke Charles. It was a sermon preached by Dr Sacheverell (q.v.) denounced toleration and the right of resistance in tones worthy of the first days of the Restoration. Foolish was the sermon was, it was the reflection of folly which was widely spread amongst the rude and less educated classes. The Whig leaders unwisely took up the challenge and impeached Sacheverell. His trial was the signal for riot. Dissenting chapels were sacked to the cry of High Church and Sacheverell. The queen, who had personal reasons for disliking the Whigs, dismissed them from office (1710), and a Tory House of Commons was elected amidst the excitement to support the Tory ministry of Harley and St John.

After some hesitation the new ministry made peace with France, and the treaty of Utrecht (1713), still dating for the permanent separation of the crowns of France and Spain, and assigning Milan, Naples and the Spanish Netherlands to the Austrian claimant, accomplished all that could reasonably be desired, though the abandonment to the vengeance of the Spanish government of her Catalan allies, and the base desertion of her continental confederates on the very field of action, brought dishonour on the good name of England. The Commons gladly welcomed the cessation of the war. The approval of the Lords had been secured by the creation of twelve Tory peers. In home politics the new ministry was in danger of being carried away by its more violent supporters. St John, now Viscount Bolingbroke, with unscrupulous audacity placed himself at their head. The Occasional Conformity Bill was at last carried (1711). To it was added the Schism Act (1714), forbidding dissenters to keep schools or engage in tuition. Bolingbroke went still farther. He engaged in an intrigue for bringing over the Pretender to succeed the queen upon her death. This wild conduct alienated the moderate Tories, who, much as they wished to see the throne occupied by the heir of the ancient line, could not bring themselves to consent to its occupation by a Roman Catholic prince. Such men, therefore, when Anne died (1714) joined the Whigs in proclaiming the elector of Hanover king as George I.

X. THE HANOVERIAN KINGS (1714–1753)

The accession of George I. brought with it the predominance of the Whigs. They had on their side the royal power, the greater part of the aristocracy, the dissenters and the higher trading and commercial classes. The Tories appealed to the dislike of dissenters prevalent amongst the country gentlemen and the country clergy, and to the jealousy felt by the agricultural classes towards those who enriched themselves by trade. Such a feeling, if it was aroused by irritating legislation, might very probably turn to the advantage of the exiled house, especially as the majority of Englishmen were to be found on the Tory side. It was therefore the government, with the consent of the Whigs, to act as little action as possible, in order to give time for old habits to wear themselves out. The landing of the Pretender in Scotland (1715), and the defeat of a portion of his army which had advanced to Preston—a defeat which was the consequence of the apathy of his English supporters, and which was followed by the complete suppression of the rebellion—gave increased strength to the Whig government. But they were reluctant to face an immediate dissolution, and the Septennial Act was passed (1716) to extend to seven years the duration of parliaments, which had been fixed at three years by the Triennial Act of William and Mary. Under General Stanhope an effort was made to draw legislation in a more liberal direction. The Occasional Conformity Act and the Schism Act were repealed (1719); but the majorities on the side of the government were unusually small, and Stanhope, who would willingly have repealed the
ENGLISH HISTORY

Test Act so far as it related to dissenters, was compelled to abandon the project as entirely impracticable. The Peerage Bill, introduced at the same time to limit the royal power of creating peers, was happily thrown out in the Commons. It was proposed, partly from a desire to guard the Lords against such a sudden increase of their numbers as had been forced on them when the treaty of Utrecht was under discussion, and partly to secure the Whigs in office against any change in the royal counsels in a succeeding reign. It was in fact conceived by men who valued the immediate victory of their principles more than they trusted to the general good sense of the nation. The Lords were at this time, as a matter of fact, not merely wealthier but wiser than the Commons; and it is no wonder that, in days when the Commons, by passing the Septennial Act, had shown their distrust of their own constituents, the peers should show, by the Peerage Bill, their distrust of that House which was elected by those constituencies. Nevertheless, the remedy was worse than the disease, for it would have established a close oligarchy, bound sooner or later to come into conflict with the will of the nation, and only to be overthrown by a violent alteration of the constitution.

Walpole's ministry.

Walpole, a man of business when men of business were few in the House of Commons, he was eminently fit to manage the affairs of the country. But he owed his long continuance in office especially to his sagacity. He clearly saw, what Stanhope had failed to see, that the mass of the nation was not fitted as yet to interest itself wisely in affairs of government, and that therefore the rule must be kept in the hands of the upper classes. But he was too sensible to adopt the coarse expedient which had commended itself to Stanhope, and he preferred humoring the masses to contradicting them.

The struggle of the preceding century had left its mark in every direction on the national development. Out of the reaction against Puritanism had come a widely-spread relaxation of morals, and also, as far as the educated class was concerned, an eagerness for the discussion of all social and religious problems. The fierce excitement of political life had quickened thought, and the mostanciently received doctrines were held of little worth until they were brought to the test of reason. It was a time when the pen was more powerful than the sword, when a secretary of state would treat with condescension a witty pamphlet, and when such a pamphleteer might hope, not in vain, to become a secretary of state.

It was in this world of reason and literature that the Whigs of the Peerage Bill moved. Walpole perceived that there was another world which understood none of these things. With cynical insight he discovered that a great government cannot rest on a clique, however distinguished. If the mass of the nation was not conscious of political wants, it was conscious of material wants. The merchant needed protection for his trade; the voter gladly welcomed election days as bringing guineas to their pockets. Members of parliament were ready to sell their votes for places, for pensions, for actual money. The system was not new, as Dampier is credited with the discovery that a vote in the House of Commons might be purchased. But with Walpole it reached its height.

Such a system was possible because the House of Commons was not really accountable to its constituents. The votes of its members were not published, and still less were their speeches made known. Such a silence could only be maintained around the House when there was little interest in its proceedings. The great questions of religion and taxation which had agitated the country under the Stuarts were now fairly settled. To reawaken those questions in any shape would be dangerous. Walpole took good care never to repeat the mistake of the Sacheverell trial. When on one occasion he was led into the proposal of an unpopular excise he at once drew back. England in his days was growing rich. Englishmen were bluff and independent, in their ways often coarse and unmanly. Their life was the life depicted on the canvas of Hogarth and the pages of Fielding. All high imagination, all devotion to the public weal, seemed laid asleep. But the political instinct was not dead, and it would one day express itself for better ends than an agitation against an excise bill or an outcry for a popular war. A government could no longer employ its powers for direct oppression. In his own house and in his own conscience, every Englishman, as far as the government was concerned, was the master of his destiny. By and by the idea would dawn on the nation that anarchy is as productive of evil as tyranny, and that a government which omits to regulate or control allows the strong to oppress the weak, and the rich to oppress the poor.

Walpole's administration lasted long enough to give room for some feeble expression of this feeling. When George I. was succeeded by George II. (1727), Walpole remained in power. His eagerness for the possession of that power which he desired to use for his country's good, together with the incapacity of two kings born and bred in a foreign country to take a leading part in English affairs, completed the change which had been effected when William first entrusted him with the task of good government. Walpole was not for the first time a prime minister in England, a person who was himself a subject imposing harmonious action on the cabinet. The change was so gradually and silently effected that it is difficult to realize its full importance. So far, indeed, as it only came about through the incapacity of the first two kings of the house of Hanover, it might be undone, and was in fact to a great extent undone by a more active successor. But so far as it was the result of general tendencies, it could never be obliterated. In the ministries in which Somers and Montagu on the one hand and Harley and St John on the other had taken part, there was no prime minister except so far as one member of the administra- tion dominated over his colleagues by the force of character and intelligence. In the reign of George III., even North and Addington were universally acknowledged by that title, though they had little claim to the independence of action of a Walpole or a Pitt.

The change was, in fact, one of the most important of those by which the English constitution has been altered from an hereditary monarchy with a parliamentary regulative agency to a parliamentary government with an hereditary regulative agency. In Walpole's time the forms of the constitution had become, in all essential particulars, what they are now. What was wanting was a national force behind them to set them to their proper work.

The growing opposition which finally drove Walpole from power was not entirely without a nobler element than could be furnished by personal rivalry, or ignorant distrust of commercial and financial success. It was well that complaints that a great country ought not to be governed by patronage and bribery should be raised, although, as subsequent experience showed, the causes which rendered corruption inevitable were not to be removed by the expulsion of Walpole from office. But for one error, indeed, it is probable that Walpole's rule would have been still further prolonged. In 1739, a popular excitement arose for a declaration of war against Spain. Walpole believed that war to be certainly unjust, and likely to be disastrous. He had, however, been so accustomed to give way to popular pressure that he did not perceive the difference between a wise and timely determination to leave a right action undone in the face of inanerable difficulties, and an unwise and cowardly determination to do that which he believed to be wrong and imprudent. If he had now resigned rather than demean himself by acting against his conscience, it is by no means unlikely that he would have been recalled to power before many years were over. As it was, the failures of the war were charged on his own head, and in 1742 his long ministry came to an end.

After a short interval a successor was found in Henry Pelham. All the ordinary arts of corruption which Walpole had practised were continued, and to them were added arts of corruption.
which Walpole had disdained to practise. He at least understood that there were certain principles in accordance with which he wished to conduct public affairs, and he had driven his colleague after colleague out of office rather than allow them to distract his method of government. Pelham and his brother, the Thomas Pelham, duke of Newcastle, had no principles of government whatever. They offered place to every man of parliamentary skill or influence. There was no opposition, because the ministers never attempted to do anything which would arouse opposition, and because they were ready to do anything called for by any one who had power enough to make himself dangerous; and in 1743 they embarked on a useless war with France in order to please the king, who saw in every commotion on the continent of Europe some danger to his beloved Hanover.

At most times in the history of England such a ministry would have been driven from office by the outcry of an offended people. In the days of the Pelhams, government was regarded as lying too far outside the all-important private interests of the community to make it worth while to make any effort to rescue it from the degradation into which it had fallen; yet the Pelhams had not been long in power before this serene belief that the country could get on very well without a government in any real sense of the word was put to the test. In 1745 Charles Edward, the son of the Pretender, landed in Scotland. He was followed by many of the Highland clans, always ready to draw the sword against the constituted authorities of the Lowlands; and even in the Lowlands, and especially in Edinburgh, he found adherents, who still felt the sting inflicted by the suppression of the national independence of Scotland. The British army was in as chaotic a condition as the British government, and Charles Edward inflicted a complete defeat on a force which met him at Prestonpans. Before the end of the year the victor, at the head of 5000 men, had advanced to Derby. But he found no support in England, and the mere numbers brought against him compelled him to retreat, to find defeat at Culloden in the following year (1746). The war on the continent had been waged with indifferent success. The victory of Dettingen (1743) and the glorious defeat of Fontenoy (1745) had achieved no objects worthy of English intervention, and the peace of Aix-la-Chapelle put an end in 1748 to hostilities which could never have been begun. The government pursued its inglorious career as long as Henry Pelham lived. He had at least some share in the financial ability of Walpole, and it was not till he died in 1745 that the real difficulties of a system which was based on the avoidance of difficulties had fairly to be faced.

The change which was needed was not any mere re-adjustment of the political machine. Those who cared for religion or morality had forgotten that man is an imaginative and emotional being. Defenders of Christianity and of deism alike appealed to the reason alone. Enthusiasm was treated as a folly or a crime, and earnestness of every kind was branded with the name of enthusiasm. The higher order of minds dwelt with prehense upon the beneficent wisdom of the Creator. The lower order of minds treated religion as a kind of life assurance against the inconvenience of eternal death. Upon such a system as this human nature was certain to revenge itself. The preaching of Wesley and Whitefield appealed direct to the emotions, with its doctrine of "conversion," and called upon each individual not to understand, or to admire, or to act, but vividly to realize the love and mercy of God. In all this there was nothing new. What was new was that Wesley added an organization, Methodism (q.v.), in which each of his followers unfolded to one another the secrets of their heart, and became accountable to his fellows. Large as the numbers of the Methodists ultimately became, the influence is not to be measured by their numbers. The double want of the age, the want of spiritual earnestness and the want of organized coherence, would find satisfaction in many ways which would have seemed strange to Wesley, but which were, nevertheless, a continuance of the work which he began.

As far as government was concerned, when Henry Pelham died (1754) the lowest depth of baseness seemed to have been reached. The duke of Newcastle, who succeeded his brother, looked on the work of corruption with absolute pleasure, and regarded genius and ability as an awkward interruption of that happy arrangement which made men subservient to flattery and money. Whilst he was in the very act of trying to drive from office all men who were possessed of any sort of ideas, he was surprised by a great war. In America, the French settlers in Canada and the English settlers on the Atlantic coast were falling to blows for the possession of the vast territories drained by the Ohio and its tributaries. In India, Frenchmen and Englishmen had striven during the last war for authority over the native states round Pondicherry and Madras, and the conflict threatened to break out anew. When war began in earnest, and the reality of danger came home to Englishmen by the capture of Minorca (1756), there arose a demand for a more capable government than any which Newcastle could offer. Terrified by the storm of obloquy which he aroused, he fled from office. A government was formed, of which the soul was William Pitt. Pitt was, in some sort, to the political life of Englishmen what Wesley was to their religious life. He brought no new political ideas into their minds, but he ruled them by the force of his character and the example of his purity. His weapons were trust and confidence. He appealed to the patriotism of his fellow-countrymen, to their imaginative love for the national greatness, and he did not appeal in vain to the benevolence which he could not but feel instinctively that a large number, even of those who took greedily the bribes of Walpole and the Pelhams, took them, not because they loved money better than their country, but because they had no conception that their country had any need of them at all. It was a truth, but it was not the whole truth. The great Whig families rallied under Newcastle and drove Pitt from office (1757). But if Pitt could not govern without Newcastle's corruption, neither could Newcastle govern without Pitt's energy.

At last a compromise was effected, and Newcastle undertook the work of brising, whilst Pitt undertook the work of governing (see CHATHAM, WILLIAM PITT, 1ST EARL OF). The war which had already broken out, the Seven Years' War (1756–1763), was not confined to England alone. By the side of the duel between France and England, a war was going on upon the continent of Europe, in which Hanover—its allies, France, Russia, and the German princes—had fallen upon the new kingdom of Prussia and its sovereign Frederick II. England and Prussia therefore necessarily formed an alliance. Different as the two governments were, they were both alike in recognizing, in part at least, the conditions of progress. Even in Pitt's day England, however imperfectly, rested its strength on the popular will. Even in Frederick's day Prussia was ruled by administrators selected for their special knowledge. Neither France nor Austria had any conception of the necessity of fulfilling these requirements. Hence the strength of England and of Prussia. The war seemed to be a mere struggle for territory. There was no feeling in either Pitt or Frederick, such as there was in the men who contended half a century later against Napoleon, that they were fighting the battles of the civilized world. There was something repulsive as well in the enthusiastic nationalism of Pitt as in the cynical nationalism of Frederick. Pitt's sole object was to exact England to a position in which she would fear no rival. But in so doing he exalted that which, in spite of all that had happened, best deserved to be exalted. The habits of individual energy fused together the creation of patriotism; conquest was the work of Pitt. The intelligent over-regulation of the French government could not maintain the colonies which had been founded in happier times. In 1758 Louisburg was taken, and the mouth of the St Lawrence guarded against France. In 1759 Quebec fell before Wolfe, who died at the moment of victory. In the same year the naval victories of Lagos and Quiberon Bay established the supremacy of the British at sea. The battle of Plassey (1757) had laid Bengal at the feet of the British.
of Clive; and Coote's victory at Wandiwash (1760) led to the final
ral of the ruins of French authority in southern India.
When George II. died (1760) England was the first maritime and
colonial power in the world (see \textit{SEVEN YEARS' WAR; CA-
\textit{NADA: History; INDIA: History}).

In George III. the king once more became an important factor in
English politics. From his childhood he had been trained by
his mother and his instructors to regard the break-
ing down of the power of the great families as the task
of his life. In this he was walking in the same direction as Pitt.
If the two men could have worked together, England might have been spared many misfortunes. Unhappily, the
king could not understand Pitt's higher qualities, his bold con-
\cfidence in the popular feeling, and his contempt for corruption and
\ctrigue. And yet the king's authority was indispensable to Pitt, if he was to carry on his conflict against the great families
with success. When the war came to an end, as it must come
to an end sooner or later, Pitt's special predominance, derived
as it was from his power of breathing a martial spirit into the
\c fleets and armies of England, would come to an end too. Only
the king, with his hold upon the traditional instincts of loyalty and
the force of his still unimpaired prerogative, could, in ordinary
times, hold head against the wealthy and influential aristocracy.
Unfortunately, George III. was not wise enough to deal with the
difficulty in a high-minded fashion. With a well-intentioned
but narrow mind, he had nothing in him to strike the imagination of
his subjects. He met influence with influence, corruption with
\ctrigue, and intrigue with intrigue. Unhappily, too, his earliest
relations with Pitt involved a dispute on a point on which he
was right and Pitt was wrong. In 1761 Pitt resigned his office,
because neither the king nor the cabinet were
\ctiling to declare war against Spain in the midst of the
\c war with France. As the war with Spain was inevitable, and as,
when it broke out in the following year (1762), it was followed by
\c triumphs for which Pitt had prepared the way, the prescience of
\c the great war-minister appeared to be fully established.

But it was his love of war, not his skill in carrying it on, which was
\ctually in question. He would be satisfied with nothing short of
the absolute ruin of France. He would have given England
\t\ct that dangerous position of supremacy which was gained for
France by Louis XIV. in the 17th century, and by Napoleon in the
19th century. He would have made his country still more
\ctbony and arrogant than it was, till other nations rose against it,
as they have three times risen against France, rather than
\ctit to the intolerable yoke. It was a happy thing for England
\t that peace was signed (1763).

Even as it was, a spirit of contemptuous disregard of the rights
of others had been roused, which would not be easily allayed.
The king's premature attempt to secure a prime
\c minister of his own choosing in Lord Bute (1761)
came to an end through the minister's incapacity
(1763). George Grenville, who followed him, kept the king in
\c leading strings in reliance upon his parliamentary majority.
Something, no doubt, had been accomplished by the incorrupt-
\cibility of Pitt. The practice of bribing members of parliament
by actual presents in money came to an end, though the practice of
\ctripping them by place and pension long continued. The
arrogance which Pitt displayed towards foreign nations was
displayed by Grenville towards classes of the population of the
British dominions. It was enough for him to establish a right.
He never put himself in the position of those who were to suffer
by its being put in force.

The first to suffer from Grenville's conception of his duty
were the American colonists. The mercantile system, which had
sprung up in Spain in the 16th century, held that
\c colonies were to be entirely prohibited from trading
\t except with the mother country. Every European
\c country had adopted this view, and the acquisition of
\c fresh colonial dominions by England, at the peace of 1763,
had been made not so much through lust of empire as through
\c love of trade. Of all English colonies, the American were the
\t most populous and important. Their proximity to the Spanish
colonies in the West Indies had naturally led to a contraband
\c trade. To this trade Grenville put a stop, as far as lay in his
\c power. Obnoxious as this measure was in America, the colonists
\t had acknowledged the principle on which it was founded too
\t long to make it easy to resist. Another step of Grenville's
\t was met with more open opposition. Even with all the experience
\t of the century which followed, the relations between a mother
country and her colonies are not easy to arrange. If the burthen
\c of defence is to be borne in common, it can hardly be left to the
\c mother country to declare war, and to exact the necessary
taxation, without the consent of the colonies. If, on the other
\c hand, it is to be borne by the mother country alone, she may well
\c complain that she is left to bear more than her due share of the
\c weight. The latter alternative forced itself upon the attention
\c of Grenville. The British parliament, he held, was the supreme
\c legislature, and, as such, was entitled to raise taxes in America
\c to support the military forces needed for the defence of America.

The act (1765) imposing a stamp tax on the American colonies
\t was the result.

As might have been expected, the Americans resisted. For
\t them, the question was precisely that which Hampden had
\t fought out in the case of ship-money. As far as they
\t were concerned, the British parliament had stepped
\t into the position of Charles I. If Grenville had re-
\t mained in office he would probably have persisted in
\t his resolution. He was driven from his post by the king's resolve
\t no longer to submit to his insoucience, and a new ministry
\t was formed under the marquess of Rockingham, composed of some of
\t those leaders of the Whig aristocracy who had not followed the
\t Grenville ministry. They were well-intentioned, but, weak, and
\t without political ability; and the king regarded them with
distrust, only qualified by his abhorrence of the ministry which
\t they superseded.

As soon as the bad news came from America, the ministry
\t was placed between two recommendations. Grenville, on the
\t one hand, advised that the tax should be enforced.
Pitt, on the other, declared that the British parliament
\t had absolutely no right to tax America, though he
\t held that it had the right to regulate, or in other words
to tax, the commerce of America for the benefit of the
British merchant and manufacturer. Between the
\t two the government took a middle course. It obtained from
\t parliament a total repeal of the Stamp Act, but it also passed
\t a \textit{Declaratory Act}, claiming for the British parliament the
\t supreme power over the colonies in matters of taxation, as well
\t as in matters of legislation.

It is possible that the course thus adopted was chosen simply
\t because it was a middle course. But it was probably suggested
\t by Edmund Burke, who was then Lord Rockingham's
\t private secretary, but who for some time to come was
\t to furnish thought to the party to which he attached
\t himself. Burke carried into the world of theory those
\t \textit{political expediency} of which Walpole had been the practical
\t originator. He held that questions of abstract right had no
\t place in politics. It was therefore as absurd to argue with Pitt
\t that England had a right to regulate commerce, as it was to argue
\t with Grenville that England had a right to levy taxes.
All that could be said was, that it was expedient in a widespread empire
\t that the power of final decision should be lodged somewhere,
\t and that it was also expedient not to use that power in such
\t a way as to irritate those whom it was the truest wisdom to
\t conciliate.

The weak side of this view was the weak side of all Burke's
\t political philosophy. Like all great innovators, he was intensely
\t opposed to making it easy to put an advocate of change.

With new views on every subject relating to the
\t exercise of power, he shrank even from entertaining the
\t slightest question relating to the distribution of power.

He recommended to the British parliament the most self-denying
\t wisdom, but he could not see that in its relation to the colonies
\t the British parliament was so constituted as to make it entirely
\t unprepared to be either wise or self-denying. It is true that if

he had thought out the matter in this direction, he would have been led further than he or any other man in England or America was at that time prepared to go. If the British parliament was unfit to legislate for America, and if, as was undoubtedly the case, it was impossible to create a representative body which was fit to legislate, then it would follow that the American colonies could only be fairly governed as practically independent states, though they might possibly remain, like the great colonies of our own day, in a position of alliance rather than of dependence. It was because the issues opened led to changes so far greater than the wisest statesmen then perceived, that Pitt's solution, logically untenable as it was, was preferable to Burke's. Pitt would have given bad reasons for going a step in the right direction. Burke gave excellent reasons why those who were certain to go wrong should have the power to go right.

Scarcely were the measures relating to America passed when the king turned out the ministry. The new ministry was formed by Pitt, who was created Earl of Chatham (1766), on the principle of bringing together men who had shaken themselves loose from any of the different Whig cliques. Whatever chance the plan had of succeeding was at an end when Chatham's mind temporarily gave way under stress of disease (1767). Charles Townshend, a brilliant, headstrong man, led parliament in the way which had been prepared by the Declaratory Act, and laid duties on tea and other articles of commerce entering the ports of America.

It was impossible that the position thus claimed by the British parliament towards America should affect America alone. The habit of obtaining money otherwise than by the consent of those who are required to pay it would be certain to make parliament careless of the feelings and interests of that great majority of the population at home, which was unrepresented in parliament. The resistance of America to the taxation imposed was therefore not without benefit to the people of the mother country. Already there were signs of a readiness in parliament to treat even the constituencies with contempt.

In 1763, in the days of the Grenville ministry, John Wilkes, a profligate and scurrilous writer, had been arrested on a general warrant—that is to say, a warrant in which the name of no individual was mentioned—as the author of an alleged libel on the king, contained in No. 45 of The North Briton. He was a member of parliament, and as such was declared by Chief Justice Pratt to be privileged against arrest. In 1768 he was elected member for Middlesex. The House of Commons expelled him. He was again elected, and again expelled a third time, in 1770, to which Wilkes was a third time chosen to Colonel Luttrell, who was far down in the poll. Wilkes thus became the representative of a great constitutional principle, the principle that the electors have a right to choose their representatives without restriction, save by the regulations of the law.

For the present the contention of the American colonists and of the defenders of Wilkes at home was confined within the compass of the law. Yet in both cases it might easily pass beyond that compass, and might rest itself upon an appeal to the duty of governments to modify the law, and to enlarge the basis of their authority, when law and authority have become too narrow.

As regards America, though Townshend died, the government persisted in his policy. As resistance grew stronger in America, the king urged the use of compulsion. If he had not the wisdom of the country on his side, he had his prejudices. The arrogant spirit of Englishmen made them contemptuous towards the colonists, and the desire to thrust taxation upon others than themselves made the new colonial legislation popular. In 1770 the king made Lord North prime minister. He had won the object on which he had set his heart. A new Tory party had sprung up, not distinguished, like the Tories of Queen Anne's reign, by a special ecclesiastical policy, but by their acceptance of the king's claim to nominate ministers, and so to predominate in the ministry itself.

Unhappily the opposition, united in the desire to conciliate America, was divided on questions of home policy. Chatham would have met the new danger by parliamentary reform, giving increased voting power to the freeholders of the counties. Burke from principle, and his noble patrons mainly from lower motives, were opposed to any such change. As Burke had wished the British parliament to be supreme over the colonies, in confidence that this supremacy would not be abused, so he wished the great landowning connexion resting on the rotten boroughs to rule over the unrepresented people, in confidence that this power would not be abused. Amid these distractions the king had an easy game to play. He had all the patronage of the government in his hands, and beyond the circle which was influenced by gifts of patronage, he could appeal to the ignorance and self-seeking of the nation, with which, though he knew it not, he was himself in the closest sympathy.

No wonder resistance grew more vigorous in America. In 1773 the inhabitants of Boston ship-loads of tea into the harbour rather than pay the obnoxious duty. In 1774 the Boston Port Bill deprived Boston of its commercial rights, whilst the Massachusetts Government Bill took away from that colony the ordinary political liberties of Englishmen. The first skirmish of the war was fought at Lexington in 1775. In 1776 the thirteen colonies united in the continental congress issued their Declaration of Independence. England put forth all its strength to beat down resistance; but the task, which seemed easy at a distance, proved impossible. It might have been so even had the war been conducted on the British side with greater military skill and with more insight into the conditions of the struggle, which was essentially a civil contest between men of the same race. But the initial difficulties of the vast field of operations were greatly increased by the want of skill of the British leaders in adapting themselves to new conditions, while even loyalist sentiment was shocked by the employment of German mercenaries. Red victory would have been possible, had King George III. not been in the habit of sending able men to defend the American colonies, who had upheld the standard of liberty against the Stuarts, and worthy of the great cause for which they fought. In 1777 a British army under Burgoyne capitulated at Saratoga; and early in 1778 France, eager to revenge the disasters of the Seven Years' War, formed an alliance with the revolted colonies as free and independent states, and was soon joined by Spain.

The American War of Independen-
Already the ministry on which such great hopes had been placed had broken up. Rockingham died in July 1782. The two sections of which the government was composed had different aims. The Rockingham section, which now looked up to Fox, rested on aristocratic connexion and influence; the Shelburne section was anxious to gain popular support by active reforms, and to gain over the king to their side. Judging by past experience, the combination might well seem hopeless, and honourable men like Fox might easily regard it with suspicion. But Fox's allies took good care that their name should not be associated with the idea of improvement. They pruned Burke's Economical Reform Bill till it left as many abuses as it suppressed; and though the bill prohibited the grant of pensions above £200, they hastily gave away pensions of much larger value to their own friends before the bill had received the royal assent. They also opposed a bill for parliamentary reform brought in by young William Pitt. When the king chose Shelburne as prime minister, they refused to follow him, and put forward the incompetent duke of Portland as their candidate for the office. The struggle was thus renewed on the old ground of the king's right to select his ministers. But while the king now put forward a minister notoriously able and competent to the task, his opponents put forward a man only claim to office was the possession of large estates. They forced their way back to power by means as unscrupulous as their claim to it was unjustifiable. They formed a coalition with Lord North, whose politics and character they had denounced for years.

The coalition, as soon as the peace with America and France had been signed (1783), drove Shelburne from office. The duke of Portland became the nominal head of the government, Fox and North its real leaders. Such a ministry could not afford to make a single blunder. The king detected it, and the assumption by the Whig houses of the direction of the government was without reference to the national interests threatened to be popular. The blunder was soon committed. Burke, hating wrong and injustice with a bitter hatred, had described in the government no honourable man can think of uttering a word of defence. The helpless natives were oppressed and robbed by the company and its servants in every possible way. Burke drew up a bill, which was adopted by the coalition government, for taking all authority in India out of the hands of the company, and even placing the company's management of its own commercial affairs under control. The governing and controlling body was naturally to be a council appointed at home. The question of the nomination of this council at once drew the whole question within the domain of party politics. The whole patronage of India would be in its hands, and, as parliament was then constituted, the balance of parties might be more seriously affected by the distribution of that patronage than it would be now. When, therefore, it was understood that the government bill meant the council to be named in the bill for four years, or, in other words, to be named by the coalition ministry, it was generally regarded as an unblushing attempt to turn his ministers' heads. Good government of India into a measure for securing the ministry in office. The bill of course passed the Commons. When it came before the Lords, it was thrown out in consequence of a message from the king, that he would regard any one who voted for it as his enemy.

The contest had thus become one between the influence of the crown and the influence of the great houses. Constitutional historians, who treat the question as one of merely theoretical politics, leave out of consideration this essential element of the situation, and forget that, if it was wrong for the king to influence the Lords by his message, it was equally wrong for the ministry to acquire for themselves fresh patronage with which to influence the Commons. But there was now, what there had not been in the time of Walpole and the Pelhams, a public opinion ready to throw its weight on one side or the other. The county members still formed the most independent portion of the representation, and there were many possessors of rotten boroughs, who were ready to agree with the county members rather than with the great landowners. In choosing Pitt, the young son of Chatham, for his prime minister, as soon as he had dismissed the coalition, George III. gave assurance that he wished his councils to be directed by integrity and ability. After a struggle of many weeks, parliament was dissolved (1784), and the new House of Commons was prepared to support the king's minister by a large majority.

As far as names go, the change effected placed the new Tory party in office for an almost uninterrupted period of forty-six years. It so happened, however, that after the first eight years of that period had passed by, circumstances occurred which effected so great a change in the composition and character of that party as to render any statement to this effect entirely illusory. During eight years, however, Pitt's ministry was not merely a Tory ministry resting on the choice of the king, but a Liberal ministry resting on national support and upon advanced political knowledge.

The nation which Pitt had behind him was very different from the populace which had assailed Walpole's Excise Bill, or had cheered for Wilkes. At the beginning of the century the intellect of thoughtful Englishmen had applied itself to speculative questions of religion and philosophy. In the middle of the century it applied itself to practical problems affecting the employment of industry. In 1776 Adam Smith published the Wealth of Nations. Already in 1762 the work of Brindley, the Bridgewater canal, the first joint of a network of inland water communication, was opened. In 1767 Hargreaves produced the spinning-jenny; Arkwright's spinning machine was exhibited in 1768; Crompton's mule was finished in 1770; Cartwright hit upon the idea of the power-loom in 1784, though it was not brought into profitable use till 1801. The cotton factories had begun by 1763, and the improved steam-engines were brought into shape by Watt in 1768. During these years the duke of Bedford, Coke of Norfolk, and Robert Bakewell were busy in the improvement of stock and agriculture.

The increase of wealth and prosperity caused by these changes went far to produce a large class of the population entirely outside the associations of the landowning class, but with sufficient intelligence to appreciate the advantages of a government carried on without regard to the personal interests and rivalries of the aristocracy. The mode in which that increase of wealth was effected was even more decisive on the ultimate destinies of the country. The substitution of the organization of hereditary wealth and station for the organization of wealth and station would ultimately have led to evils as great as those which it superseded. It was only tolerable as a stepping-stone to the organization of intelligence. The larger the numbers admitted to influence the affairs of state, the more necessary is it that they respect the powers of intellect. It would be foolish to institute a comparison between an Arkwright or a Crompton and a Locke or a Newton. But it is certain that for one man who could appreciate the importance of the treatise On the Human Understanding or the theory of gravitation, there were thousands who could understand the value of the water-frame, or the power-loom. The research for the organization of wealth and station would have led to evils as great as those which it superseded. It was only tolerable as a stepping-stone to the organization of intelligence. The larger the numbers admitted to influence the affairs of state, the more necessary is it that they respect the powers of intellect. It would be foolish to institute a comparison between an Arkwright or a Crompton and a Locke or a Newton. But it is certain that for one man who could appreciate the importance of the treatise On the Human Understanding or the theory of gravitation, there were thousands who could understand the value of the water-frame, or the power-loom. But it is certain that for one man who could appreciate the importance of the treatise On the Human Understanding or the theory of gravitation, there were thousands who could understand the value of the water-frame, or the power-loom.
Still more excellent was his plan of legislation for Ireland. Irishmen had taken advantage of the weakness of England during the American War to enforce upon the ministry of the day, in 1780 and 1782, an abandonment of all claim on the part of the English government and the English people to interfere in any way with Irish affairs. From 1782, therefore, there were independent legislatures within the British Isles—the one sitting at Westminster and the other sitting in Dublin. With these political changes Fox professed himself to be content. Pitt, whose mind was open to wider considerations, proposed to throw open commerce to both nations by removing all the restrictions placed on the trade of Ireland with England and with the rest of the world. The opposition of the English parliament was only removed by concessions continuing some important restrictions upon Irish exports, and by giving the English parliament the right of initiation in all measures relating to the regulation of the trade which was to be common to both nations. The Irish parliament took umbrage at the superiority claimed by England, and threw out the measure as an insult, though, even as it stood, it was undeniably in favour of Ireland. The lesson of the incompatibility of two coordinate legislatures was not thrown away upon Pitt.

In 1786 the commercial treaty with France opened that country to English trade, and was the first result of the theories laid down by Adam Smith ten years previously. The first attack upon the horrors of the slave-trade was made in 1788; and in the same year, in the debates on the Regency Bill caused by the king's insanity, Pitt defended against Fox the right of parliament to make provision for the exercise of the powers of the crown when the wearer of the regal robe was permanently or temporarily disabled from exercising his authority.

When the king recovered, he went to St Paul's to return thanks on the 23rd of April 1789. The enthusiasm with which he was greeted showed how completely he had the nation on his side. All the hopes of liberal reformers were now with him. All the hopes of moral and religious men were on his side as well. The seed sown by Wesley had grown to be a great tree. A spirit of thoughtfulness in religious matters and of moral energy was growing in the nation, and the king was endeared to his subjects, as much by his domestic virtues as by his support of the great minister who acted in his name. The happy prospect was soon to be overclouded. On the 4th of May, eleven days after the appearance of George III. at St Paul's, the French states-general met at Versailles.

By the great mass of intelligent Englishmen the change was greeted with enthusiasm. It is seldom that one nation understands the tendencies and difficulties of another; and the mere fact that power was being transferred from an absolute monarch to a representative assembly led superficial observers to imagine that they were witnessing a mere repetition of the victory of the English parliament over the Stuart kings. In fact, that which was passing in France was of a totally different nature from the English struggle of the 17th century. In England, the conflict had been carried on for the purpose of limiting the power of the king. In France, it was begun in order to sweep away an aristocracy in church and state which had become barbarously oppressive. The French Revolution was not, therefore, a conflict for the reform of the political organization of the state, but one for the reorganization of the whole structure of society; and in proportion as it turned away from the path which English ignorance had marked out for it, Englishmen turned away from it in disgust. As they did not understand the aims of the French Revolutionists, they were unable to make that excuse for even so much of their conduct as admits of excuse. Three men, Fox, Burke and Pitt, however, represented there were two of opinion into which the nation was very unequally divided.

Fox, generous and trustful towards the movements of large masses of men, had very little intellectual grasp of the questions at issue in France. He treated the struggle as one simply for the establishment of free institutions; and when at last the crimes of the leaders became patent to the world, he contented himself with lamenting the unfortunate fact, and fell back on the argument that though England could not sympathize with the French tyrants, there was no reason why she should go to war with them.

Burke, on the other hand, while he failed to understand the full tendency of the Revolution for good as well as for evil, understood it far better than any Englishman of that day understood it. He saw that its main aim was equality, not liberty, and that not only would the French nation be ready, in pursuit of equality, to welcome any tyranny which would serve its purpose, but would be the more prone to acts of tyranny over individuals. This would arise from the remodelling of institutions, with the object of giving immediate effect to the will of the masses, which was especially liable to be counterfeited by designing and unscrupulous agitators. There is no doubt that in all this Burke was in the right, as he was in his denunciation of the mischief certain to follow when a nation tries to start afresh, and to blot out all past progress in the light of simple reason, which is often most fallible when it believes itself to be most infallible. Where he went wrong was in his ignorance of the special circumstances of the French nation, and his consequent blindness to the fact that the historical method of gradual progress was impossible where institutions had become so utterly bad as they were in France, and that consequently the system of starting afresh, to which he reasonably objected, was to the French a matter not of choice but of necessity. Nor did he see that the passion for equality, like every great passion, justified itself, and that the problem was, not how to obtain liberty in defiance of it, but how so to guide it as to obtain liberty by it and through it.

Burke did not content himself with pointing out speculatively the evils which he foreboded for the French. He perceived clearly that the effect of the new French principles could no more be confined to French territory than the principles of Protestantism in the 16th century could be confined to Saxony. He knew well that the appeal to abstract reason and the hatred of aristocracy would spread over Europe like a flood, and, as he was in the habit of considering whatever was most opposed to the object of his dislike to be wholly excellent, he called for a crusade of all established governments against the anarchical principles of dissolution which had broken loose in France.

Burke was the most thorough-going of the clerical and propria group apart from either Fox or Burke. He had neither Fox's sympathy for popular movements, nor Burke's intellectual appreciation of the immediate tendencies of the Revolution. Hence, whilst he pronounced against any active interference with France, he was an advocate of peace, not because he saw more than Fox or Burke, but because he saw less. He fancied that France would be so totally occupied with its own troubles that it would cease for a long time to be dangerous to other nations.

This view was soon to be justified by the effect of the coalition against France in 1792 of Prussia and Austria. The proclamation of the allies calling on the French to restore the royal authority was answered by a passionate outburst of irreducible defiance. The king himself was suspected of complicity with the invaders of his country, and the rising of the 10th of August was followed by the proclamation of the republic and by the awful "September massacres" of helpless prisoners, guilt of no crime but noble birth, and therefore presumably of attachment to the old régime, and treason towards the new. This passionate attachment to the Revolution, which in France displayed itself in a carnival of insane suspicion and cruelty, inspired on the frontiers an astonishing patriotic resistance. Before the end of the year the invasion was repulsed, and the ragged armies of the Revolution had overrun Savoy and the ancient territories of the various Netherlands, and were threatening the aristocratic Dutch republic.

Very few governments in Europe were so rooted in the affections of their people as to be able to look without terror on the challenge thus thrown out to them. The English government was one of those very few. No mere despotism was here exercised by the king. No broad impassable line here divided
the aristocracy from the people. The work of former generations of Englishmen had been too well done to call for that breach of historical continuity which was a dire necessity in France. There was much need of reform. There was no need of a revolution. The whole of the upper and middle classes, with few exceptions, clung together in a fierce spirit of resistance; and the mass of the lower classes, especially in the country, were too well off to wish for change. The spirit of resistance to revolution quickly developed into a spirit of resistance to reform, and those who continued to advocate changes, more or less after the French model, were treated as the enemies of mankind. A fierce hatred of France and of all that attached itself to France became the predominating spirit of the nation.

Such a change in the national mind could not but affect the constitution of the Whig party. The reasoning of Burke would, in itself, have done little to effect its disruption. But the great landowners, who contributed so strong an element in it, composed the very class which had most to fear from the principles of the Revolution. The old questions which had divided them from the king and Pitt in 1783 had dwindled into nothing before the appalling question of the immediate present. They were now the principal members of the war party, and they knew that that party comprised almost the whole of the parliamentary classes.

What could Pitt do but surrender? The whole of the intellectual basis of his foreign policy was swept away when it became evident that the continental war would bring with it an accession of French territory. He did not abandon his opinions. His opinions rather abandoned him. A wiser intelligence might have held that, let France gain what territorial aggrandizement it might upon the continent of Europe, it was impossible to resist such changes until the opponents of France had so purified themselves as to obtain a hold upon the minds of men.

Pitt could not take this view; perhaps no man in his day could be fairly expected to take it. He did not indeed declare war against France; but he sought to set a limit to her conquests in the winter, though he had not sought to set a limit to the conquests of the allied sovereigns in the preceding summer. He treated with supercilious contempt the National Convention, which had dethroned the king and proclaimed a republic. Above all, he took up a declaration by the Convention, that they would give help to all peoples struggling for liberty against their respective governments, as a challenge to England. The horror caused in England by the trial and execution of Louis XVI. completed the separation between the two countries, and though the declaration of war came from France (1793), it had been in great part brought about by the bearing of England and its government.

(S. R. G.)

XI. The Revolutionary Epoch, the Reaction, and the Triumph of Reform (1793-1797)

In appearance the great Whig landowners gave their support to Pitt, and in 1794 some of their leaders, the duke of Portland, Lord Fitzwilliam, and Windham, entered the cabinet to serve under him. In reality it was Pitt who had surrendered. The ministry and the party by which it was supported might call themselves Tory still; but the great reforming policy of 1784 was at an end, and the government, unconscious of its own strength, conceived its main function to be at all costs to preserve the constitution, which it believed to be in danger of being overwhelmed by the rising tide of revolutionary feeling. That this belief was idle it is now easy enough to see; at the time this was not so obvious. Thomas Paine's Rights of Man, published in 1791, a brilliant and bitter attack on the British constitution from the Jacobin point of view, sold by tens of thousands. Revolutionary tracts and high-sounding names were established, of which the most conspicuous were the Revolution Society, the Society for Constitutional Information, the London Corresponding Society, and the Friends of the People. Of these, indeed, only the two last were directly due to the example of France. The Revolution Society, founded to commemorate the revolution of 1688, had long carried on a respectable existence under the patronage of cabinet ministers; the Society for Constitutional Information, of which Pitt himself had been a member, was founded in 1780 to advocate parliamentary reform; both had, however, developed under the influence of the events in France in a revolutionary direction. The London Corresponding Society, composed mainly of working-men, was the direct outcome of the excitement caused by the developments of the French Revolution. Its leaders were obscure and usually illiterate men, who delighted to propound their theories for the universal reformation of society and the state in rhetoric of which the characteristic phrases were borrowed from the tribune of the Jacobin Club. Later generations have learned by repeated experience that the eloquence of Hyde Park orators is not the voice of England; there were some even then—among those not immediately responsible for keeping order—who urged the government "to trust the people," but with the object-lesson of France before them it is not altogether surprising that ministers refused to believe in the harmlessness of societies, which not only kept up a frequent correspondence with the National Convention of France, but, by attempting to establish throughout the country a network of affiliated clubs, were apparently aiming at setting up in Great Britain the Jacobin idea of popular control.

The danger, of course, was absurdly exaggerated; as indeed was proved by the very popularity of the repressive measures to which the government thought it necessary to resort, and which gave to the vapourings of a few knots of agitators the dignity of a widespread conspiracy for the overthrow of the constitution. On the 1st of December 1792 a proclamation was issued calling out the militia on the ground that a dangerous and insurmountable disorder had been excited by evil-disposed persons, acting in concert with persons in foreign parts, and this statement was repeated in the king's speech at the opening of parliament on the 13th. In spite of the protests of Sheridan and other members of the opposition, a campaign of press and other prosecutions now began which threatened to extinguish the most cherished right of Englishmen—liberty of speech. The country was flooded with government spies and informers, whose efforts were seconded by such voluntary societies as the Association for preserving Liberty and Property against Republicans and Levellers, founded by John Reeves, the historian of English law. No one was safe from these zealous and too often credulous defenders of the established order; and a few indelicate words spoken in a coffee house were enough to bring imprisonment and ruin, as in the case of John Frost, a respectable attorney, condemned for sedition in March 1793. In Scotland the panic, and the consequent cruelty, were worse than in England. The meeting at Edinburgh of a "convention of delegates of the associated friends of the people," at which some foolish and exaggerated language was used, was followed by the trial of Thomas Muir, a talented young advocate whose brilliant defence did not save him from a sentence of fourteen years' transportation (August 30, 1793), while seven years' transportation was the punishment of the Rev. T. Fyshe Palmer for circulating an address from "a society of the friends of liberty to their fellow-citizens" in favour of a reform of the House of Commons. These sentences and the proceedings which led up to them, though attacked with bitter eloquence by Sheridan and Fox, were confirmed by a large majority in parliament.

It was not, however, till late in the session of 1794 that ministers laid before parliament any evidence of seditionary practices. In May certain leaders of democratic societies were arrested and their papers seized, and on the 13th a king's message directed the books of certain corresponding societies to be laid before the House of Commons. The committee of the House of Commons at once reported that there was evidence of a conspiracy

1 The position of the Corresponding Society was greatly strengthened by the establishment of the Friends of the People by Erskine and Grey.
to supersede the House of Commons by a national convention, and Pitt proposed and carried a bill suspending the Habeas Corpus Act. This was followed by further reports of the Committees of Both Houses, the presenting of the secret manufacture of arms and of other proceedings calculated to endanger the public peace. A series of state prosecutions followed. The trials of Robert Watt and David Downie for high treason (August and September 1794) actually revealed a treasonable plot on the part of a few obscure individuals at Edinburgh, who were found in the possession of no less than fifty-seven pikes of home manufacture, wherewith to overthrow the British government. The execution of Watt gave to this trial a note of tragedy which was absent from that of certain members of the Corresponding Society, accused of conspiring to murder the king by means of a poisoned arrow shot from an air-gun. The ridicule that greeted the revelation of the "Pop-gun Plot" marked the beginning of a reaction that found a more serious expression in the trials of Thomas Hardy, John Horne Tooko and John Thelwall (October and November 1794). The prisoners were accused of high treason, their chief offence consisting in their attempt to assemble a general convention of the people, ostensibly for the purpose of obtaining parliamentary reform, but really—as the prosecution urged—for subverting the constitution. This latter charge, though proved to the satisfaction of the committees of Both Houses of Parliament, broke down under the cross-examination of the government witnesses by the counsel for the defence, and could indeed only have been substantiated by a dangerous stretching of the doctrine of constructive treason. Happily the jury refused to convict, and its verdict saved the nation from the disgrace of meting out the extreme penalty of high treason to an attempt to hold a public meeting for the redress of grievances.

The common sense of a British jury had preserved, in spite of parliament and ministry, that free right of meeting which was to be one of the strongest instruments of future reform. The government, however, saw little reason in the events of the following months for reviving their coercive policy. The year 1795 was one of great suffering and great popular unrest; for the effect of the war upon industry was now beginning to be felt, and the distress had been aggravated by two bad harvests. The sudden determination of those in power, who had hitherto advocated reform, to stereotype the existing system, closed the avenues of hope to those who had expected an improvement of their lot from constitutional changes, and the disaffected temper of the populace that resulted was taken advantage of by the London Corresponding Society, embodied by its triumph in the courts, to organize open and really dangerous demonstrations, such as the vast mass meeting at Copenhagen House on the 26th of October. On the 29th of October the king, on his way to open parliament, was attacked by an angry mob shouting, "Give us bread," "No Pitt," "No war," "No famine," and the glass panels of his state coach were smashed to pieces.

The result of these demonstrations was the introduction in the House of Lords, on the 4th of November, of the Treasonable Practices Bill, the main principle of which was that it modified the law of treason by dispensing with the necessity for the proof of an overt act in order to secure conviction; and in the House of Commons, on the 10th, of the Seditious Meetings Bill, which seriously limited the right of public meeting, making all meetings of over fifty persons, as well as all political debates and lectures, subject to the previous consent and active supervision of the magistrates. In spite of the strenuous resistance of the opposition, led by Fox, and of numerous meetings of public Gentlemen held outside the walls of parliament in protest against this legislation, it was carried, passed, and become law by an overwhelming majority.

The inevitable result followed. The London Corresponding Society and other political clubs, deprived of the right of public meeting, became secret societies pledged to the overthrow of the existing system by any means. United Englishmen and United Scotsmen plotted with United Irishmen for a French invasion, and sedition was foisted in the army and the navy. Their baneful activities were exposed in the inquiries that followed the Irish rebellion of 1798, and the result was the Corresponding Societies Bill, introduced by Pitt on the 19th of April 1799, which completed the series of repressive measures and practically suspended the popular constitution of England. The measure of public opinion, the free press, had alike ceased for the time to exist.

The justification of the government in all this was the life and death struggle in which Great Britain was engaged with the power of republican France in Europe. Yet Pitt's conduct of the war, so far as the continent was concerned, had hitherto led to nothing but failure after failure. In 1794, in spite of the presence of an English army under the duke of York, the Austrian Netherlands had been finally conquered and annexed to the French republic; in 1795 the Dutch republic was affiliated to that of France, and the peace of Basel between Prussia and the French republic left Austria to continue the war alone with the aid of British subsidies. On the sea Great Britain had been more successful, Howe's victory of the 1st of June 1794 being the first of the long series of defeats inflicted on the French navy, while in 1795 a beginning was made of the vast expansion of the British Empire by the capture of Ceylon and the Cape of Good Hope from the Dutch (see French Revolutionary Wars). The war, however, had become so expensive, and its results were evidently so small, that there was a growing feeling in England in favour of peace, especially as the Reign of Terror had come to an end in 1794, and a regular government, the Directory, had been appointed in 1795. At last Pitt was forced to yield to the popular clamour, and in the autumn Lord Malmesbury was sent to France to treat for peace. The negotiation, however, was at once broken off by his demand that France should abandon the Netherlands.

The French government, assured now of the assistance of Spain and Holland, and freed of the danger from La Vendée, now determined to attempt the invasion of Ireland. On the 16th of December a fleet of 17 battle-ships, 13 frigates and 15 smaller vessels set sail from Brest, carrying an expeditionary force of some 15,000 men under General Howe. The British fleet, under Lord Bridport, was wintering at Spithead, and before it could put to sea the French had slipped past. Before it reached the coast of Ireland, however, the French fleet had already suffered serious losses, owing partly to the attacks of British frigate detachments, partly to the bad seamanship of the French crews and the rotteness of the ships. Only a part of the fleet succeeded in reaching Bantry Bay on the 20th of December, and of these a large number were scattered by a storm on the 23rd. Howe himself, with the French admiral, had been driven far to the westward in an effort to avoid capture; the attempt of Grouchy, in his absence, to land a force was defeated by the weather, and by the end of the month the whole expedition was in full retreat for Brest. A French diversion on the coast of Pembroke was even less successful; a force of 1500 men, under Colonel Tate, an American adventurer, landed in Cardigan Bay on the 22nd of February 1797, but was at once surrounded by the local militia and surrendered without a blow.

A more serious attempt was now made to renew the enterprise by means of a junction of the French, Spanish and Dutch fleets. The victory of Jervis over the Spanish fleet at St Vincent on the 14th of February postponed the imminence of the danger; but this again became acute owing to the general disaffection in the fleet, which in April and May had been marked in the serious mutinies at Spithead and the Nore. The mutiny at Spithead, which was due solely to the intolerable conditions under which the seamen served at the time, was ended on the 1st of May after the mutineers had been promised an increase of pay, the removal of officers who had abused their power of discipline, and the promise of a general free pardon. More serious was the outbreak at the Nore. The disaffection had spread practically to the whole of Admiral Duncan's fleet, and by the beginning of June the mutineers were blockading the Thames with no less than 26 vessels. The demands of the seamen were more extensive than at Spithead; their resistance was better organized; and they were suspected, though without
reason, of harbouring revolutionary designs. The return of the Channel fleet to its duty emboldened the admiralty to refuse any concessions, and the vigorous measures of repression taken proved effective. One by one the mutinous crews surrendered; and the arrest of the ringleader, Richard Parker, on board the “Sandwich,” on the 14th of June, brought the affair to an end.

The seamen regained their reputation, and those who had been imprisoned their liberty, by Duncan’s victory over the Dutch fleet at Camperdown (October 11), by which the immediate danger was averted. Though the French attempt at a concerted invasion had failed, however, the Directory did not desist from the enterprise, and commissioned Bonaparte to draw up fresh plans.

At the close of the year 1797 the position of Great Britain was indeed sufficiently alarming. On the 18th of April, during the very crisis of the mutiny at Spithead, Austria had signed with Bonaparte the humiliating terms of the preliminary peace of Leoben, which six months later were embodied in the treaty of Campo Formio (October 17). On the 10th of August Portugal had concluded a treaty with the French Republic; and Great Britain was left without an ally in Europe. The mutiny at the Nore, the threat of rebellion in Ireland, the alarming fall in continental bargains, the mounting of the funds; by these Bonaparte was ready to hand, and in July Lord Malmesbury had been sent to Lille to open fresh negotiations with the pleni potentiaries of France. The negotiations broke down on the refusal of England to restore the Cape of Good Hope to the Dutch. But though forced, in spite of misgivings, to continue the struggle, the British government in one very important respect was now in a far better position to do so. For though Great Britain was now isolated and her policy in Europe advertised as a failure, the temper of the British people was less inclined to peace in 1798 than it had been three years before. The early enthusiasm of the disfranchised classes for French principles had cooled with the later developments of the Revolution; the attempted invasions had roused the national spirit; and in the public imagination the sinister figure of Bonaparte, the rapacious conqueror, was beginning to loom large to the exclusion of lesser issues. Henceforth, in spite of press prosecutions and trials for political libel, the government was supported by public opinion in its vigorous prosecution of the war.

If the danger of French invasion was a reality, it was so mainly owing to the deplorable condition of Ireland, where the natural disaffection of the Roman Catholic majority of the population—deprived of political and many social rights—was subjected to the insults and oppression of a Protestant minority corrupted by centuries of ascendancy—invited the intervention of a foreign enemy. The full measure of the intolerable conditions prevailing in the country was revealed by the horrors of the rebellion of 1798, and after this had been suppressed Pitt decided that the only way to deal with the situation was to establish a union between Great Britain and Ireland, similar to that which had proved so successful in the case of England and Scotland. He saw that to establish peace in Ireland the Roman Catholics would have to be enfranchised; he realized that to enfranchise them in a separated Ireland would be to subject the proud Protestant minority to an impossible domination, and to establish not peace but war. The Union, then, was in his view the necessary preliminary to Catholic emancipation, which was at the same time the reward held out to the majority of the Irish people for the surrender of their national quasi-independence. It was a bribe little likely to appeal to the Protestant minority which constituted the Irish parliament, and to them other inducements had to be offered if the scheme was to be carried through. These inducements were not all corrupt. Those members who stood out were, indeed, bought by a lavish distribution of money and coronets; but the advantages to Ireland which might reasonably be expected from the Union were many and obvious; and if all the promises held out by the promoters of the measure have even now not been realized, the fault is not theirs. The Act of Union was placed on the statute-book in 1800; Catholic emancipation was to have been accomplished in the following session, the first of the united parliament. But Pitt’s policy broke on the stubborn obstinacy of George III., who believed himself bound by his coronation oath to resist any concession to the enemies of the Established Church. The disadvantage of the possession of too strait a conscience in politics was never more disarmingly illustrated. To the Irish people it was the first breach of faith in connexion with the Union, and threw them into opposition to a settlement into which they believed themselves to have been driven under false pretences. Pitt, realizing this, had no option but to resign.

The resignation of the great minister who had so long held the reins of power coincided with a critical situation in Europe. The isolation of Bonaparte in Egypt, as the result of Nelson’s victory of the Nile (1798), had enabled the allies to recover some of the ground lost to France. But this had merely increased Bonaparte’s prestige, and on his return in 1799 he found no difficulty in making himself master of France by the coup d’état of the 18th Brumaire. The Bonaparte brothers followed (1800) and the peace of Lunéville, which not only once more isolated Great Britain, but raised up against her new enemies, to the list of whom she added by using her command of the sea to enforce the right of search in order to seize enemies’ goods in neutral vessels. Russia joined with Sweden and Denmark, all hitherto friendly powers, in resistance to this claim.

Such was the position when Addington became prime minister. He was a man of weak character and narrow intellect, whose main claim to succeed Pitt was that he shared to the full the Protestant prejudices of king and people.

Renewal of the war.

had of carrying out the spirit of the treaty, refused to abandon Malta, as she had engaged to do by the terms of peace. The war began again, no longer a war against revolutionary principles and their propaganda, but against the boundless ambitions of a military conqueror. This time the British nation was all but unanimous in resistance. This time its resistance would be sooner or later supported by all that was healthy in Europe. The news that Bonaparte was making preparations on a vast scale for the invasion of England roused a spirit of resistance in the country. Volunteers were enrolled, and the coast was dotted with Martello towers, many of which yet remain as monuments of the time when the “army of England” was camped on the heights near Boulogne within sight of the English cliffs. To meet so great a crisis Addington was not the man. He had been ceaselessly assailed, in and out of parliament, by the trenchant criticism, and often unmannerly wit, of “Pitt’s friends,” among whom George Canning was now conspicuous. Pitt himself had remained silent; but in view of the seriousness of the crisis and of a threatened illness of the king, which would have necessitated a regency—and in view of the prince of Wales’s dislike for him—the government was forced to admit permanent exclusion from office, he now put himself forward once more. The government majorities in the House now rapidly dwindled; on the 20th of April 1804, Addington resigned; and Pitt, after his attempt to form a national coalition ministry had broken

A vivid account of the mutiny and its causes is given in Captain Marryat’s King’s Own.
down on the king's refusal to admit Fox, became head of a government constructed on a narrow Tory basis. Of the members of the late government Lord Eldon, the duke of Portland, Lord Westmorland, Lord Castlereagh and Lord Hawkesbury retained office, the latter surrendering the signiture of Lord Harrowby and going to the home office. During now Lord Melville, born on navy's administration were ad of the admiralty, and the cabinet further included Lord Camden, Lord Mulgrave and the duke of Montrose. Canning, Huskisson and Perceval were given subordinate offices.

Save for the commanding personality of Pitt, the new government was scarcely stronger than that which it had replaced. It had to face the same Whig opposition, led by Fox, who scoffed at the French peril, and reinforced by Addington and his friends; and the whole burden of meeting this opposition fell upon Pitt; for Castlereagh, the only other member of the cabinet in the House of Commons, was of little use in debate. Nevertheless, fresh vigour was infused into the conduct of the war. The Additional Forces Act, passed in the teeth of a strenuous opposition, introduced the principle of a modified system of conscription to supplement the deficiencies of the army and reserve, while the navy was largely increased. Abroad, Pitt's whole energies were directed to forming a fresh coalition against Bonaparte, who, on the 14th of May 1804, had proclaimed himself emperor of the French; but it was a year before Russia signed with Great Britain the treaty of St Petersburg (April 11, 1805), and the accession to the coalition of Austria, Sweden and Naples was not obtained till the following September. In the following month (October 21) Nelson's crowning victory at Trafalgar over the allied fleets of France and Spain retrieved England of the dread of invasion. It served, however, to precipitate the crisis on the continent of Europe; the great army assembled at Boulogne was turned eastwards; by the capitulation of Ulm (October 19) Austria lost a large part of her forces; and the last news that reached Pitt on his death-bed was that of the ruin of all his hopes by the crushing victory of Napoleon over the Russians and Austrians at Austerlitz (December 2).

Pitt died on the 23rd of January, and the refusal of Lord Hawkesbury to assume the premiership forced the king to summon Lord Grenville, and to agree to the inclusion of Fox in the cabinet as secretary for foreign affairs. Several members of Pitt's administration were admitted to this "Ministry of all the Talents," including Addington (now Lord Sidmouth), who had rejoined the ministry in December 1804 and again resigned, owing to a disagreement with Pitt as to the charges against Lord Melville (q.v.) in July 1805. The new ministry remained in office for a year, a disastrous year which saw the culmination of Napoleon's power: the crushing of Prussia in the campaign of Jena, the formation of the Confederation of the Rhine and the end of the Holy Roman Empire. In the conduct of the war the British government had displayed little skill, frittering away its forces on distant expeditions, instead of concentrating them in support of Prussia or Russia, and the chief title to the "Ministry of all the Talents" is that it secured the passing of the bill for the abolition of the slave-trade (March 25, 1807).

The death of Fox (September 13, 1806) deprived the ministry of its strongest member, and in the following March it fell on the old question of concessions to the Roman Catholics. True to his principles, Fox had done his best to negotiate terms of peace with Napoleon; but the breakdown of the attempt had persuaded even the Whigs that an arrangement was impossible, and in view of this fact Grenville thought it his duty to advise the king that the disabilities of Roman Catholics and dissenters in the matter of serving in the army and navy should be removed, in order that the backbone of the nation might be united in face of the enemy. The situation, moreover, was in the highest degree anomalous; for by an act passed in 1703 Roman Catholics might hold commissions in the army in Ireland up to the rank of colonel, and this right had not been extended to England, though by the Act of Union the armies had become one. The king, however, was not to be moved from his position; and he was supported in this attitude not only by public opinion, but by a section of the ministry itself, of which Sidmouth made himself the mouthpiece. The demand of George III. that ministers should undertake never again to recommend to the king to negotiate with Napoleon was rejected by Grenville, rightly, as unconstitutional, and on the 8th of March 1807 he resigned.

The new ministry, under the nominal headship of the valutudinarian duke of Portland, included Perceval as chancellor of the exchequer, Canning as foreign secretary and Castlereagh as secretary for war and the colonies. It had given the undertaking demanded by the king; those of its members who, like Canning, were in favour of Catholic emancipation, arguing that, in view of greater and more pressing questions, it was useless to insist in a matter which could never be settled so long as the old king lived. Of more importance to Great Britain, for the time being, than any constitutional issues, was the life- and -death struggle with Napoleon, which had now entered on a new phase. Defeated at sea, but master now of the greater part of the continent of Europe, the French emperor planned to bring Great Britain to terms by ruining her commerce with the vast territories under his influence. In November 1806 he issued from Berlin the famous decree prohibiting the importation of British goods and excluding from the harbours under his control even neutral ships that had touched at British ports. The British government replied by the famous Orders in Council of 1807, which declared all vessels trading with France liable to seizure, and that all such vessels clearing from France must touch at a British port to pay customs duties. To this Napoleon responded with the Milan decree (December 17), forbidding neutrals to trade in any articles imported from the British dominions. The effects of these measures were destined to be far-reaching. The Revolution had made war on princes and privilege, and the common people had in general gained wherever the Napoleonic régime had been substituted for their effete despotisms; but the "Continental System" was felt as an oppression in every humble household, suddenly deprived of the little imported luxuries, such as sugar and coffee, which custom had made necessities, and from this time date the beginnings of that popular revolt against Napoleon that was to culminate in the War of Liberation. Great Britain, too, was to suffer from her own retaliatory policy. The Americans had taken advantage of the war to draw into their own hands a large part of the British carrying trade, a process greatly encouraged by the establishment of the Continental System. This brought them into conflict with the British acting under the Orders in Council, and the consequent ill-feeling culminated in the war of 1812.

It was not only the completion of the Continental System, however, that made the year 1807 a fateful one for Great Britain. On the 7th of July the young emperor Alexander I. of Russia, fascinated by Napoleon's genius and bribed by the offer of a partition of the world, concluded the treaty of Tilsit, which not only brought Russia into the Continental System, but substituted for a coalition against France a formidable coalition against England. A scheme for wrestling from the British the command of the sea was only defeated by Canning's action in ordering the English fleet to capture the Danish navy, though Denmark was still nominally a friendly power (see Canning, GEORGE). Meanwhile, in order to complete the ring fence round Europe against British commerce, Napoleon had ordered Junot to invade Portugal; Lisbon was occupied by the French, and the first of the royal family migrated to Brazil. In the following year Napoleon seized the royal family of Spain, and gave the crown, which Charles VI. resigned on behalf of himself and his heir, to his brother Joseph, king of Naples. The revolt of the Spanish people that followed was the first of
the national uprisings against his rule by which Napoleon was destined to be overthrown. In England it was greeted with immense popular enthusiasm, and the government, without realizing the full import of the step it was taking, sent an expedition to the Peninsula. It disembarked, under the command of Sir Arthur Wellesley, at Figueras on the 1st of August. It was the beginning of the Peninsular War, which was destined not to end until, in 1814, the British troops crossed the Pyrenees into France, while the Allies were pressing over the Rhine. The political and military events on the continent of Europe do not, however, belong strictly to English history, though they profoundly affected its development, and they are dealt with elsewhere (see Europe: History; Napoleon; Napoleonic Campaigns; Peninsular War; Waterloo Campaign).

The war, while it lasted, was of course the main preoccupation of British ministers and of the British people. It entailed enormous sacrifices, which led to corresponding discontent, and these, as its result, produced frequent friction within the government itself. A cabinet crisis was the result of the outcome of the unfortunate expedition of 1808, and Castlereagh’s conception of it, and had it been as well executed as it was conceived, it might have dealt a fatal blow to Napoleon’s hopes of recovering his power at sea, by destroying his great naval establishments at Antwerp. It failed, and it became the subject of angry dispute between Canning and Castlereagh, a dispute embittered by personal rivalry and the friction due to the ill-defined relations of the foreign secretary to the secretaries for war; the quarrel culminated in a duel, and in the resignation of both ministers (see LONDON, 2d Marquess of, and CANNING, George). The duke of Portland resigned at the same time, and in the reconstruction of the ministry, under Perceval as premier, Lord Wellesley became first secretary, while Lord Liverpool, with Palmerston as his under-secretary, succeeded Castlereagh at the war office.

The most conspicuous member of this government was Wellesley, whose main object in taking office was to second his brother’s efforts in the Peninsula. In this he was, however, only partially successful, owing to the incapacity of his colleagues to realize the unique importance of the operations in Spain. In November 1810 the old king’s mind gave way, and on the 11th of February 1811, an act of parliament bestowed the regency, under certain restrictions, upon the prince of Wales. The prince had been on intimate terms with the Whig leaders, and it was assumed that his accession to power would mean a change of government. He had, however, been offended by their attitude on the question of the restriction of his authority as regent, and he continued Perceval in office. However, the king’s insanity being proved incurable, the regency was definitively established (February 1812). Lord Wellesley took advantage of the reconstruction of the cabinet to resign a position in which he had not been given a free hand, and his post of foreign secretary was offered to Canning. Canning, however, refused to serve with Castlereagh as minister of war, and the latter received the foreign office, which he was to hold till his death in 1822. A month later, on the 11th of May, Perceval was assassinated in the lobby of the House of Commons, and Lord Liverpool became the head of a government that was to last till 1827.

The period covered by the Liverpool ministry was a fateful one in the history of Europe. The year 1812 saw Napoleon’s invasion of Russia, and the disastrous retreat from Moscow. In the following year Wellington’s victory at Vitoria signalled the ruin of the French cause in Spain; while Prussia threw off the yoke of France, and Austria, realizing after cautious delay her chance of retrieving the humiliations of 1809, joined the Alliance, and in concert with Russia and the other German powers overthrew Napoleon at Leipzig. The invasion of France followed in 1814, the abdication of Napoleon, the restoration of the Bourbons and the assembling of the congress of Vienna. The following year saw the return of Napoleon from Elba, the close of the congress of Vienna, and the campaign that ended with the battle of Waterloo. The succeeding period, after so much storm and stress, might seem dull and unprofitable; but it witnessed the instructive experiment of the government of Europe by a concert of the great powers, and the first victory of the new principle of nationality in the insurrection of the Greeks. The share taken by Great Britain in all this, for which Castlereagh pre-eminently must take the praise or blame, is outlined in the article on the history of Europe (q.v.). Here it must suffice to point out how closely the development of foreign affairs was intertwined with that of home politics. The great war, so long as it lasted, was the supreme affair of moment; the supreme interest when it was over was to prevent its recurrence. For above all the world needed peace, in order to recover from the exhaustion of the revolutionary epoch; and this peace, bought at so great a cost, could be preserved only by the honest co-operation of Great Britain in the great international alliance based on “the treaties.” This explains Castlereagh’s policy at home and abroad. He was grossly attacked by the Opposition in parliament and by irresponsible criticism from the outside; but he never lost his mind in the atmosphere of mid-Victorian Liberalism, has re-established his authority under the cry against him and the government of which he was the most distinguished member; but history has largely justified his attitude. He was no friend of arbitrary government; but he judged it better that “oppressed nationalities” and “persecuted Liberals” should suffer than that Europe should be again plunged into war. He was hated in his day as the arch-opponent of reform, yet the triumph of the reform movement would have been impossible but for the peace his policy secured.

To say this is not to say that the attitude of the Tory government towards the great issues of home politics was wholly, or even mainly, inspired by a faith in peaceful wisdom. It had departed widely from the Toryism of Pitt’s younger years, which had sought to base itself on popular support, as opposed to the aristocratic exclusiveness of the Whigs. It conceived itself as the trustee of a system of government which, however theoretically imperfect, alone of the governments of Europe had survived the storms of the Revolution intact. To tamper with a constitution that had so proved its quality seemed not so much a sacrilege as a folly. The rigid conservatism that resulted from this attitude served, indeed, a useful purpose in giving weight to Castlereagh’s opponents in the Evelyn coalition, and in preventing Parliament from being occupied with “propping up mouldering institutions,” which could not have worked harmoniously with a minister suspected of an itch for reform. At home, however, it undoubtedly tended to provoke that very revolution which it was intended to prevent. This was due not so much to the notorious corruption of the representative system as to the fact that it represented social and economic conditions that were rapidly passing away.

Both Houses of Parliament were in the main assemblies of aristocrats and landowners; but agriculture was ceasing to be the characteristic industry of the country and the concentrated agricultural relationships were breaking up through rapid dissolution. The invention of machinery and the concentration of the working population in manufacturing centres had all but destroyed the old village industries, and great populations were growing up outside the traditional restraints of the old system of class dependence. The distress inevitable in connexion with such an industrial revolution was increased by the immense burden of the war and by the high protective policy of the parliament, which restricted trade and deliberately increased the price of food in the interests of the agricultural classes. Between 1811 and 1814 bands of so-called “Luddites,” starving operatives out of work, roamed the country, smashing machines—the immediate cause of their misfortunes—and committing every sort of outrage. The fault of the government lay, not in taking vigorous measures for the suppression of these disorders, but in remaining obstinately blind to the true causes that had produced them.
Ministers saw in the Luddite organization only another conspiracy against the state; and, so far from seeking means for removing the grievances that underlay popular disaffection, the activity of parliament, inspired by the narrowest class interests, only tended to increase them. The price of food, already raised by the war, was still further increased by successive Corn Laws, and the artificial value thus given to arable land led to the passing of Enclosure Bills, under which the country people were deprived of their common rights with very inadequate compensation, and life in the village communities was made more and more difficult. In the circumstances it is not surprising that the spirit of unrest grew apace. In 1815 the passing of a new Corn Law, forbidding the importation of corn so long as the price for home-grown wheat was under 8s. the quarter, led to riots in London. An attack made on the prince regent at the opening of parliament on the 28th of January 1817 led to an inquiry, which revealed the existence of an elaborate organization for the overthrow of the existing order. The repressive measures of 1793 and 1799 were now revived and extended, and a bill suspending the Habeas Corpus Act for a year was passed through both Houses by a large majority.

On the 27th of March Lord Sidmouth opened the government campaign against the press by issuing a circular to the lords-lieutenants, directing them to instruct the justices of the peace to issue warrants for the arrest of any person charged on oath with publishing blasphemous or seditious libels. The legality of this suggestion was more than doubtful, but it was none the less acted on, and a series of press prosecutions followed, some—as in the case of the bookseller William Hone—on grounds so trivial that juries refused to convict. William Cobbett, the most influential of the reform leaders, in order to avoid arbitrary imprisonment, “deprived of pen, ink and paper,” suspended the Political Register and sailed for America. A disturbance that was almost an armed insurrection, which broke out in Derbyshire in June of this year, seemed to justify the severity of the government; it was suppressed without great difficulty, and three of the ringleaders were sentenced to death. It was, however, in 1819 that the conflict between the government and the new popular forces culminated. Distress was acute; and in the manufacturing towns mass meetings were held to discuss a remedy, which, under the guidance of political agitators, was discovered in universal suffrage and annual parliaments. The right to return members to parliament was claimed for all communities; and since this right was unconstitutionally withheld, unrepresented towns were invited to exercise it in anticipation of its formal concession. At Birmingham, accordingly, Sir Charles Wollasey was duly elected "legislatorial attorney and representative" of the town. Manchester followed suit; but the meeting arranged for the 7th of August was declared illegal by the magistrates, on the strength of a royal proclamation against seditious meetings issued on the 30th of July. Another meeting was accordingly summoned for the undoubtedly legal purpose of petitioning parliament in favour of reform. On the appointed day (August 16) thousands poured in from the surrounding districts. These men had been previously drilled, for the purpose, as their own leaders asserted, of enabling the vast assemblage to be conducted in an orderly manner; for the purpose, as the magistrates suspected, of preparing them for an armed insurrection. An attempt was made by a party of yeomanry to arrest a popular agitator, Henry Hunt; the angry mob surged round the horsemen, who found themselves powerless; the Riot Act was read, and the 15th of the month drawn swords. The meeting rapidly broke up, but not before six had been killed and many injured. The “Manchester Massacre” gave an immense impetus to the movement in favour of reform. The employment of soldiers to suppress liberty of speech stirred up the resentment of Englishmen as nothing else could have done, and this resentment was increased by the conviction that the government was engaged with the "Holy Alliance" in an unholy conspiracy against liberty everywhere. The true tendency of Castlereagh’s foreign policy was not understood, nor had he any of the popular arts which would have enabled Canning to carry public opinion with him in cases where a frank explanation was impossible. The Liberals could see no more than that he appeared to be committed to international engagements, the logical outcome of which might be—as an orator of the Opposition put it—that Cossacks would be encamped in Hyde Park for the purpose of overawing the House of Commons.

The dangerous agitation that gave expression to this state of feeling was met by the government in the session of November 1819 by the passing of the famous Six Acts. The first of these deprived the defendant of the right of traversing the country in the course of a trial; the second directed that he should be brought to trial within a year; the second increased the penalties for seditions libel; the third imposed the newspaper stamp duty on all pamphlets and the like containing news; the fourth (Seditious Meetings Act) once more greatly curtailed the liberty of public meetings; the fifth forbade the training of persons in the use of arms; the sixth empowered magistrates to search for and seize arms.

The apparent necessity for the passing of these exceptional measures was increased by the imminent death of the old king, the tragic close of whose long reign had won for him a measure of popular sympathy which was wholly unmerited in the case of the prince regent. On the 23rd of February 1820 George III died, and the regent became king as George IV. This was the signal for an outburst of popular discontent with the existing order of a far more ominous character than any that had preceded it. The king was generally loathed, not so much for his vices—which would have been, in this case as in others, condoned in a more popular monarch—but for the notorious meanness and selfishness of his character. Of these qualities he took the occasion of his accession to make a fresh display. He had long been separated from his wife, Caroline of Brunswick; he now refused her the title of queen consort, forbade the mention of her name in the liturgy, and persuaded the government to promote an inquiry in parliament into her conduct, with a view to a divorce. Whatever grounds there may have been for this action, popular sympathy was wholly with Queen Caroline, who became the centre round which all the forces of discontent rallied. The failure of the Bill of Pains and Penalties against the queen, which was dropped after it had passed its third reading in the Lords by a majority of only seven, was greeted as a great popular triumph. The part played by the government in this unsavoury affair had discredited them even in the eyes of the classes whose fear of revolution had hitherto made them supporters of the established system; and the movement for reform received a new stimulus.

The Tory government itself realized the necessity for some concessions to the growing public sentiment. In 1832 a small advance was made. The reform bill (equal electoral districts) introduced by Lambton (afterwards Lord Durham) was thrown out; but the corrupt borough of Grampound in Cornwall was disfranchised and the seats transferred to the county of York. Even more significant was the change in the cabinet, which was strengthened by the admission of some of the more conservative section of the Opposition, Lord Sidmouth retiring and Robert Peel becoming home secretary. A bill for the removal of Catholic disabilities, too, was carried in the Commons, though rejected in the Lords; and the appointment of Lord Wellesley, an advocate of the Catholic claims, to the lord-lieutenancy of Ireland marked yet another stage in the settlement of a question which till then involved anything else at that time, kept Ireland and Irishmen in a state of chronic discontent and agitation.

It is not without significance that this modification of the policy of the Tory government at home coincided with a modification of its relations with the European powers. The tendency of Metternich’s system had long been growing distasteful to Castlereagh, who had consistently protested against the attempt to constitute the Grand Alliance general police of Europe and
had specially protested against the Carlsbad Decrees (q.v.). The first steps towards the inevitable breach with the reactionary powers had already been taken before Castlereagh's tragic death on the eve of the congress of Verona brought George Canning into office as the executor of his policy. With Canning, foe of the Revolution and all its works though he was, the old liberal Toryism of Pitt's younger days seemed once more to emerge. It might have emerged in any case; but Canning, with his brilliant popular gifts and his frank appeal to popular support, gave it a revivingly stimulus which it would never have received from an aristocrat of the type of Castlereagh.

The new spirit was most conspicuous in foreign affairs; in the protest of Great Britain against the action of the continental powers at Verona (see Verona, Congress of), in the recognition of the South American republics, and later in the sympathetic attitude of the government towards the insurrection in Greece. This policy had been foreshadowed in the instructions drawn up by Castlereagh for his own guidance at Verona; but Canning succeeded in giving it a popular and national colour and thus removing from the government of necessity an aspect of sympathy, after which it was to be one of the "Holy Alliance." In home affairs, too, the government made tentative advances in a Liberal direction. In January 1826 Vansittart was succeeded as chancellor of the exchequer by Robinson (afterwards Lord Goderich), and Huskisson became president of the Board of Trade. The term of office of the latter was marked by the first tentative efforts to modify the high protective system by which British trade was hampered, especially by the Reciprocity of Duties Act (1823), a modification of the Navigation Acts, by which British and foreign shipping were placed on an equal footing, while the right to impose restrictive duties on ships of powers refusing reciprocal treatment was retained. In spite, however, of the improvement in trade that ultimately resulted from these measures, there was great depression; in 1825 there was a financial crisis that caused widespread ruin, and in 1826 the misery of the labouring poor led to renewed riots and machinery smashing. It became increasingly clear that a drastic alteration in the existing system was absolutely inevitable. As to this necessity, however, the ministry was in fact hopelessly divided. The government was one of compromise, in which even so burning a question as Catholic emancipation had been left open. Among its members were some—like the lord chancellor Eldon, the duke of Wellington, and, the premier, Lord Liverpool, himself—whose Toryism was of the type crystallized under the influence of the Revolution, adamant against change. Such progressive measures as it had passed had been passed in the teeth of its own nominal supporters, even of its own members. In 1826 Lord Palmerston, himself a member of the government, wrote: "On the Catholic question, on the principles of commerce, on the corn laws, on the settlement of the currency, on the laws relating to trade in money, on colonial slavery, on the game laws . . . on all these questions, and everything like them, the government will find support from the Whigs and resistance from their self-denominated friends." In 1828, in the critical period of Liverpool that held the ministry together, and when, on the 17th of February 1827, he was seized with an apoplectic fit, a crisis was inevitable.

The crisis, indeed, arose before the nominal expiration of the Liverpool administration. Two questions were, in the view of Canning and his supporters, of supreme importance—Catholic emancipation and the reform of the Corn Laws. The first of these had assumed a new urgency since the formation in 1823 of the Catholic Association, which under the brilliant leadership of Daniel O'Connell established in Ireland a national organization that threatened the very basis of the government. In March 1826 Sir Francis Burdett had brought in a Catholic Relief Bill, which, passed in the Commons, was thrown out by the Lords. A year later Burdett's motion that the affairs of Ireland required immediate attention, though supported by Canning, was rejected in the Commons. A bill modifying the Corn Laws, introduced by Canning and Huskisson, passed the House of Commons on the 12th of April 1827, but was rejected by the Lords.

Meanwhile (April 10) Canning had become prime minister, his appointment being followed by the resignation of all the most conspicuous members of the Liverpool administration: Wellington, Eldon, Melville, Bathurst, Westmorland and Peel, the latter of whom resigned on account of his opposition to Catholic emancipation. The new government had perforce to rely on the Whigs, who took their seats in the government ministry of the House, Lord Landsdowne being included in the cabinet. Before this coalition could be completed, however, Canning died (August 8). The short-lived Goderich administration followed; and in January 1828 the king, weary of the effort to arrange a coalition, summoned the duke of Wellington to office as head of a purely Tory cabinet. Yet the logic of facts was too strong even for the stubborn spirit of the Iron Duke. In May 1828, on the initiative of Lord John Russell, the Test and Corporation Acts were repealed; in the same session a Corn Bill, differing but little from that which Wellington had hitherto opposed, was passed; and finally, after a tremendous agitation which culminated in the election of O'Connell for Clare, and in spite of the obstinate resistance of King George IV., the Catholic Emancipation Bill was passed (April 10, 1829) by a large majority. On the 26th of June 1830 the king died, exactly a month before the outbreak of the revolution in Paris that hurled Charles X. from the throne and led to the establishment of the Liberal Monarchy under Louis Philippe; a revolution that was to exert a strong influence on the movement for reform in England.

King William IV. ascended the throne at a critical moment in the history of the English constitution. Everywhere misery and discontent were apparent, manifesting themselves in riots against machinery, in rick-burning on a large scale, and in the formation of trades unions which tended to develop into organized armies of sedition. All the elements of violent revolution were present. Nor was there anything in the character of the new king greatly calculated to restore the damaged prestige of the crown; for, if he lacked the evil qualities that had caused George IV. to be loathed as well as despised, he lacked also the sense of personal dignity that had been the saving grace of George, while he shared the conservative and Protestant prejudices of his predecessors. Reform was now inevitable. The Wellington ministry, hated by the Liberals, denounced even by the Tories as traitorous for the few concessions made, resigned on the 16th of November; and the Whigs at last came into office under Lord Grey, the ministry also including a few of the more Liberal Tories. Lord Durham, perhaps the most influential leader of the reform movement, became privy seal, Althorp chancellor of the exchequer, Palmerston foreign secretary, Goderich colonial secretary. Lord John Russell, as paymaster-general, and Stanley (afterwards Lord Derby), as secretary for Ireland, held important places. The Wellington ministry, however, the government was powerless to effect its purpose. Though it succeeded in carrying the second reading of the Reform Bill (March 21, 1831), it was defeated in committee, and appealed to the country. The result was a great governmental majority, and the bill passed the Commons in September. Its rejection by the Lords on the 8th of October was the signal for dangerous rioting; and in spite of the opposition of the king, the bill was once more passed by the Commons (December 12). A violent agitation marked the recess. On the 14th of April 1832 the bill was read a second time in the Lords, but on the 7th of May was again rejected, whereupon the government resigned. The attempt of Wellington, at the king's instance, to form a ministry failed; all of the Tory obstructionists he alone had the courage to face the popular rage. On the 15th Lord Grey was in office again; the demand was made for a sufficient creation of peers to swap
the House of Lords; the king, now thoroughly alarmed, used his influence to persuade the peers to yield, and on the 4th of June the great Reform Bill became law. Thus was England spared the crisis of a bloody revolution, and proof given to the world that her ancient constitution was sufficiently elastic to expand with the needs of the times.

The effect of the Reform Bill, which abolished fifty-six “rotten” boroughs, and by reducing the representation of others set free 143 seats, which were in part conferred on the new industrial centres, was to transfer a large share of political power from the landed aristocracy to the middle classes. Yet the opposition of the Tories had not been wholly inspired by the desire to maintain the political predominance of a class. Canning, who had the best reason for knowing, defended the unreformed system on the ground that its very anomalies opened a variety of paths by which talent could make its way into parliament, and that produced an assembly far more widely representative than could be expected from a more uniform and logical system. This argument, which the effect of progressive extensions of the franchise on the intellectual level of parliament has certainly not tended to weaken, was however far outweighed—as Canning himself would have come to see—by the advantage of reconciling with the old constitution the new forces which were destined during the century to transform the social organization of the country. Nor, in spite of the drastic character of the Reform Bill, did it in effect constitute a revolution. The 143 seats set free were divided equally between the towns and the counties; and in the counties the landowning aristocracy was still supreme. In the towns however the new 50 household franchise secured a democratic constituency; in the counties the inclusion of tenants at will (of £50 annual rent), as well as of copyholders and leaseholders, only tended to increase the influence of the landlords. There was as yet no secret ballot to set the voter free.

The result was apparent in the course of the next few years. The first reformed parliament, which met on the 20th of January 1833, consisted in the main of Whigs, with a sprinkling of Radicals and a compact body of Liberal Tories under Sir Robert Peel. Its great work was the act emancipating the slaves in the British colonies (August 30). Other burning questions were the condition of Ireland, the scandal of the established church there, the misery of the poor in England. In all these matters the House showed little enough of the revolutionary temper; so little, indeed, that in March Lord Durham resigned. To the Whig leaders the church was all but sacrosanct as to the Tories, the very foundation of the constitution, not to be touched save at imminent risk to the state; the most they would adventure was to remedy a few of the more glaring abuses of an establishment imposed on an unwilling population. As for O’Connell’s agitation for the repeal of the Union, that met with but scant sympathy in parliament; on the 27th of May 1834 his repeal motion was rejected by a large majority.

The Melbourne ministry. In July the Grey ministry resigned, and on the 16th Lord Melbourne became prime minister. His short tenure of office is memorable for the passing of the bill for the reform of the Poor Law (August). The reckless system of outdoor relief, which had pauperized whole neighbourhoods, was abolished, and the system of unions and workhouses established (see Poor Law). An attempt to divert some of the revenues of the Irish Church led in the autumn to serious differences of opinion in the cabinet; the king, as tenacious as his father of the exact obligations of his coronation oath, dismissed the ministry, and called the Tories to office under Sir Robert Peel and the duke of Wellington. Thus, within three years of the passing of the Reform Bill, the party which had most strenuously opposed it was again in office. Scarcely less striking testimony to the constitutional temper of the English was given by the new attitude of the party under the new conditions. In the “Tammany Manifesto” of January 1835 Peel proclaimed the principles which were henceforth to guide the party, no longer Tory, but “Conservative.” The Reform Bill and its consequences were frankly accepted; further reforms were promised, especially in the matter of the municipal corporations and of the disabilities of the dissenters. The new parliament, however, which met on the 10th of February, was not favourable to the ministry, which fell on the 8th of April. Lord Melbourne once more came into office, and the Municipal Corporations Act of the 17th of September was the work of a Liberal government. This was the last measure of first-rate importance passed before the death of King William, which occurred on the 20th of June 1837.

It is impossible to exaggerate the importance, not only for England but for the world at large, of the epoch which culminated in the passing of the Reform Bill of 1832. All Europe, whether Liberal or reactionary, was watching the constitutional struggle with strained attention; the principles of monarchy and of constitutional liberty were alike at stake. To foreign observers it seemed impossible that the British monarchy could survive. Baron Brunnow, the Russian ambassador in London, sent home to the emperor Nicholas I. the most pessimistic reports. According to Brunnow, King William, by using his influence to secure the passage of the Reform Bill, had “cast his crown into the gutter”; the throne might endure for his lifetime, but the next heir was a young and inexperienced girl, and, even were the princess Victoria ever to mount the throne—which was unlikely—she would be speedily swept off it again by the rising tide of republicanism. The course of the next reign was destined speedily to convince even Nicholas I. of the baselessness of these fears, and to present to all Europe the exemplar of a progressive state, in which the principles of traditional authority and democratic liberty combined for the common good.

Queen Victoria’s accession. The death of William IV., on the 20th of June 1837, placed on the throne of England a young princess, who was destined to reign for a longer period than any of her predecessors. The new queen, the only daughter of the duke of Kent, the fourth son of George III., had just attained her majority. Educated in comparative seclusion, her character and her person were unfamiliar to her future subjects, who were a little weary of the extravagances and eccentricities of her immediate predecessors. Her accession gave them a new interest in the house of Hanover. And their loyalty, which would in any case have been excited by the accession of a young and inexperienced girl to the throne of the greatest empire in the world, was stimulated by her conduct and appearance. She displayed from the first a dignity and good sense which won the affection of the multitude who merely saw her in public, and the confidence of the advisers who were admitted into her presence.

The ministry experienced immediate benefit from the change. The Whigs, who had governed England since 1830, under Lord Grey and Lord Melbourne, were suffering from the reaction which is the inevitable consequence of revolution. The country which, in half-a-dozen years, had seen a radical reform of parliament, a no less radical reform of municipal corporations, the abolition of slavery, and the reconstruction of the poor laws, was longing for a period of political repose. The alliance, or understanding, between the Whigs and the Irish was increasing the distrust of the English people in the ministry, and Lord Melbourne’s government, in the first half of 1837, seemed doomed to perish. The accession of the queen gave it a new lease of power. The election, indeed, which followed her accession did not materially alter the composition of the House of Commons. But the popularity of the queen was extended to her government. Taper’s suggestion in Contingey that the Conservatives should go to the country with the cry, “Our young queen and our old institutions,” expressed, in an epigram, a prevalent idea. But the institution which derived most immediate benefit from the new sovereign was the old Whig ministry.

The difficulties of the ministry, nevertheless, were great. In the preceding years it had carried most of the reforms which were demanded in Great Britain; but it had failed to
obtain the assent of the House of Lords to its Irish measures. It had desired (1) to follow up the reform of English corporations by a corresponding reform of Irish municipalities; (2) to convert the tithes, payable to the Irish Church, into a rent charge, and to appropriate the proceeds to public purposes; (3) to deal with the chronic distress of the Irish people by extending to Ireland the principles of the English poor law. In the year which succeeded the accession of the queen it accomplished two of these objects. It passed an Irish poor law and a measure commuting tithes in Ireland into a rent charge. The first of these measures was carried in opposition to the views of the Irish, who thought that it imposed an intolerable burden on Irish property. The second was only carried on the government consenting to drop the appropriation clause, on which Lord Melbourne's administration had virtually been founded.

It was with two leaders of the Whig party alone that the ministry was harpered. In the months which immediately followed the queen's accession news reached England of disturbances, or even insurrection in Canada. The rising was easily put down; but the condition of the colony was so grave that the ministry decided to suspend the constitution of lower Canada for three years, and to send out Lord Durham with almost dictatorial powers. Lord Durham's conduct was, unfortunately, marked by indiscretions which led to his resignation; but before leaving the colony he drew up a report on its condition and on its future, which practically became a text-book for his successors, and has influenced the governments of other colonies ever since. Nor was Canada the only great colony which was seething with discontent. In Jamaica the planters, who had sullenly accepted the abolition of slavery, were irritated by the passage of an act of parliament intended to remedy some grave abuses in the management of the prisons of the island. The colonial House of Assembly denounced this act as a violation of its rights, and determined to desist from its legislative functions. The governor dissolved the assembly, but the new house, elected in its place, reaffirmed the decision of its predecessor; and the British ministry, in face of the crisis, asked parliament in 1839 for authority to suspend the constitution of the island for five years. The bill introduced for this purpose placed the Whig ministry in a position of some embarrassment. The advocates of popular government, they were inviting parliament, for a second time, to suspend representative institutions in an important colony. Supported by only small and dwindling majorities, they saw that it was hopeless to carry the measure, and they decided on placing their resignations in the queen's hands. The queen naturally sent for Sir Robert Peel, who undertook to form a government. In the course of the negotiations, however, he stated that it would be necessary to make certain changes in the household, which contained some great ladies closely connected with the old régime. The queen shrank from separating herself from ladies who had surrounded her since she came to the throne, and Sir Robert thereupon declined the task of forming a ministry. Technically he was justified in adopting this course, but people generally felt that there was some hardship in compelling a young queen to separate herself from her companions and friends, and they consequently approved the decision of Lord Melbourne to support the queen in her refusal, and to resume office. The Whigs returned to place, but they could not be said to return to power. They did not even venture to renew the original Jamaica Bill. They substituted for it a modified proposal, which they were unable to carry. They were obviously indebted for office to the favour of the queen, and not to the support of parliament.

Yet the session of 1839 was not without important results. After a long struggle, in which ministers narrowly escaped defeat in the Commons, and in the course of which they suffered severe rebuffs in the Lords, they succeeded in laying the foundation of the English system of national education. In the same session they were forced against their will to adopt a reform, which had been recommended by Rowland Hill, and to confer on the nation the benefit of a uniform penny postage. No member of the cabinet foresaw the consequences of this reform. The postmaster-general, Lord Lichfield, in opposing it, declared that, if the revenue of his office was to be maintained, the correspondence of the country, on which postage was mainly based, would increase from 42,000,000 to 450,000,000 letters a year, and he contended that there were neither people to write, nor machinery to deal with, so prodigious a mass of letters. He would have been astonished to hear that, before the end of the century, his office had to deal with more than 3,000,000,000 postal packets a year, and that the net profit which it paid into the exchequer was to be more than double what it received in 1839.

In 1840 the ministry was not much more successful than it had proved in 1839. After years of conflict it succeeded in placing on the statute book a measure dealing with education. The bill was attacked by Whigs and radicals; but its success was assured, if not by concessions to the Lords, which deprived the measure of much of its original merit. The closing years of the Whig administration were largely occupied with the financial difficulties of the country. The first three years of the queen's reign were memorable for a constantly deficient revenue. The deficit amounted to £1,400,000 in 1837, to £400,000 in 1838, and to £1,457,000 in 1839. Baring, the chancellor of the exchequer, endeavoured to terminate this deficiency by a general increase of taxation, but this device proved a disastrous failure. The deficit rose to £1,844,000 in 1840. It was obvious that the old reforming ministry had failed, and that some new method had to be substituted for it. This new method Baring tried to discover in altering the differential duties on timber and sugar, and substituting a fixed duty of 8s. per quarter for the sliding duties hitherto payable on wheat. By these alterations he expected to secure a large increase of revenue, and at the same time to maintain a sufficient degree of protection for colonial produce. The Conservatives, who believed in protection, at once attacked the proposed alteration of the sugar duties. They were reinforced by many Liberals, who cared very little for protection, but a great deal about the abolition of slavery, and consequently objected to reducing the duties on foreign or slave-grown sugar. This combination of interests proved too strong for Baring and his proposal was rejected. As ministers, however, did not resign on their defeat, Sir Robert Peel followed up his victory by moving a vote of want of confidence, and this motion was carried in an exceptionally full house by 312 votes to 311.

Before abandoning the struggle, the Whigs decided on appealing from the House of Commons to the country. The general election which ensued largely increased the strength of the Conservative party. On the meeting of the new parliament in August 1841, votes of want of confidence in the government were passed and carried in both houses; the Whigs were compelled to resign office, and the queen again charged Sir Robert Peel with the task of forming a government. If the queen had remained unmarried, it is possible that the friction which had arisen in 1839 might have recurred in 1841. In February 1840, however, Her Majesty had married her cousin, Prince Albert of Saxe-Coburg-Gotha. She was, therefore, no longer dependent on the Whig ladies, to whose presence in her court she had attached so much importance in 1839. By the management of the prince—who later in the reign was known as the prince consort—the great ladies of the household voluntarily tendered their resignations; and every obstacle to the formation of the new government was in this way removed. Thus the Whigs retired from the offices which, except for a brief interval in 1834-1835, they had held for eleven years. During the earlier years of their administration they had succeeded in carrying many memorable reforms: during the later years their weakness in the House of Commons had prevented their passing any considerable measures. But, if they had failed in this respect, Lord Melbourne had rendered conspicuous service to the queen. Enjoying her full confidence, consulted by her on every occasion, he had always used his influence for the public
good; and perhaps those who look back now with so much satisfaction at the queen's conduct during a reign of unexampled length, imperfectly appreciate the debt which in this respect is owed to her first prime minister. The closing years of the Whig government were marked by external complications. A controversy on the boundary of Canada and the United States was provoking increasing bitterness on both sides of the Atlantic. The intervention of Lord Palmerston in Syria, which resulted in a serious dispute at Washington, and the French & Indian War between France and England, while the unfortunate expedition to Afghanistan, which the Whigs had approved, was already producing embarrassment, and was about to result in disaster. Serious, however, as were the complications which surrounded British policy in Europe, in the East, and in America, the country, in August 1841, paid more attention to what a great writer called the "condition of England" question. There had never been a period in British history when distress and crime had been so general. There had hardly ever been a period when food had been so dear, when wages had been so low, when poverty had been so widespread, and the condition of the lower orders so depraved and so hopeless, as in the early years of the queen's reign. The condition of the people had prompted the formation of two great associations. The Chartists derived their name from the charter which set out their demands. The rejection of a monster petition which they presented to parliament in 1839 led to a formidable riot in Birmingham, and to a projected march from South Wales on London, in which twenty persons were shot dead at Newport. Another organization, in one sense even more formidable than the Chartist, was agitating at the same time for the repeal of the corn laws, and was known as the Anti-Corn Law League. It had already secured the services of two men, Cobden and Bright, who, one by clear reasoning, the other by fervid eloquence, were destined to make a profound impression on all classes of the people.

The new government had, therefore, to deal with a position of almost unexampled difficulty. The people were apparently sinking into deeper poverty and misery year after year. As an outward and visible sign of the inward distress, the state was no longer able to pay its way. It was estimated that the deficit, which had amounted to £1,842,000 in 1840, would reach £2,334,000 in 1841. It is the signal merit of Sir Robert Peel that he terminated this era of private distress and public deficits. He accomplished this task partly by economical administration—for no minister ever valued economy more—and partly by a reform of the financial system, effected in three great budgets. In the budget of 1842, Sir Robert Peel terminated the deficit by reviving the income tax. The proceeds of the tax, which was fixed at 7d. in the £, and was granted in the first instance for three years, were more than sufficient to secure this object. Sir Robert used the surplus to reform the whole customs tariff. The duties on raw materials, he proposed, should never exceed 5% of their value in articles of 1", and the duties on manufactured conditions 20% of their value. At the same time he reduced the duties on stage coaches, on foreign and colonial coffee, on foreign and colonial timber, and repealed the export duties on British manufactures. The success of this budget in stimulating consumption and in promoting industry prompted Sir Robert Boulton to propose an even more remarkable proposal. Instead of allowing the income tax to expire, he induced parliament to continue it for a further period, and with the resources which were thus placed at his disposal he purged the tariff of various small duties which produced little revenue, and had been imposed for purposes of protection. He swept away all the duties on British exports; he repealed the duties on glass, on cotton wool, and still further reduced the duties on foreign and colonial sugar. This budget was a much greater step towards free trade than the budget of 1842. The chief object in his third budget in 1846—the reduction of the duties on corn to 1s. a quarter—was necessitated by causes which will be immediately referred to. But it will be convenient at once to refer to its other features. Sir Robert Peel told the house that, in his previous budgets, he had given the manufacturers of the country free access to the raw materials which they used. He was entitled in return to call upon them to relinquish the protection which they enjoyed. He decided, therefore, to reduce the protective duties on cotton, woolen, silk, metal and other goods, as well as on raw materials still liable to heavy taxation, such as timber and tallow. As the policy of 1842 and 1843 had proved unquestionably successful in stimulating trade, he proposed to extend it to agriculture. He reduced the duties on farm produce, which the farmers used, such as seed and maize, and in return he called on them to give up the duties on cattle and meat, to reduce largely the duties on butter, cheese, and hops, and to diminish the duty on corn by gradual stages to 1s. a quarter. In making these changes Sir Robert Peel avowed that it was his object to make the country a cheap one to live in. There is no doubt that they were followed by a remarkable development of British trade. In the twenty-seven years from 1815 to 1842 the export trade of Great Britain diminished from £49,600,000 to £47,280,000; while in the twenty-seven years which succeeded 1842 it increased from £47,280,000 to nearly £150,000,000. These figures are a simple and enduring monument to the minister's memory. It is fair to add that the whole increase was not due to free trade; it was partly attributable to the remarkable development of communications which marked this period.

Two other financial measures of great importance were accomplished in Sir Robert Peel's ministry. In 1844 some £250,000,000 of the national debt still bore an interest of 3%. The improvement in the credit of the country enabled the government to reduce the interest on the stock to 3% for the succeeding ten years, and to 3% afterwards. This conversion, which effected an immediate saving of £655,000, and an ultimate saving of £1,250,000 a year, was by far the most important measure which has hitherto been applied to the debt; and no operation on the same scale was attempted for more than forty years. In the same year the necessity of renewing the charter of the Bank of England afforded Sir Robert Peel an opportunity of reforming the currency. He separated the issue department from the banking department of the bank, and decided that in future it should only be at liberty to issue notes against (1) the debt of £14,000,000 due to it from the government, and (2) any bullion actually in its coffers. Few measures of the past century have been the subject of more controversy than this famous act, and at one time its repeated suspension in periods of financial crises seemed to suggest the necessity of its amendment. But opinion on the whole has vindicated its wisdom, and it has survived all the attacks which have been made upon it.

The administration of Sir Robert Peel is also remarkable for its Irish policy. The Irish, under O'Connell, had constantly supported the Whig ministry of Lord Melbourne. But their alliance, or understanding, with the Whigs had not procured them all the results which they had expected from it. The two great Whig measures, dealing with the church and the municipalities, had only been passed after years of controversy, and in a shape which deprived them of many expected advantages. Hence arose a notion in Ireland that nothing was to be expected from a British parliament, and hence began a movement for the repeal of the union which had been so long in operation. The agitation which smouldered during the reign of the Whig ministry, was rapidly revived when Sir Robert Peel entered upon office. The Irish contributed large sums, which were known as repeal rent, to the cause, and they held monster meetings in various parts of Ireland to stimulate the demand for repeal. The ministry met this campaign by coercive legislation regulating the use of arms, by quartering large bodies of troops in Ireland, and by prohibiting a great meeting at Clontarf, the scene of Brian Boru's victory, in the immediate neighbourhood of Dublin. They further decided in 1843 to place O'Connell and some of the leading agitators on their trial for conspiracy and sedition. O'Connell was tried before a jury of twelve men, which was convicted on an indictment which contained many counts, and the court passed sentence without distinguishing between these counts.
These irregularities induced the House of Lords to reverse the judgment, and its refusal did much to prevent mischief. O'Connell's illness, which resulted in his death in 1847, tended also to establish peace. Sir Robert Peel was now stilled by a stilled agitation by making considerable concessions to Irish sentiment. He increased the grant which was made to the Roman Catholic College at Maynooth; he established three colleges in the north, south, and west of Ireland for the unde- 
nominal educational middle classes; he appointed a commission—the Devon commission, as it was called, from the name of the nobleman who presided over it—to investigate the conditions on which Irish land was held; and, after the report of the commission, he introduced, though he failed to carry, a measure for remedying some of the grievances of the Irish tenants. These concessions, though possibly having some effect in pacifying Ireland, if, in the autumn of 1845, they had not been forgotten in the presence of a disaster which suddenly fell on that unhappy country. The potato, which was the sole food of at least half the people of an overcrowded island, failed, and a famine of unprecedented proportions was obviously imminent. Sir Robert Peel, whose original views on protection had been rapidly yielding to the arguments afforded by the success of his own budgets, concluded that it was impossible to provide for the necessities of Ireland without suspending the corn laws; and that, if they were once suspended, it would be equally impossible to restore them. He failed, however, to convince two prominent ministers, the Home 

Free trade. 

minister—Lord Stanley and the duke of Bucleuch—that protection must be finally abandoned, and considering it hopeless to persevere with a disunited cabinet he resigned office. On Sir Robert's resignation the queen sent for Lord John Russell, who had led the Liberal party in the House of Commons with conspicuous ability for more than ten years, and charged him with the task of forming a new ministry. Differences, which it proved impossible to remove, between two prominent Whigs—Lord Palmerston and Lord Grey—made the task impracticable, and after an interval Sir Robert Peel consented to resume power. Sir Robert Peel was probably aware that his fall had been only postponed. In the four years and a half during which his ministry had lasted he had done much to estrange his party. They said, with some truth, that, whether his measures were right or wrong, they were opposed to the principles which he had been placed in power to support. The general election of 1841 had been mainly fought on the rival policies of protection and free trade. The country had decided for protection, and Sir R. Peel had done more than all his prede- 

ecessors to give it free trade. The Conservative party, moreover, was closely allied with the church, and Sir Robert had offended the church by giving an increased endowment to Maynooth, and by establishing undenominational colleges— "godless colleges" as they were called—in Ireland. The Conservatives were, therefore, sullenly discontented with the conduct of their leader. They were lashed into positive fury by the proposal which he was now making to abolish the corn laws. Lord George Bentinck, who, in his youth, had been private secretary to Canning, but who in his mature years had devoted more time to the turf than to politics, placed himself at their head. He was assisted by a remarkable man—Benjamin Disraeli—who joined great abilities to great ambition, and who, embittered by Sir Robert Peel's neglect to appoint him to office, had already displayed his animosity to the minister. The policy on which Sir Robert Peel resolved facilitated attack. For the minister thought it necessary, while providing against famine by repealing the corn laws, to ensure the preservation of order by a new coercion bill. The financial and the coercion bill were both pressed forward, and each gave opportunities for discussion and, what was then new in parliament, for obstruction. At last, on the very night on which the fiscal proposals of the ministers were accepted by the Lords, the coercion bill was defeated in the Commons by a combination of Whigs, radicals and protectionists; and Sir R. Peel, worn out with a protracted struggle, placed his resignation in the queen's hands. 

Thus fell the great minister, who perhaps had conferred more benefits on his country than any of his predecessors. The external policy of his ministry had been almost as remarkable as its domestic programme. When he accepted office the country was on the eve of a great disaster in India; it was engaged in a serious dispute with the United States; and its relations with France were so strained that the two great countries of western Europe seemed unlikely to be able to settle their differences without war. In the earlier years of his administration the disaster in Afghanistan was repaired in a successful campaign; and Lord Ellenborough, who was sent over to replace Lord Auckland as governor-general, increased the dominion and responsibilities of the East India Company by the unscrupulous but brilliant policy which led to the conquest of Sind. The disputes with the United States were satisfactorily composed; and not only were the differences with France terminated, but a perfect understanding was formed between the two countries, under which Guizot, the prime minister of France, and Lord Aberdeen, the foreign minister of England, agreed to compromise all minor questions for the sake of securing the paramount object of peace. The good understanding was so complete that a disagreeable incident in the Sandwich Islands, in which the injudicious conduct of a French agent very nearly precipitated hostilities, was amicably settled; and the ministry had the satisfaction of knowing that, if their policy had produced prosperity at home, it had also maintained peace abroad.

On Sir R. Peel's resignation the queen again sent for Lord John Russell. The difficulties which had prevented his forming a ministry in the previous year were satisfactorily arranged, and Lord Palmerston accepted the seals of the foreign office, while Lord Grey was sent to the colonial office. The history of the succeeding years was destined, however, to prove that Lord Grey had had solid reasons for objecting to Lord Palmerston's return to his old post; for, whatever judgment may ultimately be formed on Lord Palmerston's foreign policy, there can be little doubt that it did not tend to the maintenance of peace. The first occasion on which danger was threatened arose im- 

The Spanish marriages. 

mediately after the installation of the new ministry on the question of the Spanish marriages. The queen of Spain, Isabella, was a young girl still in her teens; the heir to the throne was her younger sister, the infanta Fernanda. Diplomacy had long been occupied with the marriages of these children; and Lord Aberdeen had virtually accepted the principle, which the French government had laid down, that a husband for the queen should be found among the descendants of Philip V., and that her sister's marriage to the duc de Montpensier—a son of Louis Philippe—should not be celebrated till the queen was married and had issue. While agreeing to this compromise, Lord Melbourne declared that he regarded the Spanish marriages as a Spanish, and not as a European question, and that, if it proved impossible to find a suitable consort for the queen among the descendants of Philip V., Spain must be free to choose a prince for her throne elsewhere. The available descendants of Philip V. were the two sons of Don Francis, the younger brother of Don Carlos, and of these the French government was in favour of the elder, while the British government preferred the younger brother. Lord Palmerston strongly objected to the prince whom the French government supported; and, almost immediately after acceding to office, he wrote a despatch in which he enumerated the various candi- 
dates for the queen of Spain's hand, including Prince Felix of Saxe-Coburg, a near relation of the prince consort, among the number. Louis Philippe regarded this despatch as a departure from the principle on which he had agreed with Lord Aberdeen, and at once hurried on the simultaneous marriages of the queen with the French candidate, and of her sister with the duc de Montpensier. His action broke up the entente cordiale which had been established between Guizot and Lord Aberdeen. 

The second occasion on which Lord Palmerston's vigorous diplomacy excited alarm arose out of the revolution which broke out almost universally in Europe in 1848. A rising in Hungary
was suppressed by Austria with Russian assistance, and after its suppression many leading Hungarians took refuge in Turkish territory. Austria and Russia addressed demands to the Porte for their surrender. Lord Palmerston determined to support the Porte in its refusal to give up these exiles, and actually sent the British fleet to the Dardanelles with this object. His success raised the credit of Great Britain and his own reputation. The French fleet in London, and at the Dardanelles suggested to him the possibility of settling another long-standing controversy. For years British subjects settled in Greece had raised complaints against the Greek government. In particular

Don Pacinco, a Jew, but a native of Gibraltar, complained that, at a riot, in which his house had been attacked, he had lost jewels, furniture and papers which he alleged to be worth more than £30,000. As Lord Palmerston was unable by correspondence to induce the Greek government to settle claims of this character, he determined to enforce them; and by his orders a large number of Greek vessels were seized and detained by the British fleet. The French government tendered its good offices to compose the dispute, and an arrangement was actually arrived at between Lord Palmerston and the French minister in London. Unfortunately, before its terms reached Greece, the British minister at Athens had ordered the resumption of hostilities, and had compelled the Greek government to submit to more humiliating conditions. News of this settlement excited the strongest feelings both in Paris and London. In Paris, Prince Louis Napoleon, who had acceded to the presidency of the French republic, decided on recalling his representative from the British court. In London the Lords passed a vote of censure on Lord Palmerston’s proceedings; and the Commons only sustained the minister by adopting a resolution approving in general terms the principles on which the foreign policy of the country had been conducted.

In pursuing the vigorous policy which characterized his tenure of the foreign office, Lord Palmerston frequently omitted to consult his colleagues in the cabinet, the prime minister, or the queen. In the course of 1849 Her Majesty formally complained to Lord John Russell that important despatches were sent off without her knowledge; and an arrangement was made under which Lord Palmerston undertook to submit every despatch to the queen through the prime minister. In 1850, after the Don Pacinco debate, the queen repeated these commands in a much stronger memorandum. Palmerston, however, disregarded all communication between himself and the court was destroyed, continued in office. In the autumn of 1851 the queen was much annoyed at hearing that he had received a deputation at the foreign office, which had waited on him to express sympathy with the Hungarian refugees, and to denounce the conduct of “the despots and tyrants” of Russia and Austria, and that he, in his reply, expressed his gratification at the demonstration. If the queen had her way, Lord Palmerston would have been removed from the foreign office after this incident. A few days later the coup d’état in Paris led to another dispute. The cabinet decided to do nothing that could wear the appearance of interference in the internal affairs of France; but Lord Palmerston, in conversation with the king ministry, thought all communication between himself and the court was destroyed, continued in office. The ministry naturally refused to tolerate this conduct, and Lord Palmerston was summarily removed from his office.

The removal of Lord Palmerston led almost directly to the fall of the Whig government. Before relating, however, the exact occurrences which produced its defeat, it is necessary to retrace our steps and describe the policy which it had pursued in internal matters during the six years in which it had been in power. Throughout that period the Irish famine had been its chief anxiety and difficulty. Sir Robert Peel had attempted to deal with it (1) by purchasing large quantities of Indian corn, which, at the low prices in Ireland, and (2) by sending the grand juries to employ the people on public works, which were to be paid out of moneys advanced by the state, one-half being ultimately repayable by the locality. These measures were not entirely successful. It was found, in practice, that the sale of Indian corn at low prices by the government checked the efforts of private individuals to supply food; and that the offer of comparatively easy work to the poor at the cost of the public, prevented their seeking harder private work either in Ireland or in Great Britain. The new government, with this experience before it, decided on trusting to private enterprise to supply the necessary food, and on throwing the whole cost of the terraces which Peel the locality might undertake on local funds. If the famine had been less severe, this policy might possibly have succeeded. Universal want, however, paralysed every one. The people, destitute of other means of livelihood, crowded to the relief works. In the beginning of 1847 nearly 750,000 persons—or nearly one person out of every ten in Ireland—were so employed. With such vast multitudes to relieve, it proved impracticable to exact the labour which was required as a test of destitution. The roads, which it was decided to make, were blocked by the labourers employed upon them, and by the stones, which the labourers were supposed to crush for their repair. In the absence of this difficulty the government decided, early in 1847, gradually to discontinue the relief works, and to substitute for them relief committees charged with the task of feeding the people. At one time no less than 3,000,000 persons—more than one-third of the entire population of Ireland—were supported by these committees. At the same time it decided on adopting two measures of a more permanent character. The poor law of 1838 had made no provision for the relief of the poor outside the workhouse, and outdoor relief was sanctioned by an act of 1847. Irish landlords complained that their properties, ruined by the famine, and encumbered by the extravagances of their predecessors, could not bear the cost of this new poor law; and the ministry introduced and carried a measure enabling the embarrassed owners of life estates to sell their property and discharge their liabilities. It is the constant misfortune of Ireland that the measures intended for her relief aggravate her distress. The encumbered estates act, though it substituted a solvent for an insolvent proprietor, placed the Irish tenants at the mercy of landlords of whom they had no previous knowledge, who were frequently absentees, who bought the land as a matter of business, and who dealt with it on business principles by raising the rent. The new poor law, by throwing the maintenance of the poor on the soil, encouraged landlords to extricate themselves from their responsibilities by ejecting the tenants. Evictions were made on a scale which the electorate of Sir Robert Peel could not bear. The deepest abhorrence. The unfortunate persons driven from their holdings and forced to seek a refuge in the towns, in England, or—when they could afford it—in the United States, carried with them everywhere the seeds of disease, the constant handmaiden of famine.

Famine, mortality and emigration left their mark on Ireland. In four years, from 1845 to 1849, its population decreased from 8,295,000 to 7,256,000, or by more than a million persons; and the decline which took place at that time went on to the end of the century. The population of Ireland in 1801 had decreased to 4,457,000 souls. This fact is the more remarkable because it is almost the only portion of the British empire, or indeed of the civilized world, where such a circumstance has occurred. We must go to countries like the Asiatic provinces of Turkey, devastated by Ottoman rule, to find such a diminution in the numbers of the people as was seen in Ireland during the last half of the 19th century. It was probably inevitable that the distress of Ireland should have been followed by a renewal of Irish outrages. A terrible series of agrarian crimes was committed in the autumn of 1847; and the ministry felt compelled, in consequence, to strengthen its hands by a new measure of coercion; and by suspending the Habeas Corpus Act of Ireland. The government was brought to a crisis the so-called rebellion of 1848, for his share in which Smith O’Brien, an Irish member of parliament, was convicted of high treason. The government, however, did not venture to carry out the grim sentence which the law still applied.
to traitors, and introduced an act enabling it to commute the death penalty to transportation. The "insurrection" had from the first proved abortive. With Smith O'Brien's transportation it practically terminated.

In the meanwhile the difficulties which the government was experiencing from the Irish famine had been aggravated by a grave commercial crisis in England. In the autumn of 1847 a series of failures in the great commercial centres created a panic in the city of London, which forced consols down to 78, and induced the government to take upon itself the responsibility of suspending the Bank Charter Act. That step, enabling the directors of the Bank of England to issue notes unsecured by bullion, had the effect of gradually restoring confidence. The grave commercial crisis of this character is often attended with other than financial consequences. The stringency of the money market increases the distress of the industrial classes by diminishing the demand for work; and, when labour suffers, political agitation flourishes. Early in 1848, moreover, revolutions on the continent produced a natural craving for changes at home. Louis Philippe was driven out of Paris, the emperor of Austria was driven out of Vienna, the Austrian soldiery had to withdraw from Milan, and even in Berlin the crown had to make terms with the people. While thrones were falling or tottering in every country in Europe, it was inevitable that excitement and agitation should prevail in Great Britain. The government, with the machinery which they had endeavoured to employ in 1830, decided on preparing a monster petition to parliament, which was to be escorted to Westminster by a monster procession. Their preparations excited general alarm, and on the invitation of the government no less than 170,000 special constables were sworn in to protect life and property against a rabble. By the judicious arrangements, however, which were made by the duke of Wellington, the peace of the metropolis was secured. The Chartists were induced to abandon the procession which had caused so much alarm, and the monster petition was carried in a cab to the House of Commons. The members, however, found it was marked dear to pieces by a select committee. It was found that, instead of containing nearly 6,000,000 signatures, as its originators had boasted, less than 2,000,000 names were attached to it. Some of the names, moreover, were obviously fictitious, or even absurd. The exposure of these facts turned the whole thing into ridicule, and gave parliament an excuse for postponing measures of organic reform which might otherwise have been brought forward.

If the ministry thus abstained from pressing forward a large scheme of political reform, it succeeded in carrying two measures of the highest commercial and social importance. In 1840 it supplemented the free trade policy. But a Sir Robert Peel had developed, by the repeal of the Navigation Acts. Briefly stated, these acts, which had been originated during the Protectorate of Cromwell, and continued after the Restoration, reserved the whole coasting trade of the country for British vessels and British seamen, and much of the foreign trade for British vessels, commanded and chiefly manned by British subjects. The acts, therefore, were in the strictest sense protective, but they were also designed to increase the strength of Great Britain at sea, by maintaining large numbers of British seamen. They had been defended by Adam Smith on the ground that they were "one of those important truths which, however obscure, ought to be generally known," and by the same reasoning they had been described by John Stuart Mill as "though economically disadvantageous, politically expedient." The acts, however, threw a grave burden on British trade and British shippers. Their provisions by restricting competition naturally tended to raise freights, and by restricting employment made it difficult for shippers to man their vessels. Accordingly the government wisely determined on their repeal; and one of the last and greatest battles between Free Trade and Protection was fought over the question. The second reading of the government bill was carried in the House of Lords by a majority of only ten: it would not have been carried at all if the government had not secured a much larger number of proxies than their opponents could obtain.

If the repeal of the Navigation Acts constituted a measure of the highest commercial importance, the passage of the Ten Hours Bill in 1847 was the first great landmark in the history of factory legislation. Something, indeed, had already been done to remedy the evils arising from the employment of women and very young children in factories and mines. In 1833 Lord Ashley, better known as Lord Shaftesbury, had carried the first important Factory Act. In 1842 he had succeeded, with the help of the striking report of a royal commission, in inducing parliament to prohibit the employment of women and of boys under ten years of age in mines. And in 1843 Sir James Graham, who was home secretary in Sir Robert Peel’s administration, had been compelled by the pressure of public opinion to introduce a measure providing for the education of children employed in factories, and for limiting the hours of work of children and young persons. The educational clauses of this bill were obviously framed in the interests of the Church of England, and raised a heated controversy which led to the abandonment of the measure; and in the following year Sir James Graham introduced a new bill dealing with the labour question alone. Briefly stated, his proposal was that no child under nine years of age should be employed in a factory, and that no young person under eighteen should be employed for more than twelve hours a day. This measure gave rise to the famous "Cottagers’ Meeting," which commenced in 1842, and was protracted till 1847. Lord Ashley and the factory reformers contended, on the one hand, that ten hours were long enough for any person to work; their opponents maintained, on the contrary, that the adoption of the clause would injure the working-classes by lowering the rate of wages, and ruin the manufacturers by exposing them to foreign competition. In 1847 the reform was at last adopted. It is a remarkable fact that it was carried against the views of the leading statesmen on both sides of the House. It was the triumph of common sense over official arguments.

During the first four years of Lord John Russell’s government, his administration had never enjoyed any very large measure of popular support, but it had been partly sustained by the advocacy of Sir Robert Peel. The differences which estranged Sir Robert from his old supporters were far greater than those which separated him from the Whigs, and the latter were therefore constantly able to rely on his assistance. In the summer of 1850, however, a lamentable accident—a fall from his horse—deprived the country of the services of its great statesman. His death naturally affected the position of parties. The small remnant of able men, indeed, who had been associated with him in his famous administration, Peel’s administration, endeavoured to prove that the doctrines of the Church of England were identical with those of the primitive Catholic Church, and that every Catholic doctrine might be held by those who were within its pale. This view was explained in a remarkable series of tracts, which gave their authors the name of Tractarians. The most famous of these, and the last of the series, Tract XC., was published three years after the queen’s accession to the throne. In Scotland, the Presbyterian Church—mainly under the guidance of Dr Chalmers, one of the most eloquent preachers of the century—was simultaneously engaged in a contest with the state on the subject of ecclesiastical patronage. Both movements had this
in common, that they indicated a revival of religious energy, and aimed at vindicating the authority of the church, and resisting the interference of the state in church matters. The Scottish movement led to the disruption of the Church of Scotland and the formation of the Free Church in 1843. The Tractarian movement was ultimately terminated by the secession of Newman and many of his associates from the Church of England, and their admission to the Church of Rome. These secessions raised a feeling of alarm throughout England. The people, thoroughly Protestant, were excited by the proofs—which they thought were afforded—that the real object of the Tractarians was to reconcile England with Rome; and practices which are now regarded as venial or even praiseworthy—such as the wearing of the surplice in the pulpit, and the institution of the weekly offertory—were denounced because they were instituted by the Tractarians, and were regarded as insidious devices to lead the country Romeward. The sympathies of the Whigs, and especially of the Whig prime minister, Lord John Russell, were with the people; and Lord John displayed his dislike to the Romanizing tendencies of the Tractarians by appointing Renn Dickson Hampden—whose views had been formally condemned by the Hebdomadal Board at Oxford—to the bishopric of Hereford. The High Church party endeavoured to oppose the appointment at every stage; but their attempts exposed them to a serious defeat. The courts held that, though the appointment of a bishop by the crown required confirmation in the archbishop's court, the confirmation was a purely ministerial act which could not be refused. The effort which the High Church party had made to resist Dr Hampden's appointment had been in vain. It was shown positively that authority resided in the crown, and not in the archbishop. It so happened that about the same time this view was confirmed by another judicial decision. The lord chancellor presented the Rev. G. C. Gorham to a living in Devonshire; and Dr Phillpotts, the bishop of Exeter, declined to institute him, on the ground that he held heretical views on the subject of baptism. The court of arches upheld the bishop's decision. The finding of the court, however, was reversed by the privy council, and its judgment dealt a new blow at the Tractarian party. For it again showed that authority—even in doctrine—resided in the crown and not in the church. Within a few months of this famous decision the pope—perhaps encouraged by the activity and dependancy of the High Church party—issued a brief "for re-establishing and extending the Catholic faith in England," and proceeded to divide England and Wales into twelve sees. One of them—Westminster—was made an archbishopric, and the new dignity was conferred on Nicholas Patrick Stephen Wiseman, who was almost immediately afterwards created cardinal. The publication of this brief caused much excitement throughout the country, which was fanned by a letter from the prime minister to the bishop of Durham, condemning the brief as "insolent and insidious" and "inconsistent with the queen's supremacy, with the rights of our bishops and clergy, and with the spiritual independence of the nation." Somewhat unnecessarily the prime minister went on to condemn the clergymen of the Church of England who had subscribed the Thirty-nine Articles, "who have been the most forward in leading their own flocks, step by step, to the very edge of the precipice."

In accordance with the promise of Lord John Russell's letter, the ministry, at the opening of the session of 1851, introduced a measure forbidding the assumption of territorial titles by the priests and bishops of the Roman Catholic Church, declaring all gifts made to them and all acts done by them under these titles null and void, and forfeiting to the crown all property bequeathed to them. The bill naturally encountered opposition from Catholic Liberals, while it failed to excite any enthusiasm among Conservatives, who thought its remedies inadequate. In the middle of the debates upon it the government was defeated on another question—a proposal to reduce the county franchise—and, feeling that it could no longer rely on the support of the House of Commons, tendered its resignation. But Lord Stanley, whom the queen entrusted with the duty of forming a new administration, was compelled to decline the task, and Lord John resumed office. Mild as the original Ecclesiastical Titles Bill had been thought, the new edition of it, which was introduced after the restoration of Lord John and before his recall, was even more offensive. Though, after protracted debates, it at last became law, it sought to impede its provisions, as was soon found, could be easily evaded, and the bill, which had caused so much excitement, and had nearly precipitated the fall of a ministry, remained a dead letter. The government, in fact, was experiencing the truth that, if a defeated ministry may be occasionally restored to place, it cannot be restored to power. The dismissal of Lord Palmerston from the foreign office in 1851 further increased the embarrassments of the government. In February 1852 it was defeated on a proposal to revive the militia, and resigned.

The circumstances which directly led to the defeat of the Whigs were, in the sense, a consequence of the revolutionary wave which had swept over Europe in 1848. The fall of Louis Philippe in that year created a panic in Great Britain. Men thought that the unsettled state of France made war probable, and they were alarmed at the defenceless condition of England. Lord Palmerston, speaking in 1845, had declared that "steam had bridged the Channel"; and the duke of Wellington had addressed a letter to Sir John Burgoyne, in which he had demonstrated that the country was not in a position to resist an invading force. The panic was so great that the ministry felt it necessary to make exceptional provisions for allaying it. Lord John Russell decided on asking parliament to sanction increased armaments, and to raise the militia. Lord John could not, in the pounds in order to pay for them. The occasion deserves to be recollected as one on which a prime minister, who was not also chancellor of the exchequer, has himself proposed the budget of the year. But it was still more memorable because the remedy which Lord John proposed at once destroyed the panic which had suggested it. A certain increase of the income tax to a shilling seemed a much more serious calamity than the uncertain prospect of a possible invasion. The estimates were recast, the budget was withdrawn, and the nation was content to dispense with any addition to its military and naval strength. Events in France, in the meanwhile, moved with railway speed. Louis Napoleon became president of the French Republic: in 1852 he became emperor of the French. The new emperor, indeed, took pains to reassure a troubled continent that "the empire was peace." The people insisted on believing—and, as the event proved, rightly—that the empire was war. Notwithstanding the success of the Great Exhibition of 1851, which was supposed to inaugurate a new reign of peace, the panic, which had been temporarily allayed in 1848, revived at the close of 1851, and the government endeavoured to allay it by reconstituting the militia. There were two possible expedients. An act of 1757 had placed under the direct authority of the crown a militia composed of men selected in each parish by ballot, liable to be called out for active service, and to be placed under military law. But the act had been supplemented by a series of statutes passed between 1808 and 1812, which had provided a local militia, raised, like the regular militia, by ballot, but, unlike the latter, only liable for service for the suppression of riots, or in the event of imminent invasion. Lord John Russell's government, forced to do something by the state of public opinion, but anxious—from the experience of 1848—to make that something moderate, decided on reviving the local militia. Lord Palmerston at once suggested that the regular and not the local militia should be revived; and, in a small house of only 265 members, he succeeded in carrying a resolution to that effect: He had, in this way, what he called his tit for tat with the Whigs; and when, accepting his minister's resignation, sent for Lord Derby—for Lord Stanley had now succeeded to this title—and charged him with the task of forming a ministry.

The government which Lord Derby succeeded in forming was composed almost exclusively of the men who had rebelled against Sir Robert Peel in 1845. It was led in the House of
Commons by the brilliant, but somewhat unscrupulous statesman who had headed the revolt. With the exception of Lord Derby and one other man, its members had no experience of high office; and it had no chance of securing a majority in the House of Commons in the existing parliament. It owned its position to the divisions of its opponents. Profiting by their experience, it succeeded in framing and passing a measure reconstituting the regular militia, which obtained general approval. It is perhaps worth observing that it maintained the machinery of a ballot, but reserved it only in case experience should prove that it was necessary. Voluntary enlistment under the new Militia Bill was to be the rule: compulsory service was only to be resorted to if voluntary enlistment should fail. This success, to a certain extent, strengthened the position of the new ministry. It was, however, that its stability was ultimately ensured by its financial policy. Composed of the men who had resisted the free trade measures of the previous decade, its fate depended on its attitude towards free trade. In forming his administration Lord Derby had found it necessary to declare that, though he was still in favour of a tax on corn, he should take no steps in this direction till the country had received an opportunity of expressing its opinion. His leader in the House of Commons went much further, and declared that the time had gone by for reverting to protection. The view which Disraeli thus propounded in defiance of his previous opinions was confirmed by the electors on the dissolution of parliament, and the new government obtained some increased strength from the result of the polls, the country, it was evident, had no intention of abandoning the policy of free trade, which by this time, it was clear, had conferred substantial benefits on all classes. When the new parliament met in the autumn of 1852, it was at once plain that the issue would be determined on the rival merits of the old and the new financial systems. Disraeli courted the decision by at once bringing forward the budget, which custom, and perhaps convenience, would have justified him in postponing till the following spring. His proposal—in which he avowedly threw over his friends on the ground that "he had greater subjects to consider than the triumph of obsolete opinions"—was, in effect, an attempt to conciliate his old supporters by a policy of doles, and to find the means for doing so by the increased taxation of the middle classes. He offered to relieve the shipping interest by transferring some of the cost of lighting the coasts to the Consolidated Fund; the West India interest by sanctioning the refining of sugar in bond; and the landed classes by reducing the malt tax by one-half, and by repealing the old war duty on hops. He suggested that the cost of these measures should be defrayed by extending the income tax to Ireland; to industrial incomes of £100 and to permanent incomes of £50 a year, as well as by doubling the house tax, and extending it to all £100 householders. The weight, therefore, of these measures was either purposely or unintentionally thrown mainly on persons living in houses worth from £10 to £20 a year, or on persons in receipt of incomes from £50 to £150 a year. This defect in the budget was exposed in a great speech by Gladstone, which did much to ensure the defeat of the scheme and the fall of the ministry.

On the resignation of Lord Derby, the queen, anxious to terminate a period of weak governments, decided on endeavouring to combine in one cabinet the chiefs of the Whig party and the followers of Sir Robert Peel. With this view she sent both for Lord Aberdeen, who had held the foreign office under Sir Robert, and for Lord Lansdowne, who was the Nestor of the Whigs; and with Lord Lansdowne's concurrence charged Lord Aberdeen with the task of forming a government. In the new ministry Lord Aberdeen became first lord of the treasury, Gladstone chancellor of the exchequer, Lord John Russell foreign minister—though he was almost immediately replaced in the foreign office by Lord Clarendon, and himself assumed the presidency of the council. Lord Palmerston went to the home office. One other appointment must also be mentioned. The secretary of state for the colonies was also at that time secretary of state for war. No one in 1852, however, regarded that office as of material importance, and it was entrusted by Lord Aberdeen to an amiable and conscientious nobleman, the duke of Newcastle.

The essence of the Aberdeen administration will be chiefly recollected for the remarkable budget which Gladstone brought forward. It constituted a worthy supplement to the measures of 1842, 1845 and 1846. Gladstone swept away the duty on one great necessary of life—soap; he repealed the duties on 123 other articles; he reduced the duties on 133 others, among them that on tea; and he found means for paying for these reforms and for the gradual reduction and ultimate abolition of the income tax, which had become very unpopular, by (1) extending the tax to incomes of £100 a year; (2) an increase of the spirit duties; and (3) applying the proceeds of these reforms and the revenue from the land tax to real property, and to property passing by settlement. There can be little doubt that this great proposal was one of the most striking which had ever been brought forward in the House of Commons; there can also, unhappily, be no doubt that its promises and intentions were frustrated by events which proved too strong for its author. For Gladstone, in framing his budget, had contemplated a continuance of peace, and the country was, unhappily, already drifting into war.

For some years an obscure quarrel had been conducted at Constantinople about the custody of the holy places at Jerusalem. France, relying on a treaty concluded in the first half of the 18th century, claimed the guardianship of these places. The Latin Church, however, had the rights which the Latin Church had thus obtained had practically fallen into disuse, while the Greek branch of the Christian Church had occupied and repaired the shrines which the Latins had neglected. In the years which preceded 1853, however, France had shown more activity in asserting her claims; and the new emperor of the French, anxious to reconcile the church which had supported his elevation to the throne, had a keen interest in upholding them. If, for reasons of policy, the emperor had grounds for his action, he had personal motives for thwarting the tsar of Russia; for the latter potentate had been foolish enough, in recognizing the second empire, to address its sovereign as "Mon Cher Ami," instead of, in the customary language of sovereigns, as "Monseigneur Mon Frère." Thus, at the close of 1852, and in the beginning of 1853, Russia and France were both addressing opposite and irreconcilable demands to the Porte, and France was already talking of sending her fleet to the Dardanelles, while Russia was placing an army corps on active service and despatching Prince Menshikov on a special mission to Constantinople. So far the quarrel which had occurred at the Porte was obviously one in which Great Britain had no concern. The Aberdeen ministry, however, thought it desirable that it should be represented in the crisis by a strong man at Constantinople; and it selected Lord Stratford de Redcliffe for the post, which he had filled in former years with marked ability. Whatever merits Lord Stratford possessed—and he stands out in current diplomacy as the one strong man whom England had abroad—there was no doubt that he had this disqualification: the emperor Nicholas had refused some years before to receive him as ambassador at St Petersburg, and Lord Stratford had resented, and never forgiven, the discourtesy of this refusal. Lord Stratford soon discovered that Prince Menshikov was the bearer of larger demands, and that he was requiring the Porte to agree to a treaty acknowledging the right of Russia to protect the Greek Church throughout the Turkish dominions. By Lord Stratford's advice the Porte—while making the requisite concession respecting the holy places—refused to grant the new demand; and Prince Menshikov thereupon withdrew from Constantinople.

The rejection of Prince Menshikov's ultimatum was followed by momentous consequences. Russia—or rather her tsar—resolved on the occupation of the Danubian principalities; the British ministry—though the quarrel did not directly concern Great Britain—sent a fleet to the Dardanelles and placed it under Lord Stratford's orders. Diplomacy, however, made a fresh attempt to terminate the dispute, and in July 1853 a note
was agreed upon by the four neutral powers, France, Great Britain, Austria and Prussia, which it was decided to present to Constantinople and St. Petersburg. This note, the adoption of which would have ensured peace, was accepted at St Petersburg; at Constantinople it was, unfortunately, rejected, mainly on Lord Stratford’s advice, and in opposition to his instructions from home. Instead, however, of insisting on the adoption of the note to which it had agreed, Lord Aberdeen’s ministry recommended the tsar to accept some amendments to it suggested by Lord Stratford, which it was disposed to regard as unimportant. It then discovered, however, that the tsar attached a meaning to the original note differing from that which it had itself applied to it, and in conjunction with France it thereupon ceased to recommend the Vienna note—as it was called—for acceptance. This decision separated the two western powers from Austria and Prussia, who were disposed to think that Russia had done all that could have been required of her in accepting the note which the four powers had agreed upon.

It was obvious that the control of the situation was passing from the hands of the cabinet at home into those of Lord Stratford at Constantinople. The ambassador, in fact, had the great advantage that he knew his own mind; the cabinet laboured under the disadvantage of not knowing the tsar’s; that was the price Russian diplomacy had imposed on the West. Its chief, Lord Aberdeen, was dominated by a desire to preserve peace; but he had not the requisite force to control the stronger men who were nominally serving under him. Lord John Russell was a little sore at his own treatment by his party. He thought that he had a claim to the first place in the ministry, and he did not, in consequence, give the full support to Lord Aberdeen which the latter had a right to expect from him. Lord Palmerston, on the other hand, had no personal grudge to nurture, but he was convinced that the first duty of England was to support Turkey and to resist Russia. He represented in the cabinet the views which Lord Stratford was enunciating at Constantinople, and step by step Lord Stratford, thus supported, drove the country nearer to the revolution in Russia that the tsar had come to the throne to prevent.

In October the Porte, encouraged by the presence of the British fleet in the Bosporus, took the bold step of summoning the Russians to evacuate the principalities. Following up this demand the Turkish troops attacked the Russian army, and inflicted on it one or two sharp defeats. The Russians retaliated by loosing their squadron from Sevastopol, and on the 30th of November it attacked and destroyed the Turkish fleet at Sinope. The massacre of Sinope—as it was rather inaccurately called in Great Britain, for it is difficult to deny that it was a legitimate act of a belligerent power—created an almost irresistible demand for war among the British people. Yielding to popular opinion, the British ministry assented to a suggestion of the French emperor that the fleets of the allied powers should enter the Black Sea and “invite” every Russian vessel to return to Sevastopol. The decision was taken at an unfortunate hour. Diplomats, pursuing their labours at Vienna, had succeeded in drawing up a fresh note which they thought might prove acceptable both at St Petersburg and at Constantinople. This note was presented almost at the moment the tsar learned that the French and British fleets had entered the Black Sea, and the Russian government, instead of considering it, withdrew its ministers from London and Paris; the French and British ambassadors were thereupon withdrawn from St Petersburg. An ultimatum was soon afterwards addressed to Russia requiring her to evacuate the principalities, and war began. In deciding on war the British government relied on the capacity of its fleet, which was entrusted to the command of Sir Charles Napier, to strike a great blow in the Baltic. The fleet was despatched with extraordinary rejoicings, and amidst loud and confident expressions of its certain triumph. As a matter of fact it did very little. In the south of Europe, however, the Turkish armies on the Danube, strengthened by the advice of British officers, were more successful. The Russians were forced to retire, and the principalities were evacuated. A prudent administration might possibly have succeeded in stopping the war at this point. But the temper of the country was by this time excited, and it was loudly demanding something more than a preliminary success. It was resolved to invade the Crimea and attack the great arsenal, Sevastopol, whence the Russian fleet had sailed to Sinope, and in September 1854 the allied armies landed in the Crimea. On the 20th the Russian army, strongly posted on the banks of the Alma, was completely defeated, and it is almost certain that, if the victory had been at once followed up, Sevastopol would have fallen. The commanders of the allied armies, however, hesitated to throw themselves against the forts erected to the north of the town, and decided on the hazardous task of marching round Sevastopol and attacking it from the south. The movement was successfully carried out, but the Allies again hesitated to attempt an immediate assault. The Russians, who were advised by Colonel Todleben, the only military man who attained a great reputation in the war, thus gained time to strengthen their position by earthworks; and the Allies found themselves forced, with scanty preparations, to undertake a regular siege against an enemy whose force was numerically superior to their own. In the early days of the siege, indeed, the allied armies were twice in great peril. A formidable attack on the 25th October on the British position at Balaklava led to a series of encounters which displayed the unity of purpose and the courage of the British and French troops. It is probable that the reputation of the British commanders. A still more formidable sortie on the 5th of November was with difficulty repulsed at Inkerman. And the Russians soon afterwards found, in the climate of the country, a powerful ally. The allied armies, imperfectly organized, and badly equipped for such a campaign, suffered severely from the hardships of a Crimean winter. The whole expedition seemed likely to melt away from want and disease.

The terrible condition of the army, vividly described in the letters which the war correspondents of the newspapers sent home, aroused strong feelings of indignation in Great Britain. When parliament met Roebuck gave notice that he would move for a committee of inquiry. Lord John Russell—who had already vainly urged in the cabinet that the duties of the conduct of the war be superseded, and the conduct of the war entrusted to a stronger minister—resigned office. His resignation was followed by the defeat of the government, and Lord Aberdeen, thus driven from power, was succeeded by Lord Palmerston. In selecting him for the post, the queen undoubtedly placed her seal on the wish of the country to carry out the war to the bitter end. But it so happened that the formation of a new ministry was accompanied by a fresh effort to make terms of peace. Before the change of administration a conference had been decided on, and Lord Palmerston entrusted its management to Lord John Russell. While the conference was in progress, an event occurred which seemed at first to facilitate its task. The tsar, worn out by the strain of administration, suddenly died, and was succeeded by his son Alexander. Unfortunately the conference failed, and the war went on for another year. In September 1855 the allied troops succeeded in obtaining possession of the southern side of Sevastopol, and the emperor of the French, satisfied with this partial success, or alarmed at the expense of the war, decided on withdrawing from the struggle. The attitude of Napoleon made the conclusion of peace only a question of time. In the beginning of 1856 a congress to discuss the terms was assembled at Paris; in February hostilities were suspended; and in April a treaty was concluded. The peace set back the boundaries of Russia from the Danube to the Pruth; it secured the free navigation of the first of the rivers; it opened the Black Sea to the commercial navies of the world, closing it to vessels of war, and forbidding the establishment of arsenals upon its shores. The last condition, to which Great Britain attached most importance, endured for about fourteen years. Peace without this provision could undoubtedly have been secured at Vienna, and the prolongation of the war from 1855 to 1856 only resulted in securing this arrangement for a little more than one decade.

The Crimean War left other legacies behind it. The British government had for some time regarded with anxiety the gradual encroachments of Russia in central Asia. Russian
diplomacy was exerting an increasing influence in Persia, and the latter had always coveted the city of Herat, which was popularly regarded as the gate of India. In 1856 the Persian government, believing that England had her hands fully occupied in the Crimean, seized Herat, and, in consequence, a fresh war—in which a British army under Sir James Outram rapidly secured a victory—broke out. The campaign, entered upon when parliament was not in session, was unpopular in the country. A grave constitutional question, which was ultimately settled by legislation, was raised as to the right of the government to undertake military operations beyond the boundaries of India without the consent of parliament. But the incidents of the Persian war were soon forgotten in the presence of a still graver crisis; for in the following year, 1857, the country suddenly found itself involved in war with China, and face to face with one of the greatest dangers which it has ever encountered—the mutiny of the sepoys army in India. The Chinese war arose from the seizure by the Chinese authorities of a small vessel, the "Arrow" commanded by a British subject, and at one time holding a licence (which, however, had expired at the time of the seizure) from the British superintendant at Hongkong, and the detention of her crew on the charge of piracy. Sir John Bowring, who represented Great Britain in China, failing to secure the reparation and apology which he demanded, directed the British admiral to bombard Canton. Lord Palmerston's cabinet decided to approve and support Sir John Bowring's vigorous action. Cobden, however, brought forward a motion in the House of Commons condemning these high-handed proceedings. He succeeded in securing the co-operation of his own friends, of Lord John Russell, and of other independent Liberals, as well as of the Conservative party, and in inflicting a signal defeat on the government. Lord Palmerston at once appealed from the House to the country. The constituencies, imperfectly acquainted with the technical issues involved in the dispute, rallied to the minister, who was upholding British interests. Lord Palmerston obtained a decisive victory, and returned to power apparently in irresistible strength. Lord Elgin had already been sent to China with a considerable force to support the demand for redress. On his way thither he learned that the British in India were reduced to the last extremities by the mutiny of the native army in Bengal, and, on the application of Lord Canning, the governor-general, he decided on diverting the troops, intended to bring the mutineers to reason, to the more pressing duty of saving India for the British crown.

During the years which had followed the accession of the queen, the territories and responsibilities of the East India Company had been considerably enlarged by the annexation of Sind by Lord Ellenborough, the conquest of the Punjab after two desperate military campaigns under Lord Dalhousie, the conquest of Pegu, and the annexation of Oudh. These great additions to the empire had naturally imposed an increased strain on the Indian troops, while the British garrison, instead of being augmented, had been depleted to meet the demands of the supreme war. When circumstances, moreover, tended to propagate disaffection in the Indian army. Indian troops operating outside the Company's dominions were granted increased allowances, but these were automatically reduced when conquest brought the provinces in which they were serving within the British pale. The Sepoys again had an ineradicable dislike to serve beyond the sea, and the invasion of Pegu necessitated their transport by water to the seat of war. Finally, the invention of a new rifle led to the introduction of a cartridge which, though it was officially decided at the moment, was in fact lubricated with a mixture of cow's fat and lard. The Sepoys thought that their caste would be destroyed if they touched the fat of the sacred cow, and the Sepoy Mutiny was at last taken by a brilliant assault. Lucknow, where a small British garrison was besieged in the residency, was twice relieved, once temporarily by Sir James Outram and General Havelock, and afterwards permanently by Sir Colin Campbell, who had been sent out from England to take the chief command. Subsequent military operations broke up the remnants of the revolt, and in the beginning of 1858 the authority of the queen was restored throughout India. The mutiny, however, had impressed its lesson on the British people, and, as the first consequence, it was decided to transfer the government from the old East India Company to the crown. Lord Palmerston's administration was defeated on another issue before it succeeded in carrying the measure which it introduced for the purpose, though Lord Derby's second ministry, which succeeded it, was compelled to frame its proposals on somewhat similar lines. The home government of India was entrusted to a secretary of state, with a council to assist him; and though the numbers of the council have been reduced, the form of government which was then established has endured.

The cause which led to the second fall of Lord Palmerston was in one sense unexpected. Some Italian refugees living in London, of whom Orsini was the chief, formed a design to assassinate the emperor of the French. On the evening of 14th January 1858, while the emperor, accompanied by the empress, was driving to the opera, these men threw some bombs under his carriage. The brutal attempt happily failed. Neither the emperor nor the empress was injured by the explosion, but the carriage in which they were driving was wrecked, and a large number of persons who happened to be in the street at the time were either killed or wounded. This horrible outrage naturally created indignation in France, and it unfortunately became plain that the conspiracy had been hatched in England, and that the bombs had been manufactured in Birmingham. On these facts becoming known, Count Walewski, the chief minister of France, consulted with the British government as to the best means of blood to the emperor, called on the British government to provide against the danger to which France was exposed. "Ought the right of asylum to protect such a state of things?" he asked. "Is hospitality due to assassins? Ought the British legislature to continue to favour their designs and their plans? And can it continue to shelter persons who by these flagrant acts place themselves beyond the pale of common rights?" Lord Clarendon, the head of the British foreign office, told the French ambassador, who read him this despatch, that "no consideration on earth would induce the British parliament to pass a measure for the extradition of political refugees," but he added that it was a "question which we must ask of ourselves whether the circumstances of the case are such as to make it right that we should adopt this procedure." He then proposed that "the numbers of the council have been reduced, the form of government which was then established has endured.

assassins' den," and invited the emperor to give his troops the order to destroy it. Such language did not make it easier to alter the law in the manner desired by the government. The House of Commons, reflecting the spirit of the country, blamed Lord Clarendon for neglecting to answer Count Walewski's despatch; and blamed Lord Palmerston for introducing a bill at French dictation. The feeling was so strong that, when the Conspiracy Bill came on for a second reading, an amendment hostile to the government was carried, and Lord Palmerston at once resigned.

For a second time Lord Derby undertook the difficult task of carrying on the work of government without the support of a majority of the House of Commons. If the Liberal party had been united his attempt would have failed immediately. In 1858, however, the Liberal party had no cohesion. The wave of popularity which had carried Lord Palmerston to victory in 1857 had lost its strength. The Radicals, who were slowly recovering the influence they had lost during the Crimean War, regarded even a Conservative government as preferable to his return to power, while many Liberals desired to entrust the fortunes of their party to the guidance of their former chief, Lord John Russell. It was obvious to most men that the discontents thus visible in the Liberal ranks could not be healed by the cold, distant attitude of the opposition benches rather than in the warmer sunlight of office. And therefore, though no one had much confidence in Lord Derby, or in the stability of his second administration, every one was disposed to acquiesce in its temporary occupation of office.

Ministries which exist by sufferance are necessarily compelled to adapt their measures to the wishes of those who permit them to continue in power. The second ministry of Lord Derby experienced the truth of this rule. For some years a controversy had been conducted in the legislature in reference to the admission of the Jews to parliament. This dispute had been raised in 1847 into a question of practical moment by the election of Baron Lionel Nathan Rothschild as representative of the City of London, and its contingency had been emphasised in 1852 by the refusal of another Jew, Alderman Salomon, for another constituency. The Liberal party generally in the House of Commons was in favour of such a modification of the oaths as would enable the Jews so elected to take their seats. The bulk of the Conservative party, on the contrary, and the House of Lords, were strenuously opposed to the change. Early in 1858 the House of Commons, by an increased majority, passed a bill amending the oaths imposed by law on members of both Houses, and directimg the omission of the words "on the true faith of a Christian" from the oath of abjuration when it was taken by a Jew. If the Conservatives had remained in opposition there can be little doubt that this bill would have shared the fate of its predecessors and have been rejected by the Lords. The lord chancellor, indeed, in speaking upon the clause relieving the Jews, expressed a hope that the peers would not hesitate to pronounce that our "Lord is king, be the people never so impatient." But some Conservative peers realized the inconvenience of maintaining a conflict between the two Houses when the Conservatives were in power; and Lord Luco, who had commanded the cavalry in the Crimea, suggested as a compromise that either House should be authorized by resolution to determine the form of oath to be administered to its members. This solution was reluctantly accepted by Lord Derby, and Baron Rothschild was thus enabled to take the seat from which he had been so long excluded. Eight years afterwards parliament was induced to take a fresh step in advance. It imposed a new oath from which the words which disqualified the Jews were omitted. The door of the House of Lords was thus thrown open, and in 1858 Baron Nathan Mayer Rothschild, raised to the peerage, was enabled to take his seat in the upper chamber.

This question was not the only one on which a Conservative government, without a majority at its back, was compelled to make concessions. For some years past a growing disposition had been displayed among the more earnest Liberals to extend the provisions of the Reform Act of 1832. Lord John Russell's ministry had been defeated in 1851 on a proposal of Locke King to place £10 househoolders in counties on the same footing as regards the franchise as £10 househoolders in towns, and Lord John himself in 1854 had actually introduced a new Reform Bill. After the general election of 1857 the demand for reform increased, and, in accepting office in 1858, Lord Derby thought it necessary to declare that, though he had maintained in opposition that the settlement of 1832, with all its anomalies, afforded adequate representation to all classes, the promises of previous governments and the expectations of the people imposed on him the duty of bringing forward legislation on the subject. The scheme which Lord Derby's government adopted was peculiar. Its chief proposal was the extension of the county franchise to £10 househoolders. But it also proposed that persons possessing a 40s. freehold in a borough should in future have a vote in the borough in which their property was situated, and not in the county. The bill also conferred the franchise on holders of a certain amount of stock, on depositors in savings banks, on graduates of universities, and on other persons qualified by position or education. The defect of the bill was that it did nothing to meet the only real need of reform—the enfranchisement of a certain proportion of the working classes. On the contrary, in this respect it perpetuated the settlement of 1832. The £10 householder was still to furnish the bulk of the electorate, and the ordinary working man could not afford to pay £10 a year for his house. While the larger proposals of the bill were thus open to grave objection, its subsidiary features provoked ridicule. The suggestions that votes should be conferred on graduates and stockholders were laughed at as "fancy franchises." The bill, moreover, was not brought forward with the authority of a united cabinet. Two members of the government—Spencer Walpole and Henley—declined to be responsible for its provisions, and placed their resignations in Lord Derby's hands. In Walpole's judgment the bill was objectionable because it afforded no reasonable basis for a stable settlement. There was nothing in a £10 franchise which was capable of permanent defence, and if it was at once applied to counties as well as to boroughs it would sooner or later be certain to be extended. He himself advocated with some force that it would be wiser and more popular to fix the county franchise at £20 and the borough franchise at £6 rateable value; and he contended that such a settlement could be defended on the old principle that taxation and representation should go together, for £20 was the minimum rent at which the house tax commenced, and a rateable value of £6 was the point at which the householder could not compound to pay his rates through his landlord. Weakened by the defection of two of its more important members, the government had little chance of obtaining the acceptance of its scheme. An amendment by Lord John Russell, condemning its main provisions, was adopted in an unusually full house by a substantial majority, and the cabinet had no alternative but to resign or dissolve. It chose the latter course. The general election, which almost immediately took place, increased to some extent the strength of the Conservative party. For the first time since their secession from Sir Robert Peel the Conservatives commanded more than three hundred votes in the House of Commons, but this increased strength was not sufficient to ensure them a majority. When the new parliament assembled, Lord Harington, the eldest son of the duke of Devonshire, was put forward to propose a direct vote of want of confidence in the administration. It was carried by 323 votes to 310, and the second Derby administration came to an end.
endeavoured to solve the first of these difficulties by sending for Lord Granville, who led the Liberal party in the Lords, and authorizing him to form a government which should combine, as far as possible, all the more prominent Liberals. The attempt, however, failed, and the queen thereupon fell back upon Lord John Russell. Lord John Russell agreed to accept office as foreign minister; Gladstone consented to take the chancellorship of the exchequer. Cobden was offered, but declined, the presidency of the Board of Trade; and the post which he refused was conferred on a prominent free trader, who had associated himself with Cobden's fortunes, Milner Gibson. Thus Lord Palmerston had succeeded in combining in one ministry the various representatives of political progress. He had secured the support of the Peelites, who had left him after the fall of Lord Aberdeen in 1855, and of the free traders, who had done so much to defeat him in 1857 and 1858. His new administration was accordingly based on a broader bottom, and contained greater elements of strength than his former cabinet. And the country was requiring more stable government. The first three ministries of the queen had endured from the spring of 1835 to the spring of 1832, or for very nearly seventeen years; but the next seven years had seen the formation and dissolution of no less than four cabinets. It was felt that these frequent changes were unfortunate for the country, and every one was glad to welcome the advent of a government which seemed to promise greater permanence. That promise was fulfilled. The administration which Lord Palmerston succeeded in forming in 1859 endured till his death in 1865; and with slight modifications, under its second chief Lord John (afterwards Earl) Russell, till the summer of 1866. It had thus a longer life than any cabinet which had governed England since the first Reform Act. But it owed its lasting character to the benevolence of its opponents rather than to the enthusiasm of its supporters. The Conservatives learned to regard the veteran statesman, who had combined all sections of Liberals under his banner, as the most powerful champion of Conservative principles; a virtual truce of parties was established during his continuance in office; and, for the most part of his ministry, a tacit understanding existed that the minister, on his side, should pursue a Conservative policy, and that the Conservatives, on theirs, should abstain from any real attempt to oust him from power. Lord John Russell, indeed, was too earnest in his desire for reform to abstain from one serious effort to accomplish it. Early in 1860 he proposed, with the sanction of the cabinet, a measure providing for the extension of the county franchise to 10,000 householders, of the borough franchise to £6 householders, and for a moderate redistribution of seats. But the country, being in enjoyment of considerable prosperity, paid only a languid attention to the scheme; its indifference was reflected in the House; the Conservatives were encouraged in their opposition by the lack of interest which the new bill excited, and the almost unconcealed dislike of the prime minister to its provisions. The bill, thus steadily opposed and half-heartedly supported, made only slow progress; and at last it was withdrawn by its author. He did not again attempt during Lord Palmerston's life to reintroduce the subject. Absorbed in the work of the foreign office, which at this time was abnormally active, he refrained from pressing home the arguments for internal reform.

In one important department, however, the ministry departed from the Conservative policy it pursued in other matters. Gladstone signalized his return to the exchequer by introducing a series of budgets which excited keen opposition at the time, but in the result largely added to the prosperity of the country. The first of these great budgets, in 1860, was partly inspired by the necessity of adapting the fiscal system to meet the requirements of a commercial treaty which, mainly through Cobden's exertions, had been concluded with the emperor of the French. The treaty bound France to reduce her duties on English coal and iron, and on many manufactured articles; while, in return, Great Britain undertook to sweep away the duties on all manufactured goods, and largely to reduce those on French wines. But Gladstone was not content with these great alterations, which involved a loss of nearly £1,200,000 a year to the exchequer; he voluntarily undertook to sacrifice another million on what he called a supplemental measure of customs reform. He proposed to repeal the duties on paper, by which means he hoped to increase the opportunities of providing cheap literature for the people. The budget of 1860 produced a protracted controversy. The French treaty excited more criticism than enthusiasm on both sides of the Channel. In France the manufacturers complained that they would be unable to stand against the competition of English goods. In England many people thought that Great Britain was wasting her resources and risking her supremacy by giving the French increased facilities for taking her iron, coal and machinery, and that no adequate advantage could result from the greater consumption of cheap claret. But the criticism which the French treaty aroused was drowned in the clamour which was created by the repeal of the paper duties. The manufacture of paper was declared to be a struggling industry, which would be destroyed by the withdrawal of protection. The dissemination of cheap literature and the multiplication of cheap newspapers could not compensate the nation for the ruin of an important trade. If money could be spared, moreover, for the remission of taxation, the paper duties were much less oppressive than on some other articles. The tax on tea, for example, which had been raised during the late war to no less than 18 s. 5d. a lb, was much more onerous; and it would be far wiser—so it was contended—to reduce the annual value of the duties on tea than to repeal the paper duties. Notwithstanding the opposition which the Paper Duties Bill undoubtedly excited, the proposal was carried in the Commons; it was, however, thrown out in the Lords, and its rejection led to a crisis which seemed at one time to threaten the good relations between the two houses of parliament. It was argued that if the Lords had the right to reject a measure remitting existing duties, they had in effect the right of imposing taxation, since there was no material difference between the adoption of a new tax and the continuance of an old one which the Commons had determined to repeal. Lord Palmerston, however, with some tact postponed the controversy for the time by obtaining the appointment of a committee to search for precedents; and, after the report of the committee, he moved a series of resolutions affirming the right of the Commons to grant aids and supplies as their exclusive privilege, stating that the occasional rejection of financial measures by the Lords had always been regarded with peculiar jealousy, but declaring that the Commons had the remedy in their own hands by so framing bills of supply as to secure their acceptance. In accordance with this suggestion the Commons in the following year again resolved to repeal the paper duties; but, instead of embodying their decision in a separate bill, they included it in the same measure as the proposed repeal of all the financial arrangements of the year, and thus threw on the Lords the responsibility of either accepting the proposal, or of paralysing the whole machinery of administration by depriving the crown of the supplies which were required for the public services. The Lords were not prepared to risk this result, and they accordingly accepted a reform which they could no longer resist, and the bill became law. In order to enable him to accomplish these great changes, Gladstone temporarily raised the income tax, which he found at 9d. in the £, to 10d. But the result of his reforms was so marked that he was speedily able to reduce it. The revenue increased by leaps and bounds, and the income tax was gradually reduced till it stood at 4d. in the closing years of the administration. During the same period the duty on tea was reduced from 15 s. 6d. to 6d. a lb; and the national debt was diminished from rather more than £800,000,000 to rather less than £750,000,000, the charge for the debt declining, mainly through the falling in of the long annuities, by some £2,600,000 a year. With the possible exception of Sir Robert Peel's term of office, no previous period of British history had been memorable for a series of more remarkable financial reforms. Their success redeemed the character of the administration. The
Liberals, who complained that their leaders were pursuing a Conservative policy, could at least console themselves by the reflection that the chancellor of the exchequer was introducing satisfactory budgets. The language, moreover, which Gladstone was holding on other subjects encouraged the more advanced Liberals to expect that he would ultimately place himself at the head of the party of progress. This expectation was the more reasonable, as Gladstone as the representative in the cabinet of the old Conservative party which Sir Robert Peel had led to victory. As lately as 1858 he had reluctantly refused to serve under Lord Derby; he was still a member of the Carlton Club; he sat for the university of Oxford; and on many questions he displayed a constant sympathy with Conservative traditions. Yet, on all the chief domestic questions which came before parliament in Lord Palmerston's second administration, Gladstone almost invariably took a more Liberal view than his chief. It was understood, indeed, that the relations between the two men were not always harmonious; that Lord Palmerston disapproved the resolute conduct of Gladstone, and that Gladstone disapproved the Conservative tendencies of Lord Palmerston. It was believed that Gladstone on more than one occasion desired to escape from a position which he disliked by resigning office, and that the resignation was only averted through a consciousness that the ministry could not afford to lose its most eloquent member.

While on domestic matters, other than those affecting finance, the Liberal ministry was pursuing a Conservative policy, its members were actively engaged on, and the attention of the public was keenly directed to affairs abroad. For the period was one of foreign unrest, and the wars which were then waged had left an enduring mark on the map of the world, and have affected the position of the Anglo-Saxon race for all time. In the far East, the operations which it had been decided to undertake in China were necessarily postponed on account of the diversion of the forces, intended to exact redress at Peking, to the suppression of mutiny in India. It was only late in 1858 that Lord Elgin and Baron Gros, the French plenipotentiary (for France joined England in securing simultaneous redress of grievances of her own), were enabled to obtain suitable reparation. It was arranged that the treaty, which was then provisionally concluded at Tientsin, should be ratified at Peking in the following year; and in June 1859 Mr (afterwards Sir Frederick) Bruce, Lord Elgin's brother, who had been appointed plenipotentiary, attempted to proceed up the Peiho with the object of securing the ratification. The allied squadron, however, was stopped at the forts at the mouth of the Peiho, which fired on the vessels; a landing party, which was dismembered to storm the forts, met with a disastrous check, and the squadron had to retire with an acknowledged loss of three gunboats and 400 men. This reverse necessitated fresh operations, and in 1860 Lord Elgin and Baron Gros were directed to return to China, and, at the head of an adequate force, were instructed to exact an apology for the attack on the allied fleets, the ratification and execution of the treaty of Tientsin, and the payment of an indemnity for the expenses of the war. The weakness of the Chinese empire was not appreciated at that time; the unfortunate incident on the Peiho in the previous summer had created an exaggerated impression of the strength of the Chinese armies, and some natural anxiety was felt for the success of the expedition. But the allied armies met with no serious resistance. The Chinese, indeed, endeavoured to delay their progress by negotiation rather than by force; and they succeeded in treacherously arresting some distinguished persons who had been sent into the Chinese lines to negotiate. But by the middle of October the Chinese army was decisively defeated; Peking was occupied; those British and French prisoners who had not succumbed to the hardships of their confinement were liberated. Lord Elgin determined on teaching the rulers of China a lesson by the destruction of the summer palace; and the Chinese government was compelled to submit to the terms of the Allies, and to ratify the treaty of Tientsin. There is no doubt that these operations helped to open the Chinese markets to British trade; but incidentally, by regulating the emigration of Chinese coolies, they had the unforeseen effect of exposing the industrial markets of the world to the serious competition of "cheap yellow" labour. A distinguished foreign statesman observed that Lord Palmerston had made a mistake. He thought that he had opened China to Europe; instead, he had let out the Chinese. It was perhaps a happier result of the war that it tended to the continuance of the Anglo-French alliance. French and British troops had again co-operated in a joint enterprise, and had shared the dangers and successes of a campaign.

War was not confined to China. In the beginning of 1859 diplomats were alarmed at the language addressed by the emperor of the French to the Austrian ambassador at Paris, which seemed to breathe the menace of a rupture. Notwithstanding the exertions which Great Britain made to avert hostilities, the provocation of Count Cavour induced Austria to declare war against Piedmont, and Napoleon thereupon moved to the support of his ally, promising to free Italy from the Alps to the Adriatic. As a matter of fact, the attitude of northern Germany, which was massing troops on the Rhine, and the defenceless condition of France, which was drained of soldiers for the Italian campaign, induced the emperor to halt before he had carried out his purpose, and terms of peace were hastily concerted at Villafranca, and were afterwards confirmed at Zurich, by which Lombardy was given to Piedmont, while Austria was left in possession of Venice and the Quadrilateral, and central Italy was restored to its former rulers. The refusal of the Italians to take back the Austrian grand dukes made the execution of these arrangements impracticable. Napoleon, indeed, used his influence to carry them into effect; but Lord John Russell, who was now in charge of the British foreign office, and who had Lord Palmerston and Gladstone on his side in the cabinet, gave a vigorous support to the claim of the Italians that their country should be allowed to regulate her own affairs. The French emperor had ultimately to yield to the determination of the inhabitants of central Italy, when it was backed by the arguments of the British foreign office, and Tuscany, Modena, Parma, as well as a portion of the states of the Church, were united to Piedmont. There was no doubt that through the whole of the negotiations the Italians were largely indebted to the labours of Lord John Russell. They recognized that they owed more to the moral support of England than to the armed assistance of France. The French emperor, moreover, took a step which lost him the sympathy of many. It appeared that the war he had arranged with Count Cavour that France should receive, as the price of her aid, the duchy of Savoy and the county of Nice. After Villafranca, the emperor, frankly recognizing that he had only half kept his promise, consented to waive his claim to these provinces. But, when he found himself unable to resist the annexation of central Italy to Piedmont, he reverted to the old arrangement. The formation of a strong Piedmontese kingdom, with the spoliation of the papal dominion, was unpopular in France; and he thought—perhaps naturally—that he must have something to show his people in return for sacrifices which had cost him the lives of 50,000 French soldiers, and concessions which the whole Catholic party in France resented. Cavour of course consented to the price which Napoleon thus exacted, and the frontier of France was accordingly extended to the Alps. But it is very doubtful whether Napoleon did not lose more than he gained by this addition to his territory. It certainly cost him the active friendship of Great Britain. The Anglo-French alliance had been already strained by the language of the French colonels in 1858 and the Franco-Austrian War of 1859; it never fully recovered from the shock which it received by the evidence, which the annexation of Savoy and Nice gave, of the ambition of the French emperor. The British people gave way to what Cobden called the last of the three panics. Lord Palmerston proposed and carried the provision of a large sum of money for the formation of the Crimean volunteer movement, which had its origin in 1859, received a remarkable stimulus in 1860. In this year the course of events in Italy
emphasized the differences between the policy of Great Britain and that of France. Garibaldi, with a thousand followers, made his famous descent on the coast of Sicily. After making himself master of that island, he crossed over to the mainland, drove the king of Naples out of his capital, and forced him to take refuge in Gaeta. In France these events were regarded with dismay. The people wished to stop Garibaldi's passage across the strait, and stationed his fleet at Gaeta to protect the king of Naples. Lord John Russell, on the contrary, welcomed Garibaldi's success with enthusiasm. He declined to intervene in the affairs of Italy by confining the great liberator to Sicily; he protested against the presence of the French fleet at Gaeta; and when other foreign nations denounced the conduct of Piedmont, he defended it by quoting Vattel and citing the example of William III. When, finally, Italian troops entered the dominions of the pope, France withdrew her ambassador from the court of Turin, and England under Lord John Russell's advice at once recognized the new kingdom of Italy.

In these great events—for the union of Italy was the greatest fact which had been accomplished in Europe since the fall of the first Napoleon—the British ministry had undoubtedly acquired credit. It was everywhere felt that the new kingdom owed much to the moral support which had been steadily and consistently given to it by Great Britain. Soon afterwards, however, in the autumn of 1863, the death of the king of Denmark led to a new revolution in the north of Europe, in which Lord Palmerston's government displayed less resolution, and lost much of the prestige which it had acquired by its Italian policy. The duchies of Schleswig and Holstein had been for centuries united to the kingdom of Denmark by the golden link of the crown; in other respects they had been organically kept distinct, while one of them—Holstein—was a member of the German confederation. The succession to the crown of Denmark, however, was different from that in the duchies. In Denmark the crown could descend, as it descends in Great Britain, through females. In the duchies the descent was confined to the male line; and, as Frederick VII., who ascended the Danish throne in 1848, had no direct issue, the next heir to the crown of Denmark under this rule was Prince Christian of Glücksburg, afterwards king; the next heir to the duchies being the duke of Augustenburg. In 1850 an arrangement had been made to prevent the separation of the duchies from the kingdom. As a result of a conference held in London, the duke of Augustenburg was induced to renounce his claim on the receipt of a large sum of money. Most of the great powers of Europe were parties to this plan. But the German confederation was not represented at the conference, and was not therefore committed to its conclusions. During the reign of Frederick VII. the Danish government endeavoured to cement the alliance between the duchies and the kingdom, and specially to separate the interests of Schleswig, which was largely Danish in its sympathies, from those of Holstein, which was almost exclusively German. With this object, in the last year of his life, Frederick VII. granted Holstein autonomous institutions, and bound Schleswig more closely to the Danish monarchy. The new king Christian IX. confirmed this arrangement. The German diet at Frankfort at once protested against it. Following up words with acts, it decided on occupying Holstein, and it delegated the duty of carrying out its order to Hanover and Saxony. While this federal execution was taking place, the duke of Augustenburg—regardless of the arrangements to which he had consented—delegated his rights in the duchies to his son, who formally recognised his father's misfortune. He had made some attempt to ascertain whether the emperor of the French would support him if he went to war. But he found that the emperor had not much fancy for a struggle which would have restored Holstein to Denmark; and that, if he went to war at all, his chief object would be the liberation of Venice and the rectification of his own frontiers. Even Lord Palmerston shrank from entering on a campaign which would have involved all Europe in conflagration and would have unsettled the boundaries of most continental nations; and the British government endeavoured thenceforward to stop hostilities by referring the question immediately in dispute to a conference in London. The labours of the conference proved abortive. Its members were unable to agree upon any methods of settlements, and the war went on. Denmark, naturally unable to grapple with her powerful antagonists, was forced to yield, and the two duchies which were the subject of dispute were taken from her.

The full consequences of this struggle were not visible at the time. It was impossible to foresee that it was the first step which was to carry Prussia forward, under her ambitious minister, to a position of acknowledged supremacy on the continent. But the results to Great Britain were plain enough. She had been mighty in words and weak in deeds. It was no doubt open to her to appeal, which she was the most wise people consider, that the cause of Denmark was not of sufficient importance to justify her in going to war. But it was not open to her to encourage a weak power to resist and then desert her in the hour of her necessity. Lord Palmerston should not have used the language which he employed in 1863 if he had not decided that his brave words would be followed by brave action. His conduct lowered the prestige of Great Britain at least as much as his Italian policy had raised it. Continental statesmen thenceforward assumed that Great Britain, however much she might protest, would not resort to arms, and the influence of England suffered, as it was bound to suffer, in consequence.
the one side the Confederate States—as the seceding states were called—were animated by a resolution to protect their property. On the other side the "conscience" of the North was excited by a passionate desire to wipe out the blot of slavery. Thus both parties were affected by some of the most powerful considerations which can influence mankind, while the North were further actuated by the natural incentive to preserve the union, which was threatened with disruption. The progress of the great struggle was watched with painful attention in England.

The most important manufacturing interest in England was paralysed by the loss of the raw cotton, which was obtained almost exclusively from the United States, and tens of thousands of workpeople were thrown out of employment. The distress which resulted naturally created a strong feeling in favour of intervention, which might terminate the war and open the Southern ports to British commerce; and the initial successes which the Confederates secured seemed to afford some justification for such a proceeding. In the course of 1862 indeed, when the Confederate armies had secured many victories, Gladstone, speaking at Newcastle, used the famous expression that President Jefferson Davis had "made a nation"; and Lord Palmerston's language in the House of Commons—while opposing a motion for the recognition of the South—induced the impression that his government was in the same position as Monroe's. The emperor Napoleon, in July of the same year, confidentially asked the British minister whether the moment had not come for recognizing the South; and in the following September Lord Palmerston was himself disposed in concert with France to offer to mediate on the basis of separation. Soon afterwards, however, the growing exhaustion of the South improved the prospects of the Northern States: an increasing number of persons in Great Britain objected to interfere in the interests of slavery; and the combatants were allowed to fight out their quarrel without the interference of Europe.

At the beginning of the war, Lord John Russell (who was made a peer as Earl Russell in 1861) acknowledged the Southern States as belligerents. His decision caused some ill-feeling at Washington; but it was inevitable. For the North had proclaimed a blockade of the Southern ports; and it would have been both inconvenient and unfair if Lord Russell had decided to recognize the blockade and had refused to acknowledge the belligerent rights of the Southern States. Lord Russell's decision, however, seemed to indicate some latent sympathy for the Southern cause; and the irritation which was felt in the North was increased by the news that the Southern States were accrediting two gentlemen to represent them at Paris and at London. These emissaries, Messrs Mason and Slidell, succeeded in running the blockade and in reaching Cuba, where they embarked on the "Trent," a British mail steamer sailing for England. On her passage home the "Trent" was stopped by the Federal steamer "San Jacinto"; she was boarded, and Messrs Mason and Slidell were arrested. There was no doubt that the captain of the "San Jacinto" had acted irregularly. While he had the right to stop the "Trent," examine the mails, and, if he found despatches for the enemy among them, carry the vessel into an American port for adjudication, he had no authority to board the vessel and arrest two of her passengers. "The British government, to use its own language, "could not allow such an affront to the national honour to pass without due reparation." They decided on sending what practically amounted to an ultimatum to the Federal government, calling upon it to liberate the prisoners and to make a suitable apology. The presentation of this ultimatum, which was accompanied by the despatch of troops to Canada, was very nearly provoking war with the United States. If, indeed, the ultimatum had been presented in the form in which it was originally framed, war might have ensued. But at the prince consorts' suggestion its language was considerably modified, and the responsibility for the outrage was thrown on the officer who committed it, and not on the government of the Republic. It ought not to be forgotten that this important modification was the last service rendered to his adopted country by the prince consort before his fatal illness. He died before the answer to the despatch was received; and his death deprived the queen of an adviser who had stood by her side since the earlier days of her reign, and who, by his prudence and conduct, had done much to raise the tone of the court and the influence of the crown. Happily for the future of the world, the government of the United States felt itself able to accept the despatch which had been thus addressed to it, and to give the reparation which was demanded; and the danger of war between the two great branches of the Anglo-Saxon race was averted. But, in the following summer, a new event excited fresh animosities, and aroused a controversy which endured for the best part of ten years.

The Confederates, naturally anxious to harass the commerce of their enemies, endeavoured from the commencement of hostilities to purchase armed cruisers from builders of neutral nations. In June 1862 the American minister in London drew Lord Russell's attention to the fact that a vessel, lately launched at Messrs Laird's yard at Birkenhead, was obviously intended to be employed as a Confederate cruiser. The solicitor to the commissioners of customs, however, considered that no facts had been revealed to authorize the detention of the vessel, and this opinion was reported in July to the American minister, Charles Francis Adams. He thereupon informed the government of additional facts, and at the same time furnished them with the opinion of an eminent English lawyer, R. P. Collier (afterwards Lord Monkswell), to the effect that "it would be difficult to make out a stronger case of infringement of the Foreign Enlistment Act, which if not enforced on this occasion is little better than a dead letter." These facts and this opinion were at once sent to the law officers. They reached the queen's advocate on Saturday the 26th of July; but, by an unfortunate mishap, the queen's advocate had just been wholly incapacitated by a distressing illness; and the papers, in consequence, did not reach the attorney-general till the evening of the following Monday, when they at once advised the government to detain the vessel. Lord Russell thereupon sent orders to Liverpool for her detention. In the meanwhile the vessel—probably aware of the necessity for haste—had put to sea, and had commenced the career which made her famous as the "Alabama." Ministers might even then have taken steps to stop the vessel by directing her detention in any British port to which she resorted for supplies. The cabinet, however, shrank from this course. The "Alabama" was allowed to prey on Federal commerce, and undoubtedly inflicted a vast amount of injury on the trade of the United States. In the autumn of 1862 Adams demanded redress for the injuries which had thus been sustained, and this demand was repeated for many years in stronger and stronger language. At last, in 1871, long after Lord Palmerston's death and Lord Russell's retirement, a joint commission was appointed to examine into the many cases of dispute which had arisen between the United States and Great Britain. The commissioners agreed upon three rules by which they thought neutrals should in future be bound, and recommended that they should be given a retrospective effect. They decided also that the claims which had arisen out of the depredations of the "Alabama" should be referred to arbitration. In the course of 1872 the arbitrators met at Geneva. Their finding was adverse to Great Britain, which was condemned to pay a large sum of money—more than £3,000,000—as compensation. A period of exceptional prosperity, which largely increased the revenue, enabled a chancellor of the exchequer to boast that the country had drunk itself out of the "Alabama" difficulty.

In October 1865 Lord Palmerston's rule, which had been characterized by six years of political inaction at home and by constant disturbance abroad, was terminated by his death. The ministry, which had suffered many losses from death during its duration, was temporarily reconstructed under Lord Russell; and the new minister at once decided to put an end to the period of internal stagnation, which had lasted so long, by the introduction of
new Reform Bill. Accordingly, in March 1866 Gladstone, who now led the House of Commons, introduced a measure which proposed to extend the county franchise to £4 4 and the borough franchise to £7 householders. The bill did not create much enthusiasm among Liberals, and it was naturally opposed by the Conservatives, who were reinforced by a large section of middle-class Liberalism: in the course of a phrase in one of Bright’s speeches, Adullamites. After many debates, in which the Commons showed little disposition to give the ministry any effective support, an amendment was carried by Lord Dunkellin, the eldest son of Lord Clancaride, basing the borough franchise on rating instead of rental. The cabinet, recognizing from the division that the control of the House had passed out of its hands, resigned office, and the queen was compelled to entrust Lord Derby with the task of forming a new administration.

For the third time in his career Lord Derby undertook the formidable task of conducting the government of the country with only a minority of the House of Commons to support him. The moment at which he made this third attempt was one of unusual anxiety. Abroad, the almost simultaneous outbreak of war between Prussia and Austria was destined to affect the whole aspect of continental politics. At home, a terrible murmur had fallen on the cattle, inflicting ruin on the agricultural interest; a grave commercial crisis was creating alarm in the city of London, and, in its consequences, injuring the interests of labour; while the working classes, at last roused from their long indifference, and angry at the rejection of Lord Russell’s bill, were assembling in their tens of thousands to demand reform. The cabinet determined to prohibit a meeting which the Reform League decided to hold in Hyde Park on the 23rd of July, and closed the gates of the park on the people. But the mob, converging on the park in thousands, surged round the railings, which a little inquiry might have shown were too weak to resist any real pressure. Either accidentally or intentionally, the railings were overturned in one place, and the people, perceiving their opportunity, at once threw them down round the whole circuit of the park. Few acts in Queen Victoria’s reign were attended with greater consequences. For the riot in Hyde Park led almost directly to a new Reform Act, and to the transfer of power from the middle classes to the masses of the people.

Yet, though the new government found it necessary to introduce a Reform Bill, a wide difference of opinion existed in the cabinet as to the form which the measure should take. Several of its members were in favour of assimilating the borough franchise to that in force in municipal elections, and practically conferring a vote on every householder who had three years’ residence in the constituency. General Peel, however—Sir Robert Peel’s brother—who held the seals of the war office, objected to this extension; and the cabinet ultimately decided on evading the difficulty by bringing forward a series of resolutions on which a scheme of reform, might ultimately be based. Their success in 1858, in dealing with the government of Ireland, in this way, commanded the decision to the acceptance of the cabinet. But it was soon apparent that the House of Commons required a definite scheme, and that it would not seriously consider a set of abstract resolutions which committed no one to any distinct plan. Hence on the 23rd of February 1867 the cabinet decided on withdrawing its resolutions and reverting to its original bill. On the following day Lord Cranborne—better known afterwards as Lord Salisbury—discovered that the bill had more democratic tendencies than he had originally supposed, and refused to be a party to it. On Monday, the 25th, the cabinet again met to consider the new difficulty which had thus arisen; and it decided (as was said afterwards by Sir John Pakington) in the case of a phrase for the measure a mild measure extending the borough franchise to houses rated at £5 a year, and conferring the county franchise on £20 householders. The bill, it was soon obvious, would be acceptable to no one; and the government again fell back on its original proposal. Three members of the cabinet, however, Lord Cranborne, Lord Carnarvon and General Peel, refused to be parties to the measure, and resigned office, the government being necessarily weakened by these defections. In the large scheme which the cabinet had now adopted, the borough franchise was conferred on all householders rated to the relief of the poor, who had for two years occupied the houses which gave them the franchise; the county franchise was given to the occupiers of all houses rated at £5 a year or upwards. But it was proposed that these extensions should be accompanied by an educational franchise, and a franchise conferred on persons who had paid twenty shillings in assessed taxes or income tax; the tax-payers who had gained a vote in this way being given a second vote in respect of the property which they occupied. In the course of the discussion on the bill in the House of Commons, the securities on which its authors had relied to enable them to stem the tide of democracy were, chiefly through Gladstone’s exertions, swept away. The dual vote was abandoned, direct payment of rates was surrendered, the county franchise was extended to £2 householders, and the redistribution of seats was largely increased. The bill, in the shape in which it had been introduced, had been surrounded with safeguards to property. With their loss it involved a great radical change, which placed the working classes of the country in the position of predominance which the middle classes had occupied since 1832.

The passage of the bill necessitated a dissolution of parliament; but it had to be postponed to enable parliament to supplement the English Reform Act of 1867 with measures applicable to Scotland and Ireland, and to give time for settling the boundaries of the new constituencies which had been created. This delay gave the Conservatives another year of office. But the first place in the cabinet passed in 1868 from Lord Derby to his lieutenant, Disraeli. The change added interest to political life. Thenceforward, for the next thirteen years, the chief places in the two great parties in the state were filled by the two men, Gladstone and Disraeli, who were unquestionably the ablest representatives of their respective followers. But the situation was also remarkable because power thus definitely passed from men who, without exception, had been born in the 18th century, and had all held cabinet offices before 1832, to men who had been born in the 19th century, and had only risen to cabinet rank in the ‘forties and the ‘fifties. It was also interesting to reflect that the Irish crisis of 1847 had begun a movement which gradually moved to the ranks of the Liberal party; while Disraeli had fought his first election under the auspices of O’Connell and Hume, had won his spurs by his attacks on Sir Robert Peel, and had been only reluctantly adopted by the Conservatives as their leader in the House of Commons.

The struggle commenced in 1868 on an Irish question. During the previous year considerable attention had been paid to a secret conspiracy in Ireland and among the Irish in America. The Fenians, as they were called, actually attempted insurrection in Ireland, and an invasion of Canada from the United States. At the beginning of 1866 Lord Russell’s government thought itself compelled to suspend the Habeas Corpus Act in Ireland; and in 1867 Lord Derby’s government was confronted in the spring by a plot to seize Chester Castle, and in the autumn by an attack on a prison van at Manchester containing Fenian prisoners, and by an atrocious attempt to blow up Clerkenwell prison. Conservative politicians deduced from these circumstances the necessity of applying firm government to Ireland. Liberal statesmen, on the contrary, desired to extinguish rebellion by remedying the grievances of which Ireland still complained. Chief among these was the fact that the Established Church in Ireland was the church of only a minority of the people. In March 1869 John Francis Manning, Bishop of the Irish Church, wrote to the House of Commons to resolve itself into a committee to take into immediate consideration the affairs of Ireland. Gladstone, in the course of the debate, declared that in his opinion the time had come when the Irish Church, as a political institution, should cease; and he followed up his declaration by a series of resolutions, which
were accepted by considerable majorities, pledging the House to its disestablishment. Disraeli, recognizing the full significance of this decision, announced that, as soon as the necessary preparations could be made, the government would appeal from the House to the country. Parliament was dissolved at the end of July, but the general election did not take place till the end of the following November. The future of the Irish Church naturally formed one of the chief subjects which occupied the attention of the electors, but the issue was largely determined by wider considerations. The country, after the long political truce which had been maintained by Lord Palmerston, was again ranged in two hostile camps, animated by opposing views. It was virtually asked to decide in 1868 whether it would put its trust in Liberal or Conservative, in Gladstone or Disraeli. By an overwhelming majority it threw its lot in favour of Gladstone; and Disraeli, without even venturing to meet parliament, took the unusual course of at once placing his resignation in the queen's hands.

The Conservative government, which thus fell, will be chiefly recollected for its remarkable concession to democratic principles by the passage of the Reform Act of 1867; but it deserves perhaps a word of praise for its conduct of a distant and unusual war. The emperor of Abyssinia had, for some time, detained some Englishmen prisoners in his country; and the government, unable to obtain redress in other ways, decided on sending an army to release them. The expedition, entrusted to Sir Robert Napier, afterwards Lord Napier of Magdala, was fitted out at great expense, and was rewarded with complete success. The prisoners were released, and the Abyssinian monarch committed suicide. Disraeli—who's oriental imagination was excited by the triumph incurred some ridicule by his bombastic declaration that "the standard of St George was hoisted upon the mountains of Rasselas." But the ministry could at least claim that the war had been waged to rescue Englishmen from captivity, that it had been conducted with skill, and that it had accomplished its object. The events of the Abyssinian war, however, were forgotten in the great political revolution which had swept the Conservatives from office and placed Gladstone in power. His government was destined to endure for more than five years. During that period it experienced the alternate prosperity and decline which nearly forty years before had been the lot of the Whigs after the passage of the first Reform Act. During its first two sessions it accomplished greater changes in legislation than had been attempted by any ministry since that of Lord Grey. In its three last sessions it was destined to sink into gradual disrepute; and it was ultimately swept away by a wave of popular reaction, as remarkable as that which had borne it into power.

It was generally understood that Gladstone intended to deal with three great Irish grievances—the three branches of the upas tree—the religious, agricultural and educational grievances. The session of 1869 was devoted to the first of these subjects. Gladstone introduced a bill disconnecting the Irish Church from the state, establishing a synod for its government, and—after leaving it in possession of its churches and its parsonages, and making ample provision for the life-interest of its existing clergy—devoting the bulk of its property to the relief of distress in Ireland. The bill was carried by large majorities through the House of Commons; and the feeling of the country was so strong that the Lords did not venture on its rejection. They satisfied themselves with engraving on it a series of amendments which, on the whole, secured rather more liberal terms of compensation for existing interests. Some of these amendments were adopted by Gladstone; a compromise was effected in respect of the others; and the bill, which had practically occupied the whole session, and had perhaps involved higher constructive skill than any measure passed in the previous half-century, became law.

Having dealt with the Irish Church in 1869, Gladstone turned to the more complicated question of Irish land. So far back as the 'forties Sir R. Peel had appointed a commission, known from its chairman as the Devon commission, which had recommended that the Irish tenant, in the event of disturbance, should receive some compensation for certain specified improvements which he had made in his holding. Parliament neglected to give effect to these recommendations; in a country where agriculture was the chief or almost only occupation, the tenant remained at his landlord's mercy. In 1870 Gladstone proposed to give the tenant a pecuniary interest in improvements, suitable to the holding, which he had made either before or after the passing of the act. He proposed also that, in cases of eviction, the smaller tenantry should receive compensation for disturbance. The larger tenants, who were supposed to be able to look after their own interests, were entirely debarred, and tenants enjoying leases were excluded from claiming compensation, except for tillages, buildings and reclamation of lands. A special court, it was further provided, should be instituted to carry out the provisions of the bill. Large and radical as the measure was, reversing many of the accepted principles of legislation by giving the tenant a quasi-partnership with the landlord in his holding, no serious opposition was made to it in either House of Parliament. Its details, indeed, were abundantly criticized, but its principles were hardly disputed, and it became law without any substantial alteration of its original provisions. In two sessions the branches of the upas tree had been summarily cut off. But parliament in 1870 was not solely occupied with the wrongs of Irish tenantry. In the same year Forster, as vice-president of the council, succeeded in carrying the great measure which for the first time made education compulsory. In devising his scheme, Forster endeavoured to utilize, as far as possible, the educational machinery which had been voluntarily provided by various religious organizations. He gave the institutions, which had been thus established, the full benefit of the assistance which the government was prepared to afford to board schools, on their adopting a conscience clause under which the religious susceptibilities of the parents of children were respected. This provision led to many debates, and produced the first symptoms of disruption in the Liberal party. The Nonconformists contended that no such aid should be given to any school which was not conducted on undenominational principles. Supported by the bulk of the Conservative party, Forster was enabled to defeat the dissenters.

In the session of 1871, two other events, for which the government had no direct responsibility, introduced new difficulties. War unexpectedly broke out between France and Prussia. The French empire fell; the German armies marched on Paris; and the Russian government, at Count Bismarck's instigation, took advantage of the collapse of France to repudiate the clause in the treaty of 1856 which neutralized the Black Sea. Lord Granville, who had succeeded Lord Clarendon at the foreign office, protested against this proceeding. But it was everywhere felt that his mere protest was not likely to affect the result; and the government at last consented to accept a suggestion made by Count Bismarck, and to take part in a conference to discuss the Russian proposal. Though this device enabled them to say that they had not yielded to the Russian demand, it was obvious that they entered the conference with the foregone conclusion of conceding the Russian claim. The attitude which the government thus chose to adopt was perhaps inevitable in the circumstances, but it confirmed the impression, which the abandonment of the cause of Denmark had produced in 1864, that Great Britain was not prepared to maintain its principles by going to war. The weakness of the British foreign office was emphasized by its consenting, almost at the same moment, to allow the claims of the United States, for the depredations of the "Alabama," to be settled under a rule only agreed upon in 1871. Most Englishmen now
appreciate the wisdom of a concession which has gained for them the friendship of the United States. But in 1871 the country resolved the manner in which Lord Granville had acted. Whatever credit the government might have derived from its domestic measures, it was discredited, or it was thought to be, by its foreign policy. In these circumstances legislation in 1871 was not marked with the success which had attended the government in previous sessions. The government succeeded in terminating a long controversy by abolishing ecclesiastical tests at universities. But the Lords ventured to reject a measure for the introduction of the ballot at elections, and refused to proceed with a bill for the abolition of purchase in the army. The result of these decisions was indeed remarkable. In the one case, it was not open to him to reverse the decision of the legislature by resorting to the prerogative. Two appointments, one to a judicial office, the other to an ecclesiastical preferment, in which Gladstone, about the same time, showed more disposition to obey the letter than the spirit of the law, confirmed the impression which the abolition of purchase had made. Great reforming ministers would do well to recollect that the success of even liberal measures may be dearly purchased by the resort to what are regarded as unconstitutional expedients.

In the following years the embarrassments of the government were further increased. In 1872 Bruce, the home secretary, succeeded in passing a measure of licensing reform. But the abstainers condemned the bill as inadequate; the publicans denounced it as oppressive; and the whole strength of the licensed victuallers was thenceforward arrayed against the ministry. In 1873 Gladstone attempted to complete his great Irish measures by conferring on Ireland the advantage of a university which would be equally acceptable to Protestants and Roman Catholics. But his proposal again failed to satisfy those in whose interests it was proposed. The second reading of the bill was rejected by a small majority, and Gladstone resigned; but, as Disraeli could not form a government, the ministry continued in office. The power of the great minister was, however, spent; his ministry was hopelessly discredited. History, in fact, was repeating itself. The ministry was suffering, as Lord Grey's government had suffered nearly forty years before, from the effect of its own successes. It had accomplished more than any of its supporters had expected, but in doing so it had harassed many interests and excited much opposition. Gladstone endeavoured to meet the storm by a rearrangement of his crew. Bruce, who had offended the licensed victuallers, was removed from the home office, and made a peer and president of the council. Lowe, who had incurred unpopularity by his fiscal measures, and especially by an abortive suggestion for the taxation of matches, was transferred from the exchequer to the home office, and Gladstone himself assumed the duties of chancellor of the exchequer. He thereby created a difficulty for himself which he had not foreseen. At the end of 1873 he had not been contemplated in 1867. He had not been transferred from one office to another. He had accepted a new in addition to his old office. It was, however, uncertain whether his action in this respect was wise, or had not, vacated his seat. It would be unfair to suggest that the inconvenient difficulty with which he was thus confronted determined his policy, though he was probably insensibly influenced by it. However this may be, on the eve of the session of 1874 he suddenly decided to dissolve parliament and to appeal to the country. He announced his decision in an address to his constituents, in which, among other financial reforms, he promised to repeal the income tax. The course which Gladstone took, and the bait which he held out to the electors, were generally condemned. The country, wearied of the ministry and of its measures, almost everywhere supported the Conservative candidates. Disraeli found himself restored to power at the head of an overwhelming majority, and the great minister who, five years before, had achieved so marked a triumph temporarily withdrew from the leadership of the party to which he had accomplished such important results. His ministry had been essentially of a ministerial character, and its closing days were memorable for one little war in which a great soldier increased a reputation already high. Sir Garnet Wolseley triumphed over the difficulties which the climate of the west coast of Africa imposes on Europeans, and brought a troublesome contest with the Ashanti to a successful conclusion.

The history of Disraeli's second administration affords an exact reverse to that of Gladstone's first cabinet. In legislation the ministry attempted little and accomplished less. They did something to meet the wishes of the publicans, whose discontent had contributed largely to Gladstone's defeat, by amending some of the provisions of Bruce's licensing bill; they supported and succeeded in passing a measure, brought in by the primate, to restrain some of the irregularities which the Ritualists were introducing into public worship; and they were compelled by the violent insistence of Pimlott to pass an act to protect the lives of merchant seamen. Disraeli's government, however, will be chiefly remembered for its foreign policy. Years before he had propounded in Tancred the theory that England should aim at eastern empire. Circumstances in his second term of office enabled him to translate his theory into practice. In 1875 the country was suddenly startled at hearing that it had acquired possessions and responsibilities in Egypt by the purchase of the shares which the khedive of Egypt held in the Suez Canal. In the following spring a new surprise was afforded by the introduction of a measure authorizing the queen to assume the title of empress of India. But these significant actions were almost forgotten in the presence of a new crisis; for in 1876 misgovernment in Turkey had produced its natural results, and the European provinces of the Porte were in a state of armed insurrection. In the presence of a grave danger, Count Andrassy, the Austrian minister, drew up a note which was afterwards known by his name, declaring that the Porte had failed to carry out the promises of reform which she had made, and that some combined action on the part of Europe was necessary to compel her to do so. The note was accepted by the three continental empires, but Great Britain refused in the first instance to assent to it, and only ultimately consented at the desire of the Porte, whose statesmen seem to have imagined that the nominal co-operation of England would have the effect of restraining the action of other powers. Turkey accepted the note and renewed the promises of reform, which she had so often made, and which meant so little. The three northern powers then proposed a memorandum, in which they demanded an armistice, and proposed to watch over the completion of the reforms which the Porte had promised. The British government refused to be a party to this memorandum, which in consequence became abortive. The insurrection increased in intensity. The sultan Abdul Aziz, thought unequal to the crisis, was hastily deposed; he was either murdered or led to commit suicide; and insurrection in Bulgaria was stamped out by massacre. The story of the "Bulgarian atrocities" was published in Great Britain in the summer of 1876. Disraeli characteristically dismissed it as "coffee-house babble," but official investigation proved the substantial accuracy of the reports which had reached England. The people regarded these events with horror. Gladstone, emerging from his retirement, denounced the conduct of the
Turks. In a phrase which became famous he declared that the only remedy for the European provinces of the Porte was to turn out the Ottoman government “bag and baggage.” All England was at once arrayed into two camps. One party was led by Disraeli, who was supposed to represent the traditional policy of England of maintaining the rule of the Turk at all hazards; the other, inspired by the example of Gladstone, was resolved at all costs to terminate oppression, but was at the same time distrust ed as indirectly assisting the ambitious views by which the Eastern policy of Russia had always been animated. The crisis soon began intense. In June 1876 Servia and Montenegro declared war against Turkey. In a few months Servia was hopelessly beaten. Through the insistence of Russia an armistice was agreed upon; and Lord Beaconsfield—for Disraeli had now been raised to the peerage—endeavoured to utilize the breathing space by organizing a conference of the great powers at Constantinople, which was attended on behalf of Great Britain by Lord Salisbury. The Constantinople conference proved abortive, and in the beginning of 1877 Russia declared war. For some time, however, her success was hardly equal to her expectations. The Turks, entrenched at Plevna, delayed the Russian army; and it was not until towards the close of 1877 that Plevna at last fell and Turkish resistance collapsed. With its downfall the war party in England, which was led by the prime minister, increased in violence. From the refrain of a song, sung night after night at a London music hall, its members became known as Jingoes. The government ordered the British fleet to pass the Dardanelles and go up to Constantinople; and though the order was subsequently withdrawn, it asked for and obtained a grant of £6,000,000 for naval and military purposes. When news came that the Russian armies had reached Adrianople, that they had concluded some arrangement with the Turks, and that they were pressing forward towards Constantinople, the fleet was again directed to pass the Dardanelles. Soon afterwards the government decided to call out the reserves and to bring a contingent of Indian troops to the Mediterranean. Lord Derby,1 who was at the foreign office, thereupon retired from the ministry, and was succeeded by Lord Salisbury. Lord Derby’s resignation was everywhere regarded as a proof that Great Britain was on the verge of war. Happily this did not occur. At Prince Bismarck’s suggestion Russia consented to refer the treaty which she had concluded at San Stefano to a congress of the great powers; and the congress, at which Great Britain was represented by Lord Beaconsfield and Lord Salisbury, succeeded in substituting for the treaty of San Stefano, the treaty of Berlin. The one great advantage derived from it was the tacit acknowledgment by Russia that Europe could alone alter arrangements which Europe had made. In every other sense it is doubtful whether the provisions of the treaty of Berlin were more favourable than those of the treaty of San Stefano. On Lord Beaconsfield’s return, however, he claimed for Lord Salisbury and himself that they had brought back “peace with honour,” and the country accepted with wild delight the phrase, without taking much trouble to analyse its justice.

If Lord Beaconsfield had dissolved parliament immediately after his return from Berlin, it is possible that the wave of popular enthusiasm which some parts had raised by his success would have borne him forward to a fresh victory in the constituencies. His omission to do so gave the country time to meditate on the consequences of his policy. One result soon became perceptible. Differences with Russia produced their inevitable consequences in fresh complications on the Indian frontier. The Russian government, confronted with a quarrel with Great Britain in eastern Europe, endeavoured to create difficulties in Afghanistan. A Russian envoy was sent to Kabul, where Shere Ali, who had succeeded his father Dost Mahommed in 1863, was amir; and the British government, alarmed at this new embarrassment, decided on sending a mission to the Afghan capital. The mission was stopped on the frontier by an agent of Shere Ali, who declined to allow it to proceed. The British government refused to put up with an affront of this kind, and their envoy, supported by an army, continued his advance. Afghanistan was again invaded. Kabul and Kandahar were occupied; and Shere Ali was forced to fly, and soon afterwards died. His successor, Yakub Khan, came to the British camp and signed, in May 1879, the treaty of Gandamak. Under the terms of this treaty the Indian government undertook to pay the new amir a subsidy of £60,000 a year; and Yakub Khan consented to receive a British mission at Kabul, and to cede some territory in the Himalayas which the military advisers of Lord Beaconsfield considered necessary to make the frontier more “scientific.” This apparent success was soon followed by disastrous news. The plorable events of 1871 were re-enacted in 1879. The new envoy reached Kabul, but was soon afterwards murdered. A British army was again sent into Afghanistan, and Kabul was again occupied. Yakub Khan, who had been made amir in 1879, was deposed, and Abdur Rahman Khan was selected as his successor. The British did not assert their superiority without much fighting and some serious reverses. Their victory was at last assured by the excellent strategy of Sir Donald Stewart and Sir Frederick (afterwards Lord) Roberts. But before the final victory was gained Lord Beaconsfield had fallen. His policy had brought Great Britain to the verge of disaster in Afghanistan: the credit of reasserting the superiority of British arms was deferred till his successors had taken office.

It was not only in Afghanistan that the new imperial policy which Lord Beaconsfield had done so much to encourage was straining the resources of the empire. In South Africa a still more serious difficulty was already commencing. At the time at which Lord Beaconsfield’s administration began, British territory in South Africa was practically confined to Cape Colony and Natal. Years before, in 1872 and 1873 respectively, the British government, at that time a little weary of the responsibilities of colonial rule, had recognized the independence of the two Dutch republics, the Transvaal and the Orange Free State. Powerful native tribes occupied the territory to the north of Natal and the east of the Transvaal. War broke out between the Transvaal Republic and one of the most powerful of these native chieftains, Sikukini; and the Transvaal was worsted in the struggle. Wariness of the condition of anarchy which existed in the republic, many inhabitants of the Transvaal were ready to welcome its annexation to Great Britain—a proposal which had been made by the colonial secretary, Lord Carnarvon, who wished to federate the South African states, after the manner in which the North American colonies had become by confederation the Dominion of Canada. Sir Theophilus Shepstone, who was sent to inquire into the proposal, mistook the opinion of a party for the verdict of the republic, and declared (April 1877) the Transvaal a part of the British Empire. His policy entailed far more serious consequences than the mission to Afghanistan. The first was a war with the Zulus, the most powerful and warlike of the South African natives, who under their ruler, Cetewayo, had organized a formidable army. A dispute had been going on for some time about the possession of a strip of land which some of the so-called arbitrators had awarded to the Zulu king. Sir Bartle Frere, who had won distinction in India, and was sent out by Lord Beaconsfield’s government to the Cape, kept back the award; and, though he ultimately communicated it to Cetewayo, thought it desirable to demand the disbandment of the Zulu army. In the war which ensued, the British troops who invaded Zulu territory met with a severe reverse; and, though the disaster was ultimately retrieved by Lord Chelmsford, the war involved heavy expenditure and brought little credit to the British army, while one unfortunate incident, the death of Prince Napoleon, who had obtained leave to serve with the British troops, and was surprised by the Zulus while reconnoitring, created a deep and unfortunate impression. Imperialism, which had been excited by Lord Beaconsfield’s policy in 1878, and by the prospect of a war with a great European power, fell into discredit when it degenerated into a fresh expedition into
Afghanistan, and an inglorious war with a savage African tribe. A period of distress at home increased the discontent which Lord Beaconsfield’s external policy was exciting; and, when parliament was at last dissolved in 1880, it seemed no longer certain that the country would endorse the policy of the minister, who only a short time before had acquired such popularity. Gladstone, emerging from his retirement, practically placed himself again at the head of the Liberal party. In a series of speeches in Midlothian, where he offered himself for election, he denounced the whole policy which Lord Beaconsfield had pursued. His impassioned eloquence did much more than influence his own election. His speeches decided the contest throughout the kingdom. The Liberals secured an even more surprising success than that which had rewarded the Conservatives six years before. For the first time in the queen’s reign, a solid Liberal majority, independent of all extraneous Irish support, was returned, and Gladstone resumed in triumph his old position as prime minister.

The new minister had been swept into power on a wave of popular favour, but he inherited from his predecessors difficulties in almost every quarter of the world; and his own language had perhaps tended to increase them. He was committed to a Three-In-One doctrine by the Belts’ policy; and, in politics, it is never easy, and perhaps rarely wise, suddenly and violently to change a system. In one quarter of the world the new minister achieved much success. The war in Afghanistan, which had begun with disaster, was credibly concluded. A better understanding was gradually established with Russia; and, before the ministry went out, steps had been taken which led to the delimitation of the Russian and Afghan frontier. In South Africa, however, a very different result ensued. Gladstone, before he accepted office, had denounced the policy of annexing the Transvaal; his language was so strong that he was charged with encouraging the Boers to maintain their independence by force; his example had naturally been imitated by some of his followers at the general election; and, when he resumed power, he found himself in the difficult dilemma of either maintaining an arrangement which he had declared to be unwise, or of yielding to a demand which the Boers were already threatening to support in arms. The events of the first year of his administration added to his difficulty. Before its close the Boers seized Heidelberg and established a republic; they destroyed a detachment of British troops at Bronkhorst Spruit; and they surrounded and attacked the British garrisons in the Transvaal. Troops were of course sent from England to maintain the British cause, and Sir George Colley, who enjoyed a high reputation and had experience in South African warfare, was made governor of Natal, and entrusted with the military command. The events which immediately followed will not be easily forgotten. Wholly miscalculating the strength of the Boers, Sir George Colley, at the end of January 1881, attacked them at Laing’s Nek, in the north of Natal, and was repulsed with heavy loss. Some ten days afterwards he fought another action on the Ingogo, and was again forced to retire. On the 26th February, with some 600 men, he occupied a hill, known as Majuba, which, he thought, dominated the Boers, who thus began to attack the hill, overwhelmed its defenders, and Sir George Colley was himself killed in the disastrous contest on the summit. News of these occurrences was received with dismay in England. It was, no doubt, possible to say a good deal for Gladstone’s indignant denunciation of his predecessor’s policy in annexing the Transvaal; it would have been equally possible to advance many reasons for reversing the measures of Lord Beaconsfield’s cabinet, and for conceding independence to the Transvaal in 1880. But the great majority of persons considered that, whatever arguments might have been urged for concession in 1880, when British troops had suffered no reverses, nothing could be said for concession in 1881, when their arms had been tarnished by a humiliating disaster. Great countries can afford to be generous in the hour of victory; but they cannot yield, without loss of credit, in the hour of defeat. Unfortunately this reasoning was not suited to Gladstone’s temperament. The justice or injustice of the British cause seemed to him a much more important matter than the vindication of military honour; and he could not bring himself to acknowledge that Majuba had altered the situation, and that the terms which he had made up his mind to concede before the battle could not be safely granted till military reputation was restored. The retrocession of the Transvaal was decided upon, though it was provided that the country should remain under the suzerainty of the queen. Even this great concession did not satisfy the ambition of the Boers, who were naturally elated by their victory. Three years later some Transvaal deputies, with their president, Kruger, came to London and saw Lord Derby, the secretary of state for the colonies. Lord Derby consented to a new convention, from which any verbal reference to suzerainty was excluded; and the South African republic was made independent, subject only to the condition that it should conclude no treaties with foreign powers without the approval of the crown. (For the details and disputes concerning the terms of this convention the reader is referred to the articles Transvaal and Suzerainty.)

Gladstone’s government declined in popularity from the date of this convention. Gladstone, in fact, had succeeded in doing what Lord Beaconsfield had failed to accomplish. Annoyance at his foreign policy had rekindled the imperialism which the embarrassments created by Lord Beaconsfield had done so much to damp down. And, if things were going badly with the new government abroad, matters were not progressing smoothly at home. At the general election of 1880, the borough of Northampton, which of late years has shown an unwavering preference for Liberals of an advanced type, returned as its members Henry Labouchere and Charles Bradlaugh. Bradlaugh, who had attained some notoriety for an aggressive atheism, claimed the right to make an affirmation of allegiance instead of taking the customary oath, which he declared was, in his eyes, a meaningless form. The speaker, instead of deciding the question, submitted it to the judgment of the House, and it was ultimately referred to a select committee, which reported against Bradlaugh’s claim. Bradlaugh, on hearing the decision of the committee, presented himself at the bar and offered to take the oath. It was objected that, as he had publicly declared that the words of the oath had no clear meaning for him, he could not be permitted to take it; and after some wrangling the matter was referred to a fresh committee, which supported the view that Bradlaugh could not be allowed to take the oath. He should be permitted to make the affirmation at his own risk. The House refused to accept the recommendation of this committee when a bill was introduced to give effect to it. This decision naturally enlarged the question before it. For, while hitherto the debate had turned on the technical points whether an affirmation could be substituted for an oath, or whether a person who had declared that an oath had no meaning for him could properly be sworn, the end at which Bradlaugh’s opponents were thenekooward aiming was the imposition of a new religious test—the belief in a God—on members of the House of Commons. The controversy, which of which began, continued through the parliament of 1886, and led to many violent scenes, which lowered the dignity of the House. It was quietly terminated, in the parliament of 1886, by the firm action of a new speaker. Mr Peel, who had been elected to the chair in 1884, decided that neither the speaker nor any other member had the right to intervene to prevent a member from taking the oath if he was willing to take it. Parliament subsequently, by a new act, permitted affirmations to be used, and thenceforward religion, or the absence of religion, was no disqualification for a seat in the House of Commons. The atheist, like the Roman Catholic and the Jew, could sit and vote.

The Bradlaugh question was not the only difficulty with which the new government was confronted. Ireland was again attracting the attention of politicians. The Fenian movement had practically expired; some annual motions for the introduction of Home Rule, made with all the decorum of
parliamentary usage, had been regularly defeated. But the Irish were placing themselves under new leaders and adopting new methods. During the Conservative government of 1874, the Irish members had endeavoured to arrest attention by organized obstruction. Their efforts had increased the difficulties of government and taxed the endurance of parliament. These tactics were denounced with some effect by Parnell, who succeeded to the head of the Irish party at the time of the formation of Gladstone's government. It was Parnell's determination to make legislation impracticable, and parliament unendurable, till Irish grievances were redressed. It was his evident belief that by pursuing such tactics he could force the House of Commons to concede the legislation which he desired. The Irish members were not satisfied with the legislation which parliament had passed in 1869-1870. The land act of 1870 had given the tenant no security in the case of eviction for non-payment of rent; and the tenant whose rent was too high or had been raised was at the mercy of his landlord. It so happened that some bad harvests had temporarily increased the difficulties of the tenantry, and there was no doubt that large numbers of evictions were taking place in Ireland. In these circumstances, the Irish contended that the relief which the act of 1870 had afforded should be extended, and that, till such legislation could be devised, a temporary measure should be passed giving the tenant compensation for disturbance. Gladstone admitted the force of this reasoning, and a bill was introduced to give effect to it. Passed by the Commons, it was thrown out towards the end of the session by the Lords; and the government acquiesced—perhaps could do nothing but acquiesce—in this decision. In Ireland, however, the rejection of the measure was attended with disastrous results. Outrages increased, obnoxious landlords and agents were "boycotted"—the name of the first gentleman exposed to this treatment adding a new word to the language; and Forster, who had accepted the office of chief secretary, thought it necessary, in the presence of outrage and intimidation, to adopt stringent measures for enforcing order. A measure was passed on his initiation, in 1881, authorizing him to arrest and detain suspected persons; and many well-known Irishmen, including Parnell himself and other members of parliament, were thrown into prison. It was an odd commentary on parliamentary government that a Liberal ministry should be in power, and that Irish members should be in prison; and early in 1882 Gladstone determined to liberate the prisoners on terms. The new policy—represented by what was known as the Kilmainham Treaty—led to the resignation of the viceroy, Lord Cowper, and of Forster, and the appointment of Lord Spencer and Lord Frederick Cavendish as their successors. On the 6th of May 1882 Lord Spencer made his entry into Dublin, and on the evening of the same day Lord Frederick, unwisely allowed to walk home alone with Burke, the under-secretary to the Irish government, was murdered with his companion in Phoenix Park. This gross outrage led to fresh measures of coercion. The disclosure, soon afterwards, of a conspiracy to resort to dynamite still further alienated the sympathies of the Liberal party from the Irish nation. Gladstone maintained that he had done much, that he had risked much, for Ireland, and that Ireland was making him a poor return for his services.

In the meanwhile another difficulty was further embarrassing a harassed government. The necessities of the khedive of Egypt had been only temporarily relieved by the sale to Lord Beaconsfield's government of the Suez Canal shares. Egyptian finance, in the interests of the bondholders, had been placed under the "dual control of England and France. The new arrangement naturally produced some national resentment, and Arabi Pasha placed himself at the head of a movement which was intended to rid Egypt of foreign interference. His preparations were tactfully led to the bombardment of Alexandria by the British fleet, and still later to the invasion of Egypt by a British army under Sir Garnet, afterwards Lord Wolseley, and to the battle of Tell-el-Kebir, after which Arabi was defeated and taken prisoner. The bombardment of Alexandria led to the immediate resignation of Bright, whose presence in the cabinet had been of importance to the government; the occupation of Egypt broke up the dual control, and made Great Britain responsible for Egyptian administration. The effects of British rule were, in one sense, remarkable. The introduction of good government increased the prosperity of the people, and restored confidence in Egyptian finance. At the same time it provoked the animosity of the French, who were naturally jealous of the increase of British influence on the Nile, and it also threw new responsibilities on the British nation. For south of Egypt lay the great territory of the Sudan, which to some extent commands the Nile, and which had been added to the Egyptian dominions at various periods between 1820 and 1875. In 1881 a fanatic sheik—known as the mahdi—had headed an insurrection against the khedive's authority; and towards the close of 1883 an Egyptian army under an Englishman, Colonel Hicks, was annihilated by the mahdi's followers. The insurrection increased the responsibilities which intervention had imposed on England, and an expedition was sent to Suakin to guard the littoral of the Red Sea; while, at the beginning of 1884, General Gordon—who survived in Khartoum to win him a high reputation, and who had had previous experience in the Sudan—was sent to Khartoum to report on the condition of affairs. These decisions led to momentous results. The British expedition to Suakin was engaged in a series of battles with Osman Digna, the mahdi's lieutenant; while General Gordon, after alternate reverses and successes, was isolated at Khartoum. Anxious as Gladstone's ministry was to restrict the sphere of its responsibilities, it was compelled to send an expedition to relieve General Gordon; and Lord Wolseley, who was appointed to the command, decided on moving up the Nile to his relief. The expedition proved much more difficult than Lord Wolseley had anticipated. And before it reached its goal, Khartoum was forced to surrender, and General Gordon and his few faithful followers were murdered (January 1885). General Gordon's death inflicted a fatal blow on the Liberal government. It was thought that the general, whose singular devotion to duty made him a popular hero, had been allowed to assume an impossible task; had been feebly supported; and that the measures for his relief had been unduly postponed and at last only reluctantly undertaken. The ministry ultimately experienced defeat on a side issue. The budget, which Childers brought forward as chancellor of the exchequer, was attacked by the Conservative party; and an amendment proposed by Sir Michael Hicks-Benzie, condemning an increase in the duties on spirits and beer, was adopted by a small majority. Gladstone resigned office, and Lord Salisbury, who, after Lord Beaconsfield's death, had succeeded to the lead of the Conservative party, was instructed to form a new administration. It was obvious that the new government, as its first duty, would be compelled to dissolve the parliament that had been elected when Gladstone was enjoying the popularity which he had lost so rapidly in office. But it so happened that it was no longer possible to appeal to the old constituencies. For, in 1884, Gladstone had introduced a new Reform Bill; and, though its passage had been arrested by the Lords, unofficial communications from both parties had resulted in a compromise which had led to the adoption of a large and comprehensive Reform Act. By this measure, household franchise was extended to the counties. But counties and boroughs were broken up into a number of small constituencies, for the most part returning only one member each; while the necessity of increasing the relative weight of Great Britain, and the reluctance to inflict disfranchisement on Ireland, led to an increase in the numbers of the House of Commons from 658 to 670 members. This radical reconstruction of the electorate necessarily made the result of the elections doubtful. As a matter of fact, the new parliament comprised 334 Liberals, 250 Conservatives and 86 Irish Nationalists. It was plain beyond the possibility of doubt that the future depended on the course which the Irish Nationalists might adopt. It they threw in their lot with Gladstone, Lord Salisbury's
government was evidently doomed. If, on the contrary, they joined the Conservatives, they could make a Liberal administration impracticable.

In the autumn of 1885 it was doubtful what course the Irish Nationalists would take. It was generally understood that Lord Carnarvon, who had been viceroy of Ireland, had been in communication with Parnell; that Lord Salisbury was aware of the interviews which had taken place; and it was whispered that Lord Carnarvon was in favour of granting some sort of administrative autonomy to Ireland. Whatever opinion Lord Carnarvon may have formed—and his precise view is uncertain—a greater man than he had suddenly arrived at a similar conclusion. In his election speeches Gladstone had insisted on the necessity of the country returning a Liberal majority which could act independently of the Irish vote; and the result of the general election had left the Irish the virtual arbiters of the political situation. In these circumstances Gladstone arrived at a momentous decision. He recognized that the system under which Ireland had been governed in the past had failed to win the allegiance of her people; and he decided that it was wise and safe to entrust her with a large measure of administrative autonomy, as Gladstone, though it was unquestionably unfortunate, that, in determining on this radical change of policy, he consulted few, if any, of his previous colleagues. On the meeting of the new parliament Lord Salisbury's government was defeated on an amendment to the address, demanding facilities for agricultural labourers to obtain small holdings for gardens and pasture—the policy, in short, which was described as "three acres and a cow." Lord Salisbury resigned, and Gladstone resumed power. The attitude, however, which Gladstone was understood to be taking on the subject of Home Rule threw many difficulties in his way. Lord Hartington, and others of his former colleagues, declined to join his administration; Mr. Chamberlain, who, in the first instance, accepted office, retired almost at once from the ministry; and Bright, whose eloquence and past services gave him a unique position in the House, threw in his lot in opposition to Home Rule. A split in the Liberal party thus began, which was destined to endure; and Gladstone found his difficulties increased by the defection of the men on whom he had hitherto largely relied. He persevered, however, in the task which he had set himself, and introduced a measure endowing Ireland with a parliament, and excluding the Irish members from Westminster. He was defeated, and appealed from the House which had rejected his measure. For the first time in the queen's reign two general elections occurred within twelve months. The country showed no more disposition than the House of Commons to approve the course which the minister was taking. A large majority of the members of the new parliament were pledged to resist Home Rule. Gladstone, bowing at once to the verdict of the people, resigned office, and Lord Salisbury returned to power.

The new cabinet, which was formed to resist Home Rule, did not succeed in combining all the opponents to this measure. Unionism. The secessionists from the Liberal party—the Liberal Unionists—were led by Lord Iddesleigh, while Lord Salisbury himself returned to the foreign office, which the dramatically sudden death of Lord Iddesleigh, better known as Sir Stafford Northcote, vacated. These arrangements lasted till 1891, when, upon Smith's death, the treasury and the lead of the Commons were entrusted to Lord Salisbury's nephew, Mr. Arthur Balfour, who had made a great reputation as chief secretary for Ireland.

The ministry of 1886, which endured till 1892, gave to London a county council; introduced representative government into every English county; and made elementary education free throughout England. The alliance with the Liberal Unionists was, in fact, compelling the Conservative government to promote measures which were not wholly consistent with the stricter Conservative traditions, or wishes. In other respects, the legislative achievements of the government were not great; and the time of parliament was largely occupied in debates for the conduct of its business, which the obstructive attitude of the Irish members made necessary, and in discussing the charges brought against the Nationalist party by The Times, of complicity in the Phoenix Park murders. Under the new rules, the sittings of the House on ordinary days were made to commence at 3 p.m., and opposed business was automatically interrupted at midnight, while for the first time a power was given to the majority in a House of a certain size to conclude debate by what was known as the closure. Notwithstanding the government's opposition to such obstructive tactics continued to prevail; and, in the course of the parliament many members were suspended for disorderly conduct. The hostility of the Irish members was perhaps increased by some natural indignation at the charges brought against Parnell. The Times, in April 1887, printed the facsimile of a letter purporting to be signed by Parnell, in which he declared that he had no other course open to him but to denounce the Phoenix Park murders, but that, while he regretted "the accident" of Lord Frederick Cavendish's death, he could not "refuse to admit that Burke got no more than his deserts." The publication of this letter, and later of other similar documents, naturally created a great sensation; and the government ultimately appointed a special commission of three judges to inquire into the charges and allegations that were made. In the course of the inquiry it was proved that the letters had emanated from a man named Pigott, who, had at one time been associated with the Irish Nationalist movement, but who for some time past had earned a precarious living by writing begging and threatening letters. Pigott, subjected to severe cross-examination by Sir Charles Russell (afterwards Lord Russell of Killowen), broke down, fled from justice and committed suicide. His flight practically settled the question; and an inquiry, which many people had thought at its inception would last for years, settled nothing. The excitement which witnessed his triumph, he was doomed to fall. He was made co-responsible in a divorce suit brought by Captain O'Shea—another Irishman—for the dissolution of his marriage; and the disclosures made at the trial induced Gladstone, who was supported by the Nonconformists generally throughout the United Kingdom, to request Parnell to withdraw from the leadership of the Irish party. Parnell refused to comply with this request, and the Irish party was shattered into fragments by his decision. Parnell himself did not long survive the disruption of the party which he had done so much to create. The exertions which had retrieved his waning influence proved too much for his strength, and in the autumn of 1891 he died suddenly at Brighton. Parnell's death radically altered the political situation. At the general elections of 1885 and 1886 the existence of a strong united Irish party had exercised a dominating influence. As the parliament of 1886 was drawing to a close, the dissensions among the Irish members, and the loss of their great leader, were visibly sapping the strength of the Nationalists. At the general election of 1892 Home Rule was still the prominent subject before the electors. But the English Liberals were already a little weary of ostensibly being quarrelling among themselves, and whose disputes were introducing a new factor into politics. The political struggle virtually turned not on measures, but on men. Gladstone's great age, and the marvellous powers which he displayed at a time when most men seek the repose of
His influence enabled him to secure a small Liberal majority. But it was noticed that the majority depended on Scottish, Irish and Welsh votes, and that England—the "predominant partner," as it was subsequently called by Lord Rosebery—returned a majority of members pledged to resist any attempt to dissolve the union between the three kingdoms.

On the meeting of the new parliament Lord Salisbury's government was defeated on a vote of want of confidence for a fourth time Gladstone became prime minister.

In the session of 1893 he again introduced a Home Rule Bill. But the measure of 1893 differed in many respects from that of 1886. In particular, the Irish were no longer to be excluded from the imperial parliament at Westminster. The bill which was thus brought forward was actually passed by the Commons. It was, however, rejected by the Lords. The dissensions among the Irish themselves, and the hostility which English constituents were displaying to the proposal, embittered the Peers to arrive at this decision. Some doubt was felt as to the course which Gladstone would take in this crisis. More than a million votes had been added to the party of the Unionists since 1886, and it was thought that the Irish question had appealed to the country, and have endeavoured to obtain a distinct mandate from the constituencies to introduce a new Home Rule Bill. Other persons imagined that he should have followed the precedent which had been set by Lord Grey in 1831, and, after a short prorogation, have reintroduced his measure in a new session. As a matter of fact, Gladstone adopted neither of these courses. The government decided not to take up the gauntlet thrown down by the Peers, but to proceed with the rest of their political programme. With this object an autumn session was held, and the Parish Councils Act, introduced by Mr Fowler (afterwards Lord Wolverhampton), was passed, after important amendments, which had been introduced into it in the House of Lords, had been reluctantly accepted by Gladstone. On the other hand, an Employers' Liability Bill, introduced by Mr Asquith, the home secretary, was ultimately dropped by Gladstone after passing all stages in the House of Commons, rather than that an amendment of the Peers, allowing "contracting out," should be accepted.

Before, however, the session had quite run out (3rd March 1894), Gladstone, who had now completed his eighty-fourth year, laid down a load which his increasing years made it impossible for him to sustain (see the article GLADSTONE). He was succeeded by Lord Rosebery, whose abilities and attainments had raised him to a high place in the Liberal councils. Lord Rosebery did not succeed in popularizing the Home Rule proposal which Gladstone had failed to carry. He declared, indeed, that success was not attainable till England was converted to its expediency. He hinted that success would not even then be assured until something was done to reform the constitution of the House of Lords. But if, on the one hand, he refused to introduce a new Home Rule Bill, he hesitated, on the other, to court defeat by any attempt to reform the Lords. His government, in these circumstances, while it failed to conciliate its opponents, excited no enthusiasm among its supporters. It was generally understood, moreover, that a large section of the Liberal party resented Lord Rosebery's appointment to the first place in the ministry, and thought that the lead should have been conferred on Sir W. Harcourt. It was an open secret that these differences in the party were reflected in the cabinet, and that the relations between Lord Rosebery and Sir W. Harcourt were too strained to ensure either the harmonious working or the stability of the administration. In these circumstances the fall of the ministry was only a question of time. It occurred—as often happens in parliament—on a minor issue which no one had foreseen. Attention was drawn in the House of Commons to the insufficient supply of cordite provided by the war office, and the House—notwithstanding the assurance of the war minister (Sir Henry Campbell-Bannerman) that the supply was adequate—placed the government in a minority. Lord Rosebery resigned office, and Lord Salisbury for the third time became prime minister, the duke of Devonshire, Mr Chamberlain and other Liberal Unionists joining the government. Parliament was dissolved, and a new parliament, in which the Unionists obtained an overwhelming majority, was returned.

The government of 1892–1895, which was successively led by Gladstone and Lord Rosebery, will, on the whole, be remembered for its failures. Yet it passed two measures which have exercised a wide influence. The Parish Councils Act introduced electoral institutions into the government of every parish, and in 1894 Sir W. Harcourt, as chancellor of the exchequer, availed himself of the opportunity, which a large addition to the navy invited, to reconstruct the death duties. He swept away in doing this many of the advantages which the owner of real estate and the life tenant of settled property had previously enjoyed, and drove home a principle which Goschen had tentatively introduced a few years before by increasing the rate of the duty with the amount of the estate. Rich men, out of their superfluities, were thene-forward to pay more than poor men out of their necessities.

The Unionist government which came into power in 1895 lasted, with certain changes of personnel, till 1905, with a break caused by the dissolution of 1900. History may hereafter conclude that the most significant circumstance of the earlier years of this period should be the new feeling of national rivalry and affection to which the sixtieth anniversary of Queen Victoria's accession led in 1897. Ten years before, her jubilee had been the occasion of enthusiastic rejoicings, and the queen's progress through London to a service of thanksgiving at Westminster had impressed the imagination of her subjects and proved the affection of her people. But the rejoicings of 1887 were forgotten amid the more striking demonstrations ten years later. It was seen then that the queen, by her conduct and character, had gained a popularity which has had no parallel in history, and had won a place in the hearts of her subjects which perhaps no other monarch had ever previously enjoyed. There was no doubt that, if the opinion of the English-speaking races throughout the world could have been tested by a plebiscite, an overwhelming majority would have declared that the fittest person for the rule of the British empire was the gracious and kindly lady who for sixty years, in sorrow and in joy, had so worthily discharged the duties of her high position. This remarkable demonstration was not confined to the British empire alone. In every portion of the globe the sixty-sixth anniversary of the queen's reign excited interest; in every country the queen's name was mentioned with affection and respect; while the people of the United States vied with the subjects of the British empire in praise of the queen's character and in expressions of regret that her person had not been divested of the grave dispute on the boundary of British Venezuela had brought the United States and Great Britain within sight of a quarrel. The jubilee showed conclusively that, whatever politicians might say, the ties of blood and kinship, which united the two peoples, were too close to be severed by either for some trilling cause; that the wisest heads in both nations were aware of the advantages which must arise from the closer union of the Anglo-Saxon races; and that the true interests of both countries lay in their mutual friendship. A war in which the United States was subsequently engaged with Spain cemented this feeling. The government and the people of the United States recognized the advantage which they derived from the goodwill of Great Britain in the hour of their necessity, and the two nations drew together as no other two nations had perhaps ever been drawn together before.

If the jubilee was a proof of the closer union of the many sections of the British empire, and of their warm attachment to their sovereign, it also gave expression to the "imperialism" which was becoming a dominant factor in British politics. Few people realized the mighty change which in this respect had been effected in thought and feeling. Forty years before, the most prominent English statesmen had regarded with anxiety the huge responsibilities of a world-wide empire. In 1897 the whole tendency of thought and opinion was to enlarge the burden of which the preceding generation had been weary. The extension of British influence, the protection of British interests, were almost universally advocated; and the few statesmen who
repeated in the 'nineties the sentiments which would have been generally accepted in the 'sixties, were regarded as "Little Englanders." It is important to note the consequences which these new ideas produced in Africa. Both in the north and in the south of this great and imperfectly explored continent, memories still clung which were ungrateful to imperialism. In the north, the murder of Gordon was still unavenged; and the vast territory known as the Sudan had escaped from the control of Egypt. In the south, war with the Transvaal had been concluded by a British defeat; and the Dutch were elated, the English irritated, at the recollection of Majuba. In 1866 Lord Salisbury’s government decided on extending the Anglo-Egyptian rule over the Sudan, and an expedition was sent from Egypt under the command of Sir Herbert (afterwards Lord) Kitchener to Khartum. Few military expeditions have been more elaborately organized, or have achieved a more brilliant success. The conquest of the country was achieved in three separate campaigns in successive years. In September 1898 the Sudanese forces were decisively beaten, with great slaughter, in the immediate neighbourhood of Omdurman; and Khartoum became thenceforward the capital of the new province, which was placed under Lord Kitchener’s rule. Soon after this decisive success, it was found that a French expedition under Major Marchand had reached the upper Nile and had hoisted the French flag at Fashoda. It was obvious that the French could not be allowed to remain at a spot which the khedive of Egypt claimed as Egyptian territory; and after some negotiation, and some irritation, the French were withdrawn. In South Africa still more important events were in the meanwhile progressing. Ever since the independence of the South African Republic had been virtually conceded by the convention of 1884, unhappy differences had prevailed between the Dutch and British residents in the Transvaal. The discovery of gold at Johannesburg and elsewhere in 1885-1886 had led to a large immigration of British and other colonists. Johannesburg had grown into a great and prosperous city. The foreign population of the Transvaal, which was chiefly English, became in a few years more numerous than the Boers themselves, and they complained that they were deprived of all political rights, that they were subjected to unfair taxation, and that they were hampered in their industry and unjustly treated by the Dutch courts and Dutch officials. Failing to obtain redress, at the end of 1895 certain persons among them made preparations for a revolution. Dr Jameson, the administrator of Rhodesia, accompanied by some British officers, actually invaded the Transvaal. His force, utterly inadequate for the purpose, was stopped by the Boers, and fled back into the Transvaal. There was no doubt that this raid on the territory of a friendly state was totally unjustifiable. Unfortunately, Dr Jameson’s original plans had been framed at the instance of Cecil Rhodes, the prime minister at the Cape, and many persons thought that they ought to have been suspected by the colonial office in London. England at any rate would have had no valid ground of complaint if the leaders of a buccaneering force had been summarily dealt with by the Transvaal authorities. The president of the republic, Kruger, however, handed over his prisoners to the British authorities, and parliament instituted an inquiry by a select committee into the circumstances of the raid. The inquiry was terminated somewhat abruptly. The committee acquitted the colonial office of any knowledge of the plot; but a good many suspicions remained unanswered. The chief actors in the raid were tried under the Foreign Enlistment Act, found guilty, and subsequently released after short terms of imprisonment. Rhodes himself was not removed from the privy council, as his more extreme accusers demanded; but he had to abandon his career in Cape politics for a time, and confine his energies to the development of Rhodesia, which had been added to the empire through his instrumentality in 1886-1889. In consequence of these proceedings, the Transvaal authorities at once set to work to accumulate armaments, and they succeeded in procuring vast quantities of artillery and military stores. The British government would undoubtedly have been entitled to insist that these armaments should cease. It was obvious that they could only be directed against Great Britain; and no nation is bound to allow another people to prepare great armaments to be employed against itself. The criminal folly of the raid prevented the British government from making this demand. It could not say that the Transvaal government had no cause for alarm when British officers had attempted an invasion of its territory, and had been treated rather as heroes than as criminals at home. Ignorant of the strength of Great Britain, and elated by the recollection of their previous successes, the Boers themselves believed that a new struggle might give them predominance in South Africa. The knowledge that a large proportion of the population of Cape Colony was of Dutch extraction, and that public men at the Cape sympathized with them in their aspirations, increased their confidence. In the meantime, while the Boers were silently and steadily continuing their military preparations, the British settlers at Johannesburg—the Uitlanders, as they were called—continued to demand consideration for their grievances. In the spring of 1899, Sir Alfred Milner, governor of the Cape, met President Kruger at Bloemfontein, the capital of the Orange Free State, and endeavoured to accomplish that result by negotiation. He thought, at the time, that if the Uitlanders were given the franchise, and a fair proportion of influence in the legislature, other difficulties might be left to settle themselves. The negotiations thus commenced unfortunately failed. The discussion, which had originally turned on the franchise, was enlarged by the introduction of the question of suzerainty or supremacy; and at last, in the beginning of October, when the rains of an African spring were causing the grass to grow on which the Boer armies were largely dependent for forage, the Boers declared war and invaded Natal. The British government had not been altogether happy in its conduct of the preceding negotiations. It was certainly unhappy in its preparations for the struggle. It made the great mistake of underestimating the strength of its enemy; it suffered its agents to commit the strategical blunder of locking up its few troops it had in an untenable position in the north of Natal. It was not surprising, in such circumstances, that the earlier months of the war should have been memorable for a series of exasperating reverses. These reverses, however, were redeemed by the valour of the British troops, the spirit of the British nation, and the enthusiasm which induced the great autonomous colonies of the empire to send men to support the cause of the mother country. The gradual arrival of reinforcements, and the appointment of a soldier of genius—Lord Roberts—to the supreme command, changed the military situation; and, before the summer of 1899 was concluded, the place which had been besieged by the Boers—Kimberley—was finally cleared; and Mafeking—had been successively relieved; the capitals of the Orange Free State and of the Transvaal had been occupied; and the two republics, which had rashly declared war against the British empire, had been formally annexed.

The defeat and dispersal of the Boer armies, and the apparent collapse of Boer resistance, induced a hope that the war was over; and the government seized the opportunity in 1900 to terminate the parliament, which had already endured for more than five years. The election was conducted with unusual bitterness; but the constituencies practically affirmed the policy of the government by maintaining, almost unimpaired, the large majority which the Unionists had secured in 1895. Unfortunately, the expectations which had been formed at the time of the dissolution were disappointed. The same circumstances which had emboldened the Boers to declare war in the autumn of 1899, induced them to renew a guerilla warfare in the autumn of 1900—the approach of an African summer supplying the Boers with the grass on which they were dependent for feeding their hardy horses. Guerilla bands suddenly appeared in different parts of the Orange River Colony and of the Transvaal. They interrupted the communications of the British armies; they won isolated victories over British detachments; they even invaded Cape Colony. Thus the last year of the century closed in disappointment.
and gloom. The serious losses which the war entailed, the heavy expenses which it involved, and the large force which it absorbed, filled thoughtful men with anxiety.

No one felt more sincerely for the sufferings of her soldiers, and no one regretted more truly the useless prolongation of the struggle, than the venerable lady who occupied the throne. She had herself lost a grandson (Prince Albert Victor) in the South African War, and she probably also felt some sense of anxiety perhaps told even on a constitution so unusually strong as hers. About the middle of January 1901 it was known that she was seriously ill; on the 22nd she died. The death of the Queen thus occurred immediately after the close of the century over so long a period of which her reign had extended.

The Queen's own life is dealt with elsewhere (see VICTORIA, QUEEN), but the Victorian era is deeply marked in English history. During her reign the people of Great Britain doubled their number; but the accumulated wealth of the country increased at least threefold, and its trade sixfold. All classes shared the prevalent prosperity. Notwithstanding the increase of population, the roll of paupers at the end of the reign, compared with the same roll at the beginning, stood as 2 stands to 3; the criminals as 1 to 2. The expansion abroad was still more remarkable. There were not 200,000 white persons in Australasia when the Queen came to the throne; there were nearly 5,000,000 when she died. The great Australian colonies were almost created in her reign; two of them—Victoria and Queensland—owe their name to her; they all received those autonomous institutions, under which their prosperity has been built up, during its continuance. Expansion and progress were not confined to Australasia. The opening months of the Queen's reign were marked by rebellion in Canada. The close of it saw Canada one of the most loyal portions of the Empire. In Africa, the advance of the red line which marks the bounds of British dominion was even more rapid; while in India the Punjab, Sind, Oudh and Burma were some of the acquisitions added to the British empire while the queen was on the throne. When she died one square mile in four of the land in the world was under the British flag, and at least one person out of every five persons alive was a subject of the queen.

Material progress was largely facilitated by industry and invention. The first railways had been made, the first steamship had been built, before the queen came to the throne. But, so far as railways are concerned, none of the great trunk lines had been constructed in 1877; the whole capital to be spent on railway construction did not exceed £5,500,000; and, five years after the reign had begun, there were only 18,000,000 passengers. The paid-up capital of British railways in 1901 exceeded £1,100,000,000; the passengers, not including season-ticket-holders, also numbered 1,100,000,000; and the sum annually spent in working the lines considerably exceeded the whole capital authorized to be spent on their construction in 1837. The progress of the commercial marine was still more noteworthy. In 1837 the entire commercial navy comprised 2,500,000 tons, of which less than 100,000 tons were moved by steam. At the end of the reign the tonnage of British merchant vessels had reached 3,500,000 tons, of which more than 11,000,000 tons were moved by steam. At the beginning of the reign it was supposed to be impossible to build a steamer which could either cross the Atlantic, or face the monsoon in the Red Sea. The development of steam navigation since then has made Australia much more accessible than America was in 1837, and had brought New York, for all practical purposes, nearer to London than Aberdeen was at the commencement of the reign.

Electricity had even a greater effect on communication than steam on locomotion; and electricity, as a practical invention, had its origin in the reign. The first experimental telegraph line was only erected in the year in which Queen Victoria came to the throne. Submarine telegraphy, which had done so much to knit the empire together, was not perfected for many years afterwards; and long ocean cables were almost entirely constructed in the last half of the reign.

(S. W.)

On the death of Queen Victoria, the prince of Wales succeeded to the throne, with the title of Edward VII. (q.v.) The coronation fixed for June in the following year was at the last moment stopped by the king's illness with appendicitis, but he recovered marvellously from the operation and the ceremony took place in August. His excellent health and activity in succeeding years struck every one with astonishment. The Boer War had at last been brought to an end in May 1902 (see TRANSVAAL), and the king had the satisfaction of seeing South Africa settle down and eventually receive self-government. The political history of his reign, which ended with his death in May 1910, is dealt with in detail in separate biographical and other articles in this work (see especially those on Lord Salisbury, Mr A. J. Balfour, Mr J. Chamberlain, Lord Rosebery, Sir H. Campbell-Bannerman, Mr H. H. Asquith, Mr D. Lloyd George, and on the history of the various portions of the British Empire); and in this place only a summary need be given.

The king himself (see EDWARD VII.), who nobly earned the title of Edward the Peacemaker, played no small part in the domestic and international politics of these years; and contemporary publications, even more recent commentary, have shown that Edward realized that, within the limits of the constitutional monarchy, there was much more scope for the initiative of a masculine sovereign in public life than had been supposed by the generation which grew up after the death of his father in 1862. Edward VII. made the Crown throughout all classes of society a popular power which it had not been in England for long ages. And while the growing rivalry between England and Germany, in international relations, was continually threatening danger, his influence in cementing British friendship on all other sides was of the most marked description. His sudden death was felt, not only throughout the empire but throughout the world, with even more poignant emotion than that of Queen Victoria herself, for his personality had been much more in the forefront.

The end of his reign coincided with a domestic constitutional crisis, to which party politics had been working up more and more acutely for several years. The Tariff Reform propaganda of Mr Chamberlain (q.v.) in 1903 convulsed the Conservative party, and the longperiod of Unionist domination came to an end in November 1905. Mr Balfour (q.v.), who became prime minister in 1902 on Lord Salisbury's retirement, resigned, and was succeeded by Sir H. Campbell-Bannerman (q.v.), as head of the Liberal party; and the general election of January 1906 resulted in an overwhelming victory for the Liberals and their allies, the Labour party (now a powerful force in politics) and the Irish Nationalists. Just before Sir H. Campbell-Bannerman's death in April 1908 he was succeeded as prime minister by Mr Asquith, a leader of far higher personal ability though with less hold on the affections of his party. The Liberals had long arrears to make up in their political programme, and their supremacy in the House of Commons was an encouragement to assert their views in legislation. In several directions, and notably in administration, they carried their policy into effect; but the House of Lords (see PARLIAMENT) was an obvious stumbling-block to some of their more important Bills, and the Unionist control of that House did not end with the return of Mr Asquith's government in 1908. There was a general election of January 1910. The Unionists came back equal in numbers to the Liberals, but the latter could also count on the Labour party and the Irish Nationalists; and the battle was fully arrayed for
a frontal attack on the powers of the Second Chamber when the king's death in May upset all calculations. This unthought-of complication seemed to act like the letting of blood in an apoplectic patient.

The prince of Wales became king as George V. (q.v.), and a temporary truce was called; and the reign began with a serious attempt between the leaders of the two great parties, by private conference, to see whether compromise was not possible (see PARLIAMENT). Apart from the parliamentary crisis, really hinges on the difficulty of discovering a means by which the real will of the people should be carried out without actually making the House of Commons autocratically omnipotent, but also without allowing the House of Lords to obstruct a Liberal government. The son of the Tory party, the new king succeeded to a noble heritage. The monarchy itself was popular, the country was prosperous and in good relations with the world, except for the increasing naval rivalry with Germany, and the consciousness of imperial solidarity had made extraordinary progress among all the dominions. However the domestic problems in the United Kingdom might be solved, the future of the greatness of the English throne lay with its headship of an empire, loyal to the core, over which the sun never sets.

(H. Ch.)

XIII.—SOURCES AND WRITERS OF ENGLISH HISTORY

The attempt here made to combine a bibliography of English history with some account of the progress of English historical writing is beset with some difficulty. The evidential value of what a writer says is quite distinct from the literary art with which he says it; the real sources of history are not the works of historians, but records and documents written with no desire to further any literary purpose. Domesday Book is unique as a source of medieval history, but it does not count in the development of English historical writing. That is quite a secondary consideration; for there was much English history before any Englishman could write; and even after he began to write, his compositions constitute a minor part of the evidence.

Our earliest information about the land and its people is derived from geological, ethnological and archaeological studies, from the remains in British barrows and caves, Roman roads, walls and villas, coins, place-names and inscriptions. The writings of Caesar and Tacitus, and a few scattered notices in other Roman authors, supplement this evidence. But the scientific accuracy of Tacitus' Germania is not beyond dispute, and that light fails centuries before the Anglo-Saxon conquest of Great Britain. The history of that conquest itself is mainly inferential; there is the Bede's narrative of Gildas, vague and rhetorical, moral rather than historical in motive, and written more than a century after the conquest had begun, and the narrative of the Welsh Nennius, who wrote two and a half centuries after Gildas, and makes no critical distinction between the deeds of dragons and those of Anglo-Saxons. The Anglo-Saxons themselves could not write until Christian missionaries had reintroduced the art at the end of the 6th century, and history was not by any means the first purpose to which they applied it. It was first used to compile written statements of customs and dooms which were their nearest approach to law, and these codes and charters are the earliest written materials for Anglo-Saxon history.

The remarkable outburst of literary culture in Northumbria during the 7th and 8th centuries produced a real historian in Bede; Bede, however, knows little or nothing of English history between 450 and 596, and he is valuable only for the 7th and early part of the 8th centuries. Almost contemporary is the Vita Wilfridi by Eddius, but more valuable are the letters we possess of Boniface and Alcuin. The famous Anglo-Saxon Chronicle was probably started under the influence of Alfred the Great towards the end of the 9th century. Its chronology is often one, two or three years wrong even when it seems to be a contemporary authority, and the value of its evidence on the conquest and the first two centuries after it is very uncertain. But from Egbert's reign onwards it supplies a good deal of apparently trustworthy information. For Alfred himself we have also Asser's biography and the Annales of St Neots, a very imaginative compilation, while most of the stories which have made Alfred's name a household word are fabulous. Even the Chronicle becomes meagre a few years after Alfred's death, and its value depends largely upon the ballads which it incorporates; nor is it materially supplemented by the lives of St Dunstan, for hagiologists have never treated historical accuracy as a matter of moment; and our knowledge of the last century of Anglo-Saxon history is derived mainly from Anglo-Norman writers who wrote after the Norman Conquest. Some collateral light on the Danish conquest of England is thrown by the Heims entrance and other materials collected in Vigfusson and Powell's Cæsarius Poeticus Boreale, and for the Norman Conquest and his sons there is the contemporary Encomium Emmae, which is a dishonourable panegyric on the widow of Athelred and Canute. For Edward the Confessor there is an almost equally biased biography.

For the Norman Conquest itself strictly contemporary evidence is extremely scanty, and historians have exhausted their own and their readers' patience in disputing the precise significance of some phrases about the battle of Hastings used by Wace, a Norman poet who wrote nearly a century after the battle. One version of the Anglo-Saxon Chronicle goes down to 1070 and another to 1154, but both are less than trustworthy and meagre. The Bayeux tapestry affords, however, valuable contemporary evidence, and there are some facts related by eye-witnesses in the works of William of Poitiers and William of Jumièges. A generation of copious chroniclers was, moreover, springing up, and among them were Florence of Worcester, Henry of Huntingdon, Simeon of Durham and William of Malmesbury. Their ambition was almost invariably to write the history of the world, and they generally begin with the Creation. They only become original and contemporary authorities towards the end of their appointed tasks, and the bulk of their works is therefore historical or geographical, and they embody materials which would otherwise have perished, but their transcription is marred by an amount of conscious or unconscious falsification which seriously impairs their value. All the above-mentioned writers lived in the half-century immediately following the Norman Conquest, but their critical acumen and their literary art vary considerably. William of Malmesbury, Eadmer and Ordericus Vitalis attain a higher historical standard than had yet been reached in England by any one, with the possible exception of Bede. They are not mere annalists; they practise an art and cultivate a style; history has become to them a form of literature. They have brought the historical method to perfection, and with a historical conception, blinded to economic influences, and attaching excessive importance to the effects of the individual action of emperors and popes, kings and cardinals. Even their characters are painted in different colours according to their action on quite irrelevant questions, as, for instance, their benefactions to the monastery, to which the historian happens to belong, or to rival houses; and the character once determined by such considerations, history is made to point the moral of their fortunes, or their fate. It is regarded as the record of moral judgments and the protest of a world of men against the world, and it is long before ecclesiastical historians expel the sermon from their text.

The line of monastic historians stretches out to the close of the middle ages. Most of the great monasteries had their official annalists, who produced such works as the Annales of Tewkesbury, Gloucester, Burton, Waverley, Dunstable, Bermondsey, Osney, Winchester (see Annales Monastici, 5 vols., ed. Luard, and other volumes in the Rolls series). Some of them are mainly local chronicles; others are almost national histories. In particular, St Albans developed a remarkable school of historians extending over nearly three centuries to the death of Wetheramsteed in 1465 (see Chronica Monasterii de S. Albani, Rolls series, 7 vols., ed. Riley). Only a few of the 235 volumes published under the direction of the master of the Rolls, and called the Rolls series, can here be mentioned. Other medieval writers have been
ENGLISH HISTORY

AUTHORITIES

[Edited for the earlier English Historical Society; some of them have been re-edited without being superseded in the Rolls series. For the reign of Stephen we have the anonymous Gesta Stephani in addition to the writers already mentioned, several of whom continue into Stephen's reign. For Henry II. we have William of Newburgh, who reaches the highest point attained by historical composition in the 12th century; the so-called Historia of Peterborough, Historia Hugen, which Stubbs tentatively and without sufficient authority ascribes to Richard Fitzigel; Robert of Tornigni; and seven volumes of "Materials for the History of Thomas Becket," which contain some of the best and worst samples of hagiographical history. For Richard and John the chronicles of Roger of Hoveden, Ralph de Diceto (Diss), Gervase of Canterbury, Ralph of Coggeshall, and a later continuation of Hoveden, known under the name of Walter of Coventry, are the best narrative authorities.

With the accession of Henry III., Roger of Wendover, the first of the St Albans school whose writings are extant, becomes our chief authority. He was re-edited and continued after 1236 by Matthew Paris, the greatest of medieval historians. His work, which was once perhaps felt to be too grand for private reading by a considerable breadth of view and independence of judgment. The story is carried on by a series of jejune compilations known as the Flores historiarum (ed. Luard). Better authorities for Edward I. are Rishanger, Trehole and Blanforde, Wykes, Walter of Hemingburgh, Nicholas Trevet, Oxnead and Bartholomew Cotton, and others contained in Stubbe's Chronicles of Edward I. and Edward II. In the 14th century there is a significant deterioration in the monastic chroniclers, and their place is taken by the works of secular clergy like Adam Murimuth, Geoffrey the Baker, Robert of Avesbury, Henry Knighton and the anonymous author of the Eulogium historiarum. Monastic history is represented by Hydgeresque, vivid, and marred by a considerable breadth of view and independence of judgment. The story is carried on by a series of jejune compilations known as the Flores historiarum (ed. Luard). Better authorities for Edward I. are Rishanger, Trehole and Blanforde, Wykes, Walter of Hemingburgh, Nicholas Trewet, Oxnead and Bartholomew Cotton, and others contained in Stubbe's Chronicles of Edward I. and Edward II. In the 14th century there is a significant deterioration in the monastic chroniclers, and their place is taken by the works of secular clergy like Adam Murimuth, Geoffrey the Baker, Robert of Avesbury, Henry Knighton and the anonymous author of the Eulogium historiarum. Monastic history is represented by Hydgeresque, vivid, and marred by a great amount of light is thrown on English history by foreign writers. Of these authorities one of the earliest is the Histoire des ducs de Normandie et des rois d'Angleterre (ed. Michel); brief is the Chronique de l'Anonyme de Béthune and the Histoire de Guillaume le Maréchal. A large number of French and Flemish chronicles illustrate the history of the Hundred Years' War, by far the most important being Froissart (best edition by Luce, though Lettenhove's is bigger). Next come Jehan le Bel, Waurin's Recueil, Monstrelet, Chastelsain, Juvenal des Ursins, and more limited works such as Créton's Chronique de la triaison et mort de Richard II.

Chronicles, but very few, have remained as sources of history as time goes on. Their value is always dependent upon the absence of the more satisfactory materials known as records, and these records gradually become more copious and complete. They develop with the government, of whose activity and policy they are the real test and evidence. Perhaps the most important thing in history is the evolution of government, the development of consciousness and a will on the part of the state. This will is expressed in records; and, as the state progresses from infancy through the stage of tutelage under the church to its modern "omnicompetence," so its will is expressed in an ever widening and differentiating series of records. The first need of a government is finance; the earliest organized machinery for exerting its will is the exchequer; and the earliest great record in English history is Domesday Book. It is followed by a series of records, called the Pipe Rolls, which begin in the reign of Henry I., and dating from that of Henry II. is the Dialogus de scaccario, which explains in none too lucid language the intricate working of the exchequer system. It was Henry II. who gave the greatest impetus to the development of the machinery for expressing the will of the state. He began with finance and went on to justice, recognizing that justitia magnum emolumentum, the administration of justice was a great source of revenue. So national courts were set up, and other local national exchequer, and by the end of the 12th century legal records become an even more important source of history than financial documents. The judicial system is described by Glanvill at the end of the 12th, and by Bracton and Fleta in the 13th century (for the exchequer see the Testa de Nevill and the Red Book of the Eschequer). During that period the Curia Regis threw off three offshoots—the courts of exchequer, king's bench and common pleas; and records of their judicial proceedings survive in the Plea Rolls and Year Books, some of which have been edited for the Rolls series, the Selden and other societies. Numerous other classes of legal and administrative records gradually develop, the Patent and Close Rolls (futures handed to the Record Commission, and subsequently treated more adequately under the direction of the deputy keeper of the Records), Charters (which were first grants to individuals, then to collective groups, monasteries or boroughs, then to classes, and finally expanded—as in Magna Carta—into grants to the whole nation), Escheats, Feet of Fines, Inquisitions post mortem, Inquisitions ad quod damnum, Placita de quo Warranto, and others for which the reader is referred to S. R. Scargill-Bird's Guide to the Principal Classes of Documents preserved in the Record Office (3rd ed., 1908). Every branch of administration comes to be represented in records almost as soon as it is developed. The evolution of the army which won Crecy and Poitiers is accompanied by the accumulation of a mass of instructions and other military documents, the value of which has been illustrated in Dr Morris's Welsh Wars of Edward I. and George Wrottesley's Crecy and Calais from the Public Records. The growth of naval organization is reflected in the Black Book of the Admiralty; the growth of taxation in the Liber custumarum and Subsidy Rolls; the rise of parliament in the Parliamentary Writs (ed. Palgrave), in the Rotuli parliamentorum, in the Official Return of Members of Parliament, and in the Statutes of the Realm; that of Convocation in David Wilkins's Concilia. The register of the privy council does not begin until later in the 14th century, and then is broken off between the middle of the 15th and 1539.

Local as well as central government begets records as it grows. From the Extenta monæris of the 12th century we get to the Memorial Rolls of the 13th, when also we have Hundred Rolls, records of forest courts, of courts leet and of coroners' courts, and a variety of municipal documents, for which the reader is referred to Dr C. Gross's Bibliography of British Municipal History and to Mrs J. R. Green's more popular Town Life in the Fifteenth Century. The municipal records of London, its hustings court and city companies, are too multifarious to describe; some classes of these documents have been exemplified in the works of Dr R. R. Sharpe. Ecclesiastical records are represented by the episcopal registers (for the most part still unpublished), the rolls of patronage, and other documents rendered comparatively scarce by the spoliation of the monasteries, and scattered proceedings of ecclesiastical courts. (See also the article RECORDS.)

Documents, other than records strictly so called, begin to grow with the habit of correspondence and the necessity of communication. A few letters survive from the time of the Norman kings, but the earliest collection of English royal letters is the Letters of Henry III. (Rolls series). Contemporary are the Letters of Grosseteste, and a little later come the Letters of Archbishops Peckham and Raine's Letters from Northern Registers (all in the Rolls series). Private correspondence appeared earlier in the voluminous epistles of Peter of Blois, archdeacon of Bath (ed. Giles). This is a somewhat intermittent source of history until we come to the 15th century, when the well-known Paston
Letters (ed. Gairdner) begin a stream which never fails thereafter and soon becomes a torrent. The most important series of official correspondence is the Papal Letters, calendared from 1198 to 1404 in 4 vols. (ed. Bliss, Johnson and Twemlow). Subsidiary sources are the Political Songs (ed. Wright), treatises like those of John of Salisbury, Gerald of Wales, and, later, Wycliffe's works, Netter's Fasciculi Zizaniorum, Gascoigne's Loci et libro veritatem, Pecock's Repressor, and the literary writings of Chaucer, Langland, Gower, Richard Rolle and others.

During the 15th century the transition, which marks the change from medieval to modern history, affects also the character of historical sources and historical writing. In the first place, history ceases to be the exclusive province of the church; monastic chronicles shrink to a trickle and then dry up; the last of their kind in England is the Greyfriars Chronicle (Camden Society), which ends in 1554. Their place is taken by the city chronicle compiled by middle-class laymen, just as the Renaissance was not a revival of clerical learning, but the expression of new intellectual demands on the part of the laity. Secondly, the definite disappearance of the medieval ideas of a cosmopolitan world and the emergence of national states begat diplomacy, and with it an ever-swelling mass of diplomatic material. Diplomacy had hitherto been occasional and intermittent, and embassies rare; now we get efficient envoys of merchant princes or of Venice, which made it the pioneer in this direction, though its representatives abroad were at first commercial rather than diplomatic agents. The Calendar of Venetian State Papers goes back to the 14th century, but does not become copious till the reign of Henry VII., when also the Spanish Calendar begins. Resident French ambassadors in England only begin in the 16th century, and later still those from the emperor, the German and Italian states other than Venice. In the third place, the development of the new monarchy involved an enormous extension of the activity of the central government, and therefore a corresponding expansion in the records of its energy.

The political records of this energy are the State Papers, a class of document which soon dwarfs all others, and renders chroniclers, historians and the like almost negligible quantities as sources of history; but in another way their value is enhanced, for these hundreds of thousands of documents provide a test of the accuracy of modern historians which is imperfect in the case of medieval chroniclers and almost non-existent in that of ancient writers. These state papers are either "foreign" or "domestic," that is to say, the correspondence of the English government with its agents abroad, or at home. There is also the correspondence of foreign ambassadors resident in England with those of the last of the long line of ambassadors from the church, mainly in the form of transcripts from the originals in foreign archives, which have been made for the purpose of the Venetian and Spanish Calendars of state papers. The Venetian Calendar had by 1599 been carried well into the 17th century; the Spanish (which includes transcripts from the Habsburg archives at Vienna, Brussels and Simancas) covered only the reigns of Henry VII. and VIII. and Queen Elizabeth. No attempt had yet been made to calendar the French correspondence in a similar way, though the French Foreign Office published some fragmentary collections, such as the Correspondance de MM. de Castillon et de Marillac and that of Odet de Selve. There are other collections too numerous to enumerate, such as Lettenhoven's edition of Philip II.'s correspondence relating to the Netherlands, Diegerick and Müller's, Teulet's and Albóri's collections, the French Documents inédits and the Spanish Documentos inéditos, all containing state papers relating to England's foreign policy in the 16th century. The Scottish and Irish state papers are calendared in separate series and without much system. Thus for Scottish affairs there are four series, the Border Papers, the Hamilton Papers, Thorp's Calendar, and, more recent and complete, Bain's Calendar. For Ireland, besides the regular Irish state papers, there are the Carew Papers, almost as important. Anarchy, indeed, pervades the whole method of publication. For the reign of Henry VII. we have, besides the Venetian and Spanish Calendars, only three volumes—Gairdner's Letters and Papers of Richard III. and Henry VII. and Campbell's Materials (2 vols., Rolls series). Then with the reign of Henry VIII. begins the magnificent and monumental Letters and Papers of Henry VIII., the one modern series for which the Record Office deserves unstinted praise. This is not limited to state papers, domestic and foreign, nor to documents in the Record Office; it calendars private letters, grants, &c., extant in the British Museum and elsewhere. It extends to 21 volumes, each volume consisting of two or more parts, and some parts (as in vol. iv.) containing over a thousand pages; it comprises at least fifty thousand documents. Its value, however, is limited; the earlier volumes are not so full as the later, the documents are not so well calendared, and some classes are excluded from earlier, which appear in the later, volumes.

After 1547 a different plan is adopted, though not consistently followed. Only state papers are calendared, and as a rule only those in the Record Office; and the domestic are separated from the foreign. The great fault is the neglect of the vast quantities of state papers in the British Museum. The Domestic Calendar (the first volume of which is very inadequate) extended in 1909 in a series of more than seventy volumes nearly to the end of the 17th century; the mass of MSS. calendared therein may be gathered from the fact that for the reign of Elizabeth the Domestic state papers fill over three hundred MS. Volumes. The Foreign Calendar had only got to 1582, but it occupied sixteen printed volumes against one of the Domestic Calendar. For the masses of MSS. uncalendared in the British Museum there is no guide except the imperfect indexes to the Cotton, Harleian, Lansdowne, Additional and other collections. Hardly less important than the calendars are the reports of the Historical Manuscripts Commission and the appendices thereto, which extend to over a hundred volumes; twelve are occupied by Lord Salisbury's 16th-century MSS. at Hatfield House. The dispersion of these state papers is due to the fact that they were in those days treated as the property of the state, but as the private property of individual secretaries.

State papers represent only one side of the activity of the central government. The register of the privy council, extending with some lacunae from 1559 to 1604, has been printed in thirty-two volumes. The Rotuli parliamentorum end with Henry VII., but in 1599 begin the journals of the House of Lords, and in 1547 the journals of the House of Commons. These are supplemented by private diaries of members of parliament, several of which were used in D'Ewes's Journals. Legal history can now be followed in a continuous series of law reports, beginning with Keilway, Staunford and Dyer, and going on with Coke, Dyer, and others. Documentary records of various courts are exemplified in the Select Cases From the Star Chamber, the court of requests and admiralty courts, published by the Selden Society; and there are voluminous records of the courts of augmentations, first-fruits, wards and liveries in the Record Office. For Ireland, besides the state papers, there are the Calendars of Patents and of Fiants, and for Scotland the Exchequer Rolls and Registers of the Privy Council and of the Great Seal, both extending to many volumes.

Unofficial sources multiply with equal rapidity, but it is impossible to enumerate the collections of private letters, &c., only a few of which have been published. The chronicles, which in the 17th century are usually meagre productions like Warkworth's (Caden Society), get fuller, especially those emanating from London. Fabyan is succeeded by Hall, an indispensable authority for Henry VIII., and Hall by Grafton. Other useful books are Wriothesley's Chronicle and Machyn's Diary, and they have numerous successors; some of their works have been edited for the Camden Society, which now takes the place of the Rolls series. The most important are Holinshed, Stow and Camden; and gradually, with Speed and Bacon, the chronicle develops into the history, and early in the 17th century we get such works as Lord Herbert's Reign of Henry VIII., Hayward's Edward VI., and, on the ecclesiastical side, Heylyn, Fuller, Burnet and Collier's histories of the church and
Reformation. Foxe, who died in 1587, included a vast and generally accurate collection of documents in his Acts and Monuments, popularized as the Book of Martyrs, though his own contributions have to be discounted as much as those of Sanders, Parsons and other Roman Catholic controversialists. Two other great collections are the Parker Society's publications (56 vols.), which contain besides the works of the reformers a considerable number of their letters, and Strype's works (26 vols.). The naval epic of the period is Hakluyt's Navigations, re-edited in 12 vols. in 1902, and continued in Purchas's Pilgrims.

In the 17th century the domestic and foreign state papers eclipse other sources almost more completely than in the 16th. The colonial state papers now become important and extensive, those relating to America and the West Indies being most numerous (18 vols. to 1700). Parliamentary records naturally expand, and the journals of both Houses become more detailed. Parliamentary diarists like D'Ewes, Burton and Walter Yonge, only a fragment of whose shorthand notes in the British Museum has been published (Camden Society), elucidate the bare official statements; and from 1660 the series of parliamentary debates is fairly complete, though not so full or authoritative as it becomes with Hansard in the 19th century. Social diarists of great value appear after the Restoration in Pepys, Evelyn, Reresby, Narcissus Luttrell and Swift (Journal to Stella), and political writing grows more important as a source of history, whether it takes the form of Bacon's (ed. Spedding) or Milton's treatises, or of satires like Dryden's and political pamphlets like Halifax's and then Swift's, Defoe's and Steele's. Clarendon's Great Rebellion and Burnet's History of My Own Time are the first modern attempts at contemporary history, as distinct from chronicles and annals, in England, although it is difficult to exclude the work of Matthew Paris from this category. The innumerable tracts and newsletters are a valuable source for the Civil Wars and Commonwealth period (see J. B. Williams, A History of English Journalism, 1909), while Thurlow's, Clarendon's and Nisdon's collections of state papers deserve a mention apart from the Domestic Calendar. There is a still more monumental collection—the Carte Papers—on Irish affairs in the Bodleian Library, where also the Tanner MSS. and other collections have only been very partially worked. The volumes of the Historical MSS. Commission are of great value for the later Stuart period, notably the House of Lords MSS.

For the 18th century the only calendars are the Home Office Papers and the Treasury Books and Papers, the latter specializing in government having made it necessary to differentiate domestic state papers into several classes. But it need hardly be said that the bulk of correspondence in the Record Office does not diminish. Outside its walls the most important single collection is perhaps the duke of Newcastle's papers among the Additional MSS. in the British Museum; the Stuart papers at Windsor, Mr Fortescue's at Dropmore, Lord Charlemont's (Irish affairs), Lord Dartmouth's (American affairs) and Lord Carlisle's, all calendared by the Historical MSS. Commission, are also valuable. Chatham's correspondence with colonial governors has been published (2 vols., 1906), as have the Greville Papers, Bedford Correspondence, Maltravers Correspondence, and Lord North's Correspondence with George III., and other correspondence in The Memoirs of Rockingham, and the Duke of Buckingham's Court and Cabinets of George III. Mention should also be made of Gower's Despatches, the Cornwalis Correspondence, Rose's Correspondence and Lord Colchester's Correspondence. Of special interest is the series of naval records, despatches to and from naval commanders, proceedings of courts-martial, and logs in the Record Office which have never been properly utilized.

Among unofficial sources the most characteristic of the 18th century are letters, memoirs and periodical literature. Horace Walpole's Letters (Clarendon Press, 16 vols.) are the best comment on the history of the period; his Memoirs are not so good, though they are superior to Wrazzall, who succeeds him. Periodical literature becomes regular in the reign of Queen Anne, chiefly in the form of journals like the Spectator; but several daily newspapers, including The Times, were founded during the century. The Craftsman provided a vehicle for Bolingbroke's attacks on Walpole, while the Gentleman's Magazine and Annual Register begin a more serious and prolonged career. Both contain occasional state papers, and not very trustworthy reports of parliamentary proceedings. The publication of debates was not authorized till the 19th century; parliamentary papers begin earlier, but only slowly attain their present portentous dimensions. Political writing is at its best from Halifax to Cobbett, and its three greatest names are perhaps Swift, "Junius" and Burke, though Steele, Defoe, Bolingbrooke and Dr Johnson are not far behind, while Canning's contributions to the Anti-Jacobin and Gillray's caricatures require mention.

The sources for 19th-century history are somewhat similar to those for the 18th. Diaries continue in the Creevey Papers, Greville's Diary, and lesser but not less voluminous writers like Sir M. E. Grant-Duff. The most important series of letters is Queen Victoria's (ed. Lord Esher and A. C. Benson, 1918), and the correspondence of most of her prime ministers and many of her other advisers has been partially published. Of political biographies there is no end. The great bulk of material, however, consists of blue-books, Hansard's Parliamentary Debates, and newspapers—which are better as indirect than direct evidence. The real truth is not of course revealed at once, and many episodes in 19th-century history are still shrouded by official secrecy. In this respect English governments are more cautious or reactionary than many of those on the continent of Europe, and access to official documents is denied when it is granted elsewhere; even the lapse of a century is not considered a sufficient salve for susceptibilities which might be wounded by the whole truth.

Meanwhile the 19th century witnessed a great development in historical writing. In the middle ages the stimulus to write was mainly of a moral or ecclesiastical nature, though the patriotic impulse which had suggested the Anglo-Saxon Chronicle was perhaps never entirely absent, and the ecclesiastical motive often degenerated into a desire to glorify, sometimes even by forgery, not merely the church as a whole, but the particular monastery to which the writer belonged. As nationalism developed, the patriotic motive supplanted the ecclesiastical, and stress is laid on the "famous" history of England. Insular self-glorification was, however, modified to some extent by the Renaissance, which developed an interest in other lands, and the Reformation, which gave much historical writing a partisan theological bias. This still colours most of the "histories" of the Reformation period, because the issues of that time are living issues, and the writers of these histories are committed beforehand by their profession and their position to a particular interpretation. In the 17th century political partisanship coloured historical writing, and that, too, remained a potent motive so long as historians were either Whigs or Tories. Histories were often elaborate party pamphlets, and this race of historians is hardly yet extinct. Macaulay is not greatly superior in impartiality to Hume; Gibbon and Robertson were less open to temptation because they avoided English subjects. Hallam deliberately aimed at impartiality, but he could not quite attain it. Willoughby's History of England is a valuable vehicle for one of the best histories of the 17th century, but is at least partially biased by dates, and is to be read as an introduction to Froude's and Hallam's. The work of the French historians is based on an elaborate examination of the archives of every period in French history, and is nearer to looking at documents than to writing history. The work of the modern historians is generally less ambitious in its scope, and is more open to charges of partiality. However, it is still the case that many men of learning have found it impossible to write a balanced and impartial history of events in which they have a personal interest.

The work of the 19th century is characterized by a desire to eliminate the unconscious bias of the author; but such a work, if possible, is never achieved. Phrases like "the Whiggish bias of the age" and "the Tory tendency to exaggerate" and "the feeling in favour of anti-constitutional parties," and even "the anti-clerical bias" of certain writers, tell us little as to the nature of the bias, and are better used to indicate the general tone of a publication than as a basis for judging it. It is the nature of the historian's bias that is the most important point in the criticism of his work, and this cannot be determined by such phrases as "Whiggish" or "Tory." It is not always easy to distinguish the bias of the author from the bias of the age, and it is clear that the work of the 19th century is more restricted in its scope than that of the 18th, when there was a wider range of opinion and a greater variety of thought. But the 19th century has produced more work in a shorter period than any other, and the general tone of the work of the period is one of great learning and wide knowledge of the subject.
ENGLISH LANGUAGE

The historical controversy about history is whether it is a science or an art. It is, of course, both, simply because there must be science in every art and art in every science. The antithesis is largely false; science lays stress on analysis, art on synthesis. The historical methods are scientific; they apply scientific methods to his subjects, and while the results be the test his documents and then turn them into literature. The relative importance of the two methods is a matter of dispute. There are some who still maintain that history is merely an art, that the best history is the story that is best told, and that what is said is less important than the way in which it is said. This school generally ignores records. Others attach little importance to the form in which truth is presented; they are concerned mainly with the principles and methods of scientific criticism, and specialize in palaeography, diplomatic and sources. The works of this school are little read, but in time its results penetrate the teaching in some few cases. If anything, history is the science of the past and not the science of the present; it is represented in England by a fairly good organization, the Royal Historical Society (with which the Camden Society has been amalgamated), and by an excellent periodic, The English Historical Review (founded in 1884), while some sort of propaganda is attempted by the Historical Association (started in 1906). Its standards have also been upheld with varying success in great co-operative undertakings, such as the Dictionary of National Biography, the Cambridge Modern History, and Messrs Longman's Political History of England.

To give some sort of classification for purposes of reference, and the chronological is the most convenient. Lingard's, J. R. Green's and Messrs Longmans' histories are the only notable attempts to tell the history of England as a whole. The Cambridge Modern History (3 vols.) brings the middle ages and embodies a political survey as well (for corrections and modifications see Petit-Dutaillis, Supplementary Studies, 1908), while Hallam's Constitutional History (3 vols.) extends from 1485 to 1760 and Erskine May's (3 vols.) from 1760 to 1860. Sir James Ramsay's six volumes also cover the greater part of medieval English history. There is no work on a larger scale than Lappenberg and Kemble, dealing with England before the Norman Conquest, though J. R. Green's Making of England and Conquest of England deal with certain portions in some detail, and Freeman gives a preliminary survey in his Norman Conquest (6 vols.). For the subsequent centuries, Green, Macaulay, Stubbs, Longmans' Political History and monographs (some of them good), until we come to Wylie's Henry IV. (4 vols.); and again from 1413 the same is true (Gairdner's Lollardy and the Reformation being the most elaborate monograph) until we come to Brewer's Reign of Henry VIII. (2 vols.; 1500 only), Froude's History (12 vols. 1529-1588) and R. W. Dixon's Church History (6 vols., 1529-1750). From 1603 to 1666 we have Gardiner's History (England, 10 vols.; Civil War, 4 vols.; Commonwealth and Protectorate, 3 vols.), and to 1714 Ranke's History of England (6 vols.; see also Firth's Cromwell and Cromwell's Army, and various editions of texts and monographs). For Charles II. there is no good history; then come Macaulay, and Stanhope and Wyon's Queen Anne (2 vols. 1852-1885), and for the 18th century Oldfield's Rise and Growth of Literature, 3 vols. Ireland, 5 vols.), from 1793 to 1815 is another gap only partially filled. Spencer Walpole deals with the period from 1815 to 1837, and will be published with the year 1850.

A few books on special subjects deserve mention. For legal history see Pollock and Maitland's History of English Law (2 vols.; to Edward I.), Maitland's Domesticity Book and Beyond, and Anson's Law of the Constitution (chosen by Lord Halsbury). For economic history, see Hargreaves's Growth of Industry and Commerce, and Ashley's Economic History; for ecclesiastical history, Stephens and Hunt's series (7 vols.); for foreign and colonial, seeley's British Foreign Policy and Empire, and J. A. Doyle's books on the American colonies; for military history, Fortescue's History of the British Army, Napier's and Oman's works on the Peninsular War, and Kitchener's War in Egypt. For events before the Crimean War, Coningsby's Crimean War, Drake and the Tudor Navy, Successors of Drake, English in the Mediterranean and Seven Years' War, and Mahan's Influence of Sea-Power on History and Influence of Sea-Power upon the French Revolution, give the necessary information.

BIBLIOGRAPHY OF BIBLIOGRAPHIES.—The sources for the middle ages have been enumerated in C. Goss's Sources and Literature of English History . . . to about 1485 (London, 1900), but there is nothing similar for modern history. C. C. Lee's Source Book of English History is not very satisfactory. More information can be obtained from the indexes of the works mentioned in Longmans' Political History, or in the bibliographical articles in the D.N.B. and B.C.P. A series of bibliographical leaflets for the use of teachers is issued by the Herbert Archive Trust, and there is also Scargill's Guide to the Record Office, and the class catalogues in the MSS. Department of the British Museum. Lists of the state papers and other documents printed and catalogued under the direction of the master of the Rolls and deputy keeper of the Records are supplied at the end of many of their volumes. (A. F. P.)

ENGLISH LANGUAGE. In its historical sense, the name English is now conveniently used to comprehend the language of the English people from their settlement in Britain to the present day, the various stages through which it has passed being distinguished as Old, Middle, and New or Modern English. In works yet recent, and even in some still current, the term is confined to the third, or at most extended to the second and third of these stages, since the language assumed in the main the vocabulary and grammatical forms which it now presents, the oldest or inflected stage being treated as a separate language, under the title of Anglo-Saxon, while the transition period which connects the two has been called Semi-Saxon. This view had the justification that, looked upon by themselves, either as vehicles of thought or as objects of study and analysis, Old English or Anglo-Saxon and Modern English are, for all practical ends, distinct languages,—as much so, for example, as Latin and Spanish. No amount of familiarity with Modern English, including its local dialects, would enable the student to read Anglo-Saxon, three-fourths of the vocabulary of which have perished and been reconstructed within 900 years; nor would a knowledge even of these last words give him the power, since the grammatical system, alike in accidence and syntax, would be entirely strange to him. Indeed, it is probable that a modern Englishman would acquire the power of reading and writing French in less time than it would cost him to attain to the same proficiency in Old English; so that if the test of distinct languages be their degree of practical difference from each other, it cannot be denied that "Anglo-Saxon" is a distinct language from Modern English. But when we view the subject historically, recognizing the fact that living speech is subject to continuous change in certain definite directions, determined by the conditions and circumstances in which an evolution or development of which we can trace the stages is going on, owing to the abundance of written materials, this evolution appears so gradual in English that we can nowhere draw distinct lines separating its successive stages, we recognize these stages as merely temporary phases of an individual whole, and speak of the English language as used alike by Cynwulf, by Chaucer, by Shakespeare and by Tennyson. It must not be forgotten, however, that in this wide sense the English language includes, not only the literary or courtly forms of speech used at successive periods, but also the popular and, it may be, of lesser and unwritten dialects that exist by their side. Only on this basis, indeed, can we speak of Old, Middle and Modern English as a single language, since in actual fact the precise dialect which is now the cultivated language, or "Standard English," is not the descendant of that dialect which was the cultivated language or "Englisc" of Alfred, but of a sister dialect then sunk in comparative obscurity,—even as the direct descendant of Alfred's Englisc is now to be found in the non-literate rustic speech of Wiltshire and Somersetshire. Causes which, linguistically

1 A careful examination of several letters of Bosworth's Anglo-Saxon dictionary gives in 2000 words (including derivatives and compound words, but excluding orthographic variants) 535 which still exist as modern English words.

2 The practical convenience of having one name for what was the same thing in various stages of development is not affected by the proposition that (E. A. Cornewall's famous phrase) "the English were, at an early period, not applied to the whole of the inhabitants of Teutonic Britain, but only to a part of them. The dialects of English and Seaxon were alike old forms of what was afterwards English speech, and so, viewed in relation to it, Old English, whatever their contemporary names might be.
ENGLISH LANGUAGE

considered, are external and accidental, have shifted the political and intellectual centre of England, and along with it transferred literary and official patronage from one form of English to another; if the centre of influence had happened to be fixed at York or on the banks of the Forth, both would probably have been neglected for a third.

The English language, thus defined, is not "native" to Britain, that is, it was not found there at the dawn of history, but was introduced by foreign immigrants at a date many centuries later. At the Roman Conquest of the island the languages spoken by the natives belonged all (so far as is known) to the Celtic branch of the Indo-European or Indo-Germanic family, modern forms of which still survive in Wales, Ireland, the Scottish Highlands, Isle of Man and Brittany, while one has at no distant date become extinct in Cornwall (see Celt: Language). Brythonic dialects, allied to Welsh and Cornish, were apparently spoken over the greater part of Britain, as far north as the firths of Forth and Clyde; beyond these estuaries and in the isles to the west, including Ireland and Man, Goidelic dialects, akin to Irish and Scottish Gaelic, prevailed. The long occupation of south Britain by the Romans (A.D. 43-409)—a period, it must not be forgotten, equal to that from the Reforma-
tion to the present day, or nearly as long as the whole duration of modern English—familiarized the provincial inhabitants with Latin, which was probably the ordinary speech of the towns. Gildas, writing nearly a century and a half after the renunciation of Honorius in 410, addressed the British princes in that language;¹ and the linguistic history of Britain might have been not different from that of Gaul, Spain and the other provinces of the Western Empire, in which a local type of Latin, giving birth to a neo-Latinic language, finally superseded the native tongue except in remote and mountainous districts,² had not the course of events been entirely changed by the Teutonic conquests of the 5th and 6th centuries.

The Angles, Saxons, and their allies came of the Teutonic stock, and spoke a tongue belonging to the Teutonic or Germanic branch of the Indo-Germanic (Indo-European) family, the same race and form of speech being represented in modern times by the people and languages of Holland, Germany, Denmark, the Scandinavian peninsula and Iceland, as well as by those of England and her colonies. Of the original home of the so-called primitiva Aryan,³ of the name Indo-European (q.v.), which now as the parent Indo-European, nothing is certainly known, though the subject has called forth many conjectures; the present tendency is to seek it in Europe itself. The tribe can hardly have occupied an extensive area at first, but its language came by degrees to be diffused over the greater part of Europe and some portion of Asia. Among those whose Aryan descent is generally recognized as beyond dispute are the Teutons, to whom the Angles and Saxons belonged.

The Teutonic or Germanic people, after dwelling together in a body, appear to have scattered in various directions, their language gradually breaking up into three main groups, which can be already clearly distinguished in the 4th century A.D., North-Germanic or Scandinavian, West Germanic or Low and High German, and East Germanic, of which the only important representative is Gothic. Gothic, often called Moeso-Gothic, was the language of a people of the Teutonic stock, who, passing down the Danube, invaded the borders of the Empire, and obtained settlements in the province of Moesia, where their language was committed to writing in the 4th century; its literary remains are of peculiar value as the oldest specimens, by several centuries, of Germanic speech. The dialects of the invaders of Britain belonged to the West Germanic branch, and within this to the Low German group, represented at the present
day by Dutch, Frisian, and the various "Platt-Deutsch" dialects of North Germany. At the dawn of history the fore-
 fathers of the English appear to have been dwelling between and about the estuaries and lower courses of the Rhine and the Weser, and the adjacent coasts and isles; at the present day the most English or Anglo-form dialects of the European continent are held to be those of the North Frisian islands of Amrum and Sylt, on the west coast of Schleswig. It is well known that the greatest part of the ancient Friesland has been swept away by the encroachments of the North Sea, and the disjecta membra of the Frisian race, pressed by the sea in front and more powerful nationalities behind, are found only in isolated fragments from the Zuider Zee to the coasts of Denmark. Many Frisians accompanied the Angles and Saxons to Britain, and Old English was in many respects more closely connected with Old Frisian than with any other Low German dialect. Of the Geatas, Eotus or "Jutes," who, according to Bede, occupied Kent and the Isle of Wight, and formed a third tribe along with the Angles and Saxons, it is difficult to speak linguistically. The speech of Kent certainly formed a distinct dialect in both the Old English and the Middle English periods, but it has tended to be assimilated more and more to neighbouring southern dialects, and is at the present day identical with that of Sussex, one of the old Saxon kingdoms. Whether the speech of the Isle of Wight ever showed the same characteristic differences as that of Kent cannot now be ascertained, but its modern dialect differs in no respect from that of Hampshire, and shows no special connexion with that of Kent. It is at least entirely doubtful whether Bede's Geatas came from Jutland, on the linguistic grounds we should expect that they occupied a district lying not to the north of the Angles, but between these and the old Saxons.

The earliest specimens of the language of the Germanic invaders of Britain that exist point to three well-marked dialect groups: the Anglian (in which a further distinction may be made between the Northumbrian and the Mercian, or South-
humbrian); the Saxon, generally called West-Saxon from the almost total lack of sources outside the West-Saxon domain; and the Kentish. The Kentish and West-Saxon are sometimes, especially in later times, grouped together as southern dialects as opposed to midland and northern. These three groups were distinguished from each other by characteristic points of phonological inflection. Speaking generally, the Anglian dialects may be distinguished by the absence of certain normal West-Saxon vowel-changes, and the presence of others not found in West-
Saxon, and also by a strong tendency to confuse and simplify inflections, in all which points, moreover, Northumbrian tended to deviate more widely than Mercian. Kentish, on the other hand, occupied a position intermediate between Anglian and West-
Saxon, early Kentish approaching more nearly to Mercian, owing perhaps to early historical connexion between the two, and late Kentish tending to conform to West-Saxon characteristics, while retaining several points in common with Anglian. Though we cannot be certain that these dialectal divergences date from a period previous to the occupation of Britain, such evidence as can be deduced points to the existence of differences already on the continent, the three dialects corresponding in all likelihood to Bede's three tribes, the Angles, Saxons and Gentas.

As it was amongst the Englisc or Angles of Northumbria that literary culture first appeared, and as an Angle or Englisc dialect was the first to be used for vernacular literature, Englisc came eventually to be a general name for all forms of the vernacular as opposed to Latin, &c., and even when the West-Saxon of Alfred became in its turn the literary or classical form of speech, it was still called Englisc or English. The origin of the name Anglo-Saxon (Anglo-Saxons) has been disputed; some maintain that it means a union of Angles and Saxons, others (with better foundation) that it meant English Saxons, or Saxons of England or of the Angle-cynn as distinguished from Saxons of the Continent (see New English Dictionary, s.v.). Its modern use is mainly due to the little band of scholars who in the 16th and 17th centuries turned their attention to the long-forgotten language of Alfred and Ælfric, which, as it differed so greatly from

¹ The works of Gildas in the original Latin were edited by Mr Stevenson for the English Historical Society. There is an English translation in Six Old English Chronicles in Bohn's Antiquarian Library.

² As to the continued existence of Latin in Britain, see further in Rhys's Lectures on Welsh Philology, pp. 226-227; also Dogatschur, Lautlehre d. gr., lat. u. roman. Lernworte im Alten. (Strassburg. 1888).
the English of their own day, they found it convenient to distinguish by a name which was applied to themselves by those who spoke it. 3 To these scholars "Anglo-Saxon" and "English" were separated by a gulf which it was reserved for later scholars to bridge across, and show the historical continuity of the English of all ages.

As already hinted, the English language, in the wide sense, presents three main stages of development—Old, Middle and Modern—distinguished by their inflectional characteristics. The latter can be best summarized in the words of Dr Henry Sweet in his History of English Sounds: 4 "Old English is the period of full inflections (næme, geofan, cer). Middle English of reduced inflections (naume, given, case), and Modern English of lost inflections (name, give, care = nám, gje, càr). We have besides two periods of transition, the first in which naume and name exist side by side, and the other in which final e [with other endings] is beginning to drop." By lost inflections it is meant that only very few remain, and those mostly non-syllabic, as the -r in stones and loves, the -ed in loved, the -r in their, as contrasted with the Old English stán-as, lufa-, luf-ed- and luf-æd-on, hâ-ra. Each of these periods may also be divided into two or three; but from the want of materials it is difficult to make any such division for all dialects alike in the first.

As to the chronology of the successive stages, it is of course impossible to lay down any exclusive series of dates, since the linguistic changes were inevitably gradual, and also made themselves felt in various parts of the country much earlier than in others, the north being always in advance of the midland, and the south much later in its changes. It is easy to point to periods at which Old, Middle and Modern English were fully developed, but much less easy to draw lines separating these stages; and even if we recognize between each part a "transition" period or stage, the determination of the beginning and end of this will to a certain extent be a matter of opinion. But bearing these considerations in mind, and having special reference to the midland dialect from which literary English is mainly descended, the following may be given as approximate dates, which if they do not demarcate the successive stages, at least include them:

Old English or Anglo-Saxon ("Semi-Saxon")
- to 1100

Transition Old English
- 1100 to 1150

Early Middle English
- 1150 to 1250

(Normal) Middle English
- 1250 to 1400

Late and Transition Middle English
- 1400 to 1485

Early Modern English
- 1485 to 1611

Seventeenth century transition
- 1611 to 1688

Modern or current English
- 1689 onward

Dr Sweet has reckoned Transition Old English (Old Transition) from 1050 to 1150, Middle English thence to 1450, and Late or Transition Middle English (Middle Transition) 1450 to 1500.

As to the Old Transition see further below.

3 The origin of Old-Saxon or Anglo-Saxon tongue, as introduced into Britain, was highly inflectional, though its inflections at the date when it becomes known to us were not so full as those of the earlier Gothic, and considerably less so than those of Greek and Latin during their classical periods. They corresponded more closely to those of modern literary German, though both in nouns and verbs the forms were more numerous and distinct; for example, the German guten answers to three Old English forms,—gœdne, gœdum, gœdan; guter to two—gœdre, gœdra; lieben to two,—liefodan and liefoden. Nouns had four cases, Nominative, Accusative (only sometimes distinct), Genitive, Dative, the latter used also with prepositions to express locative, instrumental, and most ablative relations; of a distinct instrumental case only vestiges occur. There were several declensions of nouns, the main division being that shown in Germanic languages generally as strong and weak,—a distinction also extending to adjectives in such wise that every adjective assumed either the strong or the weak inflection as determined by associated grammatical forms. The first and second personal pronouns possessed a dual number—we two, ye two; the third person had a complete declension of the stem he, instead of being made up as now of the three stems seen in he, she, they. The verb distinguished the subjective from the indicative mood, but had only two inflected tenses, present and past (more accurately, that of incomplete and that of completed or "perfect" action)—the former also used for the future. The order of the sentence corresponded generally to that of German. Thus from King Alfred's additions to his translation of Orosius: "Done by ylcane dage hine to jœm æde boran wylla5 þonne todæla5 hi his feoh þaet ðære to lafe bis5 after þæm gedrynce and þæm plegen, on ôf ôðre syw, hwilum on ma, swa swa þaes feos andefn bis5" ("Then on the same day [that] they him to the pile bear will, then divide they his property that there to remain shall be after the drinking and the sports, into five or six, at times into more, according as the property's value is").

The poetry was distinguished by alliteration, and the abundant use of figurative and metaphorical expressions, of bold compounds and archaic words never found in prose. Thus in the following lines from Beowulf (ed. Thorpe, i. 645, Zupitza 320):

Sæsæ wæsæ þæs-fæh, stig wæsode
Gumum ætægærede, gæþ-byrne scæn
Heard bond-locen, bring-æren scæn
Song æfæ æamæ wæsæ, þæc ætæ ætæ æfæ
In hyra græþæ æamæ wæsæ æamæ wæsæ

The Old English was a homogeneous language, having very few foreign elements in it, and forming its compounds and derivatives entirely from its own resources. A few Latin appellatives learned from the Romans in the German wars had been adopted into the common West Germanic tongue, and are found in English as in the allied dialects. Such were stræt (street, via strata), cæmp (battle), cæsere (Casar), mil (mile), pm (punishment), mynel (money), pund (pound), wæl (wine); probably also cyrcle (church), bispoc (bishop), ladan (Latin language), celce (chalice), can (camel), fræna (frayna, fræna), deplephantus, yeance (inch), fæse (feet), and a few others. The relations of the first invaders to the Britons were to a great extent those of destroyers; and with the exception of the proper names of places and prominent natural features, which as is usual were retained by the new population, few British words found their way into the Old English. Among those are named broc (a badger), bræc (breeches), elæd (clout), pæl (pool), and a few words relating to the employ-ment of field or household menials. Still fewer words seem to have been adopted from the provincial Latin, almost the only certain ones being cœstula, applied to the Roman towns, which appeared in English as caste, caster, now used both in composition as caster, cheaster,—asster, and inculled (kitchen), which gave cowen (kitchen). The introduction and gradual adoption of Christianity, brought a new series of Latin words connected with the offices of the church, the accompaniments of higher civilization, the foreign productions either actually made known, or mentioned in the Scriptures and devotional books. Such were mæstyr (monasterium), nunuc (monk), nunne (nun), maesce (mass), school (school), almesse (eleemosyna), canded (candel), turtle (turtur), fic (lucus), cedar (cedrus). These words, whose number increased from the 7th to the 10th century, are commonly called Latin of the second period, the Latin of the first period including the Latin borrowed words never found in prose. Thus in mention, as well as those picked up in Britain either from the Roman provincials or the Welsh. The Danish invasions of the 8th and 9th centuries.
resulted in the establishment of extensive Danish and Norwegian populations, about the basin of the Humber and its tributaries, and above Morecambe Bay. Although these Scandinavian settlers must have greatly affected the language of their own localities, but few traces of their influence are to be found in the literature of the Old English period. As with the greater part of the words adopted from the Celtic, it was not until after the dominion of the Norman had overlaid all preceding conquests, and the new English began to emerge from the ruins of the old, that Danish words in any number made their appearance in books, as equally "native" with the Anglo-Saxon.

The earliest specimens we have of English date to the end of the 7th century, and belong to the Anglian dialect, and particularly to Northumbrian, which, under the political eminence of the early Northumbrian kings from Edwin to Egfrith, aided perhaps by the learning of the scholars of Ireland and Iona, first attained to literary distinction. Of this literature in its original form mere fragments exist, one of the most interesting of which consists of the verses uttered by Bede on his deathbed, and preserved in a nearly contemporary MS.:

Fore there neid faerœ, naenig uuiurith thone smotterra. than him thræfl sie, to ymb-hrynsic, swe蜘: his hín-ih-sē, huæt his gastæa, godes æetha yfæes, acfigr. acc. deoth-daæge, doemid uuærothæ.

Tran.:
Before the inevitable journey becomes not any
Thought more wise than (that) it is needful for him,
To consider, ere his hence-going,
What, to his ghost, of good or ill,
After death-day, doomed may be.

But our chief acquaintance with Old English is in its West-Saxon form, the earliest literary remains of which date to the 9th century, when under the political supremacy of Wessex and the scholarship of King Alfred it became the literary language of the English nation, the classical "Anglo-Saxon." If our materials were more extensive, it would probably be necessary to divide the Old English into several periods; as it is, considerable differences have been shown to exist between the "early West-Saxon" of King Alfred and the later language of the 11th century, the earlier language having numerous phonetic and inflectional distinctions which are "levelled" in the later, the inflectional changes showing that the tendency to pass from the synthetic to the analytical stage existed quite independently of the Norman Conquest. The northern dialect, whose literary career had been cut short in the 8th century by the Danish invasions, reappears in the 10th in the form of glosses in the Latin gospels and a service-book, often called the Ritual of Durham, where we find that, owing to the confusion which had so long reigned in the north, and to special Northumbrian tendencies, e.g. the dropping of the inflectional in both verbs and nouns, this dialect had advanced in the process of inflection-leveling far beyond the sister dialects of Mercian and the south, so as already to anticipate the forms of Early Middle English.

Among the literary remains of the Old English may be mentioned the epic poem of Beowulf, the original nucleus of which has been supposed to date to heathen and even continental times, though we cannot accept it only on the authority of its later works of Cynewulf; those formerly ascribed to Cædmon; several works of Alfred, two of which, his translation of Orosius and of The Pastoral Care of St Gregory, are contemporary specimens of his language; the Old English or Anglo-Saxon Chronicle; the theological works of Ælfric (including translations of the Pentateuch and the gospels) and of Wulfstan; and many works both in prose and verse, of which the authors are unknown.

The earliest specimens, the inscriptions on the Ruthwell and Beawcastles crosses, are in a Runic character; but the letters used in the manuscripts generally are a British variety of the Roman alphabet which the Anglo-Saxons found in the island, and which was also used by the Welsh and Irish. Several of the Roman letters had been developed forms, and retained or acquired values, unlike those used on the continent, in particular s p g n r.

1 See on this Rhys, Lectures on Welsh Philology, v.

2 During the Old English period both c and ȝ appear to have acquired a palatal value in conjunction with front or palatal vowelsounds, except in the north where c, and in some cases ȝ, tended to be written with h, as in ȝed, ȝeread, ȝerard = orchard, fealle, feaceson = fetch), as well as from the normal occurrence of ȝ in these positions in later stages of the language, e.g. cild = child, tacean = teach. ȝedgel = yll, daes = day, &c.

3 There is no reason to suppose that any attempt was made to prescribe or suppress the native tongue, which was indeed used in official documents of the Conqueror and his immediate successors, as is maintained by Freeman, Norman Conquest, ch. xxv.

4 The Old English period is usually considered as terminating 1120, with the death of the generation who saw the Norman Conquest. The Conquest established in England a foreign court, a foreign aristocracy and a foreign hierarchy. The French language, in its Norman dialect, became the only polite medium of intercourse. The native tongue, despised not only as unknown but as the language of a subject race, was left to the use of boors and serfs, and except in a few stray cases ceased to be used at all. The verbal results followed. With the educated generation that saw the arrival of the Norman died out, the language, ceasing to be read and written, lost all its literary words. The words of ordinary life whose preservation is independent of books lived on as vigorously as ever, but the literary terms, those that related to science, art and higher culture, the bold artistic compounds, the figurative terms of poetry, were speedily forgotten. The practical vocabulary shrank to a fraction of its former extent. And when, generations later, English began to be used for general literature, the only terms at hand to express ideas above those of every-day life were to be found in the French of the privileged classes, of whom alone art, science, law and theology had been for generations the inheritance. Hence each successive literary effort of the reviving English tongue showed a larger adoption of French words to supply the place of the forgotten native ones, till by the days of Chaucer they constituted a notable part of the vocabulary. Nor was it for the time being only that the French words affected the English vocabulary. The Norman French words introduced by the Conquest, as well as the Central or Parisian French words which followed under the early Plantagenets, were mainly Latin words which had lived on among the people of Gaul, and, modified in the mouths of succeeding generations, had reached forms more or less remote from their originals. These being rejected in turn, a certain cycle of precedents in accordance with which other Latin words might be converted into English ones, whenever required; and long after the Renascence of classical learning, though in much greater numbers after that epoch, these precedents were freely followed.

While the eventual though distant result of the Norman Conquest was thus a large reconstruction of the English vocabulary,
the grammar of the language was not directly affected by it. There was no reason why it should—we might almost add, no way by which it could. While the English were giving up their own sounds, they could not forget their own expressions, and the inflections and constructions by which alone the words expressed ideas—in other words, their grammar; when one by one French words were introduced into the sentence they became English by the very act of admission, and were at once subjected to all the duties and liabilities of English words in the same position. This is of course precisely what happens at the present day: telegraph and telegram make participle telegraphing and plural telegrams, and naivé the adverb naively, precisely as if they had been in the language for ages.

But indirectly the grammar was affected very quickly. In languages in the inflected or synthetic stage the terminations must be pronounced with marked distinctness, as these contain the correlation of ideas; it is all-important to hear whether a word is bonus or bonus or bonus or bonus. This implies a measured and distinct pronunciation, against which the effort for ease and rapidity of utterance is continually struggling, while indolence and carelessness continually compromise it. In the Germanic languages, as a whole, the main stress-accent falls on the radical syllable, or on the prefix of a nominal compound, and thus at or near the beginning of the word; and the result of this in English has been a growing tendency to suffer the concluding syllables to fall into obscurity. We are familiar with the coinage of winder, softer, holier, Surer, Sunder; would you, the final vowels sinking into an obscure neutral one now conventionally spelt er, but formerly represented by final e. Already before the Conquest, forms originally hate, sello, tungo, appeared as hate, selle, tunge, with the terminations levelled to obscure e; but during the illiterate period of the language after the Conquest this careless obsuring of terminal vowels became universal, all unaccented vowels in the final syllable (except e) sinking into e. During the 12th century, while this change was going on, we see a great confusion of grammatical forms, the full inflections of Old English standing side by side in the same sentence with the levelled ones of Middle English. It is to this state of the language that the names Transition and Period of Confusion (Dr Abbott's appellation) point; its appearance, that of Anglo-Saxon broken down in its endings, had previously given to it the suggestive if not logical appellation of Semi-Saxon.

Although the written remains of the transition stage are few, sufficient exist to enable us to trace the course of linguistic change in some of the dialects. Within three generations after the Conquest, faithful pens were at work transmuting the old homilies of Ælfric, and other lights of the Anglo-Saxon Church, into the current idiom of their posterity. During the period, in the reigns of Stephen and Henry II, Ælfric's gospels were similarly modernized so as to be "understood of the people," Homilies and other religious works of the end of the 12th century show us the change still further advanced, and the language passing into Early Middle English in its southern form. While these southern remains carry on in unbroken sequence the history of the Old English of Alfred and Ælfric, the history of the northern English is an entire blank from the 11th to the 13th century. The stubborn resistance of the north, and the terrible retaliation inflicted by William, apparently effaced northern English culture for centuries. If anything was written in the vernacular in the kingdom of Scotland during the same period, it probably perished during the calamities to which that country was subjected during the half-century of struggle for independence. In reality, however, the northern homilies entered upon their transition stage two centuries earlier; the glosses of the 10th century show that the Danish inroads had there anticipated the results hastened by the Norman Conquest in the south.

Meanwhile a dialect was making its appearance in another quarter of England, destined to overshadow the old literary dialects of north and south alike, and become the English of the future. The Mercian kingdom, which, as its name imports, lay along the marches of the earlier states, and was really a congeries of the outlying members of many tribes, must have presented from the beginning a linguistic mixture and transition; and it is evident that more than one intermediate form of speech arose within its confines, between Lancashire and the Thames. The specimens of early Mercian now in existence consist mainly of glosses, in a mixed Mercian and southern dialect, dating from the 8th century; but, in a 9th-century gloss, the so-called Vespasian Psalter, representing what is generally held to be pure Mercian. Towards the close of the Old English period we find some glosses of a still more advanced character, from the Rolls of St Matthew and a few verses of St John xvi., to be in Mercian. These glosses, with a few charters and one or two small fragments, represent a form of Anglo which in many respects stands midway between Northumbrian and Kentish, approaching the one or the other more nearly as we have to do with North Mercian or South Mercian. And soon after the Conquest we find an undoubted midland dialect in the transition stage from Old to Middle English, in the eastern part of ancient Mercia, in a district bounded on the south and south-east by the Saxon Middlesex and Essex, and on the east and north by the East Anglian Norfolk and Lindsey, and the Danish settlements on the banks of the Humber. In this district, and in the monastery of Peterborough, one of the copies of the Anglo-Saxon Chronicle, transcribed about 1120, was continued by two succeeding hands to the death of Stephen in 1154. The section 1172 to 1197, probably written in the latter year, shows a notable confusion between Old English forms and those of a Middle English, impotent to rid itself of the inflectional trammels which were still, though in weakened forms, so faithfully retained south of the Thames. And in the concluding section, containing the annals from 1132 to 1154, and written somewhere about the latter year, we find Middle English fairly started on its career. A specimen of this new tongue will best show the change that had taken place:

1140 A.D.—And 

On this with great confidence a specimen of southern English, translated from 10 to 20 years later (Hatton Gospels, Luke i. 49),

Da cwæð Maþ; Min saule mereo dhrithen, and min gast

Schon was, mid disiot bihen, and min geblisse on gode minen haelende. For Pám Þe gesæ Þe Þine eadmodnysse. Þin lif beæð freo Þe ældige seggë alle cnenornes; for Pám Þe me mychele Fing dyde se Þe mihtyg ys; and his name is halig. And his midhlohtynysse of cnenornes on cnenornese hine hondraende. Þe worhte maegne on hys earme; Ûe Þe Òode Þa ofermonde, on moda heora heartan. Þe wæp Þa ofermonde, and Þa ofermonde, Þa ofermonde, and Þa ofermonde, and Þa ofermonde, and Þa ofermonde.

For Þe wæp on Þe sice, and Þa ofermonde, and Þa ofermonde, and Þa ofermonde, and Þa ofermonde.

Swæ he spræc to ure ßeðeran, Abraham and his cade on a weorde.

To a still later date, apparently close upon 1200, belongs the very fine chronicle of Layamon or Lawman, a priest of Ely on the Severn, who, using as his basis the French Brul de Wace, expanded it by additions from other sources to more than twice the extent: his prose is 32,250 lines is a mine of illustration for the language of his time and locality. The latter was intermediate between midland and southern, and the language, though forty years later than the specimen from the Chronicle, is much more archaic in structure, and can scarcely be considered even as Early Middle English. The following is a specimen (lines 9964–9979):

The article be becomes ta after a preceding I or d by assimilation.

The Earle, Two of the Saxon Chronicles parallel (1866), p. 265.

Skeat, Anglo-Saxon and Northumbrian Gospels (1874).
On Kinbelines daie ... Pe king wes inne Bruttene, com a Fisen middel aerde ... anes maidesen sune, boren wes in Bepleem ... of beest, thir burden. He is Ihaten Jesi Crist ... Purh Pene halie gost, alie wriold wunne ... walde engele; fider he is on heuenen ... froure monconunnes; sune he is on erfenn ... of sele Pon maideine, & Pene halie gost ... halde8 mid him seoluen.

The **Middle English** was pre-eminently the *dialectal* period of the language. It was not till after the middle of the 14th century that English obtained official recognition. For three centuries, therefore, there was no standard form of speech which claimed any pre-eminence over the others. The writers of each district wrote in the dialect familiar to them; and between extreme forms the difference was so great as to amount to unintelligibility; works written for southern Englishmen had to be translated for the benefit of the men of the north:

44 "In soother Ingils was it drawin, And turbid le hau it till ur awin Langage of Pe northe lede. That can na nothir Ingils rede."

*Cursor Mundi*, 20,064.

Three main dialects were distinguished by contemporary writers, as in the often-quoted passage from Trevisa's translation of *Higden's Polyforicon* completed in 1387:

45 "Also Englyshe men ... hadde fram Pe bygynnynge pre maner speche, Souperoun, Midland and Soupeche (in Pe mydel of Pe lond) as by come of Pre maner people of Germania. ... Also of Pe fersyde Saxone tonge, Pat ys deled a *Pre*, and ys abyde scarse lyylc wyf teaww uplandysshe men and ys get wondur, for men of Pe est wip men of Pe west, as byt were under Pe same part of heuyvene, acordeb more in souynyng of speche Pan men of Pe norf wip men of Pe soul; Perfore hyt ys Pat Mercii, Pat bu5n men of myddel Engloned, as byt were parteners of Pe endes, undurstande5 bete Pe syde longages NorfPeron and Souperon, Pan NorfPern and Souperun undurstande5 oyer oyer."

The modern study of these Middle English dialects, initiated by the elder Richard Garnett, scientifically pursued by Dr Richard Morris, and elaborated by many later scholars, both English and German, has shown that they were readily distinguished by the conjugation of the present tense of the verb, which in typical specimens was as follows:

**Southern.**
Ich singe. We singe.  
Dau singest. 3e singe.  
He singef. Hy singe.  

**Midland.**
Ich, I. singe. We singen.  
Pou singest. 3e singen.  
He singef. Hy, thei, singen.  

**Northern.**
Ic, i, sing(e) (I Pat singes). We sing(e), We Pat synges.  
Pu singes. 3e sing(e), 3e foules synges.  
He singes. Thay sing(e), Men synges.  

Of these the southern is simply the old West-Saxon, with the vowels levelled to *e*. The northern second person in *es* preserves an older form than the southern and West-Saxon *est*; but the *es* of the third person and plural is derived from an older *eth*, the change of *-i* into *-s* being found in progress in the Durham glosses of the 10th century. In the plural, when accompanied by the pronoun subject, the verb had already dropped the inflections entirely as in Modern English. The origin of the *-en* plural in the midland dialect, unknown to Old English, is probably an instance of *form-llevelling*, the inflection of the present indicative being assimilated to that of the past, and the present and past subjunctive, in all of which *-en* was the plural termination. In the declension of nouns, adjectives and pronouns, the northern dialect had attained before the end of the 13th century to the simplicity of Modern English, while the southern dialect still retained a large number of inflections, and the midland a considerable number. The dialects differed also in phonology, for while the northern generally retained the hard or guttural values of *k, g, x*, these were in the two other dialects palatalized before front vowels into *ch, j and st*. *Kirk, chirche or church, bryg, bridge; stryke, strike; frys, fire; fres, there.* The *-en* plural in the north was written in the north *w(u)*, but elsewhere *w*, often sinking into *w*. The original long *a* in *stan, mar*, preserved in the northern *stane, more*, became *o* elsewhere, as in *stone, more*. So that the north presented a general aspect of conservatism of old sounds with the most thorough-going dissolution of old inflections; the south, a tenacious retention of the inflections, with an extensive evolution in the sounds. In one important respect, however, phonetic decay was far ahead in the north: the final *e* to which all the old vowels had been levelled during the transition stage, and which is a distinguishing feature of Middle English in the midland and southern dialects, became mute, i.e., disappeared, in the northern dialect before that dialect emerged from its three centuries of obscurcation, shortly before 1300. So thoroughly modern had its form consequently become that we might almost call it Modern English, and say that the Middle English stage of the northern dialect is lost. For comparison with the other dialects, however, the same nomenclature may be used, and we may class as Middle English the extensive literature which northern England produced during the 14th century. The earliest specimen is probably the Metrical Psalter in the Cotton Library,1 copied during the reign of Edward II. from an original of the previous century. The gigantic versified paraphrase of Scripture history called the *Cursor Mundi*,2 is held also to have been composed before 1300. The dates of the numerous alliterative romances in this dialect have not been determined with exactness, as all survive in later copies, but it is probable that some of them were written before 1300.

In the 14th century appeared the theological and devotional works of Richard Rolle, the anchorite of Hampole, Dan Jon Gaytrigg, William of Nassington, and other writers whose names are unknown; and towards the close of the century, specimens of the language also appear from Scotland both in official documents and in the poetical works of John Barbour, whose language, barring minute points of orthography, is identical with that of the contemporary northern English writers. From 1400 onward, the distinction between northern English and Lowland Scottish becomes clearly marked.

In the southern dialect one version of the work called the *Ancen Risle or "Rule of Nuns,"* adapted about 1225 for a small sisterhood at Tarrant-Kaines, in Dorsetshire, exhibits a dialect characteristic which had probably long prevailed in the south, though concealed by the spelling, in the use of *s* for *f*, as *vall, toordone fordo, toor for toor, sider father, strom from*. Not till later do we find a recognition of the parallel use of *z* for *s*. Among the writings which succeed, *The Owl and the Nightingale* of Nicholas de Guildford, of Portesham in Dorsetshire, before 1250, the *Chronicle of Robert of Gloucester, 1268*, and Trevisa's translation of *Higden, 1387*, are of special importance in illustrating the history of southern English. The earliest form of Langland's *Piers Plowman*, 1362, as preserved in the Vernon MS, appears to be in an intermediate dialect between southern and midland.3 The Kentish form of southern English seems to have retained specially archaic features; five short sermons in it of the middle of the 13th century were edited by Dr Norris (1866); but the great work illustrating it is the *Aynedite of Inwet* (Remorse of Conscience), 1340,4 a translation from the French by Dan Michiel of Northgate, Kent, who tells us—

"Pet Pis boc is y-write mid engliss of Kent; Pis boc is y-mad uor lewede men; Vor uader, and uor moder, and uor o'per kcn; Plam nor to berte wam alle manere zen. Pet ine hare inwyttte ne bleue no soul wen."

In its use of *s* (*u*) and *s* for *f* and *s*, and its grammatical inflections, it presents an extreme type of southern speech, with peculiarities specially Kentish; and in comparison with contemporary Midland English works, it looks like a fossil of two centuries earlier.

Turning from the dialectal extremes of the Middle English to the midland speech, which we left at the closing leaves of the

Peterborough Chronicle of 1154, we find a rapid development of this dialect, which was before long to become the national literary language. In this, the first great work is the Ormulum, or metrical Scripture paraphrase of Orm or Ormin, written about 1200, somewhat before the northern frontier of the midland area.

The dialect has a decided smack of the north, and shows for the first time in English literature a large percentage of Scandinavian words, derived from the Danish settlers, who, in adopting English, had preserved a vast number of their ancestral forms of speech, which were in time to pass into the common language, of which they now constitute some of the most familiar words. Blunt, bull, die, dwell, ill, kid, raise, same, thrive, wond, wing, are words from this source, which appear first in the work of Orm, of which the following lines may be quoted:

"He judewihshe folkes boc hemn setide, Patt hemn birde. Twa bukses samenn to Pe proest att kirkde-dre brinngen; and te11 f3a didenn luveli. swa sumn Pe boc hemn tahhte. And brohthenn tew3enn bukses Paer. Drhithin PerwifP to lakenn. And d'ant te kirkde-dre too. Pe proest ta tew3enn bukses, and o Patt an he le3ide Paer all po'frre sake and sine. Ormulum, ed. White, l. 1324.

The author of the Ormulum was a phonetist, and employed a special spelling of his own to represent not only the quality but the quantities of vowels and consonants—a circumstance which gives his work a peculiarity of the investigator. He is generally assumed to have been a native of Lincolnshire or Notts, but the point is a disputed one, and there is somewhat to be said for the neighbourhood of Ormskirk in Lancashire.

It is customary to differentiate between east and west midland, and to subdivide these again into north and south. As was natural in a tract of country which stretched from Lancaster to Essex, a very considerable variety is found in the documents which agree in presenting the leading midland features, those of Lancashire and Lincolnshire approaching the northern dialect both in vocabulary, phonetic character and greater neglect of inflections. But this diversity diminishes as we advance.

Thirty years after the Ormulum, the east midland rhymed Story of Genesis and Exodus shows us the dialect in a more southern form, with the vowels of modern English, and from about the same date, with rather more northern characteristics, we have an east midland Bestiary.

Different tests and different dates have been proposed for subdividing the Middle English period, but the most important is that of Henry Nicol, based on the observation that in the early 13th century, as in Ormin, the Old English short vowels in an open syllable still retained their short quantity, as näm, òver, míles; but by 1250 or 1260 they had been lengthened to nöm, òver, míls. Nicol has also taken place at a particular period in all the Germanic, and even the Romance languages, in bù-do for bò-num, òd-dre for òd-trem, &c. The lengthening of the penult left the final syllable by contrast shortened or weakened, and paved the way for the disappearance of final e in the century following, through the stages nöm-

1 Here, and in tat, tu, tær, for òtt, òu, òaset, after ò, òd, there is the same phonetic assimilation as in the last section of the Anglo-Saxon Chronicle above.

2 Edited for the Early English Text Society by Dr Morris (1865).

nöm-nën, nöm-nœ, nœn, the one long syllable in näm(e) being the quantitative equivalent of the two short syllables in nöm-në; hence the notion that mute e makes a preceding vowel long, the truth being that the lengthening of the vowel led to the e becoming mute.

After 1250 we have the Lay of Havelok, and about 1300 the writings of Robert of Brunne in South Lincolnshire. In the 14th century we find a number of texts belonging to the western part of the district. South-west midland is hardly to be distinguished from southern in its south-western form, and hence texts like Piers Plowman elude any satisfactory classification, but several metrical romances exhibit what are generally considered to be west midland characteristics, and a little group of poems, Sir Gawaine and the Greene Knight, the Pearl, Cleanness and Patience, thought to be the work of a north-west midland writer of the 14th century, bear a striking resemblance to the modern Lancashire dialect. The end of the century witnessed the prose of Wycliff and Mandeville, and the poetry of Chaucer, with whom Middle English may be said to have culminated, and in whose writings its main characteristics as distinct from Old and Modern English may be studied. Thus, we find final e in full use representing numerous original vowels and terminations as

Him thoughtë that his hertë wolde brekë,
in Old English—

Him þuhte þat his hearte wolde brecan,

which may be compared with the modern German—

Hem dautchte dass sein Herze wolte brechen.

In nouns the -es of the plural and genitive case is still syllabic—

Reede as the berst-es of a sow-es cer-es.

Several old genitives and plural forms continued to exist, and the dative or prepositional case has usually a final e. Adjectives retain so much of the old declension as to have -e in the definite form and in the plural—

The tender cropp-es and the yong-e sonne.

And small-e fow-ës make melodie.

Numerous old forms of comparison were in use, which have not come down to Modern English, as herre, ferre, lenger, heast—higher, farther, longer, highest. In the pronouns, ich lingered alongside of I; ye was only nominative, and you objective; the northern thei had dispossessed the southern hy, but her and hem (the modern 'em) stood their ground against their and them. The verb is I lov-e, thou lov-est, he lov-eth; but, in the plural, lov-en is interchanged with lov-e, as rhyme or euphony requires. So in the plural of the past we love-don or love-de. The infinitive also ends in en, often e, always syllabic. The present participle, ending in English -(e)n, passing through -inde, has been confounded with the verbal noun in -yng, -ynge, as in Modern English. The past participle largely retains the prefix y- or i-, representing the Old English ge-, as in i-ronne, y-don, Old English serunnan, sedon, run, done. Many old verb forms still continued in existence. The adoption of French words, not only those of Norman introduction, but those subsequently introduced under the Angevin kings, to supply obsolete and osolescent English ones, which had kept pace with the growth of literature since the beginning of the Middle English period, had now reached its climax; later times added many more, but they also dropped some that were in regular use with Chaucer and his contemporaries.

Chaucer's great contemporary, William Langland, in his Vision of William concerning Piers the Ploughman, and his imitator the author of Pierce the Ploughman's Crude (about 1400) used the Old English alliterative versification for the last time in the south. Rhyme had made its appearance in the language shortly after the Conquest—if not already known before; and in the south and midlands it became decidedly more popular than alliteration; the latter retained its hold much longer in the north, where it was written even after 1500: many of the northern romances are either simply alliterative, or have both alliteration and rhyme. To these characteristics of northern and southern verse respectively Chaucer alludes in the prologue of the "Persone," who, when called upon for his tale said—
to be intelligible to each other; in its south-eastern form, it was the language of London, where the supreme law courts were, the centre of political and commercial life; it was the language in which the Wyclifite versions had given the Holy Scriptures to the people; the language in which Chaucer had raised English poetry to a height of excellence admired and imitated by contemporaries and followers. And accordingly after the end of the 14th century, all Englishmen who thought they had anything to say to their countrymen generally said it in the midland speech. Trevisa's own work was almost the last literary effort of the southern dialect; henceforth it was but a rustic patois, which the dramatist might use to give local colouring to his creations, as Shakespeare uses it to complete Edgar's peasant disguise in Lear, or which 19th century research might disinter to illustrate obscure chapters in the history of language. And though the northern English proved a little more stubborn, it disappeared also from literature in England; but in Scotland, which had now become politically and socially estranged from England, it continued its course as the national language of the country, attaining in the 15th and 16th centuries a distinct development and high literary culture, for the details of which readers are referred to the works of Skene.

The 15th century of English history, with its bloody French war abroad and Wars of the Roses at home, was a barren period in literature, and a transition one in language, witnessing the decay and disappearance of the final e, and most of the syllabic inflections of Middle English. Already by 1420, in Chaucer's disciple Holcove, final e was quite uncertain; in Lydgate it was practically gone. In 1450 the writings of Pecock against the Wyclifites show the verbal inflections in -en in a state of obsolescence; he has still the southern pronouns her and hem for the northern their, them:—

And here-then holy scripture wrote me to make schulden to lacke, and in the French partes of his bookes, and the schulde is the same; and his bookes do so welle be the heeres of his heedes schulden be schorne, and schulde not growe in lengte doune as wommanys heer schulde growe.

The change of the language during the second period of Transition, as the dialect of all other uses and of the extent of dialectal differences, is quaintly expressed a generation later by Caxton, who in the prologue to one of the last of his works, his translation of Virgil's Enéides (1490), speaks of the difficulty he had in pleasing all readers:—

1. I doubted that it shold not please some gentylmen, which late blamed me, saying, y in my translacyons I had ouer curyous termes, which coude not be vnderstanste of comyn peple, and desirde me to vse olde and homely termes in my translacyons. And yaf whele I satisfye every man; and so tooke, an olde boke and rede beheme; and certeynly the same boke was a thinge that may not be cromed, and coude not wole vnderstanste it. And also my lordes abode of Westmyner ded do shewe to me late certayn euencies wrynt in olde englysshe for to reduc it in to our englysshe now vysid. And certaynly it was wredtyn in olde englysshe thys wyse thay that was olde olde englysshe, thay coude not reduc ne bryngye it to be vnderstenste. And also our clymen language now vysid vryre fyrre from that which was vysid and spoken when I was borne. For we englysshemen bene borne under the dominacye of Synon and other more tevyse, but ouer waueryng, wyxynge one season, and waneth and dyrecseste another season. And that comyn englysshe that is spoken in one shyre vryre from a nother. In so much that in my dayes happenly I was marwachynde in a chyld despite that was sayde ouer the se into zelande, and for lacke of wynde thay tarye alfornd, and wente to lande for to refraye themes. And one of or tendes on the field, he cam to on to the fymond of the fynge, and specially he asyd after everyse, And all men yfte wyrse answerede, thay coude speke no freche. And the marchant was angry.

The changes from Old to Middle English may be summed up thus: Loss of a large part of the native vocabulary, and adoption of French words to fill their place; not infrequent adoption of French words as synonyms of existing native ones; modernization of the English words preserved, by vowel change in a definite direction from back to front, and from open to close, q becoming q, original e, ë, tending to ee, oo, monophthongization of the old diphthongs eo, ea, and development of new diphthongs in connexion with e, e, and w; adoption of French orthography; introduction of new old symbols, q, iu, v, ch, and gradual loss of the symbols j, y, ñ; obscurcization of the vowels after the nasal, and especially of a, o, u to ë; consequent confusion and loss of old inflections, and their replacement by prepositions, auxiliary verbs and rules of position; abandonment of alliteration for rhyme; and great development of dialects, in consequence of there being no standard or recognized type of English.

But the recognition came at length. Already in 1258 was issued the celebrated English proclamation of Henry III., or rather of Simon de Montfort in his name, which, as the only public recognition of the native tongue between William the Conqueror and Edward III., has sometimes been spoken of as the first statute in the English language:

“Henri rurci godes fulsome king on Englelondene Lahouerd on Yrolande. Duk on Normandie on Aquitaine and er on Anlow. Send igretinge to alle hise holde ilære and ilawei on Huntendone-schire. Pat witen se wel alle pat we willen and vennen pat vrt vre relesmen alle oðer þe moare deel of heom þat heofe þen pur us and pur þat kandes folk on vre kuneriche, habbe idon and schulden don in der wortenese of gode and on vre trewe. For þe freme of te loande, pur þat besete of þan to-foren-iseide relesmen, þe stoedestef and liestenstef on þe þan to-foren-iseide alre vre trewe in þe trewe þat heo vs oþen. Þat heo stoedestefliche healden and swiren to healden and to werien Po iseinnes þat þen imakeide and beo to mãkide. Pur þan to-foren-iseide relesmen, oþer þur þe moare deel of heom alowe alse hit is biffere iden. And þat aþer heþel þat pur to do fordi þan ilche oðer sene alle men. Rit for to done and to loagen. And noo ne nime of loandene ne of ete, wherþur þis besete muthe beon iðer iweren on onei wise. And ifi oni oni eðer cumen her on on; we willen and hoaten þal at vre treowe heom healden deadliche ioan. And for þat we willen þat þis beo stoedestef and lestide; we senden Jezw þis writ open iswiden with þe pe of þe Amenant, þat þe sene foliow unnepe sene hit. Pexnes te, ðane Þetentde te, on þe Monbe of October In þe too-awend-fowertre þære of vre cruning. And þis wes idon aþeren vre isworen relesmen. . . .

And alþe þat pur is ingen in to auriche iðer schiere over al þære kuneriche on Englelondene. and ek in te Irelond.”
for he also could speak no frenshe, but wolde haue hadde egges; and she vnderstode hym not. And thence at lasie a nother sayd they ought to be the moste of the words that she sette hym well. Look! what shold a man in thys dayes now wyte, egges or eyren? certaynly, it is hard to playse every man, by cause of disyusere & chauenge of laungue. For in these dayes, every man have, in any repreycion in hisc hco!e vye wyll vster his comyny-cayyon and maters in suche maners & termes that fewe men shal vnderstonde theym. And so honest and grete clerkes haue ben wyte of the moste curuory and termes that man coude fynde. And thus bittyme playen, rude and curiously, I stond abasshed; but in my judgemente, the comyn termes that be dayly vset ben bedyr to vnderstonde the olde and auncyent englyshe.

In the productions of Caxton's press we see the passage from Middle to Early Modern English completed. The earlier of these have still an occasional verbal plural in -n, especially in the word _they ben_; the southern _her_ and _hem_ of Middle English vary with the northern and Modern English form. The older forms have been practically ousted, and the year 1485, which witnessed the establishment of the Tudor dynasty, may be conveniently put as that which closed the Middle English transition, and introduced Modern English. Both in the completion of this result, and in its comparative permanence, the printing press had an important share. By its exclusive patronage of the midland speech, it raised it still higher above the sister dialects, and secured its abiding victory. As books were multiplied and found their way into every corner of the land, and the art of reading became a more common acquirement, the man of Northumberland or of Somersetshire had forced upon his attention the book-English in which alone these were printed. This became in turn the model for his own writings, and by-and-by, if he made any pretensions to education, of his own speech. The written form of the language also tended to uniformity. In previous periods the scribe made his own spelling with a primary aim at expressing his own speech, according to the particular values attached by himself or his contemporaries to the letters and combinations of the alphabet, though liable to disturbance in the most common words and combinations by his ocular recollections of the spelling of others. But after the introduction of printing, this ocular recognition of words became ever more and more an aim; the book addressed the mind directly through the eye, instead of circuitously through eye and ear; and thus there was a continuous tendency for written words and parts of words to be reduced to a single form, and that the most usual, or through some accident the best known, but not necessarily that which would have been chosen had the ear been called in as umpire. Modern English spelling, with its rigid uniformity as to individual results and whimsical caprice as to principles, is the creation of the printing-office, the victory which, after a century and a half of struggle, mechanical convenience won over natural habits. Besides eventually creating a uniformity in writing, the introduction of printing made or at least ratified some important changes. The British and Old English form of the Roman alphabet has already been referred to. This at the Norman Conquest was superseded by an alphabet with the French forms and values of the letters. Thus _k_ took the place of the older _c_ before _e_ and _i_; _qu_ replaced _ew_; the Norman _w_ took the place of the _wh_ (j), _&c.;_ and hence it has often been said that Middle English stands nearer to Old English in pronunciation, but to Modern English in spelling. But there were certain sounds in English for which Norman writing had no provision; and for these, in writing English, the native characters were retained. Thus the Old English _g_ (g), beside the sound in _go_, had a guttural sound as in German _gaz_, Irish _magh_, and in certain positions a palatalized form of this approaching _y_ as in you (if pronounced with aspiration _you_ or _g(y)ou_). These sounds continued to be written with the native form of the letter as _bur33our_, while the French form was used for the sounds in _go_, _ace_,—one original letter being thus represented by two. So for the sounds of _th_, especially the sound in _that_, the Old English _thorn_ (b) continued to be used. But as these characters were not used for French and Latin, their use even in English became distorted towards the 13th century, and when printing was introduced, the founts, cast for continental languages, had no characters for them, so that they were dropped entirely, being replaced, _3_ by _gh_, _y_, and _b_ by _th_. This was a real loss to the English alphabet. In the north it is curious that the printers tried to express the _forms_ rather than the powers of these letters, and consequently _3_ was represented by _z_, the black letter form of which was confounded with it, while the _b_ was expressed by _y_, which its MS. form had come to approach or in some cases simulate. So in early Scotch books we find _yellou_, _ze_, _yem_ = _yellow_, _ye_, _that_; and in Modern Scottish, such names as _Mensie_, _Dalziel_, _Cockensie_, and the word _gaberlanzie_, in which the _z_ stands for _y_.

Modern English thus dates from Caxton. The language had at length reached the all but fictionless state which it now presents. A single older verbal form, the southern _eth_ of the third person singular, continued to be the literary prose form throughout the 16th century, but the northern form in _-s_ was intermixed with it in poetry (where it saved a syllable), and must ere long, as we see from Shakespeare, have taken its place in familiar speech. The fuller _an_, _none_, _mine_, _thine_, in the early part of the 16th century at least, were used in positions where their shortened forms _a_, _no_, _my_, _thy_ are now found (none other, _mine own_ = _no other, my own_). But with such minute exceptions, the accidence of the 16th century was the accidence of the 19th. While, however, the older inflections had disappeared, there was as yet no general agreement as to the mode of their replacement. Hence the 16th century shows a syntactic licence and freedom which distinguishes it strikingly from that of later times. The language seems to be in a plastic, uniform state, and its writers, as it were, experiment with it, bending it to constructions which now seem indefensible. Old distinctions of case and mood have disappeared from noun and verb, without custom having yet decided what prepositions or auxiliary verbs shall most fittingly convey their meaning. The laxity of word-order which was permitted in older states of the language by the _formal_ expression of relations was often continued though the inflections which expressed the relations had disappeared. Partial analogy was followed in allowing forms to be identified in one case, because, in another, such identification was accidentally produced, as for instance the past participles of _write_ and _take_ were often made _rote_ and _took_ because the contracted participles of _bind_ and _break_ were _bound_ and _broke_. Finally, because, in dropping inflections, the former distinctions even between parts of speech had disappeared, so that _iron_, _e.g._, was at once _noun_, _adjective_ and _verb_, _clean_; _adjective_, _verb_ and _adverb_, it appeared as if any word whatever might be used in any grammatical relation, where it conveyed the idea of the speaker. Thus, as has been pointed out by Dr Abbott, _"you can happy your friend, malice or foot your enemy, or fall an axe on his neck._ You can speak and act easy, free, excellent, you can talk of _fair_ instead of beauty (_fairness_), and a _pole_ instead of _a poleness._ A _he_ is used for a man, and a _lady_ is described by a gentleman as _the fairest she he has yet beheld._ An adverb can be used as a verb, as _they askance their eyes_; as a _noun_, _the backward and abyss of time_; or as an _adjective_, a _"seldom pleasure._" For, as he also says, _"clearness was preferred to grammatical correctness, and brevity both to correctness and clearness. Hence it was common to place words in the order in which they came uppermost in the mind without much regard to syntax, and the result was a forcible and perfectly unambiguous but ungrammatical sentence, such as_"

_The prince that feeds great natures they will slay him_,

_Ben Jonson._

Be guilty of my death since of my crime.

_Shakespeare._

It cost more to get than to lose in a day.

_Ben Jonson._

These characteristics, together with the presence of words now obsolete or archaic, and the use of existing words in senses

_A Shakespearean Grammar_, by Dr E. A. Abbott. To this book we are largely indebted for its admirable summary of the characters of Tudor English.
different from our own, as general for specific, literal for metaphorical, and vice versa, which are so apparent to every reader of the 16th-century literature, make it useful to separate Early Modern or Tudor English from the subsequent and still existing stage, since the consensus of usage has declared in favour of individual senses and constructions which are alone admissible in ordinary language.

The beginning of the Tudor period was contemporaneous with the Renaissance in art and literature, and the dawn of modern discoveries in geography and science. The revival of the study of the classical writers of Greece and Rome, and the translation of their works into the vernacular, led to the introduction of an immense number of new words derived from these languages, either to express new ideas and objects or to indicate new distinctions in or grouping of old ideas. Often also it seemed as if scholars were so pervaded with the form as well as the spirit of the old, that it came more natural to them to express themselves in words borrowed from the old than in their native tongue, and thus words of Latin origin were introduced even when English already possessed perfectly good equivalents. As has already been stated, the French words of Norman and Angevin introduction, being principally Latin words in an altered form, were more easily Englished than the pure Latin words. Latin words could be converted into English ones, and it is after these models that the Latin words introduced during and since the 16th century have been fashioned. There is nothing in the form of the words procession and progression to show that the one was used in England in the 11th, the other not till the 16th century. Moreover, as the formation of new words from Latin had gone on in French as well as in English since the Renaissance, we often cannot tell whether such words, e.g. as persuade and persuasion, were borrowed from their French equivalents or formed from Latin in England independently. With some words indeed it is impossible to say whether they were formed in England directly from Latin, borrowed from contemporary French, or had been in England since the Norman period, even photograph, geology and telephone have the form that they would have had if they had been living words in the mouths of Greeks, Latins, French and English from the beginning, instead of formations of the 19th century.1 While every writer was thus introducing new words according to his notion of their being needed, it naturally happened that a large number were not accepted by contemporaries or posterity; a long list might be formed of these mintsages of the 16th and 17th centuries, which either never became current coin, or circulated only as it were for a moment. The revived study of Latin and Greek also led to modifications in the spelling of some words which had entered Middle English in the French form. So Middle English donw, debt were changed to doubt, debt, to show a more immediate connexion with Latin dubitum, debitum; the actual derivation from the French being ignored. Similarly, words containing a Latin and French t, which might be traced back to an original Greek θ, were remodelled upon the Greek, e.g. theme, throne, for Middle English teme, trone, and, by false association with Greek, anthem, Old English antene, Latin antiphona; Anthony, Latin Antonius; Thames, Latin Tamesis, apparently after Thomas.

The voyages of English navigators in the latter part of the 16th century introduced a considerable number of Spanish words, and American words in Spanish forms, of which negro, potato, tobacco, cargo, armadillo, alligator, galleon may serve as examples.

The date of 1611, which nearly coincides with the end of Shakespeare's literary work, and marks the appearance of the Authorized Version of the Bible (a compilation from the various 16th-century versions), may be taken as marking the close of Tudor English. The language was thenceforth Modern in structure, style and expression, although the spelling did not settle down to present usage till about the revolution of 1688. The latter date also marks the disappearance from literature of a large number of words, chiefly of such as were derived from Latin during the 16th and 17th centuries. Of these nearly all that survived 1688 are still in use; but a long list might be made out of those that appear for the last time before that date. This sitting of the literary vocabulary and gradual fixing of the literary spelling, which went on between 1611, when the language became modern in structure, and 1688, when it became modern also in form, suggests for this period the name of Seventeenth-Century Transition. The distinctive features of Modern English have already been anticipated by way of contrast with preceding stages of the language. It is only necessary to refer to the fact that the vocabulary is now much more composite than at any previous period. The immense development of the physical sciences has called for a corresponding extension of terminology which has been supplied from Latin and especially Greek; and although these terms are in the first instance technical, yet, with the spread of education and general diffusion of the rudiments and appliances of science, the boundary line between technical and general, indefinite at the best, tends more and more to melt away—this in addition to the fact that words still technical become general in figurative or metonymic senses. Achieve, diamond, stomach, comet, organ, lane, bell, carte, are none the less English words, derivable from Latin. Commercial, social, artistic or literary contact has also led to the adoption of numerous words from modern European languages, especially French, Italian, Portuguese, Dutch (these two at a less recent period): thus from French soiree, stance, depot, debris, programme, prestige; from Italian bust, como, folio, cartone, concert, regatta, ruffian; from Portuguese caste, palaver; from Dutch yachi, skipper, schooner, sloop. Commercial intercourse and colonization have extended far beyond Europe, and given us words more or fewer from Hindostani, Persian, Arabic, Turkish, Malay, Chinese, and from American, Australian, Polynesian and African languages. More important even than these, perhaps, are the dialect words that from time to time obtain literary recognition, restoring to us obsolete Old English words, or rare and seldom words of Celtic or Danish origin, which have been preserved in local dialects, and thus at length find their way into the standard language.

As to the actual proportion of the various elements of the language, it is probable that original English words do not now form more than a fourth or perhaps a fifth of the total entries in a full English dictionary; and it may seem strange, therefore, that we still identify the language with that of the 9th century, and class it as a member of the Low German division. But this explains itself, when we consider that of the total words in a dictionary only a small portion are used by any one individual in speech or writing; that this portion includes the great majority of the Anglo-Saxon words, and but a minority of the others. The latter are in fact almost all names—the vast majority names of things (nouns), a smaller number names of attributes and actions (adjectives and verbs), and, from their very nature, names of the things, attributes and actions which come less usually or, it may be, very rarely under our notice. Thus in an ordinary book, a novel or story, the foreign elements will amount to from 10 to 15% of the whole; as the subject becomes more recondite or technical their number will increase; till in a work on chemistry or abstract mathematics the proportion may be 40%. But after all, it is not the question whence words may have been taken, but how they are used in a language that settles its character. If new words when adopted conform themselves to the manner and usage of the adopting language, it makes absolutely no difference whether they are taken over from some other language, or invented off at the ground. In either case they are new words to begin with; in either case also, if they are needed, they will become as thoroughly native, i.e. familiar from childhood to those who use them, as those that possess the longest native pedigree. In this respect English is still the same language it was in the days of Alfred; and, comparing its history with that of other Low German tongues, there is no reason to believe that

---

1 Evangelist, astronomy, dialogue, are words that have so lived, of which their form is the result. Photograph, geology, &c., take this form as if they had the same history.

2 See extended lists of the foreign words in English in Dr Morris's Historical Outlines of English Accidence, p. 33.
its grammar or structure would have been very different, however different its vocabulary might have been, if the Norman Conquest had never taken place.

A general broad view of the sources of the English vocabulary and of the dates at which the various foreign elements flowed into the language, as well as of the great change produced in it by the Norman Conquest, and consequent influx of French and Latin elements, is given in the accompanying chart. The transverse lines represent centuries, and it will be seen how limited a period after all is occupied by modern English, how long the language had been in the country before the Norman Conquest, and how much of this is prehistoric and without any literary remains. Judging by what has happened during the historic period, great changes may and indeed must have taken place between the first arrival of the Saxons and the days of the English language.

King Alfred, when literature practically begins. The chart also illustrates the continuity of the main stock of the vocabulary, the body of primary "words of common life," which, notwithstanding numerous losses and more numerous additions, has preserved its corporate identity through all the periods. But the "poetic and rhetorical," as well as the "scientific" terms of Old English have died out, and a new vocabulary of "abstract and general terms" has arisen from French, Latin and Greek, while a still newer "technical, commercial and scientific" vocabulary is composed of words not only from these, but from every civilized and many uncivilized languages.

The preceding sketch has had reference mainly to the grammatical changes which the language has undergone; distinct from, though intimately connected with these (as where the confusion or loss of inflections was a consequence of the weakening of final sounds) are the great phonetic changes which have taken place between the 8th and 19th centuries, and which result in making modern English words very different from their Anglo-Saxon originals, even where no element has been lost, as in words like stone, mine, doom, day, nail, child, bridge, shoot, Anglo-Saxon stān, min, dām, dag, nagel, cild, brycg, scet. The history of English sounds (see Phonetics) has been treated at length by Dr. A. J. Ellis and Dr. Henry Sweet; and it is only necessary here to indicate the broad facts, which are the following. (1) In an accented closed syllable, the first and second vowels were almost always nearly unchanged; thus the words at, men, bill, God, dust are pronounced now nearly as in Old English, though the last two were more like the Scotch o and North English u respectively, and in most words the short a had a broader sound like the provincial a in mau. (2) Long accented vowels and diphthongs have undergone a regular sound shift toward closer and more advanced positions, so that the words bān, her, sooce or sōce, stōl (bōhn or bāwn, hōr, sōk or sālk, stōle) are now bōn, hair, seck, stōl; while the two high vowels ā (≈ oo) and ē (≈ e) have become diphthongs, as āuā, sēir, now house, shire, though the sound of the second remains in notarial house), and the original ā in the pronunciation shee, approved by Walker, "as in machine, and shire, and magazine." (3) Short vowels in an open syllable have usually been lengthened, as in wā-μa, cō-fa, now name, cove; but to this there are exceptions, especially in the case of ē and ē. (4) Vowels in terminal unaccented syllables have all sunk into short obscure ā, and then, if final, disappeared; so oxa, sēo, wūdu became ox-ɛ, sɛ-ɛ, wūd-ɛ, and then ox, sē, wood; oxān, lufud, now oxen, loved, lūf; tetūn, sečt, later seten, sete, set, now set. (5) The back consonants r, s, s, in connexion with front vowels, have often become palatalized to or ē, sh, as circe, rye, fis, now church, ridge, fish. A medial or final ē has passed through a guttural or palatal continual to or ē, forming a diphthong or new vowel, as in bąga, ląga, dag, hęg, drig, now bow, law, day, hoy, dry. W and h have disappeared before r and l, as in write, (w)lr̃p̃, (h)r̃g; h final (≈ gh) has become f, k, w or nothing, but has developed the glides u or ū before itself; these combining with the preceding vowel to form a diphthong, or merging with it into a simple vowel-sound, as r̃uh, k̃oh, b̃oh, dẽah, h̃ẽah, b̃ẽah, now rough, hough, bough, dough, high, laugh=r̃ũf, h̃ok, b̃ob, d̃ō, h̃i, l̃ōf. R after a vowel has practically disappeared in standard English, or at most become vocalized, or combined with the vowel, as in hear, h̃ar, more, h̃er. These and other changes have taken place gradually, and in accordance with well-known phonetic laws; the details as to time and mode may be studied in special works. It may be mentioned that the total loss of grammatical gender in English, and the almost complete disappearance of cases, are purely phonetic phenomena.

Gender (whatever its remote origin) was practically the use of adjectives and pronouns with certain distinctive terminations, in accordance with the genus, genre, gender or kind of nouns to which they were attached; when these distinctive terminations were uniformly levelled to final ē, or other weak sounds, and thus ceased to distinguish nouns into kinds, the distinctions into genders or kinds having no other existence disappeared. Thus when had ē gode hōrs, ēone ēgodan ēwōnd, had ī godan ēbē, became, by phonetic weakening, ī gode hōrs, ī gode ēmōnd, ī gode bōkē, and later still the good hōrs, the good hōund, the good bōk, the words hōrs, hōund, bōk were no longer grammatically different kinds of nouns; grammatical gender had ceased to exist. The concord of adjectives has entirely disappeared; the concord of the pronouns is now regulated by rationality and sex, instead of grammatical gender, which has no existence in English. The man who lost his life; the bird which built its nest.

Our remarks from the end of the 14th century have been confined to the standard or literary form of English, for of the other dialects from that date (with the exception of the northern
English in Scotland, where it became in a social and literary sense a distinct language), we have little history. We know, however, that they continued to exist as local and popular forms of speech, as well from occasional specimens and from the fact that they exist still as from the statements of writers during the interval. Thus Puttenham in his *Arte of English Poesie* (1589) saysː-

"Our maker [i.e. poet] therefor at these dayes shall not follow Piers Plowman, nor Gower, nor Lydgate, nor yet Chaucer, for their language is of no use with usː neither shall he take the termes of Northern-men, such as they use in dayly talke, whether they be noble men or gentle men or of their best clarks, all is an one matter; nor in effect any speach used beyond the river of Trent, though it can deny but that theirs is the purer English tong at this day, yet it is not so Courty nor so currant as our Southerne English is, no more is the far Western man speach: ye shall therefore take the usual speach of the Court, and that of London and the shire of Lancashire, and that of the northern and not the southern, I say not this but that in every shyre of England there be gentlemen and others that speake but specially write as good Southerne as we of Middlesex or Surrey do, but not the common people of every shire, to whom the gentlemen, and also their learned clarks do for the most part condescend, but herein we are already ruled by th' English Dictionaries and other books written by learned men."—Arber's *Reprint*, p. 157.

In comparatively modern times there has been a revival of interest in these forms of English, several of which following in the footsteps of the revival of Lowland Scots in the 18th and 19th centuries, have produced a considerable literature in the form of local poems, tales and "folk-lore." In these respects Cumberland, Lancashire, Yorkshire, Devon, Somerset and Dorset, the "far north" and "far west" of Puttenham, where the dialect was felt to be so independent of literary English as not to be branded as a mere vulgar corruption of it, stand prominent. More recently the dialects have been investigated philologically, a department in which, as in other departments of English philology, the elder Richard Garnett must be named as a pioneer. The work was carried out zealously by Prince Louis Lucien Bonaparte and Dr A. J. Ellis, and more recently by the English Dialect Society, and by the Reyreyter Society, for the investigation of this branch of philology. The efforts of this society resulted in the compilation and publication of glossaries or word-books, more or less complete and trustworthy, of most of the local dialects, and in the production of grammars dealing with the phonology and grammatical features of a few of these, among which that of the Windhill dialect in Yorkshire, by Professor Joseph Wright, and that of West Somerset, by the late F. T. Elworthy, deserve special mention. From the whole of the glossaries of the Dialect Society, and from all the earlier dialect works of the 18th and 19th centuries, amplified and illustrated by the contributions of local collaborators in nearly every part of the British Isles, Professor Joseph Wright has conspired an admirable and characteristic work of the dialects, their pronunciation, and in most cases with illustrative quotations or phrases. To this he has added an *English Dialect Grammar*, dealing very fully with the phonology of the dialects, showing the various sounds which now represent each Old English sound, and endeavouring to define the area over which each modern form extends; the accidence is treated more summarily, without going minutely into that of each dialect-group, for which special dialect grammars must be consulted. The work has also a very full and valuable index of every word and form treated.

The researches of Prince L. L. Bonaparte and Dr Ellis were directed specially to the classification and mapping of the existing dialects, and the relation of these to the dialects of Old and Middle English. They recognized a *Northern* dialect lying north of a line drawn from Morcambe Bay to the Humber, which, with the kindred Scottish dialects (already investigated and classed), is the direct descendant of early northern English, and a *South-western* dialect occupying Somerset, Wilts, Dorset, Gloucester and western Hampshire, which, with the *Devonian* dialect beyond it, are the descendants of early southern English and the still older West-Saxon of Alfred. This dialect must in the 14th century have been spoken everywhere south of Thames; but the influence of London caused its extinction in Surrey, Sussex and Kent, so that already in Puttenham it had become "far western." An *East Midland* dialect, extending from south Lincolnshire to London, occupies the cradle-land of the standard English speech, and still shows least variation from it. Between and around these typical dialects are others, representing the old Midland proper, or dialects between it and the others already mentioned. Thus "north of Trent" the *North-eastern* dialect of North Lancashire, Cheshire, Derby and Stafford, with that of Shropshire, represents the early West Midland English, of which several specimens remain; while the *North-eastern* of Nottingham and north Lincolnshire represents the dialect of the *Lay of Helevok*. With the *North Midland* dialect of south-west Yorkshire, these represent forms of speech which to the modern Londoner, as to Puttenham, are still decidedly northern, though actually intermediate between northern proper and midland, and preserving interesting traces of the midland pronouns and verbal inflections. There is an *Eastern* dialect in the East Anglian counties; a *Midland* in Leicester and Warwick shires; a *West Midland* in Hereford, Worcestershire and north Worcestershire, intermediate between south-western and north-western, and representing the dialect of Piers Plowman. Finally, between the east midland and south-western, in the counties of Buckingham, Oxford, Berks, Hants, Surrey and Sussex, there is a dialect which must have once been south-western, but of which the most salient characters have been rubbed off by proximity to London and the East Midland speech. In east Sussex and Kent this *South-eastern* dialect attains to a more distinctive character. The *Kentish* form of early Southern English evidently maintained its existence more strongly than that of the counties immediately south of London. It was very distinct in the days of Sir Thomas More; and even, as we see from the dialect attributed to Edgar in *Leor*, was still strongly marked in the days of Shakespeare. In the south-eastern corner of Ireland, in the baronies of Forth and Bally, in county Wexford, a very archaic form of English, of which specimens have been preserved, was still spoken in the 18th century. In all probability it dated from the first English invasion. In many parts of Ulster forms of Lowland Scotch dating to the settlement under James I. are still spoken; but the English of Ireland generally seems to represent 16th and 17th century English, as in the pronunciation of *tea*, *wheat* (*tay*, *wheat*), largely affected, of course, by the native Celtic. The subsequent work of the English Dialect Society, and the facts set forth in the *English Dialect Dictionary*, confirm in a general way the classification of Bonaparte and Ellis; but they bring out strongly the fact that only in a few cases can the boundary between dialects now be determined by precise lines. For every dialect there is a central region, larger or smaller, in which its characteristics are at a maximum; but towards the edges of the area these become mixed and blended with the features of the contiguous dialects, so that it is often impossible to define the point at which the one dialect ends and the other begins. The fact is that the various features of a dialect, whether its distinctive words, characteristic pronunciations or special grammatical features, though they may have the same centre, have not all the same circumference. Some of them extend to a certain distance round the centre; others to a much greater distance. The only approximately accurate way to map the area of any dialect, whether in England, France, Germany or elsewhere, is to take a well-chosen set of its characteristic features—words, senses, sounds or grammatical peculiarities, and draw a line round the area over which each of these extends; between the innermost and outermost of these there will often be a large border district. If the same process be followed with the contiguous dialects,

The vertical lines represent the four leading forms of English—Northern, Midland, Southern, and Kentish—and the names occurring down the course of each are those of writers and works in that form of English at the given date. The thickness of the line shows the comparative literary position of this form of speech at the time; thick indicating a literary language; medium, a literary dialect; thin, a popular dialect or patois; a dotted line shows that this period is unrepresented by specimen. The horizontal lines divide the periods; these (after the first two) refer mainly to the Midland English; in inflectional decay the Northern English was at least a century in advance of the Midland, and the Southern nearly as much behind it.
it will be found that some of the lines of each intersect some of the lines of the other, and that the passing of one dialect into another is not affected by the formation of intermediate or blended forms of any one characteristic, but by the overlapping or intersecting of more or fewer of the features of each. Thus a definite boundary of village or district may use 10 of the features of dialect A and 10 of those of B, while a village on the one side of the line of the 12 of those of A with 8 of those of B, and one on the other side has 7 of those of A with 13 of those of B. Hence a dialect boundary line can at best indicate the line within which the dialect has, on the whole, more of the features of A than of B or C; and usually no single line can be drawn as a dialect boundary, but that without it there are some features of the same dialect, and within it some features of the contiguous dialects.

Beyond the limits of the British Isles, English is the language of extensive regions, now or formerly colonies. In all these countries the presence of numerous new objects and new conditions of life has led to the supplementing of the vocabulary by the adoption of words from native languages, and special adaptation and extension of the sense of English words. The use of a common literature, however, prevents the overgrowth of these local peculiarities, and also makes them more or less familiar to Englishmen at home. It is only in the older states of the American Union that anything like a local dialect has been produced; and even there many of the so-called Americanisms are quite as much archaic English forms which have been lost or have become dialectal in England as developments of the American soil.

The story by which English, from being the language of a few thousand invaders along the eastern and southern seaboard of Britain, has been diffused by conquest and colonization over its present area form a subject too large for the limits of this article. It need only be remarked that within the confines of Britain itself the process is not yet complete. Representatives of earlier languages survive in Wales and the Scottish Highlands, though in neither case can the substitution of English be very remote. In Ireland, where English was introduced by conquest much later, Irish is still spoken in patches all over the country; though English is understood, and probably spoken after a fashion, almost everywhere. At opposite extremities of Britain, the Cornish of Cornwall and the Norse dialects of Orkney and Shetland died out before the 15th century, while for the whole of the 19th century, the Manx, or Celtic of Man, is even now in the last stage of dissipation; and in the Channel Isles the Norman patois of Jersey and Guernsey have largely yielded to English.

The table on p. 509 (a revision of that brought before the Philological Society in Jan. 1876) graphically presents the chronological and dialectal development of English. Various names have been proposed for the different stages; it seems only necessary to add to those in the table the descriptive names of Dr Abbott, who has proposed (How to Parse, p. 298) to call the Old English, or Anglo-Saxon, the "Synthetic or Inflexional Period"; the Old English Transition (Late Anglo-Saxon of Dr Skeat), the "Period of Confusion"; the Early Middle English, "Analytical Period" (1250-1530); the normal Middle English, "National Period" (1350-1500); the Tudor English, "Period of Licence"; and the Modern English, "Period of Settlement".

BIBLIOGRAPHY.—As the study of English has made immense advances within the last generation, it is only in works recently published that the student will find the subject satisfactorily handled. Among the earlier works treating of the whole subject or parts of it may be mentioned—A History of English Rhythm, by Edwin Guest (London, 1838); the Philological Essays of Richard Garnett (1835-1848), edited by his son (London, 1859); The English Language, by G. Latham (5th ed., London, 1862); Origin and History of the English Language (ed. 1859); Lessons on the English Language, by the same (New York and London, 1863); Historische Grammatik der englischen Sprache, by C. F. Koch (Weimar, 1863); English Grammar, by Edward Mätzer (Berlin, 1866); English Grammar, by L. H. Brain (London, 1874); Principles of English Etymology (Oxford, 1887-1901); Byl. Storm, English Philologie (Leipzig, 1892-1896); L. Kellner, Historical and Comparative English Syntax (London, 1892); The History of English Sounds, by Henry Sweet (London, 1895); The Romance Periods of English Literature, by various authors in the Transactions of the Philological Society, and the publications of the Early English Text Society.

The more recent works of E. M. Kaluza, Historische Grammatik der englischen Sprache (Berlin, 1890); D. M. W. Weitzel, Principiels of English Etymology (Oxford, 1887-1891); Johan Sturm, English Philologie (Leipzig, 1892-1896); L. Kellner, Historial and Comparative English Syntax (London, 1892); E. M. Kaluza, The History of English Language (London and New York, 1898); Otto Jespersen, Progress in Language, with special reference to English (London, 1894); Lorenz Morsbach, Mittelenglische Grammatik, part 1 (Halle, 1894); Paul, From the Origin of the English Speech to Grundriss der german. Philologie (Strassburg, 1898); Eduard Sievers, Angldischische Grammatik (3rd ed., Halle, 1868); English and their Ways in English Speech (London and New York, 1902); Henry Bradley, The Making of English (London, 1904). Numerous contributions to the subject have also been made in the modern American journals; for example, Anglia (ed. Wilker, Fligel, &c.; Halle, 1878 onward); publications of Mod. Lang. Assoc. of America (J. W. Bright; Baltimore, 1884 onward), and A. M. Elliott, Modern Language Notes (Baltimore, 1886 onward).
Digest. In the Occident the time for the Germanic "folk-laws" (Luges Barbarorum) had come, and a Canon law, ambitious of independence, was being constructed, when in the Orient the lord of church and state was "enucleating" all that was to live of the classical jurisprudence of pagan Rome. It was a matter of degree for it was only a demonstration that enabled him to give law to Italy: Gaul and Britain were beyond his reach.

The Anglo-Saxon laws that have come down to us (and we have no reason to fear the loss of much beyond some dooms of the Mercian Offa) are best studied as members of a large Teutonic family. Those that proceed from the Kent and Wessex of the 7th century are closely related to the continental folk-laws. Their next of kin seem to be the Lex Saxonum and the laws of the Lombards. Then, though the 8th and 9th centuries are unproductive, we have from Alfred (c. 900) and his successors a series of edicts which strongly resemble the Frankish capitularies—so strongly that we should see a clear case of imitation, were it not that in Frankland the age of legislation had come to its disastrous end long before Alfred was king. This, it may be noted, gives to English legal history a singular continuity from Alfred's day to our own. The king of the English was expected to publish laws at a time when hardly any one else was attempting any such feat, and the English dooms of Canute the Dane are probably the most comprehensive statutes that were issued in the Europe of the 11th century. No genuine laws of the sainted Edward have descended to us, and during his reign England seems but too likely to follow the bad example of Frankland, and become a loose congeries of lordships. From this fate it was saved by the Norman duke, who, like Canute before him, subdued a land in which kings were still expected to publish laws.

In the study of early Germanic law—a study which now for some considerable time has been scientifically prosecuted in Germany—the Anglo-Saxon dooms have received their due share of attention. A high degree of racial purity may be claimed on their behalf. Celtic elements have been sought for in them, but have never been detected. At certain points, notably in the regulation of the blood-feud and the construction of a tariff of atonements, the law of one rude folk will always be somewhat like the law of another; but the existing remains of old Welsh and old Irish law stand far remote from the dooms of Ethelbert and Ine than stand the edicts of Rothari and Liutprand, kings of the Lombards. Indeed, it is very dubious whether distinctively Celtic customs play any considerable part in the evolution of that system of rules of Anglian, Scandi- navian and Frankish origin which becomes the law of Scotland. Within England itself, though for a while there was fighting enough between the various Germanic folks, the tribal differences were not so deep as to prevent the formation of a common language and a common law. Even the strong Scandinavian strain seems to have rapidly assimilated with the Anglian. It amplified the language and the law, but did not permanently divide the country. If, for example, we can to-day distinguish between law and right, we are debtors to the Danes; but very soon law is not distinctive of eastern or right of western England. In the first half of the 12th century a would-be expounder of the law of England had still to say that the country was divided between the Wessex law, the Mercian law, and the Danes' law, but he had also to point out that the law of the king's own court stood apart from and above all partial systems. The local customs were those of shires and hundreds, and shaded off into each other. We may speak of more Danish and less Danish counties; it was a matter of degree; for rivers were narrow microclimats were often more effective than local laws. England was meant by nature to be the land of one law.

Then as to Roman law. In England and elsewhere Germanic law developed in an atmosphere that was charged with traditions of the old world, and many of these traditions had become implicit in the Christian religion. It might be argued that all that we call progress is due to the influence exercised by Roman civilization; that, were it not for this, Germanic law would never have been set in writing; and that theoretically unchangeable custom would never have been supplemented or superseded by express legislation. All this and much more of the same sort might be said; but the survival in Britain, or the reintroduction into England, of anything that we should dare to call Roman jurisprudence would be a different matter. Eyes, carefully trained, have minutely scrutinized the Anglo-Saxon legal texts without finding the least trace of the rules of the ecclesiastical sphere. Even within that sphere modern research is showing that the church-property-law of the middle ages, the law of the ecclesiastical "benefice," is permeated by Germanic ideas. This is true of Gaul and Italy, and yet truer of an England in which Christianity was for a while extinguished. Moreover, the laws that were written in England were, from the first, written in the English tongue; and this gives them a unique value in the eyes of students of Germanic folk-law, for even the very ancient and barbarous Lex Salica is a Latin document, though many old Frankish words are ensnared in it. Also we notice that the Black laws of the Franks, like the English in time, were for a long time divided between the Lex Salica, "A system of personal law," the "homo Romanus"手里 had been on his Roman law to his children, while Frankish or Lombardic, Swabian or Saxon law would run in the blood of the "homo barbarus." All of this we hear nothing in England. Then on the mainland of Europe Roman and barbarian law could not remain in juxtaposition without affecting each other. On the one hand we see distinctively Roman rules making their way into the law of the victorious tribes; and on the other hand we see a decay and debasement of jurisprudence which ends in the formation of what modern historians have called a Roman "vulgar-law" (Vulgarrecht). For a short age which centres round the year 800 it seemed possible that Frankish kings, who were becoming Roman emperors, would be able to rule by their capitularies nearly the whole of the Christian Occident. The dream vanished before fratricidal wars, heathen invaders, centrifugal feudalism, and a centripetal church which found its law in the newly concocted forgeries of the Pseudo-Isidore (c. 850). The "personal laws" began to transmute themselves into local customs, and the Roman vulgar-law began to look like the local custom of those districts where the Romani were the preponderant element in the population. Meanwhile, the Norse pirates subdued a large tract of what was to be northern France; the land, where Romani were few. Their restless and boundless vigour these Normans retained; but they showed a wonderful power of appropriating whatever of alien civilization came in their way. In their language, religion and law, they had become French many years before they subdued England. It is a plausible opinion that among them there lived some sound traditions of the Frankish monarch's best days, and that Norman dukes, rather than German emperors or kings, of the French, are the truest spiritual heirs of Charles the Great.

In our own day German historians are wont to speak of English law as a "daughter" of French or Frankish law. This tendency grew "mainly from H. Brunner's doctrine that the term of trial by jury, which cannot be found in the Anglo-Saxon laws, can be found in the prerogative procedure of the Frankish kings. We must here remember that during a long age English lawyers wrote in French and even thought in French, and that to this day most of the technical terms of the law, more especially of the private law, are of French origin. Also it must be allowed that when English law has taken shape in the 13th century it is very like one of the coutumes of northern France. Even when linguistic difficulties have been surmounted, the Saxo
of Eike von Repgow will seem far less familiar to an Englishman than the so-called Establishments of St Louis. This was the outcome of a slow process which fills more than a century (1060-1189), and was in a great measure due to the reforming energy of Henry II., the French prince who, in addition to England, ruled a good half of France. William the Conqueror seems to have intended to govern Englishmen by English law. After the tyranny of Rufus, Henry I. promised a restoration of King Edward's law; that is, the law of the Confessor's time (Legam Edwdardi regis vobis reddo). Various attempts were then made, mostly, so it would seem, by men of French birth, to state in modern and practicable form the laga Edwdardi which was thus restored. The result of their labours is an intricate group of legal tracts which has been explored of late years by Dr Liebermann. The best of these has long been known as the Leges Henrici Primi, and aspires to be a comprehensive law-book. Its author, though he had some foreign sources at his command, such as the Lex Ribnaria and an epitome of the Breviary of Alaric, took the main part of his matter from the code of Canute and the older English dooms. Néel has the Conqueror, who had been lord of the English, known many ordinances: the invading Normans had little, if any, written law to bring with them, and had invaded a country where kings had been lawgivers. Moreover, there was much in the English system that the Conqueror was keenly interested in retaining—especially an elaborate method of taxing the land and its holders. The greatest product of Norman government, the grandest feat of government that the world had seen for a long time past, the compilation of Domesday Book, was a conservatory effort, an attempt to fix upon every landholder, French or English, the amount of geld that was due from his predecessor in title. Himself the rebellious vassal of the French king, the duke of the Normans, who had become lord of the English, knew many ordinances; he had invaded a country where feudalism had already been established which the Conqueror which it had threatened to become in the days of his pious but incompetent cousin. The sheriffs, though called vice-comites, were to be the king's officers; the shire-reeves might be called county courts, but were not to be the courts of counts. Much that was sound and royal in English public law was to be preserved if William could preserve it.

The gulf that divides the so-called Leges Henrici (c. 1115) from the text-book ascribed to Ranulf Glanvill (c. 1188) seems at first sight very wide. The one represents a not easily imaginable chaos and clash of old rules and new; it represents also a stage in the development of feudalism which in other countries is the English, chiefly by a significant silence. The other is an orderly, rational book, which through all the subsequent centuries will be readily understood by English lawyers. Making no attempt to tell us what goes on in the local courts, its author, who may be Henry II.'s chief justiciar, Ranulf Glanvill, or may be Glanvill's nephew, Hubert Walter, fixes our attention on a novel element which is beginning to subdue all else to its powerful operation. He speaks to us of the judge that is done by the king's own court. Henry II. had opened the doors of his French-speaking court to the mass of his subjects. Judges chosen for their ability were to sit there, term after term; judges were to travel in circuits through the land, and in many cases the procedure by way of “an inquest of the country,” by which the Norman kings had used for the ascertaining of their fiscal rights, was to be at the disposal of ordinary litigants. All this had been done in a piecemeal, experimental fashion by ordinances that were known as “assizes.” There had not been, and was not to be, any enunciation of a general principle inviting all who were wronged to bring in their own words their complaints to the king's audience. The general prevalence of feudal justice, and of the world-old methods of supernatual probate (ordeals, battle, oaths sworn with oath-helpers), was to be theoretically respected; but in exceptional cases, which would soon begin to devour the rule, a royal remedy was to be open to any one who could frame his case within the compass of some carefully-worded and presept formula. With allusion to a remote stage in the history of Roman law, a stage of which Henry's advisers can have known little or nothing, we may say that a “formulary system” is established which will preside over English law until modern times. Certain actions, each with a name of its own, are open to litigants. Each has its own formula set forth in its original (or, as we might say, originating) writ; each has its own pro-cedure and its appropriate mode of trial. The litigant chooses his writ, his action, and must stick to it by his choice. Thus a book about royal justice tends to become, and Glanvill's book already is, a commentary on original writs.

The precipitation of English law in so coherent a form as that which it has assumed in Glanvill's book is not to be explained without reference to the revival of Roman jurisprudence in Italy. Out of a school of Lombard lawyers at Pavia had come Lanfranc the Conqueror's adviser, and the Lombardists had already been studying Justinian's Institutes. Then at length the Digest came by its rights. About the year 1100 Irnerius was teaching at Bologna, and from all parts of the West men were eagerly flocking to hear the new gospel of civilization. About the year 1149 Vacarius was teaching Roman law in England. The rest of the English fiscal system and faculties of Roman and Canon law took shape in the nascent university of Oxford. Whatever might be the fate of Roman law in England, there could be no doubt that the Canon law, which was crystalizing in the Decretum Gratiani (c. 1139) and in the decreals of Alexander III., would be the law of the English ecclesiastical tribunals. The great quarrel between Henry II. and Thomas of Canterbury brought this system into collision with the temporal law of England, and the king's ministers must have seen that they had much to learn from the methodic enemy. Some of them were able men who became the justices of Henry's court, and bishops to boot. The luminous Dialogue of the Exchequer (c. 1279), which expounds the English fiscal system, the treasurier, Richard Fitz Nigel, who became bishop of London; and the treatise on the laws of England came perhaps from Glanvill, perhaps from Hubert Walter, who was to be both primate and chief justiciar. There was healthy emulation of the work that was being done by Italian jurists, but no meek acceptance of foreign results.

A great constructive era had opened, and its outcome was a large and noble book. The author was Henry of Bracton (his name has been corrupted into Bracton), who died in 1268 after having been for many years one of Henry III.'s justices. The model for its form was the treatise of Azo of Bologna ("master of all the masters of the laws," an Englishman called him), and the treatise opens with a definition of jurisprudence: maxims that might be regarded as of universal and natural validity. But the true core of the work was the practice of an English court which had yearly been extending its operations in many directions. For half a century past diligent record had been kept on parchment of all that this court had done, and from its rolls Bracton cited numerous decisions. He cited them as precedents, paying special heed to the judgments of two judges who were already dead, Martin Pateushull and William Raleigh. For this purpose he compiled a large Note Book, which was discovered by Prof. Vinogradoff in the British Museum in 1884. Thus at a very early time English common law "shaped itself to become what it afterwards definitely became, namely, "case law." The term "common law" was being taken over from the canonists by English lawyers, who used it to distinguish the general law of the land from local customs, royal prerogatives, and in short from all that was exceptional or special. Since statutes and ordinances were still rarities, all expressly enacted laws were also excluded from the English lawyers' notion of "the common law." The Great Charter (1215) had taken the form of a grant of "liberties and privileges," comparable to the grants that the king made to individual men and favoured towns. None the less, it was in that age no small body of enacted law, and, owing to its importance and solemnity, it was in after ages regarded as the first article of a statute book. There it was followed by the "provisions" issued at Merton in 1236, and by those issued at
Marlborough after the end of the Barons' War. But during Henry III.'s long reign the swift development of English law was due chiefly to new "original words" and new "forms of action" devised by the chancery and sanctioned by the court. Bracton knew many of these which are known to Glanvill, and men nowadays, perceiving that limits must be set to the inventive power of the chancery unless the king was to be an uncontrollable law-maker. Thus the common law was losing the power of rapid growth when Bracton summed the attained results in a book, the success of which is attested by a crowd of manuscript copies. Bracton had introduced just enough of Roman law and Bolognese method to save the law of England from the fate that awaited German law in Germany. His book was printed in 1590, and Coke owed much to Bracton.

The comparison that is suggested when Edward I. is called the English Justinian is true of the value of Bracton's work, as is well known, it is in his reign (1272-1307) that English institutions finally take the forms that they are to keep through coming centuries. We already see the parliament of the three estates, the convocations of the clergy, the king's council, the chancery or secretarial department, the exchequer or financial department, the king's bench, the common bench, the commissioners of assize and gaol delivery, the small group of professionally learned judges, and a small group of professionally learned lawyers, whose skill is at the service of those who will employ them. Moreover, the statutes that were passed in the first eighteen years of the reign, though their bulk seems slight to us nowadays, bore so fundamental a character that in subsequent ages they appeared as the substructure of huge masses of superincumbent law. Coke commented upon them sentence by sentence, and even now the merest smatterer in English law must profess some knowledge of Quia emptores and De donis conditionalibus. If some American states have, while others have not, accepted these statutes, that is a difference which is not unimportant to citizens of the United States in the 20th century. Then from the early years of Edward's reign come the first "law reports" that have descended to us; the oldest of them was not yet been printed; the oldest that has been printed belongs to 1292. These are the precursors of the long series of Year Books (Edw. II.-Hen. VIII.) which runs through the residue of the middle ages. Lawyers, we perceive, are already making and preserving notes of the discussions that take place in court; French notes that will be more useful to them than the formal Latin records inscribed upon the plea rolls. From these reports we learn that there are already, as we should say, a few "leading counsel," some of whom will be retained in almost every important cause. Papal decretsals had been endeavouring to withdraw the clergy from secular employment. The clerical element had been strong among the judges of Henry III.'s reign: Bracton was an archdeacon, Patshull a dean, Raleigh died a bishop. Their places begin to be filled by men who are not in orders, but who have pleaded the king's causes for him—his serjeants or servants at law—and beside them there are young men who are "apprentices at law," and are learning to plead. Also we begin to see men who, as "attorneys at law," are making it their business to appear on behalf of litigants. The history of the legal profession and its monopoly of legal aid is intricate, and at some points still obscure; but the influence of the canonical system is evident: the English attorney corresponds to the canonical proctor, and the English barrister to the canonical advocate. The main outlines were being drawn in Edward I.'s day; the legal profession became organic, and professional opinion became one of the main forces that moulded the law.

The study of English law fell apart from all other studies, and the impulse that had flowed from Italian jurisprudence was ebbing. We have two comprehensive text-books from Edward's reign: the one known to us as Fleta, the other as Britton; both of them, however, quarry their materials from Bracton's treatise. Also we have two little books on procedure which are attributed to Chief-Justice Henham, and a few other small tracts of an intensely practical kind. Under the cover of fables about King Alfred, the author of the Mirror of Justices made a bitter attack upon King Edward's judges, some of whom had fallen into deep disgrace. English legal history has hardly yet been purified of the leaven of falsehood that was introduced by this fantastic crystallisation of a chivalrous paraphenema. He is a technical book that is the literate age which begins with Glanvill's treatise and the treasurer's dialogue. Between Edward I.'s day and Edward IV.'s hardly anything that deserves the name of book was written by an English lawyer.

During that time the body of statute law was growing, but not very rapidly. Acts of parliament intervened at a sufficient number of important points to generate and maintain a persuasion that no limit, or no ascertainable limit, can be set to the legislative power of king and parliament. Very few are the signs that the judges ever inquired the cases that the law was made for in any way as the power of decision. Thus the way was being prepared for the definite assertion of parliamentary "omnicompetence" which we obtain from the Elizabethan statesman Sir Thomas Smith, and for those theories of sovereignty which we couple with the names of Hobbes and Austin. Nevertheless, English law was being developed rather by debates in court than by open legislation. The most distinctively English of English institutions in the later middle ages are the Year-Books and the Inns of Court. Year by year, term by term, lawyers were reporting cases in order that they and their fellows might know how cases had been decided. The passage of specific precedents was indeed much rarer than it afterwards became, and no calculus of authority so definite as that which now obtains had been established in Coke's day, far less in Littleton's. It was still a perusal of reported cases that a man would learn the law of England. A skeleton for the law was provided, not by the Roman rubrics (such as public and private, real and personal, possessory and proprietary, contract and delict), but by the cycle of original writs that were inscribed in the chancery's Registrum Brevia. A new form of action could not be introduced without the authority of Parliament, and the growth of the law took the shape of an explication of the true intent of ancient formulas. Times of inventive liberality alternated with times of cautious and capricious conservatism. Coke could look back to Edward III.'s day as to a golden age of good pleading. The otherwise miserable time which saw the Wars of the Roses produced some famous lawyers, and some bold doctrines which broke new ground. It produced also Sir Thomas Littleton's (d. 1481) treatise on Tenures, which (though it be not, as Coke thought it, the most perfect work that ever was written in any human science) is an excellent statement of law in exquisitely simple language.

Meanwhile English law was being scholastically taught. This, if we look at the fate of native and national law in Germany, France, or Scotland, appears as a fact of primary importance. From beginnings, so small and formless, that they still elude research, the Inns of Court had grown. The lawyers, like other men, had grouped themselves in gilds, or gild-like "fellowsipps." The fellowship acquired property; it was not technically incorporate, but made use of the thoroughly English machinery of a trust. Behind a hedge of trustees it lived an autonomous life, unhampered by charters or statutes. There was a hall in which its members dined in common; there was the nucleus of a library; there were also dormitories or chambers in which during term-time lawyers lived celibately, leaving their wives in the country. Something of the college thus enters the constitution of these fellowships; and then something academical. The craft guild regulated apprenticeship; it would protect the public against incompetent artificers, and its own members against unfair competition. So the fellowship of lawyers. In course of time a lengthy and laborious course of education of the medieval sort had been devised. He who had pursued it to its end received a call to the bar of his inn. This call was in effect a degree. Like the doctor or master of a university, the full-blown barrister was competent to teach others, and was expected to read lectures to students. But further, in a manner that is still very dark, these societies
had succeeded in making their degrees the only steps that led to practice in the king's courts. At the end of the middle ages (c. 1470) Sir John Fortescue rehearsed the praises of the laws of England in a book which is one of the earliest efforts of comparative politics. Contrasting England with France, he rightly connects limited monarchy, public and oral debate in the law courts, trial by jury, and the teaching of national law by schools that are throned by wealthy and well-born youths. But nearly a century earlier, the assertion that English law affords as subtle and civilizing a discipline as any that is to be had from Roman law was made by a man no less famous than John Wycliffe. The hierarchically loathed the Canon law; but he also spoke with reprobation of the "paynims' law," the "heathen men's law," the study of which in the two universities was being fostered by some of the bishops. That study, after inspiring Bracton, had come to little in England, though the canonist was compelled to learn something of Justinian, and there was a small demand for learned civilians in the court of admiralty, and in what we might call the king's diplomatic service. No medieval Englishman did anything considerable for Roman law. Even the canonists were content to read the books of French and Italian masters, though John Acton (c. 1340) and William Lyndwood (1430) wrote meritorious glosses. The Angevin kings, by appropriating to the temporal forum the whole province of ecclesiastical patronage, had robbed the decreets of an inexhaustible source of learning and of lucro. The work that was done by the legal faculties at Oxford and Cambridge is slight when compared with the inestimable services rendered to the cause of national continuity by the schools of English law which grew within the Inns of Court.

A danger threatened: the danger that a prematurely osseous system of common law would be overwhelmed by summary and royal equity. Even when courts for an ordinary causes had been established, a reserve of residuary justice remained with the king. Whatever lawyers and even parliaments might say, it was seen to be desirable that the king in council should with little regard for form punish offenders who could break through the meshes of a tardy procedure and should redress wrongs which corrupt and timid judges would leave unrighted. Papal edicts against heretics had made familiar to all men the notion that a judge should at times proceed summarie et de plano et sine strepitu et figura justitiae. And so extraordinary justice of a penal kind was done by the king's council upon misdeemants, and extraordinary justice of a civil kind was ministered by the English chancery. The chancellor (the "ancient council") to those who "for the love of God and in the way of charity," craved his powerful assistance. It is now well established that the chancellors started upon this course, not with any desire to introduce rules of "equity" which should supplement, or perhaps supplant, the rules of law, but for the purpose of driving the law through those accidental impediments which sometimes unfortunately beset its due course. The wrongs that the chancellor redressed were often wrongs of the simplest and most brutal kind: assaults, batteries and forcible dispossessions. However, he was warned off this field of activity by parliament; the danger to law, to lawyers, to trial by jury, was evident. But just when this was happening, a new field was being opened for him by the growing practice of conveying land to trustees. The English trust of land had ancient Germanic roots, and of late we have been learning how in far-off centuries our Lombard cousins were in effect giving themselves a power of testament by putting their lands in trust. In England, when the forms of action were crystallizing, this practice had not been common enough to obtain the protection of a writ; but many causes conspired to make it common in the 14th century; and so, with the general approval of lawyers and laity, the chancellors began to enforce by summary process against the trustee the duty that lay upon his conscience. In the next century it was clear that England had come by a new civil tribunal. Negatively, its competence was defined by the rule that when the common law offered a remedy, the chancellor was not to intervene. Positively, his power was conceived as that of doing what "good conscience" required, more especially in cases of "fraud, accident or breach of confidence." His procedure was the summary, the heresys-suppressing (not the ordinary and solemn) procedure of an ecclesiastical court; but there are few signs that he borrowed any substantive rules from legislet or decreet, and many proofs that within the new field of trust he pursued the ideas of the common law. It was long, however, before lawyers made a habit of reporting his decisions. He was not supposed to be tightly bound by precedent. Adaptability was of the essence of the justice that he did.

A time of strain and trial came with the Tudor kings. It was questionable whether the strong "government" for which the weary nation yearned could work within the limits of a parliamentary system, or would be compatible with the preservation of the common law. We see new courts appropriating large fields of justice and proceeding summarie et de plano; the star chamber, the chancery, the courts of requests, of wards, of augmentations, the councils of the North and Wales; a little later we see the high commission. We see also that judicial torture which Fortescue had called the road to hell. The stream of law reports became incommittent under Henry VIII.; few judges of his or his son's reign left names that are to be remembered. In an age of humanism, alphabetically arranged "abridgments" of medieval cases were the best work of English lawyers: one comes to us from Anthony Fitzherbert (d. 1538), and another from Robert Broke (d. 1558). This was the time when Roman law swelt like a flood over Germany. The modern historian of Germany will speak of "the Reception" (that is, the reception of Roman law), as no less important than the Renaissance and Reformation with which it is intimately connected. Very probably he will bestow hard words on a movement which disintegrated the nation and consolidated the tyranny of the profligate kings. Now we know that Roman law should be "received" in England occurred to Reginald Pole (d. 1558), a humanist, and at one time a reformer, who with good fortune might have been either king of England or pope of Rome. English law, said the future cardinal and archbishop, was barbarous; Roman law was the very voice of nature pleading for "civility" and good princely governance. Pole's words were brought to the ears of his majestice cousin, and, had the course of events been somewhat other than it was, King Henry might well have decreed a reception. The rôle of English Justinian would have perfectly suited him, and there are distinct traces of the civilian's Byzantium in the doings of the Church of England's supreme head. The academic study of the Canon law, such as had existed in the courts of the early days when the idea of precedent was not thought of, was reorganized; civilians were to sit as judges in the ecclesiastical courts. A little later, the Protector Somerset was deeply interested in the establishment of a great school for civilians at Cambridge. Scottish law was the own sister of English law, and yet in Scotland we may see a reception of Roman jurisprudence which might have been more whole-hearted than it was, but for the drift of two British and Protestant kingdoms towards union. As it fell out, however, Henry could get what he wanted in church and state without any decisive supercession of English by foreign law. The omniscience of an act of parliament stands out the more clearly if it settles the succession to the throne, annuls royal marriages, forgives royal debts, defines religious creeds, attains guilty or innocent nobles, or prospectively lends the force of statute to the king's proclamations. The courts of common law were suffered to work in obscurity, for jurors feared fines, and matter of state was reserved for council or star chamber. The Inns of Court were spared; their roots and readings did no perceptible harm, if little perceptible good.

Yet it is no reception of alien jurisprudence that must be chronicled, but a marvellous resuscitation of English medieval law. We may see it already in the Commentaries of Edward Plowden (d. 1585) who reported cases at length and lovingly. Bracton's great book was put in print, and was a key to much that had been forgotten or misunderstood. Under Parker's patronage, even the Anglo-Saxon dooms were brought to light; they seemed to tell of a Church of England that had not yet been
enslaved by Rome. The new national pride that animated
Elizabethan England issued in boasts touching the antiquity,
humanity, enlightenment of English law. Resuming the
strain of Fortescue, Sir Thomas Smith, himself a civilian, wrote concern-
ing the commonwealth of England a book that claimed the
attention of foreigners for her law and her polity. There
was dignified rebuke for the French jurist who had dared to speak
lightly of Littleton. And then the common law took flesh in
the person of Edward Coke (1552–1634). With an
enthusiastic love of English tradition, for the sake
of which many offences may be forgiven him, he ranged over
nearly the whole field of law, commenting, reporting, arguing,
deciding—disorderly, pedantic, masterful, an incarnation
of national dogmatism tenacious of continuous life.
Imbued with this new spirit, the lawyers fought the battle of the constitution against
James and his ministers. Coke (d. 1628) was in all Europe among the very
first to write legal history as it should be written. His book
about tithes is to this day a model and a masterpiece. When
this accomplished scholar had declared that he had laboured
to make himself worthy to be called a common lawyer, it could
no longer be said that the common lawyers were
indoctissimus genus doctissimorum hominum. Even pliant judges, whose
tenure of office depended on the king's will, were compelled to
cite and discuss old precedents before they could give judgment
for their master; and even at their worst moments they could not
openly break with medieval tradition, or declare in favour of that "modern policed state" which has too often become the
ideal of foreign publicists trained in Byzantine law.

The current law of equity was by this time so strong
and voluminous that such events as the Civil War, the Restoration
and the Revolution hardly deflected the course of
the stream. In retrospect, Charles II. reigns so soon
as life has left his father's body, and James II. ends a lawless
career by a considerate and convenient abdication. The statute
book of the restored king was enriched by leaves excerpted from
the acts of a lord protector; and Matthew Hale (d. 1676), who
was, perhaps, the last of the great record-searching judges,
sketched a map of English law which Blackstone was to colour.
Then a time of self-complacency came for the law, which
seemed to be the perfection of wisdom, and any proposal for drastic
legislation would have worn the garb discredited by the tyranny
of the Puritan Casar. The need for the yearly renewal of the
Mutiny Act secured an annual session of parliament. The
mass of the statute law made in the 18th century is enor-
mos but, even when we have excluded from view such acts as are technically called "private," the residuary matter bears a
wonderfully empirical, partial and minutely particularizing
character. In this "age of reason," as we are wont to think it,
the British parliament seems rarely to rise to the dignity of
a general proposition, and in our own day the legal practitioner
is likely to know less about the statutes of the 18th century
than he knows about the statutes of Edward I., Henry VIII.
and Elizabeth. Parliament, it should be remembered, was
endeavouring directly to govern the nation. There was little
that resembled the permanent civil service of to-day. The
choice lay between direct parliamentary government and royal
"prerogative"; and lengthy statutes did much of that work
of detail which would now be done by virtue of the powers that
are delegated to ministers and governmental boards. Moreover,
extreme and verbose particularity was required in statutes,
for judges were loath to admit that the common law was capable
of amendment. A vague doctrine, inherited from Coke, taught
that statutes might be so unreasonable as to be null, and any
political theory that seemed to derive from Hobbes would have
been regarded with not unjust suspicion. But the doctrine
of equity had never been taught in any accommodating way
to protect the common law by aiggardly exposition of every
legislating word. It is to be remembered that some main features
of English public law were attracting the admiration of en-
lighted Europe. When Voltaire and Montesquieu applauded,
the English lawyer had cause for complacency.

The common law was by no means stagnant. Many rules
which come to the front in the 18th century are hardly to be
traced farther. Especially is this the case in the province of
mercantile law, where the earl of Mansfield's (d. 1793) long
presidency over the king's bench marked an epoch. It is too
often forgotten that, until this court'srequest came to the
king; it was a thoroughly rustic kingdom, and that trade with England
was mainly in the hands of foreigners. Also in medieval fairs,
the assemblified merchants declared their own "law merchant,"
which was considered to have a supernatural validity. In
the reports of the common law courts it is late in the day before we
read of some mercantile usages which can be traced far back
in the statutes of Italian cities. Even on the basis of the exces-
ively elaborated land law—a basis which Coke's Commentary
on Littleton seemed to have settled for ever—a lofty and
ingenious superstructure could be reared. One after another
delicate devices were invented for the accommodation of new
facts within the law; but only by the assurance that the old
law could not be frankly abolished can we be induced to admire
the subtlety that was thus displayed. As to procedure, it had
become a maze of evasive fictions, to which only a few learned
men held the historical clue. By fiction the courts had stolen
business from each other, and by fiction a few comparatively
speedy forms of action were set to tasks for which they were not
originally framed. Two fictitious persons, John Doe and Richard
Roe, reigned supreme. On the other hand, that healthy and
vigorous institution, the Commission of the Peace, with a long
history behind it, was giving an important share in the adminis-
tration of justice to numerous country gentlemen who were thus
compelled to learn some law. A like beneficial work was being
done among jurors, who, having ceased to be regarded as wit-
nesses, had become "judges of fact." No one doubted that trial
by jury was the "palladium" of English liberties, and popularity
awaited those who would exalt the office of the jurors and
narrowly limit the powers of the judge.

But during this age the chief addition to English jurisprudence
was made by the crystallization of the chancellor's equity. In
the 17th century the chancery had a narrow escape
of sharing the fate that befell its twin sister the star-
chancery. It was that, until the court's request for an exposition
under the persistent attacks of the common lawyers. Having outlived
troubles, the chancery took to orderly habits, and administered
under the name of "equity" a growing group of rules, which
in fact were supplemental law. Stages in this process are marked
by the chancellories of Nottingham (1673-1675) and Hard-
wicke (1757-1758). Slowly a continuous series of Equity Reports
began to flow, and still more slowly an "equity bar" began to
form itself. The principal outlines of equity were drawn by
men who were steeped in the common law. By way of ornament
a Roman maxim might be borrowed from a French or Dutch
expositor, or a phrase which smacked of the "nature-lightly
school which was dominating continental Europe; but the
influence exercised by Roman law upon English equity has been
the subject of gross exaggeration. Parliament and the old
courts being what they were, perhaps it was only in a new court
that the requisite new law could be evolved. The result
was not altogether satisfactory. Freed from contact with the plain
man in the jury-box, the chancellors were tempted to forget how
plain and rough good law should be, and to screw up the legal
standard of reasonable conduct to a height hardly attainable
except by those whose pursuits could command the constant
advice of a family solicitor. A court which started with the

605

ENGLISH LAW
idea of doing summary justice for the poor became a court which did a highly refined, but tardy justice, suitable only to the rich.

About the middle of the century William Blackstone, then a disappointed barrister, began to give lectures on English law at Oxford (1759), and soon after he began to publish (1759) his Commentaries. Accurate enough in its history and doctrine to be an invaluable guide to professional students and a useful aid to practitioners, his book set before the unprofessional public an artistic picture of the laws of England such as had never been drawn of any similar system. No nation but the English had so eminently readable a law-book, and it must be doubtful whether any other lawyer ever did more important work than was done by the first professor of English law. Over and over again the Commentaries were edited, sometimes by distinguished men, and it is hardly too much to say that for nearly a century the English lawyer's main ideas of the organization and articulation of the body of English law were controlled by Blackstone. This was far from all. The Tory lawyer little thought that he was giving law to colonies that were on the eve of a great and successful rebellion. Yet so it was. Out in America, where books were few and lawyers had a mighty task to perform, Blackstone's facile presentment of the law of the mother country was of inestimable value. It has been said that among American lawyers the Commentaries "stood for the law of England," and this at a time when the American daughter of English law was rapidly growing in stature, and was preparing herself for her destined march from the Atlantic to the Pacific Ocean. Excising only what seemed to savour of oligarchy, those who had defined King George retained with marvellous tenacity the law of their forefathers. Profound discussions of English medieval law have been heard in American courts; admirable researches into the recesses of the Year-Books have been made in American law schools; the names of the great American judges are familiar in an England which knows little indeed of foreign jurists; and the debt due for the loan of Blackstone's Commentaries is being fast repaid. Lectures on the common law delivered by Mr Justice Holmes of the Supreme Court of the United States may even have begun to turn the scale against the old country. No chapter in Blackstone's book nowadays seems more antiquated than that which describes the modest territorial limits of that English law which was soon to spread throughout Australia and New Zealand and to follow the dome of the British flag to the horizon of the South Sea.

Long wars, vast economic changes and the conservatism generated by the French Revolution piled up a monstrous arrear of work for the English legislature. Meanwhile, Jeremy Bentham (d. 1832) had laboured for the overthrow of much that Blackstone had lauded. Bentham's largest projects of destruction and reconstruction took but little effect. Profoundly convinced of the fungibility and pliability of mankind, he was but too ready to draw a code for England or Spain or Russia at the shortest notice; and, scornful as he was of the past and its historic deposit, a code drawn by Bentham would have been a sorry failure. On the other hand, as a critic and derider of the system which Blackstone had complacently expounded he did not fail to see some good. Reform, whatever it meant, was indeed sadly needed throughout a system which was encumbered by noxious rubbish, the useless leavings of the middle ages: trial by battle and compurgation, deodands and benefit of clergy, John Doe and Richard Roe. It is perhaps the main fault of "judge-made law" (to use Bentham's phrase) that its destructive work can never be cleanly done. Of all vitality, and therefore of all patent harmfulness, the old rule can be deprived, but the moribund husk must remain in the system doing latent mischief. English law was full of decaying husks when Bentham attacked it, and his persistent demand for reasons could not be answered. At length a general interest in "law reform" was excited; Romilly and Brougham were inspired by Bentham, and the great changes in constitutional law which cluster round the Reform Act of 1832 were accompanied by many measures which purged the private, procedural and criminal law of much, though hardly enough, of the medieval dross. Some credit for rousing an interest in law, in definitions of legal terms, and in schemes of codification, is due to John Austin (d. 1859) who was regarded as the jurist of the reforming and utilitarian group. But, though he was at times an acute disector of confused thought, he was too ignorant of the English. the Roman and every other system of laws. The main considerable addition to the sum of knowledge was, and when Savigny, the herald of evolution, was already in the field, the day for a "Nature-Right"—and Austin's projected "general jurisprudence" would have been a Nature-Right—was past beyond recall. The obsolescence of the map of law which Blackstone had inherited from Hale, and in which many outlines were drawn by medieval formulas, left intelligent English lawyers without a guide, and they were willing to listen for a while to what in their insularity they thought to be the voice of cosmopolitan science. Little came of it all. The revived study of Germanic law in Germany, which was just beginning in Austin's day, seems to be showing that the scheme of Roman jurisprudence is not the scheme into which English law will run without distortion.

In the latter half of the 19th century some great and wise changes were made by the legislature. Notably in 1875 the old courts were merged in a new Supreme Court of Judicature, and a concurrent administration of law and equity was introduced. Successful endeavours have been made also to reduce the bulk of old statute law, and to improve the form of acts of parliament; but the emergence of new forces whose nature may be suggested by some such names as "socialism" and "imperialism" has distracted the attention of the British parliament from the commonplace law of the land, and the development of obstructive tactics has caused the issue of too many statutes whose brevity was purchased by disgraceful obscurity. By way of "partial codification" some branches of the common law (bills of exchange, sale of goods, partnership) have been skillfully stated in statutes, but a draft criminal code, upon which much expert labour was expended, lies pigeon-holed and almost forgotten. British India has been the scene of some large legislative exploits, and in America a few big experiments have been made in the way of code-making, but have given little satisfaction to the bulk of those who are competent to appreciate their results. In England there are large portions of the law which, in their present condition, no one would think of codifying; notably the law of real property, the law of family, and the law of personal property.

Recent changes.

Law reporting.

The Council of Law Reporting was formed in the year 1863. The council now consists of three ex-officio members—the attorney-general, the solicitor-general and the president of the Incorporated Law Society, and ten members appointed by the three Inns of Court, the Incorporated Law Society and the council itself on the nomination of the general council of the bar. The practitioner and the student now get for a subscription of four guineas a year the reports in all the superior courts and the House of Lords, and the judicial committee of the privy council issued in monthly parts a king's printer's copy of the statutes, and weekly notes, containing short notes of current decisions and announcements of all new rules made under the Judicature Acts and other acts of parliament, and other legal information. In addition the subscriber receives the chronological index of the statutes published from time to time by the Stationery Office. Last, but not least, the Digest of decided cases published by the council from time to time. In 1892 a Digest was published containing the cases and statutes for twenty-five years, from 1865 to 1890, and this was supplemented by one for the succeeding ten years, from 1891 to 1900. The digesting is now carried on continuously by means
of "Current Indexes," which are published monthly and annually, and consolidated into a digest at stated intervals (say) of five years. The Indian appeals series, which is not required by the general practitioner, is supplied separately at one guinea a year.

In the 16th and 17th centuries the corporate life of the Inns of Court in London became less and less active. The general decay of the organization of crafts and guilds showed itself among lawyers as among other craftsmen. Successful barristers, sharing in the general prosperity of the country, became less and less able and willing to devote their time to the welfare of their profession as a whole. The Inns of Chancery, though some of their buildings still remain—picturesque survivals in their "suburbs"—ceased to be used as places for the education of students. The members of the Inns of Chancery towards the middle of the 19th century, had wholly ceased to concern themselves with the systematic teaching of law. The modern system of legal education may be said to date from the establishment, in 1850, of the council of legal education, a body of twenty judges and barristers appointed by the four Inns of Court to control the legal education of students preparing to be called to the bar. The most important feature is the examination which a student must pass before he can be called. The examination (which by degrees has been made "stiffer") serves the double purpose of fixing the compulsory standard which all must reach, and of guiding the reading of students who may desire, sooner or later, to carry their studies beyond this standard. The subjects in which the examination is held are divided into Roman law; constitutional law and law history; Evidence, Procedure and Criminal law; Real and Personal Property; Equity; and Common law. The council of legal education also appoint a body of readers and assistant readers, practising barristers, who deliver lectures and hold classes.

Meanwhile the custom remains by which a student reads for a year or more as a pupil in the chambers of some practising barrister. In the 18th century it first became usual for students to read with a solicitor or attorney, and after a short time the modern practice grew up of reading in the chambers of a conveyancer, equity draftsman or special pleader, or, in more recent times, in the chambers of a junior barrister. Before the modern examination system, a student required to have a certificate from the barrister in whose chambers he had been a pupil before he could be "called," but the only relic of the old system now is the necessity of "eating dinners," six (three for university men) in each of the four terms for three years, at one of the Inns of Court.

The education of solicitors suffered from the absence of any professional organization until the Incorporated Law Society was established in 1825 and the following years. So far as any professional education is provided for solicitors or required from them, this is due to the efforts of the Law Society. As early as 1729 it was required by statute that any person applying for admission as attorney or solicitor should submit to examination by one of the judges, who was to test his fitness and capacity in consideration of a fee of one shilling. At the same time regular preliminary service under articles was required, that is to say, under a contract by which the clerk was bound to serve for five years. The examination soon became, perhaps always was, an empty form. The Law Society, however, soon showed zeal for the education of future solicitors. In 1833 solicitors were instituted. In 1836 the first regular examinations were established, and in 1850 the present system of examinations—preliminary, intermediate and final—came into effect. Of these only the last two are devoted to law, and both are of a strictly professional character. The final examination is a fairly severe test of practical acquaintance with all branches of modern English law. The Law Society makes some provision for the teaching of students, but this teaching is designed solely to assist in preparation for the examinations.

At the universities of Oxford and Cambridge there has, since 1850, been an attempt to promote the study of law. The curriculum of legal subjects in which lectures are given and examinations held is calculated to give a student a sound fundamental knowledge of general principles, as well as an elementary acquaintance with the rules of modern English law. Jurisprudence, Roman law, constitutional law and International law are taught, as well as the law of Real and Personal Property, the Law of Contract and Tort, Criminal law, Procedure and Evidence. But the law trips and the law schools suffer from remoteness from the law courts, and from the exclusively academic character of the teaching. Law is also taught, though not on a very large scale, at Manchester and at Liverpool. London University has encouraged the study of law by its examinations for law degrees, at which a comparatively high standard of knowledge is required; and at University College, London, and King's College, London, teaching is given in law and jurisprudence.

ENGLISH LITERATURE.

The following discussion of the evolution of English literature, and of the contribution to literature made in the course of ages by the writers of England, is planned so as to give a comprehensive view, the details as to particular authors and their work, and special consideration of the greater writers, being given in the separate articles devoted to them. It is divided into the following sections: (1) Earliest times to Chaucer; (2) Chaucer to the end of the middle ages; (3) Elizabethan times; (4) the Restoration period; (5) the Eighteenth century; (6) the Nineteenth century. The object of these sections is to form connecting links among the successive literary ages, leaving the separate articles on individual great writers to deal with their special interest; attention being paid in the separate articles to the development of the national literature, and the growth of the national literature, and the growth of the language as a literary vehicle.

The precise delimitation of what may narrowly be called "English" literature, i.e. in the English language, is perhaps impossible, and separate articles are devoted to American literature (q.v.), and to the vernacular literatures of Scotland (see Scotland; and Celt: Literature), Ireland (see Celt: Literature), and Wales (see Celt: Literature); see also Canada: Literature. Reference may also be made to such general articles on particular forms as Novel; Romance; Verse, &c.

I. Earliest Times to Chaucer

English literature, in the tymological sense of the word, had, so far as we know, no existence until Christian times. There is no evidence either that the heathen English had adopted the Roman alphabet, or that they had learned to employ their native monumental script (the runes) on materials suitable for the writing of continuous compositions of considerable length.

It is, however, certain that in the pre-literary period at least one species of poetic art had attained a high degree of development, and that an extensive body of poetry was handed down—not, indeed, with absolute fixity of form or substance—from generation to generation. This unwritten poetry was the work of minstrels who found their audiences in the halls of kings and nobles. Its themes were the exploits of heroes belonging to the royal houses of Germanic Europe, with which its listeners claimed kinship. Its metre was the alliterative long line, the lax rhythm of which was that which was intended, not to be sung to regular melody, but to be recited—probably with some kind of instrumental accompaniment. Of its beauty and power we may judge from the best passages in Beowulf (q.v.); for there can be little
doubt that this poem gained nothing and lost much in the process of literary redaction.

The conversion of the people to Christianity necessarily involved the decline of the minstrelsy that celebrated the glories of heathen times. Yet the descendants of Woden, even when they were devout Christians, would not easily lose all interest in the achievements of their kindred of former days. Chaucer’s knowledge of “the song of Wode” is one proof among others that even so late as the 14th century the deeds of Germanic heroes had not ceased to be recited in minstrel verse. The paucity of the extant remains of Old English heroic poetry is no argument to the contrary. The wonder is that any of it has survived at all. We may well believe that the professional reciter would, as a rule, be jealous of any attempt to commit to writing the poems which he had received by tradition or had himself composed. The clergy, to whom we owe the writing and the preservation of the Old English MSs, would only rarely instances be keenly interested in secular poetry. We possess, in fact, portions of four narrative poems, treating of heroic legend—Beowulf, Widsith, Finnesburh and Waldere. The second of these has no poetical merit, but great archaeological interest. It is an enumeration of the famous kings known to German tradition, put into the mouth of a minstrel (named Widsith, “far-travelled”), who claims to have been at many of their courts and to have been rewarded by them for his song. The list includes historical persons such as Ermanaric and Alboin, who really lived centuries apart, but (with the usual chronological vagueness of tradition) are treated as contemporaries. The extant fragment of Finnesburh (50 lines) is a brilliant battle force, belonging to a story of the W tunes which probably thrived episodically in Beowulf. Waldere, of which we have two fragments (together 68 lines) is concerned with Frankish and Burgundian traditions based on events of the 5th century; the hero is the “Waltharius” of Ekkehart’s famous Latin epic. The English poem may possibly be rather a literary composition than a genuine example of minstrel poetry, but the portions that have survived are hardly inferior to the best passages of Beowulf.

It may reasonably be assumed that the same minstrels who entertained the English kings and nobles with the recital of ancient heroic traditions would also celebrate in verse the martial deeds of their own patrons and their immediate ancestors. From Ju o, there may have existed at Exeter and in other cities a poetry commemorative of events in the conquest of Britain and the struggle with the Danes. Two examples only have survived, both belonging to the 10th century: The Battle of Brunanburh, which has been greatly over-praised by critics who were unaware that its striking phrases and compound are mere traditional echoes; and the Battle of Maldon, the work of a truly great poet, of which unhappily only a fragment has been preserved.

One of the marvels of history is the rapidity and thoroughness with which Christian civilization was adopted by the English. Augustine landed in 597; forty years later was born an Englishman, Aldhelm, who in the judgment of his contemporaries throughout the Christian world was the most accomplished scholar and the finest Latin writer of his time. In the next generation England produced in Bede (Beda) a man who in solidarity and variety of knowledge, and in literary power, had for centuries no rival in Europe. Aldhelm and Bede are known to us only from their Latin writings, though the former is recorded to have written vernacular poetry of great merit. The extant Old English literature is almost entirely Christian, for the poems that belong to an earlier period have been expurgated and interpolated in a Christian sense. From the writings that have survived, it would seem as if men strove to forget that England had ever been heathen. The four deities whose names are attached to the days of the week are hardly mentioned at all. The names Thunor and Tiw are sometimes used to translate the Latin Marti and Mercurius, but the word Woden (Wolof as a god) in the genealogies of the kings, and his name occurs once in a magical poem, but that is all. Bede, as a historian, is obliged to tell the story of the conversion; but the only native divinities he mentions are the goddesses Hrith and Eostre, and all we learn about them is that they gave their names to Hrithemonth (March) and Easter. That superstitious practices of heathen origin long survived among the people is shown by the acts of church councils and by a few poems of a magical nature that have been preserved; but, so far as can be discovered, the definite worship of the ancient gods quickly died out. English heathenism perished without leaving a record.

The Old English religious poetry was written, probably without exception, in the cloister, and by men who were familiar with the Bible and with Latin devotional literature. Setting aside the wonderful Dream of the Rood, it gives little evidence of high poetic genius, though much of it is marked by a degree of culture and refinement that we should hardly have expected. Its material and thought are mainly derived from Latin sources; its expression is imitated from the native heroic poetry. Considering that a great deal of Latin verse was written by Englishmen in the 7th and succeeding centuries, and that in some or two poems the line is actually composed of an English and a Latin hemistich rhyming together, it seems strange that the Latin influence on Old English versification should have been so small. The alliterative long line is throughout the only metre employed, and although the laws of alliteration and rhythm were less rigorously obeyed in the later than in the earlier poetry, there is no trace of approximation to the structure of Latin verse. It is true that, owing to imitation of the Latin hymns of the church, rhyme came gradually to be more and more frequently used as an ornament of Old English verse; but it remained an ornament only, and never became an essential feature. The only poem in which rhyme is employed throughout is one in which sense is so completely sacrificed to sound that its transmission would hardly be possible. It was not only in metrical respects that the Old English religious poetry remained faithful to its native models. The imagery and the diction are mainly those of the old heroic poetry, and in some of the poems Christ and the saints are presented, often very uncongruously, under the aspect of Germanic warriors. Nearly all the religious poetry that has any considerable religious value seems to have been written in Northumbria during the 8th century. The remarkably vigorous poem of Judith, however, is certainly much later; and the Exodus, though early, seems to be of southern origin. For a detailed account of the Old English sacred poetry, the reader is referred to the articles on Eadwine, Cynhwulf, and Bede, or other of whom nearly every one of the poems, except those of obviously late date, has at some time been attributed.

The Riddles (q.v.) of the Exeter Book resemble the religious poetry in being the work of scholars, but they bear more decisively the impress of the native English character. Some of them rank among the most artistic and pleasing productions of Old English poetry. The Exeter Book contains also several pieces of a gnomic character, conveying proverbial instruction in morality and worldly wisdom. Their morality is Christian, but it is not unlikely that some of the wise sayings they contain may have come down by tradition from heathen times. The very curious Dialogue of Solomon and Saturn may be regarded as belonging to the same class.

The most original and interesting portion of the Old English literary poetry is the group of dramatic monologues—The Banished Wife’s Complaint, The Husband’s Message, The Wanderer, The Seafarer, Deor and Wulf and Eadwacer. The date of these compositions is uncertain, though their occurrence in the Exeter Book shows that they cannot be later than the 10th century. That they are all of one period is at least unlikely, but they are all marked by the same peculiar tone of pathos. The monodramatic form renders it difficult to obtain a clear idea of the situation of the supposed speakers. It is not improbable that most of these poems may relate to incidents of heroic legend, with which the original readers were presumed to be familiar. This, however, can be definitely affirmed only in the case of the two short pieces—Deor and Wulf and Eadwacer—which have something of a lyric character, being the only examples in Old English of strophic structure and the use of the refrain. Wulf and Eadwacer, indeed, exhibits a still further
TO CHAUCER

ENGLISH LITERATURE

609

development in the same direction, the monotony of the long line metre being varied by the admission of short lines formed by the suppression of the second hemistich. The highly developed art displayed in this remarkable poem gives reason for believing that the existing remains of Old English poetry very inadequately represent its extent and variety.

While English literature goes back to heathen times, English prose may be said to have had its effective beginning in the reign of Alfred. It is of course true that vernacular prose of some kind was written much earlier. The English laws of Æthelberht of Kent, though it is perhaps unlikely that they were written down, as is commonly supposed, in the lifetime of Augustine (died a.d. 604), or even in that of the king (d. 616), were well known to Bede; and even in the 12th-century transcript that has come down to us, their crude and elliptical style gives evidence of their high antiquity. Later kings of Kent and of Wessex followed the example of publishing their laws in the native tongue. Bede is known to have translated the early part of the gospel of John (down to vi. 9). The Anglo-Saxon Chronicle (p.e.) is probably founded partly on prose annals of pre-Alfredian date. But although the amount of English prose written between the beginning of the 7th and the middle of the 9th century may have been considerable, Latin continued to be regarded as the appropriate vehicle for works of any literary pretension. If the English clergy had retained the scholarship which they possessed in the days of Alfeldhelm and Bede, the creation of a vernacular prose literature would probably have been longer delayed; for while Alfred certainly was not indifferent to the need of the laity for instruction, the evil that he was chiefly concerned to combat was the ignorance of their spiritual guides.

Of the works translated by him and the scholars whom he employed, St Gregory's Pastoral Care and his Dialogues (the latter rendered by Bishop Wwerforth) are expressly addressed to the priesthood; if the other translations were intended for a wider circle of readers, they are all (not excepting the secular History of Orosius) essentially religious in purpose and spirit. In the interesting preface to the Pastoral Care, in the important accounts of Northern lands and peoples inserted in the Orosius, and in the free rendering and amplification of the Consolation of Boethius and of the Soliloquies of Augustine, Alfred appears as the genuine writer of English prose. Other foreign works, with the English translations of Bede's Laws (preceded by a collection of those of his 7th-century predecessor, Ine of Wessex), and the beginnings of the Anglo-Saxon Chronicle. The Old English prose after Alfred is entirely of clerical authorship; even the Laws, so far as their literary form is concerned, are hardly to be regarded as an exception. Apart from the Chronicle (see ANGLO-SAXON CHRONICLE), the bulk of this literature consists of translations from Latin and of homilies and saints' lives, the substance of which is derived from sources mostly accessible to us in their original form; it has therefore for us little importance except from the philological point of view.

This remark may be applied, in the main, even to the writings of Ælfric, notwithstanding the great interest which attaches to his brilliant achievement in the development of the capacities of the native language for literary expression. The translation of the gospels, though executed in Ælfric's time (about 1000), is by other hands. The sermons of his younger contemporary, Archbishop Wulfstan, are marked by earnestness and eloquence, and contain some passages of historical value.

From the early years of the 11th century we possess an encyclopaedic manual of the science of the time—chronology, astronomy, arithmetic, metre, rhetoric and ethics—by the monk Byrhtferth, a pupil of Abbo of Fleury. It is a compilation, but extremely well executed with intelligence. There are numerous edifications on the properties of herbs, and the like, are in the main composed of selections from Latin treatises; so far as they are original, they illustrate the history of superstition rather than that of science. It is interesting to observe that they contain one or two formulas of incantations in Irish.

Two famous works of fiction, the romance of Apollonius of Tyre and the Letter of Alexander, in which their Latin form had much influence on the later literature of Europe, were Englished in the 11th century with considerable skill. To the same period belongs the curious tract on The Wonders of the East. In these works, and some minor productions of the time, we see that the minds of Englishmen were beginning to find interest in other than religious subjects.

The Anglo-Saxons translated into their own tongue the works of foreign authors, especially those of the Eastern Church; one of the results of the Norman Conquest, brought about a rapid arrest of the development of the vernacular literature. It was not long before the boys trained in the monastic schools ceased to learn to read and write their native tongue, and learned instead to read and write French. The effects of this change are visible in the rapid alteration of the literary language. The artificial tradition of grammatical correctness lost its hold; the archaic literary vocabulary fell into disuse; and those who wrote English at all wrote as they spoke, using more and more and an extended phonetic spelling based largely on French analogies. The 13th century is a brilliant period in the history of Anglo-Latin literature, and many works of merit were written in French (see ANGLO-NORMAN). But vernacular literature is scanty and of little originality. The Peterborough Chronicle, it is true, was continued till 1154, and its later portions, while markedly exemplifying the changes in the language, contain some really admirable writing. But it is substantially correct to say that from this point until the age of Chaucer vernacular prose served no other purpose than that of popular religious edification. For light on the intellectual life of the nation during this period we must look mainly to the works written in Latin. The homilies of the 12th century are partly modernized transcriptions from Ælfric and other older writers, partly translations from French and Latin; the remainder is mostly commonplace in substance and clumsy in expression. At the beginning of the 13th century the Acuern Rituale (p.e.), a book of counsel for nuns, shows true literary genius, and is singularly interesting in its substance and spirit; but notwithstanding the author's remarkable mastery of English expression, his culture was evidently French rather than English. Some minor religious prose works of the same period are not without merit. But these examples had no literary following. In the early 14th century the writings of Richard Rolle and his school attained great popularity. The profound influence which they exercised on later religious thought, and on the development of prose style, has been adequately recognized. The Ayenbite of Inwyt (see MICHEL, DAN), a wretchedly unintelligible translation (finished in 1340) from Frère Lorens's Somme des vices et des vertus, is valuable to the student of language, but otherwise worthless.

The break in the continuity of literary tradition, induced by the Conquest, was no less complete with regard to poetry than with regard to prose. The poetry of the 13th and the latter part of the 12th century was unconstrained by the written works of Old English poets, whose archaic diction had to a great extent become unintelligible. But there is no ground to suppose that the succession of popular singers and reciters was ever interrupted. In the north-west, indeed, the old recitative metre seems to have survived in oral tradition, with little more alteration than was rendered necessary by the changes in the language, until the middle of the 14th century, when it was again adopted by literary versifiers. In the south this metre had greatly degenerated in strictness before the Conquest, but, with gradually increasing laxity in the laws of alliteration and rhythm, it continued long in use. It is commonly believed, with great intrinsic probability but with scanty actual evidence, that in the Old English period there existed, beside the alliterative long line, other forms of verse adapted not for recitation but for singing. The alliterative forms of verse have not as yet been adequately studied. The influence of native popular poetic tradition, whether in the form of recited or of sung verse, is clearly discernible in the earliest Middle English poems that have been preserved. But the authors of these poems were familiar with Latin, and probably spoke French as easily as their mother tongue; and there was no longer any literary convention to restrain them from adopting foreign metrical forms. The
artless verses of the hermit Godric, who died in 1270, exhibit in their metre the combined influence of native rhythm and of that of Latin hymnology. The Proverbs of Alfred, written about 1200, is (like the later Proverbs of Hengwyr) in style and substance a gnomic poem of the ancient Germanic type, containing maxims some of which may be of immemorial antiquity; and its rhythm is mainly of native origin. On the other hand, the solemn and touching meditation known as the Moral Ode, which is somewhat earlier in date, is in a metre derived from contemporary Latin verse—a line of seven accents, broken by a caesura, and with feminine end-rhymes. In the Ormulum (see Osm) this metre (known as the septenarius) appears without rhyme, and with regular syllabic regularity previously without example in English verse, the line (or distich, as it may be called with almost equal propriety) having invariably fifteen syllables. In various modified forms, the septenarius was a favourite measure throughout the Middle English period. In the poetry of the 13th century the influence of French models is conspicuous. The many devotional lyrics, some of which, as the Lwe Kon of Thomas of Hales, have great beauty, show this influence not only in their varied metrical form, but also in their peculiar mystical tenderness and fervour. The Story of Genesis and Exodus, the substance of which (edited in T. Wright's Specimens of Lyric Poetry) still derives its metre chiefly from French. Its poetical merit is very small. The secular poetry also received a new impulse from France. The brilliant and sprightly dialogue of the Owl and Nightingale, which can hardly be dated later than about 1320, is a "contention" of the type familiar in French and Provençal literature. The "Gallic" type of humour may be seen in various other writings of this period, notably in the Land of Cockaigne, a vivacious satire on monastic self-indulgence, and in the fabliau of Dame Sivis, a story of Eastern origin, told with almost Chaucerian skill. Predominantly, though not exclusively French in metrical structure, are the charming love poems collected in a MS. (Harl. 2253) written about 1320 in Herefordshire, some of which (edited in T. Wright's Specimens of Lyric Poetry) find a place in modern popular anthologies. It is noteworthy that they are accompanied by some French lyrics very similar in style. The same MS. contains, besides some religious poetry, a number of political songs of the time of Edward II. They are not quite the earliest examples of their kind; in the time of the Barons' War the popular cause had had its singers in English as well as in French. Later, the victories of Edward III. down to the taking of Guines in 1352, were celebrated by the Yorkshireman Laurence Minot in alliterative verse with strophic arrangement and rhyme.

At the very beginning of the 13th century a new species of composition, the metrical chronicle, was introduced into English literature. The huge work of Layamon, a history (mainly legendary) of Britain from the time of the mythical Brutus till after the mission of Augustine, is a free rendering of the Norman-French Brut of Wace, with extensive additions from traditional sources. Its metre seems to be a degenerate survival of the Old English alliterative line, gradually modified in the course of the work by assimilation to the regular syllabic measure of the French original. Unquestionable evidence of the knowledge of the poem on the part of later writers is scarce, but distinct echoes of its diction appear in the chronicle ascribed to Robert of Gloucester, written in rhymed septenary measures about 1300. This work, founded in its earlier part on the Latin historians of the 12th century, is an independent historical source of some value for the events of the writer's own times. The succession of versified histories of England was continued by Thomas Bek of Castleford in Yorkshire (whose work still awaits an editor), and by Robert Mannyng of Brunne (Bourne, Lincolnshire). Mannyng's chronicle, finished in 1338, is a translation, in its earlier part from Wace's Brut, and in its later part from an Anglo-French chronicle (still extant) written by Peter Langtoft, canon of Bridlington.

Not far from the year 1300 (for the most part probably earlier rather than later) a vast mass of hagiological and homiletic verse was produced in divers parts of England. To Gloucester belongs an extensive series of Lives of Saints, metrically and linguistically closely resembling Robert of Gloucester's Chronicle, and perhaps wholly or in part of the same authorship. A similar collection was written in the north of England, as well as a large body of homilies showing considerable poetic skill, and abounding in exempla or illustrative stories. Of exempla several prose collections had already been made in Anglo-French, and William of Wadington's poem Manuel des pêchés, which contains a great number of them, was translated in 1303 by Robert Mannyng already mentioned, with some enlargement of the anecdotic element, and frequent omissions of didactic passages. The great rhyming chronicle of Scripture history entitled Cursor Mundi (q.v.) was written in the north about this time. It was extensively read and transcribed, and exercised a powerful influence on later writers down to the end of the 14th century. The remaining homiletic verse of this period is too abundant to be referred to in detail; it will be enough to mention the sermons of William of Shoreham, written in strophic form, but showing little either of metrical skill or poetic feeling. To the next generation belongs the Prise de Conscience by Richard Rolle, the influence of which was not less powerful than that of the author's prose writings.

The chivalric romance in French had been extensively cultivated, both on the continent and in England from the early years of the 12th century, did not assume a vernacular form till about 1250. In the next hundred years its development was marvellously rapid. Of the vast mass of metrical romances produced during this period no detailed account need here be attempted (see Romance, and articles, &c. referred to; Arthurian Romance). Native English traditions form the basis of King Horn, Guy of Warwick, Bevis of Hampton and Hawelok, though the stories were first put into literary form by Anglo-Norman poets. The popularity of these home-grown tales (with which may be classed the wildly fictitious Coer de Lion) was soon rivaled by that of importations from France. The English rendering of Floris and Blancheflor (a love-romance of Grecian origin) is found in the same MS. that contains the earliest copy of King Horn. Before the end of the century, the French "matter of Britain" was represented in English by the Southern Arthur and Merlin and the Northern Tristram and Ysane and Gawain, the "matter of France" by Roland and Verna and Ouel; the Alexander was also translated, but in this instance the immediate original was an Anglo-French and not a continental poem. The tale of Troy did not come into English till long afterwards. The Auchinleck MS., written about 1350, contains no fewer than 14 poetical romances; there were many others in circulation, and the number continued to grow. About the middle of the 14th century, a new English alliterative long line, which for centuries had been used only in unwritten minstrel poetry, emerges again in literature. One of the earliest poems in this revived measure, Wynne and Wastour, written in 1352, is by a professional reciter-poet, who complains bitterly that original minstrel poetry no longer finds a welcome in the halls of great nobles, who prefer to listen to those who recite verses not of their own making. About the same date the metre began to be employed by men of letters for the translation of romance—William of Palerne and Joseph of Armaitheo from the French, Alexander from Latin prose. The later development of alliterative poetry belongs mainly to the age of Chaucer.

The extent and character of the literature produced during the first half of the 14th century indicate that the literary use of the native tongue was no longer, as in the preceding age, a mere condescension to the needs of the common people. The rapid disuse of French as the ordinary medium of intercourse among the middle and higher ranks of society, and the consequent substitution of English for French as the vehicle of school instruction, created a widespread demand for vernacular reading. The literature which arose in answer to this demand, though it consisted mainly of translations or adaptations of foreign works, yet served to develop the appreciation of poetic beauty, and to prepare an audience in the near future for a poetry in which the genuine thought and feeling of the nation were to find expression.
II. CHAUCER TO THE RENAISSANCE

The age of Chaucer is of peculiar interest to the student of literature, not only because of its brilliance and productiveness but also because of its apparent promise for the future. In this, as in other aspects, Chaucer (c. 1340–1400) is its most notable literary figure. Beginning as a student and imitator of the best French poetry of his day, he was for a time, like most of his French contemporaries, little more than a skilful maker of elegant verses, dealing with conventional material in a conventional way, arranging in new figures the same flowers and bowers, sunsets and song-birds, and companies of fair women and the like. But the transformation of the Norman Conquest to Chaucer (London, 1906).

(II. BR.)

BIBLIOGRAPHY.—Only general works need be mentioned here. Those cited contain lists of books for more detailed information.

(1) For the life of Chaucer from the earliest extant works and poems: B. ten Brink, Geschichte der englischen Literatur, vol. i, 2nd ed., by A. Brandl (Strassburg, 1899) (English translation from the 1st ed. of 1857, by H. M. Kennedy; London, 1893). (2) For the Old English period:—

for fine words and fine sentiments, but for the proper arrangement of events, the significant exponent of character, the right tone, and even the appropriate background and atmosphere,—as may be seen, for example, in the transformations he wrought in The Pardoner's Tale. It is therefore in the latest and most original of the Canterbury Tales that his art is most admirable, most distinguished by technical excellences. In these we find so many admirable qualities that we almost forget that he had any defects. His diction is a model of picturesqueness, of simplicity, of dignity, and of perfect adaptation to his theme: his versification is not only correct but musical and varied, and shows a progressive tendency towards freer and more complex melodies; his best tales are not mere repetitions of the ancient stories they retell, but new creations, transformed by his own imaginative realization of them, full of figures having the dimensions and the vividness of real life, acting on adequate motives, and the logic of the pangs of his enhanced melancholy. He is not, perhaps, in all his voluminous work in English, French and Latin, any indication that he regarded composition as an art requiring consideration or any care beyond that of conforming to the chosen rhythm and finding suitable rhymes.

There were others more richly endowed as poets and more finely developed as artists. There was the beginning of the Piers Plowman cycle, the author of the Prologue and first eight passus of the A-text, a man of clear and profound observation, a poet whose imagination brought before him with distinctness and reality visual images of the motley individuals and masses of men of whom he wrote, an artist who knew how to organize and direct the figures of his dream-world, the movement of his ever-unfolding vision. There was the remarkable successor of this man, the author of the B-text, an almost prophetic figure, a great poetical idealist, and, helpless though he often was in the direction of his thought, an absolute master of images and words that seize upon the heart and haunt the memory. Besides these, an unknown writer far in the north-west had, in Gaunwayne and the Grene Knight, transformed the medieval romance into a thing of speed and colour, of vitality and mystery, no less remarkable for its fluent definiteness of form than for the delights of hall-feast and hunt, the graceful comedy of temptation, and the lively riddle of the doomed Gaunwayne through the silence of the forest and the deep snow. In the same region, by its author's power of visual imagination, the Biblical paraphrase, so often a mere humdrum narrative, had been transformed, in Patience, into a narrative so detailed and vivid that the reader is almost ready to believe that the author himself, rather than Jonah, went down into the sea in the belly of the great fish, and sat humbled and rebuked beside the withered gourd-vine. And there also, by some strange chance, blossomed, with perhaps only a local and temporary fragrance until its rediscovery in the 19th century, that delicate flower of loneliness and aspiration, Pearl, a wonder of elaborate art as well as of touching sentiment.

All these writings are great, not only relatively, but absolutely. There is not one of them which would not, if written in our own time, immediately mark its author as a man of very unusual ability. But the point of special concern to us at the present moment is not so much that they show remarkable poetical power, as that they possess technical merits of a very high order. And we are accustomed to believe that, although genius is a purely

1 Piers Plowman has been so long attributed as a whole to Langland (q.v.), that in spite of modern analytical criticism it is most conveniently discussed under that name.
personal and incommodable element, technical gains are a common possession; that after Marlowe he developed the technique of blank verse, this technique was available for all; that after Pope he mastered the heroic couplet and Gray the ode, and Poe the short story, all men could write couplets and odes and short stories of technical correctness; that, as Tennyson puts it,

"All can grow the flower now, For all have got the seed."

But this was singularly untrue of the technical gains made by Chaucer and his great contemporaries. Pearl and Patience were apparently unknown to the 15th century, but Gawain and Sir Gisborne and Chaucer's works were known and were influential in one way or another throughout the century. Gawain called into existence a large number of romances dealing with the same hero or with somewhat similar situations, some of them written in verse suggested by the remarkable verse of their model, but the resemblance, even in versification, is only superficial. Piers Plowman gave rise to satirical allegories written in the alliterative long line and furnished the figures and the machinery for many satires in other metres, but the technical excellence of the first Piers Plowman poem was soon buried for centuries under the tremendous social significance of itself and its successors. And Chaucer, in spite of the fact that he was praised and imitated by many writers and definitely claimed as master by more than one, not only transmitted to them scarcely any of the technical conquests he had made, but seems also to have been almost without success in creating any change in the taste of the public that read his poems so eagerly, any demand for better literature than had been written by his predecessors.

Wide and lasting Chaucer's influence undoubtedly was. Not only was all the court-poetry, all the poetry of writers who pretended to cultivation and refinement, throughout the century, in England and Scotland, either directly or indirectly imitative of his work, but even the humblest productions of unpretentious writers show at times traces of his influence. Scotland was fortunate in having writers of greater ability than England had (see Scotland: Literature). In England the three chief followers of Chaucer known to us by name are Lydgate, Hoccleve (see Occleve) and Hawes. Because of their praise of Chaucer and their supposed personal relations to him, Lydgate and Hoccleve are almost inseparable in modern discussions, but 15th century readers and writers seem in many efforts with Chaucer to have interested themselves closely. Indeed, Hoccleve is rarely mentioned, while Lydgate is not only mentioned continually, but continually praised as Chaucer's equal or even superior. Hoccleve was not, to be sure, as prolific as Lydgate, but it is difficult to understand why his work, which compares favourably in quality with Lydgate's, attracted so much less attention. The title of his greatest poem, De regimine principum, may have repelled readers who were not princely born, though they would have found the work full of the moral and prudential maxims and illustrative anecdotes so dear to them; but his attack upon Sir John Oldcastle as a heretic ought to have been decidedly to the taste of the orthodox upper classes, while his lamentations over his misspent youth, his tales and songs of his minor poems might have interested any ear. Of a less vigorous spirit, an airy line, in his mild way, more humorous and more original. Also despite his sense of personal loss in Chaucer's death and his care to transmit to posterity the likeness of his beloved master, he seems to have been less slavish than Lydgate in imitating him. His memory is full of Chaucer's phrases, he writes in verse-forms hallowed by the master's use, and he tries to give to his lines the movement of Chaucer's decasyllables, but he is comparatively free from the influence of those early allegorical works of the Master which produced in the 15th century so dreary a flock of imitators.

Lydgate's productivity was enormous,—how great no man can say, for, as was the case with Chaucer also, his fame caused many masterless poems to be ascribed to him, but, after making all necessary deductions, the amount of verse that has come down to us from him is astonishing. Here it may suffice to say that his translations are predominantly epic (140,000 lines), and his original compositions predominantly allegorical love poems or didactic poems. If there is anything duller than a dull epic it is a dull allegory, and Lydgate has achieved both. This is not to deny the existence of good passages in his epics and ingenuity in his allegories, but there is no pervading, persistent life in either. His epics, like almost all the narrative verse of the time, whether epic, legend, versified chronicle or metrical romance, seem designed merely to satisfy the desire of 15th century readers for information, the craving for facts—true or fictitious—the same craving that made possible the poems on alchemy, on hunting, on manners and morals, on the duties of parish priests, on the seven liberal arts. His allegories, like most allegories of the age, are ingenious rearrangements of old figures and old machinery, they are full of what had once been imagination but had become merely memory assisted by cleverness.

The great fault of all his work, as of nearly all the literature of the age, is that it is merely a more or less skilful manipulation of what the author had somewhere read or heard, and not a faithful transcript of the author's own peculiar sense or conception of what he had seen or heard or read. The fault is not that the old is repeated, that a twice-told tale is retold, but that it is retold without being re-imagined by the teller of the tale, without taking on from his personality something that was not in it before. Style, to be sure, was a thing that Lydgate and his fellows tried to supply, and some of them supplied it abundantly according to their lights. But style meant to them external decoration, classical allusions, personifications, an inverted or even dislocated order of words, and that famous "ornate diction," those "aurate terms," with which they strove to surpass the melody, picturesque ness and dignity which, for all its simplicity, they somehow dimly discerned in the diction of Chaucer.

Stephen Hawes, with his allegorical treatise on the seven liberal sciences, came later than these men, only to write worse. He was a disciple of Lydgate rather than of Chaucer, and is not only lacking in the vigour and sensibility which Lydgate sometimes displays, but exaggerates the defects of his master. If it be a merit to have conceived the pursuit of knowledge under the form of the efforts of a knight to win the hand of his lady, it is almost the sole merit to which Hawes can lay claim. Two or three good situations, an episode of low comedy, and the epiphany of the Knight with his famous final couplet, exhaust the list of his merits. The fact is that 'tis Hawes leads the line of Spenser's spiritual ancestry seem not well advised.

The resemblances that have been pointed out are such as arise inevitably from the allegories and from the traditional material with which both worked. There is no reason to believe that Spenser owed his general conception to Hawes, or that the Faery Queene would have differed in even the slightest detail from its present form if the Pastime of Pleasure had never been written. The machinery of chivalric romance had already been applied to spiritual and moral themes in Spain without the aid of Hawes.

It is obvious that the fundamental lack of all these men was imaginative power, poetic ability. This is a sufficient reason for failure. In an age good for imitating and for taking, why have they been made to triumph in Hawes' ability? Because of the perturbed conditions arising from the prevalence of foreign and civil wars? Perhaps not, though it is clear that if Sir Thomas Malory had perished in one of the many fights through which he lived, the chivalric and literary impulses which he perhaps received from the "Fadre of Curtesy," Richard Beauchamp, earl of Warwick, would have gone for nothing and we should lack the Mort Arthur. But it may very well be that the wars and the tremendous industrial growth of England fixed the attention of the strongest and most original spirits among the younger men and so withdrew them from the possible attractions of literature. But, after all, whatever general truth may lie in such speculations, the way of a young man with his own life is as incautious as any of the four things which Agur son of Jakeb declared to be past finding out; local
and special accidents rather than general communal influences are apt to shape the choice of boys of exceptional character, and we have many instances of great talents turning to literature or art when war or commerce or science was the dominant attraction of social life.

But even recognizing that the followers of Chaucer were not men of genius, it seems strange that their imitation of Chaucer was what it was. They not only entirely failed to see what his merits as an artist were and how greatly superior his mature work is to his earlier in point of technique; they even preferred the earlier and imitated it almost exclusively. Furthermore, his mastery of verse seemed to them to consist solely in writing verses of approximately four or five stresses and arranging them in couplets or in stanzas of seven or eight lines. Their preference for the early allegorical work can be explained by their lack of taste and critical discernment and by the great vogue of allegorical writing in England and France. Men who are just beginning to think about the distinction between literature and ordinary writing usually feel that it consists in making literary expression differ as widely as possible from simple direct speech. For this reason some sort of artificial diction is developed and some artificial word order devised. Allegory is used as an elegant method of avoiding unpoetical plainness, and is an easy means of substituting logic for imagination. The failure to reproduce in some degree at least the melody and smoothness of Chaucer's decasyllabic verse, and the particular form which that failure took in Lydgate, are to be explained by the fact that Lydgate and his fellows never knew how Chaucer's verse sounded when properly read. It is a mistake to suppose that the disappearance of final unaccented e from many words or its instability in many others made it difficult for Lydgate and his fellows to write melodic verse. Melodious verse has been written since the disappearance of all these sounds, and the possibility of a choice between a form with final e and one without it is not a hindrance but an advantage to a poet, as Goethe, Schiller, Heine and innumerable German poets have shown by their practice. The real difficulty with these men was that they pronounced Chaucer's verse as if it were written in the English of their own day. As a matter of fact all the types of verse discovered by scholars in Lydgate's poems can be discovered in Chaucer's also if they be read with Lydgate's pronunciation. Chaucer did not write archaic English, as some have supposed,—that is, English of an earlier and popular strain of the language—nor could it have been impossible for him to do so with the unflagging accuracy he shows; he did, however, write a conservative, perhaps an old-fashioned, English, such as was spoken by the conservative members of the class of society to which he was attached and for which he wrote. An English with fewer final e's was already in existence among the less conservative classes, and this rapidly became standard English in consequence of the social changes which occurred during his own life. We know that a misunderstanding of Chaucer's verse existed from the 16th century to the time of Thomas Tyrwhitt; it seems clear that it began even earlier, in Chaucer's own lifetime.

There are several poems of the 15th century which were long ascribed to Chaucer. Among them are:—the Complaint of the Black Knight, or Complaint of a Lover's Life, now known to be Lydgate's; the Mother of God, now ascribed to Hoccleve; the Cuckoo and the Nightingale, by Clavwove; La Belle Dame sans merci, a translation from the French of Alain Chartier by Richard Ros; Chaucer's Dream, or the Isle of Ladies; the Assembly of Ladies; the Flower and the Leaf; and the Court of Love. The two poems of Lydgate and Hoccleve are as good as Chaucer's poorest work. The Assembly of Ladies and the Flower and the Leaf are perhaps better than book of the Duchess, but not so good as the Parliament of Fowls. The Flower and the Leaf, it will be remembered, was very dear to John Keats, who, like all his contemporaries, regarded it as Chaucer's. An additional interest attaches to both it and the Assembly of Ladies, from the fact that the author may have been a woman; Professor Skeat is, indeed, confident that he knows who the woman was and when she wrote. These poems, like the Court of Love, are thoroughly conventional in material, all the figures and poetical machinery may be found in dozens of other poems in England and France, as Professor Neilson has shown for the Court of Love and Mr Marsh for the Flower and the Leaf; but there are a freshness of spirit and a love of beauty in them that are not common; the conventional birds and flowers are there, but they seem, like those of Chaucer's Legend, to have some touch of life, and the conventional companies of ladies and gentlemen ride and talk and walk with natural grace and ease. The Court of Love is usually ascribed to a very late date, if late even as the middle of the 16th century. If this is correct, it is a notable instance of the persistence of a Chaucerian influence. An effort has been made, to be sure, to show that it was written by Scogain and that the writing of it constituted the offence mentioned by Chaucer in his Envoi to Scogain, but it has been clearly shown that this is impossible, both because the language is later than Scogain's time and because nothing in the poem resembles the offence clearly described by Chaucer.

Whatever may be true of the authorship of the Assembly of Ladies and the Flower and the Leaf, there were women writers in England in the middle ages. Juliana of Norwich wrote her Revelations of Divine Love before 1400. The much discussed Dame Juliana Berners, the supposed compiler of the treatise on hunting in the Book of St Albins, may be mythical, though there is no reason why a woman should not have written such a book; and a shadowy figure that disappears entirely in the sunlight is the supposed authoress of the Nut Brown Maid, for if language is capable of definite meaning, the last stanza declares unequivocally that the poem is the work of a man. But there is a poem warning young women against entering a nunnery which may be by a woman, and there is an interesting entry among the records of New Romney for 1463-1464, "Paid to Agnes Forde for the play of the Interlude of our Lord's Passion, 6s. 8d." which is apparently the earliest mention of a woman dramatist in England. Finally, Margaret, countess of Richmond, the mother of Henry VII., not only aided scholars and encouraged writers, but herself translated the (spurious) fourth book of St Thomas à Kempis' Imitatio Christi. Another Margaret, the duchess of Burgundy, it will be remembered, encouraged Caxton in his translation and printing. Women seem, indeed, to have been especially lovers of books and patrons of writers, and Skelton, if we may believe his Garland of Lowre, may have been addressed by her. In London, as in France, there grew up literary clubs; Erasmus's Sufferaget Convention may correspond to no reality, but the Learned Lady arguing against the Monk for the usefulness and pleasure derived from books was not an unknown type. Women were capable of many things in the middle ages. English records show them to have been physicians, churchwardens, justices of the peace and sheriffs, and, according to a satirist, they were also priests.

The most original and powerful poetry of the 15th century was composed in popular forms for the ear of the common people and was apparently written without conscious artistic purpose. Three classes of productions deserve special attention,—songs and carols, popular ballads and certain dramatic compositions. The songs and carols belong to a species which may have existed in England before the Norman Conquest, but which certainly was greatly modified by the musical and lyric forms of France. The best of them are the direct and simple if not entirely artless expressions of personal emotion, and even when they contain, as they sometimes do, the description of a person, a situation, or an event, they deal with these things so subjectively, confine themselves so closely to the rendering of the emotional effect upon the singer, that they lose none of their spontaneous characteristic. Often a great many of them deal with similar subjects, some with religious, and some are curious and delightful blendings of religious worship and aspiration with earthly tenderness for the embodiments of helpful infancy and protecting motherhood which gave Christianity so much of its power over the affections and imagination of the middle ages. Even those which begin as mere expressions of joy in the Yule-tide eating and drinking and merriment catch at moments hints of higher
joys, of finer emotions, and lift singer and hearer above the noise and stir of earth. Hundreds of songs written and sung in the 15th century must have perished; many, no doubt, lived only a single season and were never even written down; but chance has preserved enough of them to make us wonder at the age which could produce such masterpieces of tantalizing simplicity.

The lyrics which describe a situation form a logical, if not a real transition to those which narrate an episode or an event. The most famous of the latter, the *Nut Brown Maid*, has often been called a ballad, and “lyrical ballad” it is in the sense established by Coleridge and Wordsworth, but its affinities are rather with the song or carol than with the folk-ballad, and, like Henryson’s charming *Robin and Malkin*, it is certainly the work of a man of culture and of conscious artistic purpose and methods. Unaccompanied, as it is, by any other work of the same author, this poem, with its remarkable technical merits, is an even more astonishing literary phenomenon than the famous single sonnet of Blanco White. It can hardly be doubted that the author learned his technique from the songs and carols.

The folk-ballad, like the song or carol, belongs in some form to immemorial antiquity. It is doubtless a mistake to suppose that any ballad has been preserved to us that is a purely communal product, a confection of the common knowledge, traditions and emotional currents of the community, brought by subconscious processes into a song that finds change as it passes through one or more individuals as the whole community moves in its molecular dance. But it is equally a mistake to argue that ballads are essentially metrical romances in a state of decay. Both the matter and the manner of most of the best ballads forbid such a supposition, and it can hardly be doubted that in some of the folk-ballads of the 15th century are preserved not only traditions of dateless antiquity, but formal elements and technical processes that actually are derived from communal song and dance. By the 15th century, however, communal habits and processes of composition had ceased, and the traditional elements, formal and technique had become merely conventional aids and not the individual singer. Ancient as they were, conventional as, in a sense, they also were, they exercised none of the denuding, benumbing influence of ordinary conventions. They furnished, one may say, a vibrant framework of emotional expression, each tone of which moved the hearers all the more powerfully because it had sung to them so many old, unhappy, far-off, so many battles and treacheries and sudden griefs; a framework which the individual singer needed only to fill out with the simplest statement of the event which had stirred his own imagination and passions to produce, not a work of art, but a song of universal appeal. Not a work of art, because there are scarcely half a dozen ballads that are really works of art, and the greatest ballads are not among these. There is scarcely one that is free from excrescences, from dulness, from trivialities, from additions that would spoil their greatest situations and their greatest lines, were it not that we resolutely shut our ears and our eyes, as we should, to all but their greatest moments. But at their best moments the best ballads have an almost incomparable power, and to a people sick, as we are, of the ordinary, the usual, the very trivialities and impertinences of the ballads only help to define and emphasize these best moments. In histories of English literature the ballads have been so commonly discussed in connexion with their rediscovery in the 18th century, that we are apt to forget that some of the very best were demonstrably composed in the 15th and that many others of uncertain date probably belong to the same time. Along with the genuine ballads dealing with a recent event or a traditional theme, there were also occasional phantasmagoria which earlier writers have retold in ballad style. This was doubtless inevitable in view of the increasing epic tendency of the ballad and the interest still felt in metrical romances, but it should not mislead us into regarding the genuine folk-ballad as an out-growth of the metrical romance.

Besides the ordinary epic or narrative ballad, the 15th century produced ballads in dramatic form, or, perhaps it was better to say, dramatized some of its epic ballads. How commonly this was done we do not know, but the scanty records of the period indicate that it was a widespread custom, though only three plays of this character (all concerning Robin Hood) have come down to us. These plays had, however, no further independent development, but merely furnished elements of incident and atmosphere to later plays of a more highly organized type. With these ballad plays may also be mentioned the Christmas plays (usually of St George) and the sword-dance plays, which also flourished in the 15th century, but survive for us only as obscure elements in the masques and plays of Ben Jonson and in such modern rustic performances as Thomas Hardy has so charmingly described in *The Return of the Native*.

The additions which the 15th century made to the ancient cycles of Scripture plays, the so-called Mysteries, are another instance of a literary effort which spent itself in vain (see DRAMA). The most notable of these are, of course, the world renowned comic scenes in the *Townley* (or *Wakefield*) *Plays*, in the pageants of Cain, of Noah and of the Shepherds. In none of these is the 15th century writer responsible for the original comic intention; in the pageants of Cain and of the Shepherds fragments of the work of a 14th century writer still remain to prove the earlier existence of the comic conception, and that it was traditional in the Noah pageant we know from the testimony of Chaucer’s Miller; but none the less the 15th century writer was very skilful in the use of incident and in the development of both character and situation previously unexampled in England. The inability of Lydgate to develop a comic conception is strikingly displayed if one compares his *Pageant for Presentation before the King at Hereford* with the work of this unknown artist. But in our admiration for this man and his famous episode of Mak and the fictitious infant, we are apt to forget the equally fine, though very different qualities shown in some of the later pageants of the *York Plays*. Such, for example, is the final pageant, that of the *Last Judgment*, a drama of slow and majestic movement, to be sure, but with a large and fine conception of the great situation, and a noble and dignified eloquence not inadequate to the theme. The *Abraham and Isaac* play of the 14th and of the MS.; extant as a separate play and perhaps so performed, which has been so greatly admired for its cumulative pathos, also belongs demonstrably to this century. It is not, as has been supposed, an intermediate stage between French plays and the Chester *Abraham and Isaac* play of the 13th and of the MS.; but is derived directly from the latter by processes which comparison of the two easily reveals. Scripture plays of a type entirely different from the well-known cyclic mysteries, apparently confined to the Passion and Resurrection and the related events, become known to us for the first time in the records of this century. Such plays seem to have been confined to the towns of the south, and, as both their location and their structure suggest, may have been borrowed from France. In any event, the records show that they flourished greatly and that new versions were made from time to time.

Another form of the medieval drama, the *Moral Play*, had its origin in the 15th century,—or else very late in the 14th. The earliest known examples of it in England date from about 1420. These are the *Castle of Perseverance* and the *Pride of Life*. Others belonging to the century are *Mind, Will and Understanding*, *Mankind* and *Medwall’s Nature*. There are also parts of two pageants in the *Ludus Coventriae* (c. 1460) that are commonly classed as *Morality*, and these, together with the existence of a few personified abstractions in other plays, have led some critics to suppose that the *Moral Play* was derived from the *Mystery* by the gradual introduction of personified abstractions in the place of real persons. But the two kinds of plays are fundamentally different, different in subject and in technique; and no replacement of real persons by personifications can change a *Mystery* into a *Moral Play*. Moreover, the *Moral Play* features in *Mysteries* are later than the origin of the *Moral Play* itself and are due to the influence of the latter. The *Moral Play* is merely a dramatized allegory, and derives its characters and its peculiar technique from the application of the dramatic method to the allegory, the favourite literary form of the middle ages. None of the 15th
century. Morality is literature of the first rank, though both the
Castle of Perseverance and Pride of Life contain passages ringing
with a passionate sincerity that communicates itself to the
hearer or reader. But it was not until the beginning of the
16th century that a Morality of permanent human interest
appeared in Everyman, which, after all, is a translation from
the Dutch, as is clearly proved by the fact that in the two prayers
near the end of the play the Dutch has complicated but regular
stanzas, whereas the English has only irregularly rhymed
passages.

Besides the Mysteries and Morals, the 15th century had also
Miracle Plays, properly so called, dealing with the lives, martyr-
izations and visions of saints. As we know these only from
records of their performance or their more fortunate existence
in texts, we can only place them as curiosities in the literature,
the Everyman, which must be read as a Play of the
Sacrament—it is impossible to speak of their literary or dramatic
qualities. The Miracle Play as a form was, of course, not confined
to the 15th century. Notwithstanding the assertions of historians
of literature that it died out in England soon after its introduction
at the beginning of the 12th century, its existence can be demon-
strated from c. 1110 to the time of Shakespeare. But records
seem to indicate that it flourished especially during this period
of supposed barrenness.

As the nature of the "Komedie of Troylyous and
Pandor" performed before Henry VIII. on the 6th of January
1526 we have no means of knowing. It is very early indeed
to assume the influence of either classical or Italian drama,
and although we have no records of similar plays from the 15th
century, it must be remembered that our records are scanty,
that the middle ages applied the dramatic method to all sorts of
material, and that it is therefore not impossible that secular
plays like this were performed at court at a much earlier date.
The record at any rate does not indicate that it was a new type
of play, and the Giselda story had been dramatized in France,
Italy and the Netherlands before 1500. No prose was written in the 15th century is
less surprising than that so little good verse was written. The
technique of verse composition had been studied and mastered
in the preceding age, as we have seen, but the technique of prose
had apparently received no serious consideration.

Indeed, it is doubtful if any one thought of prose as a possible medium
of artistic expression. Chaucer apparently did not, in spite of the
comparative excellence of his Preface to the Astrolabe and his
occasional noteworthy successes with the difficulties of the
philosophy of Boethius; Wyclif is usually clumsy; and the translators
of Mandeville, though they often give us passages of great
merit, obviously were plain men who merely translated as
best they could. There was, however, a comparatively large
amount of prose written in the 15th century, mainly for religious
or educational purposes, dealing with the same sorts of
subjects that were dealt with in verse, and in some cases not distinguish-
able from the verse by any feature but the absence of rhyme.
The vast body of this we must neglect; only five writers need
be named: John Capgrave, Reginald Pecock, Sir John Fortescue,
Caxton and Malory. Capgrave, the compiler of the first chronicle
in English prose since the Conquest, wrote by preference in Latin;
his English is a condescension to those who could not
read Latin and has the qualities which belong to the talk of an
earnest and sincere man of commonplace ability. Pecock and
Fortescue are more important. Pecock (c. 1305-c. 1460) was
a man of singularly acute and logical mind. He prided himself
upon his dialectic skill and his faculty for discovering arguments
that had been overlooked by others. His writings, therefore—
or at least the Repessor—are excellent in general structure and
arrangement, his ideas are presented clearly and simply, with
few digressions or excrescences, and his sentences, though
sometimes too long, are more like modern prose than any of
his ideas while his intellectual immensity coexists with intense
even those whom his prejudices and preconceptions repel.
Fortescue, like Capgrave, wrote by preference in Latin, and, like
Pecock, was philosophical and controversial. But his principal
English work, the Difference between an Absolute and a Limited
Monarchy, differs from Pecock's in being rather a pleasing than a
logical argument, and the geniality and glowing patriotism of
its author give it a far greater human interest.

No new era in literary composition was marked by the activity
of William Caxton as translator and publisher, though the print-
ing-press has, of course, changed fundamentally the problem
of the dissemination and preservation of culture, and thereby
ultimately affected literary production profoundly. But neither
Caxton nor the writers whose works he printed produced anything
new in form or spirit. His publications range over the whole
field of 15th century literature, and no doubt he tried, as his
writings indicate, to direct the public taste to what was
best among the works of the past, as when he printed and re-
printed the Canterbury Tales, but among all his numerous publications not one is the herald of a new era. The only book
of permanent interest as literature which he introduced to the
world was the Morte Darthur of Sir Thomas Malory, and this is
a compilation from older romances (see Arthurian Legend).
It is, to be sure, the only book of permanent literary significance
produced in England in the 15th century; it glows with the
warmth and beauty of the old knight's conception of chivalry
and his love for the great deeds and great men of the visionary
Renaissance and it continually allure the reader by its fresh and vivid
diction and by a synecdoche, though sometimes faulty, that
has almost always a certain native charm; "thystorye (i.e. the
history) of the sayd Arthur," as Caxton long ago declared, "is
so glorious and shynyng, that he is stailled in the first place
of the moost noble, beste and worthyest of the Crysten men";
it is not, however, as the first of a new species, but as the final
flower of an old that this glorious and shining book retains its
place in English literature.

Whatever may have been the effect of the wars and the growth
of industrial life in England in withdrawing men of the best
abilities from the pursuit of literature, neither these causes
nor any other internal or external can account for the lesser
powers. The amount of writing is really astonishing, as is also
its range. More than three hundred separate works (exclusive of
the large number still ascribed to Lydgate and of the seventy
printed by Caxton) have been made accessible by the Early
English Text Society and other public or private presses, and
it seems probable that an equal number remains as yet
unpublished. No list of these writings can be given here, but it
may not be unprofitable to indicate the range of interests by
noting the classes of writing represented. The classification
is necessarily rough, as some writings belong to more than one
class. Thus, for example, poems, allegorical and un-
allegorical, narrative, didactic, lyrical and miscellaneous
autobiographical and expository; poems of elogy and appeal
for aid; tales of entertainment or instruction, in prose and
verse; histories ancient and modern, and brief accounts
of recent historical events, in prose and in verse; prose
romances and metrical romances; legends and lives of saints, in prose and
in verse; poems and prose works of religious meditation,
devotion and controversy; treatises of religious instruction, in
prose and in verse; ethical and philosophical treatises, and
ethical and prudential treatises; treatises of government, of
politics and economy, of foreign travel, of hygiene, of surgery, of
alchemy, of herbalry, of hunting and washing and fishing,
of farming, of good manners, and of cooking and carving.

Prosac and intended merely to serve practical uses as many of these
were, verse is the medium of expression as often as prose.
Besides this large amount and variety of English compositions, it must
be remembered that much was also written in Latin, and that
Latin and French works of this and other centuries were read by
the educated classes.

Although the intellectual and spiritual movement which we
call the Italian Renaissance was not unknown in England in the
14th and 15th centuries, it is not strange that it exercised no
perceptible influence upon English literature, except in the case of
Chaucer. Chaucer was the only English man of letters before
the 16th century who knew Italian literature. The Italians who visited England and the Englishmen who visited Italy were interested, not in literature, but in scholarship. Such studies and translations were done by Free, Grey, Fleming, Tilly, Gunthorpe and others who went to Italy, Germany, and other countries and brought back to England numerous examples of the best of the Italian and other literatures, and no doubt gave them a freer, wider outlook, but upon their return to England they were immediately absorbed in administrative cares, which left them little leisure for literary composition, even if they had had any inclination to write. They prepared the way, however, for the leaders of the great intellectual awakening which began in England with Linacre, Colet, More and their fellows, and which finally culminated in the age of Spenser, Bacon, Shakespeare, Jonson, Gilbert, Harvey and Hariot.

When the middle ages ceased in England it is impossible to say definitely. Long after the new learning and culture of the Renaissance had been introduced there, long after classical and Italian models were eagerly chosen and followed, the epic and lyric models of the middle ages were admired and imitated, and the ancient forms of the drama lived side by side with the new until the time of Shakespeare himself. John Skelton, although according to Erasmus "unum Britanniarum literarum lumen ac decus," and although possessing great originality and vigour both in diction and in versification when attacking his enemies or indulging in playful rhyming, was not only a great admirer of Lydgate, but equalled even the worst of his predecessors in aureate pedantries of diction, in complicated impossibilities of syntax, and in meaningless inversions of word-order whenever he wished to write elegant and dignified literature. And not a little of the absurd diction of the middle of the 16th century is due to the persistency of the bad ideals and practices of the refined writers of the 15th.

In fine, the 16th century has, aside from its vigorous, though sometimes coarse, popular productions, little that can interest the lover of literature. It offers, however, in richest profusion problems for the literary antiquarian and the student of the relations between social conditions and literary productivity,—problems which have usually been attacked only with the light weapons of irresponsible speculation, but which may perhaps be solved by a careful comparative study of many literatures and many periods. Moreover, although in the quality of its literary output it is decidedly inferior to the 14th century, the amount and the wide range of its productions indicate the gradual emergence of a center of reading and criticism, of reading and criticism, the pre-eminence of which as a center of reading and criticism could have been anticipated only by the most sanguine of students. And the student who would study English literature, just as the innumerable dramatic performances throughout England were important in developing audiences for Marlowe and Shakespeare and Beaumont and Fletcher.

For bibliography see vol. ii. of the Cambridge History of Literature (1909); and Brand's Geschichte der mittelenglischen Literatur (reprinted from Paul's Grundriss der germanischen Philologie). Interesting general discussions may be found in the larger histories of English Literature, such as Ten Brink's, Jusserand's, and (a little more antiquated) Courthope's and Morley's. (J. M. MA.)

III. ELIZABETHAN TIMES

General Influences, and Prologue to 1579.—The history of letters in England from More's Utopia (1516), the first Platonic vision, to Milton's Samson Agonistes (1671), the latest classic tragedy, is one and continuous. That is the period of the English Renaissance, in the wider sense, and it covers all and more of the literature loosely called "Elizabethan." With all its complexity and subdivisions, it has as real a unity as the age of Pericles, or that of Petrarch and Boccaccio, or the period in Germany that includes both Lessing and Heine. It is peculiar in length of span, in variety of power, and in wealth of production, though its master-works on the greater scale are relatively few. It is distinct, while never quite cut off, from the middle age preceding, and also from the classical or "Augustan" age that followed. The coming of Dryden denoted a new phase; but it was still a phase of the Renaissance; and the break that declared itself about 1660 counts as nothing beside the break with the middle ages; for this implied the whole change in art, thought and temper, which re-created the European mind. It is true that many filaments unite Renaissance and middle ages, not only in the religious and purely intellectual region, but in that of art. The music of Geoffrey of Monmouth, the tales of Arthur and of Troilus, the old fairy folklore of the South, the lyric of the Falls of Princes, lived on; and so did the characteristic medieval form, allegory and many of the old metres of the 14th century. But then these things were transformed, often out of knowledge. Shakespeare's use of the histories of Macbeth, Lear and Troilus, and Spenser's of the allegoric romance, are examples. And when the gifts of the middle ages are not transformed, as in the Mirror for Magistrates, they strike us as survivals from a lost world.

So vital a change took long in the working. The English Renaissance of letters only came into full flower during the last twenty years of the 16th century, later than in any Southern land; but it was all the richer for delay, and would have missed many a life-giving element could it have been driven forward sooner. If the actual process of genius is beyond analysis, we can still notice the subjects which genius receives, or chooses, to work upon, and also the vesture which it chooses for them; and we can watch some of the forces that long retard but in the end fertilize these workings of genius.

What, then, in England, were these forces? Two of them lie outside letters, namely, the political settlement, culminating in the later reign of Elizabeth, and the religious settlement, whereby the Anglican Church grew out of the English Reformation. A third force lay within the sphere of the Renaissance itself, in the narrower meaning of the term. It was culture,—the literal and immediate work of culture and education, which at once prepared and put off the flowering of pure genius. "Elizabethan" literature took its complexion from the circumstance that all these three forces were in operation at once. The Church began to be fully articulate, just when the national feeling was at its highest, and the tides of classical and immigrant culture were strongest. Spenser's Faerie Queene, Hooker's Ecclesiastical Polity and Shakespeare's Henry V. came in the same decade (1590-1600). But these three forces, political, religious and educational, were of very different duration and value. The enthusiasm of 1590-1600 was already dying down in the years 1600-1610, when the great tragedies were written; and soon a wholly new set of political forces began to tell on the country. The religious inspiration was mainly confined to certain important channels; and literature as a whole, from first to last, was far more secular than religious. But Renaissance culture, in its ramifications and consequences, tells all the time and over the whole field, from 1500 to 1660. It is this culture which really binds together the long and varied chronicle. Before passing to narrative, a short review of each of these elements is required.

Down to 1579 the Tudor rule was hardly a direct inspiration to authors. The reign of Henry VII. was first duly told by Bacon, and that of Henry VIII. staged by Shakespeare and Fletcher, in the time of James I. Sir Thomas More, John Donne, John Webbe, Wolfen, and Wolsey in Cavendish, and young Langhans, who are nearly the earliest in the language. The later years of Henry VIII. were full of episodes too tragically picturesque for safe handling in the lifetime of his children. The next two reigns were engrossed with the religious war; and the first twenty years of Elizabeth, if they laid the bases of an age of peace, well-being, and national self-confidence that was to prove a teeming soil for letters, were themselves poor in themes for patriotic art. The abortive treason of the northern earls was echoed only in a ringing ballad. But the voyagers, freebooters, and explorers reported their experiences, as a duty, not for fame; and these, though not till the golden age, were edited by Hakluyt, and fed the poetic fancies that took wing from the "Indian men" to the "still-vested Bermoothes." Yet, in default of any true historian, the queen's wise deliberations and diplomacies that upheld the English power, and her refusal to launch on a Protestant or a national war until occasion compelled and the country
was ready, were subjects as uninspiring to poets as the burning questions of the royal marriage or the royal title. But by 1580 the nation was filled with the sense of Elizabeth's success and greatness and of its own prosperity. No shorter struggle and no less achievement could have nursed the insolent, jubilant patriotism of the years that followed; a feeling that for good reason was peculiar to England among the countries of the north, and was like the peculiar forms of the chronicler and poet. Those were borrowed neither from antiquity nor from abroad, and were never afterwards revised. The same exultation found its way into the current forms of ode and pastoral, of masque and allegory, and into many a dedication and interlude of prose. It was so strong as to outlive the age that gave it warrant. The passion for England, the passion of England for herself, animates the bulk of Drayton's *Poly-Olbion*, which was finished so late as 1622. But the public issues were then changing, the temper was darker; and the civil struggle was to speak less in poetry than in the prose of political theory and ecclesiastical argument, until its after-explosion came in the verse of Milton.

The English Reformation, so long political rather than doctrinal or imaginative, cost much writing on all sides; but no book like Calvin's *Institution* is its trophy, at once defining the religious change for millions of later men and marking a term of departure in the national prose.

Still, the debating weapons, the axes and bill-hooks, of vernacular English were sharpened—somewhat jaggedly—in the pamphlet battles that dwarfed the original energies of Sir Thomas More and evoked those of Tyndale and his friends. The powers of the same style were proved for descriptive economy by Starkey's *Dialogue between Pole and Lupset*, and for religious appeal by the blunt sound rhetoric and forthright jests in the sermons of Latimer (died 1555). Foxe's reports of the martyrs are the type of early Protestant English (1563); but the reforming divines seldom became real men of letters even when their Puritanism, or discontent with the final Anglican settlement and its temper, began to announce itself. Their spirit, however, comes out in many a corner of poetry, in Gosseigne's *Steel Glass* as in Spenser's *Shepherd's Calendar*; and the English Reformation affected partly on its pre-natal memories of Langland as well as of Wycliffe. The fruit of the struggle, though retarded, was ample. Carrying on the work of Fisher and Cranmer, the new church became the nursing mother of English prose, and trained it more than any single influence,—trained it so well, for the purposes of sacred learning, translation and oratory, and also as a medium of poetic feeling, that in these activities England came to rival France. How late any religious writer of true rank arose may be seen by the lapse of over half a century between Henry VIII.'s Act of Supremacy and Hooker's treatise. But after Hooker the chain of eloquent divines was unbroken for a hundred years.

Renaissance culture had many stages and was fed from many streams. At the outset of the century, in the wake of Erasmus, under the teaching of Colet and his friends, there spread a sounder knowledge of the Greek and Latin tongues, of the classic texts, and so of the ancient life and mind. This period of humanism in the stricter sense was less brilliant than in Italy and France. No very great scholar or savant arose in Britain for a long time; but neo-Latin literature, the satellite of scholarship, shone brightly in George Buchanan. But scholarship was created and secured; and in at least one, rather solitary, work of power, the *Utopia* (which remained in Latin till 1551), the fundamental process was begun which appropriate medieval mind, fermented with the new, to mix, but as a source of new and independent thinking. In and after the middle of the century the classics were again put forward by Cheke, by Wilson in his *Art of Rhetoric* (1553), and by Ascham in his letters and in his *Schoolmaster* (1570), as the true staple of humane education, and the pattern for a simple yet lettered English. The literature of translations from the classics, in prose and verse, increased; and these works, at first plain, business-like, and uninspired, slowly rose in style and power, and at last, like the translations from modern tongues, were written by a series of masters of English, who thus introduced Plutarch and Tacitus to poets and historians. This labour of mediation was encouraged by the rapid expansion and reform of the two universities, of which almost every great master except Shakespeare was a member; and even Shakespeare had ample Latin for his purpose.

Metaphysics is the classics on "Elizabethan" literature, whether through such translations or the originals, would take long to describe. But their indirect impact is far stronger, though in result the two are hard to discern. This is another point that distinguishes the English Renaissance from the Italian or the French, and makes it more complex. The knowledge of the thought, art and enthusiasm of Rome and Athens constantly came round through Italy or France, tinted and charged in the passage with something characteristic of those countries. The early playwrights read Seneca in Latin and English, but also the foreign Senecan tragedies. Spenser, when starting on his pastorals, studied the Sicilianus, but also Sannazzaro and Marot. Shakespeare saw heroic antiquity through Plutarch, but also, surely, through Montaigne's reading of antiquity. Few of the poets can have distinguished the original fountain of Plato from the canalized supply of the Italian Neoplatonists. The influence, however, of Cicero on the Anglical pulpit was immediate as well as constant; and so was that of the conciser Roman masters, Sallust and Tacitus, on Ben Jonson and on Bacon. Such scattered examples only intimate the existence of two great chapters of English literary history,—the effects of the classics and the effects of Italy. The bibliography of 16th-century translations from the Italian in the fields of political and moral speculation, poetry, fiction and the drama, is so large as itself to tell part of the story. The genius of Italy served the genius of England in three distinctive ways. It inspired the recovery, with new modulations, of a lost music and a lost prosody. It modelled many of the chief poetic forms, which soon were developed out of recognition; such were tragedy, allegory, *song*, pastoral and sonnet. Thirdly, it disclosed some of the master-thoughts upon government and conduct formed both by the old and the new Mediterranean world. Machiavel, the student of ancient Rome and modern Italy, riveted the creed of Bacon. It might be said that never has any modern people so influenced another in an equal space of time—and letters, here as ever, are only the voice, the symbol, of a whole life and culture—if we forgot the sway of French in the later 17th and 18th centuries. And the power of French was alive also in the 16th. The track of Marot, of Ronsard and the Pleiad and Desportes, of Rabelais and Calvin and Montaigne, is found in England. Journeymen like Boistaud and Belleforest handed on immortal tales. The influence is noteworthy of Spanish mannerists, above all of Guevara upon sententious prose, and of the novelists and humorists, headed by Cervantes, upon the drama. German legend is found not only in Marlowe's *Faustus*, but in the byways of play and story. It will be long before the rich and coloured tangle of these threads has been completely unravelled with due tact and science. The presence of one strand may here be mentioned, which appears in unexpected spots.

As in Greece, and as in the day of Coleridge and Shelley, the fabric of poetry and prose is shot through with philosophical ideas; a further distinction from other literatures like the Spanish of the golden age or the French of 1830. But these were not so much the ideas of the new physical science and of Bacon as of the ethical and metaphysical tradition of the 16th century, the old gloomy problem of Europe. The same spirit of adventure of Marlowe, Greville and Raleigh ripples through their writings. Though the immediate influence of Giordano Bruno on English writers is probably limited to a reminiscence in the *Faerie Queene* (Book vii.), he was well acquainted with Sidney and Greville, argued for the Copernican theory at Greville's house, lectured on the soul at Oxford, and published his episcopal marking Italian dialogues during his two years' stay (1583–1585) in London. The debates in the earlier schools of Italy on the nature and tenure of the soul are heard in the
Nosce Teipsum (1599) of Sir John Davies; a stoicism, "of the schools" as well as "of the blood," animates Cassius and also the French heroes of Chapman; and if the earlier drama is sown with Seneca's old maxims on sin and destiny, the later drama, at least in Shakespeare, is penetrated with the freer reading of life and conduct suggested by Montaigne. Platonism—with its <i>vox angelica</i> sometimes a little hoarse—is present from the youthful <i>Hymns</i> of Spenser to the last followers of Donne; sometimes drawn from Plato, it is often the Christianized doctrine codified by Ficino or Fico. It must be noted that this play of philosophic thought only becomes marked after 1580, when the preparatory tunings of English literature are over.

We may very briefly review the period down to 1580, in the departments of prose, verse and drama. It was a time which left few memorials of form.

Early modern English prose, as a medium of art, was of slow growth. For long there was alternate strife and union (ending in marriage) between the Latin, or more rhetorical, and the ancestral elements of the language, and this was true both of diction and of construction. We need to begin with the talk of actual life, as we find it in the hands of the more naivé writers, in its idiom and gusto and unshapen power, to see how style gradually declared itself. In state letters and reports, in the recorded words of Elizabeth and Mary of Scotland and public men, in travels and memoirs, in Latin of the mid-century in Auctor's <i>Works</i> of early voyagers, and in the more unstudied speech of Ascham or Leland, the material lies. At the other extreme there are the English liturgy (1549, 1552, 1559, with the final fusion of Anglican and Puritan eloquence), and the sermons of Fisher and Cranmer,—nearly the first examples of a sinuous, musical and Ciceroan cadence.

A noble pattern for saga-narrative and lyrical prose was achieved in the successive versions (1526-1540-1568) of the Hebrew and Greek Scriptures, where a native simple diction of short and melodious clauses are prescribed by the matter itself. Prose, in fact, down to Shakespeare's time, was largely the work of the churchmen and translators, aided by the chroniclers. About the mid-century the stories, as well as the books of conduct and maxims, drawn from Italy and France, begin to thicken. Perverted symmetry of style is found in euphuistic hacks like Pettie. Painter's <i>Palace of Pleasure</i> (1566) provided the plots of Bandello and others for the dramatists. Hoby's version (1561) of Castiglione's <i>Courtier</i>, with its command of elate and subtle English, is the most notable imported book between Berner's <i>Froissart</i> (1523-1525) and North's <i>Plutarch</i> (1570). Ascham's <i>Schoolmaster</i> is the most typical English book of Renaissance culture, in its narrower sense, since <i>Utopia</i>. Holinshed's <i>Chronicle</i> (1577-1587) and the work of Halle, if pre-critical, were all the fitter to minister to Shakespeare.

The lyric impulse was fledged anew at the court of Henry VIII. The short lines and harping burdens of Sir Thomas Wyatt's songs show the revival, not only of a lover's poetry more plangent than anything in English since Chaucer, but also of the long-deadened sense of metre.

In Wyatt's sonnets, octaves, terzines and other Italian measures, we can watch the painful triumphant struggles of this noble old master out of the slough of formlessness in which verse had been left by Skelton. Wyatt's primary deed was his gradual rediscovery of the iambic decasyllabic line dully accented—the line that had been first discovered by Chaucer for England; and next came its building into sonnet and stanza. Wyatt (d. 1542) ended with perfect formal accuracy; he has the honours of victory; and Henry Howard, earl of Surrey (d. 1547), a younger-hearted and more gracious but a lighter poet, carried on his labour, and caught some of Chaucer's <i>art de vers</i> and Italian tunes. The lustre of his sonnets varied like Ateneus, like all that written previous to Peele, gave little inkling of the latencies of the measure which was to become the cardinal one of English poetry. It was already the vogue in Italy for translations from the classics; and we may think of Surrey importing it like an uncult jewel and barely conscious of its value. His original poems, like those of Wyatt, waited for print till the eve of Elizabeth's reign, when they appeared, with those of followers like Grimauld, in <i>Tottel's Miscellany</i> (1557), the first of many such garlands, and the outward proof of the poetical revival dating twenty years earlier. But this was a false dawn. Only one poem of authentic power, Sackville's <i>Induction</i> (1563) to that dreary patriotic venture, <i>A Mirror for Magistrates</i>, was published for twenty years. In spirit medieval, this picture of the gates of hell and of the kings in bale achieves a new melody and a new intensity, and makes the coming of Spenser far less incredible. But poetry was long starved by the very ideal that nursed it—that of the all-sided, all-accomplished "courtier" or cavalier, to whom verse-making was but one of all the accomplishments that he must perfect, like fencing, or courting, or equestrian skill. Wyatt and Surrey, Sackville and Sidney (and we may add Hamlet, a true Elizabethan) are of this type.

One of the first competent professional writers was George Gascoigne, whose remarks on merit, and whose blank verse satire, <i>The Steel Glass</i> (1576), save the years between Sackville and Spenser. Otherwise the gap is filled by painful rhymerst with rare flashes, such as Googe, Churchyard and Tubberville.

The English Renaissance drama, both comic and tragic, illustrates on the largest scale the characteristic power of the antique at this period—at first to reproduce itself in imitation, and then to generate something utterly different from itself, something that throws the antique to the winds. Out of the Morality, a sermon upon the certainty of the future, theComing of the Truth, of the personified qualities and supernatural creatures, had grown up, in the reign of Henry VII., the <i>Interlude</i>, a dialogue spoken by representative types or trades, who faintly recalled those in Chaucer's <i>Prologue</i>. These forms, which may be termed medieval, continued long and blended; sometimes heated, as in <i>Restpublica</i>, with doctrine, and usually lightened by the comic play of a "Vice" or incarnation of sinister ruggery. John Heywood was the chief maker of the pure interludes, and Bishop Bale of the Protestant medleys; his <i>King Johan</i>, a reformer's partisan tract in verse, contains the germs of the chronicle play. In the drama down to 1580 the native talent is sparse enough, but the historical interest is high. Out of a seeming welter of forms, the structure, the metres and the species that Kyd and Marlowe found slowly emerged. Comedy was first delivered from the interlude, and fashioned in essence as we know it, by the schoolmasters. Drawing on Plautus, they constructed duly-knitted plots, divided into acts and scenes and full of homely native fun, for their pupils to present. In <i>Thersites</i> (written 1537), the oldest of these pieces, and in Udall's <i>Ralph Roister Doister</i> (1552 at latest), the best known of them, the characters are lively, and indeed are almost individuals. In others, like <i>Misogonus</i> (written 1560), the abstract element and improving purpose remain, and the source is partly neo-Latin comedy, native or foreign. Romance crept in: serious comedy, with its brilliant future, the comedy of high sentiment and averted dangers mingled still with farce, was shadowed forth in <i>Damon and Pithias</i> and in the curious play <i>Common Conditions</i>; while the domestic comedy of intrigue dawned in Gascoigne's <i>Supposes</i>, adapted from Ariosto. Thus were dispersed the ranker rustic fun of <i>Commer Curton's Needle</i> (written c. 1559) and other labours of "rhyming mothers." But there was no style, no talk, no satisfactory metre. The verse of comedy waited for Greene, and its prose for Lyly. Structure, without style, was also the main achievement of the early tragedies. The Latin plays of Buchanan, sometimes biblical in topic, rest, as to their form, upon Euripides. But early English tragedy was shapen after the Senecan plays of Italy and after Seneca himself, all of whose dramas were translated by Udall and Talliessin. Thus of his own plays, written by Sackville and Norton, and Hughes' <i>Misfortunes of Arthur</i> (acted 1588), are not so much plays as wraths of plays, with their chain of slauters and revenges, their two-dimensional personages, and their lifeless maxims which fail to sweeten the bloodshot atmosphere. The Senecan form was not barren in itself, as its sequel in France was to show: it was only barren for England. After Marlowe it was driven to the study, and was
still written (possibly under the impulse of Mary countess of Pembroke), by Daniel and Greville, with much reminiscence of the French Senecans. But it left its trail on the real drama. It set the pattern of a high tragic action, often motived by revenge, played by large ideas of fate and retribution, and dealt in blank metre; and it bequeathed, besides many moral sentences, such minor points of mechanism as the Ghost, the Chorus and the inserted play. There were many hybrid forms like Gismond of Salern, based on foreign story, alloyed with the mere personifications of the Morality, and yet contriving, as in the case of Promos and Cassandra (the foundation of Measure for Measure), to interest Shakespeare. Thus the drama by 1580 had some of its carpentry, though not yet a true style or versioning. These were only to be won by escape from the classic tutelage. The ruder chronicle play also began, and the reigns of James I and Charles I, with bad and good. These intertwine often and make the mirror, of which many are lost; and he became the chief non-dramatic poet of his time and country. Both the plaintive pessimism of Petrarch and du Bellay, with their favourite method of emblem, and the Platonic theory of the spiritual love and its heavenly begetting sank into him; and the Hymns To Love and To Beauty are possibly his earliest verses of sustained perfection and exaltation. These two strains of feeling Spenser never lost and never harmonized; the first of them recurs in his Complaints of 1591, above all in The Ruins of Time, the second in his Amoretti (1595), and Colin Clout and Epithalamion, which are autobiographical. These and a hundred other threads are woven into The Faerie Queene, an unfinished allegorical epic in honour of moral goodness, of which three books came out in 1590 and three more in 1596, while the fragment Of Constancy (so-called) is first found in the posthumous folio of 1609. This poem is the fullest reflex, outside the drama, of the soul and aspirations of the time. For its scenery and mechanism the Orlando Furioso of Ariosto furnishes the framework. In both poems tales of knightly adventure intertwine unconfused; in both the slaying of monsters, the capture of strong places, and the release of the innocent, hindered by wizard andовары, and aided by magic sword that is a star and mirror, constitute the quest; and in both warriors, ladies, dwarfs, dragons and figures from old mythology jostle dreamily together. To all this pomp Spenser strove to give a moral and often a political meaning. Ariosto was not a sabel, and so Spenser took Tasso's theme of the holy war waged for the Sepulchre, and expanded it into a war between good and evil, as he saw them in the world: between chastity and lust, loyalty and detraction, England and Spain, England and Rome, Elizabeth and usurpers, Irish governor and Irish rebel, right and wrong. The virtues of his six extant books he affects to take from Aristotle; but Holiness, Temperance, Chastity, Justice, Friendship and Courtesy form a medley of medieval, puritanical and Greek ideals.

Spenser's moral sentiments, often ethereally noble, might well be contrasted, and that not always to their credit, with those more secular and naturalistic ones that rule in Shakespeare or in Bernardino Telesio and Giordano Bruno. But The Faerie Queene lives by its poetry; and its poetry lives independently of its creed. The idealized figures of Elizabeth, who is the Faerie Queene, and of the "magnificent" Prince Arthur, fail to bind the adventures together, and after two books the poem breaks down in structure. And indeed all through it relies on episode and pageant, on its prevailing and insuppressible loveliness of scene and tint, of phrasing and of melody, beside which the inner meaning is often an interruption. Spenser is not to be tired; in and out of his tapestry, with its "glooming light much like a shade," pace his figures on horseback, or in durance, with their clear and pictorial allegoric trappings; and they go either singly, or in his favourite masques or pageants, suggested by emblematical painting or civic procession. He is often duly praised for his lingering and liquid melodies and his gracious images, or blamed for their langour; but his ground-tone is a sombre melancholy—unlike that of Jaques—and his deepest quality as a writer is perhaps his angry power. Few of his forty and more thousand lines are unpoetical; in certainty of style, amongst English poets who have written profusely, he has no equals but Chaucer, Milton and Shelley. His "artificial" "diction, drawn..." middle thoughts, from dialect and from false analogy, has always the intention and nearly always the effect of beauty; we soon feel that its absence would be unnatural, and it has taken its rank among the habitual and exquisite implements of English poetry. This equality of noble form is Spenser's strength, as dilution and diffusion of phrase, and a certain monotonous slowness of tempo, are beyond doubt his weaknesses. His chief technical invention, the nine-line stanza (ababbcdece) was developed not from the Italian octave (abababc), but by adding an alexandrine to the eight-line stave (ababbece) of Chaucer's Monk's Tale. It is naturally articulated twice—at the fifth line, where the turn of repeated rhyme inevitably charms, and at the ninth, which runs now to a climaxing dash, now to a pause and sighing close. In rhyming, Spenser, if not always accurate, is one of the most natural and resourceful of poets. His power over the heroic couplet or quatrain is shown in his fable, Mother Hubbard's Tale, and in his curious verse memoir, Colin Clout; both of which are medleys of satire and flattery. With formal tasks so various and so hard, it is wonderful how effortlessly the style of Spenser remains. His Musieipomos is the lightest-handed of mock-heroes. No writer of his day except Marlowe was so faithful to the law of beauty.

The mantle of Spenser fell, somewhat in shreds, upon poets of many schools until the Restoration. As though in thanks to his master Tasso, he lent to Edward Fairfax, the best translator of the Jerusalem Delivered (Godfrey of Bulloigne, 1600), some of his own ease and intricate melody. Harington, the witty translator of Ariosto (1591) and spoilt child of the court, owed less to Spenser. The allegorical colouring was nobly caught, if sometimes barbarized, in the Christ's Victory and Triumph of the younger Giles Fletcher (1610), and Spenser's emblematic style was strained, even cracked, by Thineas Fletcher in The Purple Island (1633), an aspiring fable, gorgeous in places, of the human body and afterlife. Both of the thoughts, from dialect and from false analogy, but they form a link between Spenser and their student Milton. The allegoric form, long-winded and broken-backed, survived late in Henry More's and Joseph Beaumont's verse disquisitions on the soul. Spenser's pastoral and allusive manner was allowed by Dryden in his Shepherd's Garland (1693), and differently by William Browne in Britannia's Pastorals (1613-1616), and by William Basse; while his more honeyed descriptions took on a mawkish taste in the anonymous Brittain's Ida and similar poems. His golden Platonic style was buoyantly echoed in Orchestra (1696), Sir John Davies' poem on the dancing spheres. He is continually traceable in 17th-century verse, blending with the alien currents of Ben Jonson and of Donne. He was edited and imitated in the age of Thomson, in the age of William Morris, and constantly between.

The typical Elizabethan poet is Michael Drayton; who followed Spenser in pastoral, Daniel, Sidney, Spenser and Shakespeare in sonnet, Daniel again in chronicle and legend, and Marlowe in mythological story, and who yet remained himself. His Endimion and Phoebe in passages stands near Hero and Leander; his England's Heroical Epistles (1597) are in ringing rhetorical couplets; his Odes (1606), like the Ballad of Agincourt and the
Virginian Voyage, forestall and equal Cowper’s or Campbell’s; his 
_Nymphidia_ (1627) was the most popular of burlesque fairy 
poems; and his pastorals are full ofgraces and felicities. 
The work of Drayton that least read and most often mentioned is 
_Boly-Olbion_ (1612–1622), a vast and pious effort, now and 
then nobly repaid, to versify the legend, scene, custom and 
particularities of every English county. The more recluse and 
pensive habit of Samuel Daniel chills his long chronicle poems; but 
with Chapman he is the clearest voice of Stoicism in Eliza-
beth’s letters; and his harmonious nature is perfectly expressed 
in a style of happy, even excellence, free alike from “fine madness” 
and from strain. Sonnet and epistle are his favoured 
forms, and in his _Musophilus_ (1590) as well as in his admirable 
prose _Defence of Rhyme_ (1602), he truly prophesies the hopes 
and glories of that _illustre vulgare_, the literary speech of England.
All this patriotic and historic verse, like the earlier and ruder 
_Albion’s England_ (1586) of William Warner, or Fitzgeoffrey’s 
poem upon Drake, or the outbursts of Spenser, was written during 
or inspired by the last twenty years of the queen’s reign; and 
the same is true of Shakespeare’s and most of the other history 
plays, which duly eclipsed the formal, rusty-gray chronicle poem 
of the type of the _Mirror for Magistrates_, though editions (1550– 
1610) of the latter were long repeated. This patriotic verse 
of the time, though full of zeal, started at a disadvantage 
compared with love-sonnet, song, or mythic narrative, because it 
had no models before it in other lands, and remained therefore 
the more shapeless.

The English love-sonnet, brought in by Wyatt and rife 
between 1590 and 1600, was revived as a purely studious imitation 
by Watson in his _Hekatompathia_ (1582), a string of 
translations in one of the exceptional measures that 
were freely entitled “sonnets.” But from the first, in the hands 
of Sidney, whose _Astrophel and Stella_ (1591) was written, as 
remarked above, about 1581, the sonnet was ever ready to 
pulse into feeling, and to flash into unborrowed beauty, embodying 
sometimes dramatic fancy and often living experience. These 
three fibres of imitation, inspiration, and imagination were 
interwoven beyond severance in many of the cycles, and now one, 
now another is uppermost. Incautious might read a personal 
diary into Thomas Lodge’s _Philis_ (1593), which is often a 
translation from Ronsard. Literal judges have announced that 
Shakespeare’s _Sonnets_ are but his mode of taking exercise. 
But there is poetry in “God’s plenty” almost everywhere; and 
 exceedingly few of the series fail of lovely lines or phrasing or even of perfect 
sonnets. This holds of Henry Constable’s _Diana_ (1592), of the 
_Partheneophyl_ and _Partheneophone_ of Barne Barnes (1593), inebriate 
with poetry, and of the stray minor groups, _Alcina, Licia, Caedia_; 
while the _Caedia_ of Fulke Greville, Lord Brooke, in irregular 
form, is full of metaphorical passion struggling to be delivered. 
_Astrophi and Stella_, Drayton’s _Idea_ (1594–1610), Spenser’s _Amoretti_ 
and Shakespeare’s _Sonnets_ (printed 1609) are addressed 
to definite and probably to known persons, and are charged with 
true poetic rage, ecstatic or plaintive, desperate or solemn, if they 
are also intermingled with the mere word-play that mocks or 
beguiles the ebb of feeling, or with the purely plastic work that is 
done for solace. In most of these series, as in Daniel’s paler but 
exquisitely-wrought _Deila_ (1591–1592), the form is that of the 
three separate quatrains with the closing couplet for emotional and 
melodic climax; a scheme slowly but deftly evolved, through 
traceable gradations, from that stricter one of Italy, 
which Drummond and Milton revived, and where the crisis 
properly coincides with the change from octave to sestet.

The amorous mythologic tale in verse derives immediately 
from contemporary Italy, and in the beginning from Ovid, 
whose _Metamorphoses_, familiar in Golding’s old version 
(1555–1557), furnished descriptions, decorations and 
many tales, while his _Heroides_ gave Chaucer and 
Boccaccio a model for the self-anatomy of tragic or 
plaintive sentiment. Within ten years, between 1588 and 1598, during 
the early sonnet-vogue, appeared Lodge’s _Scillices Metamorphis_, 
Shakespeare’s _Venus and Adonis_ and _Rape of Lucrece_, Marlowe’s 
_Heo and Leader_ and Drayton’s _Endimion_ and _Phœbe_. Shake-
speare owed something to Lodge, and Drayton to Marlowe.
All these poems describe a love-situation at length, and save 
in one instance they describe it from without. The exception is 
Marlowe, who achieves a more than Sicilian perfection; he 
says everything, and is equal to everything that he has to say. In 
_Venus and Adonis_ the poet is enamoured less of love than of the 
tones and poses of lovers and of the beauty and gallant motion 
of animals, while in _The Rape of Lucrece_ he is intent on the 
gradients of lust, shame and indignation, in which he has a 
spectator’s interest. Virtuosity, or the delight of the executant in 
his own brilliant cunning, is the mark of most of these pieces.

If we go to the lyrics, the versified mythic tales and the 
sonnets of Elizabethan times for the kind of feeling that Molière’s 
Alcestes loved and that Burns and Shelley poured into 
song, we shall often come away disappointed, and 
think the old poetry heartless. But it is not heartless, any more than 
it is always impassioned or personal; it is decorative. The 
feeling is often that of the craftsman; it is not of the singer 
who spends his vital essence in song and commands an answering 
thrill so long as his native language is alive or understood.
The arts that deal with ivories or enamelling or silver suggest 
themselves while we watch the delighted titling and chasing, 
the sense for gesture and grouping (in _Venus and Adonis_), or the 
three fibres of imitation, inspiration, and imagination, 
whether of a single motive, or two contrasted motives, within the panel 
of the sonnet. And soon it is evident how passion and emotion 
readily become plastic matter too, whether they be drawn from 
books or observation or self-scrutiny. This is above all 
the case in the sonnet; but it is found in the lyric as well. 
The result is a wonderful fertility of lyrical pattern, a wonderfully 
diffused power of lyrical execution, never to recur at any later 
time of English literature. Wyatt had to recover the very form of 
such verse from oblivion, and this he did in the school of translation 
and adaptation. Not only the decasyllabic, but the lyric, 
in short lines had almost died out of memory, and Wyatt brought 
it back. From his day to Spenser’s there is not much lyric 
that should be read in our time. Yet the impulse is seen. 
The introduction of Italian music, with its favourite 
metrical schemes, such as the madrigal, powerfully schooled and 
coloured lyric: in especial, the caressing double ending, regular 
in Italian but heavier in English, became common. The Italian 
poems were often translated in their own measure, line by line, 
and the musical setting retained. Their tunes, or other tunes, 
were then coupled with new and original poems; and both appeared 
together in the song-books of Dowland the lutanist, of Jones and Byrd (1588), and in chief (1601–1610) of Thomas 
Campion. The words of Campion’s songs are not only supremely 
musical in the wider sense, but are chosen for their singing 
quality. Misled awhile by the heresy that rhyme was wrong, 
he was yet a master of lovely rhyming, as well as of a lyrical style 
of great range, gaily or gravely happy. But, as with most of 
his fellows, singing is rather his calling than his consolation. 
The lyrics that are sprinkled in plays and romances are the finest 
of this period, and perhaps, in their kind, of any period. Shake-
speare is the greatest in this province also; but the power of 
infallible and unforgettable song is often granted to slighter, 
gentler playwrights like Greene and Dekker, while it is denied to 
men of weightier builder and sterner purpose like Chapman and 
Jonson. The songs of Jonson are indeed at their best of absolute 
and antique finish; but the irrevocable dew of night or dawn 
seldom lies upon them as it lies on the songs of Webster or of 
Fletcher. The best lyrics in the plays are dramatic; they must 
be read in their own setting. While the action stops, they seize 
and daily with the dominant emotion of the scene, and yet relieve it. 
The songs of Lodge and Breton, of Drayton and Daniel, 
of Oxford and Raleigh, and the fervid brief flights of the Jesuit 
Southwell, show the omnipresence of the vital gift, whether 
among professional writers of the journalistic type, or among 
poets whose gift was not primarily song, or among men of action 
and quality or men of religion, who only wrote when they 
were stirred. Lullaby and valentine and compliment, and love-
plaint ranging from gallantry to desperation, are all there;
and the Fortunate Hour, which visits commonly only a few men in a generation, and those but now and then in their lives, is never far off. But the master of melody, Spenser, left no songs, apart from his two insuperable wedding odes. And religious lyric is rarer than the reign of James. Much of the best lyric is saved for us by the various Miscellanies, A Handful of Pleasant Delights (1584), the Phoenix Nest (1593) and Davison’s Poetical Rhapsody (1602); while other such collections, like England’s Helicon (1600), were chiefly garlands of verse that was already in print.

There is plenty of satiric anger and raillery in the spirit of the time, but the most genuine part of it is drawn off into drama. Except for stray passages in Spenser, Drayton and others, formal satire, though profuse, was a literary unreal thing, a pose in the manner of Persius or Juvenal, and tiresome in expression. In this and only Donne’s tracts, the attempts of Lodge and Hall and Marston and John Davies of Hereford and Guiprin and Wither are for the most part simply weariful in different ways, and satire waited for Dryden and his age. The attempt, however, persisted throughout. Wyatt was the first and last who succeeded in the genial, natural Horatian style.

Verse from Donne to Milton.—As the age of Elizabeth receded, some changes came slowly over non-lyrical verse. In Jonson, as in John Donne (1573–1631), one of the greater poets of the nation, and in many writers after Donne, may be traced a kind of Counter-Renaissance, or revulsion against the natural man and his claims to pleasure—a revulsion from which regret for pleasure lost is seldom far. Poetry becomes more ascetic and mystical, and this feeling takes shelter alike in the Anglican and in the Roman faith. George Herbert (The Temple, 1633), the most popular, quaint and pious of the school, but the least poetical; Crashaw, with his one ecstatic vision (The Flaming Heart) and occasional golden stanzas; Henry Vaughan, who wrote from 1646 to 1678, with his mystical landscape and magical cadences; and Thomas Traherne, his fellow-dreamer, are the best known of the religious Fantastics. But, earlier than most of these are Lord Herbert of Cherbury, and Hahington with his Castora (1634), who show the same temper, if a fitful power and felicity. Such writers form the devout section of the famous “metaphysical” or “fantastic” school, which includes, besides Donne his founder, pure amorists like Carew (whose touch on certain rhythms has no fellow), young academic followers like Cartwright and Cleveland (in whom survives the vein of satire that also marks the school), and Abraham Cowley, who wrote from 1633 to 1678, and was perhaps the most acceptable living poet of the middle of the century. In his Life of Cowley Johnson tramples on the “metaphysical” poets and their vices, and he is generally right in detail. The jolliness of cold quaintness, which every one of them continues to administer, is fatal. He only ordered in ignoring all their virtues and all their historical importance.

In Donne poetry became deeply intellectualized, and in temper suggestive and introspective. The poet’s emotion is played with in a cat-and-mouse fashion, and he torments it subtly. Donne’s passion is so real, if so unheard-of, and his brain so finely-dividing, that he can make almost any image, even the remotest, even the commonest, poetical. His satires, his Valentine, his Libanus, and his lyric or odic pieces in general, have an insolent and sudden daring which is warranted by deep-set power and is only equaled by a few of those tragedians who are his nearest of kin. The recurring contrast of “wit” or intelligence, and “will” or desire, their struggle, their mutual illumination, their fusion as into some third and undiscovered element of human nature, are but one idiosyncrasy of Donne’s intricate soul, whose general progress, so far as his dateless poems permit of its discovery, seems to have been from a paganism that is unashamed but crossed with gusts of compunction, to a mystical and otherworldly temper alloyed with covetous regrets. The Anatomy of the World and other ambitious pieces have the same quality amid their outrageous strangeness. In Donne and his successors the merely ingenious and ransacking intellect often came to overbalance truth and passion; and hence arose conceits and abstract verbiage, and the difficulty of finding a perfect poem, however brief, despite the omnipresence of the poetical gift. The “fantastic” school, if it contains some of the rarest sallies and passages in English, is one of the least satisfactory. Reason very largely, it may be, has exaggerated those of Sidney, Greville and Shakespeare, who often misused homesly or technical metaphors; and English verse shared, by coincidence not by borrowing, and with variations of its own, in the general strain and tortoise of style that was besetting so many poets of the Latin countries. Yet these poets well earn the name of metaphysical, not for their philosophic phrasing, but for the shuttle-flight of their fancy to and fro between the things of earth and the realties of spirit that lie beyond the screen of the flesh.

Between Spenser and Milton many measures of lyrical and other poetry were modified. Donne’s frequent use of roughly the same tuneless lines is unexplained and was not often followed. Rhythm in general came to be studied more for its own sake, and the study was rewarded. The lovely musical peace of Carew’s amorous iambics, or of Wither’s trochees, or of Crashaw’s odes, or of Marvell’s octosyllables, has never been regained. The formal ode set in, sometimes regularly “Pindaric” in strophe-grouping, sometimes irregularly “Pindaric” as in Cowley’s works. Above all, the heroic couplet, of the isolated, balanced, rhetorical order, such as Spenser, Drayton, Fairfax and Sylvester, the translator (1590–1666) of Du Bartas, had often used, began to be a regular instrument of verse, and that for special purposes which soon became lastingly associated with it. The victories of Edmund Waller and the Ovidian translations of Sandy’s dispute the priority for smoothness and finish, though the fame was Waller’s for two generations; but Denham’s overestimated Cooper’s Hill (1642), Cowley’s Davideis (1656), and even Ogilby’s Aeneid made the path plainer for Dryden, the first sovereign of the rhetorical couplet which4 threw as blank verse declined. Sonnet and madrigal were the favoured measures of William Drummond of Hawthorned, a real and exquisite poet of the studio, who shows the general drift of verse towards sequestered and religious feeling. Drummond’s Poems of 1616 and Flowers of Zon (1632) are full of Petrack and Plato as well as of Christian resignation, and he kept alive the artistry of phrasing and versification in a tight of indiscipline and conflicting forms. William Browne has been named as a Spenserian, but his Britannia’s Pastoral (1613–1616), with their slowly-rippling and overflowing couplets which influenced Keats, were a medley of a novel kind. George Wither may equally rank among the lighter followers of Spenser, the easy masters of lyrical narrative, and the devotional poets. But his Shepherd’s Hunting and other pieces in his volume of 1622 contain lovely landscapes, partly English and partly artificial, and stand far above his pious works, and still further above the few rare satires which he lived to continue after the Restoration.

Of poets yet unmentioned, Robert Herrick is the chief, with his two thousand lyrics and epigrams, gathered in Hesperides and Noble Numbers (1648). His power of song and sureness of cadence are not excelled within his range of topic, which includes flowers and maidens—who he treats as creatures of the same race—and the swift decay of both their beauties, and secular regret over this decay and his own mortality and the transience of amorous pleasure, and the virtues of his friends, and country sports and lore, and religious composition for his own paganism. The Hesperides are pure Renaissance work, in natural sympathy with the Roman elegiac writings and with the Pseudo-Argenean. Cowley is best where he is nearest Herrick, and his posy of short lyrics outlives his “epic and Pindaric art.” There are many writers who last by virtue of one or two poems; Suckling by his adept playfulness, Love lace and Montrose by a few gallant stanzas, and many a nameless poet by many a consummate cadence. It is the age of sudden flights and brief perfection. All the farther out of reach, yet never wholly despaired of or attempted in England, was the “long poem,” heroic and noble, the “phantom epic,” that shadow of the ancient masterpieces.
had driven to life in Italy and France. Davenant's
Gondibert (1651), Cowley's D'Ovidet and Chamberlayne’s Phaen-
nida (1659) attest the effort which Milton in 1658 resumed with
triumph. These works have between them all the vices possible
to epic verse, dulness and flatness, faintness and quaintness and
incoherence. But there is some poetry in each of them, and in
Phaenida there is far more than enough poetry to save it.

Few writers have found a bawdy style of their own so early
in life as John Milton (1608-1674). His youthful pieces show
some signs of Spenser and the Caroline fantastics;
but soon his vast poetical reading ran clear and lay at
the service of his talent. His vision and phrasing of natural
things were already original in the Nativity Ode, written when he
was twenty; and, there also, his versification was already that
of a master, of a renovator. The pensive and figured beauty of
L’Allegro and Il Penseroso, two contrasted emblematic panels,
the high innocent Platonism and golden blank verse of the
Comus (1634); the birth of long-sleeping power in the Lycidas
(1637), with its unapproached contrivance both in evolution
and detail, where the precious essences of earlier myth and
pastoral seem to be distilled for an offering in honour of the
tongue of the new man; the virility and mannerliness of it
all amid the current schools! The historian finds in these
poems, with their echoes of Plato and Sannazzaro, of Geoffrey
of Monmouth and St John, the richest and most perfect instance
of the studious, decorative Renaissance style, and is not surprised
to find Milton’s scholars a century later in the age of Gray.
The critic, while feeling that the strictly lyrical, spontaneous
element is absent, is all the more baffled by the skill and enduring
charm. The sonnets were written before or during Milton’s
long immersions (1637-1658) in prose and warfare, and show the
same gifts. They are not cast in the traditional form of love-
cycle, but are occasional poems; in metre they revert, not always
strictly but once or twice in full perfection, to the Italian scheme;
and Paradise Lost as such a play, with the spiritual elegies or patriotic
exaltations of Dante or Guidiccioni.

Milton also had a medieval side to his brain, as the History
of Britain shows. The heroic theme, which he had resolved from
his youth up to celebrate, at last, after many hesitations, proved
to be the fall of man. This, for one of his creed and for the
audience he desired, was the greatest theme of all. Its scene
was the Ptolemaic universe with the Christian heaven and hell
inserted. The time, indicated by retrospect and prophecy,
was the whole of that portion of eternity, from the creation of
Christ to the doomsday, of which the history was sacredly
revealed. The subject and the general span of the action went
back to the popular mystery play, and Milton at first planned
out his time in three acts. Paradise Regained as such a play, with certain elements of classic
tragedy embodied. But according to the current theory the epic,
not the drama, was the noblest form of verse; and, feeling
where his power lay, he adopted the epic. The subject, therefore,
was partly medieval, partly Protestant,—for Milton was a true
Protestant in having a variant of doctrine shared by no other
mortal. But the ordering and presentment, with their alteration,
their interpolated episodes or narratives, their journeys between
Olympus, Earth and hell, invocations, set similes, battles and
divine thunderbolts, are those of the classical epic. Had Milton
shared the free thought as well as the scholarship of the Renais-
sance, the poem could never have existed. With all his range
of soul and skill, he had a narrower speculative brain than any
poet of equal gift; and this was well for his great and peculiar
work. But whatever Milton may fail to be, his heroic writing
is the permanent and absolute expression of something that in
the English stock is inveterate—the Promethean self-possession
of the mind in defeat, its right to solitude there, its claim to
judge and deny the victor. This is the spirit of his devils, beside
whom his divinities, his unfallen angels (Abdiel excepted), and
even his human couple with their radiance and beauty of line,
all seem shadowy. The discord between Milton’s doctrine and
his sympathies in Paradise Lost (1667) has never escaped notice.
The discord between his doctrine and his culture comes out
in Paradise Regained (1671), when he has at once to reproduce
and glorify Athens, the “mother of arts.” In this afterthought
the earlier epic the action is slight, the Enemy has lost spirit,
and the Christ is something of a pedagogue. But there is a new
charm in its even, grey desert tint, sprinkled with illuminations
of gold and luxury. In Samson Agonistes (1671) the ethical
emotion of the machine is Sophoclean, and the theo-
logy not wholly Christian. But the fault of Samson is forgotten
in his suffering, which is Milton’s own; and thus a cross-current
of sympathy is set up, which may not be much in keeping with
the story, but revives the somewhat exhausted interest and
heightens a few passages into a bare and inaccessible grandeur.

The essential solutio of Milton’s energies is best seen in his
later style and versification. When he resumed poetry about
1658, he had nothing around him to help him as an artist in
heroic language. The most recent memories of the drama
were also the worst; the forms of Cowley and Davenant, the
would-be epic poets, were impossible. Spenser’s manner was
too even and fluid as a rule for such a purpose, and his power
was of an alien kind. Thus Milton went back, doubtless full
of Greek and Latin memories, to Marlowe, Shakespeare and others
among the greater dramatists (including John Ford); and their
traditional elements, their brawny, their grace, their authority
of language, and their ability to find the appropriate
rhythm for words, Milton could and did adopt; and, for soliloquy
and choric speech of a might unapproachable since Dante.
To these calls his blank verse responds at every
point. It is the seal of Milton’s artistry, as of his self-confidence,
for it greatly extends, for the epical purpose, all the known
powers and liberties of the metre; and yet, as has often been
shown, it does so not spasmodically but within fixed technical
laws or rather habits. Latterly, the underlying metrical ictus is
at times hard to detect. But Milton remains by far the surest
and greatest instrumentalist, outside the drama, on the English
unrhymed line. He would, however, have scorned to be judged
on his form alone. His soul and temper are not merely
articulate in metre. Their historic and representative character
ensure attention, so long as the oppositions of soul and temper
in the England of Milton’s time remain, as they still are, the
deepest in the national life. He is sometimes said to harmonize
the Renaissance and the Puritan spirit; but he does not do this,
for nothing can do it. The Puritan spirit is the deep thing in
Milton; all his culture only gives immortal form to its expression.
The critics have instinctively felt that this is true; and that
is why their political and religious prepossessions have nearly
always coloured, and perhaps must colour, every judgment
passed upon him. Not otherwise can he be taken seriously,
until historians are without public passions and convictions,
or the strife between the hierarchy and the Protestant is quenched
in English civilization.

Drama, 1580-1642.—We must now go back to the drama,
which lies behind Milton, and is the most individual product of
all English Literature. The nascent drama of genius
can be found in the "University Wits," who flour-
ished between 1580 and 1595, and the chief of whom are Lyly,
Kyd, Peele, Greene and Marlowe. John Lyly is the first practi-
tioner in prose—of shapely comic plot and pointed talk—the
artificial but actual talk of courtly masques who rally one
another with a bright and barren finish that is second nature.
Campaspe, Sapho and Phao, Mids, and Lyly’s other comedies,
mostly written from 1580 to 1591, are frail vessels, often filled
with compliment, mythological allegory, or topical satire, and

ENGLISH LITERATURE

ELIZABETHAN AGE
enamelled with pastoral interlude and flower-like song. The work of Thomas Kyd, especially *The Spanish Tragedy* (written c. 1583), was the most violent effort to put new wine into the old Senecan bottles, and he probably wrote the lost pre-Shakespearean *Richard II*. He translated to the later drama the subject of pious but ruinous revenge, which is used by Chapman, Marston, Webster and many others; and his chief play was translated and long acted in Germany. Kyd's want of modulation is complete, but he commands a substantial skill of dramatic mechanism, and he has more than the feeling for power, just as Peele and Greene have more than the feeling for luxury or grace. To the expression of luxury Peele's often stately blank verse is well fitted, and it is by far the most correct and musical before Marlowe's, as his *Arms and the Man* (1584) and his *David and Bathsheba* attest. Greene did something to create the blank verse of gentle gloom and intense artistic exposition. If Marlowe in his *Friar Bacon and Friar Bungay* (1594). Otherwise these writers, with Nashe and Lodge, fall into the wake of Marlowe. *Tamburlaine*, in two parts (part i. c. 1587), *The Life and Death of Doctor Faustus*, *The Jew of Malta*, *Edward II.* (the first chronicle play of genius), and the incomplete poem *Edward III.* *Here and Leander* are Christopher Marlowe's title-deeds (1584–1593). He established tragedy, and inspired its master, and created for it an adequate diction and versification. His command of vibrant and heroic recitative should not obscure his power, in his greater passages, describing the descent of Helen, the passing of Mortimer, the unfeeling Hero and Leander, to attain a kind of Greek transparency and perfection. The thirst for ideal beauty, for endless empire, and for prohibited knowledge, no poet has better expressed, and in this respect Giordano Bruno is nearest in his own time. This thirst is his own; his great cartoon-figures, gigantic rather than heroic, proclaim it for him: their type recurs through the drama, from Richard III. to Dryden's oriental heroes; but in *Faustus* and in *Edward II.* they become real, almost human beings. His constructive gift is less developed in proportion, though Goethe praised the planning-out of *Faustus*. The glory and influence of Marlowe on the side of form rest largely on his meteoric blank lines, which are varied not a little, and nobly harmonized into periods, and resonant with names to the point of splendid extravagance; and their sound is heard in Milton, whom he taught how to express the grief and despair of demons dissatisfied with their kingdom. Shakespeare did not excel Marlowe in Marlowe's own excellences, though he humanized Marlowe's Jew, launched his own blank verse on the tide of Marlowe's oratory, and modulated, in *Richard II.* its matter of chronic tragedy.

As the middle ages receded, the known life of man upon this earth became of sovereign interest, and of this interest the dramas are the most effective confession. This is the voice of the impulse to explore, the plays of Shakespeare are the amnest freight brought home by any voyager. Shakespeare is not only the greatest but the earliest English dramatist who took humanity for his province. But this he did not do from the beginning. He was at first subdued to what he worked in; and though the dry pedantic tragedy was scattered and could not touch him, the grave and the impure though genuine force of Kyd do not seem at first to have repelled him; if, as is likely, he had a hand in *Titus Andronicus*. He probably served with Marlowe and Marlowe and the school of authors at various stages in the composition of the three chronic dramas finally entitled *Henry VI*.* But besides the high-superlative style that is common to them all, there runs through them the rhymed rhetoric with which Shakespeare dallied for some time, as well as the softer flute-notes and deeper undersong that foretell his later blank verse. In *Richard III.* though it is built on the scheme and charged with the style of Marlowe, Shakespeare first showed the intensity of his original power. But after a few years he swept out of Marlowe's orbit into his own vast and unreturning curve. In *King John* the lyrical, epic, satirical and pathetic chords are all present, if they are scarcely harmonized. Meanwhile, Lyly and Greene having displaced the uncouth comedy, Shakespeare learned all they had to teach, and shaped the comedy of poetic, chivalrous fancy and good-tempered high spirits, which showed him the way of escape from his own rhetoric, and enabled him to perfect his youthful noble and gentle blank verse. This reached its utmost fineness in *Richard II.*, and its full cordiality and beauty in the other plays that consummate this period—*A Midsummer Night's Dream*, *The Merchant of Venice*, and one romantic tragedy, *Romeo and Juliet*. Behind them lay the earlier and fainter romances, with their chivalry and gaiety, *The Comedy of Errors*, *Love's Labour's Lost* and *The Two Gentlemen of Verona*. Throughout these years blank verse contended with rhyme, which Shakespeare after a while abandoned save for special purposes, as though he had exhausted its honey. The Italian Renaissance is felt in the scenery and in the less free plots. *The Spanish Tragedy* thus passes in a city of the Southern type, with its absolute ruler, its fantastic by-laws on which the plot nominally turns, and its mixture of real life and marvel. The personages, at first fainter of feature and symmetrically paired, soon assume sharper outline: *Richard II.* and *Shylock*, Portia and Juliet, and Juliet's Nurse and Bottom are created. The *novella* has left the earth and taken wings: the spirit is now that of youth and fancy (or love brooding among the shallows) with interludes of "fierce exaction," or of tragedy, or of kindly farce. And there is a visionary element, felt in the musings of Theseus upon the nature of poetry and its place in the ages. Shakespeare's style is now, like the use made of fairy folklore, in the poetry of England.

Tragedy is absent in the succeeding histories (1597–1599), and the comedies of wit and romance (1599–1600), in which Shakespeare perfected his style for stately, pensive or boisterous themes. Falstaff, the most popular as he is the wittiest of all imaginable comic persons, dominates, as to their prose or lower world, the two parts of *Henry IV.* and its interlude or offshoot, *The Merry Wives of Windsor*. The play that celebrates Henry V. is less a drama than a pageant, diversified with mighty orations and cheerful humours, and filled with the love of Shakespeare for England. Here the most indigenous form of art invented by the English Renaissance reaches its climax. The Histories are peopled chiefly by men and warriors, of whom Hotspur, "dying in his excellence and flower," is perhaps more attractive than Henry of Agincourt. But in the "middle comedies," *As You Like It*, *Merry Wives of Windsor*, and *Twelfth Night*, the warriors are home at court, where women rule the scene and deserve to rule it; for their wit now gives the note; and Shakespeare's prose, the medium of their talk, has a finer grace and humour than ever before, euphuism lying well in subjection behind it.

Mankind and this world have never been so sharply sifted or so sharply contrasted. The lurid light, as in Shakespeare's tragedies, the energy which created them evades, like that of the sun, our estimate. But they were not out of relation to their time, the first few years of the reign of James, with its conspiracies, its Somerset and Overbury horrors, its enigmatic and sombre figures like Raleigh, and its revulsion from Elizabethan buoyancy. In the same decade were written the chief tragedies of Jonson, Chapman, Dekker, Marston, Tourneur; and *The White Devil*, and *A Yorkshire Tragedy*, and *The Maid's Tragedy*, and *A Woman Killed with Kindness*. But, in spite of Shakespeare's affinities with these authors at many points, *Hamlet*, *Macbeth*, * Lear*, *Othello*, with the three Roman plays (written at intervals and not together), and the two quasi-antique plays *Trovius and Cressida*, and *Timon of Athens*, form a body of drama apart from anything else in the world. They reveal a new tragic philosophy, a new poetical style, a new dramatic technique and a new world of characters. In one way above all Shakespeare stands apart; he not only appropriates the ancient pattern of heroism, of right living and right dying, revealed by North's Plutarch; others did this also; but the intellectual movement of the time, though by no means fully reflected, is reflected in his tragedies far more than elsewhere. The new and troubous thoughts on man and conduct
that were penetrating the general mind, the freedom and play of vision that Montaigne above all had stimulated, here find their fullest scope; and Florio's translation (1603) of Montaigne's Essays, coming out between the first and the second versions of Shakespeare's Hamlet, counted probably for more than any other book. The Sonnets (published 1609) are also full of far-wandering thoughts on truth and beauty and on good and evil. The story they reveal may be ranked with the situations of the stranger dramas like Troilus and Cressida or Measure for Measure. But whether or not it is a true story, and the Sonnets in the main a confession, they would be at the very worst a perfect dramatic record of a great poet's suffering and friendship.

Shakespeare's last period, that of his tragi-comedies, begins about 1608 with his contributions to Pericles, Prince of Tyre.

For unknown reasons he was moved, about the time of his retirement home, to record, as though in justice to the world, the happy turns by which tragic disaster is at times averted. Pericles, The Winter's Tale, Cymbeline, and The Tempest all move, after a series of crimes, calamities, or estrangements, to some final scene of enthralling beauty, where the lost are found and love is restored; as though after all the faint and desperate last partings-of Lear and Cordelia, of Hamlet and Horatio—which Shakespeare had imagined, he must make retrieval with the picture of young and happy creatures whose life renewes hope even in the experienced. To this end he chose the loose action and free atmosphere of the roman d'aventure, which had already been adapted by Beaumont and Fletcher, who may herein have furnished Shakespeare with novel and successful theatrical effects, and who certainly in turn studied his handwork. In The Tempest this tragi-comic scheme is fitted to the tales brought by explorers of far islands, wild men, strange gods and airy music. Even if it be true that in Prospero's words the poet says: But Duan per his magic, he was made a skilful landscape, the lines of the great verse essay of Henry VIII.; and not improbably also in The Two Noble Kinsmen. His share in two early pieces, Arden of Faversham (1592) and Edward III., has been begun, new established, and of many other dramas he was once idly accused.

Shakespeare's throne rests on the foundation of three equal and master faculties. One is that of expression and versification; the next is the invention and presentation of human character in action; the third is the theatrical faculty. The writing of Dante may seem to us more splendidly grand and perfect, when we remember Shakespeare's conceits, his experiments, his haste and impatience in his long wrestle with tragic language, his infractions of the stuff, his lack of the technical effects he had not to find words for hundreds of imaginary persons. Balzac, again, may have created and exhibited as many types of mankind, but except in soul he is not a poet. Shakespeare is a supreme if not infallible poet; his verse, often of an antique simplicity or of a rich, harmonious, romantic perfection, is at other times strained and shattered with what it tries to express, and attains beauty only through discord. He is also many persons in one; in his Sonnets he is even, it may be thought, himself. But he had furthermore to study a personality not of his own fancying—with something in it of Caliban, of Dogberry and of Cleopatra—that of the audience in a playhouse. He belongs distinctly to the poets like Jonson and Massinger who are true to their art as practical dramaticists, not to the poets like Chapman whose works chance to be in the form of plays. Shakespeare's mastery of this art is approved now by every nation. But apart from the skill that makes him eternally adaptable—the skill of raising, straining and relieving the suspense, and bringing it to such an ending as the theatre will tolerate—he played upon every chord in his own hearers. He frankly enlisted Jew-hatred, Pope-hatred and France-hatred; he flattered the queen, and celebrated the Union, and stormed the house with his fanfare over the national, soldier, Henry of Agincourt, and glorified England, as in Cymbeline, to the last. But in deeper ways he is the chief of playwrights. Unlike another master, Ibsen, he nearly always tells us, without emphasis, by the words and behaviour of his characters, which of them we are to love and hate, and when we are to love and when to hate those whom we can neither love nor hate wholly. Yet he is not to be bribed, and deals to his characters something of the same injustice or rough justice that is found in real life. His loyalty to life, as well as to the stage, puts the crown on his felicity and his fertility, and raises him to his solitude of dramatic greatness.

Shakespeare's method could not be imparted, and despite reverberations in Beaumont, Fletcher, Webster and others he never did it. Jonson, his nearest equal in vigour of brain, though not in his technical education, was the greatest of dramatic influences down to the shutting of the theatres in 1642, and his comedies found fresh disciples even after 1660. He had "the devouring eye and the portraying hand"; he could master and order the contents of a mighty or if somewhat burdensome memory into an organic drama, whether the matter lay in Roman historians or before his eyes in the London streets. He had an armouy of doctrine, drawn from the Poetics and Horace, which moulded his creative practice. This was also partly founded on a revulsion against the plays around him, with their loose build and moral improbabilities. But in spite of his photographic and constructive power, Jonson is not a poet. His verse is that of the satirist who thinks that his office is to improve mankind by derisively representing it. And he does this by beginning with the "humour," or abstract idiosyncrasy or quality, and clothing it with accurately minute costume and gesture, so that it may pass for a man; and indeed the result is as real as many a man, and in his best-tempered and youthful comedy, Every Man in his Humour (act ed 1598), it is very like life. In Jonson's monumental pieces, Volpone or the Fox (acted 1605) and The Alchemist (acted 1610), our laughter is arrested by the lowering and portentous atmosphere, or is loud and hard, startled by the enormous skill and energy displayed. Nor are the joy and relief of poetical comedy given for an instant by The Silent Woman, Bartholomew Fair (acted 1614), or The Staple of News, still less by topical plays like Cynthia's Revels, though their unfailing farce and rampant fun are less charged with contempt. The rude tragedies, Sejanus, act ed 1603 and Catiline, chiefly live by passages of high forensic power. Jonson's finer elegies, eulogies and lyrics, which are many, and his fragmentary Sad Shepherd, show that he also had a free and lovely talent, often smothered by doctrine and temper; and his verse, usually strong but full of knots and snags, becomes flowing and graciously finished. His prose is of the best, especially in his Discoveries, a series of ethical essays and critical maxims; its prevalently lucid style is aloof from rhetoric, suggesting those of Hobbes, and even, though less exact and clear, that of Dryden. The "sons" of Jonson, Randolph and Browne, Shadwell and Wilson, were heirs rather to his riot of "humours," his learned method and satiric aim, than to his larger style, his architectural power, or his relieving graces.

As a whole, the romantic drama (so to entitle the remaining bulk of plays down to 1642) is a vast stifled jungle, full of wild life and song, with strange growths and heady perfumes, with glades of sunshine and recesses of poisoned darkness; it is not a cleared forest, where single and splendid trees grow to shapely perfection. It has "poetry enough for anything"; passionate situations, and their eloquence; and a number, doubtless small considering its mass, of living and memorable personages. Moral keeping and constructive mastery are rarer still; and too seldom through a whole drama do we see human life and hear its voices, arranged and orchestrated by the artist. But it can be truly said in defence that while structure without poetry is void (as it tended at times to be in Ben Jonson), poetry without structure is still poetry, and that the romantic drama is like nothing else in this world for variety of accent and unexpectedness of beauty. We must read it through, as Charles Lamb did, to do it justice. The diffusion of its characteristic excellences is surprising. Of its extant plays it is hardly safe to leave unopened, if we are searching for whatsoever is lovely or admirable. The reasons for the lack of steadfast power and artistic conscience lay partly
in the conditions of the stage. Playwrights usually wrote rapidly for bread, and sold their rights. The performances of each play were few. There was no authors' copyright, and dramas were made to be seen and heard, not to be read. There was no articulate dramatic criticism, except such as we find casually in Shakespeare, and in the practice and theory of Jonson, who was deaf or hostile to some of the chief virtues of the romantic playwrights.

The wealth of dramatic production is so great that only a broad classification is here offered. George Chapman stands Chapman. apart, nearest to the greatest in high austerity of sentiment and in the gracious gravity of his romantic love-comedies. But the crude melodrama of his tragedies is void of true theatrical skill. His quasi-historical French tragedies on Bussy d'Ambois and Biron and Chabot best show his gift and also his insufferable interrupting quaintness. His versions of Homer (1598-1624), honoured alike by Jonson and by Keats, are the greatest verse translations of the time, and the real work of Chapman's life. Their virtues are only partially Homer's, but the general epic nobility and the majesty of single lines, which in length are the near equivalent of the hexameter, redeem the want of Homer's limpidity and continuity and the translator's imperfect knowledge of Greek. A vein of satiric ruggedness unites Jonson and Chapman with Marston and Hall, the professors of an artificial and disgusting invective; and the same strain spoils Marston's plays, and obscures his genuine command of the language of feverish and bitter sentiment. With these writers satire and contempt of the world lie at the root both of their comedy and tragedy.

It is otherwise with most of the romantic dramatists, who may be provisionally grouped as follows: (a) Thomas Dekker and Thomas Heywood are writers-of-all-work, the former profuse of tracts and pamphlets, the latter of treatises and compilations. They are both unrhetoical and void of pose, and divide themselves between the artless comedy of bustling, lively, English humours and pathetic, unheroic tragedy. But Dekker has splendid and poetical dreams, in Old Fortunatus (1600) and The Honest Whore, both of luxury and of tenderness; while Heywood, as in his English Traveller and Woman killed with Kindness (acted 1605), excels in pictures of actual, chivalrous English gentlemen and their generosities. The fertility and volubility of these writers, and their modest carelessness of fame, account for many of their imperfections. With them may be named the large crowd of professional journeymen, who did not want for power, but wrote usually in partnership together, like Monday, Chettle and Drayton, or supplied, like William Rowley, underplots of rough, lively comedy or tragedy. (b) Amongst dramatists of primarily tragic and sombre temper, who in their best scenes recall the creator of Angelo, Iago and Timon, must be named Thomas Middleton (1575-1627), John Webster, and Cyril Tourneur. Middleton has great but scattered force, and his verse has the grip and ring of the best period without a sign of the decadence. He is strong in high comedy, like The Changeling; that is true on some occasions, like The Portuguese Husband; "the moral sense of our ancestors"; in comedy that is merely graphic and vigorous; and in detached sketches of lowering wickedness and lust, like those in The Chimelings and Women beware Women. He and Webster each created one unforgettable spectacle, de Flores in The Changeling and Bosola in The Duchess of Malfi (whose "pity," when it came, was "nothing akin to him"). In Webster's other principal play, Vittoria Corombona, or the White Devil (produced about 1616), the title-character is not less magnificent in defiant crime than Goneril or Lady Macbeth. The style of Webster, for all his mechanical horrors, distils the essences of pity and terror, of wrath and scorn, and is profoundly poetical; and his point of view seems to be blank fatalism, without Shakespeare's ever-arching rainbow of moral sympathy. Cyril Tourneur, in The Revenger's Tragedy, is even more of a poet than Webster; he can find the phrase for half-insane wrath and nightmare brooding, but his chaos of impieties revolts the artistic judgment. These specialists, when all is said, are great men in their dark province. (c) The playwrights who may be broadly called romantic, of whom Beaumont, Fletcher and Massinger are the chief, while they share in the same sombre vein, have a wider range and move more in the daylight. The three just named left a very large body of drama, tragic, comic and tragi-comic, in which their several shades can partly be discerned by metrical or other tests. Beaumont (d. 1616) is nearest the prime, with his vein of Cervantesque mockery and his pure, beautifully-broken and cadenced verse, which is seen in his contributions to Philaster and And the Maid's Tragedy. Fletcher (d. 1625) brings us closest to the actual gaieties and humours of Jacobean life; he has a profuse comic gift and the rare instinct for natural dialogue. His verse, with its flood of vehemence and expansive rhetoric, heard at its best in plays like Bondua, cannot cheat us into the illusion that it is truly dramatic; but it overflows with beauty, like his silvery but monotonous versification with its endsyllables arrested at the end. In Fletcher the decadence of form and feeling palpably begins. His personages often face about at critical instants and bely their natures by sudden revulsions. Wanton and cheap characters invite not only dramatic but personal sympathy, as though the author knew no better. There is too much fine writing about a chastity which is comeliant rather than instinctive, and satisfied with its formal resistances and technical escapes; so that we are far from Shakespeare's heroines. These faults are present also in Philip Massinger (d. 1640), who offers in substantial recom- pense, not like Beaumont and Fletcher treasures of incessant vivacious episode and poetry and lyric interlude, but an often splendid and usually solid constructive skill, and a steady eloquence which is like a high table-land without summits. A New Way to Pay Old Debts (1632) is the most enduring popular comedy of the time outside Shakespeare's, and one of the best. Massinger's interweaving of impersonal or political conceptions, as in The Bondman and The Roman Actor, is often a triumph of arrangement; and though he wrote in the reign of Charles, he is saved by many noble qualities from being merely an artist of the decline. (d) A mass of plays, of which the authorship is unknown, uncertain or attached to a mere name, battle classification. There are domestic tragedies, such as Arden of Feversham; scions of the vindictive drama, like The Second Maiden's Tragedy; historic or halft-historic romances like Anna Bolena; and comedies of which the last and one of the best is Ford's Perkin Warbeck; and melodramas of adventure such as Thomas Heywood poured forth. There are realistic citizen comedies akin to The Merry Wives, like Porter's refreshing Two Angry Women of Abingdon; there are Jonsonian comedies, vernacular farces, light intrigue-pieces like Field's and many more. Few of these, regarded as wholes, regard to near perfection; few fail of some sally or scene that proves once more the unmatched diffusion of the dramatic or poetic instinct. (e) Outside the regular drama there are many varieties: academic plays, like The Return from Parnassus and Lungs, which are still mirthful; many pastoral plays or enter- tainers, as in the case of Chaldecot: The Five Fishes and Si- versed character-sketches, of which Day's Parliament of Bees, with its Theocritean grace and point, is the happiest; many masques and shows, often lyrically and scenically lovely, of which kind Jonson is the master, and Milton, in his Comus, the transfigurer; Senecan dramas made only to be read, like Daniel's and Fulke Greville's; and Latin comedies, like Ignoramus. All these species are only now being fully grouped, sifted and edited by scholars, but a number of the six or seven hundred dramas of the time remain unprinted.

There remain two writers, John Ford and James Shirley, who kept the higher tradition alive till the Puritan ordinance crushed the theatre in 1642. Ford is another specialist, of grave, sinister and concentrated power (reflected in his verse and diction), to whom no topic, the incest of Annabella in 'Tis Pity She's a Whore, or the high crazed heroism of Calanthe in The Broken Heart, is beyond the pale, if only he can dominate it; as indeed he does, without
complicity, standing above his subject. Shirley, a fertile writer, has the general characteristic gifts, in a somewhat dilute but noble form, of the more romantic playwrights, and claims honour as the last of them.  

Prose from 1579 to 1660.—With all the unevenness of poetry, the sense of style, of a standard, is everywhere; felicity is never far off. Prose also is full of genius, but it is more disfigured than verse by aberration and wasted power. A central, classic, durable, adaptive prose had been attained by Machiavelli, and by Amyot and Calvin, before 1550. In England it was only to become distinct after 1660. Vocabulary, sentence-structure, paragraph, idiom and rhythm were in a state of unchartered freedom, and the history of their crystallization is not yet written. But in more than compensation there is a company of prose masters, from Florio and Hooker to Milton and Clarendon, not one of whom clearly or fully anticipates the modern style, and who claim all the closer study that their special virtues have been for ever lost. They seem farther away from us than the poets around them. The verse of Shakespeare is near to us, for its tradition has persisted; his prose, the most natural and noble of his age, is far away, for its tradition has not persisted. One reason of this difference is that English prose tried to do more work than did the art of France and Italy; it tried the work of poetry; and it often did that better than it did the normal work of prose. This overflow of the imaginative spirit gave power and elasticity to prose, but made its task of finding equilibrium the harder. Moreover, prose in England was for long a natural growth, never much affected by critical or academic canons as in France; and when it did submit to canons, the result was often merely manner. The tendons and sinews of the language, still in its adolescent power and bewilderment, were long unset; that is, the parts of speech—noun and verb, epithet and adverb—were in freer interchange than at any period afterwards. The build, length and cadence of a complex sentence were habitually elaborate; and yet they were disorganized, so that only the ear of a master craftsman and the taste and measure, perhaps through some national disability, was long unperceived. Prose, in fact, could never be sure of doing the day's work in the right fashion. The cross-currents of pedantry in the midst of simplicity, the distrust of clear plain brevity, which was apt to be affected when it came, the mimickeries of foreign fashions, and the quaintness and curiousness of so much average writing, make it easier to classify Renaissance prose by its interests than by its styles. 

The Elizabethan novel was always unhappily mannered, and is therefore dead. It fed the drama, which devoured it. The tales of Boccaccio, Bandello, Cinthio, Margaret of Navarre, and others were purveyed; as remarked above, in the forgotten treasures of Painter, Pettit, Fenton and Whetstone, and many of these works or their originals filled a shelf in the playwrights' libraries. The first of famous English novels, Lyly's Euphues (1578), and its sequel Lyly and euphunium. Euphues and his England, are documents of form. They are commended by a certain dapper shrewdness of observation and an almost witty priggery, not by any real beauty or deep feeling. Euphuism, of which Lyly was only the patentee, not the inventor, strikes partly back to the Spaniard Guevara, and was a model for some years to many followers like Lodge and Greene. It did not merely provide Falstaff with a pattern for mock-moral diction and vegetable similes. It genuinely helped to organize the English sentence, complex or co-ordinate, and the talk of Portia and Rosalind shows what could be made of it. By the arch-euphuists, clauses and clusters of clauses were paired for parallel or contrast, with the beat of emphatic alliteration on the corresponding parts of speech in each constituent clause. This was a useful discipline for prose in its period of groping. Sidney's inconstant and unfinished Arcadia, written 1580-1581, despite its painful forced antitheses, is sprinkled with lovely rhythms, with pleasing formal landscapes, and even with impassioned sentiment and situation, through which the writer's eager and fretted spirit shines. Both these stories, like those of Greene and Lodge, show by their somewhat affected, edited delineation of life and their courtly tone that they were meant in chief for the eyes of ladies, who were excluded alike from the stage and from its audience. Nashe's drastic and photographic tale of masculine life, Jack Wilton, or The Unfortunate Traveller, stands almost alone, but some of the gap is filled by the contemporary pamphlets, sometimes vivid, often full of fierce or maudlin declamation, of Nashe himself—by far the most powerful of the group—and of Greene, Dekker and Nicholas Breton. Thus the English novel was a minor passing form; the leisurely and amorous romance went on in the next century, owing largely to French influence and example.

In criticism, England may almost be counted with the minor Latin countries. Sidney, in his Defence of Poetry (1595, written about 1580), and Jonson, in his Discoveries, offer a well-informed and lofty restatement of the current answers to the current questions, but could give no account of the actual creative writing of the time. To defend the "truth" of poetry—which was identified with all inventive writing and not only with verse—poetry was saddled with the work of science and instruction. To defend its character it was treated as a delightful but deliberate bait to good behaviour, and of the drama unity of action and didactic verse. The real relation of tragedy to spiritual things, which is admittedly shown, however hard its definition, in Shakespeare's plays, no critic for centuries tried to fathom. One of the chief quartets turned on metric. A few lines that Sidney and Campion wrote on what they thought the system of Latin quantity are really musical. This theory, already raised by Ascham, made a stir, at first in the group of Harvey, Sidney, Dyer and Spenser, called the "Areopagus," an informal attempt to copy the Italian academies; and it was revived on the brink of the reign of James. But Daniel's firm and eloquent Defence of Rhyming (1602) was not needed to persuade the poets to continue rhyming in syllabic verse. The stricter view of the nature and classification of poetry, and of the drama unity of action, is commonly given, partly by Jonson, partly by Bacon in his Advancement of Learning and De Augmentis; and Jonson, besides passing his famed judgments on Shakespeare and Bacon, enriched our critical vocabulary from the Roman rhetoricians. Scholastic and sensible manuals, like Webb's Discourse of Poetry and the Art of English Poesy (1589) ascribed to Puttenham, come in the rear.

The translators count for more than the critics; the line of their great achievements from Berners' Frosart (1523-1525) to Urquhart's Rabelais (1633) is never broken, and though their lives are often obscure, their number witnesses to that far-spread diffusion of the talent for English prose, which the wealth of English poetry is apt to hide. The typical craftsman in this field, Philemon Holland, translated Livy, Pliny, Suetonius, Plutarch's Morals and Camden's Britannia, and his fount of English is of the amplest and purest. North, in his translation, made from Amyot's classic French, of Plutarch's Lives (1579), disclosed one of the master-works of old example; Florio, in Montaigne's Essays (1603), the charter of the new freedom of mental exploration; and Shetlon, in Don Quixote (1612), the chief tragi-comic creation of continental prose. These versions, if by no means accurate in the letter, were adequate in point of soul and style to their great originals; and the English dress of Tactus (1591), Apuleius, Heliodorus, Comines, Celestina and many others, is so good and often so sumptuous a fabric, that no single class of prose authors, from the time of More to that of Dryden, excels the prose translators, unless it be the Anglican preachers. Their matter is given to them, and with it a certain standard of form, so that their natural strength and richness of phrase are controlled without being deadened. But the want of such control is seen in the many pamphleteers, who are the journalists of the time, and are often also playwrights or tale-tellers, divines or politicians. The writings, for instance, of the hectic, satiric and graphic Thomas Nashe, run at one extreme into fiction, and at the other into the virulent rag-sheets of the Marprelate controversy, which is of historical and social but not of artistic
note, being only a fragment of that vast mass of disputatious literature, which now seems grotesque, excitable or dull.

Richard Hooker’s *Laws of Ecclesiastical Polity* (1554–1597), an accepted defence of the Anglican position against Geneva and Rome, is the first theological work of note in the Anglican tongue, and a model of note and style. Wordsworth, written by an Englishman, is a plea for reason as one of the safe and lawful guides to the faith; it also speaks with admirable temper and large feeling to the ceremonial and aesthetic sense. The First Book, the scaffolding of the treatise, discusses the nature of law at large; but Hooker hardly has pure speculative power, and the language had not yet learnt to move easily in abstract trains of thought. In its elaboration of clause and period, in its delicate resonant eloquence, Hooker’s style is Ciceronian; but his invervations and maxes of subordinate sentence somewhat rack the genius of English. Later divines like Jeremy Taylor had to disintegrate, since the thought was willed, this admirable but over-complex eloquence. The sermons (1621–1631) of Donne have the mingled strangeness and intensity of his verse, and their subtle flame, imaginative tenacity, and hold upon the springs of awe make them unique. Though without artificial symmetry, their sentences are intricately harmonized, in strong contrast to such pellet-like clauses as those of the learned Lancelot Andrews, who was Donne’s younger contemporary and the subject of Milton’s Latin epitaph.

With Francis Bacon (1561–1626) English philosophy began its unbroken course and took its long-delayed rank in Europe. In his works, of which he is the only master in English, was shaped and coloured by his bent as orator and pleader, by his mixture in affairs, by his speculative brain, and by his use and estimate of Latin. In his conscious craftsmanship, his intellectual confidence and curiosity, his divining faith in the future of science, and his resolve to follow the leadings of nature and experience unswervingly; in his habit of storing and using up his experience, and in his wide worldly insight, crystallized in maxim, he suggests a kind of Goethe, without the poetic hand or the capacity for love and lofty suffering. He saw all nature in a map, and wished to understand and control her by outwitting the “idols,” or inherent paralyzing frailties of the human judgment. He planned but could not finish a great cycle of books in order to realize this conception. The *De Augmentis Scientiarum* (1623) expanded from the English *Advancement of Knowledge* (1605) draws the map; the *Novum Organum* (1620) sets out the errors of scholasticism and the methods of inductive logic; the *New Atlantis* sketches an ideally equipped and moralized scientific community. Bacon shared with the great minds of his century the notion that Latin would outlast any vernacular tongue, and committed his chief scientific writings to a Latin which is alive and splendid and his own, and which also disciplined and ennobled his English. The *Essays* (1597, 1612, 1625) are his lifelong, gradually accumulated diary of his opinions on human life and business. These famous compositions are often sadly mechanical. They are chippings and basketings of maxims and quotations, and of anecdotes, often classical, put together inductively, or rather by “simple enumeration” of the pros and cons. Still they are the honest notes of a practical observer and statesman, disenchanted—why not—with mankind, concerned with cause and effect rather than with right and wrong, wanting the finer faith and insight into men and women, but full of reality, touched with melancholy, and redeeming some arid, small and pretentious counsels by many that are large and wise. Though sometimes betraying the workshop, Bacon’s style, at its best, is infallibly expressive; like Milton’s angels, it is “diluted or condensed” according to its purposes. In youth and age alike, Bacon commanded the most opposite patterns and extremes of prose—the curt maxim, balanced in antithesis or triplet, or standing solitary; the sumptuous, satisfying and brocaded period; the movements of exposition, oratory, pleading and narrative. The *History of Henry VII* (1623), written after his fall from office, is in form as well as insight and mastery of material the one historical classic in English before Clarendon. Bacon’s musical sense for the value and placing of splendid words and proper names resembles Marlowe’s. But the master of mid-Renaissance prose is Shakespeare; with him it becomes the voice of finer and more impassioned spirits than Bacon’s—the voice of Rosalind and Hamlet. And the eulogist of both men, Ben Jonson must be named in this company for his weighty and dignified eloquence and critical maxim.

As the Stuart rule declined and fell, prose became enriched from five chief sources: from philosophy, whether formal or unmethodical; from theology and preaching and political dispute; from the poetical contemplation of death; from the observation of men and manners; and from antiquarian scholarship and history. As in France, where the first three of these kinds of writings flourished, it was a time rather of individual great writers than of any admitted pattern or common ideal of prose form, although in France this pattern was always clearer defined. Though the mental and aesthetic discipline, and the brilliant colour of the English drama passed with its decay over into prose. But Latin was still often the supplanter: the treatise of Lord Herbert of Cherbury, *De Veritate*, of note in the early history of Deism, and much of the writing of the ambidextrous Thomas Hobbes, are in Latin. In this way Latin disciplined English once more, though it often tempted men of genius away from English. The *Leviathan* (1651) with its companion books on *Human Nature and Liberty*, and Hobbes’ explosive dialogue on the civil wars, *Bemethem* (1679), have the bitter concision of Tacitus and the clearness of a half-relic in breaking with the habit of the Great Tribulation, of the social contract, the absolute power of the sovereign, and the subservience owed to the sovereign by the Church or “Kingdom of Darkness,” enraged all parties, and left their track on the thought and controversial literature of the century. With Ben Jonson and the jurist Selden (whose English can be judged from his *Table Talk*), Hobbes anticipates the brief and clear sentence-structure of the next age, though not its social ease and amenity of form. But his grandeur is not that of a poet, and the poetical prose is the most distinctive kind of this period. It is eloquent above all on death and the vanity of human affairs; its solemn tenor prolongs the reflections of Claudio, of Fletcher’s *Phileaster*, or of Spenser’s Despair. It is exemplified in Bacon’s *Essay Of Death*, in the anonymous descant on the same subject wrongly ascribed to him, in Donne’s plea for suicide, in Raleigh’s *History of the World*, in Drummond’s *Cypress Grove* (1623), in Jeremy Taylor’s sermons and *Holy Dying* (1651), and in Sir Thomas Browne’s *Urn Burial* (1658) and *Letter to a Friend*. Its usual metre is a long purple period, freely Latinized, though Browne equally commands the form of solemn and monumental epigram. He is also free from the dejection that wraps round the other writers on the subject, and a holy quaintness and gusto relieve his ruminations. The *Religio Medici* (1642), the mental and aesthetic discipline, and the splendid, is the fullest memorial of his power. Amongst modern prose writers, De Quincey is his only true rival in musical sensibility to words.

Jeremy Taylor, the last great English casuist and schoolman, and one of the first preachers for religious tolerance (in his *Liberty of Prophesying*, 1647), is above all a preacher; tender, intricate, copious, inexhaustible in image and picturesque quotation. From the classics, from the East, from the animal world, from the life of men and children, his illustrations flow, without end or measure. He is a master of the lingering cadence, which soars upward and onward on its coupled clauses, as on balanced iridescent wings, and is found long after in his scholar Ruskin. Imaginative force of another kind pervades Robert Burton’s *Anatomy of Melancholy* (1621), where the humorous medium refracts and colours every ray of the recluse’s far-travelled spirit. The mass of Latin citation, woven, not quilted, into Burton’s style, is another proof of the vitality of the cosmopolitan language. Burton and Browne owe much to the pre-critical learning of their time, which yields up such precious savours to their fancy, that we may be thankful for the delay of more precise science and
scholarship. Fancy, too, of a sudden and wittier sort, preserves some of the ample labours of Thomas Fuller, which are scattered over the years 1631–1662; and the Lives and Monument Angler (1653) of Izaak Walton are unspoil'd, happy or pious pieces of idyllic prose. No adequate note on the secular or sacred learning of the time can here be given; on Camden, with his vast erudition, historical, antiquarian and comparatively critical Britannia, in Latin, 1586; or on Ussher, with his patristic and chronological learning, one of the many saviors of the Anglican church. Other divines of the same camp pleaded, in a plainer style than Taylor, for freedom of personal judgment and against the multiplying of "vitals in religion"; the chief were Chillingworth, one of the closest of English apologists, in his Religion of Protestants (1638), and John Hales of Eton. The Platonists, or rather Platonists, of Cambridge, who form a curious digression in the history of modern philosophy, produced two writers, John Smith and Henry More, of an exalted and exotic prose, more directly inspired by Greece than any other of the time; and their champion of erudition, Codwod, in his True Intellectual System, gave some form to their doctrine.

Above all, patriot and disputatious writing that form the historian's material stands Edward Hyde, Earl of Clarendon. His History of the Rebellion, written in 1702–1704, thirty years after his death, Historical writing hitherto, but for Bacon's Henry VII., had been tentative though profuse. Raleigh's vast disquisition upon all things, The History of the World, 1614, survives by passages and poetic splendorous; gallantly written second-hand works like Knolles's History of the Turks, and the rhetorical History of the Long Parliament by May, had failed to give England rank with France and Italy. Clarendon's book, one of the greatest of memoirs and most vivid of portrait-galleries, spiritually unappreciative of the other side, but full of a subtle discrimination of character and political motive, brings vast literary lines, with Retz and Saint-Simon, the watchers and recorders and sometimes the makers of contemporary history. Clarendon's Life, above all the picture of Falkland and his friends, is a personal record of the delightful sort in which England was thus far infertile. He is the last old master of prose, using and sustaining the long, sinuous sentence, unworkable in weaker hands. He is the last, for Milton's polemic prose, hurled from the opposite camp, was written between 1643 and 1660. Whether reviling bishops or royal privilege or indissoluble monogamy, or recalling his own youth and aims; or claiming liberty for print in Areopagitica (1644); in his demonic defiance, or angelic calls to arms, or his animal eruptions of spite and hatred, Milton often described a style, as if it were a power of words, to be transformed into Paradise Lost and Samson. His sentences are ungainly and often inharmonious, but often irresistible; he rigidly withstood the tendencies of form, in prose as in verse, that Dryden was to represent, and thus was true to his own literary dynasty.

A special outlying position belongs to the Authorized Version (1611) of the Bible, the late fruit of the long toil that had begun with Tyndale's, and, on the side of style, with the Wyclifite translations. More scholarly than all the preceding versions which it utilized, it won its incomparable form, not so much because of the "grand style that was in the air," which would have been the worst of models, as because the style had been already tested and enabled by generations of translators. Its effect on poetry and letters was for some time far smaller than its effect on the national life at large, but it was the greatest translation—being of a whole literature, or rather of two literatures—in an age of great translations.

Some other kinds of writing soften the transition to Restoration prose. The vast catalogue of Characters numbers hundreds of titles. Deriving from Theophrastus, who was edited by Casaubon in 1592, they are yet another Renaissance form that England shared with France. But in English hands, falling a La Brûlèr—In Hall's, in Overbury's, even in those of the gay and skilful Earle (Microcosmographie, 1638)—the Character is a mere list of the attributes and oddities of a type or calling. It is to the Jonsonian drama of humours what the Pensée, or detached remark, practised by Bishop Hall and later by Butler and Halifax, is to the Essay. These works tended long to be commonplace or didactic, as the popular Resolves of Owen Fletcham shows. Cowley was the first essayist to come down from the desk and talk as to his equals in easy phrases of middle length. A time of dissenion was not the best for this kind of peaceful, detached writing. The letters of James Howell, the autobiography of Lord Herbert of Cherbury, and the memoirs of Kenelm Digby belong rather to the older and more mannered than to the more modern form, though Howell's English is in the plainer and quicker movement.

IV. Restoration Period

Literature from 1660 to 1700.—The Renaissance of letters in England entered on a fresh and peculiar phase in the third quarter of the century. The balance of intellectual and artistic power in Europe had completely shifted since 1580. Inspiration had died down in Italy, and its older classes were no longer a stimulus. The Spanish drama had flourished, but its influence, though real was scattered and indirect. The Germanic countries were slowly emerging into literature; England they scarcely touched. But the literary empire of France began to declare itself both in Northern and Southern lands, and within half a century was assured. Under this empire the English genius partly fell, though it soon asserted its own equality, and by 1720 had so reacted upon France as more than to repay the debt. Thus between 1660 and 1700 is prepared a temporary dual period of European letters. But in the age of Dryden France gave England more than it received; it gave more than it had ever given since the age of Chaucer. During Charles II.'s days Racine, Molière, La Fontaine and Bossuet ran the best of their course. Cavalle exiles like Waller, Congreve and Hobbes had come back from the winter of their discontent in Paris, and Saint-Evremond, the typical bel esperit and critic, settled long in England. A vast body of translations from the French is recounted, including latterly the works of the Protestant refugees printed in the free Low Countries or in England. Naturally this influence told most strongly on the social forms of verse and prose—upon comedy and satire, upon criticism and epigram, while it also affected theology and thought. And this meant the Renaissance once more, still unexhausted, only working less immediately and in fresh if narrower channels. Greek literature, Plato and Homer and the dramatists, became dimmer; the secondary forms of Latin poetry came to the fore, the satire of Juvenal and the satirists, and the pedestris sermo, epistolary and critical, of Horace. These had some direct influence, as Dryden's translation of them, accompanying his Virgil and Lucretius, may show. But they came commended by Boileau, their chief modernizer, and in their train was the fashion of gallant, epigrammatic and social verse. The tragedy of Corneille and Racine, developed originally from the Senecan drama, contended with the traditions of Shakespeare and Fletcher, and was reinforced by that of the corrector Jonson, in shaping the new theatre of England. The French codifiers, who were often also the disturbers, of Aristotle's Poetics and Horace's Ars poetica, furnished a canonical body of criticism on the epic and the drama, to which Dryden is half a disciple and half a rebel. All this implied at once a loss of the larger and fuller inspirations of poetry, a decadence in its grand and primary forms, epic, lyric and tragic, and a disposition, in default of such creative power, to turn and take stock of past production. In England, therefore, it is the age of secondary verse and of nascent, often searching criticism.

The same critical spirit was also whetted in the fields of science and speculation, which the war and the Puritan rule had not encouraged. The activities of the newly-founded Royal Society told directly upon literature, and counted powerfully in the organization of a clear, uniform prose—the "close, naked, natural way of speaking," which the historian of the Society, Sprat, cites as
part of its programme. And the style of Sprat, as of scientific
masters like Newton and Ray the botanist, itself attests the
change. A time of profound and peaceful and fruitful scientific
labour began; the whole of Newton's Principia appeared in
1687; the dream of Bacon came nearer, and England was less
isolated from the international work of knowledge. The spirit of
method and observation spread everywhere in the field of thought
and was typified in John Locke, whose Essay concerning Human Understanding came out in English in 1690,
and who applied the same deeply sagacious and cautious calculi
to education and religion and the "conduct of the understanding."
But his works, though their often mellow and dignified
style has been ignorantly underrated, also show the change in
philosophic writing since Hobbes. The old grandeur and
pugnacity are gone; the imaginative play of science, or quasi-
science, on the literature of reflection is gone; the eccentrics,
the fantasists, the dreamers are gone, or only survive in curious
transitional writers like Joseph Glanvill (Sceptics scientifica, 1665)
or Thomas Burnet (Sacred Theory of the Earth, 1684). This
change was in part a conscious and an angry change, as is clear
from the attacks made in Samuel Butler's Hudibras (1663-1668)
upon scholastic verbiage, astrology, fanatical sects and their
disputes, poetical and "heroic" enthusiasm and intellectual
whim.

Before the Restoration men of letters, with signal exceptions
like Milton and Marvell, had been Cavalier, courtly and Anglican
in their sympathies. The Civil War had scattered them
away from the capital, which, despite Milton's dream in Areopagitica of its humming and surging energies,
had ceased to be, what it now again became, the natural
haunt and Rialto of authors. The taste of the new king and
court served to rally them. Charles II. relished Hudibras, used
and pensioned Dryden, sat under Barrow and South and heard
them with appreciation, countenanced science, visited comedies,
and held his own in talk by mother-wit. Letters became the
pastime, and therefore one of the more serious pursuits, of men
of quality, who soon excelled in song and light scarifying verse
and comedy, and took their own tragedies and criticisms gravely.
Poetry under such auspices became gallant and social, and also
personal and partisan; and satire was soon its most vital form,
with the accessories of compliment, rhymed popular argumenta-
tion and lagniappe. The social and conversational instinct was the
master-influence in prose. It produced a subtle but fundamental
change in the attitude of author to reader. Prose came nearer
to living speech, it became more civil and natural and persuasive,
and this not least in the pulpit. The sense of ennui, or boredom,
which seemed as unknown in the earlier part of the century as
it is to the modern German, became strongly developed, and
prose was much improved by the fear of provoking it. In all
these ways the Restoration accompanied and quickened a
speedier and greater change in letters than any political event in
English history since the reign of Alfred, when prose itself was
created.

The formal change in prose can thus be assigned to no one
writer, for the good reason that it presupposes a change of
spoken style lying deeper than any personal influence.

Prose and Preachers. If we begin with the writing that is nearest living
talk—the letters of Otway or Lady Rachel Russell,
or the diary of Pepys (1659-1669)—that supreme disclosure of our mother-earth—or the evidence in a state trial, or the
dialogue in the more natural comedies; if we then work upwards through some of the plainer kinds of authorship, like the less
slangy of L'Estrange's pamphlets, or Burnet's History of My
Own Time, a sombre Whig memoir of historical value, until we reach
really admirable or lasting prose like Dryden's Preface to his
Fables (1700), or the maxims of Halifax;—if we do this, we are
aware, amid all varieties, survivals and revisions, of a strong
and rapid drift towards the style that we call modern. And one
sign of this movement is the revulsion against any over-saturating
of the working, daily language, and even of the language of appeal
and eloquence, with the Latin element. In Barrow and Glanvill,
descendants of Taylor and Browne, many Latinized words remain,
which were soon expelled from style like foreign bodies from
an organism. As in the mid-sixteenth and the mid-eighteenth
century, the process is visible by which the Latin vocabulary
and Latin complication of sentence first gathers strength, and
then, though not without leaving its traces, is forced to ebb.
The instinct of the best writers secured this result, and secured
it for good and all. In Dryden's diction there is a nearly perfect
balance and harmony of learned and native constituents, and
a sensitive tact in Gallicizing; in his build of sentence there is
the same balance between curtness or bareness and complexity or
ungainly lengthiness. For ceremony and compliment he keeps a
rolling period, for inventive a short sharp stroke without the
gloves. And he not only uses in general a sentence of moderate
scale, inclining to brevity, but he finds out its harmonies; he is
a seeming-careless but an absolute master of rhythm. In delusive
ease he is unexcelled; and we only regret that he could not have
written prose oftener instead of plays. We should thus, how-
ever, have lost their prefaces, in which the bulk and the best of
Dryden's criticisms appear. From the Essay of Dramatic Poesy
(1668) down to the Preface to Fables (1700) runs a series of essays:
On the Grounds of Criticism in Tragedy, On Heroic Plays, On
Translated Verse, On Satire and many more; which form the
first connected body of criticisms in the language, and are nobly
written always. Dryden's prose is literature as it stands, and
yet it is talk, and yet again is mysteriously better than talk.
The critical writings of John Dennis are but a sincere application
of the rules and canons that were now becoming conventional;
Rymer, though not so despicable as Macaulay said, is still
more depressing than Dennis; and for any critic at once so
free, so generous and so sure as Dryden we wait in vain for a
century.

Three or four names are usually associated with Dryden's
in the work of reforming or modifying prose: Sprat, Tillotson,
Sir William Temple, and George Savile, marquis of
Halifax; but the honours rest with Halifax. Sprat, though
clear and easy, has little range; Tillotson, though lucid, orderly,
and a very popular preacher, has little distinction; Temple, the
elegant essayist, has a kind of barren gloss and fine literary
manner, but very little to say. The political tracts, essays and maxims of Halifax (died 1695) are
the most typically modern prose between Dryden and Swift,
and are a proof of his being something else to the best French writing of
the same order, in their finality of epigram, their neatness and
mannerliness and sharpness. The Character of a Trimmer and
Advice to a Daughter are the best examples.

Religious literature, Anglican and Puritan, is the chief remain-
ing department to be named. The strong, eloquent and coloured
preaching of Isaac Barrow the mathematician, who
died in 1677, is a survival of the larger and older
manner of the Church. In its balance of logic, learning and
emotion, in its command alike of Latin splendour and native
force, it deserves a recognition it has lost. Another athlete of
the pulpit, Robert South, who is so often praised for his wit
that his force is forgotten, continues the lineage, while Tillotson
and the elder Sherlock show the tendency to the smoother and
more level prose. But the revulsion against strangeness and
fancy and magnificence went too far; it made for a temporary
barrenness and meanness and disharmony, which had to be checked
by Addison, Bolingbroke and Berkeley. From what Addison
saved our daily written English, may be seen in the vigorous
slangy hackwork of Roger L'Estrange, the translator and
pamphleteer, in the news-sheets of Dunton, and in the satires
of Tom Brown. These writers were debasing the coinage with
their street journalism.

Another and far nobler variety of vernacular prose is found in
the Puritans. Baxter and Howe, Fox and Bunyan, had
the English Bible behind them, which gave them the best
of their inspiration, though the first two of them were
also erudite men. Richard Baxter, an immensely
fertile writer, is best remembered by those of his own fold for
his Saint's Everlasting Rest (1650) and his autobiography, John
Howe for his evangelical apologia The Living Temple of God

Contributors to the new prose.
ENGLISH LITERATURE

[RESTORATION PERIOD]

The Pope. seen nearest The Samuel spiritual which afterwards. of the John satire. Burns. Soagsters time exchanged verse. mately progress is Death Banyan.

The Pilgrim’s Progress, of which the first part appeared in 1678, the second in 1684, is the happy flowering sport amidst a growth of barren plants of the same tribe. The Progress is a dream, more vivid to its author than most men’s waking memories to themselves; the emblem and the thing signified are merged at every point, so that Christian’s journey is not so much an allegory with a key as a spiritual vision of this earth and our neighbours. Grace Abounding, Bunyan’s diary of his own voyage to salvation, The Holy War, an overloaded fable of the fall and recovery of mankind, and The Life and Death of Mr Badman, a novel telling of the triumphal earthly progress of a scoundrelly tradesman, are among Bunyan’s other contributions to literature. His union of spiritual intensity, sharp humorous vision, and power of simple speech consummately chosen, mark his work off alike from his own inarticulate public and from all other literary performance of his time.

The transition from the older to the newer poetry was not abrupt. Old themes and tunes were slowly disused, others previously of lesser mark rose into favour, and a few quite fresh ones were introduced. The poems of John Oldham and Andrew Marvell belong to both periods. Both of them begin with fantasy and elegy, and end with satires, which indeed are rather documents than works of art. The monody of Oldham on his friend Morvent is poorly exchanged for the Satires on the Jesuits (1681), and the lovely metaphysical verses of Marvell on gardens and orchards and the spiritual love sadly give place to his Last Instructions to a Painter (1669). In his Horatian metre; and impartially applied his earlier style to national affairs; but the time proved too strong for this delightful poet. Another and a stranger satire had soon greeted the Restoration, the Hudibras. Hudibras (1663–1678) of Samuel Butler, with its companion pieces. The returned wanderers delighted in this horribly agile, boisterous and fierce attack on the popular party and its religions, and its wrangles and its manners. Profoundly eccentric and tiresomely allusive in his form, and working in the short rhyming couplets thenceforth called “Hudibrastics,” Butler founded a small and peculiar but long-lived school of satire. The other verse of the time is largely satire of a different tone and metre; but the earlier kind of finished and gallant lyric persisted through the reign of Charles II. The rhyming of John Wilmot, Earl of Rochester, are usually malicious, sometimes passionate; they have a music and a splendid self-abandonment such as we never meet again till Burns. Sedley and Dorset and Aphra Behn and Dryden are the rightful heirs of Carew and Lovelace, those inimitable masters of short rhymes; and this secret also was lost for a century afterwards.

In poetry, in prose, and to some extent in drama, John Dryden, the creature of his time, is the master of its expression. He began with panegyric verse, first on Cromwell and then on Charles, which is full of fine things and false writing. The Anima Miraeefts (1667) is the chief example, celebrating the Plague, the Fire and the naval victory, in the quatrains for which Davenant’s pompous Gondibert had shot the way. The Essay on Dramatic Poesy (1668), a dialogue on the rivalries of blank verse with rhyme, and of the Elizabethan drama with the French, is perfect modern prose; and to this perfection Dryden attained at a bound, while he attained his poetical style more gradually. He practised his couplet in panegyric, in heroic tragedy, and in dramatic prologue and epilogue for twenty years before it was consummated. Till 1680 he supported himself chiefly by his plays, which have not lived so long as their critical prefaces, already mentioned. His diction and versification came to their full power in his satires, rhymed arguments, dedications and translations. Absalom and Achitophel (part i, 1685; part ii, with Nahum Tate, 1686), as well as The Medal and Mac Flecknoe, marked a new birth of English satire, placing it at once on a level with that of any ancient or modern country. The mixture of deadly good temper, Olympian unfairness, and rhetorical and metrical skill in each of these poems has never been repeated. The presentment of Achitophel, earl of Shaftesbury, in his relations with Absalom Walters and Charles the minstrel-king of Judah, as well as the portraits of Shimei and Barzillai and Jotham, the eminent Whigs and Tories, and of the poets Og and Doeg, are things whose vividness age has never discoulered. Dryden’s Protestant Religio Laici (1682) and his equally sincere Papistical arguments in The Hind and the Panther (1687) are just as skilful. His translations of Virgil and parts of Lucretius, of Chaucer and Boccaccio (Fables, 1700), set the seal on his command of his favourite couplet for the higher kinds of appeal and oratory. His Ode on Anne Killigrew, and his popular but coarser Alexander’s Feast, have a more lyric harmony; and his songs, inserted in his plays, reflect the change of fashion by their metrical adeptness and often thoroughlygoing wantonness. The epithet of “glorious,” in its older sense of a certain conscious and warranted pride of place, not in that of boastful or pretentious, suits Dryden well. Not only did he leave a model and a point of departure, but his influence recurs in Churchill, in Gray, in Johnson and in Crabbe, where he is seen counteracting, with his large, wholesome and sincere bluntness, the acidity of Pope. Dryden was counted near Shakespeare and Milton until the romantic revival renewed the sense of proportion; but the same sense now demands his acknowledgment as the English poet who is nearest to their frontiers of all those who are exiled from their kingdom. Restoration and Revolution tragedy is nearly all abortive; it is now hard to read it for pleasure. But it has noble flights, and its historic interest is high. Two of its species, the rhymed heroic play and the rehandling of Shake-speare in blank verse, were also brought to their acme by Dryden, though in both he had many companions. The heroic tragedies were a hybrid offspring of the heroic romance and French tragedy; and though The Conquest of Granada (1669–1670) and Tyrannic Love would be very open to satire in Dryden’s own vein, they are at least generously absurd. Their intention is never ignoble, if often impossible. After a time Dryden went back to Shakespeare, after a fashion already set by Sir William Davenant, the connecting link with the older tragedy and the inaugurator of the new. They “revived” Shakespeare; they vamped him in a style that did not wholly perish till after the time of Garrick. The Tempest, Troilus and Cressida, and Antony and Cleopatra were thus handled by Dryden; and the last of these, as converted by him into All for Love (1678), is loftier and stronger than any of his original plays, its blank verse renewing the ties of Restoration poetry with the great age. The heroic plays, written in one or other metre, lived long, and expired in the burlesques of Fielding and Sheridan. The Rehearsal (1671), a gracious piece of fooling partially aimed at Dryden by Buckingham and his friends, did not suffice to kill its victims. Thomas Otway and Nathaniel Lee, both of whom generally used blank verse, are the other tragic writers of note, children indeed of the extreme old age of the drama. Otway’s long-acted Venice Preserved (1682) has an almost Shakespearian skill in melodrama, a wonderful tide of passion, and a blunt and bold delineation of character; but Otway’s Inferior style and verse could only be admired in an age like his own.

Lee is far more of a poet, though less of a dramatist, and he wasted a certain talent in noise and fury.

Restoration comedy at first followed Jonson, whom it was easy to try and imitate; Shadwell and Wilson, whose works are a museum for the social antiquity, photographed the humours of the town. Dryden’s many comedies often show his more boisterous and blatant, rarely his finer qualities. Like all playwrights of the time he pillaged from the French, and vulgarizes Molière without stint or shame. A truer light comedy began with Sir George Etherege, who mirrored in
English literature

18th century

his foppish the gaiety and insolence of the world he knew. The society depicted by William Wycherley, the one comic dramatist of power between Massinger and Congreve, at first seems hardly human; but his energy is skilful and faithful as well as brutal; he excels in the graphic realism of manner; and in the most callous good spirits and with careful cynical skillful translation, as well as a depravation of Molière's Le Misanthrope, is his best piece: he writes in prose, and his prose is excellent, modern and lifelike.

Many articles in English Studien, Anglia, &c., on influences, texts and sources. See too arts. Drama; Sonnet; Renaissance.

(V. E.)

V. THE 18TH CENTURY

In the reign of Anne (1702-1714) the social changes which had begun with the Restoration of 1660 began to make themselves definitely felt. Books began to penetrate among all classes of society. The period is consequently one of differentiation and expansion. As the practice of reading becomes more and more universal, English writers lose much of their old idiosyncrasy, intensity and obscurity. As in politics and religion, so in letters, there is a great development of nationality. Commercial considerations too for the first time become important. We hear relatively far less of religious controversy, of the bickering between episcopalians and non-conformists and of university squabbles. Specialization and cumbersome pedantry fall into profound disfavour. Provincial feeling exercises a diminishing sway, and literature becomes increasingly metropolitan or suburban. With the multiplication of moulds, the refinement of prose polish, and the development of breadth, variety and ease, it was natural enough, having regard to the place that the country played in the world's affairs, that English literature should make its debut in western Europe. The strong national savour seemed to stimulate the foreign appetite, and as represented by Swift, Pope, Defoe, Young, Goldsmith, Richardson, Sterne and Ossian, if we exclude Byron and Scott, the 18th century may be deemed the cosmopolitan age, par excellence, of English Letters. The charms of 18th-century English literature, as it happens, are essentially of the rational, social and translatable kind: in intensity, exquisiteness and eccentricity of the chooser kinds it is proportionately deficient. It is pre-eminently an age of prose, and although verbal expression is seldom represented at its highest power, we shall find nearly enough in the English prose of the period to cover the world.

The aristocratic style of Bolingbroke, Addison and Berkeley; the gentlemanly style of Fielding; the keen and logical controversy of Butler, Middleton, Smith and Bentham; the rhythmic and balanced if occasionally involved style of Johnson and his admirers; the limpid and flowing manner of Hume and Mackintosh; the light, easy and witty flow of Walpole; the divine chit-chat of Cowper; the colour of Gray and Berkeley; the roll of Burke; the detective journalism of Swift and Defoe; the sly familiarity of Sterne; the dance music and wax candles of Sheridan; the pomposity of Gibbon; the air and ripple of Goldsmith; the peeping precisiousness of Boswell,—these and other characteristics can be illustrated in 18th-century prose as probably nowhere else.

But more important than the historian of literature even than the development of qualities is the evolution of types. And in this respect the 18th century is a veritable index-museum of English prose. Essentially, no doubt, it is true that in form the prose and verse of the 18th century is mainly an extension of Dryden, just as in content it is a reflection of the increased variety of the city life which came into existence as English trade rapidly increased in all directions. But the taste of the day was rapidly changing. People began to read in vastly increasing numbers. The folio was making place on the shelves for the octavo. The bookseller began to transcend the mere tradesman. Along with newspapers the advertising of books came into fashion, and that man of the time was undoubtedly Joseph Addison who wanted to write, but what an increasing multitude wanted to read. The arrival of the octavo is said to have marked the enrolment of man as a reader, that of the novel the attachment of woman. Hence, among other causes, the rapid decay of lyrical verse and printed drama, of theology and epic, in ponderous tomes. The fashionable types of which the new century was to witness the fixation are accordingly the essay and the satire as represented respectively by Addison and Steele, Swift and Goldsmith, and by Pope and Churchill. Pope, soon to be followed by Lady Mary Wortley Montagu, was the first Englishman who treated letter-writing as an art upon a grand scale. Personalities and memoirs prepare the way for history, in which as a department of literature English letters hitherto had been almost scandalously deficient. Similarly the new growth of fancy essay (Addison) and plain biography (Defoe) prepared the way for the English novel, the most important by far of all new literary combinations. Finally, without going into unnecessary detail, we have a significant development of topography, journalism and criticism. In the course of time, too, we shall perceive how the pressure of town life and the logic of a capital city engendered, first a fondness for landscape gardening and a somewhat artificial Arcadianism, and then, by degrees, an intensifying love of the country, of the open air, and of the rare, exotic and remote in literature.

At the outset of the new century the two chief architects of public opinion were undoubtedly John Locke and Joseph Addison. When he died at High Laver in October 1704 at the mature age of seventy-two, Locke had, perhaps, done more than any man of the previous century to prepare the way for the new era. Social and duty responsibility were his two watchwords. The key to both he discerned in the Human Understanding—"no province of knowledge can be regarded as independent of reason." But the great modernist of the time was undoubtedly Joseph Addison (1672-1719). He first left the 17th century, with its stiff and awkward, its fo' mal obsequiousness, its ponderous scholasticism and its metaphorical antitheses, definitely behind. He did for English culture what Rambouillet did for that of France, and it is hardly an exaggeration to call the half-century before the great fame of the English novel, the half century of the Spectator. Addison's mind was fertilized by intercourse with the greater and more original genius of Swift and with the more inventive and more genial mind of Steele. It was Richard Steele (1672-1729) in the Taller of 1705-1710 who first realized that the specific which that urban age both needed and desired was no longer copious preaching and rigorous declamation, but homoeopathic doses of good sense, good taste and good-humoured morality, disguised beneath an easy and fashionable style. Nothing could have suited Addison better than the opportunity afforded him of contributing an occasional essay or roundabout paper in praise of virtue or dispraise of stupidity and bad form to his friend's periodical. When the Spectator succeeded the Taller in March 1711, Addison took a more active share in shaping the chief characters of the immortal baronet, Sir Roger, at their head) who were to make
up the "Spectator Club"; and, better even than before, he saw his way, perhaps, to reinvigorating his copious friend with his own more frugal but more refined endowment. Such a privileged talent came into play at precisely the right moment to circulate through the coffee houses and to convey a large measure of French courtly ease and elegance into the more humdrum texture of English prose. Steele became rather indisputable in his later years, Swift was banished and went mad, but Addison became a personage of the most consideration, and the essay as he left it became an almost indispensable accomplishment to the complete gentleman of that age. As an architect of opinion from 1717 to 1775 Addison may well rank with Locke.

The other side, both in life and politics, was taken by Jonathan Swift (1667-1745), who preferred to represent man on his unsocial side. He sneered at most things, but not at his own order, and he came to defend the church and the country squirearchy against the conventicle and Capel court. To undermine the complacent entrenchments of the Whig capitalists at war with France no sap proved so effectual as his pen. Literary influence was then exercised in politics mainly by pamphlets, and Swift was the greatest of pamphleteers. In the Journal to Stella he has left us a most wonderful portrait of himself in turn carrying and casting aside the baggage of party, half-buried by the party leaders of the Tories from 1730-1733. He had always been savage, and when the Hanoverians came in and he was treated as a suspect, his hate widened to embrace all mankind (Gulliver's Travels, 1726) and he bit like a mad dog. Would that he could have bitten more, for the infection of English stylists! In wit, logic, energy, pitch, resourcefulness and Saxon simplicity, his prose has never been equalled. The choicest English then, it is the choicest English still.

Dr John Arbuthnot (1667-1735) may be described as an understudy of Swift on the whimsical side only, whose malignity, in a nature otherwise kindly, was circumscribed strictly by the limits of political partisanship. Bernard Mandeville (1670-1733), unorthodox as he was in every respect, discovered a little of Swift's choice pessimism in The Fable of the Bees - although no claim. Yet, alas! He wrote the Saires and Epistles, which are largely of the proverb-in-rhyme order. Yet in lucid, terse and pungent phrases he has rarely if ever been surpassed. His classical fancy, his elegant turn for periphrasis and his venomous sting alike made him the idol of that urbane age. Voltare in 1726 had called him the best poet living, and at his death his style was paramount throughout the civilized world. It was the apotheosis of wit, point, lucidity and technical correctness. Pope was the first Englishman to make poetry pay (apart from patronage). He was flattered by imitation to an extent which threatened to throw the school of poetry which he represented into permanent discredit. Prior, Gay, Parnell, Akenside, and unconvincing imitator, Thomson, all joined in battle, and the great Charles Granger, Grainger, Darwin, Rogers, Hayley and indeed a host of others of the once famous mob of gentlemen who wrote with ease—worshiped Pope as their poetic founder. The second-rate wore his badge. But although the cult of Pope was the established religion of poetic taste from 1714 to 1798, there were always nonconformists. The poetic revolt, indeed, was far more versatile than the religious revival of the century. The Winter (1726) of James Thomson may be regarded as inaugurating a new era in English poetry. Lady Winchelsea, John Philips, author of Cider, and John Dyer, whose Grongar Hill was published a few months before Winter, had pleaded by their work for a truthful and unaffected, and at the same time a romantic treatment of nature in poetry; but the ideal of artificiality and of a frigid poetic diction by which English poetry was dominated since the days of Waller and Cowley was first effectively challenged by Thomson. At the time when the Popean couplet was at the height of its vogue he deliberately put it aside in favour of the higher poetic power of blank verse. And he it was who transmitted the sentiment of natural beauty not merely to imitators such as Savage, Armstrong, Somerville, Langhorne, Mickle and Shenstone, but also to his elevist, William Collins, to Gray and to Cowper, and so indirectly to the lyrical bards of 1798. By the same hands and those of Shenstone experiments were being made in the stanzas of The Faerie Queen; a little later, owing to the vocation of Bishop Percy, the cultivation of the old English and Scottish ballad literature was beginning to take a serious turn. Dissatisfaction with the limitations of "Augustan" poetry was similarly responsible for the revived interest in Shakespeare and Chaucer. Gray stood not only for a far more intimate worship of wild external nature, but also for an awakened curiosity in Scandinavian, Cletic and Icelandic poetry.

To pretend that the poetic heart of the 18th century was Popean to the core is nothing short of extravagance. There were a number of true poets in the second and third quarters of
the century to whom all credit is due as pioneers and precursors of the romantic movement under the depressing conditions to which innovators in poetry are commonly subject. They may strike us as rather an anemic band after the great Elizabethan poets. Four of them were mentally deranged (Collins, Smart, Cowper, Blake), while Gray was a hermit, and Shenstone and Thomson the most indolent of reclusees. The most adventurous, one might say the most virile of the group, was a boy who died at the age of seventeen. Single men all (save for Blake), a more despondent group of artists as a whole it would not perhaps be easy to discover. Catacombs and cypress vases were the forms of imagery that came to them most naturally. Elegies and funeral odes were the types of expression in which they were happiest. Yet they strove in the main to follow the gleam in poetry, to reinstate imagination upon its throne, and to substitute the singing voice for the rhetorical recitative of the heroic couplet. Within two years of the death of Pope, in 1746, William Collins was content to sing (not say) what he had in him without a glimpse of wit or a flash of eloquence—and in him many have discerned the germ of that romantic eclosion which blossomed in Christabel. A more important if less original factor in that movement was Collins's severe critic Thomas Gray, a man of the widest curiosities of books and men. With the concomitants of the romantic spirit, ship, taste and refinement are contributory may be found to the full, but in whom the strong creative energy is fatally lacking—despite the fact that he wrote a string of "divine truisms" in his Elegy, which has given to multitudes more of the exquisite pleasure of poetry than any other single piece in the English language. Shenstone and Percy, Capell, the Warton's and eventually Chatterton, continued to mine in the shafts which Gray had been the first to sink. Their laborious work of discovery resembled that which was commencing in regard to the Gothic architecture which the age of Pope had come to regard as rude and barbaric. The Augustans had come seriously to regard English poetry as grossly barbarian. One of the greatest achievements of the mid-eighteenth century was concerned with the disintegration of this obsolete delusion. The process was manifold; and it led, among other things, to a realization of the importance of the study of comparative literature.

The literary grouping of the 18th century is, perhaps, the biggest thing on the whole that English art has to show; but among all its groups the most famous, and probably the most original, is that of its proto-novelist's Richardson, Fielding, Smollett and Sterne. All nations have had their novelists, which are as old at least as Greek vases. The various types have generally had collective appellations such as Milesian Tales, Alexandrian Romances, Romances of Chivalry, Acta Sanctorum, Gesta Romanorum, Cent Nouvelles Nouvelles, Romances of Roguery, Arabian Nights; but owing to the rivalry of other more popular or more respectable or at least more eccentric literary forms, they seldom managed to attain a permanent lodgment in the library. The taste in prose fiction changes, perhaps, more rapidly than that in any other kind of literature. In Britain alone several forms had passed their prime since the days of Caxton and his Arthurian prose romance of Morte d'Arthur. Such were the wearisome Arcadian romance or pastoral heroic; the new centos of tales of chivalry like the Seven Champions of Christendom; the utopian, political and philosophical romances (Oceana, The Man in the Moon); the grotesque and facetious stories of rogues retailed from the Spanish or French in dwarf volumes; the prolix romance of modernized classic heroism (The Grand Cyrus); the religious allegory (Bunyan's Life and Death of Mr Badman); the novels of outspoken French or Italian gallantry, represented by Apha Behn; the imaginary voyages so notably adapted to satire by Dr Swift; and last, but not least, the minutely prosaic chthonic novels of Daniel Defoe. The prospect of the novel was changing rapidly, all pre-Davydean form of the individual and of a large well-to-do urban middle class, which was rapidly multiplying its area of leisure, involved a curious and self-conscious society, hungry for pleasure and new sensations, anxious to be told about themselves, willing in some cases even to learn civilization from their better. The disrepute into which the drama had fallen since Jeremy Collier's attack on it directed this society by an almost inevitable course into the flowery paths of fiction. The novel, it is true, had a reputation which was for the time being almost as unsavoury as that of the drama, but the novel was not a confirmed ill-doer, and it only needed a touch of genius to create for it a vast congregation of enthusiastic votaries. In the Tatler and Spectator were already found the methods and subjects of the modern novel. The De Coverley papers in the Spectator, in fact, want nothing but a love-thread to convert them into a serial novel of a high order. The supreme importance of the sentimental interest had already been discovered and exemplified to good purpose in France by Madame de la Fayette, the Marquise de Tencin, Marivaux and the Abbé Prevost. Samuel Richardson (1689-1761), therefore, when he produced the first two modern novels of European fame in Pamela (1740) and Clarissa (1748), inherited far more than he invented. There had been Richardsonian before Richardson. Clarissa is nevertheless a pioneer work, and we have it on the high authority of M. Jusserand that the English have contributed more than any other people to the "romantic" novel, to the novels of passion and of sentiment, the novel which delicately and rather rather chaotic English novel of love analysis and moral sentiment (as opposed to the romance of adventure) Richardson is the first successful charioteer. The novel in England gained prodigiously by the shock of opposition between the ideals of Richardson and Henry Fielding (1707-1754), his rival and parodist. Fielding's brutal toleration is a fine corrective to the slightly raned morality of Richardson, with its frank insistence upon the cash-value of chastity and virtue. Fielding is, to be brief, the succinct antithesis of Richardson, and represents the opposite pole of English character. He is the Cavalier, Richardson the Roundhead; he is the gentleman, Richardson the tradesman; he represents church and county, Richardson chapel and borough. Richardson had much of the patient insight and intensity of genius, but he lacked the humour and literary accomplishment which Fielding had in rich abundance. Fielding combined breadth and keenness, classical culture and a delicate Gallic irony to an extent rare among English writers. He lacked the delicate intuition of Richardson in the analysis of women, nor could he compass the broad farcical humour of Smollett or the sombre colouring by which Smollett produces at times such poignant effects of contrast. There was no poetry in Fielding; but he was perfectly at home in the other ingredient of a great prose writer—taste, culture, order, vivacity, humour, penetrating irony and vivid, pervading common sense; and it is Fielding's chef-d'œuvre Tom Jones (1749) that we must regard if not as the fundament at least as the corner of English prose fiction. Before Tom Jones appeared, the success of the novel had drawn a new competitor into the field in Tobias Smollett, the descendant of a good western lowland family who had knocked about the world and seen more of its hurlyburly than Fielding himself. In Roderick Random (1748) Smollett represents a rougher and more uncivilized world even than that depicted in Joseph Andrews. The savage and hearty play peculiar to these two novelists derives in part from the rough romance of Spain (as then recently revived by Lesage), and has a counterpart to some extent in the graphic art of Hogarth and Rowlandson; yet one cannot altogether ignore an element of exaggeration which has greatly injured both these writers in the estimation (and still more in the affection) of posterity. The genius which struggles through novels such as Roderick Random and Ferdinand Count Fathom was nearly submerged under the hard conditions of a general writer during the third quarter of the 18th century, and it speaks volumes for Smollett's powers of recuperation that he survived to write two such masterpieces of satiric and humorous observation as his Travels and Humphry Clinker.

The fourth proto-master of the English novel was the anti-

rhetorical humorist Lawrence Sterne. Though they owed a
good deal to Don Quixote and the French novelists, Fielding and Smollett were essentially observers of life in the quick.

Sterne. Sterne brought a far-fetched style, a bookish apparatus and a deliberate eccentricity into fiction. *Tristram Shandy*, produced successively in nine small volumes between 1760 and 1764, is the pretended history of a personage who is not born (before the fourth volume) and hardly ever appears, carried on in an eccentric rigmarole of old and new, original and borrowed humour, arranged in a style well known to students of the later Valois humorists as *farces*. Far more than Molière, Sterne took his literary *bien* wherever he found it. But he invented a kind of tremolo style of his own, with the aid of which, in conjunction with the most unblushingly indecent innuendoes, and with a conspicuous genius for humorous portrait-traiture, trembling upon the verge of the pathetic, he succeeded in winning a new domain for the art of fiction.

These four great writers then, Richardson, Fielding, Smollett and Sterne—all of them great pessimists in comparison with the benignant philosophers of a later fiction—first thoroughly fertilized this important field. Richardson obtained a European fame during his lifetime. Sterne, as a pioneer impressionist, gave all subsequent stylists a new handle. Fielding and Smollett grasped the new instrument more vigorously, and fashioned it with models which, after serving as patterns to Scott, Marryat, Cooper, Ainsworth, Dickens, Lever, Stevenson, Merrill, Weyman and other romancers of the 19th century, have still retained a fair measure of their original popularity unimpaired.

Apart from the novelists, the middle period of the 18th century is strong in prose writers: these include Dr Johnson, Oliver Goldsmith, Lord Chesterfield and Horace Walpole.

Johnson. The last three were all influenced by the sovereign lucidity of the best French style of the day. Chesterfield and Walpole were both writers of aristocratic experience and of European knowledge and sentiment. Johnson alone was a distinctively English thinker and stylist. His knowledge of the world, outside England, was derived from books, he was a good deal of a scholar, an earnest moralist, and something of a divine; his style, at any rate, reaches back to Taylor, Barrow and South, and has a good deal of the complex cadence, and the balance of English and Latin, in words proper to the period. Much of vacuity, by which the later influence of Addison and Bolingbroke is also apparent; Johnson himself was fond of the essay, the satire in verse, and the moral tale (*Rasselas*); but he lacked the creative imagination indispensable for such work and excelled chiefly as biographer and critic. For a critic even, it must be admitted that he was singly deficient in original ideas. He upholds authority. He judges by what he regards as the accepted rules, derived by Dryden, Rapin, Boliloe, Le Bossu, Rymer, Dennis, Pope and such "estimable critics" from the ancients, whose decisions on such matters he regards as paramount. He tried to carry out a systematic, motivated criticism; but he asserts rather than persuades or convinces. We go to his critical works (Lives of the Poets and Essay on Shakespeare) not for their conclusions, but for their shrewd comments on life, and for an application to literary problems of a cautious common sense.

Johnson's character and conversation, his knowledge and memory were far more remarkable than his ideas or his writings, admirable though the best of these were; the exceptional traits which met in his person and made that age regard him as a nonpareil have found in James Boswell a delineator unrivalled in patience, dexterity and dramatic insight. The result has been a portrait of a man of letters more alive at the present time than that which any other age or nation has bequeathed to us. In most of his ideas Johnson was a generation behind the typical academic critics of his date, Joseph and Thomas Warton, who championed against his authority what the doctor regarded as the finicking notions of Gray. Both of the Wartons were enthusiastic for Spenser and the older poetry; they were saturated with Milton whom they placed far above the correct Mr Pope, they wrote sonnets (thence provoking Johnson's ire) and attempted to revive medieval and Celtic lore in every direction. Johnson's one attempt at a novel or tale was *Rasselas*, a long "rambler" essay upon the vanity of human hope and ambition, something after the manner of the Oriental tales of which Voltaire had caught the idea from Swift and Montesquieu; but *Rasselas* is quite unenlivened by humour, personality or any other charm.

This one quality that Johnson so completely lacked was possessed in its fullest perfection by Oliver Goldsmith, whose style is the supreme expression of 18th-century clearness, simplicity and easy graceful fluency. Much of Goldsmith's material, whether as playwright, story writer or essayist, is trite and commonplace—his material worked up by any other hand would be worthless. But, whenever Goldsmith writes about human life, he seems to pay it a compliment, a relief of fun and good fellowship accompanies his slightest description, his playful and delicate touch could transform every thought that he handled into something radiant with sunlight and fragrant with the perfume of youth. Goldsmith's plots are Irish, his critical theories are French with a light top dressing of Johnson and Reynolds or Burke, while his prose style is an idealization of Addison. His versatility was great, and, in this and in other respects, he and Johnson are constantly reminding us that they were hardened professionals, writing against time for money.

Much of the best prose work of this period, from 1740 to 1780, was done under very different conditions. The increase of travel, of intercourse between the nobility of Europe, and of a sense of solidarity, self-consciousness, leisure and connoisseurship among that section of English society known as the governing class, or, since Disraeli, as "the Venetian oligarchy," could hardly fail to produce an increasing crop of those elaborate collections of letters and memoirs which had already attained their apotheosis in France with Mme de Sévigné and the duc de Saint-Simon. England was not to remain far behind, for in 1718 commence the *Letters* of Lady Mary Wortley Montagu; ten years more saw the commencement of Lord Hervey's *Memoirs of the Reign of George II.*; and Lord Chesterfield and Lord Orford (better known as Horace Walpole) both began their inimitable series of *Letters* about 1740. These writings, none of them written ostensibly for the press, serve to show the enormous strides that English prose was making as a result of the artistic propriety and practice of the editions of *Shakespeare* and *Spenser*. The letters represent the re-creation of extensive knowledge and cosmopolitan acquirements; they are not strong on the poetic or imaginative side of things, but they have an intense appreciation of the actual and mundane side of fallible humanity. Lord Chesterfield's *Letters* to his son and to his godson are far more, for they introduce a Ciceronian polish and a Gallic irony and wit into the hitherto uncultivated garden of the literary graces in English prose. Chesterfield, whose theme is manners and social amenity, deliberately seeks a form of expression appropriate to his text—the perfection of tact, neatness, good order and *savoir faire*. After his grandfather, the marquess of Halifax, Lord Chesterfield, the synonym in the vulgar world for a heartless exquisite, is in reality the first fine gentleman and epicurean in the best sense in English polite literature. Both Chesterfield and Walpole were conspicuous as racooneurs in an age of witty talkers, of whose talk R. B. Sheridan, in *The School for Scandal* (1777), served up a suprême. Some of it may be tinseil, but it looks wonderfully well under the lights. The star comedy of the century represents the sparkle of this brilliant crowd: it reveals no hearts, but it shows us every trick of phrase, every eccentricity of manner and every foil of thought. But the most mundane of the letter writers, the most frivolous, and also the most pungent, is Horace Walpole, whose writings are an epitome of the history and biography of the Georgian era. "Fiddles sing all through them, wax lights, fine dresses, fine jokes, fine plate, fine equipages glitter and sparkle; never was such a brilliant, smirking Vanity Fair as that through which he leads us." Yet, in some ways, he was a corrective to the self-complacency of his generation, a vast dilettante, lover of "Gothic," of curios and antiques, of costly printing, of old illuminations and stained glass. In his short miracle-novel,
called *The Castle of Otranto*, he set a fashion for mystery and terror in fiction, for medieval legend, diablerie, mystery, horror, antique furniture and Gothic jargon. The general outlines of *Gothic* were successively drawn by the celebrated James Boswell, first and most fatuous of all interviewers, in *The Life of Johnson*. His was the first modernist

The progres of authorship. 

In addition to the novel one need only mention the economic treatise, as exemplified for the first time in the admirable symmetry of *The Wealth of Nations*, the diary of a faithful observer of nature such as Gilbert White, the *Fifteen Discourses* (1769–1791) in which Sir Joshua Reynolds endeavours for the first time to expose for England a philosophy of Art, the historico-philosophical tableau as exemplified by Robertson and Gibbon, the light political parody of which the poetry of *The Rolliad* and *Anti-Jacobin* afford so many excellent models; and, going to the other extreme, the ponderous archaeological or topographical monograph, as exemplified in Stuart and Revett's *Antiquities of Athens*, in Robert Wood's colossal *Ruins of Palmyra* (1753), or the monumental *History of Leicestershire* by John Nichols. Such works as this last might well seem the outcome of Horace Walpole's maxim: In this scribbling age "let those who can't write, glean." In short, the literary landscape in Johnson's day was slowly but surely filling up with works which we are accustomed. The literary conditions of the period dated from the time of Pope in their main features, and it is quite possible that they were more considerably modified in Johnson's own lifetime than they have been since. The book-sellers, or, as they would now be called, publishers, were steadily superseding the old ties of patronage, and basing their relations with authors upon a commercial footing. A stage in their progress is marked by the success of Johnson's friend and Hume's correspondent, William Strahan, who kept a coach, "a credit to literature." The evolution of a normal status for the author was aided by the definition of copyright and gradual extinction of piracy.

Histories of their own time by Clarendon and Burnet have been in much request from their own day to this, and the first, at least, is a fine monument of English prose; Bolingbroke again, in 1735, dwelt memorably upon the ethical, political and philosophical value of history. But it was not until the third quarter of the 18th century that English literature freed itself from the imputation of lagging hopelessly behind France, Italy and Germany in the serious work of historical reconstruction. Hume published the first volume of his *History of England* in 1754. Robertson's *History of Scotland* saw the light in 1759 and his *Charles V.* in 1769; Gibbon's *Decline and Fall of the Roman Empire* came in 1776. Hume was, perhaps, the first modernist in history; he attempted to give his work a modern interest and, Scott though he was, a modern style—it could not fail, as he knew, to derive piqunance from its derivation of the Whiggish assumption which regarded 1668 as a political millennium. Wm. Robertson was, perhaps, the first man to adapt the polished periphrases of the pulpit to historical generalization. The gifts of compromise which he had learned as Moderator of the General Assembly he brought to bear upon his historical studies, and a language so unfamiliar to his lips as academic English he wrote with so much the more care that the greatest connoisseurs of the day were enthusiastic about "Robertson's wonderful style." Even more portentous in its superhuman dignity was the style of Edward Gibbon, who combined with the unspiritual optimism of Hume and Robertson far more keen observation of the outside world than any industry more monumental, a greater co-ordinative vigour, and a malicious which, even in the 18th century, rendered him the least credulous man of his age. Of all histories, therefore, based upon the transmitted evidence of other ages rather than on the personal observation of the writer's own, Gibbon's *Decline and Fall* has hitherto maintained its reputation best. Hume, even before he was superseded, fell a prey to continuations and abridgements, while Robertson was supplanted systematically by the ornate pages of W. H. Prescott.

The increasing transparency of texture in the working English prose during this period is shown in the writings of theologians such as Butler and Paley, of thinkers such as Berkeley and Hume, who, by prolonging and extending Berkeley's contention that matter was an abstraction, had shown that mind would have to be considered an abstraction too, thereby signalling a school of reaction to common sense or "external reality" represented by Thomas Reid, and with modifications by David Hartley, Abraham Tucker and others. Butler and Paley are merely two of the biggest and most characteristic apologists of that day, both great stylists, though it must be allowed that their very lucidity and good sense excites almost more doubt than it stills, and both very successful in repelling the enemy in controversy, though their very success accredits faults that universal age in which churchmen were so far more concerned about the title deeds than about the living portion of the church's estate. Free thought was already beginning to sap their defences in various directions, and in Tom Paine, Priestley, Price, Godwin and Mackintosh they found more formidable adversaries than in the earlier deists. The greatest champion, however, of continuity and conservation both in church and state, against the new schools of latitudinarians and radicals, the great eulogist of the unwritten constitution, and the most perfect master of emotional prose in this period, prose in which the harmony of sense and sound is attained to an unprecedented degree, to which it is in some degree more accessible in which churchmen were so far more concerned about the title deeds than about the living portion of the church's estate. to the earlier and more primitive moods of earth. The breath had scarcely left the body of the Grand Monarque before an intrigue was set on foot to dispute the provisions of his will. So with the critical testament of Pope. Within a few years of his death we find Gray, Warson, Hurd and other disciples of the new age denying to Pope the highest kind of poetic excellence, and exalting imagination and fancy into a sphere far above the Augustan qualities of correct taste and good judgment. De-

centralization and revolt were the new watchwords in literature. We must eschew France and Italy and go rather to Iceland or the Hebrides for fresh poetic emotions: we must shun academies and classic coffee-houses and go into the street-corners or the hedge-lanes in search of Volksposie. An old monument chest and a roll of yellow parchment were the finest incen-
tives to the new spirit of the picturesque. How else are we to explain the enthusiasm that welcomed the sham Ossianic poems of James Macpherson in 1760; Percy's patched-up ballads of 1765 (Reliques of Ancient Poetry); the new enthusiasm for Chaucer; the "black letter" school of Ritson, Tyrwhitt, George Ellis, Steevens, Ireland and Malone; above all, the spirit of the 18th-century poets poured forth in 1766-1769 with such a wild gusto of arcanic imagination by a prodigy not quite seventeen years of age? Chatterton's precocious fantasy cast a wonderful spell upon the romantic imagination of other times. It does not prepare us for the change that was coming over the poetic spirit of the last two decades of the century, but it does at least help us to explain it. The great masters of verse in Britain during this period were the three very disparate figures of William Cowper, William Blake and Robert Burns. Cowper was not a poet of vivid and rapturous visions. There is always something of the rusticating city-

scholar about his humour. The ungovernable impulse and imaginative passion of his generation were nigh to his heart.

Cowper.

BURNS.

His motives to express himself in verse came largely from the outside. The greater part, nearly all his best poetry is of the occasional order. To touch and retouch, he says, in one of his letters—among the most delightful in English—

is the secret of almost all good writing, especially verse. What-
ever is short should be nervous, masculine and compact. In all

the arts that raise the best occasional poetry to the

level of greatness Cowper is supreme. In phrase-
moulding, verbal gymnastic and prosodical marquetry he has scarcely a rival, and the fruits of his poetic industry are enshrined in the filigree of a most delicate fancy and a highly cultivated intelligence, purified and thrice refined in the fire of mental affliction. His work expresses and is approved of mankind. His humanitarian feeling and growing sensitiveness to natural beauty, home comfort, the claims of animals and the charms of light literature. In many of his short

poems, such as "The Royal George," artistic simplicity is indistinguishable from the stern reticence of genius. William Blake had no immediate literary descendants, for he worked alone, and Lamb was practically alone in recognizing what he wrote as poetry. But he was by far the most original of the reactionaries who preceded the Romantic Revival, and he caught far more of the Elizabethan air in his lyric verse than any one else before Coleridge. The Songs of Innocence and Songs of Experience, in 1789 and 1794, sing themselves, and have a bird-

like spontaneity that has been the despair of all song-writers from that day to this. After 1800 he winged his flight farther and farther into strange and unknown regions. In the finest of these earlier lyrics, which owe so little to his contemporaries, the ripple of the stream of romance that began to gush forth in 1798 is distinctly heard. But the first poetic genius of the century was unmistakably Robert Burns. In song and satire alike Burns is racy, in the highest degree, of the poets of North Britain, who since Robert Sempill, Willy Hamilton of Gilbertfield, douce Allan Ramsay, the Edinburgh periwig-maker and miscellaneous, and Robert Fergusson, "the writer-chiel, a deathless name," had kept alive the old native poetic tradition, had provided the strolling fiddlers with merry and wanton staves, and had perpetuated the daintiest shreds of national music, the broadest col-

loquialisms, and the warmest hues of patriotic or local sentiment. Burns immortalizes these old staves by means of his keenier vision, his more fiery spirit, his stronger passion and his richer volume of sound. Burns's fate was a pathetic one. Brief, broken glimpses of a genius that could never show itself complete, his poems wanted all things for completeness: culture, leisure, sustained effort, length of life. Yet occasional, fragmentary, extant, his name is as much the name of the genuine stamp of true genius. His eye is unerring, his humour of the ripest, his wit both fine and abundant. His car is less subtle, except when dialect is concerned. There he is infallible. Landscape he understands in subordination to life. For abstract ideas about Liberty and 1789 he cares little. But he is a patriot and an insurgent, a hater of sexual distinction and of the rich. Of the divine right or eternal merit of the system under which the poor man sweats to put money into the rich man's pocket and fights to keep it there, and is despised in proportion to the amount of his perspiration, he had a low opinion. His work has inspired the meek, has made the poor feel themselves less of ciphers in the world and given courage to the down-trodden. His love of women has inspired some of the most ardently beautiful lyrics in the world. Among modern folk-poets such as Jokai and Mistral, the position of Burns in the hearts of his own people is the best assured.

BIBLIOGRAPHICAL NOTE.—The dearness of literary history in England makes it rather difficult to obtain a good general view of letters in Britain during the 18th century. Much may be gleaned, however, from the parts of Literature in the 18th Century, chamber's Cyclo-
pedia of English Literature (1802). The two vols. dealing respectively with the Age of Pope and the Age of Johnson in Bell's Handbooks of English Literature will be found useful, and suggestive chapters will be found in Sainty's Short History, Dr. A. H. Thompson's Student's History of English Literature (1901). The same may, perhaps, be said of books v. and vi. in the Bookman Illustrated History of English Literature (1906), by the present writer. Sidelong stains of value are to be found in Walter Raleigh's little book on the English Novel, in Beljame's Le Publique et les hommes de lettres en Angleterre au XVIII° siècle, in H. A. Beers' History of English Romanticism in the 18th Century (1898), and above all Sir Leslie Stephen's History of English Thought during the 18th Century; Stephen's Hours in a Library, the monographs dealing with the period in the English Men of Letters series, the Vignettes and Portrait Tast of Greece by Granville-Barker, Elwin's Eighteenth Century Men of Letters, and Thomas Wright's Caricature History of the Georges, must also be kept in mind. (T. E.)

VI. THE 19TH CENTURY

We have seen how great was the reverence which the 18th century paid to poetry, and how many different kinds of poetic experiment were going on, mostly by the imitative efforts of revivalists (Spenserians, Miltonians, Shakespeareans, Ballad-
mongers, Scandinavian, Celtic, Gothic scholars and the like), but also in the direction of nature study and landscape descrip-
tion, while the more formal type of Augustan poetry, satire and description, in the direct succession of Pope, was by no means neglected.

The most original vein in the 19th century was supplied by the Wordsworth group, the first manifesto of which appeared in the Lyrical Ballads of 1798. William Wordsworth himself rep-

resents, in the first place, a revolutionary movement of thinking in the poetic direction, and the poet's acceptance of the Miltonic model by Addison. His idea, im-

perfectly carried out, was a reversion to popular language of the utmost simplicity and directness. He added to this the idea of the enlargement of man by Nature, after Rousseau, and went further than this in the utterance of an essentially pantheistic desire to become part of its loveliness, to partake in a mystical sense of the loneliness of the mountain, the sound of falling water, the upper horizon of the clouds and the wind. To the growing multitude of educated people who were being pent in huge cities these ideas were far sweeter than the formalities of the old pastoral. Wordsworth's great discovery, perhaps, was that popular poetry need not be imitative, artificial or condescending,
but that a simple story truthfully told of the passion, affliction or devotion of simple folk, and appealing to the primal emotion, is worthy of the highest effort of the poetical artist, and may achieve a poetic value far in advance of conventional descriptions of strikingly grouped incidents picturesquely magnified or rhetorically exaggerated. But Wordsworth's theories might have ended very much where they began. and for their impregnation by the complementary genius of Coleridge.

Coleridge at his best was inspired by the supreme poetical gifts of passion, imagination, simplicity and mystery, combining form and colour, sound and sense, novelty and antiquity, realism and romanticism, scholarly ode and popular ballad. His three fragmentary poems The Rime of the Ancient Mariner, Christabel and Kubla Khan are the three spells and touchstones, constituting what is often regarded by the best judges as the high-standard of modern English poetry. Their subtleties and beauties irradiated the homelier artistic conceptions of Wordsworth, and the effect on him was permanent. Coleridge's inspiration, on the other hand, was irrecuperable; a physical element was due, no doubt, to the first exaltation indirectly due to the opium habit, but the moral influence was contributed by the Wordsworths. The steady will of the Dalesman seems to have constrained Coleridge's imagination from aimless wandering; his lofty and unswerving self-confidence inspired his friend with a similar energy. Away from Wordsworth after 1798, Coleridge lost himself in visions of work that always remained to be "transcribed," by one who had every poetic gift—save the rudimentary will for sustained and concentrated effort.

Coleridge's more delicate sensibility to the older notes of that more musical era in English poetry which preceded the age of Lamb.

Dryden and Pope was due in no small measure to the luminous yet subtle intimations of his friend Charles Lamb. Lamb's appreciation of the imaginative beauty inherent in old English literature amounted to positive genius, and the persistence with which he brought his perception of the supreme importance of imagination and music in poetry to bear upon some of the finest creative minds of 1800, in talk, letters, selections and essays, brought about a gradual revolution in the aesthetic morality of the day. He paid little heed to the old rhetoric and the art poética of classical comparison. His aim was rather to discover the mystery, the folk-seed and the old-world element, latent in so much of the finer ancient poetry and implicit in so much of the new. The Essays of Elia (1820-1825) are the binnacle of Lamb's vessel of exploration. Lamb and his great rival, William Hazlitt, both maintained that criticism was not so much an affair of learning, or an exercise of comparative and expository judgment, as an act of imagination in itself. Hazlitt became one of the master essayists, a fine critical analyst and declamer, denouncing all insipidity and affectation, stirring the soul with metaphor, soaring easily and acquiring a momentum in his prose which often approximates to the impassioned utterance of Burke. Like Lamb, he wanted to measure his contemporaries by the Elizabethans, or still older masters, and he was deeply impressed by Lyrical Ballads. The new critics gradually found responsible auxiliaries, notably Leigh Hunt, De Quincey and Wilson of Blackwood's. Leigh Hunt, not very important in himself, was a cause of great authorship in others. He increased both the depth and area of modern literary sensibility.

The world of books was to him an enchanted forest, in which every leaf had its own secret. He was the most catholic of critics, but he knew what was poetic for himself. As an essayist he is a feminine diminutive of Lamb, excellent in fancy and literary illustration, but far inferior in decisive insight or penetrative masculine wit. The Miltonic quality of impassioned pyramidal prose is best seen in Thomas De Quincey, of all the essayists of this age, or any age, the most diffuse, unequal and irreducible to rule, and which yet at times trembles upon the brink of a rhythmical sonority which seems almost to rival that of the greatest poetry. Leigh Hunt supplies a valuable link between Lamb, the sole external moderator of the Lake school, Byron, Shelley, and the junior branch of imaginative Aesthetic, represented by Keats.

John Keats (1795-1821), three years younger than Shelley, was the greatest poetical artist of his time, and would probably have surpassed all, but for his collapse of health at twenty-five close on by the end of his studentship. His vocation was as uncompakable as that of Chatterton, with whose youthful ardour his own had points of likeness. The two contemporary conceptions of him as a fatuous Cockney Bunthorne or as "a tadpole of the lakes" were equally erroneous. But Keats was in a sense the first of the virtuoso or aesthetic school (caricatured later by the formula of "Art for Art's sake"); artistic beauty was to him a kind of religion, his expression was more technical, less personal than that of his contemporaries, he was a conscious "romantic," and he travelled in the realms of gold with less impedimenta than any of his fellows. Byron had always himself to talk about, Wordsworth saw the universe too much through the medium of his own self-importance, Coleridge was a metaphysician, Shelley hymned Intellectual Beauty; Keats treats of his subject, "A Greek Urn," "A Nightingale," the season of "Autumn," in such a way that our thought centres not upon the poet but upon the enchantment of that which he sings. In his three great mediavalising poems, "The Pot of Basil," "The Eve of St Agnes" and "La Belle Dame Sans Merci," even more than in his Odes, Keats is the forerunner of Tennyson, the greatest of the word-painters. But apart from his perfection of loveliness, he has a natural magic and a glow of humanity surpassing that of any other known poet. His poetry, immature as it was, gave a new beauty to the language. His loss was the greatest English Literature has sustained.

Before Tennyson, Rossetti and Morris, Keats's best disciples in the aesthetic school were Thomas Lovell Beddoes, George Clare and Thomas Hood, the failure of whose Midsummer Fairies and "Fair Inez" drove him into that almost mortific vein of verbal humour which threw up here and there a masterpiece such as "The Song of a Shirt." The master virtuoso of English poetry in another department (the classical) during this and the following age was Walter Savage Landor, who threw off a few fragments of verse worthy of the Greek Anthology, but in his Dialogues or "Imaginary Conversations" evolved a kind of violent monologizing upon the common-place which descends into the most dismal caverns of egotism. Carlyle furiously questioned his competence. Mr Shaw allows his classical amateurishness and exalted stridency of character, but denounces his work, with a substratum of truth, as that of a "blathering, unreadable pedant."

Among those, however, who found early nutrimint in Landor's Miltonic Gebir (1798) must be reckoned the most poetical of our poets. P. B. Shelley was a spirit apart, who fits into no group, the associate of Byron, but spiritually as remote from him as possible, hated by the rationalists of his age, and regarded by the poets with more pity than jealousy. He wrote only for poets, and had no public during his lifetime among general readers, by whom, however, he is now regarded as the poet par excellence. In his conduct it must be admitted that he was in a sense, like Coleridge, irresponsible, but on the other hand his poetic energy was irresistible and all his work is technically of the highest order of excellence. In ideal beauty it is supreme; its great lack is its want of humanity; in this he is the opposite of Wordsworth who reads human nature into everything. Shelley, on the other hand, dehumanises things and makes them unearthly. He hangs a poem, like a cobweb or a wisp thread, on a horn of the crescent moon, and leaves it to dangle there in a current of ether. His quest was continuous for figures of beauty, figures, however, more ethereal and less sensuous than those in Keats; having obtained such an idea he passed it again and again through the prism of his mind, in talk, letters, prefaces, poems. The deep sense of the mystery of words and their slightest variations in the skein of poetry, half forgotten since Milton's time, had been recovered in a great measure by Coleridge and Wordsworth since 1798; Lamb, too, and Hazlitt, and, perhaps, Hogg were in the secret, while Keats...
had its open sesame on his lips ere he died. The union of poetic emotion with verbal music of the greatest perfection was the aim of all, but none of these masters made words breathe and sing with quite the same spontaneous ease and fervour that Shelley attained in some of the lyrics written between twenty-four and thirty, such as "The Cloud," "The Skylark," "The Ode of the West Wind," "The Sensitive Plant," the "Indian Serenade."

The path of the new romantic school had been thoroughly prepared during the age of Gray, Cowper and Burns, and it won its triumphs with little resistance and no severe convulsions. The opposition was noisy, but its representative character has been exaggerated. In the meantime, however, the old-fashioned school and the Popean couplet, the Johnsonian dignity of reflection and the Goldsmithian ideal of generalized description, were well maintained by George Crabbe (1754-1832), "though Nature's sternest painter yet the best," a worsted-stockinged Pope and austere delineator of village misdoing and penurious age, and Samuel Rogers (1763-1855), the banker poet, liberal in sentiment, extreme Tory in form, and dillattante delineator of Italy to the music of the heroic couplet. Robert Southey, Thomas Campbell and Thomas Moore were a dozen years younger than their more ancient rivals, and consequently more able to claim a place in the list of the three great poets of the primary period. In the main, however, they were still poeticisers of the orthodox old pattern, though all wrote a few songs of exceptional merit, and Campbell especially by defying the old anathemas.

The great champion of the Augustan masters was himself the architect of revolution. First the idol and then the outcast of respectable society, Lord Byron sought relief in new cadences and new themes for his poetic talent. He was, however, essentially a history painter or a satirist in verse. He had none of the sensitive aesthetic taste of a Keats, none of the spiritual ardour of a Shelley, or of the elemental beauty or artistry of Wordsworth or Coleridge. He manages the pen (said Scott) with the careless and negligent ease of a man of quality. The "Lake Poets" sought to create an impression deep, calm and profound, Byron to start a theme which should enable him to pose, travel, astonish, bewilder and confound as lover of daring, freedom, passion and revolt. For the subtler symphonic music—that music of the spheres to which the ears of poets alone are attuned—Byron had an imperfect sympathy. The delicate ear is often revolted in his poetry by the vices of impromptu work. He steadily refused to polish, to file or to furbish—the damning, inevitable sign of a man born to wear a golden tassel. "I am like the tiger. If I miss the first spring I go growing back to the jungle." Subtlety is sacrificed to freshness and vigour. The exultation, the breadth, the sweep of his effects are consequently most appreciated abroad, where the ineradicable flaws of his style have no power to annoy.

The European fame of Byron was from the first something quite unique. At Missolonghi people ran through the streets crying "The great man is dead—he is gone." His corpse was refused entrance at Westminster; but the poet was taken to the inmost heart of Russia, Poland, Spain, Italy, France, Germany, Scandinavia, and among the Slavonic nations generally. In Italy his influence is plainly seen in Berchet, Leopardi, Giusti, and even Carducci. In Spain the Myrtle Society was founded in Byron's honour. Hugo in his most extreme range and versatility of Scott's powers, we are constrained to assign him the first place in his own age, if not that in the next seat to Shakespeare in the whole of the English literary Pantheon. Like Shakespeare, he made humour and a knowledge of human nature his first instruments in depicting the past. Unlike Shakespeare, he was a born antiquary, and he had a great (perhaps excessive) belief in mise en scène, costume, patriots and scenic properties generally. His portraiture, however, is Shakespearean in its wisdom and maturity, and, although he wrote very rapidly, it must be remembered that his mind had been prepared by strenuous work for twenty years as a storehouse of material in which nothing was handled until it had been carefully mounted by the imagination, classified in the memory and tested by experimental use. Once he has got the imagination of the reader well grounded to earth, there is nothing he loves...
better than telling a good story. Of detail he is often careless. But he trusted to a full wallet, and rightly, for mainly by his abundance he raised the literature of the novel to its highest point of influence, breathing into it a new spirit, giving it a fulness and universality of life, a romantic charm, a dignity and elevation, and thereby a coherence, a power and predominance which it had not had before.

In Scott the various lines of 18th-century conservatism and 19th-century romantic revival most wonderfully converge. His intense feeling for Long Ago made him a romantic almost from his cradle. The master faculties of history and humour made a strong conservative of him; but his Toryism was of a very different spring from that of Coleridge or Wordsworth. It was not a reaction from disappointment in the sequel of 1759, nor was it the result of reasoned conviction. It was indwellng, rooted deeply in the fibres of the soil, to which Scott's attachment was passionate, and nourished as from a source by ancestral sentiment and "heather" tradition. This sentiment made Scott a victorious pioneer of the Romantic movement all over Europe. At the same time we must remember that, with all his fondness for medievalism, he was fundamentally a thorough 18th-century Scotsman and successor of Bailie Nicol Jarvie: a worshipper of good sense, toleration, modern and expert government mental ideas, who valued the past chiefly by way of picturesqueness, and who was thoroughly alive to the benefit of peaceful and orderly rule, and deeply convinced that we are much better off as we are than we could have been in the days of King Richard or good Queen Bess. Scott had the mind of an enlightened 18th-century administrator and statesmen who had made a fierce hobby of armour and old ballads. To expect him to treat of intense passion or romantic medievalism as Charlotte Brontë or Dante Gabriel Rossetti would have treated them is as absurd as to expect to find the sentiments of a Mrs Browning blossoming amidst the horse-play of Tom Jones or Harry Lorrequer. Scott has few niceties or secrets: he was never subtle, morbid or fantastic. His handling is ever broad, vigorous, easy, careless, healthful and free. Yet nobly simple and straightforward as man and writer were, there is something very complex about his literary legacy, which has gone into all lands and created bigoted enemies (Carlyle, Borrow) as well as unexpected friends (Hazlitt, Newman, Jowett); and we can seldom be sure whether his influence is reactionary or the reverse. There has always been something semi-feudal about it. The "shirra" has a demesne in letters as broad as a countryside, a band of mesne vassals and a host of Eldon hillsmen, Tweedsde cottiers, minor feudatories and forest retainers attached to the "Aberfoyle Hunt." Scott's humour, humanity and insistence upon the continuity of history transformed English literature profoundly.

Scott set himself to coin a quarter of a million sterling out of the new continent of which he felt himself the Columbus. He failed (quite narrowly), but he made the novel the paymaster of literature for at least a hundred years.

His immediate contemporaries and successors were not particularly great. John Galt (1779-1839), Susan Ferrier (1782-1854) and D. M. Moir (1798-1851) all attempted the delineation of Scottish scenes with a good deal of shrewdness of insight and humour. The main bridge from Scott to the great novelists of the "forties and 'fifties was supplied by sporting, military, naval and political novels, represented in turn by Surtees, Smith, Hock, Maxwell, Lever, Marryat, Cooper, Morier, Ainsworth, Bulwer Lytton and Disraeli. Surtees gave all-important hints to Pickwick, Marryat developed grotesque character-drawing, Ainsworth and Bulwer-Lytton were comfortably in line with the contemporary glitter. Disraeli in the 'thirties was one of the foremost romantic wits who had yet attempted the novel. Early in the 'forties he received the laying-on of hands from the Young England party, and attempted to propagandize the good tidings of his mission in Coningsby and Sybil, novels full of entramment and promise, if not of actual genius. Unhappily the author was enmeshed in the fatal drolleries of the English party system, and Lothair is virtually a confession of abandoned ideals. He completes the forward party in fiction; Jane Austen (1775-1815) stands to this as Crabbe and Rogers to Coleridge and Shelley. She represents the fine flower of the expiring 18th century. Scott could do the trumpet notes on the organ. She fingers the fine ivory flutes. She combines self-knowledge and artistic reticence with a complete tact and an absolute lucidity of vision within the area prescribed. Within the limits of a park wall in the sunny parish, absolutely oblivious of Europe and the universe, her art is among the finest and most finished that our literature has to offer. In irony she had no rival at that period. But the trimness of her plots and the delicacy of her miniature work have affinities in Maria Edgeworth, Harriet Martineau and Mary Russell Mitford, three excellent writers of pure English prose. There is a finer aroma of style in the contemporary "novels" of Thomas Love Peacock (1785-1860). These, however, are rather tournaments of talk than novels proper, releasing a flood of satiric portraiture upon the idealism of the day—difficult to be apprehended in perfection save by professed students. Peacock's style had an appreciable influence upon his son-in-law George Meredith (1828-1909). His philosophy is for the most part Tory irritability exploding in ridicule; but Peacock was one of the most lettered men of his age, and his flouts and jeers smack of good reading, old wine and respectable prejudices. In these his greatest successor was George Borrow (1803-1881), who used three volumes of half-imaginary autobiography and road-faring in strange lands as a sounding-board for a kind of romantic revolt against the century of comfort, toleration, manufactures, mechanical inventions, cheap travel and commercial expansion, unaccompanied (as he maintains) by any commensurate growth of human wisdom, happiness, security or dignity.

In the year of Queen Victoria's accession most of the great writers of the early part of the century, whom we may denominate as "late Georgian," were silent. Scott, Byron, Shelley, Keats, Coleridge, Lamb, Sheridan, Hazlitt, Mackintosh, Crabbe and Cobbett were gone. Wordsworth, Southey, Campbell, Moore, Jeffrey, Sydney Smith, De Quincey, Miss Edgeworth, Miss Mitford, Leigh Hunt, Brougham, Samuel Rogers were still living, but the vital portion of their work was already done. The principal authors who belong equally to the Georgian and Victorian eras are Landor, Bulwer, Marryat, Hallam, Milman and Disraeli; none of whom, with the exception of the last, approaches the first rank in either. The significant work of Tennyson, the Brownings, Carlyle, Dickens, Thackeray, the Brontës, George Eliot, Mrs Gaskell, Trollope, the Kingsleys, Spencer, Mill, Darwin, Ruskin, Grote, Macaulay, Freeman, Froude, Lecky, Buckle, Green, Maine, Borrow, FitzGerald, Arnold, Rossetti, Swinburne, Meredith, Hardy, Stevenson, Morris, Newman, Pater, Jefferies—the work of these writers may be termed conclusively Victorian; it gives the era a stamp of its own and distinguishes it as the most varied in intellectual riches in the whole course of our literature. Circumstances have been more favourable to a great outburst of literary energy. The nation was secure and prosperous to an unexampled degree, conscious of the will and the power to expand still further. The canons of taste were still aristocratic. Books were made and unmade according to a regular standard. Literature was the one form of art which the English understood, in which they had always excelled since 1570, and in which their originality was supreme. To the native genius for poetry was now added the advantage of materials for a prose which in lucidity and versatility should surpass even that of Goldsmith and Hazlitt. The diversity of form and content of this great new literature is commensurate with the development of man's knowledge and power which marked its age. In this and some other respects it resembles the extraordinary contemporary development in French literature which began under the reign of Louis Philippe. The one signally disconcerting thing about the great Victorian writers is their amazing proflixity. Not content with two or three long books, they write whole literatures. A score of volumes, each as long as the Bible or Shakespeare, barely represents the output of such authors as Carlyle, Ruskin, Froude, Dickens, Thackeray, Newman, Spencer or Trollope.
They obtained vast quantities of new readers, for the middle class was beginning to read with avidity; but the quality of brevity, the knowledge when to stop, and with it the older classic conciseness and the nobler Hellenic idea of a perfect measure—these things were as though they had not been. Meanwhile, the old schools were broken up and the foolscap addressed to the old masters. Singers, entertainers, critics and historians abound. Every man may say what is in him in the phrases that he likes best, and the sole motto that compels is "every style is possible except the style that is tiresome." The old models are strangely discredited, and the only conventions which hold are those concerning the subjects which English delicacy held to be tabooed. These conventions were inordinately strict, and were held to include all the unrestrained, illicit impulses of love and all the more violent aberrations from the Christian code of faith and ethics. Infidel speculation and the liaisons of lawless love (which had begun to form the staple of the new French fiction—hence regarded by respectable English critics of the time as profoundly vitiated and scandalous) had no recognized existence and were totally ignored in literature designed for general reading. The huge popular magazines continued their strong influence in the period until the penultimate decade of the 19th century, and was acquiesced in or at least submitted to by practically all the great writers of the Victorian age. The great poets and novelists of that day easily out-topped their fellows. Society had no difficulty in responding to the summons of its literary leaders. Nor was their fame partial, social or sectional. The great novelists of early Victorian days were aristocratic and democratic at once. Their popularity was universal within the limits of the language and beyond it. The greatest of these were men of imagination rather than men of ideas, but such sociological and moral ideas as they derived from their environment were poured helter-skelter into their novels, which took the form of a gigantic novelization of the history and manners of the day, the national idiom being strictly in force until the penultimate decade of the 19th century, and was acquiesced in or at least submitted to by practically all the great writers of the Victorian age. The great poets and novelists of that day easily out-topped their fellows. Society had no difficulty in responding to the summons of its literary leaders. Nor was their fame partial, social or sectional.

The novels to a certain extent created their own method like the great dramatists, but such rigid prejudices or conventions, as they found already in possession they respected without demur. Both Dickens and Thackeray write as if they were almost entirely innocent of the existence of sexual vice. As artists and thinkers they were both formless. But the enormous self-complacency of the English of their time, assisted alike by the part played by the nation from 1793 to 1815, evangelism, free trade (which was associated with division from the super-political super-society) and later, evolution, generated in them a great benignity and a strong determination towards a liberal and humanitarian philosophy. Despite, however, the diffuseness of the envelope and the limitations of horizon referred to, the unbookish and almost unlettered genius of Charles Dickens (1812-1870), the son of a poor lower middle-class clerk, almost entirely self-educated, has asserted for itself the foremost place in the literary history of the period. Dickens broke every rule, rioted in absurdity and bathed in extravagance. But everything he wrote was received with an almost frantic joy by those who recognized his creations as delineations of themselves, his scenery as drawn by one of the quickest and keenest observers that ever lived, and his drollery as an accumulated dividend from the treasury of human laughter. Dickens's mannerisms were severe, but his geniality as a writer broke down every obstruction, reduced Jeffrey to tears and Sydney Smith to helpless laughter.

The novel in France was soon to diverge and adopt the form of an anecdote illustrating the traits of a very small group of Thackeray, persons, but the English novel, owing mainly to the predilection of Dickens for those Gargantuan entertainers of his youth, Fielding and Smollett, was to remain anchored to the history. William Makepeace Thackeray (1811-1863) was even more historical than Dickens, and most of his leading characters are provided with a detailed genealogy. Dickens's great works, excepting David Copperfield and Great Expectations, had all appeared when Thackeray made his mark in 1848 with Vanity Fair, and Thackeray follows most of his predecessor's conventions, including his conventional religion, ethics and politics, but he avoids his worse faults of theatricality. He never forces the note or lashes himself into fury or sentimentality; he limits himself in satire to the polite sphere which he understands, he is a great master of style and possesses every one of its fairy gifts except brevity. He creates characters and scenes worthy of Dickens, but within a smaller range and without the same abundance. He is a traveller and a cosmopolitan, while Dickens is irremediably Cockney. He is often content to criticize or annotate or to preach upon some congenial theme, while Dickens would be in the flush of humorous creation. His range, it must be remembered, is wide, in most respects a good deal wider than his great contemporary's, for he is at once novelist, pamphleteer, essayist, historian, critic, and the writer of some of the most delicate and sentimental vers d'occasion in the language.

The absorption of England in itself is shown with exceptional force in the case of Thackeray, who was by nature a cosmopolitan, yet whose work is so absorbed with the structure of English society as to be almost unintelligible for Godwin, Coleridge and Wordsworth. The firm belief in Laws and Conscience in relation to the new problems of the time had been almost abandoned by the novel since Richardson's time. It was for woman to attempt to resolve these questions, and with the aid of powerful imagination to propound very different conclusions. The conviction of Charlotte Brontë (1816-1855) was that the mutual passionate love of one man and one woman is sacred and creates a centre of highest life, energy and joy in the world. George Eliot (1819-1880), on the other hand, detected a blind and cruel egoism in all such ecstasy of individual passion. It was in the autumn of 1847 that Jane Eyre shocked the primness of the coteries by the unconcealed ardour of its love passages. Twelve years later Adam Bede astonished the world by the intensity of its ethical light and shade. The introspective novel was now very gradually to establish a supremacy over the historical. The romance of the Brontës' forlorn life colours Jane Eyre, colours Wuthering Heights and colours Villette; their work is inseparable from their story to an extent that we perhaps hardly realize. George Eliot did not receive this adventitious aid from romance, and her work was, perhaps, unduly burdened by ethical diatribe, scientific disquisition and moral and philosophical asides. It is more than redeemed, however, by her sovereign humour, by the actual truth in the portrayal of that absolutely self-centred and essentially egotistical society of the 'thirties and 'forties, and by the moral significance which she extracts from the smaller actions and more ordinary characters of life by means of sympathy, imagination and a deep human compassion. Her novels are generally admitted to have obtained twin summits in Adam Bede (1859) and Middlemarch (1872). An even nicer delineator of the most delicate shades of the curiously remote provincial society of that day was Mrs Gaskell (1810-1865), whose Cranford and Wives and Daughters attain to the perfection of easy, natural and unaffected English narrative. Enthusiasm and a picturesque boyish ardour and partisanship are the chief features of Woodrow Hol and the other vivid and stirring novels of Charles Kingsley (1819-1875), to which the bubble-gum in the gymnastics of chivalry must be added in the case of his brother Henry Kingsley (1830-1876). Charles, however, was probably more accomplished as a poet than in the to him too exciting operation of taking sides in a romance. The novels of Trollope, Reade and Wilkie Collins are, generally speaking, a secondary product of the literary forces which produced the great fiction of the 'fifties. The two last were great at structure and sensation; Trollope dogs the proce of every-day life with a certainty and a clearness that border upon inspiration. The great novels of George Meredith range between 1859 and 1886, stories of characters deeply interesting who reveal themselves to us by flashes and trust to our inspiration to do the rest. The wit, the sparkle, the entrain and the horizon of these books, from Richard Feverel to the master analysis of
His protest against the materialistic view of life is, perhaps, a more valid one than Tennyson's; he is at pains to show us the noble elements valuable in spite of failure to achieve tangible success. He realizes that the greater the man, the greater is the failure, yet protests unfailingly against the despondent or materialist view of life. His nimble appreciation of character and motive attracts the attentive curiosity of highly intellectual people; but if the question recurs with some persistency as to whether poetry, after all, was the right medium for the expression of these views.

Many of Browning's ideas and fertilizations will, perhaps, owing to the difficulty and uncertainty which attaches to their form, penetrate the future indirectly as the stimulant of other men's work. This is especially the case with those remarkable writers who have for the first time given the fine arts a considerable place in English literature, notably John Ruskin (Modern Painters, 1842, Seven Lamps, 1849, Stones of Venice, 1853), William Morris, John Addington Symonds and Walter Pater. Browning, it is true, shared the discipleship of the first two with Kingsley and Carlyle. But Ruskin outlived all discipleships and transcended almost all the prose writers of his period in a style the elements of emotional power in which still preserve their secret.

More a poet of doubt than either Tennyson or the college friend, A. H. Clough, whose loss he lamented in one of the finest pastoral elegies of all ages, Matthew Arnold takes rank with Tennyson, Browning and Swinburne alone among the Dil Majoes of Victorian poetry. He is perhaps a disciple of Wordsworth even more than of Goethe, and he finds in Nature, described in rarefied thought at times intensely beautiful phrase, the balm for the unrest of man's unsatisfied yearnings, the divorce between soul and intellect, and the sense of contrast between the barren toll of man and the magic operancy of nature. His most delicate and intimate strains are tinged with melancholy. The infinite desire of what might have been, the lacrimae rerum, inspires "Resignation," one of the finest pieces in his volume of 1849 (The Strayed Reveller). In the deeply-sighed lines of "Dover Beach" in 1867 it is associated with his sense of the decay of faith. The dreaming garden trees, the full moon and the white evening star of the beautiful English-coloured Thyrsis evoke the same mood, and render Arnold one of the supreme among elegiac poets. But his poetry is the most searching, the circle and admits the popular heart never for an instant. As a popularizer of Renan and of the view of the Bible, not as a rabbinist but as a literature, and, again, as a chastener of his contemporaries by means of the iteration of a few telling phrases about philosophies, baritones, sweetness and light, sweet reasonableness, high seriousness, Hebraism and Hellenism, "young lions of the Daily Telegraph," and "the note of provinciality," Arnold far eclipsed his fame as a poet during his lifetime. His crusade of banter against the bad civilization of his own class was one of the most audaciously successful things of the kind ever accomplished. But all his prose theorizing was excessively superficial. In poetry he sounded a note which the prose Arnold seemed hopelessly unable ever to fathom.

It is easier to speak of the virtuouso group who derived their first incitement to poetry from Chatterton, Keats and the early exotic ballads of Tennyson, far though these yet were from attaining the perfection in which they now appear after half a century of assiduous correction. The chief of them were Dante Gabriel Rossetti, his sister Christina, William Morris and Algernon Charles Swinburne. The founders of this school, which took and acquired the name Pre-Raphaelite, were primarily the brains of Dante Gabriel Rossetti and by the study of the early Florentine masters. Rossetti himself was an accomplished translator from Dante and from Villon. He preferred Keats to Shelley because (like himself) he had no philosophy. The 19th century was to him as if it had never been, he dislikes Greek lucidity and the open air, and prefers lean medieval saints, spectral images and mystic loves. The passion of these students was retrospective; they wanted to revive the literature of a
forgotten past, Italian, Scandinavian, French, above all, medieval. To do this is a question of enthusiastic experiment and adventure. Rossetti leads the way with his sonnets and ballads. Christina follows with *Goblin Market*, though she subsequently, with a perfected technique, writes poetry more and more confined to the religious emotions. William Morris publishes in 1883 his *Defence of Guenevere*, followed, in ten years by *The Earthly Paradise*, a collection of metrical tales, which hang in the sunshine like tapestries woven of golden thread, where we should naturally expect the ordinary paperhanging of prose romance.

From the verdurous gloom of the studio with its mysterious and occult properties in which Rossetti compounded his colours, Morris went forth shortly to chant and then to narrate. Socialist songs and parables, Algernon Charles Swinburne set forth to scandalize the critics of 1860 with the roses and lilies of vice and white death in *Poems and Ballads*, which was greeted with howls and hisses, and reproach against a "fleshy school of modern poetry." Scandalous verses these were, rioting on the crests of some of these billows of song. More discerning persons perceived the harmless impersonal unreality and mischievous youthful extravagance of all these Cyprian outbursts, that the poems were the outpourings of a young singer up to the chin in the Pierian flood, and possessed by a poetic energy so sudden that it caused the touchstones of reality or the chastening planes of experience. Swinburne far surpassed the promoters of this exotic school in technical excellence, and in *Atalanta in Calydon* and its successors may be said to have widened the bounds of English song, to have created a new music and liberated a new harmonic scale in his verse. Of the two elements which, superadded to a consummate technique, compose the great poet, intensity of imagination and intensity of passion, the latter in Swinburne much predominated. The result was a great abundance of heat and glow and not perhaps quite enough defining light. Hence the tendency to incomprehensibility, so fatal in its fascination for the poets of the last century, which would be a protest against the title of the triumvir of twilight to three of the greatest. It is this incomprehensibility which alienates the poet from the popular understanding and confines his audience to poets, students and scholars. Poetry is often comparable to a mountain range with its points and aiguilles, its peaks and crags, its domes and its summits. But Swinburne's poetry, filled with the sound and movement of great waters, is as incommunicable as the sea. Trackless and almost boundless, it has no points, no definite summits. The poet never seems to know precisely when he is going to stop. His metrical flow is wave-like, beautiful and rather monotonous, inseparable from the general effect. His endings seem due to an exhaustion of rhythm rather than to an exhaustion of sense. A cessation of meaning is less perceptible than a cessation of magnificent sound.

Akin in some sense to the attempt made to get behind the veil and to recapture the old charms and spells of the middle ages, to discover the open sesame of the *Morte D'Arthur* and the *Mabinogion* and to reveal the old Celtic and monastic life which once filled and dominated our islands, was the attempt to overthrow the twin gods of the 'forties and 'fifties, state-Protestantism and the sanctity of trade. The curiously assorted Saint Georges who fought these monsters were John Henry Newman and Thomas Carlyle. The first cause of the movement was, of course, the anomalous position of the Anglican Church, which had become a province of the oligarchy officered by younger sons. It stood apart from fashionable Protestantism, its ignorance of Rome, and consequently of what it protested against, was colossal; it was conscious of itself only as an establishment—it had produced some very great men since the days of the non-jurors, when it had mislaid its historical conscience, but these had either been great scholars in their studies, such as Berkeley, Butler, Warburton, Thomas Scott, or revivalists, evangelicals and missionaries, such as Wilson, Wesley, Newton, Romaine, Cecil, Venm, Martyn, who were essentially Congregationalists rather than rational Churchmen. A new spiritual beacon was to be raised; an attempt was to be made to realize the historical and cosmic aspects of the English Church, to examine its connexions, its descent and its title-deeds. In this attempt Newman was to spend the best years of his life.

The growth of liberal opinions and the denudation of the English Church of spiritual and historical ideas, leaving "only pulpit orators at Clapham and Islington and two-bottle orthodox" to defend it, seemed to involve the continued existence of Anglicanism in any form in considerable doubt. Swift had said at the commencement of the 18th century that if an act was passed for the extirpation of the gospel, bank stock might decline 10%; but a century later it is doubtful whether the passing of such a bill would have left any trace, however insensible, upon the stability of the money market. The Anglican *via media* had enemies not only in the philosophical radicals, but also in the new caste of men of science. Perhaps, as J. A. Froude suggests, these combined enemies, *The Edinburgh Review*, Brougham, Mackintosh, the Reform Ministry, Low Church philosophy and the London University were not so very terrible after all. The Church was a vested interest which had a greater stake in the country and was harder to eradicate than they imagined. But it had nothing to give to the historian and the idealist. They were right to fight for what their souls craved after and found in the Church of Andrews, Herbert, Ken and Waterland. In the divine mission of the Church lingered on in the minds of such men as Alexander Knox or his disciple Bishop Jebb; but few were prepared to answer the question—"What is the Church as spoken of in England? Is it the Church of Christ?"—and the answers were various. Hooker had said it was "the nation"; and in entirely altered circumstances, with some qualifications, Dr Arnold said the same. It was "the Establishment" according to the lawyers and politicians, both Whig and Tory. It was an invisible and mystical body, said the Evangelicals. It was the aggregate of separate congregations, said the Nonconformists. It was the parliamentary creation of the Reformation, said the Erastians. The true Church was the communion of the Pope; the pretended Church was a legalized schism, said the Roman Catholics. All these ideas were floating about, loose and vague, among people who talked much about the Church.

One thing was persistently obvious, namely, that the nationalist church had become opportunist in every fibre, and that it had thrown off almost every semblance of ecclesiastical discipline. The view was circulated that the Church owed its continued existence to the good sense of the individuals who officered it, and to the esteem which possession and good sense combined invariably engendered in the reigning oligarchy. But since Christianity was true—and Newman was the one man of modern times who seems never to have doubted this, never to have overlooked the unmistakable threat of eternal punishment to the wicked and unbelieving—modern England, with its march of intellect and its chatter about progress, was advancing with a light heart to the verge of a bottomless abyss. By a diametrically opposite chain of reasoning Newman reached much the same conclusion as Carlyle. Newman sought a haven of security in a rapprochement with the Catholic Church. The medieval influences already at work in Oxford began to fan the flame which kindled to a blaze in the ninetieth of the celebrated *Tracts for the Times*. It proved the turning of the ways leading Keble and Pusey to Anglican ritual and Newman to Rome. This anti-liberal campaign was poison to the state-churchmen and Protestants, and became perhaps the chief intellectual storm centre of the century. Charles Kingsley in 1864 sought to illustrate by recent events that veracity could not be considered a Roman virtue.

After some preliminary ironic sparring Newman was swung into writing what he deliberately called *Apologia pro vita sua*. In this, apart from the masterly dialectic and exposition in which he had already shown himself an adept, a volume of autobiography is made a chapter of general history, unsurpassed in its kind since the *Confessions* of St Augustine, combined with a perfection of form, a precision
of phrasing and a charm of style peculiar to the genius of the author, rendering it one of the masterpiece[s] of English prose. But while Newman was thus sounding a retreat, louder and more urgent voices were signalling the advance in a totally opposite direction. The Apologia fell in point of time between The Origin of Species and Descent of Man, in which Charles Darwin was laying the corner stones of the new science of which Thomas Huxley and Alfred Russel Wallace were to be among the first apostles, and almost coincided with the First Principles of a synthetic philosophy, in which Herbert Spencer was formulating a set of probabilities wholly destructive to the acceptance of positive truth in any form of religion. The typical historian of this Macaulay, 'fifties, Thomas Babington Macaulay, and the seminal thinker of the 'sixties, John Stuart Mill, had as determinedly averted their faces from the old conception of revealed religion. Nourished in the school of the great Whig pamphleteer historians, George Grote and Henry Hallam, Macaulay combined gifts of memory, enthusiastic conviction, portraiture and literary expression, which gave to his historical writing a resonance unequalled (even by Michelet) in modern literature. In spite of faults of taste and fairness, Macaulay's resplendent gifts enabled him to achieve for the period from Charles II. to the peace of Ryswick which Thucydides had done to the history of the ancients. The pictures that he drew with such exultant force are stamped ineffaceably upon the popular mind. His chief faults are not of detail, but rather a lack of subtlety as regards characterization and motive, a disposition to envisage history too exclusively as a politician, and the sequence of historical events as a kind of ordered progress towards the material ideals of universal trade and Whig optimism as revealed in the Great Exhibition of 1851.

Macaulay's tendency to disparage the past brought his whole vision of the Cosmos into sharp collision with that of his rival appellant to the historical conscience, Thomas Carlyle, the author of the Essay on the French Revolution. Carlyle had been one of Newman's. But Carlyle's descendency was totally irreconcileable with the attitude preserved by England towards the Holy Father, to whom he seldom referred save as "the three-hatted Papa," and "servant of the devil." It may be in fact almost regarded as the reverse or complement to the excess of self-complacency in Macaulay. We may correct the excess of one by the opposite excess of the other. Macaulay was an optimist in ecstasy with the material advance of his time in knowledge and power; the growth of national wealth, machinery and means of lighting and locomotion caused him to glow with satisfaction. Carlyle, the pessimist, regards all such symptoms of mechanical development as contemptible. Far from magnifying his own time, he criticizes it without mercy. Macaulay had great faith in rules and regulations, reform bills and parliamentary machinery. Carlyle regards them as wiles of the devil. Frederick William of Prussia, according to Macaulay, was the most execrable of fiends, a cross between Moloch and Puck, his palace was hell, and Oliver Twist and Smike were petted children compared with his son the crown prince. In the same bluff and honest father Carlyle recognized the ideal of his fancy and hugged the just man made perfect to his heart of hearts. Such men as Bentham and Cobden, Mill and Macaulay, had in Carlyle's opinion spared themselves no mistaken exertion to exalt the happiness of mankind and the happiness of their own day. The time had come to react at all hazards against the prevalent surfeit of civilization. Henceforth his literary activity was to take two main directions. First, tracts for the times against modern tendencies, especially against the demoralizing modern talk about progress by means of money and machinery which emanated like a miasma from the writings of such men as Mill, Macaulay, Brougham, Buckle and from the Quarterly. Secondly, a cyclopaean exhibition of Caesarism, discipline, the regimentation of workers, and the convertible of the Big Stick and the Bible, with a preference to the Big Stick as a panacea. The snowball, the present easily exceeded by reasoning or deductive processes which they despised. Carlyle himself felt that the condition of England was one for anger rather than discussion. He detested the rationalism and symmetry of such methodists of thought as Mill, Buckle, Darwin, Spencer, Lecky, Ricardo and other demonstrations of the dismal science—mere chaff he called it. The palliative philanthropy of the day had become his aversion even more than the inroads of Rome under cover of the Oxford movement which Froude, Borrow and Kingsley set themselves to correct. As an historian of a formal order Carlyle's historical portraits cannot hear a strict comparison with the published work of Gibbon and Macaulay, or even of Maine and Froude in this period, but as a biographer and autobiographer Carlyle's caustic insight has enabled him to produce much which is of the very stuff of human attention. His biographies of his contemporaries were written smoothly about the perfectibility of man and his institutions. Carlyle almost alone refused to distil his angry eloquence and went on railing against the passive growth of civilization at the heart of which he declared that he had discovered a cancer. This uncouth Titan worship and prostration before brute force, this constant ranting about jarls and vikings trembles often on the verge of cant and comedy, and his fiddling on the one string of human pretension and bankruptcy became discordant almost to the point of chaos. Instinctively destructive, he resents the apostleship of teachers like Mill, or the pioneer discoveries of the savants like Maine, of which he is always the most enthusiastic spectator, a great incalculable figure, the cross grandfather of a school of thought which is largely unconscious of its debt and which so far as it recognizes it takes Carlyle in a manner wholly different from that of his contemporaries.

The deaths of Carlyle and George Eliot (and also of George Borrow) in 1888 make a starting-point for the new schools of historians, novelists, critics and biographers, and those new nature students who claim to cure those evil effects of civilization which Carlyle and his disciples had discovered. History in the hands of Macaulay, Carlyle, and Mill had turned against machinery with the bias and tendency of change, the results obtained by those who consulted the oracle being more often than not diametrically opposite. With Froude still on the one hand as the champion of Protestantism, and with E. A. Freeman and J. R. Green on the other as nationalist historians, the school of applied history was fully represented in the next generation, but as the records grew and multiplied in print in accordance with the wise provisions made in 1857 by the commencement of the Rolls Series of medieval historians, and the Calendars of State Papers, to be followed shortly by the rapidly growing volumes of Calendars of Historical Manuscripts, historians began to concentrate their attention more upon the process of change as their right subject matter and to rely more and more upon documents, statistics and other impersonal and disinterested forms of material. Such historical writers as Lecky, Lord Acton, Creighton, Morley and Bryce contributed to the process of transition mainly as essayists, but the new doctrines were tested and to a certain extent put into action by such writers as Thorold Rogers, Stubbs, Gardiner and Maitland. The theory that History is a science, no less and no more, was propounded in so many words by Professor Bury in his inaugural lecture at Cambridge in 1903, and this view and the corresponding divergence of history from the traditional path as "the science of history" has become steadily more dominant in the world of historical research and historical writing since 1888. The bulk of quite modern historical writing can certainly be justified from no other point of view.

The novel since 1881 has pursued a course curiously analogous to that of historical writing. Supported as it was by masters of the old régime such as Meredith and Hardy, and by those who then ranked even higher in popular esteem such as Wilkie Collins, Anthony Trollope, Besant and Rice, Blackmore, William Black and a monstrous rising regiment of lady novelists—Mrs Lynn Linton, Rhoda Broughton, Mrs Henry Wood, Mrs Braden, Mrs Humphry Ward, the type seemed securely anchored to the old formats and the old way. In reality, however, many of these popular workers were already moribund and the novel was being honeycombed by French influence.
This is perceptible in Hardy, but may be traced with greater
distinctness in the best work of George Gissing, George Moore,
Mark Rutherford, and later on of H. G. Wells, Arnold Bennett
and John Galsworthy. The old novelists had left behind them
a giant's robe. Intellectually giants, Dickens and Thackeray
were equally gigantic spendthrifts. They worked in a fervent
heat above a glowing furnace, into which they flung
lavish masses of unshaped metal, caring little for immediate
effect or minute dexterity of stroke, but knowing full well that
the emotional energy of their temperaments was capable of
fusing the most intractable material, and that in the end they
would produce their great downright effect. Their spirits rose and fell,
but the case was desperate; copy had to be despatched at once
or the current serial would collapse. Good and had had to make
up the tale against time, and revelling in the very exuberance
and excess of their humour, the novelists invariably triumphed.
It was incumbent on the new school of novelists to economize their
work with more skill, to relieve their composition of
irrelevancies, to keep the writing in one key, and to direct it
consistently to one end—in brief, to unify the novel as a work
of art and to simplify its ornament.

The novel, thus lightened and sharpened, was conquering new
fields. The novel of the 'sixties remained not, perhaps, to win
many new triumphs, but a very popular instrument in the hands of
those who performed variations on the old masters, and much
later in the hands of Mr William de Morgan, showing a new
force and quiet power of its own. The novel, however, was
ramifying in other directions in a way full of promise for the
future. A young Edinburgh student, Robert Louis Stevenson,
had inherited much of the spirit of the Pre-Raphaelite virtuosos,
and combined with their passion for the romance of the historic
past a curiosity fully as strong about the secrets of romantic
technique. A coterie which he formed with W. E. Henley and his
cousin R. A. M. Stevenson studied words as a young art student
studies paint, and made studies for portraits of buccaneers with
the same minute drudgery that Rossetti had studied a wall or
Morris a piece of figured tapestry. While thus forming a new
romantic school whose work when wrought by his methods should be
fit to be grafted upon the picturesque historic fiction of Scott
and Dumas, Stevenson was also naturalizing the short story of
the modern French type upon English ground. In this
particular field he was eclipsed by Rudyard Kipling, who, though less
original as a man of letters, had a technical vocabulary and
descriptive power far in advance of Stevenson's, and was able in
addition to give his writing an exotic quality derived from
Oriental colouring. This regional type of writing has since been
widely imitated, and the novel has simultaneously developed in
many other ways, of which perhaps the most significant is the
psychological study as manipulated severally by Shorthouse,
Mallock and Henry James.

The expansion of criticism in the same thirty years was not a
whit less marked than the vast diversion of the novel. In
Criticism, the early 'eighties it was still tongue-bound by the
hypnotic influence of one or two copy-book formulae—
Arnold's "criticism of life" as a definition of poetry, and Walter
Pater's imputed doctrine of art. However, two dicta so manifestly absurd should have cast such a augur-like spell
upon the free expression of opinion, though it may of course,
like all such instances, be easily exaggerated, is nevertheless a
curious example of the enslavement of ideas by a confident clip-
trap. A few representatives of the old schools of motivated or
scientific criticism, deduced from the literatures of past time,
survived the new century in Leslie Stephen, Saintsbury, Stopford
Brooke, Austin Dobson, Courthouse, Sidney Colvin, Watts-
Dunton; but their argument is certainly not greater than among
the large class of emancipated who endeavour to concentrate the
attention of others without further ado upon those branches of
literature which the currents of art and taste make. Among the finest
appreciators of this period have been Pattison and Jebb, Myers,
Hutton, Dowden, A. C. Bradley, William Archer, Richard
Garnett, E. Gosse and Andrew Lang. Birrell, Walkley and Max
Beerbom have followed rather in the wake of the Stephens and
Bagehot, who have criticized the sufficiency of the titles made
out by the more enthusiastic and lyrical eulogists. In Arthur
Symons, Walter Raleigh and G. K. Chesterton the new age
possessed critics of great originality and power, the work of the
last two of whom is concentrated upon the application of ideas about art at large to the conception of literature. In
exposing palpable nonsense as such, no one perhaps did better serve in criticism than the veteran Frederic Harrison.

In the cognate work of memoir and essay, the way for which
has been greatly smoothed by co-operative lexicographical
efforts such as the Dictionary of National Biography, the New
English Dictionary, the Victoria County History and the like,
some of the most dexterous and permeating work of the transition
from the old century to the new was done by H. D. Traill, Gosse,
Lang, Mackail, E. V. Lucas, Lowes Dickinson, Richard le
Gallienne, A. C. Benson, Hilaire Belloc, while the open-air
relief work for dwellers pent in great cities, pioneered by Gilbert
White, has been expanded with all the zest and charm that a
novel pursuit can endow by such writers as Richard Jefferies,
an open-air and nature mystic of extraordinary power at his best,
Selous, Seton Thompson, W. H. Hudson.

The age has not been particularly well attuned to the efforts
of the newer poets since Coventry Patmore in the Angel in the
House achieved embroidery, often extremely beautiful,
on the Tennysonian pattern, and since Edward
FitzGerald, the first of all letter-writing commentators on life
and letters since Lamb, gave a new cult to the decadent century
in his version of the Persian centoist Omar Khayyam. The
prizes which in Moore's day were all for verse have now been
transferred to the prose novel and the play, and the poems them-
theselves have played into the hands of the Philistines by
distancing popularity in a fond preference for virtuosity and obscurity.
Most kinds of the older verse, however, have been well repre-
sented, descriptive and elegiac poetry in particular by Robert
Bridges and William Watson; the music of the waters of the
western sea and its isles by W. B. Yeats, Synge, Moira O'Neill,
"Fiona Macleod" and an increasing group of Celtic bards;
the highly wrought verse of the 17th-century lyricists by Francis
Thompson, Lionel Johnson, Ernest Dowson; the simplicity of a
more popular strain by W. H. Davies, of a brilliant rhetoric by
John Davidson, and of a more intimate romance by Sturge
Moore and Walter de la Mare. Light verse has never, perhaps,
been more lavishly rewarded than by the great and
Calverley and Lewis Carroll than by Austin Dobson, Locker
Lampson, W. S. Gilbert and Owen Seaman. The names of C. M. Doughty,
Alfred Noyes, Herbert Trench and Laurence Binyon were also
becoming prominent at the opening of the 20th century. For
originality in form and substance the palm rests in all probability
with A. E. Houseman, whose Shropshire Lad opens new avenues and
issues, and with W. E. Henley, whose town and hospital
poems had a poignant as well as an ennobling strain. The work
of Henry Newbolt, Mrs. Meynell and Stephen Phillips showed a
real poetic gift. Above all these, however, in the esteem of
many reign the verses of George Meredith and of Thomas Hardy,
whose Dynasts was widely regarded by the best judges as the
most remarkable literary production of the new century.

The new printed and acted drama dates almost entirely from the
late 'seventies. Tom Robertson in the 'seventies printed
nothing, and his plays were at most a timid recognition
of the claims of the drama to represent reality
and truth. The enormous superiority of the French drama as
represented by Augier, Dumas fils and Sardou began to
dawn slowly upon the English consciousness. Then in the 'eighties
came Ibsen, whose daring in handling actuality was only equalled
by his intrepid stage-craft. Oscar Wilde and A. W. Pinero were
the first to discover how the spirit of these new discoveries might
be adapted to the English stage. Gilbert Murray, with his
fascinating and tantalizing versions from Euripides, gave a new
flexibility to the expansion that was going on in English dramatic
ideas. Bernard Shaw and his disciples, conspicuous among them
Graville Barker, gave a new seasoning of wit to the absolute
novelties of subject, treatment and application with which
Poetry.
transfixed the public which had so long abandoned thought upon entering the theatre. This new adventure enjoyed a succès de siécle, the precise range of which can hardly be estimated, and the force of which is clearly by no means spent.

English literature in the 20th century still preserves some of the old arrangements and some of the consecrated phrases of patronage and aristocracy; but the circumstances of its production were profoundly changed during the 19th century. By 1895 English literature had become a subject of regular instruction for a special degree at the universities, both in England and America. There has begun to lead to research embodied in investigations which show that what were regarded as facts in connexion with the earlier literature can be regarded so no longer. It has also brought comparative and historical treatment of a closer kind and on a larger scale to bear upon the evolution of literary types. On the other hand it has concentrated an excessive attention perhaps upon the grammar and prosody and etymology of literature, it has sterilized the admiration of lifeless and obsolete forms, and has substituted antiquarian notes and ready-made commentary for that true enjoyment, which is essentially individual and which tends to insulate the separate from some of the circumstance of its changes.

It is prone, moreover, to force upon the immature mind a rapt admiration for the mirror before ever it has scanned the face of the original. A result due rather to the general educational agencies of the time is that, while in the middle of the 19th century one man could be found to write competently on a given subject, in 1910 there were fifty. Books and apparatus for reading have multiplied in proportion. The fact of a book having been done quite well in a certain way is no longer any bar whatever to its being done again without hesitation in the same way. This continual pouring of ink from one bottle into another is calculated gradually to raise the standard of all subaltern writing and compounding and to leave fewer and fewer books securely rooted in a universal recognition of their intrinsic excellence, power and idioms or personality of charm. Even then, of what we consider first-rate in the 19th century, for instance, but a very small residue can possibly survive. The one characteristic that seems likely to cling and to differentiate this voluminous century is its curious reticence, of which the 20th century has already made uncommonly short work. The new playwrights have untaught England a shyness which came in about the time of Southey, Wordsworth and Sir Walter Scott. That the best literature has survived hitherto is at best a pious opinion. The historian, therefore, it is a large work some day perhaps, to differentiate the supreme best, and such attempts have always been responsible for base superstition. It is clear that some limitation of the literary stock-in-trade will become increasingly urgent as time goes on, and the question may well occur as to whether we are insuring the right baggage. The enormous apparatus of literature at the present time is suitable only to a peculiar phasia and manner of existence. Some hold to the innate and essential aristocracy of literature; others that it is bound to develop on the popular and communal side for that at present, like machinery and other trades, it is a large work of some day to become advantageous to the rich. But to predict the direction of change in literature is even more futile than to predict the direction of change in human history, for of all factors of history, literature, if one of the most permanent, is also one of the least calculable.

T. STE.
ENGROSSING—ENIGMA

A real knowledge of engraving can only be attained by a careful study and comparison of the prints themselves, or of accurate facsimiles, so that books are of little use except as guides to prints when the reader happens to be unaware of their existence, or when their production is of technical processes. The value of the prints varies not only according to the artist, but also according to the fineness of the impression, and the "state" (or stage) in the making of the plate, which may be altered from time to time. "Proofs" may also be taken from the plate, and even touched up by the artist, in various stages and various degrees of fineness of impression.

The department of art-litterature which classifies prints is called Iconography, and the classifications adopted by iconographers are of the most various kinds. For example, if a complete book were written on Shakespearean iconography it would contain full information about all prints illustrating the life and works of Shakespeare, and in the same way there may be the iconography of a locality or of a single event.

The history of engraving is a part of iconography, and various histories of the art exist in different languages. In England W. Y. Otteley wrote an *Early History of Engraving*, published in two volumes 4to, in 1783, and that was intended to be a second volume on engravers and their works. The facilities for the reproduction of engravings by the photographic processes have of late years given an impetus to iconography. One of the best modern writers on the subject is Mr. W. H. Wood, whose book is *The History of Engraving in France* (1888), and published many notices of engravers to accompany the reproductions by M. Amand Durand. He is also the author of a useful little manual entitled *Les Mémoires de la gravure* (1871). Janson's work on the origin of wood and plate engraving, and on the knowledge of prints of the 15th and 16th centuries, was published at Paris in two volumes 8vo in 1868. The world's greatest works are Adam Bartsch, *Le Peintre-graveur* (1803-1843); J. D. Passavant, *Le Peintre-graveur* (1860-1864); P. G. Hamerton, *Graphic Arts* (1882); William Giphin, *Essay on Prints* (1781); J. Maberly, *The Print Collector* (1847). There is an *Introduction to the Collection of Ancient Prints* (1874); F. Wedmore, *Fine Prints* (1897). See also the lists of works given under the separate headings for *Line-Engraving*, *Etching*, *Mezzotint* and *Wood-Engraving*.

**ENGROSSING**, a term used in two legal senses: 1st the writing or copying of a legal or other document in a fair large hand (en gros), and 2nd the buying up of goods wholesale in order to sell at a higher price so as to establish a monopoly. The word "engross" has also an ordinary signification, *Lat.*, *litterae grossae*, thick, stout, large; through the A. Fr. *engrosser*, Med. Lat. *ingrossare*, to write in a large hand, and the French phrase *en gros*, in gross, wholesale. Engrossing and the kindred practices of forestalling and regrating were early regarded as serious offences in restraint of trade, and were punishable both at common law and by statute. They were of more particular importance in relation to the distribution of corn supplies. The statute of 1552 defines engrossing as "buying corn growing, or any other corn, grain, butter, cheese, fish or other dead victual, with intent to sell the same again." The law forbade all dealing in corn as an article of ordinary merchandise, apart from questions of foreign import or export. The theory was that when corn was plentiful in any district it should be consumed and therefore worth what it would bring, without much respect to whether the next harvest might be equally abundant, or to what the immediate wants of an adjoining province of the same country might be. The first statute on the subject appears to have been passed in the reign of Henry III., though the general policy had prevailed before that time both in popular prejudice and in the feudal custom. The statute of Edward VI. (1552) was the most important, and in it the offences were elaborately defined; by this statute any one who bought corn to sell it again was made liable to two months' imprisonment with forfeit of the corn. A second offence was punished by six months' imprisonment and forfeit of double the value of the corn, and a third by the pillory and utter ruin. The purpose was to prevent corn from one part of the country under licence to men of approved probity, which implied that there was to be some buying of corn to sell it again and elsewhere. Practically "engrossing" came to be considered buying wholesale to sell again wholesale. "Forestalling" was different, and the statutes were directed against a class of dealers who went forward and bought or contracted for corn and other provisions, and spread false rumours in derogation of the public and open markets appointed by law; to which our ancestors appear to have attached much importance, and probably in these times without reason. The statute of Edward VI. was modified by many subsequent enactments, particularly by the statute of 1563, by which it was declared that there could be no "engrossing" of corn when the price did not exceed 48s. per quarter, and which Adam Smith recognized, though it adhered to the variable and unsatisfactory element of price, as having contributed more to the progress of agriculture than any previous law in the statute book. In 1773 these injurious statutes were abolished, but the penal character of "engrossing" and "forestalling" had a root in the common law of England, as well as in the popular prejudice, which kept the evil alive to a later period. As the public enlightenment increased the judges were at no loss to give interpretations of the common law consistent with public policy. Subsequent to the act of 1773, for example, there was a case of conviction and punishment for engrossing hops, *v. Waddington*, 1880, 1 East, 143, but though this was deemed a sound and proper judgment at the time, yet it was soon afterwards overthrown in other cases, on the ground that buying wholesale to sell wholesale was not in "restraint of trade," as the former judges had assumed.

In 1800, one John Rusby was indicted for having bought ninety quarters of oats at 41s. per quarter and selling thirty of them at 43s. the same day. Lord Kenyon, the presiding judge, animadverted strongly against the repealing act of 1773, and addressed the jury strongly against the accused. Rusby was heavily fined, but, on appeal, the court was equally divided as to whether engrossing, forestalling and regrating were still offences at common law. In 1844, all the statutes, English, Irish and Scottish, defining the offences, were repealed and with them the supposed common law foundation. In the United States there have been strong endeavours by the government to suppress trusts and combinations for engrossing. (See also *Trusts; Monopoly*.)

**ENGYON**, an ancient town of the interior of Sicily, a Cretan colony, according to legend, and famous for an ancient temple of the Matres which aroused the greed of Verres. Its site is uncertain; some topographers have identified it with Gangi, a town 20 m. S.S.E. of Cefalu, but only on the ground of the similarity of the two names.

**ENID**, a city and the county-seat of Garfield county, Oklahoma, U.S.A., about 35 m. N.W. of Guthrie. Pop. (1900) 3444; (1907) 10,087 (355 of negro descent); (1910) 13,799. Enid is served by the St. Louis & San Francisco, the Atchison, Topeka & Santa Fé, and the Chicago, Rock Island & Pacific railways, and by several branch lines, and is an important railway centre. It is the seat of the Oklahoma Christian University (1907; co-educational). Enid is situated in a flourishing agricultural and stock-raising region, of which it is the commercial centre, and has various manufactures, including lumber, brick, tile and flour. Natural gas was discovered near the city in 1907. Enid was founded in 1893 and was chartered as a city in the same year.

**ENIGMA** (Gr. ἐνίγμα), a riddle or puzzle, especially a form of sphinx or prose composition in which the answer is concealed by means of metaphors. Such were the famous riddle of the Sphinx and the riddling answers of the ancient oracles. The most celebrated form of enigma-making became fashionable in Greece, and prizes were often given at banquets for the best solution of them (Athen. x. 457). In France during the 17th century enigma-making became fashionable. Boileau, Charles Rivière Dufresny and J. J. Rousseau did not consider it beneath their literary dignity. In 1646 the abbé Charles Cotier (1604-1682)
published a *Recueil des énigmes de ce temps*. The word is applied figuratively to anything inexplicable or difficult of understanding.

**ENKUIZEN,** a seaport of Holland in the province of North Holland, on the Zuider Zee, and a railway terminus, 114 m. N.E. by E. of Hoorn, with which it is also connected by steam tramway. In conjunction with the railway service there is a steamboat ferry to Stavoren in Friesland. Pop. (1900) 6865. Enkhuizen, like its neighbour Hoorn, exhibits many interesting examples of domestic architecture dating from the 16th and 17th centuries, when it was an important and flourishing city. The façades of the houses are usually built in courses of brick and stone, and adorned with *tarfings*, sculptures and inscriptions. Some ruined gateways belonging to the old city walls are still standing; among them being the tower-gateway called the Dromedary (1540), which overlooks the harbour. The tower contains several rooms, one of which was formerly used as a prison. Among the churches mention must be made of the Zuiderkerk, or South church, with a conspicuous tower (1450-1523); and the Westerkerk, or West church, which possesses a beautifully carved Renaissance screen and pulpit of the middle of the 16th century, and a quaint wooden bell-house (1519) built for use before the completion of the bell-tower. There are also a Roman Catholic church and a synagogue. The picturesque church hall (1589) contains some finely decorated rooms with paintings by Johan van Neck, a collection of local antiquities and the archives. Other interesting buildings are the orphanage (1616), containing some 17th and 18th century portraits and ancient leather hangings; the weigh-house (1550), the upper story of which was once used by the Surgeons' Guild, several of the windows being decorated with the arms of various members; the former mint (1611); and the ancient assembly-house of the dike-reeves of Holland and West Friesland. Enkhuizen possesses a considerable fishing fleet and has some shipbuilding and rope-making, as well as market traffic.

**ENNEKING, JOHN JOSEPH (1842— ),** American landscape painter, was born, of German ancestry, in Minster, Ohio, on the 4th of October 1842. He was educated at Mount St Mary's College, Cincinnati, served in the American Civil War in 1861-1862, studied art in New York and Boston, and gave it up because his eyes were weak, only to return to it after failing in the manufacture of tinware. In 1873-1876 he studied in Munich under Schleich and Leier, and in Paris under Daubigny and Bonnat; and in 1878-1879 he studied in Paris again and sketched in Holland. Enneking is a "plein-airist," and his favourite subject is the "November landscape" of Northern Holland, and more generally the half lights of early spring, late autumn, and winter dawn and evening.

**ENNIS (Gaelic, *Innis*, an island; Irish, *Ennis* and *Inish*),** the county town of Co. Clare, Ireland, in the east parliamentary division, on the river Fergus, 25 m. W.N.W. from Limerick by the Great Southern & Western railway. Pop. of urban district (1901) 5933. It is the junction for the West Clare line. Ennis has breweries, distilleries and extensive flour-mills; and in the neighbourhood limestone is quarried. The principal buildings are the Roman Catholic church, which is the pro-cathedral of the diocese of Killaloe; the parish church formed out of the "Novene monument" of Norbertine convent, beautifully situated on the shore of the same name, 3 m. S. of the town, possessing the unusual feature of a crypt and a holy well. Five miles N.W. of Ennis is Dysert O'Dea, with interesting ecclesiastical remains, a cross, a round tower and a castle. Ennis was incorporated in 1612, and returned two members to the Irish parliament until the Union, and thereupon to the Imperial parliament until 1885.

**ENNISCORTHY,** a market town of Co. Wexford, Ireland, in the north parliamentary division, on the side of a steep hill above the Slaney, which here becomes navigable for barges of large size. Pop. of urban district (1901) 3438. It is 7½ m. S. by W. from Dublin by the Dublin & South-Eastern railway. There are breweries and flour-mills; tanning, distilling and woollen manufactures are also prosecuted to some extent, and the town is the centre of the agricultural trade for the district, which is supplied with m. & s. by a regular communication with Wexford. There are important fowl markets and horse-fairs. Enniscorthy was taken by Cromwell in 1649, and in 1798 was stormed and burned by the rebels, whose main forces encamped on an eminence called Vinegar Hill, which overlooks the town from the east. The old castle of Enniscorthy, a massive square pile with a round tower at each corner, is one of the earliest military structures of the Anglo-Norman invaders, founded by Raymond le Gros (1176). Ferns, the next station to Enniscorthy on the railway towards Dublin, was the seat of a former bishopric, and the modernized cathedral, and ruins of a church, an Augustinian monastery founded by Dermot Mac-Murchadh in 1160, and a castle of the Norman period, are still to be seen. Enniscorthy was incorporated by James I., and sent two members to the Irish parliament until the Union.

**ENNISKILLEN, WILLIAM WILLOUGHBY COLE, 3rd Earl of (1807-1886),** British palaeontologist, was born on the 25th of January 1807, and educated at Harrow and Christ Church, Oxford. As Lord Cole he early began to devote his leisure to the study and collection of fossil fishes, with his friend Sir Philip de M. G. Egerton, and he amassed a fine collection at Florence Court, Enniskillen—a including many specimens that were later figured in Sir George DeKay's *Fossil Fishes*. The Cole Collection was subsequently acquired by the British Museum. He died on the 21st of November 1886, being succeeded by his son (b. 1845) as 4th earl.

The first of the Coles (an old Devonshire and Cornwall family) to settle in Ireland was Sir William Cole (d. 1653), who was "undertaker" of the northern plantation and received a grant of a large property in Fermanagh in 1611, and became provost and later governor of Enniskillen. In 1760 his descendant John Cole (d. 1767) was created Baron Mountflorence, and the latter's son, William Willoughby Cole (1736-1803), was in 1776 created Viscount Enniskillen and in 1789 earl. The 1st earl's second son, Sir Galbraith Lowry Cole (1772-1852), was a prominent general in the Peninsular War, and colonel of the 27th Inniskillings, the Irish regiment with whose name the family was associated.

**ENNISKILLEN [ENNISKILLING],** a market town and the county town of county Fermanagh, Ireland, in the north parliamentary division, picturesquely situated on an island in the river connecting the upper and lower loughs Erne, 116 m. N.W. from Dublin by the Great Northern railway. Pop. of urban district (1901) 5412. The town occupies the whole island, and is connected with two suburbs on the mainland on each side by two bridges. It has a brewery, tanneries and a small manufactory of cutlery, and a considerable trade in corn, pork and bacon. In 1689 Enniskillen defeated a superior force sent against it by James II. at the battle of Crome; and part of the defenders of the town were subsequently formed into a regiment of cavalry, which still retains the name of the Inniskilling Dragoons. The town was incorporated by James I., and returned two members to the Irish parliament until the Union; thereafter it returned one to the Imperial parliament until 1885. There are wide communications by water by the river and the upper and lower loughs Erne, and by the Ulster canal to Belfast. The loughs contain trout, large pike and other coarse fish. Two miles from Enniskillen in the lower lough is Devenish Island. Its celebrated monastic remains. The abbey of St Mary here was founded by St Molaise (Laserian) in the 6th century; here too are a fine round tower 85 ft. high, remains of domestic buildings, a holed stone and a tall well-preserved cross. The whole is carefully preserved by
the commissioners of public works under the Irish Church Act of 1869. Steamers ply between Enniskillen and Belleek on the lower lake, and between Enniskillen and Knocknanny on the upper lake.

ENNIUS, QUINTUS (239–170 B.C.), ancient Latin poet, was born at Rutiae in Calabria. Familiar with Greek as the language in common use among the cultivated classes of his district, and with Oscan, the prevailing dialect of lower Italy, he further acquired a knowledge of Latin; to use his own expression (Gellius xvii. 17), he had three "hearts" (corda), the Latin word being used to signify the seat of intelligence. He is said (Servius on Aen. vii. 691) to have claimed descent from one of the legendary kings of his native district, Messapus the eponymous hero of Messapia, and this consciousness of ancient lineage is in accordance with the high self-confident tone of his mind, with his sympathy with the dominant genius of the Roman republic, and with his personal relations to the members of her great families. Of his early years nothing is directly known, and we first hear of him in middle life as serving during the Second Punic War, with the rank of centurion, in Sardinia, in the year 204, where he attracted the attention of Cato the elder, and was taken by him to Rome in the same year. Here he taught Greek and adapted Greek plays for a livelihood, and by his poetical compositions gained the friendship of the greatest men in Rome. Amongst these were the elder Scipio and Fulvius Nobilior, whom he accompanied on his Aetolian campaign (189). Through the influence of Nobilior's son, Ennius subsequently obtained the privilege of free citizenship (Cicero, Brutus, 20, 70). He lived plainly and simply on the Aventine with the poet Caecilius Statius. He died at the age of 70, immediately after producing his tragedy Thyestes. In the last book of his epic poem, in which he seems to have given various details of his personal history, he mentions that he was in his 67th year at the date of its composition. He compared himself, in contemplation of the close of the great work of his life, to a gallant horse which, after having won the prize at the Olympic games, obtained his rest when weary with age. A similar feeling of pride at the completion of a great career is expressed in the memorial lines which he composed to be placed under his bust after death,—

"Let no one weep for me, or celebrate my funeral with mourning; for I still live, as I pass to and fro through the mouths of men." From the impression stamped on his remains, and from the testimony of his countrymen, we think of him as a man of a robust, sagacious and cheerful nature (Hor. Epp. ii. 1, 50; Cic. De sen. 5); of great industry and versatility; combining imaginative enthusiasm and a vein of religious mysticism with a sceptical indifference to popular beliefs and a scorn of religious imposture; and tempering the grave seriousness of a Roman with a genial capacity for enjoyment (Hor. Epp. i. 19, 7).

Till the appearance of Ennius, Roman literature, although it had produced the epic poem of Naevius and some adaptations of Greek tragedy, had been most successful in comedy. Naevius and Plautus were men of thoroughly popular fibre. Naevius suffered for his attacks on members of the aristocracy, and, although Plautus carefully avoids any direct notice of public matters, yet the bias of his sympathies is indicated in several passages of his extant plays. Ennius, on the other hand, was by temperament in thorough sympathy with the dominant aristocratic element in Roman life and institutions. Under his influence literature became less suited to the popular taste, more especially addressed to a limited and cultivated class, but at the same time more truly expressive of what was greatest and, most worthy to endure in the national sentiment and traditions. He was a man of many-sided activity. He devoted attention to questions of Latin orthography, and is said to have been the first to introduce shorthand writing in Latin. He attempted comedy, but with so little success that in the canon of Volcacius Sedigetus he is mentioned, solely as a mark of respect "for his antiquity," tenth and last in the list of comic poets. He may be regarded also as the inventor of Roman satire, in its original sense of a "medley" or "miscellany," although it was by Lucilius that the character of aggressive and censorious criticism of men and manners was first imparted to that form of literature. The work satura was originally applied to a rude scenic and musical performance, exhibited at Rome before the production of the regular drama. The satura of Ennius were collected in writings on various subjects, written in various metres and contained in four (or six) books. Among these were included metrical versions of the physical speculations of Epicurians, of the gastronomic researches of Archestratus of Gela (Hedypagheia), and, probably, of the rationalistic doctrines of Euhemerus. It may be noticed that all these writers whose works were thus introduced to the Romans were Sicilian Greeks. Original compositions were also contained in these sature, and among them the panegyric on Scipio, unless this was a drama. The satire of Ennius seems to have resembled the most artistic satire of Horace in its record of personal experiences, in the occasional introduction of dialogue, in the use made of fables with a moral application, and in the didactic office which it assumed.

But the chief distinction of Ennius was gained in tragic and narrative poetry. He was the first to impart to the Roman adaptations of Greek tragedy the masculine dignity, pathos and oratorical fervour which continued to animate them in the hands of Pacuvius and Accius, and, when set off by the acting of Aesopus, called forth vehement applause in the age of Cicero. The titles of about twenty-five of his tragedies are known to us, and a considerable number of fragments, varying in length from a few words to about fifteen lines, have been preserved. These tragedies were for the most part adaptations and, in some cases, translations from Euripides. One or two were original dramas of the class called praetextae, i.e. dramas founded on Roman history or legend; thus, the Ambracia treated of the capture of that city by his patron Nobilior, the Sabine of the rape of the Sabine women. The heroes and heroines of the Trojan cycle, such as Achilles, Ajax, Telamon, Cassandra, Andromache, were prominent figures in some of the dramas adapted from the Greek. Several of the more important fragments are found in Cicero, who expresses a great admiration for their manly fortitude and dignified pathos. In these remains of the tragedies of Ennius we can trace indications of strong sympathy with the nobler and bolder elements of character, of vivid realization of impassioned situations, and of sagacious observation of life. The frank bearing, fortitude and self-sacrificing heroism of the best type of the soldierly character find expression in the persons of Achilles, Telamon and Eurypylus; and a dignified and passionate tenderness of feeling makes itself heard in the lyrical utterances of Cassandra and Andromache. The language is generally nervous and vigorous, occasionally vivified with imaginative energy. But it flows less smoothly and easily than that of the dialogue of Latin comedy. It shows the same tendency to aim at effect by alliterations, assonances and plays on words. The rudeness of early art is most apparent in the inequality of the metres in which both the dialogue and the "recitative" are composed.

But the work which gained him his reputation as the Homer of Rome, and which called forth the admiration of Cicero and Lucretius and frequent imitation from Virgil, was the Annales, a long narrative poem in eighteen books, containing the record of the national story from mythical times to his own. Although the whole conception of the work implies that confusion of the provinces of poetry and history which was perpetuated by later writers, and especially by Lucan and Silius Italicus, yet it was a true instinct of genius to discern in the idea of the national destiny the only possible motive of a Roman epic. The execution of the poem (to judge from the fragments, amounting to about six hundred lines), although rough, unequal and often of strength less than the realistic fidelity and freshness of feeling of a contemporary chronicle with the vivifying and idealizing power of genius. Ennius prided himself especially on being the first to form the strong speech of Latin into the mould of the Homeric hexameter in place of the old Saturnian metre. And although it took several generations of poets to beat their music out to the perfection of the Virgilian cadences, yet in the rude adaptation of Ennius the secret of what ultimately
ENNOADIUS—ENOC

became one of the greatest orators of literary expression was first discovered and revealed. The inspiring idea of the poem was accepted, purified of all alien material, and realized in artistic shape by Virgil in his national epic. He deliberately imparted to that poem the charm of antique associations by incorporating with it much of the phraseology and sentiment of Ennius. The occasional references to Roman history in Lucretius are evidently reminiscences of the Annales. He as well as Cicero speaks of him with pride and affection as "Ennius noster." Of the great Roman writers Horace had least sympathy with him; yet he testifies to the high esteem in which he was held during the Augustan age. Oviedo expresses the grounds of that esteem when he characterizes him as

"Ingenio maximus, arte rudis."

A sentence of Quintilian expresses the feeling of reverence for his genius and character, mixed with distaste for his rude workmanship, with which the Romans of the early empire regarded him: "Let us revere Ennius as we revere the sacred groves, hallowed by antiquity, whose massive and venerable oak trees are not so remarkable for beauty as for the religious awe which they inspire." (Inst. or. x. i. 88.)

(5) Authors by M. Lapicida (1884). L. Valmaggi (1900, with notes), J. Vahlen (monographs by L. Müller (1884 and 1893). C. Pascal, Studi sugli scrittori Latini (1900); see also Mommsen, History of Rome, bk. iii. ch. 14. On Virgil's indebtedness to Ennius see C. Vrillari, Quae praeputae basili

ENNODIUS, MAGNUS FELIX (A.D. 474-521), bishop of Pavia, Latin rhetorician and poet. He was born at Areatius (Aries) and belonged to a distinguished but impenetrable family. Having lost his parents at an early age, he was brought up by an aunt at Ticinium (Pavia); according to some, at Mediolanum (Milan). After her death he was received into the family of a pious and wealthy young lady, to whom he was betrothed. It is not certain whether he actually married this lady; she seems to have lost her money and retired to a convent, whereupon Ennodius entered the Church, and was ordained deacon (about 493) by Epiphanius, bishop of Pavia. From Pavia he went to Milan, where he continued to reside until his elevation to the see of Pavia about 515. During his stay at Milan he visited Rome and other places, where he gained a reputation as a teacher of rhetoric. As bishop of Pavia he played a considerable part in ecclesiastical affairs. On two occasions (in 515 and 517) he was sent to Rome by Pope Symmachus (probably delivered before the king the occasion of his entry into Ravenna or Milan); like all similar works, it is full of flattery and exaggeration, but if used with caution is a valuable authority. The Life of St. Epiphanius, bishop of Pavia, the most often and perhaps the most important of all his writings, an interesting picture of the political activity and influence of the church; Eucharisticion de Vita Sua, a sort of "confessions," after the manner of St. Augustine; the description of the confiscation of a slave with religious formalities in the presence of a bishop; Paraenesis didascalica, an educational guide, in which the claims of grammar as a preparation for the study of rhetoric, the mother of all the sciences, are strongly insisted on. The discourses (Dictiones) are sacred, scholastic, controversial and ethical. The discourse on the acts of Laurentius, bishop of Milan, is the chief authority for the life of that saint. The introduction, which contains records of the practical exercises for the schools, contain eulogies of classical learning, distinguished professors and pupils; the controversial deal with subjects of religious polemic and are probably intended for church use; epigrams on various subjects, some being epigrams proper—inscriptions for tombs, basilicas, baptisteries—others imitations of Martial, satirical pieces and descriptions of scenery.

There are two excellent editions of Ennodius by G. Hartel (vol. vi. of Corpus scriptorum ecclesiasticorum Latinorum, Vienna, 1882) and F. Vogel (vol. vii. of Monumenta Germanica historicorum, 1883, with exhaustive prolegomena). On Ennodius generally consult M. Fertig, Ennodius und seine Zeit (1855-1860); A. Dubois, La Latinité d'Ennodius (1903); F. Magani, Ennodio (Pavia, 1886); A. Ebert, Allgemeine Geschichte der Liti. des Mittelalters (Abend-landische Geschichte der Poesie (1891); Teuffel, Hist. of Roman Literature, § 479 (Eng. tr., 1892). French translation by the abbé S. Léglise (Paris, 1906 foll.).

ENNS, a town of Austria, in upper Austria, 11 m. by rail S.E. of Linz. Pop. (1900) 4371. It is situated on the Enns near its confluence with the Danube and possesses a 15th-century castle, an old Gothic church, and a town hall erected in 1566. Three miles to the S.W. lies the Augustinian monastery of St Florian, one of the oldest and largest religious houses of Austria. Founded in the 7th century, it was occupied by the Benedictines till the middle of the 11th century. It was restored on a firm basis in 1071, when it passed into the hands of the Augustinians. The actual buildings, which are among the most magnificent in Austria, were constructed between 1686 and 1745. Its library, with over 70,000 volumes, contains valuable manuscripts and also a fine collection of coins. Enns is one of the oldest towns in Austria, and stands near the site of the Roman Lauroecum. The nucleus of the actual town was formed by a castle, called Anasburg or Anensburg, erected in 900 by the Bavarians as a post against the incursions of the Hungarians. It soon attained commercial prosperity, and by a charter of 1212 was made a town. It was incorporated into the abbey of Habsburg in 1247. An encounter between the French and the Austrian troops took place here on the 5th of November 1805.

ENOC (יון, יון, Henoch, Teaching or Dedication). (1) In Gen. iv. 17, 18 (J), the eldest son of Cain, born while Cain was building a city, which he named after Enoc; nothing is known of the city. (2) In Gen. v. 24, &c. (P), seventh in descent from Adam in the line of Seth; he "walked with God," and after 365 years "was not for God took him." (1) and (2) are often regarded as both corruptions of the seventh primitive king Evedorachos (Enmeduranki in cuneiform inscriptions), the two genealogies, Gen. iv. 16-24, v. 12-17, being variant forms of the Babylonian list of primitive kings. Enmeduranki is the favourite of the sun-god, cf. Enoc's 365 years.1) Heb. xi. 5 says Enoc "was not found, because God translated him." Later Jewish legends represented him as receiving revelations on astronomy, &c., as the first author; apparently following the Babylonian account which makes Enmeduranki receive instruction in all wisdom from the sun-god. One apocryphal works written in the name of Enoch are extant, the Book of Enoch, compiled from documents written 200-50 B.C., quoted as the work of Enoch, Jude 14 and 15; and the Book of the Secrets of Enoch, a.d. 1-50. Gen. 17: Concerning i. 3; Luke ii. 57; Wisdom iv. 7-14; Eclesius, xiv. 16. v. 32. 13) (2) Son, i.e. clan, of Midian, in Gen. xxiv. 4. 1 Chron. i. 33. (4) Son, i.e. clan, of Reuben, E. V. Henoch, Henoch, in Gen. xlvii. 9; Exod. vi. 14; Num. xxvi. 5; 1 Chron. v. 3. There may have been some historical connexion between these two clans with identical names.

ENOCHE, BOOK OF

The Ethiopic version, which alone preserves the entire text, is a very faithful translation of the Greek. Twenty-eight MSS. of this version are in the different libraries of Europe, of which fifteen are to be found in England. This version was made from an ancestor of the Greek fragment discovered at Giza. Some of the utterly unintelligible passages in this fragment are likewise reproduced in the Ethiopic. The same wrong order of the text in vii.-viii. is common to both. In order to recover the original text, it is from time to time necessary to retranslate the Ethiopic into Greek, and the latter in turn into Aramaic or Hebrew. By this means we are able to detect dittographies in the Greek and variants in the original Semitic. The original was written to a large extent in verse. The discovery of this fact is most helpful in the criticism of the text. This version was first edited by Laurence in 1838 from one MS., in 1851 by Dillmann from five, and in 1902 by Flemming from fifteen MSS., and in 1906 by the present editor from twenty-three.

Translations and Commentaries.—Laurence, The Book of Enoch (Oxford, 1821); Dillmann, Das Buch Henoch (1855); Schodde, The Book of Enoch (1882); Charles, The Book of Enoch (1893); Beer, Das Buch Henoch, in Kautzsch's Apok. u. Pseud. des A.T. (1900), ii. 217-310; Fleming and Radermacher, Das Buch Henoch (1901); Testa, Geschichte d. Christl. Judentums, 5. ed. (1892), p. 176; Theology of the Greek Apocrypha and Pseudepigrapha, by G. W. Baur; also by H. J. Driver, The Apocryphal and Pseudepigraphal Literature (1900); and several others. These works contain the text, with a valuable discussion and interpretation.

The different Elements in the Book, with their respective Characteristics and Dates.—We have remarked above that the Book of Enoch is divided into five parts:—i.-xxxvi., xxxvii.-lxxvi., lxxvi.-lxxxii., lxxxii.-lxxxi., lxxxi.-xcviii., written in the time of John Hyrcanus; (2) xxxviii.-lxxvi., lxxvi.-lxxix., before 64 B.C.; (3) the Noachic fragments, vi. 3-8, vii. 1-3, ix. 7, xi. 1, xi. xx., xxxix. 1, 24, liv. 7-iv. 2, lv., lv., lv. 25, cvi.-cvi., and (4) cvi., from a later hand. With much of this analysis there is no reason to disagree. The similitudes are undoubtedly of different authorship from the rest of the book, and in certain instances were added to the Book of Noah. On the other hand, the so-called groundwork has no existence unless in the minds of earlier critics and some of their belated followers in the present. It springs from at least four hands, and may be roughly divided into four parts, corresponding to the present actual divisions of the book.

A new critical analysis of the book based on this view was given by Charles (op. cit. pp. 24-33), and further developed by Clemen and Beer. The analysis of the latter (see Herzog, Realeencyx, xiv. 240) is very complex. The book, according to this scholar, is composed of the following separate elements from the Enoch tradition:—(1) Ch. i.-v.; (2) xii.-xvi.; (3) xvi.-xix.; (4) xx.-xxxvi.; (5) xxxvii.-lxxvi. (from diverse sources); (6) lxx.-lxxvi.; (7) lxxii.-lxxxi.; (8) lxxiii.-lxxv.; (9) lxxvi.-cvi.; (x) xliv.-xlvi.; (xi) xlv.-cvi.; (xii) cvi., and from the Noah tradition; (13) vi.-xii.; (xiv) xxxix. 1-2a, liv. 7-lv. 2, lx., lxv.-lxviii. 25; (15) cvii.-cvi. While Clemen finds eleven separate sources, Beer finds fifteen. A fresh study from the hand of Appel (Die Compositions des ethiopischen Henochbuchs, 1906) seeks to reach a final analysis of our book. But though it evinces considerable insight, it cannot escape the charge of extravagance. The original book or ground-work of Enoch consisted of i.-xvi., xx.-xxxvi. This work called forth a host of imitators, and a number of their writings, together with the groundwork, were edited as a Book of Methuselah, i.e. lxxii.-cvii. Then came the final redactor, who interpolated the groundwork and the Methuselah sections, adding two others from his own pen. The Similitudes he worked up from a series of later sources, and gave them the second place.
ENOCH, BOOK OF

in the final work authenticating them with the name of Noah. The date of the publication of the entire work Appel assigns to the years immediately following the death of Herod.

We shall now give an analysis of the book, with the dates of the various sections. Of the two sections only Chap. lxxvi.-lxxvii. the easiest first. Chap. lxxvi.-lxxvii. constitutes a work in itself, the writer of which had very different objects before him from the writers of the rest of the book. His sole aim is to give the law of the heavenly bodies in a form different from that which already existed in the hands of the editor of the whole work. Thus lxxvi.-lxxvii., which are concerned with the winds, the quarters of the heaven, and certain geographical regions: what is concerned here with written matters, are foreign to a work which professes in its title (lxxvi. 1) to deal only with the luminaries of the heaven and their laws. Finally, lxxvii. should stand before lxxviii.; for the opening words of lxxviii. do not introduce the whole section and the section can be partially established, for it was known by the author of Jubilees, and was therefore written before the last third of the 2nd century A.D.

Chaps. lxxvi.-lxxvii.—This section was written before 161 B.C., for "the great horn," who is Judas the Maccabees, was still warning when the author was writing. (Dillmann, Schurer and others take the great horn to be John Hyrcanus, but this interpretation is very much to be rejected.) These chapters record what was to be the first two deals with the first-world judgment; the third with the entire history of the world till the final judgment. An eternal Messianic kingdom is set up in the great city, which is established under the Messiah, with its centre in the New Jerusalem set up by God Himself.

Chaps. cxi.-civ.—In the preceding section the Maccabees were the religious champions of the nation and the friends of the Hasmoneans. Here we are concerned with the Sadducees and the Pharisees party. This section was written therefore after 134 B.C., when the breach between John Hyrcanus and the Pharisees took place and before the savage massacres of the latter by Judas Maccabaeus (55 B.C.); for it is not likely that the work was ready read in its present form in the hands of the Pharisees such a reference would be omitted. These chapters indicate a revolution in the religious hopes of the nation. An eternal Messianic Kingdom is no longer possible, for the soul, the one, at the close of which the final judgment will ensue. The righteous dead rise not to this kingdom but to spiritual blessedness in heaven itself—to an immortality of the soul. This section also has much to do with the Messianic prophecies of the first-chapter, which is described in the first three weeks of the Ten-Weeks Apocalypse, should be read immediately after xxii. 1-10, which recount the first seven weeks of the same apocalypse. But, furthermore, the section obviously begins with cxi. "Written by Enoch the scribe," &c. Then comes cxi. 1-10 as a natural sequel. The Ten-Weeks Apocalypse, xxii. 1-10, cxi. 12-17, it if came from the same hand, followed, and then xxiv. The attempt (by Clemen and Beer) to place the Ten-Weeks Apocalypse before 167, because it makes no reference to the Maccabees, is not successful; for here where the history of mankind begins from Adam to the final judgment is despatched in sixteen verses, such an enormous province of truth would have been sold for a trifle if the ten weeks of the Apocalypse are of test. It is the determined foe of the Maccabees, whom he would probably have stigmatized as apostates, if he had mentioned them at all, just as he similarly brands all the Sadducean priesthood that preceded them. The end of the capital of the world is approached in the third hundred years, in which time the Israel of God's glory and instructed in the secrets of nature and of man, which he wrote down in 366 books. God reveals to Enoch the history of the creation of the earth and the seven planets and circles of heaven and of man, the story of the fallen angels, the destruction of the world through 7000 years, and its millennium of rest. xxvii. 1-14, Enoch returns to earth, whence he was sent to heaven, he, not to dwell there, but to see if man has learned the lesson of the fallen angels; and if he has, to be shown how to avert the great judgment; xxvii. 14-28, Enoch saw in a vision. Now whereas vii., dealt with the fall of the angels, their destruction of mankind, and the condemnation of the fallen angels, we find, in the following chapters, the second great judgment, the judgment of the world by fire, xvi.-xxvi. 1-100. This is the most difficult section of the book. It from the prologue, Chap. vii.-xlvi., is apparently an independent fragment of the Enoch text. It is itself compounded of the Semajia and Azael myths, and in its present composite form is already presupposed by xxxvii.-xxxix. 1: hence its present form is earlier than 166 B.C. It represents a primitive and very original view of the eternal Messianic kingdom on earth, seeing that the righteous were to be present in the midst of the sons of men, and that he had seen them in heaven already. The author of the Book of Noah, his subject-matter (vii. 21-25) agrees most closely with that of these chapters in Enoch (see Charles' edition of Jubilees, pp. Ixxi. sq. 264). xvi.-xxvi. 1-10, on the other hand, belong to the Book of Noah, the second great judgment, 255 ordering, and with that of these chapters in Enoch (see Charles' edition of Jubilees, pp. Ixxi. sq. 264). xvi.-xxvi. 1-10. The original text seems to have been altered from the original text, and with that of these chapters in Enoch (see Charles' edition of Jubilees, pp. Ixxi. sq. 264).

Language and Place of Writing.—A large part of this book was written for the first time in Greek. This may be inferred from such statements as (i) xxx. 13, "And I gave him a name (i.e. from the four substances: the East, the West, the North and the South") (ii) xxvii. 19, "This is the word of the Lord in the mouth of Enoch," and the "first letter of the four quarters: ἀρχαῖον." It is impossible to derive this from the Semitic text. ἀρχαῖον? This derivation is impossible in Semitic. This context found elsewhere in the Sibylline Oracles of the seven angels mentioned in xx, have anything to do in xxxvii.-xxxviii. 1-5. vi.-v. seems to be of a different date and authorship.

Chaps. xxxvii.-xxxvii.—These constitute the well-known Similitudes. They were written before 64 B.C., for Rome was not yet known to the writer, and after 95 B.C., for the slaying of the righteous, of which the writer complains, was not perpetrated by the Maccabees before that date. This section consists of three similitudes—xlv. 1-44, xxvii. 5-7, xxvii. 14-25. They are included by xxxvii. and xxxviii. There are many interpolations—lxv.-lxxix. 25 confessedly from the Book of Noah; most probably also liv. 7-12. Whence others, as xx in. 1, 26, xli. 3-6, xlii. 1-6, xliii. 5-8 (since the 7 full months of the month, and place of the seven days mentioned in xx, have anything to do in xxxvii.-xxxviii. Finally, i.-v. seems to be of a different date and authorship.
sections may wholly or in part go back to Hebrew originals. There is a Hebrew Book of Enoch attributed to R. Ishmael ben Eliahu who lived at the close of the 1st century and the beginning of the 2nd century B.C. This book is very closely related to the Book of the Secrets of Enoch, or rather, to a large extent dependent upon it. Did Ishmael ben Eliahu use the Book of the Secrets of Enoch in its Greek form, or did he find portions of it in Hebrew? At all events, extensive quotations from a Book of Enoch are found in the rabbinical literature of the middle ages, and the provenance of these has not yet been determined. See Jewish Ency., i. 676 seq.

But there is a stronger argument for a Hebrew original of certain sections to be found in the fact that the Testaments of the XII. Patriarchs appears to quote xxxiv. 2, 3 of our author in T. Napht., v. 1, 7 mo. (1:19).

The book in its present form was written in Egypt. This may be inferred (1) from the variety of speculations which it holds in common with Philo and writings of a Hellenistic character that circulated mainly in Egypt. (2) The Phoenixes are Chalckydries (ch. xii.)—monstrous serpents with the heads of crocodiles—are natural products of the Egyptian imagination. (3) The syncretistic character of the creation account (xviii.-xxvi.) betrays Egyptian elements.

Relation to Jewish and Christian Literature.—The existence of a kindred literature in Neo-Hebrew has been already pointed out. We might note besides that it is quoted in the Book of Adam and Eve, the Apocalypse of Moses, the Apocalypse of Paul, the augury work De mens. Sinae et Sion, the Sybilline Oracles ii. 75, Origen, De princip. i. 3. 2. The authors of the Ascension of Isaiah, the Apoc. of Baruch and the Epistle of Barnabas were probably acquainted with it. In the New Testament the similarity of matter and diction is sufficiently strong to establish a close connexion, if not a literal dependence. Thus with Matt. v. 9, "Blessed are the peacemakers," cf. lii. 11, "Blessed is he who establishes peace": with Matt. v. 34, 35, 37, "Swear not at all," cf. xlii. 1, "I will not swear by a single oath, neither by heaven, nor by earth, nor by any other creature which God made—if there is no truth in man, let them swear by a word yea, yea, or nay, nay."

Date and Authorship.—The book was probably written between 160 B.C. and A.D. 70. It was written after 30 B.C., for it makes use of Sirach, the (Ethiopic) Book of Enoch and the Book of Wisdom. It was written before A.D. 70; for the temple is still standing: see lix. 2.

The author was an orthodox Hellenistic Jew who lived in Egypt. He believed in the value of sacrifices (xliii. 6; lix. 1, 2, &c.), but is careful to enforce enlightened views regarding them (xlv. 3; lixi. 4, 5) in the law, lii. 8, 9; in a blessedimmortality, l. 2; lxv. 6, 8-10, in which the righteous should be clothed in "the raiment of God's glory," xxii. 8. In questions relating to cosmology, sin, death, &, he is an eclectic, and himself the most unrestricted freedom, and readily incorporates Platonic (xxxv. 16), Egyptian (xlvv. 2) and Zend (xlivv. 4-6) elements into his system of thought.

Anthropological Views.—All the souls of men were created before the foundation of the world (xxxii. 15) and likewise their future abodes in heaven or hell (xlix. 2, lvi. 5). Man's name was derived, as we have already seen, from the four quarters of the world, and his body was compounded from seven substances (xxx. 8). He was created originally good: freewill was bestowed upon him with instruction in the two ways of light and darkness, and then he was left to mould his own destiny (xii. 15). But his preferences through the bias of the flesh took an evil direction, and death followed as the wages of sin (xxxv. 16).

ENOMOTO, BUYOU, VISCOUNT (1839-1909), Japanese vice-admiral, was born in Tokyo. He was the first officer sent by the Tokugawa government to study naval science in Europe, and after going through a course of instruction in Holland he returned in command of the frigate Kairyu Maru," built at Amsterdam to order of the Yedo administration. The salient episode of his career was an attempt to establish a republic at Hakodate. Finding himself in command of a squadron which represented practically the whole of Japan's naval forces, he refused to acquiesce in the deposition of the Shōgun, his liege lord, and, steaming off to Yezo (1867), proclaimed a republic and fortified Hakodate. But he was soon compelled to surrender. The newly organized government of the empire, however, instead of inflicting the death penalty on him and his principal followers, as would have been the inevitable sequel of such a drama in previous times, punished them with imprisonment only, and for four years after the Hakodate episode, Enomoto received an important expedition in Hokkaido, the very scene of his wild attempt. Subsequently (1874), as his country's representative in St. Petersburg, he concluded the treaty by which Japan exchanged the southern half of Sakhalien for the Kuriles. He received the title of viscount in 1885, and afterwards held the portfolios of communications, education and foreign affairs. He died at Tokyo in 1900.

ENOS (anc. Aenus), a town of European Turkey, in the villayet of Adrianople; on the southern shore of the river Maritza, where its estuary broadens to meet the Aegean Sea in the Gulf of Enos. Pop. (1905) about 8000. Enos occupies a ridge of rock surrounded by broad marshes. It is the seat of a Greek bishop, and the population is mainly Greek. It long possessed a valuable export trade, owing to its position at the mouth of the Maritza, the great natural waterway from Adrianople to the sea. But its commerce has declined, owing to the unhealthiness of its climate, to the accumulation of sandbanks in its harbour, which now only admits small coasters and fishing-vessels, and to the rivalry of Dédéagatch, a neighbouring seaport connected with Adrianople by rail.

ENRÍQUEZ GOMEZ, ANTONIO (c. 1601-c. 1661), Spanish dramatist, poet and novelist of Portuguese-Jewish origin, was known in the early part of his career as Enrique Enriquez de Paz. Born at Segovia, he entered the army, obtained a captaincy, was suspected of heresy, fled to France about 1636, assumed the name of Antonio Enriquez Gomez, and became major-domo to Louis XIII., to whom he dedicated Luis dado de Dios à Anna (Paris, 1645). Some twelve years later he removed to Amsterdam, avowed his conversion to Judaism, and was buried in effigy at Seville on the 14th of April 1660. He is supposed to have returned to France, and to have died there in the following year. Three of his plays, El Gran Cardenal de España, don Gil de Albornoz, and the two parts of Pernan Mendes Pinto were received with great applause at Madrid about 1629; in 1635 he contributed a sonnet to Montalban's collection of posthumous panegyrics on Lope de Vega, to whose dramatic school Enriquez Gomez belonged. The Academias morales de las Musas, consisting of four plays (including A lo que obliga el honor, which recalls Calderon's Málaco de su honor), was published at Bordeaux in 1642; La Torre de Babillónia, containing the two parts of Pernan Mendes Pinto, appeared at Rouen in 1647; and in the preface to his poem, El Samson Nosareno (Rouen, 1656), Enriquez Gomez gives the titles of sixteen other plays issued, as he alleges, at Seville. There is no foundation for the theory that he wrote the plays ascribed to Fernando de Zárate. His dramatic works, though effective on the stage, are disfigured by extravagant incidents and preciosity of diction. The latter defect is likewise observable in the mingled prose and verse of La Culpa del primer peregrino (Rouen, 1644) and the dialogues entitled Política Amorous (Rouen, 1647). Enriquez Gomez is best represented by El Síntomas Feligrénico y Vida de don Gregorio Guadastra (Rouen, 1644), a striking picareseque novel in prose and verse which is still reprinted.

ENSICHEDE, a town in the province of Overysel, Holland, near the Prussian frontier, and a junction station 5 m. by rail S.E. of Hengelo. Pop. (1900) 23,141. It is important as the centre of the flourishing cotton-spinning and weaving industries of the Twente district; while by the railway via Gronau and
Koesfeld to Dortmund it is in direct communication with the Westphalian coalfields. Enschede possesses several churches, an industrial trade school, and a large park intended for the benefit of the working classes. About two-thirds of the town was burnt down in 1862.

**ENSENADA, MARQUES DE SOMODEVILLA, MARQUES DE LA (1701–1781)**, Spanish statesman, was born at Alesanco near Logroño on the 2nd of July 1702. When he had risen to high office it was said that his pedigree was distinguished, but nothing is known of his parents—Francisco de Somodevilla and his wife Francisca de Bengoechea,—nor is anything known of his own life before he entered the civil administration of the Spanish navy as a clerk in 1720. He served in administrative capacities at the relief of Ceuta in that year and in the recaptured of Oran in 1731. His ability was recognized by Don Jose Patiños, the chief minister of King Philip V. Somodevilla was much employed during the following years (11th of April 1744), when, on the death of Patiños's successor Campillo, he was chosen by Philip V. as minister of finance, war, the navy and the Indies (i.e. the Colonies). Ensenada met the nomination with a becoming _nolo episcopari_, professing that he was incapable of filling the four posts at once. His reluctance was overborne by the king, and he became in fact prime minister at the age of forty-one. During the remainder of the king's reign, which lasted till the 11th of July 1746, and under his successor Ferdinand VI. until 1754, Ensenada was the effective prime minister. His administration is notable in Spanish history for the vigour of his policy of internal reform. The reports on the finances and general condition of the country, which he drew up for the new king on his accession, and again after peace was made with England at Aix-la-Chapelle on the 18th of October 1748, are very able and clear-sighted. Under his direction the despotism of the Bourbon kings became paternal. Public works were undertaken, shipping was encouraged, trade was fostered, numbers of young Spaniards were sent abroad for education. Many of them abused their opportunity, but on the whole the prosperity of the country revived, and the way was cleared for the more sweeping innovations of the following reign. Ensenada was a strong partisan of a French alliance and of a policy hostile to England. Sir B. Keene, the English minister, supported the Spanish court party opposed to him, and succeeded in preventing him from adding the foreign office to others which he held. Ensenada would probably have fallen sooner but for the support he received from the Portuguese queen, Barbara. In 1754 he offended her by opposing an exchange of Spanish and Portuguese colonial possessions in America which she favoured. On the 20th of July of that year he was arrested by the king's order, and sent into mild confinement at Granada, which he was afterwards allowed to exchange for Puerto de Santa Maria. On the accession of Charles III. in 1759, he was released from arrest and allowed to return to Madrid. The new king named him as member of a commission appointed to reform the system of taxation. Ensenada could not renounce the hope of again becoming minister, and entered into intrigues which offended the king. On the 18th of April 1766 he was again exiled from court, and ordered to go to Medina del Campo. He had no further share in public life, and died on the 2nd of December 1781. Ensenada acquired wealth in office, but he was never accused of corruption. Though, like most of his countrymen, he suffered from the mania for grandeur, and was too fond of imposing schemes out of all proportion with the resources of the state, he was undoubtedly an able and patriotic man, whose administration was beneficial to Spain.

For his administration see W. Cox, Memoirs of the Kings of Spain of the House of Bourbon, London, 1815, but the only complete biography of Ensenada is that of Don Antonio Rodrigues Villa, Don Benito de Somodevilla, Marques de la Ensenada (Madrid, 1878). (D. H.)

**ENSIGN** (through the Fr. enseigne from the Latin plural _insignia_), a distinguishing token, emblem or badge such as symbols of office, or in heraldry, the ornament or sign, such as the crown, coronet or mitre borne above the charge or arms. The word is more particularly used of a military or naval standard or banner. In the British navy, ensign has a specific meaning, and is the name of a flag having a red, white or blue ground, with the Union Jack in the upper corner next the staff. The white ensign (which is sometimes further distinguished by having the St. George's Cross, quadrilobe or postern in the middle of the royal navy and the royal yacht squadron, while the blue and red ensigns are the badges of the naval reserve, some privileged companies, and the merchant service respectively (see FLAG). Until 1871 the lowest grade of commissioned officers in infantry regiments of the British army had the title of ensign (now replaced by that of second lieutenant). It is the duty of the officers of this rank to carry the colours of the regiment (see COLOURS, MILITARY). In the 16th century ensign was corrupted into "ancient," and was used in the two senses of a banner and the bearer of the banner. In the United States navy, the title ensign superseded in 1862 that of paymaster. It designates an officer ranking with second lieutenant in the army.

**ENSELAGE**, the process of preserving green food for cattle, in an undried condition in a silo (from Gr. ἐσίλαξ, Lat. _sirus_, a pit for holding grain), _i.e._ a pit, an erection above ground, or stack, from which air has been as far as possible excluded. The fodder which is the result of the process is called silage. In various parts of Germany a method of preserving green fodder precisely similar to that used in the case of _Sauerkraut_ has prevailed for upwards of a century. Special attention was first directed to the practice of ensilage by a French agriculturist, Auguste Goffart of the district of Sologne, near Orleans, who in 1877 published a work (Manuel de la culture et de l'ensilage des maïs et autres fourrages verts) detailing the experiences of many years in preserving green crops in silos. An English translation of Goffart's book by J. B. Brown was published in New York in 1879, and, as various experiments had been previously made in the United States in the way of preserving green crops in pits, Goffart's experience attracted considerable attention. The conditions of American dairy farming proved eminently suitable for the ensiling of green maize fodder; and the success of the method was soon indisputably demonstrated among the New England farmers. The favourable results obtained in America led to much discussion and to the introduction of the system in the United Kingdom, where, with different conditions, success has been more qualified. It has been abundantly proved that ensilage forms a wholesome and nutritious food for cattle. It can be substituted for root crops with advantage, because it is succulent and digestible; milk resulting from it is good in quality and taste; it can be securely kept irrespective of weather; it carries over grass from the period of great abundance and waste to times when none would otherwise be available; and a larger number of cattle can be supported on a given area by the use of ensilage than is possible by the use of green crops.

Early silos were made of stone or concrete either above or below ground, but it is recognized that air may be sufficiently excluded in a tightly pressed stack, though in this case a few inches of the fodder round the sides is generally useless owing to mildew. In America round erections made of wood and 35 or 40 ft. in depth are most commonly used. The crops suitable for ensilage are the ordinary grasses, clovers, lucerne, vetches, oats, rye and maize, the latter being the most important silage crop in America; various weeds may also be stored in silos with good results, notably spurrey (_Spergula arvensis_), a most troublesome plant in poor light soils. As a rule the crop should be mown
ENTHUSIASM, a word originally meaning inspiration by a divine aphasis or by the presence of a god. The Gr. ἐθυσιασμός, from which the word is adapted, is formed from the verb ἐθυσιάζειν, to be ἐθος, possessed by a god (θεός). Applied by the Greeks to manifestations of divine "possession," by Apollo, as in the case of the Pythia, or by Dionysus, as in the case of the Bacchantes and Maenads, it was also used in a transferred or figurative sense; thus Socrates speaks of the inspiration of poets as a form of enthusiasm (Plato, Apol. Soc. 22 c). Its use in religious contexts, as confined to an exaggerated or wrongful belief in religious inspiration, or to intense religious fervour or emotion. Thus a Syrian sect of the 4th century B.C. was known as "the Enthusiasts"; they believed that by perpetual prayer, ascetic practices and contemplation, man could become inspired by the Holy Spirit, in spite of the ruling evil spirit, which the fall had given to him. From their belief in the efficacy of prayer (εὐθύγη), they were also known as Euclites. In ordinary usage, "enthusiasm" has lost its peculiar religious significance, and means a whole-hearted devotion to an ideal, cause, study or pursuit; sometimes, in a depreciatory sense, it implies a devotion which is partisan and is blind to difficulties and objections. (See further Inscriptions, for a comparison of the religious meanings of "enthusiasm," "erythyma." )

ENTHYMEME (Gr. ἐνθυμεμένος), in formal logic, the technical name of a syllogistic argument which is incompletely stated. Any one of the premises may be omitted, but in general it is that one which is most obvious or most naturally present to the mind. In point of fact the full formal statement of a syllogism is rare, especially in rhetorical language, when the deliberate omission of one of the premises has a dramatic effect. Thus the
suppression of the conclusion may have the effect of emphasizing the idea which necessarily follows from the premises. Far more common is the omission of one of the premises which is either too clear to need statement or of a character which makes its omission desirable. A famous instance quoted in the Port Royal Logic, pt. iii. ch. xiv., is Medea's remark to Jason in Ovid's Medea, "Servare potui, perdere an possim rogab?" where the major premise "Quis servare, perdere possint?" is understood. This use of the word enthymeme differs from Aristotle's original application of it to a syllogism based on probabilities or signs (ἐπί οἷς ἑν διωκομένων), i.e. on propositions which are generally valid (ἐξάκριτα) or on particular facts which may be held to justify a general principle or another particular fact (Anal. prior. β. xxvii. 70 a 10).

ENTOMOLOGY (Gr. ἔντομα, insects, and λέγειν, a discourse), the science that treats of insects, i.e. of the animals included in the class Hexapoda of the great phylum (or sub-phylum) Arthropoda. The term, however, is somewhat elastic in its current use, and students of centipedes and spiders are often reckoned among the entomologists. As the number of species of insects is believed to be in excess of that of all other animals taken together, it is no wonder that their study should form a special division of zoology with a distinctive name.

Beetles (Scarabaei) are the subjects of some of the oldest sculptured works of the Egyptians, and references to locusts, bees and ants are familiar to all readers of the Hebrew scriptures. The interest of insects to the eastern races was, however, economic, religious or moral. The science of insects began with Aristotle, who included in a class "Entoma" the true insects, the arachnids and the myriapods, the Crustacea forming another class ("Malacostraca") of the "Anaea" or "bloodless animals." For nearly 2000 years the few writers who dealt with zoological subjects followed Aristotle's leading.

In the history of the science, various lines of progress have to be traced. While some observers have studied in detail the structure and life-history of a few selected types (insect anatomy and development), others have made a more superficial examination of large series of insects to classify them and determine their relationships (systematic entomology), while others again have concerned themselves with the habits and life of insects (insect bionomics). During recent years the study of fossil insects (palaéoentomology) has attracted much attention.

The foundations of modern entomology were laid by a series of wonderful memoirs on anatomy and development published in the 17th and 18th centuries. Of these the most famous are M. Malpighi's treatise on the silkworm (1669) and J. Swammerdam's Bibliotheca naturae, issued in 1737, fifty years after his author's death, and containing observations on the structure and life-history of a series of insect types. Aristotle and Harvey (De generatione animalium, 1651) had considered the insect larva as a prematurely hatched embryo and the pupa as a second egg. Swammerdam, however, showed the presence under the larval cuticle of the pupal structures. His only unfortunate contribution to entomology—indeed to zoology generally—was his theory of pre-formation, which taught the presence within the egg of a perfectly formed but miniature adult. A year before Malpighi's great work appeared, another Italian naturalist, F. Redi, had disproved by experiment the spontaneous generation of maggots from putrid flesh, and had shown that they can only develop from the eggs of flies.

Meanwhile the English naturalist, John Ray, was studying the classification of insects, and he published in 1705 his Methodus insectarum, in which the nature of the metamorphosis received due weight. Ray's "Insects" comprised the Arachnids, Crustacea, Myriapoda and Annelida, in addition to the Hexapoda. Ray was the first to formulate that definite conception of the species which was adopted by Linnaeus and emphasized by his binomial nomenclature. In 1735 appeared the first edition of the Systema naturae of Linnaeus, in which the "Insecta" form a group equivalent to the Arthropoda of modern zoologists, and are divided into seven orders, whose names—Coleoptera, Diptera, Lepidoptera, &c., founded on the nature of the wings—have become firmly established. The fascinating subjects of insect bionomics and life-history were dealt with in the classical memoirs (1734-1742) of the Frenchman R. A. F. de Réaumur, and (1752-1758) of the Swede C. de Geer. The freshness, the air of leisure, the enthusiasm of discovery that mark the work of these old writers have lessons for the modern professional zoologist, who at times feels burdened with the accumulated knowledge of a century and a half. From the end of the 18th century until the present day, it is only possible to enumerate the outstanding features in the progress of entomology. In the realm of classification, the work of Linnaeus was continued in Denmark by J. C. Fabricius (Systema entomologica, 1775), and extended in France by G. P. B. Lamarck (Animalux sans vertèbres, 1801) and G. Cuvier (Leçons d'anatomie comparée, 1800-1805), and in England by W. E. Leach (Trans. Linn. Soc. xii., 1813). These three authors definitely separated the Arachnida, Crustacea and Myriapoda as classes distinct from the Insecta (see Hexapoda). The work of J. O. Westwood (Modern Classification of Insects, 1839-1840) connects these older writers with their successors of to-day.

In the anatomical field the work of Malpighi and Swammerdam was at first continued most energetically by French students. P. Lyonnet had published in 1760 his elaborate monograph on the goat-moth caterpillar, and H. E. Strauss-Dürckheim in 1828 issued his great treatise on the cockchafer. But the name of J. C. L. de Savigny, who (Mém. sur les animaux sans vertèbres, 1816) established the homology of the jaws of all insects whether biting or sucking, deserves especial honour. Many anatomical and developmental details were carefully worked out by L. Dufour (in a long series of memoirs from 1811 to 1860) in France, by G. Newport ("Insecta" in Ency. Anat. and Physiol., 1839) in England, and by H. Burmeister (Handbuch der Entomologie, 1832) in Germany. Through the 19th century, as knowledge increased, the work of investigation became necessarily more and more specialized. Anatomists like F. Leydig, F. Müller, B. T. Lowne and V. Gruber turned their attention to the detailed investigation of some one species or to special points in the structure of some particular organs, using for the elucidation of their subject the ever-improving microscopic methods of research.

Societies for the discussion and publication of papers on entomology were naturally established as the number of students increased. The Société Entomologique de France was founded in 1832, the Entomological Society of London in 1834. Few branches of zoology have been more valuable as a meeting-ground for professional and amateur naturalists than entomology, and not seldom has the amateur—as in the case of Westwood—developed into a professor. During the pre-Linnaean period, the beauty of insects—especially the Lepidoptera—had attracted a number of collectors; and these "Aurelians,"—regarded as harmless lunatics by most of their friends—were the forerunners of the systematic students of later times. While the insect fauna of European countries was investigated by local naturalists, the spread of geographical exploration brought ever-increasing stores of exotic material to the great museums, and specialization—either in the fauna of a small district or in the world-wide study of an order or a group of families—became constantly more marked in systematic work. As examples may be instanced the studies of A. H. Haliday and H. Lowc on the European Diptera, of John Curtis on British insects, of H. T. Stainton and O. Staudinger on the European Lepidoptera, of R. M'Lachlan on the European Coleoptera, of A. Hagen on the North American Neuroptera, of D. Sharp on the Dytiscidae and other families of Coleoptera of the whole world.

The embryology of insects is entirely a study of the last century. C. Bonnet indeed observed in 1745 the virgin-reproduction of Aphids, but it was not until 1842 that R. A. von Kölliker described the formation of the blastoderm in the egg of the midge Chironomus. Later A. Weismann (1863-1864)
traced details of the growth of embryo and of pupa among the Diptera, and A. Kovalevsky in 1871 first described the formation of the germinal layers in insects. Most of the recent work on the embryology of insects has been done in Germany or the United States, and among numerous students V. Graber, K. Heider, W. M. Wheeler and R. Heymons may be especially mentioned.

The work of de Réaumur and de Geer on the bionomics and life-history of insects has been continued by numerous observers, among whom may be especially mentioned in France J. H. Fabre and C. Janet, in England W. Kirby and W. Spence, J. Lubbock (Lord Avebury) and L. C. Miall, and in the United States C. V. Riley. The last-named may be considered the founder of the strong current of entomological workers now labouring in America. Though Riley was especially interested in the habits of insect life on agriculture and industry—economic entomology (g.v.)—he and his followers have laid the science generally under a deep obligation by their researches.

After the publication of C. Darwin's Origin of Species (1859) a fresh impetus was given to entomology as to all branches of zoology, and it became generally recognized that insects form a group convenient and hopeful for the elucidation of certain problems of animal evolution. The writings of Darwin himself and of A. R. Wallace (both at one time active entomological collectors) contain much evidence drawn from insects in favour of descent with modification. The phylogeny of insects has since been discussed by F. Brauer, A. S. Packard and many others; minute and alluring systems have been proposed by F. Müller, E. B. Poulton and M. C. Piepers; the bearing of insect habits on theories of use-inheritance by A. Weismann, G. W. and E. Peckham, G. H. T. Eimer and Herbert Spencer; variation by W. Bateson and M. Standfuss.

Bibliography.—References to the works of the above authors, and to many others, will be found under Hexapoda and the special articles on various insect orders. Valuable summaries of the labours of Malpighi, Swammerdam and other early entomologists are given in L. C. Miall and A. Denny's Cockroach (London, 1886), and L. Henneguy's Les Insectes (Paris, 1904).

ENTOMOSTRACA. This zoological term, as now restricted, includes the Branchiopoda, Ostracoda and Copepoda. Most of the Ostracoda have the body enclosed in a bivalve shell-covering, and normally unsegmented. The Branchiopoda have a very variable number of body-segments, with or without a shield, simple or bivalved, and some of the posterior appendages normally branchial. The Copepoda have normally a segmented body, not enclosed in a bivalved shell-covering, the segments not exceeding eleven, the limbs not branchial.

Under the heading Crustacea the Entomostraca have already been distinguished not only from the Thyrostraca and Cirripedia, but also from the Malacostraca, and an intermediate group of which the true position is still disputed. The choice is open to maintain the last as an independent subclass, and to follow Claus in calling it the Lepostraca, or to introduce it among the Malacostraca as the Nebaliacea, or with Packard and Sars to make it an entomostracan subdivision under the title Phyllo-
carida. At present it comprises the single family Nebaliidae. The bivalved carapace has a jointed rostrum, and covers only the front part of the body, to which it is only attached quite in front, the valve-like sides being under control of an adductor muscle. The eyes are stalked and movable. The first antennae have a lamellar appendage at the end of the peduncle, a decidedly non-entomostracan feature. The second antennae, mandibles and two pairs of maxillae may also be claimed as of malacostracan type. To these succeed eight pairs of foliaceous branchial appendages on the front division of the body, followed on the hind division by four pairs of powerful bifurcate swimming feet and two rudimentary pairs, the number, though not the nature, of these appendages varies in the different species. On the other hand, the two limbless segments that precede the caudal furca are decidedly non-malacostracan. The family was long limited to the single genus Nebalia (Leach), and the single species N. bipes (O. Fabricius). Recently Sars has added a Norwegian species, N. typhlops, not blind but weak-eyed. There are also now two more genera, Paranebalia (Clauis, 1886), in which the branchial feet are much longer than in Nebalia, and Nebaliopsis (Sars, 1887), in which they are much shorter. All the species are marine.

Branchiopoda.—In this order, exclusion of the Phyllobranchiata will leave three suborders of very unequal extent, the Phyllopoda, Cladocera, Branchiura. The constituents of the last have often been classed as Copepoda, and among the Branchiopods must be regarded as aberrant, since the "branchial tail" implied in the name has no feet, and the actual feet are by no means obviously branchial.

Phyllopoda.—This "leaf-footed" suborder has the appendages which follow the second maxillare variable in number, but all foliaceous and branchial. The development begins with a free development. There are three to five pairs of which there is great want of uniformity, one set having their limbs sheltered by no carapace, another having a broad shield over most of them, and a third having a bivalved shell-cover within which the whole body can be enclosed. In accord with these differences the sections may be named Gymnophylla, Notophylla, Concho-
phylia. The equivalent terms applied by Sars are Anostraca, Notostraca, Conchostraca, involving a termination already appropriated to higher divisions of the Crustacean class, for which it ought to be reserved.

1. Gymnophylla.—These singular crustaceans have long soft flexible bodies, the eyes stalked and movable, the first antennae small and filiform, the second lamellar in the female, in the male prehensile; this last character gives rise to some very fanciful developements. There are three to five pairs, or of which there is great want of uniformity, one set having their limbs sheltered by no carapace, another having a broad shield over most of them, and a third having a bivalved shell-cover within which the whole body can be enclosed. In accord with these differences the sections may be named Gymnophylla, Notophylla, Concho-
phylia. The equivalent terms applied by Sars are Anostraca, Notostraca, Conchostraca, involving a termination already appropriated to higher divisions of the Crustacean class, for which it ought to be reserved.

2. Notophylla.—In this division the body is partly covered by a broad shield, united in front with the head; the eyes are sessile. The first antennae are small, the second considerably modified to form an ovisac. Development begins with a nauplius stage. Males are very rare. The single family Apodidae contains only two genera, Aphis and its very near neighbour Lepidus, A. placenta (Spassky) and Hali, (1896) may rank as the largest of the Entomostraca, reaching in the male, from front of shield to end of telson, a length of 70 mm., in the female of 64 mm. In a few days, or at most a fortnight, after a rainfall numberless specimens of these crustaceans are found in the water-pool in which they are to be found in the water-pools prior to the rain, these must have been developed from the egg. Similarly, in Northern India A. hima-
lolax (H. Milne-Edwards) "collected from stagnant pool in a jungle four days after a shower of rain had fallen," or "during a drought of four months (Packard)."
3. Conchocephalia.—Though concealed within the bivalved shell-cover, the mouth-parts are nearly as in the Gymnophylly, but the breathing tube is not the branchial opening. The antennae correspond with what is only a larval character in the other phyllopods. In the male the one or two pairs of feet are situated beneath the ventral valves. Though a small large cremaster is present beneath the dorsal part of the valves. The development usually begins with a nauplius stage (Sars, 1896, 1900). There are four families: (a) The Limnadiidae, with feet from 18 to 32 pairs, composed of that single genus Lymna, established by O. F. Müller in 1778 and 1781, and first described by Leach in 1816 in the Encyclopaedia Britannica (Art. Annuola), of this edition. Leach assigns the title to the single species L. brachyurus (Müller), and as this is included in the genus Limnita (Lövén, 1873), that genus must be a synonym of Lymna as restricted. (b) Leptothoracidae. Estheria (Küppel, 1837) was instituted for the species dakaholacemis, which Sars includes in his genus Leptothorax (1866); but Estheria was already appropriated, and of its synonyms Cyclus (Audouin, 1837) is lost for vagueness, while Isaura (Joly, 1842) is also appropriated, so that Leptothorax becomes the name of the type-species of that family. This family consists of the single species Cyclesithorax hislop1 (Baird), reported from India, Ceylon, Celebes, Australia, East Asia and New Zealand (1857) by S. H. Godwin-Austen. The first time it applied Sars with representatives of all the three in his Norwegian aquaria, in some of which the family Macrosticidae (Baird, 1843) is the earliest genus, among the latest being Grimaldina (Richard, 1882) and Jheringula (Sars, 1900). Dried mud and vegetable matter or the mud itself, and the animal is said to be of a character suited for the first ephippial formation in the females. For Sterblocerus pygmaeus, grown under the same conditions, Sars observes: "This is perhaps the smallest of the Cladocera known, and is hardly more than visible to the naked eye, the adult female scarcely exceeding 0.25 mm. Yet in the next family Alonella nana (Baird) disputes the palm and claims to be the smallest of all known Arthropoda. (d) Podotidae. This family is properly called Lymnaeidae, contains a large number of genera, among which one may usually search in vain, and rightly so, for the genus Lymnaeidae. The key to the ridge is to be found in the Encyclopaedia Britannica for 1816. There, as before explained, Leach assigns the subdivision of Müller's Cladoceran comprehensive genus, the result being that Lymnaeidae belongs to the Phyllopoda, and Chydoridae (Leach, 1816) properly gives its name to the present family, in which the doubly convoluted intestine is so remarkable its many genera, Leydigia, leydigoiopsis, monomolopistion have been already mentioned. Daphnia macroptera, (Sars, 1901), from South America and Ceylon, has a very large eye and an eye-spot fully half the length of its body, but it is a very active swimmer, odd in its behaviour, moving by jumps at the very surface of the water itself. The naked eye it looked like a little black atom darting about in a most wonderful manner. The Gymnoma, with a carapace too small to cover the feet, which are all prehensile, are divided also into two tribes, the Onychopa, in which the four pairs of feet have a toothed maxillary process at the base, and the Cladopoda, in which there are six pairs of feet, without such a process. To the Polyphemidae, the well-known family of the former tribe, Sars in 1897 added two remarkable genera, Carcaopis, meaning "tail with a sting," and Aplatus, "without a sting," for seven species from the Sea of Azov. The Cladopoda-like shape but with a single genus Lleptodora (Lilljeborg, 1861), Dr. Richard (1865, 1866) gives several references. Branchiura.—This term was introduced by Thorell in 1864 for the Argulidae, a family which had been transferred to the Branchiopoda by Zenker in 1854, though sometimes before and since united with the parasitic Copepoda. Though the animals have an oral siphon, they do not carry ovisacs like the siphonostomatous copepods, nor do they have exogenous objects. The lateral, compound, feebly movable eyes agree with those of the Phyllopoda. The family is described by Claus as

with setae arranged like the teeth of a comb, "variety-feet," in which the front feet are elongated and the posterior pairs composed of densely setose appendages. The Ctenopodinae comprise two families with a solitary species, Holopedium gibber, colored in a small large shell of bristles or spines. There, the carapace is divided into two parts, the cephalothorax and the abdomen, the latter part being composed of the first two segments. The exoskeleton is produced upon the ventral surface, and the appendages are generally of a more advanced type than in the previous orders. Within the order, the branches and appendages are typically elongated, the chitinous covering is often calcified, and the animals are usually active swimmers or floaters. The members of this order are generally found in freshwater environments, though some species are known from marine habitats. The order includes a number of families, each with distinct characteristics and geographic distributions.
ENTOMOSTRACA

Traced attanto parasites," because when gorged they lose their

Dias, fishes or frogs, and swim about in freedom for a con-

siderable period. The long-known Argulus (O. F. Müller) has

the second maxillae transformed into suckers, but in Dolops

(Audouin, 1837) (fig. 1), the name of which supersedes the more

familiar Gyropeltis (Heller, 1857), these effect attachment by

ending in strong hooks (Bouvier, 1897). A third genus, Chona-

pelis (Thiele, 1900), has suckers, but has lost its first antennae,

at least in the female.

Ostracoda.—The body, seldom in any way segmented, is

wholly encased in a bivalved shell the cavity of which is partly

infused, and almost always ending in a furca. The limbs, in-

cluding antennae and mouth organs, never exceed seven

definite pairs. The first antennae never have more than eight

joints. The young usually pass through several stages of
development after leaving the egg, and this commonly after,
even long after, the egg has left the maternal shell. Partheno-
genesis is frequent.

The four tribes instituted by Sars in 1865 were reduced to

two by G. W. Müller in 1894, the Myodocopa, which almost

always have a heart, and the Podocopa, which have none.

Myodocopa have the head and segments usually marine, with

at least three pairs of strong spines or unguis. Almost always

the shell has a rostral sinus. Müller divides the tribe into three

families, Cypridinidae, Holocyprididae, and the heartless Polycy-

poda, which contains the tribe Cladocora of Sars. From the first of

these Brady and Norman distinguish the Asastodeidae (fig. 3), re-

markable for seven pairs of long branchial leaves which fold

under the hinder extremity of the animal, and the Sarsidiidae, still somewhat

obscurely defined. It may be remarked that in the latter the

segmented, though entirely marine, Limiscythere is found in fresh water, and Xestoleberis broterii

(Fritz Müller) lives in the water that collects among the leaves

of Bromelias, plants allied to the pine-apples, (d) Darwinulidae, in

cladocora of fresh water. Brady and Norman, in their

Trieste, have described as "perhaps the most characteristic Entomostracan of

the East Anglian Fen District," (c) Cytherellidae, which, unlike the

Ostracoda in general, have the hinder part of the body segmented,
at least ten segments being distinguishable in the female. They

have the valves broad at both ends, and were placed by Sars in a

separate tribe, called Platycopa.

The range in time of the Ostracoda is so extended that, in

G. W. Müller’s opinion, their separation into the families now

living may have already taken place in the Cambrian period.

Their range in space, including carriage by birds, may be co-

extensive with the distribution of water, but it is not known

what height of climate they could withstand, though born

of the water they can sustain, how far they can penetrate

underground, nor what are the limits of their activity between

the floor and the surface of aquatic expanses, fresh or saline. In

individual size they have never been important, and of living

forms the largest is one of recent discovery, Crossophorus afri-

canus, a Cypridinid about three-fifths of an inch (15 mm.) long;

but a length of one or two millimetres is more common, and it

can ascend to the seventy-fifth of an inch. By multitude they

have been, and still are, extremely important.

Though the exterior is more uniform than in most groups of

Crustacea, yet in structure they are very various, and even
diversely sculptured (fig. 2), or membranaceous and polished,

hairly or smooth, oval or round or bean-shaped, or of some less

simple pattern; the valves may fit neatly, or to overlap the other,

their hinge may be teeth or bidental, and their front part

may be excavated for the protrusion of the antennae or have no

such "rostral sinus." By various modifications of their valves and

appendages the creatures have become adapted for swimming,

dwellers in fresh water, or parasites, as combining two or

more of these activities, for which their structure seems best

at first glance little adapted. Considering the imprisonment of

the ostracod body within the valves, it is more surprising that

the Asteroptidae and Cytherididae should have a pair of compound

and sometimes large eyes, in addition to the median organ at the base

of the "frontal tentacle," than that other members of the group should be limited

so much that median organ of sight, or have no eyes at all. The

median eye when present may be unjointed, or not be even,

and its three pigment-cups may be close together or

in a wide apart and the middle one rudimentary. As might be expected, in

thickened and highly embossed valves thin spaces occur over

the visual organ. The frontal organ varies in form and apparently

in function, and is sometimes absent. The first antennae, according

to the family, may assist in walking, swimming, burrowing, climbing,

and may be armed with strong spines or unguis. As in the

Asteroptidae, besides the "frontal tentacle," they have suckers on their setae (see Brady and Norman on Cytri-

dina norvegica). The second antennae are usually the chief motor

organs for swimming, walking and climbing. The mandibles

are generally strong, and their five-jointed, or less, legs that on

the second joint, the biting edge varying from strong development to

evanescent, the terminal joints or "palp" giving the organ a

function, which disappears in scuatorial genera such as Paragyna.

The variable first maxillae are seldom pediform, their function being concerned chiefly with

nutrition, sensation and respiration. The variability in form and

function of the second maxillae is sufficiently shown by the fact

that G. W. Müller, our leading authority, adopts the confusion

of calling them second maxillae in the Cypridinidae (including

Asteroptidae), maxillipeds in the Holocyprididae and Polycy-

poda, and first legs in the Brachyuranidae, Polycyprididae and Cyther-

idae, so that in his fine monograph he uses the term frill leg in

two quite different senses. The first legs, meaning thereby the sixth

pair of appendages, are generally pediform and locomotive, but

sometimes unjointed, acting as a kind of brushes to cleanse the furca, while in the Polycypridae they are entirely wanting. The second legs are sometimes wanting, sometimes pediform and locomotive, sometimes strangely metamorphosed into the "vermiform organ," generally long, many-jointed, and distally armed with retraced spines, its function seeming that of an extremely mobile cleansing foot. The abdomen

insert itself among the eggs in the broad-space, between the branchial

leaves of Asteroptidae (fig. 2), and sometimes passing through the external surface of the valves. The "brush-formed"

organs of the Podocopa are medially placed, and, in spite of their sometimes

forward situation, Müller believes among other possibilities that they

and the penis in the Cypri-

Ididae are alike remanants of a third pair of legs, not homologous

with the penis of other Ostracoda (Podocopa included). The furca is,

as a powerful organ, equipped with a large number of setae, and has its laminae edged with strong

toothy, or scute, or both. The furca have at first a naupliar body, and may differ and pass through various stages to

maturity. Brady and Norman, in their Mono-

graph of the Ostracoda of the North Atlantic and North-Western Europe

(1889), give a bibliography of 125 titles, and in the second edition (1896) they give 55 more. The

lists are not meant to be exhaustive, any more than G. W. Müller’s literature list of 125 titles in 1894. They do not refer to Latreille, 1802, with whom the term Ostracoda originates.

Copepoda.—The body is not encased in a bivalved shield; its articulated segments are at most eleven, those behind

the genital segment being without trace of limbs, but the last

almost always carrying a furca. Sexes separate, fertilization by

spermatophores. Ova in single or double or rarely several

Fig. 2.—Cythereis ornata (G. W. Müller). One eye-space is shown

above on the left.

Fig. 3.—Asteroptera artii. Left valve removed.
packets, attached as osivas or egg-strings to the genital openings, or enclosed in a dorsal marsupium, or deposited singly or occasionally in bundles. The youngest larvae are typical nauplii. The next, the copepodid or cyclopoid, stage is characterized by a cylindrical segmented body, with fore- and hind-body distinct, and by having at most six cephalic limbs and two pairs of swimming legs.

The species thus defined (see Giesbrecht and Schmeil, *Das Tierreich*, 1898), with far over a thousand species (Hansen, 1900), embraces forms of extreme diversity, although, when species are known in all their phases and both sexes, they constantly tend to prove that there are no sharply dividing lines between the free-living, the semi-parasitic, and those which in adult life are wholly parasitic and then sometimes grotesquely unlike the normal standard. Giesbrecht and Hansen have shown that the mouth-organs consist of mandibles, first and second maxillae and maxillipeds; and Claus himself relinquished his long-maintained hypothesis that the last two pairs were the separated exopods and endopods of a single pair of appendages.

Thorell's classification (1859) of Gnathostoma, Pocelostoma, Siphonostoma, based on the mouth-organs, was long followed, though almost at the outset shown by Claus to depend on the erroneous supposition that the Pocelostoma were devoid of mandibles. Brady added a new section, Choniotostoma, in 1894, and another, Leptostoma, in 1900, each for a single species. Canu in 1893 proposed two groups, Monoporedelphya and Diporedelphya, the copulatory openings of the female being paired in the latter, unpaired in the former. It may be questioned whether this distinction, however important in itself, would lead to a satisfactory grouping of families. In the same year Giesbrecht proposed his division of the order into Gymnoplea and Podopela.

In appearance an ordinary Copepod is divided into fore- and hind-body, of its eleven segments the composite first being the head, the next five constituting the thorax, and the last five the abdomen. The coalescence of segments, though frequent, does not after a little experience materially confuse the counting. But there is this peculiarity, that the middle segment is sometimes continuous with the broader fore-body, sometimes with the narrower hind-body. In the former case the hind-body, consisting only of the abdomen, forms a pleon or tail-part devoid of feet, and the species so constituted are Gymnoplea, those of (ii); naked or footless pleon. In the latter case the middle segment almost always carries with it to the hind-body a pair of rudimentary limbs, whence the term Podopela, meaning species that have a pleon with feet. It may be objected that hereby the term pleon is used in two different senses, first applying to the abdomen alone and then to the abdomen plus the last thoracic segment. Even this verbal flaw would be obviated if Giesbrecht could prove his tentative hypothesis, that the Gymnoplea may have lost a pre-genital segment of the abdomen, and the Podopela may have lost the last segment of the thorax. The classification is worked out as follows:

1. Gymnoplea.—First segment of hind-body footless, bearing the organs of the genital organs (in the male asymetrically placed); last foot of the fore-body in the male a copulatory organ; neither, or only one, of the first pair of antennae in the male geniculating; cephalic limbs abundantly articulated and provided with many plumose setae; heart generally present. Animals usually free-living, pelagic (Giesbrecht and Schmeil).

This group, with 65 genera and four to five hundred species, is divided into five tribes: (a) Gnathostomatidae (Bishop Gunner in 1770) of the marine free-swimming Copepoda. Among them also is the peacock Calanid, *Calocalanus pusio* (Dana), with its highly ornamented antennae and gorgeous tail, the most famous of all (fig. 9). (b) Amphipodinae. Here the males have one or the other of the first pair of antennae modified into a grasping organ for holding the female. The Ctenopodidae with 27 genera and *Ctenopoda* each with one genus. The first of these families is often called Centropodidae, but, as Sars has pointed out, *Diatomus* (Westwood, 1836) is the oldest genus in it. Of 177 species valid in the family Giesbrecht and Schmeil assign 67 to *Diatomus*. In regard to one of its species Dr. Brady says: "In one instance, at least (Tahiti Tarn, Cumberlend) I have seen the net come up from a depth of 6 or 8 ft. below the surface with a dense mass consisting almost entirely of *D. gracilis*."

The length of this net-filling species is about a twentieth of an inch.

2. Podoplea.—The first segment of the hind-body almost always with mandibles and a copulatory pair of segments (i) or (ii), symetrically placed in both sexes) in the following segment; neither the last foot of the fore-body nor the rudimentary feet just mentioned acting as a copulatory organ in the male; both or neither of the first pair of antennae in the male geniculating; cephalic limbs less abundantly articulated and with fewer plumose setae or none, but with hooks and clasping setae. Heart almost always wanting. Free-living (rarely pelagic or paraclitic (Giesbrecht and Schmeil).

This group is also divided by Giesbrecht into two tribes, Amphiathanria and Isolenania. In 1892 he distinguished the former as those in which the first antennae of the male have both members modified for holding the female, and the genital openings of the female have a ventral position, sometimes in close proximity, sometimes strongly lateral; the latter as those in which the first antennae of the male are similar to those of the female, the function of holding her being transferred to the male maxilipeds, while the genital openings of the female are dorsal, though at times strongly lateral. In 1899, with a view to the many modifications exhibited by parasitic and semi-parasitic species, the definitions, stripped of a too hampering precision, took a different form: (a) Amphipodiania. "Swimming Podopela with geniculating first antennae in the male sex, and descendants of such; first antennae in female and male almost always differently articulated." The families occupy fresh water as well as the sea. Naturally "descendants" which have lost the characteristical feature of the definition cannot be recognized without some further assistance than the definition supplies. Of the Podoplea, which were first described, the earliest described is *Dortopogus* (Giesbrecht), and are not mentioned by Giesbrecht in 1899 in the grouping of this section.

The *Thaumatoidea* include *Thaumatoessa* (Kroyer), established earlier than its synonym *Thaumatoidea* (O. Newton), of the Podoplea tribe, are imperfectly known. The defect of mouth-organs probably does not apply to the period of youth, which some of them spend parasitically in the body-cavity of various animals. The genera are allotted by Giesbrecht in 1900. *Cyclops* (O. F. Müller, 1776), though greatly restricted since Müller's time, still has several species of species abundantly peopling inland waters of every kind and situation, without one that can be relied on as exclusively marine like the species of *Oithona* (Baird). The *Misopodidae* are now limited to *Misophria* (Bosc.). The presence of a heart in this genus helps to make it a link between the Podopela and Gymnoplea, though in various other respects it approaches the next family. The *Arcticoidae* owe their name to the genus *Arcticoid* (Milne-Edwards, 1840). Brady in 1880 assigns to this family 23 genera and 81 species. Canu (1892) distinguishes eight subfamilies: *Lepidocerinae*, *Pelidocerinae*, *Tanachidae*, *Amphihopodiinae*, *Harpacticinae*, *Idyinae*, *Canthocamptinae* (for which Canthocamptinae should be read), and *Nannopinae*, adding *Slenheedinae* (Brady) without distinctive characters for it. The *Ascoceridae* have variable characters, showing a gradual adaptation to parasitic life in Tunicates. Giesbrecht (1900) considers Canu quite right in grouping together in this single family those parasitoids of ascidians, simple and compound, which had been previously distributed among families with the more or less distinct names *Notodelphyidae*, *Doropygidae*, *Buporidae*, *Schiapoidea*, *Kosmochelidae*, *Enteroxidae*, *Enteroidea*. Further, he includes in it his own *Enterognathina* (Usamai, not from an ascidian, but from the intestine of the beautiful starfish *Asterias rubens*). The *Asteroceridae*, which have a good swimming capacity, except in the case of *Cancella tubulata* (Dalyell), lead a semi-parasitic life on echinoderms, *spongios* &c., imbibing their food. Giesbrecht, displacing the older name *Ascosomontia*, assigns to this family 21 genera in five subfamilies, and suggests that the long-known but still puzzling *Nicothet* from the gills of the lobster might be placed in an
ENTRAGUES—ENTRE MINHO E DOURO

additional subfamily, or be made the representative of a closely related family. The Dichelestidae, on account of their sometimes many-jointed first antennae, are referred also to this tribe by Giesbrecht. (b) Swimming Podophila, without gniculating first antennae in the male sex, and descendants of such. First antennae of male and female almost always articulated alike. To this tribe Giesbrecht assigns the families Clausiidae, Corycaeidae, Oncopodidae, Lichnomolgidae, Entomonidae, Clausiidae, Nereicellidae. Here also must for the time be placed the Caligidae, Phyllophidae (Phyllophidae of Vogt, Carus, Claus), Lernaedae, Chondroeachididae, Sphaeromatidae (better known as Chlorionomatidae, from H. J. Hansen’s remarkable study of the group), Lernaeopodidae, HEPHYLOPIDAE. For the distinguishing marks of all these, the number of their genera and species, their habits and transformations and dwellings, the reader must be referred to the writings of specialists. (b) Swimming Podophila, without gniculating first antennae, or the Capitispidae, Cyclopidae, Notodapeda, Montriulidae, Caligidae, Lernaedae.

ENTRAGUES, CATHERINE HENRIETTE DE BALZAC D’ (1759–1833), marquise de Verneuil, mistress of Henry IV., king of France, was the daughter of Charles Balzac d’Entragues and of Marie Touchet, mistress of Charles IX. Ambitious and intriguing, she succeeded in inducing Henry IV. to promise to marry her after the death of Gabrielle d’Estrees, a promise which led to bitter scenes at court when shortly afterwards Henry married Marie de’ Medici. She carried her spite so far as to be deeply compromised in the conspiracy of Marshal Biron against the king in 1666, but escaped with a slight punishment, and in 1668 Henry actually took her back into favour again. She seems then to have been involved in the Spanish intrigues which preceded the flight of the king in 1668. See H. de la Ferrière, Henri IV. le roi, l’amoureux (Paris, 1890).

ENTRECASTEAUX, JOSEPH-ANTOINE BRUNI D’ (1739–1793), French navigator, was born at Aix in 1739. At the age of fifteen he entered the navy. In the war of 1778 he commanded a frigate of thirty-two guns, and by his clever seamanship was successful in convoying a fleet of merchant vessels from Mar- seilles to the Levant, although they were attacked by two pirate vessels, each of which was larger than his own ship. In 1785 he was appointed to the command of the French fleet in the East Indies, and two years later he was named governor of the Mauritius and the Isle of Bourbon. While in command of the East India fleet he made a voyage to China, an achievement which, in 1791, led the French government to select him to command an expedition which it was proposed to launch to the coast of China, tidings of the Chinese failure to return having been received by February 1788. Rear-admiral d’Entrecaustex’s expedition comprised the “Recherche” and “L’Esperance,” with Captain Huon de Kermadec as second in command. No tidings were obtained of the missing navigator, but in the course of his search Entrecaustex made important geographical discoveries. He traced the outlines of the eastern coast of New Caledonia, made extensive surveys round the Tasmanian coast, and touched at several places on the south coast of New Holland. The two ships entered Storm Bay, Tasmania, on the 21st of April 1792, and remained there until the 16th of May, surveying and naming the d’Entrecaustex Channel, the entrances to the Huon and Derwent rivers, Bruni Island, Recherche Bay, Port Esperance and various other localities. Excepting the naming of the river Derwent (originally called Riviere du Nord by its French discoverers), these foregoing appellations have been retained. Leaving Tasmania the expedition sailed northward for the East Indies, and while coasting near the island of Java, Entrecaustex was attacked by scurvy and died on the 20th of July 1793.

ENTRE MINHO E DOURO (popularly called Minho), a former province of Northern Portugal, bounded on the N. by Galicia and Spain, E. by Traz-os-Montes, S. by Beira and W. by the Atlantic Ocean. Pop. (1900) 1,710,361; area 2,790 sq. m. Though no longer officially recognized, the old provincial name remains in common use. The coast-line of Entre Minho e Douro is level and unbroken except by the estuaries of the main rivers; inland, the elevation gradually increases towards the north and east, where several mountain ranges mark the frontier. Of these, the most important are the Serra da Peneda (4,278 ft.), between the rivers Minho and Limia; the Serra do Geres (3,517 ft.), on the Galician border; the Serra da Cabreira (4,211 ft.), immediately to the south; and the Serra de Marão (4,642 ft.), in the extreme south-east. As its name implies, the province is bounded by two great rivers, the Douro (g.) on the south and the Minho (Spanish Miño) on the north; but a small tract of land south of the Douro estuary is also included within the provincial boundary. There are three other large rivers which, like the Minho, flow west-south-west into the Atlantic. The Limia or Antela (Spanish Linia) rises in Galicia, and reaches the sea at Vianna do Castello; the Cavado springs from the southern foot hills of La Raya Seca, on the northern frontier of Traz-os-Montes, and, forms at its mouth, the small harbour of Espozende; and the Ave descends from its sources in the Serra da Cabreira to Villa do Conde, where it enters the Atlantic. A large right-hand tributary of the Douro, the Tamega, rises in Galicia, and skirts the western slopes of the Serra de Marão.

The climate is mild, except among the mountains, and such plants as heliotrope, fuchsias, palms, and aloes thrive in the open throughout the year. Wheat and maize are grown on the plains, and other important products are wine, fruit, olives and chestnuts. Fish abound along the coast and in the main rivers; timber is obtained from the mountain forests, and dairy-farming and the breeding of pigs and cattle are carried on in all parts. As the province is occupied by a hardy and industrious peasantry, and the density of population (419-5 per sq. m.) is more than twice that of any other province on the Portuguese mainland, the soil is very closely cultivated. The methods and implements of the farmers are, however, most primitive, and at the beginning of the 20th century it was not unusual to see a mule, or even a woman, harnessed with the team of oxen to an old-fashioned wooden plough. Small quantities of coal, iron, antimony, lead and gold are mined; granite and slate are quarried; and there are mineral springs at Monção (pop. 2,283) on the Minho. The Oporto-Corunna railway traverses the western districts and crosses the Spanish frontier at Tuy; its branch lines give access to Braga, Guimarães and Povoa de Varzim; and the Oporto-Salamanca railway passes up the Douro valley. The greater part of the north and west can only be reached by road, and even the chief highways are ill-kept. In these regions the principal means of transport is the springless wooden cart, drawn by one or more of the tawny and under-sized but powerful oxen, with immense horns and elaborately carved yoke, which are characteristic of northern Portugal. For administrative purposes the province is divided into three districts: Vianna do Castello in the north, Braga in the centre, Oporto in the south. The chief towns are separately described; they include Oporto (167,955), one of the greatest wine-producing cities in the world; Braga (24,202), the seat of an archbishop who is primate of Portugal; the sea-ports of Povoa de Varzim (126,625) and Vianna do Castello (99,020); and Guimarães (91,049), a place of considerable historical interest.
ENTREPÔT—EOCENE

ENTREPÔT (a French word, from the Lat. interpositum, that which is placed between), a storehouse or magazine for the temporary storage of goods, provisions, &c.; also a place where goods, which are not allowed to pass into a country duty free, are stored under the superintendence of the custom house authorities till they are re-exported. In a looser sense, any town which has a considerable distributive trade is called an entrepôt. The word is also used attributively to indicate the kind of trade carried on in such towns.

ENTRE RIOS (Span. "between rivers"), a province of the eastern Argentine Republic, forming the southern part of a region sometimes described as the Argentine Mesopotamia, bounded N. by Corrientes, E. by Uruguay with the Uruguay river as the boundary line, S. by Buenos Aires and W. by Santa Fé, the Paraná river forming the boundary line with these two provinces. Pop. (1895) 202,010; (1905, est.) 375,000. The province has an area of 28,754 sq. m., consisting for the most part of an undulating, well-watered and partly-wooded plain, terminating in a low, swampy district of limited extent in the angle between the two great rivers. The great forest of Monteith occupies an extensive region in the N., estimated at nearly one-fifth the area of the province. Its soil is exceptionally fertile and its climate is mild and healthy. The province is sometimes called the "garden of Argentina," which would probably be sufficiently correct had its population devoted as much energy to agriculture as they have to political conflict and civil war. Its principal industry is that of stock-raising, exporting live cattle, horses, hides, jerked beef, tinned and salted meats, beef extract, mutton and wool. Its agricultural products are also important, including wheat, Indian corn, barley and fruits. Lime, gypsum and firewood are also profitable items in its export trade. The Paraná and Uruguay rivers provide exceptional facilities for the shipment of produce and the Entre Rios railways, consisting of a trunk line running E. and W. across the province from Paraná to Concepción del Uruguay and several tributary branches, afford ample transportation facilities to the ports. Another railway line follows the Uruguay from Concordia northward into Corrientes. Entre Rios has been one of the most turbulent of the Argentine provinces, and has suffered severely from political disorder and civil war. Comparative quiet reigned from 1842 to 1870 under the autocratic rule of Gen. J. J. Urquiza. After his assassination in 1870 there were constant risings for two or three years, and then the province settled down to a life of comparative peace, followed by an extraordinary development in her pastoral and agricultural industries. Among these is the slaughtering and packing of beef, the exportation of which has reached large proportions.

The capital is Paraná, though the seat of government was originally located at Concepción del Uruguay, and was again transferred to that town during Urquiza's domination. Concepción del Uruguay, or Concepción (founded 1728), is a flourishing town and port on the Uruguay, connected by railway with an extensive producing region which gives it an important export trade, and is the seat of a national college and normal school. Its population was estimated at 9000 in 1905. Other large towns are Gualeguay and Gualeguaychú.

ENVOY (Fr. envoyé, "sent"), a diplomatic agent of the second rank. The word envoyé comes first into general use in this connexion in the 17th century, as a translation of the Lat. ablégatus or missus (see DIPLOMACY). Hence the word envoy is commonly used of any one sent on a mission of any sort.

ENZIO (c. 1220-1272), king of Sardinia, was a natural son of the emperor Frederick II. His mother was probably a German, and his name, Enzio, is a diminutive form of the German Heinrich. His father was a great king, and he was probably present at the battle of Cortenova in 1237. In 1238 he was married, in defiance of the wishes of Pope Gregory IX., to Adelasia, widow of Ubaldo Visconti and heiress of Torres and Gallura in Sardinia. Enzio took at once the title of king of Torres and Gallura, and in 1243 that of king of Sardinia, but he only spent a few months in the island, and his sovereignty existed in name alone. In July 1250 he was appointed imperial vicegerent in Italy, and sharing in his father's excommunication in the same year, took a prominent part in the war which broke out between the emperor and the pope. He commenced his campaign by subduing the march of Ancona, and in May 1241 was in command of the forces which defeated the Genoese fleet at Meloria, where he seized a large amount of booty and captured a number of rich ecclesiastical vessels. In 1244 he summoned a council summoned by Gregory to Rome. Later he fought in Lombardy. In 1248 he assisted Frederick in his vain attempt to take Parma, but was wounded and taken prisoner by the Bolognese at Fossalta on the 26th of May 1249. His captivity was a severe blow to the Hohenstaufen cause in Italy, and was soon followed by the death of the emperor. He seems to have been well treated by the people of Bologna, where he remained a captive until his death on the 14th of March 1272. He was apparently granted a magnificent funeral, and was buried in the church of St. Dominic at Bologna. During his imprisonment Enzio is said to have been loved by Lucia da Viadagola, a well-born lady of Bologna, who shared his captivity and attempted to procure his release. Some doubt has, however, been cast upon this story, and the same remark applies to another which tells how two friends had almost succeeded in freeing him from prison concealed in a wine-cask, when he was recognized by a lock of his golden hair. His marriage with Adelasia had been declared void by the pope in 1243, and he left one legitimate, and probably two illegitimate daughters. Enzio forms the subject of a drama by E. S. S. Raupach and of an opera by A. B. Dulk.

ENZYME (Gr. enzymatos, leavened, from ἐν, in, and ἐζύμων, a leaven), a term, first suggested by Kühne, for an unorganized ferment (see FERMENTATION), a group of substances, in the constitution of plants and animals, which decompose certain carbon compounds occurring in association with them. See also PLANTS: Physiology; Nutrition, &c.

EOCENE (Gr. Εοκενός, dawn, καιρός, recent), in geology, the name suggested by Sir C. Lyell in 1833 for the lower subdivision of the rocks of the Tertiary Era. The term was intended to convey the idea that this was the period which saw the dawn of the recent or existing forms of life, because it was estimated that among the fossils of this period only 33% of the species are still living. Sir Charles Lyell has been learned about the fauna and flora of the period, and many palaeontologists doubt if any of the Eocene species are still extant, unless it be some of the lowest forms of life. Nevertheless the name is a convenient one and is in general use. The Eocene as originally defined was not long left intact, for E. Beyrich in 1854 proposed the term "Oligocene" for the upper portion, and later, in 1874, K. Schimper suggested "Paleocene" as a separate appellation for the lower portion. The Oligocene division has been generally accepted as a distinct period, but "Paleocene" is not so widely used.

In north-western Europe the close of the Cretaceous period was marked by an extensive emergence of the land, accompanied, in many places, by considerable erosion of the Mesozoic rocks; a prolonged interval elapsed before a relative depression of the land set in and the first Eocene deposits were formed. The early Eocene formations of the London-Paris-Belgian basin were of fresh-water and brackish origin; towards the middle of the period they had become marine, while later they reverted to the original type. In southern and eastern Europe changes of sea-level were less pronounced in character; here the late Cretaceous seas were followed without much modification by those of the Eocene period, so rich in foraminiferal life. In many other regions, the great gap which separates the Mesozoic rocks in the neighbourhood of London and Paris does not exist, and the boundary line is difficult to draw. Eocene strata succeed Cretaceous rocks without serious unconformity in the Libyan area, parts of Denmark, S.E. Alps, India, New Zealand and central N. America. The unconformity is marked in England, parts of Egypt, on the Atlantic coastal plain and in the eastern gulf region of N. America, as well as in the marine Eocene of western Oregon. The clastic Flysch formation of the
Carpathians and northern Alps appears to be of Eocene age in the upper and Cretaceous in the lower part. The Eocene sea covered at various times a strip of the Atlantic coast from New Jersey southward and a great tongue or bay up the Mississippi valley; similar epicontinental seas spread over parts of the Pacific border, but the plains of the interior with the mountains on the west were meanwhile being filled with terrestrial and lacustrine deposits which attained an enormous development. This great extension of non-marine formations in the Eocene of different countries has introduced difficulties in the way of exact correlation; it is safer, therefore, in the present state of knowledge, to make no attempt to find in the Eocene strata of America and India, &c., the precise equivalent of subdivisions that have been determined with more or less exactitude in the London-Paris-Belgian area.

It is possible that in Eocene times there existed a greater continuity of the northern land masses than obtains to-day. Europe at that time was probably united with N. America through Iceland and Greenland; while on the other side, America may have joined Asia by the way of Alaska. On the other hand, the great central, mediterranean sea which stretched across the Eurasian continents sent an arm northward somewhere just east of the Ural mountains, and thus divided the northern land mass in that region. S. America, Australia and perhaps Africa may have been connected more or less directly with the Antarctic continent.

Associated, no doubt, with the crustal movements which closed the Cretaceous and inaugurated the Eocene period, there were local and intermittent manifestations of volcanic activity throughout the period. Diallasses, gabbros, serpentines, soda-potash granites, &c., are found in the Eocene of the central and northern Apennines. Tufts occur in the Veronese and Vicentin Alps—Ronca and Spelecco schists. Tufts, basalts and other igneous rocks appear also in Montana, Wyoming, California, Oregon, Washington, Idaho, Colorado; also in Central America, the Antillean region and S. America.

It has been very generally assumed by geologists, mainly upon the evidence of plant remains, that the Eocene period opened with a temperate climate in northern latitudes; later, as indicated by the London Clay, Alum Bay and Bournemouth beds, &c., the temperature appears to have been at least subtropical. But it should be observed that the frequent admixture of temperate forms, and what are now tropical species makes it difficult to speak with certainty as to the degree of warmth experienced. The occurrence of lignites in the Eocene of the Paris basin, Tirol and N. America is worthy of consideration in this connexion. On the other hand, the coarse boulder beds in the lower Flysch have been regarded as evidence of local glaciation; this would not be inconsistent with a period of widespread geniality of climate, as is indicated by the large size of the nummulites and the dispersion of the marine Mollusca, but the evidence for glaciation is not yet conclusive.

**Eocene Stratigraphy.**—In Britain, with the exception of the Bovey beds (q.v.) and the leaf-bearing beds of Antrim and Mull, Eocene rocks are confined to the south-eastern portion of England. They include the well-known Lower, Middle and Upper London Clay and the Hampshire Beds, which are conterminous in the western area (Hampshire, Berkshire), but are separated towards the east by the denuded anticline of the Weald. The strata in these two basins have been grouped in the following manner:

- **London Basin.**
  - Upper: Upper Bagshot Beds, Middle Bagshot Beds and part of Lower Bagshot Beds.
  - Middle: Part of Lower Bagshot Beds, London Clay, Blackheath and Old-haven Beds, Woolwich and Reading Beds, Thanet Sands.
  - Lower: London Clay and the equivalent Bagnori Beds, Woolwich and Reading Beds.

The Thanet sands have not been recognized in the Hampshire basin; they are usually pale yellow and greensand with streaks of clay and at the base; resting on an evenly denuded surface of chalk is a very constant layer of green-coated, well-rounded chalk pebbles. The London Clay is a grey-brown slaty clay; it is at E. Kent, where it attains its most complete development. The Woolwich and Reading beds (see Reading Beds) contain both marine and estuarine fossils. In western Kent, between the Woolwich and Old-haven, the London Clay, and the London Beds and the London Clay, are the London Beds and Blackheath pebbles, 20 to 40 ft., made up almost entirely of well-rounded flint pebbles set in sand; the fossils are marine and estuarine. The London Clay, 500 ft. thick, is a marine deposit consisting of blue or green clay with sand layers and clast formations; its equivalent in the Hampshire area is sometimes called the Bognor Clay, well exposed on the coast of Sussex. The Bagshot, Blackheath and Barton beds will be found briefly described under those heads.

Crossing the English Channel, we find in northern France and Belgium a series of deposits identified in their general characters with those of England. The Antalcan sea is prolonged south-eastwards on to the continent, and separates the Belgian from the French Eocene areas much as it separates the areas of London and Hampshire; and it is clear that at the time of deposition four regions were intimately related, each subject to similar variations of marine and estuarine conditions. With a series of strata so variable from point to point it is natural that many purely local phases should have received distinctive names; in the Upper Eocene of the Paris basin the more important formations are the highly fossiliferous marine sands known as the "Sands of Beau champ," and the local fresh-water limestone, the "Calcaire de St. Ouen." The Middle Eocene is represented by the well-known "Calcaire grossier," about 200 ft. thick, in which the formations vary a good deal lithologically, some being sandy, others marly or glauconitic; fossils are abundant. The Upper Calcaire grossier or "Calcaires," is a fresh-water formation; the middle division is marly while the lower division is partly fresh-water origin. The numerous quarries and mines for building stone in the neighbourhood of Paris have made it possible to acquire a very perfect knowledge of the stratigraphy of the Paris basin, and the various formations in the Paris basin have received trade names, such as "Rochette," "Roche," "Banc françois," "Banc vert," "Clilquent," "Saint Nom," the last two names are dolomitic. Below these limestones are the nummulitic sands of Cuisy and Soissons. The Lower Eocene contains the lignitic plastic clay (argile plastique) of Soissons and elsewhere; the limestones of Rilly and Sézanne and the greenish glauconitic sands of Brachex. The relative position of the above formations with respect to those of the Upper Eocene is given in the table of Eocene strata (p. 639).

The Eocene deposits of southern Europe differ in a marked manner from those of the Anglo-Parisian basin. The most important feature is the great development of nummulitic limestone with thin marls and nummulitic sands. In the Mediterranean Sea, the nummulitic limestones were formed upon the site of an enlarged Mediterranean communicating with similar waters right round the world, for these rocks are found not only in southern Europe, including all the Alpine tracts, Greece and Turkey and southern Russia, but they are well developed in northern Africa, Asia Minor, Palestine, and they may be followed through Persia, Baluchistan, India, into China, and through Japan and Korea. The Mediterranean nummulitic limestones are frequently hard and crystalline, especially where they have been subjected to elevation and compression as in the Alpine region, 10,000 ft. above the sea, or from 16,000, to 20,000 ft. in the central Asian plough. Besides being widespread formation the nummulitic limestone is locally several thousand feet thick.

While the foraminiferal limestones were being formed over most of southern Europe, a series of clastic beds were in course of formation in the Carpathians and the northern Alpine region, viz. the Flysch and the Vienna sandstone. Some portions of this Alpine Eocene are coarsely conglomeratic, and in places there are boulders of
non-local rocks of enormous dimensions included in the argillaceous or sand matrix. The occurrence of these large boulders together with the scarceness of fossils has suggested that especially in the Periodic. Here, however, it is not conclusive. C. W. von Gümbl has classified the Eocene of the northern Alps (Bavaria, &c.) as follows:

Upper Eocene

Flysch and Vienna sandstone, with younger nummulitic beds and Burdigalian group.

Middle

Kressenberg Beds, with older nummulitic beds.

Lower

Burbegg Beds, Greensands with small nummulites.

The Haring group of northern Tirol contains lenticular beds of some importance. In the southern and S. E. Alps the following divisions are recognizable:

Upper Eocene

Maganio or Tassello—Vienna Sandstone, conglomerates, marls and shales.

Middle

Neyersite, limestone, three sub-divisions.

Lower

Liburnian stage (or Protococene), foraminiferal limestones with fresh-water intercalations at the top and bottom, the Cosma beds, fresh-water in the middle.

In the central and southern Apennines the Eocene strata have been subdivided by Prof. F. Sacco into an upper Bartonian, a middle Parisian and a lower Suessonian series. In the middle member are the representatives of the Flysch and the Maganio. These Eocene strata are upward of 3500 ft. thick. In the north Africa the nummulitic limestones and sandstones are widely spread; the lower portions comprise the Libyan and (Paleo) Nubian beds of Sokota and others; the Libyan stage of Egypt is a representative of the later Eocene. Much of the N. African Eocene contains phosphatic beds. In India the strata of Eocene age are extensively developed; in Sind the marine Rankait beds, 500 to 2000 ft., consisting of clays with gypsum and linites, shales and sandstones; these beds have, side by side with Eocene nummulites, a few fossils of Cretaceous affinities. Above the Rankait beds are the massive nummulitic limestones and sandstones of the Kirthar group; these are succeeded by the nummulitic limestones and shales at the base of the Nari group. In the southern Himalayan region the nummulitic phase of Eocene development is marked, but there are difficulties in fixing the line of demarcation between this and the younger formations. The lower part of the Birmur series of the Simla district may belong to this period; it is subdivided into the Kasauli group and the Dagshai group. Subba in the group at the base. Beneath the thick nummulitic Eocene limestone of the Salt Range are shales and marls with a few coal seams. The marine Eocene rocks of N. America are most extensively developed round the east coast of the Gulf of Mexico, where the Pockau formation of Washington we have a great series of sediments, largely of brackish water origin, and in parts coal-bearing. The total thickness of this formation has been estimated at 20,000 ft. (it may prove to be less than this), but it is probable that only the lower portion is of Eocene age. The members of the S. American Eocene deposits are those of the Rocky Mountains and the adjacent western plains, in Wyoming, Nevada, Colorado, &c.; they are of terrestrial, lacustrine or aeolian origin, and they do not differ essentially from those of the N. African deposits. There are, however, considerable difficulties in placing them in their true position in the time-scale. The main divisions of the series are generally recognized as follows:

Upper

Uinta Group, 800 ft. [= Jacksonis].

Middle

Brider Group, 2000 ft. [= Clayburnis].

Lower

Wasatch Group, 2000 ft. [= Chickashan].

Basal

Topsiltz Group, 300 ft.

Puerco Group, 500 to 1000 ft.

The Fort Union beds of Canada and parts of Montana and N. Dakota are probably the oldest Eocene strata of the Western Interior; they are of the underlying Laramie series and the underlying Laramie rocks.

Many local aspects of Eocene rocks have received special names, but too little is known about them to enable them to be classified in the Eocene series. Such are the Clarion formation (late Eocene) of the John Day series in Oregon, the agglomerate of Yellowstone Park, the Sphinx conglomerate of Montana, the Whitetail conglomerate of Arizona, the Manti shales of Utah, the Mojave formation of S. California and the Amboy formation of Nevada.

Of the Eocene formations, only a few are ancient in detail. Strata of this age occur in Central and S. America (Patagonia—Sedgwickian series—Brazil, Chile, Argentina), in S. Australia (in the Great Australian Bight), New Zealand, in Seymour Island near Graham Land in the Antarctic Regions, Japan, Java, Borneo, New Guinea, Moluccas, Philippines, New Caledonia, in S. Asia (the Birmur beds of S.E. China) are one of the most ancient formations in the world. The strata there are more abundant than they are at present, but as a whole the Cephalopods took a subordinate part than they had done in previous periods. On the other hand, Gasteropods and Pelecypods found in the numerous shallow seas a very suitable environment and flourished exceedingly, and their shells are often preserved in a state of great perfection and in enormous numbers. Of the Gasteropod genus Cerithium with its estuarine and lagoonous forms Potamides, Potamopidus, &c., is very characteristic; Castoraria, Veluta, Fasus, Pleurotomaria, Conus, Typhis, may also be cited. Cardium, Venericardia, Crassatella, Corbuloma, Cytheres, Lucina, Anomia, Patella are a few of the many Pelecypod genera. Echinodermata were represented by abundant sea-urchins, Echinolampas, Linithia, Conolycepus, &c. Corals flourished on the numerous reefs and approached to modern forms (Trocchiomelis, Dendrophylia). But by far the most abundant marine organisms were the foraminifera which flourished in the warm seas in countless myriads. Foremost among these are the Nummulites, which by their extraordinary numerical development and great size, as well as by their wide distribution, demand special recognition. Many other genera of almost equal importance as rock builders, lived at the same time: Orthophragma, Operculina, Astyline, Orbitides, Miltoid, Actinocyclus, and most of the orders and many families of modern insects were represented.

When we turn to the higher forms of life, the reptiles and mammals, we find a remarkable contrast between the fauna of the Eocene and those periods which preceded and succeeded it. The great group of Saurian reptiles, whose members had held dominion on land and sea during most of the Mesozoic time, had completely disappeared by the beginning of the Eocene; in their place placental mammals made their appearance and rapidly became the dominant group. In the Eocene, the early Eocene mammals no longer were dominated by the large forms, but can be found of the numerous and clearly-marked orders with which we are familiar to-day; instead we find obscurely differentiated forms, which cannot be fitted without violence into any of the modern orders. The early placental mammals were generalized types (with certain non-placental characters) with potentialities for rapid divergence and development in the direction of the more specialized modern orders. Thus, the Cretocodonta foreshadowed the Carnivora,

Condylarthra presaged the herbivorous groups; but before the close of this period, so favourable were the conditions of life to a rapid evolution of types, that most of the great orders had been clearly defined, though none of the Eocene genera are still extant. Among the early carnivores were Arctocyon, Palaeonictis, Amblyclytemos, Hyaenodon, Cynodon, Proveria, Parafelis. The primitive dog-like forms did not appear until late in the period, in Europe; and true cats did not arrive until later, though they were represented by Euarctos in the Upper Eocene of France. The primitive ungulates (Condylarthra) were generalized forms with five effective toes, exemplified in Phensacodus. The great Amblypodia, with five-toed stumpy feet (Coryphodon), were prominent in the early Eocene; particularly striking forms were the Dinoceratidae, Dinoceras, with three pairs of horns or protuberances on its massive skull and a pair of huge canine teeth projecting downwards; Tinoceras, Uintatherium, Loxophodon, &c.; these elephantine creatures, whose remains are so abundant in the Eocene deposits of western America, died out before the close of the period. The divergence of the hoofed mammals into the two prominent divisions, the odd-toed and even-toed, began in this period, but the former did not get beyond the three-toed stage in Europe. The least differentiated of the odd-toed group were the Lophiodonts: tapirs are foreshadowed by Systemodon and similar forms (Palaeotherium, Paloprotherium); the peccary-like Hyaerotherium was a forerunner of the horse, Hyracotherium, a primitive rhinoceros. The evolution of the horse through such forms as Hyracotherium, Pachynothelus, Eohippus, &c., appears to have proceeded along parallel lines in Eurasia and America, but the true horse did not arrive until later. Ancestral deer were represented by Dichobune, Amphitragulus and others, while many small hog-like forms existed (Diplopus, Eohyrax, Hypothamnus, Homoedon). The primitive stock of the camel group developed in N. America in late Eocene time and sent branches into S. America and Eurasia. The edentates were very generalized forms at this period (Ganodonta); the rodents (Tillodontia) attained a large size for members of this group, e.g. Tillatherium. The Insectivores had Eocene forerunners, and the Lemuroidea—probable ancestors of the apes—were forms of great interest, Anaptomorphus, Microzyops, Heterorhinus, Microcochas, Coecophiкус; even the Cetaceans were well represented by Zeuglodon and others.

The non-placental mammals although abundant were taking a secondary place; Didelphus, the primitive opossum, is noteworthy on account of its wide geographical range.

Among the birds, the large flightless forms, Eutherorhinus, Glosornis, were prominent, and many others were present, such as the ancestral forms of our modern gulls, albatrosses, herons, buzzards, eagles, owls, quails, plovers. Reptiles were poorly represented, with the exception of crocodilians, tortoises, turtles and some large snakes.

The flora of the Eocene period, although full of interest, does not convey the impression of newness that is afforded by the fauna of the period. The reason for this difference is this: the newer flora had been introduced and had developed to a considerable extent in the Cretaceous period, and there is no sharp break between the flora of the earlier and that of the later period. In which we find a mixed assemblage—what we should now regard as tropical palms, growing side by side with mid-temperate trees. Early Eocene plants in N. Europe, oaks, willows, chestnuts (Castanea), laurels, indicate a more temperate climate than existed in Middle Eocene when in the Isle of Wight, Hampshire and the adjacent portions of the continent, palms, figs, cinnamon flourished along with the cactus, magnolia, sequoia, cypress and ferns. The late Eocene flora of Europe was very similar to its descendant in modern Australasia.

J. A. H.)

EON DE BEAUMONT, CHARLES GENEVIEVE LOUISE AUGUSTE ANDRE TIMOTHEE D’ (1728-1810), commonly known as the CHEVALIER D’EON, French political adventurer, famous for the supposed mystery of his sex, was born near Tonnerre in Burgundy, on the 7th of October 1728. He was the son of an advocate of good position, and after a distinguished course of study at the Collège Mazarin he became a doctor of law by special dispensation before the usual age, and adopted his father’s profession. He
began literary work as a contributor to Fréron's Année littéraire, and attracted notice as a political writer by two works on financial and administrative questions, which he published in his twenty-fifth year. His reputation increased so rapidly that in 1755 he was, on the recommendation of Louis François, prince of Conti, entrusted by Louis XV. (who had originally stated publicly, "secretly," the opportunity of realizing the ideals of a lifetime for undiscovered agents behind the backs of his ministers—in favour of the prince of Conti's ambition to be king of Poland) with a secret mission to the court of Russia. It was on this occasion that he is said for the first time to have assumed the dress of a woman, with the connivance, it is supposed, of the French court. In this disguise he obtained the appointment of reader to the empress Elizabeth, and won her over entirely to the views of his royal master, with whom he maintained a secret correspondence during the whole of his diplomatic career. After a year's absence he returned to Paris to be immediately charged with a second mission to St Petersburg, in which he figured in his true sex, and as brother of the reader who had been at the Russian court the year before. He played an important part in the negotiations between the courts of Russia, Austria and France during the Seven Years' War. For these diplomatic services he was rewarded with the decoration of the grand cross of St Louis. In 1759 he served with the French army on the Rhine as aide-de-camp to the marshal de Broglio, and was wounded during the campaign. He had held for some years previously a commission in a regiment of dragoons, and was distinguished for his skill in military exercises, particularly in fencing. In 1762, on the return of the due de Nivernais, d'Eon, who had been secretary to his embassy, was appointed his successor, first as resident agent and then as minister plenipotentiary at the court of Great Britain. He had not been long in this position when he lost the favour of his sovereign, chiefly, according to his own account, through the adverse influence of Madame de Pompadour, who was jealous of him as a secret correspondent of the king. Superseded by count de Guercy, d'Eon showed his irritation by denying the genuineness of the letter of appointment, and by raising an action against Guercy for an attempt to poison him. Guercy, on the other hand, had previously commenced an action against d'Eon for libel, founded on the publication by the latter of certain state documents of which he had possession in his official capacity. Both parties succeeded in so far as a true bill was found against Guercy for the attempt to murder, though by pleading his privilege as ambassador he escaped a trial, and d'Eon was found guilty of the libel. Failing to come up for judgment when called on, he was outlawed. For some years afterwards he lived in obscurity, appearing in public chiefly at fencing matches. During this period rumours as to the sex of d'Eon, originating probably in the story of his first residence at St Petersburg as a female, began to excite public interest. In 1774 he published at Amsterdam a book called Les Loisirs du Chevalier d'Eon, which stimulated gossip. Bets were frequently laid on the subject, and an action raised before Lord Mansfield in 1777 for the recovery of one of these bets brought the question to a judicial decision, by which d'Eon was declared a female. A month after the trial he returned to France, having received permission to do so as the result of negotiations in which Beaumarchais was employed as agent. The conditions were that he was to deliver up certain state documents in his possession, and to wear the dress of a female. The reason for the latter of these stipulations has never been clearly explained, but he complied with it to the close of his life. In 1784 he received permission to visit London for the purpose of recovering his beaten hawks. He did not, however, return to France, though after the Revolution he sent a letter, using the name of Madame d'Eon, in which he offered to serve in the republican army. He continued to dress as a lady, and took part in fencing matches with success, though at last in 1796 he was badly hurt in one. He died in London on the 22nd of May 1810. During the closing years of his life he is said to have enjoyed a small pension from George III.  

A post-mortem examination of the body conclusively established the fact that d'Eon was a man.

The best modern accounts are in the duc de Broglie's Le Secret du roi (1888); Captain J. Buchan Telfer's Strange Career of the Chevalier d'Eon (1888); Octave Homberg and Paul de Merode, Le Chevalier d'Eon (1904); and A. Lang's Historical Mysteries (1904).

EÖTVÖS, JÓZSEF, BARON (1813-1871), Hungarian writer and statesman, the son of Baron Ignác Eötvös and the baroness Lilian, was born at Buda on the 13th of September 1813. After an excellent education he entered the civil service as a vice-notary, and was early introduced to political life by his father. He also spent many years in western Europe, assimilating the new ideas both literary and political, and making the acquaintance of the leaders of the Romantic school. On his return to Hungary he wrote his first political work, Prison Reform; and at the diet of 1839-1840 he made a great impression by his eloquence. He was one of the leaders in the first speeches (published, with additional matter, in 1842) warmly advanced Jewish emancipation. Subsequently, in the columns of the Pesti Hírlap, Eötvös disseminated his progressive ideas farther afield, his standpoint being that the necessary reforms could only be carried out administratively by a responsible and purely national government. The same sentiments pervade his novel The Village Notary (1844-1846), one of the classics of the Magyar literature, as well as in the less notable romance Hungary in 1514, and the comedy Long live Equality! In 1842 he married Anna Rosty, but his happy domestic life did not interfere with his public career. He was now generally regarded as one of the leading writers and politicians of Hungary, while the charm of his oratory was such that, whenever the archduke palatine Joseph desired to have a full attendance in the House of Magnates, he called upon Eötvös to address it. The February revolution of 1848 was the complete triumph of Eötvös' ideas, and he held the portfolio of public worship and instruction in the first responsible Hungarian ministry. But his influence extended far beyond his own department. Eötvös, Deák and Széchenyi represented the pacific, moderating influence in the council of ministers, but when the premier, Batthyány, resigned, Eötvös, in despair, retired for a time to Munich. Yet, though withdrawn from the tempests of the War of Independence, he continued to serve his country with his pen. His Influence of the Ruling Ideas of the 19th Century on the State (Pest, 1851-1854, German editions at Vienna and Leipzig the same year) profoundly influenced literature and public opinion in Hungary. On his return home, in 1851, he kept resolutely aloof from all political movements. In 1859 he published The Guarantees of the Power and Unity of Austria (Ger. ed. Leipzig, same year), in which he tried to arrive at a compromise between personal union and ministerial responsibility on the one hand and centralization on the other. After the Italian war, however, such a halting-place was regarded as inadequate by the majority of the nation. In the diet of 1861 Eötvös was one of the most loyal followers of Deák, and his speech in favour of the "Address" (see DEÁK, FRANCIS) made a great impression at Vienna. The enforced calm which prevailed during the next few years enabled him to devote himself once more to literature, and, in 1866, he was elected president of the Hungarian academy. In the diets of 1865 and 1867 he fought zealously by the side of Deák, with whose policy he now completely associated himself. On the formation of the Andrassy cabinet (Feb. 1867) he once more accepted the portfolio of public worship and education, being the only one of the ministers of 1848 who thus returned to office. He had now, at last, the opportunity of realizing the ideals of his time. That very year the diet passed his bill for the emancipation of the Jews; though his further efforts in the direction of religious liberty were less successful, owing to the opposition of the Catholics. But his greatest achievement was the National Schools Act, the most complete system of education provided for Hungary since the days of Maria Theresa. Good Catholic though he was (in matters of religion he had been the friend and was the disciple of Montalembert), Eötvös looked with disfavour on the dogma of papal infallibility, promulgated in 1870, and when the bishop of

FEHERVAR PROCLAIMED IT, EÖTVOS CITED HIM TO APPEAR AT THE CAPITAL AS AD AUIDENDAM VERBUM REGNUM. HE WAS A CONSTANT DEFENDER OF THE AUDIENDAM VERBUM REGNUM. He was a constant defender of the composition with Austria (Auszleit), and during the absence of ANDRASSY used to preside over the council of ministers; but the labours of the last few years were too much for his failing health, and he died at Pest on the 2nd of February 1871. On the 3rd of May 1879 a statue was erected to him at Pest in the square which bears his name.

EÖTVOS OCCUPIED AS PROMINENT A PLACE IN HUNGARIAN LITERATURE AS IN HUNGARIAN POLITICAL. His peculiarity, both as a politician and as a statesman, lies in the fact that he was a true philosopher, a thinker at heart as well as in theory. In his stories, novels he clothed in artistic forms all the great ideas for which he contended in social and political life. The best of his verses are to be found in his ballads, but his poems are insignificant compared with his romances. It was The Carthusians, written on the occasion of the floods at Pest in 1838, that first took the public by storm. The Magyar novel was then in its infancy, being chiefly represented by the historico-epics of JOSFIK. EÖTVOS first modernized it, giving prominence in his pages to current social problems and political aspirations. The famous Village Notary came still nearer to actual life, while Hungary in 1514, in which the terrible Dossa Jacquerie (see Dozza) is so vividly described, is especially interesting because it rightly attributes the great national catastrophe of Mohacs to the blind selfishness of the Magyars and the self-seeking of the western invaders. Yet, as already stated, all these books are written with a moral purpose, and their somewhat involved and difficult style is, nowadays at any rate, a trial to those who are acquainted with the easy, brilliant and lively novels of JOKAI.

The best edition of EÖTVOS’ collected works is that of 1891, in 17 vols. Comparative few of his writings have been translated, but there are a good English versions (London, 1856) and numerous German versions of The Village Notary, while The Emancipator of the Jews has been translated into Italian and German (Pest, 1843-1842), and a German translation of Hungary in 1514, under the title of Der Teufenkriege in Ungarn was published at Pest in 1850. See A. BÁRÁNY, Life and Art of Baron Joseph EÖTVÖS (Budapest, 1902); Zoltan Ferenczi, Baron Joseph EÖTVÖS (Budapest, 1903) (this is the best biography); and M. Bercovics, Baron Joseph EÖtvös and the French Literature (Hung.) (Budapest, 1904). (R. N. B.)

EPAMINONDAS (c. 418-362) Theban general and statesman, born about 418 B.C. of a noble but impoverished family. For his education he was chiefly indebted to Lysis of Tarentum, a Pythagorean exile who had found refuge with his father Polymnis. He first comes into notice in the attack upon Mantinea in 365, when he fought on the Spartan side and saved the life of his future colleague PELOPIDAS. In his youth Epaminondas took little part in public life, but the held of the battle of THEBES which preceded the Theban insurrection of 371. But in the following campaigns against SPARTA he rendered good service in organizing the Theban defence. In 371 he represented THEBES at the congress in SPARTA, and by his refusal to surrender the Boeotian cities under THEBAN control prevented the conclusion of a general peace. In the ensuing campaign he commanded the Boeotian army which met the Peloponnesian levy at Leuctra, and by a brilliant victory on this site, due mainly to his daring innovations in the tactics of the heavy infantry, established at once the predominance of Thebes among the land-powers of Greece and his own fame as the greatest and most original of Greek generals. At the instigation of the Peloponnesian states which armed against Sparta in consequence of this battle, Epaminondas in 369 led a large host into Laconia; though unsuccessful in raising its territory and dealt a lasting blow at Sparta’s predominance in Peloponnesus by liberating the Messenians and rebuilding their capital at Messene. Accused on his return to THEBES of having exceeded the term of his command, he made good his defence and was re-elected boeotarch. In 369 he forced the Isthmus lines and secured SICYON for THEBES, but gained no considerable successes. In the following year he served as a common soldier in Thessaly, and upon being reinstated in command contrived the safe retreat of the Theban army from a difficult position. Returning to Thessaly next year at the head of an army he procured the liberation of Pelopidas from the tyrant Alexander of Pherae without striking a blow. In his third expedition (366) to Peloponnesus, Epaminondas again eluded the Isthmus garrison and won over the Achaenans to the Theban alliance. Turning his attention to the growing maritime power of Athens, Epaminondas next equipped a fleet of 100 triremes, and during a cruise to the Propontis detached several states from the Athenian confederacy. When subsequent complications threatened the position of THEBES in Peloponnesus he again mustered a large army in order to crush the newly formed Spartan league (362). After some masterly operations between SPARTA and MANTINEDIA, by which he nearly captured both these towns, he engaged in a decisive battle on the latter site, and by his vigorous shock tactics gained a complete victory over his opponents (see MANTINEIA). Epaminondas himself received a severe wound during the combat, and died soon after the issue was decided. His title to fame rests mainly on his brilliant qualities both as a strategist and as a tactician; his influence on military art in Greece was of the greatest. For the purity and uprightness of his character he likewise stood in high repute; his culture and eloquence equalled the highest Attic standard. In politics his chief achievement was the final overthrow of Sparta’s predominance in the Peloponnesus; as a constructive statesman he displayed no lack of talent and, the lofty pan-Hellenic aspirations which are imputed to him at any rate never found a practical expression.

EPARCH, an official, a governor of a province of Roman GREECE, eraxos, whose title was equivalent to, or represented that of the Roman proconsul. The area of his administration was called an eparchy (eparxia). The term survives as one of administration. Aeparchies were formed in the newly divided into nomarchies, subdivided into eparchies, again divided into demarchies (see GREECE: Local Administration). “Eparch” and “eparchy” are also used in the Russian Orthodox Church for a bishop and his diocese respectively.

EPAULLETTE (a French word, from épaule, a shoulder), properly a shoulder-piece, and so applied to the shoulder-knot of ribbon to which a scapulary was attached, worn by members of a religious order. The military usage was probably derived from the metal plate (épauleière) which protected the shoulder in the defensive armour of the 16th century. It was first used merely as a shoulder knot to fasten the baldric, and the application of it to mark distinctive grades of rank was begun in France at the suggestion, it is said, of Charles Louis Auguste Fouquet, due de Belle-Ise, in 1759. In modern times it is always seen as a shoulder ornament for military and naval uniforms. At first it consisted merely of a fringe hanging from the end of the shoulder-strap or cord over the sleeve, but towards the end of the 18th century it became a solid ornament, consisting of a flat shoulder-piece, extended beyond the point of the shoulder into an oval plate, from the edge of which hangs a thick fringe, in the case of officers of gold or silver. The epaulette is worn in the British navy by officers above the rank of sub-lieutenant; in the army it ceased to be worn about 1855. It is worn by officers in the United States navy above the rank of ensign; since 1872 it is only worn by general officers in the army. In most other countries epaulettes are worn by officers, and in the French army by the men also, with a narrow stripe of white and of black in the distinctions of shape and colour being observed between ranks, corps and arms of the service. The “scale” is similar to the epaulette, but has no fringe.

ÉPÉE, CHARLES-MICHEL, Abbé de (1712-1789), celebrated for his labours in behalf of the deaf and dumb, was born at Paris on the 25th of November 1712, being the son of the king’s architect. He studied for the church, but having declined to sign a religious formula opposed to the doctrines of the Jansenists, he was denied ordination by the bishop of his diocese. He then
devoted himself to the study of law; but about the time of his admission to the bar of Paris, the bishop of Troyes granted him an ordination, and offered him a canonry in his cathedral. This bishop died soon after, and the abbé, coming to Paris, was, on account of his relations with Soane, the famous Jansenist, deprived of his ecclesiastical functions by the archbishop of Beauumont. About the same time it happened that he heard of two deaf mutes whom a priest lately dead had been endeavouring to instruct, and he offered to take his place. The Spaniard Pereira was then in Paris, exhibiting the results he had obtained in the education of deaf mutes; and it has been affirmed that it was from him that Épée obtained his manual alphabet. The abbé, however, affirmed that he knew nothing of Pereira's method; and whether he did or not, there can be no doubt that he attained far greater success than Pereira or any of his predecessors, and that the whole system now followed in the instruction of deaf mutes virtually owes its origin to his intelligence and devotion. In 1735 he founded, for this beneficent purpose, a school which he supported at his own expense until his death, and which afterwards was succeeded by the "Institution Nationale des Sourd Muet à Paris," founded by the National Assembly in 1791. He died on the 23rd of December 1789.

In 1838 a bronze monument was erected over his grave in the church of Saint Roch. He published various books on his method of instruction, but that published in 1784 virtually superseded all others. It is entitled La Véritable Manière d'introduire les sourds et muets, confirmée par une longue expérience. He also began a Dictionnaire général des signes, which was completed by his successor, the abbé Sicard.

**Épée-de-Combat**, a weapon still used in France for duelling, and there and elsewhere (blunted, of course) for exercise and amusement in fencing (q.v.). It has a sharp-pointed blade, about 35 in. long, without any cutting edge, and the guard, or shell, is bowl-shaped, having its convexity towards the point. The épée is the modern representative of the small-sword, and both are distinguished from the older rapier, mainly by being several inches shorter and much lighter in weight. The small-sword (called thus in opposition to the heavy cavalry broadsword), was worn by gentlemen in full dress throughout the 18th century, and it still survives in the modern English court costume.

Fencing practice was originally carried on without the protection of any mask for the face. Wire masks were not invented until the middle of the last century, and were of various forms and patterns; usually the younger and skilful, as a rule, were the elder, and did not come into general use until much later. Consequently, in order to avoid dangerous accidents to the face, and especially the eyes, it was long the rigorous etiquette of the fencing-room that the point should always be kept low.

In the 17th century a Scottish nobleman, who had procured the assassination of a fencing-master in revenge for having had one of his eyes destroyed by the latter at sword-play, pleaded on his trial for murder that it was the custom to "spare the face."

Rowlandson's well-known drawing of a fencing bout, dated 1787, shows two accomplished amateurs making a foil assault without masks, while in the background a less practised one is wearing a wire mask tied on.*

For greater safety the convention was very early arrived at that no hits should count in a fencing-bout except those landing on the breast. Thus sword-play soon became so unpractical as to lose much of its value as a training for war or the duel. For, hits with "sharps" take effect wherever they are made, and many an expert fencer of the old school has been seriously wounded, or lost his life in a duel, through forgetting that very simple fact.

Strangely enough, when masks began to be generally worn, and the fleuret (anglise, "foil," a cheap and light substitute for the real épée) was invented, fencing practice became gradually even more conventional than before. No one seems to have uniform, and without masks all would have been done away with, root and branch, and sword-practice might assume all the semblance of reality. Nevertheless it should be clearly recognized that the basis of modern foil-fencing was laid with the épée or small-sword alone, and that, of the days of Angelo, of Danet, and the famous chevalier de St George, who were among the first to adopt the fleuret also. All the illustrious French professors who came after them, such as La Boësnière the younger, LaFaugère, Jean Louis, Cordelois, Grisier, Bertrand and Robert, with amateurs like the baron d'Espélot, were foil-players pure and simple, whose reputations were gained before the modern épée play had any recognized status. It was reserved for the Parisian fencing-master, to establish in the last quarter of the 19th century a definite method of the épée, which differed essentially from all its forerunners. He was soon followed by Baudry, Spinnewyn, Laurent and Ayat. The methods of the four first-named, not differing much inter se, are based on the perception that in the real sword fight, where hits are effective on all parts of the person, the "classical" bent-arm guard, with the foil inclining upwards, is hopelessly bad. It offers a tempting mark in the exposed sword-arm itself, while the point requires a movement to bring it in line for the attack, which involves a fatal loss of time. The épée is really in the nature of a short lance held in one hand, and for both rapidity and precision of attack, as well as for the defence of the sword-arm and the body behind it, a position of guard with the arm almost fully extended, and épée in line with the forearm, is far the safest. Against this guard the direct lunge at the body is impossible, except at the risk of a mutual or double hit (le coup des deux vues). No safe attack at the face or body can be made without first binding or being, opposing or evading the adverse blade, and such an attack usually involves an initial forward movement. Beats and binds of the blade, with retreats of the body, or counter attacks with opposition, replace the old foil-parries in most instances, except at close quarters. And much of the offensive is reduced to thrusts at the wrist or forearm, intended to disable without seriously wounding the adversary. The direct lunge (coup-droit) at the body often succeeds in tournaments, but usually at the cost of a counter hit, which, though later in time, would be fatal with sharp weapons.

Ayat's method, as might be expected from a first-class foil-player, is less simple. Indeed for years, too great simplicity marked the most successful épée-play, because it usually gained its most conspicuous victories over those who attempted a foil defence, and whose practice gave them no safe strokes for an attack upon the extended blade. But by degrees the épéists themselves discovered new ways of attacking with comparative safety, and at the present day a complete épée-player is master of a large variety of attractive as well as scientific movements, both of attack and defence.

It was mainly by amateurs that this development was achieved. Perhaps the most conspicuous representative of the new school is J. Joseph-Renaud, a consummate swordsman, who has also been a champion foil-player. Lucien Gaudin, Albert and Edmond Wallace may be also mentioned as among the most skilful amateurs, Albert Ayat and L. Bouché as professors—all of Paris, Belgium, Italy and England have also produced épéists quite of the first rank.

The épée lends itself to competition far better than the foil, and the revival of the small-sword soon gave rise in France to "pools" and "tournaments" in which there was the keenest rivalry between all comers.

In considering the épée from a British point of view, it may be mentioned that it was first introduced publicly in London by C. Newton-Robinson at an important assault-at-arms held in the Steinway Hall on the 4th May 1900. Professor Spinnewyn was the principal demonstrator, with his pupil, the late Willy Sulzbacher. The next day was held at the Inns of Court R. V. School of Arms, Lincoln's Inn, the first English open épée tournament for amateurs. It was won by W. Sulzbacher, C. Newton-Robinson being second, and Paul Ettlinger, a French resident in London, third. The name of the Épée Club of London, which, under the distinguished residences of a veteran swordsman, Sir Edward Jenkinson, and of Lord Desborough, subsequently held annual open international tournaments. The winners were: 1901, Willy Sulzbacher; 1902, Robert Montmogerie; 1903, the marquis de Chasselpau-Labh; 1904, J. J. Renaud; 1905, R. Montogmerie.
the Amateur Fencing Association for the first time recognized the best-placed Englishman, Edgar Seligman (who was the actual winner), as the English épée champion. In 1907 R. Montgomerie was again the winner, in 1908 C. L. Daniell, and in 1909 R. Montgomerie.

Among the most active of the English amateurs who were the earliest to perceive the wonderful possibilities of épée-play, it is possible to mention Captain Hutton, Lord Desborough, Sir Cosmo Duff-Gordon, Bart., Sir Charles Dilke, Bart., Lord Howard de Walden, Egerton Castle, A. S. Cope, R.A., W. H. C. Staveley, C. F. Clay, Lord Morpeth, Evan James, Paul King, J. B. Cunliffe, John Norbury, Jr., Theodore A. Cook, John Jenkins, R. Montgomerie, S. Martineau, E. B. Milnes, H. J. Law, R. Mervile, the Marquis of Dufferin, Hugh Pollock, R. W. Doyle, A. G. Ross, the Hon. Ivor Guest and Henry Balfour.

Among foreign amateurs who did most to promote the use of the épée in England were Mesrs P. Ettlinger, Anatole Paroissien, J. Joseph-Renaud, W. Sulzbacher, René Lacroix, H. G. Berger and the Marquis de Chasseloup-Laubat.

Épée practice became popular among Belgian and Dutch fencers about the same time as in England, and this made it possible to set up on foot international team-competitions for amateurs, which have done much to promote good feeling and acquaintance-ship among swordsmen of several countries. In 1903 a series of international matches between teams of six was inaugurated in Paris. Up to 1909 the French team uniformly won the first place, with Belgium or England second.

English fencers who were members of these international teams were Lord Desborough, Theodore A. Cook, Bowden, Cecil Haig, J. Norbury, Jr., R. Montgomerie, John Jenkins, F. Townsend, W. H. C. Staveley, S. Martineau, C. L. Davill, W. Gordon, Captain Haig, M. V. Holt, Edgar Seligman, C. Newton-Robinson, A. V. Buckland, P. M. Davson, E. M. Amphlett and L. V. Fildes. In 1906 a British épée team of four, consisting of Lord Desborough, Sir Cosmo Duff-Gordon, Bart., Edgar Seligman and C. Newton-Robinson, with Lord Howard de Walden and Theodore Cook as reserves (the latter acting as captain of the team), went to Athens to compete in the international match at the Olympic games. After defeating the Germans rather easily, the team opposed and worsted the Belgians. It thus found itself matched against the French in the final, the Greek team having been beaten by the French and the Dutch eliminated by the Belgians. After a very close fight the result was officially declared a tie. This was the first occasion on which an English fencing team had encountered a French one of the first rank upon even terms. In fighting off the tie, however, the French were awarded the first prize and the Englishmen the second.

In the Olympic games of London, 1908, the Épée International Individual Tournament was won by Alibert (France), but Montgomerie, Haig and Holt (England) took the 4th, 5th, and 8th places in the final pool. The result of the International Team competition was also very creditable to the English representatives, Daniell, Haig, Holt, Montgomerie and Amphlett, who by defeating the Dutch, Germans, Danes and Belgians took second place to the French. Egerton Castle was captain of the English team.

In open International Tournaments on the Continent, English épéists have also been coming to the front. None had won such a competition up to 1909 outright, but the following had reached the final pool: C. Newton-Robinson, Brussels, 1901 (10th), Étretat, 1904 (6th); E. Seligman, Copenhagen, 1907 (2nd), and Paris, 1909 (12th); R. Montgomerie, Paris, 1909 (5th); and E. M. Amphlett, Paris, 1909 (10th).

The method of ascertaining the victor in épée "tournaments" is by dividing the competitors into "pools," usually of six or eight fencers. Each of these fights an assault for first hit only, with every other member of the same pool, and he who is least often hit, or not at all, is returned the winner. If the competitors are numerous, fresh pools are formed out of the first two, three or four in each pool of the preliminary round, and so on, until a small number are left in for a final pool, the winner of which is the victor of the tournament.

Épée fencing can be, and often is, conducted indoors, but one of its attractions consists in its fitness for open-air practice in pleasant gardens.

In the use of the épée the essential points are (1) the position of the sword-arm, which, whether fully extended or not, should always be so placed as to ensure the protection of the wrist, forearm and elbow from direct thrusts, by the intervention of the guard or shell; (2) readiness of the legs for instant advance or retreat; and (3) the way in which the weapon is held, the best position (though hard to acquire and maintain) being that adopted by J. J. Renaud with the fingers over the grip, so that a downward beat does not easily disarm.

The play of individuals is determined by their respective temperaments and physical powers. But every fencer should be always ready to deliver a well-aimed, swift, direct thrust at any exposed part of the antagonist's arm, his mask or thigh. Very tall men, who are usually not particularly quick on their legs, should not as a rule attack, otherwise than by direct thrust, except when the shorter may extend their sword-arm in response to a simple attack, their longer reach will ward it off with a stop or counter-thrust. Short men can only attack them safely by beating, binding, grasping, pressing or evading the blade, and the taller fencers must be prepared with all the well-known parries and counters to such offensive movements, as well as with the stop-thrust to be made either with advancing opposition or with a retreat. Fencers of small stature must be exceedingly quick on their feet, unless they possess the art of parrying to perfection, and even then, if slow to shift ground, they will continually be in danger. With plenty of room, the quick mover can always choose the moment when he will be within distance, for an attack which his slower opponent will be always fearing and unable to prevent or anticipate.

It is desirable to put on record the modern form of the weapon. An average épée weighs, complete, about a pound and a half, while a foil weighs approximately one-third less. The épée blade is exactly like that of the old small-sword after the abandonment of the "colichemarde" form, in which the "forte" of the blade was greatly thickened. In length from guard or shell to point it measures about 35 in., and in width at the shell about ¾ ths of an inch. From this it gradually and regularly tapers to the point. There is no cutting edge. The side of the épée which is usually held uppermost is slightly concave, and the other is strengthened with a midrib, nearly equal in thickness and similar in shape to either half of the true blade. The material is tempered steel. There is a haft or tang about 8 in. long, which is pushed through a circular guard or shell ("cuillie") of convex form, the diameter of which is normally 5 in. and the convexity ⅓ in. The shell is of steel or aluminium, and if of the latter metal, sometimes fortified at the centre with a disc of steel the size of a crown piece. The insertion of the haft or tang through the shell may be either central or eccentric to the extent of about 1 in., for the better protection of the outside of the forearm.

After passing through the shell, the haft of the blade is inserted in a grip or handle ("poignard"), averaging 7 in. in length and of quadrangular section, which is made of tough wood covered with leather, india-rubber, wound cord or other strong material with a rough surface. The grip is somewhat wider than its vertical thickness when held in the usual way, and it diminishes gradually from shell to pommel for convenience of holding. It should have a slight lateral curvature, so that in executing circular movements the pommel is kept clear of the wrist. The pommel, usually of steel, is roughly spherical or eight-sided, and serves as a counterbalance. The end of the haft is riveted through it, except in the case of "épée démontables," which are the most convenient, as a blade may be changed by simply unscrewing or unlocking the pommel.

An épée is well balanced and light in hand when, on poising the blade across the forefinger, about 1 in. in advance of the shell, it is in equilibrium.
For practice, the point is blunted to resemble the flat head of a nail, and is made still more incapable of penetration by winding around it a small ball of waxed thread, such as cobblers use. This "pointe d'arrêt," or sometimes "pointe d'arrêt," is used in various forms of "boutons margueurs," all of which are unsatisfactory, and are occasionally used. The "pointe d'arrêt," like a small tin-tack placed head downwards on the flattened point of the épée, and fastened on by means of the waxed thread, is, on the contrary, most useful, by fixing in the clothes, to show where and when a good hit has been made. The point need only protrude about 1/8th of an inch from the button. There are several kinds of pointes d'arrêt. The best is called, after its inventor, the "Léon Sazie," and has three blunt points of hardened steel each slightly excentric. The single point is sometimes protected by the thickness of the button from scoring a good hit.

A mask of wire netting is used to protect the face, and a stout glove on the sword hand. It is necessary to wear strong clothes and to pad the jacket and trousers at the most exposed parts, in case the sword should break unnoticcd. A vulnerable spot, which ought to be specially padded, is just under the sword-arm.

**BIBLIOGRAPHY.**—Among the older works on the history and practice of the various small-sword, or épée, are the following: The Sword-Fencing-Master, or Compleat Small-swordman, by W. H. Gent (Sir William Hope, afterwards baronet) (Edinburgh, 1687), and several other works by the same author, of later date, for which see Secretes of Arms and Fence, by Egerton Castle; Nouveau traité de la perfection sur le fait des armes, by P. G. Girard (Paris, 1736); L'École des armes, by M. Angelo (London, 1753); L'Art des armes, by M. Danet (2 vols., Paris, 1756–1757); Nouveau traité de l'arti des armes, by Nicolas Demouze (Lille, 1728).

More modern are: Traité de l'arti des armes, by la Bessière, Jr. (Paris, 1818); Les Armes et le duel, by A. Gréissier (2nd ed., Paris, 1847); Les Secrets de l'épée, by the baron de Bazancourt (Paris, 1862); Schools and Masters of Fence, by Egerton Castle (London, 1885); Le Jeu de l'épée, by J. Jacob and Emil André (Paris, 1887); L'Éscrime pratique au XIXe siècle, by Ambroise Baudry (Paris); L'Épée, by A. Spinnewyn and Paul Manoury (Paris, 1905); The Sword and the Centuries, by Captain Hutton (London, 1901); "The Revival of the Small-sword," by C. Newton-Robinson, in the Nineteenth Century and After (London, January 1905); Nouveau Traité de l'épée, by Dr Edom, privately published (Paris, 1908); and, most important of all, Méthode d'escrime à l'épée, by J. Joseph-Renaud, privately published (Paris, 1909).

**EPERJES,** a town of Hungary, capital of the county of Szérs, 190 m. N.E. of Budapest by rail. Pop. (1900) 13,098. It is situated on the left bank of the river Tisza, an affluent of the Theiss, and has been almost completely rebuilt since a great fire in 1887. Eperjes is one of the oldest towns of Hungary, and is still partly surrounded by its old walls. It is the seat of a Greek-Catholic bishop, and possesses an hospice giving the regency to Mgr de Marchi in 1616, and as a result exercised a considerable influence upon the government. During his governorship of Guienne in 1622 he had some scandalous scenes with the parliament and the archbishop of Bordeaux. He died in 1642. His eldest son, Henri de Nogaret de la Valette, duke of Candale, served under Richelieu, in the armies of Guienne, of Picardy and of Italy. The second son of Jean Louis de Nogaret, Bernard, who was born in 1592, and died in 1661, was, like his father, duke of Épernon, colonel-general in the infantry and governor of Guienne. After his death, the title of duke of Épernon was borne by the families of Goth and of Pardaillan.

**EPHERBEUM** (from Gr. ἐπάθος, a young man), in architecture, a large hall in the ancient Palaestra furnished with seats (Vitruvius v. 11), the length of which should be three times a third larger than the width. It served for the exercises of youths from the sixteenth to eighteen years of age.

**EPHESI** (Gr. ἐφές, and ἐφή, i.e. "those who have reached puberty"), a name specially given, in Athens and other Greek towns, to a class of young men from eighteen to twenty years of age, who formed a sort of college under state control. On the conclusion of his seventeenth year the Athenian youth attained his civil majority, and, provided he belonged to the first three property classes and passed the scrutiny (bouzaidia) as to age,
civic descent and physical capability, was enrolled on the register of his deme (ῥιζαρχικόν γραμματεῖον). He thereby at once became liable to the military training and duties, which, at least in the earliest times, were the main object of the Ephebia. In the time of Aristotle the names of the enrolled ephebi were engraved on a large pillar (form Ephebos) erected in front of the council-chamber. After admission to the college, the ephebi took the oath of allegiance, recorded in Pollux and Stobaeus (but not in Aristotle), in the temple of Aglauros, and was sent to Munychia or Acte to form one of the garrison. At the end of the first year of training, the ephebi were reviewed, and, if their performance was satisfactory, were provided by the state with a spear and a shield, which, together with the chlamys (cloak) and petasus (broad-brimmed hat), made up their equipment. In their second year they were transferred to other garrisons in Attica, patrolled the frontiers, and on occasion took an active part in war. During these two years they were free from taxation, and were not allowed (except in certain cases) to appear in the law courts as plaintiffs or defendants. The ephebi took part in some of the most important Athenian festivals. Thus during the Eleusinia they were told off to fetch the sacred objects from Eleusis and to escort the image of Iacchus on the sacred way. They also performed police duty at the meetings of the ecclesia.

After the end of the 4th century B.C. the institution underwent a radical change. Enrolment ceased to be obligatory, lasted only for a year, and the limit of age was dispensed with. Inscriptions attest a continually decreasing number of ephebi, and with the admission of foreigners the college lost its representative national character. This was mainly due to the weakening of the military spirit and the progress of intellectual culture. The military element was no longer all-important, and the ephebi became a sort of university for well-to-do young men of good family, whose social position has been compared with that of the Athenian "knight" of earlier times. The institution lasted till the end of the 3rd century A.D.

It is probable that the ephebia was in existence in the 5th century B.C., and controlled by the Areopagus and strategus as its moral and military supervisors. In the 4th century their place was taken by ten sophronistae (one for each tribe), who, as the name implies, took special interest in the morals of those under them, their military training being in the hands of experts, of whom the chief were the hoplomachus, the acontistes, the toxotes and the ephebes (instructors respectively in the use of arms, of the mysteries, and of the ephebe). Later, the sophronistae were superseded by a single official called cosmocles, elected for a year by the people, who appointed the instructors. When the ephebia instead of a military college became a university, the military instructors were replaced by philosophers, rhetoricians, grammarians and artists. In Roman imperial times several new officials were introduced, one of special importance being the director of the Diogenieon, where youths under age were trained for the ephebia. At this period the college of ephebi was a miniature city; its members called themselves "citizens," and it possessed an archon, strategus, herald and other officials, after the model of ancient Athens.

The subject of inscriptions, ranging from the 3rd century B.C. to the 3rd century A.D., containing decrees relating to the ephebi, their officers and instructors, and lists of the same, and a whole chapter (42) of the Aristotelian Constitution of Athens is devoted to them. The main subject of these inscriptions is: W. Dittenberger, De ephesiis Atticis (Gottingen, 1863); A. Dumont, Essai sur l'Éphèbodie attique (1875-1876); L. Grasberger, Erziehung und Unterricht im klassischen Allerthum, iii. (Würzburg, 1881); J.-F. Mahaffy, Old Greek Education (1881). P. Girard, L'Éducation athénienne au Ve et IVe siècle avant J.-C. (2nd ed., 1891), and article in Darenbourg and Saglio's Dictionnaire des antiquités which contains further bibliographical references; G. Gilbert, The Constitutional History of Athens (1885); G. Nolte, Die griechischen Staats- und Rechtsaltertümer (1862); T. Thalheim and J. Ohler in Pauly-Wissowa, Realencyclopadie der classischen Alterthümer, iv. (1900); W. W. Capes, University Life in Ancient Athens (1877).

EPEHMERIS—EPHESIANS

EPEHMERIS (Greek for "a diary"), a table giving for stated times the apparent position and other numerical particulars relating to a heavenly body. The Astronomical Ephemeris, familiarly known as the "Nautical Almanac," is a national annual publication containing ephemerides of the principal or more conspicuous heavenly bodies, elements and other data of eclipses, and other matter useful to the astronomer and navigator. The governments of the United Kingdom, United States, France, Germany and Spain publish such annals.

EPHESIANS, EPISTLE TO THE. This book of the New Testament, the most general and least occasional and polemic of all the Pauline epistles, a large section of which seems almost like the literary elaboration of a theological topic, may best be described as a solemn oration, addressed to absent hearers, and intended not primarily to clarify their minds but to stir their emotions. It is thus a true letter, but in the grand style, verging on the nature not of an essay but a poem. Ephesians has been called "the crown of St Paul's writings," and whether it be measured by its theological or its literary interest and importance, it can fairly dispute with Romans the claim to be his greatest epistle. In the public and private use of Christians some parts of Ephesians have been among the most favourite of all New Testament passages. Like its sister Epistle to the Colossians, it represents, whoever wrote it, deep experience and bold use of reflection on the meaning of that experience; if it be from the pen of the Apostle Paul, it reveals to us a distinct and important phase of his thought.

To the nature of the epistle correspond well the facts of its title and address. The title "To the Ephesians" is found in the Muratorian canon, in Irenaeus, Tertullian and Clement of Alexandria, as well as in all the earliest MSS. and versions. Marcion, however (c. A.D. 150), used and recommended copies with the title "To the Laodiceans." This would be inexplicable if Eph. i.i had read in Marcion's copies, as it does in most ancient authorities, "To the saints which are at Ephesus;" but in fact the words επ' Εφέσος of verse 1 were probably absent. They were not contained in the text used by Origen (d. 253); Basil (d. 379) says that "ancient copies" omitted the words; and they are actually omitted by Codices B (Vaticanus, 4th century) and K (Sinaithicus, 4th century), together with Codex 67 (11th century). The words, "in Ephesus" were thus probably originally lacking in the address, and were inserted from the suggestion of the title. Either the address was general ("to the saints who are also faithful") or else a blank was left. In the latter case the name may have been intended to be supplied by the reader, as a common heading of the letter, or a different name may have been written in each of the individual copies. Under any of these hypotheses the address would indicate that we have a circular letter, written to a group of churches, doubtless in Asia Minor. This would account for the general character of the epistle, as well as for the entire and striking absence of personal greetings and of concrete allusions to existing circumstances among the readers. It appears to have drawn its title, "To the Ephesians," from one of the churches for which it was intended, perhaps the one from which a copy was secured when Paul's epistles were collected, shortly before or after the year 100. That our epistle is the one referred to in Col. iv. 16, which was too heavy for the Colossians from Laodicea, is not unlikely. Such a surmise is rendered the more probable by the consideration that the main ideas worked out in chapters i.–iii. Throughout the epistle we have a singular combination of the seemingly desultory method of a letter, turning aside at a word and straying wherever...
the mood of the moment leads, with the firm, forward march of earnest and mature thought. In this conformation resides the doctrine unconscious but nevertheless real literary art of the composition.

The fundamental theme of the epistle is The Unity of Mankind in Christ, and hence the Unity and Divinity of the Church of Christ. God's purpose from eternity was to unite mankind in Christ, and so to bring human history to its goal, the New Man, the measure of the stature of the fullness of Christ. Those who have believed in Christ are the present representatives and result of this purpose; and a clear knowledge of the purpose itself, the secret of the ages, has now been revealed to men. This theme is not formally discussed, as in a theological treatise, but is rather, as it were, celebrated in lofty eulogy and application. First, in chapters i.-iii., under the mask of a conventional congratulatory paragraph, the writer declares at length the privileges which this great fact confers upon those who by faith receive the gift of God, and he is thus able to touch on the various aspects of his subject. Then, in chapters iv.-vi., he turns, with a characteristic and impressive "therefore," to set forth the obligations which correspond to the privileges he has just expounded. This author is indeed interested to prosecute vigorous and substantial thinking, but the mainspring of his interest is the conviction that such thought is significant for inner and outer life.

The relationship, both literary and theological, between the epistle to the Ephesians and that to the Colossians (p. 87) is very close. It is to be seen in many of the prominent ideas of the two writings, especially in the developed view of the central position of Christ in the whole universe; in the conception of the Church as Christ's body, of which He is the head; in the thought of the great Mystery, once secret, now revealed. There is further resemblance in the formal moral code, arranged by classes of persons, and having much the same contents in the two epistles (Eph. v. 22-24; Col. iii. 18-24). In both, also, Tychoicus carries the letter, and in almost identical language the readers are told that he will by word of mouth give fuller information about the apostles' affairs (Eph. vi. 21-22; Col. iv. 8-9). Moreover, in a great number of characteristic phrases and even whole verses the two are alike. Compare, for instance, Eph. i. 7, Col. i. 14; Eph. i. 10, Col. i. 20; Eph. i. 21, Col. i. 16; Eph. i. 22, 23, Col. i. 18, 19; Eph. ii. 5, Col. ii. 13; Eph. ii. 11, Col. ii. 11; Eph. ii. 16, Col. i. 20; Eph. iii. 2, 3, Col. i. 25, 26, and many other parallels. Only a comparison in detail will give a true impression of the extraordinary degree of resemblance. Yet the two epistles do not follow the same course of thought, and their contents cannot be successfully exhibited in a common synoptic table. Each has its independent occasion, purpose, character, as it were, celebrated in lofty eulogy and a common store of thought and use common means of expression.

The question of the authorship of Ephesians is less important to the student of the history of Christian thought than in the case of most of the Pauline epistles, because of the generalness of tone and the lack of specific allusion in the work. It purports to be by Paul, and was held to be his by Marcion and in the Muratorian canon, and by Irenaeus, Tertullian and Clement of Alexandria, all writing at the end of the 2nd century. No doubt of the Pauline authorship was expressed in ancient times; nor is there any lack of early use by writers who make no direct quotation, to raise doubts as to the genuineness of the epistle. The influence of its language is probably to be seen in Ignatius, Polycarp and Hermas, less certainly in the epistle of Barnabas. Some resemblances of expression in Clement of Rome and in Second Clement may have significance. There is here abundant proof that the epistle was in existence, and was highly valued and influential with leaders of Christian thought, about the year 100, when persons who had known Paul well were still living.

To the evidence given above may be added the use of Ephesians in the First Epistle of Peter. If the latter epistle could be finally established as genuine, or its date fixed, it would give important evidence with regard to Ephesians; but in the present state of discussion we must confine ourselves to pointing out the fact. Some of the more striking points of contact are the following: Eph. i. 3, 1 Peter i. 2; Eph. i. 20, 21, 1 Peter ii. 27; Eph. ii. 3, 4; Eph. iv. 17, 1 Peter iv. 3; Eph. ii. 21, 22, 1 Peter ii. 5; Eph. v. 1, 2 Peter iii. 1, i; Eph. v. 25, 1 Peter iii. 7, 8; Eph. vi. 5, 1 Peter ii. :18, 19. A similar relation exists between Romans and 1 Peter. In both cases the dependence is clearly on the part of 1 Peter; for ideas and phrases that in Ephesians and Romans have their firm place in closely wrought sequences, are found in 1 Peter with less profound significance and transformed into smooth and pointed maxims and apopthegmatic sentences.

Objections to the genuineness of Ephesians have been urged since the earliest part of the 19th century. "The influence of Schleiermacher, whose pupil Loebhard 'sayed in his Entwurf der paulinischen Lehrbegriffe (1824) expressed strong doubts as to Ephesians, carried weight. He held that Tychoicus was the author. De Wette first (1826) doubted, then (1843) denied that the epistle was by Paul. The chief attack came, however, from Baur (1849) and his colleagues of the Tubing school. Against the genuineness have appeared Ewald, Renan, Hausrath, Hilgenfeld, Ritschl, Pleiferer, Weizsäcker, Holtzmann, von Soden, Schmiedel, von Dobschütz and many others. On the other hand, the epistle has been defended by Bleek, Neander, Reuss, W. Weiss, Meyer, Sahatter, Lightfoot, Hort, Sanday, Schweitzer, Harnack, Zahn and many others. In recent years a tendency has been apparent among critics to accept Ephesians as a genuine work of Paul. This has followed the somewhat stronger reaction in favour of Colossians.

Before speaking of the more fundamental grounds urged for the rejection of Ephesians, we may look at various points of detail which are of less significance.

1. The style is unquestionably a slow and lumbering movement, in marked contrast with the quick effectiveness of Romans and Galatians. The sentences are much longer and less vivacious, as any one can see by a superficial examination. But nevertheless there are parts of the earlier epistles where the same tendency appears (e.g. Rom. iii. 23-26), and on the whole the style shows Paul's familiar traits. 2. The vocabulary is said to be peculiar. But it can be shown to be no more so than that of Galatians (Zahn, Einleitung, i. pp. 365 ff.). On the other hand, some words characteristic of Paul's use appear (notably δύο, five times), and the most recent and careful investigation of Paul's vocabulary (Nägel, Wörterbuch der paulinischen Briefe, 1905) concludes that the evidence speaks for Pauline authorship. 3. Certain phrases have aroused suspicion, for instance, "the devil" (vi. 11, instead of Paul's usual term "Satan"); "his holy apostles and prophets" (ii. 5, as a parallel of later "bishops and elders"); "the fullness of Christ" (iii. 1); "unto none of which was less than the least of all the saints" (iii. 8, as exaggerated). But these cases, when properly understood and calmly viewed, do not carry conviction against the epistle. 4. The relation of Ephesians to Colossians would be a serious difficulty only if Colossians were held to be not by Paul. Those who hold to the genuineness of Colossians find it easier to explain the resemblances as the product of the free working of the same mind, than as due to a deliberate imitator. Holtzmann's elaborate and very ingenious theory (1872) that Colossians has been expanded, on the basis of a shorter letter of Paul, by the same later hand which had previously written the whole of Ephesians, has not met with favour from recent scholars.

But the more serious difficulties which to many minds still stand in the way of the acceptance of the epistle have come from the developed phase of Pauline theology which it shows, and from the general background and atmosphere of the underlying system of thought, in which the absence of the well-known earlier controversies is remarkable, while some things suggest the thought of John and a later age. Among the most important points in which the ideas and implications of Ephesians suggest an authorship and a period other than that of Paul are the following:

(a) The union of Gentiles and Jews in one body is already accomplished. (b) The Christology is more advanced, uses
EPHESUS is an ancient Ionian city on the west coast of Asia Minor. In historic times it was situated on the lower slopes of the hills, Coressus and Prius, which rise out of a fertile plain near the mouth of the river Cäyster, while the temple and precinct of Artemis or Diana, to the fame of which the town owed much of its celebrity, were in the plain itself, E.N.E. at a distance of about a mile. But there is reason to think both town and shrine had different sites in pre-Ionian times, and that both lay farther south among the foot-hills of Mt. Somissus. The situation of the city was such as at all times to command a great commerce. Of the three great river basins of Ionia and Lydia, those of the Hermus, Cäyster and Maeander, it commanded the second, and had already access by easy passes to the other two.

The earliest inhabitants assigned to Ephesus by Greek writers are the "Amazons," with whom we hear of Leleges, Carians and Pelasgi. In the 11th century B.C., according to tradition (the date is probably too early), Androclus, son of the Athenian king Codrus, landed on the spot with his Ionians and a mixed body of colonists; and from his conquest dates the history of the Greek Ephesus. The deity of the city was Artemis; but we must guard against misconception when we use that name, remembering that she bore close relation to the primitive Asiatic goddess of nature, whose cult existed before the Ionian migration and even before the founding of Oxytgyia, and that she always remained the virgin-mother of all life and especially wild life, and an emblem of the fertility and productive power of the earth. The well-known monstrous representation of her, as a figure with many breasts, swathed below the waist in grave-clothes, was probably of late and alien origin. In early Ionian times she seems to have been represented as a natural matronly figure, sometimes accompanied by a child, and to have been a more typically Hellenic goddess than she became in the Hellenistic and Roman periods.

Twice in the period 700-500 B.C. the city owed its preservation to the interference of the goddess; once when the swarms of the Cimmerians overran Asia Minor in the 7th century and burnt the Athenian temple itself; and again in the middle of the 6th century succeeding, and only retired after it had solemnly dedicated itself to Artemis, the sign of such dedication being the stretching of a rope from city to sanctuary. Croesus was eager in every way to propitiate the goddess, and since about this time her temple was being restored on an enlarged scale, he presented most of the columns required for the building as well as some

BIBLIOGRAPHY.—The best commentaries on Ephesians are by C. J. Ellicott (1866), H. A. W. Meyer (4th ed., 1867), (Eng. trans. 1880), T. K. Abbott (1897), J. A. Robinson (1903, 2nd ed. 1904); in German by H. von Soden (in Hand-Commentar (1891, 2nd ed. 1893), E. Haupt (in Meyer's Kommentar (6th ed., 1897), B. Lightfoot (Colossians 1895, 3rd ed. 1879) is important for Ephesians also. O. Cullmann see H. G. Moule (in Cambridge Bible for Schools (1887), R. W. Dale, Ephes. the Epistles of the Ephesians; its Doctrine and Ethics (1882), is a valuable survey and expository study of the work in its context (1897). Questions of genuineness, purpose, &c., are discussed in the New Testament Introductions of H. Holtzmann (1885, 3rd ed. 1892); B. Weiss (1886, 3rd ed. 1897, Eng. trans. 1897); G. Salmon (1887, 3rd ed. 1897); A. Jülicher (Colossians 1895). See also the works on the Apostolic Age of C. Weizsäcker (1886, 2nd ed. 1892, Eng. trans. 1893-1895); O. Pfeiffer (Das Urchristenthum (1887, 2nd ed. 1902, Eng. trans. 1906); and A. C. McGregor (1897).

On early attestation see A. H. Charteris, Canonity (1880) and the New Testament in the Apostolic Fathers (Oxford, 1905). The theological ideas of Ephesians are also discussed in some of the works on Paul's theology; see especially F. C. Baur, Paulus (1845, 2nd ed. 1866-1867, Eng. trans. 1873), and F. C. Baur, Der Paulinismus (1873, 2nd ed. 1890, Eng. trans. 1877); and in the works on New Testament theology by B. Weiss (1868, 7th ed. 1879, Eng. trans. 1891), H. H. Schmidt (1879), and G. B. Stevens (1899). See also Sommerville, St Paul's Conception of Christ (1897).

(J. H. R.)

EPHESIANS is one of the five epistles to the seven churches in Asia Minor (Rev. 2:19). The theme of this letter is the Ephesian church's spiritual relationship to Christ, and it is a call to them to maintain their reconciled status in the spiritual realm.

The letter begins with a greeting to the Ephesians, which includes their membership in the family of God and the grace and truth that have been revealed to them. The letter then proceeds to discuss various aspects of the Ephesian church's life, such as their walk in Christ, their spiritual growth, and their role in the spiritual kingdom.

One of the most significant parts of the letter is its emphasis on the Ephesian church's unity and the divine purpose for this unity. The letter also contains a warning against false teachers and a call to hold fast to the truth of the Gospel.

The letter concludes with a prayer for the Ephesians, asking for God's blessings and a further understanding of the mystery of Christ's love. The letter ends with a benediction, expressing the writer's hope that the Ephesian church will continue to grow in the love and knowledge of Christ.
cows of gold. That is to say, these gifts were probably paid for out of the proceeds of the sequestration of the property of a rich Lydian merchant, Sadyattes, which Croesus presented to Ephesus (Nic. Damasc. fr. 65). To counteract, perhaps, the growing Lydian influence, Athens, the mother-city of Ephesus, despatched one of her noblest citizens, Aristarchus, to restore love on the Ionian shores. A third Persian condominium was then in force. Ephesus and Aristarchus seem to have borne fruit. It was an Ephesian follower of his, Hermodorus, who aided the Decemviri at Rome in their compilation of a system of law. And in the same generation Heraclitus, probably a descendant of Codrus, quitted his hereditary magistracy in order to devote himself to philosophy, in which his name became almost as great as that of any Greek. Poetry had long flourished at Ephesus. From very early times the Homeric poems found a home and admirers there; and to Ephesus belong the earliest elegiac poems of Greece, the war songs of Callinus, who flourished in the 7th century B.C. and was the model of Tyrtæus. The city seems to have been more than once under tyrannical rule in the early Ionian period; and it fell thereafter first to Croesus of Lydia, and then to Cyrus, the Persian, and when the Ionian revolt against Persia broke out in the year 500 B.C. under the lead of Miletus, the city remained submissive to Persian rule. When Xerxes returned from the march against Greece, he honoured the temple of Artemis, although he sacked other Ionian shrines, and even left his children behind at Ephesus for safety's sake. We hear again of Persian respect for the temple in the time of Tissaphernes (411 B.C.). After the final Persian defeat at the Eurymeon (466 B.C.), Ephesus for a time paid tribute to Athens, with the other cities of the coast, and Lysander first and Agesilaus afterwards made it their headquarters. To the latter fact we owe a contemporary description of it by Xenophon. In the early part of the 4th century it fell again under Persian influence, and was administered by an oligarchy. Alexander was received by the Ephesians in 334, and established democratic government. Soon after his death the city fell into the hands of Lysimachus, who introduced fresh Greek colonists from Lebedus and Colophon and, it is said, by means of an artificial inundation compelled those who still dwelt in the plain by the temple to migrate to the city on the hills, which he surrounded by a solid wall. He renamed the city after his wife Arsinoë, but the old name was soon resumed. Ephesus was of very prosperous during the Hellenistic period, and is conspicuous both then and later for the abundance of its coinage, which gives us a more complete list of magistrates' names than we have for any other Ionian city. The Roman coinage is remarkable for the great variety and importance of its types. After the defeat of Antiochus the Great, king of Syria, by the Romans, Ephesus was handed over by the conquerors to Eumenes, king of Pergamum, whose successor, Attalus Philadelphus, unintentionally worked the city irremediable harm. Thinking that the shallowness of the harbour was due to the width of its mouth, he built a mole part-way across the latter; the result, however, was that the silting up of the harbour proceeded more rapidly than before. The third Attalus of Pergamum bequeathed Ephesus with the rest of his possessions to the Roman people, and it became for a while the chief city, and for longer the first port, of the province of Asia, the richest in the empire. Henceforth Ephesus remained subject to the Romans, save for a short period, when, at the instigation of Mithradates Eupator of Pontus, the cities of Asia Minor revolted and massacred their Roman residents. The Ephesians even dragged out and slew those Romans whom they found to the precinct of Artemis for protection, notwithstanding the warning of a government envoys. The purpose was, however, new to their former masters, and even had the eflentory to state, in an inscription preserved to this day, that their defection to Mithradates was a mere yielding to superior force. Sulla, after his victory over Mithradates, brushed away their pretenses, and inflicting a very heavy fine told them that the punishment fell far short of their deserts. In the civil wars of the 1st century B.C. the Ephesians twice supported the unsuccessful party, giving shelter to, or being made use of by, first, Brutus and Cassius, and afterwards Antony, for which partisanship or weakness they paid very heavily in fines.

All this time the city was gradually growing in wealth and in devotion to the service of Artemis. The story of St Paul's doings there illustrates this fact, and the sequel is very suggestive, the burning, namely, of books of sorcery of great value. Addition to the practice of cult, arts had already become general in the new semi-orientalized city. The Christian Church which Paul planted there was governed by Timothy and John, and is famous in Christian tradition as a nurse of saints and martyrs. According to local belief, Ephesus was also the last home of the Virgin, who was lodged near the city by St John and there died. But to judge from the Apocalyptic Letter to this Church (as shown by Sir W. M. Ramsay), the latter showed a dangerous tendency to lightness and reaction, and later events show that the pagan tradition of Artemis continued very strong and perhaps never became quite extinct in the Ephesian district. It was, indeed, long before the spread of Christianity threatened the old local cult. The city was proud to be termed mecorus or servant of the goddess. Roman emperors vied with wealthy natives in lavish gifts, one Vibius Salutarius in the latter presenting a quantity of gold and silver images to be carried annually in procession. Ephesus contested stoutly with Smyrna and Pergamum the honour of being called the first city of Asia; each city appealed to Rome, and we still possess rescripts in which the emperors endeavoured to mitigate the bitterness of the rivalry. One privilege Ephesus secured; the Roman governor of Asia always landed and first assumed office there: and it was long the provincial centre of the official cult of the emperor, and seat of the Archias. The Goths destroyed both city and temple in the year A.D. 262, and although the city revived and the cult of Artemis continued, neither ever recovered its former splendour. A general council of the Christian Church was held there in 431 in the great double church of St Mary, which is still to be seen. On this occasion Nestorius was condemned, and the honour of the Virgin established as Theotokos, amid great popular rejoicing, due, doubtless, in some measure to the hold which the cult of the virgin Artemis still had on the city. (On this council see below.) Thereafter Ephesus seems to have been gradually deserted owing to its malaria; and life transferred itself to another and higher site near the Artemision, the name of which, Ayathulukh, is now known to be a corruption of the title of St John Theologos, given to a great cathedral built on a rocky hill near the present railway station, in the time of Justinian I. This church was visited by Ibn Batuta in A.D. 1353; but few traces are now visible. The ruins of the Artemision, after serving as a quarry to local builders, were finally covered deep with mud by the river Cayster, or one of its left bank tributaries, the Selinus, and the true site remained unsuspected until 1869.

Excavations.—The first light thrown on the topography of Ephesus was due to the excavations conducted by the architect, J. T. Wood, on behalf of the trustees of the British Museum, during the years 1863-1874. He first explored the Odeum and the Great Theatre situate in the city itself, and in the latter place had the good fortune to find an inscription which indicated to him in what direction to search for the Artemision; for it stated that processions came to the city from the temple by the Magnesian gate and returned by the Coressian. These two gates were next identified, and following up that road which issued from the Magnesian gate, Wood lighted first on a ruin which he believed to be the tomb of Androcles, and afterwards on an angle of the perfumed pool of the time of Augustus. After further tentative explorations, he struck the actual pavement of the Artemision on the last day of 1869.

The Artemision.—Wood removed the whole stratum of superficial deposit, nearly 10 ft. deep, which overlay the huge area of the temple, and exposed to view not only the scanty remains of the latest edifice, built after 350 B.C., but the platform of an earlier temple, now known to be that of the 6th century to which Croesus contributed. Below this he did not find any remains. He discovered and sent to England parts of several
Ephesus

sculptured drums (columnae caelatae) of the latest temple, and archaic sculptures from the drums and parapet of the earlier building. He also made accurate measurements and a plan of the Hellenistic temple. Found many inscriptions and a few miscellaneous antiquities, and had begun to explore the Precinct, when the great expense and other considerations induced the trustees of the British Museum to suspend his operations in 1874. Wood made two subsequent attempts to resume work, but failed; and the site lay desolate till 1904, when the trustees, wishing to have further information about the earlier strata and the Precinct, sent D. G. Hogarth to re-examine the remains. As a result of six months' work, Wood's "earliest temple" was revealed, and planned, remains of three earlier shrines were found beneath it, a rich deposit of offerings, &c., belonging to the earliest shrine was discovered, and tentative explorations were made in the Precinct. This deep digging, however, which reached the sand of the original marsh, released much ground water and resulted in the permanent flooding of the site.

The history of the Artemision, as far as it can be inferred from the remains, is as follows. (1) There was no temple on the plain previous to the Ionian occupation, the primeval seat of the nature-goddess having been in the southern hills, at Ortygia (near mod. Aradena). Towards the end of the 8th century B.C. a small shrine came into existence on the plain. This was little more than a platform of crude stone, probably a temple, and an altar, and perhaps later a wooden icon (image), the whole enclosed in a *teumēn*; but, as is proved by a great treasure of objects in precious and other metals, ivory, bone, crystal, paste, glass, terra-cotta and other materials, found in 1904-1905, partly within the platform on which the cult-statue stood and partly outside, in the lowest stratum of deposit, this early shrine was presently enriched by Greeks with many and splendid offerings of Hellenic workmanship. A large number of electron coins, found among these offerings, and in style the earliest of their class known, combine with other evidence to date the whole treasure to a period considerably anterior to the reign of Croesus. This treasure is now divided between the museums of Constantinople and London. (Win on a short time, perhaps after the Cimmerian sack (? 650 B.C.), this shrine was restored, slightly enlarged, and raised in level, but not altered in character. (2) About the close of the century, for some reason not known, but possibly owing to collapse brought about by the marshy nature of the site, this was replaced by a temple of regular Hellenic form. The latter was built in relation to the earlier central statue-base but at a higher level than either of its predecessors, doubtless for dryness' sake. Very little but its foundations was spared by later builders, and there is now no certain evidence of its architectural character; but it is very probable that it was the early temple in which the Ionic order is said to have been first used, after the colonists had made use of Dorian in their earlier constructions (e.g. in the *Paeonion*); and that it was the work of the Cnossian Chersiphron and his son, Metagenes, always regarded afterwards as the first builders of a regular Artemision. Their temple is said by Strabo to have been made bigger by another architect. (3) The latter's work must have been the much larger temple, exposed by Wood, and usually known as the Archai or Croesus temple. This overlies the remains of No. 3, at a level higher by about a metre, and the area of its *cella* alone contains the whole of the earlier shrines. Its central point, however, was still the primitive statue-base, now enlarged and heightened. About half its pavement, parts of the *cella* walls and of three columns of the peristyle, and the foundations of nearly all the platform, are still in position. The visible work was all of very fine, finely finished, nearly square, about 7 m. N.E., near the modern Kos Bunar. Fragments of relief-sculptures belonging to the parapet and columns, and of fluted drums and capitals, cornices and other architectural members have been recovered, showing that the workmanship and Ionic style were of the highest excellence, and that the building presented a variety of ornament, rare among Hellenic temples. The whole ground-plan covered about 30,000 sq. ft. The height of the temple is doubtful, the measurements of columns given us by later authority having reference probably to its successor, the height of which was considered abnormal and marvellous. Judged by the diameter of the drums, the columns of the Croesus temple were not two-thirds of the height of those of the Hellenistic temple. This fourth temple is, beyond question, that to which Croesus contributed, and it was, therefore, in process of building about 540 B.C. Our authorities seem to be referring to it when they tell us that the Artemision was raised by common contribution of the great cities of Asia, and took 120 years to complete. It was dedicated with great ceremony, probably between 450 and 430 B.C., and the famous Timotheus, son of Themander, carried off the magnificent prize for a lyric ode against all comers. Its original architects were, probably, Paeonius of Ephesus, and Demetrius, a *leipos* of the shrine itself: but it has been suggested that the latter may have been rather the actual contracting builder than the architect. Of this temple Herodotus speaks as existing in his day; and unless weight be given to an isolated statement of Eusebius, that it was burned about 395 B.C., we must assume that it survived until the night when one Herastratus, desirous of acquiring eternal fame if only by a great crime, set it alight. This is said to have happened in 356 B.C. on the - October night on which Alexander the Great came into the world, and, as Hegesias said, the goddess herself was absent, assisting at the birth; but the exactness of this reportous synchronism makes the Temple at Ephesus, conjecturally restored by date suspect. (5) It A. E. Henderson, succeeded by what is called the Hellenistic temple, begun almost immediately after the catastrophe, according to plans drawn by the famous Dinocrates the architect of Alexandria. The platform was once more raised to a higher level, some 7 ft. above that of the Archai, by means of huge foundation blocks bedded upon the earlier structures; and this increase of elevation necessitated a slight expansion of the area all round, and ten steps in place of three. The new columns were of greater diameter than the old and over 60 ft. high; and from its great height the whole structure was regarded as a marvel, and accounted one of the wonders of the world. Since, however, other Greek temples had colonnades hardly less high, and were of equal or greater area, it has been suggested that the Ephesian temple had some distinct element of grandiosity, no longer known to us—perhaps a lofty sculptured parapet or some imposing form of *pudium*. Bede, in his treatise De sept. mir. mundi, describes a stupendous erection of several storeys; but his other descriptions are so fantastic that no credence can
Ephesus, Council of

be attached to this. The fifth temple was once more of Ionic order, but the finish and style of its details as attested by existing remains were inferior to those of its predecessor. The great sculptured drums and pedestals, now in the British Museum, belong to the lower part of certain of its columns: but nothing of its frieze or pediments (if it had any) has been recovered. Begun probably before 350 B.C., it was in building when Alexander came to Ephesus in 334 and offered to bear the cost of its completion. It was probably finished by the end of the century; for Pliny the Elder states that its cypress-wood doors had been in existence for 400 years up to his time. It stood intact, except for very partial restorations, till A.D. 262 when it was sacked and burned by the Goths: but it appears to have been to some extent restored afterwards, and its cult no doubt survived till the Edict of Theodosius closed the pagan temples. Its material was then quarried extensively for the construction of the great cathedral of St John Theologos on the neighbouring hill (Aya- soluk), and a large Byzantine building (a church?) came into existence on the central part of its denuded site, but did not last long. Before the Ottoman conquest its remains were already being used as building-stones.

The organization of the temple hierarchy, and its customs and privileges, retained throughout an Asianic character. The priestesses of the goddess were ἀσταλίναι (i.e. unwedded), and her priests were compelled to celibacy. The chief among the latter, who bore the Persian name of Megabyzus and the Greek title Neocorus, was doubtless a power in the state as well as a dignitary of religion. His official dress and spadonic appearance are probably revealed to us by a small ivory statuette found by D. G. Hogarth in 1905. Besides these there was a vast throng of dependents who lived by the temple and its services—theologoi, who may have expounded sacred legends, ἱμωνίοι, who composed hymns in honour of the deity, and others, together with a great crowd of ἱεροί who performed more menial offices. The making of shrines and images of the goddess occupied many hands. To support this greedy mob offerings flowed in in a constant stream from votaries and from visitors, who contributed sometimes money, sometimes statues and works of art. These latter so accumulated that the temple became a rich museum, among the chief treasures of which were the figures of Amazoni sculptured in competition by Phedias, Polyclitus, Cresilas and Phradmon, and the painting by Apelles of Alexander holding a thunderbolt. The temple was also richly endowed with lands, and possessed the right of taxation and rent, which seem to have been an important source of revenue. But perhaps the most important of all the privileges possessed by the goddess and her priests was that of asylum. Fugitives from justice or vengeance who reached her precincts were perfectly safe from all pursuit and arrest. The boundaries of the space possessing such virtue were from time to time enlarged. Mithradates extended them to a bowshot from the temple in all directions, and Mark Antony imprudently allowed them to take in part of the city, which part thus became free of all law, and a haunt of thieves and villains. Augustus, while leaving the right of asylum untouched, diminished the space to which the privilege belonged, and limited it to the length of a wall, which still surrounds the ruins of the temple at the distance of about a quarter of a mile, bearing an inscription in Greek and Latin, which states that it was erected in the proconsulship of Asinius Gallus, out of the revenues of the temple. The right of asylum, however, had once more to be defended by a deputation sent to the emperor Tiberius. Besides being a place of worship, a museum and a sanctuary, the Ephesian temple was a great bank. Nowhere in Asia could money be more safely bestowed, and both kings and private persons placed their treasures under the guardianship of the goddess.

The City.—After Wood's superficial explorations, the city remained desolate till 1818, when the American Archaeological Institute obtained a concession for excavation and began systematic work. This has continued regularly ever since, but has been carried down no farther than the imperial stratum. The main areas of operation have been: (1) The Great Theatre. The stage buildings, orchestra and lower parts of the cavea have been cleared. In the process considerable additions were made to Wood's find of sculptures in marble and bronze, and of inscriptions, including missing parts of the Vibiai Salutaris texts. This theatre has a peculiar interest as the scene of the tumult aroused by the mission of St Paul; but the existing remains represent a reconstruction carried out after his time. (2) The Hellenistic Agora, a huge square, surrounded by porticoes, lying S.W. of the theatre and having fine public halls on the S. It has yielded to the Austrians fine sculpture in marble and bronze and many inscriptions. (3) The Roman Agora, with its large halls, lying N.W. of the theatre. Here were found many inscriptions of Roman date and some statuary. (4) A street running from the S.E. angle of the Hellenic Agora towards the Magnesian gate. This was found to be lined with pedestals of honorific statues and to have on the west side a remarkable building, stated in an inscription to have been a library. The tomb of the founder, T. Julius Celsus, is hard by, and some fine Roman reliefs, which once decorated it, have been sent to Vienna. (5) A street running direct to the port from the theatre. This is of great breadth, and had a Horologion half-way down the upper part of the street. It was known as the "Jewish street" after having been restored at a higher level than formerly by the emperor Arcadius (A.D. 395). It leaves on the right the great Thermae of Constantine, of which the Austrians have cleared out the south-east part. This huge pile used to be taken for the Artemision by early visitors to Ephesus. Part of the quays and buildings rounding the port were exposed, after measures had been taken to drain the upper part of the marsh. (6) The Double Church of the Virgin "Deipara" in the N.W. of the city, wherein the council of 431 was held. Here interesting inscriptions and Byzantine architectural remains were found. Besides these excavated monuments, the Stadion; the eucinete of fortifications erected by lysimachus, which runs from the tower called the "Prison of St Paul" and right along the crests of the Bulbul (Prion) and Panajir hills; the round monument miscalled the "Tomb of St Luke"; and the Opisthopleian gymnasium near the Magnesian gate, are worthy of attention. The work done by the Austrians enables a good idea to be obtained of the appearance presented by a great Graeco-Roman city of Asia in the last days of its prosperity. It may be realized better there than anywhere how much architectural splendour was concentrated in the public quarters. But the restriction on clearance to the upper stratum of deposit has prevented the actual collection of many of the buildings. Both the Hellenistic and, still more, the original Ionian cities remain for the most part unexplored. It should, however, be added that very valuable topographical exploration has been carried out in the environs of Ephesus by members of the Austrian expedition, and that the Ephesian district is now mapped more satisfactorily than any other district of ancient interest in Asia Minor.

The Turkish village of Ayasoluk (the modern representative of Ephesus), more than a mile N.E. of the ancient city, has revived somewhat of recent years owing to the development of its fig gardens by the Aidin railway, which passes through the upper part of the plain. It is noteworthy for a mosque, the ruined mosque built by the Seljuk, Isa Bey II., of Aidin, in 1274, which contains magnificent columns: for a castle, near which lie remains of the pendentives from the cupola of the great cathedral of St John, now deeply buried in its own ruins; and for an aqueduct, Turkish baths and mosque-tombs. There is a fair inn managed by the Aidin Railway Company.

Ephesus, Council of. This Church council was convened in 431 for the purpose of taking authoritative action concerning...
the doctrine of the person of Christ. The councils of Nicea and Constantinople had asserted the full divinity and real humanity of Christ, without, however, defining the manner of their union. The attempt to solve the apparent incongruity of a perfect union of two complete and distinct natures in one person produced first Apollinarism, which substituted the divine Logos for the human υἱός or πρωτόκος of Jesus, thereby detracting from the completeness of his humanity; and then Nestorianism, which destroyed the unity of Christ’s person by affirming that the divine Logos dwelt in the man Jesus as in a temple, and that the union of the two was in respect of dignity, and furthermore that, inasmuch as the Logos could not have been born, to call Mary Θεοτόκος, “Godbearer,” was absurd and blasphemous. The Alexandrians, led by Cyril, stood for the doctrine of the perfect union of two complete natures in one person, and made Θεοτόκος the shibboleth of orthodoxy. The theological controversy was intensified by the rivalry of the two patriarchates, Alexandria and Constantinople, for the primacy of the East. As bishop of Constantinople Nestorius naturally looked to the emperor for support, while Cyril turned to Rome. A Roman synod in 430 found Nestorius heretical and decreed his excommunication unless he should retract. Shortly afterwards an Alexandrian synod condemned his doctrines in twelve anathemas, which only provoked counter-anathemas. The emperor now intervened and summoned a council, which met at Ephesus on the 22nd of June 431. Nestorius was present with an armed escort, but refused to attend the council on the ground that the patriarch of Antioch (his friend) had not arrived. The council, nevertheless, proceeded to depose him. When the Roman legates appeared they “examined and approved” the acts of the council, whether as if by themselves giving them validity, or as if concurred with the council, is a question not easy to answer from the records. Cyril, the president, apparently regarded the subscription of the legates as the acknowledgment of a “canonical agreement” with the synod. The disturbances that followed the arrival of John, the patriarch of Antioch, are sufficiently described in the article Nestorius.

The emperor finally interposed to terminate that scandalous strife, banished Nestorius and dissolved the council. Ultimately he gave decision in favour of the orthodox. The council was generally received as ecumenical, even by the Antiochenes, and the different views of Cyril and John were adjusted (433) by a “Unicephalous Creed,” which, however, did not prevent a recurrence of theological controversy.

The so-called “Robber Synod” of Ephesus (Latrocinium Ephesinum) of 449, although wholly irregular and promptly repudiated by the church, may, nevertheless, not improperly be treated here. The archimandrite Eutyches (q.v.) having been deposed by his bishop, Flavianus of Constantinople, as the head of his heterodox cens of Christ, had appealed to Dioscorus of Alexandria for the successor of Cyril in the see of Alexandria, who restored him and moved the emperor Theodosius II. to summon a council, which should “utterly destroy Nestorianism.” Rome recognizing that she had more to fear from Alexandria, departed from her traditional policy and sided with Constantinople. The council of 130 bishops, which convened on the 8th of August 449, was completely dominated by Dioscorus. Eutyches was acquitted of heresy and reinstated, Flavianus and other bishops deposed, the Roman legates insulted, and all opposition was overborne by intimidation or actual violence. The death of Flavianus, which soon followed, was attributed to injuries received in this synod; but the proof of the charge leaves something to be desired.

The emperor confirmed the synod, but the Eastern Church was divided upon the question of accepting it, and Leo I. of Rome excommunicated Dioscorus, refused to recognize the successor of Flavianus and demanded a new and greater council. The death of Theodosius II. removed the main support of Dioscorus, and cleared the way for the council of Chalcedon (q.v.), which deposed the Alexandrian and condemned Eutychianism.

EPHOD, a Hebrew word (ephod) of uncertain meaning, retained by the translators of the Old Testament. In the post-exilic priestly writings (6th century B.C. and later) the ephod forms part of the gorgeous ceremonial dress of the high-priest (see Ex. xxix. 5 sq. and especially Ex. xlv. 7-13). It was a very richly decorated object of coloured threads interwoven with gold, worn outside the luxurious mantle or robe; it was kept in place by a girdle, and by shoulder-pieces (?), to which were attached brooches of onyx (fastened to the robe) and golden rings from which hung the “breastplate” (or rather pouch) containing the sacred lots, Urim and Thummim. The somewhat involved description in Ex. xxviii. 6 sqq., xxix. 2-8 sqq. (see V. Ryssel’s ed. of Dillmann’s commentary on Ex.-Lev.) leaves it uncertain whether it covered the back, encircling the body like a kind of waistcoat, or only the front; at all events it was not a garment in the ordinary sense, and its association with the sacred lots indicates that the ephod was used for divination (cf. Num. xxvii. 21), and had become the distinguishing feature of the leading priestly line (cf. 1 Sam. ii. 28).1 But from other passages it seems that the ephod had been a familiar object whose use was by no means so restricted. Like the teraphim (q.v.) it was placed in the high altar; its presence at the Shiloh cult is borne of stock and stone of the Ark.1 It has been worn by persons acting in a priestly character (Samuel at Shiloh, priests of Nob, David), it is part of the worship of individuals (Gideon at Ophrah), and is found in a private shrine with a lay attendant (Mishah; Judg. xvii. 5; see, however, vv. 10-13).2 Nevertheless, while the prophetic teaching came to regard the ephod as contrary to the true worship of Yahweh, the priestly doctrine of the post-exilic age (when worship was withdrawn from the community at large to the recognized priesthood of Jerusalem) has retained it along with other remains of earlier usage, legalizing it, as it were, by confining it exclusively to the Aaronites.

An intricate historical problem is involved at the outset of the ephod, which the priest Abiathar brought into his hand when he fled to David after the massacre of the priests of Nob. It is evidently regarded as the one which had been in Nob (1 Sam. xxi. 9), and the presence of the priests at Nob is no less clearly regarded as the sequel to David’s flight to Shiloh. The ostensibly intention is to indicate the transference of the sacred objects to David (cf. 2 Sam. i. 10), and henceforth he regularly inquires of Yahweh in his movements (1 Sam. xxix. 9-12, xxx. 7 sq.; cf. xxii. 2, 4; 2 Sam. ii. 1, v. 19-23). It is possible that the modern practice of employing the trace the earlier history of the ephod through the line of Eli and Abiathar to the time when the Zadokite priests gained the supremacy (see Lev.; but elsewhere Abiathar is said to have borne the ark (1 Kings ii. 26; cf. 2 Sam. vii. 6), and this fluctuation is noteworthy by reason of the present confusion in the title of 1 Sam. xiv. 3, 18 (see commentaries). On one view, the ark in Kirjath-jearim was in non-Israelite hands (1 Sam. vii. 9 sq.), and it was only when the Philistines visited Ushai and Abigail that his way extended over Judah and Israel, including those cities which otherwise appear to have been in the hands of aliens (1 Sam. xiv. 47 sq.; cf. xvii. 54, sq.). There are some further indications that the ephod is of the tradition of both David and Saul (q.v.), and there is indirect and 1 Cf. the phrase “ephod of prophecy.” (Testament of Levi, viii. 2). The priestly appurtenance of the post-exilic age retains several traces of old mythological symbolism and earlier cult, the meaning of which has not altogether been forgotten. With the dress one may perhaps read the appurtenance of the gods. See Amos xxv. 14, 15, and J. Jeremias, Das Alte Testament im Lichte des Alten Orientes, 2nd ed., figs. 33, 46, and pp. 162, 449.

The ordinary interpretation “linen ephod” (1 Sam. ii. 18, xxv. 2, 2 Sam. vi. 17) has been challenged by T. C. F. Foote in his useful monograph, Journ. Bibl. Lit. xii. 1902, pp. 3, 47. This writer also aptly compares the infant Samuel with the child who drew the lots at the temple of Fortuna at Praeneste (Cicerone, De deo, ii. 44, 66) which see A. N. Jeremias, Das Alte Testament im Lichte des Alten Orientes, 2nd ed., figs. 33, 46, and pp. 162, 449.
independent evidence which makes 1 Kings ii. 26 not entirely isolated. Here it must suffice to remark that the ark, too, was also an object for ascertaining the divine will (especially Judg. xx. 26-28; cf. 18, 23), and it is borne out by the fact that the latter records of the ark (which was too heavy to be borne by one) is like those of the ephod, are valid for earlier times.

For the form of the earlier ephod the classic passage is 2 Sam. vi. 14, where David girt in (or with) a linen ephod dances before the ark at its entry into Jerusalem and incurs the unqualified contempt of his wife Michal, the daughter of Saul. Relying upon the known custom of performing certain observances in a practically, or even entirely, nude condition, it seems plausible to infer that the ephod was a scanty wrapping, perhaps of linen cloth, and this view has found weighty support. On the other hand, the idea of contempt at the exposure of the person, to whatever extent, may not have been so prominent, especially if the custom were not unfamiliar, and it is possible that the sequel refers more particularly to grosser practices attending outbursts of religious enthusiasm.\(^d\)

The favourite view that the ephod was also an image rests partly upon 1 Sam. xxi. 9, where Goliath's sword is wrapped in a cloth in the sanctuary of Nob behind the ephod. But it is equally natural to suppose that it hung on a nail in the wall, and apart from the omission of the significant words in the original Septuagint, this view is supported by the fact (as seen above; also G. F. Moore, Ency. Bib. col. 1307, n. 2) that after the story of Michal's shame and the removal of the sacred objects and the Levite priest by the Danites, parallel narratives have been used: the graven and molten images of Judg. xvii. 2-4 corresponding to the ephod and teraphim of ver. 5. Throughout there is confusion in the use of these terms, and the finale refers only to the graven image of Dan (xvii. 30 sq.; see 1 Kings xii. 28 sq.). But the combination of ephod and teraphim (as in Hos. iii. 4) is noteworthy, since the fact that the latter were images (1 Sam. xix. 13; Gen. xxxi. 34) could be urged against the view that the former were a similar character. Finally, according to Judg. viii. 27, Gideon made an ephod of gold, about 70 lb in weight, and "put it in Ophrah. It is regarded as a departure from the worship of Yahweh, although the writer of ver. 33 (cf. also ver. 23) hardly shared this feeling; it was probably something once harmlessly associated with the cult of Yahweh (cf. CALP, GOLDEN), and the term "ephod" may be due to a later hand under the influence of the prophetic teaching referred to above. The present passage is the only one which appears to prove that the ephod was also an image, and several writers, including Loets (Redencyk. f. prot. Theol. vol. v., s.v.), T. C. Foote (pp. 13-18) and A. Maceklenburg (Zeit. f. wiens. Theol., 1906, pp. 433 sqq.) find this interpretation preposterous.

Archaeological evidence for objects of divination (see, e.g., the interesting details in Ohnelfsich-Richter, Kypros, the Bible and Homer, i. 447 sqq.), and parallels from the Oriental area, can be readily cited in support of any of the explanations of the ephod which have been offered, but naturally cannot prove the form which it actually took in Palestine. Since images were clothed, it could be supposed that the diviner put on the god's apparel (cf. Ency. Bib. col. 1141); but they were also placed, and in either case the transference from a covering to the object covered is intelligible. If the ephod was a loin-clth, its use as a receptacle and the known evolution of the article find useful analogies (Foote, p. 43 sqq., and Ency. Bib. col. 1734 [1]). Finally, if there is no decisive evidence for the view that it was an image (Judg. viii. 27), or that as a wrapping it formed the sole covering of the officiating agent (2 Sam. vii.), all that can safely be said is that it was certainly used in divination and presumably did not differ radically from the ephod of the post-exilic age.

\(^{d}\) EPHOR (Gr. ἐφόρος), the title of the highest magistrates of the ancient Spartan state. It is uncertain when the office was created and what was its original character. That it owed its institution to Lycurgus (Herod. i. 65; cf. Xen. Respub. Lacedaem. viii. 3) is very improbable, and we may either regard it as an immemorial Dorian institution (with C. O. Müller, H. Gabriel, and E. G. R. Stein, Ed. Meyer, and others), or accept the tradition that it was founded during the first Messenian War, which necessitated a prolonged absence from Sparta on the part of both kings (Plato, Laws, iii. 692 a; Aristotle, Politics, v. 9. 1 = p. 1313 a 26; Plut. Cleomenes, 10; so G. Dum, G. Gilbert, A. H. J. Greenidge).

There is no evidence for the theory that originally the ephors were market inspectors; they seem rather to have had from the outset judicial or police functions. Gradually they extended their powers, aided by the jealousy between the royal houses, which made it almost impossible for the two kings to co-operate heartily, and from the 5th to the 3rd century they exercised a growing despotism which Plato justly calls a tyrannis (Laws, 692). Cleombrotus I. and II. restored the old office of the ephors and abolishing the office, and though it was revived by Antigonus Doson after the battle of Sellasia, and existed at least down to Hadrian's reign (Sparta Museum Catalogue, Introd. p. 10), it never regained its former power.

In historical times the ephors were five in number, the first of them giving his name to the year, like the eponymous archon at Athens. Where opinions were divided the majority prevailed. The ephors were elected annually, originally no doubt by the kings, later by the people; their term of office began with the new moon after the autumnal equinox, and they had an official residence (ἐφορά, ἐφόροι) in the Agora. Every free citizen was eligible and no property qualification was required.

The ephors summoned and presided over meetings of the Gerousia and Apella, and formed the executive committee responsible for carrying out decrees. In their dealings with the kings they represented the supremacy of the people. There was a monthly exchange of oaths, the kings swearing to rule according to the laws, the ephors undertaking on this condition to maintain the royal authority (Xen. Resp. Laced. 15, 7). They alone might remain seated in a king's presence, and had power to try and even to imprison a king, who must appear before them at the third summons. Two of them accompanied the army in the field, not exercising active command, but to act as a reserve, as a kind of reserve force in case of need, to bring him to trial on his return. The ephors, again, exercised a general guardianship of law and custom and superintended the training of the young. They shared the criminal jurisdiction of the Gerousia and decided civil suits. The administration of taxation, the distribution of booty, and the regulation of the calendar also devolved upon them. They could actually put perioeci to death without trial, if we may believe Isocrates (xii. 181), and were responsible for protecting the state against the helots, against whom they formally declared war on entering office, so as to be able to kill any whom they regarded as dangerous without violating religious scruples. Finally, the ephors were supreme in questions of foreign policy. They enforced, when necessary, the alien acts (ἐξωνομοί), negotiated with foreign ambassadors, instructed generals, sent out expeditions and were the guiding spirits of the Spartan confederacy.

EPHORUS (c. 400–330 B.C.), of Cyme in Aeolis, in Asia Minor, Greek historian. Together with the historian Theopompos he was a pupil of Isocrates, in whose school he attended two courses of rhetoric. But he does not seem to have made much progress in the art, and it is said to have been at the suggestion of Isocrates himself that he took up literary composition and the study of history. The fruit of his labours was his *Istropias* in 29 books, the first universal history, beginning with the return of the Heraclidae to Peloponnesus, as the first well-attested historical event. The whole work was edited by his son Demophilus, who added a 30th book, containing a summary description of the Social War and ending with the taking of Perinthus (340) by Philip of Macedon (cf. Diod. Sic. xvi. 14 with xvi. 76). Each book was complete in itself, and had a separate title and preface.

It is clear that Ephoros made critical use of the best authorities, and his work, highly praised and much read, was freely drawn upon by Diodorus Siculus1 and other compilers. Strabo (viii. p. 337) attaches much importance to his geographical notices, in which he appears to have been the first to separate the historical from the merely geographical element. Polybius (xii. 25 g) while crediting him with a knowledge of the conditions of naval warfare, ridicules his description of the battles of Leuctra and Mantinea as being ignorant of the nature of land operations. He was further to be commended for drawing (though not always) a sharp line of demarcation between the mythical and historical (Strabo ix. p. 424); he even recognized that a profusion of detail, though lending corroborative force to accounts of recent events, is ground for suspicion in reports of far-distant history. His style was high-flown and artificial, as was natural considering his early training, and he frequently sacrificed truth to rhetoric effect; but, according to Dionysius of Halicarnassus, he and Theopompos were the only historical writers whose language was accurate and finished. Other works attributed to him were:—*A Treatise on Discoveries; Respecting Good and Evil Things; Ou Remarkable Things in Various Countries* (it is doubtful whether these were separate works, or merely extracts from the *Histories*); *A Treatise on my Country*, on the history and antiquities of Cyme, and an essay *On Style*, his only rhetorical work, which is occasionally mentioned by the rhetorician Theon. Nothing is known of his life, except the statement in Plutarch that he declined to visit the court of Alexander the Great.

Fragments in C. W. Müller, *Fragmenta historiorum Graecorum* i., with critical introduction on the life and writings of Ephoros; see J. A. Klösgen, *De Ephoro historico* (1860); C. A. Volker, *Untersuchungen über die Quellen der griechischen und syrischen Geschichten bei Diodor, xi.-xxi.* (1868); and especially J. B. Bury, *Ancient Greek Historians* (1900); E. Schwartz, in *Parnassus, Realencyc.*, s.v.; and article *Greece: History: Ancient Authors*.

EPHRAEM SYRUS (Ephraim the Syrian), a saint who lived in Mesopotamia during the first three quarters of the 4th century A.D. He is perhaps the most influential of all Syriac authors; and his fame as a poet, commentator, preacher and defender of orthodoxy has spread throughout all branches of the Christian Church. This reputation he owes partly to the vast fertility of his pen—according to the historian Sozomen he was credited with having written altogether 3,000,000 lines—partly to the elegance of his style and a certain measure of poetic inspiration, more perhaps to the strength and consistency of his personal character, and his ardour in defence of the creed formulated at Nicaea.

An anonymous life of Ephraim was written not long after his death in 373. The biography has come down to us in two recensions. But in neither form is it free from later interpolation; and its untrustworthiness is shown by its conflicting with data supplied by his own works, as well as by the manner in which it is overloaded with miraculous events. The following is a probable outline of the main facts of Ephraim's life. He was born in the reign of Constantine (perhaps in 306) at or near Nisibis. His father was a pagan, the priest of an idol called Abnîl or Abâblî. During his boyhood Ephraim showed a repugnance towards heathen worship, and was eventually driven by his father from the home. He became a warrior and disciple of the famous Jacob—the same who attended the Council of Nicaea as bishop of Nisibis, and died in 338. At his hands Ephraim seems to have received baptism at the age of 18 or of 28 (the two recensions differ on this point), and remained at Nisibis till its surrender to the Persians by Jovian in 363. Probably in the course of these years he was ordained a deacon, but from his humble estimate of his own worth refused advancement to any higher degree in the church. He seems to have played an important part in guiding the fortunes of the city during the war begun by Shapur II. in 337, in the course of which Nisibis was thrice unsuccessfully besieged by the Persians (in 338, 346 and 350). The statements of his biographer to this effect accord with the impression we derive from his own poems (*Carmina Nisibena*, 1–21). His intimate relations with Bishop Jacob continued with the three succeeding bishops—Babu (338–749), Vologaeses (?349–361), and Abraham—on all of whom he wrote during the remainder of his life. The influence of the city in 363 to the Persians resulted in a general exodus of the Christians, and Ephraim left with the rest. After visiting Aim (Diarbekr) he proceeded to Edessa, and there settled and spent the last ten years of his life. He seems to have lived mainly as a hermit outside the city: his time was devoted to study, writing, teaching and the refutation of heresies. It is possible that during these years he paid a visit to Basil at Caesarea. Near the end of his life he rendered great public service by distributing provisions in the city during a famine. The best attested date for his death is the 9th of June 373. It is clear that this chronology leaves no room for the visit to Egypt, and the eight years spent there in refuting Arianism, which are alleged by his biographer. Perhaps, as has been surmised, there may be confusion with another Ephraim. Nor can he have written the funeral panegyric on Basil who survived him by three months. But with all necessary deductions the biography is valuable as witnessing to the immense reputation for sanctity and for theological acumen which Ephraim had gained in his lifetime, or at least soon after he died. His biographer's statement as to his habits and appearance is worth quoting, and is probably true:—"From the time he became a monk to the end of his life his only food was barley bread and sometimes pulse and vegetables; his drink was water. And his flesh was dried upon his bones, like a potter's sherd. His clothes were of many pieces patched together, the colour of dirt. In stature he was little; his countenance was always sad, and he never condescended to laughter. And he was bald and beardless."

The statement in his Life that Ephraim miraculously learned Coptic falls to the ground with the narrative of his Egyptian visit: and the story of his suddenly learning to speak Greek through the prayer of St Basil is equally unworthy of credence. He probably wrote only in Syriac, though he may have possessed some knowledge of Greek and possibly of Hebrew. But many of his works must have been early translated into other languages; and we possess MSS. versions into Greek, Armenian, Coptic, Arabic and Ethiopic. The Greek versions occupy three entire volumes of the Roman folio edition, and the extant Armenian versions (mainly of N.T. commentaries) were published at Venice in four volumes in 1836.

It was primarily as a sacred poet that Ephraim impressed himself on his fellow-countrymen. With the exception of his commentaries on scripture, nearly all his extant Syriac works are composed in metre. In many cases the metrical structure...

1. It is now generally recognized, thanks to Voluqardies and others, that Ephoros is the principal authority followed by Diodorus, except in the chapters relating to Sicilian history.
of Ephraim—EPHTHALITES

is of the simplest, consisting only in the arrangement of the discourse in lines of uniform length—usually heptasyllabic (Ephraim’s favourite metre) or penta-syllabic. A more complicated arrangement is found in other poems, such as the Carmina Nisibena: these are made up of strophes, each consisting of lines of different lengths according to a settled scheme, with a recurring refrain. T. J. Lamy has estimated that, in this class of poems, there are as many as 66 different varieties of metres to be found in the works of Ephraim. These strophic poems were set to music, and sung by alternating choirs of girls. According to Ephraim’s biographer, his main motive for adding these hymns to his works was his desire to counteract the baneful effects produced by the heretical hymns of Bardaisan and his son Harmonius, which had enjoyed popularity and been sung among the Edessenes for a century and a half.

The subject-matter of Ephraim’s poems covers all departments of theology. Thus the Roman edition contains (of metrical works) exegetical discourses, hymns on the Nativity of Christ, 65 hymns against heretics, 83 on the Faith against sectaries, a discourse against the Jews, 55 funeral hymns, 4 on free-will, 76 exhortations to repentance, 12 hymns on paradise, and 12 on miscellaneous subjects. The expository-hymnatic material is probably connected with church festivals. It must be confessed that, judged by Western standards, the poems of Ephraim are prolix and wearisome in the extreme, and are distinguished by few striking poetic beauties. And so far as they are made the vehicle of reasoning, their efficiency is seriously hampered by their poetic form. On the other hand, it is fair to remember that the taste of Ephraim’s countrymen in poetry was very different from ours. As Duval remarks: “Quant à la prolixité de saint Ephrem que nous trouvons parfois fastidieuse, on ne peut la condamner sans tenir compte du goût des Syriens qui aimaient les répétitions et les développements de la même pensée, et voyaient des qualités là où nous trouvons des défauts” (Littér. syriaque, p. 16). He is no worse in these respects than the best of the Syriac writers who succeeded him. And he surpasses almost all of them in the richness of his diction, and his skill in the use of metaphors and illustrations.

Of Ephraim as a commentator on Scripture we have only imperfect means of judging. His commentaries on the O.T. are at present accessible to us only in the form they had assumed in the Catena Patrum of Severus (compiled in 861), and to some extent in quotations by later Syriac commentators. His commentary on the Gospels is of great importance in connexion with the textual history of the N.T., for the text on which he composed it was that of the Diatessaron. The Syriac original is lost: but the ancient Armenian version survives, and was published at Venice in 1836 along with Ephraim’s commentary on the Pauline epistles (also only extant in Armenian) and some other works. A Latin version of the Armenian Diatessaron commentary has been made by Aupper and Mösinger (Venice, 1876). Using this version as a clue, J. R. Harris has been able to identify a number of Syriac quotations from or references to this commentary in the works of Isho’dadh, Bar-Kepha (Severus), Bar-quatî and Barhebraeus. Although as Harris points out, it is not altogether clear that the Diatessaron had come down unchanged through the two centuries to Ephraim’s day, the text on which he comments was in the main unaffected by the revision which produced the Peshitta. Side by side with this conclusion may be placed the result of F. C. Burkitt’s careful examination of the quotations from the Gospels in the other works of Ephraim; he shows conclusively that in all the undoubtedly genuine works the quotations are from a pre-Peshitta text.

As a theologian, Ephraim shows himself a stout defender of Nicæan orthodoxy, with no leanings in the direction of either the Nestorian or the Monophysite heresies which arose after his time. He regarded it as his special task to combat the views of Marcon of Bardaisan and of Mani.

To the modern historian Ephraim’s main contribution is in the material supplied by the 72 hymns known as Carmina Nisibena and published by G. Bickell in 1866. The first 20 poems were written at Nisibis between 350 and 363 during the Persian invasions; the remaining 52 at Edessa between 363 and 373. The former tell us much of the incidents of the frontier war, and particularly enable us to reconstruct in detail the history of the third siege of Nisibis in 350.

Of the many editions of Ephraim’s works a full list is given by Nestle in Realenk. f. prot. Theol. und Kirche (3rd ed.). For modern students the most important are: (1) the great folio edition in 6 volumes (3 of works in Greek and 3 in Syriac), in which the text is throughout accompanied by a Latin version (Rome, 1733-1746); one the satisfactory character of this edition (which includes many works that are not Ephraim’s) and especially of the Latin version, see Burkitt, Ephraim’s Quotations, pp. 4 sqq.; (2) Carmina Nisibena, Inter-tribal Latin translation by the cizizg, 1866; (3) Hymnæ et sermones, edited with a Latin translation by T. J. Lamy (4 vols., Malines, 1882-1902). Many selected homilies have been edited or translated by Overbeck, Zingerle and others (cf. Wright, Short History, pp. 35 sqq.); a selection of the Hymns was translated by H. Burgess, Select Metrical Hymns of Ephrem Syrus (1853). Of the two recensions of Ephraim’s biography, one was edited in part by J. S. Assemani (B.O. i. 16 sqq.) and in full by E. E. Assemani in the Acta sanctorum, 1st ser. i. 10 (1789); it was also published in 1790 by Bedjan and Bedjan (Acta mart., etc. sancti, ii. 621-665). The long poem on the history of Joseph, twice edited by Bedjan (Paris, 1887 and 1891) by him attributed to Ephraim, is more probably the work of Balasch (N. M.)

EPHTHALITES. A tribe of Israel, called after the younger son of Joseph, who in his benediction exclaimed Ephraim over the elder brother Manasseh (Gen. xlvi. 21). These two divisions were often known as the “house of Joseph” (Josh. xvii. 14 sqq.; Judg. i. 22; 2 Sam. xix. 20; 1 Kings xi. 28). The relations between them are obscure; conflicts are referred to in Is. ix. 21, and Ephraim’s proud and ambitious character is indicated in its demands as narrated in Josh. xvii. 14; Judg. viii. 1-3, xii. 1-6. Though Ephraim played a distinctive and prominent part; it probably numbered Manasseh in numerical strength, and the name became a synonym for the northern kingdom of Israel. Originally the name may have been a geographical term for the central portion of Palestine. Regarded as a tribe, it lay to the north of Benjamin, which traditionally belongs to it; but whether the young “brother” (see BENJAMIN) sprang from it, or grew up separately, is uncertain. Northwards, Ephraim lost itself in Manasseh, even if it did not actually include it (Judg. i. 27; 1 Chron. vii. 20); the boundaries between them can hardly be recovered. Ephraim’s strength lay in the possession of famous sites: Shechem, with the tomb of the tribal ancestor, also one of the capitals, at that time, of King Solomon; at Gibbethon, the site of the war of Shechem (or Heres), the burial-place of Joshua; and Samaria, whose name was afterwards extended to the whole district (see SAMARIA).

Shechem itself was visited by Abraham and Jacob, and the latter bought from the sons of Hamor a burial-place (Gen. xxxiii. 19). The story of Dinah may imply some early settlement of tribes in its vicinity (but see SIMEON), and the reference in Gen. xlviii. 22 (see R. V. marg.) alludes to its having been forcibly captured. But how this part of Palestine came into the hands of the Israelites is not definitely related in the story of the invasion (see JOSHUA).

A careful discussion of the Biblical data referring to Ephraim is given by H. W. Hogg, Enzy. Bibl., s.v. On the characteristic narratives which appear to have originated in Ephraim (viz. the Ephraimitic or Elohist source, E), see GENESIS and BIBLE: Old Testament Criticism. See further AHIMELECH; GIDEON; MANASSEH; and JEWS: History.

EPHALITES, or white Huns. This many-named and enigmatical tribe was of considerable importance in the history of India and Persia in the 5th and 6th centuries, and was known to the Byzantine writers, who call them Ἐφθαλίων, Εὐθαλίων, Νεθθαλίων or Άββδολον. The last of these is an independent attempt to render the original name, which was probably

1 There were originally 77, but 5 have perished.

2 There are no real conditions for the Sarmatian raids during the period of the monarchy may underlie the events mentioned in 1 Kings xvi. 9 sq., 21 sq.; 2 Kings xv. 10, 14.

1 Fragments of the Commentary of Ephrem Syrus upon the Diatessaron (London, 1895).
something like Apatl or Hapta, but the initial N of the third is believed to be a clerical error. They were also called Λεωνος Ovis or Ηπεθρος, White (that is fair-skinned) Huns. In Arabic and Persian they are known as Hstial and in Armenian as Haithal, Idal or Haptha. The Chinese name Yetha seems an attempt to represent the same sound. In India they were called Hinas. Ephthalite is the usual orthography, but Hephthalite is perhaps more correct.

Our earliest information about the Ephthalites comes from the Chinese chronicles, in which it is stated that they were originally a tribe of the great Yue-Chi (q.v.), living to the north of the Great Wall, and in subjection to the Jwen-Jwen, as were also the Turks at one time. Their original name was Hao or Hsia-tun; subsequently they styled themselves Ye-tha-i-li-to after the name of their royal family, or more briefly Ye-tha. Before the 4th century a.d. they began to move westwards, for about 420 we find them in Transoxiana, and for the next 130 years they were a menace to Persia, which they continually and successfully invaded, though they never held it as a conquest. The Sassanid king, Bahram V., fought several campaigns with them and succeeded in keeping them at bay, but they defeated and killed Peroz (Firuz), a.D. 424. His son Kavad I. (Kohad), being driven out of Persia, took refuge with the Ephthalites, and recovered his throne with the assistance of Mihiragula, the last chief of the Huns in India, and of other Huns, whom he married, but subsequently he engaged in prolonged hostilities with them. The Persians were not quit of the Ephthalites until 557 when Chosroes Anushirwan destroyed their power with the assistance of the Turks, who now make their first appearance in western Asia.

The Huns who invaded India appear to have belonged to the same stock as those who molested Persia. The headquarters of the horde were at Bamian and at Balkh, and from these points they raided south-east and south-west. Skandagupta repelled an invasion in 455, but the defeat of the Persians in 484 probably stimulated their activity, and at the end of the 6th century their chief Toraman penetrated to Malwa in central India and succeeded in holding it for some time. His successor (c. 540), who was still in the Punjab his Indian capital, but the cruelty of his rule provoked the Indian princes to form a confederation and revolt against him about 528. He was not, however, killed, but took refuge in Kashmir, where after a few years he seized the throne and then attacked the neighbouring kingdom of Gandhara, perpetrating terrible massacres. About a year after this he died (c. 540), and shortly afterwards the Ephthalites collapsed under the attacks of the Turks. They do not appear to have moved on to another sphere, as these nomadic tribes often did when defeated, and were probably gradually absorbed in the surrounding populations. Their political power perhaps continued in the Gurjara empire, which at one time extended to Bengal in the east and the Nerbudda in the south, and continued in a diminished form until a.d. 1040. These Gurjaras appear to have entered India in connexion with the Huns. invasions.

Our knowledge of the Indian Hunas is chiefly derived from coins, from a few inscriptions distributed from the Punjab to central India, and from the account of the Chinese pilgrim Hsuan Tsang, who visited the country just a century after the death of Mihiragula. The Greek monk Cosmas Indicopleustes, who visited India about 530, describes the ruler of the country, whom he calls Gallas, as a White Hun king, who exacted an oppressive tribute with the help of a large army of cavalry and war elephants. Gallas no doubt represents the last part of the name Mihiragula or Mirharaka. The accounts of the Ephthalites, especially those of the Indian Hunas, dwell on their ferocity and cruelty. They are represented as delighting in massacres and torture, and it is said that popular tradition in India still retains the story that Mihiragula used to amuse himself by rolling elephants down a precipice and watching their agonies. Their invasions shook Indian society and institutions to the foundations, but, unlike the earlier Kushans, they do not seem to have introduced new ideas into India or have acted as other than a destructive force, although they may perhaps have kept up some communication between India and Persia. The first part of Mihiragula seems to be the name of the Persian deity Mithra, but his patron deity was Siva, and he left behind him the reputation of a ferocious persecutor of Buddhism. Many of his coins bear the Nandi bull (Siva's emblem), and the king's name is preceded by the title sāhi (shah), which had previously been used by the Kushan dynasty. Toramana's coins are found plentifully in Kashmir, which, therefore, probably formed part of the Huna dominions before Mihiragula's time, so that when he fled there after his defeat he was taking refuge, if not with his own subjects, at least with a kindred clan.

Greek writers give a more detailed account of the Ephthalites, which may perhaps be due to the fact that they were useful to the East Roman empire as enemies of Persia and also not dangerously near. Procopius says that they were far more civilized than the Huns of Attila, and the Turkish ambassador who was received by Justin is said to have described them as átowů, which may merely mean that they lived in the cities which they conquered. The Chinese writers say that their customs were like those of the Turks; that they had no cities, lived in felt tents, were ignorant of writing and practised polyandry. Nothing whatever is known of their language, but some scholars explain the names Toramana and Jaulva as Türkmen.

For the possible connexion between the Ephthalites and the European Huns see HUNS. The Chinese statement that the Hao or Ye-tha were a section of the great Yue-Chi, and that their customs resembled those of the Turks (Tu-Kiue), is probably correct, but does not amount to much, for the relationship did not prevent them from fighting with the Yue-Chi and Turks, and means little more than that they belonged to the warlike and energetic section of central Asian nomads, which is in any case certain. They appear to have been more ferocious and less assimilative than the other conquering tribes. This may, however, be due to the fact that their contact with civilization was so short; the Yue-Chi and Turks had had some commerce with more advanced races before they played any part in political history, but the Ephthalites appear as raw barbarians, and were annihilated as a nation in little more than a hundred years. Like the Yue-Chi they have probably contributed to form some of the physical types of the Indian population, and it is noticeable that polyandry is a recognized institution among many Himalayan tribes, and is also said to be practised secretly by the Jats and other races of the plains.

Among original authorities may be consulted Procopius, Menander Pansiskos, Cosmas, and the authors of the Mihirakula (trans. Winkler, 1827); M. H. G. Prinsep, Skandagupta (1905); C. Frankel, Skandagupta (1905); H. D. S. Richardson, The Huns (1901); T. A. D. Winkler, Skandagupta (1905); and M. H. G. Parker in the Journal of the Royal Asiatic Society, Journal asiatique, Revue numismatique, Athis Quarterly, &c. (C. E. L.)

ÉPİ, the French architectural term for a light finial, generally of metal, but sometimes of terra-cotta, forming the termination of a spire or the angle of a roof.

EPICENE (from the Gr. ἐπικενός, common), a term in Greek and Latin grammar denoting nouns which, possessing but one gender, are used to describe animals of either sex. In English grammar there are no true epicene nouns, but the term is sometimes used instead of common gender. In figurative and literary language, epicene is an adjective applied to persons having the characteristics of both sexes, and hence is occasionally used as a synonym of "effeminat."
few fragments have survived. In the city of tyrants it would have been dangerous to present comedies like those of the Athenian stage, in which attacks were made upon the authorities. Accordingly, the comedies of Epicharmus are of two kinds, neither of them calculated to give offence to the ruler. They are either mythological travesties (resembling the satyrical drama of Athens) or character comedies. To the first class belong the Buxiris, in which Heracles is represented as a voracious glutton; the Marriage of Hebe, remarkable for a lengthy list of dainties. The second class dealt with different classes of the population (the sailor, the prophet, the boor, the parasite). Some of the plays seem to have bordered on the political, as The Plunderings, describing the devastation of Sicily in the time of the poet. A short fragment has been discovered (in the Rainer papyri) from the "Odvorev ανθρώπων", which told how Odysseus got inside Troy in the disguise of a beggar and obtained valuable information. Another feature of his works was the large number of excellent sentiments expressed in a brief proverbial form; the Pythagoreans claimed him as a member of their school, who had forsaken the study of philosophy for the writing of comedy. Plato (Theaetetus, 512 E.) puts him at the head of the second generation, and poetry, comparable with Homer and, according to a remark in Diogenes Laërtius, Plato was indebted to Epicharmus for much of his philosophy. Ennius called his didactic poem on natural philosophy Epicharmus after the comic poet. The metres employed by Epicharmus were iambic trimeter, and especially trochaic and anapaetic tetrameter. The plot of the plays was simple, the action lively and rapid; hence they were classed among the fabulae motoriae (stirring, bustling), as indicated in the well-known line of Horace (Epistles, ii. 1. 58):

"Plautus ad exemplar Siculi praegrapho Epicharmi."

Epicharmus is the subject of articles in Suidas and Diogenes Laërtius (viii. 3). See A. O. Lorenz, Leben und Schriften des Korns E. (with account of the Doric drama and fragments, 1864); J. Girard, Études sur la poésie grecque (1884); Kaibel in Pauly-Wissowa's Realencyclopädie, according to whom Epicharmus was a Sicilien; for the papyrus fragment, Blass in Jahrbücher für Philologie, xxxix., 1889.

**EPIC POETRY,** or Epos (from the Gr. ἔρως, a story, and ἐρωτάω, pertaining to a story), the names given to the most dignified and elaborate forms of narrative poetry. The word ἐπος is also, but more rarely, employed to designate the same thing, ἐρωτάω in Greek being a maker of epic poetry, and ἐρωτάω a lover.

It is to Greece, where the earliest literary monuments which we possess are of an epic character, that we turn for a definition of these vast heroic compositions, and we gather that their subject-matter was not confined, as Voltaire and the critics of the 18th century supposed, to "narratives in verse of warlike adventures." When we first discover the epos, hexameter verse has already been selected for its vehicle. In this form epic poems were composed not merely dealing with war and personal romance, but carrying out a didactic purpose, or celebrating the mysteries of religion. These three divisions, to which are severally attached the more or less mythical names of Homer, Hesiod, and Orpheus, are compared to the three ages which in the next generation, the Pharsalia of Lucan, of which Cato, as the type of the republican spirit, is the hero, was the principal example of Latin epic. Statius, under the Flavian emperors, wrote several epic poems, of which the Thebaid survives. In the 1st century A.D. Valerius Flaccus wrote the Argonautica in 8 books, and Silius Italicus the Punic War, in 17 books; these authors show a great decline in taste and merit, even in comparison with Statius, and Silius Italicus, in particular, is as purely imitative as the worst of the epic writers of modern Europe. At the close of the 4th century the style revived with Claudian, who produced five or six elaborate historical and mythological epics of which the Res of Probus is perhaps the most remarkable; in his interesting poetry we have a valuable link between the Silver Age in Rome and the Italian Renaissance. With Claudian the history of epic poetry among the ancients closes.

In medieval times there existed a large body of narrative
poetry to which the general title of Epic has usually been given. Three principal schools are recognized, the French, the Teutonic and the Icelandic. Teutonic epic poetry deals, as a rule, with legends founded on the history of Germany in the 4th, 5th and 6th centuries, and in particular with such heroes as Ermanaric, Attila and Theodoric. But there is also an important group in it which deals with English themes, and among these Beowulf, Waldere, The Lay of Maldb and Finneburh are pre-eminent. To this group is added the purely German poem of Hildebrand, attributed to c. 800. Among these Beowulf is the only one which exists in anything like complete form, and it is of all examples of Teutonic epic the most important. With all its trivialities and incongruities, which belong to a barbarous age, Beowulf is yet a solid and comprehensive example of native epic poetry. It is written, like all old Teutonic work of the kind, in alliterative unrhymed rhythm. In Iceland, a new heroic literature was invented in the middle ages, and to this we owe the Sagas, which are, in fact, a reduction to prose of the epic like history of the North. These Sagas took the place of a group of archaic Icelandic epics, the series of which seems to have closed with the noble poem of Atlamdl, the principal survival among the epics preserved in the primitive literature of Iceland. The surviving epical fragments of Icelandic composition are found thrown together in the Codex Regius, under the title of The Elder Edda, a most precious MS, discovered in the 17th century. The Icelandic epics seem to have been shorter and more episodical in character than the lost Teutonic specimens; both kinds were written in alliterative verse. It is not probable that either possessed the organic unity and vitality of spirit which make the Sagas so delightful. The French medieval epics (see CHANSONS DE GESTE) are late in comparison with those of England, Germany and Iceland. They form a curious transitional link between primitive and modern poetry; the literature of civilized Europe may be said to begin with them. But it can amount far greater to the FRENCH POETRY, and the broadening of the scene of action. The Teutonic epics were obscure and intense, the French chansons de geste are lucid and easy. The existing masterpiece of this kind, the magnificent Roland, is doubtless the most interesting and pleasing of all the epics of medieval Europe. Professor Ker's analysis of its merits may be taken as typical of all that is best in the vast body of epic which comes between the antiqve models; which were unknown to the medieval poets, and the artificial epics of a later time which were founded on vast ideal themes, in imitation of the ancients. "There is something lyrical in Roland, but the poem is not governed by lyrical principles; it requires the deliberation and the freedom of epic; it must move up to the height of its argument. The abruptness of its periods is not really an interruption of its even flight; it is an abruptness of detail, like a broken sea with a larger wave moving under it; it does not impair or disguise the grandeur of the movement as a whole." Of the progress and decline of the chansons de geste (q.v.) from the ideals of Roland a fuller account is given elsewhere. To the Nibelungenlied (q.v.) also, detailed attention is given in a separate article.

What may be called the artificial or secondary epics of modern Europe, founded upon an imitation of the Iliad and the Aeneid, are more numerous than the ordinary reader supposes, although but few of them have preserved much vitality. In Italy the Chanson de Roland inspired romantic epics by Luigi Pulci (1432-1457), whose Morgante Maggiore appeared in 1481, and is a masterpiece of burlesque; by M. M. Boiard (1434-1494), whose Orlando Innamorato was finished in 1486; by Francesco Bello (1490-1495), whose Mambriano was published in 1497; and by Lodovico Ariosto (q.v.), whose Orlando Furioso, by far the greatest of its class, was published in 1516, and by Luigi Dolce (1508-1568), as well as by a great number of less illustrious poets. G. G. Trissino (1478-1549) wrote a Delivrance of Italy from the Gaths in 1547, and Bernardo Tasso (1493-1569) an Amadigi in 1559; Berni remodelled the epic of Boiard in 1547, and Teofilo Folongo (1491-1544), ridiculed the whole school in an Orlando in 1526. An extraordinary feat of mock-heroic epic was The Bucket (1622) of Alessandro Tassoni (1565-1638). The most splendid of all the epics of Italy, however, was, and remains, the Jerusalem Delivered of Torquato Tasso (q.v.), published originally in 1588, and afterwards rewritten as The Conquest of Jerusalem, 1593. The fantastic Adone (1623) of G. B. Marini (1560-1624) and the long poems of Chiabrera, close the list of Italian epics. Early Portuguese literature is rich in epic poetry. Luis Pereira Brandao wrote an Ellegiado in 18 books, published in 1598; Jeronimo Cort-Real (d. 1588) a Shipwreck of Sepulveda and two other epics; V. M. Quevedo, in 1601, an Alphonso of Africa, in 12 books; Sá de Menezes (d. 1664) a Conquest of Malacca, 1634; but all these, and many more, are obscured by the glory of Camoens (q.v.), whose magnificent Lusiads had been printed in 1572, and forms the summit of Portuguese literature. In Spanish poetry, the Poem of the Cid takes the first place, as the great national epic of the middle ages; it is supposed to have been written between 1135 and 1175. It was followed by the Rodrigo, and the medieval school closes with the Alfonso XI. of Rodrigo Yáñez, probably written at the close of the 12th century. The success of the Italian imitative epics of the 15th century led to some imitation of their form in Spain. Juan de la Cueva (1534-1600) published a Conquest of Bettica in 1563; Cristóbal de Villavicencio in 1588; Luis Barahona de Soto continued Ariosto in a Tears of Anglica; Gutierrez wrote an Ausiriada in 1584; but perhaps the finest modern epic in Spanish verse is the Araucana (1560-1590) of Alonso de Ercilla y Zúñiga (1533-1595), "the first literary work of merit," as Mr Fitzmaurice-Kelly remarks, "composed in either American continent." In France, the epic never flourished in modern times, and no real success attended the Franciade of Ronsard, the Alaric of Scudéré, the Pusselle of Chapelain, the Divine Epoque of Soumet, or even the Henriade of Voltaire. In English literature The Faery Queen of Spenser has the same claim as the Italian poems mentioned above to bear the name of epic, and Villon, who stands entirely apart, may be said, by his isolated Paradise Lost, to take rank with Homer and Virgil, as one of the three types of the mastery of epic composition.

**EPICTETUS** (born c. A.D. 60), Greek philosopher, was probably a native of Hieropolis in south-west Phrygia. His name Epictetus is merely the Greek for "acquired" (from ἐπείκετος); his original name is not known. As a boy he was a slave in the house of Epaphroditus, a freedman and courtier of the emperor Nero. He managed, however, to attend the lectures of the Stoic Musonius Rufus, and subsequently became a freedman. He was lame and of weakly health. In 90 he was expelled with the other philosophers by Domitian, who was irritated by the support and encouragement which the opposition to his tyranny found amongst the adherents of Stoicism. For the rest of his life he settled at Nicopolis, in southern Epirus, not far from the scene of the battle of Actium. There for several years he lived, and taught by close earnest personal address and conversation. According to some authorities he lived into the time of Hadrian; he himself mentions the coinage of the emperor Trajan. His contemporaries and the next generation held his character and teaching in high honour. According to Lucian, the earthenware lamp which had belonged to the sage was bought by an anti-quarian for 3000 drachmas. He was never married. He wrote nothing; but much of his teaching was taken down with affectionate care by his pupil Flavius Arrianus, the historian of Alexander the Great, and is preserved in two treatises, of the larger of which, called the Discourses of Epictetus (Ἐπικέτου Λαμπριάδα, four books are still extant. The other treatise is a shorter and more popular work, the Euchrethidion ("Hand-book"). It contains in an aphoristic form the main doctrines of the longer work.
The philosophy of Epictetus is intensely practical, and exhibits a high idealistic type of morality. He is an earnest, sometimes stern and sometimes pathetic, preacher of righteousness, who despises the mere graces of style and the subtleties of an abstruse logical argument, and who proceeds with mere simplicity in his thought. Stoical writers. The problem of how life is to be carried out well is the one question which throws all other inquiries into the shade. True education lies in learning to wish things to be as they actually are; it lies in learning to distinguish what is our own from what does not belong to us. But there is only one thing which is fully our own—that, is, our will or purpose. God, acting as a good king and a true father, has given us a will which cannot be restrained, compelled or thwarted. Nothing external, neither death nor exile nor pain nor any such thing, can ever force us to act against our will; if we are conquered, it is because we have willed to be conquered. And thus, although we are not responsible for the ideas that present themselves to our consciousness, we are absolutely and without any modification responsible for the way in which we use them. Nothing is ours besides our will. The divine law which bids us keep fast what is our own forbids us to make any claim to what is not ours; and while enjoining us to make use of whatever is given to us, it bids us not long after what has not been given. "Two maxims," he says, "we must ever bear in mind—that apart from the will there is nothing either good or bad, and that we must not try to anticipate or direct events, but merely accept them with intelligence." We must, in short, resign ourselves to whatever fate is to befall us, and learn, as the first article of our creed, that there is a god, whose thought directs the universe, and that not merely in our acts, but even in our thoughts and plans, we cannot escape his eye. In the world the true position of man is that of member of a great system, which comprehends God and men. Each human being is in the first instance a citizen of his own nation or commonwealth; but he is also a member of the great city of gods and men, whereof the city political is only a copy in miniature. All men are the sons of God, and kindred in nature with the divinity. For man, though a member in the system of the world, has also within him a principle which can guide and understand the movement of all the members; he can enter into the method of divine administration, and thus can learn—and it is the acme of his learning—the will of God, which is the will of nature. Man, said the Stoic, is a rational animal; and in virtue of that rationality he is neither less nor worse than the gods, for the magnitude of reason is estimated not by length nor by height but by its judgments. Each man has within him a guardian spirit, a god within him, who never sleeps; so that even in darkness and solitude we are not alone, because God is within, our guardian spirit. The body which accompanies us is not strictly speaking ours; it is a poor dead thing, which belongs to the things outside us. But by reason we are the masters of those ideas and appearances which present themselves from without; we can combine them, and systematize, and can set up in ourselves an order of ideas corresponding with the order of nature.

The natural instinct of animated life, to which man also is originally subject, is self-preservation and self-interest. But men are so ordered and constituted that the individual cannot secure his own interests unless he contribute to the common welfare. We are bound up by the law of nature with the whole fabric of the world. The aim of the philosopher therefore is to reach the position of a mind which embraces the whole world in its view,—to grow into the mind of God and to make the will of nature our own. Such a sage agrees in his thought with God; he no longer blames either God or man; he fails of nothing which he purposed and falls in with no misfortune unprepared; he indulges in neither anger nor envy nor jealousy; he is leaving manhood for godhead, and in his dead body his thoughts are concerned about his fellowship with God.

The historical models to which Epictetus reverts are Diogenes and Socrates. But he frequently describes an ideal character of a missionary sage. the perfect Stoic—or, as he calls him, the Cynic. This missionary has neither country nor home nor land nor slave; his bed is the ground; he is without wife or child; his only mansion is the earth and sky and a shabby cloak. He must suffer stripes, and must love those who beat him as if he were a father or a brother. He must be perfectly unembarrassed in the service of God, not bound by the common ties of life, nor entangled by relationships, which if he thinks well, he will lose the character of a man of honour, while if he upholds them he will cease to be the messenger, watchman and herald of the gods. The perfect man thus described will not be angry with the wrong-doer; he will only pity his erring brother; for anger in such a case would only betray that he too thought the wrong-doer gained a substantial blessing by his wrongful act, instead of being, as he is, utterly ruined.

The best editions of the works of Epictetus are by J. Schopenhauer (6 vols., Leipzig, 1859-1860) and H. Schenkel (Leipzig, 1864, 1898). English translations by Elizabeth Carter (London, 1758); G. Long (London, 1845, ed. 1877, 1892, 1907); T. W. Higginson (Boston, 1865, new ed. 1876); the Encheiridion alone by H. Talbot (London, 1881); T. W. H. Rolleston (London, 1881). See A. Bonhöffer, Epiktet und die Stea (Stuttgart, 1890) and Die Ethik des Stoikers Epiktet (1894); E. M. Schranke, Der Stoiker Epiktet und seine Philosophie (Frankfort, 1885); T. Zahn, Der Stoiker Epiktet und sein Verhältnis zum Christentum (2nd ed. Erlangen, 1895). See also Srous and works quoted. (W.W.; X.).

EPICTETUS (342-270 B.C.), Greek philosopher, was born in Samos in the end of 342 or the beginning of 341 B.C., seven years after the death of Plato. His father Neeoles, a native of Gar- getos, a small village of Attica, had settled in Samos, not later than 345, as one of the successors of Areopagites after the victory of Timoleon in 366-365. At the age of eighteen he went to Athens, where the Platonist school was flourishing under the head of Xenocrates. A year later, however, Antipater banished some 12,000 of the poorer citizens, and Epictetus joined his father, who was now living at Colophon. It seems possible that he had listened to the lectures of Nausiphanes, a Democritean philosopher, and Pamphilus the Platonist, but he was probably, like his father, merely an ordinary teacher. Stimulated, however, by the perusal of some writings of Democritus, he began to formulate a doctrine of his own; and at Mitylene, Colophon and Lampscus, he gradually gathered round him several enthusiastic disciples. In 307 he returned to Athens, which has just been restored to a nominal independence by Demetrius Poliorcetes, and there he lived for the rest of his life. The scene of his teaching was a garden which he bought for about £300 (80 minae). There he passed his days as the loved and venerated head of a remarkable, and up to that time unique, society of men and women. Amongst the number were Metrodorus (d. 277), his brother Timocrates, and his wife Leontion (formerly a hetaera), Polyaeus, Her- narchus, who succeeded Epictetus as chief of the school, Leontus and his wife Theistia, and Idomeneus, whose wife was a sister of Metrodorus. It is possible that the relations between the sexes—in this prototype of Rabelais's Abbey of Thélème—were not entirely what is termed Platonian. But there is on the other hand scarcely a doubt that the tales of licentiousness circulated by opponents are groundless. The stories of the Stoics, who sought to refute the views of Epictetus by an appeal to his alleged antecedents and habits, were no doubt in the main, as Diogenes Laertius says, the stories of maniacs. The general charges, which they endeavoured to substantiate by forged letters, need not count for much, and in many cases they only exaggerated what, if true, was not so heinous as they suggested. Against them trustworthy authorities testified to his general and remark- able considerateness, pointing to the statues which the city had raised in his honour, and to the numbers of his friends, who were men of high birth and character. The mode of life in his community was plain. The general drink was water and the food barley bread; half a pint of wine was held an ample allowance. "Send me," says Epictetus to a correspondent, "send me some Cynthian cheese, so that, should I choose, I may fare sumptuously." There was no community of property, which, as Epictetus said, would imply distrust of their own and others' good resolutions. The company was held in unity by the charms of his personality, and by the free inter- course which he inculcated and exemplified. Though he seems
to have had a warm affection for his countrymen, it was as human beings brought into contact with him, and not as members of a political body, that he preferred to regard them. He never entered public life. His kindness extended even to his slaves, one of whom, named Mouse, was a brother in philosophy. Epicurus died under a stone table, which he had left as an inalienable part of his house, consisting of the garden (Κήπος Ἐπικουρίου), a house in Melite (the south-west quarter of Athens), and apparently some funds besides, to two trustees on behalf of his society, and for the special interest of some youthful members. The garden was set apart for the use of the school; the house became the house of Hermarchus and his fellow-philosophers during his lifetime. The surplus proceeds of the property were further to be applied to maintain a yearly offering in commemoration of his departed father, mother and brothers, to pay the expenses incurred in celebrating his own birthday every year on the 7th of the month Gamelion, and for a social gathering of the sect on the 20th of every month in honour of himself and Metrodorus. Besides similar tributes in honour of his brothers and Polyaenus, he directed the trustees to be guardians of the son of Polyaenus and the son of Metrodorus; whilst the daughter of the last mentioned was to be married by the guardians to some member of the society who should be approved of by Hermarchus. His four slaves, three men and one woman, were left their freedom. His books passed to Hermarchus.

**Philosophy.**—The Epicurean philosophy is traditionally divided into the three branches of logic, physics and ethics. It is, however, only as a basis of facts and principles for his theory of life that logical and physical inquiries find a place at all. Epicurus himself had not apparently shared in any large or liberal culture, and his influence was certainly thrown on the side of those who depreciated purely scientific pursuits. Never were sides and misleading. "Clear and all culture" was his advice to a young disciple. In this aversion to a purely or mainly intellectual training may be traced a recoil from the systematic metaphysics of Plato and Aristotle, whose tendency was to subordinate the practical man to the philosopher. Ethics had been based upon logic and metaphysics. But experience showed that systematic knowledge of truth is not synonymous with right action. Hence, in the second place, Plato and Aristotle had assumed a perfect state with laws to guide the individual aghast. It was thus comparatively easy to show how the individual could learn to apprehend and embody the moral law in his own conduct. But experience had in the time of Epicurus shown the temporary and artificial character of the civic form of social life. It was necessary, therefore, for Epicurus to go back to nature to find a more enduring and rational foundation for ethical doctrine, to go back from words to realities, to give up reasonings and get at feelings, to test conceptions and arguments by a final reference to the only touchstone of truth,—sensation. There, and there only, one seems to find a common and a satisfactory ground, supposing always that all men’s feelings give the same answer. Logic must go, but so also must the state, as a specially-privileged and eternal order of things, as anything more than a contrivance serving certain purposes of general utility.

To the Epicureans the elaborate logic of the Stoics was a superfluity. In place of logic we find canonic, the theory of the three tests of truth and reality. (1) The only ultimate canon of reality is sensation; whatever we feel, whatever we can perceive by any sense, is real. When in evidence we can have to be real, and in proportion as our feeling is clear, distinct and vivid, in that proportion are we sure of the reality of its object. But in what that vividness (δραγμα) consists is a question which Epicurus does not raise, and which he would no doubt have deemed superfluous quibbling over a matter sufficiently settled by common sense. (2) Besides our sensations, we learn truth and reality by our preconceptions or ideas (προλήψεις). These are the fainter images produced by repeated sensations, the "ideas" resulting from previous "impressions"—sensations at second-hand as it were, which are stored up in memory, and which a general name serves to recall. These bear witness to reality, not because we feel anything new, but because we felt it once; they are sensations registered in language, and again, if need be, translatable into immediate sensations or groups of sensation. (3) Lastly, reality is vouched for by the imaginative apprehensions of the mind (κατασκευα τονδοιαλ), immediate feelings of which the mind is conscious as produced by some action or other in the body. This view of things eliminates all doubt in size, figure. Epicureanism generally was content to affirm that whatever we effectively feel in consciousness is real; in which sense they allow reality to the fancies of the insane, the dreams of a sleeper, and those feelings by which we imagine the existence of beings of perfect blessedness and endless life. Similarly, just because fear, hope and remembrance add to the intensity of consciousness, the Epicurean can hold that bodily pain and pleasure is a less durable and important thing than pain and pleasure of mind. Whatever we feel to affect us does affect us, and is therefore real. Error can arise only because we mix up our opinions and suppositions with what we actually feel. The Epicurean canon is a rejection of logic; it sticks fast to the one point that "sensation is sensation," and there is no more to be made of it. Sensation, it says, is unreasoning (ἄλγος); it must be accepted, and not criticized. Reasoning can come in only to put sensations together, and to point out how they severally contribute to human welfare; it does not make them, and cannot alter them.

**Physics.**—In the Epicurean physics there are two parts—a general metaphysic and psychology, and a special explanation of particular phenomena of nature. The method of Epicurus is the argument of analogy. It is an attempt to make the phenomena of nature intelligible to us by regarding them as instances on a grand scale of that with which we are already familiar on a small scale. This is what Epicurus calls explaining what we do not see by what we do see.

In physics Epicurus founded upon Democritus, and his chief object was to abolish the dualism between mind and matter which is so essential a point in the systems of Plato and Aristotle. All that exists, says Epicurus, is corporeal (τό ὄντα καὶ εἴδη); the intangible is non-existent, or empty space. If a thing exists it must be felt, and to be felt it must exert resistance. But not all things are intangible which our senses are not subtle enough to detect. We must indeed accept our feelings; but we must also believe much which is not directly testified by sensation, if only it serves to explain phenomena and does not contravene our sensations. The fundamental postulates of Epicureanism are atoms and the void (στοιχεῖον καὶ κενόν). Space is infinite, and there is an illimitable multitude of indestructible, indivisible and absolutely compact atoms in perpetual motion in this space. Time, length, weight, are perpetually moving with equal velocities, but at a rate far surpassing our conceptions; as they move, they are for ever giving rise to new worlds; and these worlds are perpetually tending towards dissolution, and towards a fresh series of creations. This universe of ours is only one section out of the innumerable worlds in infinite space; other worlds may present systems very different from that of our own. The soul of man is only a finer species of body, spread throughout the whole aggregation which we term his bodily frame. Like a warm breath, it pervades the human structure and works with it; nor could it act as it does in perception unless it were corporeal. The various processes of sense, notably vision, are explained on the principles of materialism. From the surfaces of all objects there are continually flowing thin filmy images exactly copying the solid body whence they originate; and these images by direct impact on the organism produce (we need not care to ask how) the phenomena of vision. Epicurus in this way explains vision by substituting for the apparent action of a body at a distance a direct contact of image and organ. But without following the explanation into the details in which it reveals, it may be enough to say that the whole hypothesis is but an attempt to exclude the occult conception of action at a distance, and substitute a familiar phenomenon.

**The Gods.**—This aspect of the Epicurean physics becomes clearer when we look at his mode of rendering particular phenomena intelligible. His purpose is to eliminate the common idea of
divine interference. That there are gods Epicurus never dreams of denying. But these gods have not on their shoulders the burden of upholding and governing the world. They are themselves the products of the order of nature—a higher species than humanity, but not the rulers of man, neither the makers nor the upholders of the world. Man should worship them, but b'f worship is the reverence due to the ideals of perfect blessedness; it ought not to be inspired either by hope or by fear. To prevent all reference of the more potent phenomena of nature to divine action Epicurus rationalizes the processes of the cosmos. He imagines all possible plans or hypotheses, not actually contradicted by our experience of familiar events, which will represent in an intelligible way the processes of astronomy and meteorology. When two or more modes of accounting for a phenomena are equally admissible as not directly contradicted by known phenomena, it seems to Epicurus almost a return to the old mythological habit of mind when a savant asserts that the real cause is one and only one. "Thunder," he says, "may be explained in many other ways; only let us have no myths of divine action. To assign only a single cause for these phenomena, when the facts familiar to us suggest several, is insane, and is just the absurd conduct to be expected from people who dabble in the vanities of astronomy." We need not be too curious to inquire how these celestial phenomena actually do come about; we can learn how they might have been produced, and to go further is to trench on ground beyond the limits of human knowledge.

Thus, if Epicurus objects to the doctrine of mythology, he objects to the doctrine of divine interference. The imposition of a rigid order of things unchangeable and supreme over the human will. The Stoic doctrine of Fatalism seemed to Epicurus no less deadly a foe of man's true welfare than popular superstition. Even in the movement of the atoms he introduces a sudden change of direction, which is supposed to render their aggregation easier, and to break the even law of destiny. So, in the sphere of human action, Epicurus would allow of no absolutely controlling necessity. In fact, it is only when we assume for man this independence of the gods and of fatality that the Epicurean theory of life becomes possible. It assumes that man can, like the gods, withdraw himself out of reach of all external influences, and thus, as a sage, "live like a god among men, seeing that the man is in no wise like a mortal creature who lives in undying blessedness." And this present life is the only one. With one concept Epicureanism preaches that the death of the body is the end of everything for man, and hence the other world has lost all its terrors as well as all its hopes.

The attitude of Epicurus in this whole matter is antagonistic to science. The idea of a systematic enchainment of phenomena, in which each is conditioned by every other, and none can be taken in isolation and explained apart from the rest, was foreign to his mind. So little was the scientific conception of the solar system familiar to Epicurus that he could reproach the astronomers, because their account of an eclipse represented things otherwise than as they appear to the senses, and could declare that the sun and stars were just as large as they seemed to us.

Ethics.—The moral philosophy of Epicurus is a qualified hedonism, the heir of the Cyrenaic doctrine that pleasure is the good thing in life. Neither sect, it may be added, advocated sensuality pure and unfeigned—the Epicurean least of all. By pleasure Epicurus meant both more and less than the Cyrenaics. To the Cyrenaics pleasure was of moments; to Epicurus it extended as a habit of mind through life. To the Cyrenaics pleasure was something active and positive; to Epicurus it was rather negative—tranquillity more than vigorous enjoyment. The test of true pleasure, according to Epicurus, is the removal and absorption of all that gives pain; it implies freedom from pain of body and from trouble of mind. The happiness of the Epicurean was, it might almost seem, a grave and solemn pleasure—a quiet unobtrusive ease of heart, but not exuberance and excitement. The sage of Epicureanism is a rational and reflective seeker for happiness, who balances the claims of each pleasure against the evils that may possibly ensue, and treads the path of enjoyment cautiously. Prudence is, therefore, the only real guide to happiness; it is thus the chief excellence, and the foundation of all the virtues. It is, in fact, says Epicurus—in language which contrasts strongly with that of Aristotle on the same topic—a more precious power than philosophy." The reason or intellect is introduced to balance possible pleasures and pains, and to construct a scheme in which pleasures are the materials of a happy life. Feeling, which Epicurus declared to be the means of determining what is good, is subordinated to a reason which adjudicates between competing pleasures with the view of securing tranquillity of mind and body. "We cannot live pleasantly without living wisely and nobly and righteously." Virtue is at least a means of happiness, though apart from that it is no good in itself, any more than more sensual enjoyments, which are good only because they may sometimes serve to secure health of body and tranquillity of mind. (See further Ethics.)
have read little, and to be the original architect of his own system, and the claim was no doubt on the whole true. But he had read Democritus, and, it is said, Anaxagoras and Archelaus. His works, we learn, were full of repetition, and critics speak of vulgarities of language and faults of style. None the less his work was committed to memory, and remained the textbook of Epicureanism to the last. His chief work is a treatise on nature (Περὶ φύσεως), in thirty-seven books, of which fragments from about nine books have been found in the rolls discovered at Herculaneum, along with considerable treatises by several of his followers, and most notably Philodemus. An epitome of his doctrine is contained in three letters preserved by Diogenes.

AUTHORITIES.—The chief ancient accounts of Epicurus are in the treatises of Diogenes Laërtius, in Laecceutis, and in several of Cicero's and Plutarch. Gassendi, in his De vita, moribus, et doctrina Epicuri (Lyons, 1647), and his Synagoga philosophic Epicuri, systematized the doctrine. The Volumina Herculanensia (1st and 2nd series) contain fragments by Epicurus and members of his school. See also H. Usener, Epicurea (Leipzig, 1887) and Epicuri recognitum speciem (Bohn, 1880); Epicuri physica et meteorologica (ed. J. C. Schneider, Leipzig, 1813); Th. Gomperz in Einleitende und historische Studien, and in contributions to the Vienna Academy (Monatsberichte), has tried to evolve from the fragments more approximation to modern empiricism than they seem to contain. For English works, see W. S. M. Edwards, Epicures, Epicureanism, and Epicureans (London, 1880), and Epicurus: A Lecture (London, 1887); E. T.􀄀rke, Epicureismo (Florence, 1877; ed. Milan, 1885); E. Zeller, Philosophy of the Stoics, Epicureans and Sceptics (Eng. trans. O. J. Reiche, 1881); Sir James Mackintosh, On the Progress of Epicurean Philosophy (4th ed.); J. Watson, Hedontite Theories (Glasgow, 1895); J. Kreibig, Epicures (Vienna, 1886); A. Goedeckemeyer, Epikurs Verhältnis zu Demokrit in der Naturphil. Picavet, De Epicuro novae religiones sectatore (Paris, 1884); H. Sisgwick, History of Ethics (5th ed., 1902).

EPICYCLE (Gr. ἐπίκυκλος, circle), in ancient astronomy, a small circle the centre of which describes a larger one, especially used to represent geometrically the periodic apparent retrograde motion of the outer planets, Mars, Jupiter and Saturn, which we now know to be due to the annual revolution of the earth around the sun, but which in the Ptolemaic astronomy were taken to be real.

EPICYCLOID, the curve traced out by a point on the circumference of a circle rolling externally on another circle. If the moving circle rolls internally on the fixed circle, a point on the circumference describes a "hypocycloid" (from ὑπό, under). The locus of any other carried point is an "epitrochoid" when the circle rolls externally, and a "hypotrochoid" when the circle rolls internally. The epicycloid was so named by Ole Rümmer in 1674, who also demonstrated that cog-wheels having epicycloid teeth evolved with minimum friction (see MECHANICS: Applied); this was also proved by Girard Desargues, Philippe de la Hire and Charles Stephen Louis Camus. Epicycloids also received attention at the hands of Edmund Halley, Sir Isaac Newton and others; spherical epicycloids, in which the moving circle is inclined at a constant angle to the plane of the fixed circle, were studied by the Bernoullis, Pierre Louis M. de Maupertuis, François Nicole, Alexis Claude Clairaut and others.

In the annexed figure, there are shown various examples of the curves named above, when the radii of the rolling and fixed circles are 1 to 2 or 1 to 3. Since the circumference of a circle is proportional to its radius, it follows that the ratio of the radii being constant, the curve will consist of a finite number of cusps, and ultimately return into itself. In the particular case when the radii are in the ratio of 1 to 1, the epicycloid (curve a) will consist of three cusps external to the circle and placed at equal distances along its circumference. Similarly, the corresponding epicycloids will exhibit three loops or nodes (curve b), or assume the form shown in the annexed figure (curve c), or have the curves (curve d) formed with the three forms of the cycloid (q.v.). The hypocycloid derived from the same circles is shown as curve e, and is seen to consist of three cusps arranged internally to the fixed circle; the corresponding hypotrochoid consists of a three-foil and is shown in curve f. The epicycloid shown is termed the "three-cusped epicycloid" or the "epicycloid of Cremona."

The cartesian equation to the epicycloid assumes the form:

\[ x = (a + b) \cos \theta - mb \cos \left(\frac{a + b}{b} \theta\right), \]

\[ y = (a + b) \sin \theta - mb \sin \left(\frac{a + b}{b} \theta\right), \]

when the centre of the fixed circle is the origin, and the axis of \( x \) passes through the initial point of the curve (i.e. the original position of the moving point on the fixed circle), \( a \) and \( b \) being the radii of the fixed and rolling circles, and \( \theta \) the angle through which the line joining the centres of the two circles has passed. It may be shown that if the distance of the carried point from the centre of the rolling circle be \( mb \), the equation to the epicycloid is:

\[ x = (a + b) \cos \theta - mb \cos \left(\frac{a + b}{b} \theta\right), y = (a + b) \sin \theta - mb \sin \left(\frac{a + b}{b} \theta\right). \]

The equations to the hypocycloid and its corresponding trochooidal curves are derived from the two preceding equations by changing the sign of \( b \). Leonard Euler (Acta petropol. 1784) showed that the same hypocycloid can be generated by circles having radii \( \frac{a}{a+b} \) rolling on a circle of radius \( a \); and also that the hypotrochoid formed when the radius of the rolling circle is greater than that of the fixed circle is the same as the epicycloid formed by the rolling of a circle whose radius is the difference of the original radii. These positions may be derived from the formulae given above, or proved directly by purely geometrical methods.

The tangential polar equation to the epicycloid, as given above, is:

\[ p = (a+b) \sin \left(\frac{a+b}{b} \phi\right), \]

while the intrinsic equation is:

\[ s = \frac{a+b}{b} \cos \left(\frac{a+b}{b} \phi\right) \] and the pedal equation is:\n
\[ r^2 = a^2 + \left(\frac{a}{a+b}\right)^2 b^2. \]

Therefore any epicycloid or hypocycloid may be represented by the equations:

\[ p = a \sin B \phi + b \cos B \phi, \]

\[ s = a \sin B \phi, \]

or:

\[ r^2 = a^2 + B^2 b^2, \]

the constants \( A \) and \( B \) being readily determined by the above considerations.

If the radius of the rolling circle be one-half of the fixed circle, the epicycloid becomes a diameter of this circle, this may be conformed from the equation to the hypotrochoid. If the ratio of the radii be as 1 to 4, we obtain the four-cusped hypocycloid, which has the simple cartesian equation:

\[ x^2 + y^2 = a^2. \]

This curve is the envelope of a line of constant length, which moves so that its extremities are always on two fixed lines at right angles to each other, i.e., of the line \( x/a+y/b=1 \), with the condition \( a+b=1/a, \) a constant. The epicycloid when the radii of the circles are equal is the cardoid (q.v.), and the corresponding trochooidal curves are limaçons (q.v.).

Epicycloids are also examples of certain caustics (q.v.).

For the methods of determining the formulae and results stated above see J. Edwards, Algebraical Calculus, and for geometrical constructions see T. H. Eagles, Plane Curves.

EPIDAUROS, the name of two ancient cities of southern Greece.

1. A maritime city situated on the eastern coast of Argolis, sometimes distinguished as Ἑραία Ἑρεία, or Epidaurus, was the Holy. It stood on a small rocky peninsula with a natural harbour on the northern side and an open but serviceable bay on the southern; and from this position acquired the epithet of Ἐρεία, or the two-mouthed. Its narrow but fertile territory consisted of a plain shut in on all sides except towards the sea by considerable elevations, among which the most remarkable were Mount Arachnaeon and Tithinion. The conterminous states were Corinth, Argos, Troezen and Hermione. Its proximity to Athens and the islands of the Saronic gulf, the commercial advantages of its position, and the fame of its temple
Among the notables of Epicurus, architecture was a field in which he excelled. Wealth was a criterion of the place of a person in the city; it was afterwards occupied by Ionians, and appears to have incorporated the town of Phlegyrea from Thrace. The Ionians in turn succumbed to the Dorians of Argos, who, according to the legend, were led by Deiphontes; and from that time the city continued to preserve its Doric character. It not only colonized the neighboring islands, and founded the city of Aegina, by which it was ultimately outstripped in wealth and power, but also took part with the people of Argos and Troezen in their settlements in the south of Asia Minor. The monarchical government introduced by Deiphontes gave way to an oligarchy, and the oligarchy degenerated into a despotism. When Procles the tyrant was carried captive by Periander of Corinth, the oligarchy was restored, and the people of Epidaurus continued ever afterwards close allies of the Spartan power. The governing body consisted of 180 members, chosen from certain influential families, and the executive was entrusted to a select committee of archons (from ἀρχή, to manage). The rural population, who had no share in the affairs of the city, were called korivoses ("dusty-feet"). Among the objects of interest described by Pausanias as extant in Epidaurus are the image of Athena Cissa in the Acropolis, the temple of Dionysus and Artemis, a shrine of Aphrodite, statues of Asclepius and his wife Epione, and a temple of Hera. The site of the last is identified with the chapel of St. Nicolas; a few portions of the outer walls of the city can be traced; and the name Epidaurus is still preserved by the little village of Nea-Epidaurus, or Pidhavro.

The Hieron (sacred precinct) of Asclepius, which lies inland about 8 m. from the town of Epidaurus, has been thoroughly excavated by the Greek Archaeological Society since the year 1881, under the direction of M. Kavvadias. In addition to the sacred precinct, with its temples and other buildings, the theatre and stadium have been cleared; and several other extensive buildings, including baths, gymnasia, and a hospital for invalids, have also been found. The sacred road from Epidaurus, which is flanked by tombs, approaches the precinct through a gateway or propylaea. The chief buildings are grouped together, and include temples of Asclepius and Artemis, the Tholos, and the Abaton, or portico where the patients slept. In addition to remains of architecture and sculpture, some of them of high merit, there have been found many inscriptions, throwing light on the cures attributed to the god. The chief buildings outside the sacred precinct are the theatre and the stadium.

The temple of Asclepius, which contained the gold and ivory statue by Thrasyomedes of Paros, had six columns at the ends and eleven at the sides; it was raised on stages and approached by a ramp at the eastern front. An inscription has been found recording the contracts for building this temple; it dates from...
about 460 B.C. The sculptor Timotheos—one of those who collaborated in the Mausoleum—is mentioned as undertaking to make the acroteria that stood on the ends of the pediments, and also models for the sculpture that filled one of them. Some of this sculpture has been found; the acroteria are Nereids mounted on sea-horses, and one pediment contained a battle of Greeks and Amazons. The great altar lay to the south of the temple, and a little to the east of it are what appear to be the remains of an earlier altar, built into the corner of a large square edifice of Roman date, perhaps a house of the priests. Just to the south of this are the foundations of a small temple of Artemis. The Tholos lay to the south-west of the temple of Asclepius; it must, when perfect, have been one of the most beautiful buildings in Greece; the exquisite carving of its mouldings is only equalled by that of the Erechtheum at Athens. It consisted of a circular chamber, surrounded on the outside by a Ionic colonnade, and on the inside by a Corinthian one. The architect was Polyclitus, probably to be identified with the younger sculptor of that name. In the inscription recording the contracts for its building it is called the Thymele; and this name may give the clue to its purpose; it was probably the idealized architectural representative of a primitive pit of sacrifice, such as may still be seen in the Asclepianum at Athens. The foundations now visible present a very curious appearance, consisting of a series of concentric walls. Those in the middle are thin, having only the pavement of the cela to support, and are provided with doors and partitions that make a sort of subterranean labyrinth. There is no evidence for the statement sometimes made that there was a well or spring below the Tholos. North of the Tholos, the wide portico described in Inscriptions as the Abaton; it is on two different levels, and the western portion of it had two storeys, of which the upper one was on a level with the ground in the eastern portion. Here the invalids used to sleep when consulting the god, and the inscriptions found there record not only the method of consulting the god, but the manner of his cures. Some of the inscriptions are contemporary dedications; but those which give us most information are long lists of cases, evidently compiled by the priests from the dedications in the sanctuary, or from tradition. There is no reason to doubt that most of the records have at least a basis of fact, for the cases are in accord with well-attested phenomena of a similar nature at the present day; but there are others, usually miraculous mending of a broken vase, which suggest either invention or trickery. In early times, though there is considerable variety in the cases treated and the methods of cure, there are certain characteristics common to the majority of the cases. The patient consulting the god sleeps in the Abaton, sees certain visions, and, as a result, comes forth cured the next morning. Sometimes there seem to be surgical cases, like that of a man who had a spear-head extracted from his jaw, and found it laid in his hands when he awoke in the morning, and there are many examples resembling those known at the present day at Lourdes or Tenos, where hysterical or other similar affections are cured by the influence of imagination or sudden emotion. It is, however, difficult to make very certain the correctness of the records, owing to the indiscriminate manner in which genuine and spurious cases are mingled, and circumstantial details are added. We learn the practice of later times from some dedicated inscriptions. Apparently the old faith-healing had lost its efficacy, and the priests substituted for it elaborate prescriptions as to diet, baths and regimen which must have made Epidaurus and its visitors resemble their counterparts in a modern spa. At this time there were extensive buildings provided for the accommodation of invalids, some of which have been discovered and partially cleared; one was built by Antoninus Pius. They were in the form of great courtyards surrounded by colonnades and chambers. Between the precinct and the theatre was a large gymnasium, which was in later times converted to other purposes, a small aedem being built in the middle of it. In a valley just to the south-west of the precinct is the stadium, of which the seats and goal are well preserved. There is a gutter round the level space of the stadium, with basins at intervals for the use of spectators or competitors, and a post at every hundred feet of the course, thus dividing it into six portions. The goal, which is well preserved at the upper end, is at the east end of this course. They were well arranged and guides to them running. For these were substituted later a set of stone columns resembling those in the proscenium of a theatre. There was doubtless a similar sill at the lower end for the start of the stadium, this upper one being intended for the starting of foot races.

The theatre still deserves the praise given it by Pausanias as the most beautiful in Greece. The auditorium is in remarkable preservation, almost every seat being still in situ, except a few where the supporting walls have given way on the wings. The whole plan is drawn from three centres, the outer portion of the curves being arcs of a larger circle than the one used for the central portion; the complete circle of the orchestra is marked by a sill of white limestone, and exactly resembles the effect of a black cast with benches with backs not only in the bottom row, but also above and below the diazoma. The acoustic properties of the theatre are extraordinarily good, a speaker in the orchestra being heard throughout the auditorium without raising his voice. The stage buildings are not preserved much above their foundations, and show signs of later repairs; but their general character can be clearly seen. They consist of a long rectangular building, with a prosenium or column front which almost forms a tower, to the circle of the orchestra; at the middle and at either end of this prosenium are doors leading into the orchestra, those at the end set in projecting wings. Half the length of the orchestra, of which the lower part is still preserved, running parallel to the auditorium, but sloping up as they slope down. The prosenium was originally about 14 ft. high and 12 ft. broad; so corresponding approximately to the Greek stage as we see it in other buildings, the Tholos, which excavated the theatre, believes that the prosenium is contemporaneous with the rest of the theatre, which, like the Tholos, was built by Polyclitus (the younger); but Professor W. Dörpfeld maintains that it is a later addition. In any case, the theatre at Epidaurus ranks as the most typical of Greek theatres, both from the simplicity of its plan and the beauty of its proportions.

2. A city of Peloponnesus on the east coast of Laconia, distinguished by the epithe of Limera (either “The Well-havened” or “The Hungry”). It was founded by the people of Epidaurus, but the city fell under Sparta and was given the name of Asclepiopolis and Aphrodis. It was abandoned during the middle ages, its inhabitants took possession of the promontory of Minoa, turned it into an island, and built and fortified thereon the city of Monembasia, which became the most flourishing of all the towns in the Morea, and gave its name to the well-known Malmsey or Malvasia wine. The ruins of Epidaurus are to be seen at the place now called Palaea Monemvasia.

A third Epidaurus was situated in Illyricum, on the site of the present Ragusa Vecchia; but it is not mentioned till the time of the civil wars of Pompey and Caesar, and has no special interest.

(£. Gr.)

EPIDORITE, in petrology, a typical member of a family of rocks consisting essentially of hornblende and felspar often with epidote, garnet, sphele, biotite, or quartz, and having usually a foliated structure. The term is to some extent synonymous with "amphibolite" and "hornblende-schist". These rocks are metamorphic, and though having a mineral constitution somewhat similar to that of diorite, they have been produced really from rocks of more basic character, such as diabase, dolerite and gabbro. They occur principally among the schists, slates and gneisses of such districts as the Scottish Highlands, the north-west of Ireland, Brittany, the Harz, the Alps, and the crystalline ranges of eastern N. America. Their hornblende in microscopic section is usually dark green, rarely brown. The hornblende is, in their foliation, usually a reconstituted one, but more frequently is converted into a tubular aggregate of epidote, zosite, quartz, sericite and albite. In the less complete stages of alteration, opthic structure may persist. In the more advanced stages of augite of the rock may not have been entirely replaced by
horneblende. Pink or brownish garnets are common and may be an inch or two in diameter. The iron oxides, originally ilmenite, are usually altered to sphene. Biotite, if present, is brown; epidote is yellow or colourless; rutile, apatite and quartz all occur with some frequency. The essential minerals, hornblende and feldspar, rarely show crystalline outlines, and this is generally true also of the others. The rocks may be fine-grained, so that their constituents are hardly visible to the unaided eye; or may show crystals of hornblende an inch in length. Their prevalent colour is dark green and they weather with brown surfaces. In many parts of the world epidiorites and the quartz veins which sometimes occur in them have proved to be auriferous. As they are tough, hard rocks, when fresh, they are well suited for use as road-mending stones.

**Epidote**, in petrology, a typical member of a family of metamorphic rocks composed mainly of epidote and quartz. In colour they are pale yellow or greenish-yellow, and they are hard and somewhat brittle. They may occur in more than one way and are derived from several kinds of rock. Some have been epidotic grits and sandstones; others are limestones which have undergone contact- alteration; probably the majority, however, are allied to epidiorite and amphibolite, and are local modifications of rocks which were originally basic, ultrabasic, or laves. The sedimentary epidotes occur with mica-schists, sheared grits and granulitic gneisses; they often show, on minute examination, the remnants of clastic structures. The epidotises derived from limestones may contain a great variety of minerals such as calcite, augite, garnet, scapolite, &c., but their source may usually be inferred from their close association with calc-silicate rocks in the field. The third group of epidotises may form bands, veins, or irregular streaks and nodules in masses of epidiorite and hornblende-schist. In microscopic section they are often merely a granular mosaic of quartz and epidote with some iron oxides and chlorite, but in other cases they retain much of the structure of the original rock though there has been a complete replacement of the former minerals by new ones. Epidotises when streaked and variegated have been cut and polished as ornamental stones. They are translucent and hard, and hence serve for brooch stones, and the simpler kinds of jewelry. These rocks occasionally carry gold in visible yellow specks.

**Epidote**, a mineral species consisting of basic calcium, aluminium and iron orthosilicate, Ca₂(AlO₂)(Fe₂O₃)(SiO₄)₂, crystallizing in the monoclinic system. Well-developed crystals are of frequent occurrence: they are commonly prismatic in habit, the direction of elongation being perpendicular to the single plane of symmetry. The faces lettered M, T and r in the figure are often deeply striated in the same direction: M is a direction of perfect cleavage, and T of imperfect cleavage: crystals are often twinned on the face T. Many of the characters of the mineral vary with the amount of iron present (Fe₂O₃, 5-17 %), for instance, the colour, the optical constants, and the specific gravity (3-3). The hardness is 6. The colour is green, grey, brown or nearly black, but usually a characteristic shade of yellowish-green or pistachio-green. The pleochroism is strong, the pleochroic colours being usually green, yellow and brown. The names thallite (from ἥλθεν, “a young shoot”) and pistacite (from πιστάκιον, “pistachio nut”) have reference to the colour. The name epidote is one of R. J. Hatly’s crystallographic names, and is derived from ἐπίδοτος, “increase,” because the base of the primitive prism has one side longer than the other. Several other names (achmatite, bucklandite, eschermite, puschkinite, &c.) have been applied to this species. Witherite is a carminie-red to straw-yellow, strongly pleochroic variety from Glencoe in Scotland. Fouqueite and clineisinite are white or pale green and variously pleochrotic, and thus having the same chemical composition as the orthorhombic mineral zoisite (q.v.).

Epidote is an abundant rock-forming mineral, but one of secondary origin. It occurs in crystalline limestones and schistose rocks of metamorphic origin; and is also a product of weathering of various minerals (feldspars, micas, pyroxenes, amphiboles, garnets, &c.) composing igneous rocks. A rock composed of quartz and epidote is known as epidosite. Well-developed crystals are found at many localities, of which the following may be specially mentioned: Knappennwand, near the Gross-Venediger in the Untersulzbachtal in Salzburg, as magnificient, dark green crystals of long prismatic habit in cavities in epidote-schist, with asbestos, adularia, calcite, and apatite; the Alava valley and Traversella in Piedmont; Arendal in Norway (arendellite); Le Bourget d’Oisans in Dauphîné (oisanite and delphinite); Haddam in Connecticut; Prince of Wales Island in Alaska, here as large, dark green, tabular crystals with copper ores in metamorphosed limestone.

The perfectly transparent, dark green crystals from the Knappennwand and from Brazil have occasionally been cut as gem-stones.

Belonging to the same isomorphous group with epidote are the species piedmontite and allanite, which may be described as manganese and cerium epidotes respectively.

Piedmontite has the composition Ca₄(AlO₂)(Fe₂O₃)(SiO₄)₂; it occurs as small, reddish-black, monoclinic crystals in the manganiferous mines at San Marcel, near Ivrea in Piedmont, and in crystalline schists at several places in Japan. The purple colour of the Egyptian porfido rosso antico is due to the presence of this mineral.

Allanite has the same general formula $R^+_2(OH)R^-_2(SiO₄)_₄$, where $R^+$ represents calcium and ferrous iron, and $R^-_2$ aluminium, ferric iron and metals of the cerium group. In external appearance it differs widely from epidote, being black or dark brown in colour, pitchy in lustre, and opaque in the mass; further, there is little or no cleavage, and well-developed crystals are rarely met with. The crystallographic and optical characters are similar to those of epidote; the pleochroism is strong with reddish-, yellowish-, and greenish-brown colours. Although not a common mineral, allanite is of fairly wide distribution as a primary accessory constituent of many crystalline rocks, e.g. gneiss, granite, syenite, rhyolite, andesite, &c. It was first found in the granite of east Greenland and described by Thomas Allan in 1868, after whom the species was named. Allanite is a mineral readily altered by hydration, becoming optically isotropic and amorphous: for this reason several varieties have been distinguished, and many different names applied. Orthite, from ὀρθός, “straight,” was the name given by J. J. Berzelius to a hydrated form found as slender prismatic crystals, sometimes a foot in length, at Flinio, near Falun in Sweden.

**Epigonus** (“descendants”), in Greek legend, the sons of the seven heroes who fought against Thebes (see Aestraus). Ten years later, to avenge their fathers, the Epigoni undertook a second expedition, which was completely unsuccessful. Thebes was forced to surrender and razed to the ground. In early times the war of the Epigoni was a favourite subject of epic poetry. The term is also applied to the descendants of the Diadochi, the successors of Alexander the Great.

**Epigononion**, Gr. ἐπιγονονίων, an instrument mentioned in Athenaeus 183 C, probably a psalterium. The epigonon was invented, or at least introduced into Greece, by Epigonus, a Greek musician of Ambracia in Epirus, who was admitted to citizenship at Sicyon as a recognition of his great musical ability and of his having been the first to pluck the strings with his fingers, instead of using the plectrum. The instrument, which Epigonus named after himself, had forty strings. It was undoubtedly a kind of harp or psalterium, since in an instrument of so many strings some must have been of different lengths, for tension and thickness only could hardly have produced forty different sounds, or even twenty, supposeing that they were arranged in pairs of unisons. Strings of varying lengths require

a frame like that of the harp, or of the Egyptian cithara which had one of the arms supporting the cross bar or zugen shorter than the other,1 or else strings stretched over hour-glass shaped bridges on a sound-board in the case of a psaltery. Juba II, king of Mauretania, who reigned from 30 B.C., said (ap. Athen. l.c.) that Epigonus brought the instrument from Alexandria and played upon it with the fingers of both hands, not only using it as an accompaniment to the voice, but introducing chromatic passages, and a chorus of other stringed instruments, probably citharas, to accompany the voice. Epigonus was also a skilled citharist and played with his bare hands without plectrum.2 Unfortunately we have no record of when Epigonus lived. Vincenzo Galilei3 has given us a description of the epigonion accompanied by an illustration, representing his conception of the ancient instrument, an upright psaltery with the outline of the citharytherion but no key or frets. (K. S.)

EPIGRAM, properly speaking, anything that is inscribed. Nothing could be more hopeless, however, than an attempt to discover or devise a definition wide enough to include the vast multitude of little poems which at one time or other have been honoured with the title of epigram, and precise enough to exclude all others. Without taking account of its evident misapplications, we find that the name has been given—first, in strict accordance with its Greek etymology, to any actual inscription on monument, statue or building; secondly, to verses never intended for such a purpose, but assuming for artistic reasons the epigraphical form; thirdly, to verses expressing with something of the terseness of an inscription a striking or beautiful thought; and forthwith, by unwarrantable restriction, to a little poem ending in a “point,” especially of the satirical kind. The last of these has obtained considerable popularity from the well-known lines—

"The qualities rare in a bee that we meet
In an epigram never should fail;
The body should always be little and sweet.
And a sting should be left in its tail."—

which represent the older Latin of some unknown writer—

"Omne epigramma sit instar apis: sit aculeus illi;
Sint suæ mellis: sit et corporis exigui."

Attempts not a few of a more elaborate kind have been made to state the essential element of the epigram, and to classify existing specimens; but, as every lover of epigrams must feel, most of them have been attended with very partial success. Scaliger, in the third book of his Poetica, gives a fivefold division, which displays a certain ingenuity in the nomenclature but is very superficial: the first class takes its name from mel, or honey, and consists of adulatory specimens; the second from jol, or gall; the third from acuelum, or vinegar; and the fourth from sal, or salt; while the fifth is styled the condensed, or multiplex. This classification is adopted by Nicolaus Mercierius in his De conscripto epigrammate (Paris, 1653); but he supplemented it by another of much more scientific value, based on the figures of the ancient rhetoricians. Lossing, in the preface to his own epigrams, gives an interesting treatment of the theory, his principal doctrine being practically the same as that of several of his less eminent predecessors, that there ought to be two parts more or less clearly distinguished,—the first awakening the reader’s attention in the same way as an actual monument might do, and the other satisfying his curiosity in some unexpected manner. An attempt was made by Herder to increase the comprehensiveness and precision of the theory; but as he himself confesses, his classification is rather vague—the expository, the paradigmatic, the pictorial, the impassioned, the artfully turned, the illusory, and the swift. After all, if the arrangement according to authorship be rejected, the simplest and most satisfactory is according to subjects. The epigram is one of the most catholic of literary forms, and lends itself to the expression of almost any feeling or thought. It may be an elegy, a satire, or a love-poem in miniature, an embodiment

of the wisdom of the ages, a bon-mot set off with a couple of rhymes.

"I cannot tell thee who lies buried here;
No man that knew him followed by his bier;
The winds and waves conveyed him to this shore,
Then ask the winds and waves to tell thee more."—

Anonymous.

"Wherefore should I vainly try
To teach thee what my love will be
In after years, when thou and I
Have both grown old in company,"

If words are vain to tell thee how,
Mary, I do love thee now!"

Anonymous.

"O Bruscus, cease our aching ears to vex,
With thy loud railing at the softer sex;
No accusation worse than this could be,
That once a woman did give birth to thee."—

Aelius.

"Treason doth never prosper. What’s the reason?
For if it prosper none dare call it treason."

Harrington.

"Ward has no heart they say, but I deny it;
He has a heart, and gets his speeches by it."—

Rogers.

From its very brevity there is no small danger of the epigram passing into childish triviality: the paltriest pun, a senseless anagram, is considered stuff enough and to spare. For proof of this there is unfortunately no need to look far; but perhaps the reader could not find a better collection ready to his hand than the second twenty-five of the Epigrammatae centuriae of Samuel Erichius; by the time he reaches No. 11 of the 47th century, he will be quite ready to grant the appropriateness of the identity maintained between the German Seelc, or soul, and the German Esel, or ass. Of the epigram as cultivated by the Greeks an account is given in the article ANTHOLOGY, discussing those wonderful collections which bid fair to remain the richest of their kind. The delicacy and simplicity of so much of what has been preserved is perhaps their most striking feature; and one cannot but be surprised at the number of poets possessed of such work. In Latin literature, on the other hand, the epigrammatists whose work has been preserved are comparatively few, and though several of them, as Catullus and Martial, are men of high literary genius, too much of what they have left behind is vitiated by brutality and obscenity. On the subsequent history of the epigram, indeed, Martial has exercised an influence as baneful as it is extensive, and he may fairly be counted the far- off progenitor of a host of scurrilous verses. Nearly all the learned Latinists of the 16th and 17th centuries may claim admittance into the list of epigrammatists,—Bembo and Scaliger, Buchanan and More, Stroza and Sanmazaro. Melanchthon, who succeeded in combining so much of Pagan culture with his Reformation Christianity, has left us some graceful specimens, but his editor, In Latin Joannes Major Joachimhus, has so little idea of what an epigram is, that he includes in his collection some translations from the Psalms. The Latin epigrams of Étienne Pasquier were among the most admirable which the Renaissance produced in France. John Owen, or, as he Latinized his name, Johannes Audoenus, a Cambro-Briton, attained quite an unusual celebrity in this department, and is regularly distinguished as Owen the Epigrammatist. The tradition of the Latin epigram has been kept alive in England by such men as Porson, Vincent Bourne and Walter Savage Landor. Happily there is now little danger of any too personal epigrammatist suffering the fate of Niccolo Franco, who paid the forfeit of his life for having launched his venomous Latin against Pius V, though he may still incur the milder penalty of having his name inserted in the Index Ex purgatorius, and find, like John Owen, that he consequently has lost an inheritance.

In English literature proper there is no writer like Martial in Latin or Logau in German, whose fame is entirely due to his epigrams; but several even of those whose names can perish never have not disdained this diminutive form. The designation epigram, however, is used by earlier English writers with excessive laxity, and given or withheld without apparent reason.

1 For an illustration, see Kathleen Schlesinger, Orchestral Instruments, part ii. 2 Precursors of the Violin Family, 61, p. 219.
3 Dialogo della musica antica e moderna, ed. 1602, p. 40.
The epigrams of Robert Crowley (1550) and of Henry Parrot (1613) are worthless so far as form goes. John Weaver's collection (1599) is of interest mainly because of its allusion to Shakespeare. Ben Jonson furnishes a number of noble examples in his Underwoods; and one or two of Newman's little poems, and a great many of Herrick's are properly classed as epigrams. Cowley, Waller, Dryden, Prior, Parnell, Swift, Addison, Johnson, Goldsmith and Young have all been at times successful in their epigrammatic attempts; but perhaps none of them has proved himself so much "to the manner born" as Pope, whose name indeed is almost identified with the epigrammatic spirit in English literature. Few English modern poets have followed in his footsteps, and though nearly all might plead guilty to an epigram or two, there is no one who has a distinct reputation as an epigrammatist. Such a reputation might certainly have been earned by Wordsworth, had he found the best manner to render his language.

The French are undoubtedly the most successful cultivators of the "salt" and the "vinaigre" epigram; and from the 16th century downwards many of their principal authors have earned no small celebrity in this department. The epigram was introduced into French literature by Mellin de St. Gelas and Clément Marot. It is enough to mention the names of Boileau, J. B. Rousseau, Lebrun, Voltaire, Marmontel, Piron, Rulhière, and M. J. Chénier. In spite of Rapiis's dictum that a man ought to be content if he were considered only as "a good enough poet," and of Rancé's on leaving, "one of Lebrun alone number upwards of 600, and a very fair proportion of them would doubtless pass muster even with Rapiis himself. If Piron was never anything better than "pas même académicien," he appears at any rate in Grimm's phrase to have been "une machine à saillies, à épigrammes, et à bons mots." Perhaps more than anywhere else the epigram has been recognized in France as a regular weapon in literary and political contests, and it might not be altogether a hopeless task to compile an epigrammatic history from the Revolution to the present time.

While any fair collection of German epigrams will furnish examples that for keenness of wit would be quite in a place in a French anthology, the Teutonic tendency to the moral and didactic has given rise to a class but sparingly represented in French. The very name of Sinngedichte bears witness to this peculiarity, which is exemplified equally by the rude priamel or procedeln, of the 13th and 14th centuries and the polished lines of Goethe and Schiller. Logau published his Deutsche Sinngedichte Drey Tausend in 1654, and Wernicke no fewer than six volumes of Uberschriften oder Epigrammata in 1697; Kästner's Sinngedichte appeared in 1782, and Haug and Weissen's Epigrammatische Anthologie in 1804. Kleist, Optiz, Gleim, Hagedorn, Klostock and A. W. Schlegel all possess some reputation as epigrammatists; Lessing is facile princeps in the satirical style; and Herder has the honour of having enriched his language with much of what is best from Oriental and classical sources.

It is often by no means easy to trace the history of even a single epigram, and the investigator soon learns to be cautious of congratulating himself on the attainment of a genuine original. The same point, refurbished and fitted anew to its tiny shaft, has been shot again and again by laughing cupids or fierce-eyed furies in many a frolic and many a fray. During the period when the epigram was the favourite form in Germany, Gervinus tells us how the works, not only of the Greek and Roman writers, but of Neo-Latinists, Spaniarda, Dutchmen, Frenchmen, Englishmen and Poles were ransacked and plundered; and the same process of pillage has gone on in a more or less modified degree in other times and countries. Very noticeable often are the modifications of tone and expression occasioned by national and individual characteristics; the simplicity of the prototype may become common-place in the imitation, the sublins be distorted into the grotesque, the pathetic degenerate into the absurdly sentimental; or on the other hand, an unpromising motif may be happily developed into unexpected beauty. A good illustration of the variety with which the same epigram may be translated and travestied is afforded by a little volume published in Edinburgh in 1808, under the title of Lucrations on the Epigram—

*Et vidi quem matris et dei vestris,*

*et quae vasis, calice, annis.*

*et de vestris et b. v. me matris,*

*et mi vestris; chy & vab vestris.*

The two collections of epigrams most accessible to the English reader is neither 's Epigrams of Modern (1663) and Dodd's The Epigrammatists (1870). In the appendix to the latter is a pretty full bibliography, to which the following list may serve as a supplement—

- Thomas Cora, *De isto et poenamino genere quod epigrammata iconem* (Venice, 1653); Bologna, 1599; *of the many* epigrammatists (Bologna, 1632); Vincentius Gallus, *Opusculum de epigrammate* (Milan, 1614); *Vavassor, De epigrammate liber* (Paris, 1663); Gedenke von deutschen Epigrammatais (Leipsic, 1688); *De origine nostrae ade animum epigrammata; Flaminii Moliere.*

'T. C. Moravia, *Gelais:* *Gelais Lithographia; Cota, Lampirdi,* Sadoleti, et aliorum, cura Jo. Gognaei (Paris, c. 1550); *Brugiere de Barante, Recueil des plus belles epigrams modernes avec de nombreux commentaires* (Paris, 1716); *Gellateck, Epigrammatiche Anthologie, Sauvage, Les Grilles galaises: petit encyclopédie des meilleurs épigrammes, &c.*

This list contains many more names and much miscellaneous information in regard to their origin, application and translation is scattered through Notes and Queries.

See also an article in *The Quarterly Review* No. 253.

**EPIGRAPHY** (Gr. ἔπιτραγος, and ἔγραφω, to write), a term used to denote (1) the study of inscriptions collectively, and (2) the science connected with the classification and explanation of inscriptions. It is sometimes employed, too, in a more contracted sense, to denote the palaeography, in inscriptions. Generally, it is that part of archaeology which has to do with inscriptions engraved on stone, metal or other permanent material (not, however, coins, which come under the heading Numismatics).

See Inscriptions; Palaeography.

**EPILEPSY** (Gr. ἐρί, upon, and ἀπομακρύνω, to seize), or Falling Sickness, a term applied generally to a nervous disorder, characterized by a fit of sudden loss of consciousness, attended with convulsions. There may, however, exist manifestations of epilepsy much less marked than this, yet equally characteristic of the disease; while, on the other hand, it is to be borne in mind that many other attacks of a convulsive nature have the term "epileptic" or "epileptiform" applied to them.

Epilepsy was well known in ancient times, and was regarded as a special infliction of the gods, hence the names morbus sacer, morbus divus. It was also termed morbus Hercules, from Hercules having been supposed to have been epileptic, and morbus comitialis, from the circumstance that when any member of the forum was seized with an epileptic fit the assembly was broken up. *Morbus calvus, morbus lunaticus, asterigia, morbus demoniacus, morbus major,* were all terms employed to designate epilepsy.

There are three well-marked varieties of the epileptic seizure; to these the terms the grand mal, le petit mal and Jacksonian epilepsy are usually applied. Any of these may exist alone, but the two former may be found to exist in the same individual. The first of these, if not the more common, is at least that which attracts the most attention, being what is generally known as an *epileptic fit.*

Although in most instances such an attack comes on suddenly, it is only in cases preceded by certain premonitory indications or warnings, which may be present for a greater or less time previously. These are of very varied character, and may be in the form of some temporary change in the disposition, such as unusual depression or elevation of spirits, or of some alteration in the look. Besides these general symptoms, there are frequently peculiar sensations which immediately precede the onset of the fit, and to such the name of aura epileptica is applied. In its strict sense this term refers to a feeling of a breath of air blowing upon some part of the body, and passing upwards towards the head. This sensation, however, is not a common one, and the term has now come to be applied to any peculiar feeling which the
patient experiences as a precursor of the attack. The so-called aura may be of mental character, in the form of an agonizing feeling of momentary duration; of somatic character, in the form of pain in a limb or in some internal organ, such as the stomach, or morbid feeling connected with the special senses; or, further, of motorial character, in the form of contractions or trembling in some of the muscles. When such sensations affect a limb, the employment of firm compression by the hand or by a ligature occasionally succeeds in warding off an attack. The aura may be so distinct and of such duration as to enable the patient to lie down, or seek a place of safety before the fit comes on.

The seizure is usually preceded by a loud scream or cry, which is not to be ascribed, as was at one time supposed, to terror or pain, but is due to the convulsive action of the muscles of the larynx, and the elevation of the diaphragm. The patient is often in a state of delirium, in which all the higher mental faculties are lost. The breathing is noisy and laboured, and often (often tinged with blood) issues from the mouth, while the contents of the bowels and bladder are ejected. The aspect of the patient in this condition is shocking to witness, and the sight has been known to induce a similar attack in an onlooker. This stage lasts for a period varying from a few seconds to several minutes, when the convulsive movements gradually subside, and relaxation of the muscles takes place, together with partial return of consciousness, the patient looking confusedly about him and attempting to speak. This, however, is soon followed by drowsiness and stupor, which may continue for several hours, when he awakes either apparently quite recovered or fatigued and depressed, and occasionally in a state of excitement which sometimes so far the form of mania. Epileptic fits of this sort succeed each other with varying degrees of frequency, and occasionally, though not frequently, with regular periodicity. In some persons they only occur once in a lifetime, or once in the course of many years, while in others they return every week or two, or even are of daily occurrence, and occasionally there are numerous attacks each day. According to Sir J. R. Reynolds, there are four times as many epileptics who have their attacks more frequently than once a month as there are of those whose attacks recur at longer intervals. When the fit returns it is not uncommon for one seizure to be followed by another within a few hours or days. Occasionally there occurs a constant succession of attacks extending over many hours, and with such rapidity that the patient appears as if he were possessed by some being personified; this form is applied to this condition, which is sometimes followed with fatal results. In many epileptics the fits occur during the night as well as during the day, but in some instances they are entirely nocturnal, and it is well known that in such cases the disease may long exist and yet remain unrecognized either by the patient or the physician.

The second manifestation of epilepsy, to which the names epilepsia milia or le petit mal are given, differs from that above described in the absence of the convulsive spasms. It is also termed by some authors epileptic vertigo (giddiness), and consists essentially in the sudden arrest of volition and consciousness, which is of but short duration, and may be accompanied with staggering or some alteration in position of the body, or may simply exhibit itself in a look of absence or confusion, and should the patient happen to be engaged in conversation, by an abrupt termination of the act. In general it lasts but a few seconds, and the individual resumes his occupation without perhaps being aware of anything having been the matter. In some instances there is a degree of spasmodic action of the limbs which may cause the patient to make some unexpected movement, such as turning half round, or walking abruptly aside, or may show itself by some unusual expression of countenance, such as squinting or grinning. There may be some amount of aura preceding such attacks, and also of faintness following them. The petit mal most commonly co-exists with the grand mal, but has no necessary connexion with it, as each may exist alone. According to Armand Trébuclé, the petit mal in general precedes the manifestation of the grand mal, but sometimes the reverse is the case.

The third manifestation—Jacksonian epilepsy or partial epilepsy—is distinguished by the fact that consciousness is retained or lost late. The patient is conscious throughout, and is able to watch the march of the spasm. The attacks are usually the result of lesions in the motor area of the brain, such as being caused, in many instances, by depression of the vault of the skull, due to trauma.

Epilepsy appears to exert no necessarily injurious effect upon the general health, and even where it exists in an aggravated form is quite consistent with a high degree of bodily vigour. It is very different, however, with regard to its influence upon the mind; and the question of the relation of epilepsy to insanity is one of great and increasing importance. Allusion has already been made to the occasional occurrence of maniacal excitement as one of the results of the epileptic seizure. Such attacks, to which the name of faro epilepticus is applied, are generally regarded as the more paroxysmic part of the patient, rendering him dangerous, and demanding prompt movement, such as these attacks are by no means limited to the more severe form of epilepsy, but appear to be even more frequently associated with the milder form—the epileptic vertigo—where they either replace altogether or immediately follow the short period of absence characteristic of this form of the disease. Numerous cases are on record of persons known to be epileptic being suddenly seized, either after or without apparent spasmodic attack, with some sudden impulse, in which they have used dangerous violence to those beside them, irrespective altogether of malevolent intention, as appears from their retaining no recollection whatever, after the short period of excitement, of anything that had occurred. In some cases there is reason to believe that crimes of heinous character, for which several persons, having been seized in the convulsion, have been committed in a state of mind such as that now described. The subject is obviously one of the greatest medico-legal interest and importance in regard to the question of criminal responsibility.

Apart, however, from such marked and comparatively rare instances of what is termed epileptic insanity, the general mental condition of the epileptic is in a large proportion of cases unfavourably affected by the disease. There are doubtless examples (and their number according to statistics is estimated at less than one-third) where, even among those suffering from frequent and severe attacks, no departure from the normal condition of mental integrity can be recognized. But in general the condition of the mind is likely to be damaged, with defects of memory, or diminishing intelligence, or what is perhaps as frequent, in irregularities of temperament, the patient being irritable or perverse and eccentric. In not a few cases there is a steady mental decline, which ends in dementia or idiocy. It is stated by some high authorities that epileptic women suffer in regard to their mental condition more than men. It also appears to be the case that the later in life the disease shows itself the more likely is the mind to suffer. Neither the frequency nor the severity of the seizures seem to have any necessary influence in the matter; and the general opinion appears to be that the milder form of the disease is that with which mental failure is more apt to be associated. (For a consideration of the conditions of the nervous system which result in epilepsy, see the article Neuropathology.)

The influence of hereditary predisposition in epilepsy is very
marked. It is necessary, however, to bear in mind the point so forcibly insisted on by Trousseau in relation to epilepsy, that hereditary transmission may be either direct or indirect, that is to say, that what is epilepsy in one generation may be some other form of neurosis in the next, and conversely, nervous diseases being remarkable for their tendency to transformation in their descent in families. Where epilepsy is hereditary, it generally manifests itself at an unusually early period of life. A singular fact, which also bears to some extent upon the pathology of this disease, was brought to light by Dr Brown Séguard in his experiments, namely, that the young of animals which had been artificially rendered epileptic were liable to similar seizures. In connexion with the hereditary transmission of epilepsy it must be observed that all authorities concur in the opinion that this disease is one among the baneful effects that often follow marriages of consanguinity. Further, there is reason to believe that intemperance, apart altogether from its direct effect in favouring the occurrence of epilepsy, has an evil influence in the hereditary transmission of this as of other nervous diseases. A want of symmetry in the formation of the skull and defective cerebral development are not infrequently observed where epilepsy is hereditarily transmitted.

Age is of importance in reference to the production of epilepsy. The disease may come on at any period of life, but it appears from the statistics of Rejouls and others, that it most frequently first manifests itself between the ages of ten and twenty years, the period of second dentition and puberty, and again at about the age of forty. Among other causes which are influential in the development of epilepsy may be mentioned sudden fright, prolonged mental anxiety, over-work and debauchery. Epileptic fits also occur in connexion with a depraved stage of the general health, and with irritations in distant organs, as seen in the fits occurring in dentition, in kidney disease, and as a result of worms in the intestines. The symptoms traceable to these causes are sometimes termed sympathetic or eccentric epilepsy; these are but rarely epileptic in the strictest sense of the word, but rather epileptiform.

Epilepsy is occasionally feigned for the purpose of extortion, but an experienced medical practitioner will rarely be deceived; and when it is stated that although many of the phenomena of an attack, particularly the convulsive movements, can be readily simulated, yet that the condition of the pupils, which are dilated during the fit, cannot be feigned, and that the impostor seldom bites his tongue or injures himself, deception is not likely to succeed even with non-medical persons of intelligence.

The medical treatment of epilepsy can only be briefly alluded to here. During the fit little can be done beyond preventing as far as possible the patient from injuring himself while unconsciousness continues. Tight clothing should be loosen, and a cord or pad inserted between the teeth. When the fit is of long continuance, the dashing of cold water on the face and chest, or the inhalation of chloroform, or of nitrite of amyl, may be useful; in general, however, the fit terminates independently of any such measures. When the fit is over the patient should be allowed to sleep, and have the head and shoulders well raised.

In the intervals of the attack, the general health of the patient is one of the most important points to be attended to. The strictest hygienic and dietetic rules should be observed, and all such causes as have been referred to as favouring the development of the disease should, as far as possible, be avoided. In the case of children, parents must be made to realize that epilepsy is a chronic disease, and that therefore the seizures must not be allowed to interfere unnecessarily with the child's training. The patient must be treated as such only during the attack; between times, though being carefully watched, must be made to follow a child's normal pursuits, and no distinction must be made from other children. The same applies to adults: it is far better for them to have some definite occupation, preferably one that keeps them in the open air. If such patients become irritable, then they should be placed under supervision. As regards those who cannot be looked after at home, colonies on a self-supporting basis have been tried, and where the supervision has been intelligent the success has been proved, a fairly high level of health and happiness being attained.

The various bromides are the only medical drugs that have produced any beneficial results. They require to be given in large doses which are carefully regulated for every individual patient, as the quantities required vary enormously. Children take far larger doses in proportion than adults. They are best given in a very diluted form, and after meals, to diminish the chances of gastric disturbance. Belladonna seems also to have some influence on the disease, and forms a useful addition; arsenic should also be prescribed at times, both as a tonic, and for the sake of the bromide in those who develop a tendency to acne, which is one of the troublesome results of bromism. The administration of the bromides should be maintained until three years after the cessation of the fits. The occurrence of gastric pain, palpitations and loss of the palatine reflex are indications to stop, or to decrease the quantity of the drug. In very severe cases opium may be required.

Surgical treatment for epilepsy is yet in its infancy, and it is too early to judge of its results. This does not apply, however, to cases of Jacksonian epilepsy, where a very large number have been operated on with marked benefit. Here the lesion of the brain is, in a very large percentage of the patients, caused by pressure from without, or by the presence of a tumour or a depressed fracture; the removal of the one, or the elevation of the other is the simple procedure, and it is usually followed by the complete disappearance of the seizures.

EPILOGUE. The appendix or supplement to a literary work, and in particular to a drama in verse, is called an epilogue, from εριλογος, the name given by the Greeks to the peroration of a speech. As we read in Shakespeare's Midsummer Night's Dream, the epilogue was generally treated as the apology for a play; it was a final appeal made to encourage the good-nature of the audiences, and to deprecate attack. The epilogue should form no part of the work as an entire composition, but should be independent of it; it should be treated as a sort of commentary. Sometimes it adds further information with regard to what has been left imperfectly concluded in the work itself. For instance, in the case of a play, the epilogue will occasionally tell us what became of the characters after the action closed; but this is irregular and unusual, and the epilogue is usually no more than a graceful way of dismissing the audience. Among the ancients the form was not cultivated, further than that the leader of the chorus or the last speaker advanced and said "Vos valete, et plaudite, cives." — Good-bye, citizens, and we hope you are pleased. Sometimes this formula was reduced to the one word, " Plaudite!" The use of the epilogue as a literary species is almost entirely confined to England, and it does not occur in the earliest English plays. It is rare in Shakespeare, but Ben Jonson made it a particular feature of his drama, and may almost be said to have invented the tradition of its regular use. He employed the epilogue for two purposes, either to assert the merit of the play or to deprecate censure of its defects. In the former case, as in Cynthia's Revels (1600), the actor went off, and immediately came on again saying—

"Gentles, be't known to you, since I went in I am turned rhymers, and do thus begin—

The author (jealous how your sense doth take His travails) hath enjoined me to make Some short and ceremonious epilogue,—

and then explained to the audience what an extremely interesting play it had been. In the second case, when the author was less confident, his epilogue took a humbler form, as in the comedy of Volpone (1605), where the actor said—

"The seasoning of a play is the applause. Now, as the Fox be punished by the laws, He yet doth hope, there is no suffering due For any fact which he hath done 'gainst you. If there be, censure him; here he doubtfull stands: If not, fare jovially and clap your hands."

Beaumont and Fletcher used the epilogue sparingly, but after
EPIMENIDES—EPINAY

their day it came more and more into vogue, and the form was almost invariably that which Ben Jonson had brought into fashion, namely, the short complete piece in heroic couplets. The hey-day of the epilogue, however, was the Restoration, and from 1660 to the decline of the drama in the reign of Queen Anne scarcely a play, serious or comic, was produced on the London stage without a prologue and an epilogue. These were almost always in verse, even if the play itself was in the roughest prose, and they were intended to impart a certain literary finish to the piece. These Restoration epilogues were often very elaborate essays or satires, and were by no means confined to the subject of the preceding play. They dealt with fashions, or politics, or criticism. The prologues and epilogues of Dryden are often brilliantly finished exercises in literary polemic. It became the custom for playwrights to ask their friends to write these poems for them, and the publishers would even come to a prominent poet and ask him to supply one for a fee. It gives us an idea of the sensibilities with which the dialogue was treated that Dryden originally published his valuable "Defence of the Epilogue; or An Essay on the Dramatic Poetry of the Last Age" (1672) as a defence of the epilogue which he had written for The Conquest of Granada. In France the custom of reciting dramatic epilogues has never prevailed. French criticism gives the name to such aedictus to the public, at the close of a non-dramatic work, as are reserved by La Fontaine for certain critical points in the "Fables." (E. G.)

EPIMENIDES, poet and prophet of Crete, lived in the 6th century B.C. Many fabulous stories are told of him, and even his existence is doubted. While tending his father's sheep, he is said to have fallen into a deep sleep in the Dictaean cave near Cnossus where he lived, and did not awake for fifty-seven years (Diogenes Laërtius i. 100-115). When the Athenians were visited by a pestilence in consequence of the murder of Cylon, he was invited by Solon (560) to purify the city. The only reward he would accept was a branch of the sacred olive, and a promise of perpetual friendship between Athens and Cnossus (Plutarch, Solon, 12; Aristotle, Ath. Pol. 1). He died in Crete at an advanced age; according to his countrymen, who afterwards honoured him as a god, he lived nearly three hundred years. According to another story, he was taken prisoner in a war between the Spartans and Cnossians, and put to death by his captors, because he refused to prophesy favourably for them. A collection of oracles, a theogony, an epic poem on the creation of the world, and other poems, were ascribed to him. The productions of Epimenides, the office of magistrates, and sacrifices, and a cosmogony, were attributed to him. Epimenides must be reckoned with Melampus and Onomacritus as one of the founders of Orphism. He is supposed to be the Cretan prophet alluded to in the epistle to Titus (i. 12).

EPINAL, a town on the north-eastern frontier of France, capital of the department of Vosges, 46 m. S.S.E. of Nancy on the Eastern railway between that town and Belfort. Pop. (1906), town 21,296, commune (including garrison) 56,593; 10,000 inhabitants; 131,000 acres; its sites on the Ille.-Ville—is situated on the right bank of the Moselle, which at this point divides into two arms forming an island whereon another quarter—the Petite Ville—is built. The lesser of these two arms, which is canalized, separates the island from the suburb of Hospice on its left bank. The right bank of the Moselle is bordered for some distance by pleasant promenades, and an extensive park surrounds the ruins of an old stronghold which dominated the Grande Ville from an eminence on the east. Apart from the church of St. Goërly (or St. Maurice) rebuilt in the 13th century but preserving a tower of the 12th century, the public buildings of Epinal offer little of architectural interest. The old hospital on the island-quarter contains a museum with interesting collections of paintings, Gallo-Roman antiquities, sculpture, &c. Close by stands the library, which possesses many valuable MSS.

The fortifications of Epinal are connected to the southward with Belfort, Dijon and Besançon, by the fortified line of the Moselle, and north of it lies the unfortified zone called the Trouée d'Épinal, a gap designedly left open to the invaders between Épinal and Toul, another great fortress which is itself connected by the Meuse forts d'arrêt with Verdun and the places of the north-east. Épinal therefore is a fortress of the greatest possible importance to the defence of France, and its works, all built since 1879, are formidable permanent fortifications. The Moselle runs from S. to N. through the middle of the girdle of forts; the fortifications of the right bank, beginning with Fort de la Mouché, near the river 3 m. above Épinal, form a chain of detached forts and batteries over 6 m. long from S. to N., and the northernmost part of this line is immensely strengthened by numerous advanced works between the villages of Dognévile and Longchamp. On the left bank, a larger area of ground is included in the perimeter of defence for the purposes of encampment, the most westerly of the forts, Girancourt, being 7 m. distant from Épinal; from the lower Moselle to Girancourt the works are grouped principally about Uxegney and Sarechy; from Girancourt to the upper river and Fort de la Mouché a long ridge extends in an arc, and on this south-western section the principal defence is Fort Ticha and its annexes. The circle of forts, which has a perimeter of nearly 30 m., was in 1890 re-inforced by the construction of sixteen new works, and the area of ground enclosed and otherwise protected by the defences of Épinal is sufficiently extensive to accommodate a large army.

Épinal is the seat of a prefect and of a court of assizes and has tribunals of first instance and of commerce, a board of trade-arbitrators, a chamber of commerce, training-colleges, a commercial college and industrial school, and exchange and a branch of the Bank of France. The town, which is important as the centre of a cotton-spinning region, carries on cotton-spinning, weaving and printing, brewing and distilling, and the manufacture of machinery and iron goods, glucose, embroidery, hats, wallpaper and tapioca. An industry peculiar to Épinal is the production of cheap images, lithographs and engravings. There is also trade in wine, grain, live-stock and starch products made in the vicinity. Épinal is an important junction on the Eastern railway.

Épinal originated towards the end of the 10th century with the founding of a monastery by Theodoric (Dietrich) I., bishop of Metz, whose successors ruled the town till 1444, when its inhabitants placed themselves under the protection of King Charles VII. In 1466 it was transferred to the duchy of Lorraine, and in 1766 it was, along with that duchy, incorporated with France. It was occupied by the Germans on the 12th of October 1870 after a short fight, and until the 15th was the headquarters of General von Werder.

ÉPINAY (Gr. ἔπινα), a city, in architecture, the open vestibule behind the nave. The term is not found in any classic author, but is a modern coinage, originating in Germany, to differentiate the feature from "opisthodomus," which in the Parthenon was an enclosed chamber.

ÉPINAY, LOUISE FLORENCE PÉTRONILLE TARDIEU D'ESCLAVELLES D' (1726-1783), French writer, was born at Valenciennes in the parish of Marché, 1726. She is well known on account of her liaisons with Rousseau and Baron von Grimm, and her acquaintanceship with Diderot, D'Alembert, D'Holbach and other French men of letters. Her father, Tardieu d'Esclavelles, a brigadier of infantry, was killed in battle when she was nineteen; and she married her cousin Denis Joseph de La Live d'Épinay, who was made a collector-general of taxes. The marriage was an unhappy one; and Louise d'Épinay believed that the prodigality, dissipation and infidelities of her husband justified her in obtaining a formal separation in 1740. She settled in the château of Le Chevrette in the valley of Montmorency, and there received a number of distinguished visitors. Conscious of a strong attachment for J. J. Rousseau, she furnished for him in 1756 in the valley of Montmorency a cottage which she named the "Hermitage," and in this retreat he found for a time the quiet and natural rural pleasures he praised so highly. Rousseau, in his Confessions, affirmed that
the inclination was all on her side; but as, after her visit to Geneva, Rousseau became her bitter enemy, little weight can be given to his statements on this point. Her intimacy with Grimm, which began in 1755, marks a turning-point in her life, for under his influence she escaped from the somewhat compromising conditions of her life at La Chevrrette. In 1757-1759 she paid a long visit to Geneva, where she was a constant guest of Voltaire. In Grimm's absence from France (1775-1776), Madame d'Epiney continued, under the superintendence of Diderot, the correspondence he had begun with various European sovereigns. She spent most of her later life at La Brie, a small house near La Chevrrette in the society of Grimm and of a small circle of men of letters. She died on the 17th of April 1783. Her Conversations d'Émilie (1774), composed for the education of her grand-daughter, Émilie de Belanue, was crowned by the French Academy in 1783. The Mémoires et Correspondance de Mme d'Épinay, renfermant un grand nombre de lettres inédites de Grimm, de Diderot, et de J. J. Rousseau, ainsi que des détails, c. s., was published at Paris (1818) from a MS. which she had bequeathed to Grimm. The Mémoires are written by herself in the form of a sort of autobiographical romance. Madame d'Épiney figures in it as Madame de Montbrillant, and René is generally recognized as Rousseau, Volt as Grimm, Gaspard as Diderot. Two anonymous letters, published along with the Mémoires are genuine. Many of Madame d'Épiney's letters are contained in the Correspondance de l'abbé Galliani (1818). Two anonymous works, Lettres à mon fils (Geneva, 1758) and Mes moments heureux (Geneva, 1759), are also by Madame d'Épiney.

See Rousseau’s Confessions; Lucien Perret [Mlle Herpin] and Gaston Maugras, La Jeunesse de Mme d'Épinay, les dernières années de Mme d'Épinay (1882-1883); Sainte-Beuve, Causeries du lundi, vol. ii.; Edmond Scherer, Études sur la littérature contemporaine, vols. iii. and vii. There are editions of the Mémoires by L. Enault (1855) and by P. Boiteau (1865); and an English translation, with introduction and notes (1867), by J. H. Frenzen.

EPHIPHIANS, SAINT (c. 310-402), a celebrated Church Father, born in the beginning of the 4th century at Bezanda, a village of Palestine, near Eleutheropolis. He is said to have been of Jewish extraction. In his youth he resided in Egypt, where he began an ascetic course of life, and, freeing himself from Hellenistic influences, invoked episcopal assistance against heretical thinkers, eighty of whom were driven from the cities. On his return to Palestine he was ordained presbyter by the bishop of Eleutheropolis, and became the president of a monastery which he founded near his native place. The account of his intimacy with the patriarch Hilarius is not trustworthy. In 367 he was nominated bishop of Constantinople, previously known as Salamis, the metropolis of Cyprus—an office which he held till his death in small circle of for the truth, but passionate and bigoted, he devoted himself to two great labours, namely, the spread of the recently established monasticism, and the confutation of heresy, of which he regarded Origen and his followers as the chief representatives. The first of the Origenists that he attacked was John, bishop of Jerusalem, whom he denounced from his own pulpit at Jerusalem (394) in terms so violent that the bishop sent his archdeacon to request him to desist; and afterwards, instigated by Theophilus, bishop of Alexandria, he proceeded so far as to summon a council of Cyprian bishops to condemn the errors of Origen. In his closing years he came into conflict with Chrysostom, the bishop of Constantinople, who had given temporary shelter to four Nitrian monks whom Theophilus had expelled on the charge of Origenism. The monks gained the support of the empress Eudoxia, and when she summoned Theophilus to Constantinople that prelate forced the aged Epiphanius to go with him. He had some controversy with Chrysostom but did not stay to see the result of Theophilus's machinations, and died on his way home. The principal work of Epiphanius is the Panarion, or treatise on heresies, of which he also wrote an abridgment. It is a “medicine chest” of remedies for all kinds of heretical belief, of which he names eighty varieties. His accounts of the earlier errors (where he has preserved for us excerpts from the original Greek of Irenaeus) are more reliable than those of contemporary heresies. In his desire to see the Church safely moored he also wrote the

Ancoratus, or discourse on the true faith. His encyclopaedic learning shows itself in a treatise on Jewish weights and measures, and another (incomplete) on ancient gems. These, with two epistles to John of Jerusalem and Jerome, are his only genuine remains. He wrote a large number of works which are lost. In allusion to his knowledge of Hebrew, Syriac, Egyptian, Greek and Latin, Jerome styles Epiphanius Περιγλώσσας (Five-tongued); but if his knowledge of languages was really so extensive, it is certain that he was utterly destined of critical and logical power. His early asceticism seems to have imbued him with a love of the marvellous; and his religious zeal served only to increase his credulity. His judgment is outweighed by his prejudice, and his inability to recognize the responsibilities of authorship makes it necessary to assign most value to those portions of his works which he simply cites from earlier writers.

The primary sources for the life are the church histories of Socrates and Sozomen, Palladius's De vita Chrysostomi and Jerome's De vir. illust. 114. Petau (Petaius) published an edition of the works in 2 vols. fol. at Paris in 1622; cf. Migne, Patr. Græca. 41-43. The Panarion and other works were edited by F. Oehler (Berlin, 1859-1861). For more recent work especially on the fragments see K. Bonwetsch's art. in Herzog-Hauck's Realencyk. v. 417.

Other theologians of the same name were: (1) Epiphanius Scholasticus, friend and helper of Cassiodorus; (2) Epiphanius, bishop of Ticinum (Pavia), c. 436-496; (3) Epiphanius, bishop of Calahorra; (4) Epiphanius, bishop of Metz; (5) Epiphanius, bishop of Orange (14th cent.). Also, to whom some critics have ascribed certain of the works supposed to have been written by the greater Epiphanius; (6) Epiphanius, bishop of Constantinople in the 9th century, to whom a similar attribution has been made.

EPHIPANY, FEAST OF. The word epiphany, in Greek, signifies an apparaition of a divine being. It was used as a singular or a plural, both in its Greek and Latin forms, according as one epiphany was contemplated or several united in a single commemoration. For in the East from an early time were associated with the feast of the Baptism of Christ commemorations of the physical birth, of the Star of the Magi, of the Presentation of Jesus in the Temple, and of his Blessing after his Baptism. Also, to whom some critics have ascribed certain of the works supposed to have been written by the greater Epiphanius; (6) Epiphanius, bishop of Constantinople in the 9th century, to whom a similar attribution has been made.

In the following article it is attempted to ascertain the date of institution of the Epiphany feast, its origin, and its significance and development.

Clement of Alexandria first mentions it. Writing c. 90 he states that the Heliandians feasted the day of the Baptism, devoting the whole night which preceded it to lections of the scriptures. They fixed it in the 15th year of Tiberius, on the 15th or 11th of the month Tobi, dates of the Egyptian fixed calendar equivalent to January 13th and 6th. When Clement wrote the great church had not adopted the feast, but toward A.D. 300 it was widely in vogue. Thus the Acts of Philip the Martyr, bishop of Heraclea in Thrace, A.D. 304, mention the "holy day of the Epiphany." Note the singular. Origen seems not to have heard of it as a feast of the Catholic church, but Hippolytus (died c. 235) recognized it in a homily which may be genuine.

In the age of the Nicene Council, A.D. 325, the primate of Alexandria was charged at every Epiphany Feast to announce to the churches in a "Festal Letter" the date of the forthcoming Easter. Several such letters written by Athanasius and others remain. In the churches so addressed the feast of Jan. 6 must have been already current.

In Jerusalem, according to the Epistle of Macarius to the Armenians, c. 330, the feast was kept with zeal and splendour, and was with Easter and Pentecost a favourite season for Baptism. We have evidence of the 4th century from Spain that a long and elaborate "Choral Enact," the Adveno, was written for the feast of Epiphany on the 6th of January. The council of

1 For its text see The Key of Truth, translated by F. C. Conybeare, Oxford, and the article Armenian Church.
EPIPHANY

Saragossa c. 380 enacted that for 21 days, from the 17th of December to the 6th of January, the Epiphany, the faithful should not miss the feast, but should frequently attend the churches. The synod of Lerida in 524 went further and forbade marriages during Advent. Our earliest Spanish lectionary, the Liber comicus of Toledo, edited by Don Morin (Anecd. Maredol. vol. i.), provides lections for five Sundays in Advent, and the gospel lections chosen regard the Baptism of Christ, not His Birth, of which the feast, like that of the Annunciation, is mentioned, but not yet dated, December 25 being assigned to St Stephen. It is odd that for "the Apparition of the Lord" the lection Matt. ii. 1-15 is assigned, although the lections for Advent belong to a scheme which identified Epiphany with the Baptism. This anomaly we account for below. The old editor of the Mozarabic Liturgy, Fr. Antonio Lorenzano, notes in his preface § 28 that the Spaniards anciently terminated the Advent season with the Epiphany Feast. In Rome also the earliest fixed system of the ecclesiastical year, which may go back to 500, makes Epiphany the caput feorum or chief of feasts. The Sundays of Advent lead up to it, and the first Sundays of the year are "The Sunday within the octave of Epiphany," "the first Sunday after," and so forth. December 25 is no critical date at all. In Armenia as early as 450 a month of fasting prepared for the Advent of the Lord at Epiphany, and the fast was interpreted as a reiteration of John the Baptist’s season of Repentance.

In Antioch as late as about 386 Epiphany and Easter were the two great feasts of the physical Birth of Christ, and yet at the eve of Epiphany after nightfall the springs and rivers were blessed, and water was drawn from them and stored for the whole year to be used in illuminations and baptisms. Such water, says Chrysostom, to whose orations we owe the information, kept pure and fresh for one, two and three years, and like good wine actually improved the longer it was kept. Note that Chrysostom speaks of the Feast of the Epiphanies, implying two, one of the Baptist, the other of the Second Advent, when Christ will be manifested afresh, and we with him in glory. This Second Epiphany inspired, as we saw, the choice of Pauline lections in the Liber comicus. But the salient event commemorated was the Baptist, and Chrysostom almost insists on this as the exclusive significance of the feast—

"It was not when he was born that he became manifest to all, but when he was baptized." In his commentary on Ezekiel Jerome employs the same language ambendas et non apparuit, by way of protest against an interpretation of the Feast as that of the Birth of Jesus in Bethlehem, which was essayed as early as 375 by Epiphanius in Cyprus, and was being enforced in Jerome’s day by John, bishop of Jerusalem. Epiphanius boldly removed the date of the Baptism to the 5th of November. "January 6" (= Tobi 111), he writes, "is the day of Christ’s Birth, that is, of the Epiphanies." He uses the plural, because he adds on January 6 the commemoration of the water miracle of Cana. Although in 375 he thus protested that January 6 was the day "of the Birth after the Flesh," he became before the end of the century a convert, according to John of Nice, to the new opinion that December 25 was the real day of this Birth. That as early as about 385, January 6 was kept as the physical birthday in Jerusalem, or rather in Bethlehem, we know from a contemporary witness of it, the lady pilgrim of Gaul, whose peregrinatio, recently discovered by Gamurrini, is confirmed by the old Jerusalem Lectorial preserved in Armenian. Ephraem the Syrian father is attested already by Epiphanius (c. 375) to have celebrated the physical birth on January 6. His genuine Syriac hymns confirm this, but prove that the Baptist, the Star of the Magi, and the Marriage at Cana were also commemorated on the same day. That the same union prevailed in Rome up to the year 354 may be inferred from Ambrose, Philastrius (De haer. ch. 140) notes that some abolished the Epiphany feast and substituted a Birth feast. This was between 370 and 390.

In 385 Pope Siricius 4 calls January 6 Natalicia, "the Birthday of Christ or of Epiphany," and protests against the Spanish custom (at Tarragona) of baptizing on that day. Another proof that in Spain in the 4th century it commemorated the Baptism. In Gaul at Vienna in 360 Julian the Apostate, out of deference to Christian feeling, went to church "on the festival which they keep in January and call Epiphania." So Ammianus; but Zonaras in his Greek account of the event calls it the day of the Saviour’s Birth.

Why the feast of the Baptism was called the feast or day of the Saviour’s Birth, and why fathers of that age when they call Christmas the birthday constantly qualify and add the words "in the flesh," we are able to divine from Pope Leo’s c. 447 18th Epistle to the bishops of Sicily. Even before we learn that in Sicily they held that in His Baptism the Saviour was reborn through the Holy Spirit. "The Lord," protests Leo, "needed no remission of sins, no remedy of rebirth." The Sicilians also baptized neophytes on January 6, "because baptism conveyed to Jesus and to them one and the same grace." Not so, argues Leo, the Lord sanctioned and hallowed the power of regeneration, not when He was baptized, but "when the blood of redemption and the water of baptism flowed forth from his side." Neophytes should therefore be baptized at Easter and Pentecost alone, never at Epiphany.

Fortune has preserved to us among the Spuria of several Latin fathers, Ambrose, Augustine, Jerome and Maximus of Turin, various homilies for Sundays of Advent and Epiphany. The Advent lections of these homilists were much the same as those of the Spanish Liber comicus; and they insist on Advent being kept as a strict fast, without marriage celebrations. Their Epiphany lection is however Matt. iii. 1-17, which must therefore have once on a time been assigned in the Liber comicus also in harmony with its general scheme. The psalms used on the day are, xxiii. (xxiv.) "When Israel went forth," xxvii. (xxix.) "Give unto the Lord," and xxviii. (xxxii.) "the Lord is my Shepherd." The same lection of Matthew and also Ps. xxix. are noted for Epiphany in the Greek oration for the day assigned to Hippolytus, which is at least earlier than 300, and also in special old Epiphany rites for the Benediction of the waters found in Latin, Greek, Armenian, Coptic, Syriac, &c. Now by these homilists as by Chrysostom, the Baptism is regarded as the occasion on which "the Saviour first appeared after the flesh in the world or on earth." These words were classical to the homilists, who explain them as best they can. The baptism is also declared to have been "the consecration of Christ," and "regeneration of Christ and a strengthening of our faith," to have been "Christ’s second nativity." "This second birth hath more renown than his first . . . for now the God of majesty is inscribed (as his father), but then (at his first birth) Joseph the Carpenter was assumed to be his father . . . he had the honour who cries aloud from Heaven (viz. God the Father), than he who labours upon earth" (viz. Joseph).

Similarly the old ordo Romanus of the age of Pepin (given by Montfaucon in his preface to the Mozarabic missal in Migne, Patr. Latina, 85, col. 46), under the rubric of the Vigil of the Theophany, insists that "the second birth of Christ (in Baptism) being distinguished by so many mysteries (e.g. the miracle of Cana) is more honoured than the first" (birth from Mary).

These homilies mostly belong to an age (? 300-400) when the commemoration of the physical Birth had not yet found its own day (Dec. 25), and was therefore added alongside of the Baptism on January 6. Thus the two Births, the physical and the

1 Epist. ad Hierimenium, c. 2.
2 Hom. i. in Pentec. 69, tom. ii. 458; "With us the Epiphanies is the first festival. What is this festival’s significance? This, that God was seen upon earth and honored with men." For this idea there had soon to be substituted that of the manifestation of Christ to the Gentiles.
4 These are Matt. iii. 1-11, xi. 2-15, xxi. 1-9; Mark i. 1-8; Luke iii. 1-18. The Pauline lections regard the Epiphany of the Second Advent, of the prophetic or Messianic kingdom.
EPHESUS

spiritual, of Jesus were celebrated on one and the same day, and one homily contains the words: "Not yet is the feast of his origin fully completed, and already we have to celebrate the solemn commemoration of his Baptism. He has hardly been born humanwise, and already he is being reborn in sacramental wise. For to-day, though after a lapse of many annual cycles, he was hallowed (or consecrated) in Jordan. So the Lord arranged as to link rite with rite; I mean, in such wise as to be brought forth through the Virgin and to be begotten through the mystery (i.e. sacrament) in one and the same season." Another homily preserved in a MS. of the 7th or 8th century and assigned to Maximus of Turin declares that the Epiphany was known as the Birthday of Jesus, either because he was then born of the Virgin or reborn in baptism. This also was the view of Epiphanius. China Chrestos, to their custom of keeping the feast of the Birth and Baptism together on January 6. They argued from Luke's gospel that the Annunciation took place on April 6, and therefore the Birth on January 6. The Baptism was on Christ's thirtieth birthday, and should therefore be also kept on January 6. Cosmas Indicopleustes (c. 550) relates that on the same grounds believers of Jerusalem joined the feasts. All such reasoning was of course apokris coup. As late as the 9th century the Armenians had at least three discrepant dates for the Annunciation—January 5, January 0, April 6; and of these January 5 and 0 were older than the 6. They perhaps borrowed from Epiphanius the commentary on the Gospels. The old Latin homilist, above quoted, hits the mark when he declares that the innate logic of things required the Baptism (which must, he says, be any how called a natal or birth festival) to fall on the same day as Christmas —Ratio enim exigit. Of the argument from the 6th of April as the date of the Annunciation he knows nothing. The 12th century Armenian Patriarch Nerses, like this homilist, merely resta his case against the Greeks, who incessantly reproached the Armenians for ignoring their Christmas on December 25, on the inherent logic of things, as follows: "Virtually the same occurs after the feast of the holy virgin, so he was born through baptism and from the Jordan, by way of example unto us. And since there are here two births, albeit differing one from the other in mystic import and in point of time, therefore it was appointed that we should feast them together, as the first, so also the second." The Epiphany feast had therefore in its own right acquired the name of natalis dies or birthday, as commemorating the spiritual rebirth of Jesus in Jordan, before the natalis in carne, the Birthday in the flesh, as Jerome and others call it, was associated with it. This idea was condemned as Ebionite in the 3rd century, yet it influences Christian writers long before and long afterwards. So Tertullian says: "We little fishes (pisciculi), after the example of our great fish (lycim). Jesus Christ also are born (egignimus) in the water, nor except by abiding in the water are we in a state of salvation." And Hilary, like the Latin homilists cited above, writes that "he was born again through baptism, and then became Son of God," adding that the Father cried, when he had gone up out of the water, "My Son art thou, I have this day begotten thee" (Luke iii. 22). "But this," he adds, "was with the begetting of a man who is being reborn; on that occasion too he himself was being reborn unto God to be perfect son; as he was son of man, so in baptism, he was constituted son of God as well." The idea frequently meets us in Hilary; it occurs in the Epiphany hymn of the orthodox Greek church, and in the Epiphany hymns and homilies of the Armenians.

A letter is preserved by John of Nice of a bishop of Jerusalem to the bishop of Rome which attests a temporary union of both feasts on January 6 in the holy places. The faithful, it says, met before dawn at Bethlehem to celebrate the Birth from the Virgin in the cave; but before their hymns and lections were finished they had to hurry off to Jordan, 13 m. the other side of Jerusalem, to celebrate the Baptism, and by consequence neither commemoration could be kept fully and reverently. The writer therefore begs the pope to look in the archives of the Jews brought to Rome after the destruction of Jerusalem, and to ascertain from them the real date of Christ's birth. The pope looked in the works of Josephus and found it to be December 25. The letter's genuineness has been called in question, but reveals, as it does, the Church's ignorance of the date of the Birth, the inconvenience and precariousness of its association with the Baptism, the recency of its separate institution, it could not have been invented. It is too tell-tale a document. Not the least significant fact about it is that it views the Baptism as an established feast which cannot be altered and set on another date. Not it but the physical birth must be removed from January 6 to another date. It has been shown above that perhaps as early as 380 the difficulty was got over in Jerusalem by making the Epiphany wholly and solely a commemoration of the miraculous birth, and suppressing the commemoration of the Baptism. Therefore this letter must have been written or, if invented, then invented before that date. Chrysostom seems to have known of it, for in his Epiphany homily preached at Antioch, c. 392 (op. vol. ii. 354, ed. Montf.), he refers to the archives at Rome as the source from which the date December 25 could be confirmed, and declares that he had obtained it from those who dwell there, and who observing it from the beginning and by old tradition, had communicated it to the East. The question arises why the feast of the Baptism was set on January 6 by the sect of Basilides? And why the great church adopted the date? Now we know what sort of considerations influenced this sect in fixing other feasts, so we have a clue. They fixed the Birth of Jesus on Pachon 25 (= May 20), the day of the Niloa, or feast of the descent of the Nile from heaven. We should thus expect January 6 to be equally a Nile festival. And this from various sources we know it was. On Tobi 11, says Epiphanius (c. 370), 'every one draws up water from the river and stores it up, not only in Egypt itself, but in many other countries. In many places, he adds, springs and rivers turn into wine on this day, e.g. at Cybyra in Caria and Gerasa in Arabia. Aristides Rhetor (c. 160) also relates how in the winter, which began with Tobi, the Nile water was at its purest. Its water, he says, if drawn at the right time conquers time, for it does not go bad, whether you keep it on the spot or export it. Galleys were waiting on a certain night to take it on board and transport it to Italy and elsewhere for libations and illuminations in the Temples of Isis. "Such water," he adds, "remained fresh, long after other water supplies had gone bad. The Egyptians filled their pitchers with this water, as others did with wine; they stored it in their houses for three or four years or more, and recommended it the more, the older it grew, just as the Greeks did their wines." Two centuries later Chrysostom, as we have seen, commends in identical terms the water blessed and drawn from the rivers at the Basilian feast. It is therefore probable that the Basilian feast was a Christianized form of the blessing of the Nile, called by Chasus in his Coptic calendar Hydrous. Mas'ud the Arab historian of the 10th century, in his Prairias d'or (French trans. Paris, 1863, ii. 354), enlarges on the splendours of this feast as he saw it still celebrated in Egypt. Epiphanius also (Haer. 51) relates a curious celebration held at Alexandria of the Birth of the Aeon. On January 5 or 6 the votaries met in the holy compound or Temple of the Maiden (Koré), and sang hymns to the music of the flute till dawn, when they went down with torches into a shrine underground, and fetched up a wooden idol on a bier representing Koré, seated and naked, with crosses marked on her brow, her hands on her knees. Then with flute-playing, hymns and dances they carried the image seven times round the central shrine, before restoring it again to its dwelling-place below. He adds: "And the votaries say that to-day at this hour Kord, that is, the Virgin, gave birth to the Aeon." Epiphanius says this was a heathen rite, but it rather resembles some Basilidian or Gnostic commemoration of the spiritual birth of the Divine life in Jesus of the Christhood, from the older creation the Ecclesia. The earliest extant Greek text of the Epiphany rite is in a

Perhaps Epiphanius is here, after his wont, transcribing an earlier source.
EPIRUS

The prayers recite that at His baptism Christ hallowed the waters by His presence in Jordan, and ask that they may now be blessed by the Holy Spirit visiting them, by its power and inworking, as the streams of Jordan were blessed. So they will be able to purify soul and body of all who draw up and partake of them.

The hymn sung contains such clauses as these: "To-day the grace of the Holy Spirit hallowing the waters appears (ἡ ὁμοίωσις ἡ ἁγίωσις); To-day the systems of waters spread out their backs under the Lord's footsteps. To-day the unseen is seen, that he may reveal himself to us. To-day the Incarnation of His own will ordained (fil. thab hands laid life by his own creature. To-day the Unbending bends his neck to his own servant, in order to free us from servitude. To-day we were liberated from darkness and are illumined by light of divine knowledge. To-day the mind of rebirth (fil. palingenesy) of the image reshapes the Archetype."

This last clause is obscure. In the Armenian hymns the ideas of the rebirth not only of believers, but of Jesus, and of the latter's ordination by John, are very prominent.

The history of the Epiphany feast may be summed up thus:—

From the Jews the Church took over the festivals of Pascha and Pentecost; and Sunday was a weekly commemoration of the Resurrection. It was inevitable, however, that believers should before long desire to commemorate the Baptism, with which the life of Christ began, and which was widely regarded as the occasion when the divine life began in Jesus; when the Logos or Holy Spirit appeared and rested on Him; conferring upon Him spiritual union as the promised Messiah; when, according to an old reading of Luke iii. 22, He was begotten of God. Perhaps the Ebionites Christians of Palestine first instituted the feast, and this, if a fact, must underlie the statement of John of Nicaea, a late but well-informed writer (c. 950), that it was fixed by the disciples of John the Baptist who were present at Jesus' Baptism. The Egyptian gnostics anyhow had the feast and set it on January 6, a day of the blessing of the Nile. It was a feast of Adoptionist complexion, as one of its names, viz. the Birthday (Greek γενεθλία, Latin Natâlia or Natalia de die natalis). This explains why in east and west the feast of the physical Birth was for a time associated with it; and to justify this association it was suggested that Jesus was baptized just on His thirtieth birthday. In Jerusalem and Syria it was perhaps the Ebionite or Adoptionist, we may add also the Gnostic, associations of the Baptism that caused this aspect of Epiphany to be relegated to the background, so that it became wholly a feast of the miraculous Baptism. At the same time other epiphanies of Christ were superadded, e.g. of Cana where Christ began His miracles by turning water into wine and manifested forth His glory, and of the Star of the Magi. Hence it is often called the Feast of Epiphanies (in the plural). In the West the day is commonly called the Feast of the three kings, and its early significance as a commemoration of the Baptism and season of blessing the waters has been obscured; the Eastern churches, however, of Greece, Russia, Georgia, Armenia, Egypt, Syria have been more conservative. In the far East it is still the season of seasons for baptisms, and in Armenia children born long before are baptized at it. Long ago it was a baptismal feast in Sicily, Spain, Italy (see Pope Gelasian to the Lusorian Bishops), Africa and Ireland. In the Manx prayer-book of Bishop Phillips of the year 1610 Epiphany is called the "little Nativity" (La notolich bigge), and the Sunday which comes between December 25 and January 6 is "the Sunday between the two Nativities; or Ith dâni ody o 'Notlick; Epiphany itself is the 'feast of the water vessel', leid ymmryi uskyey, or 'of the well which the ambyr ushyk."

(See also the works enumerated under CHRISTMAS.) (F. C. C.)

1 The same idea is frequent in Epiphany homilies of Chrysostom and other 4th-century fathers.

EPIRUS, or EPIRUS, an ancient district of Northern Greece extending along the Ionian Sea from the Acrocorinian promontory on the N. to the Ambracian gulf on the S. It was conterminous on the landward side with Illyria, Macedonia and Thessaly, and thus corresponds to the southern portion of Albania (q.v.). The name Epirus (Ἑπερος) signified "mainland," and was originally applied to the whole coast southward to the Corinthian Gulf, in contradistinction to the neighbouring islands, Corcyra, Leucas, &c. The country is all mountainous, especially towards the east, where the great rivers of north-western Greece—Atholus, Arachthos and Aous—rise in Mt. Lacoen, the backbone of the Pindus chain. In ancient times Epirus did not produce corn sufficient for the wants of its inhabitants; but it was celebrated, as it has been almost to the present day, for its cattle and its horses. According to Theopompos (4th cent. B.C.), the Epikrots were divided into fourteen independent tribes, of which the principal were the Chaones, the Thespotri and the Molossi. The Chaones (perhaps akin to the Chones who dwelt in the heel of Italy) inhabited the Acrocorinian shore, the Molossians the inland districts round the lake of Pamvotis (mod. Jannina), and the Thespotrians the region to the north of the Ambracian gulf. In spite of its distance from the chief Greek thought and action, and the barbarian repulse of its inhabitants, Epirus was believed by the Greeks to have exerted at an early period no small influence on Greece, by means more especially of the oracle of Dodona. Aristotle even placed in Epirus the original home of the Hellenes. But in historic times its part in Greek history is mainly passive. The states of Greece proper founded a number of colonies on its coast, which formed stepping-stones towards the Adriatic and the West. Of these one of the earliest and most flourishing was the Corinthian colony of Ambracia, which gives its name to the neighbouring gulf. Elatris, Bucheta and Pandosia, in Thespotria, originated from Elis. Among the other towns in the country the following were of some importance. In Chaonia: Palaece and Chimaera, fortified towns to which the daughters of the anachronous gulf could retire in time of war; Onchesmus or Arachthos, on the E. coast of Corcyra (Corfu), now represented by Santi Quarante; Phoenice, still so called, the wealthiest of all the native cities of Epirus, and after the fall of the Molossian kingdom the centre of an Epiprotic League; Butroton, the modern Butrinto; Phanote, important in the Roman campaigns in Epirus; and Adrianopolis, founded by the emperor whose name it bore. In Thespotria: Cassope, the chief town of the most powerful of the Thespotrian clans; and Ephyra, afterwards Cichyryas, identified by W. M. Leake with the monastery of St John 3 m. from Phanari, and by C. Bursian with Kastri at the northern end of the Acherusian Lake. In Molossia: Passaron, where the kings were wont to take the oath of the constitution and receive their people's allegiance; and Tecmon, Phylace and Horremus, all of doubtful identification. The Byzantine town of Rogus is probably the same as the modern Luro, the Greek Oropus.

History.—The kings, or rather chieftains, of the Molossians, who ultimately extended their power over all Epirus, claimed to be descended from Pyrrhus, son of Achilles, who, according to legend, settled in the country after the sack of Troy, and transmitted his kingdom to Molossus, his son by Andromache. The early history of the dynasty is very obscure; but Admetus, who lived in the 5th century B.C., is remembered for his hospitable reception of the banished Themistocles, in spite of the fact that the great Athenian had persuaded his countrymen to refuse the alliance tardily offered by the Molossians when victory against the Persians was already secured. Admetus was succeeded, about 420 B.C., by his son or grandson, Thamyris or Armys I., who being placed by a decree of the people under the guardianship of Sabylinthus, chief of the Attinates, was educated at Athens, and at a later date introduced a higher civilization among his subjects. Alcetas, the next king mentioned in history, was restored to his throne by Dionysius of Syracuse about 385 B.C. His son Armys II. (who succeeded by the death of his brother Neoptolomeus) ruled with prudence and equity, and gave encouragement to literature and the arts.
EPISCOPACY

To him Xenocrates of Chalcodon dedicated his four books on the art of governing; and it is specially mentioned that he bestowed great care on the education of his brother's children. One of them, Troas, he married; Olympias, the other, married was to Philip II. of Macedon and became the mother of Alexander the Great. On the death of Amyrbas, Alexander the brother of Olympias, was put on the throne by Philip and married his daughter Cleopatra. Alexander assumed the new title of king of Epirus, and raised the reputation of his country abroad. Asked by the Tarentines for aid against the Samnites and Lucanians, he made a descent at Paestum in 332 B.C., and reduced several cities of the Lucani and Bruttii; but in a second attack he was surrounded, defeated and slain near Pandosia in 330 B.C.

Aecidas, the son of Amyrbas II., succeeded Alexander. He espoused the cause of Olympias against Cassander, but was dethroned by his own soldiers, and had hardly regained his position when he fell in battle (313 B.C.) against Philip, brother of Cassander. He had, by his wife Phthia, a son, the celebrated Pyrrhus, and two daughters, Diodamia and Troas, of whom the former married Demetrius Poliorcetes. His brother Alexetas, who succeeded him, continued unsuccessfully the war with Cassander; he was put to death by his rebellious subjects in 265 B.C., and was succeeded by Pyrrhus (q.v.), who for six years fought and directed the war in Sicily and Italy, and gave to Epirus a momentary importance which it continued to possess again nowhere for so long a time.

Alexander, his son, who succeeded in 272 B.C., attempted to seize Macedonia, and defeated Antigonus Gonatas, but was himself shortly afterwards driven from his kingdom by Demetrius. He recovered it, however, and spent the rest of his days in peace. Two other insignificant reigns brought the family of Pyrrhus to its close, and Epirus was thenceforward governed by a magistrate, elected annually in a general assembly of the nation held at Passaron. Having imprudently espoused the cause of Perseus (q.v.) in his ill-fated war against the Romans, 168 B.C., it was rendered to the fury of the conquerors, who destroyed it, is said, seventy towns, and carried into slavery 150,000 of the inhabitants. From this blow it never recovered. At the dissolution of the Achaean League (q.v.), 146 B.C., it became part of the province of Macedonia, receiving the name Epirus Vetus, to distinguish it from Epirus Nova, which lay to the east.

On the division of the empire it fell to the East, and so remained until the taking of Constantinople by the Latins in 1204, when Michel Angelus Comnenus seized Aetolia and Epirus. On the death of Michel in 1216, these countries fell into the hands of his brother Theodore. Thomas, the last of the direct line, was murdered in 1316 by his nephew Thomas, lord of Zante and Cephalonia, and in his dominions were driven out long after, Epirus was overrun by the Samians and Albanians, and the confusion which had been growing since the division of the empire worse confounded still. Charles II. Tocco, lord of Cephalonia and Zante, obtained the recognition of his title of Despot of Epirus from the emperor Manuel Comnenus in the beginning of the 15th century; but his family was deprived of their possession in 1431 by Murad (Amurath) II. In 1444, Sandor, king of Albania, made himself master of a considerable part of Epirus; but on his death it fell into the power of the Venetians.

From these it passed again to the Turks, under whose dominion it still remains. For modern history see ALBANIA.

EPISCOPACY (from Late Lat. episcopus, the office of a bishop, episcopus), the general term technically applied to that system of church organization in which the chief ecclesiastical authority within a defined district, or diocese, is vested in a bishop. It is distinguished on the one hand from Presbyterianism, government by general Congregations with no individual church or community of worshippers autonomous, and on the other from Papalism. The origin and development of episcopacy in the Christian Church, and the functions and attributes of bishops in the various churches, are dealt with elsewhere (see CHURCH HISTORY and BISHOP). Under the present heading it is proposed only to discuss briefly the various types of episcopacy actually existing, and the different principles that they represent.

The deepest line of cleavage is naturally between the view that episcopacy is a divinely ordained institution essential to the effective existence of a church as a church, and the view that it is merely a convenient form of church order, evolved as the result of a variety of historical causes, and not necessary to the proper constitution of a church. The first of these views is closely connected with the doctrine of the Apostolical Succession. According to this, Christ committed to his apostles certain powers of order and jurisdiction in the Church, among others that of transmitting these powers to others through "the laying on of hands"; and this power, whatever obscurity may surround the practice of the primitive Church (see APOSTLE, ad fin.) was very early confined to the order of bishops, who by virtue of a special anointing or consecration in the hands of the apostles in the function of handing on the powers and graces of the ministry. A valid episcopate, then, is one derived in an unbroken series of "layings on of hands" by bishops from the time of the apostles (see ORDER, HOLY). This is the Catholic view, common to all the ancient Churches whether of the West or East, and it is one that necessarily excludes from the union of Christendom all those Christian communities which possess no such apostolically derived ministry.

Apart altogether, however, from the question of orders, episcopacy represents a very special conception of the Christian Church. In the fully developed episcopal system the bishop sums up in his own person the collective powers of the Church; in his diocese, not by delegation of these powers from below, but by divinely bestowed authority from above. "Ecclesia est in episcoopo," wrote St Cyprian (Cyp. iv. Ep. 9); the bishop, as the successor of the apostles, is the centre of unity in his diocese, the unity of the Church as a whole is maintained by the intercommunion of the bishops, who for this purpose represent their dioceses. The bishops, individually and collectively, are thus the essential ties of Catholic unity; they alone, as the depositaries of the apostolic traditions, establish the norm of Catholic orthodoxy in the general councils of the Church. This high theory of episcopacy, which, if certain of the Ignatian letters be genuine, has a very early origin, has, of course, fallen upon evil days. The power of the collective episcopate to maintain Catholic unity was dispersed long before it was overshadowed by the centralized authority of Rome; before the Reformation, its last efforts to assert its supremacy in the Western Church, at the councils of Basel and Constance, had broken down; and the religious revolution of the 16th century left it largely discredited and exposed to a double attack, by the papal monarchy on the one hand and the democratic Presbyterian model on the other. Within the Roman Catholic Church the high doctrine of episcopacy continued to be maintained by the Church in its definition of the Episcopate.

1 See Bishop C. Gore, The Church and the Ministry (1887).
of the Papacy, and for a while with success; but a system
which had failed to preserve the unity of the Church even when
the world was united under the Roman empire could not be
expected to do so in a world split up into a series of rival states,
of which many had already reorganized their churches on a
national basis. 2 Febronius, indeed, was in favour of a frank
recognition of this national basis of ecclesiastical organization,
and saw in Episcopacy the best means of reuniting the dissidents
to the Catholic church; but it was not true that it was, of a free
federation of episcopal churches under the presidency of the
bishop of Rome. The idea had considerable success; for it
happened to march with the views of the secular princes. But
religious people could hardly be expected to see in the worldly
prince-bishops of the Empire, or the wealthy courtier-prelates of
France, the trustees of the apostolical tradition. The Revolution
intervened; and when, during the religious reaction that
followed, men sought for an ultimate authority, they found it
in the papal monarchy, exalted now by ultramontane zeal into the
sole depository of the apostolical tradition (see ULTRAMONTAN
ism). At the Vatican Council of 1870 episcopacy made its last
stand against papalism, and was vanquished (see VATICAN
COUNCIL). The pope still addressed his fellow-bishops as "very
benefactors of the Roman Catholic Church", and the fraternal union
of coequal authorities, which is of the essence of
episcopacy, has vanished; and in its place is set the autocracy
of one. The modern Roman Catholic Church is episcopal, for it
preserves the bishops, whose potestas ordinis not even the pope
can exercise until he has been duly consecrated; but the
bishops as such are now but subordinate elements in a system
for which "Episcopacy" is certainly no longer an appropriate
term.

The word Episcopacy has, in fact, since the Reformation, been
more especially associated with those churches which, while
ceasing to be in communion with Rome, have preserved the
episcopal model. Of these by far the most important is the
Church of England, which has maintained its organization
unaltered since its foundation by St Augustine, and its daughter churches (see ENGLAND, CHURCH OF, and
ANGLICAN COMMUNION). The Church of England since the
Reformation has been the champion of the principle of
Episcopacy against the papal pretensions on the one hand and
Presbyterianism and Congregationalism on the other. As to the
divine origin of Episcopacy and, consequently, of its universal
obligation in the Christian Church, Anglican opinion has been,
and still is, considerably divided. 1 The "High Church" view,
now predominant, is practically identical with that of the
Gallicans and Febronians, and is based on Catholic practice in
those ages of the Church to which, as well as to the Bible, the
formularies of the Church of England make appeal. So far as
this view, however, is the outcome of the general Catholic
movement of the 19th century, it can hardly be taken as typical of
Anglican tradition in this matter. Certainly, in the 16th and
17th centuries, the Church of England, while rigorously enforcing
the episcopal model at home, and even endeavouring to extend it
to Presbyterian Scotland, did not regard foreign non-episcopal
Churches otherwise than as sister communions. The whole
issue had, in fact, become confused with the confusion of functions
of the Church and State. In the view of the Church of England
the ultimate governance of the Christian community, in things
spiritual and temporal, was vested not in the clergy but in the
"Christian prince" as the vicegerent of God. 2 It was the

1 Neither the Articles nor the authoritative Homilies of the Church of England contain the doctrine of episcopacy.
The latter make "the three notes or marks" by which a true church is known "pure and sound doctrine, the sacraments
administered according to Christ's holy institution, and the right use of ecclesiastical discipline." These marks are perhaps ambiguous,
but they certainly do not depend on the possession of the Apostolic
Succession; for it is further stated that "the bishops of Rome and
their adherents are not the true Church of Christ" (Homilies "concerning the Holy Ghost," ed. Oxford, 1683, p. 292).

2 He and his holy apostles likewise, namely Peter and Paul,
did forbid unto all Ecclesiastical Ministers, dominion over the Church of Christ "(Homilies appointed to be read in Churches, "The V. part

transference to the territorial sovereigns of modern Europe of the
theocratic character of the Christian heads of the Roman
world-empire; with the result that for the reformed Churches
the unit of church organization was no longer the diocese, or the
group of dioceses, but the Christian state. Thus in England the
bishops, while retaining their potestas ordinis in virtue of their
consecration as successors of the apostles, came to be regarded
not as representing their dioceses in the state, but the state in
their dioceses. Forced on their dioceses by the royal Congé
d'être (q.v.) and enthusiastic apostles of the High Church
doctrine of non-resistance, the bishops were looked upon as no
more than lieutenants of the crown; 3 and Episcopacy was
ultimately resisted by Presbyterians and Independents as an
expression and instrument of arbitrary government, "Prelacy"
being confounded with "Popery" in a common condemnation.
With the constitutional changes of the 18th and 19th centuries,
however, a corresponding modification took place in the character
of the English episcopate; and a still further change resulted from
the multiplication of colonial and missionary sees having no
connexion with the state (see ANGLICAN COMMUNION).
The consciousness of being in the line of apostolic succession helped
the English clergy to revert to the principle Ecclesia est in
Episcopis, and this resulted in a reassertion of the episcopal
principle from all parts of the world have something of the character,
though they do not claim the ecumenical authority, of the general
councils of the early Church (see LAMBEITH CONFERENCES).

Of the reformed Churches of the continent of Europe only the
Lutheran Churches of Denmark, Iceland, Norway, Sweden and
Finland preserve the episcopal system in anything of its historical
sense; and of these only the two last can lay claim to the
possession of bishops in the unbroken line of episcopal suc
cession. 4 The superintendents (variously entitled also arch
priests, deans, provosts, bishops) of the Evangelical (Lutheran)
Church, as established in the several states of Germany and in
Austria, are not bishops in any canonical sense, though their
jurisdictions are known as dioceses and they exercise some
functions. They have no special powers of order, being
presbyters, and their legal status is admitted merely that of
officials of the territorial sovereign in his capacity as head of the
territorial church (see SUPERINTENDENT). The "bishops"
of the Lutheran Church in Transylvania are equivalent to the
superintendents.

Episcopacy in a stricter sense is the system of the Moravian
Brethren (q.v.) and the Methodist Episcopal Church of America
(see METHODISM). In the case of the former, claim is laid to the
unbroken episcopal succession through the Waldenses, and the
question of their eventual intercommunion with the Anglican
Princes are "God's lieutenants, God's presidents, God's ministers,

4 Jurisprudentially they were, of course, this in the strict sense in
which the term could be used of the Lutheran superintendents (see
below). They were never mere royal officials, but peers of parlia
tment, holding their temporalities as baronies under the crown.

During the crisis of the Reformation all the Swedish sees be
came vacant but two bishops were consecrated in the
year 1590. The episcopate, however, was preserved by Peter Mag
nusson, who, when residing as warden of the Swedish hospital of
St Bridget in Rome, had been duly elected bishop of the see of
Westernpary and consecrated, c. 1524. No official record of his
consecration can be discovered, but there is no sufficient reason to doubt
the fact; and it is certain that during his lifetime he was acknowledged
as a canonical bishop both by Roman Catholics and by Protestants.
In 1548 Magnusson consecrated bishops to fill the vacant sees, and,
accepting of one of these, Magnus Sommar, bishop of Stenness,
he afterwards consecrated the Reformer, Lawrence Petersen,
as archbishop of Upsala, Sept. 22, 1531. Some doubt has been raised
as to the validity of the consecration, but in the end the reformer,
also named Lawrence Petersen, in 1575, from the insufficiency of the
documentary evidence of the consecration of his consecrator, Paul
Justin, bishop of Abo. The integrity of the succession, however,
accepted after some interval of hesitation by Bishop of such learning
as Grabe and Routh, and has been formally recognized by the con
venation of the American Episcopal Church. The succession to the
daughter church of Finland, now independent, stands or falls with
that of Sweden.
Church was accordingly mooted at the Lambeth Conference of 1908. The bishops of the Methodist Episcopal Church, on the other hand, derive their orders from Thomas Coke, a presbyter of the Church of England, who in 1784 was ordained by John Wesley, assisted by two other presbyters, "superintendent" of the Methodist Society in America. Methodist episcopacy is therefore based on the denial of any special powers ordinis in the degree of bishop, and is fundamentally distinct from that of the Catholic Church—using this term in its narrow sense as applied to the ancient churches of the East and West.

In all of these ancient churches episcopacy is regarded as of divine origin; and in those of them which reject the papal supremacy the bishops are still regarded as the guardians of the tradition of apostolic orthodoxy and the stewards of the gifts of the Holy Ghost to men (see Orthodox Eastern Church; Armenian Church; Copts: Coptic Church, &c.). In the West, Gallican and Febronian Episcopacy are represented by two ecclesiastical bodies: the Jansenist Church under the archbishop of Utrecht (see Jansenism and Utrecht), and the Old Catholics (q.v.). Of these the latter, who separated from the Roman communion after the promulgation of the dogma of papal infallibility, represent a pure revolt of the system of Episcopacy against that of Papalism. (W. A. P.)

**EPISCOPIUS, SIMON** (1538-1643), the Latin form of the name of Simon Bishof, Dutch theologian, was born at Amsterdam on the 1st of January 1538. In 1600 he entered the university of Leiden, and probably soon received the title of Dr. Arminius, whose teaching he followed. In 1610, the year in which the Arminians presented the famous Remonstrance to the states of Holland, he became pastor at Bleyswick, a small village near Rotterdam; in the following year he advocated the cause of the Remonstrants (q.v.) at the Hague conference. In 1612 he succeeded Francis Gomarus as professor of theology at Leiden, an appointment which awakened the bitter enmity of the Calvinists, and, on account of the influence lent by it to the spread of Arminian opinions, was doubtless an ultimate cause of the meeting of the synod of Dort in 1618. Episcopius was chosen as the spokesman of the thirteen representatives of the Remonstrants before the synod; but he was refused a hearing, and the Remonstrant doctrines were condemned without any explanation or defence of them being permitted. At the end of the synod's sittings in 1619, Episcopius and the other twelve Armenian representatives were deprived of their offices and expelled from the country (see Dort, Synod of). Episcopius retired to Antwerp and ultimately to France, where he lived partly at Paris, partly at Rouen. He devoted most of his time to writings in support of the Armenian cause; but the attempt of Luke Wadding (1658-1657) to win him over to the Romish faith involved him also in a controversy with that famous Jesuit. After the death (1632) of Maurice, prince of Orange, the violence of the Armenian controversy began to abate, and Episcopius was permitted in 1626 to return to his own country. He was appointed preacher at the Remonstrant church in Rotterdam and afterwards rector of the Remonstrant college in Amsterdam. Here he died in 1643. Episcopius may be regarded as in great part the theological founder of Arminianism, since he developed and systematized the principles tentatively enunciated by Arminius. Besides opposing at all points the peculiar doctrines of Calvinism, Episcopius protested against the tendency of Calvinists to lay so much stress on abstract dogma, and argued that Christianity was practical rather than theoretical—not so much a system of intellectual belief as a moral order that an orthodox faith did not necessarily imply the knowledge of and assent to a system of doctrine which included the whole range of Christian truth, but only the knowledge and acceptance of so much of Christianity as was necessary to effect a real change on the heart and life.

The principal works of Episcopius are his Confessio s. declaratio sententiae pastorum qui in foedero Belgice Remonstrantes occantur super praecipue articulis religionis Christianae (1621), his Apologia pro confessione (1629), his Verus theologos remonstrans, and his unpublished work Institutiones theologicae. A life of Episcopius was written by Philip Limborch, and one was also prefixed by his successor, Jean de Courcelles (Curcelianus; 1580-1659), to an edition of his collected works published in 2 vols. (1650-1665). See also an article in Herzog-Hauck, Realencyclopdie.

**EPISODE**, an incident occurring in the history of a nation, an institution or an individual, especially with the significance of being an interruption of an ordered course of events, an irrelevance. The word is derived from a word (ἐπίστειλα) with a technical meaning in the ancient Greek tragedy. It is defined by Aristotle (Poeticon, 12) as μέρος διον γραφότας το μεταχθων χωρικων μελων, all the scenes, that is, which fall between the choric songs. ἐπίστειλα, or entrance, is generally applied to the entrance of the chorus, but the reference may be to that of the actors at the close of the choric songs. In the early Greek tragedy the parts which were spoken by the actors were considered of subsidiary importance to those sung by the chorus, and it is from his aspect that the meaning of the word, as something which breaks off the course of events, is derived (see A. E. Haigh, The Tragic Drama of the Greeks, 1886, at p. 353).

**EPISTAXIS** (Gr. ἔπισταξις, upon, and στάσιν, to drop), the medical term for bleeding from the nose, whether resulting from local injury or some constitutional condition. In persistent cases of nose-bleeding various measures are adopted, such as holding the arms over the head, the application of ice, or of such astringents as zinc or alum, or plugging the nostrils.

**EPISTEMOLOGY** (Gr. ἐπιστήμη, knowledge, and λόγος, theory, account; Germ. Erkenntnistheorie), in philosophy, a branch that considers the nature, scope and limits of knowledge, whether by reason or experience, and the principles of thought whose subject matter is the nature and origin of knowledge. It is thus contrasted with metaphysics, which considers the nature of reality, and with psychology, which deals with the objective part of cognition, and as Prof. James Ward said, "is essentially genetic in its method" (Mind, April 1883, pp. 166-167). Epistemology is concerned rather with the possibility of knowledge in the abstract (sub specie aeternitatis, Ward, ibid.). In the evolution of thought epistemological inquiry succeeded the speculations of the early thinkers, who concerned themselves primarily with attempts to explain existence. The differences of opinion which arose on this problem naturally led to the inquiry as to whether any universally valid statement was possible. The Sophists and the Sceptics, Plato and Aristotle, the Stoics and the Epicureans took up the question, and from the time of Locke and Kant it has been prominent in modern philosophy. It is extremely difficult, if not impossible, to draw a hard and fast line between epistemology and other branches of philosophy. If, for example, philosophy is divided into the theory of knowing and the theory of being, it is impossible entirely to separate the latter (Ontology) from the analysis of knowledge (Epistemology), so close is the connexion between the two. Again, the relation between logic in its widest sense and the theory of knowledge is extremely close. Some thinkers have identified the two, while others regard Epistemology as a subdivision of logic; others demarcate their relative spheres by confining logic to the science of the laws of thought, i.e., to formal logic. An attempt has been made by some philosophers to substitute "Gnosiology" (Gr. γνωσίας) for "Epistemology" as a special term for that part of Epistemology which is confined to "systematic analysis of the conceptions employed by ordinary and scientific thought in interpreting the world, and including an investigation of the art of knowing, or the nature of knowledge as such." Epistemology "would thus be reserved for the broad questions of the origin, nature and limits of knowledge." (Baldwin's Dict. of Philos. i. pp. 333 and 414.) The term Gnosiology has not, however, come into general use. (See PHILOSOPHY.)

**EPISTLE**, in its primary sense any letter addressed to an absent person; from the Greek word ἐπιστολή, a thing sent on a particular occasion. Strictly speaking, any such communication is an epistle, but at the present day the term has become archaic, and is used only for letters of an ancient time, or for elaborate literary productions which take an epistolary form, that is to say, are, or affect to be, written to a person at a distance.
1. Epistles and Letters.—The student of literary history soon discovers that a broad distinction exists between the letter and the epistle. The letter is essentially a spontaneous, non-literary production, ephemeral, intimate, personal and private, a substitute for a spoken conversation. On the other hand, rather than a speech of an audience in view, it is a literary form, a distinctly artistic effort aiming at permanence; and it bears much the same relation to a letter as a Platonic dialogue does to a private talk between friends. The posthumous value placed on a great man’s letters would naturally lead to the production of epistles, which might be written to set forth the views of a person or a school, either genuinely or as forgeries under some eminent name. Pseudonymous epistles were especially numerous under the early Roman empire, and mainly attached themselves to the names of Plato, Demosthenes, Aristotel and Cicero.

Both letters and epistles have come down to us in considerable variety and extent from the ancient world. Babylon, Assyria, Egypt, Greece and Rome alike contribute to our inheritance of letters. Those of Aristotle are of questionable genuineness, but we can rely, at any rate in part, on those of Isocrates and Epictetus. Some of the letters of Cicero are rather epistles, since they were meant ultimately for the general eye. The papyrius discoveries in Egypt have a peculiar interest, for they are mainly the letters of people unknown to fame, and having no thought of publicity. It is less to be wondered at that we have a large collection of ancient epistles, especially in the realm of magic and religion, for epistles were meant to live, were published in several copies, and were not a difficult form of literary effort. The Tell el-Amarna tablets found in Upper Egypt in 1887 are a series of dispatches in cuneiform script from Babylonian kings and Pharaohs and Palestinian governors to the Pharaohs (c. 1400 B.C.). The epistles of Dionysius of Halicarnassus, Plutarch, Seneca and the Younger Pliny claim mention at this point. In the later Roman period and into the middle ages, formal epistles were almost a distinct branch of literature. The ten books of Symmachus’ Epistolae, so highly esteemed in the cultured circles of the 4th century, may be contrasted with the less elegant but more forceful epistles of Jerome.

The distinction between letters and epistles has particular interest for the student of early Christian literature. G. A. Deissmann (Bible Studies) assigns to the category of letters all the Pauline writings as well as 2 and 3 John. The books bearing the names of James, Peter and Jude, together with the Pastoral (though these were written far later) and the Apocalypse, he regards as epistles. The first epistle of John he calls less a letter or an epistle than a religious tract. It is doubtful, however, whether we can thus reduce all the letters of the New Testament to one or other of these categories; and W. M. Ramsay (Hastings’ Dict. Bib. Extra vol. p. 401) has pointed out with some force that “in the new conditions a new category had been developed—the general letter addressed to a whole class of persons or to the entire Church of Christ.” Such writings have affinities with both the letter and the epistle, and they may further be compared with the “edicts and rescripts by which Roman law grew, documents arising out of special circumstances but treating them on general principles.” Most of the literature of the sub-apostolic age is epistolary, and we have a particularly interesting form of epistle in the communications between churches (as distinct from individuals) known as the First Epistle of Clement (Rome to Corinth), the Martyrdom of Polycarp ( Smyrna to Philomelium), and the Letters of the Churches of Vienne and Lyons (to the congregations of Asia Minor and Phrygia) describing the Gallican martyrs of A.D. 177. In the following centuries we have the valuable epistles of Cyprian, of Gregory Nazianzen (to Cledonius on the Apollinarian controversy), of Basil (to be classed rather as letters), of Ambrose, Chrysostom, Augustine and Jerome. The encyclical letters of the Roman Catholic Church are epistles, even more so than bulls, which are usually more special in their destination. In the Renaissance one of the most common forms of literary production was that modelled upon Cicero’s letters. From Petrarch to the Epistolae obscurorum virorum there is a whole epistolary literature. The Epistolae obscurorum virorum have to some extent a counter-part in the Epistles of Martin Marprelate. Later satires in an epistolary form are Pascal’s Provincial Letters, Swift’s Drapier Letters, and the Letters of Junius. The “open letter” of modern journalism is really an epistle.

The Epistles in Parnassus, a branch of poetry bearing the name of the Epistle, and is modelled on those pieces of Horace which are almost essays (sermones) on moral or philosophical subjects, and are chiefly distinguished from other poems by being addressed to particular patrons or friends. The epistle of Horace to his agent (or villicus) is of a more familiar order, and is at once a masterpiece and a model of what an epistle should be. Examples of the work in this direction of Ovid, Claudian, Ausonius and other late Latin poets have been preserved, but it is particularly those of Horace which have given this character to the epistles in verse which form so very characteristic a section of French poetry. The graceful precision and dignified familiarity of the epistle are particularly attractive to the temperament of France. Clement Marot, in the 16th century, first made the epistle popular in France, with his brief and spirited specimens. We possess the witty epistles of Scarron and Voiture, to reach those of Boileau, whose epistles, twelve in number, are the classic examples of this form of verse in French literature; they were composed at different dates between 1668 and 1695. In the 18th century Voltaire enjoyed a supremacy in this graceful and sparkling species of writing; the Épitre à Uranie is perhaps the most famous of his verse-letters. Gesset, Bernis, Sedaine, Dorat, Gentil-Bernard, all excelled in the epistle. The curious Épitres of J. P. G. Viennet (1777–1886) were not easy and mundane like their predecessors, but violently polemical.

Viennet, a hot defender of lost causes, may be considered the latest of the epistolary poets of French literature.

In England the verse-epistle was first prominently employed by Samuel Daniel in his “Letter from Octavia to Marcus Antonius” (1596), and later, on, more legitimately, in his “Certain Epistles” (1601–1603). His letter, in terza rima, to Lucy, Countess of Bristol, is one of the finest examples of this form in English literature. It was Daniel’s deliberate intention to introduce the Epistle into English poetry, “after the manner of Horace.” He was supported by Ben Jonson, who has some fine Horatian epistles in his Forests (1616) and his Underwoods. Letters to Several Persons of Honour form an important section in the poetry of John Donne. Habington’s Epistle to a Friend and the pieces of Vanbrugh and Gay, among the epistles of Pope, have been so much admired that van der Goes (1648–1703) addressed a fine epistolary poem to the French romance-writer Gombault (1570–1666). Such “letters” were not unfrequent down to the Restoration, but they did not create a department of literature such as Daniel had proposed. At the close of the 17th century Dryden greatly excelled in this class of poetry, and his epistles to Congreve (1694) and to the Duchess of Ormond (1700) are among the most graceful and eloquent that we possess. During the age of Anne various Augustan poets in whom the lyrical faculty was slight, from Congreve and Richard Duke down to Ambrose Philips and William Somerville, essayed the epistle with more or less success, and it was employed by Gay for several exercises in his elegant persoissance. Among the epistles of Gay, one rises above the rest—though Mr. Pope’s “world from Greece,” written in 1720. But the great writer of epistles in English is Pope himself, to whom the glory of this kind of verse belongs. His “Eloisa to Abelard” (1717) is carefully modelled on the form of Ovid’s “Heroides,” while in his Moral Essays he adopts the Horatian formula for the epistle. In either case his success was brilliant and complete. The Epistle to Dr Arbuthnot has not been surpassed, if it has been equalled, in Latin or French poetry of the same class. But Pope excelled, not only in the volupuctuous and in the didactic epistle, but in that of compliment as well, and there is no more graceful example of this in literature than is afforded by the letter about the poems of Parnell addressed, in 1721, to Robert, Earl of Oxford. After the day of Pope the epistle again fell into desuetude, or occasional use, in England. It revived in
the charming nalvéte of Cowper’s lyrical letters in octosyllabics to his friends, such as William Bull and Lady Austin (1782). At the close of the century Samuel Rogers endeavoured to reproduce the neglected form in his Epistle to a Friend" (1798). The formality and conventional grace of the epistle were elements with which the leaders of romantic revival were not out of sympathy, and it was not cultivated to any important degree in the 19th century. It is, however, to be noted that Shelley’s “Letter to Maria Gisborne” (1820), Keats’s “Epistle to Charles Clarke” (1819), and Landor’s “To Julius Hare” (1836), in spite of their romantic colouring, are genuine Horatian epistles and of the pure Augustan type. This type, in English literature, is commonly, though not at all universally, cast in heroic verse. But Daniel employs rime royal and terza rima, while some modern epistles have been cast in short iambic rhymed measures or in blank verse. It is sometimes not easy to distinguish the epistle from the elegy and from the dedication.

For St Paul’s Epistles see Paul, for St Peter’s see Peter, for Apocryphal Epistles see APOCRYPHAL LITERATURE, for Plato’s see Plato, &c.

EPISTYLE (Gr. εpιστυλός, στυλος, the column), the Greek architectural term for architrave, the lower member of the entablature of the classic orders (q.v.).

EPISTYLIS (C. G. Ehrenberg), in zoology, a genus of peritrichous Infusoria with a short oral disc and collar, and a rigid stalk, often branching to form a colony.

EPITAPH (Gr. επιτάφιον, ὑπάρχος, from επιτάφος, a tomb), strictly, an inscription upon a tomb, though by a natural extension of usage the name is applied to anything written ostensibly for that purpose whether actually inscribed upon a tomb or not. When the word was introduced into English in the 14th century it took the form epitaphy, as well as epitaphe, which latter word is used both by Gower and Lydgate. Many of the best-known epitaphs, both ancient and modern, are merely literary memorials, and find no place on sepulchral monuments. Sometimes the intention of the writer to have his production placed upon the grave of the person he has commemorated may have been frustrated, sometimes it may never have existed; what he has written is still entitled to be called an epitaph if it be suitable for the purpose, whether the purpose has been carried out or not. The most obvious external condition that suitability for mural inscription imposes is one of rigid limitation as to length. An epitaph must express the nature of things extend to the proportions that may be required in an elegy. The desire to perpetuate the memory of the dead being natural to man, the practice of placing epitaphs upon their graves has been common among all nations and in all ages. And the similarity, amounting sometimes almost to identity, of thought and expression that often exists between epitaphs written more than two thousand years ago and epitaphs written only yesterday is as striking an evidence as literature affords of the close kinship of human nature under the most varying conditions where the same primary elemental feelings are stirred. The grief and hope of the Roman mother as expressed in the touching lines—

"Lagge fili bene quiescas; Moser tua roget te; Ut me ad te recipias: Vale!"

find their echo in similar inscriptions in many a modern cemetery. Probably the earliest epitaphical inscriptions that have come down to us are those of the ancient Egyptians, written, as their mode of sepulture necessitated, upon the sarcophagi and coffins. Those that have been deciphered are all very much in the same form, commencing with a prayer to a deity, generally Osiris or Anubis on behalf of the deceased, whose name, descent and office are usually specified. There is, however, no attempt to delineate individual character, and the feelings of the survivors are not expressed otherwise than in the fact of a prayer being offered. Ancient Greek epitaphs, unlike the Egyptian, are of great literary interest, deep and often tender in feeling, rich and varied in expression, and generally epigrammatic in form. They are written usually in elegiac verse, though many of the later epitaphs are in prosé. Among the gems of the Greek anthology familiar to English readers through translations are the epitaphs upon those who had fallen in battle. There are several ascribed to Simonides on the heroes of Thermopylae, of which the most celebrated is the epitaph—

"Go tell the Spartans, thou that passest by, that here obedient to her iron law,
A hymn of Simonides on the same subject contains some lines of great beauty in praise of those who were buried at Thermopylae, and these may be regarded as forming a literary epitaph. In Sparta epitaphs were inscribed only upon the graves of those who had been especially distinguished in war; in Athens they were applied more indiscriminately. They generally contained the name, the descent, the deme, and some account of the life of the person commemorated. It must be remembered, however, that many of the so-called Greek epitaphs are merely literary memorials not intended for monumental inscription, and that in these freer scope is naturally given to general reflections, while less attention is paid to biographical details. Many of them, even some of the monumental, do not contain any personal name, as in the one ascribed to Plato—

"I am a shipwrecked sailor’s tomb; a peasant’s there doth stand: Thus the same world of Hades lies beneath both sea and land."

Others again are so entirely of the nature of general reflections upon death that they contain no indication of the particular case that called them forth. It may be questioned, indeed, whether several of this character quoted in ordinary collections are epitaphs at all, in the sense of being intended for a particular occasion.

Roman epitaphs, in contrast to those of the Greeks, contained, as a rule, nothing beyond a record of facts. The inscriptions on the urns, of which numerous specimens are to be found in the British Museum, present but little variation. The letters D.M. or D.M.S. (Dis Manibus or Dis Manibus Sacrum) are followed by the name of the person whose ashes are enclosed, his age at death, and sometimes one or two other particulars. The inscription closes with the name of the person who caused the urn to be made, and his relationship to the deceased. It is a curious illustration of the survival of traces of an old faith after it has been formally discarded to find that the letters D.M. are not uncommon on the Christian inscriptions in the catacombs. It has been suggested that in his case the meaning of the word Maximo and not Dis Manibus, but the explanation would be quite unanswerable even if there were not many other undeniable instances of the survival of pagan superstitions in the thought and life of the early Christians. In these very catacomb inscriptions there are many illustrations to be found, apart from the use of the letters D.M., of the union of heathen with Christian sentiment, (see Maitland’s Church in the Catacombs). The private burial-places for the ashes of the dead were usually by the side of the various roads leading into Rome, the Via Appia, the Via Flaminia, &c. The traveller to or from the city thus passed for miles an almost uninterrupted succession of tombs, whose inscriptions usually began with the appropriate words Stitie Vitator or Aspice Vitator, the origin doubtless of the "Stop Passenger," which still meets the eye in many parish churchyards of Britain. Another phrase of very common occurrence on ancient Roman tombs, Sit tibi terra levis ("Light lie the earth upon thee"), has continued in frequent use, as conveying an appropriate sentiment, down to modern times. A remarkable feature of many of the Roman epitaphs was the terrible denunciation often pronounced upon those who violated the sepulchre. Such denunciations were not uncommon in later times. A well-known instance is furnished in the lines on Shakespeare’s tomb at Stratford-on-Avon, said to have been written by the poet himself—

"Good friend, for Jesus’ sake forebear
to dig the dust encloseth ear;
Blest be y’ man y’ spares thos stones,
And curt be he y’ moves my bones."

The earliest existing British epitaphs belonged to the Roman period, and are written in Latin after the Roman form. Specimens are to be seen in various antiquarian museums throughout
the country; some of the inscriptions are given in Bruce's Roman Wall, and the seventh volume of the Corpus inscriptionum Latinarum edited by Hübner, containing the British inscriptions, is a valuable repository for the earlier Roman epitaphs in Britain. The earliest, of course, are commemorative of soldiers, belonging to the legions of occupation, but the Roman form was afterwards adopted for native Britons. Long after the Roman form was discarded, the Latin language continued to be used, especially for inscriptions of a more public character, as being from its supposed permanence the most suitable medium of communication to distant ages. It is only, in fact, within recent years that Latin has become unusual, and the more natural practice has been adopted of writing the epitaphs of distinguished men in the language of the country in which they lived. While Latin was the chief if not the sole literary language, it, was, as a matter of course, almost exclusively used for epitaphial inscriptions. The comparatively few English epitaphs that remain of the 11th and 12th centuries are all in Latin. They are generally confined to a mere statement of the name and rank of the deceased following the words "Hic jacet." Two noteworthy exceptions to this general brevity are, however, to be found in most of the collections. One is the epitaph to Gundreda, daughter of the Conqueror (d. 1059), which still exists at Lewes, though in an imperfect state, two of the lines having been lost; another is that to William de Warren, earl of Surrey (d. 1089), believed to have been inscribed in the abbey of St Pancras, near Lewes, founded by him. Both are encomiastic, and describe the character and work of the deceased with considerable fulness and beauty of expression. They are written in Leonine verse. In the 13th century French began to be used in writing epitaphs, and most of the inscriptions to celebrated historical personages between 1200 and 1400 are in that language. Mention may be made of those to Robert, the 3rd earl of Oxford (d. 1221), as given in Weever, to Henry III. (d. 1272) at Westminster Abbey, and to Edward the Black Prince (d. 1376) at Canterbury. In most of the inscriptions of this period the deceased addresses the reader in the first person, describes his rank and position while alive, and, as in the case of the Black Prince, contrasts it with his wasted and loathsome state in the grave, and warns the reader to prepare for the same inevitable change. The epitaph almost invariably closes with a request, sometimes very urgently worded, for the prayers of the reader that the soul of the deceased may pass to glory, and an invocation of blessing, general or specific, upon all who comply. Epitaphs preserved much of the same character after English began to be used towards the close of the 14th century. The following, to a member of the Savile family at Thornhill, is probably even earlier, though its precise date cannot be fixed:

"Bonya emongg stony lyf ful steyl gwyllst the savle wan
ders were that God wyleth "

that is, Bones among stones lie full still, whilst the soul wanders whiter God willeth. It may be noted here that the majority of the inscriptions, Latin and English, from 1300 to the period of the Reformation, that have been preserved, are upon brasses (see BRASSES, MONUMENTAL). The very curious epitaph on St Bernard, probably written by a monk of Clairvaux, has the peculiarity of being a dialogue in Latin verse. It was in the reign of Elizabeth that epitaphs in English began to assume a distinct literary character and value, entitling them to rank with those that had hitherto been composed in Latin. We learn from Nash that at the close of the 16th century it had become a trade to supply epitaphs in English verse. There is one on the dowager countess of Pembroke (d. 1621), remarkable for its successful use of a somewhat daring hyperbole. It was written by William Browne, author of Britannia's Pastorals:

"Underneath this sable hearse
Lies the subject of all verse;
Sydney's sister, Pembroke's mother;
Death, ere thou slayest thee,
Fair and learned and good as she,
Time will throw his dart at thee.
Marble piles let no man raise
To her name for after days;"

Some kind woman, born as she,
Reading this, like Niobe,
Shall turn marble, and become
Both her mourner and her tomb."

If there be something of the exaggeration of a conceit in the second stanza, it need scarcely be pointed out that epitaphs, like every other form of composition, mirror the literary characteristics of the age in which they were written. The deprecation of marble as unnecessary suggests one of the finest literary epitaphs in the English language, that by Milton upon Shakespeare.

The epitaphs of Pope are still considered to possess very great literary merit, though they were rated higher by Johnson and critics of his period than they are now.

Dr Johnson, who thought so highly of Pope's epitaphs, was himself a great authority on both the theory and practice of this species of composition. His essay on epitaphs is one of the few existing monographs on the subject, and his opinion as to the use of Latin had great influence. The manner in which he met the deliberately insinuated request of a number of eminent men that English should be employed in the case of Oliver Goldsmith was characteristic, and showed the strength of his conviction on the subject. His arguments in favour of Latin were chiefly drawn from its inherent fitness for epitaphial inscriptions and its classical stability. The first of these has a very considerable force, it being admitted on all hands that few languages are in themselves so suitable for the purpose; the second is outweighed by considerations that had considerable force in Dr Johnson's time, and have acquired more since. Even to the learned Latin is no longer the language of daily thought and life as it was at the period of the Reformation, and the great body of those who may fairly claim to be called the well-educated classes can only read it with difficulty, if at all. It seems, therefore, little less than absurd, for the sake of a stability which is itself in great part delusive, to write epitaphs in a language unintelligible to the vast majority of those for whose information presumably they are intended. Though a stickler for Latin, Dr Johnson wrote some very beautiful English epitaphs, as, for example, the following on Philips, a musician:

"Philips, whose touch harmonious could remove
The pangs of guilty power or hapless love;
Rest here, distressed and disconsol'd
Here find that calm thou gav'st so oft before;
Sleep undisturbed within this peaceful shrine
Till angels wake thee with a note like thine!"

In classifying epitaphs various principles of division may be adopted. Arranged according to nationality they indicate distinctions of race less clearly perhaps than any other form of literature does,—and this obviously because when under the influence of the deepest feeling men think and speak very much in the same way whatever be their country. At the same time the influence of nationality may to some extent be traced in epitaphs. The characteristics of the French style, its grace, clearness, wit and epigrammatic point, are all recognizable in French epitaphs. In the 16th century those of Étienne Pasquier were universally admired. Instances such as "La première au rendez-vous," inscribed on the grave of a mother, Piron's epitaph, written for himself after his rejection by the French Academy—

"Ci-git Piron, qui ne fut rien,
Mais a cette académie,
Et un reléve, dont qui a été bien
Pour son repos et pour le mien"

might be multiplied indefinitely. One can hardly look through a collection of English epitaphs without being struck with the fact that these represent a greater variety of intellectual and emotional states than those of any other nation, ranging through every style of thought from the sublime to the commonplace, every mood of feeling from the most delicate and touching to the coarse and even brutal. Few subordinate illustrations of the complex nature of the English nationality are more striking.

Epitaphs are sometimes classified according to their authorship and sometimes according to their subject, but neither division
is so interesting as that which arranges them according to their characteristic features. What has just been said of English epitaphs is, of course, more true of epitaphs generally. They exemplify every variety of sentiment and taste, from lofty pathos and dignified eulogy to coarse burlesquetry and the vilest scurrility. The extent to which the humorous and even the low comic element prevails is among the most noteworthy circumstances.

It is probable that the most solemn of all subjects should have been frequently treated, intentionally or unintentionally, in a style so ludicrous that a collection of epitaphs is generally one of the most amusing books that can be picked up. In this as in other cases, too, it is to be observed that the unintended humour is generally of a much more entertaining kind than that which has been deliberately perpetrated.

EPITHALAMUM (Gr. ἐπιθαλάμιον, at or upon, and θάλαμος, a nuptial chamber), originally among the Greeks a song in praise of bride and bridegroom, which was sung by a number of boys and girls at the door of the nuptial chamber. According to the scholiast on Theocritus, one form, the κατακαμαμπῖκιν, was employed at night, and another, the δικερπῖκιν, to arouse the bride and bridegroom on the following morning. In either case, as was natural, the main burden of the song consisted of invitations of blessing and predictions of happiness, interrupted from time to time by the ancient chorus of Ἰφύμοντινον. Among the Romans a similar custom was in vogue, but the song was sung by girls only after the marriage ceremony, and it contained much more of what modern morality would condemn as obscene. In the hands of the poets the epithalamium was developed into a special literary form, and received considerable cultivation.

Sappho, Anacreon, Stesichorus and Pindar are all regarded as masters of the species, but the finest example preserved in Greek literature is the 8th Idyll of Theocritus, which celebrates the marriage of Menelaeus and Helen. In Latin, the epithalamium, imitated from Hesychinae Greek models, was a base form of literature, when Catullus redeemed it and gave it dignity by modelling his Marriage of Thoias and Peleus on a lost ode of Sappho. In later times Statius, Ausonius, Sidonius Apollinaris and Claudian are the authors of the best-known epithalami in classical Latin; and they have been imitated by Buchanan, Scaliger, Sannazar, and a whole host of modern Latin poets, with whom, indeed, the form was at one time in great favour.

The names of Rosand, Malherbe and Scarron are especially associated with the species in French literature, and Marinii and Metastasio in Italian. Perhaps no poem of this class has been more universally admired than the Epithalamium of Spenser (1593), though he has found no unworthy rivals in Ben Jonson, Donne and Quarles. At the close of In Memoriam Tennyson has inscribed a poem on the nuptials of his sister, which is strictly an epithalamium.

EPITHELIAL, ENDOTHELIAL and GLANDULAR TISSUES, in anatomy. Every surface of the body which may come into contact with foreign substances is covered with a protecting layer of cells closely bound to one another to form continuous sheets. These are epithelial cells (from ἐπιθήλαμον, a nipple). By the formation of outgrowths or in-growths from these surface structures, consisting largely or entirely of cells directly derived from the surface epithelium, may be formed. In this way originate the central nervous system, the sensitive surfaces of the special sense organs, the glands, and the hair, nails, &c. The epithelial cells possess typical microscopical characters which enable them to be readily distinguished from all others. Thus the cell outline is clearly marked, the nucleus large and spherical or ellipsoidal. The protoplasm of the cell is usually large in amount and often contains large numbers of granules.

The individual cells forming an epithelial membrane are classified according to their shape. Thus we find flattened, or squamous, cubical, columnar, irregular, ciliated or flagellated cells. Many of the membranes formed by these cells are only one cell thick, as for instance is the case for the major part of the alimentary canal. In other instances the epithelial membrane may consist of a number of layers of cells, as in the case of the epidermis of the skin. Considering in the first place those membranes of which the cells are in a single layer we may distinguish the following——

1. Columnar Epithelium (figs. 1 and 2).—This variety covers the main part of the intestinal tract, i.e. from the end of the oesophagus to the commencement of the rectum. It is also found lining the ducts of many glands. In a highly typical form it is found covering the villi of the small intestine (fig. 1). The external layer of the cell is commonly modified to form a thin membrane showing a number of very fine radially arranged lines, which are probably the expression of very minute tubular perforations through the membrane.

The close apposition of these cells to form a closed membrane is well seen when a surface covered by them is examined from above (fig. 3). The surfaces of the cells are then seen to form a mosaic, each cell area having a polyhedral shape.

2. Cubical Epithelium.—This differs from the former in that the cells are less in height. It is found in many glands and ducts (e.g. the kidney), in the middle ear, choroid plexuses of the brain, &c.

3. Squamous or Flattened Epithelium (fig. 4).—In this variety the cell is flattened, very thin and irregular in outline. It occurs as the covering epithelium of the alveoli of the lung, of the kidney glomeruli and capsule, &c. The surface epithelial cells of a stratified epithelium are also of this type (fig. 4). Closely resembling these cells are those known as endothelial (see later).

4. Ciliated Epithelium (fig. 5).—The surface cells of many epithelial membranes are often provided with a number of cilia on their free surface. These are the cilia of the trachea, bronchi, parts of the nasal cavities and the

---
uterus, oviduct, vas deferens, epididymis, a portion of the renal tubule, &c.

In the instance of some cells there may be but a single process from the exposed surface of the cell, and then the process is usually of large size and length. It is then known as a flagellum. Such cells are common among the surface cells of many of the simple animal organisms.

When the cells of an epithelial surface are arranged several layers deep, we can again distinguish various types:

1. Stratified Epithelium (figs. 6 and 7).—This is found in the epithelium of the skin and of many mucous membranes (mouth, oesophagus, rectum, conjunctiva, vagina, &c.). Here the surface cells are very much flattened (squamous epithelium), those of the middle layer are polyhedral and those of the lower layer are cubical or columnar. This type of epithelium is found covering surfaces commonly exposed to friction. The surface may be dry as in the skin, or moist, e.g. the mouth. The surface cells are constantly being rubbed off, and are then replaced by new cells growing up from below. Hence the deepest layer, that nearest the blood supply, is a formative layer, and in successive stages from this we can trace the gradual transformation of these protoplasmic cells into scaly cells, which no longer show any sign of being alive. In the moist mucous surfaces the number of cells forming the epithelial layer is usually much smaller than in a dry stratified epithelium.

2. Stratified Ciliated Epithelium.—In this variety the superficial cells are ciliated and columnar, between the bases of these are found fusiform cells and the lowest cells are cubical or pyramidal. This epithelium is found lining parts of the respiratory passages, the vas deferens and the epididymis.

3. Transitional Epithelium (fig. 8).—This variety of epithelium is found lining the bladder, and the appearance observed depends upon the contracted or distended state of the bladder from which the preparation was made. If the bladder was contracted the form seen in fig. 8 is obtained. The epithelium is in three or more layers, the superficial one being very characteristic. The cells are cubical and fit over the rounded ends of the cells of the next layer. These are pear-shaped, the points of the pear resting on the basement membrane. Between the bases of these cells lie those of the lowermost layer. These are irregularly columnar. If the bladder is distended before the preparation is made, the cells are then found stretched out transversely. This is especially the case with the surface cells, which may then become very flattened.

Considering epithelium from the point of view of function, it may be classified as protective, absorptive or secretory. It may produce special outgrowths for protective or ornamental purposes, such as hairs, nails, horns, &c., and for such purposes it may manufacture within itself chemical material best suited for that purpose, e.g. keratin; here the whole cell becomes modified. In other instances may be seen in the interior of the cells many chemical substances which indicate the nature of their work, e.g. fat droplets, granules of various kinds, protein, mucin, watery granules, glycogen, &c. In a typical absorbing cell granules of material being absorbed may be seen. A secreting cell of normal type forming specific substances stores these in its interior until wanted, e.g. fat as in sebaceous and mammary glands, ferment precursors (salivary, gastric glands, &c.), and various excretory substances, as in the renal epithelium.

Initially the epithelial cell might have all these functions, but later came specialization and therefore to most cells a specific work. Some of that work does not require the cell to be at the surface, while for other work this is indispensable, and hence when the surface becomes limited those of the former category are removed from the surface to the deeper parts. This is seen typically in secretory and excretory cells, which usually lie below the surface on to which they pour their secretions. If the secretion required at any one point is considerable, then the secreting cells are numerous in proportion and a typical gland is formed. The secretion is then conducted to the surface by a duct, and this duct is also lined with epithelium.

Glandular Tissues.—Every gland is formed by an ingrowth from an epithelial surface. This ingrowth may from the beginning possess a tubular structure, but in other instances may start as a solid column of cells which subsequently becomes tubulated. As growth proceeds, the column of cells may divide or give off offshoots, in which case a compound gland is formed. In many glands the number of branches is limited, in others (salivary, pancreas) a very large structure is finally formed by repeated growth and subdivision. As a rule the branches do not unite with one another, but in one instance, the liver, this does occur when a reticulated compound gland is produced. In compound glands the more typical or secretory epithelium is found forming the terminal portion of each branch, and the united portions form ducts and are lined with a less modified type of epithelial cell.

Glands are classified according to their shape. If the gland retains its shape as a tube throughout it is termed a tubular gland, simple tubular if there is no division (large intestine), compound tubular (fig. 9) if branching occurs (pyloric glands of stomach). In the simple tubular glands the gland may be coiled without losing its tubular form, e.g. in sweat glands. In the second main variety of gland the secretory portion is enlarged and the lumen variously increased in size. These are termed alveolar or saccular glands. They are again subdivided into simple or compound alveolar glands, as in the case of the tubular glands (fig. 10). A further complication in the case of the alveolar glands may occur in the form of still smaller saccular diverticuli growing out from the main sacculi (fig. 11). These are termed alveoli.

The typical secretory cells of the glands are found lining the...
terminal portions of the ramifications and extend upwards to varying degrees. Thus in a typical acinous gland the cells are restricted to the final alveoli. The remaining tubes are to be considered mainly as ducts. In tubulo-alveolar glands the secreting epithelium lines the alveus as well as the terminal tubules.

The gland cells are all placed upon a basement membrane. In many instances this membrane is formed of very thin flattened cells, in other instances it is apparently a homogeneous membrane, and according to some observers is simply a modified part of the basal surface of the cell, while according to others it is a definite structure distinct from the epithelium.

In the secretory portion of the gland and in the smaller ducts the epithelial layer is one cell thick only. In the larger ducts there are two layers of cells, but even here the surface cell usually extends by a thinned-out stalk down to the basement membrane.

The detailed characters of the epithelium of the different glands of the body are given in separate articles (see ALIMENTARY (CANA, &c.). It will be sufficient here to give the more general characters possessed by these cells. They are cubical or conical cells with distinct oval nuclei and granular protoplasm. Within the protoplasm is accumulated a large number of spherical granules arranged in diverse manners in different cells. The granules vary much in size in different glands, and in chemical composition, but in all cases represent a store of material ready to be discharged from the cell as its secretion. Hence the general appearance of the cell is found to vary according to the previous degree of activity of the cell. If it has been at rest for some time the cell contains very many granules which swell it out and increase its size. The nucleus is then largely hidden by the granules. In the opposite condition, i.e. when the cell has been actively secreting, the protoplasm is much clearer, the nucleus obvious and the cell shrunk in size, all these changes being due to the extrusion of the granules.

Endothelium and Mesothelium.—Lining the blood vessels, lymph vessels and lymph spaces are found flattened cells apposed to one another by their edges to form an extremely thin membrane. These cells are developed from the middle embryonic layer and are termed endothelium. A very similar type of cells is also found, formed into a very thin continuous sheet, lining the body-cavity, i.e. pleural pericardial and peritoneal cavities. These cells develop from that portion of the mesoderm known as the mesothelium, and are therefore frequently termed mesothelial, though by many they are also included as endothelial cells.

A mesothelial cell is very flattened, thus resembling a squamous epithelial cell. It possesses a protoplasm with faint granules and an oval or round nucleus (fig. 12). The outline of the cell is irregularly polygonal, and the borders may be finely serrated. The cells are united to one another by an intercellular cement substance which, however, is very scanty in amount, but can be made apparent by staining with silver nitrate when the appearance reproduced in the figure is seen. By being thus united together, the cells form a continuous layer. This layer is pierced by a number of small openings, known as stomata, which bring the cavity into direct communication with the lymph spaces or vessels lying beneath the membrane. The stomata are surrounded by a special layer of cubical and granular cells. Through these stomata fluids and other materials present in the body-cavity can be removed into the lymph spaces.

Endothelial membranes (fig. 13) are quite similar in structure to mesothelial. They are usually elongated cells of irregular outline and serrated borders.

By means of endothelial or mesothelial membranes the surfaces of the parts covered by them are rendered very smooth, so that movement over the surface is greatly facilitated. Thus the abdominal organs can glide easily over one another within the peritoneal cavity; the blood or lymph experiences the least amount of friction; or again the friction is reduced to a minimum between a tendon and its sheath or in the joint cavities. The cells forming these membranes also exhibit further physiological properties. Thus it is most probable that they play an active part in the blood capillaries in transmitting substances from the blood into the tissue spaces, or conversely in preventing the passage of materials from blood to tissue space or from tissue space to blood. Hence the fluid of the blood and that of the tissue space need not be of the same chemical composition.

EPITOME (Gr. ἐπίτομα, from ἐπιτίμομαι, to cut short), an abridgment, abstract or summary giving the salient points of a book, law case, &c., a short and concise account of any particular subject or event. By transference epitome is also used to express the representation of a larger thing, concrete or abstract, reproduced in miniature. Thus St Mark's was called by Ruskin the "epitome of Venice," as it embraces examples of all the periods of architecture from the 10th to the 19th centuries.

EPICHE (Gr. ἐπικῆ, holding in suspense, a pause, from ἐπικεῖσθαι, to hold up, to stop), a term for a stated period of time, and so used of a date accepted as the starting-point of an era or of a new period in chronology, such as the birth of Christ. It is hence transferred to a period which marks a great change, whether in the history of a country or a science, such as a great discovery or invention. Thus an event may be spoken of as "epoch-making." The word is also used, synonymously with "period," for any space of time marked by a distinctive condition or by a particular series of events.

In astronomy the word is used for a moment from which time is measured, or at which a definite relation of a body or a definite condition of a body occurs. For example, the position of a body moving in an orbit cannot be determined unless its position at some given time is known. The given time is then the epoch; but the term is often applied to the mean longitude of the body at the given time.

EPODE, in verse, the third part in an ode, which followed the strophe and the antistrophe, and completed the movement; it was called ἐπόδος περισσός by the Greeks. At a certain moment the choirs, which had chanted to right of the altar or stage and then to left of it, combined and sang in unison, or permitted the coryphaeus to sing for them all, standing in the centre. When, with the appearance of Stesichorus and the evolution of choral lyric, a learned and artificial kind of poetry began to be cultivated in Greece, a new form, the ἐπόδος ἐπικῆ, or epode-song, came into existence. It consisted of a verse of triglottic iambic, followed by a diereter iambic, and it is reported that, although the epode was carried to its highest perfection by Stesichorus, an earlier poet, Archilochus, was really the inventor of this form. The epode soon took a firm place in choral poetry, which it lost when that branch of literature declined. But it extended beyond the ode, and in the early dramatists we find numerous examples of monologues and dialogues framed on the epodeal system. In Latin poetry the epode was cultivated, in conscious archaism, both as a part of the ode and as an independent branch of poetry. Of the former class, the epithalamia of Catullus, founded on an imitation of Pindar, present us with an example of strophe, antistrophe and epode; and it has been observed that the celebrated ode of Horace, beginning Quem virum aut heroa lyra vel acer, possesses this triple character. But the word is now mainly familiar from an experiment of Horace in the second class, for he entitled his fifth book of odes Epoden liber or the Book of Epodes. He says in the course of these poems, that in composing them he was introducing a new form, at least in Latin literature, and that he was imitating the effect of the iambic distichs invented by Archilochus. Accordingly we find the first ten of these epodes.
composed in alternate verses of iambic trimeter and iambic
dimeter, thus:—

"At o Deorum quicquid in coelo regit.
Terras et humanum genus."

In the seven remaining epodes Horace has diversified the
measures, while retaining the general character of the distich.
This group of poems belongs in the main to the early youth of the
poet, and displays a truculence and a controversial heat which
are absent from his more mature writings. As he was imitating
Archilochus in form, he believed himself justified, no doubt, in
repeating the sarcastic violence of his fierce model. The curious
thing is that these particular poems of Horace, which are really
short lyrical satires, have appropriated almost exclusively the
name of epodes, although they bear little enough resemblance
to the genuine epode of early Greek literature.

EPONA, a goddess of horses, asses and mules, worshipped
by the Romans, though of foreign, probably Gallic, origin. The
majority of inscriptions and images bearing her name have been
found in Gaul, Germany and the Danube countries; of the
few that occur in Rome itself most were exhumed on the site of
the barracks of the equites singulares, a foreign imperial body-
guard mainly recruited from the Batavians. Her name does not
appear in Tertullian's list of the indigetes di, and Juvenal con-
trasts her worship with that of old Roman Numa's rituals.
Her cult does not appear to have been introduced before
imperial times, when she is often called Augusta and invoked
on behalf of the emperor and the imperial house. Her chief
function, however, was to see that the beasts of burden were
duly fed, and to protect them against accidents and malicious
influence. In the countries in which the worship of Epona was
said to have had its origin it was a common belief that certain
beings were in the habit of casting a spell over stables during
the night. The Romans used to place the image of the goddess,
crowned with flowers on festive occasions, in a sort of shrine in
the centre of the architrave of the stable. In art she is generally
represented seated, with her hand on the head of the accompanying
horse or animal.

See Tertullian, Apol. 16; Juvenal viii. 157; Prudentius, Apoth. 197; Apuleius, Metam. iii. 27; articles in Daremberg and Saglio's Dict. des antiquités and Pauly-Wissowa's Realencyclopädie.

EPONYMUS, that which gives a name to anything (Gr. ἐπωνύμος, from ὁ ὄνομα, a name), a term especially applied to the
mythical or semi-mythical personages, heroes, deities, &c, from
whom a country or city took its name. Thus Pelops is the giver
of the name to the Peloponnesian. At Athens the chief archon
of the year was known as the ἄρχον ἐπωνύμος, as the year was
known by his name. There was a similar official in ancient
Assyria. In ancient times, as in historical and modern cases,
a country or a city has been named after a real personage, but
in many cases the person has been invented to account for the
name. Tertullian, Apol. 16; Juvenal viii. 157; Prudentius, Apoth. 197; Apuleius, Metam. iii. 27; articles in Daremberg and Saglio's Dict. des antiquités and Pauly-Wissowa's Realencyclopädie.

EPPING, a market town in the Epping parliamentary division
of Essex, England, 17 m. N.N.E. from London by a branch of
the Great Eastern railway. Pop. of urban district (1901),
3289. The town lies high and picturesquely, at the northern
outskirts of Epping Forest. The modern church of St John
the Baptist replaces the old parish church of All Saints in the
village of Epping Upland 2 m. N.W. This is in part Norman.
There is considerable trade in butter, cheese and sausages.
Epping Forest forms part of the ancient Waltham Forest,
which covered the greater part of the county. All the "London
Basin," within which the Forest lies, was densely wooded.
The Forest became one of the comonable lands of Royal
Chases or hunting grounds. It was threatened with total
deforestation, when under the Epping Forest Act of 1871 a
board of commissioners was appointed for the better manage-
ment of the lands. The corporation of the city of London then
acquired the freehold interest of waste land belonging to the lords
of the manor, and finally secured 55593 acres, magnificently
timbered, to the use of the public for ever, the tract being
declared open by Queen Victoria in 1882. The Ancient Court
of Verderers was also revived, consisting of an hereditary lord
warden together with four verderers elected by freeholders of the
county. The present forest lies between the valleys of the Roding
and the Lea, and extends southward from Epping to the vicinity
of Woodford and Walthamstow, a distance of about 7 m. It is
readily accessible from the villages on its outskirts, such as
Woodford, Chingford and Loughton, which are served by branches
of the Great Eastern railway. These are centres of residential
districts, and, especially on public holidays in the summer,
receive large numbers of visitors.

EPPS, the name of an English family, well known in commerce
and medicine. In the second half of the 18th century they
had been settled near Ashford, Kent, for some generations, claiming
descent from an esquirey of Charles II., but were reduced in
circumstances, when John Epps rose to prosperity as a provision
merchant in London, and restored the family fortunes. He
had four sons, of whom John Epps (1805–1869), George
Napoleon Epps (1815–1874), and James Epps (1821–1907)
were notable men of their day, the two former as prominent
doctors who were ardent converts to homeopathy, and James
as a homeopathic chemist and the founder of the great cocoa
business associated with his name. Among Dr G. N. Epps's
children were Dr Washington Epps, a well-known homeopathist,
Lady Almada Epps, and Mrs Edmund Epps (Mrs EpemSNiL or EpérmSnIL), Jean Jacques
DUVAL D' (1745–1794), French magistrate and politician, was
born in India on the 5th of December 1745 at Pondicherry, his
city being a consulate of Duplex. Returning to France in 1759
he was educated in Paris for the law, and became in 1775
consulier in the parliament of Paris, where he soon distinguished
himself by his zealous defence of its rights against the royal
prerogative. He showed bitter enmity to Marie Antoinette in
the matter of the diamond necklace, and on the 10th of November
1787 he was the spokesman of the parliament in demanding
the convocation of the states-general. When the court retaliated
by an edict depriving the parliament of its functions, Épremsnil
bribed the printers to supply him with a copy before its pro-
clamation, and this he read to the assembled parliament. A
royal officer was sent to the palais de justice to arrest Épremsnil
and his chief supporter Golslard de Montsabert, but the parliment
(5th of May 1788) declared that they were all Épremsnls, and
the arrest was only effected on the next day on the voluntary
surrender of the two members. After four months' imprisonment
on the island of St Marguerite, Épremsnil found himself a
popular hero, and was returned to the states-general as deputy
of the nobility of the outlying districts of Paris. But with the
rapid advance towards revolution his views changed; in his
Réflexions impartiales . . . (January 1789) he defended the
monarchy, and he led the party among the nobility that refused
to meet with the third estate until summoned to do so by royal
commission. In the Cospitient Assembly he opposed every
step towards the destruction of the monarchy. After a narrow
escape from the fury of the Parisian populace in July 1792 he
was imprisoned in the Abbaye, but was set at liberty before the
September massacres. In September 1793, however, he was
arrested at Le Havre, taken to Paris, and denounced to the
Convention as an agent of Pitt. He was brought to trial before
the revolutionary tribunal on the 21st of April 1794, and was
guillotined the next day.

D'Épremsnil's speeches were collected in a small volume in 1832.
See also H. Carré, Un Précurseur inconscient de la Révolution (Paris, 1897).

EPSOM, a market town in the Epsom parliamentary division
of urban district (1901), 16,915. It is served by the London &
South-Western and the London, Brighton & South Coast railways,
and on the racecourse on the neighbouring Downs there is a
station (Tattenham Corner) of the South-Eastern & Chatham
railway. The principal building is the parish church of St
Martin, a good example of modern Gothic, the interior of which
contains some fine sculptures by Flaxman and Chantrey. Epsom
(a contraction of Ebbisham, still the name of the manor) first
came into notice when mineral springs were discovered there

708
about 1618. For some time after their discovery the town enjoyed a wonderful degree of prosperity. After the Restoration it was often visited by Charles II., and when Queen Anne came to the throne her husband, Prince George of Denmark, made it his frequent resort. Epsom gradually lost its celebrity as a spa, but the annual races held on its downs arrested the decay of the town. Races appear to have been established here as early as James I’s residence at Nonsuch, but they did not assume a permanent character until 1730. The principal races—the Derby and Oaks—are named after one of the ears of Derby and his seat, the Oaks, which is in the neighbourhood. The latter race was established in 1779, and the former in the following year. The spring races are held on a Thursday and Friday towards the close of April; and the great Epsom meeting takes place the following Friday and three following days immediately before Whitsunday. The Derby and Oaks were excepted on the Oaks on the Friday (see HORSE-RACING). The grand stand was erected in 1829, and subsequently enlarged; and there are numerous training stables in the vicinity. Close to the town are the extensive buildings of the Royal Medical Benevolent College, commonly called Epsom College, founded in 1855. Scholars on the foundation must be the sons of medical men, but in other respects the school is open. In the neighbourhood is the Durdans, a seat of the earl of Rosebery.

**Epsom Salts**, heptahydrated magnesium sulphate, MgSO₄·7H₂O, the magnesia sulphas of pharmacy (Ger. Bitter salis), is used, especially in neutral and in mineral waters, especially in those at Epsom (from which place it takes its name). Seidlitz, Saidischutz and Pullna. It also occurs in nature in fibrous excrescences, constituting the mineral epsomite or hair-salt; and as compact masses (reichardite), as in the Stassfurt mines. It is also found associated with limestone, in the Mammoth Caves, Kentucky, and with gypsum, as at Montmartre. Epsom salts crystallizes in the orthorhombic system, being isomorphous with the corresponding zinc and nickel sulphates, and also with magnesium chromate. Occasionally monoclinic crystals are obtained by crystallizing from a strong solution. It is used in the arts for weighting cotton fabrics, as a top-dressing for clover hay in agriculture, and in dyeing. In medicine it is frequently employed as a hydrogogre purgative, specially valuable in febrile diseases, in congestion of the portal system, and in the obstinate constipation of painters’ colic. In the last case it is combined with potassium iodide, the two salts being exceedingly effective in causing the elimination of lead from the system. It is also very useful as a supplement to mercury, which needs a saline aperient to complete its action. The salt should be given a few hours after the mercury, e.g. in the early morning, the mercury having been given at night. It possesses the advantage of exercising but little irritant effect upon the bowels. Its nauseous bitter taste may be some except be concealed by acidifying the solution with dilute sulphuric acid, and in some cases where full doses have failed the repeated administration of small ones has proved effectual.

For the manufacture of Epsom salts and for other hydrated magnesium sulphates see **Magnesium**.

**Equation** (from Lat. aequatio, aequare, to equalize), an expression or statement of the equality of two quantities. Mathematical equivalence is denoted by the sign =, a symbol invented by Robert Recorde (1510–1558), who considered that nothing could be more equal than two equal and parallel straight lines. An equation states an equality existing between two classes of quantities, distinguished as known and unknown; these correspond to the data of a problem and the thing sought. It is the purpose of the mathematician to state the unknowns separately in terms of the knowns; this is called solving the equation, and the values of the unknowns so obtained are called the roots or solutions. The unknowns are usually denoted by the terminal letters, ... x, y, z, of the alphabet, and the knowns are either actual numbers or are represented by the literals a, b, c, &c., i.e. the introductory letters of the alphabet. Any number or literal which expresses what multiple of term occurs in an equation is called the coefficient of that term; and the term which does not contain an unknown is called the absolute term. The degree of an equation is equal to the greatest index of an unknown in the equation, or to the greatest sum of the indices of products of unknowns. If each term has the sum of its indices the same, the equation is said to be homogeneous. These definitions are exemplified in the equations:

\[(1) \ a^2 + b^2 + c = 0, \]
\[(2) \ x^2 + 4x + 8a^3, \]
\[(3) \ a^2 + b^2 + c = 0. \]

In (1) the unknown is x, and the knowns a, b, c; the coefficients of x² and x are a and b; the absolute term is c, and the degree is 2. In (2) the unknowns are x and y, and the known a; the degree is 3, i.e. the sum of the indices in the term xy³. (3) is a homogeneous equation of the second degree in x and y. Equations of places of the second degree are called quadratic equations, of the second, **quadratic**, of the third, cubical; of the fourth, **biquadratic** of the fifth, quintic, and so on. Of equations containing only one unknown the number of roots equals the degree of the equation; thus a simple equation has one root, a quadratic two, a cubic three, and so on. If one equation be given containing two unknowns, as for example ax + by = c or ax² + by² = c, it is seen that there are an infinite number of roots, for we can give x, say, any value and then determine the corresponding value of y; such an equation is called **indeterminate**; of the examples chosen the first is a linear and the second a quadratic indeterminate equation. If, on the other hand, we have two equations connecting two unknowns, it is possible to solve the equations separately for one unknown, and then if we equate these values we obtain an equation in one unknown, which is soluble if its degree does not exceed the fourth. By substituting these values the corresponding values of the other unknown are determined. Such equations are called **simultaneous**; and a simultaneous system is a series of equations equal in number to the number of unknowns. Such a system is not always soluble, for it may happen that one equation is implied by the others; when this occurs the system is called **permutations** or **permutation**. An identity differs from an equation inasmuch as it cannot be solved, the terms mutually cancelling; for example, the expression \(x^2 - a^2 = (x-a)(x+a)\) is an identity, for on reduction it gives \(a = 0\). It is usual to employ the sign = to express this relation.

An equation admits of description in two ways:—(1) It may be regarded purely as an algebraic expression, or (2) as a geometrical locus. The first case is the more obvious and does not require a separate statement; the second case is the more general, and the study of the theory of equations involves the solution of the problem of finding the geometrical figure corresponding to an equation. If, however, that by the introduction of appropriate hyperspaces, i.e. of degree equal to the number of unknowns, any equation theoretically admits of geometrical visualization, in other words, every equation may be represented by a geometrical figure and every geometrical figure by an equation. Corresponding to these two aspects, there are two typical methods by which equations can be solved, viz. the algebraic and geometric. The former leads to exact results, or, by methods of approximation, to results correct to any required degree of accuracy. The latter can only yield approximate values; when theoretically exact constructions are available there is a source of error, and this is the difference between the two methods. However, all equations are not solvable, and the accuracy of the results is more problematical. The geometric aspect, however, is of considerable value in discussing the theory of equations.

**History.**—There is little doubt that the earliest solutions of equations are given in the Rhind papyrus, a hieratic document written some 2000 years before our era. The problems solved were of an arithmetical nature, assuming such forms as "a mass and its 1/4 makes 79." Calling the unknown mass \(x\), we have given \(x + \frac{x}{4} = 19\), which is a simple equation. Mathematical problems also gave origin to equations involving two unknowns; the early Greeks were familiar with and solved simultaneous linear equations, but indeterminate equations, such, for instance, as the system given in the "cattle problem" of Archimedes, were not seriously studied until Diophantus solved many particular problems. Quadratic equations arose in the Greek investigations in the doctrine of proportion, and
although they were presented and solved in a geometrical form, the methods employed have no relation to the generalized conception of algebraic geometry which represents a curve by an equation and vice versa. The simplest quadratic arose in the construction of a mean proportional (z) between two lines (a, b), or in the construction of a square equal to a given rectangle; for we have the proportionation \( ax/z = x; b = \) a more general equation, viz. \( x^2 - ax + b = 0 \), this is the algebraic equivalent of the problem to divide a line in medial section; this is solved in Euclid, ii. 11. It is possible that Diophantus was in possession of an algebraic solution of quadratics; he recognized, however, only one root, the interpretation of both being first effected by the Hindu Bhaskara. A simple cubic equation was presented in the problem of finding two mean proportions, x, y, between two lines, one double the other. We have \( ax^2 + bx + c = 0 \), which gives \( x^2 = ay \) and \( x^2 = 2a \); eliminating y we obtain \( x^2 = 2a \), a simple cubic. The Greeks could not solve this equation, which also arose in the problems of duplicating a cube and trisecting an angle, by the ruler and compasses, but only by mechanical curves such as the conchoid, conchoid and quadratrix. Such solutions were much improved by the Arabs, who also solved both cubics and biquadratics by means of intersecting conics; at the same time, they developed methods, originated by Diophantus and improved by the Hindus, for finding approximate roots of numerical equations by algebraic processes. The algebraic solution of the general cubic and biquadratic was effected in the 16th century by S. Ferro, N. Tartaglia, H. Cardan and L. Ferrari (see Algebra: History). Many fruitless attempts were made to solve algebraically the quintic equation until P. Ruffini and N. H. Abel proved the problem to be impossible; a solution involving elliptic functions has been given by C. Hermite and H. Kronecker, while F. Klein has given another solution.

In the geometric treatment of equations the Greeks and Arabs based their constructions upon certain empirically deduced properties of the curves and figures employed. Knowing various metrical relations, generally expressed as proportions, it was found possible to solve particular equations, but a general method was wanting. This lacuna was not filled until the 17th century, when Descartes discovered the general theory which explained the nature of such solutions, in particular those wherein conics were employed, and, in addition, established the most important facts that every equation represents a geometrical locus, and conversely. To represent equations containing two unknowns, x, y, we chose two axes of reference mutually perpendicular, and measured x along the horizontal axis and y along the vertical. The point of intersection of the two lines x = a and y = b is the solution of the equation. Analytical, he showed that — (1) a linear equation represents a straight line, and (2) a quadratic represents a conic. If the equation be homogeneous or break up into factors, it represents a number of straight lines in the first case, and the loci corresponding to the factors in the second. The solution of simultaneous equations is easily seen to be the values of x, y corresponding to the intersections of the loci. It follows that there is only one value of x, y which satisfies two linear equations, since two lines intersect in one point only; two values which satisfy a linear and quadratic, since a line intersects a conic in two points; and four values which satisfy two quadratics, since two conics intersect in four points. It may happen that the curves do not actually intersect in the theoretical maximum number of points; the principle of continuity (see Geometrical Continuity) shows us then in such cases some of the roots are imaginary. To represent equations involving three unknowns x, y, z, a third axis is introduced, the z-axis, perpendicular to the plane xy and passing through the intersection of the lines x, y. In this notation a linear equation represents a plane, and two linear simultaneous equations represent a line, i.e. the intersection of two planes; a quadratic equation represents a surface of the second degree. In order to graphically consider equations containing only one unknown, it is convenient to equate the terms to y; i.e. if the equation is \( f(x) = 0 \), we take \( y = f(x) \) and construct this curve on a rectangular Cartesian co-ordinates by determining the values of y which correspond to chosen values of x, and describing a curve through the points so obtained. The intersections of the curve with the axis of x gives the real roots of the equation; imaginary roots are obviously not represented.

In this article we shall treat of: (1) Simultaneous equations, (2) indeterminate equations, (3) cubic equations, (4) biquadratic equations, (5) theory of equations. Simple, linear simultaneous and quadratic equations are treated in the article Algebra; for differential equations see Differential Equations.

I. Simultaneous Equations.

Simultaneous equations which involve the second and higher powers of the unknown may be impossible of solution. No general rules can be given, and the solution of any particular problem will largely depend upon the student’s ingenuity. Here we shall only give a few typical examples.

Multiplying the equations \( ax + by + cz = d \) and \( ex + fy + gz = h \) and subtracting, we have \( (a - e)x + (b - f)y + (c - g)z = (d - h) \).

Such equations may be reduced to linear equations.—Ex. To solve \( x + 2y = 3z \) and \( 2x + 3y = 4z \). Eliminating y we have \( x + 2y = 3z \), and \( 2x + 3y = 4z \).

Multiply by \( e, x \) and \( y \), and divide the sum by \( xz \); then \( a + b - e = 0 \) and \( a + b - e = 0 \).

From (1) and (2) by cross multiplication we obtain \( \frac{1}{x} \) and \( \frac{1}{y} \).

2. Equations which are homogeneous and of the same degree.—The equations \( ax + by + cz = d \) and \( ex + fy + gz = h \) and \( ax + by + cz = d \) and \( ex + fy + gz = h \) may be solved by substituting \( w = ax + by + cz \) and \( w = ex + fy + gz \) and \( w = ax + by + cz \) and \( ex + fy + gz \).

Ex. To solve \( 2x^2 - y^2 + z^2 = 15 \) and \( 2x^2 - z^2 + y^2 = 15 \). Substituting \( y = mz \) in both these equations, and then dividing, we obtain \( 2m^2 - 1 = 3 \) and \( 2m^2 - 1 = 3 \), or \( m^2 = \frac{1}{2} \). The roots of this equation are \( m = 1 \) and \( m = 2 \).

Taking \( z = x \) and \( y = z \) in both these equations, and then dividing, we obtain \( 2m^2 - 1 = 3 \) and \( 2m^2 - 1 = 3 \), or \( m^2 = \frac{1}{2} \). The roots of this equation are \( m = 1 \) and \( m = 2 \). Therefore the solutions are \( x = 2z \) and \( y = z \) and \( z = x \).

Alternative forms of the equations of, for which the reader is referred to J. J. Milne, Companion to Weekly Problem Papers.

II. Indeterminate Equations.

1. When the number of unknown quantities exceeds the number of equations, the equations will admit of innumerable solutions, and are therefore said to be indeterminate. Thus if it be required to find two numbers such that their sum be 10, we have two unknown quantities x and y, and only one equation, viz. \( x + y = 10 \), which may be presently satisfied by innumerable different values of x and y, if fractional solutions be allowed. Thus we may ask such questions as this, to restrict values of the numbers sought to positive integers, and therefore, in this case, we can have only these nine solutions,

\[ x = 1, 2, 3, 4, 5, 6, 7, 8, 9; \]

\[ y = 9, 8, 7, 6, 5, 4, 3, 2, 1; \]

which indeed may be reduced to five; for the first four become the same as the last four, by simply changing x into y, and the contrary. This branch of analysis was extensively studied by Diophantus, and is sometimes termed the Diophantine Analysis. Thus if we require to solve the equations of the form \( ax + by = c \),

where a, b, c denote given whole numbers, and x, y two numbers to be found, so that both may be integers, and under this condition may be fulfilled, it is necessary that the coefficients a, b have no common divisor which is not also a divisor of c; for if a = 2ma and b = mb, then \( ax + by = m(a + b) = c \), and \( x + y = c/m \); but a, b, c are supposed to be whole numbers, therefore c/m is a whole number; hence m must be a divisor of c.

Of the four forms expressed by the equation \( ax + by = c \), it is obvious that \( ax + by = c \) can have no positive integral solutions. Also \( ax + by = c \) is equivalent to \( by = ax - c \), and so we have only to consider the forms \( ax + by = c \). Before proceeding to the general solution of these equations we shall give a numerical example.

To solve \( 2x + 3y = 25 \) in positive integers. From the given equation

\[ 2x + 3y = 25 \]
we have \( x = (25 - 3y)/2 = 12 - y - (y-1)/2 \). Now, since \( z \) must be a whole number, it follows that \( (y-1)/2 \) must be a whole number, so let us assume \((y-1)/2 = b\), where \( b \) is any whole number whatever, if there were no limitation as to the signs of \( x \) and \( y \). But since these quantities are required to be whole, it is evident, from the value of \( y \), that \( z \) must be either 0 or positive, and from the value of \( x \), that \( x \) must be less than 4; hence \( z \) may have these four values, 0, 1, 2, 3.

### 3. Application of the preceding general methods of resolution to a particular case

The expression of the given square number, \( x^2 + y^2 \), in the form \( x = \pm a \) or \( y = \pm a \), as in the foregoing cases.

**Ex.** It is required to find two square numbers whose sum is a given square number.

Let the given square number, and \( x^2 \), \( y^2 \) the numbers required; then, by the question, \( x^2 + y^2 = a^2 \), and \( x = \sqrt{a^2 - x^2} \). This equation is evidently of such a form as to be resolvable by the method employed in case 1. Accordingly, comparing \( \sqrt{a^2 - x^2} \) with the general expression \( \sqrt{b^2 - x} \) we have \( x = a, y = b, a = +1 \), and substituting these values in the formulae, and also \( -n \) for \( +m \), we find

\[
x = a, y = b, a = +1,
\]

if \( a = n^2 + 1 \), there results \( x = 2n, y = n^2 - 1, a = +n^2 + 1 \). Hence if \( r \) be an even number, the three sides of a rational right-angled triangle are \( r, (r^2 - 1), (r^2 + 1) \). If \( r \) be an odd number, they become \((1 + r^2), (r^2 - 1), (r^2 + 1) \).

For example, if \( r = 4, 4, 4 \), or 3, 4, 5, the sides are of a right-angled triangle; if \( r = 7, 7, 24, 25 \), the sides are of a right-angled triangle.

### III. Cubic Equations

1. **Cubic Equations.**

Cubic equations, like all equations above the first degree, are divided into two classes: they are said to be pure when they contain only one power of the unknown quantity; and affected when they contain two or more powers of the unknown quantity.

Pure cubic equations are therefore of the form \( x^3 + r ; \) and hence it appears that a value of the simple power of the unknown quantity may always be found without difficulty, by extracting the cube root of each side of the equation. We let consider the equation \( x^3 - c = 0 \) more fully. This is decomposible into the factors \( x-c=0 \) and \( x+c \). The roots of this radical equation are \( (1 - 1 - \sqrt{3})c \), and we see that the equation \( x^3 - c \) has three roots, namely, one real root \( c \), and two imaginary roots \( \frac{1}{2}(1 - \sqrt{-3})c \). By making \( c \) equal to unity, we observe that \( (1 - 1 - \sqrt{3})c \) are the imaginary cube roots of unity, which are generally denoted by \( \omega \) and \( \omega^2 \), for it is easy to show that \( (1 - 1 - \sqrt{3})c \).

2. Let us now consider such cubic equations as have all their terms, and which are therefore of this form,

\[
x^3 + Ax^2 + Bx + C = 0,
\]

where \( A, B \) and \( C \) denote known quantities, either positive or negative.

This equation may be transformed into another in which the second term is wanting by the substitution \( x = y - A/3 \). This transformation is a particular case of a general theorem. Let \( x^3 + Ax^2 + Bx + C = 0 \). Upon comparing this equation with the general equation \( x^3 + px^2 + qx + r = 0 \) by the binomial theorem, and let us fix our attention on the coefficient of \( y^2 \). By this process we obtain \( a = y^2 + (A + \omega^2) + \omega \) terms, involving lower powers of \( y \). Now let \( C \) have any value, and if we choose it so that \( A + \omega^2 + C \), then the second term of our derived equation vanishes.

Resuming, therefore, the equation \( y^3 + gy^2 + ry + m = 0 \), let us suppose \( y = t + u \); then we have \( y^3 + gy^2 + ry + m = t^3 + 3ut^2 + 3u^2t + u^3 + g(t^2 + 2ut + u^2) + r(u + t^2 + 2ut) + m \), and the equation becomes \( t^3 + 3ut^2 + (g + r)u^2 + (r + m) \); for the cubic is \( t^3 + 3ut^2 + (g + r)u^2 + (r + m) \). Thus we have obtained a value of the unknown quantity \( y \), in terms of the known quantities \( g, r \) and \( m \); therefore the equation is resolved.

3. But this is only one of three values which \( y \) may have. Let us, for the sake of brevity, put

\[
A = -1 + \sqrt[3]{(y^2 + 3p)^3},
\]

\[
B = -1 + \sqrt[3]{(y^2 - 3p)^3},
\]

and put \( \phi = -1 + \sqrt[3]{-3} \) and \( \phi = -1 - \sqrt[3]{-3} \).

Then, from what has been shown (1), it is evident that \( z \) and \( z \) have each these three values,

\[
v = z, \phi A, z = \phi A,
\]

\[
\phi B, z = \phi B, z = \phi B.
\]

To determine the corresponding values of \( r \) and \( m \), we must consider that \( v = -y^2 = \chi (AB) \). Now if we observe that \( \phi A = 1 \), it will immediately appear that these three values,

\[
v = z, \phi A, z = \phi A,
\]

\[
\phi B, z = \phi B, z = \phi B,
\]

which are therefore the three values of \( y \).
EQUATION

The first of these formulae is commonly known by the name of Cardan’s rule (see Algebra: History). The formula given above for the roots of a cubic equation may be put under a different form, better adapted to the purposes of arithmetical calculation, as follows:—Because \( \sqrt{z} = -\sqrt{\frac{a}{3}} \), therefore \( z = -\sqrt{\frac{a}{3}} \cdot \sqrt{x} \); hence \( x = \frac{a}{3} \cdot \sqrt{x} \); thus it appears that the three values of \( x \) may also be expressed thus:

\[
y = \frac{a}{3} - \sqrt{x} \sqrt{\frac{a}{3} \cdot \sqrt{x}} \quad y = \frac{a}{3} + \sqrt{x} \sqrt{\frac{a}{3} \cdot \sqrt{x}} \quad y = \frac{a}{3} \cdot \sqrt{x} - \sqrt{\frac{a}{3} \cdot \sqrt{x}} \cdot \sqrt{\frac{a}{3} \cdot \sqrt{x}}.
\]

See below, Theory of Equations, §§ 16 et seq.

IV. Biquadratic Equations.

1. When a biquadratic equation contains all its terms, it has this form,

\[
x^2 + a_4 x^4 + b_3 x^3 + c_2 x^2 + d_1 x + e_0 = 0,
\]

where \( A, B, C, D \) denote known quantities.

We shall first consider pure biquadratics, or such as contain only the first and last terms, and therefore of this form, \( x^2 = b_1 \). In this case it is evident that \( x \) may be readily had by two extractions of the square root; by the first we find \( x^2 = b_1 \), and by the second \( x = \pm \sqrt{b_1} \). This, however, is only one of the values which \( x \) may have; for since \( x^2 = b_1 \), therefore \( x^2 = b_1 \) or \( x^2 = -b_1 \), each of which admits of a similar resolution. We shall first consider pure biquadratics, or such as contain only the first and last terms, and therefore of this form, \( x^2 = b_1 \). In this case, the roots of the equation \( x^2 = b_1 \) may be expressed thus:

\[
(x - b)(x + b)(x - b)(x + b) = x^4 - 16b^2 = 0.
\]

2. Next to pure biquadratics, in respect of easiness of resolution, are such the second and fourth terms, and therefore have this form, \( x^2 + 2b_2 x + b_2^2 = 0 \). These may be resolved in the manner of quadratic equations; for if we put \( y = x^2 \), we have

\[
y^2 + 2b_2 y + b_2^2 = 0,
\]

from which we find \( y = \frac{-b_2 \pm \sqrt{b_2^2 - b_2^2}}{2} \), and therefore

\[
x = \pm \sqrt{\frac{-b_2}{2}} \pm \sqrt{\frac{b_2^2 - b_2^2}{2}}.
\]

3. When a biquadratic equation has all its terms, its resolution may be always reduced to that of a cubic equation. There are various methods by which such a reduction may be effected. The following was first given by Leonhard Euler in the Petersburg Commentaries, and afterwards explained more fully in his Elementa of Algebra. We shall already explained how an equation which is complete in its terms may be transformed into another of the same degree, but which has the root of the second term, therefore any biquadratic equation may be reduced to this form,

\[
y^4 + \beta y^2 + \gamma y + \delta = 0,
\]

where the second term is wanting, and where \( p, q, r \) denote any known quantities whatever.

That we may form an equation similar to the above, let us assume \( y = a + b + c \), and let \( a, b, c \) denote the roots of the curve

\[
x^2 + 2a x + a^2 = 0,
\]

then, from the theory of equations we have

\[
a + b + c = P, \quad ab + ac + bc = Q, \quad abc = R.
\]

We square the assumed formula

\[
y = a + b + c,
\]

and obtain

\[
y^2 = 2a^2 + b^2 + c^2 + 2(ab + ac + bc);
\]

or, substituting \(-P, a + b + c\), and transposing,

\[
y^2 + P = 2(ab + ac + bc).
\]

Let this equation be also squared, and we have

\[
y^4 + 2P^2 y^2 + P^4 = 4(ab + ac + bc) + 8(a b^2 c + a^2 b c + a c b^2);
\]

and since

\[
ab + ac + bc = Q,
\]

the same equation may be expressed thus:

\[
y^4 + 2P^2 y^2 + P^4 = 4Q + 8R.
\]

Thus we have the biquadratic equation

\[
y^4 + 2P^2 y^2 + P^4 = 8R, \quad y^4 + P^2 y^2 + P^4 = 0
\]

one of the roots of which is \( y = \sqrt{\frac{8R}{P^2}} \), while \( a, b, c \) are the roots of the cubic equation \( x^3 + 2P^2 x^2 + P^4 = 0 \).

In order to apply this resolution to the proposed equation

\[
y^4 + \alpha y^2 + \gamma y + \delta = 0,
\]

we must express the assumed coefficients \( P, Q, R \) by means of \( p, q, r \), the coefficients of that equation. For this purpose let us compare the equations

\[
y^4 + \alpha y^2 + \gamma y + \delta = 0,
\]

and it immediately appears that

\[
P = \frac{\gamma}{R}, \quad \alpha = \frac{P^2}{R}, \quad \delta = \frac{P^4}{R};
\]

and from these equations we find

\[
P = \frac{\gamma}{R}, \quad Q = \frac{\delta}{R}, \quad R = \frac{\delta}{R^3}.
\]

Hence it follows that the roots of the proposed equation are generally expressed by the formula

\[
y = \sqrt{a} + \sqrt{b} + \sqrt{c};
\]

where \( a, b, c \) denote the roots of this cubic equation,

\[
z^2 + 2P^2 z^2 + P^4 = 0.
\]

But to find each particular root, we must consider, that as the square root of a number may be either positive or negative, so each of the quantities \( \sqrt{a}, \sqrt{b}, \sqrt{c} \) may have either the sign \(+\) or \(-\) prefixed to it; and hence our formula will give eight different expressions for the root. It is, however, to be observed, that as the product of the three quantities \( \sqrt{a}, \sqrt{b}, \sqrt{c} \) must be equal to \( \sqrt{R} \) or \(-\sqrt{R} \); when \( q \) is positive, their product must be a negative quantity, and this can only be effected by making one or three of them negative; again, when \( q \) is negative, their product must be a positive quantity; so that in this case they must either all be positive, or two of them must be negative. These considerations enable us to determine that four of the eight expressions for the root belong to the case in which \( q \) is positive, and the other four to that in which it is negative.

5. We shall now give the result of the preceding investigation in the form of a practical rule; and as the coefficients of the cubic equation which has been found involve fractions, we shall transform it into another, in which the coefficients are integers, by supposing \( z = 1 \). Thus the equation

\[
z^4 + \frac{2P^2}{R} z^2 + \frac{P^4}{R} = 0
\]

becomes, after reduction,

\[
y^4 + 2p^2 y^2 + (p^2 - a) = 0
\]

and find its roots, which let us denote by \( a, b, c \).

Then the roots of the proposed biquadratic equation are,

\[
\frac{q}{p^2} = \frac{\sqrt{a} + \sqrt{b} + \sqrt{c}}{\sqrt{R}}, \quad \frac{q}{p^2} = \frac{-\sqrt{a} + \sqrt{b} + \sqrt{c}}{\sqrt{R}}, \quad \frac{q}{p^2} = \frac{-\sqrt{a} - \sqrt{b} + \sqrt{c}}{\sqrt{R}}, \quad \frac{q}{p^2} = \frac{\sqrt{a} - \sqrt{b} + \sqrt{c}}{\sqrt{R}}.
\]

See also below, Theory of Equations, §§ 17 et seq.

(X.)

V. Theory of Equations.

1. In the subject “Theory of Equations” the term equation is used to denote an equation of the form \( x^n - p_1 x^{n-1} - \ldots = p_0 = 0 \), where \( p_1, p_2, \ldots, p_n \) are regarded as known, and \( x \) as a quantity to be determined; for shortness the equation is written \( f(x) = 0 \).

The equation may be numerical; that is, the coefficients \( p_1, p_2, \ldots, p_n \) are then numbers—understanding by number a quantity of the form \( a + bi \) (a and \( b \) having any positive or negative real values whatever, or say each of these is regarded as susceptible of continuous variation from an indefinitely large negative to an indefinitely large positive value), and \( i \) denoting \( \sqrt{-1} \).

Or the equation may be algebraical; that is, the coefficients are not then restricted to denote, or are not explicitly considered as denoting numbers.

2. We consider first numerical equations. (Real theory, 2-6; Imaginary theory, 7-10.)

Real Theory.

2. Postponing all consideration of imaginaries, we take in the first instance the coefficients to be real, and attend only to the real roots (if any); that is, \( p_1, p_2, \ldots, p_n \) are real positive or negative quantities, and a root \( a \), if it exists, is a positive or negative quantity such that \( a^2 - p_1 a^{n-1} \ldots = p_0 = 0 \), or say,

\[
f(a) = 0.
\]

It is very useful to consider the curve \( y = f(x) \); or, what would come to the same, the curve \( y = f(x) \). But it is better to retain the first-mentioned form of equation, drawing, if need be, the ordinate \( y \) on a reduced scale. For instance, if the given equation be \( x^3 - 6x^2 + 11x - 6 = 0 \), then the curve

\[
1 \text{ The coefficients were selected so that the roots might be nearly } 1, 2, 3.
\]
EQUATION

\[ y = \sqrt[3]{x^2 - 6x^4 + 11x^6 - 6x^6} \] is as shown in fig. 1, without any reduction of scale for the ordinate.

It is clear that, in general, \( y \) is a continuous one-valued function of \( x \), finite for every finite value of \( x \), but becoming infinite when \( x \) is infinite; i.e., assuming throughout that the coefficient of \( x^n \) is +1, then when \( x = \infty \), \( y = \infty \); but when \( x = -\infty \), then \( y = \infty \) or \(-\infty \), according as \( n \) is even or odd; the curve cuts any line whatever, and in particular it cuts the axis of \( x \) in at most \( n \) points; and the value of \( x \), at any point of intersection with the axis, is a root of the equation \( f(x) = 0 \).

If \( \beta, \alpha \) are any two values of \( x(\alpha > \beta) \), that is, a nearer + \( \infty \) or \(-\infty \) if \( f(\beta), f(\alpha) \) have opposite signs, the curve cuts the axis an odd number of times, and therefore at least once, between the points \( x = \beta, x = \alpha \); but if \( f(\beta), f(\alpha) \) have the same sign, then between these points the curve cuts the axis an even number of times, or it may be not at all. That is, \( f(\beta), f(\alpha) \) having opposite signs, there are between the limits \( \beta, \alpha \) an odd number of real roots, and therefore at least one real root; but \( f(\beta), f(\alpha) \) having the same sign, there are between these limits an even number of real roots, or it may be there is no real root. In particular, by giving to \( \beta, \alpha \) the values \(-\infty, +\infty \) (or, what is the same thing, any two values sufficiently near to these values respectively) it appears that an equation of an odd order always has an odd number of real roots, and therefore at least one real root; but that an equation of an even order has an even number of real roots, or it may be no real root.

If \( \beta \), \( \alpha \) be such that for \( x = \alpha > \beta \) (that is, \( x \) nearer to \(+\infty \) \( \alpha = \beta \) is always +, and \( \beta > \beta \) be such that for \( x = \alpha > \beta \) \( f(x) \) is always +, then the real roots (if any) lie between these limits \( x = \beta, x = \alpha \); and it is easy to find by trial such two limits including between them all the real roots (if any).

3. Suppose that the positive value \( \delta \) is an inferior limit to the difference between two real roots of the equation; or rather (since the foregoing expression would imply the existence of real roots) suppose that there are not two real roots such that their difference taken positively \( \delta = \beta > \beta \); and by what precedes there is real root or there is not such real root, according as \( f(\gamma), f(\gamma + \delta) \) have opposite signs or have the same sign. And by dividing in this manner the interval \( \beta \) to \( \beta \) into intervals each of which is \( \beta < \delta \leq \beta \), we should not only ascertain the number of the real roots (if any), but we should also separate the real roots, that is, find for each of them limits \( \beta, \gamma \) between which there lies one, and only one this root.

In particular cases it is frequently possible to ascertain the number of the real roots, and to effect their separation by trial or otherwise, without much difficulty; but the foregoing was the general process as employed by Joseph Louis Lagrange even in the second edition (1808) of the Traité de la résolution des équations numériques; the determination of the limit \( \delta \) had to be effected by means of the "equation of differences" or equation of the order \( m(n-1) \), the roots of which are the squares of the differences of the roots of the given equation, and the process is a cumbersome and unsatisfactory one.

4. The great step was effected by the theorem of J. C. F. Sturm (1835)—viz., here starting from the function \( f(x) \), and its first derived function \( f'(x) \), we have (by a process which is a slight modification of that for obtaining the greatest common measure of two functions) to form a series of functions:

\[
f(x), f(x), f(x), \ldots, f(x)
\]

depending on \( n \), \( n-1 \), \( n-2 \) . . . respectively,—the last term \( f(x) \) being thus an absolute constant. These lead to the immediate determination of the number of real roots (if any) between any two given limits \( \beta, \alpha \); viz., supposing \( \beta > \beta \) (that is, a nearer to \(+\infty \), then substituting successively these two values in the series of functions, and attending only to the signs of the resulting values, the number of the changes of signs lost in passing from \( \beta \) to \( \alpha \) is the required number of real roots between the two.

The third edition (1826) is a reproduction of that of 1808; the first edition has the date 1798, but a large part of the contents is taken from memoirs of 1767-1768 and 1770-1771.

5. Supposing the separation once effected, the determination of the limits \( \beta, \alpha \) between which two given limits may be effected to any required degree of approximation either by the processes of W. G. Horner and Lagrange (which are in principle a carrying out of the method of Sturm's theorem), or by the process of Sir Isaac Newton, as perfected by Joseph Fourier (which requires to be separately considered).

First as to Horner and Lagrange. We know that between the limits \( \beta, \alpha \) there lies one, and only one, real root of the equation; \( f(\beta), f(\alpha) \) have therefore opposite signs. Suppose any intermediate value \( \beta \), such that \( \beta > \beta \), to be determined; whether the root lies between \( \beta, \alpha \), or between \( \beta, \alpha \), it would be quite unnecessary to calculate the signs of \( f(\beta), f(\alpha), f(\beta) \); only the sign of \( f(\beta) \) is required; for, if this has the same sign as \( f(\beta) \), then the root is between \( \beta, \alpha \); whereas if \( f(\beta) \) and \( f(\beta) \) have opposite signs, it is \( \beta \) and \( \alpha \). We want to make \( \beta \) increase from the inferior limit \( \beta \), at which \( f(\beta) \) has the sign of \( f(\beta) \), so long as \( f(\beta) \) retains this sign, and therefore have for which it assumes the opposite sign; we have thus two nearer limits of the required root, and the process may be repeated indefinitely.

Horner's method (1819) gives the root as a decimal, figure by figure; thus if the equation be known to have one real root between 0 and 1, it is in effect shown say that \( f(\beta) \) is too small (that is, the root is between 5 and 6); that \( f(\beta) \) is too small (that is, the root is between 5 and 6); and so on to any number of decimals. Each figure is obtained by the successive division by all of the number of the root, and the result is a number of the root, and the process is a continued fraction. This produces a number of the root, and the result is a number of the root, and the process is a continued fraction.

Lagrange's method (1767) gives the root as a continued fraction

\[
a + \frac{1}{b + \frac{1}{c + \frac{1}{d + \cdots}}} \]

where \( a \) is a positive or negative integer (which may be zero), but \( b, c, \ldots \) are positive integers. Suppose the roots have been separated; then (by trial if need be of consecutive integer values) the limits may be made to be consecutive integer numbers: say they are \( a, a+1 \); the value of \( y \) is therefore \( a+1+y \), where \( y \) is an integer, and greater than the absolute value of \( y \), writing therein \( x = a+y \), we form an equation of the same order for \( y \), and this equation will have one, and only one, positive root greater than 1; hence finding for it the limits \( b, b+1 \) (where \( b = \beta+1 \)), and then the continued fraction for \( x \) as \( \alpha \) is, we thus obtain the successive denominators \( b, c, d, \ldots \) of the continued fraction. The method is theoretically very elegant, but the disadvantage is that it gives the result in the form of a continued fraction, which is always the most tedious part of the calculation.
roughly stated as follows. If \( x = \gamma \) be an approximate value of any root, and \( \gamma + h \) the correct value, then \( f(\gamma + h) = 0 \), that is,
\[
f(\gamma) + f'(\gamma)h + \frac{h^2}{2}f''(\gamma) + \ldots = 0;
\]
and then, if \( h \) be so small that the terms after the second may be neglected, \( f(\gamma) + f'(\gamma)h = 0 \), that is, \( h = -f(\gamma)/f'(\gamma) \), or the new approximate value is \( x = \gamma - f(\gamma)/f'(\gamma) \); and so on, as often as we please. It will be observed that so far nothing has been assumed as to the separation of the roots, or even as to the existence of a real root; \( \gamma \) has been taken as the approximate value of a root, but no precise meaning has been attached to this expression. The question arises, What are the conditions to be satisfied by \( \gamma \) in order that the process may by successive repetitions actually lead to a certain real root of the equation; or that, \( \gamma \) being an approximate value of a certain real root, the new value \( \gamma - f(\gamma)/f'(\gamma) \) may be a more approximate value.

Referring to fig. 1, it is easy to see that if OC represents the assumed value \( \gamma \), then, drawing the ordinate \( CP \) to meet the curve in \( P \), and the tangent \( PC' \) to meet the axis in \( C' \), we shall have OC as the new approximate value of the root. But observe that there is here a real root \( OX \), and that the curve beyond \( X \) is convex to the axis; under these conditions the point \( C' \) is nearer to \( X \) than was \( C \); and, starting with \( C' \) instead of \( C \), and proceeding in like manner to draw a new ordinate and tangent, and so on as often as we please, we approximate continuously, and that with great rapidity, to the true value \( OX \). But if \( C \) had been taken on the other side of \( X \), the curve is concave to the axis, the new point \( C' \) might or might not be nearer to \( X \) than was the point \( C \); and in this case the method, if it succeeds at all, does so by accident only, i.e. it may happen that \( C' \) or some consequent point comes to be a point \( C \), such that \( OC \) is a proper approximate value of the root, and then the subsequent approximations proceed in the same manner as if this value had been assumed in the first instance, all the preceding work being wasted.

FIG. 1.

It thus appears that for the proper application of the method we require more than the mere separation of the roots. In order to be able to approximate to a certain root \( a = OX \), we require to know that, between \( OX \) and some value \( ON \), the curve is always convex to the axis (analytically, between the two values, \( f(x) \) and \( f'(x) \) must have always the same sign). When this is so, the point \( C \) may be taken anywhere on the proper side of \( X \), and within the proper side of the axis; and the process is then the one already explained. The approximation is in general a very rapid one. If we know for the required root \( OX \) the two limits \( OM, ON \) such that from \( M \) to \( X \) the curve is always convex to the axis,—then, taking \( D \) anywhere in the portion \( MX \) and (as before) \( C \) in the portion \( CN \), drawing the ordinates \( DO, CP \), and joining the points \( P, Q \) by a line which meets the axis in \( D' \), also constructing the point \( C' \) by means of the tangents at \( P, Q \), we have for the required root the new limits \( OD', OC' \); and proceeding in like manner with the points \( D', C' \), and so on as often as we please, we obtain at each step two limits approximating more and more nearly to the required root \( OX \). In the process as to the point \( D' \), translated into analysis, is the process of interpolation. Suppose \( OD = \beta, OC = \alpha \), we have approximately
\[
\alpha - \beta = f(\beta) - f(\alpha) = f(\beta - \alpha)\theta(\alpha, \beta, \gamma),
\]
whence if the root is \( \beta + h \) then \( h = -f(\beta)/f'(\beta) \).

Returning for a moment to Horner's method, it may be remarked that the correction \( h \), to an approximate value \( a \), is therein found as a quotient the same or such as the quotient \( f(z) - f(\alpha) \) which presents itself in Newton's method. The difference is that with limits for \( a \) of this quotient is taken as the presumptive value of \( h \), and the figure is verified at each step. With Newton the quotient itself, developed to the proper number of decimal places, is taken as the value of \( h \); if too many decimals are taken, there would be a waste of work; but the result will correct itself at the next step. Of course the calculation should be conducted without any such waste of work.

**Imaginary Theory.**

7. It will be recollected that the expression \( n \) and the correlative epitet \( n \) were at the outset used in a wide sense, as extending to imaginaries. This extension arises out of the theory of equations by a process analogous to that by which number, in its original most restricted sense of positive integer number, was extended to have the meaning of a real positive or negative magnitude susceptible of continuous variation.

If for a moment number is understood in its most restricted sense as meaning positive integer number, the solution of a simple equation leads to an extension; \( ax^2 + b = 0 \) gives \( x = \pm \sqrt{\frac{-b}{a}} \), a positive, and we can in this manner represent, not accurately, but as nearly as we please, any positive magnitude whatever; so an equation \( ax^2 + b = 0 \) gives \( x = \pm \sqrt{\frac{b}{a}} \), which (approximately as before) represents any negative magnitude. We thus arrive at the extended signification of number as a continuously varying real or negative magnitude. Such numbers may be added or subtracted, multiplied or divided one by another, and the result is always a number. Now from a quadric equation we derive, in like manner, the notion of a complex or imaginary number such as is spoken of above. The equation \( x^2 + 1 = 0 \) is not (in the foregoing sense, number=real number) satisfied by any numerical value whatever of \( x \); but we assume that there is a number which we call \( i \), satisfying the equation \( i^2 + 1 = 0 \), and then taking \( a + bi \) any real numbers, we form an expression such as \( a + bi \), and use the expression number in this extended sense: any two such numbers may be added or subtracted, multiplied or divided one by the other, and the result is always a number. Thus, if we consider first a quadratic equation \( x^2 + px + q = 0 \), and \( p \) and \( q \) being now numbers of the last-mentioned extended form—non constant—that every such equation has a numerical root—and if not, we might be led to other imaginaries \( k, l, \&c. \), and so on ad infinitum in inextricable confusion.

But in fact a numerical equation of any order whatever has always a numerical root, and thus numbers (in the foregoing sense, number=quantity of the form \( a + bi \)) form (what real numbers do not) a universe complete in itself, such that starting in it we are never led out of it. There may very well be, and perhaps are, numbers in a more general term (quaternions are not a case in point, as the ordinary laws of combination are not adhered to), but in order to have to do with such numbers (if any) we must start with them.

8. The capital theorem as regards numerical equations thus is, every numerical equation has a numerical root; or for shortness (the meaning being as before), every equation has a root. Of course the theorem is the reverse of self-evident, and it requires proof; but provisionally assuming it as true, we derive from it the general theory of numerical equations. As the term root was introduced in the course of an explanation, it will be convenient to give here the formal definition.

A number \( a \) such that substituted for \( x \) it makes the function \( f(x) = 0 \) is a root, or factor, of \( f(x) \). Thus it satisfies the equation \( f(x) = 0 \), is said to be a root of the equation; that is, being a root, we have
\[
a = 0 \quad \text{or} \quad a = \pm \sqrt{-1} = \pm i = \pm a + bi = \pm a + (b, c) \text{numbers} + (a, b, c) \text{of the kind hereinafter considered}. \]

In general \( a \) is not a root of the equation \( f(x) = 0 \), but it may be so:—i.e. \( f(x) \) may contain the factor \( (x-a) \); when this is so, \( f(x) \) will contain the factor \( (x-\alpha) \); writing then \( f(x) = (x-\alpha)j(x) \), and assuming that \( a \) is not a root of the equation \( f(x) = 0 \), \( a = \alpha \) is then said to
be a double root of the equation \( f(x) = 0 \); and similarly \( f(x) \) may contain the factor \((x-a)^2\) and no higher power, and \( x = a \) is then a triple root, and so on.

It is evident that \( f(x) = (x-a)^2 f(x) \) being a positive integer which may be \( 1, (x-a)^2 \) the highest power of \( x - a \) which divides \( f(x) \), and \( f(x) \) being of course of the order \( n - a \), then the equation \( f(x) = 0 \) will have a root \( b \) which will be different from \( x \); \( a \) will be a factor, in general a simple one, but it may be a multiple one, of \( f(x) \), and \( f(x) \) will in this case be \( (x-a)^2 (x-b) \) (\( \beta \) a positive integer which may be \( 1, (x-b)\) the highest power of \( x - b \) in \( f(x) \) or \( f(x) \), and \( f(x) \) being of course of the order \( n - a - \beta \).

The original equation \( f(x) = 0 \) is in this case said to have a roots each \( a, a, b \) and so on for any other factors \((x-a)^2 \).

We have thus the theorem—A numerical equation of the order \( n \) has in every case \( n \) roots, viz., there exist \( n \) numbers, \( a, b, \ldots \) (in general all distinct, but which may arrange themselves in any sets of \( n \) roots the equation \((x-a)^2 \) is the equation of the \( n \) numbers, \( \Phi(x) \) is each of them a function with real coefficients; and it thus appears that the equation \( f(x) = 0 \), with imaginary coefficients, has not in general any real root; supposing it to have a real root \( a \), this number \( a \) satisfies each of the \( n \) numbers, \( \Phi(x) \).

But an equation with real coefficients may have as well imaginary as real roots, and we have further the theorem that for any such equation the imaginary roots enter in pairs, viz., \( a + bi \) and \( a - bi \) being a root, then \( a - bi \) is also a root. It will be also be shown that if the equation has \( n \) roots, then there is always an odd number of real roots, and therefore at least one real root.

9. In the case of an equation with real coefficients, the question of the existence of real roots, and of their separation, has been already considered. In the general case of an equation with imaginary (it may be real) coefficients, the like question arises as to the separation of the (real or imaginary) roots; thus, if for facility of conception, we take the configuration \( f(x) = 0 \), with the real root \( a + bi \) as the co-ordinates of a point in the complex plane, and assume the representation of the root by such point, then drawing in the plane any closed curve or "contour," the question is how many roots lie within such contour.

This is solved theoretically by means of a theorem of A. L. Cauchy (1837), viz. writing in the original equation \( x - iy \) in place of \( x \), the function \( f(x) + iy \) becomes \( f(x) + i Q \), where \( P \) and \( Q \) are each of them a real function of \( x \). Imagining the point \((x, y)\) to travel along the contour, and considering the number of changes of sign from \(- \) to \( + \) and from \(+ \) to \(- \) of the fraction corresponding to passages of the fraction through zero, we find that the numbers \( P \) for which \( Q = 0 \) are not imaginary, and for which \( Q = 0 \), the difference of these numbers gives the number of roots within the contour.

It is to be remarked that the demonstration does not pre-suppose the existence of any root; the contour may be the infinity of the plane (such infinity regarded as a contour, or closed curve), and in this case it can be shown (and that very easily) that the difference of the numbers of changes of sign \( = n \); that is, there are within the infinite contour, or (what is the same thing) there are in all \( n \) roots; thus Cauchy's theorem contains really the proof of the fundamental theorem that a numerical equation of the \( n \)th order (not only has a numerical root, but) has precisely \( n \) roots.

It would seem from the proof of the fundamental theorem in its most complete form is in principle identical with the last proof of K. F. Gauss (1849) of the algebraical form.—A numerical equation of the \( n \)th order has always \( n \) roots.

But in the case of a finite contour, the actual determination of the difference which gives the number of real roots can be effected only in the rarest cases, and so on for the determination of this side separately a method such as that of Sturm's theorem; and thus the actual determination ultimately depends on a method such as that of Sturm's theorem.

It has been given in regard to the calculation of the imaginary roots of an equation by approximation; and the question is not here considered.

10. A class of numerical equations which needs to be considered is that of the binomial equations \( x^n = a \) \((a = a + bi)\), a complex number).

The foregoing conclusions apply, viz., there are always \( n \) roots, which, it may be shown, are all unequal. And these can be found numerically by the extraction of the square root, and of an \( n \)th root, of real numbers, and by the aid of a table of natural sines and cosines. For writing

\[ a + bi = \sqrt{(a^2 + b^2)} \left( \cos \theta + i \sin \theta \right) \]

there is always a real angle \( \lambda \) (positive and less than \( \pi \)), such that its cosine and sine are \( a = \cos \lambda \) and \( b = \sin \lambda \) respectively; that is, writing for shortness \( \sqrt{(a^2 + b^2)} = \rho \), we have \( a + bi = \rho (\cos \lambda + i \sin \lambda) \); or the equation is \( x^n = \rho (\cos \lambda + i \sin \lambda) \); hence observing that

\[ \cos \left( \frac{\lambda}{n} \right) + i \sin \left( \frac{\lambda}{n} \right) = \cos \frac{\lambda}{n} + i \sin \frac{\lambda}{n} \]

the formula really gives all the roots, for instead of \( \lambda \) we may write \( 2\pi / n \), a positive or negative integer, and then we have

\[ x = \rho \left( \cos \left( \frac{2\pi k}{n} \right) + i \sin \left( \frac{2\pi k}{n} \right) \right) \]

which has the \( n \) values obtained by giving to \( \lambda \) the values 1, 2, \ldots \( n - 1 \) in succession; the roots are, it is clear, represented by points lying at equal intervals on a circle. But it is more convenient to proceed somewhat differently; taking one of the roots to be \( \rho \), so that \( \theta = a \), then assuming \( x = \rho \), the equation becomes \( x^n = 1 \), which equation, like the original equation, has precisely \( n \) roots (one of them being of course \( 1 \)). And the original equation \( x^n = 0 \) is thus reduced to the equation \( x^n = 1 \); and although the theory of this equation is included in the preceding one, yet it is proper to state it separately.

The equation \( x^n = 0 \) has its several roots expressed in the form

\[ x = \rho e^{i\pi k/n} \]

where \( \rho \) may be taken \( = \cos \frac{\pi}{n} + i \sin \frac{\pi}{n} \); in fact, \( \sqrt{(a^2 + b^2)} \)

having this value, any integer power \( \omega \) is \( = \cos \left( \frac{2\pi k}{n} \right) + i \sin \left( \frac{2\pi k}{n} \right) \), and we thence have \( (\omega)^n = \cos \left( \frac{2\pi k}{n} \right) + i \sin \left( \frac{2\pi k}{n} \right) \), \( k = 1, \ldots \).

By what precedes, we are led to the notion (\( n \) numerical) of the radical \( \omega^{1/n} \) regarded as an \( n \)-valued function; any one of these being denoted by \( \omega \), then the series of values is \( \omega, \omega^2, \omega^3, \ldots \omega^{n-1} \); and the value of \( \omega \) for which, by whatever method we please, use \( \omega \) instead of \( \omega^{1/n} \) as a symbol to denote the \( n \)-valued function.

As the coefficients of an algebraical equation may be numerical, all which follows in regard to algebraical equations is (with, may be, some few modifications) applicable to numerical equations; and hence, concluding for the present this subject, it will be convenient to pass on to algebraical equations.

### Algebraical Equations

11. The equation is

\[ x^n - p_1 x^{n-1} + \ldots + p_n = 0, \]

and we here assume the existence of roots, viz. we assume that there are \( n \) roots \( a, b, \ldots \).

In general all of them different, but which in particular cases may become equal in sets in any manner, (such that

\[ x^n - p_1 x^{n-1} + \ldots + p_n = 0 \]

or looking at the question in a different point of view, and starting with the roots \( a, b, c, \ldots \) as given, we express the product of the \( n \) factors \( x-a, x-b, \ldots \) in the foregoing form, and thus arrive at an equation of the order \( n \) having the \( n \) roots \( a, b, c, \ldots \).

In either case we have

\[ p_1 = 2a; p_2 = 2ab; \ldots \]

i.e., regarding the coefficients \( p_1, p_2, \ldots \) as given, then we assume the existence of roots \( a, b, c, \ldots \) such that \( p_1 = 2a, \ldots \); or, regarding the roots as given, then we write \( p_1, p_2, \ldots \), to denote the functions \( 2a, 2ab, \ldots \).

As already explained, the epithet algebraical is not used in opposition to numerical; an algebraical equation is merely an equation wherein the coefficients are not restricted to denote, or are not expressed as the abstraction of rational numbers. That the abstraction is legitimate, appears by the simplest example; in saying that the equation \( x^n - px + q = 0 \) has a root \( x = \sqrt[p]{v + \sqrt{q}} \), we mean that the numerical value for this equation becomes an identity, \( |p| + \sqrt{q} = |v + \sqrt{q}| \); and the verification of this identity in new signs depends upon \( p \) and \( q \) meaning numbers. But if it be asked what there is beyond numerical equations included in the term algebraical equation, or algebraic, that is the full extent of the meaning attributed to the term,—the latter question at any
rate it would be very difficult to answer; as to the former one, it may be said that the coefficients may, for instance, be symbols of operation. As regards such equations, there is certainly no proof that every equation has a root, or that an equation of the $n$th order has $n$ roots; nor is it any wonder what the preciseness of the statement is. But it is found that the assumption of the existence of the $n$ roots can be made without contradictory results; conclusions derived from it, if they involve the roots, rest on the same ground as the original assumption; but the conclusion may be independent of the roots altogether, and in this case it is undoubtedly valid; the reasoning, although actually conducted by aid of the assumption (and, it may be, most easily and elegantly in this manner), is really independent of the assumption. In illustration, we observe that it is allowable to express a function of $p$ and $q$ as follows,—that is, by means of a rational symmetrical function of $a$ and $b$, this can, as a fact, be expressed as a rational function of $a$ and $b$. And if we prescribe that $a$ and $b$ shall then be changed into $p$ and $q$ respectively, we have the required function of $p$, $q$. That is, we have $F(a, b)$ as a representation of $f(p, q)$, obtained as if we had $a = p, b = q$; but without in any wise assuming the existence of the $a$, $b$ of these equations.

12. Starting from the equation
\[ x^n - p_1 x^{n-1} + \cdots + x - a = 0, \]
or the equivalent equations $p_1 = \Sigma a, \kappa$, we find
\[ a^n - p_1 a^{n-1} + \cdots = 0, \]
and
\[ x^n - p_1 x^{n-1} + \cdots = x - a = x - b, \]
and
\[ x^n - p_1 x^{n-1} + \cdots = x - a = x - b, \]
observe that if, for instance, $a = b$, then the equations
\[ a^n - p_1 a^{n-1} + \cdots = 0, \]
would reduce themselves to a single relation, which would not of itself express that $a$ was a double root,—that is, that $(x - a)^2$ was a factor of $x^n - p_1 x^{n-1} + \cdots$; but by considering $a$ as the limit of $a + h$, $h$ indefinitely small, we obtain a second equation
\[ n x^{n-1} - (a - 1) p_1 x^{n-2} + \cdots = 0, \]
which, with the first, expresses that $a$ is a double root; and then the whole system of equations leads as before to the equations $p_1 = 2a, \kappa$. But the existence of a double root implies a certain relation between the coefficients; the general case is when the roots are all unequal.

We have then the theorem that every rational symmetrical function of the roots is a rational function of the coefficients. This is an easy consequence from the less general theorem, every rational and integral symmetrical function of the roots is a rational and integral function of the coefficients.

In particular, the sums of the powers $\Sigma a^2, \Sigma a^3, \kappa$, are rational and integral functions of the coefficients.

The process originally employed for the expression of other functions $2a + b, \kappa$, in terms of the coefficients is to make them depend upon the sums of powers: for instance, $\Sigma a^2 b = \Sigma a \Sigma a b - 2a \Sigma b^2$; but this is very objectionable; the true theory consists in showing that we have systems of equations:

\[
\begin{align*}
p_1 &= \Sigma a, \\
p_2 &= \Sigma ab, \\
p_3 &= \Sigma ab^2 + 2ab, \\
p_4 &= \Sigma ab^3 + 3abc, \\
p_5 &= \Sigma ab^4 + 6abc, \\
p_6 &= \Sigma ab^5 + 10abc^2, \\
&\vdots
\end{align*}
\]

where in each system there are precisely as many equations as there are root-functions on the right-hand side; e.g. 3 equations and 3 functions $2ab, 3ab, 2a^2$. Hence in each system the root-functions can be determined linearly in terms of the powers and products of the coefficients:

\[
\begin{align*}
zab &= 2a, \\
3ab &= p_1 + 2p_3, \\
2ab^2 &= p_2 - 3p_3, \\
2ab^3 &= p_1 - 3p_2 + 3p_4, \\
2ab^2 &= 4p_1 - 6p_3 + 3p_5, \\
2ab &= 2p_2 - 3p_4 + 3p_6, \\
&\vdots
\end{align*}
\]

and so on. The other process, if applied consistently, would derive the originally assumed value $2ab = p_1$, from the two equations $\Sigma a = p_1, 2z = p_1 - 2p_3$; i.e. we have $2z = 2ab = 2a - 2a = p_1 - (p_1 - 3p_3) = 2p_3$.

13. It is convenient to mention here the theorem that, $x$ being determined as above by an equation of the order $n$, any rational and integral function whatever of $x$, or more generally any rational function which does not become infinite in virtue of the equation itself, can be expressed as a rational and integral function of $x$, of the order $n - 1$, the coefficients being rational functions of the coefficients of the equation. Thus the equation gives $x$ a function of the form in question; multiplying each side by $x$, and on the right-hand side writing for $x^2$ its foregoing value, we have $x^{n+1}$, a function of the form in question; and the like for any higher power of $x$, and therefore also for any rational and integral function of $x$. The proof in the case of a rational non-integral function is somewhat more complicated. The final result is of the form $\phi(x)/\psi(x) = I(x)$, or say $\phi(x)/\psi(x) = 0$, where $\phi, \psi, I$ are rational and integral functions; in other words, this equation, being true if only $f(x) = 0$, can only be so by reason that $\frac{\phi(x)}{\psi(x)}$ is an integral rational function, $\phi(x)$ and $\psi(x)$ must have identical $\phi(x)/\psi(x) = I(x)$, being satisfied if only $f(x) = 0$, must be satisfied by each root of the equation.

From the theorem that a rational symmetrical function of the roots is expressible in terms of the coefficients, it at once follows that it is possible to determine an equation of an assignable order, having for its roots the several values of any given (unsymmetrical) function of the roots of the given equation. For example, in the case of a quartic equation, $a, b, c, d$, it is possible to find an equation having the roots $ab, ac, ad, bc, bd, cd$ (being therefore a sextic equation): viz. in the preceding notation,

\[
(y - ab)(y - ac)(y - ad)(y - bc)(y - bd)(y - cd)
\]

the coefficients of the several powers of $y$ will be symmetrical functions of $a, b, c, d$ and therefore rational and integral functions of the coefficients of the quartic equation; hence, supposing the product so expressed and equating it to zero, we have the required sextic equation. In the same manner can be found the sextic equation having the roots $(a - b)^2, (a - c)^2, (a - d)^2, (b - c)^2, (b - d)^2, (c - d)^2$, which is the equation of differences previously referred to; and similarly we can form the equation of differences for a given higher equation of any order. Again, the equation sought for may be that having for its roots the given rational functions $\phi(a), \phi(b), \ldots$ of the several roots of the given equation. Any such rational function can (as was shown) be expressed as a rational and integral function of the order $n - 1$; and, retaining $x$ in place of any one of the roots, the problem is to find $y$ from the equations $x^n - p_1 x^{n-1} + \cdots = 0, y = \text{Ma}^x + \text{Ma}^{x/2} + \cdots$, or, what is the same thing, from these two equations to eliminate $x$. This is in fact E. W. Tschirnhausen's transformation (1683).

14. In connexion with what precedes, the question arises as to the number of values (obtained by permutations of the roots) of given unsymmetrical functions of the roots, or say of a given set of letters: for instance, with roots or letters $(a, b, c, d)$ as before, how many values are there of the function $ab + cd$, or better, how many functions are there of this form? The answer is 3, viz. $ab + cd, ac + bd, ad + bc$; or again we may ask whether, in the case of a given number of letters, there exist functions with a given number of values? It is at once seen that for any given number of letters there exist 2-valued functions; the product of the differences of the letters is such a function; however the letters are interchanged, it alters only its sign; or say the two values are $A$ and $-A$. And if $P, Q$ are symmetrical functions of the letters, then the general form of such a function is $P + QA$; this has only the two values $P + QA, P - QA$.

In the case of 4 letters there exist (as appears above) 3-valued functions; but in the case of 5 letters there does not exist any 5-valued function; and the only 5-valued functions are those which are symmetrical in regard to four of the letters, and can thus be expressed in terms of one letter and of symmetrical functions of all the letters. These last theorems present themselves in the determination of the non-existence of a solution of a quintic equation by radica.

The theory is an extensive and important one, depending on the notions of substitutions and of groups (q.v.).

15. Returning to equations, we have the very important theorem that, given the value of any unsymmetrical function of the roots, e.g. in the case of a quartic equation, the function $ab + cd$, it is in general possible to determine rationally the value of any similar function, such as $(a + b)d + (c + d)^2$.

The a priori ground of this theorem may be illustrated by means of a numerical equation. Suppose that the roots of a quartic equation are $1, 2, 3, 4$, then if it is given that $ab + cd = 14$, this in effect determines $a, b, c, d$ to be $1, 2, 3, 4$ (viz. $a = 1, b = 2$ or $a = 2, b = 1$, \ldots
EQUATION

case
By what precedes there is nothing in
this that might not have been expected; the algebraical solution
makes the solution depend on the extraction of the cube root of
a number, and there was no reason for expecting this to be a real
number. It is well known that the case in question is that wherein
the three roots of the numerical cubic equation are all real; if the
roots are two imaginary, one real, then contrariwise the quantity
under the cube root is real; and the algebraical solution gives
the numerical one.
The irreducible case is solvable by a trigonometrical formula, but
this is not a solution by radicals: it consists in effect in reducing the
given numerical cubic (not to a cubic of the form z' = a, solvable by
the extraction of a cube root, but) to a cubic of the form 4** 3x a,
corresponding to the equation ^ cos's 3 cos 9=cos 30 which serves
to determine cos 8 when cos 36 is known. The theory is applicable
to an algebraical cubic equation; say that such an equation, if it
"
can be reduced to the form 4x' 3x = a, is solvable by
trisection
then the general cubic equation is solvable by trisection.
18. A quartic equation is solvable by radicals: and it is to be
remarked that the existence of such a solution depends on the
existence of 3-valued functions such as ab+cd of the four roots
(a, b, c, d): by what precedes ab+cd is the root of a cubic
equation, which equation is solvable by radicals: hence ab+cd
can be found by radicals; and since abed is a given function, ab
and cd can then be found by radicals. But by what precedes,
if ab be known then any similar function, say a+b, is obtainable
rationally; and then from the values of a+b and ab we may by
radicals obtain the value of a or b, that is, an expression for the
root of the given quartic equation: the expression ultimately
obtained is 4-valued, corresponding to the different values of the
several radicals which enter therein, and we have thus the expression by radicals of each of the four roots of the quartic
But when the quartic is numerical the same thing
equation.
happens as in the cubic, and the algebraical solution does not in
every case give the numerical one.
It will be understood from the foregoing explanation as to the
quartic how in the next following case, that of the quintic, the question
of the solvability by radicals depends on the existence or nonexistence of A-valued functions of the five roots (o, fr, c, d, e) the
fundamental theorem is the one already stated, a rational function
of five letters, if it has less than 5, cannot have more than 2 values,
that is, there are no 3-valued or 4-valued functions of 5 letters and
by reasoning depending in part upon this theorem, N. II. Abel (1824)
showed that a general quintic equation is not solvable by radicals;
and a fortiori the general equation of any order higher than 5 is not
real

by radicals.

:

solvable by radicals.
19. The general theory of the solvability of an equation by radicals
depends fundamentally on A. T. Vandermonde's remark (1770)
that, supposing an equation is solvable by radicals, and that we have
therefore an algebraical expression of x in terms of the coefficients,
then substituting for the coefficients their values in terms of the roots,
the resulting expression must reduce itself to any one at pleasure of

LM

M

,


is a rational function of the coefficients, which when these are replaced by their values as functions of the roots becomes, according to the sign given to the quadric radical, \(1 = aL^1\) or \(M^1\); taking it \(= L\), the cube root of the expression has the three values \(L, aL, iL\); and \(LM\) divided by the cube root has therefore the values \(M, aM, iM\); whence finally the expression 
\[\{b + \{(L^3 + M^3 + i(L - M)^3) + L^2 + \{(L^3 + M^3 + i(L - M)^3)\}\}\}
has the three values 
\[\{b + \{(L^3 + M^3) + L + \{(L^3 + M^3 + i(L - M)^3)\}\}\}
that is, these are \(a, b, c\) respectively. If the value \(M^1\) had been taken instead of \(L\), then the expression would have had the same three values \(a, b, c\). Comparing the solution given for the cubic \(x^3 + q = 0\), it will readily be seen that the two solutions are identical, and that the function \(r = q^{\frac{1}{3}}\) under the radical sign must (by aid of the relation \(p = 0\) which subsists in this case) reduce itself to \((L^3 - M^1)\); it is only by each radical being equal to a rational function of the roots that the final expression can become equal to the roots \(a, b, c\) respectively.

20. The formulae for the cubic were obtained by J. L. Lagrange (1770-1771) from a different point of view. Upon examining and comparing the principal known methods for the solution of algebraical equations, he found that all ultimately depended upon finding a "resolvent" equation of which the root is \(a + \omega b + \omega^2 c + \omega^3 d + \ldots\), \(\omega\) being an imaginary root of unity, of the same order as the equation; e.g., for the cubic the root is \(a + \omega b + \omega^2 c\), \(\omega\) an imaginary cube root of unity. Evidently the method gives for \(L^1\) a quadratic equation, which is the "resolvent" equation in this particular case.

For a quartic the formulae present themselves in a somewhat different form, by reason that 4 is not a prime number. Attempting to apply it to a quintic, we seek for the equation of which the root is \((a + \omega b + \omega^2 c + \omega^3 d + \omega^4 e)\), \(\omega\) an imaginary fifth root of unity, or rather the fifth power thereof \((a + \omega b + \omega^2 c + \omega^3 d + \omega^4 e)^5\); this is a 24-valued function, but if we consider the four values corresponding to the roots of unity \(\omega, \omega^2, \omega^3, \omega^4\), viz. the values 
\[\{a + \omega b + \omega^2 c + \omega^3 d + \omega^4 e\}, \{a + \omega b + \omega^2 c + \omega^3 d + \omega^4 e\}, \{a + \omega b + \omega^2 c + \omega^3 d + \omega^4 e\}, \{a + \omega b + \omega^2 c + \omega^3 d + \omega^4 e\},\]
any symmetrical function of these, for instance their sum, is a 6-valued function of the roots, and may therefore be determined by means of a sextic equation, the coefficients whereof are rational functions of the coefficients of the original quintic equation; the conclusion being that the solution of an equation of the fifth order is made to depend upon that of an equation of the sixth order. This is, of course, useless for the solution of the sextic equation, which is not symmetric and does not admit of solution by radicals; but the equation of the sixth order, Lagrange's resolvent sextic, is very important, and is intimately connected with all the later investigations in the theory.

21. It is to be remarked, in regard to the question of solvability by radicals, that not only the coefficients are taken to be arbitrary, but it is assumed that they are represented each by a single letter, or say rather that they are not so expressed in terms of other arbitrary quantities as to make a solution possible. If the coefficients are not all arbitrary, for instance, if some of them are zero, a sextic equation might be of the form \(x^6 + ax^4 + bx^2 + c = 0\), and so be solvable as a cubic; or if the coefficients of the sextic are given functions of the six arbitrary quantities \(a, b, c, d, e, f\), such that the sextic is really of the form \(x^6 + ax^4 + bx^2 + c = 0\), then it breaks up into the equations \(x^2 = a, x^2 = b, x = c, x^2 = f = 0\), and consequently soluble by radicals; so also if the form is \((x - a)(x - b)(x - c)(x - d)(x - e)(x - f) = 0\), then the equation is soluble by radicals,—in this extreme case rationally. Such cases of solvability are self-evident; but they are enough to show that the general theorem of the non-solvability by radicals of an equation of the fifth or any higher order does not in any wise exclude for such orders the existence of particular equations soluble by radicals, and there are, in fact, extensive classes of equations which are thus soluble; the binomial equations \(x^n = 1\) present an instance.
that is, this is a $6$-valued function of $a, b, c, d$, the root of a sextic (which is, in fact, solvable by radicals; but this is not here material).

If, however, $a, b, c, d$ designate the roots $r, r', r''$ of the special equation, then the expansion becomes

$$
719 \text{ tin-} 5 \\
\text{+} 719 \\
\text{xy.}$$

viz. this is

$$
\begin{align*}
&= -1 + 4\omega^2 + 16\omega^2 = 16\omega^2, \\
&\text{a completely determined value. That is, we have} \\
&(r^2 + r'^2 + r''^2) = 1 + 4\omega + 16\omega = 16\omega, \\
&\text{which results confirm the solution of the equation} \\
&U = 0, \text{we have} \\
&(r^2 + r'^2 + r''^2) = 1, \text{if} \omega = 1, \text{and} \\
&\text{if} \omega = -1, \text{then} \omega^r - (r^2 - r'^2 - r''^2) = 25; \\
&\text{if} \omega = i, \text{then we have} \\
&(r^2 - r'^2 - r''^2) = -15 + 20i; \text{and if} \omega = -i, \\
&\text{then} \omega^r = -15 - 20i; \text{the solution may be completed without difficulty.} \\
\end{align*}
$$

The result is perfectly general, thus: $n$ being a prime number, $r$ a root of the equation $x^n + x^{n-1} + \ldots + x + 1 = 0,$ $\omega$ a root of $\omega^{n-1} - 1 = 0,$ and $g$ a prime number of $g^n = 1 \pmod{n}$, then

$$(r^2 + r'^2 + r''^2) + r^2 = a^2 + b^2 + c^2 = \text{integer},$$

is a given function $M_1 + M_2 + \ldots + M_n$ with integer coefficients, and by the extraction of $(n-1)$th roots of this and similar expressions we ultimately obtain $r$ in terms of $\omega$, which is taken to be known; the equation $x^n - 1 = 0$, a prime number, is thus solvable by radicals. In particular, if $n = 2$ it is an equation of $\omega$, the solution (by either process) requires the extraction of square roots only; and it was thus that Gauss discovered that it was possible to construct geometrically the regular polygons of 17 sides and 257 sides respectively. Subsequently, with the development of the theory to the work of C. G. J. Jacobi (1837); see the memoir " Uber die Kreistheilung, u.s.w.," Crelle, t. xxx. (1836).

The equation $x^n = 1 + x^{n-1} + \ldots + x + 1 = 0$ has been considered for its own sake, but it also serves as a specimen of a class of equations solvable by radicals, considered by N. H. Abel (1828), and since called Abelian equations, viz. for the Abelian equation of the order $n$, if $x$ be any root, the roots are $x, \theta x, \theta^2 x, \ldots \theta^{n-1}$ and $\theta$ being a rational function of $x$, and $\theta(x) = \pi$; the theory is, in fact, very analogous to that of the above particular case.

A more general theorem obtained by Abel is as follows: If the roots of an equation of any order are connected together in such wise that all the roots can be expressed rationally in terms of any one of them, say $x$; if, moreover, $\theta x, \theta^2 x$ being any two of the roots, we have $\theta x = \theta x$, the equation will be solvable algebraically. It is proper to refer also to Abel's definition of an irreducible equation: viz., an equation $\phi(x)$, the coefficients of which are rational functions of a certain number of known quantities $a, b, c, \ldots$ is called irreducible when it is impossible to express its roots by an equation of an inferior degree, which is reduced to an equation of the same degree if any of the quantities are put equal to zero.

Now, the useful and important result obtained from a direct investigation in a valuable memoir by E. Luther, Crelle, t. xxxiv. (1847).

The other results demonstrated or announced by Galois may be mentioned those relating to the modular equations in the theory of elliptic functions: for the transformations of the orders 5, 7, 11, the modular equations of the orders 6, 8, 12 are expressible in the form

$$t^2 + a t + b = 0,$$

The actual reduction by means of Tschirnhausen's theorem was effected by Charles Hermite in connexion with his elliptic function solution of the quintic equation (1858) in a very elegant manner. The problem was also attacked (1881) by Lagrange, who demonstrated the correctness of his results by a direct investigation in a valuable memoir by E. Luther, Crelle, t. xxxiv. (1847).

25. Returning to quintic equations, George Birch Jerrard (1839) established the theorem that the general quintic equation is reducible by the extraction of only square and cubic roots reducible to the form $x^4 + ax^3 + bx^2 + cx + d = 0$, or what is the same thing, to $x^4 + x^3 + b x^2 + c x + d = 0$. The actual reduction by means of Tschirnhausen's theorem was effected by Charles Hermite in connexion with his elliptic function solution of the quintic equation (1858) in a very elegant manner. The problem was also attacked (1881) by Lagrange, who demonstrated the correctness of his results by a direct investigation in a valuable memoir by E. Luther, Crelle, t. xxxiv. (1847)
depends, as already mentioned, on an equation of the order 5; and conversely the general quintic equation may be made to depend upon this modular equation of the order 6; that is, assuming the solution of this modular equation, we can solve (not by dividing) the general quintic equation; this is Hermite's solution of the general quintic equation by elliptic functions (1868); it is analogous to the before-mentioned trigonometrical solution of the cubic equation. The theory is reproduced and developed in Briot's memoir, "Über die Auflösung der Gleichungen vom fünften Grade," Math. Annalen, 1. cl. (1877–1878).

26. The modern work, reproducing the theories of Galois, and exhibiting the theory of algebraic equations as a whole, is C. Jordan's "Cours de substitutions et des équations algébriques" (Paris, 1870). The work is divided into four books—book i., preliminary, relating to the theory of congruences; book ii. is in two chapters, the first relating to substitutions in general, the second to substitutions defined analytically, and chiefly to linear substitutions; book iii. has four chapters, the first discussing the principles of the general theory, the other three containing applications to algebra, geometry, and the theory of transcendents; lastly, book iv., divided into seven chapters, contains a determination of the general types of equations solvable by radicals, and a complete system of classification of these types. A glance through the index will show the vast extent which the theory has assumed. The form of some of the conclusions arrived at; thus, in book iii., the algebraical applications comprise Abelian equations, equations of Galois; the geometrical ones comprise Q. Hesse's equation, R. F. A. Clebsch's equations, lines on a quartic surface, having the singular points of E. E. Kummer's surface, lines on a cubic surface, problems of contact; the applications to the theory of transcendents comprise circular functions, elliptic functions (including division and the modular equation), hyperelliptic functions, solution of equations by transcendents. And on this last subject, solution of equations by transcendents, we may quote the result—"the solution of the general equation of an order superior to five cannot be made to depend upon that of the equations for the division of the circle or the elliptic functions; and again (but with a reference to a possible case of exception), "the general equation cannot be solved by aid of the equations which give the division of the hyperelliptic functions into an odd number of parts." (C. AMTHUR. Trans. Am. Math. Soc., 26. 1925.)

EQUATION OF THE CENTRE, in astronomy, the angular distance, measured around the centre of motion, by which a planet moving in an ellipse deviates from the mean position which it would occupy if it moved uniformly. Its amount is the correction which must be applied positively or negatively to the mean anomaly in order to obtain the true anomaly. It arises from the ellipticity of the orbit, is zero at pericentre and apocentre, and reaches its greatest amount nearly midway between these points. (See Anomaly and Orbit.)

EQUATION OF TIME, the difference between apparent time, determined by the meridian passage of the real sun, and mean time, determined by the passage of the mean sun. It goes through a double period in the course of a year. Its amount varies a fraction of a minute for the same date, from year to year and from one longitude to another, on the same day. The following table shows an average value for any date and for the Green-

EQUATOR (Late Lat. aequator, from aequare, to make equal), in geography, that great circle of the earth, equidistant from the two poles, which divides the northern from the southern hemisphere and lies in a plane perpendicular to the axis of the earth; this is termed the "geographical" or "terrestrial equator." In astronomy, the "celestial equator" is the name given to the great circle in which the plane of the terrestrial equator intersects the celestial sphere; it is consequently equidistant from the celestial poles. The "magnetic equator" is an imaginary line encircling the earth, along which the vertical component of the earth's magnetic force is zero; it nearly coincides with the terrestrial equator.

EQUERRY (from the Fr. écurie, a stable, through its older form estrie, from the Med. Lat. stræia, a word of Teutonic origin, 'a stable' or shed, cf. Ger. Scheuer; the modern spelling has confused the word with the Lat. equester, a horse), a contracted form of "gentleman of the equerry," an officer in charge of the stables of a royal household. At the British court, equerries are officers attached to the department of the master of the horse, the first of whom is called chief equerry (see HOUSEHOLD, ROYAL).

EQUIDAE, the family of perissodactyle ungulate mammals typified by the horse (Equus caballus); see HORSE. According to the older classification this family was taken to include only the forms with tall-crowned teeth, more or less closely allied to the typical genus Equus. There is, however, such an almost complete graduation from the former to earlier and more primitive mammals with short-crowned cheek-teeth, at one time included in the family Lophiodontidae (see PERISSODACTYLA), that it has now become a very general practice to include the whole "phylum" in the family Equidae. The Equidae, in this extended sense, together with the extinct Palaeotheriidae, are indeed now regarded as forming one of four main groups into which the Perissodactyla are divided, the other groups being the Tapiridae, Rhinocerotidae and Titanotheriidae. For the horse-group the name Hippoidea is employed. All four groups were closely connected in the Lower Eocene, so that exact definition is almost impossible.

In the Hippoidea there is generally the full series of 44 teeth, but the first premolar is often deciduous or wanting in the lower or, in both jaws. The incisors are chisel-shaped, and the canines tend to become isolated so as in the now specialized forms to occupy nearly the middle of a longer or shorter gap between the incisors and premolars. In the upper molars the two outer columns of the primitive tubercular molar coalesce to form an outer wall, from which proceed two crescentic transverse crests; the connexion between the crests and the wall being imperfect or slight, and the crests themselves sometimes tubercular. Each of the lower molars carries two crescentic ridges. The number of toes ranges from four to one in the fore-foot, and from three to one in the hind-foot. The paroccipital, postglenoid and posttympanic processes of the skull are large, and the latter always distinct, and the former usually there are no traces of horn-cores. The calcaneum lacks the facet for the fibula found in the Titanotheriidae.

In the earlier Equidae the teeth were short-crowned, with the premolars simpler than the molars; but there is a gradual tendency to an increase in the height of the crowns of the teeth, accompanied by increasing complexity of structure and the filling up of the hollows with cement. Similarly the gap on each side of the canine tooth in each jaw continues to increase in
The name *Pliobippus* has been applied to species from the same two formations on the supposition that the foot-structure was similar to that of *Hippidium*, but Mr J. W. Gidley is of opinion that the lateral digits may have been fully developed.

Apparently there is here some gap in the line of descent of the horse, and it may be suggested that the evolution took place, not as commonly supposed, in North America, but in eastern central Asia, of which the palaeontology is practically unknown; some support is given to this theory by the fact that the earliest species with which we are acquainted occur in northern India.

Be this as it may, the next North American representatives of the family constitute the genera *Protobippus* and *Merychippus* of the Miocene, in both of which the lateral digits are fully developed and terminate in small though perfect hoofs. In both the cheek-teeth have moderately tall crowns, and in the first named of the two those of the milk-series are nearly similar to their permanent successors. In *Merychippus*, on the other hand, the milk-molars have short crowns, without any cement in the hollows, thus resembling the permanent molars of the under-mentioned genus *Anchitherium*. From the well-known *Hipparion*, or *Hipppotherium*, typically from the Lower Pliocene of Europe, but also occurring in the corresponding formation in North Africa, Persia, India and China, and represented in the Upper Miocene Loup Fork beds of the United States by species which it has been proposed to separate generically as *Neo-

![Fig. 1.—a, Side view of second upper molar tooth of *Anchitherium* (brachyodont form); b, corresponding tooth of horse (hypsidont form).](image)

In the skull the orbit is surrounded by bone, and there is no distinct depression in front of the same. Each limb terminates in one large toe; the lateral digits being represented by the splint-bones, corresponding to the lateral metacarpals and metatarsals of *Hipparion*. Not unfrequently, however, the lower ends of the splint-bones carry a small expansion, representing the phalanges.

Remains of horses indistinguishable from *E. caballus* occur in the Pleistocene deposits of Europe and Asia; and it is from them that the dun-coloured small horses of northern Europe and Asia are probably derived. The ancestor of these Pleistocene horses is probably *E. stenonis*, of the Upper Pliocene of Europe, which has a small depression in front of the orbit, while the skull is relatively larger, the feet are rather shorter, and the splint-bones somewhat more developed. In India a nearly allied species (*E. sivalensis*), occurs in the Lower Pliocene, and may have been the ancestor of the Arab stock, which shows traces of the depression in front of the orbit characteristic of the earlier forms. In North America species of *Equus* occur in the Pleistocene and from that continent others reached South America during the same epoch. In the latter country occurs *Hippidium*, in which the cheek-teeth are shorter and simpler, and the nasal bones very long and slender, with elongated slits at the side. The limbs, especially the cannon-bones, are relatively short, and the splint-bones large. The allied Argentine *Onohippidium*, which is also Pleistocene, has still longer nasal bones and slits, and a deep double cavity in front of the orbit, part of which probably contained a gland. *Onohippidium* is certainly off the direct line of descent of the modern horses, and, on account of the length of the nasals and their slits, the same probably holds good for *Hippidium*.

Species from the Pliocene of Texas and the Upper Miocene (Loup Fork) of Oregon were at one time assigned to *Hippidium*, but this is incorrect; that genus being exclusively South American.
the outermost incisor is short, the bones of the middle part of
the leg are separate, and there are at least three toes to each foot.

The longest-known genus and the one containing the largest
species is Anchilotherium, typically from the Miocene of
Europe, but also represented by one species from the Upper
Miocene of North America. The European A. bedfordi had
succulents, and on morbid changes in the posterior columns of
the spinal cord, by which impulses are ultimately transmitted
upwards to the brain. These facts point to the existence
of impulses coming from the muscles and tendons. It is now
known that there exist peculiar spindles, in muscle, and rossetes
or coils or loops of nerve fibres in close proximity to tendons.
These are the end organs of the sense. The transmission of
impulses gives rise to the muscular sense, and the guiding sensa-
tion which precedes co-ordinated muscular movements depends
on these impulses. Thus from the limbs streams of nervous
impulses pass to the sensorium from the skin and from muscles
and tendons; these may or may not arouse consciousness, but
they guide or evoke muscular movements of a co-ordinated
character, more especially of the limbs.

In animals whose limbs are not adapted for delicate touch nor
for the performance of complicated movements, such as some
mammals and birds and fishes, the guiding sensations depend
largely on the sense of vision. This sense in man, instead of
assisting, sometimes disturbs the guiding sensation. It is true
that in locomotor ataxia visual sensations may take the place
of the tactile and muscular sensations that are inefficient, and
the man can walk without staggering if he is allowed to look at
the floor, and especially if he is guided by transverse straight
lines. On the other hand, the acrobat on the wire-ropes dare not
trust his visual sensations in the maintenance of his equilibrium.
He keeps his eyes fixed on one point instead of allowing them to
wander to objects below him, and his muscular movements are
regulated by the impulses that come from the skin and muscles
of his limbs. The feeling of insecurity probably arises from a
conception of height, and also from the knowledge that by no
muscular movements can a man avoid a catastrophe if he should
fall. A bird, on the other hand, depends largely on visual
impressions, and it knows by experience that if it launched into
the air from a height it can fly. Here, probably, is an explanation
of the large size of the eyes of birds. Cover the head, as in hood-
ing a falcon, and the bird seems to be deprived of the power of
voluntary movement. Little effect will be produced if we attempt
to restrain the movements of the eyes, or to close the eyelids.
A fish also is deprived of the power of motion if its eyes are
closed. But both in the bird and in the fish tactile and muscular
impressions, especially the latter, come into play in the mechanism
of equilibrium. In flight the large-winged birds, especially in
soaring, can feel the most delicate wind-pressures, both as
regards direction and force, and they adapt the position of their
body so as to catch the pressure at the most efficient angle.
The same is true of the fish, especially of the flat-fishes. In
mammals the sense of equilibrium depends, then, on streams
to tactile, muscular and visual impressions pouring in on the
sensorium, and calling forth appropriate muscular movements.
It has also been suggested that impulses coming from the abdomi-
nal viscera may play a part in the mechanism. The presence
in the mesentery of felines (cats, &c.) of large numbers of Pacinian
corpuscles, which are believed to be modified tactile bodies,
falls in this favour. Such animals are remarkable for the
delicacy of such muscular movements, as balancing and leaping.

There is another channel by which nervous impulses reach the
sensorium and play their part in the sense of equilibrium, namely,
from the semicircular canals, a portion of the internal ear. It is
pointed out in the article Hearing that the appreciation of sound
is in reality an appreciation of variations of pressure. The
labyrinth consists of the vestibule, the cochlea and the semi-
circular canals. The cochlea receives the sound-waves (varia-
tions of pressure) that constitute musical tones. It accomplis-
hes by the structures in the ductus cochleares. In the vesti-
bule we find two sacs, the sacculus next to and communicating
with the ductus cochleares, and the utriculus communicating
with the semicircular canals. The base of the stapes communicates,

**EQUILIBRIUM**

(From the Lat. aequus, equal, and libra, a balance), a condition of equal balance between opposite or
counteracting forces. By the "sense of equilibrium" is meant
the sense, or sensations, by which we have a feeling of security
in standing, walking, and indeed in all the movements by which
the body is carried through space. Such a feeling of security
is necessary both for maintaining any posture, such as standing,
or for performing any movement. If this feeling is absent or
uncertain, or if there are contradictory sensations, then definite
muscular movements are inefficient or irregularly performed,
and the balance is insecure or fall. When we stand erect on a
firm surface, like a floor, there is a feeling of resistance, due to
nervous impulses reaching the brain from the soles of the feet
and from the muscles of the limbs and trunk. In walking or
running, these feelings of resistance seem to precede and guide
the muscular movements necessary for the next step. If these
are absent or perverted or deficient, as is the case in the disease
known as locomotor ataxia, then, although there is no loss of
the power of voluntary movement, the patient staggers in walking,
especially if he is not allowed to look at his feet, or if he is blind-
folded. He misses the guiding sensations that come from the
limbs; and with a feeling that he is walking on a soft substance,
offering little, no resistance, he staggers, and his muscular
movements become irregular. Such a condition may be artificially
brought about by washing the soles of the feet with chloroform
or ether. And it has been observed to exist partially after
extensive destruction of the skin of the soles of the feet by burns
or scalds. This shows that tactile impulses from the skin take
a share in generating the guiding sensation. In the disease
above mentioned, however, tactile impressions may be nearly
normal, but the guiding sensation is weak and inefficient, owing
to the absence of impulses from the muscles. The disease is
known to be associated with nodular changes in the posterior columns of
the spinal cord, by which impulses are eventually transmitted
upwards to the brain. These facts point to the existence of
impulses coming from the muscles and tendons. It is now
known that there exist peculiar spindles, in muscle, and rossetes
or coils or loops of nerve fibres in close proximity to tendons.
These are the end organs of the sense. The transmission of
impulses gives rise to the muscular sense, and the guiding sensation
which precedes co-ordinated muscular movements depends
on these impulses. Thus from the limbs streams of nervous
impulses pass to the sensorium from the skin and from muscles
and tendons; these may or may not arouse consciousness, but
they guide or evoke muscular movements of a co-ordinated
character, more especially of the limbs.

In animals whose limbs are not adapted for delicate touch nor
for the performance of complicated movements, such as some
mammals and birds and fishes, the guiding sensations depend
largely on the sense of vision. This sense in man, instead of
assisting, sometimes disturbs the guiding sensation. It is true
that in locomotor ataxia visual sensations may take the place
of the tactile and muscular sensations that are inefficient, and
the man can walk without staggering if he is allowed to look at
the floor, and especially if he is guided by transverse straight
lines. On the other hand, the acrobat on the wire-ropes dare not
trust his visual sensations in the maintenance of his equilibrium.
He keeps his eyes fixed on one point instead of allowing them to
wander to objects below him, and his muscular movements are
regulated by the impulses that come from the skin and muscles
of his limbs. The feeling of insecurity probably arises from a
conception of height, and also from the knowledge that by no
muscular movements can a man avoid a catastrophe if he should
fall. A bird, on the other hand, depends largely on visual
impressions, and it knows by experience that if it launched into
the air from a height it can fly. Here, probably, is an explanation
of the large size of the eyes of birds. Cover the head, as in hood-
ing a falcon, and the bird seems to be deprived of the power of
voluntary movement. Little effect will be produced if we attempt
to restrain the movements of the eyes, or to close the eyelids.
A fish also is deprived of the power of motion if its eyes are
closed. But both in the bird and in the fish tactile and muscular
impressions, especially the latter, come into play in the mechanism
of equilibrium. In flight the large-winged birds, especially in
soaring, can feel the most delicate wind-pressures, both as
regards direction and force, and they adapt the position of their
body so as to catch the pressure at the most efficient angle.
The same is true of the fish, especially of the flat-fishes. In
mammals the sense of equilibrium depends, then, on streams
to tactile, muscular and visual impressions pouring in on the
sensorium, and calling forth appropriate muscular movements.
It has also been suggested that impulses coming from the abdomi-
nal viscera may play a part in the mechanism. The presence
in the mesentery of felines (cats, &c.) of large numbers of Pacinian
corpuscles, which are believed to be modified tactile bodies,
falls in this favour. Such animals are remarkable for the
delicacy of such muscular movements, as balancing and leaping.

There is another channel by which nervous impulses reach the
sensorium and play their part in the sense of equilibrium, namely,
from the semicircular canals, a portion of the internal ear. It is
pointed out in the article Hearing that the appreciation of sound
is in reality an appreciation of variations of pressure. The
labyrinth consists of the vestibule, the cochlea and the semi-
circular canals. The cochlea receives the sound-waves (varia-
tions of pressure) that constitute musical tones. It accomplis-
hes by the structures in the ductus cochleares. In the vesti-
bule we find two sacs, the sacculus next to and communicating
with the ductus cochleares, and the utriculus communicating
with the semicircular canals. The base of the stapes communicates,
pressures to the utricle. The membranous portion of the semi-
circular canals consists of a tube, dilated at one end into a
swelling or pouch, termed the ampulla, and each end com-
municates freely with the utricle. On the posterior wall of both
the sacculc and of the utricle there is a ridge, termed in each case
the macula acustica, bearing a highly specialized epithelium.
A similar structure exists in each ampulla. This would suggest
that all three structures have to do with hearing; but, on the
other hand, there is experimental evidence that the utricle
and the canals may transmit impressions that have to do with
equilibrium. Pressure of the base of the staples is exerted on
the utricle. This will compress the fluid in that cavity, and tend
to drive the fluid into the semicircular canals that communicate
with that cavity by five openings. Each canal is surrounded by
a thin layer of perilymph, so that it may yield a little to this
pressure, and exert a pull or pressure on the nerve-endings
in each ampulla. Thus impulses may be generated in the nerves
of the ampullae.

The three semicircular canals lie in the three directions in
space, and it has been suggested that they have to do with our
appreciation of the direction of sound. But our appreciation of
sound is very inaccurate: we look with the eyes for the source
of a sound, and instinctively direct the ears or the head, or both,
in the direction from which the sound appears to proceed. But
the relationship of the canals on the two sides must have a
physiological significance. Thus (1) the six canals are parallel,
two and two; or (2) the two horizontal canals are in the same
plane, while the superior canal on one side is nearly parallel with
the posterior canal of the other. These facts point to the two
sets of canals and ampullae acting as one organ, in a manner
analogous to the action of two retinæ for single vision.

We have next to consider how the canals may possibly act in
connexion with the sense of equilibrium. In 1820 J. Purkinje
studied the vertigo that follows rapid rotation of the body in the
erect position on a vertical axis. On stopping the rotation there
is a sense of rotation in the opposite direction, and this may
occur even when the eyes are closed. Purkinje noticed that the
position of the imaginary axis of rotation depends on the axis
around which the head revolves. In 1828 M. J. F. Flourens
discovered that injury to the canals causes disturbance to the
equilibrium and loss of co-ordination, and that sections of the
canals produce a rotatory movement of a kind corresponding
to the canal that had been divided. Thus division of a mem-
branous canal causes rotatory movements round an axis at right
angles to the plane of the divided canal. The body of the animal
always moves in the direction of the cut canal. Many other
observers have corroborated these experiments. F. Golz was
the first who formulated the conditions necessary for equilibra-
tion. He put the matter thus:—(1) A central co-ordinating organ—in the brain; (2) centripetal fibres, with their peripheral
terminations—in the ampullæ; and (3) centrifugal fibres, with
their terminal organs—in the muscular mechanisms. A lesion of
any one of these portions of the mechanism causes loss or im-
pairment of balancing. Cyon also investigated the subject, and
concluded:—(1) To maintain equilibrium, we must have an
accurate notion of the position of the head in space; (2) the
function of the semicircular canals is to communicate impressions
that give a representation of this position—each canal having a
relation to one of the dimensions of space; (3) disturbance of
equilibrium follows section; (4) involuntary movements follow-
 ing section are due to abnormal excitations; (5) abnormal
movements occurring a few days after the operation are caused
by the structure of the semicircular canals.

On theoretical considerations of a physical character, E. Mach,
Crumb-Brown and Breuer have advanced theories based on the
idea of the canals being organs for sensations of acceleration of
movement, or for the sense of rotation. Mach first pointed out
that Purkinje's phenomena, already alluded to, were in all
probability related to the semicircular canals. He showed that
when the body is moved in space, in a straight line, we are not
conscious of the velocity of motion, but of variations in this
velocity. Similarly, if a body is rotated round a vertical axis,
we perceive only angular acceleration and not angular velocity.
The sensations produced by angular acceleration last longer
than the acceleration itself, and the position of the head during
the movements enables us to determine direction. Both Mach
and Golz state that varying pressures of the fluid in the canals
produced by angular rotation produce sensations of movement
(always in a direction opposite to the rotation of the body),
and that these, in turn, cause the vertigo of Purkinje and the
phenomena of Flourens. Mach, Crumb-Brown and Breuer ad-
vance hydrodynamical theories in which they assume that the
fluids move in the canals. Golz, on the other hand, supports a
hydrostatic theory in which he assumes that the phenomena
can be accounted for by varying pressures. Crumb-Brown differs
from Mach and Breuer as follows:—(1) In attributing movement
or variation of pressure not merely to the endolymph, but also
to the walls of the membranous canals and to the surrounding
perilymph, and (2) in regarding the two labyrinths as one
organ, all the six canals being required to form a true conception
of the rotating motion of the head. He sums up the matter thus:
"We have two ways in which a real motion can occur between
the endolymph and the walls of the cavity containing it:—(1) When the head begins to move, here the walls leave the fluid behind; (2) when the head stops, here the fluid flows on.
In both cases the sensation of rotation is felt. In the first
this sensation corresponds to a real rotation, in the second it
does not, but in both it corresponds to a real acceleration (positive
or negative) of rotation, using the word, acceleration in its
technical kinematical sense.

Cyon states that the semicircular canals only indirectly assist
in giving a notion of spatial relations. "If he holds that knowledge
of the position of bodies in space depends on nervous impulses
coming from the contracting ocular muscles; that the oculo-
motor centres are in intimate physiological relationship with
the centres receiving impulses from the nerves of the semicircular
canals; and that the oculomotor centres, thus excited, produce
the movements of the eyeballs, which then determine our notions
of spatial relations." These views are supported by experiments
of Lee on dog-fish. When the fish is rotated round different
axes there are compensating movements of the eyes and fins.
"It was observed that if the fish were rotated in the plane of
one of the canals, exactly the same movements of the eyes and
fins occurred as were produced by experimental operation and
stimulation of the ampulla of that canal." Sewall, in 1883,
carried out experiments on young sharks and skates with negative
results. Lee returned to the subject in 1894, and, after numerous
experiments on dog-fish, in which the canals or the auditory
nerves were divided, obtained evidence that the ampullæ con-
tain sense-organs connected with the sense of equilibrium.
It has been found by physicians and aurists that disease or
injury of the canals, occurring rapidly, produces giddiness,
staggering, nystagmus (a peculiar twitching movement of the
eyeballs), vomiting, noises in the ear, and more or less deafness.
It is said, however, that if pathological changes come on slowly, so that the canals and vestibule are converted
into a solid mass, none of these symptoms may occur. On
the whole, the evidence is in favour of the view that from the semi-
circular canals nervous impulses are transmitted, which, co-
ordinated with impulses coming from the visual organs, from
the muscles and from the skin, form the bases of these guiding
sensations on which the sense of equilibrium depends.
These impulses may not reach the level of consciousness, but they
call into action co-ordinated mechanisms by which complicated
muscular movements are executed.

vol. ii. p. 1194.

EQUINOX (from the Lat. æquinus, equal, and nght, night), a
term used to express either the moment at which, or the point at
which, the sun apparently crosses the celestial equator. Since
the sun moves in the ecliptic, it is in the last-named sense the
point of intersection of the ecliptic and the celestial equator.
This is the usual meaning of the term in astronomy. There are
two such points, opposite each other, at one of which the sun crosses the equator toward the north and at the other toward the south. They are called vernal and autumnal respectively, from the relation of the corresponding times to the seasons of the northern hemisphere. The line of the equinoaxes is the imaginary diameter of the celestial sphere which joins them. The angles at the center of the sphere which the right ascensions and the longitudes of the heavenly bodies are measured (see Astronomy: Spherical). It is affected by the motions of Precession and Nutation, of which the former has been known since the time of Hipparchus. The actual equinoax is defined by first taking the conception of a fictitious point called the Mean Equinoax, which moves at a nearly uniform rate, slow varying, however, from century to century. The true equinoax then moves around the mean equinoax in a period equal to that of the moon’s nodes. These two motions are defined with greater detail in the articles PRECESSION OF THE EQUINOAXES and NUTATION.

Equinoaxial Gales.—At the time of the equinoax it is commonly believed that strong gales may be expected. This popular idea has no foundation in fact, for continued observations have failed to show any unusual prevalence of gales at this season. In one case observations taken for fifty years show that during the five days from the 21st to the 25th of March and September, there were fewer gales and storms than during the preceding and succeeding five days.

Equites ("horsemen", or "knights", from equus, "horse"), in Roman history, originally a division of the army, but subsequently a distinct political order, which under the empire resumed its military character. According to the traditional account, Romulus instituted a cavalry corps, consisting of three centuriae ("hundreds"), called after the three tribes from which they were taken (Ramos, Tities, Luceres), divided into ten turmae ("squadrons") of thirty men each. The collective name for the corps was celerec ("the swift," or possibly from κλής, "a riding horse"); Livy, however, restricts the term to a special body-guard of Romulus. The statements in ancient authorities as to the changes in the number of the equites during the regal period are very confusing; but it is regarded as certain that Servius Tullius found six centuries in existence, to which he added twelve, making eighteen in all, a number which remained unchanged throughout the republican period. A proposal by M. Porcius Cato the elder to supplement the deficiency in the cavalry by the creation of four additional centuries was not adopted. The earlier centuries were called sex sufragia ("three voicings") and at first consisted exclusively of patricians, while those of Servius Tullius were entirely or for the most part plebeian. Until the reform of the comitia centuriata (probably during the censorship of Gaius Flaminius in 220 B.C.; see Comitia), the equites had voted first, but after that time this privilege was transferred to one century selected by lot from the centuries of the equites and the first class. The equites then voted with the first class, the distinction between the sex sufragia and the other centuries being abolished.

Although the equites were selected from the wealthiest citizens, service in the cavalry was so expensive that the state gave financial assistance. A sum of money (aes equestre) was given to each equus for the purchase of two horses (one for himself and the other for his keep), and for his keep (aes hordearium); hence the name equus equestre pubico. In later times, pay was substituted for the aes hordearium, three times as much as that of the infantry. If competent, an equus could retain his horse and vote after the expiration of his ten years' service, and (till 129 B.C.) even after entry into the senate.

As the demands upon the services of the cavalry increased, it was decided to supplement the regulars by the enrolment of wealthy citizens who kept horses of their own. The origin of these equites eque private dates back, according to Livy (v. 7), to the siege of Veii, when a number of young men came forward and offered their services. According to Mommsen, although the institution was not intended to be permanent, in later times vacancies in the ranks were filled in this manner, with the result that service in the cavalry, with either a public or a private horse, became obligatory upon all Roman citizens possessed of a certain income. These equites eque private had no vote in the centuries, received pay in place of the aes equestre, and did not form a distinct corps.

Thus, at a comparatively early period, three classes of equites may be distinguished: (a) the patrician equites eque publico of the sex sufragia; (b) the plebeian equites in the twelve remaining centuries; (c) the equites eque private, both patrician and plebeian.

The equites were originally chosen by the curiae, then in succession by the kings, the consuls, and (after 443 B.C.) by the censors, by whom they were reviewed every five years in the Forum. Each equus, as his name was called out, passed before the censors, leading his horse. Those whose physique and character were satisfactory, and who had taken care of their horses and equipments, were bidden to lead their horse on (traducere equum), those who failed to pass the scrutiny were ordered to sell it, in token of their expulsion from the corps. This inspection (recongitio) must not be confused with the full-dress procession (transvectio) on the 17th of July from the temple of Mars or Honos to the Capitol, instituted in 304 B.C. by the censor Q. Fabius Maximus Rullianus to commemorate the miraculous intervention of Castor and Pollux at the battle of Lake Regillus. Both inspection and procession were discontinued before the end of the republic, but revived and in a manner combined by Augustus.

In theory, the twelve plebeian centuries were open to all free-born youths of the age of seventeen, although in practice preference was given to the members of the older families. Other requirements were sound health, high moral character and an honourable calling. At the beginning of the republican period, senators were included in the equestrian centuries. The only definite information as to the amount of fortune necessary refers to later republican and early imperial times, when it is known to have been 400,000 sesterces (about £350 to £4000). The insignia of the equites were, at first, distinctly military—such as the purple-edged, short military cloak (trabeo) and decorations for service in the field.

With the extension of the Roman dominions, the equites lost their military character. Prolonged service abroad possessed little attraction for the pick of the Roman youth, and recruiting for the cavalry from the equestrian centuries was discontinued. The equites remained at home, or only went out as members of the general's staff, their places being taken by the equites ordinarie, the cavalry of the allies and the most skilled horsemen of the subject populations. The first gradually disappeared, and Roman citizens were rarely found in the ranks of the effective cavalry. In these circumstances there grew up in Rome a class of wealthy men, whose sole occupation it was to amass large fortunes by speculation, and who found a most lucrative field of enterprise in state contracts and the farming of the public revenues. These tax-farmers (see Publicani) were already in existence at the time of the Second Punic War; and their numbers and influence increased as the various provinces were added to the Roman dominions. The change of the equites into a body of financiers was further materially promoted (a) by the lex Claudia (218 B.C.), which prohibited senators from engaging in financial pursuits, especially if (as seems probable) it included public contracts (cf. Flaminius, Gaius); (b) by the enactment in the time of Gaius Gracchus excluding members of the senate from the equestrian centuries. These two measures definitely marked off the aristocracy of birth from the aristocracy of wealth—the landed proprietor from the capitalist. The term equites, originally confined to the purely military equestrian centuries of Servius Tullius, now came to be applied to all who possessed the property qualification of 400,000 sesterces.

As the equites practically monopolized the farming of the taxes, they came to be regarded as identical with the publicani, not, as Pliny remarks, because any particular rank was necessary to obtain the farming of the taxes, but because such occupation was beyond the reach of all except those who were possessed of considerable means. Thus, at the time of the Gracchi, these
equites-publicani formed a close financial corporation of about 30,000 members, holding an intermediate position between the nobility and the lower classes, keenly alive to their own interests, and ready to stand by one another when attacked. Although to some extent looked down upon by the senate as following a senatorial path, they had as a rule sided with the latter, as being at least less hostile to them than the democratic party. To obtain the support of the capitalists, Gaius Gracchus conceived the plan of creating friction between them and the senate, which he carried out by handing over to them the control (a) of the jury-courts, and (b) of the revenues of Asia.

(a) Hitherto, the list of jurors for service in the majority of processes, both civil and criminal, had been composed exclusively of senators. The result was that charges of corruption and extortion failed, when brought against members of that order, even in cases where there was little doubt of their guilt. The popular indignation at such scandalous miscarriages of justice rendered a change in the composition of the courts imperative. Apparently Gracchus at first proposed to create new senators from the equites and to select the jurors from this mixed body, but this moderate proposal was rejected in favour of one more radical (see W. W. Fowler in Classical Review, July 1896). By the Lex Sempronia (123 B.C.) the list was to be drawn from persons of free birth over thirty years of age, who must possess the equestrian census, and must not be senators. Although this measure was bound to set senators and equites at variance, it in no way improved the lot of those chiefly concerned. In fact, it brought a number of the luckless provincials, whose only appeal lay to a body of men whose interests were identical with those of the publicani. Provided he left the tax-gatherer alone, the governor might squeeze what he could out of the people, while on the other hand, if he were humanely disposed, it was dangerous for him to remonstrate.

(b) The taxes of Asia had formerly been paid by the inhabitants themselves in the shape of a fixed sum. Gracchus ordered that the taxes, direct and indirect, should be increased, and that the summing of them should be put up to auction at Rome. By this arrangement the provincials were ignored, and everything was left in the hands of the capitalists.

From this time dates the existence of the equestrian order as an officially recognized political instrument. When the control of the courts passed into the hands of the property equites, all who were summoned to undertake the duties of judges were called equites; the ordo judicium (the official title) and the ordo eques was regarded as identical. It is probable that certain privileges of the equites were due to Gracchus; that of wearing the golden ring, hitherto reserved for senators; that of special seats in the theatre, subsequently withdrawn (probably by Sulla) and restored by the lex Othonis (67 B.C.); the narrow band of purple on the tunic as distinguished from the broad band worn by the senators.

Various attempts were made by the senate to regain control of the courts, but without success. The Lex Livia of M. Livius Drusus (g.v.), passed with that object, but irregularly and by the aid of violence, was annulled by the senate itself. In 82 B.C. Sulla restored the right of serving as judges to the senate, to which he elevated 300 of the most influential equites, whose support he thus hoped to secure; at the same time he indirectly dealt a blow at the order generally, by abolishing the office of the censor (immediately revived), in whom was vested the right of bestowing the public horse. To this period Mommsen assigns the regulation, generally attributed to Augustus, that the sons of senators should be knights by right of birth. By the lex Aurelia (70 B.C.) the judices were to be chosen in equal numbers from senators, equites and tribuni sacerdotes (see AERARIUM), the last-named being closely connected with the equites, who thus practically commanded a majority. About this time the influence of the equestrian order reached its height, and Cicero's great object was to reconcile it with the senate. In this he was successful at the time of the Catilinarian conspiracy, in the suppression of which he was materially aided by the equites. But the union did not last long; shortly afterwards the majority ranged themselves on the side of Julius Caesar, who did away with the tribuni sacerdotes as judges, and replaced them by equites.

Augustus undertook the thorough reorganization of the equestrian order on a military basis. The equites quo privato were abolished (according to Herzog, not till the reign of Tiberius) and the term equites was officially limited to the equites quo publico, although all who possessed the property qualification were still considered to belong to the "equestrian order." For the equites quo publico high moral character, good health and the equestrian fortune were necessary. Although free birth was considered indispensable, the right of wearing the golden ring (jus annui aurei) was frequently bestowed by the emperor upon freedmen, who thereby became ingenui and eligible as equites. Tiberius, however, insisted upon free birth on the father's side to the third generation. Extreme youth was no bar; the emperor Marcus Aurelius had been an eques at the age of six. The sons of senators were eligible by right of birth, and appear to have been known as equites illustres. The right of bestowing the eques publicus was vested in the emperor; once given, it was for life, and was only forfeitable through degradation for some offence or the loss of the equestrian fortune.

Augustus divided the equites into six turmae (regarded by Hirschfeld as a continuation of the sex suffragia). Each was under the command of a sevir (Drapxer), who was appointed by the emperor and changed every year. During their term of command the seviri had to exhibit games (ludi sevillates). Under these officers the equites formed a kind of corporation, which, although the officer's rank was high, the right of passing resolutions, chiefly such as embodied acts of homage to the imperial house. It is not known whether the turmae contained a fixed number of equites; there is no doubt that, in assigning the public horse, Augustus went far beyond the earlier figure of 1800. Thus, Dionysius of Halicarnassus mentions 5000 equites as taking part in a review at which he himself was present.

As before, the equites wore the narrow, purple-striped tunic, and the gold ring, the latter now being considered the distinctive badge of knighthood. The fourteen rows in the theatre were extended by Augustus to seats in the circus.

The old recognito was replaced by the probatio, conducted by the emperor in his censorial capacity, assisted by an advisory board of specially selected senators. The ceremony was combined with a procession, which, like the earlier transvectio, took place on the 15th of July, and at such other times as the emperor pleased. As in earlier times, offenders were punished by expulsion.

In order to provide a supply of competent officers, each eques was required to fill certain subordinate posts, called militiae equestres. These were (1) the command of an auxiliary cohort; (2) the tribunate of a legion; (3) the command of an auxiliary cavalry squadron, this order being as a rule strictly adhered to. To these Septimius Severus added the centurionship. Nominations to the militiae equestres was in the hands of the emperor.

After the completion of their temporary military service, the equites were eligible for a number of civil posts, chiefly those with which the emperor himself was closely concerned. Such were various procuratorships; the prefectures of the corn supply, of the fleet, of the watch, of the praetorian guards; the governorships of recently acquired provinces (Egypt, Noricum), the others being reserved for senators. At the same time, the abolition of the indirect method of collecting the taxes in the provinces greatly reduced the political influence of the equites. Certain religious functions of minor importance were also reserved for them. In the jury courts, the equites, thanks to Julius Caesar, already formed two-thirds of the judges; Augustus, by excluding the senators altogether, virtually gave them the sole control of the tribunals. One of the chief objects of the emperors being to weaken the influence of the senate by the opposition of the equestrian order, the practice was adopted of elevating those equites who had reached a certain stage in their career to the rank of senator by adoptio. Certain official posts, of which it would have been inadvisable to deprive senators, could thus be bestowed upon the promoted equites.

The control of the imperial correspondence and purse was
at first in the hands of freedmen and slaves. The emperor Claudius tentatively entrusted certain posts connected with these to the equites; thus in the time of Hadrian this became the regular custom. Thus a civil career was open to the equites without the obligation of preliminary military service, and the emperor was freed from the pernicious influence of freedmen. After the reign of Marcus Aurelius (according to Mommsen) the equites were divided into: (a) praetorian prefects and the heads of the financial and secretarial departments; (b) viri perfectissimi, the other prefects and the heads of the financial and secretarial departments; (c) viri egregii, first mentioned in the reign of Antoninus Pius, a title by right of the procurators generally.

Under the empire the power of the equites was at its highest in the time of Diocletian; in consequence of the transference of the capital to Constantinople, they sank to the position of a mere city guard, under the control of the prefect of the watch. Their history may be said to end with the reign of Constantine the Great.

Mention may also be made of the equites singulares Augusti. The body-guard of Augustus, consisting of foreign soldiers (chiefly Germans and Batavians), abolished by Julian, was revived from the time of Trajan or Hadrian under the above title. It was chiefly recruited from the pick of the provincial cavalry, but contained some Roman citizens. It formed the imperial "Swiss guard," and never left the city except to accompany the emperor. In the time of Severus, these equites were divided into two corps, each of which had its separate quarters, and was commanded by a tribune under the orders of the prefect of the praetorian guard. They were subsequently replaced by the protectores Augusti.

**EQUITY (Lat. aequitas),** a term which in its most general sense means equality or justice; in its most technical sense it means a system of law, or a body of connected legal principles, which have superseded or supplemented the common law on the ground of their intrinsic superiority. Aristotle (Ethics, bk. v. c. 10) defines equity as a better sort of justice, which corrects legal justice where the latter errs through being expressed in a universal form and not taking account of particular cases. When the law speaks universally, and something happens which is not according to the common course of events, it is right that the law should be modified in its application to that particular case, as the lawgiver himself would have done, if the case had been present to his mind. Accordingly the equitable man (trespessis) is he who does not push the law to its extreme, but, having legal justice on his side, is disposed to make allowances. Equity as thus defined would correspond rather to the judicial discretion which modifies the administration of the law than to the antagonistic system which claims to supersede the law.

The part played by equity in the development of law is admirably illustrated in the well-known work of Sir Henry Maine on Ancient Law. Positive law, at least in progressive societies, is constantly tending to fall behind public opinion, and the expedients adopted for bringing it into harmony therewith are three, viz. legal fictions, equity and statutory legislation. Equity here is defined to mean "any body of rules existing by the side of the original civil law, founded on distinct principles, and claiming incidentally to supersede the civil law in virtue of a superior sanctity inherent in those principles." It is thus different from legal fiction, by which a new rule is introduced surreptitiously, and under the pretence that no change has been made in the law, and from statutory legislation, in which the obligatory force of the rule is not supposed to depend upon its intrinsic fitness. The source of Roman equity was the fertile theory of natural law, or the law common to all nations. Even in the Institutes of Justinian the distinction is carefully drawn in the laws of a country between those which are peculiar to itself and those which are common to all nations. The point of connection in Roman law between the ideas of equity, nature, right and the law common to all nations, and the influence of the Stoical philosophy on their development, are fully discussed in the third chapter of the work we have referred to. The agency by which these principles were introduced was the edicts of the praetor, an annual proclamation setting forth the manner in which the magistrate intended to administer the law during his year of office. Each successive praetor adopted the edict of his predecessor, and added new equitable rules of his own, until the further growth of the irregular code was stopped by the praetor Salvius Julianus in the reign of Hadrian.

The place of the praetor was occupied in English jurisprudence by the lord high chancellor. The real beginning of English equity is to be found in the custom of handing over to that officer, for adjudication, the complaints which were addressed to the king, praying for remedies beyond the reach of the common law. Over and above the authority delegated to the ordinary councils or, courts, a reserve of judicial power was believed to reside in the king, which was invoked as of grace by the suitors who could not obtain relief from any inferior tribunal. To the chancellor, as already the head of the judicial system, these petitions were referred, although he was not at first the only officer through whom the prerogative of grace was administered. In the reign of Edward III. the equitable jurisdiction of the court appears to have been established. Its constitutional origin was analogous to that of the star chamber and the court of requests. The latter, in fact, was a minor court of equity attached to the lord privy seal as the court of chancery was to the chancellor. The successful assumption of extraordinary or equitable jurisdiction by the chancellor caused similar pretensions to be made by other officers and courts. "Not only the court of exchequer, whose functions were in a peculiar manner connected with royal authority, but the counties palatine of Chester, Lancaster and Durham, the court of great session in Wales, the universities, the city of London, the Cinque Ports and other places silently assumed extraordinary jurisdiction similar to that exercised in the court of chancery." Even private persons, lords and ladies, affected to establish in their households courts of equity analogous to that of the star chamber and the court of requests.

English equity has one marked historical peculiarity, viz. that it established itself in a set of independent tribunals which remained in standing contrast to the ordinary courts for many hundred years. In Roman law the judge gave the preference to the equitable rule; in English law the equitable rule was enforced by a distinct set of judges. One cause of this separation was the rigid adherence to precedent on the part of the common law courts. Another was the jealousy prevailing in England against the principles of the Roman law on which English equity to a large extent was founded.

When a case of equity came to be referred to the chancellor in the reign of Edward III., he was required to grant such remedy as should be consonant to honesty (honestas). And honesty, conscience and equity were said to be the fundamental principles of the court. The early chancellors were ecclesiastics, and under their influence not only moral principles, where these were not regarded by the common law, but also the equitable principles of the Roman law were introduced into English jurisprudence. Between this point and the time when equity became settled as a portion of the legal system, having fixed principles of its own, various views of its nature seem to have prevailed. For a long time it was thought that precedents could have no place in equity, inasmuch as it professed in each case to do that which was just; and we find this view maintained by common lawyers after it had been abandoned by the professors of equity themselves. G. Spence, in his book on the Equitable Jurisdiction of
the Court of Chancery, quotes a case in the reign of Charles II., in which Chief Justice Vaughan said:

"I wonder to hear of citing of precedents in matter of equity, for if there be equity in a case, that equity is an universal truth, and there can be no precedent in it; so that in any precedent that can be produced, if it be the same with this case, the reason and equity is the same in that; and if the precedent be not the same case with this it is not to be cited."

But the lord keeper Bridgeman answered:

"Certainly precedents are very necessary and useful to us, for in them we may find the reasons of the equity to guide us, and besides the authority of those who made them is much to be regarded. We shall suppose they did it upon great consideration and with care of the matter, and it would be very strange and very ill if we should disturb and set aside what has been the course for a long series of times and ages."

Selden's description is well known: "Equity is a roguish thing. 'Tis all one as if they should make the standard for measure the chancellor's foot." Lord Nottingham in 1676 reconciled the ancient theory and the established practice by saying that the conscience which guided the court was not the natural conscience of the man, but the civil and political conscience of the judge. The same tendency of equity to settle into a system of law is seen in the recognition of its limits—in the fact that it did not attempt in all cases to give a remedy when the rule of the common law was contrary to justice. Cases of hardship, which the early chancellors would certainly have relieved, were passed over by later judges, simply because no precedent could be found for their interference. The point at which the introduction of new principles of equity finally stopped is fixed by Sir Henry Maine in the chancellorship of Lord Eldon, who held that the doctrines of the court ought to be as well settled and made as uniform almost as those of the common law. From that time certainly equity, like common law, has professed to take its principles wholly from recorded decisions and statute law. The view (traceable no doubt to the Aristotelian definition) that equity mitigates the hardships of the law where the law errrs through being framed in universals, is to be found in some of the earlier writings. Thus in the Doctor and Student it is said:

"Law makers take heed to such things as may often come, and not to every particular case, for they could not though they would; therefore, in some cases it is necessary to leave the words of the law and follow that reason and justice requireth, and to that intent equity is ordained, that is to say, to temper and mitigate the rigour of the law."

And Lord Ellesmere said:

"The cause why there is a chancery is for that men's actions are so divers and infinite that it is impossible to make any general law which shall apply meet with every particular act and not fall in some circumstances.

Modern equity, it need hardly be said, does not profess to soften the rigour of the law, or to correct the errors into which it falls by reason of its generality.

To give any account, even in outline, of the subject matter of equity within the necessary limits of this article would be impossible. It will be sufficient to say here that the classification generally adopted by text-writers is based upon the relations of equity to the common law, of which some explanation is given above. Thus equitable jurisdiction is said to be exclusive, concurrent or auxiliary. Equity has exclusive jurisdiction where it recognizes rights which are unknown to the common law. The most important example is trusts. Equity has concurrent jurisdiction in cases where the law recognized the right but did not give adequate relief, or did not give relief without circuity of action or some similar inconvenience. And equity has auxiliary jurisdiction when the machinery of the courts of law was unable to procure the necessary evidence.

"The evils of this double system of judicature," says the report of the Judicature Commission (1863-1867), "and the confusion and conflict of jurisdiction to which it has led, have been long known and acknowledged."

A partial attempt to meet the difficulty was made by several acts of parliament (passed after the reports of commissions appointed in 1830 and 1851), which enabled courts of law and equity both to exercise certain powers formerly peculiar to one or other of them. A more complete remedy was introduced by the Judicature Act 1873, which consolidated the courts of law and equity, and ordered that law and equity should be administered concurrently according to the rules contained in the 26th section of the act. At the same time many matters of equitable jurisdiction are still left to the chancery division of the High Court in the first instance. (See Chancery.)

AUTHORITIES.—The principles of equity as set out by the following writers may be consulted: J. Story, J. W. Smith, H. A. Smith and W. Ashley, 14 Equity Jurisprudence; Lord Justice Lush, in New's Equity Jurisdiction of the Court of Chancery (2 vols., 1840-1840); D. M. Kerly, Historical Sketch of the Equitable Jurisdiction of the Court of Chancery (1890).

EQUIVALENT, in chemistry, the proportion of an element which will combine with or replace unit weight of hydrogen. When multiplied by the valency it gives the atomic weight. The determination of equivalent weights is treated in the article Stoichiometry. (See also Chemistry.) In a more general sense the term "equivalent" is used to denote quantities of substances which neutralize one another, as for example NaOH, HCl, H2SO4, Ba(OH)2.

ÉRARD, Sébastien (1752-1831), French manufacturer of musical instruments, distinguished especially for the improvements he made upon the harp and the pianoforte, was born at Strassburg on the 5th of April 1752. While a boy he showed great aptitude for practical geometry and architectural drawing, and in the workshop of his father, who was an upholsterer, he found opportunity for the early exercise of his mechanical ingenuity. When he was sixteen his father died, and he removed to Paris where he obtained employment with a harpsichord maker. Here his remarkable constructive skill, though it speedily excited the jealousy of his master and procured his dismissal, almost equally soon attracted the notice of musicians and musical instrument makers of eminence. Before he was twenty-five he set up in business for himself, his first workshop being a room in the hotel of the duchesse de Villeroi, who gave him warm encouragement. The instrument was his first pianoforte, which was also one of the first manufactured in France. It quickly secured for its maker such a reputation that he was soon overwhelmed with commissions, and finding assistance necessary, he sent for his brother, Jean Baptiste, in conjunction with whom he established in the rue de Bourbon, in the Faubourg St Germain, a piano manufactory, which in a few years became one of the most celebrated in Europe. On the outbreak of the Revolution he went to London where he established a factory. Returning to Paris in 1796, he soon afterwards introduced grand pianofortes, made in the English fashion, his improvements of his own. In 1808 he again visited London, where, two years later, he produced his first double-movement harp. He had previously made various improvements in the manufacture of harps, but the new instrument was an immense advance upon anything he had before produced, and obtained such a reputation that for some time he devoted himself exclusively to its manufacture. It has been said that in the year following his invention he made harps to the value of £25,000. In 1812 he returned to Paris, and continued to devote himself to the further perfecting of the two instruments with which his name is associated. In 1823 he crowned his work by producing his model grand pianoforte with the double escapement. Érard died at Passy, on the 5th of August 1831. (See also Harp and Pianoforte.)

ERASMUS, Desiderius (1466-1536), Dutch scholar and theologian, was born on the night of the 27/28th of October, probably in 1466; but his statements about his age are conflicting, and in view of his own uncertainty (Ep. x. 397: 466) and the weakness of his memory for dates, the year of his birth cannot be definitely fixed. His father's name seems to have been Rogierus Gerardus. He himself was christened Erasmus; but in 1503, when becoming familiar with Greek, he assimilated the fashion of adding the Greek original, which he had a few years before Latinized into Desiderius. A contemporary authority states that he was born at Gouda, his father's native town;
but he adopted the style *Rotterdaminensis* or *Reterodaminus*, in accordance with a story to which he himself gave credence. His first schooling was at Gouda under Peter Winckel, who was afterwards vice-pastor of the church. In the dull round of instruction in "grammar" he did not distinguish himself, and was surprised to hear his early friends and companions, William Hermanus, who was Winckel's favourite pupil, from Gouda the two boys went to the school attached to St Lebuin's church at Deventer, which was one of the first in northern Europe to feel the influence of the Renaissance. Erasmus was at Deventer from 1475 to 1484, and when he left, had learnt from Johannes Sinthius (Syntheim) and Alexander Hegius, who had come as headmaster in 1483, the love of letters which was the ruling passion of his life. At some period, perhaps in an interval of his time at Deventer, he was a chorister at Utrecht under the famous organist of the cathedral, Jacob Obrrecht.

About 1484 Erasmus' father died, leaving him and an elder brother Peter, both born out of wedlock, to the care of guardians, their mother having died shortly before. Erasmus was eager to go to a university, but the guardians, acting under a perhaps genuine enthusiasm for the religious life, sent the boys to another school at Hertogenbosch; and when they returned after two or three years, prevailed on them to enter monasteries. Peter went to Sion, near Delft; Erasmus after prolonged reluctance became an Augustinian canon in St Gregory's at Steyn, a house of the same Chapter near Gouda. There he found little religion and less refinement; but no serious difficulty seems to have been made about his reading the classics and the Fathers with his friends to his heart's content. The monastery once entered, there was no drawing back; and Erasmus passed through the various stages which culminated in his ordination as priest on the 29th of April 1492.

But his ardor for study could not long be content with monastic life. He brought his attainments somehow to the notice of Henry of Bergen, bishop of Cambrai, the leading prelate at the court of Brussels; and about 1494 permission was obtained for him to leave Steyn and become Latin secretary to the bishop, who was then preparing for a visit to Rome. But the journey was abandoned, and after some months Erasmus found that even with occasional chances to read at Gruenendael, the life of a court was hardly more favourable to study than that of Steyn. At the suggestion of a friend, James Batt, he applied to his patron for leave to go to Paris University. The bishop consented and promised a small pension; and in August 1495 Erasmus entered the "domus pauperum" of the college of Montaigut, which was then under the somewhat rigid rule of the reformer, John Batt, of Standonck. He at once introduced himself to the distinguished French historian and diplomatist Robert Gaguin (1425-1502) and published a small volume of poems; and he became intimate with Johann Mauburnus (Mombae), the leader of a mission summoned from Windesheim in 1496 to reform the abbey of Château-Landon. But the life at Montaigut was too hard for him. Every Lent he fell ill and had to return to Holland to recover. He continued to read nevertheless for a degree in theology, and at some time completed the requirements for the B.D. After a year or two he left Montaigut and eked out his money from the bishop by taking pupils. One of these, a young Englishman, William Blount, 4th Baron Mountjoy (d. 1534), persuaded him to visit England in the spring of 1499.

Being without a benefice, he had no settled income to look to, and apart from the precarious profits of teaching and writing books, could only wait on the generosity of patrons to supply him with the leisure he craved. The faithful Batt had sought a pension for him from his own patroness, Anne of Borsselen, the Lady of Veere, who resided at the castle of Tournemhem near Calais, and whose son Batt was now teaching. But as nothing promised at once, Erasmus accepted Mountjoy's offer, and thus a tie was formed which led Mountjoy then or a few years later to grant him a pension of £20 for life. Otherwise the visit to England gave no hope of preferment; and in the summer Erasmus prepared to leave. He was delayed, and used the interval to spend two or three months at Oxford, where he found John Colet lecturing on the Epistle to the Romans. Discussions between them on theological questions soon convinced Colet of Erasmus' worth, and he sought to persuade him to stay and teach at Oxford. But Erasmus could not be content with the Bible in Latin. Oxford could teach him no Greek, so away he must go.

In January 1500 he returned to Paris, which though it could offer no Greek teacher better than George Hermannus, was at least a better centre for buying and for printing books. The next few years were spent still in preparation, supported by pupils' fees and the dedications of books; the *Collectanea adagiorum* in June 1500 to Mountjoy, and some devotional and moral compositions to Batt's patroness and her son. When the plague drove him from Paris, he went to Orleans or Tournemhem or St Omer, as the way opened. From 1502 to 1504 he was at Louvain, still declining to teach publicly; among his friends being the future Pope Adrian VI. In January 1504 the archduke Philip gave him fifty livres for the Panegyric which "un religieux de l'ordre de St Augustin" had composed on his Spanish journey; and in October, ten more, for the maintenance of his studies.

He had been working hard at Greek, of which he now felt himself master, at the Fathers (above all at Jerome), and at the Epistles of St Paul, fulfilling the promise made to Colet in Oxford, to give himself to sacred learning. But the bent of his reading is shown by the manuscript with which he returned to Paris at the close of 1504—Valla's *Annotations on the New Testament*, which Badius printed for him in 1505.

Shortly afterwards Lord Mountjoy invited him again to England, and this visit was more successful. He found in London a circle of learned friends through whom he was introduced to William Warham, archbishop of Canterbury, Richard Foxe, bishop of Winchester and other dignitaries. John Fisher (bishop of Rochester), who was then superintending the foundation of Christ's College for the Lady Margaret, took him down to Cambridge for the king's visit; and at length the opportunity came to fulfil his dream of seeing Italy. Baptista Boerio, the king's physician, engaged him to accompany his two sons thither as supervisor of their studies. In September 1506 he set foot on that sacred soil, and took his D.D. at Turin. For a year he remained with his pupils at Bologna, and then, his engagement completed, negotiated with Aldus Manutius for a new edition of his *Adagia* upon a very different scale. The volume of 1500 had been jejune, written when he knew nothing of Greek; 800 adages put together with scanty elucidations. In 1508 he had worked a work on lines more to the taste of the learned world, full of apt and recondite learning, and now and again relieved by telling comments or lively anecdotes. Three thousand and more collected justified a new title—*Chitides adagiorum*; and the author's reputation was now established. So secure in public favour did the book in time become, that the council of Trent, unable to suppress it and not daring to overlook it, ordered the preparation of a castrated edition.

To print the *Adagia* he had gone to Venice, where he lived with Andrea Torresano of Asola (Asulanus) and did the work of two men, writing and correcting proof at the same time. When it was finished, with an ample re-dedication to Mountjoy, a new pupil presented himself. Alexander Stewart, natural son of James IV. of Scotland—perhaps through a connexion formed in early days at Paris. They went together to Siena and Rome and then on to Cambrai, thurst under the summer sun. When they returned to Rome, his pupil departed to Scotland, to fall a few years later by his father's side at Ffledden; Erasmus also found a summons to call him northwards.

On the death of Henry VII. Lord Mountjoy, who had been companion to Prince Henry in his studies, had become a person of influence. He wrote to Erasmus of a land flowing with milk and honey under the "divine" young king, and with Warham sent him £10 for journey money. At first Erasmus hesitated. He had been disappointed in Italy, to find that he had not much to learn from its famed scholarship; but he had made many friends in Aldus' circle—Marcus Musurus, John Lascaris,
Baptista Egnatius, Paul Bombasius, Scipio Carteromachus; and his reception had been flattering, especially in Rome, where cardinals had delighted to honour him. But to remain in Rome was to sell himself. He might have the leisure which was so indispensable, but at price of the freedom to read, think, write what he liked. He decided, therefore, to go, though with regrets, which returned upon him sometimes in after years, when the English hopes had not borne fruit.

In the autumn he reached London, and in Thomas More's house in Bucklersbury wrote the witty satire which Milton found "in every one's hands" at Cambridge in 1628, and which is read to this day. The "Moriae encomium" was a sign of his decision. In it kings and princes, bishops and popes, are shown to be in bondage to Folly; and no class of men is spared. Its author was willing to be beholden to any one for leisure; but he would be no man's slave. For the next eighteen months he was entirely lost to view; when he reappears in April 1531, he is leaving More's house and taking the "Moria" to be printedprivily in Paris. Wherever they were spent, these must have been months of hard work, as were the years that followed. His time was now come. The long preparation and training, bought by privation and uncongenial toil, was over, and he was ready to apply himself to the scientific study of sacred letters. His English patrons were liberal. Fisher sent him in August 1531 to teach in Cambridge; Warham gave him a benefice, Aldington in Kent, worth £33.6s.8d. a year, and in violation of his own rule committed it for a pension of £20 charged on the living; and the dedications of his books were fruitful. In Cambridge he completed his work on the New Testament, the Letters of Jerome, and Seneca; and then in 1534, when there seemed no prospect of ampler preferment, he determined to transfer himself to Basel and give the results of his labours to the world.

The origin of Erasmus's connexion with Johann Froben is not clear. In 1531 he was preparing to reprint his Adagia with Jodocus Badius, who in the following year was to have also Seneca and Jerome in 1531. During the summer of 1529 Maria offered to have the Aldine Adagia, acquired through a bookseller-agent Erasmus's amended copy which had been destined for Badius. That the agent was acting entirely on his own responsibility may be doubted; for within a few months Erasmus had decided to betake himself to Basel, bearing with him Seneca and Jerome, the latter to be incorporated in the great edition which Johannes Amerbach and Froben had in hand since 1530. In Germany he was widely welcomed. The Strasbourg Literary Society feted him, and Johannes Sapidus, headmaster of the Latin school at Schleitstadt, rode with him into Basel. Froben received him with open arms, and arranged to finance but with his books. Through the winter of 1534-1535 Erasmus worked with the strength of ten; and after a brief visit to England in the spring, the New Testament was set up. Around him was a circle of students, some young, some already distinguished—the three sons of Froben's partner, Johannes Amerbach, who was now dead, Beatus Rhenanus, Wilhelm Nesen, Ludwig Ber, Heinrich Glareanus, Nikolaus Gerbell, Johannes Ocolamipadius—who looked to him as their head and were proud to do him service.

Though from this time forward Basel became the centre of occupation and interest for Erasmus, yet for the next few years he was mainly in the Netherlands. On the completion of the New Testament in 1516 he returned to his friends in England; but his appointment, then recent, as councillor to the young king Charles, brought him back to Brussels in the autumn. In the spring of 1517 he went for the last time to England, about a dispensation from wearing his canonical dress, obtained originally from Julius II. and recently confirmed by Leo X., and in May 1518 he journeyed to Basel for three months to set the second edition of the New Testament in progress. But with these exceptions he remained in proximity to the court, living much at Louvain, where he took great interest in the foundation of Hieronymus Busleiden's Collegium Trilingue. His circumstances had improved so much, by pensions, the presents which were showered upon him, and the sale of his books, that he was now in a position to refuse all proposals which would have interfered with his cherished independence. The general ardour for the restoration of the arts and of learning created an aristocratic public, of which Erasmus was supreme pontiff. Luther spoke to the people and the ignorant; Erasmus had the ear of the educated class. His friends and admirers were distributed over all the countries of Europe, and presents were continually arriving from small as well as great, from a donation of 200 florins, made by Pope Clement VII., down to sweetmeats and comfits contributed by the nuns of Cologne (Ep. 666). From England, in particular, he continued to receive supplies of money. In the last year of his life Thomas Cromwell sent him 20 angels, and Archbishop Cranmer 18. Though Erasmus led a hard-working and fat from luxurious life, and had no extravagant habits, yet he could not live up to his literary. The excessive delicacy of his constitution, not pampered appetite, exacted some unusual indulgences. He could not bear the stoves of Germany, and required an open fireplace in the room in which he worked. He was afflicted with the stone, and obliged to be particular as to what he drank. Beer he could not touch. The white wines of Baden or the Rhine did not suit him; he could only drink those of Burgundy or Franche-Comté. He could neither cat, nor bear the smell of, fish. "His heart," he said, "was Catholic, but his stomach was Lutheran." For his constant journeys he required two horses, one for himself and the other for his attendant. And though he was almost always found in horse-flesh by his friends, the keep had to be paid for. For his literary labours and his extensive correspondence he required one or more amanuenses. He often had occasion, on his own business, or on that of Froben's press, to send special couriers to a distance, employing them by the way in collecting the free gifts of his tributaries.

Precarious as these means of subsistence seem, he preferred the independence thus obtained to an assured position which would have involved obligations to a patron or professional duties which his weak health would have made onerous. The dukedom of the Fathers of the Empire, which was to have only reside, and would have named him on these terms to a chair in his new university of Ingolstadt, with a salary of 200 ducats, and the revision of one or more prebendal stalls. The archdeacon Ferdinand offered a pension of 400 florins, if he would only come to reside at Vienna. Adrian VI. offered him a deanship, but the offer seems to have been of a possible and not an actual deanship. Offers, flattering but equally vague, were made from France, on the part of the bishop of Bayeux, and even of Francis I. "Invitor amplissimis conditionibus; offeruntur dignitates et episcopatus; plane rex esset, si juvenis esset" (Ep. xix. 106: 275). Erasmus declined all, and in November 1531 settled a very hard winter at Basel, in the capacity of general superintendant and literary adviser of Froben's press. As a subject of the emperor, and attached to his court by a pension, it would have been convenient to him to have fixed his residence in Louvain. But the bigotry of the Flemish clergy, and the mockish atmosphere of the university of Louvain, overrun with Dominicans and Franciscans, united for once in their enmity to the new classical learning, inclined Erasmus to seek a more congenial home in Basel. To Froben his arrival was the advent of the very man whom he long wanted. Froben's enterprise, united with Erasmus's editorial skill, raised the press of Basel, for a time, to be the most important in Europe. The death of Froben in 1527, the final separation of Basel from the Empire, the wreck of learning in the religious disputes, and the cheap paper and scamped work of the Frankfort presses, gradually withdrew the trade from Basel. But during the years of Erasmus's co-operation the Froben press took the lead of all the presses in Europe, both in the standard value of the works published and in the style of typographical execution. Like some other publishers who preferred reputation to returns in money, Froben died poor, and his impressions never reached the splendour afterwards attained by those of the Estiennes, or of Plantin. The scribes of the Fathers of the Empire in 1515, Pseudographiae (1520), Pseudo-Arnobius (1522), Hilarius (1522), Irenaeus (Latin, 1526), Ambrose (1527), Augustine (1528). Chrysostom
Erasmus was every figure drink. He was always writing himself some book or pamphlet called for by the event of the day, some general fray in which he was compelled to mingle, or some personal assault which it was necessary to repel. But though painfully conscious how much his reputation as a writer was damaged by this extempore production, he was unable to resist the fatal facility of print. He was the object of those solicitations which always beset the author whose name upon the title page assures the sale of a book. He was besieged for dedications, and as every dedication meant a present proportioned to the circumstances of the dedicatee, there was a natural temptation to be lavish of them. Add to this a correspondence so extensive as to require him at times to write forty letters in one day. “I receive daily,” he writes, “letters from remote parts, from kings, princes, prelates and men of learning, and even from persons of whose existence I was ignorant.”

His day was thus one of incessant mental activity; but hard work was so far from breeding a distaste for his occupation, that reading and writing grew ever more delightful to him (plerumque cresciderat crescendo etsi studium).

Shortly after Froben’s death the disturbances at Basel, occasioned by the zealots for the religious revolution which was in progress throughout Switzerland, began to make Erasmus desirous of changing his residence. He selected Freiburg in the Breisgau, as a city which was still in the dominion of the emperor, and was free from religious dissension. Thither he removed in April 1529. He was received with public marks of respect by the authorities, who granted him the use of an unfinished residence which had been begun to be built for the late emperor Maximilian. Erasmus proposed only to remain at Freiburg for a few months, but found the place so suited to his habits that he bought a house of his own, and remained there six years. A desire for change of air—he fancied Freiburg was damp—rumours of a new war with France, and the necessity of seeing his Ecclesiastes through the press, took him back to Basel in 1535. He lived now a very retired life, and saw only a small circle of intimate friends. A last attempt was made by the papal court to enlist him in some public way against the Reformation. On the election of Paul III. in 1534, he had, as usual, sent the new pope a congratulatory letter. After his arrival in Basel, he received a complimentary answer, together with the nomination to the deanship of Deventer, the income of which was reckoned at 600 ducats. This nomination was accompanied with an intimation that more was in store for him, and that sufficient might be raised to provide for him for life, and that 2000 ducats, which was necessary to qualify for the cardinal’s hat. But Erasmus was even less disposed now than he had been before to barter his reputation for honours. His health had been for some years gradually declining, and disease in the shape of gout gaining upon him. In the winter of 1535–1536 he was confined entirely to his chamber, many days to his bed. Though thus afflicted he never ceased his literary activity, dictating his tract On the Purity of the Church, and revising the sheets of a translation of Origen which was passing through the Froben press. His last letter is dated the 28th of June 1536, and subscribed “Eras. Rot. aegra manu.” “I have never been so ill in my life before as I am now,—for many days unable even to read.” Dysentery set in carried him off on the 12th of July 1536, in his 70th year.

By his will, made on the 12th of February 1536, he left what he had to leave, with the exception of some of his legacies, to Bonifacius Amelbach, partly for himself, partly for trust in the benefit of the aged and the infirm, or to be spent in portioning young girls, and in educating young men of promise. He left none of the usual legacies for masses or other clerical purposes, and was not attended by any priest, or confessor in his last moments. Erasmus’s features are familiar to all, from Holbein’s many portraits or their copies. Beatus Rhenanus, “summus Erasmi observator,” as he is called by de Thou, describes his person thus: “In stature not tall, but not noticeably short; in figure well built and graceful; of an extremely delicate constitution, sensitive to the slightest changes of climate, food or drink. After middle life he suffered from the stone, not to mention the common plague of studious men, an irritable mucous membrane. His complexion was fair; light blue eyes, and yellowish hair. Though his voice was weak, his enunciation was distinct; the expression of his face cheerful; his manner and conversation polished, affable, even charming.” His highly nervous organization made his feelings acute, and his brain incessantly active. Through his ready sympathy with all forms of life and character, his attention was always alive. The active movement of his spirit spent itself, not in following out its own trains of thought, but in outward observation. No man was ever less introspective, and though he talks much of himself, his egotism is the genial egotism which takes the world into its confidence, not the selfish egotism which feels no interest but in its own woes. He says of himself, and justly, “that he was incapable of dissimulation” (Ep. xxvi. 19; 1152). There is nothing behind, no pose, no scenic effect. It may be said of his letters that in them “tota patet vita senis.” His nature was flexible without being faultily weak. He has many moods and each mood imprints itself in turn on his words. Hence, on a superficial view, Erasmus is set down as the most inconsistent of men. Further acquaintance makes us feel a unity of character underlying this susceptibility to the impressions of the moment. His seeming inconsistencies are reconciled to apprehension, not by a formula of the intellect, but by the many-sidedness of a highly impressionable nature. In the words of J. Nisard, Erasmus was one of those “dont la gloire a été de beaucoup comprendre et d’affirmer peu.”

This equal openness to every vibration of his environment is the key to all Erasmus’s acts and words, and among them to the middle attitude which he took up towards the great religious conflict of his time. The reproaches of party assailed him in his lifetime and have continued to the leaping of the memory. He was loudly accused by the Catholics of collusion with the enemies of the faith. His powerful friends, the pope, Wolsey, Henry VIII., the emperor, called upon him to declare against Luther. Theological historians from that time forward have perpetuated the indictment that Erasmus sided with neither party in the struggle for religious truth. The most moderate form of the censure presents him in the odious light of a trimmer; the vulgar and venomous assailing is sure that Erasmus was a Protestant at heart, but withheld the avowal that he might not forfeit the worldly advantages he enjoyed as a Catholic. When by study of his writings we come to know Erasmus intimately, there is revealed to us one of those natures to which partisanship is impossible, where the consciousness of the impossibility of keeping Erasmus neutral, but the reasonableness of his nature. It was not only that his intellect revolted against the narrowness of party, his whole being repudiated its clamorous and vulgar excesses. As he loathed fish, so he loathed clerical fanaticism. Himself a Catholic priest—“the glory of the priesthood and the shame”—the tone of the orthodox clergy was distasteful to him; the ignorant hostility to classical learning which reigned in their colleges and convents disgusted him. In common with all the learned men of his age, he wished to see the power of the clergy broken, as that of an obscurantist army arrayed against light. He had employed all his resources of wit and satire against the priests and monks, and the superstitions in which they traded, long before Luther’s name was heard of. The motto which was already current in his lifetime, “that Erasmus laid the egg and Luther hatched it,” is so far true, and no more. Erasmus would have suppressed the monasteries, put an end to the domination
of the clergy, and swept away scandalous and profitable abuses, but to attack the church or re-mould received theology was far from his thoughts. And when out of Luther’s revolt there arose a new fanaticism—that of evangelism, Erasmus recoiled from the violence of the new preachers. “Is it for this,” he writes to Melanchthon (Ep. xix. 113; 703), “that we have shaken off bishops and popes, that we may come under the yoke of such madmen as Otto and Farel?” Passages have been collected, and it is an easy task, from the writings of Erasmus to prove that he shared the doctrines of the Reformers. Passages equally strong might be collated to show that he repudiated them. The truth is that theological questions in themselves had no attraction for him. And when a theological position was emphasized by party passion it became odious to him. In the words of Drummond: “Erasmus was in his own age the apostle of common sense and of rational religion. He did not care for dogma, and accordingly the dogmas of Rome, which had the consent of the Christian world, were in his eyes preferable to the dogmas of Protestantism. . . . From the beginning to the end of his career he remained true to the purpose of his life, which was to fight the battle of sound learning and plain common sense against the powers of ignorance and superstition, and to see the convulsions of that period he never once lost his mental balance.”

Erasmus is accused of indifference. But he was far from indifferent to the progress of the revolution. He was keenly alive to its pernicious influence on the cherished interest of his life, the cause of learning. “I abhor the evangelicals, because it is through them that literature is everywhere declining, and upon the point of perishing.” He had been born with the hopes of the Renaissance, with its anticipation of a new Augustan age, and had seen this fair promise blighted by the irruption of a new horde of theological polemics, worse than the old scholastics, insomuch as they were revolutionary instead of conservative. Erasmus never flouted at religion nor even at theology as such, but only at blind and intemperate theologians.

In the mind of Erasmus there was no metaphysical inclination; he was a man of letters, with a general tendency to rational views on every subject which came under his pen. His was not the mind to originate, like Calvin, a new scheme of Christian thought. He is at his weakest in defending free will against Luther, and indeed he can hardly be said to enter on the metaphysical question. He treats the dispute entirely from the outside. It is impossible in reading Erasmus not to be reminded of the rationalist of the 18th century. Erasmus has been called the “Voltaire of the Renaissance.” But there is a vast difference in the relations in which they respectively stood to the church and to Christianity. Voltaire, though he did not originate, yet adopted a moral and religious scheme which he sought to substitute for the church tradition. He waged war, not only against the clergy, but against the church and its sovereigns. Erasmus drew the line at the first of these. He was not an anticipation of the 18th century; he was the man of his age, as Voltaire of his; though Erasmus did not intend it, he undoubtedly shook the ecclesiastical edifice in all its parts; and, as Melchior Adam says of him, “pontifici Romano plus nucult jacendo quam LUTHERI stomachando.”

Unlike his colleague, he insisted in that he did not declare war against the church, but remained a Catholic and mourned the disruption, he was yet a true rationalist in principle. The principle that reason is the only one guide of life, the supreme arbiter of all questions, politics and religion included, has its earliest and most complete exemplar in Erasmus. He does not dogmatically renounce the rights of reason, but he practically exercises them. Along with the charm of style, the great attraction of the writings of Erasmus is this unconscious freedom by which they are pervaded.

It must excite our surprise, then, that a man who used his pen so freely should have escaped the pains and penalties which invariably overtook minor offenders in the same kind. For it was not only against the clergy and the monks that he kept up a ceaseless stream of satiric raillery; he treated nobles, princes and kings with equal freedom. No 18th century republican has used stronger language than has this pensioner of Charles V. “The people build cities, princes pull them down; the industry of the citizens creates wealth for rapacious lords to plunder; plebeian magistrates pass good laws for kings to violate; the people love peace, and their rulers stir up war.” Such outbursts are frequent in the Adagia. These freedoms are part cause of Erasmus’s popularity. He was here in sympathy with the secret sore of his age, and gave utterance to what all felt but none dared to whisper but he. It marks the difference between 1513 and 1660 that, in a reprint of the Julius Exchamus published in 1660 at Oxford, it was thought necessary to leave out a sentence in which the writer of that dialogue, supposed by the editor to be Erasmus, asserts the right of states to deprive and punish bad kings. It is difficult to say to what we are to ascribe his immunity from painful consequences. We have to remember that he was removed from the scene early in the reaction, before force was fully organized for the suppression of the revolution. And his popular works, the Adagia, and the Colloquyía (1524), had established themselves as standard books in the more easy going age, when power, secure in its unchallenged strength, could afford to laugh with the laugthers at itself. At the date of his death the Catholic revival, with its fell antipathy to art and letters, was only in its infancy; and when times became dangerous, Erasmus cautiously declined to venture out of the protection of the Empire, refusing repeated invitations to Italy and to France. “I had thought of going to Sesançon,” he said, “ne non essem in ditione Caesaris” (Ep. xxx. 74; 1299).

In Italy a Bembo and a Sadoletto wrote a purer Latin than Erasmus, but contented themselves with pretty phrases, and were careful to touch no living chord of feeling. In France it was necessary for a Rabelais to hide his free-thinking under a disguise of revolting and unintelligible jargon. It was only in the Empire that such liberty of speech as Erasmus used was practicable, and in the Empire Erasmus passed for a moderate man. Upon the strength of an established character for moderation he enjoyed an exceptional licence for the utterance of unwelcome truths; and in spite of his flings at the rich and powerful, he remained through life a privileged person with them.

But though the men of the keys and the sword let him go his way un molested, it was otherwise with his brethren of the pen. A man who is always launching opinions must expect to be retorted on. And when these judgments were winged by epigram, and weighted by the name of Erasmus, who stood at the head of letters, a widespread exasperation was the consequence. Disraeli has said of Voltaire, that “all who read him implored that the proper punishment of his bad example should be that he be burned.” But because Erasmus’s quarrels would require a volume to themselves. “So thin-skinned that a fly would draw blood,” as the prince of Carpi expressed it, he could not himself restrain his pen from sarcasm. He forgot that though it is safe to lash the dunces, he could not with equal impunity sneer at those who, though they might not have the ear of the public as he had, could yet contradict and call names. And when literary jealousy was complicated with theological differences, as in the case of the free-thinkers, or with French vanity, as in that of Budaecus, the cause of the enemy was espoused by a party and a nation. The quarrel with Budaecus was national one. Cosmas Erasmus, as the French literati he was still the Teuton. Étienne Dolet calls him “enemy of Cicero, and jealous detractor of the French name.” The only contemporary name which could approach to a rivalry with his was that of Budaecus (Budé), who was exactly contemporary, having been born in the same year as Erasmus. Rivals in fame, they were unlike in accomplishment, each having the quality which the other wanted. Budaecus, though a Frenchman, knew Greek well; Erasmus, though a Dutchman, very imperfectly. But the Frenchman Budaecus wrote an excrable Latin style, unreadable then as now, while the Teuton Erasmus charmed the reading world with a style which, though far from good Latin, is the most delightful which the Renaissance has left us.

The style of Erasmus is, considered as Latin, incorrect, sometimes even barbarous, and far removed from any classical model. But it has qualities far above purity. The best Italian Latin is but an echo and an imitation; like the painted glass which
ERASTUS

we put in our churches, it is an anachronism. Bembo, Sadoleto and the rest write purely in a dead language. Erasmus's Latin was a living and spoken tongue. Though Erasmus had passed nearly all his life in England, France and Germany, his conversa-
tion was Latin; and the language in which he talked about common things he wrote. Hence the spontaneity and naturalness of his page, its flavour of life and not of books. He writes from himself, and not out of Cicero. Hence, too, he spoiled nothing by an age reversion in terror lest some phrase not of the golden age should escape from his pen. He confesses apologetically to Christopher Longolius (Ep. iii. 63, 402) that it was his habit to extemporize all he wrote, and that this habit was incorrigible; "effendo verius quam scribo omnia." He complains that much reading of the works of St Jerome had spoiled his Latin; but, as Scaliger says (Scal. ii.), "Erasmus's language is better than St Jerome's." The same he did, however, thought Erasmus would have done better "if he had kept more closely to the classical models."

In the annals of classical learning Erasmus may be regarded as constituting an intermediate stage between the humanists of the Latin Renaissance and the learned men of the age of Greek scholarship, between Angelo Poliziano and Joseph Scaliger. Erasmus, though justly styled by Muretus (Varr. Lect. 7, 15) "eruditus sane vir, ac multae lectiones," was not a "learned" man in the special sense of the word—not an "erudito." He was more than this; he was the "man of letters"—the first who had appeared in Europe since the fall of the Roman empire. His acquisitions were vast, and they were all brought to bear upon the work of Christian science. His chief contemporaries are "the series eruditae," as Scaliger makes them. Scaliger, however, thought Erasmus would have done better "if he had kept more closely to the classical models."

...
by Archbishop Parker. Withers had proposed a disputation against vestments, which the university would not allow; his thesis affirming the excommunicating power of the presbytery was sustained. Hence the treatise of Erastus. It was published (1589) by Giacomo Castelvetro, who had married his widow, with the title Expositio gravissimae questionis utrum excommunicatio, quotem religionem intelligentes etimplexantes, a sacramentorum usu, propter admissum facinus aetet, mandato niatur divine, an exsequiui sit ab hominibus. The work bears the imprint Peselvii (Leo Peschho in the Grisons) but was printed by John Wolfe in London, where Castelvetro was staying: the name of the alleged printer is an anagram of Jacobum Castelvethum. In the Stationers' Register (June 20, 1580) the printing is said to have been "allowed" by Archbishop Whitgift. It consists of seventy-five Theses, followed by a Confirmation in six books, and an appendix of letters to Erastus by Bullinger and Gualther, showing that his Theses, written in 1568, had been circulated in manuscript. An English translation of the Theses, with brief life of Erastus (based on Melchior Adam's account), was issued in 1593, entitled The Nullity of Church Censures; it was reprinted as A Treatise of Excommunication (1655), and, as revised by Robert Lee, D.D., the above: The aim of the work is to show, on Scriptural grounds, that sins of professing Christians are to be punished by civil authority, and not by withholding of sacraments on the part of the clergy. In the Westminster Assembly a party holding this view included Selden, Lightfoot, Coleman and Whitełoż, whose speech (1645) is appended to Lee's version of the Theses; but the opposite view, after much controversy, was carried, Lightfoot alone dissenting. The consequent chapter of the Westminster Confession ("Of Church Censures") was, however, not ratified by the English parliament. "Erastianism," as a by-word, is used to denote the doctrine of the supremacy of the state in ecclesiastical causes; but the premiss of the relations between church and state is one on which Erastus nowhere enters. What is known as "Erastianism" would be better connected with the name of Grotius. The only direct reply made to the Expositio was the Tractatus de vera excommunicatione (1590) by Theodore Beza, who found himself rather savagely attacked in the Confirmation thesium; e.g. "Apostolum et Mosen adeo Deum ipsum ausde corrigere." See A. Bonnard, Thomas Eraste et la discipline ecclésiastique (1864); Gass, in Allgemeine deutsche Bildg. (1877); G. V. Lecher and W. Schöning, in A. Hauck's Realencyklop. für protest. und röm. Kirche (1896). (A. G. O.)

ERASTOSTHENES of Alexand'ria (c. 276- c. 194 B.C.), Greek scientific writer, was born at Cyrene. He studied grammar under Callimachus at Alexandria, and philosophy under the Stoic Ariston and the Academic Arcesilaus at Athens. He returned to Alexandria at the summons of Ptolemy III. Euergetes, by whom he was appointed chief librarian in place of Callimachus. He is said to have died of voluntary starvation, being threatened with total blindness. Erastosthenes was one of the most learned men of antiquity, and wrote on a great number of subjects. He was the first to call himself "philologos" (in the sense of the "friend of learning").

On measurements (385-000), which are lost, but appear, from a remark of Pappus, to have dealt with "loci with reference to means." He devised a mechanical construction for two mean proportionals, reproduced by Pappus and Euclides (Comm. on Archimedes). His de obser uo et sidere (tripus Eratothestis) was a device for discovering all prime numbers. He laid the foundation of mathematical geography in his Geographica, in three books. His greatest achievement was his measurement of the earth. Being informed that at Syene (Assuan), on the day of the summer solstice at noon, a well shadowed through all its depth, so that Syene lay on the tropic, he measured, at the same hour, the zenith distance of the sun at Alexandria. He thus found the distance between Syene and Alexandria (known to be 5000 stadia) to correspond to the 7th of a great circle, and arrived at 250,000 stadia (which he seems subsequently to have corrected to 252,000) as the circumference of the earth. He is credited by Ptolemy and his commentator Theon with having found the distance between the tropics to be 44 1/2° of the meridian circle, which gives 23° 31' 20" for the obliquity of the ecliptic. His astronomical poem Hermes was begun apparently with the birth and exploits of Hermes, then passed to the legend of his having ordered the heavens, the zones and the stars, and gave a history of the latter. His Erigone, of which a few fragments are also preserved, is sometimes spoken of as a separate poem, but it may have belonged to the Hermes, which appears also to have been known by other names such as Catalogi. The still extant Catasterismi, containing the story of certain stars in prose, is probably not by Erastosthenes.

Erastosthenes was the founder of scientific chronology in his χρονογραφία in which he endeavoured to fix the dates of the chief literary and political events from the conquest of Troy. An important work was his treatise on the old comedy, dealing with the plays and theatrical apparatus generally, and discussing the works of the principal comic poets themselves. Works on moral philosophy, history, and a number of letters were also attributed to him.

There is a complete edition of the fragments of Erastosthenes by Bernhard (1822); poetical fragments, Hillier (1782); geographical, Seidel (1799) and Berger (1880); καταστατικαὶ, Schauchab (1795) and Robert (1878). See Sandys, Hist. Class. Schol. i. (1906). (T. L. H.)

ERBACH, a town of Germany, in the grand-duchy of Hesse-Darmstadt, on the Mümling, 22 m. S.E. of Darmstadt. It has china-clay and ivory-turning, for which last branch it possesses a technical school. The population was 3250 in 1885. Pop. 2800. The castle contains an interesting collection of weapons and pictures, and in the chapel are the coffins of Einhard, the friend and biographer of Charlemagne, and his wife, Emma.

Erbach has long been the residence of the counts of Erbach, who trace their descent back to the 12th century, and who held the office of cupbearer to the electors palatine of the Rhine until 1866. In 1532 the emperor Charles V. made the county a direct fief of the Empire, on account of the services rendered by Count Eberhard during the Peasants' War. Since 1717 the family has been divided into the three lines of Erbach-Fürstenau, Erbach-Erbach and Erbach-Schönberg, who rank for precedence, not according to the age of their descent, but according to the age of the chief of their line. In 1818 the counts of Erbach-Erbach inherited the county of Wartenberg-Roth, and in 1903 the count of Erbach-Schönberg was granted the title of prince. The county was mediatized in 1866, and is now incorporated with the duchy of Hesse-Darmstadt.

See Simon, Die Geschichte der Dynasten und Grafen zu Erbach (1857), 1858.)

ERBIUM (symbol, Er; atomic weight, 165-166), one of the metals of the rare earths. The first of the rare earth minerals was discovered in 1794 by J. Gadolin and was named gadolinite from its discoverer. In 1797 Ekeberg showed that gadolinite contained another rare earth, which was given the name yttria. Yttria is an exceedingly complex mixture, which has been decomposed, yielding as an intermediate product terbia. This latter substance in its turn has been split by J. L. Soret, P. T. Cleve, Lecoq de Boisbaudran and others into erbia, holmia, thulia and dysprosia, but it is still doubtful whether any one of these four splitting products is a single substance. The rare earth minerals are found in the minerals gadolinite, samarskite, fergusonite, euxenite and cerite. They are separated from the minerals by converting them into oxalates, which by ignition give the corresponding oxides. The oxides are then converted into double sulphates which are separated from each other by repeated fractional crystallization or by fractional precipitation with ammonia or some other base. Erbium forms rose-coloured salts and a rose-coloured oxide. The oxide dissolves slowly in acids; it is not reduced by hydrogen and is insubflble. The salts show a characteristic absorption spectrum.

ERCILLA Y ZÚNIGA—ERECH

ERCILLA Y ZÚNIGA, ALONSO DE (1533-1595). Spanish soldier and poet, was born in Madrid on the 7th of August 1533. In 1548 he was appointed page to the heir-apparent, afterwards Philip II. In this capacity ERCILLA visited Italy, Germany and the Netherlands, and was present in 1554 at the marriage of his master to Mary of England. Hearing that an expedition was preparing to subdue the Araucanians of Chile, he joined the adventurers. He distinguished himself in the ensuing campaign, but, having quarrelled with a comrade, he was condemned to death in 1558 by his general, Garcia Hurtado, Mendoza. The sentence was commuted to imprisonment, but ERCILLA was speedily released and fought at the battle of Quipeo (14th of December 1558). He returned to Spain in 1562, visited Italy, France, Germany, Bohemia, and in 1570 married Maria de Bazán, a lady distantly connected with the Santa Cruz family; in 1571 he was made knight of the order of Santiago, and in 1578 he was employed by Philip II. on a mission to Saragossa. He complained of living in poverty but left a modest fortune, and was obviously disappointed at not being offered the post of secretary of state. His principal work is La Araucana, a poem based on the events of the wars in which he had been engaged. It consists of three parts, of which the first, composed in Chile and published in 1576, is a versified narrative adapting strictly to historic fact; the second, published in 1578, is encumbered with visions and other romantic machinery; and the third, which appeared in 1580-1590, contains, in addition to the subject proper, a variety of episodes mostly irrelevant. This so-called epic lacks symmetry, and has been over-praised by Cervantes and Voltaire; but it is written in excellent Spanish, and is full of vivid rhetorical passages. An analysis of the poem was given by Hayley in his Essay on Epic Poetry (1783).

A good biography precedes the Morceaux choisis (Paris, 1900) by Jean Ducamin.

ERECH, ALFRED (1814-1868). Hungarian poet and author, was born in 1814 at Kapos, in the county of Ungvar, and educated at the Protestant college of Sárospatak. In 1833 he removed to Pest, where he was, in 1839, elected member of the Hungarian Academy of Sciences. His literary fame was made by his collection of Hungarian national poems and folk-tales, Magyar Népfalkaléji Gyűjtemény, Népdalok és Mondák (Pest, 1846-1847). This work, published by the Kisfaludy Society, was supplemented by a dissertation upon Hungarian national poetry, afterwards partially translated into German by Stier (Berlin, 1851). Erdélyi also compiled for the Kisfaludy Society an extensive collection of Hungarian proverbs—Magyar Kőmándosok kényele ( Pest, 1851),—and was for some time editor of the Szépirodalmi Szemle (Review of Pòlitte Literature). In 1848 he was appointed director of the national theatre at Pest; but after 1849 he resided at his native town. He died on the 23rd of january 1868. A collection of folklore was published the year after his death, entitled A Nép Kőltséete népdalok, népmesték és kőmándosok (Pest, 1869). This work contains 300 national songs, 15 folk-tales and 7362 Hungarian proverbs.
through the library of Assur-bani-pal. Erecch enjoyed much distinction in the later times, as a seat of learning and of the worship of Ishtar, and Assur-bani-pal drew largely on its literary stores for his library at Nineveh, from which we derive our principal information concerning ancient Babylonian literature. The inscriptions found here show that it continued in existence through the Persian and Seleucid periods. The ruins of the ancient site, known as Warka, which are among the largest in all Babylonia, forming an irregular circle nearly 6 m. in circumference, bounded by a wall, still standing in some places to the height of 40 ft., were explored and partially excavated by W. K. Loftus in 1850 and 1854. The most conspicuous ruin, now called Abu-Berdi, "Father of Marsh Grass," or Buwariye, "reed matting," because of the layers of reeds between each twelve courses of unbaked brick, is the zigurrat (tower) of the ancient temple of E-Anna. It is about 100 ft. in height, and strikingly resembles in general appearance the ruins of the zigurrat of the temple of Enlil at Nippur. Second to this in size was the ruin called Wuswas, a walled quadrangle, including an area of more than seven and a half acres, within which was an edifice 246 ft. long and 174 ft. wide, elevated on an artificial platform 50 ft. in height. The south-eastern corner, accessible to the height of 23 ft., exhibited an interesting use of half columns, and stepped recesses for purposes of decoration.

In another ruin Loftus found a wall, 30 ft. long, composed entirely of small yellow terra-cotta nail-headed cones, such as have been discovered in great numbers, inscribed and uninscribed, used for votive purposes in connexion with walls at Tello and elsewhere in Babylonia. His excavations being superficial, the Babylonian inscriptions found by him, about one hundred in all, exclusive of the ancient Ur-Gur bricks from the temple, belong in general to the neo-Babylonian, Persian and Seleucid periods. The older remains are buried deep beneath the huge mass of later brick.

Loftus also discovered at Erecch, almost everywhere within and without the walls, great numbers of clay coffins, piled one above another, to the height of over 30 ft., forming a vast and, on the whole, well-ordered cemetery belonging to the Persian, Parthian and later occupations of Babylonia, during which period Erecch, like other cities of the south, evidently became a necropolis for a large extent of country. After Loftus' time the mounds were visited by various travellers, but no further excavations have been conducted. Work on this important part of the site is attended with very great difficulties, owing to the inaccessible position of the ruins, the un excavation of the country, the frequent sand-storms, and above all, the immense mass of material of later periods which must be removed before any systematic excavation of the more ancient and interesting ruins could be undertaken. A curious feature of the Warka neighborhood is the existence of conical sand-hills, rising to a considerable height, so compact as to be almost like stone. These hills extend from Warka northward as far as Tel Ede.

See W. K. Loftus, Chaldaea and Susiana (1857); J. P. Peters, Nippur (1857); E. Sachau, Am Euphrat und Tigris (1900). Cf. also Nippur and authorities there quoted (J. P. Pw.).

Erecchtheum, a temple (commonly called after Erecchtheus, to whom a portion of it was dedicated). The plan is unique in plan, and in its execution the most refined example of the Ionic order. There is no clear evidence as to when the building was begun, some placing it among the temples projected by Pericles, others assigning it to the time after the peace of Nicias in 421 B.C. The work was interrupted by the stress of the Peloponnesian War, but in 406 B.C. a commission was appointed to make a report on the state of the building and to undertake its completion, which was carried out in the following year.

The peculiar plan of the Erecchtheum has given rise to much speculation. It may be due partly to the natural configuration of the rock, and partly to the necessity of enclosing within a single building several objects of ancient sanctity, such as the mark of Poseidon's trident and the spring that arose from it, the sacred olive tree of Athena, and the tomb of Cecrops. But there are some features which cannot be so explained, and which have led Professor W. Dörpfeld and others to believe that the plan, as we now have it, is a modification or abridgment of the original design, due to the same conservative influences as led to the curtailment of the plan of the Propylæa (q.v.).

The building as completed consisted of a temple of the ordinary type, opening by a door and two windows to the east front, before which stood a portico of six Ionic columns. This part was the temple of Athena Polias. Adjoining it on the west was the central chamber, on a lower level; this chamber was separated by a partition, originally of wood and later of marble, from the western compartment of the temple, which was of peculiar construction. The west end was formed by a wall, on which stood four columns between antae; but the main entrance to this western compartment was through a large and very ornate doorway on the north; and a large Ionic portico, consisting of four columns in the front, and one in the return on each side, was placed in front of this door. At the south end of the western compartment was a smaller door, with steps leading up to the higher level, within a projecting space enclosed by a low wall and covered with a projecting porch carried by six 'maidens' or caryatides. The construction of the building at this south-western corner shows that there was some sacred object that had to be bridged over by a huge block of marble; this we know from inscriptions to have been the Cercopæon or tomb of Cecrops. In the north portico a square hole in the floor, with a corresponding hole in the roof above it, must have given access to another sacred object, the mark of Poseidon's trident in the rock.

The sacred olive tree probably stood just outside the temple to the west in the Pandroseion. The Ionic order, as used in this temple, is of the most ornate Attic type. The bases of the columns are either reeded or decorated with a plait-pattern; the capital has the broad channel between the volutes subdivided by a carefully-profiled incision; and the top of the shafts is ornamented by a broad band of palmette or honeysuckle pattern. A similar band of ornament runs round the top of the walls outside, and at their base is a reeded torus. The frieze consisted of white marble figures in relief, affixed to a background of black Eleusinian stone.

The contents of the Erecchtheum are described by Pausanias. It contained the ancient image of Athena Polias, and three altars, one to Poseidon and Erecchtheus, one to Butes and one to Hephaestus; there were portraits of the family of the Butadæ on the walls. Within it was also the gold lamp of Callimachus, which burnt for a year without relighting, and had a chimney in the form of a palm-tree.

The Erecchtheum was damaged by a fire, soon after its completion, in 406 B.C., but was repaired early in the following century. The west end appears to have been damaged in Roman times and to have been replaced by the attached columns with
ERECHTHEU.S—ERFURT

windows between them which appear in old drawings and are still partially extant. It was used as a church in Christian times, and served as the custom house of the governor of Athens. Lord Elgin carried off to London, after the demolition of one of the columns of the east portico and one of the caryatides; these were replaced later by terra-cotta casts. During the siege of the Acropolis in 1827, the roof of the north portico was blown down and the building was otherwise much damaged. It was partially rebuilt between 1838 and 1846; the west front was blown down in a storm in 1852. Since 1900 the project of rebuilding the Erechtheum as far as possible with the original blocks has again been undertaken.

**ERECHTHEUS**, in Greek legend, a mythical king of Athens, originally identified with Erechtheus, but in later times distinguished from him. According to Homer, who knows nothing of Erechtheus, he was the son of Aorura (Earth), brought up by Athena, with whom his story is closely connected. In the later story, Erechtheus (son of Hephaestus and Athis or Athena herself) was handed over by Athena to the three daughters of Cecrops—Aglaurus (or Agraule), Hera, and Pandrosos—in a chest, which they were forbidden to open. Aglauros and Hera disdained the injunction, and when they saw the child (which had taken the form of a snake, or round which a snake was coiled) they went mad with fright, and threw themselves from the rock of the Acropolis (or were killed by the snake). Athena herself then undertook the care of Erechtheus, who, when he grew up, drove out Amphictyon and took possession of the kingdom of Athens. Here he established the worship of Athena, instituted the Panathenaea, and built an Erechtheum. The Erechtheus of later times was supposed to be the grandson of Erechtheus-Erechtheus, and was also king of Athens. When Athens was attacked by the Thracian Eumolpus (or by the Elysiunians assisted by Eumolpus) victory was promised Erechtheus if he sacrificed one of his daughters. Eumolpus was slain and Erechtheus was victorious, but was himself killed by Poseidon, the father of Eumolpus, or by a thunderbolt from Zeus. The contest between Erechtheus and Eumolpus formed the subject of a lost tragedy by Euripides; Swinburne has utilized the legend in his *Erechtheus*. The scene of the opening of the chest is represented on a Greek vase in the British Museum. The name Erechtheus is connected with ἐρέχθω ("earth") and the representation of him as half-snake, like Cecrops, indicates that he was regarded as one of the autochthones, the ancestors of the Athenians who sprang from the soil.

See Apollodorus iii. 14. 15; Euripides, *Ion*, Ovid, *Metam.* ii. 553; Hyginus, *Poet. astron.* ii. 13; Pausanias i. 2, 5, 8; E. Ermattinger, *Die attische Aischylois*nage (1897); article by J. A. Hild in Darmember and Saglio’s *Dictionnaire des antiquités*; B. Powell in *Cornell Studies*, xvii. (1906), who identifies Erechtheus, Erechtheus, Eumolpus, and Poseidon as all denoting the sacred serpent of Athens, whose cult she first contested, but then amalgamated with her own. The birth of Erechtheus (as a corn-spirit) is interpreted by Mannhardt as a mythical way of describing the growth of the corn, and by J. W. D.örpfeld in *Oriental Monuments*, 3rd ed. (1893, xxvi.) as a fiction to explain the ceremony performed by the two maidens called Arephori. See also Farnell, *Cults of the Greek States*, i. 270; and Frazer’s *Pausanias*, ii. 109.

**EREKSHIGAL**, also known as ALLATU, the name of the chief Babylonian goddess of the nether-world where the dead are gathered. Her name signifies "lady of the nether-world." She was called by some of the chiefs through the change of seasons but intended also to illustrate certain doctrines developed in the temple-schools of Babylonia. One of these myths is the famous story of Ishtar’s descent to Irkalla or Aralu, as the lower world was called, and her reception by her sister who presides over it; the other is the story of Nergal’s offence against Erekhigal, his banishment to the kingdom controlled by the goddess and the reconciliation between Nergal and Erekhigal through the latter’s offer to have Nergal share the honours of the rule over Irkalla. The story of Ishtar’s descent is told to illustrate the possibility of an escape from Irkalla, while the other myth is intended to reconcile the existence of two rulers of Irkalla—a goddess and a god.

It is evident that it was originally a goddess who was supposed to be in control of Irkalla, corresponding to Ishtar in control of fertility and vegetation on earth. Erekhigal is therefore the sister of Ishtar and from one point of view her counterpart, the symbol of nature during the non-productive season of the year. As the doctrine of two kingdoms, one of this world and one of the world of the dead, becomes crystallized, the dominions of the two sisters are sharply differentiated from one another. The addition of Nergal represents the harmonizing tendency to unite with Erekhigal as the queen of the nether-world the god who, in his character as god of war and of pestilence, compels the living to Irkalla and thus becomes the one who presides over the dead.

(M. J.A.)

**ERETRIA** (mod. *Alcetria*), an ancient coast town of Euboea about 15 m. S.E. of Chalcis, opposite to Oropus. Eretria, like its neighbour Chalcis (q.v.), early entered upon a commercial and colonizing career. Besides founding colonies in the west and north of Greece, it acquired dependencies among the Cyclades and joined the great mercantile alliance of Miletus and Aegina. Since the so-called Lelantine War (7th century B.C.) against the coming league of Chalcis, it began to be overshadowed by its rivals. The interference of Eretria in the Ionian revolt (498 B.C.) brought upon it the vengeance of the Persians, who captured and destroyed it shortly before the battle of Marathon (490).

The city was soon rebuilt, and as a member of both the Delian Leagues attached itself by numerous treaties to the Athenians. The latter, through their general Phocion, rescued it from the tyrants suborned by Philip of Macedon (354 and 347). Under Macedonian and Roman rule Eretria fell into insignificance; for a short period under Mark Antony, the triumvir, it became a possession of Athens. Eretria was the birthplace of the tragedian Achaues and of the "Megarian" philosopher Menedemus.

The modern village, which is sometimes called Nea Psará because the inhabitants of Psará were transferred there in 1821, is on an unhealthy low-lying ground near the sea. The excavation of the site was carried out by the American School of Athens (1890-1895). At the foot of the Acropolis Hill, where the ground begins to rise, the theatre lies; and though the material of which this was built is rough, and only seven imperfect rows of seats remain, a good part of the scene and of the chambers behind it is preserved, and beneath these there runs a tunnel, which, together with other peculiar features, has raised interesting questions in connexion with the arrangement of the Greek theatre, the orchestra being at present on a level about 12 ft. below that of the rooms in the scene. Near by are the substructures of a temple of Dionysus and a large altar, and also a re-arrangement with arrangements for bathing. Besides these, in 1900 the substructures of a temple of Apollo Daphnephorus were unearthed. Both the northern and the southern side of the hill are flanked by walls, which seem to have reached the sea, where there was a mole and a harbour; and the wall of the acropolis itself remains in one part to the height of eight courses.

**ERETRIAN SCHOOL OF PHILOSOPHY.** This Greek school was the other name of the Eleatic school, which was transferred to Eretria by Menedemus. It was of small importance, and in the absence of certain knowledge must be supposed to have adhered to the doctrines of Socrates. (See MENEDEMUS.)

**ERFURT,** a city of Germany, in the Prussian Saxony, on the Gera, and the railway Halle-Bebra, about midway between Goth and Weimar, which are 14 m. distant. Pop. (1875) 48,025; (1905) 100,085. The city, which is dominated on the
west by the two citadels of Petersberg and Cyriaxburg, is irregularly built, the only feature in its plan, or want of plan, being the Friedrich Wilhelmsplatz, a broad open space of irregular shape abutting on the Petersberg. On the south-western side of this square, which contains a monument to the elector Frederick Charles Joseph of Mainz (1719-1802), is the Domberg, an eminence on which stand, side by side, the cathedral and the great church of St Severus with its three spires (14th century). The churches are approached by a flight of forty-eight stone steps, the grouping of the whole mass of buildings being exceedingly impressive. The cathedral (Basilica Mariae Virginis) is one of the finest churches in Germany. It was begun in the 12th century, but the nave was rebuilt in the 13th in the Gothic style. The magnificent chancel (1349-1372), with the 14th-century crypt below, rests on massive substructures, known as the Cases. The twin towers are set between the chancel and nave. The cathedral contains, besides fine 15th-century glass, some very rich portal sculptures and bronze castings, among others the coronation of the Virgin by Peter Vischer. In one of its towers is the famous bell, called Maria Gloriosa, which bears the date 1497, and weighs 270 cwt. Besides the cathedral and St Severus, which are Roman Catholic, Erfurt possesses several very interesting medieval churches, now Evangelical. Among these may be mentioned the Frauenkirche, dating from the latter half of the 12th century; the Reglerkirche, a Romanesque building (restored in 1859) with a 13th-century tower; and the Barfüsserkirche, a Gothic building containing fine 14th-century monuments. All these were originally monastic churches. Of the former religious houses there survive a Franciscan convent, with a girls' school attached, and an Ursuline convent. The Augustinian monastery, in which Luther lived as a friar, is now used as an orphanage, under the name of the Martinisstift. The cell of Luther was destroyed by fire in 1872. A bronze statue of the reformer was erected in the Anger, the chief street of the town, in 1890. At one time Erfurt had a university, of which the charter dated from 1392; but it was suppressed in 1816, and its funds devoted to other purposes, among these being the endowment of an institution founded in 1758 and now called the royal academy of sciences, and the support of the royal library, which now contains 60,000 volumes and over 1000 manuscripts. On the W. and S.W. extensive new quarters have grown up within recent years, e.g. Hirschhügel. The interior of the town hall (1860-1872) is adorned with legendary and historical frescoes by Kämpfer and Peter Jansen. Erfurt possesses also a picture gallery and an antiquarian collection.

The educational establishments of the town include a gymnasium, a real school, technical schools for building and handicrafts, a high-class commercial school, a school of agriculture, and an academy of music. The most notable industry of Erfurt is the culture of flowers and of vegetables, which is very extensively carried on. This industry had its origin in the large gardens attached to the monasteries. It has also important and growing manufactures of ladies' mantles, boots and shoes, machines, furniture, woolen goods, musical instruments, agricultural machinery and implements, leather, tobacco, chemicals, etc. Brewing, bleaching and dyeing are also carried on on a large scale, and there are extensive railways and a government rifle factory. Erfurt (Med. Esperant, Erfurdo, Lat. Erfordia) is a town of great antiquity. Its origin is obscure, but in 741 it was sufficiently important for St Boniface to found a bishopric here, which was, however, after the martyrdom of the first bishop, Adolar, in 755, reabsorbed in that of Mainz. In 805 the place received certain market rights from the emperor Charlesmagne. Later the overlordship was claimed by the archbishops of Mainz, on the strength of charters granted by the emperor Otto I., and their authority in Erfurt was maintained by a burggrave and an advocatus, the office of the latter becoming in the 12th century hereditary in the family of the counts of Giechen. In spite of many vicissitudes (from 1100 to 1125, for instance, the town was subject to the landgraves of Thuringia), and of a charter granted in 1242 by the emperor Frederick II., the archbishops succeeded in upholding their claims. In 1555, however, Archbishop Gerhard I. had to grant the city municipal rights, the burggrave disappeared, and Erfurt became practically a free town. Its power was at its height early in the 16th century, when it joined the Hanseatic League. It had acquired by force or purchase various countships and other fiefs in the neighbourhood, and ruled a considerable territory; and its wealth was so great that in 1575 it established a university, the first in Europe that embraced the four faculties. By the end of the century, however, its prosperity had sunk owing to the perpetual feud with Mainz, the internecine war in Saxon, and the consequent dwindling of trade. By the convention of Amorhabach in 1485 the overlordship of Erfurt was ultimately transferred by the electors of Mainz to Saxony. The political and religious quarrels of the 16th century still further depressed the city, in which the reformed religion was established in 1521. Then came the Thirty Years' War, during which Erfurt was for a while occupied by the Swedes. After the peace of Westphalia (1648) the city was assigned by the emperor to the elector of Mainz, and, on its refusal to submit, it was placed under the ban of the Empire (1666). In 1664 it was captured by the troops of the archbishop of Mainz, and remained in the possession of the electorate till 1802, when it came into the possession of Prussia. In 1808 it was the scene of the memorable interview between Napoleon and the emperor Alexander I. of Russia, at which the kings of Bavaria, Saxony, Westphalia and Württemberg also assisted, which is known as the congress of Erfurt. Here in 1850 the parliament of the short-lived Prussian Northern Union (known as the Erfurt parliament) held its sittings. In 1902 the 100th anniversary of the city's incorporation with Prussia was celebrated.

See W. J. A. von Tettau, Erfurt in seiner Vergangenheit und Gegenwart (Erfurt, 1880); C. Beyer, Geschichte der Stadt Erfurt (Erfurt, 1900); and F. W. Kampschulte, Die Universität Erfurt in ihrem Verhältnisse zu dem Humanismus und der Reformation (1850-1858). For a detailed bibliography see U. Chevalier, Répertoire des établissements de l'enseignement supérieur (Montebéliard, 1892); Erfurt, or Spurred Rye, the drug ergot or Secale cornutum (Ger. Mütterkorn; Fr. seigle ergoté), consisting of the sclerotium (or hard resting condition) of a fungus, Claviceps purpurea, parasitic on the pistil of many members of the Grass family, but obtained almost exclusively from rye, Secale cereale. In the ear of rye that is infected with ergot a species of fermentation takes place, and there exudes from it a sweet yellowish mucus, which after a time disappears. The ear loses its starch, and ceases to grow, and its ovaries become penetrated with the white spongy tissue of the mycelium of the fungus which towards the end of the season forms the sclerotium, in which state the fungus lies dormant throughout the winter.

The drug consists of grains, usually curved (hence the name, from the O. Fr. argot, a cock's spur), which are violet-black or dark-purple externally, and whitish with a tinge of pink within, are between $\frac{1}{8}$ and $\frac{1}{8}$ in. long, and from 1 to 4 lines broad, and have two lateral furrows, a close fracture, a disagreeable rancid taste, and a faint, fishy odour, which last becomes more perceptible when the powder of the drug is mixed with potash solution. Ergot should be kept in stoppered bottles in order to preserve it from the attacks of a species of mite, and to prevent the oxidation of its fatty oil. The extremely complex composition of this drug has been studied in great detail, and with such important results that instead of giving ergot itself by the mouth in doses of 20 to 60 grains, it is now possible to obtain much more rapid and certain results by giving one three-hundredth of a grain of one of its constituents hydromerically. This constituent is the alkaloid cornutine, which is the valuable ingredient of the drug. Other ingredients are a fixed oil, present to the extent of 30%, ergotinic acid, a glucoside, trimethylamine, which gives the drug its unpleasant odour, and sphecanic acid, a non-nitrogenous resinoid body. Of the numerous preparations only two need be mentioned—the liquificate (Montebéliard, 1892-1899), a vial of about 5 minims, and the hydromeric injection. The latter does not keep well, and the best way of using ergot is to dissolve tablets obtained from a reputable maker, and containing some of the
active principles, in pure water, the solution being injected subcutaneously.

Ergot has no external action. Given internally it stimulates the intestinal muscles and may cause diarrhoea. After absorption it slows the pulse by stimulation of the vagus nerves. It has indeed been asserted that the slow pulse characteristic of the puerperal period is really due to the common administration of ergot at that time. This is probably an exaggeration. The important actions of ergot are on the blood-vessels and the uterus. The drug greatly raises the blood-pressure by causing extreme contraction of the arteries. This is mainly due to a direct action on the muscular coats of the vessels, but is also partly of central origin, since the drug also stimulates the vasomotor centre in the medulla oblongata. This action on the vessels is so marked as to constitute the drug a haemostatic, not only locally but also remotely. It may arrest bleeding from the nose, for instance, when injected hypodermically. Nearly all the constituents share in causing this action, but the sphecanal acid is probably the most potent. Ergot is the most powerful known stimulant of the pregnant uterus. The action is a double one. At least four of its constituent parts. The indications for the use of ergot in obstetrics are highly complex and demand detailed treatment. It can only be said here that the drug should only in the rarest possible cases be given whilst the child is still in utero. This rule is necessitated by the sphecanal acid, which causes an unnatural state of the organ. When it is possible to obtain pure cornutine, which is unfortunately very expensive, the precautions necessary in other cases may be abrogated.

Chronic poisoning, or ergotism, used frequently to occur amongst the poor fed on rye infected with the Claviceps. As it is practically impossible to reproduce the symptoms of ergotism now-days, whether experimentally in the lower animals, or when the drug is being administered to a human being for some therapeutic purpose, it is believed that the indications for the use of a drug in obstetrics are highly complex and demand detailed treatment. It can only be said here that the drug should only in the rarest possible cases be given whilst the child is still in utero. This rule is necessitated by the sphecanal acid, which causes an unnatural state of the organ. When it is possible to obtain pure cornutine, which is unfortunately very expensive, the precautions necessary in other cases may be abrogated.

In the gangrenous form various parts of the body underwent gangrene as a consequence of the arrest of blood-supply produced by the action of sphecanal acid on the arteries. In the spasmodic form the symptoms were of a nervous character. The initial indications of the disease were cutaneous itching, tingling and formation, which gave place to actual loss of cutaneous sensation, first observed in the extremities. Amblyopia and some loss of hearing also occurred, as well as mental failure. With weakness of the voluntary muscles went intermittent spasms which weakened the patient and ultimately led to death by implication of the respiratory muscles. The last-known "epidemic" of ergotism occurred in Lorraine and Burgundy in the year 1516.

ERIC XIV. (1533-1577), king of Sweden, was the only son of Gustavus Vasa and Catherine of Saxe-Lauenburg. The news of his father's death reached Eric as he was on the point of embarking for England to press in person his suit for the hand of Queen Elizabeth. He hastened back to Stockholm, after burying his father, summoned a Riksdag, which met at Arboga on the 15th of April 1561, and adopted the royal propositions known as the Arboga articles, considerably curtailting the authority of the royal dukes, John and Charles, in their respective provinces. Two months later Eric was crowned at Upsala, on which occasion he first introduced the titles of baron and count into Sweden, by way of attaching to the crown the higher nobility, these new counts and barons receiving lucrative fees adequate to the maintenance of their new dignities.

From the very beginning of his reign Eric's morbid fear of the upper classes drove him to give his absolute confidence to a man of base origin and bad character, though, it must be admitted, of superior ability. This was Göran Persson, born about 1530, who had been educated abroad in Lutheran principles, and after narrowly escaping hanging at the hands of Gustavus Vasa for some vile action entered the service of his son. This powerful upstart was the natural enemy of the nobility, who suffered much at his hands, though it is very difficult to determine whether the initiative in these prosecutions proceeded from him or his master. Göran was also a determined opponent of Duke John, with whom Eric in 1563 openly quarrelled, because John, contrary to the royal orders, had married (Oct. 4, 1562) Catherine, daughter of Sigismund I. of Poland, engaging at the same time to assist the Polish king to conquer Livonia. This act was a surpise breach of the paragraph of the Arboga articles which forbade the royal dukes to一下子就 without the royal assent. An army of 10,000 men was immediately sent by Eric to John's duchy of Finland, and John and his consort were seized, brought over to Sweden and detained as prisoners of state in Gripsholm Castle. But Eric did not stop here. His suspicion suggested to him that, if his own brother had failed him, the loyalty of the great nobles, especially the members of the ancient Sture family, who had been notable in Sweden when the Vasa's were unknown, could not be depended upon. The head of the Sture family at this time was Count Svante, who had married a sister of Gustavus Vasa's second wife, and had by her a numerous family, of whom two sons, Nils and Eric, still survived. The dark tragedy, known as the Sture murders, began with Eric XIV.'s strange treatment of young Count Nils. In 1566 he was summoned before a newly erected tribunal and condemned to death for gross neglect of duty, though not one of the frivolous charges brought against him could be substantiated. The death penalty was commuted into a punishment worse because more shameful than death. On the 15th of June 1566 the unfortunate youth, bruised and bleeding from shock, ill-treatment, was placed upon a wretched hack, with a crown of straw on his head, and led in derision through the streets of Stockholm. The following night he was sent a prisoner to the fortress of Öbyhus. A few days later he was appointed as ambassador extraordinary, and dispatched to Lorraine to resume the negotiations for Eric's marriage with the princess Renata. Before he returned, however, Eric had resolved to marry Karin, or Kitty Månssdotter, the daughter of a common soldier, who had been his mistress since 1565. In January 1567 Eric extorted a declaration from two of his senators that they would assist him to punish all who should try to prevent his projected marriage; and, in the middle of May, a Riksdag was summoned to Upsala to judge between the king and those of the aristocracy whom he regarded as his personal enemies. Eric himself arrived at Upsala on the 16th in a condition of incipient insanity. On the 19th he opened parliament in a speech which, as he explained, he had to deliver extemporaneously owing to the treachery of his secretaries. Two days later Nils Sture arrived at Upsala fresh from his embassy to Lorraine, and was at once thrown into prison, where other members of the nobility were already detained. On the following day Eric murdered Nils in his cell with his own hand, and by his order the other prisoners were despatched by the royal provost marshal forthwith. These murders were committed so promptly and secretly that it is doubtful whether the estates, actually in session at the same place, knew what had been done when, on the 26th of May, under violent pressure from Göran Persson, they signed a document declaring that all the accused gentlemen under detention had acted like traitors, and confirming all sentences already passed or that might be passed upon them.

During the greater part of 1567 Eric was so deranged that a
committee of senators was appointed to govern the kingdom. One of his illusions was that not he was king but his brother John, whom he now set at liberty. When, at the beginning of 1568, Eric recovered his reason, a reconciliation was effected between the king and the duke, on condition that John recognized the legality of his brother's marriage with Karin Månsetter, and her children as the successors to the throne. A month later, on the 4th of July, he was solemnly married to Karin at Stockholm by the primate. The next day Karin was crowned queen of Sweden and her infant son Gustavus proclaimed prince-royal. Shortly after his marriage Eric issued a circular ordering a general thanksgiving for his delivery from the assaults of the devil. This document, in every line of which madness is legible, convinced most thinking people that Eric was unfit to reign. The royal dukes, John and Charles, had already taken measures to depose him; and in July the rebellion broke out in Östergötland. Eric at first offered a stout resistance and won two victories; but on the 17th of September the dukes stood before Stockholm, and Eric, after surrendering Göran Persson to the horrible vengeance of his enemies, himself submitted, and resigned the crown. On the 30th of September 1568 John III was proclaimed king by the army and the nobility; and a Riksdag, summoned to Stockholm, confirmed the choice and formally deposed Eric on the 25th of January 1569. For the next seven years the ex-king was a source of the utmost anxiety to the new government. No fewer than three rebellions, with the object of releasing and reinstating him, had to be suppressed, and his prison was changed half a dozen times. On the 10th of March 1575, an assembly of notables, lay and clerical, at John's request, pronounced a formal sentence of death upon him. Two years later, on the 24th of February 1577, he died suddenly in his new prison at Örbyhus, poisoned, it is said, by his governor, Johan Henriksen.

ERICACEAE. In botany, a natural order of plants belonging to the higher or gamopetalous division of Dicotyledons. They are woody plants, sometimes with a slender creeping stem as in bilberry, Vaccinium (fig. 1), or Andromeda (fig. 2), or forming low bushes as in the heaths, or larger, sometimes becoming tree-like, as in species of Rhododendron. The leaves are alternate, opposite or whorled in arrangement, and in their form and structure show well-marked adaptation for life in dry or exposed situations. Thus in the true heaths they are needle-like, with the margins often rolled back to form a groove or an almost closed chamber on the under side. In others such as Rhododendron or Arbutus they are often leathery and evergreen, the strongly cuticularized upper surface protecting a water-storing tissue situated above the green layers of the leaf. The flowers are sometimes solitary and axillary or terminal as in Andromeda, but are generally arranged in racemose inflorescences at the end of the branches as in Arbutus and Rhododendron, or on small lateral shoots as in Erica. They are hermaphrodite and generally regular with parts in 4 or 5, thus: sepals 4 or 5, petals 4 or 5, stamens 8 or 10 in two series, the outer of which is opposite the petals, and carpels 4 or 5. The corolla is usually more or less bell-shaped, and in the heaths persists in a dry state in the fruit. The petals with the stamens are situated on the outer edge of a honey-secreting disk. The anthers show a very great variety in shape, the halves are often more or less free and often appended; they open to allow the escape of the pollen by a terminal pore or slit. The carpels are united to form a 4- to 5-anchored ovary, which bears a simple elongated style ending in a capitate stigma; each ovary-chamber contains one to many ovules attached to a central placenta. The brightly coloured corolla, the presence of nectar and the scent render the flowers attractive to insects, and the projection of the stigma beyond the anthers favours crossing. The fruit is generally a capsule containing many seeds, as in Erica (fig. 3) or Rhododendron; sometimes a berry as in Arbutus.

The order falls into four distinct tribes, which are characterized by the relative position of the ovary and by the fruit and seed. They are as follows:

1. Rhododendron tribe, characterized by capsule fruit, seed with a loose coat, deciduous petals and anthers without appendages. It consists mainly of the great genus Rhododendron (in which Azalea is included by recent botanists), which is chiefly

![Fig. 2.—Andromeda Hypnoides, nat. size. 1, Flower; 2, Unripe fruit cut across; 3, Stamen—all enlarged.](image-url)

![Fig. 3.](image-url)

1. Flowering shoot of Erica cinerea, about 1½ nat. size. 2. Flower cut lengthwise. 3. Stamens showing appendages and porous dehiscence of anther. 4. Capsule showing the loculicidal dehiscence; a few seeds resting on placenta. 5. Diagram of the flower having four sepals, four divisions of the corolla, eight stamens in two rows, and four divisions of the pistil.)
developed in the mountains of eastern Asia, many species occurring on the Himalayas. *Dabeocia*, St Dabeoc's heath, occurs in Ireland.

2. _Arbutus Tribe._—Fruit a berry or capsule, petals deciduous and anthers with bristle-like appendages, chiefly north temperate to arctic in distribution. *Arbutus Uveda* the strawberry-tree, so called from its large scarlet berry, is a southern European species which extends into south Ireland. *Arctostaphylos* (bearberry) and *Andromeda* are arctic and alpine genera occurring in Britain. *Epiligea repens* is the trailing arbutus or mayflower of Atlantic America.

3. _Vaccinium Tribe._—Ovary inferior, fruit a berry. Extends from the north temperate zone to the mountains of the tropics. *Vaccinium*, the largest genus, has four British species, *V. Myrtillus* is the bilberry (q.v.), blueberry or whortleberry, *V. Vitis-Idaea* the cowberry, and *V. Oxyccocos* the cranberry (q.v.). This tribe is sometimes regarded as a separate order Vaccinaceae, distinguished by its inferior ovary.

4. _Erica Tribe._—Fruit usually a capsule, seeds round, not winged; corolla persisting round the ripe fruit; anthers often appended. The largest genus is *Erica*, the true heath (q.v.), with over 400 species, the great majority of which are confined to the Cape; others occur on the mountains of tropical Africa and in Europe and North Africa, especially the Mediterranean region. *E. Cinerosa* (purple heather) and *E. Tetralix* (cross-leaved heath) are common British heaths. *Calluna* is the ling or Scotch heather.

**ERICHSEN, Sir John Eric**, Bart. (1818–1896), British surgeon, born on the 19th of July 1818 at Copenhagen, was the son of Eric Erichsen, a member of a well-known Danish family. He studied medicine at University College, London, and at Paris, devoting himself in the early years of his career to physiology, and lecturing on general anatomy and physiology at University College hospital. In 1844 he was secretary to the physiological section of the British Association, and in 1845 he was awarded the Fothergillian gold medal of the Royal Humane Society for his essay on asphyxia. In 1848 he was appointed assistant surgeon at University College hospital, and in 1850 became full surgeon and professor of surgery, his lectures and clinical teaching being much admired; and in 1875 he joined the commission staff. His Science and Art of Surgery (1853) went through many editions. He rose to be president of the College of Surgeons in 1880. From 1870 to 1881 he was president of the Royal Medical and Chirurgical Society. He was created a baronet in 1895, having been for some years surgeon-extraordinary to Queen Victoria. As a surgeon his reputation was world-wide, and he counts (says Sir W. MacCormac in his volume on the Centenary of the Royal College of Surgeons) "among the makers of modern surgery." He was a recognized authority on concussion of the spine, and was often called to give evidence in court on obscure cases caused by railway accidents, &c. He died at Folkestone on the 23rd of September 1896.

*E. loch* is a lake partly in Inverness-shire and partly in Perthshire. *S. loch*, lying between the districts of Badenoch on the N. and Rannoch on the S. The boundary line is drawn from a point opposite to the mouth of the Alder, and follows the centre of the longitudinal axis north-eastwards to 56° 50' N., where it strikes eastwards to the shore. All of the lake to the S. and E. of this line belongs to Perthshire, the rest, forming the major portion, to Inverness-shire. *I. loch* is a lonelv lake, situated in extremely wild surroundings at a height of 1153 ft. above the sea, being thus the loftiest lake of large size in the United Kingdom. It is over 143 m. long, with a mean breadth of half a mile and over 1 m. at its maximum. Its area amounts to some 71 sq. m., and it receives the drainage of an area of nearly 501 sq. m. The mean depth is 190 ft., and the maximum 512 ft. It has a general slope from N.E. to S.W., the head lying 1 m. from Dalwhinnie station on the Highland railway. It receives many streams, and discharges at the south-western extremity by the Erich. Salmon and trout afford good fishing. The surrounding mountains are lofty and rugged. Ben Alder (3757 ft.) on the west shore is the chief feature of the great Corrour

ERIDU—ERIE

by Flamsteed) was discovered to be a ternary star group by Herschel in 1783; it consists of a close pair, of magnitudes 9.2 and 10.9, revolving in a period of 180 years, associated with a star of magnitude 4.5, which is distant from the pair by 8.2; these stars have an exceptionally swift proper motion, about 4" per annum. Eridanus was the ancient name of the river Po.

ERIDU, one of the oldest religious centres of the Sumerians, described in the ancient Babylonian records as the "city of the deep." The special god of this city was Ea (Jain), god of the sea and of wisdom, and the prominence given to this god in the incantation literature of Babylonia and Assyria suggests not only that many of our magical texts are to be traced ultimately to the temple of Ea at Eridu, but that this side of the Babylonian religion had its origin in that place. Certain of the most ancient Babylonian myths, especially that of Adapa, may also be traced back to the shrine of Ea at Eridu. But while of the first importance in matters of religion, there is no evidence in Babylonian literature of any special political importance attaching to Eridu, and certainly at no time within our knowledge did it exercise hegemony in Babylonia. The site of Eridu was discovered by J. E. Taylor in 1854, in a ruin then called by the nates Abushaehr, a few miles south-south-west of Mohgair, ancient Ur, nearly in the centre of the dry bed of an inland sea, a deep valley, 15 m. at its broadest, covered for the most part with a nitrous incrustation, separated from the alluvial plain about Mohgair by a low, pebbly, sandstone range, called the Hazem, but open toward the north to the Euphrates and stretching southward to the Khanega wadi below Suk-esh-Sheikuk. In the rainy season this valley becomes a sea, flooded by the discharge of the Khanega; in summer the Arabs dig holes here which supply them with brackish water. The ruins, in which Taylor conducted brief excavations, consist of a platform of fine sand enclosed by a sandstone wall, 20 ft. high, the corners toward the cardinal points, on the N.W. part of which was a pyramidal tower of two stages, constructed of sun-dried brick, cased with a wall of kiln-burned brick, the whole still standing to a height of about 70 ft. above the platform. The summit of the first stage was reached by a staircase on the S.E. side, 15 ft. wide and 70 ft. long, constructed of polished marble slabs, fastened with copper bolts, flanked at the foot by two curious columns. An inclined road led up to the second stage on the N.W. side. Pieces of polished alabaster and marble, with small pieces of pure gold and gilded rock crystal, found at Eridu, suggest that the temple of the second stage, indicated that a small but richly adorned sacred chamber, apparently plated within or without in gold, formerly crowned the top of this structure. Around the whole tower was a pavement of inscribed baked bricks, resting on a layer of clay 2 ft. thick. On the S.E. part of the terrace were the remains of several edifices, containing suites of rooms. Inscriptions on the bricks identified the site as that of Eridu. Since Taylor's time the place has not been visited by any explorer, owing to the unsafe condition of the neighbourhood; but T. K. Loftus (1854) and J. P. Peters (1890) both report having seen it from the summit of Mohgair. The latter states that the Arabs at that time called the region Nawara, but generally not connected with the name Abushaehr. Through an error, in many recent maps and Assyriological publications Eridu is described as located in the alluvial plain, between the Tigris and the Euphrates. It was, in fact, an island city in an estuary of the Persian Gulf, stretching up into the Arabian plate. Originally "on the shore of the sea," as the old records aver, it is now about 120 m. from the head of the Persian Gulf. Calculating from the present rate of deposit of alluvium at the head of that gulf, Eridu should have been founded as early as the seventh millennium B.C. It is mentioned in historical inscriptions from the earliest times onward, as late as the 6th century B.C. From the evidence of Taylor's excavations, it would seem that the site was abandoned about the close of the Babylonian period.

ERIE, the most southerly of the Great Lakes of North America, between 41° 25′ and 42° 55′ N., and 78° 51′ and 83° 28′ W., bounded W. by the state of Michigan, S. and S.E. by Ohio, Pennsylvania and New York, and N. by the province of Ontario. It is nearly elliptical, the major axis, 250 m. long, lying east and west; its greatest breadth is 60 m.; its area about 10,000 sq. m.; and the total area of its basin 34,412 sq. m. Its elevation above mean sea-level is 573 ft.; and its surface is nearly 9 ft. below that of Lake Huron, which discharges into it through St. Clair river, Lake St Clair and Detroit river, and is 337 ft. above that of Lake Ontario, this great difference being absorbed by the rapids and falls in the Niagara river, which joins the two lakes. Lake Erie is very shallow, and may be divided into three basins, the western extending to Point Pelee and including all the islands, containing about 1200 sq. m., with a comparatively flat bottom at 5 to 6 fathoms; the main basin, between Point Pelee and the narrows at Long Point, containing about 6700 sq. m., and having a marked shelving bottom deepening gradually to 14 fathoms; and the portion east of the narrows, containing about 2100 sq. m., having a depression 30 fathoms deep just east from Long Point, with an extensive flat of 11 fathoms depth between it and the main basin. The Canadian shore is low and flat throughout, the United States shore is low but bordered by an elevated plateau through which the rivers have cut deep channels. The lake basin is relatively so small that the rivers are without importance; Grand river, on the north shore, is the largest tributary. The flat alluvial soil bordering on the lake is very fertile, and the climate is well adapted for fruit cultivation. Large quantities of peaches, grapes and small fruits are grown; the islands in the west end have a climate much warmer and more equable than the adjoining mainland, and are practically covered with vineyards. The low clayey or sandy shores are subject to erosion by waves. In severe storms the water near shore is filled with sand, which is deposited where the currents are checked around the ends of jetties in such a way as to form bars out into the lake across improved channels. This shoaling has rendered continuous dredging necessary at every harbour on the lake west of Erie, Pa. In consequence of the shallowness of the lake its waters are easily disturbed, making navigation very rough and dangerous, and causing large fluctuations of surface. Strong winds are frequent, as nearly every cyclonic depression traversing North America, either from the westward or the Gulf of Mexico, passes near enough to Lake Erie to suffer a partial depression, and have more effect on the water surface than easterly ones, lowering the water as much as 7 to 8 ft. at the west end and raising it to 8 ft. at the east end. The worst storms occur in autumn, when the immense quantity of shipping on the lake makes them specially destructive. There are no tides, and usually only a slight current towards the outlet, though powerful currents are temporarily produced by the rapid return of waters after a storm, and during the height of a westerly gale there is invariably a reflex current into the west end of the lake. There is an annual fluctuation in the level of the lake, varying from a minimum of 9 in. to a maximum of 2 ft., the normal low level occurring in February and the high level in August. Standard high water (of 1838) is 575 ft. above mean sea-level, and the lowest record was 570-8 in November 1895. The harbours and exits of the lake freeze over, but the body of the lake never freezes completely.

Ice-breaking car ferries run across the lake all winter. General navigation opens as a rule in the middle of April and closes in the middle of December. The volume of traffic is immense, because practically all freight from the more westerly lakes finds terminal harbours in Lake Erie. Official statistics of commerce passing through the Detroit river into the lake during the season of 1906 show that 15,128 vessels, having a net register of 50,673,897 tons, carried 63,805,571 (short) tons of freight, valued at $662,071,053. The 1175 vessels engaged in this business were valued at $106,223,000. Over 90% of the whole traffic is in United States ships to United States ports. Fine passenger steamers run nightly between Buffalo and Cleveland and Detroit, and there are many shorter passenger routes.

The large traffic on Lake Erie has brought into existence a number of important harbours on the south shore, nearly all artificially made and deepened, with entrances between two breakwaters running into the lake at right angles to the coast line. The principal of these are Toledo, Sandusky, Huron, Vermilion, Lorain, Cleveland, Fairport, Ashtabula, Conneaut, Erie (a natural harbour), Dunkirk and Buffalo, Rondeau, Port Stanley, Port Burwell, Port Dover, Port Maitland and Port Colborne. The Miami and Erie canal, leading from Maumee river to Cincinnati, 2424 m., with a branch to Port Jefferson, 14 m., with locks 90 by 15 by 4 ft., connects with Lake Erie through Toledo. The Erie canal leading from Buffalo to the Hudson river at Troy, and connecting with Lake Ontario at Oswego, had a capacity for boats 98 ft. long, 17 ft. 10 in. beam, with 6 ft. draught, until in 1907 the State of New York undertook its deepening to accommodate boats of 1000 tons capacity. Buffalo from its position at the eastern limit of deep draught lake navigation is a city of first rate commercial importance. Its harbour is formed by an artificial breakwater, built parallel with the shore about half a mile distant from it. It receives practically all the Lake Erie grain shipments besides large quantities of iron ore, lumber and copper, and is a large shipping port for coal, principally anthracite. It has over 600 m. of railway tracks to accommodate lake freightes. The Welland canal, 264 m. long, connecting Lake Ontario and Lake Erie, with locks 270 by 45 by 14 ft., leaves Lake Erie at Port Colborne, where the Canadian government have constructed an artificial harbour and elevators for transhipment of grain from upper lake freighters to lighters of canal capacity.

Fishing operations are carried on extensively in Lake Erie, the fish being taken with gill nets, seines and pound nets. Each state touching the lake has its own fishery regulations, which differ amongst themselves as well as from those of the Dominion. Both nations maintain a Fishery Protection Service, and the fisheries are replenished from artificial hatcheries. The most numerous and valuable fish are the lesser white fish (Coregonus artedii, Le Sueur), pickerel (Stizostedion vitreum, Walb.), pike (Lucius lucius, L.), and white fish (Coregonus clupeiformis, Mitchell), in the order named. The fish caught are estimated to be worth annually $1,000,000. They are collected in fishing tugs and distributed by rail throughout the United States and Canada.

ERIE, a city, a port of entry, and the county-seat of Erie county, Pennsylvania, U.S.A., on Lake Erie, 148 m. by rail N. of Pittsburg and near the N. W. corner of the state. Pop. (1890) 40,634; (1900) 52,733, of whom 11,955 were foreign-born, including 5226 from Germany and 1468 from Ireland, and 26,797 were of foreign parentage (both parents foreign-born), including 13,316 of German parentage and 4293 of Irish parentage; (1910 census) 66,425. Erie is served by the New York, Chicago & St. Louis, the Lake Shore & Michigan Southern, the Erie & Pittsburgh (Pennsylvania Company), the Philadelphia & Erie (Pennsylvania railway), and the Bessemer & Lake Erie railways, and by steamboat lines to many important lake ports. The city extends over an area of about 7 sq. m., which for the most part is quite level and is from 30 to 175 ft. above the lake. Erie has a fine harbour about 4 m. in length, more than 1 m. in width, with an average depth of about 20 ft. and 6000 acres from 300 ft. to 1 m. in width, and the national government has protected its entrance and deepened its channel by constructing two long breakwaters. Most of the streets of the city are 60 ft. wide—a few are 100 ft.—and nearly all intersect at right angles; they are paved with brick and asphalt, and many in the residential quarters are shaded with fine elms and maples. The city has four parks, in one of which is a soldiers' and sailors' monument of granite and bronze, and not far away, along the shore of lake and bay, are several attractive summer resorts. Among Erie's more prominent buildings are the United States government building, the city hall, the public library, and the county court house. The city's charitable institutions consist of two general hospitals, each of which has a training school for nurses; a municipal hospital, an orphan asylum, a home for the friendless, two old folks' homes, and a bureau of charities; here, also, on a bluff, within a large enclosure and overlooking both lake and city, is the state soldiers' and sailors' home, and near by is a monument erected to the memory of General Anthony Wayne, who died here on the 15th of December 1796.

Erie is the commercial centre of a large and rich grape-growing and agricultural district, has an extensive trade with the lake ports and by rail (chiefly in coal, iron ore, lumber and grain), and is an important manufacturing centre, among its products being iron, engines, boilers, brass castings, stoves, car heaters, flour, malt liquors, lumber, planing mill products, cooperage products, paper and wood pulp, cigars and other tobacco goods, gas meters, rubber goods, pipe organs, pianos and chemicals. In 1905 the city's factory products were valued at $19,911,507, the value of foundry and machine-shop products being $6,725,819, of flour and gist-mill products $1,444,450, and of malt liquors $894,840. The municipal government and operates its water-works. On site of Erie the French erected Fort Presque Isle in 1753, and about it founded a village of a few hundred inhabitants, George Washington, on behalf of the governor of Virginia, came in the same year to Fort Le Bœuf (on the site of the present Waterford), 20 m. distant, to protest against the French fortifying this section of country. The protest, however, was unheeded. The village was abandoned in or before 1758, owing probably to an epidemic of smallpox, and the fort was abandoned in 1759. It was occupied by the British in 1760, but on the 22nd of June 1763 this was one of the several forts captured by the Indians during the Conspiracy of Pontiac. In 1764 the British regained nominal control and retained it until 1785, when it passed into the possession of the United States. The place was laid out as a town in 1793; in 1800 it became the county-seat of the newly-erected county of Erie; it was incorporated as a borough in 1805, the charter of that year being revised in 1833; and in 1851 it was incorporated as a city. At Erie were built within less than six months most of the vessels with which Commodore Oliver H. Perry won his naval victory over the British off Put-in-Bay on the 10th of September 1813.

ERIGENA, JOHANNES SCOTUS (c. 800–c. 877), medieval philosopher and theologian. His real name was Johannes Scotus (Scottus) or John the Scot. The combination Johannes Scotus Erigena has not been traced earlier than Ussher and Gale; even Gale uses it only in the heading of the version of St Maximus. The date of Erigena's birth is very uncertain, and there is no evidence to show definitely where he was born. The name Scotus, which has often been taken to imply Scottish origin, really favours the theory that he was an Irishman according to the then usage of Scottus or Scotiaenius. Prudentius, bishop of Troyes, definitely states that he was of Irish extraction. The pseudonym commonly read Erigena, used by himself in the titles of his versions of Dionysius the Areopagite, is Ieruenga (in later MSS. Erugena and Erigena), formed apparently on the analogy of Grauqenca ("Greek-born"), which he applies to St Maximus. There seems no reason to doubt that Erigena is connected with Erin, the name for Ireland, and Ieruenga suggests the Greek ερείγη, ερέιγη, ερευνη being a common name form in Ireland. On the other hand, Wadding and Migne prefer to read Heruligena, which would make Scotus a Pannonian, while Bale says he was born at St David's, Dempster connects him with Ayr, and Gale with Eriuven in Hereford. Some early writers thought there were two persons, John Scotus and John Erigena.

Of Erigena's early life nothing is known. Bale quotes the story that he travelled in Greece, Italy and Gaul, and studied
not only Greek, but also Arable and Chaldaean. Since, however, Bale describes him as "ex patricio genitore natus," it is a reasonable inference (so R. L. Poole) that Bale confused him with one John, the son of Patricius, a Spaniard, who tells much the same story of his own travels. The knowledge of Greek displayed in Erigena's works is not such as to compel us to conclude that he had acquired it directly in Greece. That he had a competent acquaintance with Greek is manifest from his translations of Dionysius the Areopagite and of Maximus, from the manner in which he refers to Aristotle, and from his evident familiarity with Neoplatonist writers and the fathers of the early church. Roger Bacon, in his severe criticism on the ignorance of Greek displayed by the most eminent scholastic writers, expressly exempts Erigena, and ascribes to him a knowledge of Aristotle in the original.

Among other legends which have at various times been attached to Erigena are that he was invited to France by Charlemagne, and that he was one of the founders of the university of Paris. The only portion of Erigena's life as to which we possess accurate information was that spent at the court of Charles the Bald. Charles invited him to France soon after his accession to the throne, probably in the year 843, and placed him at the head of the court school (schola palatina). The reputation of this school seems to have increased greatly under Erigena's leadership, and the philosopher himself was treated with indulgence by the king.

William of Malmesbury's amusing story illustrates both the character of Scotus and the position he occupied at the French court. The king having asked, "Quid distat inter somum et Scotum?" Erigena replied, "Mensa tanut.

The first of the works known to have been written by Erigena during this period was a treatise on the euthycts, which has not come down to us (by some it has been identified with a treatise by Ratraminus, De corpore et sanguine Domini). In it he seems to have advanced the doctrine that the euthycts was merely symbolic or commemorative, an opinion for which Berengarius was at a later date censured and condemned. As a part of his penance Berengarius is said to have been compelled to burn publicly Erigena's treatise. So far as we can learn, however, Erigena's orthodoxy was not at the time suspected, and a few years later he was selected by Hincmar, archbishop of Reims, to defend the doctrine of liberty of will against the extreme predestinarianism of the monk Gottschalk (Gotteschalchus).

The treatise De divina praedestinatione, composed on this occasion, has been preserved, and from its general tenor one cannot be surprised that the author's orthodoxy was at once and vehemently suspected. Erigena argues the question entirely on speculative grounds, and starts with the bold affirmation that philosophy and religion are fundamentally one and the same—"Conficiunt irre veram esse philosophiam veram religionem, conversivmisque veram religionem esse veram philosophiam." Even more significant is his handling of authority and reason, to which he seems to be entirely opposed. The work was warmly assailed by Drepanius Florus, canon of Lyons, and Prudentius, and was condemned by two councils—that of Valence in 855, and that of Langres in 859. By the former council his arguments were described as Pulles Scotorum ("Scots porridge") and commentum diaboli ("an invention of the devil").

Erigena's next work was a Latin translation of Dionysius the Areopagite (see Dionysius Areopagiticus) undertaken at the request of Charles the Bald. This also has been preserved, and fragments of a commentary by Erigena on Dionysius have been discovered in MS. A translation of the Areopagite's pantheistical writings is not likely to alter the opinion already formed as to Erigena's orthodoxy. Thomas Nicholas I, when offended that the work had not been submitted for approval before being given to the world, ordered Charles to send Erigena to Rome, or at least to dismiss him from his court. There is no evidence, however, that this order was attended to.

The latter part of his life is involved in total obscurity. The story that in 882 he was invited to Oxford by Alfred the Great, that he laboured there for many years, became abbot at Malmesbury, and was stabbed to death by his pupils with their "styles," is apparently without any satisfactory foundation, and doubtless refers to some other Johannes. Erigena in all probability never left France, and Hauréau has advanced some reasons for fixing the date of his death at about 877.

Erigena is the most interesting figure among the middle-age writers. The freedom of his speculation, and the boldness with which he undertook to make a new system of the universe, altogether prevent us from classing him along with the scholastics properly so called. He marks, indeed, a stage of transition from the older Platonizing philosophy to the later and more rigid scholasticism. In no sense whatever can it be affirmed that with Erigena philosophy is in the service of theology. The above-quoted assertion as to the substantial identity between philosophy and religion is indeed repeated almost tlotidem verbis by many of the later scholastic writers, but its significance altogether depends upon the selection of one or other term of the identity as fundamental or primary. Now there is no possibility of mistaking Erigena's position: to him philosophy or reason is first, is primitive; authority or religion is secondary, derived. "Auctoritas siquidem ex vera ratione processit, ratio vero nequaquam ex auctoritate. Omnis enim auctoritas, quae vera ratione non approbabat, infirma videtur esse. Vera autem ratio, quum virtutibus suis rata atque immutabilis munitor, nullius auctoritatis adstipatione roborari indiget" (De divisione naturae, i, 71). F. D. Maurice, the only historian of note who declines to ascribe a rationalizing tendency to Erigena, obscures the question by the manner in which he states it. He asks his readers, after weighing the evidence advanced, to determine whether he (Erigena) used his philosophy to explain away his theology, or to bring out what he conceived to be the fullest meaning of it. These alternatives seem to be wrongly put. "Explanating away theology" is something wholly foreign to the philosophy of that age; and even if we accept the alternative that Erigena endeavours speculatively to bring out the full meaning of theology, we are by no means driven to the conclusion that he was primarily or principally a theologian. He does not start with the datum of theology as the completed body of truth, requiring only elucidation and interpretation; his fundamental thought is that of the universe, nature, τὸ πάν, or God, as the ultimate unity which works itself out into the rational system of the world. Man and all that concerns man are but parts of this system, and are to be explained by the rational explanation or understanding of a thing is determination of its place in the universal or all. Religion or revelation is one element or factor in the divine process, a stage or phase of the ultimate rational life. The highest faculty of man, reason, intellectus, intellectualis visio, is that which is not content with the individual or partial, but grasps the whole and thereby comprehends the parts. In this highest effort of reason, which is indeed God thinking in man, thought and being are at one, the opposition of being and thought is overcome. When Erigena starts with such propositions, it is clearly impossible to understand his position and work, if we insist on regarding him as a scholastic, accepting the dogmas of the church as ultimate data, and endeavouring only to present them in due order and defend them by argument.

Erigena's great work, De divisione naturae, which was condemned by a council at Sens, by Honorious III. (1225), who described it as "swarming with worms of heretical perverseness," and by Gregory X., 1273, is arranged in ten books. The form of exposition is that of dialogue; the method of reasoning is the syllogistic. The leading thoughts are the following. Nature is the name for the universal, the totality of all things, containing in itself being and non-being, or the two contrary poles. It is the basis on which all phenomena are manifested. But of this nature there are four distinct classes:— (1) that which creates and is not created; (2) that which is created and is not recreated; (3) that which is created and is recreated; (4) that which neither is created nor creates. The first is God as the ground or origin of all things, the last is God as the final end or goal of all things, into which the world of created things ultimately resolves. The second and third together compose the universe, which is the manifestation of God, God in processio, Theopha- naia. Thus we distinguish in the divine system beginning, middle and end; but these three are in essence one—the difference is only the consequence of our finite comprehension. We are compelled to envisage this eternal process under the form of time, to apply temporal distinctions to that which is extra- or supra-temporal.
The universe of created things, as we have seen, is twofold:—first, that which is created and creates—the primordial Ideas, archetypes, imitable relations, divine acts of will, according to which individual things are formed. It is a distinction, then, that which separates the world of individuals, the effects of the primordial causes, without which the causes have no true being. Created things have no individual or self-independent existence; they are only in God; and nothing existing is a manifestation of the divine, theophania, divina apparitio.

God alone, the uncreated creator of all, has true being. He is the true universal, all-containing and incomprehensible. The lower causality could not have distinguished him, when the various ideas of the world of individuals, the effects of the primordial causes, without which the causes have no true being. Created things have no individual or self-independent existence; they are only in God; and nothing existing is a manifestation of the divine, theophania, divina apparitio.

famous of her time and considered to rank with those of Homer. Of her best-known poem, *Hymn to Demeter* (written in Aeschylus over N.E. It pursues the mixture of Greek and Hebrew, and is a mixture of Aeolic and Doric, which contained 300 hexameter lines, only 4 lines are now extant. Three epigrams in the Palatine anthology, also ascribed to her, probably belong to a later date.

The two fragments of an Orestes (with those of Alceus) by J. Pellegrino (1894).

**ERINYES** (Late Latin), in Greek mythology, the avenging deities, properly the angry goddessess or goddesses of the curse pronounced upon evil-doers. According to Hesiod (Theog. 185) they were the daughters of Earth, and sprang from the blood of the mutilated Uranus; in Aeschylus (*Eum. 321*) they are the daughters of Night, in Sophocles (O.C. 40) of Darkness and Earth. Sometimes one Erinys is mentioned, sometimes several; Euripides first spoke of them as three in number, to whom later Alexandrian writers gave the names Alecto (unceasing in anger), Tisipho (avenger of murder), Megera (jealous). Their home is the world below, whence they ascend to earth to pursue the wicked. They punish all offences against the laws of human society, such as perjury, violation of the rites of hospitality, and, above all, the murder of relations. But they are not without benevolent and beneficent attributes. When the sinner has expiated his crime they are ready to forgive. Thus, their persecution of Orestes ceased after his acquittal by the Areopagus. It is said that on this occasion they were first called Eumenides ("the kindly"), a euphemistic variant of their real name. At Athens, however, where they had a sanctuary at the foot of the Areopagus, the daughters of Night and Earth were named the *Semaes* (venerable). Black sheep were sacrificed to them during the night by the light of torches. A festival was held in their honour every year, superintended by a special priesthood, at which the offerings consisted of milk and honey mixed with water, but no wine. In Aeschylus, the Erinys are represented as awful, Gorgon-like women, wearing long black robes, with snaky locks, bloodshot eyes and claw-like nails. Later, they are winged maidens of serious aspect, in the garb of huntresses, with snakes or torches in their hair, carrying scorpions, torches or sicks. The identification of Erinys with Sanskrit Saranyu, the swift-speeding storm cloud, is rejected by modern etymologists; according to M. Bréal, the Erinys are the personification of the formula of imprecation (apod), while E. Rohde sees in them the spirits of the dead, the angry souls of murdered men.

See C. O. Müller, *Dissertations on the Eumenides of Aeschylus*, (Eng. tr., 1835); A. Rosenberg, *Die Erinysen* (1874); J. E. Harrison, *Prolegomena to the Study of Greek Religion* (1903); and *Journal of Hellenistic Studies*, six, p. 265, according to whom the Erinys were primarily associated with fear of ghosts or evil earth genii, originally conceived as embodied in the form of snakes, whose primitive haunt and sanctuary was the omphalos at Delphi; E. Rohde, *Psyche* (1903); A. Rapp in Roscher's *Lexicon der Mythologie*, and J. A. Hild in Daremberg and Saglio's *Dictionnaire des antiquités*, s. v. *FURIAE*.

**ERIPHLUS**, in Greek mythology, sister of Adrastus and wife of Amphiarous. Having been bribed by Poenices with the necklace of Harmonia, she persuaded her husband to take part in the expedition of the Seven against Thebes, although he knew it would prove fatal to him. Before setting out, the seer charged his sons to slay their mother as soon as they heard of his death. The attack on Thebes was repulsed, and during the flight the earth opened and swallowed up Amphiarous together with his chariot. His son Alcmaeon, as he had been bidden, slew his mother, and was driven from place to place by the Erinys, seeking purification and a new home (*Apollodorus III. 6. 7*).

**ERIS**, in Greek mythology, a sister of the war-god Ares (Homer, *Iliad*, iv. 440), and in the Hesiodic *theogony* (225) a daughter of Night. In the later legends of the Trojan War, Eris, not having been invited to the marriage festival of Pelesus and Thestis, flings a golden apple ("the apple of discord") among the guests, to be given to the most beautiful. The claims of the three deities Hera, Aphrodite and Athena are decided by Paris in favour of Aphrodite, who as a reward assists him to gain possession of Helen (Hyginus, Fab. 92; Lucian, *Charidemus*, 17). Hesiod also mentions (W. and D. 24) a beneficent Eris, the personification of honourable rivalry. In Virgil (Aeneid, viii. 702) and other Roman poets Eris is represented by Discordia.

**ERITH**, an urban district in the north-western parliamentary division of Kent, England, 14 m. E. by S. of London, on the South Eastern & Chatham railway (7 m. 364), and of the coast railway, 25,306. It lies on the south bank of the Thames and extends up the hills above the shore, many villas having been erected on the higher ground. The park of a former seat, Belvedere, was thus built over (c. 1860), and the mansion became a home for disabled seamen. The church of St John the Baptist, though largely altered by modern restoration, retains Early English to Perpendicular portions, and some early monuments and brasses. Erith has large engineering and gun factories, and in the neighbourhood gunpowder, oil, glue and manure works. The southern outskirts of the London main drainage system are at Grovehurst in the neighbouing London and Medway. Erith is the headquarters of most of the local yacht clubs. Erith, the name of which is commonly derived from A.S. *Ærra-hyle* (old haven), was anciently a borough, and was granted a market and fairs in 1313. Down to the close of the 17th century it was of some importance as a naval station.

**ERITREA**, an Italian colony on the African coast of the Red Sea. It extends from Ras Kasar, a cape 110 m. S. of Suakin, in 18° 2' N., as far as Ras Dumeira (12° 42' N.), in the Strait of Bab-el-Mandeb, a coast-line of about 650 m. The colony is bounded inland by the Anglo-Egyptian Sudan, Abyssinia and French Somaliland. It consists of the coast lands lying between latitude 12° 28' N. and 38° 30' S., including the highlands, and the Abyssinian plateau. The total area is about 60,000 sq. m. The population is approximately 450,000, of which, exclusive of soldiers, not more than 3000 are whites.

The land frontier starting from Ras Kasar runs in a south-westerly direction until in about 14° 15' N., 36° 35' E. it reaches the river SetiT, some distance above the junction of that stream with the Abbara. This, the farthest point inland, is 108 m. S.W. of Massawa. The frontier now turns east, following for a short distance the course of the river SetiT; thence it strikes north-easterly to the Mareb, and from 38° E. follows that river and its tributaries the Belesa and Muna, until within 42 m. of the sea directly south of Annesley Bay. At this point the frontier runs south and east, crossing the Afar or Danakil country at a distance of 60 kilometres (37-28 m.) from the coast-line. About 12° 20' N. the French possessions in Somaliland are reached. Here the frontier turns N.E. and so continues until the coast of the Red Sea is again reached at a point south of the town of Raheita. In the southern part of the colony are small sultanates, such as those of Assa and Raheita, which are under Italian protection. The Dahlak archipelago and other groups of islands along the coast belong to Eritrea.

**Physical Features.**—The coast-line is of coral formation and is, in the neighbourhood of Massawa, thickly studded with small islands. The chief indentations are Annesley Bay, immediately south of Massawa, and Assab Bay in the south. The colony consists of two widely differing regions. The northern division is part of the Abyssinian highlands. The southern division, part of the Afar or Danakil country, includes all the territory of the colony south of Annesley Bay. These two regions are connected by a narrow strip of land behind Annesley Bay, where the Abyssinian hills approach the coast-line. From the coast the terrain is gentle and slopes S.E. so that at Tajura Bay the distance between the Abyssinian hills and the sea is over 200 m. The Afar country is part of the East African rift-valley, and in the southern parts of the valle the sea is flanked by ranges of hills, frequently volcanic, and by lakes. The plains, however, extend over large areas, they are generally arid and are often covered with mimosa trees which form a kind of juniper wood, and are watered by the rivers coming from the Abyssinian plateau usually fail to reach the sea. They are mostly bordered by dense vegetation; and in the dry season water is found in pools in the river beds or can be obtained by digging. The principal rivers are the Sena and the Danakil, which joins the Sena, and that of Assa, in the north and that of Assa in the south. The Hawash flows through the Abyssinian land in a N.E. direction, but is lost in lakes Abbebad and Assab (see Assab). The Rugali or Assab rivers drain into the Assal basin. This lake, whose level of Assa, is in places 200 ft. below sea-level. On the west the Assal basin reaches to the Abyssinian foothills; in its southern part is the small lake Aelbad. The eastern edge of the basin is formed by a
ERITREA.

The climate in different parts of the colony varies greatly. Three distinct climatic zones are found: (1) that of the coastlands, including altitudes up to 1650 ft., (2) that of the escarpments and valleys, and (3) that of the high plateau and alpine summits.

The climate in the zone that lies between 1650 ft. and 6000 ft. is ascending and hence is subject to changes with the season. The rainfall in the western coastal areas is generally between 40 and 70 inches, while that on the eastern side reaches 90 inches.

The climate in the zone above 6000 ft. is an alpine one, and the rainfall is generally between 15 and 30 inches.

The climate in the zone of the high plateau and alpine summits is characterized by a dry season and a rainy season.

Towns.—The principal places on the coast are Massawa (q.v.), pop. about 10,000, the chief seaport of the colony, Assab, chief town of the Dasukt region, and Agordat, an old and important place from Abyssinia on the coast.

The climate in the interior is Asmara (q.v.), a town in the capital territory, and handled under the administration of the Ministry of Colonial Affairs from April 1890, and active in 1861, some 30 m. S. of the port of Edd (Eddi). In 14° 52' N., 39° 53' E. and near the northern end of the zone of depression the volcano of Alid (2635 ft.) rises from the trough. Its cliffs, which rise to 1200 ft., are covered with vegetation, and a road a mile in diameter and with walls 350 ft. high. North and south of Alid extends a vast lava field. Dubbi and Alid are in Italian territory for the greater part of Afar belongs to Abyssinia.

The colony contains no navigable streams. For a short distance the Atbara, a small river, runs through the northern part of the territory, and enters the Red Sea near Massawa. The course of the Atbara, forming the northern boundary, is also the boundary between the drainage area of the Baraka or Anseba. Of the numerous streams which, north of the Danakil country, run direct from the hills to the Red Sea, the Hadas may be mentioned, as along the course of the latter a considerable number of hamlets and small villages are found. The Baraka (otherwise Barka) and Anseba rise in the Hadas river near Massawa within a short distance of each other. The Baraka flows west and then north; the Anseba, which has a more easterly course, also flows northward and joins the Baraka a little N. of 17° N. A few miles below the confluence the Baraka leaves the Italian territory. It is (as is the Anseba) an intermittent stream.

After heavy rain it discharges some of its water into the Red Sea near the small town of Sigam, and the rest falls on to the plains of the Wereda. There is a rise of 30 ft., and at times, a rise of 40 ft., in the bed of the Baraka, which encloses the Hadas river within the regime of the summer monsoon rains, while those districts adjoining the coast enjoy also winter rains. August is the most rainy and May the hottest month. On the high plateau, i.e. the third zone, the climate is generally moderately dry. November and December fall in the spring, and abundant monsoon rains from June to September. The heat is greatest in the dry season, November to April. Above 8000 ft., the climate becomes sub-alpine in character. The flora differs little from that of tropical Africa generally, whilst on the plateau the vegetation is characterized by the temperate zone. The olive tree grows on the high plateau and covers the banks of the river. The valley of the river is a succession of meadows in the highest proportions in parts of the plateau.

Lower down curra, maize, and cotton grow in profusion. In the northern part of the colony, especially along the Khor Baraka, the dunaf palm flourishes. The fauna consists of the usual game, e.g. lion, panther, elephant, camel, and antelope of numerous species. On the plateau the fauna is that of Abyssinia (q.v.).

Inhabitants.—The inhabitants of the plains and foothills are for the most part seminomad shepherds, living on curra and milk.

In the north these people are largely of Arab or Hamitic stock, such as the Beni-Amer, but also include various negro tribes. Afar and Somali form the population of the high plateau. The nomads are Musulmans and are, as a rule, docile and pacific, though the Danakils are given to occasional raiding. The Abyssinians are more warlike, but they have settled down under Italian rule. Among the native industries are mat-weaving, cotton-weaving, silver-working and rudimentary iron and leather working. (See AFAR: SOMALILAND AND ABBYSSINIA.)
established by local usage. Europeans are answerable to the Italian civil code. Penal laws are the same as in Italy, except where modified by local usage. Appeal to the Rome court of cassation is admitted against all penal and civil sentences.

The leader of the forces of colonial troops, partly Italian and partly native; to a militia (militia mobile) formed by natives who have already served in the colonial corps; and the chieftains of the levy which, in time of war, places all male able-bodied inhabitants under arms. The regional commissioners and political residents have at their disposal some hundreds of irregular paid soldiers under native chiefs. In war time these irregulars form part of the colonial corps, but in time of peace serve as frontier police. The colonial corps, about 5000 strong, garrison the chief places of strategic importance, such as Assmara, Keren and Sagantei. The irregular troops, on foot, or mounted on camels, numbered about 3000 when stationed in the provinces. The militia consists of 3800 men of all ages, and is intended in time of war to reinforce the various divisions of the colonial corps. The chief yields between 3000 and 4000 men, to be employed on the lines of communication in caravans service. All these troops are intended to ward off the first attack, so as to allow time for the arrival of reinforcements from Italy. The customs and political surveillance along the coast is entrusted, aforesaid, to the Massawa naval station, and, ashoire, to a coastguard company 400 strong stationed at Meder, with detachments at Assab, Massawa, Raheita, Edd and Taclai.

History.—Traces of the ancient Eritrean civilization are scarce. During the prosperous periods of ancient Egypt, Egyptian squadrions asserted their rule over the west Red Sea coast, and under the Ptolemy the port of Golden Berenice (82-78 B.C.) and the town of Aquae (Mned) were founded. During the early years of the Roman empire, Eritrea formed part of an important independent state—that of the Axumites (Assamites). At the end of the reign of Nero, and perhaps even earlier, the king of the Axumites ruled over the Red Sea coast from Suvakin to the strand of Bab-el-Mandeb, and traded constantly with Egypt. This potentate called himself "king of kings," commanded an army and a fleet, coined money, adopted Greek as the official language, and lived on good terms with the Roman empire. The Axumites belonged originally to the Hamitic race, but the immigration of the Himyaritic tribes of southern Arabia speedily increased and civilized the country. The chief language and the people's tongue are Abyssinian language, Gec, and its living dialects, Hamharic and Tigrina, are Semitic, although modified by the influence of the old Hamitic Agau or Agao. Adulia (Adovila), slightly to the north of Zula (q.s.), was the chief Axumite port. From Adulia started the main road, which led across the high plateau to the capital Axomis (Axum). Along the road are still to be seen vestiges of cities and inscribed monuments, such as the Himyaritic inscriptions on the high plateau of Kohait, the six obelisks with a Saban inscription at Toconda, and an obelisk with an inscription at Amba Sahl. Other monuments exist elsewhere, as well as coins of the 5th century B.C. mixed with Greek and Ethiopian ones. After the rise of the Ethiopian empire the history of Eritrea is bound up with that of Ethiopia, but not so entirely as to be completely fused. The documents of the Portuguese expedition of the 16th century and other Ethiopian records show that all the country north of the Mareb enjoyed relative autonomy under a vassal of the Ethiopian emperor.

Michael, counselor of Solomon, who was king of the country north of the Mareb, usurped the throne of Solomon during the reign of the Emperor Atzéz Jasu II. (1729-1753), and, after proclaiming himself ras of Tigré and "protector of the empire," ceded the northern Mareb country to an enemy of the righting dynasty. Hence a long struggle between the disposed families and the occupants of the North Mareb throne. The coast regions had meantime passed from the control of the Abyssinians. In the 16th century the Turks made themselves masters of Zula, Massawa, &c., and these places were never recovered by the Abyssinians. In 1865 Massawa and the neighbouring coast was acquired by Egypt, the khedive Ismail entertaining projects for connecting the port by railway with the Nile. The Egyptians took advantage of civil war in Abyssinia to seize Keren and the Bogos country in 1872, an action against which the negus Johannes (King John), newly come to the throne, did not at the time protest. In 1875 and 1876 the Egyptians, who sought to increase their conquests, were defeated by the Abyssinians at Gunet and Gara. Walad Michael, the hereditary ruler of Bogos, fought as ally of King John at Gunet and of the Egyptians at Gara. For two years Walad Michael continued to harass the border, but in December 1878 he submitted to King John, by whose orders he was (Sept. 1879) imprisoned upon an amba, or flat-toped mountain, whence he only succeeded in escaping in 1890. In 1879 his territory was given by King John to Ras Alula, who retained it until, in August 1880, the Italians occupied Asmara (see Abyssinia: History).

An Egyptian garrison remained at Keren in the Bogos country until 1884, a civil war being in consequence of the revolt of the Mahdi it was withdrawn, Bogos being occupied by Abyssinia on the 14th of September of that year. On the 6th of February 1885 an Italian force, with the approval of Great Britain, occupied Massawa, the Egyptian garrison returning to Egypt. This occupation led to wars with Abyssinia and finally to the establishment of the colony in its present limits. The history of the Italian-Abyssinian relations is fully told in the articles Italy and Abyssinia (history sections).

It was not, however, at Massawa that Italy first obtained a foothold in eastern Africa. The completion of the Suez Canal (1869), the British interest in the Nile (1868-1900), the frontiers were further defined by a French-Italian convention (24th of January 1900) fixing the frontier between French Somaliland and the Italian possessions at Raheita, and also by various agreements with Great Britain and Abyssinia. A tripartite agreement between Italy, Abyssinia and Great Britain, dated the 15th of May 1902, placed the territory of the Kanama tribe, on the north bank of the Setit, within Eritrea. A convention of the 16th of May 1908 settled the Abyssinian-Eritrean frontier in the Afar country, the boundary being fixed at 90 kilometres from the coast. The task of reconstructing the administration on a civil basis and of developing the resources of the colony was entrusted, to the governor, F. Martini, who was governor for nine years (1898-1906). Under civil rule the colony made steady though somewhat slow progress.

ERIVAN, a government of Russia, Transcaucasia, having the province of Kara on the W., the government of Tiflis on the N., that of Elisabetpol on the N. and E., and Persia and Turkish Armenia on the S. It occupies the top of an immense plateau (6,000-8,000 ft.). Continuous chains of mountains are met with only on its borders, and in the E., but the whole surface of the country is set with short ridges and isolated mountains of volcanic origin, of which Alagöz (14,440 ft.) and Ararat (16,925 ft.) are the most conspicuous and the most important. Both must have been active in Tertiary times. Lake Gok-ch'a (540 sq. m.) is encircled by such volcanoes, and the neighbourhood of Alexandropol is a "volcanic amphitheatre," being entirely buried under volcanic deposits. The same is true of the slopes leading down to the river Aras; and the valley of the upper Aras is a stony desert, watered only by irrigation, which is carried on with great difficulty owing to the character of the soil. The government is drained by the Aras, which forms the boundary with Persia and flows with great velocity down its stony bed, the fall being 17-22 ft. per mile in its upper course, and 6 ft. at Ordubad, where it quiet the bed and while lower down it again increases to 23 ft. Many of the small lakes, filling volcanic craters, are of great depth. Timber is very scarce. A variety of useful minerals exists, but only rock-salt is obtained, at Nakhichevan and Kulp. The climate is extremely varied, the following being the average temperatures and mean annual rainfall at Alexandropol (alt. 5097 ft.) and Aralykh (2755 ft.) respectively: year 42°, January 12°, July 65°, mean rainfall 16-2 in.; and year 53°, January 20-5, July 79°, rainfall 6-3 in. The population numbered 830,578 in 1897 (only 375,086 women), of whom 52,275 lived in the towns. An estimate in 1906 gave a total of 906,100. They consist chiefly of Armenians (441,000), Tatars (40%), Kurds (49,389), with Russians, Greeks and Tatars. Most of the Armenians belong to the Gregorian (Christian) Church, and only 40 to 500 to the Armenian Catholic Church. The Tatars are mostly Shitte Mussulmans, only 27,596 being Sunnites; 7772 belong to the peculiar faith of the Yezidis. While barley only can be grown on the high parts of the plateau, cotton, wool, violets, berries and all sorts of fruit are cultivated in the valley of the Aras. Cattle-breeding is extensively carried on; camels also are bred, and leeches are collected out of the swamps and exported to Persia. Industry is in its infancy, but cottons, carpets, and felt goods are made in the villages. A considerable trade is carried on with Persia, but trade with Asia Minor is declining. The government is divided into seven districts—Erevan, Alexandropol, Echmiadzin (chief town, Vagharshapat), Nakhichevan, Novobayazet, Surakai (chief town, Igarpat), and Sharur-daralagöz (chief town, Norasen). The principal towns are Erevan (see below), Alexandropol (32,018 inhabitants in 1897), Novobayazet (8507), Nakhichevan (8845), and Vagharshapat (3400).

ERIVAN, or IRVAN, in Persian, Rewan, a town of Russia, capital of the government of the same name, situated in 40° 14' N., 44° 38' E., 234 m. by rail S.S.W. of Tiflis, on the Zangar river, from which a great number of irrigation canals are drawn. Altitude, 3170 ft. Pop. (1873) 11,938; (1897) 29,093. The old Persian portion of the town consists mainly of narrow crooked lanes enclosed by mud walls, which effectually conceal the houses, and the modern Russian portion is laid out in broad pavé streets. On a steep rock, rising about 600 ft. above the river, stand the ruins of the 16th-century Turkish fortress, containing part of the palace of the former Persian governors, a handsome but greatly dilapidated mosque, a modern Greek church and a cannon foundry. One chamber, called the Hall of the Sardar, bears witness to former splendour in its decorations. The finest building in the city is the mosque of Hussein Ali Khan, familiarly known as the Blue Mosque from the colour of the enamelled tiles with which it is richly encased. At the mosque of Zal Khan a passion play is performed yearly illustrative of the assassination of Hussein, the son of Ali. Erivan is an Armenian episcopal see, and has a theological seminary. The only manufactures are a little cotton cloth, leather, earthenware and blacksmiths' work. The fruits of the district are noted for their excellence—especially the grapes, apples, apricots and melons. Armenians, Persians and Tatars are the principal elements in the population, besides some Russians and Greeks. The town fell into the power of the Turks in 1582, was taken by the Persians under Shah Abbas in 1604, besieged by the Turks for four months in 1615, and reconquered by the Persians under Nadir Shah in the 18th century. In 1780 it was successfully defended against Heracleus, prince of Georgia; and in 1816 it resisted the Russians. At length in 1827 Paskevich took the fortress by storm, and in the following year the town and government were ceded to Russia by the peace of Turkman-chai. A Tatar poem in celebration of the event has been preserved by the Austrian poet, Bodenstedt, in his Tausend und ein Tag im Orient (1850).

ERLANGEN, a town of Germany, in the kingdom of Bavaria, on a fertile plain, at the confluence of the Schwabach and the Regnitz, 11 m. N.W. of Nuremberg, on the railway from Munich to Bamberg. Pop. (1905) 25,720. It is divided into an old and a new town, the latter consisting of wide, straight and well-built streets. The market place is a fine square. Upon it stand the town-hall and the former palace of the margraves of Bayreuth, called the "new castle." The latter was founded by the margrave Frederick (d. 1763), who, in 1742, established a university at Bayreuth, but in 1743 removed it to Erlangen. A statue of the founder, erected in 1843 by King Louis I. of Bavaria, stands in the centre of the square and faces the university buildings. The university has faculties of philosophy, law, medicine and Protestant theology. Connected with it are a library of over 200,000 volumes, geological, anatomical and mineralogical institutions, a hospital, several clinical establishments, laboratories and a botanical garden. Among the churches of the town (six Protestant and one Roman Catholic), only the new town church, with a spire 220 ft. high, is remarkable. The chief industries of Erlangen are spinning and weaving, and the manufacture of glass, paper, brushes and gloves. The brewing industry is also important, the beer of Erlangen being famous throughout Germany and large quantities being exported.

Erlangen owes the foundation of its prosperity chiefly to the French Protestant refugees who settled here on the revocation of the edict of Nantes and introduced various manufactures. In 1671 the place was transferred from the bishopric of Würzburg to that of Bamberg; in 1581 it was sold to the king of Bohemia. It became a town in 1398 and passed into the hands of the Hohenzollerns, burguars of Nuremberg, in 1476. There for nearly three centuries it was the property of the margraves of Bayreuth, being ceded with the rest of Bayreuth to Prussia in 1791. In 1816 it came into the possession of Bavaria. Erlangen was for many years the residence of the poet Friedrich Rückert, and of the philosophers Johann Gottlieb Fichte and Friedrich Wilhelm von Schnelln.

See Stein and Müller, Die Geschichte von Erlangen (1898).

ERLE, SIR WILLIAM (1793-1880), English lawyer and judge, was born at Fifinehead-Magdalen, Dorset, on the 1st of October 1793, and was educated at Winchester and at New College, Oxford. Having been called to the bar at the Middle Temple in 1819 he went the western circuit, became counsel to the Bank of England, sat in parliament from 1837 to 1841 for the city of Oxford, and, although of opposite politics to Lord Lyndhurst, was made by him a judge of the common pleas in 1845. He was transferred to the queen's bench in the following year, and in 1859 came back to the common pleas as chief justice upon the promotion of Sir Alexander Cockburn. He retired in 1866, receiving the highest eulogiums for the ability and impartiality with which he had discharged the judicial office. He died at his estate at Brampshott, Hampshire, on the 28th of January.
ERLÖKING—ERMELAND

749

1850, and a monument without his name but in his memory (sometimes erroneously supposed to mark the place where an old gibbet was) stands on the top of Hindhead.

See E. Manson, Builders of our Law (1904).

ERLÖKING, or ERL-KING, a mythical character in modern German literature, represented as a gigantic bearded man with a golden crown and trailing garments, who carries children away to that undiscovered country where he himself abides. There is no such personage in ancient German mythology, and the name is linguistically nothing more than the perpetuation of a blunder.

It first appeared in Herder's Stimmun der Völker (1778), where it is used in the translation of the Danish song of the Elf-King's Daughter as equivalent to the Danish ellerkonge, or ellekonge, that is, ellerkonge, the king of the elves; and the true German word would have been Elbhökon or Elbenkönig, afterwards used under the modified form of Elfönkönig by Wieland in his Oberon (1788). Herder was probably misled by the fact that the Danish word elle signifies not only elf, but also alder tree (Ger. Erle). His mistake at any rate has been perpetuated by both English and French translators, who speak of a "king of the alders," "un roi des aunes," and find an explanation of the myth in the tree-worship of early times, or in the vapoury emanations that hang like weird phantoms round the alder trees at night. The legend was adopted by Goethe as the subject of one of his finest ballads, rendered familiar to English readers by the translations of Lewis and Sir Walter Scott; and since then it has been treated as a musical theme by Reichardt and Schubert.

ERMAN, PAUL (1764–1854), German physicist, was born in Berlin on the 29th of February 1764. He was the son of the historian Jean Pierre Erman (1735–1814), author of Histoire des Erfugis. He became teacher of science successively at the French gymnasium in Berlin, and at the military academy and on the foundation of the university of Berlin in 1810 he was chosen professor of physics. He died at Berlin on the 11th of October 1831. His work was mainly concerned with electricity and magnetism, though he also made some contributions to optics and physiology. His son, Georg Adolf Erman (1806–1877), was born in Berlin on the 12th of May 1806, and after studying natural science at Berlin and Königsberg, spent from 1828 to 1830 in a journey round the world, an account of which he published in Reise um die Erde durch Nordasi en und die beiden Ozeane (1833–1843). The magnetic observations he made during his travels were utilized by C. F. Gauss in his theory of terrestrial magnetic needle. Erman was appointed professor of physics at Berlin in 1839, and died there on the 12th of July 1872. From 1841 to 1865 he edited the Archiv für wissenschaftliche Kunde von Russland, and in 1874 he published, with H. J. R. Petersen, Die Grundlagen der Gauß'schen Theorie und die Erscheinungen des Erdmagnetismus im Jahre 1829.

His son Johann Peter Adolf Erman (1854– ), a famous Egyptologist, was born in Berlin on the 31st of October 1854. Educated at Leipzig and Berlin, he became extraordinary professor in 1883 and ordinary professor in 1892 of Egyptology in the university of Berlin, and in 1895 he was appointed director of the Egyptian department of the royal museum. For an account of his archaeological work of Erman and his school see Egypt: Language.

ERMARNIC (fl. 350–376), king of the East Goths, belonged to the Amali family, and was the son of Achuilf. His name occurs as Ermanricus (Jordanes), Afrmanareiks (Gotthic), Eormenric (A. Sax.), Jörmnunrek (Norse), Ermnich (M.H. German). Ermanric built up for himself a vast kingdom, which eventually extended from the Danube to the Baltic and from the Don to the Theiss. He drove the Vandals out of Dacia, compelled the allegiance of the neighbouring tribes of West Goths, procured the submission of the Herules, of many Slav and Finnish tribes, and even of the Thuringians and the Franks on the shores of the Gulf of Bothnia. In his later days the west Goths threw off his yoke, and, on the invasion of the Hunns, rather than witness the downfall of his kingdom he is said by Ammianus Marcellinus to have committed suicide. His fate early became the centre of popular tradition, which found its way into the narrative of Jordanes or Jornandes (De rebus gestis, chap. 24), who compared him to Alexander the Great and certainly exaggerated the extent of his kingdom. He is there said to have caused a certain Sunilda or Saniel to be torn asunder by wild horses on account of her husband's traitorous conduct. Her brothers Sarus and Ammius sought to avenge her. They succeeded in wounding, not in killing the Gothic king, whose death supervened in his one hundred and tenth year from the joint effects of his wound and fear of the Hunnish invasion. This is evidently a paraphrase of popular story which sought to supply plausible reasons for Ermanric's end. In German legend Ermanric became the typical cruel tyrant, and references to his crimes abound in German epic and in Anglo-Saxon poetry. He is made to replace Odoacer as the enemy of Dietrich of Bern, his nephew, and his history is related in the Norse Vilikina or Thidrekkssag, which chiefly embodies German tradition. His evil genius, Silka, Sibicho or Bicci, brings about the death of his three sons. The Harlings, Imbrecce and Fritelle, are his nephews, whom he has strangled for the sake of their treasure, the Brosingi meni. Sonhild or Svanhild becomes the wife of Ermanric, and the motive for the murder is replaced by the accusation of adultery, and so woven into the story.

There is already connected with theNibelungen when it found its way to the Scandinavian north by way of Germany. In the Volsunga Saga Svanhild is the daughter of Sigurd and Gudrun. She is given in marriage to the Gothic king Jörmunrek (Ermanric), who sends his son Randver as proxy wooer in company of Bicci, the evil counsellor. Randver is persuaded by Bicci to take his father's bride for himself. Randver is hanged and Svanhild trampled to death by horses in the gate of the castle. Gudrun eggs on Stöft and Hamidr or Hamtheow, her two sons by her third husband, Jonakr the Hun, to avenge their sister. On the way they slay their half-brother Erp, whom they suspect of lukewarmness in the cause; arrived in the hall of Ermanric they make a great slaughter of the Goths, and hew off the hands and feet of Ermanric, but they themselves are slain with stones. The tale is told with variations by Saxo Grammaticus (Historia Danica, ed. Müller, p. 408, &c.), and in the Icelandic poems, the Lay of Harlungs, Gudrun's Chain of Woe, and in the prose Edda.

BIBLIOGRAPHY.—W. Grimm, in Die deutsche Heldensage (2nd ed., Berlin, 1867), quotes the account given by Jornandes, references in Beowulf, in the Monchener's Song, Exxlet Book, in Poeticum, in Dietrichs Flucht, the account given in the Quedlinburg Chronicle, by Eckherad in the Chronicon Urgerspenn, by Saxo Grammaticus, &c. See also Vigfusson and Powell, Corpus poeticum boreale, vol. I. (Oxford, 1883), and H. Symons, "Die deutsche Heldensage in Pauli's Grundriss d. german. Phil. vol. iii. (Strasburg, 1900).

ERMELAND, or ERMELAND (Varmia), a district of Germany, in East Prussia, extending from the Frisches Haff, a bay in the Baltic, inland towards the Polish frontier. It is a well-wooded sandy tract of country, has an area of about 1650 sq. m., a population of 240,000, and is divided into the districts of Braunsberg, Heilsberg, Rüssel and Allenstein.

Ermeland was originally one of the eleven districts of old Prussia and was occupied by the Teutonic Knights (Deutscher Orden), being made in 1259 one of the four bishoprics of the country under their sway. The bishop of Ermeland shortly afterwards declared himself independent of the order, and became a prince of the Empire. In 1466 Ermeland, together with West Prussia, was by the peace of Thorn attached to the crown of Poland, and the bishop had a seat in the Polish senate. In 1772 it was again incorporated with Prussia. Among the bishops of the see, which still exists, with its seat in Frauenberg, may be mentioned Aneus Sylvius Piccolomini, afterwards Pope Pius II., and Cardinal Stanislaus Hosius (1504–1579), the founder of the Jesuit College in Braunsberg.

See Hipel, Literaturgeschichte des Bistums Ermeland (Braunsberg, 1873); the Monumenta historiae Warmiensis (Mainz, 1860–1864, and Braunsberg, 1866–1872, 4 vols.); and Buchholz, Abriss einer Geschichte des Ermlandes (Braunsberg, 1903).
ERMELO, a district and town of the Transvaal. The district lies in the south-east of the province and is traversed by the Drakensberg. In it are Lake Chrisie, the only true lake in the country, and the sources of the Vaal, Olifants, and Usutu rivers, which rise within 30 m. of one another. The region has a general elevation of about 3500 ft. and is fine agricultural and pastoral country, besides containing valuable minerals, including coal and gold. Ernello town, pop. (1904) 1453, is by rail 175 m. S.E. of Johannesburg, and 74 m. S.S.W. of Machadodorp on the Pretoria-Delagoa Bay railway. A government experimental farm, with some 1000 acres of plantations, is maintained here.

ERMINE, an alternative name for the stoat (Putorius ermineus), apparently applicable in its proper sense only when the animal is in its white winter coat. This animal measures 10 in. in length exclusive of the tail, which is about 4 in. long, and becomes bushy towards the point. The fur in summer is reddish brown above and white beneath, changing in the winter of northern latitudes to snowy whiteness, except at the tip of the tail, which at all seasons is black. In Scottish specimens this change in winter is complete, but in those found in the southern districts of England it is usually only partial, the ermine presenting during winter a piebald appearance. The white colour is evidently protective, enabling the animals to elude the observations of their enemies, and to steal unobserved on their prey.

It also retains heat better than a dark covering, and may thus serve to maintain an equitable temperature at all seasons within the body.

The colour change seems to be due to phagocytes devouring the pigment-bodies of the hair, and not to a moult.

The species is a native of the temperate and subarctic zones of the Old World, and is represented in America by a form which can scarcely be regarded as specifically distinct. It inhabits thickets and stony places, and frequently makes use of the deserted burrows of moles and other underground mammals. Exceedingly sanguinary in disposition, and agile in its movements, it feeds principally on rats, water-rats and rabbits, which it pursues with pertinacity and boldness, hence the name stoat, signifying bold, by which it is commonly known. It takes readily to water, and will even climb trees in pursuit of prey. It is particularly destructive to poultry and game, and has often been known to attack hares, fixing itself to the throat of its victim, and defying all the efforts of the latter to disengage it. The female brings forth five young ones about the beginning of summer. The winter coat of the ermine forms one of the most valuable of commercial furs, and is imported in enormous quantities from Norway, Sweden, Russia and Siberia. It is largely used for muffs and tippets, and as a trimming for state robes, the jet black points of the tails being inserted at regular intervals as an ornament. In the reign of Edward III. the wearing of ermine was restricted to members of the royal family; but it now enters into almost all state robes, the rank and position of the wearer being in many cases indicated by the presence or absence, and the disposition, of the black spots. (See also FUR.)

ERMINE STREET. Documents and writers of the 11th and succeeding centuries occasionally mention four "royal roads" in Britain—Icknield Street, Ernig or Ermine Street, Watling Street and Foss Way—as standing apart from all other existing roads and enjoying the special protection of the king. Unfortunately these authorities are not at all agreed as to their precise course; the roads themselves do not occur as specially privileged in actual legal or other practice, and it is likely that the category of Four Roads is the invention of a lawyer or an antiquary. The names are, however, attested to some extent by early charters which name them among other roads, as boundaries. From these charters we know that Icknield Street ran along the Berkshire downs and the Chilterns, that Ermine Street ran more or less due north through Huntingdonshire, that Watling Street ran north-west across the Midlands from London to Shrewsbury, and Foss diagonally to it from Lincoln or Leicester to Bath and mid-Somerset. This evidence only proves the existence of these roads in Saxon and Norman days. But they all seem to be much older. Icknield Street is probably a prehistoric ridgeway along the downs, utilized perhaps by the Romans near its eastern end, but in general not Roman. Ermine Street coincides with part of a line of Roman roads leading north from London through Huntingdon to Lincoln. This line is followed by the Old North Road through Cheshunt, Buntingford, Royston, and Huntingdon to Castor near Peterborough; it can be traced through lanes and byways past Ancaster to Lincoln. Watling Street is the Roman highway from London by St Alban's (Verulamium) to Wroxeter near Shrewsbury (Viroconium). Foss is the Roman highway from Lincoln to Bath and Exeter. Hence it has been supposed, and is still frequently alleged, that the Four Roads were the principal highways of Roman Britain. This, however, is not the case. Icknield Street is not Roman and the three roads which follow Roman lines, Ermine Street, Watling Street, and Foss, held no peculiar position in the Romano-British road system—see BRITAIN: Roman. In later times, the names Ermine Street, Icknield Street and Watling Street have been applied to other roads of Roman or supposed Roman origin. This, however, is purely by the law of Elizabethan or subsequent antiquaries and deserves no credence.

The derivations of the four names are unknown. Icknield, Ermine and Watling may be from English personal names; Foss, originally Fos, seems to be the Lat. fossa in its occasional medieval sense of a bank of upcast earth or stones, such as the agger of a road.

(From a Dictionary of English Place Names."

ERMOLDUS NIGELLUS, or ERMOLD THE BLACK, was a monk of Aquitaine, who accompanied King Pippin, son of the emperor Louis I., on a campaign into Brittany in 824. Subsequently he was banished from Pippin's court on a charge of inciting the king against his father, and retired to Strasburg, where he sought to regain the emperor's favour by writing a poem on his life and deeds. About 830 he obtained his recall, and has been identified with Hermoldus, who appears as Pippin's chancellor in 838. Ermoldus was a cultured man with a knowledge of the Latin poets, and his poem, In honorem Hludovici imperatoris, has some historical value. It consists of four books and deals with the life and exploits of Louis from 781 to 826. He also wrote two poems in imitation of Ovid, which were addressed to Pippin.

ERNE, the name of a river and two lakes in the north-west of Ireland. The river rises in Lough Gowna, county Longford, 274 ft. above sea-level, flows north through Lough Oughter with a serpentine course and a direction generally northward, and then broadens into the Upper Lough Erne, a shallow irregular sheet of water 13 m. long, so beset with islands as to present the appearance of a number of upper-water-channels ramifying through the land. The river then winds past the town of Enniskillen on its island, and enters Lough Erne, a beautiful lake nearly 18 m. long and 5 m. in extreme width, containing many islands, but less closely covered with them than the upper lough. One of them, Devenish, is celebrated for its antiquarian remains (see ENNISKILLEN). The river then runs westward to Donegal Bay, forming a fine fall at Ballyshannon (q.v.). Lough Erne contains trout and pike. These waters admit of navigation by small steamers, but little trade is carried on. The area of
the Erne basin, which includes a vast number of small loughs, is about 1000 sq. m., and it covers part of the counties Cavan, Longford, Leitrim, Fermanagh and Donegal. The length of the Erne valley is about 70 m.

**ERNEST I.** [ERNST ANTON KARL LUDWIG], duke of Saxe-Coburg-Gotha (1784-1844), was the son of Francis, duke of Saxe-Coburg-Saalfeld, and was born on the 2nd of January 1784. When his father in 1806 was made governor of the duchy of Coburg was occupied by Napoleon as conquered territory, and Ernest did not come into his inheritance till after the peace of Tilsit (July 1807). Owing to the part he had played in assisting the Prussians at the battle of Auerstädt he continued out of favour with Napoleon, and he threw himself with vigour into the war of liberation against the French. After the battle of Leipzig he was given the command of the V. army corps and reduced Mainz by blockade; he also commanded the Saxon troops during the campaign of 1815. By the congress of Vienna he was rewarded with the principality of Lichtenberg on the left bank of the Rhine, which received a slight augmentation after the second peace of Parma. These territories he sold to Prussia in 1834. In 1826, in the division of the territories of the duchy of Saxe-Gotha which followed the death of its last duke (February 1822), he received the duchy of Gotha, ceding that of Saalfeld to the duke of Meiningen; and he now exchanged his style of Ernest III. of Saxe-Coburg-Saalfeld for that of Ernest I. of Saxe-Coburg-Gotha. In 1831 he had given a constitution to Coburg, but he did not interfere with the traditional system of estates at Gotha. He died on the 29th of January 1844.

Duke Ernest, who was not only a good soldier and keen sportsman, but an enlightened patron of the arts and sciences, did much for the economic, educational and constitutional development of his territories; and his advice always carried great weight in the councils of the other German sovereignties. It was, however, for the splendid international position attained by the house of Coburg under him that his reign is chiefly distinguished. His younger brother Leopold (q.v.) became king of the Belgians; his brother Ferdinand (b. 1785) married the wealthy princess Antoinette von Kohary (1816) and was the father of the duchess of Nemours and of the future King Ferdinand of Portugal. Of his sisters, Antoinette (1779-1824) married Duke Alexander of Württemberg; Juliane [Alexandra Feodorovna] (1781-1860) married the Russian cesarevich Constantin, future Czar Nicholas I.; another sister was married to Leopold, Duke of Coburg, and Victoria (1786-1861), wife of Edward Augustus, duke of Kent, became the mother of Queen Victoria. Duke Ernest was twice married: (1) in 1817 to Louise, daughter of Duke Augustus of Saxe-Gotha, whom he finally divorced in 1826; (2) in 1831 to Maria, daughter of Duke Alexander of Württemberg. Of his sons, by his first wife, Ernest succeeded him in the duchy, and Albert married Queen Victoria.

**ERNST II.** duke of Saxe-Coburg-Gotha (1818-1863), was born at Coburg on the 21st of June 1818, being the eldest son of Duke Ernest I. He enjoyed a varied education; he studied at the university of Bonn with his brother Albert; his military training he received in the Saxon army. The widespread connexions of his family opened to him many courts of Europe, and after he became of age he travelled much. The position of his uncle Leopold, who was king of the Belgians, and especially the marriage of his brother Albert to the queen of England, his cousin, gave him peculiar opportunities for becoming acquainted with the political problems of Europe. In 1840-1841 he undertook a journey to Spain and Portugal; in the latter country another cousin, Ferdinand, was king-consort. In 1844 he succeeded his father. His own character and the influence of the king of the Belgians made him one of the most liberal princes in Germany. He was able to bring to a satisfactory conclusion the disputes with the Coburg estates. He passed through the ordeal of the revolution of 1848 with little trouble, for he anticipated the demands of the people of Gotha for a reform, and in 1852 introduced a new constitution by which the administration of his two duchies was assimilated in many points. The government of his small dominions did not afford sufficient scope for his restless and versatile ambition; his desire to play a great part in German affairs was probably increased by the feeling that, though he was the head of his house, he was to some extent overshadowed by the younger branches of the family which ruled in Belgium, England and Portugal. He was one of the foremost supporters of every attempt made to reform the German constitution and bring about the unity of Germany. He took a warm interest in the proceedings of the Frankfurt parliament and it was often said, probably without reason, that he hoped to be chosen emperor himself. However that may be, he strongly urged the King of Prussia to accept that position when it was offered him in 1849; he took a very prominent part in the complicated negotiations of the following year, and it was at his suggestion that a congress of princes met at Berlin in 1850. He highly valued the opportunities which this and similar meetings gave him for exercising political influence, and he would have felt most at home as a member of a permanent council of the German princes.

Ambitious also of military distinction, and sympathizing with the rising of the people of Schleswig-Holstein against the Danes in 1849, Ernest accepted a command in the federal army. In the engagement of Eckernförde in April 1849 the troops under his orders succeeded in capturing two Danish frigates, a remarkable feat of which he was justly proud. His greatest services to Germany were performed during the years of reaction which followed; almost alone among the German princes he remained faithful to the Liberal and National ideals, and he allowed his dominions to be used as an asylum by the writers and politicians who had to leave Prussia and Saxony. The reactionary parties looked on him with great suspicion, and it was at this time that he formed a friendship with Gustav Freytag, the celebrated novelist, whom he protected when the Prussian government demanded his arrest. His connexion with the English court gave him a position of much influence, but no one was more purely German in his feelings and opinions. The marriage of his niece Victoria with Frederick, the heir to the Prussian throne, strengthened his connexion with Prussia, but caused the Conservative party to look with increased suspicion on the Coburg influence. He was the first German prince to visit Napoleon III., and was present when Orsini made his celebrated attempt on the emperor's life. After 1860 he became the chief patron and protector of the National Verein; he encouraged the newly-formed rifle clubs and supported the campaign on the Rhine of the liberal-minded princes, which, by its success, allowed his court to become the centre of the rising national agitation. Still a warm adherent of Prussia, in 1862 he set an example to the other princes by voluntarily making an agreement by which his troops were placed in war under the command of the king of Prussia. Like all the other Nationalists, he was much embarrassed by the policy of Bismarck, and the democratic opinions of the Coburg court, which were shared by the crown prince Frederick, were a serious embarrassment to that minister. The opposition became more accentuated when the duke allowed his dominions to be used as the headquarters of the agitation in favour of Frederick, duke of Augustenburg, who claimed the duchies of Schleswig and Holstein, and it was at this time that Bismarck is reported to have said that if Frederick the Great had been alive the duke would have been in the fortress of Spandau. In 1863 he was present at the Fürstentag in Frankfurt, and from this time was in more frequent communication with the Austrian court, where his cousin Alexander, Count Mendsdorff, was minister. However, when war broke out in 1866, he at once placed his troops at the disposition of Prussia; Bismarck had in an important letter explained to him his policy and tactics. He was personally concerned in one of the most interesting events of the war; for the Hanoverian army, in its attempt to march south and join the Bavarians, had to pass through Thuringia, and the battle of Langensalza was fought in the immediate neighbourhood of Gotha. His troops took part in the battle, which ended in the rout of the Prussians, the duke, who was not present during the fight, in vain attempting to stop it. He bore an important share in the negotiations before and after the battle, and his action at this time has been
the subject of much controversy, for it was suggested that while he offered to mediate he really acted as a partisan of Prussia. For his services to Prussia he received as a present the forest of Schmalkalden. He was with the Prussian headquarters in Bohemia during the latter part of the war. With the coming of peace the diplomatic role which Ernest had played ended. The result was perhaps not quite equal to his expectations, but it must be remembered how difficult was the position of the minor German princes; and he quoted with great satisfaction the words used in 1871 by the emperor William at Versailles, that "to him in no small degree was due the establishment of the empire." He was a man of varied tastes, a good musician—he composed several operas and songs—and a keen sportsman, a quality in which he differed from his brother. Notwithstanding his Liberalism, he had a great regard for the dignity of his rank and family, and in his support of constitutional government would never have sacrificed the essential prerogatives of sovereignty. He died at Reinhardbrunn on the 22nd of August 1863. In 1842 the duke married Alexandrine, daughter of the grand-duke of Baden; there were no children by this marriage and the succession to Saxe-Coburg-Gotha passed therefore to the children of his younger brother Albert. By Albert's marriage contract the duchy could not be held together with the English crown; thus his eldest son, afterwards Edward VII., was passed over and it came to his second son, Alfred, duke of Edinburgh (1844-1900). When Alfred died without sons in July 1900 the succession to the duchy passed to a younger brother, Arthur, duke of Connaught; but the duke and his son, Arthur, passed on their claim to Charles Edward, duke of Albany (b. 1834), who became duke of Saxe-Coburg-Gotha in succession to his uncle Alfred. In 1905 Charles Edward married Victoria Adelaide (b. 1829), daughter of the grand-duke of Schleswig-Holstein, by whom he has a son, John Leopold (b. 1906).

Duke Ernest was something of a writer. He brought out an account of the travels in Egypt and Abyssinia which he undertook in 1862 as Reise des Herzogs von Sachsen-Koburg-Gotha nach Ägypten (Leipzig, 1864); and he published his memoirs, Aus meinem Leben und aus meiner Zeit (Berlin, 1887-1889). This work is in three volumes and contains much valuable information on a most critical period of German history; there is an English translation by P. Andreae (1888-1890).

See also Sir T. Martin, Life of H.R.H. the Prince Consort (1875-1881); Hon. C. Grey, Early years of the Prince Consort (1887); A. Oberh, Herzog Ernst II., ein Lebensbild (Leipzig, 1894); and E. Tempeltey, Herzog Ernst von Kurburg und das Jahr 1866 (Berlin, 1898).

ERNST AUGUST (1771-1831), king of Hanover and duke of Cumberland, fifth son of the English king George III., was born at Kew on the 5th of June 1771. Having studied at the university of Göttingen, he entered the Hanoverian army, serving as a leader of cavalry when war broke out between Great Britain and France in 1793, and winning a reputation for bravery. He lost the sight of one eye at the battle of Tournai in May 1794, and when Hanover withdrew from the war in 1795 he returned to England, being made lieutenant-general in the British army in 1799. In the same year he was created duke of Cumberland and Teviotdale and granted an allowance of £2,000 a year, after which he held several lucrative military positions in London and began to take a part in the sittings of the House of Lords and to take part in political life. A staunch Tory, the duke objected to all proposals of reform, especially to the granting of any relief to the Roman Catholics, and had great influence with his brother the prince regent, afterwards King George IV., in addition to being often consulted by the Tory leaders. In 1810 he was severely injured by an assassin, probably his valet Sellis, who was found dead; and subsequently two men were imprisoned for asserting that the duke had murdered his valet. Recovering from his wounds, Cumberland again proceeded to the seat of war; and having been made a British field-marshal, was in command of the Hanoverian army during the campaigns of 1813 and 1814, being present, although not in action, at the battle of Leipzig. In May 1815 Ernest married his cousin, Frederica (1778-1841), daughter of Charles II. duke of Mecklenburg-Strelitz and widow of Frederick, prince of Solms-Braunfels, a union which was very repugnant to his mother Queen Charlotte, and was disliked in England, where the duke's strong Toryism had made him unpopular. Parliament refused to increase his allowance from £18,000, to which it had been raised in 1804, to £24,000 a year, and indignant at the treatment he received the duke spent some years in England. Returning to Hanover after the accession of George IV. in 1820, his political power was again considerable, while deaths in the royal family made it likely that he would succeed to the throne. Although his personal influence with the sovereign ceased upon the death of George IV. in 1830, the duke continued to oppose all measures for the extension of civil and religious liberty, including the Reform Bill of 1832; and his unpopularity was augmented by suspicions that he had favoured the formation of Orange lodges in the army. When William IV. died in June 1837, the crowns of Great Britain and Hanover were separated; and Ernest, as the nearest male heir of the late king, became king of Hanover. At once cancelling the constitution which William had given to his kingdom in 1833, he acted as an absolute monarch, and the constitution which he sanctioned in 1840 was perverted with his own illiberal ideas. In German politics he was vigilant and active, and mindful of the material interests of his country. His reign, however, was a stormy one, and serious trouble between king and people had arisen when he died at Herrenhausen on the 18th of November 1837 (see Hanover: History). In spite of his arbitrary rule and his reactionary ideas the king was popular among his subjects, and his statue in Hanover bears the words "Dem Landes Vater sein treues Volk." Ernest, who is generally regarded as the ablest of the sons of George III., left an only child, George, who succeeded him as king of Hanover.

See C. A. Wilkinson, Reminiscences of the Court and Times of King Ernest of Hanover (London, 1880); von Malortie, König Ernst August (Hanover, 1861); and the various histories of Great Britain and Hanover for the period.

ERNST, JOHANN AUGUST (1770-1781), German theologian and philologist, was born on the 4th of August 1770, at Tennenstädt in Thuringia, of which place his father was pastor, besides being superintendent of the electoral dioceses of Thuringia, Sals and Sangerhausen. At the age of sixteen he was sent to the celebrated Saxo cloister school of Pforta (Schulpforta). At twenty he entered the university of Wittenberg, and studied afterwards at the university of Leipzig. In 1730 he was made master in the faculty of philosophy. In the following year he accepted the office of connector in the Thomas school of Leipzig, of which J. M. Gesner was then rector, an office to which Ernesti succeeded in 1734. He was, in 1742, named professor extraordinarius of ancient literature in the university of Leipzig, and in 1756 professor ordinarius of rhetoric. In the same year he received the degree of doctor of theology, and in 1759 was appointed professor ordinarius in the faculty of theology. Through his learning and his manner of discussion, he co-operated with S. J. Baumgarten of Halle (1766-1757) in disengaging the current dogmatic theology from its many scholastic and mystical excrescences, and thus paved a way for a revolution in theology. He died, after a short illness, in his seventy-sixth year, on the 11th of January 1768.

It is perhaps as much from the impulse which Ernesti gave to sacred and profane criticism in Germany, as from the intrinsic excellence of his own works in either department, that he must derive his reputation as a philologist or theologian. With J. S. Semler he co-operated in the revolution of Lutheran theology, and in conjunction with Gesner he instituted a new school in ancient literature. He detected grammatical niceties in Latin, in regard to the consecution of tenses which had escaped preceding critics. His canons are, however, not without exceptions. As an editor of the Greek classics, Ernesti hardly deserves to be named beside his Dutch contemporaries, Tiberius Hemsterhuis (1685-1766), L. C. Valkenaer (1715-1785), David Ruhnken (1723-1798), or his colleague J. J. Reiske (1716-1774). The higher criticism was not even attempted by Ernesti. But to him and to Gesner is due the credit of having formed, by discipline
and by example, philologists greater than themselves, and of having kindled the national enthusiasm for ancient learning. It is chiefly in hermeneutics that Ernesti has any claim to eminence as a theologian. But here his merits are distinguished, and, at the period when his *Institutio Interpretes N. T.* was published (1761), almost peculiar to himself. In it we find the principles of a general interpretation, formed without the assistance of any particular philosophy, but consisting of observations and rules which, though already enunciated, and applied in the criticism of the profane writers, had never rigorously been employed in biblical exegesis. He was, in fact, the founder of the grammatico-historical school of scholarship, which, far within its sphere, was the classics only one acceptance, and that the grammatical, convertible into and the same with the logical and historical. Consequently he censures the opinion of those who in the illustration of the Scriptures refer everything to the illumination of the Holy Spirit, as well as that of others who, disregarding all knowledge of the languages, would explain words by things. The "analogies of faith," as a rule of interpretation, he greatly limits, and teaches that it can never afford of itself the explanation of words, but only determine the choice among their possible meanings. At the same time he seems unconscious of any inconsistency between the doctrine of the inspiration of the Bible as usually received and his principles of interpretation.

Among his works the more important are:—I. In classical literature: *Initia doctrinarum Solidariorum* (1736), many subsequent editions; *Initia rhetorica* (1730); editions, mostly annotated, of Xenophon, *Sympos. de Rhet. X. V.* (1737–1738), *Aesop* (1748), *Tactius* (1752), the *Clouds of Aristophanes* (1754), Homer (1759–1764), Callimachus (1761), Polybius (1764), as well as of the *Nestorius of Corradus*, the Greek lexicon of Heredericus, and the *Bibliotheca Latina of Fabricius* (unfinished); *Archaeologia literaria* (1768), new and improved edition by Martini (1790); Horatius Trisulcinus *De particulis* (1769). II. In sacred literature: *Antimuratiorum sine confutatis coequalibus Muratorianae de rebus liturgicis* (1755–1758): *Neue theologische Bibliothek*, vols. i. to x. (1760–1769); *Institutio Interpretes Nov. Test.*, 3rd ed. (1775); *Neueste theologische Bibliothek*, vols. i. to x. (1771–1775). Besides these, he published many dissertations and papers of which the ninth of which has been incorporated in the three following publications:—*Opuscula oratoria* (1762, 2nd ed.; 1775); *Opuscula philologica et critica* (1764, 2nd ed., 1776); *Opuscula theologica* (1775). See Herzog–Hauke, *Realencyclopaedie*; J. E. Sandys, *Hist. of Class. Schol. III.* (1906).

ERNESTI, JOHANN CHRISTIAN GOTTLIEB (1756–1829), German classical scholar, was born at Arnstadt, Thuringia, and studied under his uncle, J. A. Ernesti, at the university of Leipzig. On the 5th of June, 1782, he was made supplementary professor of philosophy at his own university; and on the death of his cousin August Wilhelm in 1801 he was for five months professor of rhetoric. He died on the 5th of June of the following year.

His principal works are:—Editions of Aesop's *Fabelae* (1781); of the works of Herder, W. B. and Fabricius and Plinius and Plutarch (1786); and of *Silius Italicus Punica* (1791–1792); *Lexicon Technologiae Graecorom poetarum* (1798); *Lexicon technologiae Latinorum poetarum* (1797), and Ciceri's *Geist und Kunst* (1799–1802).

ERNST, HEINRICH WILHELM (1814–1865), German violinist and composer, was born at Brünn, in Moravia, in 1814. He was educated at the Conservatorium of Vienna, studying the violin under Joseph Böhm and Joseph Mayseder, and composition under Ignaz von Seyfried. At the age of sixteen he made a concert tour in south Germany, which established his reputation as a violinist of the highest promise. In 1832 he went to Paris, where he lived for several years. During this period he formed an intimacy with Stephen Heller, which resulted in their charming joint compositions—the *Penseés fugitives* for piano and violin. In 1843 he paid his first visit to London. The impression which he then made as a violinist was more than confirmed in the following year, when his rare powers were recognized by the musical public. Thenceforward he visited England nearly every year, unto the last owing to long-continued neurasthenia of a most severe kind. The last seven years of his life were spent in retirement, chiefly at Nice, where he died on the 8th of October 1865. As a violinist Ernst was distinguished by his almost unrivalled executive power, loftiness of conception, and intensely passionate expression. As a composer he wrote chiefly for his own instrument, and his *Elegie* and *Oetel Fantasia* rank among the most treasured works for the violin.

ERODE, a town of British India, in the Coimbatore district of Madras, situated on the right bank of the river Cauvery, which is here crossed by an iron railway girder bridge of 22 spans. Pop. (1901) 15,520. Here the South Indian railway joins the South-Western line of the Madras railway, 243 m. from Madras. There are exports of cotton and salt-petre; and the town has a steam cotton press.

EROS, a minor planet discovered by Witt at Berlin on the 14th of August 1858, and, so far as yet known, unique in that its perihelion lies far within the orbit of Mars.

EROS, in Greek mythology, the god of love. He is not mentioned in Homer; in Hesiod (*Theog. 120*) he is one of the oldest and the most beautiful of the gods, whose power neither gods nor men can resist. He also evolves order and harmony out of Chaos by uniting the separated elements. This cosmic Eros, who in Orphic cosmogony sprang from the world-egg which Chronos, or Time, laid in the bosom of Chaos, and which is the origin of all created beings, degenerated in later mythology into the capricious god of sexual passion, the son of Aphrodite and Zeus, Ares or Hermes. He is commonly represented as a child, sometimes as a youth of about six feet, with a naked upper half, and wearing a himation over his shoulders, and even his own mother not being proof against his attacks. His brother is Anteros, the god of mutual love, who punishes those who do not return the love of others, without which Eros could not thrive; he is sometimes described as the opponent of Eros. The chief associates of Eros are Pothos and Himeros (Longing and Desire), Peitho (Persuasion), the Muses and the Graces; he himself is in constant attendance on Aphrodite. Later writers (Euripides being the first) assumed the existence of a number of Erotes (like the Roman Amores and Cupidines) with similar attributes. According to the philosophers, Eros was not only the god of sexual love, but also of the loyal and devoted friendship of men, hence the Theban "Sacred Band" was devoted to him, and the Cretans and Spartans offered sacrifice to him before going into battle (Athenaeus xiii. p. 561). In Alexandrian poetry Eros is at one time the powerful god who conquers all, at another the elish god of love. For the Roman adaptation of Eros see CUPID, and for the later legend of Cupid and Psyche see PSYCHE.

In art Eros is represented as a beautiful youth or a winged child. His attributes are the bow and arrows and a burning torch. The rose, the hare, the cock and the goat are frequently associated with him. The most celebrated statue of him was at Thebes, the work of Praxiteles. Other famous representations are the Vatican torso and Eros trying his bow (in the Capitoline museum).

EREPNUS (original name VAN ERPE), THOMAS (1584–1624), Dutch Orientalist, was born at Gorcum, in Holland, on the 11th of September 1584. After completing his early education at Leiden, he entered the university of that city, and in 1608 took the degree of master of arts. By the advice of Scaliger he studied Oriental languages and the ancient and modern Ottoman literature. He afterwards travelled in England, France, Italy and Germany, forming connexions with learned men, and availing himself of the information which they communicated. During his stay at Paris he contracted a friendship with Casaubon, which lasted during his life, and also took lessons in Arabic from an Egyptian, Joseph Barbatus, otherwise called Abu-dakti. At Venice he perfected himself in the Turkish, Persian and Ethiopian languages. After a long absence, Erpenius returned to his own country in 1612, and on the 10th of February 1613 he was appointed professor of Arabic and other Oriental languages, Hebrew excepted, in the university of Leiden. Soon after his settlement at Leiden, animated by the example of Savary de Brèves, who had established an Arabic press at Paris at his own charge, he caused new Arabic characters to be cut at a great expense, and erected a press in his own house. In 1619 the curators of the university of Leiden
ERROLL—ERSKINE

754

instituted a second chair of Hebrew in his favour. In 1620 he was sent by the States of Holland to induce Pierre Dumoulin or André Rivet to settle in that country; and after a second journey he was successful in inducing Rivet to comply with their request. Some time after the return of Epkenius, the states appointed him their interpreter; and in this capacity he had the duty imposed upon him of translating and replying to the different letters of the Moslem princes of Asia and Africa. His reputation had now spread throughout all Europe, and several princes, the kings of England and Spain, and the archbishop of Seville made him the most flattering offers; but he constantly refused to leave his native country. He was preparing an edition of the Koran with a Latin translation and notes, and was projecting an Oriental library, when he died prematurely on the 15th of November 1624.

Among his works may be mentioned his Grammatica Arabica, published originally in 1613 and often reprinted; Rudimenta linguae Arabicae (1620); Grammatica Ebraea generalis (1621); Grammatica Chaldæo et Syria (1628); and an edition of Elmacín’s History of the Saracens.

ERROLL (or ERROL), FRANCIS HAY, 9TH EARL OF (d. 1631), Scottish nobleman, was the son of Andrew, 8th earl, and of Lady Jean Hay, daughter of William, 6th earl. The date of his birth is unrecorded, but he succeeded to the earldom (cr. 1453) in 1585, was early converted to Roman Catholicism, and as the associate of Huntly joined in the Spanish conspiracies against the throne of Elizabeth. A letter written by him, declaring his allegiance to the king of Spain, having been intercepted and sent by Elizabeth to James in February 1589, he was declared a rebel by the council. He engaged with Huntly and Crawford in a rebellion in the north of Scotland, but their forces surrendered at Aberdeen on the arrival of the king in April; and in July Erroll gave himself up to James, who leniently refrained from exacting any penalty. In September of the same year he entered into a personal bond with Huntly for mutual assistance; and in 1590 displeased the king by marrying, in spite of his prohibition, Lady Elizabeth Douglas, daughter of the earl of Morton. He was imprisoned on suspicion of complicity in the attempt made by Gray and Bothwell to surprise the king at Falkland in June 1592; and though he obtained his release, he was again proclaimed a rebel on account of the discovery of his signature to two of the “Spanish Blanks,” unwritten sheets subscribed with the names of the chief conspirators in a plot for a Spanish invasion of Scotland, to be filled up later with the terms of the projected treaty. After a failure to apprehend him in March 1593, Erroll and his companions were sentenced to abjure Romanism or leave the kingdom; and on their non-compliance were in 1594 declared traitors. On the 3rd of October they defeated at Glenlivet a force sent against them under Argyll; though Erroll himself was severely wounded, and Slains Castle, his seat, razed to the ground. The rebel lords left Scotland in 1595, and Erroll, on report of his further conspiracies abroad, was arrested by the states of Zealand, but was afterwards allowed to escape. He returned to Scotland secretly in 1598; and on the 26th of June 1597 abjured Romanism and made his peace with the Kirk. He enjoyed the favour of the king, and in 1602 was appointed a commissioner to negotiate the union with England. His relations with the Kirk, however, were not so amicable. The reality of his conversion was disputed, and on the 21st of May 1608 he was confined to the city of Perth “for the better resolution of his doubts,” being subsequently declared an obstinate “papist,” excommunicated, deprived of his estate, and imprisoned at Dumbarton; and after some further vaccination was finally released in May 1611. Lord Erroll died on the 16th of July 1631, and was buried in the church of Slains. He married (1) Anne, daughter of John, 4th earl of Atholl; (2) Margaret, daughter of the regent Murray; and (3) Elizabeth, daughter of William, 6th earl of Argyll. His third wife he had several children, of whom his eldest son, William, succeeded him. The dispute which began in his lifetime concerning the hereditary office of lord high constable between the families of Erroll and of the Earl Marischal was settled finally in favour of the former; thus establishing the precedence enjoyed by the earls of Erroll next after the royal family over all other subjects in Scotland.

ERSKINE, EBENEZER (1680–1754), Scottish divine, the chief founder of the Secession Church (formed of dissenters from the Church of Scotland), was born on the 22nd of June 1680, most probably at Dryburgh, Berwickshire. His father, Henry Erskine, who was at one time minister at Cornhill, Durham, was ejected in 1662 by the Act of Uniformity, and, after suffering some years’ imprisonment, was after the Revolution appointed to the parish of Chirnside, Berwickshire. After studying at the university of Edinburgh, Ebenezer became minister of Portmok, Kinross-shire. There he remained for twenty-eight
ERSKINE, H.—ERSKINE, R.

755

years, after which, in the autumn of 1731, he was translated to the West Church, Stirling. Some time before this, he, along with some other ministers, was “rebuked and admonished,” by the general assembly, for defending the doctrines contained in the Marrow of Modern Divinity (see Boston, Thomas). A sermon which he preached on lay patronage before the synod of Perth in 1733 furnished new grounds of accusation, and he was compelled to shield himself from rebuke by appealing to the general assembly. Here, however, the sentence of the synod was confirmed, and after many fruitless attempts to obtain a hearing, he, along with William Wilson of Perth, Alexander Monteith of Abernethy and James Fisher of Kindlaven, was suspended from the ministry by the commission in November of that year. Against this sentence they protested, and constituted themselves into a separate church court, under the name of the associate presbytery. In 1739 they were again summoned before the assembly, and in their corporate capacity declined to acknowledge the authority of the church, and were deposed in the following year. They received numerous accessions to their communion, and remained in harmony with each other till 1747, when a division took place in regard to the nature of the oath administered to burgesses. Erskine himself joined with the “burenhed” section, and became their professor of theology.

He continued also to preach to a numerous congregation in Stirling till his death, which took place on the 2nd of June 1754. Erskine was a very popular preacher, and a man of considerable force of character; he acted throughout on principle with honesty and courage. The burgher and anti-burgher sections of the Secession Church were reunited in 1820, and in 1847 they united with the relief synod in forming the United Presbyterian Church.

Erskine’s published works consist chiefly of sermons. His Life and Diary, edited by the Rev. Donald Frazer, was published in 1840. His Works were published in 1785.

ERSKINE, HENRY (1746-1817), lord advocate of Scotland, the second son of Henry David, 10th earl of Buchan and brother of the lord chancellor Erskine, was born in Edinburgh on the 1st of November 1746. He was educated at the universities of St Andrews, Glasgow and Edinburgh, and was admitted a member of the faculty of advocates in 1768. His reputation as a clever and fluent speaker was first made in the debates of the general assembly, of which he had been early elected an elder. In 1783 he was appointed to the office of lord advocate, which he held during the brief coalition ministry of Fox and North. In 1783 he was elected dean of the faculty of advocates, and was re-elected annually till 1796, when his conduct in moving a series of resolutions at a public meeting, condemning the government’s sedition and treason bills, brought on him the opposition of the ministerial party, and he was deposed in favour of Robert Dundas. On the formation of the Grenville ministry in 1806 he again became lord advocate and was returned to parliament for the Haddington burghs, which he exchanged at the general election of the same year for the Dumfries burghs. His tenure of the lord advocateship ended in March 1807 on the downfall of the ministry. In 1811 he gave up his practice at the bar and retired to his country residence of Almondel, in Linlithgowshire, where he died on the 8th of October 1817.

His eldest son, Henry David (1783-1857), succeeded as 11th earl of Buchan on his uncle’s death in 1829.

Erskine’s reputation will survive as the finest and most eloquent orator of his day at the Scottish bar; added to a charming forensic style was a most captivating wit, which, as Lord Jeffrey said, was “all argument, and each of his delightful illustrations a material step in his reasoning.” Erskine was also the author of some poems, of which the best known is “The Emigrants” (1783).

See Lieut.-Col. A. Ferguson’s Henry Erskine (1882).

ERSKINE, JOHN (1721-1803), Scottish divine, son of John Erskine of Carnock, was born on the 2nd of June 1721. He studied law for a time after completing his course in arts at the university of Edinburgh, but was eventually licensed to preach in 1743; and was successively parish minister of Kirkintilloch, near Glasgow, Culross, in Fifeshire (1753). New Greyfriars church in Edinburgh (1758), and Old Greyfriars church in 1768, where he became the colleague of Principal Robertson, the historian. Here he remained until his death, which took place on the 19th of January 1803. Dr Erskine’s writings consist chiefly of controversial pamphlets on theological subjects. His sermons are clear, vigorous expositions of a moderate Calvinism, in which metaphysical argument and practical morality are happily blended. In church politics he was the leader of the evangelical party; and was much beloved for his high character and amiability.

For his life and works see Sir H. Moncreiff Wellwood, Life and Writings of J. Erskine, D.D. (Edinburgh, 1818).

ERSKINE, JOHN, of Carnock (1695-1768), Scottish jurist, son of Lieut.-Colonel John Erskine, was born in 1695. He was admitted a member of the faculty of advocates in 1716. Although he never enjoyed much practice at the bar, he acquired a high reputation as a sound and learned lawyer, and in 1737 was appointed professor of Scots law in the university of Edinburgh. In 1754 he published his Principles of the Law of Scotland. He retired from his chair in 1765; and during the remainder of his useful and orderly life he occupied himself with the preparation of his great work, the Institutes of the Law of Scotland, which he did not live to publish. He died at Cardross, Perthshire, on the 1st of March 1768.

Erskine’s Institutes, although not exhibiting the grasp of principle which distinguished his great predecessor Lord Stair, is so conspicuous for learning, accuracy and sound good sense, that it has always been esteemed of the highest authority on the law of Scotland. The first edition appeared in 1773 and it has been many times reprinted. The Principles, although published first, is substantially an abridgment of the larger work, and is in some respects superior to it, being more concise and direct. It retains its place as the text-book on Scots law, and is frequently being re-edited.

ERSKINE, JOHN, of Dun (1509-1591), Scottish reformer, the son of Sir John Erskine, laird of Dun, was born in 1509, and was educated at King’s College, Aberdeen. At the age of twenty-one Erskine was the cause—probably by accident—of a priest’s death, and was forced to go abroad, where he came under the influence of the new learning. It was through his agency that Greek was first taught in Scotland by Petrus de Marsiliers at Montrose. This fact counted for much in the progress of the Reformation. Erskine was also drawn towards the new faith, being a close friend of George Wishart, the reformer, from whose fate he was saved by his wealth and influence, and of John Knox, whose advice openly to discontentance the mass was given in the lodgings of the laird of Dun. In the stormy controversies of the time of Mary Stuart and James VI, Erskine was a conspicuous figure and a moderating influence. He was able to soothe the queen when her feelings had been outraged by Knox’s denunciations—being a man “most gentil of nature”—and frequently acted as mediator both between the catholic and reforming parties, and among the reformers themselves. In 1570 he was named through a layman—superintendent of the reformed church of Scotland for Angus and Mearns, and in 1572 he gave his assent to the modified episcopacy proposed by Morton at the Leith convention. Though never himself ordained, he was held in such high esteem by the leaders of the church as to be more than once elected moderator of the general assembly (first in 1564), and he was amongst those who in 1578 drew up the Second Book of Discipline. From 1579 he was a member of the king’s council. He died in 1591. Erskine owed his peculiar influence among the Scottish reformers to the union rate in those days—of steadfast convictions with a conciliatory manner; Queen Mary described him as “a mild and sweet-natured man, with true honesty and uprightness.”

ERSKINE, RALPH (1685-1752), Scottish divine, brother of Ebenezer Erskine (q.v.), was born on the 18th of March 1685. After studying at the university of Edinburgh, he was in 1711
ordained assistant minister at Dunfermline. He homologated the protests which his brother laid on the table of the assembly after being rebuked for his synod sermon, but he did not formally withdraw from the establishment till 1737. He was also present, though not as a member, at the first meeting of the associate presbytery. When the severance took place on account of the oath administered to burgesses, he adhered, along with his brother, to the burgher section. He died after a short illness on the 6th of November 1752.

His works consist of sermons, poetical paraphrases and gospel sonnets. The *Gospel Sonnets* have frequently appeared separately. His *Life and Diary*, edited by the Rev. D. Fraser, was published in 1842.

ERSKINE, THOMAS, of Linlathen (1788-1870), Scottish theologian, youngest son of David Erskine, writer to the signet in Edinburgh, and of Anne Graham, of the Grahams of Airth, was born on the 13th of October 1788. He was a descendant of John, 1st or 6th earl of Mar, regent of Scotland in the reign of James VI., a grandson of Colonel John Erskine of Carnock. After being educated at the high school of Edinburgh, and at Durham, he attended the literary and law classes at the university of Edinburgh, and, becoming in 1810 a member of the Edinburgh faculty of advocates, he for some time enjoyed the intimate acquaintance of Cockburn, Jeffrey, Scott and other distinguished men whose talent then lent lustre to the Scottish bar. In 1816 he succeeded to the family estate of Linlathen, near Dundee, and devoted himself to theology. The writings of Erskine, especially his published letters, are distinguished by a graceful style, and possess originality and interest. His theological views have a considerable similarity to those of Frederick Denison Maurice, who acknowledges having been indebted to him for his first true conception of the meaning of Christ's sacrifice. Erskine had little interest in the "historical criticism" of Christianity, and was regarded as the only proper critic of its truth in conformity or nonconformity with man's spiritual nature, and its adaptability or non-adaptability to man's spiritual needs. He considered the incarnation of Christ as the necessary manifestation to man of an eternal sonship in the divine nature, apart from which those filial qualities which God demands from man could have no sanction; by faith as used in Scripture he understood to be meant a certain moral or spiritual activity or energy which virtually implied salvation, because it implied the existence of a principle of spiritual life possessed of an immortal power.

This faith, he believed, could be properly awakened only by the manifestation, through Christ, of love as the law of life, and as identical with an eternal righteousness which it was God's purpose to bestow upon every individual; by the spirit of the doctrine of grace Erskine is unrivalled. During the last thirty-three years of his life Erskine ceased from literary work. Among his friends were Madame Vernet, the duchess de Broglie, the younger Mdme de Stael, M. Vinet of Lausanne, Edward Irving, Frederick D. Maurice, Dean Stanley, Bishop Ewing, Dr John Brown and Thomas Carlyle. His wide influence was due to his high character and unassuming earnestness. He died at Edinburgh on the 20th of March 1870.

His principal works are *Remarks on the Internal Evidence for the Truth of Revealed Religion* (1820), *An Essay on Faith* (1822), and the *Unconditional Freeness of the Gospel* (1828). These have all passed through several editions, and have also been translated into French. He is also the author of the *Bride's Serpent* (1831), the *Doctrine of Election* (1839), several "Introductory Essays" to editions of Christian Authors, and a posthumous work entitled *Spiritual Order and Other Papers* (1871). Two vols. of his letters, edited by W. D. D. D., with reminiscences by Dean Stanley and Principal Shairp, appeared in 1877.

ERSKINE, THOMAS ERSKINE, 1st BARON (1750-1823), lord chancellor of England, was the third and youngest son of Henry David, 10th earl of Buchan, and was born in Edinburgh on the 20th of January 1750. From an early age he showed a strong desire to enter one of the learned professions; but his father, owing to his straitened circumstances, was unable to do more than give him a good school education at the high school of Edinburgh and the grammar school of St Andrews. In 1764 he was sent as a midshipman on board the "Tartar," but on finding, when he returned to this country after four years' absence in North America and the West Indies, that there was little immediate chance of his rank of acting lieutenant being confirmed, he quitted the service and entered the army, purchasing a commission in the 1st Royals with the meagre patrimony which had been left to him. But promotion here was as slow as in the navy; while in 1770 he had added greatly to his difficulties by marrying the daughter of Daniel Moore, M.P. for Marlows, an excellent wife, but as poor as himself. However, an accidental visit to an assize court in the town in which he was quartered, confirmed his resolve to quit the army for the law. Accordingly on the 26th of April 1775 he was admitted a student of Lincoln's Inn. He also on the 13th of January following entered himself as a gentleman commoner on the books of Trinity College, Cambridge, but merely that by graduating he might be called two years earlier.

He read in the chambers of Francis Buller (afterwards Mr Justice Buller) and George (afterwards Baron) Wood, and was called to the bar on the 3rd of July 1778. His success was immediate and brilliant. An accident was the means of bringing him his first case, *Rea v. Buller*, which he appeared for Captain Thomas Baillie, the lieutenant-governor of Greenwich hospital, who had published a pamphlet animadverting in severe terms upon the abuses which Lord Sandwich, the first lord of the admiralty, had introduced into the management of the hospital, and against whom a rule had been obtained from the court of king's bench to show cause why a criminal information for libel should not be filed. Erskine was the junior of five counsel; and it was his good fortune that the prolixity of his leaders consumed the whole of the first day, thereby giving the advantage of starting afresh next morning. He made use of this opportunity to deliver a speech of wonderful eloquence, skill and courage, which captivated both the audience and the means of the rule was patented. He received, is said, thirty retainers before he left the court. In 1781 he delivered another remarkable speech, in defence of Lord George Gordon—a speech which gave the death-blow to the doctrine of constructive treason. In 1783, when the Coalition ministry came into power, he was returned to parliament as member for Portsmouth. His first speech in the House of Commons was a failure; and he never in parliamentary debate possessed anything like the influence he had at the bar. He lost his seat at the dissolution in the following year, and remained out of parliament until 1790, when he was again returned for Portsmouth. But his success at the bar continued unimpaired. In 1785 he received a patent of precedence. His eldest son Thomas—son of Thomas Baillie—was the hero of a celebrated cause of W. D. Shiple, deans of St Asaph, who was tried in 1784 at Shrewsbury for seditious libel—a defence to which was due the passing of the Libel Act 1792, laying down the principle that it is for the jury, and not for the judge to decide the question whether or not a publication is a libel. In 1789 he was counsel for John Stockdale, a bookseller, who was charged with seditious libel in publishing a pamphlet in favour of Warren Hastings, whose trial was then proceeding; and his speech on this occasion, probably his greatest effort, is a consummate specimen of the art of addressing a jury. Three years afterwards he brought down the opposition alike of friends and foes by defending Thomas Paine, author of *The Rights of Man*—holding that an advocate has no right, by refusing a brief, to convert himself into a judge. As a consequence he lost the office of attorney-general to the prince of Wales, to which he had been appointed in 1786; the prince, however, subsequently made amends by making him his chancellor. Among Erskine's later speeches may be mentioned those for Horne Tooke and the other advocates of parliamentary reform, and that for James Hadfield, who was accused of shooting at the king. On the accession of the Grenville ministry in 1806 he was made lord chancellor, an office for which his training had in no way prepared him, but which he fortunately held only during the short period his party was in
power. Of the remainder of his life it would be well if nothing could be said. Occasionally speaking in parliament, and hoping that he might return to office should the prince become regent, he gradually degenerated into a state of useless idleness. Never conspicuous for prudence, he aggravated his increasing poverty by an unfortunate second marriage.

His first wife had died in 1805, and he married at Gretna Green a Miss Mary Mack, the date of this marriage is not definitely known. Once—by his conduct in the case of Queen Caroline—does he recall his former self. He died at Almondeil, Lithgowshire, on the 17th of November 1823, of pneumonia, caught on the voyage to Scotland.

Erskine's great forensic reputation was, to a certain extent, a concomitant of the numerous political trials of the day, but it was also due to his impassioned eloquence and undaunted courage, which so often carried audience and jury and even the court along with him. As a judge he did not succeed; and it has been questioned whether under any circumstances he could have succeeded. For the office of chancellor he was plainly unfit. As a lawyer he was well read, but by no means profound. His strength lay in the keenness of his reasoning faculty, in his dexterity and the ability with which he disentangled complicated masses of evidence, and above all in his unrivalled power of fixing and commanding the attention of juries. To no department of knowledge but law had he applied himself systematically, with the single exception of English literature, of which he acquired a thorough mastery in early life, at intervals of leisure in college, on board ship, or in the army. Vanity is said to have been his ruling personal characteristic; but those who knew him, while they admit the fault, say that in him it never took an egg-like form, even in old age, while the singular grace and attractiveness of his manner endeared him to all with whom he came in contact.

By his first wife he had four sons and four daughters. His eldest son, David Montagu (1776-1855), was a well-known diplomatist; his second son, Henry David (1786-1859), was dean of Ripon; and his third son, Thomas (1788-1864), became a judge of the court of common pleas. By his second wife he had one son, born in 1821.

In 1772 Erskine published Observations on the Prevailing Abuses in the British Army, a pamphlet which had a large circulation, and in later life, Armata, an imitation of Gulliver's Travels. His most noted speeches have repeatedly appeared in a collected form. See Campbell's Lives of the Chancellors: Moore's Diaries; Ferguson's Hennery Erskine (1888); Durner's Hennery Erskine, a Study (Paris 1883); Lord Brougham's Memoir, prefixed to Erskine's Speeches (1847); Romilly's Memoirs; The Croker Papers; Lord Holland's Memoirs.

EUBESCITE, a native copper-iron sulphide, CuFeS₃, of importance as an ore of copper. It crystallizes in the cubic system, the usual form being that of interpenetrating cubes twinned on an octahedral plane. The faces are usually curved and rough, and the crystals confusedly aggregated together. Compact and granular masses are of more frequent occurrence. The colour on a freshly fractured surface is bronze or coppery, but in moist air this rapidly tarnishes with iridescent blue and red colours; hence the names purple copper ore, variegated copper ore (Ger. Buntkupferzer), horse-flesh ore, and erubescite (from the Lat. erubesce, "to grow red"). The lustre is metallic, and the streak greyish-black; hardness 3; sp. gr. 5-0. Bornite (after Baron Ignaz von Born, b. 1742, d. 1791) is a name in common use for this mineral, and it predates erubescite, the name given by J. D. Dana in 1850, but afterwards rejected by him; French authors use the name phillipsite, after the English mineralogist, R. Phillips, who analysed the mineral; both these earlier names had, however, been previously used for other minerals.

Owing to the frequent presence of mechanically admixed chalcopyrite and chalcocite, the published analyses of erubescite show wide variations, the copper, for example, varying from 50 to 70%. Even the best Cornish crystals enclose a nucleus of chalcocopyrite (CuFeS₂), and an analysis of these made in 1839 led to the long-accepted formula Cu₂FeS₃. Recently, B. J.

Harrington has analysed carefully selected material and obtained the formula Cu₃FeS₄. Erubescite occurs in copper-bearing veins, and has been mined as an ore of copper at Redruth in Cornwall, Montecatini in the province of Pisa, Tuscany, Bristol in Connecticut, Acton in Canada, and other locations in North America. Amongst the best crystallized specimens are from the Carn Brea mine and other copper mines in the neighbourhood of Redruth, and from Bristol in Connecticut. Recently a few large isolated crystals with the form of isocistetrahedra have been found with calcite and albite in a gold-vein on Fossnitz-Alpe in the Gross-Venediger, Tirol.

ERYSPIELAS (a Greek word, probably derived from ἔρυθρος, red, and πάλας, skin)—synonyms, the Rose, St Anthony's Fire—an acute contagious disease, characterized by a special inflammation of the skin, caused by a streptococcus. Erysipelas is endemic in most countries, and epidemic at certain seasons, particularly the spring of the year. The poison is not very virulent, but it certainly can be conveyed by bedding and the clothes of a third person. Two varieties are occasionally described, a traumatic and an idiopathic, but the disease seems to depend in all cases upon the existence of a wound or abrasion. In the so-called idiopathic variety, of which facial erysipelas is the best known, the point of entry is probably an abrasion by the lachrymalt duct.

When the erysipelas is of moderate character there is simply a redness of the integument, which feeds somewhat hard and thickened, and upon which there often appear small vesications. This redness, though at first circumscribed, tends to spread and affect the neighbouring sound skin, until an entire limb or a large area of the body may become involved in the inflammatory process. There is usually considerable pain, with heat and tingling in the affected part. As the disease advances the portions of skin first attacked become less inflamed, and exhibit a yellowish appearance, which is followed by slight desquamation of the cuticle. The inflammation in general gradually disappears. Sometimes, however, it breaks out again, and passes over the area originally affected the second time. But besides the skin, the subjacent tissues may become involved in the inflammation, and give rise to the formation of pus. This is termed phlegmonous erysipelas, and is much more apt to occur in connexion with the traumatic variety of the disease. Occasionally the affected parts become gangrenous. Certain complications are apt to arise in erysipelas affecting the surface of the body, particularly inflammation of serous membranes, such as pericardium or pleura.

Erysipelas of the face usually begins with symptoms of general illness, the patient feeling languid, drowsy and sick, while frequently there is a distinct rigor followed with fever. Sore throat is sometimes felt, but in general the first indication of the local affection is a red and painful spot at the side of the nose or on one of the cheeks or ears. Occasionally it would appear that the inflammation begins in the throat, and reaches the face through the nasal fossae. The redness gradually spreads over the whole surface of the face, and is accompanied with swelling, which in the lax tissues of the cheeks and eyelids is so great that the features soon become obliterated and the countenance wears a hideous expression. Advancing over the scalp, the disease may invade the neck and pass on to the trunk, but in general the inflammation remains confined to the face and head. While the disease progresses, besides the pain, tenderness and heat of the affected parts, the constitutional symptoms are very severe. The temperature rises often to 105° or higher, remains at from three to five days, and then falls by crisis. Delirium is a frequent accompaniment. The attack in general lasts for a week or ten days, during which the inflammation subsides in the parts of the skin first attacked, while it spreads onwards in other directions, and after it has passed away there is, as already observed, some slight desquamation of the cuticle.

Although in general the termination is favourable, serious and occasionally fatal results follow from inflammation of the membranes of the brain, and in some rare instances sudden death.
has occurred from suffocation arising from oedema glettidias, the inflammatory action having spread into and extensively involved the throat. One attack of this disease, so far from protecting from, appears rather to predispose to others. It is sometimes a complication in certain forms of exhausting disease, such as phthisis or typhoid fever, and is then to be regarded as of serious import. A very fatal form occasionally attacks new-born infants, particularly in the first four weeks of their lives. In epidemics of puerperal fever this form of erysipelas has been specially found to prevail.

The treatment of erysipelas is best conducted on the expectant system. The disease in most instances tends to a favourable termination; and beyond attention to the condition of the stomata, which may be paroxysmally painful and tender, little is necessary in the way of medicine. The employment of preparations of iron in large doses is strongly recommended by many physicians. But the chief point is the administration of abundant nourishment in a light and digestible form. Of the many local applications which may be employed, hot fomentations will be found among the most soothing. Dusting the affected part with powdered starch, and wrapping it in cotton wadding, is also of use.

In the case of phlegmonous erysipelas complicating wounds, free incisions into the part are necessary.

**ERYTHRAE** [mod. Liš], one of the Ionian cities of Asia Minor, situated on a small peninsula stretching into the Bay of Erythrae, at an equal distance from the mountains Imus and Corycus, and directly opposite the island of Chios. In the peninsula excellent wine was produced. The town was said to have been founded by Ionians under Knopos, son of Codrus. Never a large city, it sent only eight ships to the battle of Lade. The Erythreanœas owned for a considerable time the supremacy of Athens, but towards the close of the Peloponnesian war they threw off their allegiance to that city. After the battle of Náuplia, however, they received Conon, and paid him honours in an inscription, still extant. Erythrae was the birthplace of two prophetesses—one of whom, Sibylla, is mentioned by Strabo as living in the early period of the city; the other, Athens, lived in the time of Alexander the Great. The ruins include well-preserved Hellenistic walls with towers, of which five are still visible. The acropolis (280 ft.) has the theatre on its N., and eastward lies many remains of Byzantine buildings. Modern Liš is a considerable place and port, extending from the ancient to the acropolis. The smaller coasting steamers call, and there is an active trade with Chios and Smyrna.

**ERYRHITE**, the name given to (1) a mineral composed of a hydrated cobalt arsenate, and (2) in chemistry, a tetrahydric alcohol. (1) The mineral erythrite has the formula Co₄(AsO₄)₂·5H₂O, and crystallizes in the monoclinic system and is isomorphous with vivianite. It sometimes occurs as beautiful radially-arranged groups of blade-shaped crystals with a bright crimson colour and brilliant lustre. On exposure to light the colour and lustre deteriorate. There is a perfect cleavage parallel to the plane of symmetry, on which the lustre is pearly. Cleavage flakes are soft (H=2), sectile and flexible; specific gravity 2.95. The mineral is, however, more often found as an earthy encrustation with a peach-blossom colour, and in this form was early (1727) known as cobalt-bloom (Ger. Kobaltblüthe). The name erythrite, from ἔρυθρος, "red," was given by F. S. Beudant in 1838. Erythrite occurs as a product of alteration of smaltite (Co₅S₃) and other cobaltiferous arsenides. The finest crystallized specimens are from Schneeberg in Saxony. The earthy variety has been found in Thuringia and Cornwall and some other places. (2) The alcohol erythrite has the constitutional formula HO·H₂C·CH(OH)·CH(OH)·CH₂OH; it is also known as erythrol, erythroglycine and phytic. It corresponds to tartaric acid, and, like this substance, it occurs in four stereo-isomeric forms. The internally compensated modification, i-erythrite, corresponding to mesotartaric acid, occurs free in the algae Protococcus vulgaris, and as the orsellinate, erythrin, C₃H₄(OH)(O-C₆H₄O₂)₂, in many lichens and algae, especially Roccella montagnesi. It has a sweet taste, melts at 126°, and boils at 330°. Careful oxidation with dilute nitric acid gives erythrosoe or tetrose, which is probably a mixture of a trioxoaldehyde and trioxoketone. Energetic oxidation gives erythritic acid and mesotartaric acid. d-Erythrite and the racemic mixture of the dextro and laevio varieties were synthesized by Griner in 1893 from divinyl.

**ERZERUM**, or Arzrum (Arm. Garin), the chief town of an important vilayet of the same name in Asiatic Turkey. It is a military station and a fortress of considerable strategical value, closing the roads from Kars, Olı and other parts of the frontier. Several important routes from Trebizond and various parts of Anatolia converge towards it from the west. It is situated at the eastern end of an open bare plain, 30 m. long and about 12 wide, bordered by steep, rounded mountains and traversed by the Kara Su, or western Euphrates, which has its source in the mountains. The town stands upon a plain of elevation of 670 ft. above sea-level, while the near hills rise to 10,000 ft. The scenery in the neighbourhood is striking, lofty bare mountains being varied by open plains and long valleys dotted with villages. Just east of the town is the broad ridge of the Deveboyun ("Camel's Neck"), across which the road passes to Kars. To the south is the Palandukên range, from which emerge numerous streams, supplying the town with excellent water. In the plain to the north the Kara Su traverses extensive marshes which afford good wild-fowl-shooting in the spring.

The town is surrounded by an earthen enceinte or rampart with some forts on the hills just above it, and others on the Deveboyun ridge facing east, the whole forming a position of considerable strength. The old walls and the citadel have disappeared. Inside the ramparts the town lies rather cramped, with narrow, crooked streets, badly drained and dirty; the houses are generally built of dark grey volcanic stone with flat roofs, the general aspect, owing to the absence of trees, being somewhat gloomy. The water-supply from Palandukên is distributed by wooden pipes to numerous public fountains. The town has a population of about 45,000, including about 10,000 Armenians, 2000 Persians and a few Jews. It has a garrison in peace of about 5000 men. It is the seat of the British consulate for Kurdistan, and there are other European consulates besides an American mission with schools. The great altitude accounts for very severe winter cold, occasionally 10° to 25° below zero F., accompanied by blizzards (tīp) sometimes fatal to travellers overtaken by them. The summer heat is moderate (50° to 77°).

There are several well-built mosques (none older than the 16th century), public baths, and several good khans. There are Armenian and Catholic churches, but the most beautiful building is a medresse erected in the 12th century by the Seljuks, with ornamental doorway and two graceful minarets known as the Chūfī Minare.
occupation continued until the peace of Adrianople (September 1829). The town was unsuccessfully attacked by the Russians on the 9th of November 1877 after a victory gained by them a short time previously on the Deboeyoun heights; it was occupied by them during the armistice (9th of February 1878) and restored to Turkey after the treaty of Berlin. In 1856 a severe earthquake destroyed the town, and another in November 1901 caused much damage.

The Erzerum vilayet extends from the Persian frontier at Bayazid, all along the Russian frontier and westward into Anatolia at Baiburt and Erzincan. It is divided into the three sanjaks of Bayazid, Erzerum, and Erzincan. It includes the highest portion of the Armenian plateau, and consists of bare undulating uplands varied by lofty ranges. The deep gorges of the Chorokh and Tortum streams near the town alone have a different appearance, being well wooded in places. Both arms of the Euphrates have their rise in this country as well as the Aras (Arazes) and the Chorokh (Acampas). It is an agricultural country with few industries. Besides forests, iron, salt, sulphur and other mineral springs are found. Some of the coal and lignite mines in Tortum have been recently worked to supply fuel for Erzerum. The population is largely Armenian and Kurd with some Turks (Moslems 500,000, Christians 140,000).

(C. W. W.; F. R. M.)

ERZEGEBIRGE, a mountain chain of Germany, extending in a W.S.W. direction from the Elbe to the Elstergeriebte along the frontier between Saxony and Bohemia. Its length from E.N.E. to W.S.W. is about 80 m., and its average breadth about 25 m. The southern declivity is generally steep and rugged, forming in some places an almost perpendicular wall of the height of from 2000 to 2500 ft.; while the northern, divided at intervals into valleys, sometimes of great fertility and sometimes wildly romantic, slopes gradually towards the great plain of northern Germany. The central part of the chain forms a plateau of an average height of more than 3000 ft. At the extremities of this plateau are situated the highest summits of the range:—in the south-east the Keilberg (4080 ft.); in the north-east the Fichtelberg (3980 ft.); and in the south-west the Spitzberg (3650 ft.). Between the Keilberg and the Fichtelberg, at the height of about 3300 ft., is situated Gottesgab, the highest town in Bohemia. Geologically, the Erzgebirge range consists mainly of gneiss, mica and phylite. As its name (Ore Mountains) indicates, it is famous for its mineral ores. These are chiefly silver and lead, the layers of both of which are very extensive, tin, nickel, copper and iron. Gold is found in several places, and some arsenic, antimony, bismuth, manganese, mercury and sulphur. The Erzgebirge is celebrated for its lace manufactures, introduced by Barbara Uttmann in 1541, embroideries, silk-weaving and toys. The climate is in winter inclement in the higher elevations, and, as the snow lies deep until the spring, the range is largely frequented by devotees of winter sport, ski, tobogganing, &c. In summer the air is bracing, and many climatic health resorts have sprung into existence, among which may be mentioned Kipsdorf, Härenfels and Oberwiesenthal. Communication with the Erzgebirge is provided by numerous lines of railway, some, such as that from Freiberg to Brux, that from Chemnitz to Komotau, and that from Zwickau to Carlsbad, crossing the range, while various local lines serve the higher valleys.

The Elstergeriebte, a range some 16 m. in length, in which the Weisse Elster has its source, runs S.W. from the Erzgebirge to the Fichtelgebirge and attains a height of 2630 ft.

See Grohmann, Das Obererzgebirge und seine Süüde (1903), and Schultz, Die Pässe des Erzgebirges (1891); also Daniel, Deutsch- land, vol. ii., and Gebauer, Länder und Völkerkunde, vol. i.

ERZINGAN, or Erzincan (Arsinas of the middle ages), the chief town of a sanjak in the Erzerum vilayet of Asiatic Turkey. It is the headquarters of the IV. army corps, being a place of some military importance, with large barracks and military factories. It is situated at an altitude of 3000 ft., near the western end of a rich well-watered plain through which runs the Kara Suer or western Euphrates. It is surrounded by orchards and gardens, and is about a mile from the right bank of the river, which here runs in two wide channels crossed by bridges. One wide street traverses the town from east to west, but the others are narrow, unpaved and dirty, except near the new government buildings and the large modern mosque of Hajji Izzet Pasha to the north, which are the only buildings of note. The principal barracks, military hospital and clothing factory are at Kukuk on the plain and along the foot-hills to the north 3 m. off, one recent addition to the business buildings having electric power and modern British machinery; some older barracks and a military tannery and boot factory being in the town. The population numbers about 15,000, of whom about half are Armenians living in a separate quarter. The principal industries are the manufacture of silk and cotton and of copper dishes and utensils. The climate is hot in summer but moderate in winter. A carriage-road leads to Trebizond, and other roads to Sivas, Karahissar, Erzerum and Kharput. The plain, almost surrounded by lofty mountains, is highly productive with many villages on it and the border hills. Wheat, fruit, vines and cotton are largely grown, and cattle and sheep are bred. Water is everywhere abundant, and there are iron and hot sulphur springs. The battle in which the sultan of Rum (1443) was defeated by the Mongols took place on the plain, and the celebrated Armenian monastery of St. Gregory, "The Illuminator," lies on the hills 11 m. S.W. of the town.

Erzincan occupies the site of an early town in which was a temple of Anaitis. It was an important place in the 4th century when St. Gregory lived in it. The district passed from Persia to the Seljuk Turks to the Mongols in 1247, and from the latter to the Mongols in 1243. After having been held by Mongols, Tatars and Turkomans, it was added to the Osmanli empire by Mahomed II. in 1473. In 1784 the town was almost destroyed by an earthquake. (C.W.W.; F. R. M.)

ESAR-HADDON [Assur-akhì-i-dìdda, "Assur has given a brother"], Assyrian king, son of Sennacherib; before his accession to the throne he had also borne another name, Assur-tilî-ì-ì-ì-i-yūкиn-abla. At the time of his father's murder (the 20th of Tebet, 681 B.C.) he was commanding the Assyrian army in a war against Ararat. The conspirators, after holding Nineveh for 42 days, had been compelled to fly northward and invoke the aid of the king of Ararat. On the 12th of Juyar (680 B.C.) a decisive battle was fought near Malatia, in which the veterans of Assyria won the day, and at the close of it saluted Esar-haddon as king. He returned to Nineveh, and on the 8th of Sivan was crowned king. A good general, Esar-haddon was also an able and conciliatory administrator. His first act was to crush a rebellion among the Chaldaeans in the south of Babylonia and then to restore Babylon, the sacred city of the West, which had been destroyed by his father. The walls and temple of Bel were rebuilt, its gods brought back, and after his rule to rule he had been solemnly acknowledged by the Babylonian priesthood Esar- haddon made Babylon his second capital. A year or two later Media was invaded and Median chiefs came to Nineveh to offer homage to their conqueror. He now turned to Palestine, where the rebellion of Abdi-milkutti of Zidon was suppressed, its leader beheaded, and a new Zidon built out of the ruins of the older city (676-675 B.C.). All Palestine now submitted to Assyria, and 12 Syrian and 10 Cyprian princes (including Manasseh of Judah) came to pay him homage and supply him with materials for his palace at Nineveh. But a more formidable enemy had appeared on the Assyrian frontier (676 B.C.). The Cimmeri (see Scythi) under Teuspa poured into Asia Minor; they were, however, overthrown in Cilicia, and the Cilician mountaineers who had joined them were severely punished. It was next necessary to secure the southern frontier of the empire. Esar-haddon accordingly marched into the heart of Arabia, to a distance of about 900 m., across a burning and waterless desert, and struck terror into the Arabian tribes. At last he was free to complete the policy of his predecessors by conquering Egypt, which alone remained to threaten Assyrian dominion in the West. Baal of Tyre had transferred his allegiance from Esar-haddon to the Egyptian king Tirkha and opened to the latter the coast
road of Palestine; leaving a force, therefore, to invest Tyre, Esar-haddon led the main body of the Assyrian troops into Egypt on the 5th of Adar, 673 B.C. The desert was crossed with the help of the Arabian sheik. Egypt seems to have submitted to the invader and was divided into twenty satrapies. Another campaign, however, was needed before it could be finally subdued.

In 670 B.C. Esar-haddon drove the Egyptian forces before him in 15 days (from the 3rd to the 18th of Tammuz) all the way from the frontier to Memphis, thrice defeating them with heavy loss and wounding Tirhaka himself. Three days after Memphis fell, and this was soon afterwards followed by the surrender of Tyre and its king. In 668 B.C. Egypt again revolted, and while on the march to reduce it Esar-haddon fell ill and died on the 10th of Marcheswan. His empire was divided between his sons: Sennacherib, who supported Esar-haddon, received Assyria and his brother Babylon, an arrangement, however, which did not prove to a success. Esar-haddon was the builder of a palace at Nineveh as well as of one which he erected at Calah for Assur-bani-pal.

ESAU, the son of Isaac and Rebecca, in the Bible, and the elder twin brother of Jacob. He was so called because he was red (admoni) and hairy when he was born, and the name Edom (red) was given to him when he sold his birthright to Jacob for a meal of red lentil porridge (Gen. xxv. 29, 30). Esau was, therefore, the older of the two half-brothers, of the four sons of Isaac, Jacob obtained the superiority is related in Gen. xxvii. Here the younger brother impersonated the elder, and succeeded in deceiving his blind father by imitating the hairiness of his brother. He thus gained the blessing intended for the first-born, and Esau, on hearing how he had been forestalled, vowed to kill him. Jacob accordingly felled to his mother’s relatives, and on his return, many years later, peace was restored between them (xxxii. sqq.). These primitive stories of the relations between the eponymous heads of the Edomites and Israelites are due to the older (Judaean) sources; the late notices of the Priestly school (see Genesis) preserve a different account of the parting of the two (Gen. xxxvi. 6-8), and lay great stress upon Esau’s marriages with the Canaanites of the land, unions which were viewed (from the writer’s standpoint) with great aversion (Gen. xxvi. 14 sqq., xxvii. 6). For “Esau” as a designation of the Edomites, cf. Jer. xlix. 8, Obad. vi. 6, 8, and on their history, see Edom.

Esau’s characteristic hairiness (Gen. xxv. 25, xxvi. 11) has given rise to the suggestion that his name is properly Ishav, from a root corresponding to the Arab. ‘išray, to have thick or matted hair; Mt xxvi. 75, οἰχώματα περάκα, is etymologically suggested by ‘išray, mountain-land. According to Hommel (Sud-arab. Chrestom. p. 39 sq.) the name Esau has S. Arabian analogies. On the possible identity of the name with Usoos, the Phoenician demi-god (Phi. of Byblis, ap. Eusebius, Praep. Evang. l. 10), see Cheyne, Encyc. Bib. col. 1335; Lagrange, Etudes sur les religions sémites, p. 416 (Paris, 1905); Ed. Meyer, Israeliten, 278 sq. (and, on general questions, ib. 128 sqq., 329 sqq.).

ESBJERG, a seaport of Denmark in the amt of Ribe, 18 m. from the German frontier on the west coast of Jutland. It has rail connections with the east and north of Jutland, and with southern Germany. It was granted municipal rights in 1000, having grown with astonishing rapidity from 13 inhabitants in 1868 to 13,355 in 1901. This growth it owes to the construction of a large harbour in 1868-1888. It is the principal outlet westward for S. Jutland; exports pork and meat, butter, eggs, fish, cattle and sheep, skins, lard and agricultural seeds, and has regular communication with Harwich and Grimsby in England. Three miles S.E. is Nordby on the island of Fanø, the northernmost of the North Frisian chain. It is an arid bank of heathland and dunes, but both Nordby and Sønderho in the south are frequently visited as seaside resorts. The former has a school of navigation.

The fisheries are valuable.

ESCANABA, the county-seat of Delta county, Michigan, U.S.A., on Little Bay de Noquette, an inlet of Green Bay, about 60 m. S. of Marquette. Pop. (1890) 6808; (1900) 9549, of whom 3214 were foreign-born; (1910 census) 13,194. It is served by the Chicago & North-Western and the Escanaba & Superior in railroad traffic, and by rail and water routes. The city is built on a picturesque peninsular which separates the waters of Green Bay from Little Bay de Noquette, and its delightful summer climate, wild landscape scenery and facilities for boating and trout fishing make it a popular summer resort. Escanaba has a water front of 8 m., and is an important centre for the shipment of iron-ore, for which eight large and well-equipped docks are provided—there is an ore-crushing plant here; considerable quantities of lumber and fish are also shipped, and furniture, flooring (especially of maple) and wooden ware (butter-dishes and clothes-pins) are manufactured. There is a large tie-preserving plant here. Good water power is supplied by the Escanaba river. Escanaba was settled in 1863, was incorporated as a village in 1883, and was first charted as a city in 1890. It is built on a picturesquely natural formation with a large forest illuminated with the sun through the cut away rocks and trees, hence the name Eschatology, Gr. Ἔσχατος, last, and κόσμος, science, the “doctrine of last things,” a theological term derived from the New Testament phrases “the last day” (ἐν τῇ ἐσχάτῃ ἡμέρᾳ, John vi. 39), “the last time” (ἐν ἐσχατοῖς τῶν χρόνων, 1 Peter i. 20), “the last state” (τὸ ἐσχατον, Matt. xiv. 45), a conception taken over from ancient prophecy (Is. ii. 2; Mal. iv. 1). It was the common belief in the apostolic age that the second advent of Christ was near, and would give the divine completion to the world’s history. The use of the term, however, has been extended so as to include all that is taught in the Scriptures about the future life of the individual as well as the final destiny of the world. The reasons for the belief in a life after death are discussed in the article IMMORTALITY. The present article, after a brief glance at the conceptions of the future of the individual or the world found in other religions, will deal with the teaching of the Old and New Testaments, the Jewish and the Christian Church regarding the hereafter.

There is a bewildering variety in the views of the future life and world held by the various peoples. The future life may be conceived as a simple continuation of the present life in its essential features, although under conditions more or less favourable. It may also be thought of as retributive, as a reversal of present conditions so that the miserable are comforted, and the prosperous laid low, or as a reward or punishment for good or evil desert here. Personal identity may be absorbed, as in the transmigration of souls, or it may even be denied, while the good or bad result of one life is held to determine the weal or woe of another. The scene of the future life may be thought of on earth, in some distant part of it, or above the earth, in the sky, sun, moon or stars, or beneath the earth. The abodes of bliss and the places of torment may be distinguished, or one last dwelling-place may be affirmed for all the dead. Sometimes the good find their abiding home with the gods; sometimes a number of heavens of varying degrees of blessedness is recognized (see F. B. Jevons, An Introduction to the History of Religion, obs. vii. and xxii., 1901; and J. A. MacCulloch’s Comparative Theology, xiv., 1902).

(1) Confucius, though unwilling to discuss any questions concerning the dead, by approving ancestor-worship recognized a future life. (2) Taoism promises immortality as the reward of
merit. (3) The Book of the Dead—a guide-book for the departed on his long journey in the unseen world to the abode of the blessed—shows the attention the Egyptian religion gave to the state of the dead. (4) Although the Babylonian religion presents a very gloomy view of the world of the dead, it is not without a few faint glimpses of a hope that a few mortals at least may gain deliverance from the dread doom.

(5) A characteristic mark of Indian thought is the transfiguration of the soul from one mode of life to another, the physical condition of each being determined by the moral and religious character of the preceding. But deliverance from this cycle of existences, which is conceived as misery, is promised by means of speculation and asceticism. Denying the continuance of the soul, Buddhism affirmed a continuity of moral consequences (Karma), each successive life being determined by the total moral result of the preceding life. Its doctrine of salvation was a guide to, if not absolute non-existence, yet cessation of all consciousness of existence (Nirvana). Later Buddhism has, however, a doctrine of many heavens and hells. (6) In Zoroastrianism not only was continuance of life recognized, but a strict retribution was taught. Heaven and hell were very clearly distinguished, and each soul according to its works passed to the one or the other. But this faith did not concern itself only with the future lot of the individual soul. It was also interested in the close of the world's history, and taught a decisive, final victory of Ormuzd over Ahriman, of the forces of good over the forces of evil. It is not at all improbable that Jewish eschatology in its later developments was powerfully influenced by the Persian faith. (7) Mahomedanism reproduces and exaggerates the lower features of popular Jewish and Christian eschatology (see the separate articles on these religions).

In the Old Testament we can trace the gradual development of an ever more definite doctrine of "the final condition of man and the world." This is regarded as the last stage in a moral process, a redemptive purpose of God. The eschatology of the Old Testament is thus closely connected with, but not limited by, Messianic hope, as there are eschatological teachings that are not Messianic. As the Old Testament revelation is concerned primarily with the elect nation, and only secondarily (in the later writings) with the individual persons composing it, we follow the order of importance as well as of time in dealing first with the people.

The universalism of the Old Testament is less striking than the monotheism. (Gen. xlix.) appears also in the blessing of Noah (ix. 25). In the promise to Abraham (xii. 3) this universal good is directly related to God's particular purpose for His chosen people; so also in the blessing of Jacob (xlix.) and of Moses (Deut. xxxiii.).

David's last words (2 Sam. xxiii.) blend together his desire that his family should retain the kingship, and his aspiration for a kingdom of righteousness on earth. The conception of the "Day of the Lord" is frequent and prominent in the prophets, and the sense given to the phrase by the people and by the prophets throws into bold relief the contrast between popular beliefs and the prophetic faith. The people simply expected deliverance from their miseries and burdens by the intervention of Yahweh, because He had chosen Israel for His people. The prophets had an ethical conception of Yahweh; the sin of His own people and of other nations called for His intervention in judgment as the moral ruler of the world. But judgment they conceived as preparing for redemption. The day of the Lord is always an eschatological conception, the term is applied to the final and universal judgment, and not to any less decisive intervention of God in the course of human history.

In the pre-exilic prophets the judgment of God is "primarily on Israel, although it also embraces the nations"; during the Exile and at the Restoration the judgment is represented as falling on the nations while redemption is being wrought for God's people; after the Restoration the people of God is again threatened, but still the warning of judgment is mainly directed towards the nations and deliverance is promised to Israel. As the manifestation of God in grace as well as judgment, the day of the Lord will bring joy to Israel and even to the world. As a day of judgment it is accompanied by terrible convulsions of nature (not to be taken figuratively, but probably intended literally by the prophets in accordance with their view of the absolute subordination of nature to the divine purpose for man).

It ushers in the Messianic age. While the moral issues are finally determined by this day, yet the world of the Messianic age is painted with the colours of the prophet's own surroundings. Israel is restored to its own land, and to it the other nations are brought into subjugation, by force or persuasion. The contributions of the Old Testament to Christian eschatology embrace these features: "(1) The manifestation or advent of God; (2) the universal judgment; (3) behind the judgment the coming of the perfect kingdom of the Lord, when all Israel shall be saved and when the nations shall be partakers of their salvation; and (4) the finality and eternity of this condition, that which constitutes the blessedness of the saved people being the Presence of God in the midst of them—this last point corresponding to the Christian idea of heaven" (A. B. Davidson, in Hastings's Bible Dictionary, i. p. 738). This hope is for the people on this earth though transfigured.

To the individual it would seem at first only old age is promised (Is. lxx. 20; Zech. viii. 4), but the abolition of death itself is also declared (Is. xxv. 8). The resurrection, which appears at first as a revival of the dead nation (Hos. vi. 2; Ez. xxxvii. 12-14), is afterwards promised for the pious individuals (Is. xxv. 10), so that they too may share in the national restoration. Only in Daniel xii. 2 is taught a resurrection of the wicked "to shame and everlasting contempt "as well as of the righteous to "everlasting life." It was only at the Exile, when the nation ceased to be, that the worth of the individual came to be recognized, and the hopes given to the nation were claimed for the individual. In dealing with the individual eschatology we must carefully distinguish the popular ideas regarding death and the hereafter which Israel shared with the other Semitic peoples, from the intuitions, inferences, aspirations evoked in the pious by the divine revelation itself. The former have not the moral significance or the religious value of the latter.

The starting-point of the development was the common belief that the dead continued to exist in an unsubstantial mode of life, but cut off from fellowship with God and man; but faith left this far behind. Sheol is the common abode of the righteous and the ungodly: life there is shadowy and feeble, but seems to be a PREPARATION IN THE SEVENTH IMPERIAL HISTORIC AGE. (Ps. xxxv. 15-20) The vision of God is anticipated after death's sleep (Ps. xvi. 15; Job xix. 25-27). This belief in individual IMMORTALITY is expressed poetically and obscurely: it is later than the eschatology of the people. It assumes the moral distinction of the righteous and the ungodly, and seeks a solution for the problem of the lack of harmony of present character and condition. Its deepest motive, however, is religious. The soul once in fellowship with God cannot even by death be separated from God. The individual hoped that he would live to share the nation's good, and thus the two streams of Old Testament eschatology at last flow together.

It is in the apocryphal and apocalyptic literature of Judaism that the fullest development of eschatology can be traced. Four words may serve to express the difference in the doctrine of these writings and the teaching of the Old Testament: apocryphal and Apocalypse, universalized (God was recognized as the creator and moral governor of all the world), individualized (God's judgment was directed, not to nations in a future age, but to individuals in a future life),
transcendentalised (the future age was more and more contrasted with the present, and the transition from the one to the other was not expected as the result of historical movements, but of miraculous divine acts), and dogmatized (the attempt was made to systematize in some measure the vague and varied prophetic anticipations). Only a very brief summary of the conceptions current in these writings can be given. The coming of the Messiah will be preceded by the Last Woes. The Messiah is very variously conceived: (1) "a passive, though supreme member of the Messianic Kingdom"; (2) "an active warrior who slays his enemies with his own hand"; (3) "one who slays his enemies by the word of his mouth, and rules by virtue of his justice, faith and holiness"; (4) a supernatural person, "eternal Ruler and Judge of Mankind" (R. H. Charles in Hastings’s Bible Dictionary, 1.p. 748). In some of the writings no Messianic kingdom is looked for; in others only a temporal duration on earth is assigned to it; in others still it abides for ever either on earth as it is, or on earth transformed. The dispersion among the nations is to return home. Sometimes the Resurrection is narrowed down to the resurrection of the righteous, at others widened out to the resurrection of all mankind for the last judgment. A blessed immortality after judgment, or even after death itself, is sometimes taught without reference to any resurrection. Retribution in human history is recognized, but attention is specially concentrated on the final judgment, which is usually conceived as taking place in two stages. (1) The Messianic is executed by the Messiah or the saints by victory in war, or by judicial sentence. (2) The final remains in God’s hands; but in one writing (the Ethiopic Enoch) is represented as Messiah’s function. This judgment either closes the Messianic age of Moses, or the temporal, or ushered in, if conceived as eternal, or closes the world’s history, if no Messianic age is expected. The place of torment for the wicked was called Gehenna (the valley of Hinnom or the Sons of Hinnom, where the bodies of criminals were cast out, is described in Is. lxvi. 24). Here corporal as well as spiritual punishment was endured; it was inflicted on apostate Jews or the wicked generally; the righteous witnessed its initial stages but not its final form. In later Judaism it was the purgatory of faithless Jews, who at last reached Paradise, but it remained the place of eternal torment for the Gentiles. Paradise was sometimes regarded as the division of Sheol to which the righteous passed after death, but at others it was conceived as the abode of Moses, Enoch and Elijah, to which other saints would pass after the last judgment.

The eschatology of the New Testament attaches itself not only to that of the Old Testament but also to that of contemporary Judaism, but it avoids the extravagances of the latter. Not at all systematic, it is occasional, practical, poetical and dominantly evangelical, laying stress on the hope of the righteous rather than the doom of the wicked. The teaching of Jesus centres, according to the Synoptists, in the great idea of the “Kingdom of God,” which is already present in the teacher Himself, but also future as regards its completion. In some parables a gradual realization of the kingdom is indicated (Matt. xiii), in others their completion is promised (Matt. xvii). After Jesus’ own return, His Parousia (Matt. xxiv. 3, 37, 39), the time of which, however, is unknown even to Himself (Mark xiii. 32). In this eschatological discourse (Matt. xxiv., xxv.) He speaks of the destruction of Jerusalem and of the end of the world as near, and seemingly as one. This is in accordance with the characteristic of prophecy, which sees in “timeless sequence” events which are historically separated from one another. While the Return is represented in the Synoptists as an external event, it is conceived in the fourth gospel as an internal experience in the operation of the Spirit on the believer (John xiv. 16-21); nevertheless here also the Parousia in the synoptic sense is looked for (John xxi. 22; cf. 1 John ii. 18). The object of which seems to refer to its completion by Christ (Matt. xxv. 31), both individual (xxii. 1-14) and universal (xiii. 36-42). The present subjective judgment, in which men determine their destiny by their attitude to Christ, on which the fourth gospel lays stress (John iii. 17-21, ix. 39), is not inconsistent with the anticipation of a final judgment (John xii. 48, v. 27). This judgment presupposes the resurrection, belief in which was rejected by the Sadducees, but accepted by the Pharisees and the majority of the Jewish people, and confirmed by Christ, not only as an individual spiritual renovation (John v. 25, 26), but as a universal physical resuscitation (28 and 29; Matt. xxiv. 30). This resurrection is of the unjust as well as the just (Matt. v. 29, 30, x. 28; Luke xiv. 14). On the Intermediate State Jesus does not speak clearly. He uses the term Hades twice metaphorically (Matt. xi. 23, xvi. 18), and once in a parable, the “Rich Man and Lazarus” (Luke xvi. 23), in which he employs the current phrases such as “Abraham’s bosom” (verse 22), without any definite doctrinal intention, to unveil the secrets of the hereafter by confirming with His authority the common beliefs of His time. The term Paradise (Luke xxiii. 43) seems to be used “in a large and general sense as a word of hope and comfort,” and we need not attach to it any of the more definite associations which it had in Jewish eschatology. When he speaks of death as “sleep” (Luke viii. 52; John xi. 11) it is to give men gentler and sweeter thoughts of it, not to inculcate the doctrine of an intermediate state as an unconscious condition. There are words which suggest rather the hope of an immediate entrance of the just into the Father’s house and glory (John xiv. 2, 3, xvii. 24). He spoke frequently and distinctly both of final reward for the righteous and final penalty for the wicked. “The recompense of the righteous is described as an inheritance, entrance into the kingdom, treasure in heaven, an existence like the angelic, a place prepared, the Father’s house, the joy of the Lord, the consummation of eternal life and the like; and there is no intimation that the reward is capable of change, that the condition is a terminable one. The retribution of the wicked is described as death, outer darkness, weeping and wailing and gnashing of teeth, the undying worm, the quenchless fire, exclusion from the kingdom, eternal punishment and the like” (S. D. J. Salmond in Hastings’s Bible Dictionary, p. 752). Degrees of award are recognized (Luke xii. 47, 48). Gehenna is applied to the condition of the lost (Matt. xviii. 9). Two sayings are held to point to a terminable penalty (Matt. v. 25, 26, xii. 31, 32), but the one is so figurative and the other so obscure, that we are not warranted in drawing any such definite conclusion from either of them. The finality of destiny seems to be unmistakably expressed (Matt. v. 23, x. 28, 29, 31; xviii. 23; John iii. 36); Mark xiv. 44, iv. 57; Luke ix. 26; John xi. 16, xii. 21, 24). No second opportunity for deciding the issue of life or death is recognized by Jesus.

The apostolic eschatology presents resemblance amid difference. Jude (v. 6), as well as 2 Peter (ii. 4), refers to the judgment of the fallen angels. 2 Peter describes the place of their detention as Tartarus, and teaches that Christ’s Parousia is to bring the whole present system of things to its conclusion, and the world itself to an end (iii. 10, 13). After the destruction of the existing order by fire, “a new heaven and a new earth” will appear as the abode of righteousness. The question of greatest interest in 1 Peter is the relation of two passages in it, the preaching to the spirits in prison (i. 18-22) and the pre-existence of the Father to the dead (iv. 6) to the “larger hope.” Peter’s discourse also contains a phrase which suggests the belief of a descent of Christ into Hades in the interval between His death and His resurrection (Acts ii. 31). No certainty has been reached in the interpretation of these passages, but they may suggest to the Christian mind the expectation that the final destiny of no soul can be fixed until in some way or other, in this life or the next, the opportunity of decision for or against Christ has been given. The phrase “the times of restoration of all things” (iii. 21) is too vague in itself, and is too isolated in its context to warrant the dogmatic teaching of universalism, although there are other passages which seem to point towards the same goal. While John’s Apocalypse is distinctly eschatological, the Epistles and the Gospels often give these conceptions an ethical and spiritual import, without, however, excluding the eschatological. Life is
present while eternal (1 John v. 12, 13), but it is also future (ii. 25). There is expected a future manifestation of Christ as He is, and what the believer himself will be does not yet appear (iii. 2). The writer speaks of the last hour (ii. 18), the Antichrist that cometh (ii. 22, iv. 3), and the Christian’s full reward (2 John v. 8) as well as the Parousia (1 John ii. 28). The Apocalypse reproduces much of the current Jewish eschatology. A millennial reign of Christ on earth is interposed between the first resurrection, confined to the saints and especially the martyrs, and the second resurrection for the rest of the dead. A final outburst of Satan’s power is followed by his overthrow and the Last Judgment.

Although Paul sometimes describes the Kingdom of God as present (Rom. xiv. 17; 1 Cor. iv. 20; Col. i. 13), it is usually represented as future. The Parousia fills a large place in his thought, and, if more prominent in his earlier writings, is not altogether absent from his later, although the expectation of personal survival does seem to grow less confident (cf. 1 Cor. xv. 51 and Phil. i. 20-24). The doctrines of the Resurrection, the Last Judgment, the Reward of the Righteous and the Punishment of the Wicked are not less distinctly expressed than in the other apocryphal writings. Peculiar elements in Paul’s eschatology are the doctrines of the Rapture of the Saints (1 Thess. iv. 17) and the Man of Sin (2 Thess. ii. 3-6), but these have affinities elsewhere. A reference to the millennial reign of Christ in the period between the two resurrections is sometimes sought in 1 Cor. xv. 22-24; but it is not a chronology of the last things Paul is here giving. So also a justification for the doctrine of purgatory is sought in iii. 12-15; but the day and the fire are of the last judgment. A descent of Christ into Hades, implying an extension of the opportunity of grace such as is ‘supposed to be taught in 1 Peter, is also discovered in the obscure statements in Rom. x. 7 (where Paul is freely quoting Deut. xxx. 11-14), and Eph. iv. 10 (where he is commenting on Ps. lxviii. 18). Universal restoration is inferred from 1 Cor. xv. 24-28, ‘God all in all,’ Phil. ii. 10-11, every knee bowing to, and every tongue confessing Jesus Christ, Eph. i. 9, 10, the summing up of all things in Christ, Col. i. 20, God reconciling all things unto Himself in Christ. These passages inspire a hope, but do not sustain a certainty. Paul’s shrinking from the disembodied state and longing to be clothed upon at death in 2 Cor. v. 1-8, cannot be regarded as a proof of an interim body prior to and preparatory for that in Hades for the remainder of the human condition with a universal renovation (Rom. viii. 19-23). Paul’s eschatology is not free of obscurities and ambiguities; and in the New Testament eschatology generally we are forced to recognize a mixture of inherited Jewish and original Christian elements (see ANTICHRIST).

During the first century of the existence of the Gentile Christian Church, “the hope of the approaching end of the world and the glorious kingdom of Christ” was dominant, although warnings had to be given against doubt and indifference. Redemption was thought of as still future, as the power of the devil had not been broken but rather increased by the First Advent, and the Second Advent was necessary to its complete overthrow. The expectations were often grossly materialistic, as is evidenced by Papias’s quotation as the words of the Lord of a group of sayings from the Apocalypse of Baruch, setting forth the amazing fruitfulness of the earth in the Messianic time.

The Gnostics rejected this eschatology as in their view the enlightened spirit already possessed immortality. Marcion expected that the Church would be assailed by Antichrist; a visible return of Christ he did not teach, but he recognized that human history would issue in a separation of the good from the bad. Montanists sought to form a new Christian commonwealth which separated from the world, should prepare itself for the descent of the Christian commonwealth, which separated from the world, should prepare itself for the descent of Jerusalem from above, and its establishment in the spot which by the direction of the Spirit had been chosen in Phrygia. While Irenaeus held fast the traditional eschatological beliefs, yet his conception of the Christian salvation as a delibration of man tended to weaken their hold on Christian thought. The Alogi in the 2nd century rejected the Apocalypse on account of its chiliastic, its teaching of a visible reign of Christ on earth for a thousand years. Montanism also brought these apocalyptic expectations into discredit in orthodox ecclesiastical circles. The Alexandrian theology strengthened this movement against chiliastic. Clement of Alexandria taught that justice is not merely retributive, that punishment is remedial, that probation continues after death till the final judgment, that Christ and the apostles preached the Gospel in Hades to those who lacked knowledge, but whose heart was right, that a spiritual body will be raised. Origen taught that a germ of the spiritual body is in the present body, and its development depends on the character, that perfect bliss is reached only by stages, that the evil are purified by pain, conscience being symbolized by fire, and that all, even the devil himself, will at last be saved. Both regarded chiliastic with aversion. But in the 5th century there were rejected as heretical (1) “the doctrine of universalism, and the possibility of the redemption of the devil; (2) the doctrine of the complete annihilation of evil; (3) the conception of the penalties of hell as torments of conscience; (4) the spiritualizing version of the resurrection of the body; (5) the idea of the continued creation of new worlds” (A. Harnack. History of Dogma, iii. p. 186).

Epiphanius, following Methodius, insisted on the most perfect identity between the resurrection body and the material body; and this belief, enforced in the West by Jerome, soon established itself as alone orthodox. Augustine made experiments on the flesh of a peacock in order to find physical evidence for the doctrine. He held fast to eternal punishment, but allowed the possibility of mitigations. Some believers, he taught, may pass through purgatorial fires; and this middle class may be helped by the sacraments and the alms of the living. “There are many souls not good enough to dispense with this provision, and not bad enough to be benefited by it” (op. cit. v. 239). This doctrine was sanctioned and developed by Gregory the Great. “After God has changed eternal punishments into temporary, the justified must expiate these temporary penalties for sin in purgatory” (p. 268). This view was inferred indirectly from Matt. xii. 31, and directly from 1 Cor. iii. 12-15. Afterwards purgatory took more and more the place of hell, and was subject to the control of the church. As regards the saints, different degrees of blessedness were recognized; they were supposed to exist in Hades for the return of Christ, but gradually the belief gained ground, especially in regard to the martyrs, that their souls at once entered Paradise. The primitive Christian eschatology was preserved in the West as it was not in the East, and in times of exceptional distress the expectation of Antichrist emerged again and again. In the middle ages there was an extravagance of speculation on this subject, which may be seen in the last division of Aquinas’ Summa Theologiae. He proposes thirty questions on these matters, among which are the following: “whether souls are conducted to heaven or hell immediately after death?”; “whether the limbus of hell is the same as Abraham’s bosom?”; “whether the sun and moon will be really obscured at the day of judgment?”; “whether all the members of the human body will rise with it?”; “whether the hair and nails will reappear?”, could thought become “more lawless and uncertain”? While rejecting purgatory, Protestantism took over this eschatology. Souls passed at once to heaven or to hell; a doctrine even less adequate to the complex quality of human life. Luther himself looked for the passing away of the present evil world. Socinianism taught a new spiritual body, an intermediate state in which the soul is near non-existence, an annihilation of the wicked, as immortality is the gift of God. Swedenborg discards a physical resurrection, as at death the eyes of men are opened to the spiritual world in which we exist now, and they continue to live essentially as they lived here, until by their affinities they are drawn to heaven or hell. The doctrine of eternal punishment has been opposed on many grounds, such as the disproportion between the offence and the penalty, the moral
and religious immaturity of the majority of men at death, the diminution of the happiness of heaven involved in the knowledge of the endless suffering of any of God’s creatures would imply, the dissatisfaction God as Father must feel until His whole family is restored. It has been argued that the term “eternal” has reference to God’s original purpose of Him and His world. But it does seem certain that the writers in the Holy Scriptures who used it did not foresee an end either to the life or to the death to which they applied the term. The conception should not be based on the meaning of a single word, but on such broader considerations as have been indicated above. The doctrine of conditional immortality taught by Socinianism was accepted by Archbishop Whately, and has been most persistently advocated by Edward White, who “maintains that immortality is a truth, not of reason, but of revelation, a gift of God” bestowed only on believers in Christ; but he admits a continued probation after death for such as have not hardened their hearts by a rejection of Christ. According to Albrecht Ritschl “the wrath of God means the resolve of God to annihilate those men who finally oppose themselves to redemption, and the final purpose of the kingdom of God.” He thus makes immortality conditional on inclusion in the kingdom of God. The doctrine of universal restoration was maintained by Thomas Erskine of Linlathen on the ground of the Fatherhood of God, and Archdeacon Wilson anticipates such discipline after death as will restore all souls to God. C. I. Nitzsch argues against the doctrine of the annihilation of the wicked, regards the teaching of Scripture about eternal damnation as hypothetical, and thinks it possible that Paul reached the hope of universal restoration. T. A. Dorner maintains that hopeless perdition can be the penalty only of the deliberate rejection of the Gospel, that those who have not had the opportunity of choice fairly and fully in this life will get it hereafter, but that the right choice will in all cases be made we cannot be confident. The attitude of theologians generally regarding individual destiny is well expressed by Dr James Orr, “The conclusion I arrive at is that we have not the elements of a complete solution, and we ought not to attempt it. What visions beyond there may be, what larger hopes, what ultimate harmonies, if such there are in store, will come in God’s good time; it is not for us to anticipate them, or lift the veil where God has left it down” (The Christian View of God and the World, 1893, p. 397).

Although in recent theological thought attention has been more directed to individual than to collective eschatology, the results of which are of course bound to affect the interpretation of the whole of Christian eschatology, the role of the Parousia of Christ. The presence and power of His Spirit, the spread of His Gospel, the progress of His kingdom have been as much a fulfilment of the eschatological teaching of the New Testament as His life and work on earth were a fulfilment of Messianic prophecy, for fulfilment always transcends prophecy. Even if the common beliefs of the apostolic age have not modified the evangelist’s reports of Jesus’ teaching, it must be remembered that He used the common prophetic phraseology, the literal fulfilment of which is not to be looked for. Some parallel may be seen, however, in the gradual progressive realization of His kingdom. The Fourth Gospel interprets both judgment and resurrection spiritually. Accordingly the general resurrection and the last judgment may be regarded as the temporal and local forms of thought to express the universal permanent truths that life survives death in the completeness of its necessary organs and essential functions, and that the character of that continued life is determined by personal choice of submission or antagonism to God’s purpose of grace in Christ, the perfect realization of which is the Christian’s hope for himself, mankind and the world.

ESCHET (O. Fr. eschete, from escheoir, to fall to one’s share; Lat. excidère, to fall out), in English law, the reversion of lands and goods to the crown or another heir if an heir or heirs does not continue in possession. When the tenant of an estate in fee simple dies without having alienated his estate in his lifetime or by his will, and without leaving any heirs either lineal or collateral, the lands in which he held his estate eschatet, as it is called, to the lord of whom he held them “(Williams on the Law of Real Property). This rule is explained by the conception of a freehold estate as an interest in lands held by the freeholder from some lord, the king being lord paramount. (See Estate.) The granter retains an interest in the land similar to that of the donor of an estate for life, to whom the land reverts after the life estate is ended. As there are now few freehold estates traceable to any mesne or intermediate lord, escheats, when they do occur, fall to the king as lord paramount. Besides escheat for defect of heirs, there was formerly also escheat propter delictum tenentis, or by the corruption of the blood of the tenant through attainer consequent on conviction and sentence for treason or felony. The blood of the tenant becoming corrupt by attainer was decreed no longer inheritable, and the effect was the same as if the tenant had died without heirs. The land, therefore, eschatet to the next heir, subject to the superior right of the crown to the forfeiture of the lands,—in the case of treason for ever, in the case of felony for a year and a day. All this was abolished by the Felony Act 1870, which provided for the appointment of an administrator to the property of the convicted tenant. Escheat is also an incident of copyhold tenure. Trust estates were not subject to escheat until the Interstate’s Estates Act 1884, but now that the act of law escheat applies in the same manner as if the estate or interest were a legal estate in corporeal hereditaments.

ESCHENBURG, JOHANN JOACHIM (1743–1820), German critic and literary historian, was born at Hamburg on the 7th of December 1743. After receiving his early education in his native town, he studied at Leipzig and Göttingen. In 1767 he was appointed tutor, and subsequently professor, at the Collegium Carolinum in Brunswick. The title of Hofrat1 was conferred on him in 1786, and in 1814 he was made one of the directors of the Collegium. He is best known by his efforts to familiarize the public with the best of the German literature. He published a series of German translations of the principal English writers on aesthetics, such as J. Brown, D. Webb, Charles Burney, Joseph Priestley and R. Hurd; and Germany owes also to him the first complete translation (in prose) of Shakespeare's plays (William Shakespeare’s Schauspiele, 13 vols., Zürich, 1775–1812). This is virtually a revised edition of the incomplete translation published by Wieland between 1762 and 1766. Eschenburg died at Brunswick on the 29th of February 1820.

Besides editing, the works of Hagedorn, Zachariä and other German poets, he was the author of a Handbuch der klassischen Literatur (1783); Entwurf einer Theorie und Geschichte der Schaubühne (1798); Geschichte der menschlichen Unsterblichkeit zur Theorie und Literatur der schönen Wissenschaften (8 vols., 1788–1795); Lehrbuch der Wissenschaftskunde (1792); and Denkmäler althedterer Dichtkunst (1799). Most of these works have passed through several editions. Eschenburg was also a poet of some pretensions, and some of his religious hymns, e.g. Ich will dich noch im Tod erheben and Dir trau ich, Gott, und wanke nicht, are contained in many hymnals to this day.

ESCHENMAYER, ADAM KARL AUGUST VON (1768–1852), German philosopher and physicist, was born at Neuenburg in Württemberg in July 1768. After receiving his early education at the Caroline academy of Stuttgart, he entered the university of Heidelberg as a student of medicine. He practised for some time as a physician at Sulz, and then at Kirchheim, and in 1811 he was chosen extraordinary professor of philosophy and medicine at Tübingen. In 1818 he became
ordinary professor of practical philosophy, but in 1836 he resigned and took up his residence at Kirchheim, where he devoted his whole attention to philosophical studies. Eschenmayer's views are largely identical with those of Schelling, but he differed from him in regard to the knowledge of the absolute. He believed that in order to complete the arc of truth philosophy must be supplemented by what he called "non-philosophy," a kind of mystical illumination by which was obtained a belief in God that could not be reached by mere intellectual effort (see Höfding, *Hist. of Mod. Phil.,* Eng. trans. vol. 3, p. 170). He carried this tendency to mysticism of a moral nature a still further and took a deep interest in the phenomena of animal magnetism. He ultimately became a devout believer in demoniacal and spiritual possession; and his later writings are all strongly impregnated with the lower supernaturalism.

His principal works are—*Die Philosophie in ihrem Uebergange zur Nichthephilosophie* (1853); *Versuch die scheinbare Magie des historischen Magnetismus aus physikal. und psychischen Gesetzen zu erklären* (1816); *System der Moralphilosophie* (1818); *Psychologie in drei Theilen, als empirische, reine, angewandte* (1817, 2nd ed. 1822); *Religionsphilosophie* (3 vols., 1818-1824); *Die Hegelsche Religionsphilosophie verglichen mit dem christl. Princip* (1834); *Der Ischario- tismus unserer Tage* (1835) (directed against Strauss's *Life of Jesus*); *Konflikt zwischen Himmel und Höle, on dem Dämern eines besessenen Mädchens beobachtet* (1837); *Grundriss der Naturphilosophie* (1832); *Grundriss der Geologie* (1840); and *Betrachtungen über den physikalischen Weltbau* (1852).

**ESCHER VON DER LINHT, ARNOLD** (1807-1872), Swiss geologist, the son of Hans Conrad Escher (1767-1852), was born at Zürich on the 8th of June 1807. In 1826 he became professor of geology at the École Polytechnique at Zürich. His researches led him to be regarded as one of the founders of Swiss geology. With B. Studer he produced (1852-1858) the first elaborate geological map of Switzerland. He was the author also of *Geologische Bemerkungen über das nördliche Vorarlberg und einige angrenzenden Gegenenden* published at Zürich in 1853. He died on the 12th of July 1872.

**ESCHSCHOLTZ, JOHANN FRIEDRICH** (1793-1831), Russian traveller and naturalist, was born in November 1793, at Dorpat, where he died in May 1831. He was a naturalist and physician to Otto von Kotzebue's exploring expedition during 1815-1818. On his return he was appointed extraordinary professor of anatomy (1819) and director of the zoological museum of the university at Dorpat (1822), and in 1823-1826 he accompanied Kotzebue on his second voyage of discovery. He became ordinary professor of anatomy at Dorpat in 1828. Among his publications were the *System der Akalephien* (1820), and the *Zoológischer Atlas* (1829-1833). The botanical genus Eschscholtzia was named by Adelbert von Chamisso in his honour.

**ESCHWEGE, a town of Germany,** in the Prussian province of Hesse-Nassau, on the Werra, and the railway Treysa-Leinefelde, 28 m. S.E. of Cassel. Pop. (1905) 11,113. It consists of the old town on the left, the new town on the right, bank of the Werra, and Brückenhausen on a small island connected with the old and new town by bridges. It is a thriving manufacturing town, its chief industries being leather-making, yarn-spinning, cotton- and linen-weaving, the manufactures of cigars, brushes, liquors and oil, and glue- and soap-boiling. It has two ancient buildings, the Nikolai-turm, built in 1455, and the old castle. After being part of Thuringia, Eschwege passed to Hesse in 1653. It was recovered by the landgrave of Thuringia in 1838, but soon reverted to Hesse, and it became the residence of one of the branches of the Hessian royal house, a branch which died out in 1655.

**ESCHEWILER,** a town of Germany, in the Prussian Rhine province, on the Inde, and the railways Cologne-Herbesthal and Munich-Grabach-Stolberg, about 8 m. E.N.E. from Aix-la-Chapelle. Pop. (1905) 20,643. Eschewiler has an Evangelical church, and four Roman Catholic churches, a gymnasion and an orphanage. The manufacture of iron and steel goods is carried on; other industries include the manufacture of zinc wares, tanning, distilling and brewing. In the neighbourhood there are valuable coal mines.

See Koch, *Geschichte der Stadt Eschweiler* (Frankfort, 1890).

**ESCOBAR Y MENDOZA, ANTONIO** (1589-1669), Spanish churchman of illustrious descent, was born at Valladolid in 1589. He was educated by the Jesuits, and at the age of fifteen took the habit of that order. He soon became a famous preacher, and his facility was so great that for fifty years he preached daily, and sometimes twice a day. In addition he was a voluminous writer, and his works fill eighty-three volumes. His first literary efforts were Latin verses in praise of Ignatius Loyola (1613) and the Virgin Mary (1618); but he is best known as a writer on casuistry. His principal works belong to the fields of casuistry and general morality. Of the latter the best known are *Summula casuum conscientiae* (1672); *Liber theologae moralis* (1644), and *Universae theologiae moralis problemata* (1652-1666). The first mentioned of these was severely criticised by Pascal in the fifth and sixth of his *Provincial Letters,* as tending to inculcate a loose system of morality. It contains the famous maxim that purity of intention may be a justification of actions which are contrary to the moral code and to human laws; and its general tendency is to find excuses for the majority of human frailties. His doctrines were disapproved of by many Catholics, and were mildly condemned by Rome. They were also ridiculed in witty verses by Molière, Boileau, and La Fontaine, and gradually the name Escober came to be used in France as a synonym for a person who is adroit in making the rules of morality harmonize with his own interests. Escober himself is said to have been simple in his habits, a strict observer of the rules of his order, and unweariedly zealous in his efforts to reform the lives of those with whom he had to deal. It has been said of him that "he purchased heaven dearly for himself, but gave it away cheap to others." He died on the 4th of July 1669.

**ESCOQUIZ, JUAN** (1762-1830), Spanish ecclesiastic, politician and writer, was born in Navarre in 1763. His father was a general officer and he began life as a page in the court of King Charles III. He entered the church and was provided for by a prebend at Saragossa. Godoy in his memoirs asserts that Escoquiz sought to gain his favour by flattery. There is every reason to believe that this is an accurate statement of the case. The mere fact that he was selected to be the tutor of the heir-apparent, Ferdinand, afterwards King Ferdinand VII., is of itself a proof that he exerted himself to gain the goodwill of the reigning favourite. In 1797 he published a translation of Young's *Night Thoughts,* which does not of itself show that he was well acquainted with English, for the version may have been made with the help of the French. In 1797 he published a long and worthless so-called epic on the conquest of Mexico. Escoquiz was in fact a busy and pushing member of the literary clique which looked up to Godoy as its patron. But his position as tutor to the heir to the throne excited his ambition. He began to hope that he might play the part of those court ecclesiastics who had often had an active share in the government of Spain. As Ferdinand grew up, and after his marriage with a Neapolitan princess, he became the centre of a court opposition to Godoy and to his policy of alliance with France. Escoquiz was the brains, as far as there were any brains, of the intrigue. His activity was so notorious that he was exiled from court, but was consolled by a canonry at Toledo. This half measure was as ineffective as was to have been expected. Escoquiz continued to be in constant communication with the prince. Toledo is close to Madrid, and the correspondence was easily maintained. He had a large share in the conspiracy of the Escorial which was detected on the 28th of October 1807. He was imprisoned and sent for trial with other conspirators. But as they had appealed to Napoleon, who would not suffer his name to be mentioned, the government had to allow the matter to be hushed up, and the trial was abandoned. After the outbreak at Aranjuez on the 17th of March 1808, in which he had a share, he became one of the most trusted advisers of Ferdinand. The new king's decision to go to meet Napoleon at Bayonne was largely inspired by him. In 1814 Escoquiz published at Madrid his "*Idea Sencilla de las razones que motivaron el viaje del Rey Fernando VII. a Bayona*" (Honest representation of the causes which inspired the journey of King Ferdinand VII. to Bayonne).
ESCOMBE

It is a valuable historical document, and contains a singularly vivacious account of an interview with Napoleon. Escoquiz was far from the mind of his ingenuity and merits to conceal the delusions and follies of himself and his associates. He displays his own vanity, frivolity and futile cleanness with much unconscious humour, but, it is only fair to allow, with some literary dexterity. When the Spanish royal family was imprisoned by Napoleon, Escoquiz remained with Ferdinand at Valençay. In 1813 he published at Bourges a translation of Milton's Paradise Lost. When Ferdinand was released in 1814 he came back to Madrid in the hope that his ambition would now be satisfied, but the king was tired of him, and was moreover resolved never to be subjected by any favourite. After a very brief period of office in 1815 he was sent as a prisoner to Murcia. Though he was afterwards recalled, he was again exiled to Ronda, where he died on the 27th of November 1820.
