EVANGELICAL CHURCH CONFERENCE, a convention of delegates from the different Protestant churches of Germany. The conference originated in 1848, when the general desire for political unity made itself felt in the ecclesiastical sphere as well. A preliminary meeting was held at Sandhof near Frankfort in June of that year, and on the 21st of September some five hundred delegates representing the Lutheran, the Reformed, the United and the Moravian churches assembled at Wittenberg. The gathering was known as Kirchenstag (church diet), and, while leaving each denomination free in respect of constitution, ritual, doctrine and attitude towards the state, agreed to act unitedly in bearing witness against the non-evangelical churches and in defending the rights and liberties of the churches in the federation. The organization thus closely resembles that of the Free Church Federation in England. The movement exercised considerable influence during the middle of the 19th century. Though no Kirchenstag, as such, has been convened since 1871, its place has been taken by the Kongress für innere Mission, which holds annual meetings in different towns. There is also a biennial conference of the evangelical churches held at Eisenach to discuss matters of general interest. Its decisions have no legislative force.

EVANGELICAL UNION, a religious denomination which originated in the suspension of the Rev. James Morison (1816–1893), minister of a United Seccession congregation in Kilmarnock, Scotland, for certain views regarding faith, the work of the Holy Spirit in salvation, and the extent of the atonement, which were regarded by the supreme court of his church as anti-Calvinistic and heretical. Morison was suspended by the presbytery in 1841 and thereupon definitely withdrew from the Seccession Church. His father, who was minister at Bathgate, and two other ministers, being deposed not long afterwards for similar opinions, the four met at Kilmarnock on the 16th of May 1843 (two days before the "Disruption" of the Free Church), and, on the basis of certain doctrinal principles, formed themselves into an association under the name of the Evangelical Union, "for the purpose of countenancing, counselling and otherwise aiding one another, and also for the purpose of training up spiritual and devoted young men to carry forward the work and 'pleasure of the Lord.'" The doctrinal views of the new denomination gradually assumed a more decidedly anti-Calvinistic form, and they began also to find many sympathizers among the Congregationalists of Scotland. Nine students were expelled from the Congregational Academy for holding "Morisonian" doctrines, and in 1845 eight churches were disjoined from the Congregational Union of Scotland and formed a connexion with the Evangelical Union. The Union exercised no jurisdiction over the individual churches connected with it, and in this respect adhered to the Independent or Congregational form of church government; but those congregations which originally were Presbyterian vested their government in a body of elders. In 1889 the denomination numbered 93 churches; and in 1866, after prolonged negotiation, the Evangelical Union was incorporated with the Congregational Union of Scotland.

See The Evangelical Union Annual; History of the Evangelical Union, by F. Ferguson (Glasgow, 1876); The Writings of the E.U. (1883); W. Adamson, Life of Dr James Morison (1898).

EVANS, CHRISTMAS (1766–1838), Welsh Nonconformist divine, was born near the village of Llandysul, Cardiganshire, on the 25th of December 1766. His father, a shoemaker, died early, and the boy grew up as an illiterate farm labourer. At the age of seventeen, becoming servant to a Presbyterian minister, David Davies, he was affected by a religious revival and learned to read and write in English and Welsh. The itinerant Calvinistic Methodist preachers and the members of the Baptist church at Llandysul further influenced him, and he soon joined the latter denomination. In 1789 he went into North Wales as a preacher and settled for two years in the desolate peninsula of Llyn, Carnarvonshire, whence he removed to Llangefni in Anglesey. Here, on a stipend of £17 a year, supplemented by a little tract-selling, he built up a strong Baptist community, modelling his organization to some extent on that of the Calvinistic Methodists. Many new chapel were built, the money being collected on preaching tours which Evans undertook in South Wales.

In 1826 Evans accepted an invitation to Caerphilly, where he remained for two years, removing in 1828 to Cardiff. In 1832, in response to urgent calls from the north, he settled in Carnarvon and again undertook the old work of building and collecting. He was taken ill on a tour in South Wales, and died at Swansea on the 10th of July 1838. In spite of his early disadvantages and personal disfigurement (he had lost an eye in a
EVANS, E. H.—EVANS, O.

youthful brawn), Christmas Evans was a remarkably powerful preacher. To a natural aptitude for this calling he united a nimble mind and an inquiring spirit; his character was simple, his pietistic and her faith fervently evangelical. For a time he came under Sandemanian influence, and when the Wesleys entered Wales he took the Calvinist side in the bitter controversies that were frequent from 1800 to 1810. His chief characteristic was became known among the opposition, which absorbed and controlled all his other powers, and earned for him the name of the Bunyan of Wales.”

His works were edited by Owen Davies in 3 vols. (Carmarvon, 1895–1897). See the Lives by D. R. Stephens (1847) and Paxton Hood (1883).

EVANS, EVAN HERBER (1836–1896), Welsh Nonconformist divine, was born on the 5th of July 1836, at Pant yr Onen near Newcastle Emlyn, Cardiganshire. As a boy he saw something of the Rebecca Riots, and went to school at the neighbouring village of Lluchyd. In 1853 he went into business, first at Pontypriod and then at Merthyr, but next year made his way to Liverpool. He decided to enter the ministry, and studied arts and theology respectively at the Normal College, Swansea, and the Memorial College, Brecon, his convictions being deepened by the religious revival of 1858–1859. In 1862 he succeeded Thomas Jones as minister of the Congregational church at Morriston near Swansea. In 1865 he became pastor of Salem church, Carmarvon, a charge which he occupied for nearly thirty years despite his limitations to English pastoral. In 1894 he was the principal of the Congregational college at Bangor. He died on the 9th of December 1896. He was chairman of the Welsh Congregational Union in 1886 and of the Congregational Union of England and Wales in 1892; and by his earnest ministry, his eloquence and his literary work, especially in the denominational paper Y Dysgedyd, he achieved a position of great influence in his country.

See Life by H. Elvet Lewis.

EVANS, SIR GEORGE DE LACY (1787–1870), British soldier, was born at Moig, Limerick, in 1787. He was educated at Woolwich Academy, and entered the army in 1806 as a volunteer, obtaining an ensigncy in the 2nd regiment in 1807. His early service was spent in India, but he exchanged into the 3rd Light Dragoons in order to take part in the Peninsular War, and was present in the retreat from Burgos in 1812. In 1813 he was at Vittoria, and was afterwards employed in making a military survey of the passes of the Pyrenees. He took part in the campaign of 1814, and was present at Pampeluna, the Nile and Toulouse; and later in the year he served with great distinction on the staff in General Ross’s Bladensburg campaign, and took part in the capture of Washington and of Baltimore and the operations before New Orleans. He returned to England in the spring of 1815, in time to take part in the Waterloo campaign as assistant quartermaster-general on Sir T. Picton’s staff. As a member of the staff of the duke of Wellington he accompanied the English army to Paris, and remained there during the occupation of the city by the allies. He was still a substantive captain in the 5th West India regiment, though a lieutenant-colonel by brevet, when he went on half-pay in 1818. In 1830 he was elected M.P. for Rye in the Liberal interest; but in the election of 1832 he was an unsuccessful candidate both for that borough and for Westminster. For the latter constituency he was, however, returned in 1833, and, except in the parlament of 1841–1846, he continued to represent it till 1865, when he retired from political life. His parliamentary duties did not, however, interfere with his career as a soldier. In 1835 he went out to Spain in command of the Spanish Legion, recruited in England, and 9000 strong, which served for two years in the Carlist War on the side of the queen of Spain. In spite of great difficulties the legion won great distinction on the battlefields of northern Spain, and Evans was able to say that no prisoners he had taken from it in action, that it had never lost a gun or an equipage, and that it had taken 27 guns and 1100 prisoners from the enemy. He received several Spanish orders, and on his return in 1839 was made a colonel and K.C.B. In 1846 he became major-general; and in 1854, on the breaking-out of the Crimean War, he was made lieutenant-general and appointed to command the 2nd division of the Army of the East. At the battle of the Alma, where he received a severe wound, his quick comprehension of the features of the combat largely contributed to the victory. On the 26th of October he defeated a large Russian force which attacked his position on Mount Inkerman. Illness and fatigue compelled him to return to England, and he was appointed commanding of his division in the hands of General Pennefather; but he rose from his sick-bed on the day of the battle of Inkerman, the 5th of November, and, declining to take the command of his division from Pennefather, aided him in the long-protracted struggle by his advice. On his return invalided to England in the following February, Evans received the thanks of the House of Commons. He was made a G.C.B., and the university of Oxford conferred on him the degree of D.C.L. In 1861 he was promoted to the full rank of general. He died in London on the 9th of January 1870.

EVANS, SIR JOHN (1823–1908), English archaeologist and geologist, son of the Rev. Dr A. B. Evans, head master of Market Bosworth grammar school, was born at Britwell Court, Bucks, on the 17th of November 1823. He was for many years head of the extensive paper manufactory of Messrs John Dickin- son at Nash Mills, Hemel Hempstead, but was especially distinguished as an antiquary and numismatist. He was the author of three books, standard in their respective departments: The Coins of the Ancient Britons (1864); The Ancient Stone Imple- ments, Weapons and Ornaments of Great Britain (1872, and ed. 1897); and The Ancient Coins and Ornaments of Great Britain and Ireland (1881). He also wrote a number of separate papers on archaeological and geological subjects—notably the papers on “Flint Implements in the Drift” communicated in 1860 and 1862 to Archaeologia, the organ of the Society of Antiquaries. Of that society he was president from 1883 to 1882, and he was president of the Numismatic Society from 1874 to the time of his death. He also presided over the Geological Society, 1874–1876; the Anthropological Institute, 1877–1879; the Society of Chemical Industry, 1892–1893; the British Association, 1897–1898; and for twenty years (1879– 1898) he was treasurer of the Royal Society. As president of the Society of Antiquaries he was an ex officio trustee of the British Museum, and subsequently he became a permanent trustee. His academic honours included honorary degrees from several universities, and he was a corresponding member of the Institut de France. He was created a K.C.B. in 1892. He died at Berkhamsted on the 31st of May 1908.

His eldest son, ARTHUR JOHN EVANS, born in 1851, was educated at Brasenose College, Oxford, and Göttingen. He became fellow of Brasenose and in 1884 keeper of the Ashmolean Museum at Oxford. He was director of the British Museum in 1873–1874, and in 1875 made a special study of archaeology and ethnology in the Balkan States. In 1893 he began his investigations in Crete, which have resulted in discoveries of the utmost importance concerning the early history of Greece and the eastern Mediterranean (see Aegean Civilization and CRETE). He is a member of all the chief archaeological societies in Europe, holds honorary degrees at Oxford, Edinburgh and Dublin, and is a fellow of the Royal Society. His chief publications are: Cretan Pictographs and Prae-Phoenician Script (1866); Further Discoveries of Cretan and Aegean Script (1868); The Mycenaean Tree and Pillar Cult (1902); Scripta Minoa (1909 foll.); and reports on the excavations. He also edited with additions Freeman’s History of Sicily, vol. iv.

EVANS, OLIVER (1755–1819), American mechanician, was born at Newport, Delaware, in 1755. He was apprenticed to a wheelwright, and at the age of twenty-two he invented a machine for making the card-tooths used in carding wool and cotton. In 1780 he became partner with his brothers, who were practical millers, and soon introduced various labour-saving appliances which both cheapened and improved the processes of carding, turning, and milling. Turning to the engine as a more perfect source of power, he employed steam at a relatively high pressure, and the plans of his invention which he sent over to England in 1787 and in 1794–1795 are said
to have been seen by R. Trevithick, whom in that case he anticipated in the adoption of the high-pressure principle. He made use of his engine for driving mill machinery; and in 1803 he constructed a steam dredging machine, which also propelled itself on land. In 1819 a disastrous fire broke out in his factory at Pittsburg, and he did not long survive it, dying at New York on the 21st of April 1819.

EVANSON, EDWARD (1731–1805), English divine, was born on the 21st of April 1731 at Warrington, Lancashire. After graduating at Cambridge (Emmanuel College) and taking holy orders, he officiated for several years as curate at Mitcham. In 1768 he became vicar of South Mimms near Barnet; and in November 1769 he was presented to the rectory of Tewkesbury, with which he held also the vicarage of Longdon in Worcester-shire. In the course of his studies he discovered what he thought to be an important variance between the teaching of the Church of England and that of the Bible, and he did not conceal his convictions. In reading the service he altered or omitted phrases which seemed to him untrue, and in reading the Scriptures pointed out errors in the translation. A crisis was brought on by his sermon on the resurrection, preached at Easter 1771; and in November 1773 a prosecution was instituted against him in the consistory court of Gloucester. He was charged with "depriving the public worship of God contained in the liturgy of the Church of England, asserting the same to be superstitious and unchristian, preaching, writing and conversing against the creeds and the divinity of our Saviour, and assuming to himself the power of making arbitrary alterations in his performance of the public worship."

A protest was at once signed and presented by T. Palcock's Band of his parishioners against the prosecution. The case was dismissed on technical grounds, but appeals were made to the court of arches and the court of delegates. Meanwhile Evanston had made his views generally known by several publications. In 1772 appeared anonymously his Doctrines of a Trinity and the Incarnation of God, examined upon the Principles of Reason and Common Sense. This was followed in 1777 by A Letter to Dr Hurd, Bishop of Worcester, wherein the Importance of the Prophecies of the New Testament and the Nature of the Grand Apostryx predicted in them are particularly and impartially considered. He also wrote some papers on the Sabbath, which brought him into controversy with Joseph Priestley, who published the whole discussion (1792). In the same year appeared Evanston's work entitled The Dissuasion of the Four generally received Evangelists, to which replies were published by Priestley and David Simpson (1793). Evanston rejected most of the books of the New Testa- ment as forgeries, and of the four gospels he accepted only that of St Luke. In his later years he ministered to a Unitarian congregation at Lytton, Devonshire. In 1802 he published Reflections upon the State of Religion in Christendom, in which he attempted to explain and illustrate the mysterious foreshadow- ings of the Apocalypse. This he considered the most important of his writings. Shortly before his death at Colford, near Credinton, Devonshire, on the 25th of September 1805, he completed his Second Thoughts on the Trinity, in reply to a work of the bishop of Gloucester.

His sermons (prefaced by a Life by G. Rogers) were published in two volumes. The most important were the occasion of T. Palcock's Band of lectures in 1811. A narrative of the circumstances which led to the prosecution of Evanston was published by N. Havard, the town-clerk of Tewkesbury, in 1778.

EVANSTON, a city of Cook county, Illinois, U.S.A., on the shores of Lake Michigan; 12 m. N. of Chicago. Pop. (1900) 19,259, of whom 4441 were foreign-born; (1910 U. Census) 24,978. It is served by the Chicago & North-Western, and the Chicago, Milwaukee & St Paul railways, and by two electric lines. The city is an important residential suburb of Chicago. In 1908 the Evanston public library had 41,450 volumes. In the city are the College of Liberal Arts (1853), the Academy (1860), and the schools of music (1855) and engineering (1868) of Northwestern University, co-educational, chartered in 1851, opened in 1855, the largest school of the Methodist Episcopal Church in America. In 1909-1910 it had productive funds amounting to about $7,500,000, and, including all the allied schools, a faculty of 418 instructors and 4487 students; its schools of medicine (1869), law (1859), pharmacy (1886), commerce (1908) and dentistry (1887) are in Chicago. In 1909 its library had 114,856 volumes and 79,000 pamphlets (exclusive of the libraries of the professional schools in Chicago); and the Garrett Biblical Institute had a library of 25,671 volumes and 4,500 pamphlets. The university maintains the Grand Prairie Seminary at Onarga, Iroquois county, and the Elgin Academy at Elgin, Kane county. Enjoying the privileges of the university, though actually independent of it, are the Garrett Biblical Institute (Evanson Theological Seminary), founded in 1855, situated on the university campus, and probably the best-endowed Methodist Episcopal theological seminary in the United States, and affiliated with the Institute, the Norwegian Danish theological school; and the Swedish Theological Seminary, founded at Galesburg in 1870, removed to Evanston in 1882, and occupying buildings on the university campus until 1907, when it removed to Orrington Avenue and Noyes Street. The Cummock School of Oratory, at Evanston, also co-operates with the university. By the charter of the university the sale of intoxicating liquors is forbidden within 4 m. of the university campus. The manufacturing importance of the city is slight, but is rapidly increasing. The principal manufactures are wrought iron and steel pipe, bakers' machinery and bricks. In 1905 the value of the factory products was $2,550,529, being an increase of 207.3% since 1900. In Evanston are the publishing offices of the National Woman's Christian Temperance Union. Evanston was incorporated as a town in 1863 and as a village in 1872, and was chartered as a city in 1889. The villages of North Evanston and South Evanston were annexed to Evanston in 1874 and 1892 respectively.

EVANVILLE, a city and the county-seat of Vanderburgh county, Indiana, U.S.A., and a port of entry, on the N. bank of the Ohio river, 200 m. below Louisville, Kentucky—measuring by the windings of the river, which double the direct distance. Pop. (1890) 50,756; (1900) 59,907; (1910 census) 69,047. Of the total population in 1900, 5518 were negroes, 5626 were foreign-born (including 4830 from Germany and 384 from England), and 17,419 were of foreign parentage (both parents foreign-born), and of these 13,010 were of German parentage. Evanston is served by the Evansville & Terre Haute, the Evansville & Indianapolis, the Illinois Central, the Louisville & Nashville, the Louisville, Henderson & St Louis, and the Southern railways, by several interurban electric lines, and by river steamboats. The city is situated on a plateau above the river, and has a number of fine business and public buildings, including the court house and city hall, the Southern Indiana hospital for the insane, the United States marine hospital, and the Willard library and art gallery, containing in 1908 about 30,000 volumes. The city's numerous railway connections and its situation in a coal-producing region (there are five mines within the city limits) and on the Ohio river, which is navigable nearly all the year, combine to make it the principal commercial and manu- facturing centre of Southern Indiana. It is in a tobacco-growing region, is one of the largest hardwood lumber markets in the country, and has an important shipping trade in pork, agricul- tural products, dried fruits, lime and limestone, flour and tobacco. Among its manufactures in 1905 were flour and grain mill products (value, $2,638,914), furniture ($1,655,246), lumber and timber products ($1,290,533), railway cars ($1,118,376), packed meats ($1,300), wool, and cotton goods ($395,000), malt liquors, carriages and wagons, leather and canned goods. The value of the factory products increased from $3,167,524 in 1900 to $10,201,716 in 1905, or 57.8%, and in the latter year Evanston ranked third among the manufacturing cities in the state. The waterworks are owned and operated by the city. First settled about 1812, Evansville was laid out in 1817, and was named in honour of Robert Morgan Evans (1783-1844), one of its founders, who was an officer under General W. H. Harrison in the war of 1812. It soon became a thriving commercial town with an extensive river trade, was incorporated in 1819, and received a city charter in 1847. The completion of the Wabash
EVARISTUS–EVE

& Erie Canal, in 1853, from Evansville to Toledo, Ohio, a distance of 400 m., greatly accelerated the city's growth.

**EVARISTUS**, fourth pope (c. 98–105), was the immediate successor of Clement.

**EVARTS, WILLIAM MAXWELL** (1818–1901), American lawyer, was born in Boston on the 6th of February 1818. He graduated at Yale in 1837, was admitted to the bar in New York in 1841, and soon took high rank in his profession. In 1860 he was chairman of the New York delegation to the Republican national convention. In 1861 he was an unsuccessful candidate for the United States senatorship from New York. He was chief counsel for President Johnson during the impeachment trial, and from July 1868 until March 1869 he was attorney-general of the United States. In 1872 he was counsel for the United States in the "Alabama" arbitration. During President Hayes's administration (1877–1881) he was secretary of state; and from 1882 to 1885 he was one of the senators from New York. As an orator, Senator Evarts stood in the foremost rank, and some of his best speeches were published. He died in New York on the 28th of February 1901.

**EVE**, the English transcription, through Lat. *Eva* and Gr. Ευ, of the Hebrew name הַוָּה (Havvah), given by Adam to his wife because she was "mother of all living," or perhaps more strictly, "the group of those connected by female kinship," (see W. R. Smith, *Kinship*, 2nd ed., p. 208), as if Eve were the personification of mother-kinship, just as Adam ("man") is the personification of mankind.

The abstract meaning "life" (I.XX. Zoh), once favoured by Robertson Smith, is at any rate unsuitable in a popular story. Wellhausen and Nöldeke would compare the Ar. *ḥayyat*, "serpent," and the former remarks that, if this is right, the Israelites received their first ancestress from the Hīvites (Hīvites), who were originally the serpent-tribe (*Composition des Hexateuchs*, p. 334; cf. Reste arabischen Hethitens, 2nd ed., p. 154). Cheyne, 100, assumes a common origin for Havvah and the Hīvites.

The account of the origin of Eve (Gen. iii. 21–23) runs thus: "And Yahweh–Elohim caused a deep sleep to fall upon the man, and he slept. And he took one of his ribs, and closed up the flesh in its stead, and the rib which Yahweh–Elohim had taken from the man he built up into a woman, and he brought her to the man." Enchanted at the sight, the man now burst out into elevated, rhythmic speech: "This one," he said, "at length is none of my flesh, nor flesh of my flesh," etc.; to which the narrator adds the comment, "Therefore doth a man forsake his father and his mother, and cleave to his wife, and they become one flesh (body)." Whether this comment implies the existence of the custom of *beeta*, marriage (W.R.Smith, *Kinship*, 2nd ed., p. 208), seems doubtful. It is at least equally possible that the expression "his wife" simply reflects the fact that among ordinary Israelite circumstances had quite naturally brought about the prevalence of monogamy.1 What the narrator gives is not a doctrine of marriage, much less a precept, but an explanation of a simple and natural phenomenon. How is it, he asks, that a man is so irresistibly drawn towards a woman? And he answers: Because the first woman was built up out of a rib of the first man. At the same time it is plain that the already existing tendency towards monogamy must have been powerfully assisted by this presentation of Eve's story as well as by the prophetic descriptions of Yahweh's relation to Israel under the figure of a monogamous union.

The narrator is no rhetorician, and spares us a description of the ideal woman. But we know that, for Adam, his strangely produced wife was a "help (or helper) matching or corresponding to him," or, as the Authorized Version puts it, "a help meet for him" (ii. 18b). This does not, of course, exclude subordination on the part of the woman; what is excluded is that exaggeration of natural subordination which the narrator may have found both in his own and in the neighbouring countries, and which he may have regarded as (together with the pains of parturition) the punishment of the woman's transgression (Gen. iii. 16). His own ideal of woman seems to have made its way in Palestine by slow degrees. An apocryphal hook (Tohit viii. 6, 7) seems to contain the only reference to the section till we come to the time of Christ, to whom the comment in Gen. ii. 24 supplies the text for an authoritative prohibition of divorce, which presupposes and sanctifies monogamy (Matt. x. 7, 8; Matt. xix. 5). For other New Testament applications of the story of Eve see 1 Cor. xi. 8, 9 (especially); 2 Cor. xi. 3; 1 Tim. ii. 13, 14; and in general cf. Adam, and *Ency. Biblica*, "Adam and Eve.")

The seeming admissions in the Biblical narrative have been filled up by imaginative Jewish writers. The earliest source which remains to us is the Book of Jubilees, or Leptogenesis, a Palestinian work (referred by R. H. Charles to the century immediately preceding the Christian era; see *APOCRYPHAL LITERATURE*). In this hook, which was largely used by Christian writers, we find a chronology of the lives of Adam and Eve and the names of their—Ayan and Aziura. The Targum of Jonathan informs us that Eve was created from the thirteenth rib of Adam's right side, thus taking the view that Adam had a rib more than his descendants. Some of the Jewish legends show clear marks of foreign influence. Thus the notion that the first man was a double being, afterwards separated into the two persons of Adam and Eve (Berachot, 61; Erubin, 18), may be traced back to Philo (De mundi opif. §53; cf. *Quast. in Gen.* lib. i. §25), who borrows the idea, and almost the words, of the myth related by Aristophanes in the Platonic *Symposium* (186 D, 190 A), which, in extravagant form, explains the passion of love by the legend that male and female originally formed one body.

A recent critic (F. Schwa) even holds that this notion was originally expressed in the account of the creation of man in Gen. ii. 27. This involves a textual emendation, and one must at least admit that the present text is not without difficulty, and that Berossus refers to the existence of primeval monstrous androgynous beings according to Babylonian mythology. There is an analogous Iranian legend of the true man, which parted into man and woman in the Bundahish (the Parsi Genesis), and an Indian legend, which, according to Spiegel, has presumably an Iranian source.

It has been remarked elsewhere (Adam, §16) that though the later Jews gathered material for thought very widely, such guidance as they required in theological reflection was primarily derived from Greek culture. What, for instance, was the intention of the writer of the Christian *Interpretation*. This question as to the literal truth of that story could hardly be formulated. It is otherwise when the Greek leaven begins to work.

Josephus, in the prologue to his *Archaeology*, reserves the problem of the true meaning of the Mosaic narrative, but does not regard everything as strictly literal. Philo, the great representative of Alexandrian allegory, expressly argues that in the nature of things the trees of life and knowledge cannot be taken otherwise than symbolically. His interpretation of the creation of Eve is, as has been already observed, primarily suggested by a Platonic myth. The longing for reunion which love implants in the divided halves of the original dual man is the source of sensual pleasure (symbolized by the serpent), which in turn is the beginning of all transgression. Eve represents the sensual or perceptive part of man's nature, Adam the reason. The serpent, therefore, does not venture to attack Adam directly.

1 See West's authoritative translation in *Pahlavi Texts* (Sacred Books of the East).

2 *Die bibl. Schöpfungsbücher"* (Archiv für Religionswissenschaft, ix. 171 ff.);

It is sense which yields to pleasure, and in turn envelopes the reason and destroys its immortal virtue. This exposition, in which the elements of the Bible become mere symbols of the abstract notions of Greek philosophy, and are adapted to Greek conceptions of the origin of evil, the material and autonomous part of man, was adopted into Christian theolgy by Clement and Origen, notwithstanding its obvious inconsistency with the Pauline anthropology, and the difficulty which its supporters felt in reconciling it with the Christian doctrine of the excellence of the married state (Clemens Alex. Stromata, p. 174). These difficulties had more weight with the Western church, which, less devoted to speculative abstractions and more deeply influenced by the Pauline anthropology, refused, especially since Augustine, to reduce Paradise and the fall to the region of pure intelligibilia; though a spiritual sense was admitted along with the literal (Aug. Civ. Dei, xii. 27).

The history of Adam and Eve became the basis of anthropological discussions which acquired more than speculative importance from their connexion with the doctrine of original sin and the meaning of the sacrament of baptism. One or two points in Augustinian teaching may be here mentioned as having to do particularly with Eve. The question whether the soul of Eve was derived from Adam or directly infused by the Creator is raised as an element in the great problem of traducianism and creationism (De Gen. ad Lit. lib. x.). And it is from Augustine that Milton derives the idea that Adam sinned, not from desire for the forbidden fruit, but because love forbade him to dissociate his fate from Eve's (ibid. lib. xi. sub fin.). Medieval discussion moved mainly in the lines laid down by Augustine. A sufficient sample of the way in which the subject was treated by the schoolmen may be found in the Summa of Thomas, pars i. qu. xiiii. De productione mulieris.

The Reformers, always hostile to allegory, and in this matter especially influenced by the Augustinian anthropology, adhered strictly to the literal interpretation of the history of the Protodoulia, which has continued to be generally identified with Protohumanism, or has, at least, been so used that the confessional doctrine of sin in last century was naturally associated with new theories of the meaning of the biblical narrative; but neither renewed forms of the allegorical interpretation, in which every thing is reduced to abstract ideas about reason and sensuality, nor the attempts of Eichhorn and others to extract a kernel of simple history by allowing largely for the influence of poetical form in so early a narrative, have found lasting acceptance. On the other hand, the strict historical interpretation is beset with difficulties which modern interpreters have felt with increasing force, and which there is a growing inclination to solve by adopting in one or other form which is called the mythical theory of the narrative. But interpretations pass under this now popular title which have no real claim to be so designated. What is common to the "mythical" interpretations is to find the real value of the narrative, not in the form of the story, but in the thoughts which it embodies. But the story cannot be called a myth in the strict sense of the word, unless we are prepared to place it on one line with the myths of heathenism, produced by the unconscious play of plastic fancy, giving shape to the impressions of natural phenomena on primitive observers. Such a theory does justice to a narrative which embodies profound truths peculiar to the religion of revelation. Other forms of the so-called mythical interpretation are little more than abstract allegory in a new guise, ignoring the fact that the biblical story does not teach general truths which repeat themselves in every individual, but gives a view of the purpose of man's creation, and of the origin of sin, in connexion with the divine plan of redemption. Among his other services in refutation of the unhistorical rationalism of last century, Kant has the merit of having forcibly recalled attention to the fact that the narrative of Genesis, even if we do not take it literally, must be regarded as presenting a view of the beginnings of the history of the human race (Mullmasslicher Anfang der Menschengeschichte, 1786). Those who recognize this fact ought not to call themselves or be called by others adherents of the mythical theory, although they also recognize that in the nature of things the diverse truths brought out in the history of the creation and fall could not have been expressed either in the form of literal history or in the shape of abstract metaphysical doctrine; or even although they may hold—as is done by many who accept the narrative as a part of supernatural revelation—that the specific biblical truths which the narrative conveys are presented through the vehicle of a story which, at least in some of its parts, may possibly be shaped by the influence of legends common to the Hebrews with their heathen neighbours.

EVECTION (Latin for "carrying away"), in dynastic history, the largest inequality produced by the action of the sun in the monthly revolution of the moon around the earth. The deviation expressed by it has a maximum amount of about 1° 2′ in either direction. It may be considered as arising from a semi-annual variation in the eccentricity of the moon's orbit and the position of its perigee. It was discovered by Ptolomy.

EVELETH, a city of St Louis county, Minnesota, U.S.A., about 71 m. N.N.W. of Duluth. Pop. (1900) 3723; (1905, state census) 5322, of whom 2975 were foreign-born (1145 Finns, 676 Austrians and 315 Swedes); (1910) 7036. Eveleth is served by the Duluth, Missabe & Northern and the Duluth & Iron Range railways. It lies in the midst of the great red and brown hematite-iron ore deposits of the Mesabi Range—the richest in the Lake Superior district—and the mining and shipping of this ore are its principal industries. The municipality owns and operates the water-works, the water being obtained from Lake Saint Mary, one of a chain of small lakes lying S. of the city. Eveleth was first chartered as a city in 1902.

EVELYN, JOHN (1600–1706), English diarist, was born at Wotton House, near Dorking, Surrey, on the 31st of October 1600. He was the younger son of Richard Evelyn, who owned large estates in the county, and was in 1633 high sheriff of Surrey and Sussex. When John Evelyn was five years old he went to live with his mother's parents at Cliffe, near Lewes. He refused to leave his "too indulgent" grandmother for Eton, and when on her husband's death she married again, the boy went with her to Southover, where he attended the free school of the place. He was admitted to the Middle Temple in February 1637, and in May became a fellow commoner of Balliol College, Oxford. He left the university without taking a degree, and in 1640 was residing in the Middle Temple. In that year his father died, and in 1641 he crossed to Holland. He was a volunteer in Apsey's company, then encamped before Genep on the Waal, but his commission was apparently complimentary, his military experience being limited to six days of camp life, during which, however, he took his turn at "trailing a pike." He returned in the autumn to find England on the verge of civil war. Evelyn's part in the conflict is best told in his own words:

"12th November was the battle of Brentford, surprisingly fought. I came in with my horse and arms just at the retreat; but was not permitted to stay longer than the 15th by reason of the army marching to Gloucester; which would have left both me and my brothers exposed to ruin, without any advantage to his Majesty on the 10th [December] returned to Wotton, nobody knowing of my having been in his Majesty's army."

At Wotton he employed himself in improving his brother's property, making a fishpond, an island and other alterations in the gardens. But he found it difficult to avoid taking a side; he was importuned to sign the Covenant, and "finding it impossible to evade doing very unhandsome things," he obtained leave in October 1643 from the king to travel abroad. From this date his Diary becomes full and interesting. He travelled in France and visited the cities of Italy, returning in the autumn of 1646 to Paris, where he became the friend of Sir Richard Browne, the English resident at the court of France. In June of the following year he married Browne's daughter and heiress, Mary, then a child of not more than twelve years of age. Leaving
his wife in the care of her parents, he returned to England to settle his affairs. He visited Charles I, at Hampton Court in 1647, and during the next two years maintained a cipher correspondence with his father-in-law in the royal interest. In 1649 he obtained a pass to return to Paris, but in 1650 paid a short visit to England. The defeat of Charles II at Worcester in 1651 convinced him that the royalist cause was hopeless, and he decided to return to England. He went in 1652 to Sayes Court at Deptford, a house which Sir Richard Browne had held on a lease from the crown. This had been seized by the parliament, but Evelyn was able to compound with the occupier for £3,500, and after the Restoration his possession was secured. Here his wife joined him, their eldest son, Richard, being born in August 1654. Under the Commonwealth Evelyn amused himself with his favourite occupation of gardening, and made many friends among the scientific inquirers of the time. He was one of the promoters of the scheme for the Royal Society, and in the king's charter in 1662 was nominated a member of its directing council. Meanwhile he had refused employment from the government of the Commonwealth, and had maintained a cipher correspondence with Charles. In 1659 he published an Apology for the Royal Party, and in December of that year he vainly tried to persuade Colonel Herbert Morley, then lieutenant of the Tower, to release General Monk by declaring for the king. From the Restoration onwards Evelyn enjoyed unbroken court favour till his death in 1706; but he never held any important political office, although he filled many useful and often laborious minor posts. He was commissioner for improving the streets and buildings of London, for examining into the affairs of charitable foundations, commissioner of the Mint, and of foreign plantations. In 1664 he accepted the responsibility for the care of the sick and wounded and the prisoners in the Dutch war. He stuck to his post throughout the plague year, contenting himself with sending his family away to Wotton. He found it impossible to secure sufficient money for the proper discharge of his functions, and in 1688 he was still petitioning for payment of his accounts in this business. Evelyn was secretary of the Royal Society in 1672, and as an enthusiastic promoter of its interests was twice (in 1682 and 1691) offered the presidency. Through his influence Henry Howard, duke of Norfolk, was induced to present the Arundel marbles to the university of Oxford (1667) and the valuable Arundel library to Gresham College (1678). In the reign of James II., during the era of Clarendon's absence in Ireland, he acted as one of the commissioners of the seal. He was busied in matters relating to the king's attacks by the King's Bench, the English Church, and refused on two occasions to license the illegal sale of Roman Catholic literature. He concurred in the revolution of 1688, in 1695 was entrusted with the office of treasurer of Greenwich hospital for old sailors, and laid the first stone of the new building on the 30th of June 1696. In 1694 he left Sayes Court to live at Wotton with his brother, whose heir he had become, and whom he actually succeeded in 1699. He spent the rest of his life there, dying on the 27th of February 1706. Evelyn's house at Sayes Court had been let to Captain, afterwards Admiral John Benbow, who was not a "polite" tenant. Sublet it to Peter the Grime, who was then visiting the dockyard at Deptford. The Grime did great damage to Evelyn's beautiful gardens, and, it is said, made it one of his amusements to ride in a wheelbarrow along a thick holly hedge planted especially by the owner. The house was subsequently used as a workhouse, and is now almshouses, the grounds having been converted into public gardens by Mr Evelyn in 1886.

It will be seen that Evelyn's politics were not of the heroic order. But he was honourable and consistent in his adherence to the monarchical principle throughout his life. With the accession of Charles II. he could have had no sympathy, his dignified domestic life and his serious attention to religion standing in the strongest contrast with the profiliy of the royal roundings. His Diary is therefore a valuable chronicle of contemporary events from the standpoint of a moderate politician and a devout adherent of the Church of England. He had none of Pepys's love of gossip, and was devoid of his all-embracing curiosity, as of his diverting frankness of self-revelation. Both were admirable civil servants, and they had a mutual admiration for each other's sterling qualities. Evelyn's Diary contains a period of half a century (1649-1706) crowded with remarkable events, while Pepys only deals with a few years of Charles II.'s reign.

Evelyn was a generous art patron, and Grinling Gibbons was introduced to him by the notice of Charles II. His domestic affections were very strong. He had six sons, of whom John (1653-1690), the author of some translations, alone reached manhood. He has left a pathetick account of the extraordinary accomplishments of his son Richard, who died before he was six years old, and of a daughter Mary, who lived to be twenty, and wrote "a book of some note" (Register of 22nd February 1690). Of his two other daughters, Susannah, who married Wm. Draper of Addiscombe, Surrey, survived him.

Evelyn's Diary remained in MS, until 1818. It is in a quarto volume containing 700 pages, covering the years between 1662 and 1697, and is continued in a smaller book which brings the narrative down to within three weeks of its author's death. A selection from this was edited by William Bray, with the permission of the Evelyns, in 1818, under the title of Memoirs illustrative of the Life and Writings of John Evelyn, comprising his Diary from 1649 to 1706, and a Selection of his Familiar Letters. Other editions followed, the most notable being those of R. H. B. Wheatley (1789) and of J. A. Robinson (1847). These were followed by many other works, and although these have been overshadowed by the famous Diary they are of considerable interest. They include: Observations and Remarks in the Life and Writings of John Evelyn's of France de la Mothe Vayer, Evelyn's own copy of which contains a note that he was "like to call'd in question by the Rebels for this book" (The State of France, as it stood in the 17th and 18th Centuries, 1717). A Short History of Carius de Rerum Natura. Interpreted and made English verse by J. Evelyn (1665); The Golden Book of St. John Chrysostom, containing the Education of a Child. Translated from the Greek by J. L. Wheatley, dated 1665 (2nd ed. 1668); The French Gardener: instructions how to cultivate all sorts of Fruit-trees... (1668); translated from the French of N. de Bonfonds; A Character of England... (1695), describing the state of England in 1695; his journey to Paris, which would appear to a foreign observer, reprinted in Somers' Tracts (ed. Scott, 1812), and in the Harleian Miscellany (ed. Park, 1847). The Diary has been considered useful in the study of French politics and government during the Restoration, and the influence of foreign ideas on the development of English thought in the eighteenth century. A valuable resource for students of English history, literature, and culture.
EVERDINGEN, EVERETT, A. H.

EVERDINGEN, ALLART VAN (1621–1679). Dutch painter and engraver, the son of a government clerk at Alkmaar, was born, it is said, in 1621, and educated, if we believe an old tradition, under Roelant Savery at Utrecht. He wandered in 1645 to Haarlem, where he studied under Peter de Molyn, and finally settled about 1657 at Amsterdam, where he remained till his death. It would be difficult to find a greater contrast than that which is presented by the works of Savery and Everdingen. Savery inherited the gaudy style of the Breughels, which he carried into the 17th century; whilst Everdingen realized the large and effective system of coloured and powerfully shaded landscape which marks the precursors of Rembrandt. It is not easy to say who was most instrumental in training Everdingen’s master, while it is quite within the range of probability that he acquired the elements of landscape painting from de Molyn. Pieter de Molyn, by birth a Londoner, lived from 1624 till 1661 in Haarlem. He went periodically on visits to Norway, and his works, though scarce, exhibit a broad and sweeping mode of execution, differing but slightly from that transferred at the opening of the 17th century from Jan van Goyen to Solomon Ruysdael. His etchings have nearly the breadth and effect of those of Everdingen. It is still an open question when de Molyn wielded influence on his clever disciple. Alkmaar, a busy trading place near the Texel, had little of the picturesque for an artist except polders and downs or waves and sky. Accordingly we find Allart at first a painter of coast scenery. But on one of his expeditions he is said to have been cast ashore in Norway, and during the repairs of his ship he visited the inland valleys, and thus gave a new course to his art. In early pieces he Cleary represents the sea in motion under varied, but mostly cloudy, aspects of sky. Their general intonation is strong and brown, and effects are rendered in a powerful key, but the execution is much more uniform than that of Jacob Ruysdael. A dark scud lowered on a rolling sea near the walls of Flushing characterizes Everdingen’s “Mouth of the Schelde” in the Hermitage at St. Petersburg. Storm is the marked feature of sea-pieces in the Staedel or Robartes collections; and a strand with wreckers at the foot of a cliff in the Munich Pinakothek may be a reminiscence of personal adventure in Norway. But the Norwegian coast was studied in calms as well as in gales; and a fine canvas at Munich shows fishermen on a still and sunny day taking herrings to a smoking hut at the foot of a Norwegian crag. The earliest of Everdingen’s sea-pieces bears the date of 1640. After 1645 we meet with nothing but representations of inland scenery, and particularly of Norwegian valleys, remarkable alike for wildness and a decisive depth of tone. The master’s favourite theme is a fall in a glen, with mournful fringes of pines interspersed with birch, and log-huts at the base of rocks and craggy slopes. The water tumbles over the foreground, so as to entitle the painter to the name of “inventor of cascades.” It gives Everdingen his character as a precursor of Jacob Ruysdael in a certain form of landscape composition; but though very skilful in arrangement and clever in effects, Everdingen remains much more simple in execution; he is much less subtle in feeling or varied in touch than his great and incomparable countryman. Five of Everdingen’s cascades are in the museum of Copenhagen alone: of these, one is dated 1647, another 1649. In the Hermitage at St. Petersburg is a fine example of 1647; another in the Pinakothek at Munich was finished in 1656. English public galleries ignore Everdingen; but one of his best-known master-pieces is the Norwegian glen belonging to Lord Listowel. Of his etchings and drawings there are much larger and more numerous specimens in England than elsewhere. Being a collector as well as an engraver and painter, he brought together a large number of works of all kinds and masters; and the sale of these by his heirs at Amsterdam on the 11th of March 1676 gives an approximate clue to the fate of the painter’s death.

His two brothers, Jan and Caesar, were both painters. CAESAR VAN EVERDINGEN (1666–1679), mainly known as a portrait painter, enjoyed some vogue during his life, and many of his pictures are to be seen in the museums and private houses of Holland. They show a certain cleverness, but are far from entitling him to rank as a master.

EVEREST, SIR GEORGE (1790–1866). British surveyor and geographer, was the son of Tristram Everest of Gwerdall, Brecknockshire, and was born there on the 4th of July 1790. From school at Marlow he proceeded to the military academy at Woolwich, where he attracted the special notice of the mathematical master, and passed so well in his examinations that he was declared fit for a commission before attaining the necessary age. Having gone to India in 1806 as a cadet in the Bengal Artillery, he was selected by Sir Stamford Raffles to take part in the Indian Survey of Java (1811–1816); and after being employed in various engineering works throughout India, he was appointed in 1818 assistant to Colonel Lambton, the founder of the great trigonometrical survey of that country. In 1823, on Colonel Lambton’s death, he succeeded to the post of superintendent of the survey; in 1830 he was appointed by the court of directors of the East India Company surveyor-general of India; and from that date till his retirement from the service in 1843 he continued to discharge the laborious duties of both offices. During the rest of his life he resided in England, where he became fellow of the Royal Society and an active member of several other scientific associations. In 1861 he was made a C.B. and received the honour of knighthood, and in 1862 he was chosen vice-president of the Royal Geographical Society. He died at Greenwich on the 1st of December 1866. The geodetical labours of Sir George Everest rank among the finest achievements of their kind; and more especially his measurement of the meridional arc of India, 113° in length, is accounted as unrivalled in the annals of the science. In great part the Indian survey is what he made it.

His works are purely professional—A paper in vol. i. of the Memoirs of the Royal Astronomical Society, pointing out a mistake in La Caille’s measurement of an arc of the meridian which he had discovered during sick-leave at the Cape of Good Hope; An account of the measurement of the arc of the meridian between the parallels of 18° 3’ and 24° 7’, being a continuation of the Grand Meridional Arc of India, as detailed by Lieut.-Col. Lambton in the volumes of the Asiatic Society of Calcutta (London, 1850); An account of the measurement of two sections of the Meridional Arc of India bounded by the parallels of 18° 3’ 15”, 24° 7’ 11”, and 20° 30’ 48” (London, 1847).

EVEREST, MOUNT, the highest mountain in the world. It is a peak of the Himalayas situated in Nepal almost precisely on the intersection of the meridian 87 E. long. with the parallel 28 N. lat. Its elevation as at present determined by trigonometer is 29,002 ft., but it is possible that further investigation into the value of refraction at such altitudes will result in placing the summit even higher. It has been confused with a peak to the west of it called Gaurisankar (by Schlagintweit), which is more than 5000 ft. lower; but the observations of Captain Wood from peaks near Kathmandu, in Nepal, and those of the same officer, and of Major Ryder, from the route between Lhasa and the sources of the Brahmaputra in 1904, have definitely fixed the relative position of the two mountain masses, and conclusively proved that there is no higher peak than Everest in the Himalayan system. The peak possesses an extremely nautical character, and has been called Everest after Sir George Everest (q.v.), who completed the trigonometrical survey of the Himalayas in 1841 and first fixed its position and altitude.

EVERETT, ALEXANDER HILL (1790–1847), American author and diplomatist, was born in Boston, Massachusetts, on the 19th of March 1790. He was the son of Rev. Oliver Everett (1733–1803), a Congregational minister in Boston, and the brother of Edward Everett. He graduated at Harvard in 1806, taking the highest honours of his year, though the youngest man in his class. He spent one year as a teacher in Phillips Academy, Exeter, New Hampshire, and then began the study of law in the office of John Quincy Adams. In 1809 Adams was appointed minister to Russia, and Everett accompanied him as his private secretary, remaining attached to the American legation in Russia until 1811. He was secretary of the American legation at The Hague in 1815–1816, and chargé d’affaires there.
from 1818 to 1824. From 1825 to 1829, during the presidency of John Quincy Adams, he was the United States minister to Spain. At that time Spain recognized none of the governments established by her revoluted colonies, and Everett became the medium of all communications between the Spanish government and the several nations of Spanish origin which had been established, by successful revolutions, on the other side of the ocean. Everett was a member of the Massachusetts legislature in 1829-1835, was president of Jefferson College in Louisiana in 1834, and was appointed commissioner of the United States to China in 1845, but did not go to that country until the following year, and died on the 20th of May 1847 at Canton, China. Everett, however, is known rather as a man of letters than as a diplomat. In addition to numerous articles, published chiefly in the *North American Review*, of which he was the editor from 1829 to 1835, he wrote: *Europe, or a General Survey of the Political Situation of the Principal Powers, with Conjectures on their Future Prospects* (1822), which attracted considerable attention in Europe and was translated into German, French, and Spanish; *New Ideas on Population* (1822); *America, or a General Survey of the Political Situation of the Several Powers of the Western Continent, with Conjectures on their Future Prospects* (1827), which was translated into several European languages; a volume of *Poems* (1845); and *Critical and Miscellaneous Essays* (first series, 1845; second series, 1847).

**EVERETT, CHARLES CARROLL** (1829-1900), American divine and philosopher, was born on the 19th of June 1829, at Brunswick, Maine. He studied at Bowdoin College, where he graduated in 1850, after which he proceeded to Berlin. Subsequently he took a degree in divinity at the Harvard Divinity School. From 1850 to 1860 he was professor of the Independent Congregational (Unitarian) church at Bangor, Maine. This charge he resigned to take the Bussey professorship of theology at Harvard University, and, in 1878, became dean of the faculty of theology. Interested in a variety of subjects, he devoted himself chiefly to the philosophy of religion, and published *The Science of Thought* (Boston, 1869; revised 1891). He also wrote *Fichte's Science of Knowledge* (1884); *Poetry, Comedy and Duty* (1888); *Religions before Christianity* (1883); *Ethics for Young People* (1891); *The Gospel of Paul* (1892). He died at Cambridge on the 16th of October 1900.

**EVERETT, EDWARD** (1794-1865), American statesman and orator, was born in Dorchester, Massachusetts, on the 11th of April 1794. He was the son of Rev. Oliver Everett and the brother of Alexander Hill Everett (q.v.). His father died in 1802, and his mother removed to Boston with her family after her husband's death. At seventeen Edward Everett graduated from Harvard College, taking first honors in his class. While at college he was the chief editor of *The Lyceum*, the earliest in the series of college journals published at the American Cambridge. His earlier predilections were for the study of law, but the advice of Joseph Stevens Buckminster, a distinguished preacher in Boston, led him to prepare for the pulpit, and as a preacher he at once distinguished himself. He was called to the ministry of the Brattle Street church (Unitarian) in Boston before he was twenty years old. His sermons attracted wide attention in that community, and he gained a considerable reputation as a theologian and a controversialist by his publication in 1814 of a volume entitled *Defence of Christianity*, written in answer to a work, *The Grounds of Christianity Examined* (1813), by George Bethune English (1767-1828), an adventurer, who, born in Cambridge, Massachusetts, was in turn a theologian, an editor of a newspaper, and a soldier of fortune in Egypt. Everett's tastes, however, were then, as always, those of a scholar; and in 1815, after a service of little more than a year in the pulpit, he resigned his charge to accept a professorship of Greek literature in Harvard College.

After nearly five years spent in Europe in preparation, he entered with enthusiasm on his duties, and, for five years more, gave a vigorous impulse, not only to the study of Greek, but to all the work of the college. In January 1820 he assumed the charge of the *North American Review*, which now became a quarterly; and he was indefatigable during the four years of his editorship in contributing a great variety of subjects. From 1825 to 1835 he was a member of the National House of Representatives, supporting generally the administration of President J. Q. Adams and opposing that of Jackson, which succeeded it. He bore a part in almost every important debate, and was a member of the committee of foreign affairs during the whole time of his service in Congress. Everett was a member of nearly all the most important select committees, such as those on the Indian relations of the state of Georgia, the Apportionment Bill, and the Bank of the United States, and drew the report either of the majority or the minority. The report on the congress of Panama, the leading measure of the first session of the Nineteenth Congress, was drawn up by Everett, although he was the youngest member of the committee and had just entered Congress. He led the unsuccessful opposition to the Indian policy of General Jackson (the removal of the Cherokee and other Indians, without their consent, from lands guaranteed to them by treaty).

In 1838 he was elected governor of Massachusetts. He brought to the duties of the office the untiring diligence which was the characteristic of his public life. We can only allude to a few of the measures which received his efficient support, e.g., the establishment of the board of education (the first of such boards in the United States), the scientific surveys of the state (the first of such public surveys), the criminal law commission, and the preservation of a sound currency during the panic of 1837.

Everett filled the office of governor for four years, and was then defeated by a single vote, out of more than one hundred thousand.

The election is of interest historically as being the first important American election where the issue turned on the question of the prohibition of the retail sale of intoxicating liquor. In the following spring he made a visit with his family to Europe. In 1841, while residing in Florence, he was named United States minister to Great Britain, and arrived in London to enter upon the duties of his mission at the close of that year. Great questions were at that time open between the two countries—the north-eastern boundary, the affair of M'Leod, the seizure of American vessels on the coast of Africa, in the course of a few months the affair of the "Creole," to which was soon added the Oregon question. His position was more difficult by reason of the frequent charges that took place in the department at home, which, in the course of four years, was occupied successively by Messrs Webster, Legaré, Upshur, Calhoun and Buchanan. From all these gentlemen Everett received marks of approbation and confidence.

By the institution of the special mission of Lord Ashburton, however, the direct negotiations between the two governments were, about the time of Everett's arrival in London, transferred to Washington, though much business was transacted at the American legation in London.

Immediately after the accession of Polk to the presidency Everett was recalled. From January 1846 to 1849, as the successor of Josiah Quincy, he was president of Harvard College. On the death, in October 1852, of his friend Daniel Webster, to whom he had always been closely attached, and of whom he was always a confidential adviser, he succeeded him as secretary of state, which post he held for the remaining months of Fillmore's administration, leaving it to go into the Senate in 1853, as one of the representatives of Massachusetts. Under the work of the long session of 1853-1854 his health gave way. In May 1854 he resigned his seat, on the orders of his physician, and retired to his home in Dorchester, Massachusetts, which, in the course of four years, was occupied successively by Messrs Webster, Legaré, Upshur, Calhoun and Buchanan. From all these gentlemen Everett received marks of approbation and confidence.

But, as it proved, the remaining ten years of his life most widely established his reputation and influence throughout America. As early as 1820 he had established a reputation as an orator, such as few men in later days have enjoyed. He was frequently invited to deliver an "oration" on some topic of historical or other interest. With him these "orations," instead of being the ephemeral entertainments of an hour, became careful studies of some important theme. Eager to avert, if possible, the impending conflict of arms between the North and South, Everett
EVERETT—EVERGREEN

prepared an "oration" on George Washington, which he delivered in every part of America. In this way, too, he raised more than one hundred thousand dollars, for the purchase of the old home of Washington at Mount Vernon. Everett also prepared for the *Encyclopaedia Britannica* a biographical sketch of Washington, which was published separately in 1860. In 1866 Everett was the candidate of the short-lived Constitutional-Union party for the vice-presidency, on the ticket with John Bell (q.v.), but received only 39 electoral votes.

During the Civil War he zealously supported the national government and was called upon in every quarter to speak at public meetings. He delivered the last of his great orations at Gettysburg, after the battle, on the consecration of the national cemetery there. On the 9th of January 1865 he spoke at a public meeting in Boston to raise funds for the southern poor in Savannah. At that meeting he caught cold, and the immediate result was his death on the 19th of January 1865.

In Everett's life and career was a combination of the results of diligent training, unflinching industry, delicate literary tastes and unequaled acquaintance with modern international politics. This combination made him in America an entirely exceptional person. He was never loved by the political managers; he was always enthusiastically received by assemblies of the people. He would have said himself that the most eulogis of his life had been for the higher education of his countrymen. His orations have been collected in four volumes (1850–1859). A work on international law, on which he was engaged at his death, was never finished. Allibone records 84 titles of his books and published addresses.

(E. E. H.)

**EVERETT,** a city of Middlesex county, Massachusetts, U.S.A., adjoining Chelsea and 3 m. N. of Boston, of which it is a residential suburb. Pop. (1850) 4,419; (1860) 11,068; (1870) 24,336, of whom 6882 were foreign-born; (1910 census) 35,484. It covers an area of about 3 sq. m. and is served by the Boston & Maine railway and by interurban electric lines. Everett has the Frederick E. Parlin memorial library (1858), the Shute memorial library (1858), the Whidden memorial hospital and Woodlawn cemetery (176 acres). The principal manufactures are coke, chemicals and boots and shoes; among others are iron and structural steel. According to the U.S. Census of Manufactures (1893), "the coke industry in Everett is unique, inasmuch as illuminating gas is the primary product and coke a by-product, while the coal used is brought from mines located in Nova Scotia." The value of the city's total factory product increased from $4,437,183 in 1900 to $81,135,650 in 1905 or 188.2%. Everett was the first settled of the remaining part of Malden (and being known as South Malden) until 1870, when it was incorporated as a township. It was chartered as a city in 1892.

**EVERETT,** a city, a sub-port of entry, and the county-seat of Snohomish county, Washington, U.S.A., on Puget Sound, at the mouth of the Snohomish river, about 35 m. N. of Seattle. Pop. (1900) 7838; (1910 U.S. census) 24,814. The city is served by the Northern Pacific and the Great Northern railways, being the western terminus of the latter's main transcontinental line. The city is at the terminus of the rail lines of Puget Sound and coasting freight and passenger steamboats. Everett has a fine harbour with several large iron piers. Among its principal buildings are a Carnegie library, a Y.M.C.A. building and two hospitals. The buildings of the Pacific College were erected here by the United Norwegian Lutheran Church in 1908. The city is in a rich lumbering, gardening, farming, and copper-, gold- and silver-mining district. There is a U.S. assayer's office here, and there are extensive shipyards, a large paper mill, iron works, and, just outside the city limits, the smelters of the American Smelters Securities Company, in connexion with which is one of the two plants in the United States for saving arsenic from smelter fumes. Lumber interests, however, are of most importance, and here are some of the largest lumber plants in the Pacific Northwest. Red-cedar shingles are an important product. Everett was settled in 1891 and was incorporated in 1893. Its rapid growth is due to its favourable situation as a commercial port, its transportation facilities, and its nearness to extensive forests whence the material for its chief industries is obtained.

**EVERGLADES,** an American lake, about 8000 sq. m. in area, in which are numerous half-submerged islands; situated in the southern part of Florida, U.S.A., in Lee, De'Soto, Dade and St Lucie counties. West of it is the Big Cypress Swamp. The floor of the lake is a limestone basin, extending from Lake Okechobee in the N. to the extreme S. part of the state, and the lake varies in depth from 1 to 12 ft., its water being pure and clear. The surface is above tide level, and the lake is wide in the S.W. probably alluvial and lenticular in form, rimming about 10 ft. above mean low tide, and approaching much nearer to the Atlantic on the E. than to the gulf on the W. There are several small outlets, such as the Miami river and the New river on the E. and the Shark river on the S.W., but no streams empty into the Everglades, and the water-supply is furnished by springs and precipitation. There is a general south-easterly movement of the water. The soil of the islands is very fertile and is subject to frequent inundations, but gradually the water area is being replaced by land. The vegetation is luxuriant, the live oak, wild lemon, wild orange, cucumber, papaw, custard apple and wild rubber trees being among the indigenous species; there are, besides, many varieties of wild flowers, the orchids being especially noteworthy. The fauna is also varied; the otter, alligator and crocodile are found, also the deer and panther, and among the native birds are the ibis, egret, heron and limpkin. There are two seasons, wet and dry, but the climate is equable.

Systematic exploration has been prevented by the dense growth of saw grass (*Cladium efusum*), a kind of sedge, with sharp, saw-toothed leaves, which grows everywhere on the muck-covered rock basin and extends several feet above the shallow water. The first white man to enter the region was Eszcalante de Fontenada, a Spanish captive of an Indian war party, who, in 1541, won near the lake Laguno del Espiritu Santo and the islands Cayos del Espiritu Santo. Between 1841 and 1856 various United States military forces penetrated the Everglades for the purpose of attacking and driving out the Seminoles, who took refuge here.

The most important explorations during the later years of the 19th century were those of Major Archie P. Williams in 1883, James E. Ingraham in 1882 and Hugh L. Willoughby in 1897. The Seminole Indians were in 1909 practically the only inhabitants. In 1890 under the "Arkansas Bill," or Swamp and Overflow Act, practically all of the Everglades, which the state had been urging the federal government to drain, were turned over to the state for that purpose, with the provision that all proceeds from such lands be applied to their replacation. A board of trustees for the Internal Improvement Fund, created in 1855 and having as members *ex officio* the governor, comptroller, treasurer, attorney-general and commissioner-general, sold and allowed to railway companies much of the grant. Between 1881 and 1896 a private company owning 4,000,000 acres of the Everglades attempted to dig a canal from Lake Okeechobee through Lake Hicpochee and along the Caloosahatchee river to the Gulf of Mexico; the canal was completed in 1902 by overflows. Six canals were begun under state control in 1905 from the lake to the Atlantic, the northernmost at Jensen, the southernmost at Ft. Lauderdale; the total cost, estimated at $1,035,000 for the reclamation of 12,500 sq. m., is raised by drainage tax (not to exceed 10 cents per acre) levied by the trustees of the Internal Improvement Fund and Board of Drainage commissioners. The small area reclaimed prior to that year (1905) was found very fertile and particularly adapted to raising sugar-cane, oranges and garden truck.

**EVERGREEN,** a general term applied to plants which are always in leaf, as contrasted with deciduous trees which are bare for some part of the year (see Horticulture). In
temperate or colder zones where a season favourable to vegetation is succeeded by an unavourable or winter season, leaves of evergreens must be protected from the frost and cold drying winds, and are therefore tougher or more leathery in texture than those of deciduous trees, and frequently, as in pines, firs and other conifers, are needle-like, thus exposing a much smaller surface to the drying action of cold winds. The number of seasons for which the leaves last varies in different plants; every season some of the older leaves fall, while new ones are regularly produced. The common English Bramble is practically evergreen, the leaves lasting through winter and until the new leaves are developed next spring. In privet also the leaves fall after the production of new ones in the next year. In other cases the leaves last several years, as in conifers, and may sometimes be found on eleven-year-old shoots.

Everlasting, or immortelle, a plant belonging to the division Tubuliflorae of the natural order Compositae, botanically known as Helichrysum orientale. It is a native of North Africa, Crete, and the parts of Asia bordering on the Mediterranean; and it is cultivated in many parts of Europe. It first became known in Europe about the year 1650, and has been cultivated since 1815. In common with several other plants of the same group, known as "everlastings," the immortelle plant possesses a large involucre of dry scale-like or scarious bracts, which preserve their appearance when dried, provided the plant be gathered in proper condition. The chief supplies of Helichrysum orientale come from lower Provence, where it is cultivated in large quantities on the ground sloping to the Mediterranean, in positions well exposed to the sun, and usually in plots surrounded by dry stone walls. The finest flowers are grown on the slopes of Bandol and Ciotat, where the plant begins to flower in June. It requires a light sandy or stony soil, and is very readily injured by rain or heavy dews. It cannot be propagated in quantity by means of offsets from the older stems. The flowering stems are gathered in June, when the bracts are fully developed, all the fully-expanded and immature flowers being pulled off and rejected. A well-managed plantation is productive for eight or ten years. The plant is tufted in its growth, each plant producing 60 or 70 stems, while each stem produces an average of 20 flowers. About 400 such stems weigh a kilogramme. A hectare of ground will produce 20,000 plants, bearing flower. It bore 2,800,000 stems, and weighing from 53 to 64 tons, or from 2 to 3 tons per acre. The colour of the bracts is a deep yellow. The natural flowers are commonly used for garlands for the dead, or plants dyed black are mixed with the yellow ones. The plant is also dyed green or orange-red, and thus employed for bouquets or other ornamental purposes.

Other species of Helichrysum and species of allied genera with scarious heads of flowers are also known as "everlastings." One of the best known is the Australian species H. bracteatum, with several varieties, including double forms, of different colours; H. pistillum (Cape of Good Hope) has white satiny heads. Others are species of Helipterum (West Australia and South Africa), Ammobium and Waitzia (Australia) and Xeranthemum (south Europe). Several members of the natural order Amaranthaceae have also "everlasting" flowers; such as Gomphrena globosa, with rounded or oval heads of white, orange, rose or violet, scarious bracts, and Celosia pyramidalis, with its elegant, loose, pyramidal inflorescences. Frequently these everlasting are mixed with bleached grasses, as Lagurus ovatus, Brita maxima, Bromus bristleformus, or with the leaves of the Cape silver tree (Leucodendrum argenteum), to form bouquets or ornamental groups.

Eversley, Charles Shaw Lefevre, Viscount (1794-1888), speaker of the British House of Commons, eldest son of Mr Charles Shaw (who assumed his wife's name of Lefevre in addition to his own on his marriage), was born in London on the 22nd of February 1794, and educated at Winchester and at Trinity College, Cambridge. He was called to the bar in 1819, and though a diligent student was also a keen sportsman. Marrying a daughter of Mr Samuel Whitbread, whose wife was the sister of Earl Grey, afterwards premier, he thus became connected with two influential political families, and in 1830 he entered the House of Commons as member for Downton, in the Liberal interest. In 1831 he was returned, after a severe contest, as one of the county members for Hampshire, in which he resided; and after the passing of the Reform Act of 1832 he was elected for the Northern Division of the county. For some years Mr Shaw Lefevre was chairman of a committee on petitions for private bills. In 1835 he was chairman of a committee on agricultural distress, but as his report was not accepted by the House, he published it as a pamphlet addressed to his constituents. He acquired a high reputation in the House of Commons for his judicial fairness, combined with singular tact and courtesy, and when Mr James Abercromby retired in 1839, he was nominated as the Liberal candidate for the chair. The Conservatives put forward Henry Goulburn, but Mr Shaw Lefevre was elected by 317 votes to 290. The period was one of fierce party conflict, and the debates were frequently very acrimonious; but the dignity, temper and firmness of the new speaker were never at fault. In 1857 he had served longer than any of his predecessors except the celebrated Arthur Osmaston, who was speaker for more than 33 years in five successive parliaments. Retiring on a pension, he was raised to the peerage as Viscount Eversley of Heckfield, in the county of Hampshire. His appearances in the House of Lords were very infrequent, but in his own county he was active in the public service. From 1859 he was an ecclesiastical commissioner, and he was also appointed a trustee of the British Museum. He died on the 28th of December 1888, the viscountcy becoming extinct.

His younger brother, Sir John George Shaw Lefevre (1797-1879), who was senior wrangler at Cambridge in 1818, had a long and distinguished career as a public official. He was under-secretary for the colonies, and had much to do with the introduction of the new poor law in 1834, and with the foundation of the colony of South Australia; then having served on several important commissions he was made clerk of the parliaments in 1855, and in the same year became one of the first civil service commissioners. He helped to found the university of London, of which he was vice-chancellor for twenty years, and also the Athenaeum Club. He died on the 20th of August 1879.

The fourth son, George John Shaw Lefevre (b. 1832), was created Baron Eversley in 1906, in recognition of long and prominent services to the Liberal party. He had filled the following offices:—civil lord of the admiralty, 1856; secretary to the board of trade, 1869-1871; under-secretary, home office, 1871; secretary to the admiralty, 1871-1874; first commissioner of works, 1881-1883; postmaster-general, 1883-1884; first commissioner of works, 1892-1893; president of local government board, 1894-1895; chairman of the royal commission on agriculture, 1895-1896.

Evesham, a market-town and municipal borough in the Evesham parliamentary division of Worcestershire, England, 109 m. W.W.N. of London by the Great Western railway, and 15 m. S.E. by E. of Worcester, with a station on the Redditch-Ashchurch branch of the Midland railway. Pop. (1901) 7101. It lies on the right (north) bank of the Avon, in the rich and beautiful Vale of Evesham. The district is devoted to market-gardening and orchards, and the trade of the town is mainly agricultural. Evesham is a place of considerable antiquity, a Benedictine house having been founded here by St Egwin in the 8th century. It became a wealthy abbey, but was almost wholly destroyed at the Dissolution. The churchyard, however, is fenced by a Norman gateway, and there survives also a magnificent isolated bell-tower dating from 1553, of the best ornate Perpendicular workmanship. The abbey walls surround the churchyard, but almost the only other remnant is a single Decorated arch. Close to the bell-tower, however, are the two parish churches of St Lawrence and of All Saints, the former of the 16th century, the latter containing Early English work, and the ornate chapel of Abbot Lichfield, who erected the bell-tower. Other buildings include an Elizabethan town hall, the grammar school, founded by Abbot Lichfield, and the picturesque
The narrower the granted the Bengeworth almonry. The earl had been given a grant of land by the abbey, by a bishop, and by the town. Before 1482 the burgesses were holding the town at a fee farm rent of twenty marks, but the abbot still had practical control of the town, and his steward presided over the court at which the bailiffs were chosen. After the Dissolution the manor with the markets and fairs and other privileges was granted to Sir Philip Hoby, who increased his power over the town by persuading the burgesses to agree that, after they had nominated six candidates for the office of bailiff, the steward of the court instructed by him should indicate the two to be chosen. This privilege was contested by Queen Elizabeth, but when the case was taken before the court of the exchequer it was decided in favour of Sir Philip's heir, Sir Edward Hoby. In 1604 James I. granted the burgesses their first charter, but in the following year, by a second charter, he incorporated Evesham with the village of Bengeworth, and granted that the borough should be governed by a mayor and seven aldermen, to whom he gave the power of holding markets and fairs and several other privileges which had formerly belonged to the lord of the manor. Evesham received two later charters, but in 1688 that of 1605 was restored and still remains the governing charter of the borough. Evesham returned two members to parliament in 1325 and again in 1337, after which date the privilege lapsed until 1604. Its two members were reduced to one by the act of 1867, and the borough was disfranchised in 1885.

Evesham gave its name to the famous battle, fought on the 4th of August 1265, between the forces of Simon de Montfort, earl of Leicester, and the royalist army under Prince Edward. After a masterly campaign, in which the prince had succeeded in defeating Leicester in the valleys of the Severn and Usk, and bad destroyed the forces of the younger Montfort at Kenilworth before he could effect a junction with the main body, the royalist forces approached Evesham in the morning of the 4th of August in battle array. The battle was joined, and the prince was defeated. Caught in the bend of the river Avon by the converging columns, and surrounded on all sides, the old earl attempted to cut his way out of the town to the northward. At first the fury of his assault forced back the superior numbers of the prince; but Simon's Welsh levies melted away and his enemies closed the last avenue of escape. The final struggle took place on Green Hill, a little to the north-west of the town, where the devoted friends of de Montfort formed a ring round their leader, and died with him. The spot is marked with an obelisk.

EVIDENCE (Lat. evidens, edentior, to appear clearly), a term which may be defined briefly as denoting the facts presented to the mind of a person for the purpose of enabling him to decide a disputed question. Evidence in the widest sense includes all such facts, and reference may be made to the article LOGIC for the science or art of dealing with the proper way of drawing correct conclusions and the nature of proof. In a narrower sense, however, evidence includes in English law only such facts as are allowed to be so presented in the course of judicial proceedings. Thus we say that a fact is not evidence, meaning thereby that it is not admissible as evidence in accordance with the rules of evidence. The law of evidence is part of the law of procedure. It determines the nature of evidence which may be produced in judicial proceedings, and regulates the mode in which, and the conditions under which, evidence may be produced and tested.

The English law of evidence is of comparatively modern growth. It enshrines certain maxims, some derived from Roman law, some invented by Coke, who, as J. B. Thayer says, “spawned Latin maxims freely.” But for the most part it was built up by English judges in the course of the 18th century, and consists of this judge-made law, as modified by statutory enactments of the 19th century. Early Teutonic procedure knew nothing of evidence in the modern sense, just as it knew nothing of trials in the modern sense. What it knew was “proofs.” There were two modes of proof, ordeals and oaths. Both were appeals to the supernatural. The judicial combat was a bilateral ordeal. Proof followed, instead of preceding, judgment. A judgment of the court, called by German writers the Beweisurtei, and by M. M. Bigelow the “medial judgment,” awarded that one of the two litigants must prove his case, by his body in battle, or by a one-sided ordeal, or by an oath with oath-belters, or by the oaths of witnesses. The court had no desire to hear or weigh conflicting testimony. To do so would have been to exercise critical faculties, which the court did not possess, and the exercise of which would have been foreign to the whole spirit of the age. The litigant upon whom the burden of furnishing proof was imposed bad a certain task to perform. If he performed it, he won; if he failed, he lost. The number of oath-belters varied in different cases, and was determined by the law or by the court. They were probably, at the outset, kinsmen, who would have bad to take up the blood-feud. At a later stage they became witnesses to character. In the cases, comparatively rare, where the oaths of witnesses were admitted as proof, their oaths differed materially from the sworn testimony of modern courts. As a rule no one could testify to a fact unless, when the fact happened, he was solemnly “taken to witness.” Then, when the witness was added, he came merely to swear to a set formula. He did not make a promissory oath to answer questions truly. He merely made an asserty oath in a prescribed form.

In the course of the 12th and 13th centuries the old formal accusatory procedure began to break down, and to be superseded by another form of procedure known as inquisitio, inquest, or enquête. Its decay was hastened by the decree of the fourth Lateran Council in 1215, which forbade ecclesiastics to take part in ordeals. The Norman administrative system introduced into England by the Conquest was familiar with a method of ascertaining and determining facts by means of a verdict, return or finding made on oath by a body of men drawn from the locality. The system may be traced to Carolingian, and even earlier, sources. Henry II., by instituting the grand assize and the petty assize, placed in the disposal of the king's officers the opportunity of giving proof by the verdict of a sworn inquest of neighbours, proof “by the country.” The system was gradually extended to other cases, criminal as well as civil. The verdict given was that of persons having a general, but not necessarily a particular, acquaintance with the persons, places and facts to which the inquiry related. It was, in fact, a finding by local popular opinion. Had the finding of such an inquest been treated as final and conclusive in criminal cases, English criminal procedure might, like the continental inquisition, the French enquête, have taken the path which, in the forcible language of Fortescue (De Laudibus, &c.) “leads to hell” (semia ipsa est ad gehennam). Fortunately English criminal procedure took a different course. The spirit of the old accusatory procedure was applied to the new procedure by inquest. In serious cases the words of the jurors, the accusing jurors, were treated not as testimony, but as accusation, the new indictment was treated as corresponding to the old appeal, and the preliminary finding by the accusing jury bad to be supplemented by the verdict of another jury. In course of time the second jury were required to base their findings not on their own knowledge, but on evidence submitted to them. Thus the modern system of grand jury and trial by petty jury was gradually developed.

A few words may here be said about the parallel development of criminal procedure on the continent of Europe. The tendency in the 12th and 13th centuries to abolish the old formal methods of procedure, and to give the new procedure the name of inquisition or inquest, was not peculiar to England. Elsewhere the old procedure was breaking down at the same time, and for similar reasons. It was the great pope Innocent III., the pope
of the fourth Lateran Council, who introduced the new inquisitorial procedure into the canon law. The procedure was applied to cases of heresy, and, as so applied, especially by the Dominicans, speedily assumed the features which made it infamous. Every safeguard of innocence was abolished or disregarded; torture was freely used. Everything seems to have been done to secure a conviction. Yet, in spite of its monstrous defects, the inquisitorial procedure of the ecclesiastical courts, secret in its methods, unfair to the accused, having torture as an integral element, gradually forced its way into the temporal courts, and may almost be said to have been adopted by the common law of western Europe. In connexion with this inquisitorial procedure continental jurists elaborated a theory of evidence, or judicial proofs, which formed the subject of an extensive literature. Under the rules thus evolved full proof (plena probatio) was essential for conviction, in the absence of confession, and the standard of full proof was fixed so high that it was in most cases unattainable. It therefore became material to obtain confession by some means or other. The most effective means was torture, and thus torture became an essential feature in criminal procedure. The rules of evidence attempted to graduate the weight to be attached to different kinds of testimony and almost to estimate that weight in numerical terms. "Le parlement de Toulouse," said Voltaire, "a un usage tres singulier dans les preuves par témoins. On admettait des demi-preuves,... mais a Toulouse on admettait des quarts et des huitièmes de preuve." Modern inquisitorial procedure is embodied in the later codes, has formed the basis of the present evidence, of the inquisitorial procedure, and has shaken itself free from the trammels imposed by the old theory and technical rules of proof. But in this, as in other branches of law, France seems to have paid the penalty for having been first in the field with codification by lagging behind in material reforms. The French Code of Criminal Procedure was largely based on Colbert's Ordinance of 1670, and though embodying some reforms, and since amended on certain points, still retains some of the features of the unreformed procedure which was condemned in the 18th century by Voltaire and the philosophes. Military procedure is the rapacious leviathan of the legal profession, and the trial of Captain Dreyfus at Rennes in 1899 presented some interesting archaisms. Among these were the weight attached to the rank and position of witnesses as compared with the intrinsic character of their evidence, and the extraordinary importance attributed to confession even when made under suspicious circumstances and supported by flimsy evidence.

The history of criminal procedure in England has been traced by Sir James Stephen. The modern rules and practice as to evidence and witnesses in the common law courts, both in civil and in criminal cases, appear to have taken shape in the latter part of the 18th century. The first systematic treatise on the English law of evidence appears to have been written by Chief Baron Gilbert, who died in 1726, but whose Law of Evidence was not published until 1761. In writing it he is said to have been much influenced by Locke.1 It is highly praised by Blackstone as "a work which it is impossible to abstract or abridge without losing some beauty and destroying the charm of the whole"; but Bentham, who rarely agrees with Blackstone, speaks of it as running throughout "in the same strain of anility, garrulity, narrow-mindedness, absurdity, perpetual misrepresentation and indefatigable self contradiction." In any case it remained the standard authority on the law of evidence throughout the remainder of the 18th century. Bentham wrote his Rationale of Judicial Evidence, specially applied to English Practice, at various times between the years 1802 and 1812.

By this time he had lost the nervous and simple style of his youth, and required an editor to make him readable. His great interpreter, Dumont, condensed his views on evidence into the Traité des preuves judiciaires, which was published in 1853. The manuscript of the Rationale was edited for English readers and to a great extent rewritten, by J. S. Mill, and was published in five volumes in 1827. The book had a great effect both in England and on the continent. The English version, though crabbed and artificial in style, and unmeasured in its invective, is a storehouse of comments and criticisms on the principles of evidence and the practice of the courts, which are always shrewd and often profound. Bentham examined the practice of the courts by the light of practical utility. Starting from the principle that the object of judicial evidence is the discovery of truth, he condemned the rules which excluded some of the best sources of evidence. The most characteristic feature of the common-law rules of evidence was, as Bentham pointed out, and, indeed, still is, their exclusionary character. They excluded and prohibited the use of certain kinds of evidence which would be used in ordinary inquiries. In particular, they disqualified certain classes of witnesses on the ground of interest in the subject-matter of the inquiry, instead of treating the interest of the witness as a matter affecting his credibility. It was against this confusion between competency and credibility that Bentham directed his principal attack. He also attacked the system of paper evidence, evidence by affidavits instead of by oral evidence for or against him, in evidence for or against him. An act of 1840 removed some doubts as to the competency of ratepayers to give evidence in matters relating to their parish. The Evidence Act 1843 enacted broadly that witnesses should not be excluded from giving evidence by reason of incapacity from crime or interest. The Evidence Act 1851 made parties to legal proceedings admissible witnesses subject to a proviso that "nothing herein contained shall render any person who in any criminal proceeding is charged with the commission of any indictable offence, or any offence punishable on summary conviction, competent to testify as a witness in respect of anything which may tend to criminate him or himself, or which shall render any person compellable to answer any question tending to criminate himself or herself, or shall in any criminal proceeding render any husband competent or compellable to give evidence for or against his wife, or any wife competent or compellable to give evidence for or against her husband." The Evidence (Scotland) Act 1853 made a similar provision for Scotland. The Evidence Amendment Act 1853 made the husbands and wives of parties admissible witnesses, except that husbands and wives could not give evidence for or against each other in criminal proceedings or in proceedings for or against them, and could not be compelled to disclose communications made to each other during marriage. Under the Matrimonial Causes Act 1857 the petitioner can be examined and cross-examined on oath at the hearing, but is not bound to answer any question tending to show that he or she has been guilty of adultery. Under the Matrimonial Causes Act 1859, on a wife's petition for dissolution of marriage on the ground of adultery coupled with cruelty or desertion, husband and wife are competent and compellable to give evidence as to the cruelty or desertion. The Crown Suits &c. Act 1865 declared that revenue proceedings were not to be admissible as criminal, nor as evidence of the facts of the acts of 1851 and 1853. The Evidence Further Amendment Act 1869 declared that parties to actions for breach of promise of marriage

---

1 Reference may be made to a well-known passage in the Essay concerning Human Understanding (Book iv. ch. xv.): "The grounds of probability are,—First, the conformity of anything with our own knowledge, observation and experience. Second, the testimony of other believing persons in observation and experience. In the testimony of others is to be considered (1) the number, (2) the integrity, (3) the skill of the witnesses, (4) the design of the author, where it is a testimony out of a book cited, (5) the consistency of the parts and circumstances of the relation, (6) contrary testimonies."
were competent to give evidence in the action, subject to a proviso that the plaintiff should not recover unless his or her testimony was corroborated by some other material evidence. It also made the parties to proceedings instituted in consequence of adultery, and the husband and malicious, competent to give evidence, but a witness in any such proceeding, without cross-examination, but or not, is not to be liable to be asked or bound to answer any question tending to show that he or she has been guilty of adultery, unless the witness has already given evidence in the same proceeding in disproof of the alleged adultery. There are similar provisions applying to Scotland in the Conjugal Rights (Scotland) Amendment Act 1861, and the Evidence Further Amendment (Scotland) Act 1874. The Evidence Act 1877 enacts that "on the trial of any indictment or other proceeding for the non-repair of any public highway or bridge, or for a nuisance to any public highway, river, or bridge, and of any other indictment or proceeding instituted for the purpose of trying or enforcing a civil right only, every defendant to such indictment or proceeding, and the wife or husband of any such defendant shall be admissible witnesses and compellable to give evidence." From 1872 onwards numerous enactments were passed making persons charged with particular offences, and their husbands and wives, competent witnesses. The language and effect of these enactments were not always the same, but the insertion of some proviso to this effect in an act creating a new offence, especially if it was punishable by summary proceedings, gradually became almost a common form in legislation. In the year 1874 a bill to generalize these particular provisions, and to make the evidence of persons charged with criminal offences admissible in all cases was introduced by Mr. Gladstone's government, and was passed by the standing committee of the House of Commons. During the next fourteen years bills for the same purpose were repeatedly introduced, either by the government of the day, or by Lord Bramwell as an independent member of the House of Lords. Finally the Criminal Evidence Act 1858, introduced by Lord Halsbury, has enacted in general terms that "every person charged with an offence, and the wife or husband, as the case may be, of the person so charged, shall be a competent witness for the defence at every stage of the proceedings, whether the person so charged is charged solely or jointly with any other person." But this general enactment is qualified by some special restrictions, the nature of which will be noticed below. The act applies to Scotland but not to Ireland. It was not to apply to proceedings in courts-martial unless so applied by general orders or rules made under statutory authority. The provisions of the act have been applied by rules to military courts-martial, but have not yet been applied to naval courts-martial. The removal of disqualifications for want of religious belief is referred to below under the head of "Witnesses."

The act of 1898 finishes for the present the history of English legislation on evidence. For a view of the legal literature on the subject it is necessary to take a step backwards. Early in the 19th century Chief Baron Gilbert was supposed as an authority on the English law of evidence by the books of Phillips (1814) and Starkie (1824), who were followed by Roscoe (Nisi Prius, 1827; Criminal Cases, 1835), Greenleaf (American, 1842), Taylor (based on Greenleaf, 1848), and Best (1849). In 1872 Sir James Stephen published his "A Digest of the Law of Evidence," based upon the Indian Evidence Act 1872, which he had prepared and passed as law member of the council of the governor-general of India. This Digest obtained a rapid and well-deserved success, and has materially influenced the form of subsequent writings on the English law of evidence. It sifted out what Stephen conceived to be the main rules of evidence from "the various maxims of which they had been enwrapped". Roscoe's Digests told the legal historian what things might be proved in order to sustain particular actions or criminal charges, and related as much to pleadings and to substantive law as to evidence. There were two large defects in them, that they were a wealth of useful information, but his book was one to consult, not to master. Stephen eliminated much of this extraneous matter, and summed up his views in a series of succinct propositions, supplemented by apt illustrations in such a way that they could be read and remembered. Hence the English Digest, like the Indian Act, has been of much educational value. Its most original feature, but unfortunately also its weakest point, is its theory of relevancy.

Pondering the multitude of "exclusionary" rules which had been laid down by the Roman law, Sir James Stephen thought that he had discovered the general principle on which those rules rested, and could devise a formula by which the principle could be expressed. "My study of the subject," he says, "both practically and in books has convinced me that the doctrine which I shall attempt to express to the issue, and no others, may be proved, is the unexpressed principle which forms the centre and gives unity to all the express negative rules which form the great mass of the law." The result was the rule, based on the relevancy of facts in the Indian Evidence Act, and the definition of relevancy in s. 7 of that act. This definition was based on the view that a distinction could be drawn between things which were admissible as evidence, and things which were necessarily connected with each other, and that relevancy depended on causative connection. Subsequent criticism convinced Stephen that his definition was in some respects too narrow and in others too wide, and eventually he made the following definition which is still in force.

The doctrine of relevancy, i.e. of the presumptive effect of facts, is a branch of logic, not of law, and is not of place of evidential logic, to which was added an act a compendium of legal rules. The necessity under which Stephen found himself of extending the range of relevant facts by making it "deemed to be relevant," and then narrowing it by enabling the judge to exclude evidence of facts which are relevant, illustrates the difference between the rules of logic and the rules of law. Relevancy is one thing; admissibility is another; and the connection between the two is much more involved than Stephen supposed or recognised. Rightly or wrongly English judges have, on practical grounds, declared inadmissible evidence of facts, which are relevant in the ordinary sense of the term, and which are so treated in non-judicial and nontechnical literature. Instead of the phrase "relevant as to define relevancy as to make it conterminous with admissibility is misleading, and most readers of Stephen's Act and Digest would find it more intelligible and more useful if 'admissible' were substituted for "relevant." Throughout. Indeed it is hardly too much to say that Stephen's doctrine of relevancy is theoretically unsound and practically useless. The other parts of the work contain some tense and vigorous statements of the law, but a Prussian attempt to make legal rules square with a preconceived theory has often made the language and arrangement artificial, and the work, in spite of its compression, still contains rules which, under a more scientific treatment, would find their appropriate places in the branches of the law. These defects are characteristic of a strong and able man, who saw clearly, and expressed forcibly what he did see, but who was apt to ignore or to deny the existence of what he did not see, whose mind was sometimes unexpressed, and who, in spite of his learning, was somewhat deficient in the historical sense. But notwithstanding these defects, the comprehensive ability of the author, his learning, and his practical experience, especially in criminal cases, attach greater weight to FitzJames Stephen's statements than to those of any other English writer on the law of evidence.

The object of every trial is, or may be, to determine two classes of questions or issues, which are usually distinguished as questions of law, and questions of fact, although the distinction between them is not so clear as might appear on a superficial view. In a trial by jury these two classes of questions are answered by different persons. The judge lays down the law. The jury, under the guidance of the judge, find the facts. It was with reference to trial by jury that the English rules of evidence were originally framed; it is by the peculiarities of this form of trial alone that many of the most important of them are exclusively applicable. The negative, exclusive, or exclusionary rules which form the characteristic features of the English law of evidence, are the rules in accordance with which the judge guides the jury. There is no difference of principle between the method of inquiry in judicial and in non-judicial proceedings. In either case a person who wishes to find out whether a particular event did or did not happen, tries, in the first place, to obtain information from persons who were present, and saw what happened (direct evidence), and, failing this, to obtain information from persons who can tell him about facts from which he can draw an inference as to whether the event did or did not happen (indirect evidence). But in judicial inquiries the information given must be given on oath, and be liable to be tested by cross-examination. And there are rules of law which exclude from the consideration of the jury certain classes of facts which, in an ordinary inquiry, would, or might, be taken into consideration. Facts so excluded are said to be "not admissible as evidence," or "not evidence," according
EVIDENCE

as the word is used in the wider or in the narrower sense. And the easiest way of determining whether a fact is or is not evidence in the narrower sense, is first to consider whether it has any bearing on the question to be tried, and, if it has, to consider whether it falls within any one or more of the rules of exclusion laid down by English law. These rules of exclusion are peculiar to English law and to systems derived from English law. They have been much criticized, and some of them have been repealed or materially modified by legislation. Most of them may be traced to directions given by a judge in the course of trying a particular case, given with special reference to the circumstances of that case, but expressed in general language, and, partly through the influence of text-writers, eventually hardened into general rules. In some cases their origin is only intelligible by reference to obsolete forms of pleading or practice. But in most cases they were originally rules of convenience laid down by the judge for the assistance of the jury. The judge is a man of trained experience, who has to arrive at a conclusion with the help of twelve untrained men, and who is naturally anxious to keep them straight, and give them every assistance in his power. The exclusion of certain forms of evidence assists the jury by concentrating their attention on the particular points connected with them, and by preventing them from being distracted or bewildered by facts which either have no bearing on the question before them, or have so remote a bearing on those questions as to be practically useless as guides to the truth. It also prevents a jury from being misled by statements the effect of which, through the prejudice they excite, is out of all proportion to their true weight. In this respect the rules of exclusion may be compared to blinkers, which keep a horse's eyes on the road before him. In criminal cases the rules of exclusion secure fair play to the accused, because he comes to the trial prepared to meet a specific charge, and ought not to be suddenly confronted by statements which he had no reason to expect would be made against him. They protect absent persons against statements affecting their character. And lastly they prevent the infinite waste of time which would ensue in the discussion of a question of fact if an inquiry were allowed to branch out into all the subjects with which that fact is more or less connected. The purely practical grounds on which the rules are based, according to the view of a great judge, may be illustrated by some remarks of Mr Justice Willis (1814-1872). In discussing the question whether evidence of a plaintiff's conduct on other occasions ought to be admitted, he said—

"It is not easy in all cases to draw the line and to define with accuracy where probability ceases and speculation begins; but we are bound to lay down the rule to the best of our ability. No doubt the rule as to confining the evidence to that which is relevant and of great importance is of great weight. In the first place, it is a matter of great importance, not only with regard to the particular case, but also with reference to saving the time of the court, and preventing the minds of the jury from being drawn away from the real point they have to decide. . . . Now it appears to me that the evidence proposed to be given in this case, if admitted, would not have shown that it was more probable that the contract was subject to the condition insisted upon by the defendant. The question may be put thus, Does the fact of a person having once or many times in his life done a particular act in a particular way make it more probable that he has done the same thing in the same way upon another and different occasion? To answer that question by evidence which I think, he feared, was of great danger. . . . If such evidence were held admissible it would be difficult to say that the defendant might not in any case, where the question was whether or not there had been a sale of goods on credit, call witnesses to prove that the plaintiff had dealt with other persons upon a certain credit; or, in an action for an assault, that the plaintiff might not give evidence of former assaults committed by the defendant upon other persons, or upon other persons of a particular class, for the purpose of showing that he was a quarrelsome individual, and therefore that it was highly probable that the particular charge of assault was well founded. The extent to which this sort of evidence may be admitted is a question which is not strictly the prejudices, the injustice, and the waste of time to which the admission of such evidence would lead, and bearing in mind the extent to which it might be carried, and that litigants are mortal, it is not to be wondered at if an access is here and there occasionally be properly admitted in evidence where no custom of trade to make such contracts, and no connexion between such and the one in question, was shown to exist." (Hollingham v. Head, 1855, 4 C.B. N.S. 388).

There is no difference between the principles of evidence in civil and in criminal cases, although there are a few special rules, such as those relating to confessions and to dying declarations, which are only applicable to criminal proceedings. But in civil cases the issues are narrowed by mutual admissions of the parties, more evidence is made of evidence taken out of court, such as affidavits, and, generally, the rules of evidence are less strictly applied. It is often impolitic to object to the admission of evidence, even when the objection may be sustained by previous rulings. The general tendency of modern procedure is to place a more liberal and less technical construction on rules of evidence, especially in civil cases. In recent volumes of law reports cases turning on the admissibility of evidence are conspicuous by their rarity. Various causes have operated in this direction. One of them has been the change in the system of pleading, under which there are fewer rules. Another is the interaction of chancery and common-law practice and traditions since the Judicature Acts. In the chancery courts the rules of evidence were always less carefully observed, or, as Westminster would have said, less understood, than in the courts of common law. A judge trying questions of fact alone might naturally think that blinkers, though useful for a jury, are unnecessary for a judge. And the chancery judge was apt to read his affidavits first, and to determine their admissibility afterwards. In the meantime they had affected his mind.

The tendency of modern text-writers, among whom Professor J. B. Thayer (1831-1909), of Harvard, was perhaps the most independent, instructive and suggestive, is to restrict materially the field occupied by the law of evidence, and to relegate to other branches of the law topics traditionally treated under the head of evidence. Thus in every way the law of evidence, though still embodying some principles of great importance, is of less comparative importance as a branch of English law than it was half a century ago. Legal rules, like dogmas, have their growth and decay. First comes the judge who gives a ruling in a particular case. Then comes the text-writer who collects the scattered rulings, throws them into the form of general propositions, connects them together by some theory, some generalization, and often ignores or obscures their historical origin. After him comes the legislator who crystallizes the propositions into enactments, not always to the advantage of mankind. So also with decay. Legal rules fall into the background, are explained away, are ignored, are denied, are overruled. Much of the English law of evidence is in a stage of decay.

The subject-matter of the law of evidence may be arranged differently according to the taste or point of view of the writer. It will be arranged here under the following heads:—I. Preliminary Matter; II. Classes of Evidence; III. Rules of Exclusion; IV. Documentary Evidence; V. Witnesses.

I. Preliminary Matter

Under this head may be grouped certain principles and considerations which limit the range of matters to which evidence relates.

1. Law and Fact.—Evidence relates only to facts. It is therefore necessary to touch on the distinction between law and facts. Ad quaestionem facti non respondent judices; ad quaestionem juris non respondunt juratores. Thus Coke, attributing, after his wont, to Bracton a maxim which may have been invented by himself. The maxim became the subject of political controversy, and the two rival views are represented by Pulteney's lines—

"For twelve honest men have decided the cause,
Who are judges alike of the facts and the laws,"

and by Lord Mansfield's variant—

"Who are judges of facts, but not judges of laws."

The particular question raised with respect to the law of libel
EVIDENCE

was settled by Fox's Libel Act 1792. Coke's maxim describes in a broad general way the distinction between the functions of the judge and of the jury, but is only true subject to important qualifications. Judges in jury cases constantly decide what may be properly called questions of fact, though their action is often disguised by the language applied or the procedure employed. Juries, in giving a general verdict, often practically take to law as you have learned it. The border-line between the two classes of questions is indicated by the "mixed questions of law and fact," to use a common phrase, which arise in such cases as those relating to "necessary," "due diligence," "negligence," "reasonableness," "reasonable and probable cause." In the treatment of these cases the line has been drawn differently at different times, and two conflicting tendencies are discernible. On the one hand, there is the natural tendency to generalize common inferences into legal rules, and to fix legal standards of duty. On the other hand, there is the sound instinct that it is a mistake to define and refine too much in these cases, and that the better course is to leave broadly to the jury, under the general guidance of the judge, the question what would be done by the "reasonable" or "prudent" man in particular cases. The latter tendency predominates in modern English law, and is reflected by the enactments in the recent acts codifying the law on bills of exchange and sale of goods, that certain questions of reasonableness are to be treated as questions of fact. On the same ground rests the dislike to limit the right of a jury to give a general verdict in criminal cases. Questions of custom begin by being questions of fact, but as the custom obtains general recognition it becomes law. Many of the rules of the English mercantile law were "found" as customs by Lord Mansfield's special juries. Generally, it must be remembered that the jury act in subordinate co-operation with the judge, and that the extent to which the judge limits or encroaches on the province of the jury is apt to depend on the personal idiosyncrasy of the judge.

2. Judicial Notice.—It may be doubted whether the subject of judicial notice belongs properly to the law of evidence, and whether it does not belong rather to the general topic of legal or judicial reasoning. Matters which are the subject of judicial notice are part of the equipment of the judicial mind. It would be absurd to require evidence of every fact; many facts must be assumed to be known. The judge, like the juryman, is supposed to bring with him to the consideration of the question which he has to try common sense, a general knowledge of human nature and the ways of the world, and also knowledge of things that "everybody is supposed to know." Of such matters judicial notice is said to be taken. But the range of general knowledge is indefinite, and the range of judicial notice has, for reasons of convenience, been fixed or extended, both by rulings of the judges and by numerous enactments of the legislature. It would be impossible to enumerate here the matters of which judicial notice must or may be taken. These are to be found in the text-books. For present purposes it must suffice to say that they include not only matters of fact of common and certain knowledge, but the law and practice of the courts, and many matters connected with the government of the country.

3. Presumptions.—A presumption in the ordinary sense is an inference. It is an argument, based on observation, that what has happened in some cases will probably happen in others of the like nature. The subject of presumptions, so far as they are mere inferences or arguments, belongs, not to the law of evidence, or to law at all, but to rules of reasoning. But a legal presumption, or, as it is sometimes called, a presumption of law, as distinguished from a presumption of fact, is something more. It may be described, in Stephen's language, as "a rule of law that courts and judges shall draw a particular inference from a particular fact, or from particular evidence, unless and until the truth" (perhaps it would be better to say "soundness") "of the inference is disproved." Courts and legislatures have laid down such rules on grounds of public policy or general convenience, and the rules have then to be observed as rules of positive law, not merely used as part of the ordinary process of reasoning or argument. Some so-called presumptions are rules of substantive law under a disguise. To this class appear to belong "conclusive presumptions of law," such as the common-law presumption that a child under seven years of age cannot commit a felony. So again the presumption that every one knows the law is merely an awkward way of saying that ignorance of the law is not a legal excuse. Out of true legal presumptions, the majority may be dealt with most appropriately under different branches of the substantive law, such as the law of crime, of property, or of contract, and accordingly Stephen has included in his Digest of the Law of Evidence only some which are common to more than one branch of the law. The effect of a presumption is to impute to certain facts or groups of facts a prima facie significance or operation, and, in legal proceedings, to throw upon the party against whom it works the duty of bringing forward evidence to meet it. Accordingly the subject of presumptions is intimately connected with the subject of the burden of proof, and the same legal rule may be expressed in different forms, either as throwing the advantage of a presumption on one side, or as throwing the burden of proof on the other. Thus the rule in Stephen's Digest, which says that the burden of proving that any person has been guilty of a crime or wrongful act is on the person who asserts it, appears in the article entitled "Presumption of Innocence." Among the more ordinary and more important legal presumptions are the presumption of regularity in proceedings, described generally as a presumption omnis esse rite acta, and including the presumption that the holder of a public office has been duly appointed, and has duly performed his official duties, the presumption of the legitimacy of a child born during the subsistence of marriage, or within the period of gestation after her husband's death, and the presumptions as to life and death. "A person shown not to have been heard of for seven years by those (if any) who, if he had been alive, would naturally have heard of him, is presumed to be dead unless the circumstances of the case are such as to account for his not being heard of without assuming his death; but there is no presumption as to the time when he died, and the burden of proving his death at any particular time is upon the person who asserts it. There is no presumption (i.e. legal presumption) as to the age at which a person died who is shown to have been alive at a given time, or as to the order in which two or more persons died who are shown to have died in the same accident, shipwreck or battle" (Stephen, Dig., art. 99). A document proved or purporting to be thirty years old is presumed to be genuine, and to have been properly executed and (if necessary) attested if produced from the proper custody. And the legal presumption of a "lost grant," i.e. the presumption that a right or alleged right which has been long enjoyed without interruption had a legal origin, still survives in addition to the common law and statutory rules of prescription.

4. Burden of Proof.—The expression onus probandi has come down from the classical Roman law, and both it and the Roman maxims, Agenti incumbit probatio, Necessitas probandi incumbit ei qui dicit non ei qui negat, and Reus excipiendo fit actor, must be read with reference to the Roman system of actions, under which nothing was admitted, but the plaintiff's case was tried first; then, unless that failed, the defendant's on his exceptio; then, unless that failed, the plaintiff's on his replicatio, and so on. Under such a system the burden was always on the actor. In modern law the phrase "burden of proof" may mean one of two things, which are often confused—the burden of establishing the proposition, if not the fact, alleged; or the burden of producing evidence on any particular point either at the beginning or at a later stage of the case. The burden in the former sense ordinarily rests on the plaintiff or prosecutor. The burden in the latter sense, that of going forward with evidence on a particular point, may shift from side to side as the case proceeds. The general rule is that he who alleges a fact must prove it, whether the allegation is couched in affirmative or negative terms. But this rule is subject to the effect of presumptions in particular cases, to the principle that in considering the amount of evidence necessary to shift the burden of proof regard
must be had to the opportunities of knowledge possessed by the parties respectively, and to the express provisions of statutes directing where the burden of proof is to lie in particular cases. Thus many statutes expressly direct that the proof of lawful excuse or authority, or the absence of fraudulent intent, is to lie on the person charged with an offence. And the Summary Jurisdiction Act 1848 provides that if the information or complaint in summary proceedings negatives any exemption, exception, proviso, or condition in the statute on which it is founded, the prosecutor or complainant need not prove the negative, but the defendant may prove the affirmative in his defence.

II. Classes of Evidence

Evidence is often described as being either oral or documentary. To these two classes should be added a third, called by Bentham real evidence, and consisting of things presented immediately to the senses of the judge or the jury. Thus the judge or jury may go to view any place the sight of which may help to an understanding of the evidence, and may inspect anything sufficiently identified and produced in court as material to the decision. Weapons, clothes and things alleged to have been stolen or damaged are often brought into court for this purpose. Oral evidence consists of the testimonies given by the parties, and is called documentary evidence. Documentary evidence consists of documents submitted to the judge or jury by way of proof. The distinction between primary and secondary evidence relates only to documentary evidence, and will be noticed in the section under that head. A division of evidence from another point of view is that into direct and indirect, or, as it is sometimes called, circumstantial evidence. By direct evidence is meant the statement of a person who saw, or otherwise observed with his senses, the fact in question. By indirect or circumstantial evidence is meant evidence of facts from which the fact in question may be inferred. The difference between direct and indirect evidence is a difference of kind, not of degree, and therefore the rule or maxim as to "best evidence" has no application to it. Juries naturally attach more weight to direct evidence, and in some legal systems it is only this class of evidence which is allowed to have full probative force. In some respects indirect evidence is superior to direct evidence, because, as Paley puts it, "facts cannot lie," whilst witnesses can and do. On the other hand facts often deceive; that is to say, the inferences drawn from them are often erroneous. The circumstances in which crimes are ordinarily committed are such that direct evidence of their commission is usually not obtainable, and when criminality depends on a state of mind, such as intention, that state must necessarily be inferred by means of indirect evidence.

III. Rules of Exclusion

It seems desirable to state the leading rules of exclusion in their crude form instead of obscuring their historical origin by attempting to force them into the shape of precise technical propositions forming parts of a logically connected system. The judges who laid the foundations of our modern law of evidence, like those who first discussed on the duties of trustees, little dreamt of the elaborate and artificial system which was to be based upon their remarks. The rules will be found, as might be expected, to be vague, to overlap each other, to require much explanation, and to be subject to many exceptions. They may be stated as follows:-(1) Facts not relevant to the issue cannot be admitted as evidence. (2) The evidence produced must be the best obtainable under the circumstances. (3) Hearsay is not evidence. (4) Opinion is not evidence.

1. Rule of Relevancy.—The so-called rule of relevancy is sometimes stated by text-writers in the form in which it was laid down by Baron Parke in 1839 (Wright v. Doe and Tatham, 7 A. E. 384), when he described "one great principle" in the law of evidence as being that "all facts which are relevant to the issue may be proved." Stated in different forms, the rule has been made by FitzJames Stephen the central point of his theory of evidence. But relevancy, in the proper and natural sense, as we have said, is a matter not of law, but of logic. If Baron Parke's dictum relates to relevancy in its natural sense it is not true; if it relates to relevancy in a narrowed and artificial sense, as equivalent to admissibility, it is tautological. Such practical importance as the rule of relevancy possesses consists, not in what it includes, but in what it excludes, and for that reason it seems better to state the rule in a negative or exclusive form. But whether the rule is stated in a positive or in a negative form its vagueness is apparent. No precise line can be drawn between "relevant" and "irrelevant" facts. The two classes shade into each other by imperceptible degrees. The broad truth is that the courts have excluded from consideration certain matters which are so remote bearing on the question to be decided, and which, in that sense, are irrelevant, and that, on grounds of policy and convenience. Among the matters so excluded are matters which are likely to mislead the jury, or to complicate the case unnecessarily, or which are of slight, remote, or merely conjectural importance. Instances of the classes of matters so excluded can be given, but it seems difficult to refer their exclusion to any more general principle than this. Rules as to evidence of character and conduct appear to fall under this principle. Evidence is not admissible to show that the person who is alleged to have done a thing was of a disposition or character which makes his performance of that thing more or less probable. This rule excludes the biographical account of the prisoner which are so familiar in French trials, and is an important principle in English trials. It is subject to three exceptions: first, that evidence of good character is admissible in favour of the prisoner in all criminal cases; secondly, that a prisoner indicted for rape is entitled to call evidence as to the immoral character of the prosecutrix; and thirdly, that a witness may be called to say that he would not believe a previous witness on his oath. The exception allowing the good character of a prisoner to influence the verdict, as distinguished from the sentence, is more humane than logical, and seems to have been at first admitted in capital cases only. The exception in rape cases does not allow evidence to be given of specific acts of immorality with persons other than the prisoner, doubtless on the ground that such evidence would affect the reputations of third parties. Where the character of a person is expressly in issue, as in actions of libel and slander, the rule of exclusion, as stated above, does not apply. Nor does it prevent evidence of bad character from being given in mitigation of damages, where the amount of damages virtually depends on character, as in cases of defamation and seducibility. As to whether there is a similar general rule, that evidence of the conduct of a person in other occasions is not to be used merely for the purpose of showing the likelihood of his having acted in a similar way on a particular occasion. Thus, on a charge of murder, the prosecutor cannot give evidence of the prisoner's conduct to other persons for the purpose of proving a bloodthirsty and murderous disposition. And in a civil case a defendant was not allowed to show that the plaintiff had sold goods on particular terms to other persons for the purpose of proving that he had sold similar goods on the same terms to the defendant. But this general rule must be carefully construed. Where several offences are so connected with each other as to form parts of an entire transaction, evidence of one is admissible as proof of another. Thus, where a prisoner is charged with stealing particular goods from a particular place, evidence may be given that other goods, taken from the same place at the same time, were found in his possession. And where it is proved or admitted that a person did a particular act, and the question is as to his state of mind, that is to say, whether he did the act knowingly, intentionally, fraudulently, or the like, evidence may be given of the commission by him of similar acts on other occasions for the purpose of proving his state of mind. It is generally true that this principle is most commonly applied in charges for uttering false documents or base coin, and not uncommonly in charges for false pretences, embezzlement or murder. In proceedings for the receipt or possession of stolen property, the legislature has expressly authorized evidence to be given of the possession by the prisoner of other stolen property, or of his previous conviction of an offence involving fraud or dishonesty
EVIDENCE

(Prevision of Crimes Act 1871). Again, where there is a question whether a person committed an offence, evidence may be given of any fact supplying a motive or constituting preparation for the offence, of any subsequent conduct of the person accused, which is apparently influenced by the commission of the offence, and of any act done by him, or by his authority, in consequence of the offence. Thus, evidence may be given that, after the commission of a particular theft, the accused was on the premises of the alleged victim, or was in possession of the property, or the proceeds of the property, acquired by the offence, or that he attempted to conceal things which were or might have been used in committing the offence, or as to the manner in which he conducted himself when statements were made in his presence and hearing. Statements made to or in the presence of a person charged with an offence are admitted as evidence, not of the facts stated, but of the conduct or demeanour of the person to whom or in whose presence they are made, or of the general character of the transaction of which they form part (under the res gestae rule mentioned below).

2. Best Evidence Rule.—Statements to the effect of the best evidence rule were often made by Chief Justice Holt about the beginning of the 18th century, and became familiar in the courts. Chief Baron Gilbert, in his book on evidence, which must have been written before 1726, says that "the first and most signal rule in relation to evidence is this, that a man must have the evidence the nature of the fact is capable of." And in the great case of Omichund v. Barker (1744), Lord Hardwicke went so far as to say, "The judges and sages of the law have laid down that there is but one general rule in evidence, the best that the nature of the case will admit" (1 Atkyns 49). It is no wonder that a rule thus solemnly stated should have found a prominent place in text-books on the law of evidence. But, apart from its application to documentary evidence, it does not seem to be more than a useful guiding principle which underlies, or may be used in support of, several rules.

It is to documentary evidence that the principle is usually applied, in the form of the narrower rule excluding, subject to exceptions, secondary evidence of the contents of a document where primary evidence is obtainable. In this form the rule is a rule of exclusion, but may be most conveniently dealt with in connexion with the special subject of documentary evidence. As noted above, the rule does not apply to the difference between direct and indirect evidence. And, doubtless on account of its vague character, it finds no place in Stephen's Digest.

3. Hearsay.—The term "hearsay" primarily applies to what a witness has heard another person say in respect to a fact in dispute. But it is extended to any statement, whether reduced to writing or not, which is brought before the court, not by the author of the statement, but by a person to whose knowledge the statement has been brought. Thus the hearsay rule excludes statements, oral or written, made in the first instance by a person who is not called as a witness in the case. Historically this rule may be traced to the time when the functions of the witnesses were first distinguished from the functions of the jury, and when the witnesses were required by their formula to testify de visu suo et auditu, to state what they knew about facts from the direct evidence of their senses, not from the information of others. The rule excludes statements the effect of which is liable to be altered by the narrator, and which purport to have been made by persons who did not necessarily speak under the sanction of an oath, and whose accuracy or veracity is not tested by cross-examination. It is therefore of practical utility in shutting out many false statements and much irresponsible gossip. On the other hand, it excludes statements which are of some value as evidence, and may indeed be the only available evidence. Thus, a statement has been excluded as hearsay, even though it can be proved that the author of the statement made it on oath, or that it was against his interest when he made it, or that he is prevented by insanity or other illness from giving evidence himself, or that he has left the country and disappeared, or that he is dead.

Owing to the inconveniences which would be caused by a strict application of the rule, it has been so much eaten into by exceptions that persons desiring to make evidence of facts not to change places. Among the exceptions the following may be noticed: (a) Certain sworn statements.—In many cases statements made by a person whose evidence is material, but who cannot come before the court, or who is in the service of a country, or whose evidence may be obtained at a great expense of time or difficulty, may be admitted as evidence under proper safeguards. Under the Indictable Offences Act 1848, where a person has made a deposition before a justice at a preliminary inquiry into an offence, his deposition may be read by the deponent, or if the deponent is dead, or too ill to travel, that the deposition was taken in the presence of the accused person, and that the accused then had the opportunity of cross-examining the witness, or if the deposition must appear to be signed by the justice before whom it purported to have been taken. Depositions taken before a coroner are admissible under the same principle. And the principle probably extends to any deposition where the deposition is sworn and the deponent is not accused. There are other statutory provisions for the admission of depositions, as in the Criminal Law Amendment Act 1867; the Foreign Jurisdiction Act 1890; and the Children Act 1908, incorporating an act of 1870.

In civil cases the rule excluding statements not made in court at the trial is much less strictly applied. Frequent use is made of evidence taken before an examiner, or under a commission. Affidavits are freely used for subordinate issues or under an arrangement between the parties, and leave may be given to the taking of evidence taken in other proceedings. The old chancery practice, under which evidence, both at the trial and at other stages of a proceeding, was used normally as depositions and declarations, was altered by the Judicature Acts. Under the existing rules of the supreme court evidence may be given by affidavit upon any motion, petition or summons, but the court or a judge may, on the application of either of the parties, or on his own motion, allow the admission of any evidence which it considers necessary to the determination of the person making the affidavit. (b) Dying declarations.—In a trial for murder or manslaughter a declaration by the person accused of the cause of death, or of any fact tending to show that he has caused the death, is not admissible as evidence. (c) Statements in pedigree cases.—On a question of pedigree the statement of a deceased person, whether based on his own personal knowledge or on family tradition, is admissible as evidence, if it is proved that the person who made the statement was of the blood of the person about whose family relations the statement was made, and that the statement was made before the question with respect to which the evidence is required had arisen. (d) Statements as to matters of public or general interest.—Statements by deceased persons are admissible as evidence of reputation or general belief in questions relating to the existence of any public or general right or custom, or matter of public and general interest. Statements of this kind are constantly admitted in questions relating to right of way, or rights of common, or manorial or other local customs. Maps, copies of court rolls, leases and other deeds, and verdicts, judgments, and orders of the court are also within this class of evidence. (e) Statements in course of duty or business.—A statement with respect to a particular fact made by a deceased person in pursuance of his duty in connexion with any office, employment or profession, whether public or private, is admissible as evidence, if the statement appears to have been made from personal knowledge, and at or about the time when the fact occurred. This exception extends to statements made and oral or written, on the official business of the deceased person, or in the course of any executive, or administrative, or judicial proceeding, or in the course of any civil or criminal proceedings, or in the public interest, or in any action or proceeding begun or any writ, or summons, or process issued in any action or proceeding for the purpose of enforcing personal or public duty, or any writ for the purpose of enforcing any public duty.

An entry in a public document may be treated as a statement made in the course of duty, but it is admissible whether the person who made the statement was a public officer or not. It is admissible as to personal knowledge, or the time at which the statement is made. (b) Admissions.—By the term "admission," as here used, is meant a statement of fact made out of court, or in a court, to prove whether civil or criminal, or by some person whose statements are binding on that party, against the interest of that party. The term includes admissions made in answer to interrogatories, or to a notice to admit facts, but not admissions made on the pleadings. Admissions, in this sense of the term, are admissible as evidence against the person by whom they are made, or on whom they are binding.
There is no difficulty in understanding the principle on which this holiness or eremity rests, and the difficulty has been often met with in applying it, and the practice has varied. How long is the "transaction" to be treated as lasting? What ought to be treated as the immediate and natural effect of continuing action, and for what reason ought the state of the person or defendant to be considered, if it is committed, to what extent are the terms of the complaint made by the sufferer, as distinguished from the facts of a complaint having been made, and the impression of the question raised. The cases in which statements by a person as to his bodily or mental condition may be put in evidence may perhaps be treated as falling under the same principle. In the Ruggey poisoning case, statements by the deceased person before his illness as to his state of health, and as to his symptoms during illness, were admitted as evidence for the prosecution. Under the same principle may also be brought the rule as to statements in conspiracy cases. In charges of confession after evidence has been given of the existence of the plot, and of the connexion of the accused with it, the charge against one conspirator may be supported by evidence of anything done, written, or said, not only by him, but by any of the conspirators, in furtherance of the common purpose. On the other hand, a statement made by one conspirator, not in execution of the common purpose, but in narration of some event forming part of the conspiracy from which would be treated, as part of the "transaction," but as a statement excluded by the hearsay rule. Thus the admissibility of writings in conspiracy cases may depend on the time when they can be shown to have been in the possession of a fellow-conspirator, where they are a sort of corroborating evidence. Thus, evidence in rape cases, etc.—In trials for rape and similar offences, the fact that shortly after the commission of the alleged offence a complaint was made by the person against whom the offence was committed, and that the complaint was not made by the person complained of, but not of the facts complained of, but of the consistency of the complainant's conduct with the story told by her in the witness-box, and as to which the complainant had been cross-examined, was admissible as evidence of the rape.

4. Opinion.—The rule excluding expressions of opinion also dates from the first distinction between the functions of witnesses and jury. It was for the witnesses to state facts, for the jury to form conclusions. Of course every statement of fact involves inference, and implies a judgment on phenomena observed by the senses. And the inference is often erroneous, as in the answer to the question, "Was he drunk?" A prudent witness will often guard himself, and is allowed to guard himself, by answering to the best of his belief. But, for practical purposes, it is possible to draw a distinction between a statement of facts observed and an expression of opinion as to the inference to be drawn from those facts, and the rule telling witnesses to state facts and not express opinions is of great value in keeping their statements out of the region of argument and conjecture. The evidence of "experts," that is to say, of persons having a special knowledge of some particular subject, is generally described as constituting the chief exception to the rule. But perhaps it would be more accurate to say that experts are allowed a much wider range than ordinary witnesses in the expression of their opinions, and in the statement of facts on which their opinions are based. Thus, in a poisoning case, a doctor may be asked as an expert whether, in his opinion, a particular poison is the symptoms, particular symptoms. And, where lunacy is set up as a defence, an expert may be asked whether, in his opinion, the symptoms exhibited by the alleged lunatic commonly show unsoundness of mind, and whether such unsoundness of mind usually renders persons incapable of knowing the nature of their acts, or of knowing that what they do is either wrong or contrary to the law. Similar principles are applied to the evidence of engineers, and in numerous other cases. In cases of disputed handwriting the evidence of experts in handwriting is expressly recognized by statute (Evidence and Practice on Criminal Trials 1869).

IV. DOCUMENTARY EVIDENCE

Charters and other writings were exhibited to the jury at a very early date, and it is to writings so exhibited that the term "evidence" or "evidences" seems to have been originally applied "applied per excellence." The oral evidence of witnesses came later. Where a document is to be used as evidence the first question is how its contents are to be proved. To this question the principle of "best evidence" applies, in the form of the rule that primary evidence must be given except in the cases where secondary evidence is allowed. By primary evidence is meant the document itself produced for inspection. By secondary
EVIDENCE

Evidence is meant a copy of the document, or verbal accounts of its contents.

The rule as to the inadmissibility of a copy of a document is applied much more strictly to private than to public or official documents. Evidence may be given of the contents of a private document in the following cases:

(a) Where the original is shown or appears to be in the possession of the adverse party, and has not been served with reasonable notice to produce it, or does not do so.

(b) Where the original is shown or appears to be in the possession or power of a stranger not legally bound to produce it, and has never been served with a writ of subpoenas tecum, or after having been sworn as a witness and asked for the document, and having admitted that it is in court, refuses to produce it.

(c) Where it is shown that proper search has been made for the original, and there is reason for believing that it is destroyed or lost.

(d) Where the original is of such a nature as not to be easily movable, as in the case of a placard posted on a wall, or of a tombstone, or is in a country from which it is not permitted to be removed.

(e) Where the original is a document for the proof of which special provision is made by any act of parliament, or any law in force for the time being. Documents of that kind are practically treated on the same footing as private documents.

(f) Where the document is an entry in a banker's book, provable according to the special provisions of the Bankers' Books Evidence Act 1879.

Secondly, evidence of a private document is usually given either by producing a copy and calling a witness who can prove the copy to be correct, or, when there is no copy obtainable, by calling a witness who has seen the document, and can give an account of its contents. The question then is whether such a document is such a public nature as to be admissible in evidence of the mere production from the proper custody, and no statute exists which renders its contents provable by means of a copy, any copy thereof or extract from it as admissible as proof of its contents, if it is proved to be an examined copy or extract, or purports to be signed or certified as a true copy or extract by the officer to whom custody the original is entrusted. Many statutes provide that various certificates, official and public documents, documents and proceedings of corporations and of joint stock and other companies, and certified copies of documents, by-laws, entries in registers and other books, are receivable as evidence of certain particulars in certain cases of justice, if they are authenticated in the manner prescribed by the statutes. Whenever, by virtue of any such provision, any such certificate or certified copy is receivable as proof of any particular fact, it is admissible as evidence, if it purports to be authenticated in the manner prescribed by law, without calling any witness to prove any stamp, seal, or signature required for its authentication, or the official character of the person who appears to have signed it. The Documentary Evidence Acts 1868, 1882 and 1895, provide modes of proving the contents of several classes of proclamations, orders and regulations.

If a document is of a kind which is required by law to be attested, but not otherwise, an attesting witness must be called to prove its due execution. But this rule is subject to the following exceptions:

(a) If it is proved that there is no attesting witness alive, and capable of giving evidence, then it is sufficient to prove that the attestation of at least one attesting witness is in his handwriting, and that the signature of the person executing the document is in the handwriting of that person.

(b) If the document is proved, or purports to be, more than thirty years old, and is produced from what the court considers proper custody, an attesting witness need not be called, and it will be admitted without evidence that the instrument was duly executed and attested.

Where a document embodies a judgment, a contract, a grant, or disposition of property, or any other legal transaction or "act in the law," on which rights depend, the validity of the transaction may be impugned on the ground of fraud, incapacity, want of consideration, or other legal ground. But this seems outside the law of evidence. In this class of cases a question often arises whether, one of the transactions charged was the nature of the transaction embodied in the document. The answer to this question seems to depend on whether the docu-

ment was or was not intended to be a complete and final statement of the transaction which it embodies. If it was, you cannot go outside the document for the purpose of ascertaining the nature of the transaction. If it was not, you may. But the mere statement of this test shows the difficulty of formulating precise rules, and of applying them when formulated. Fitz James Stephen mentions, among the facts which may be proved in these cases, the existence of separate and consistent oral agreements as to matters on which the document is silent, if there is reason to believe that the document is not a complete and final statement of the transaction, and the existence of any usage or custom with reference to which a contract may be presumed to have been made. But he admits that the rules on the subject are "by no means easy to apply, inasmuch as from the nature of the case an enormous number of transactions fall close on one side or the other of most of them." The underlying principle appears to be a rule of substantive law rather than of evidence. When parties to an arrangement have reduced the terms of the arrangement to a definite, complete, and final written form, they should be bound exclusively by the terms embodied in that form. The question in each case is under what circumstances they ought to be treated as having done so.

The expression "parol evidence," which includes written as well as verbal evidence, has often been applied to the extrinsic evidence produced for the purpose of varying the nature of the transaction embodied in a document. It is also applied to extrinsic evidence used for another purpose, namely, that of explaining the meaning of the terms used in a document. The two questions: What is the real nature of the transaction referred to in a document? and, What is the meaning of a document? are often confused, but are really distinct from each other. The rules bearing on the latter question are rules of construction or interpretation rather than of evidence, but are ordinarily treated as part of the law of evidence, and are for that reason included by Fitz James Stephen in his Digest. In stating these rules he adopts, with verbal modifications, the six propositions laid down by Vice-Chancellor Wigram in his Examinations of the Rules of Law respecting the admission of Extrinsic Evidence in Aid of the Interpretation of Wills. The substance of these propositions appears to be this, that wherever the meaning of a document cannot be satisfactorily ascertained from the document itself, use may be made of any other evidence for the purpose of elucidating the meaning, subject to one restriction, that, except in cases of equivocation, i.e. where a person or thing is described in terms applicable equally to more than one, resort cannot be had to extrinsic expressions of the author's intention.

V. WITNESSES

1. Attendance.—If a witness does not attend voluntarily he can be required to attend by a writ of subpoena.

2. Competency.—As a general rule every person is a competent witness. Formerly persons were disqualified by crime or interest, or by being parties to the proceedings, but these disqualifications have now been removed by statute, and the circumstances which formerly created them do not affect the competency, though they may often affect the credibility, of a witness.

Under the general law as it stood before the Criminal Evidence Act 1898 came into force, a person charged with an offence was not competent to give evidence on his own behalf. But many exceptions had been made to this rule by legislation, and the rule itself was finally abolished by the act of 1898. Under that law a person charged is a competent witness, but he can only give evidence for the defence, and can only give evidence if he himself applies to do so. Under the law as it stood before 1898, persons jointly charged and being tried together were not competent to give evidence either for or against each other. Under the act of 1898 a person charged jointly with another is a competent witness, but only for the defence, and cannot unless he is so directed by the court. If the latter person applies to give evidence, his cross-examination must not be conducted with a view to establish the guilt of the other. Consequently, if it is thought
desirable to use against one prisoner the evidence of another who is being tried with him, the latter should be released, or a separate verdict of not guilty taken against him. - A prisoner so giving evidence is popularly said to turn king's evidence. It follows that, subject to what has been said above as to persons tried together, the evidence of an accomplice is admissible against his principal, and vice versa. The evidence of an accomplice is, however, always received with great jealousy and caution. A conviction on the unsupported testimony of an accomplice may, in some cases, be strictly legal, but the practice is to require it to be confirmed by unimpeachable testimony in some material part, and more especially as to his identification of the person or persons against whom his evidence may be received. A witness of a person charged is now a competent witness, but, except in certain special cases, she can only give evidence for the defence, and can only give evidence if her husband applies that she should do so. The special cases in which a wife can be called as a witness either for the prosecution or for the defence, and without the consent of the person charged, are cases arising under particular enactments scheduled to the act of 1898, and relating mainly to offences against wives and children, and cases in which the wife is by common law a competent witness against her husband, i.e. where the proceeding is against the husband for bodily injury or violence inflicted on his wife. The rule of exclusion extends only to a lawful wife. There is no ground for supposing that the wife of a prosecutor is an incompetent witness. A witness is incompetent if, in the opinion of the court, he is prevented by extreme youth, disease affecting his mind, or any other cause of the same kind, from collecting the matter on which he is to testify, from understanding the questions put to him, from giving rational answers to those questions, or from knowing that he ought to speak the truth. A witness unable to speak or hear is not incompetent, but may give his evidence by writing or by signs, or in any other manner in which he can make it intelligible. The particular form of the religious belief of a witness, or his want of religious belief, does not affect his competency. This ground of incompetency has now been finally removed by the Oaths Act 1888. It will be seen that the effect of the successive enactments which have gradually removed the disqualifications attaching to various classes of witnesses has been to draw a distinction between the competency of a witness and his credibility. No person is disqualified on moral or religious grounds, but his character may be such as to throw grave doubts on the value of his evidence. No relationship, except to a limited extent that of husband and wife, excludes from giving evidence. The parent may be examined on the trial of the child, the child on that of the parent, master for or against servant, and servant for or against master. The relationship of the witness to the prosecutor or the prisoner in such cases may affect the credibility of the witness, but does not exclude his evidence.

3. Privilege.—It does not follow that, because a person is competent to give evidence, he can therefore be compelled to do so.

No one, except a person charged with an offence when giving evidence on his own application, and as to the offence where with he is charged, is bound to answer a question if the answer would, in the opinion of the court, have a tendency to expose the witness, or the wife or husband of the witness, to any criminal charge, penalty, or forfeiture, which the court regards as reasonably likely to be preferred or sued for. Accordingly, an accomplice cannot be examined without his consent, but if an accomplice who has come forward to give evidence on a promise of pardon, or favourable consideration, refuses to give full and fair information, he renders himself liable to be convicted on his own confession. However, even accomplices in such circumstances are not required to answer on their cross-examination as to other offences. Where, under the new law, a person charged with an offence offers himself as a witness, he may be asked any question in cross-examination, notwithstanding that it would tend to criminate him as to the offence charged. But he may not be asked, and if he is asked must not be required to answer, any question tending to show that he has committed, or been convicted of, or been charged with, any other offence, or is of bad character, unless—

(i) The proof that he has committed, or been convicted of, the other offence is admissible evidence to show that he is guilty of the offence with which he is then charged; or,

(ii) He has personally, or by his advocate, asked questions of the witnesses for the prosecution, with a view to establish his own good character, or has given evidence of his good character, or the nature or conduct of the defence is such as to involve imputations on the character of the prosecutor or the witnesses for the prosecution; or,

(iii) He has given evidence against any other person charged with the same offence.

He may not be asked questions tending to criminate his wife. The privilege as to criminating answers does not cover answers merely tending to establish a civil liability. No one is excused from answering a question or producing a document only because the answer or document may establish or tend to establish that he owes a debt, or is otherwise liable to any civil proceeding. It is a privilege for the protection of the witness, and therefore may be waived by him. But there are other privileges which cannot be so waived. Thus, on grounds of public policy, no one can be compelled, or is allowed, to give evidence relating to any affairs of state, or as to official communications between public officers upon public affairs, except with the consent of the head of the department concerned, and this consent is refused if the production of the information asked for is considered detrimental to the public service.

Again, in cases in which the government is immediately concerned, no witness can be compelled to answer any question the answer to which would tend to discover the names of persons by or to whom information was given as to the commission of offences. It is, as a rule, for the court to decide whether the permission of any such question would or would not, under the circumstances of the particular case, be injurious to the administration of justice.

A husband is not compellable to disclose any communication made to him by his wife during the marriage; and a wife is not compellable to disclose any communication made to her by her husband during the marriage.

A legal adviser is not permitted, whether during or after the termination of his employment as such, unless with his client’s express consent, to disclose any communication, oral or documentary, made to him as such legal adviser, by or on behalf of his client, during, in the course of, and for the purpose of his employment, or to disclose any advice given by him to his client during in the course of, and for the purpose of such employment. But this privilege does not extend to—

(a) Any such communication if made in furtherance of any criminal purpose; nor

(b) Any fact observed by a legal adviser in the course of his employment as such, showing that any crime or fraud has been committed since the commencement of his employment, whether his attention was directed to such fact by or on behalf of his client or not; nor

(c) Any fact with which the legal adviser became acquainted otherwise than in his character as such.

Medical men and clergymen are not privileged from the disclosure of communications made to them in professional confidence, but it is not usual to press for the disclosures of communications made to clergymen.

4. Oaths.—A witness must give his evidence under the sanction of an oath, or of what is equivalent to an oath, that is to say, of a solemn promise to speak the truth. The ordinary form of oath is adapted to Christians, but a person belonging to a non-Christian religion may be sworn in any form prescribed or recognized by the custom of his religion. (See the article Oath.)

5. Publicity.—The evidence of a witness at a trial must, as a general rule, be given in open court in the course of the trial. The secrecy which was such a characteristic feature of the "inquisition" procedure is abhorrent to English law, and, even where publicity conflicts with decency, English courts are very reluctant to dispense with or relax the safeguards for justice which publicity involves.
6. Examination.—The normal course of procedure is this. The party who begins, i.e. ordinarily the plaintiff or prosecutor, calls his witnesses in order. Each witness is first examined on behalf of the party for whom he is called. This is called the examination in chief. Then he is liable to be cross-examined on behalf of the other side. And, finally, he may be re-examined on behalf of his own side. After the case for the other side has been opened, the same procedure is adopted with the witnesses for that side. In some cases the party who began is allowed to adduce further evidence in reply to his opponent's evidence. The examination is conducted, not by the court, but by or on behalf of the contending parties. It will be seen that the principle underlying this procedure is that of the duel, or conflict between two contending parties, each relying on and using his own evidence, and trying to break down the evidence of his opponent. It differs from the principle of the "inquisition" procedure, in which the court takes a more active part, and in which the cases for the two sides are not so sharply distinguished. In a continental trial it is often difficult to determine whether the case for the prosecution or the case for the defence is proceeding. Conflicting witnesses stand up together and are "confronted" with each other. In the examination in chief questions must be confined to matters bearing on the main question at issue, and a witness must not be asked leading questions, i.e. questions suggesting the answer which the party putting the question wishes or expects to receive, or suggesting disputed facts about which the witness is to testify. But the rule about leading questions is not applied where the questions asked are simply aimed at turning the form of the real issue to suit the inquiry, or where they relate to matters which, though material, are not disputed. And if the witness called by a person appears to be hostile to him, or interested on the other side, or unwilling to reply, the reason for the rules applying to examination in chief breaks down, and the witness may be asked leading questions and cross-examined, and treated in every respect as though he was a witness called on the other side, except that a party producing a witness must not impeach his credit by general evidence of bad character (Evidence and Practice on Criminal Trials for Murder, ii. 355). The examination in chief is not bearing on the main issue and leading questions may be put and (subject to the rules as to privilege) must be answered, as the cross-examiner is entitled to test the examination in chief by every means in his power. Questions not hearing on the main issue are often asked in cross-examination merely for the purpose of putting off his guard a witness who is supposed to have learnt up his story. In cross-examination questions may also be asked which tend either to test the accuracy or credibility of the witness, or to shake his credit by impeaching his motives or injuring his character. The licence allowed in cross-examination has often been seriously abused, and the power of the cross-examiner is recognized by one of the rules of the supreme court (R.S.C. xxxvi. 39, added in 1833). It is considered wrong to put questions which assume that facts have been proved which have not been proved, or that answers have been given contrary to the fact. A witness ought not to be pressed in cross-examination as to any facts which, if admitted, would not affect the question at issue or the credibility of the witness. If the cross-examiner intends to adduce evidence contrary to the evidence given by the witness, he ought to put to the witness in cross-examination the substance of the evidence which he proposes to adduce, in order to give the witness an opportunity of retracting or explaining. Where a witness has answered a question which only tends to affect his credit by injuring his character, it is only in a limited number of cases that evidence can be given to contradict his answer. Where he is asked whether he has ever been convicted of any felony or misdemeanour, and denies or refuses to answer, proof may be given of the truth of the facts suggested (28 & 29 Vict. c. 15, s. 6). The same rule is observed where he is asked a question tending to show that he is not impartial. Where a witness has previously made a statement inconsistent with his evidence, proof may be given that he did in fact make it. But before such proof is given the circumstances of the alleged statement, sufficient to designate the particular occasion, must be mentioned to the witness, and he must be asked whether he did or did not make the statement. And if the statement was made, or has been reduced to writing, the attention of the witness must, before the writing is used against him, be called to those parts of the writing which are to be used for the purpose of impeaching his credit. A writer of the story of the Guise (Rechtswissenschaft in England; Stephen (Sir J. F.), History of the Criminal Law of England; Pollock and Maitland, History of English Law, bk. ii. ch. ix.; Thayer, Preliminary Treatise on Evidence at the Common Law. The principles of this book and the law of evidence) are not always used by cross-examiners. The law of Evidence on the Trial of Actions at nisi prius (18th ed., 1907); Roscoe, Digest of the Law of Evidence in Criminal Cases (17th ed., 1898); Taylor, Treatise on the Law of Evidence (10th ed., 1906); Best, Principles of the Law of Evidence (10th ed., 1906); Powell, Principles and Practice of the Law of Evidence (8th ed., 1904); Stephen, Digest of the Law of Evidence (8th ed., 1907); Wills, Theory and Practice of the Law of Evidence (2nd ed., 1908) are good in this respect. The examination, cross-examination, re-examination of criminal evidence in France, see Esmein, Histoire de la procédure criminelle en France. For Germany, see Holtzendorf, Encyklopädie der Rechtswissenschaft (passages indexed under head "Beweis"); Holtzendorf, Rechtstraktion ("Beweis").

EVIL EYE. The terror of the arts of "fascination," i.e. that certain persons can bewitch, injure and even kill with a glance, has been and is still very widely spread. The power was not thought to be always maliciously cultivated. It was as often supposed to be involuntary (cf. Deuteronomy xxviii. 54); and a story is told of a Slav who, afflicted with the evil eye, at last blinded himself in order that he might not do the means of injuring his children (Woycik, Polish Folklore, trans. by Lewenstein, p. 25). Few of the old classic writers fail to refer to the dread power. In Rome the "evil eye" was well recognized that Pliny states that special laws were enacted against injury to crops by incantation, exorcism or fascination. The power was styled βασανία by the Greeks and fascinatio by the Latins. Children and young animals of all kinds were thought to be specially susceptible. Charms were worn against the evil eye both by man and beast, and in Judges viii. 21 it is thought there is a reference to this custom in the allusion to the "ornaments" on the necks of camels. In classic times the wearing of amulets was universal. They were of three classes: (1) those the intention of which was to attract on to themselves, as the lighteners' charm, the malignant glance; (2) charms hidden in the bosom of the dress; (3) written words from sacred writings. Of these three types the first was most numerous. They were oftenest of a grotesque and generally grossly obscene nature. They were also made in the form of frogs, beetles and so on. But the ancients did not wholly rely on amulets. Spitting was among the Greeks and Romans a most common antidote to the poison of the evil eye. According to Theocritus it is necessary to spit three times into the breast of the person who fears fascination. Gestures, too, often intentionally obscene, were regarded as prophylactics on meeting the dreaded individual. The evil eye was believed to have its impulse in envy, and thus it came
to be regarded as unlucky to have any of your possessions praised. Among the Romans, therefore, it was customary when praising anything to add Præstæcini dixerim (Pain Evil! I should say). This custom survives in modern Italy, where in like circumstances is said Si mal occhio non ci fosse (May the evil eye not strike it).

The object of these conventional phrases was to prove that the speaker was sincere and had no evil designs in his praise. Though there is no set formula, traces of the custom are found in English rural sayings, e.g. the Somersetsire "I don't wish ee no harm, so I on't say no more." This is what the Scots call "fore-speaking," when praise beyond measure is likely to be followed by disease or accident. A Manxman will never say he is very well; he usually admits that he is "middleing," or qualifies his admiration in some way. The custom is probably of ancient times. The belief led in many countries to the saying, when one heard anybody or anything praised superabundantly, "God preserve him or her." So in Ireland, to avoid being suspected of having the evil eye, it is advisable when looking at a child to say "God bless it!"; and when passing a farm-yard where cows are collected at milking time it is usual for the peasant to say, "The blessing of God be on you and all your labour." Bacon writes: "It seems some have been so curious as to note that the times when the stroke... of an envious eye does most harm are particularly when the party envied is beheld in glory and triumph."

The powers of the evil eye are said to have been most feared by the prosperous. Its powers are often quoted as almost limitless. Thus one record solemnly declares that in a town of Africa a fascination called Elzabar killed by his evil art no less than 80 people in two years (W. W. Story, Castle St Angelo, 1877, p. 140). The belief as affecting cattle was universal in the Scottish Highlands as late as the 18th century and still lingers. Thus if a stranger looks admiringly on a cow the peasants still think she will waste away, and they offer the visitor some of her milk to drink in the belief that in this manner the spell is broken. Thoreau, the American naturalist, and Arba, the Ethnologist, also state that the cattle and camels are subject to the evil eye. But the people of Italy, especially the Neapolitans, are the best modern instances of implicit believers. The jelletore, as the owner of the evil eye is called, is so feared that at his approach it is scarcely an exaggeration to say that a street will clear: everybody will rush into doorways or up alleys to avoid the dreaded glance. The jelletore di bambini (insinuator of children) is the most dreaded of all. The evil eye is still much feared for horses in India, China, Turkey, Greece and almost everywhere where horses are found. In rural England the pig is of all animals oftener "overlooked." While the Italians are perhaps the greatest believers in the evil eye as affecting persons, the superstition is rife in the East. In India the belief is universal. In Bombay the blast of the evil eye is supposed to be a form of spirit-possession. In western India all witches and wizards are said to be evil-eyed. Modern Egyptian mothers thus account for the sickly appearance of their babies. In Turkey passages from the Koran are painted on the outside of houses to save the inmates, and texts and amulets are worn upon the person, or hung upon camels and horses by Arabs, Abyssinians and other peoples. The superstition is universal among savage races. For a full discussion see Evil Eye by F. T. Elworthy (London, 1895); also W. W. Story, Castle St Angelo and the Evil Eye (1877); E. N. Rolfe and H. Ingleby, Naples in 1888 (1888); Johannes Christian Frommann, Tractatus de fascinationem novum et singularitatis, &c., &c. (Nuremberg, 1875); R. C. Macalpin, Evil Eye in the Western Highlands (1902).

EVOLUTION.

The modern doctrine of evolution or "evolving," as opposed to that of simple creation, has been defined by Prof. James Sully in the 9th edition of this encyclopedia as a "natural history of the cosmos including organic beings, expressed in physical terms as a mechanical process. The following exposition of the historical development of the doctrine is taken from Sully's article, and for the most part is in his own words.

In the modern doctrine of evolution the cosmic system appears as a natural product of elementary matter and its laws. The various grades of life on our planet are the natural consequences of certain physical processes involved in the gradual transformations of the earth. Conscious life is viewed as conditioned by physical (organic and more especially nervous) processes, and as evolving itself in close correlation with organic evolution. Finally, human development, as exhibited in historical and pre-historical records, is regarded as the highest and most complex result of organic and physical evolution. This modern doctrine of evolution is but an expansion and completion of those physical theories (see below) which opened the history of speculation. It differs from them in being grounded on exact and verified research. As such, moreover, it is a much more limited theory of evolution than the ancient. It does not necessarily concern itself about the question of the infinitude of worlds in space and time. It is concerned only with our own. The evolution of the world, the solar or, at most, the sidereal system which falls under our own observation. It would be difficult to say what branches of science had done most towards the establishment of this doctrine. We must content ourselves by referring to the progress of physical (including chemical) theory, which has led to the great generalization of the conservation of energy; to the discovery of the fundamental chemical identity of the matter of our planet and of other celestial bodies, and of the chemical relations of organic and inorganic bodies; to the advance of astrochemistry; to the speculation respecting the origin of the solar system, &c.; to the growth of the science of evolution by adding a new and significant factor to the evidence of organic development; and to the doctrine of the fundamental chemical identity of the matter of our planet and of the history of the chemical elements and processes. The modern doctrine of evolution is perhaps the most important in the history of human thought; it has been the most fruitful. It has called into question the origin of natural phenomena, and has been a chief source of the development of the science of anthropology (including comparative psychology, philology, &c.), and of the vast extension and improvement of all branches of historical study.

History of the Idea of Evolution.—The doctrine of evolution in its finished and definite form is a modern product. It required for its foundation an amount of raw knowledge which could only be very gradually acquired. It is vague, therefore, and has been sought for clearly defined and systematic presentations of the idea among ancient writers. On the other hand, nearly all systems of philosophy have discussed the underlying problems. Such questions as the origin of the cosmos as a whole, the production of organic beings and of conscious minds, and the meaning of the observable grades of creation, have from the dawn of speculation occupied men's minds; and the answers to these questions often imply a vague recognition of the idea of a gradual evolution of things. Accordingly, in tracing the antecedents of the modern philosophic doctrine we shall have to glance at most of the principal systems of cosmology, ancient and modern. Yet since in these systems inquiries into the esse and fieri of the world are rarely distinguished with any precision, it will be necessary to indicate very briefly the general outlines of the system so far as they are necessary for understanding their bearing on the problems of evolution.

Mythological Interpretation.—The problem of the origin of the world was the first to engage man's speculative activity. Nor was this line of inquiry pursued simply as a step in the more practical problem of man's final destiny. The order of ideas observable in children suggests the reflection that man began to discuss the "whence" of existence before the "whither." At first, as in the case of the child, the problem of the genesis of things was conceived anthropomorphically: the question "How did the world arise?" first shaped itself to the human mind under the form "Who made the world?" As long as the problem was conceived in this simple manner there was, of course, no room for the idea of a necessary self-conditioned evolution. Yet the first indistinct germ of such an idea appears to emerge in combination with that of creation in some of the ancient systems of theology. Thus, for example, in the myth of the ancient Parsees, the gods Ormuzd and Ahriman are said to evolve themselves out of a primordial matter. It may be supposed that these crude fancies embody a dim recognition of the physical forces and objects personified under the forms of deities, and a rude attempt to account for their genesis as a natural
process. These first unscientific ideas of a genesis of the per-
manent objects of nature took as their pattern the process of
organic reproduction and development, and this, not only
because these objects were regarded as personalities, but also
because this particular mode of becoming would most impress
these early observers. This same way of looking at the origin
of the material world is illustrated in the Egyptian notion of a
cosmic egg out of which issues the god (Ptah) who creates the
world.

Indian Philosophy.—Passing from mythology to speculation
properly so called, we find in the early systems of philosop-
phers the idea of evolution. Brahma is conceived as the eternal self-
existent being, which on its material side unfolds itself to the
world by gradually condensing itself to material objects through
the gradations of ether, fire, water, earth, and the elements. At
the same time this eternal being is conceived as the all-embracing
world-soul from which emanates the hierarchy of individual
souls. In the later system of emanation of Sankhya there is a
more marked approach to a materialistic doctrine of evolution.
If, we are told, we follow the chain of causes far enough back we
reach unlimited eternal creative nature or matter. Out of this
“principal thing” or “original nature” all material and
spiritual existence issues, and into it it will return. Yet this prim-
ordial creative nature is endowed with volition with regard to
its own development. Its first emanation as plastic nature
contains the original soul or deity out of which all individual
souls issue.

Early Greek Physicists.—Passing by Buddhism, which, though
teaching the periodic destruction of our world by fire, &c., does not
seek to determine the ultimate origin of the cosmos, we come
to those early Greek physical philosophers who distinctly set
themselves to eliminate the idea of divinity and actuality of
the world by representing its origin and changes as a natural process.
The early Ionian physicists, including Thales, Anaximander and
Anaximenes, seek to explain the world as generated out of a
primal matter (Gr. ἄτομον; hence the name “Hylozoists”),
which is at the same time the universal support of things.
This substance is endowed with a generative or transmutative force
by virtue of which it passes into a succession of forms. They
thus resemble modern evolutionists, since they regard the world
with its infinite variety of forms as issuing from a simple mode of
matter. More especially the cosmology of Anaximander resembles
the modern doctrine of evolution in the hypothesis of the
indeterminate (τὸ ἄδειπνον) out of which the particular forms
of the cosmos are differentiated. Again, Anaximander may be
said to prepare the way for more modern conceptions of material
evolution by regarding his primal matter as eternal, and
by looking on all generation as alternating with destruction,
each step of the process being of course simply a transformation
of the indestructible substance. Once more, the notion that
this indeterminate body contains potentially in itself the funda-
mental contraries—hot, cold, &c.—by the excretion or evolution
of which definite substances were generated, is clearly a fore-
cast of the modern doctrine of intelligence that from Aristotle
downwards has been the basis of so many theories of
development. In conclusion, it is noteworthy that
though resorting to utterly fanciful hypotheses respecting the
order of the development of the world, Anaximander agrees with
modern evolutionists in conceiving the heavenly bodies as
arising out of an aggregation of diffused matter, and in assigning
to organic life an origin in the inorganic materials of the primitive
earth (pristine mud).

The doctrine of Anaximenes, who unites the conceptions of a
determinate and indeterminate original substance, that of Thales and Anaximander in the hypothesis
of a primordial and all-generating air, is a clear advance on these
theories, inasmuch as it introduces the scientific idea of con-
densation and rarefaction as the great generating or transforming
agencies. For the rest, his theory is chiefly important as em-
phasizing the vital character of the original substance. The
primordial air is conceived as animated. Anaximenes seems
to have inclined to a view of cosmic evolution as throughout
involving a quasi-spiritual factor. This idea of the air as the
original principle and source of life and intelligence is much
more clearly expressed by a later writer, Diogenes of Apollonia.
Diogenes made this conception of a vital and intelligent air the
ground of a teleological view of climatic and atmospheric pheno-
mena. It is noteworthy that he sought to establish the identity
of organic and inorganic matter by the help of the facts of vegetal
and animal nutrition. Diogenes distinctly taught that the world
is of finite duration, and will be renewed out of the primitive
substance.

Heraclitus again deserves a prominent place in a history of
the idea of evolution. Heraclitus conceives of the incessant
process of flux in which all things are involved as consisting
of two sides or moments—generation and decay—which are reg-
sarded as a confluence of opposite streams. In thus making
transition or change, viewed as the identity of existence and
non-existence, the leading idea of his system, Heraclitus antic-
piciated in some measure Hegel’s peculiar doctrine of evolution
as a dialectic process.3 At the same time we may find expressed
in figurative language the germ of thoughts which enter into
still newer doctrines of evolution. For example, the notion of
contraries (baimos) as the father of all things and of harmonies,
arising out of a union of discords, and again of an endeavours by
individual things to maintain themselves in permanence against
the universal process of destruction and renovation, cannot but
remind one of certain fundamental ideas in Darwin’s theory
of evolution.

Empedocles.—Empedocles took an important step in the direc-
tion of modern conceptions of physical evolution by teaching that
all things arise, not by transformations of some primitive form of
matter, but by various combinations of a number of permanent
elements. Further, by maintaining that the elements are con-
stantly being combined and separated by the two forces love
and hatred, which appear to represent in a figurative way the
physical forces of attraction and repulsion, Empedocles may be
said to have made a considerable advance in the construction
of the idea of evolution as a strictly mechanical process. It
may be observed, too, that the hypothesis of a primitive compact
mass (σφαῖρα), in which love (attraction) is supreme,
havesome curious points of similarity to, and contrast with,
that notion of a primitive nebulous matter with which the modern
doctrine of cosmic evolution usually sets out. Empedocles tries
to explain the genesis of organic beings, and, according to Lange,
anticipates the idea of Darwin that adaptations are modified,
because it is their nature to perpetuate themselves. He further recog-
nizes a progress in the production of vegetable and animal forms,
thought this part of his theory is essentially crude and unscientific.
More important in relation to the modern problems of evolution
is his thoroughly materialistic way of explaining the origin
of sensation and knowledge by help of his peculiar hypothesis
of effluvia and pores. The supposition that sensation thus rests
on a material process of absorption from external bodies natu-
really led up to the idea that plants and even inorganic substances
are precipitant, and so to an indistinct recognition of organic life
as a sort of material reality.

Atomists.—In the theory of Atomism taught by Leucippus and
Democritus we have the basis of the modern mechanical conceptions of cosmic evolution. Here the endless harmonious
diversity of our cosmos, as well as of other worlds supposed to
coexist with our own, is said to arise through the various com-
bination of indivisible material elements differing in figure and
magnitude only. The force which brings the atoms together in
the forms of objects is inherent in the elements, and all their
motions are necessary. The origin of things, which is also their
substance, is thus laid in the simplest and most homogeneous
elements or principles. The real world thus arising consists only of
diverse combinations of atoms, having the properties of
magnitude, figure, weight and hardness, all other qualities being
relative only to the sentient organism. The problem of the
genesis of mind is practically solved by identifying the soul,

1 This is brought out by F. Lassalle, Die Philosophie Herakleitos,
p. 126.
EVOLUTION

or vital principle, with heat or fire which pervades in unequal proportions, not only man and animals, but plants and nature as a whole, and through the agitation of which by incoming effluvia all sensation arises.

Aristotle.—Aristotle is much nearer a conception of evolution than his master Plato. It is true he sets out with a transcendental Deity, and follows Plato in viewing the creation of the cosmos as a process. But Aristotle developed the process from the more to the less perfect according to the distance from the original self-moving agency. Yet on the whole Aristotle leans to a teleological theory of evolution, which he interprets dualistically by means of certain metaphysical distinctions. Thus even his idea of the relation of the divine activity to the world shows a tendency to a pantheistic notion of a divine thought which gradually realizes itself in the process of becoming. Aristotle's distinction of form and matter, and his conception of becoming as a transition from actuality to potentiality, provides a new ontological way of conceiving the process of material and organic evolution. To Aristotle the whole of nature is instinct with a vital impulse towards some higher manifestation. Organic life presents itself to him as a progressive scale of complexity determined by its final end, namely, man. In some respects Aristotle approaches the modern view of evolution. Thus, though he looked on species as fixed, being the realization of an unchanging formative principle (φύσις), he seems, as Ueberweg observes, to have inclined to entertain the possibility of a spontaneous generation in the case of the lowest organisms. Aristotle's teleological conception of organic evolution often approaches modern mechanical conceptions. Thus he says that nature fashions organs in the order of their necessity, the first being those essential to life. So, too, in his psychology he speaks of the several degrees of mind as arising according to a progressive necessity. In his view of touch and taste, as the two fundamental and essential senses, he may remind one of Herbert Spencer's doctrine. At the same time Aristotle precludes the idea of a natural development of the mental series by the supposition that man contains, over and above a natural finite soul inseparable from the body, a substantial and eternal principle (ους) which enters into the individual from without. Aristotle's brief suggestions respecting the origin of society and governments in the Politics show a leaning to a naturalistic interpretation of human history as a development conditioned by growing necessities.

Strato.—Of Aristotle's immediate successors one deserves to be noticed here, namely, Strato of Lampsacus, who developed his master's cosmology into a system of naturalism. Strato appears to reject Aristotle's idea of an original source of movement and life extraneous to the world in favour of an immanent principle. All parts of matter have an inward plastic life whereby they can fashion themselves to the best advantage, according to their capability, though not with consciousness.

The Stoics.—The cosmology of the Stoics we have the germ of a monistic and pantheistic conception of evolution. All things are said to be developed out of an original being, which is at once material (fire) and spiritual (the Deity), and in turn they will dissolve back into this primordial source. At the same time the world as a developed whole is regarded as an organism which is permeated with the divine Spirit, and so we may say that the world-process is a self-realization of the divine Being. The formative principle or force of the world is said to contain the several rational germinal forms of things. Individual things are supposed to arise out of the original being, as animals and plants out of seeds. Individual souls are added from the all-compassing world-soul. The necessity in the world's order is regarded by the Stoics as identical with the divine reason, and this idea is used as the basis of a teleological and optimistic view of nature. Very curious, in relation to modern evolutionary ideas, is the Stoical doctrine that our world is but one of a series of exactly identical ones, all of which are destined to be burnt up and destroyed.

The Epicureans.—Lucretius.—The Epicureans differed from the Stoics by adopting a purely mechanical view of the world-process. Their fundamental conception is that of Democritus; they seek to account for the formation of the cosmos, with its order and regularity, by setting out with the idea of an original mass of atoms, some heavier or lighter than others, which, in movements towards and from one another. Our world is but one of an infinite number of others, and all the harmonies and adaptations of the universe are regarded as a special case of the infinite possibilities of mechanical events. Lucretius regards the primitive atoms (first beginnings or first bodies) as seeds out of which individual things are developed. All living and sentient things are formed out of sentient atoms (e.g. worms spring out of dung). The peculiarity of organic and sentient bodies is due to the minuteness and shape of their particles, and to their special motions and combinations. So, too, mind consists but of extremely minute particles of matter, and dissolves into a fume when the body dies. Lucretius traces, in the fifth book of his poem, the progressive genesis of vegetal and animal forms out of the mother-earth. He vaguely anticipates the modern idea of the world as a survival of the fittest when he says that many races may have lived and died out, and that those which still exist have been protected either by craft, courage or speed. Lucretius touches on the development of man out of a primitive, hardy, beast-like condition. Pregnant hints are given respecting a natural development of language which has its germs in the sounds of the various cries of birds, of religious ideas out of dreams and waking hallucinations, and the art of music by help of the suggestion of natural sounds. Lucretius thus recognizes the whole range of existence to which the doctrine of evolution may be applied.

Neoplatonists.—In the doctrines of the Neoplatonists, of whom Plotinus is the most important, we have the world-process represented after the example of Plato as a series of descending steps, each being less perfect than its predecessors, since it is further removed from the first cause. The system of Plotinus, Zeller remarks, is not strictly speaking one of (vertical) descent from the original of matter, but one of mutual transformation, the descent having an effect, the departure of effect from cause, and the tendency of effect to revert to its cause.

The Fathers.—The speculations of the fathers respecting the origin and course of the world seek to combine Christian ideas of the Deity with doctrines of Greek philosophy. The common idea of the origin of things is that of an absolute creation of matter and mind alike. The course of human history is regarded by those writers who are most concerned to refute Judaism as a progressive divine education. Among the Gnostics we meet with the hypothesis of emanation, as, for example, in the curious cosmic theory of Valentinus.

Middle Ages—Early Schoolmen.—In the speculative writings of the middle ages, including those of the schoolmen, we find no progress towards a more accurate and scientific view of nature. The cosmology of this period consists for the most part of the Aristotelian teleological view of nature combined with the Christian idea of the Deity and His relation to the world. In certain writers, however, there appears a more elaborate transformation of the doctrine of creation into a system of emanation. According to John Scotus Eriigena, the nothing out of which the world is created is the divine essence. Creation is the act by which God passes through the primordial causes, or universal ideas, into the region of particular things (processio), in order finally to return to himself (reversio). The transition from the
universal to the particular is of course conceived as a descent or degradation. A similar doctrine of emanation is to be found in the writings of Bernhard of Chartres, who conceives the process of the unfolding of the world as a movement in a circle from the most general to the individual, and from this back to the most general. This movement is said to go forth from God to the animated heaven, stars, visible world and man, which represent decreasing degrees of cognition.

Giordano Bruno.—In the system of Giordano Bruno, who sought to construct a philosophy of nature on the basis of new scientific ideas, more particularly the doctrine of Copernicus, we find the outlines of a theory of cosmic evolution conceived as an essentially vital process. Matter and form are here identified, and the evolution of the world is presented as the unfolding of the world-spirit to its perfect forms according to the plastic substratum (matter) which is but one of its sides. This process of change is conceived as a transformation, in appearance only, of the eternal unchanging substance (matter and form). All parts of matter are capable of developing into all forms; thus the materials of the table and chair may under proper circumstances be developed to the life of the plant or of the animal. The elementary parts of existence are the minima, or monads, which are at once material and mental. On their material side they are not absolutely unextended, but spherical. Bruno looked on our solar system as but one out of an infinite number of worlds. His theory of evolution is essentially pantheistic, and he does not employ his hypothesis of monads in order to work out a more mechanical conception.

Campanella.—A word must be given to one of Bruno’s contemporary compatriots, namely Campanella, who gave poetic expression to that system of universal vitalism which Bruno developed. He argues, from the principle quicquid est in effectibus esse et in causis, that the elements and the whole world have sensation, and thus he appears to derive the organic part of nature out of the so-called “inorganic.”

Boehme.—Another writer of this transition period deserves a passing reference here, namely, Jacob Boehme the mystic, who by his conception of a process of inner dematerialization as the essential character of all mind and of God, prepared the way for later German theories of the origin of the world as the self-differentiation and self-externalization of the absolute spirit.

Hobbes and Gassendi.—The influence of an advancing study of nature, which was stimulated if not guided by Bacon’s writings, is seen in the more careful doctrines of materialism worked out almost simultaneously by Hobbes and Gassendi. These theories, however, contain little that bears directly on the hypothesis of a natural evolution of things. In the view of Hobbes, the difficulty of the genesis of conscious minds is solved by saying that sensation and thought are part of the reaction of the organism on external movement and sensation. Yet Hobbes (sect. 5, ch. 25) points out) to have vaguely felt the difficulty; and in a passage of his Physics (ch. 25, sect. 5) he says that the universal existence of sensation in matter cannot be disproved, though he shows that there are no organic arrangements the mental side of the movement (phantasma) is evanescent. The theory of the origin of society put forth by Hobbes, though directly opposed in most respects to modern ideas of social evolution, deserves mention here by reason of its enforcing that principle of struggle (bellum omnium contra omnes) which has played so conspicuous a part in the modern doctrine of evolution. Gassendi, with some deviations, follows Epicurus in his theory of the formation of the world. The world consists of a finite number of atoms, which have in their own nature a self-moving force or principle. These atoms, which are the seeds of all things, are, however, not eternal but created by God. Gassendi distinctly argues against the existence of a world-soul or a principle of life in nature.

Descartes.—In the philosophy of Descartes we meet with a dualism of mind and matter which does not easily lend itself to the conception of evolution. His doctrine that consciousness is confined to man, the lower animals being unable to think (automata), excludes all idea of a progressive development of mind. Yet Descartes, in his Principia Philosophiae, laid the foundation of the modern mechanical conception of nature and of physical evolution. In the third part of this work he inclines to a thoroughly natural hypothesis respecting the genesis of the physical world, and adds in the fourth part that the same kind of explanation might be applied to the nature and formation of plants and animals. He is indeed careful to keep right with

1 Milanges de philosophie juite et arabe, p. 225.
the orthodox doctrine of creation by saying that he does not believe the world actually arose in this mechanical way out of the three kinds of elements which he here supposes, but that he simply puts out his hypothesis as a mode of conceiving how it might have arisen. Descartes’s account of the mind and its passions is thoroughly materialistic, and to this extent he works in the direction of a materialistic explanation of the origin of mental life.

Spinosa.—In Spinoza’s pantheistic theory of the world, which regards thought and extension as but two sides of one substance, the problem of becoming is submerged in that of being. Although Spinoza’s theory attributes a mental side to all physical events, he rejects all teleological conceptions and explains the order of things as the result of an inherent necessity. He recognizes gradations of things according to the degree of complexity of their movements and that of their conceptions. To Spinoza (as Kuno Fischer observes) man differs from the rest of nature in the degree only and not in the kind of his powers. So far Spinoza approaches the conception of evolution. He may be said to furnish a further contribution to a metaphysical conception of evolution in his view of all finite individual things as the infinite variety to which the unlimited productive power of the universal substance gives birth. Sir F. Pollock has taken pains to show how nearly Spinoza approaches certain ideas contained in the modern doctrine of evolution, as for example that of self-preservation as the determining force in this sense.

Locke.—In Locke we find, with a retention of certain anti-evolutionist ideas, a marked tendency to this mode of viewing the world. To Locke the universe is the result of a direct act of creation, even matter being limited in duration and created. Even if matter were eternal it would, he thinks, be incapable of producing motion; and if motion is itself conceived as eternal, thought can never begin to be. The first eternal being is thus spiritual or “cognitive,” and contains in itself all the perfections that can ever after exist. He repeatedly insists on the impossibility of senseless matter putting on sense. Yet while thus placing himself at a point of view opposed to that of a gradual evolution of the organic world, Locke prepared the way for this doctrine in more ways than one. First of all, his genetic method as applied to the mind’s ideas—which laid the foundations of English analytical psychology—was a step in the direction of a conception of mental life as a gradual evolution. Again he works towards the same end in his celebrated refutation of the scholastic theory of real specific essences. In this argument he emphasizes the vagueness of the boundaries which mark off organic species with a view to show that these do not correspond to absolutely fixed divisions in the objective world, that they are made by the mind, not by nature. This idea of the continuity of species is developed more fully in a remarkable passage (Essay, bk. iii. ch. vi. § 12), where he is arguing in favour of the hypothesis, afterwards elaborated by Leibnitz, of a graduated series of minds (species of spirits) from the Deity down to the lowest animal intelligence. He here observes that “all quite down from us the descent is by easy steps, and a continued series of things, that in each remove differ very little from one another.” Thus man approaches the beasts, and the animal kingdom is nearly joined with the vegetable, and so on down to the lowest and “most inorganic parts of matter. Finally, it is to be observed that Locke had a singularly clear view of organic arrangements (which of course he explained according to a theistic teleology) as an adaptation to the circumstances of the environment or to “the neighbourhood of the bodies that surround us.” Thus he suggests that man has not eyes of a microscopic delicacy, because he would receive no great advantage from such acute organs, since though adding indefinitely to his speculative knowledge of the physical world they would not practically benefit their possessor (e.g. by enabling him to avoid things at a convenient distance).

Idea of Progress in History.—Before leaving the 17th century we must just refer to the writers who laid the foundations of the essentially modern conception of human history as a gradual upward progress. According to Flint, there were four men who in this and the preceding century seized and made prominent this idea, namely, Bodin, Bacon, Descartes and Pascal. The former distinctly argues against the idea of a deterioration of man in the past. In this way we see that just as advancing natural science was preparing the way for a doctrine of physical evolution, so advancing historical research was leading to the application of a similar idea to the collective human life.

English Writers of the 18th Century—Hume.—The theological discussions which make up so large a part of the English speculation of the 18th century cannot detain us here. There is, however, one writer who sets forth so clearly the alternative suppositions respecting the origin of the world that he claims a brief notice. We refer to David Hume. In his Dialogues concerning Natural Religion he puts forward tentatively, in the person of one of his interlocutors, the ancient hypothesis that since the world resembles an animal or vegetal organism rather than a machine, it might more easily be accounted for by a process of generation than by an act of creation. Later on he develops the materialistic view of Epicurus, only modifying it so far as to conceive of matter as finite. Since a finite number of particles is only susceptible of finite transpositions, it must happen that says Hume, an eternal duration of things, to an eternal order or position will be tried an infinite number of times, and hence this world is to be regarded (as the Stoics maintained) as an exact reproduction of previous worlds. The speaker seeks to make intelligible the appearance of art and contrivance in the world as a result of a natural settlement of the universe (which passes through a succession of chaotic conditions) into a stable condition, having a constancy in its forms, yet without its several parts losing their motion and fluctuation.

French Writers of the 18th Century.—Let us now pass to the French writers of the 18th century. Here we are first struck by the results of advancing physical speculation in the bearing on the conception of the world. Careful attempts, based on new scientific truths, are made to explain the genesis of the world as a natural process. Maupertuis, who, together with Voltaire, introduced the new idea of the universe as based on Newton’s discoveries, sought to account for the origin of organic things by the hypothesis of sentient atoms. Buffon the naturalist speculated, not only on the structure and genesis of organic beings, but also on the course of formation of the earth and solar system, which he conceived after the analogy of the development of organic being out of seed. Diderot, too, in his varied intellectual activity, found time to speculate on the genesis of sensation and thought out of a combination of matter endowed with an elementary kind of sentience. De la Mettrie worked out a materialistic doctrine of the origin of things, according to which sensation and consciousness are nothing but a development out of matter. He sought (L’Homme-machine) to connect man in his original condition with the lower animals, and emphasized (L’Homme-planté) the essential unity of plan of all living things. Helvétius, in his work on man, referred all differences between our species and the lower animals to certain peculiarities of our organization, and so prepared the way for a conception of human development out of lower forms as a process of physical evolution. Charles Bonnet met the difficulty of the origin of conscious beings much in the same way as Leibnitz, by the supposition of eternal minute organic bodies to which are attached immortal souls. Yet though in this way opposing himself to the method of the modern doctrine of evolution, he aided the development of this doctrine by his view of the organic world as an ascending

A similar coincidence between the teleological and the modern evolutionary views is to be found. The doctrine was received with much account of the use of pain in relation to the preservation of our being (bk. ii. ch. vii. sect. 4).

Philosophy of History (1893), p. 103, where an interesting sketch of the growth of the idea of progress is to be found.
scale from the simple to the complex. Rohinet, in his treatise *De la nature*, worked out the same conception of a gradation in organic existence, connecting this with a general view of nature as a progress from the lowest inorganic forms of matter up to man. The process is conceived as an infinite series of variations or specifications of one primitive and common type. Man is the *chef-d’œuvre* of nature, which the gradual progression of beings was to have as its last term, and all lower creations are regarded as pre-conditions of man’s existence, since nature “could only realize the human form by combining in all imaginable ways each of the elements which was to form it.” The progressive force in this process of evolution (or “metamorphosis”) is conceived as an intellectual principle (*idée générateur*). Rohinet thus laid the foundation of that view of the world as a whole, and as a progressive unfolding of a spiritual formative principle, which was afterwards worked out by Schelling. It is to be added that Rohinet adopted a thorough-going materialistic view of the dependence of mind on body, going even to the length of assigning special nerve-fibres to the moral sense. The system of Holbach seeks to provide a consistent materialistic view of the world and its processes. Mental operations are considered as physical results of physical movement, inertia, attraction and repulsion, being in the moral world self-love, love and hate. He left open the question whether the capability of sensation belongs to all matter, or is confined to the combinations of certain materials. He looked on the actions of the individual organism and society as determined by the needs of self-preservation. He conceived of man as a product of nature that had gradually developed itself from a low condition, though he relinquished the problem of the exact mode of its first genesis and advance as not soluble by data of experience. Holbach thus worked out the basis of a rigorously materialistic conception of evolution.

The question of human development which Holbach touched on was one which occupied many minds both in and out of France during the 18th century, and more especially towards its close. The foundations of this theory of history as an upward progress of man out of a barbaric and animal condition were laid by Vico in his celebrated work *Principii di scienza nuova*. In France the doctrine was represented by Turgot and Condorcet.

*German Writers of the 18th Century—Leibnitz.*—In Leibnitz we find, if not a doctrine of evolution in the strict sense, a theory of the monads taken in its abstracted sense and used for the purposes of the *philosophie du monde,* in its static as an a-existing whole, to conceive the ultimate reality of things in such a way as to solve the mystery of mind and matter. Yet by his very mode of solving the problem he is led on to consider the nature of the world-process. By placing substantial reality in an infinite number of monads whose essential nature is force or activity, which is conceived as mental (representation), Leibnitz was carried on to the explanation of the successive order of the world. He prepares the way, too, for a doctrine of evolution by his monistic idea of the substantial similarity of all things, inorganic and organic, bodily and spiritual, and still more by his conception of a perfect gradation of existence from the lowest, “inanimate” objects, whose essential activity is confused representation, up to the highest organized being—man—with his clear intelligence.1 Turning now to Leibnitz’s conception of the world as a process, we see first that he supplies, in his notion of the underlying reality as force which is represented as spiritual (quelque chose d’analogique au sentiment et à l’appétit), both a mechanical and a teleological explanation of its order. More than this, Leibnitz supposes that the activity of the monads takes the form of a self-evolution. It is the following out of an inherent tendency or impulse to a series of changes, all of which were virtually pre-existent, and this process cannot be interfered with from without. As the individual monad, so the whole system which makes up the world is a gradual development. In this case, however, we cannot say that each step goes out of the other as in that of individual development. Each monad is an original independent being, and is determined to take this particular point in the universe, this place in the scale of beings. We see how different this metaphysical conception is from that scientific notion of cosmic evolution in which the lower stages are the antecedents and conditions of the higher. It is probable that Leibnitz’s notion of time and space, which approaches Kant’s theory, led him to attach but little importance to the successive order of the world. Leibnitz, in fact, presents to us an infinite system of perfectly distinct though parallel worlds, which on their mental side assume the aspect of a scale, not through any mutual action, but solely through the determination of the Deity. Even this idea, however, is incomplete, for Leibnitz fails to explain the physical aspect of development. Thus he does not account for the fact that organic beings—which have always existed as preformations (in the case of animals as *animaux spermatiques*)—come to be developed under given conditions. Yet Leibnitz prepared the way for a new conception of organic evolution. The modern monistic doctrine, that all material things consist of sentient elements, and that the consciousness which arises through a combination of these, was a natural transformation of Leibnitz’s conception.

Lessing.—Of Leibnitz’s immediate followers we may mention Lessing, who in his *Education of the Human Race* brought out the truth of the process of gradual development underlying human history, even though he expressed this in a form inconsistent with the idea of a spontaneous evolution.

*Herder.—Herder,* on the other hand, Lessing’s contemporary, treated the subject of man’s development in a thoroughly naturalistic spirit. In his *Ideen zur Philosophie der Geschichte,* Herder adopts Leibnitz’s idea of a graduated scale of beings, at the same time conceiving of the lower stages as the conditions of the higher. Thus he is led to think that the highest product of nature, and as such to be dependent on all lower products. All material things are assimilated to one another as organic, the vitalizing principle being inherent in all matter. The development of man is explained in connexion with that of the earth, and in relation to climatic variations, &c. Man’s mental faculties are viewed as related to his organization, and as developed under the pressure of the necessities of life.2

*Kant.*—Kant’s relation to the doctrine of evolution is a many-sided one. In the first place, his peculiar system of subjective idealism, involving the idea that time is but a mental form to which there corresponds nothing in the sphere of noumenal reality, serves to give a peculiar philosophical interpretation to every doctrine of cosmic evolution. Kant, like Leibnitz, seeks to reconcile the mechanical and teleological views of nature, only he assigns to these different spheres. The order of the inorganic world is explained by properly physical causes. In his *Naturgeschichte des Himmels,* in which he anticipated the nebular theory afterwards more fully developed by Laplace, Kant sought to explain the genesis of the cosmos as a product of physical forces and laws. The worlds, or systems of worlds, which fill infinite space are continually being formed and destroyed. Chaos passes by a process of evolution into a cosmos, and this again into chaos. So far as the evolution of the solar system is concerned, Kant held these mechanical causes as adequate. For the world as a whole, however, he postulated a beginning in time (whence his use of the word creation), and further supposed that the impulse of organization which was conveyed to chaotic matter by the Creator issued from a central point in the infinite space spreading gradually outwards.3 While

1 Both Lewes and de Bois Reymond have brought out the points of contact between Leibnitz’s theory of monads and modern biological speculations (*Hist. of Phil.* ii. 287, and Leibnish*cke Gedanken in der modernen Naturwissenschaft,* p. 23 sqq.).

2 Herder’s position in relation to the modern doctrine of evolution see F. von Bähr in *Brehm’s Vorderer Verenger Darwin’s,* a work which tends to exaggerate the proximity of the two writers.

3 Kant held it probable that other planets besides our earth are inhabited, and that their inhabitants form a scale of beings, their perfection increasing with the distance of the planet which they inhabit from the sun.
in his cosmology Kant thus relies on mechanical conceptions, in his treatment of organic life his mind is, on the contrary, dominated by teleological ideas. An organism was to him something controlled by a formative organizing principle. It was natural, therefore, that he rejected the idea of a spontaneous generation of organisms (which was just then being advocated by his friend Forster), not only as unsupported by experience but as an inadequate hypothesis. Experience forbids our excluding organic activity from natural causes, also our excluding intelligence from purposeful (zweckzügigen) causes; hence experience forbids our defining the fundamental force or first cause out of which living creatures arose. Just as Kant thus sharply marks off the regions of the inorganic and the organic, so he sets man in strong opposition to the lower animals. His ascription to man of a unique faculty, free-will, forbade his conceiving our species as a link in a graduated series of organic developments. In his doctrine of human development he does indeed recognize an early stage of existence in which our species was dominated by sensoins enjoyment and instinct. He further conceives of this stage as itself a process of (natural) development, namely, of the natural disposition of the species to vary in the greatest possible manner so as to preserve its unity through a process of self-adaptation (Anaten) to climate. This, he says, must not be conceived as resulting from the action of external causes, but is due to a natural disposition (Anlage). From this capability of natural development (which already involves a teleological idea) Kant distinguishes the power of moral self-development or self-liberation from the determination of nature, the gradual realization of which constitutes human history. This moral development is regarded as a gradual approach to that rational, social and political state in which will be realized the greatest possible quantity of liberty. Thus Kant, though he appropriated and gave new form to the idea of human progress, conceived of this as wholly distinct from a natural (mechanical) process. In this particular, as in his view of organic actions, Kant distinctly opposed the idea of evolution as one universal process swaying alike the physical and the moral world.

Schelling.—In the earlier writings of Schelling, containing the philosophy of identity, existence is represented as a becoming, or process of evolution. Nature and mind (which are the two sides, or polar directions, of the one absolute) are each viewed as an activity advancing by an uninterrupted succession of stages. The side of this process which Schelling worked out most completely is the negative side, that is, nature. Nature is essentially a process of organic self-evolution. It can only be understood by subordinating the mechanical conception to the vital, by conceiving the world as one organism animated by a spiritual principle or intelligence (Weltseele). From this point of view the processes of nature from the inorganic up to the most complex of the organic become stages in the self-realization of nature. All organic forms are at bottom but one organization, and the inorganic world shows the same formative activity in various degrees or potences. Schelling conceives of the gradual self-evolution of nature in a succession of higher and higher forms as brought about by a limitation of her infinite productivity, showing itself in a series of points of arrest. The detailed exhibition of the organizing activity of nature in the several processes of the organic and inorganic world rests on a number of fanciful and unscientific ideas. Schelling's theory is a bold attempt to revitalize nature in the light of growing physical and physiological science, and by so doing to comprehend the unity of the world under the idea of one principle of organic development. His highly figurative language might leave us in doubt how far he conceived the higher stages of this evolution of nature as following the lower in time. In the introduction to his work Von der Weltseele, however, he argues in favour of the possibility of a transmutation of species in periods incomensurable with ours. The evolution of mind (the positive pole) proceeds by way of three stages—theoretic, practical and aesthetical activity. Schelling's later theosophic speculations do not specially concern us here.

Followers of Schelling.—Of the followers of Schelling a word or two must be said. Heinrich Steffens, in his Anthropologie, seeks to trace out the origin and history of man in connexion with a general theory of the development of the earth, and this again as related to the formation of the solar system. All these processes are regarded as a series of manifestations of a vital principle in higher and higher forms. Oken, again, who carries Schelling's ideas into the region of biological science, seeks to reconstruct the gradual evolution of the material world out of original matter, which is the first immediate appearance of God, or the absolute. This process is an upward one, through the formation of the solar system and of our earth with its inorganic bodies, up to the production of man. The process is essentially a polar linear action, or differentiation from a common centre. By means of this process the bodies of the solar system separate themselves, and the order of cosmic evolution is repeated in that of terrestrial evolution. The organic world (like the world as a whole) arises out of a primitive chaos, namely, the infusoral slime. A somewhat similar working out of Schelling's idea is to be found in H. C. Oersted's work entitled The Soul in Nature (Eng. trans.). Of later works based on Schelling's doctrine of evolution mention may be made of the volume entitled Natur und Idee, by G. F. Carus. According to this writer, existence is nothing but a becoming, and matter is simply the momentary product of the process of becoming, while force is this process conceived as an ever-present immanent power.

Hegel.—Like Schelling, Hegel conceives the problem of existence as one of becoming. He differs from him with respect to the ultimate motive of that process of gradual evolution which reveals itself alike in nature and in mind. With Hegel the absolute is itself a dialectic process which contains within itself a principle of progress from difference to difference and from unity to unity. "This process (W. Wallace remarks) knows nothing of the distinctions between past and future, because it implies an eternal present." This conception of an immanent spontaneous evolution is applied alike both to nature and to mind and history. Nature to Hegel is the idea in the form of haternity; and finding itself here it has to remove this exteriority in a progressive evolution towards an existence for itself in life and mind. Nature (says Zeller) is to Hegel a system of gradations, of which one arises necessarily out of the other, and is the proximate truth of that out of which it results. There are three stadia, or moments, in this process of nature—(1) the mechanical moment, or matter devoid of individuality; (2) the physical moment, or matter which has particularized itself in bodies—the solar system; and (3) the organic moment, or organic beings, beginning with the geological organism—or the mineral kingdom, plants and animals. Yet this process of development is not to be conceived as if one stage is naturally produced out of the other, and not even as if the one followed the other in time. Only spirit has a history; in nature all forms are contemporaneous. Hegel's interpretation of mind and history as a process of evolution has more scientific interest than his conception of nature. His theory of the development of free-will (the objective spirit), which takes its start from Kant's conception of history, with its three stages of legal right, morality as determined by motive and instinctive goodness (Stiilichkeit), might almost as well be expressed in terms of a thoroughly naturalistic doctrine of human development. So, too, some of his conceptions respecting the development of art and religion (the absolute spirit) lend themselves to a similar interpretation. Yet while, in its application to history, Hegel's theory of evolution has points of resemblance with those doctrines which seek to explain the world-process as one unbroken progress occurring in time, it constitutes on the whole a theory apart and sui generis. It does not conceive of the organic as succeeding on the inorganic, or of conscious life

1 Kant calls the doctrine of the transmutation of species a "hazardous fancy of the reason." Yet, as Strauss and others have shown, Kant's mind betrayed a decided leaning at times to a more mechanical conception of organic forms as related by descent.

2 Hegel somewhere says that the question of the eternal duration of the world is unanswerable: time as well as space can be predicated of finitudes only.
as conditioned in time by lower forms. In this respect it resembles Leibnitz's idea of the world as a development; the idea of evolution is in each case a metaphysical as distinguished from a scientific one. Hegel gives a place in his metaphysical system to the mechanical and the teleological views; yet in his treatment of the world as an evolution the idea of end or purpose is the predominant one.

Of the followers of Hegel who have worked out his peculiar idea of evolution it is hardly necessary to speak. A bare reference may be made to J. K. F. Rosenkranz, who in his work *Hegel's Naturphilosophie* seems to develop Hegel's idea of an earthly organism in the light of modern science, recognizing in crystallization the morphological element.

Schopenhauer.—Of the other German philosophers immediately following Kant, there is only one who calls for notice here, namely, Arthur Schopenhauer. This writer, by his conception of the world as will which objectifies itself in a series of gradations from the lowest manifestations of matter up to conscious man, gives a slightly new shape to the evolutionary view of Schelling, though he deprives this view of its optimistic character by denying any co-operation of intelligence in the world-process. In truth, Schopenhauer's conception of the world as the activity of will is at bottom a materialistic and mechanical rather than a spiritualistic and teleological theory. Moreover, Schopenhauer's subjective idealism, and his view of time as something illusory, hindered him from viewing this process as a sequence of events in time. Thus he ascribes eternity of species to the world of the "Platonic Ideas." As Ludwig Noëtre observes, Schopenhauer has no feeling for the problem of the origin of organic beings. He says Lamarrack's original animal is something metaphysical, not physical, namely, the will to live. "Every species (according to Schopenhauer) has of its own will, and according to the circumstances under which it would live, determined its form and organization,—yet not as something physical in time, but as something metaphysical out of time."

Von Baer.—Before leaving the German speculation of the first half of the century, a word must be said of von Baer, to whose biological contributions we shall refer later in this article, who, recognized in the law of development the law of the universe as a whole. In his *Entwicklungs geschichte der Thiere* (p. 264) he distinctly tells us that the law of growing individuality is the fundamental thought which goes through all forms and degrees of animal development and determines all single relations. It is the same thought which collected in the cosmic space the divided masses into spheres, and combined these to solar systems; the same which caused the weather-beaten dust on the surface of our metallic planet to spring forth into living forms." Von Baer thus prepared the way for Herbert Spencer's generalization of the law of organic evolution as the law of all evolution.

Comte.—As we arrive at the 19th century, though yet before the days of Darwin, biology is already beginning to affect the general aspect of thought. It might suffice to single out the influence of Auguste Comte to the last great thinker who wrote before Darwin, and whose work helped to permeate philosophic speculation. Though Comte did not actually contribute to a theory of cosmic organic evolution, he helped to lay the foundations of a scientific conception of human history as a natural process of development determined by general laws of human nature together with the accumulating influences of the past. Comte does not recognize that this process is aided by any increase of innate capacity; on the contrary, progress is to him the unfolding of fundamental faculties of human nature which always pre-existed in a latent condition; yet he may perhaps be said to have prepared the way for the new conception of human progress by his inclusion of mental laws under biology.

**Development of the Biological Doctrine.**—In the 19th century the doctrine of evolution received new biological contents and became transformed from a vague, partly metaphysical theory to the dominant modern conception. At this point it is convenient to leave the guidance of Professor J. Sully and to follow closely T. H. Huxley, who in the 9th edition of this encyclopedia traced the history of the growth of the biological idea from its philosophical beginnings to its efflorescence in Charles Darwin.

In the earlier half of the 19th century the term "evolution" was introduced into biological writings in order to denote the mode in which some of the most eminent physiologists of that time conceived that the generation of living things took place; in opposition to the hypothesis advocated, in the preceding century, by W. Harvey that remarkable work 1 which would give him a claim to rank among the founders of biological science, even had he not been the discoverer of the circulation of the blood.

One of Harvey's prime objects is to defend and establish, on the basis of direct observation, the opinion already held by Aristotle, that in the higher animals at any rate, the formation of the new organism by the process of generation takes place, not suddenly, by simultaneous accretion of rudiments of all or the most important of the organs of the adult, nor by sudden metamorphosis of a formative substance into a miniature of the whole, which subsequently grows, but by *epigenesis*, or successive differentiation of a relatively homogeneous rudiment into the parts and structures which are characteristic of the adult.

"Et primo, quidem, quoniam per epigenesin sive partum super exorioritum additamentum pullum fabricari certum est: quiaeam pars ante alias omnes exstratur, et quid de illa ejusque generandi fundamentum vehiculid fundonem de novo manet sane et in ovo manifeste apparat quod Aristoteles de perfectionum animalium generacione enuntiavit: minium, non omnes partes simul fieri, sed ordine aliarm post aliun; primumque existere particularum genitalia, cujus virtute postea (tantum in principio quodam) religauque omnes partes proissil. Qualem in plantarum semenibus (lapis, putat, aut glandibus) gemmarum sive alicem protuberantem cumcrennum, totius futurae arboris principium. Estque hoc particula veluti frutis emangetatis se scilicetque collocatus, et principio per se veniens, unde postea membrorum ordo describitur; et quacunqve ad absolvendum animal partemini, dispositur*

Quoniam enim nulla pars se epum maneat, sed possum unum quidem, quae in simulacrum paleonim ino necessis, quae principalium augendi continem, sive enim plante, sive animal em, sive omnibus ino quod inum habebat vegetandi, sive nutritionis, 3 similique reliquas omnes partes quamque ordine distinct et formet; proindeque in eadem Primo genita particula anima primario inest, sensus, motusque, et totius vitae auctor et principium." (Exercitationi 51.)

Harvey proceeds to contrast this view with that of the "Medici," or followers of Hippocrates and Galen, who, "badly philosophizing," imagined that the brain, the heart, and the liver were simultaneously first generated in the form of vessels; and, at the same time, while expressing his agreement with Harvey, that the principle of *epigenesis*, he adds that the blood which is the principal generative part, and not, as Aristotle thought, the heart.

In the latter part of the 17th century the doctrine of *epigenesis* thus advocated by Harvey was controverted on the ground of direct observation by M. Malpighi, who affirmed that the body of the chick is to be seen in the egg before the *punctum sanguineum* makes it appearance. But from this perfectly correct observation a conclusion which is by no means warranted was drawn, namely, that the chick as a whole really exists in the egg antecedently to its unfolding. This view asserted that what happens in the course of the latter process is no addition of new parts, "alias post alias natas," as Harvey puts it, but a simple expansion or unfolding of the organs which already exist, though they are too small and inconspicuous to be discovered. The weight of Malpighi's observations therefore fell into the scale of that doctrine which Harvey terms metamorphosis, in contradistinction to *epigenesis*.

*The views of Malpighi were warmly welcomed on philosophical grounds by Leibnitz,* 4 who found in them a support to his

1 *Exercitationes de generatione animalium,* which Dr George Ent extracted from him and published in 1651.
2 De generatione animalium, lib. ii, cap. iv.
3 De generatione animalium, lib. ii, cap. iv.
4 "Cependant, pour revenir aux formes ordinaires ou aux ânes mastiques, cette durée et ce retournement de l'œuf qu'on attribue aux atomes pourrait faire douter si elles ne vont pas de corps en corps; ce qui serait la métamorphose, à peu près comme quelques philosophes ont cru la transmission du mouvement.
The two parts of Bonnet's hypothesis, namely, the doctrine that all living things proceed from pre-existing germs, and that these contain, one enclosed within the other, the germs of all future living things, which is the hypothesis of "emboltement," and the doctrine that every germ contains in miniature all the organs of the adult, which is the hypothesis of evolution or devolution, in the primary senses of these words, must be carefully distinguished. In fact, while holding firmly by the former, Bonnet more or less modified the latter in his later writings, and, at length, he admits that a "germ" need not be an actual miniature of the organism, but that it may be merely an "original preformation" capable of producing the latter.  

But, thus defined, the germ is neither more nor less than the "particula genitalis" of Aristotle, or the "primordium vegetale" or "ovum" of Harvey; and the "evolution" of such a germ would not be distinguishable from "epigenesis."  

Supported by the great authority of Haller, the doctrine of evolution, or development, prevailed throughout the whole of the 18th century, and Cuvier appears to have substantially adopted Bonnet's later views, though probably he would not have gone all lengths in the direction of "emboltement." In a well-known note to Charles Léopold Laurillard's Éloge, prefixed to the last edition of the Ossements fossiles, the "radical de l'être" is much the same thing as Aristotle's "particula genitalis" and Harvey's "ovum."  

Bonnet's eminent contemporary, Buffon, held nearly the same views as to the nature of the germ, and expresses them even more confidently:  

"Ceux qui ont cru que le cœur était le premier formé, se sont trompés; ceux qui disent que c'est le sang se trompent aussi; tout est formé en même temps. Si l'on ne consulte que l'observation, le poulet se voit dans l'œuf avant qu'il ait été couvé."

J'ai ouvert une grande quantité d'œufs à différents temps avant et après l'incubation, et je me suis convaincu par mes yeux que le poulet existe en entier dans le milieu de la cicatrice au moment qu'il sort du corps de la poule."  

The "moule intérieur" of Buffon is the aggregate of elementary parts which constitute the individual, and is thus the equivalent of Bonnet's germ, as defined in the passage cited above. But Buffon further imagined that innumerable "molécules organiques" are dispersed throughout the world, and that alimentation consists in the appropriation by the parts of an organism of those molecules which are analogous to them.

Growth, therefore, was, on this hypothesis, partly a process of simple evolution, and partly of what has been termed syngenesis. Buffon's opinion is, in fact, a sort of combination of views, essentially similar to those of Bonnet, with others, somewhat similar to those of the "Medici" whom Harvey condemns. The "molécules organiques" are physical equivalents of Leibnitz's "monads."  

It is a striking example of the difficulty of getting people to use their own powers of investigation accurately, that this form of the doctrine of evolution should have held its ground so long; for it was thoroughly and completely exploded, not long after its enunciation, by Caspar Frederick Wolff, who, in his Theoria generationis, published in 1759, placed the opposite theory of epigenesis upon the secure foundation of fact, from which it has never been displaced. But Wolff had no immediate
successors. The school of Cuvier was lamentably deficient in embryologists; and it was only in the course of the first thirty years of the 19th century that Prévost and Dumas in France, and, later on, Döllinger, Pander, von Bähr, Rathke, and Remak in Germany, founded modern embryology; and, at the same time, proved the utter incompatibility of the hypothesis of evolution as formulated by Bonnet and Haller with easily demonstrable facts.

Nevertheless, though the conceptions originally denoted by "evolution" and "development" were shown to be untenable, the words retained their application to the process by which the embryos of living beings gradually make their appearance; and the terms "development," "Entwicklung," and "évolutio" are now indiscriminately used for the series of genetic changes exhibited by living beings, by writers who would emphatically deny that "development" or "Entwicklung" or "évolutio," in the sense in which these words were usually employed by Bonnet or Haller, ever occurs.

Evolution, or development, is, in fact, at present employed in biology as a general name for the history of the steps by which any living being has acquired the morphological and the physiological characters which distinguish it. As civil history may be divided into biography, which is the history of individuals, and universal history, which is the history of the human race, so evolution falls naturally into two categories—the evolution of the individual (see Embryology) and the evolution of the sum of living beings.

The Evolution of the Sum of Living Beings.—The notion that all the kinds of animals and plants may have come into existence by the growth and modification of primordial germs is as old as speculative thought; but the modern scientific form of the doctrine can be traced historically to the influence of several converging lines of philosophical speculation and of physical observation, none of which go further back than the 17th century. These are:

1. The enunciation by Descartes of the conception that the physical universe, whether living or not living, is a mechanism, and that, as such, it is explicable on physical principles.

2. The observation of the gradations of structure, from extreme simplicity to very great complexity, presented by living things, and of the relation of these graduated forms to one another.

3. The observation of the existence of an analogy between the series of gradations presented by the species which compose any great group of animals or plants, and the series of embryonic conditions of the highest members of that group.

4. The observation that large groups of species of widely different habits present the same fundamental plan of structure; and that parts of the same animal or plant, the functions of which are very different, likewise exhibit modifications of a common plan.

5. The observation of the existence of structures, in a rudimentary and apparently useless condition, in one species of a group, which are fully developed and have definite functions in other species of the same group.

6. The observation of the effects of varying conditions in modifying living organisms.

7. The observation of the facts of geographical distribution.

8. The observation of the facts of the geological succession of the forms of life.

1 As Buffon has well said:—"L'idée de ramener l'explication de tous les phénomènes à des principes mécaniques est assurément grande et belle; ce n'est le plus hardi qu'on peut faire en philosophie, et c'est Descartes qui l'a faite."—I.e. p. 50.
from a single pair. Jean Baptiste René Robinet followed out much the same line of thought as De Mairiel, but less soberly; and Bonnet’s speculations in the Palaeographie, which appeared in 1769, have already been mentioned. Buffon (1733-1788), at first a partisan of the absolute immutability of species, subsequently appears to have believed that larger or smaller groups of species have been produced by the modification of a primitive stock; but he contributed nothing to the general doctrine of evolution.

Erasmus Darwin (Zoonomia, 1794), though a zealous evolutionist, can hardly be said to have made any real advance on his predecessors; and, notwithstanding the fact that Goethe had the same general knowledge of living facts, he did not even utter a true insight into their significance, when he threw all the power of a great poet into the expression of his conceptions, it may appear whether he supplied the doctrine of evolution with a firmer scientific basis than it already possessed. Moreover, whatever the value of Goethe’s labours in that field, they were not published before 1820, long after evolutionism had taken a new departure from the works of Treviranus and Lamarck—the first of its advocates who were equipped for their task with the needful large and accurate knowledge of the phenomena of nature. This remark applies to each of these writers, whose works seem to have been led, independently and contemporaneously, to invent the same name of “biology” for the science of the phenomena of life; and thus, following Buffon, to have recognized the essential unity of these phenomena, and their contrary distinction from those of inanimate nature. And it is hard to say whether Lamarck or Treviranus has the priority in propounding the main thesis of the doctrine of evolution; for though the first volume of Treviranus’s Biologie appeared only in 1802, he says, in the preface to his later work, the Erfahrungen und Gesetze des organischen Lebens, dated 1831, that he was working on the Biologie “nearly five-and-thirty years ago,” or about 1796.

Now, in 1794, there is evidence that Lamarck held doctrines which present a striking contrast to those which are to be found in the Philosophie zoologique, as the following passages show:

“685. Quoique mon objet unique dans cet article n’ait été que de traier de la cause physique de l’entretien de la vie des êtes organiques, malgré cela j’ai osé avancer en débutant, que l’existence de ces êtres étonnants n’appartiennent nullement à la nature; que tout ce qu’on peut entendre par le mot nature, ne pouvait donner la vie, c’est-à-dire, que toutes les qualités de la matière, jointes à toutes les circonstances possibles, et même à l’activité répandue dans l’univers, ne pouvaient point produire un être muni du mouvement organique, capable de reproduire son semblable, et sujet à la mort."

“686. Tous les individus de cette nature, qui existent, proviennent d’individus semblables qui tous ensemble constituent l’espèce entière. Or, je crois qu’il est aussi impossible à l’homme de connaitre la cause physique du premier individu de chaque espèce, que d’assigner aussi physiquement la cause de l’existence de la matière ou de l’univers entier. C’est au moins ce que le résultat de mes connaissances et de mes réflexions me portent à penser. S’il existe beaucoup de variétés produites par l’effet des circonstances, ces variétés ne dénaturent point les espèces; mais on se trompe, sans doute souvent, en indiquant comme espèce, ce qui n’est que variété; et je ne crois pas être un seul à avoir remarqué en conséquence dans les raisonnements que l’on fait sur cette matière."

The first three volumes of Treviranus’s Biologie, which contains his general views of evolution, appeared between 1802 and 1805. The Recherches sur l’organisation des corps vivants, which sketches out Lamarck’s doctrines, was published in 1802; but the full development of his views in the Philosophie zoologique did not take place until 1809.

1 Considérations philosophiques sur la gradation naturelle des formes de l’être; ou les essais de la nature qui apprend à faire l’homme (1768).

2 Recherches sur les causes des principaux faits physiques, par J. B. Lamarck. Paris. Seconde année de la République. In the preface, Lamarck says that the work was written in 1776, and presented to the Academy in 1780; but it was not published before 1794, and at that time it presumably expressed Lamarck’s mature views. It would be interesting to know what change of opinion manifested in the Recherches sur l’organisation des corps vivants, published only seven years later.

The Biologie and the Philosophie zoologique are both very remarkable productions, and are still worthy of attentive study, but they fell upon evil times. The vast authority of courtier was employed in support of the traditionally respectable hypotheses of special creation and of catastrophism; and the wild speculations of the Discours sur les révolutions de la surface du globe were held to be models of sound scientific thinking, while the really much more sober and philosophical hypotheses of the Hydrogologie were scouted. For many years it was the fashion to speak of Lamarck with ridicule, while Treviranus was altogether ignored.

Nevertheless, the work had been done. The conception of evolution was henceforward irresistible, and it incessantly reappears, in one shape or another. Thus, in 1820, Trewiranus’s disciple Charles Darwin and A. R. Wallace published their Theory of Natural Selection. The Origin of Species appeared in 1859; and thenceforward the doctrine of evolution assumed a position and acquired an importance which it never before possessed. In the Origin of Species, and in his other numerous and important contributions to the solution of the problem of biological evolution, Darwin confined himself to the discussion of the causes which have brought about the present condition of living matter, assuming such matter to have once come into existence. The later writer has contributed what he regards as the whole problem of evolution. The profound and vigorous writings of Spencer embody the spirit of Descartes in the knowledge of our own day, and may be regarded as the Principes de la philosophie of the 19th century; while, whatever hesitation may not infrequently be felt by less daring minds in following Haeckel in many of his speculations, his attempt to systematize the doctrine of evolution and to exhibit its influence as the central thought of modern biology, cannot fail to have a far-reaching influence on the progress of science.

If we look for the reason of the difference between the scientific position of the doctrine of evolution in the days of Lamarck and that which it occupies now, we shall find it in the great accumulation of facts, the several classes of which have been enumerated above, under the second to the eighth heads. For those which are grouped under the second to the seventh of these classes, respectively, have a clear significance on the hypothesis of evolution, while they are unintelligible if that hypothesis be denied. And those of the eighth group are not only unintelligible without the assumption of evolution, but can be proved never to be discordant with that hypothesis, while, in fact, they are exactly such as the hypothesis requires. The demonstration of these assertions would require a volume, but the general nature of the reasoning on which they rest may be briefly indicated.

2. The accurate investigation of the lowest forms of animal life, commenced by Leeuwenhoek and Swammerdam, and continued by the remarkable labours of Réaumur, Abraham Trembley, Bonnet, and a host of other observers in the latter part of the 17th and the first half of the 18th centuries, drew the attention of biologists to the gradation in the complexity of organization which is presented by living beings, and culminated in the doctrine of the échelle des êtres, so powerfully and clearly stated by Bonnet, and, before him, adumbrated by Locke and by Leibnitz. In the then state of knowledge, it appeared that all the species of animals and plants could be arranged in one series, in such a manner that, by insensible gradations, the mineral passed into the plant, the plant into the polyple, the polyple into the worm, and so, through gradually higher forms of life, to man, at the summit of the animated world.

But, as knowledge advanced, this conception ceased to be tenable in the crude form in which it was first put forward. Taking into account existing animals and plants alone, it became obvious that they fell into groups which were more or less sharply separated from one another; and, moreover, that even

See the “Historical Sketch” prefixed to the last edition of the Origin of Species.

EVOLUTION

3. There is a remarkable fact that McOe*s philosophy of evolution is not only well-developed in the field of theoretical biology, but also directly usable in the field of anatomy. In fact, McOe*s theory of evolution is not only a scientific theory, but also a practical theory, which is widely used in the field of anatomy. For example, in the field of anatomy, McOe*s theory of evolution is used to explain the relationships between different types of organisms, and to explain the development of different types of organisms. In addition, McOe*s theory of evolution is also used to explain the development of the human body, and to explain the development of the human brain. Moreover, McOe*s theory of evolution is also used to explain the development of the human heart, and to explain the development of the human lungs. In this way, McOe*s theory of evolution is not only a scientific theory, but also a practical theory, which is widely used in the field of anatomy.

4. This fact shows that McOe*s philosophy of evolution is not only well-developed in the field of theoretical biology, but also directly usable in the field of anatomy. In fact, McOe*s theory of evolution is not only a scientific theory, but also a practical theory, which is widely used in the field of anatomy. For example, in the field of anatomy, McOe*s theory of evolution is used to explain the relationships between different types of organisms, and to explain the development of different types of organisms. In addition, McOe*s theory of evolution is also used to explain the development of the human body, and to explain the development of the human brain. Moreover, McOe*s theory of evolution is also used to explain the development of the human heart, and to explain the development of the human lungs. In this way, McOe*s theory of evolution is not only a scientific theory, but also a practical theory, which is widely used in the field of anatomy.
structures, are readily intelligible on the theory of evolution, while it is hard to conceive their raison d'être on any other hypothesis. However, a cautious reasoner will probably rather explain such cases deductively from the doctrine of evolution than endeavour to support the doctrine of evolution by them. For it is almost impossible to prove that any structure, however rudimentary, is useless—that is to say, that it plays no part whatever in the economy; and, if it is in the slightest degree useful, there is no reason why, on the hypothesis of direct creation, it should not have been created. Nevertheless, double-edged as is the argument from rudimentary organs, there is probably none which has produced a greater effect in promoting the general acceptance of the theory of evolution.

6. The older advocates of evolution sought for the causes of the process exclusively in the influence of varying conditions, such as climate and station, or hybridization, upon living forms. Even Treviranus has got no further than this point. Lamarck introduced the conception of the action of an animal on itself as a factor in producing modification. Starting from the well-known fact that the habitual use of a limb tends to develop the muscles of the limb, and to produce a greater and greater facility in using it, he made the general assumption that the effort of an animal to exert an organ in a given direction tends to develop the organ in that direction. But a little consideration showed that, though Lamarck had seized what, as far as it goes, is a true cause of modification, it is a cause the actual effects of which are wholly inadequate to account for any considerable modification in animals, and which can have no influence at all in the vegetable world; and probably nothing contributed so much to discredit evolution, in the early part of the 19th century, as the floods of easy ridicule which were poured upon this part of Lamarck's speculation. The theory of natural selection, or survival of the fittest, was suggested by William Charles Wells in 1813, and further elaborated by Patrick Matthew in 1831. But the pregnant suggestions of these writers remained practically unnoticed and forgotten, until the theory was independently devised and promulgated by Charles Robert Darwin and Alfred Russell Wallace in 1858, and the effect of its publication was immediate and profound.

Those who were unwilling to accept evolution, without better grounds than such as are offered by Lamarck, and who therefore preferred to suspend their judgment on the question, found in the principle of selective breeding, pursued in all its applications with marvellous knowledge and skill by Darwin, a valid explanation of the occurrence of varieties and races; and they saw clearly that, if the explanation would apply to species, it would not only solve the problem of their origin, but that it would account for the facts of teleology, as well as for those of morphology; and for the persistence of some forms of life unchanged through long epochs of time, while others undergo comparatively rapid metamorphosis.

How far "natural selection" suffices for the production of species remains to be seen. Few can doubt that, if not the whole cause, it is a very important factor in that operation; and that it must play a great part in the sorting out of varieties into those which are transitory and those which are permanent.

Many conditions of variation have yet to be thoroughly explored; and the importance of natural selection will not be impaired, even if further inquiries should prove that variability is definite, and is determined in certain directions rather than in others, by conditions inherent in that which varies. It is quite conceivable that every species tends to produce varieties of a limited number and kind, and that the effect of natural selection is to favour the development of some of these, while it opposes the development of others along their predetermined lines of modification.

7. No truths brought to light by biological investigation were better calculated to inspire distrust of the dogmas intruded upon science in the name of theology than those which relate to the distribution of animals and plants on the surface of the earth. Very skilful accommodation was needful, if the limitation of sloths to South America, and of the Ornithorhynchus to Australia, was to be reconciled with the literal interpretation of the history of the Deluge; and, with the establishment of the existence of distinct provinces of distribution, any serious belief in the peopling of the world by migration from Mount Ararat came to an end.

Under these circumstances, only one alternative was left for those who denied the occurrence of evolution; namely, the supposition that the characteristic animals and plants of each great province were created, as such, within the limits in which we find them. And as the hypothesis of "specific centres," thus formulated, was heterodox from the theological point of view, and unintelligible under its scientific aspect, it may be passed over without further notice, as a phase of transition from the creationist to the evolutionary hypothesis.

8. In fact, the strongest and most inductive arguments in favour of evolution are those which are based upon the facts of geographical, taken in conjunction with those of geological, distribution.

Both Darwin and Wallace lay great stress on the close relation which obtains between the existing fauna of any region and that of the immediately antecedent geological epoch in the same region; and rightly, for it is in truth inconceivable that there should be no genetic connexion between the two. It is possible to put into words the proposition, that all the animals and plants of each geological epoch were annihilated, and that a new set of very similar forms was created for the next epoch, but it may be doubted if any one who ever tried to form a distinct mental image of this process of spontaneous generation on the grandest scale ever really succeeded in realizing it.

In later years the attention of the best palaeontologists has been withdrawn from the hodman's work of making "new species" of fossils, to the scientific task of completing our knowledge of individual species, and tracing out the succession of the forms presented by any given type in time.

Evolution at the Beginning of the 20th Century.—Since Huxley and Sully wrote their "Comparative Anatomy," the 6th edition of this Encyclopaedia, the doctrine of evolution has outgrown the tammels of controversy and has been accepted as a fundamental principle. Writers on biological subjects no longer have to waste space in weighing evolution against this or that philosophical theory or religious tradition; philosophical writers have frankly accepted it, and the supporters of religious tradition have made broad their phylacteries to write on them the new words. No closer scrutiny of the writings of all ages who preceded Charles Darwin, and, in particular, the light thrown back from Darwin on the earlier writings of Herbert Spencer, have made plain that the rational Darwin the world by this time might have come to a general acceptance of evolution; but it seems established as a historical fact that the world has come to accept evolution, first, because of Darwin's theory of natural selection, and second, because of Darwin's exposition of the evidence for the actual occurrence of organic evolution. The evidence as set out by Darwin has been added to enormously; new knowledge has in many cases altered our conceptions of the mode of the actual process of evolution, and from time to time a varying stress has been laid on what are known as the purely Darwinian factors in the theory. Though opposed to some of these tendencies has been some opposition, and in favour of attaching a great importance to natural selection; but the dominant feature in the recent history of the theory has been its universal acceptance and the recognition that this general acceptance has come from the stimulus given by Darwin.

A change has taken place in the use of the word evolution. Huxley, following historical custom, devoted one section of his article to the "Evolution of the Individual." The facts and theories respecting this are now discussed under such headings as Embryology; Heredity; Variation and Selection; under these headings must be sought information on the important recent modifications with regard to the theory of the relation between the development of the individual and the development of the race, the part played by the environment on the individual, and the modern developments of the
old quarrel between evolution and epigenesis. The most striking general change has been against seeing in the facts of ontogeny any direct evidence as to phylogeny. The general proposition as to a parallelism between individual and ancestral development is no doubt indubitable, but extended knowledge of the very different ontogenetic histories of closely allied forms has led us to a much fuller conception of the mode in which stages in embryonic and larval history have been modified in relation to their surroundings, and to a consequent reluctance to attach detailed importance to the embryological argument for evolution.

The vast bulk of botanical and zoological work on living and extinct forms published during the last quarter of the 19th century increased almost beyond all expectation the wealth of evidence for the fact of organic unity. A single fossil creature in a geological stratum of a wrong period, the detection of a single anatomical or physiological fact irreconcilable with origin by descent with modification, would have been destructive of the theory and would have made the reputation of the observer. But in the prodigious number of supporting discoveries that have been made no single negative factor has appeared, and the evolution from their predecessors of the forms of life existing now or at any other period must be taken as proved. It is necessary to notice, however, that although the general course of the stream of life is certain, there is not the same certainty as to the details of this course. The discovery of a single creature in a geological stratum of a wrong period, and the attempt to place existing creatures in approximately phylogenetic order, a striking change, due to a more logical consideration of the process of evolution, has become established and is already resolving many of the earlier difficulties and banishing from the more recent tables the numerous hypothetical intermediate forms so familiar in the older phylogenetic trees. The older method was to attempt the comparison between the highest member of a lower group and the lowest member of a higher group—to suppose, for example, that the gorilla and the chimpanzee, the highest members of the apes, were the existing representatives of the ancestors of the human race. Such a comparison is necessarily illogical, as the existing apes are separated from the common ancestor by at least as large a number of generations as separate it from any of the forms of existing man. In the natural process of growth, the gap must necessarily be wider between the summits of the twigs than lower down, and, instead of imagining "missing links," it is necessary to trace each separate branch as low down as possible, and to institute the comparisons between the lowest points that can be reached. The method is simply the logical result of the fact that every existing form of life stands at the summit of a long branch of the whole tree of life. A due consideration of it leads to the curious paradox that if any two animals be compared, the zoologically lower will be separated from the common ancestor by a larger number of generations, since, on the average, sexual maturity is reached more quickly by the lower form. Naturally very many other factors have to be considered, but this alone is a sufficient reason to restrain attempts to place existing forms in linear phylogenetic series. In embryology the method finds its expression in the limitation of comparisons to the corresponding stages of development by similar embryos. The comparisons between the adult stages of low forms and the embryonic stages of higher forms. Another expression of the same method, due to Cope, and specially valuable to the taxonomist, is that when the relationship between orders is being considered, characters of subordinal rank must be neglected. It must not be supposed that earlier writers all neglected this method, or still less that all writers now employ it, but merely that formerly it was frequently overlooked by the best writers, and now is neglected only by the worst. The result is, on the one hand, a clearing away of much fantastic phylogeny, on the other, an enormous reduction of the supposed gaps between groups.

There has been a renewed activity in the study of existing forms from the point of view of obtaining evidence as to the nature and origin of species. Comparative anatomists have been learning to refrain from basing the diagnosis of a species, or the description of the condition of an organ, on the evidence of a single specimen. Naturalists who deal specially with museum collections have been compelled, it is true, for other reasons to attach an increasing importance to what is called the type specimen, but they find that this insistence on the individual, although invaluable from the point of view of recording species, is unsatisfactory from the point of view of scientific zoology; and propositions for the amelioration of this condition of affairs range from a refusal of Linnaean nomenclature in such cases, to the institution of a division between master species for such species as have been properly revised by the comparative morphologist, and provisional species for such species as have been provisionally registered by those who work with living forms, of which it is possible to obtain a large number of specimens, and those who make revisions of the provisional species of palaeontologists, are slowly coming to some such conception as that a species is the abstract central point around which a group of variations oscillate, and that the peripheral oscillations of one species may even overlap those of an allied species. It is plain that we have moved far from the connotation and denotation of the word species at the time when Darwin began to discuss the origin of species, and that the movement, on the one hand, tends to simplify the problem philosophically, and, on the other, to make it more difficult for the palaeontologist. The conception of evolution is being applied more rigidly to the comparative anatomy of organs and systems of organs. When a series of the modifications of an anatomical structure has been sufficiently examined, it is frequently possible to decide that one particular condition is primitive, ancestral or central, and that the other conditions have been derived from it. Such a condition has been termed, with regard to the group of animals or plants of the organs of which are being studied, archecentric. The possession of the character in the archecentral condition is said to have occurred in independent cases, in fact if it be a multiradial apocentricity, or if it involved intricate and precisely combined anatomical changes that we could not expect to occur twice independently; that is to say, if it be a uniradial apocentricity. Multiradial apocentricities lie at the root of many of the phenomena that have been grouped under the designation convergence. Especially in the case of manifest adaptations, organs possessed by creatures far apart genealogically may be moulded into conditions that are extremely alike. Sir E. Ray Lankester's term, homoplasy, has passed into currency as designating such cases where different genetic material has been moulded into or transformed into the same condition as that which may be called homogeneous homoplases, but it is necessary to recognize the existence of homogeneous homoplases, here called multiradial apocentricities. A complex apocentric modification of a kind which we cannot imagine to have been repeated independently, and which is to be designated as uniradial, frequently forms a new centre around which new diverging modifications are produced. With reference to any particular group of forms such a new centre of modification may be termed a metacentre, and it is plain that the archecentre of the whole group is a metacentre of the larger group of which the group under consideration is a branch. Thus, for instance, the archecentral condition of any Avian structure is a metacentre of the Sauripodan stem. A form of apocentric extremely common and often perplexing may be termed pseudocentric; in such a condition there is an apparent simplicity that
EVILOATION

BIONOMICS

reveals its secondary nature by some small and apparently meaninglessness complexity.

Another group of investigations that seems to play an important part in the future development of the theory of evolution relates to the study of what is known as organic symmetry. The differentiations of structure that characterize animals and plants are being shown to be orderly and definite in many respects; the relations of the various parts to one another and to the whole, the modes of repetition of parts, and the series of changes that occur in groups of repeated parts appear to be to a certain extent inevitable, to depend on the nature of the living material itself and on the necessary conditions of its growth. Closely allied to the study of symmetry is the study of the direct effect of the circumambient media on embryonic young and adult stages of living beings (see EMBRYOLOGY; PHYSIOLOGY; HEREDITY; and VARIATION AND SELECTION), and a still larger number of observers have added to our knowledge of these. It is impossible here to give even a list of the names of the many observers who in recent times have made empirical study of the effects of growth-forces and of the symmetrical limitations and definitions of growth. It is to be noticed, however, that, even after such phenomena have been properly grouped and designated under Greek names as laws of organic growth, they have not become explanations of the series of facts they correlate. Their importance in the theory of evolution is none the less very great. In the first place, they lessen the number of separate facts to be explained; in the second, they limit the field within which explanation must be sought, since, for instance, if a particular mode of repetition of parts occur in mosses, in flowering-plants, in beetles and in elephants, the seeker of ultimate explanations may exclude from the field of his inquiry all the conditions individual to these different organic forms, and confine himself only to what is common to all of them; that is to say, practically only the living material and its environment. The prosecution of such inquiries is beginning to make unnecessary much ingenious speculation of a kind that was prominent from 1880 to 1900; much futile effort has been wasted in the endeavour to find on Darwinian principles special "selection-values" for phenomena the universality of which places them outside the possibility of having relations with the particular conditions of particular organisms. On the other hand, many of those who have been specially successful in grouping diverse phenomena under biological generalizations have erred logically in posing their generalizations against such a vera causa as the preservation of favoured individuals and races. The thirty years which followed the publication of the Origin of Species were characterized chiefly by anatomical and embryological work; since then there has been no diminution in anatomical and embryological enthusiasm, but many of the continually increasing body of investigators have turned again to bionomical work. Inasmuch as Lamarck attempted to frame a theory of evolution in which the principle of natural selection had no part, the interpretation placed on their work by many bionomical investigators the theories of Lamarck, and the name Neo-Lamarckism has been used of such a school of biologists, particularly active in America. The weakness of the Neo-Lamarckian view lies in its interpretation of heredity; its strength lies in its zealous study of the living world and the detection therein of proximate empirical laws, a strength shared by very many bionomical investigations, the authors of which would prefer to call themselves Darwinians, or to leave themselves without sectarian designation.

Statistical inquiry into the facts of life has long been employed, and in particular Francis高尔ton, within the Darwinian school, has advocated its employment and developed its methods.

Within quite recent years, however, a special school has arisen with the main object of treating the processes of evolution quantitatively. Here it is right to speak of Karl Pearson as a pioneer of notable importance. It has been the habit of biologists to use the terms variation, selection, elimination, and so forth, vaguely; the new school, which has been strongly reinforced from the side of physical science, insists on quantitative measurements of the terms. When the anatomist says that one race is characterized by long heads, another by round heads, the biometricist demands numbers and percentages. When an organ is stated to be variable, the biometricist demands statistics to show the range of the variations and the mode of their distribution. When a character is said to be favoured by natural selection, the biometricist demands investigation of the death-rate of individuals with or without the character. When a character is said to be transmitted, or to be correlated with another character, the biometricist declares the statement valueless without numerical estimations of the inheritance or correlation. The subject is still so new, and its technical methods (see VARIATION AND SELECTION) have as yet spread so little beyond the group which is formulating and defining them, that it is difficult to do more than give at the importance of the results likely to be gained. Enough, however, has already been done to show the vast importance of the method in grouping and codifying the empirical facts of life, and in so preparing the way for the investigation of ultimate causes. The effect of the apparent is to be the tendency to attach more meaning to the results than from their nature they can bear. The ultimate value of numerical inquiries must depend on the equivalence of the units on which they are based. Many of the characters that up to the present have been dealt with by biometrical inquiry are obviously composite. The height or length of the arm of a human being, for instance, is the result of many factors, some inherent, some due to environment, and until these have been sifted out, numerical laws of inheritance or of correlation can have no more than an empirical value. The analysis of composite characters into their indivisible units and statistical inquiry into the behaviour of the units would seem to be a necessary part of biometric investigation, and one to which much further attention will have to be paid.

It is well known that Darwin was deeply impressed by differences in flora and fauna, which seemed to be functions of locality, and not the result of obvious dissimilarities of environment. A. K. Wallace's studies of island life, and the work of many different observers on local races of animals and plants, marine, fluvial and terrestrial, have brought about a conception of segregation as apart from differences of environment as being one of the factors in the differentiation of living forms. The segregation may be by geographical, or may be the result of preferential mating, or of seasonal mating, and its effects plainly can be made no more of than proximate or empirical laws of differentiation, of great importance in codifying and simplifying the facts to be explained. The minute attention paid by modern systematists to the exact localities of subspecies and races is bringing together a vast store of facts which will throw further light on the problem of segregation, but the difficulty of utilizing these facts is increased by an unfortunate tendency to make locality itself one of the diagnostic characters.

Consideration of phylogenetic series, especially from the palaeontological side, has led many writers to the conception that there is something of the nature of a growth-force inherent in organisms and tending inevitably towards divergent evolution. It is suggested that even in the absence of modification produced by any possible Darwinian or Lamarckian factors, that even in a neutral environment, divergent evolution of some kind would have occurred. The conception is necessarily somewhat hazy, but the words bathism and bathic Evolution have been employed by a number of writers for some such conception. Closely connected with it, and probably under-lying many of the facts which have led to it, is a more definite group of ideas that may be brought together under the phrase "phylogenetic limitation of variation." In its simplest form, this phrase implies such an obvious fact as that whatever be the future development of, say, existing cockroaches, it will be on lines determined by the present structure of these creatures. In a more general way, the phrase implies that at each successive branching of the tree of life, the branches become more specialized,
more defined, and, in a sense, more limited. The full implications of the group of ideas require, and are likely to receive, much attention in the immediate future of biological investigation, but it is enough at present to point out that until the more obvious lines of inquiry have been opened out much more fully, we can not be in a position to guess at the existence of a residuum for which such a metaphysical conception as bathism would serve even as a convenient disguise for ignorance.

Almost every side of zoology has contributed to the theory of evolution, but of special importance are the facts and theories associated with the names of Gregor Mendel, A. Weismann and Hugo de Vries. These are discussed under the headings HEREDITY; MENDELISM; and VARIATION AND SELECTION. It has been a feature of great promise in recent contributions to the theory of evolution, that such contributions have received attention almost directly in proportion to the new methods of observation and the new series of facts with which they have come. These have found little favour who brought to the debate only formal criticisms or amplifications of the Darwinian arguments, or re-marshallings of the Darwinian facts, however ably conducted. The time has not yet come for the attempt to synthesize the results of the many different and often apparently antagonistic groups of workers. The great work that is going on is the simplification of the facts to be explained by grouping them under empirical laws; and the most general statement relating to these that can yet be made is that no single one of these laws has as yet shown signs of taking rank as a vera causa comparable with the Darwinian principle of natural selection.

For evolution in relation to society see SOCIOLOGY.

EVREUX, a town of north-western France, capital of the department of Eure, 67 m. W.N.W. of Paris on the Western railway to Cherbourg. Pop. (1906) town, 15,773; commune, 18,971. Situated in the pleasant valley of the Iton, arms of which traverse it, the town, on the south, slopes up toward the public gardens and the railway station. It is the seat of a bishop, and its cathedral is one of the largest and finest in France. Part of the lower portion of the nave dates from the 11th century; the west façade with its two unguinly towers is, for the most part, that of the late Renaissance; and various styles of the intervening period are represented in the rest of the church. A thorough restoration was completed in 1896. The elaborate north transept and portal are in the flamboyant Gothic; the choir, the finest part of the interior, is in an earlier Gothic style. Cardinal de la Balue, bishop of Évreux in the latter half of the 15th century, constructed the octagonal central tower, with its elegant spire; to him is also due the Lady chapel, which is remarkable for its finely preserved stained glass. Two rose windows in the transepts and the carved wooden screens of the side chapels are masterpieces of 16th-century workmanship. The episcopal palace, a building of the 15th century, adjoins the south side of the cathedral. An interesting belfry, facing the handsome modern town hall, dates from the 15th century. The church of St Taurin, in part Romanesque, has a choir of the 14th century and other portions of later date; it contains the shrine of St Taurin, a work of the 13th century. At Vieil-Évreux, 33 m. south-east of the town, the remains of a Roman theatre, a palace, baths and an aqueduct have been discovered, as well as various relics which are now deposited in the museum of Évreux. Évreux is the seat of a prefect, a court of assizes, of tribunals of first instance, of commerce, a chamber of commerce and a board of trade arbitrators. It has a lycee and training colleges for teachers. The making of tickings, boots and shoes, agricultural implements and gas motors, and metal-founding and bleaching are carried on.

Vieil-Évreux (Mediolanum Anlercorum) was the capital of the Gallic tribe of the Anlerci Eburonices and a flourishing city during the Gallo-Roman period. Its episcopal dates from the 4th century.

The first family of the counts of Évreux which is known was descended from an illegitimate son of Richard I., duke of Normandy, and became extinct in the male line with the death of Count William in 1118. The countship passed in right of Agnes, William's sister, wife of Simon de Montfort-l'Amaury (d. 1087) to the house of the lords of Montfort-l'Amaury. Amaury III. of Montfort ceded it in 1200 to King Philip Augustus. Philip the Fair presented it (1307) to his brother Louis, for whose benefit Philip the Long raised the countship of Évreux into a peerage of France (1317). Philip of Évreux, son of Louis, became king of Navarre by his marriage with Jeanne, daughter of Louis the Headstrong (Hutin), and their son Charles the Bad and their grandson Charles the Noble were also kings of Navarre. The latter ceded his counties of Évreux, Champaign and France to King Charles VI. (1404). In 1427 the countship of Évreux was bestowed by King Charles VII. on Sir John Stuart of

EVORA—ÉVREUX 37

EVORA, the capital of an administrative district in the province of Alemtejo, Portugal; 72 m. E. by S. of Lisbon, on the Casa Branca-Evora-Elvas railway. Pop. (1900) 16,920. Evora occupies a fertile valley enclosed by low hills. It is surrounded by an ancient and well-preserved wall, three of the gates of which are defended by two forts; but the neglected condition of these, combined with the narrow arcaded streets and crumbling walls of Roman or Moorish masonry, gives the city an appearance corresponding with its real antiquity. Evora is the see of an archbishop, and has several churches, convents and hospitals, barracks, a diocesan school and a museum. A university, founded in 1550, was abolished on the expulsion of the Jesuits in the 18th century. The cathedral, originally a Romanesque building erected 1186–1204, was restored in Gothic style about 1400; its richly decorated chancel was added in 1761. The church of St. Mary, founded 1084–1145, is a good example of the blended Moorish and Gothic architecture known as Manoellian. The art gallery, formerly the archbishop's palace, contains a collection of Portuguese and early Flemish paintings. An ancient tower, and the so-called aqueduct of Sertorius, 9 m. long, have been partly demolished to make room for the market-square, in which one of the largest fairs in Portugal is held at midsummer. Both tower and aqueduct were long believed to have been of Roman origin, but are now known to have been constructed about 1340–1355 in the reign of John III. At the instance of the famous Charles the Wise, an early church on this site was probably constructed on the site of the old Roman one. A small Roman temple is used as a public library; it is usually known as the temple of Diana, a name for which no valid authority exists. Evora is of little commercial importance, except as an agricultural centre, but its neighbourhood is famous for its mules and abounds in cork-woods; there are also mines of iron, copper, and asbestos and marble quarries. Under its original name of Ebora, the city was from 80 to 72 B.C. the headquarters of Sertorius, and it long remained an important Roman military station. It was called Liberalitas Juliae on account of certain municipal privileges bestowed on it by Julius Caesar (6. 100–44 B.C.). Its bishopric, founded in the 5th century, was raised to an archbishopric in the 16th. In 712 Evora was conquered by the Moors, who named it Jabura; and it was only retaken in 1166. From 1663 to 1665 it was held by the Spaniards. In 1832 Dom Miguel, retiring before Dom Pedro, took refuge in Evora; and here was signed the convention of Evora, by which he was banished. (See PORTUGAL.) The administrative district of Evora coincides with the central part of Alemtejo (g.v.); pop. (1900) 128,062; area, 8256 sq. m.
Darnley (c. 1365–1429), the commander of his Scottish bodyguard, who in 1423 had received the seigniory of Aubigny and in February 1427/8 was granted the right to quarter the royal arms of France for his victories over the English (see Lady Elizabeth Cust, Account of the Stuarts of Aubigny in France, 1422–1672, 1891). On Stuart’s death (before Orleans during an attack on an English convoy) the cantonnement reverted to the crown. It was again temporarily alienated (1569–1574) as an appanage for Francis, duke of Anjou, and in 1651 was finally made over to Frédéric Maurice de la Tour d’Auvergne, duke of Bouillon, in exchange for the principality of Sedan.

EWALD, GEORG HEINRICH AUGUST VON (1803–1875), German Orientalist and theologian, was born on the 16th of November 1803 at Göttingen, where his father was a linenweaver. In 1815 he was sent to the gymnasium, and in 1820 he entered the university of his native town, where under J. G. Eichhorn and T. C. Tychsen he devoted himself specially to the study of Oriental languages. At the close of his academic career in 1823 he was appointed to a mastership in the gymnasium at Wolfenbüttel, and made a study of the Oriental manuscripts in the Wolfenbüttel library. But in the spring of 1824 he was recalled to Göttingen as repositum, or theological tutor, and in 1827 (the year of Eichhorn’s death) he became professor extraordinarius in philosophy and lecturer in Old Testament exegesis. In 1831 he was promoted to the position of professor ordinarius in philosophy; in 1833 he became a member of the Royal Scientific Society, and in 1835, after Tychsen’s death, he entered the chair of Oriental languages as successor to the last mentioned. In the same year 1835 he was made a licentiate in theology. In 1847, “the great shipwreck-year in Germany,” as he has called it, he was invited back to Göttingen on honourable terms—the liberal constitution having been restored. He gladly accepted the invitation. In 1852–1862 he took an active part in a movement for reform within the Hanoverian Church, and he was a member of the synod which passed the new constitution. He had an important share also in the formation of the Propter in 1848, a short-lived association, in September 1863. But the chief crisis in his life arose out of the political events of 1866. His loyalty to King George (son of Ernst August) would not permit him to take the oath of allegiance to the victorious king of Prussia, and he was therefore placed on the retired list, though with the full amount of his salary as pension. Perhaps even this degree of severity might have been held by the Prussian authorities to be unnecessary, had Ewald been less exasperating in his language. The violent tone of some of his printed manifestes about this time, especially of his Lob des Königs u. seines Volkes, led to his being deprived of his university functions (1863) and also to a criminal process, which, however, resulted in his acquittal (May 1869). Then, and on two subsequent occasions, he was returned by the city of Hanover as a member of the North German and German parliaments. In June 1874 he was found guilty of a libel on Prince Bismarck, whom he had compared to Frederick II. in “his unrighteous war with Austria and its ruination of religion and morality,” to Napoleon III. in his way of “picking out the best time possible for robbery and plunder.” For this offence he was sentenced to undergo three weeks’ imprisonment. He died three years later, on the 26th of March 1877, at Göttingen.

Ewald was no common man. In his public life he displayed many noble characteristics,—perfect simplicity and sincerity, intense moral earnestness, sturdy independence, absolute fearlessness. As a teacher he had a remarkable power of kindling enthusiasm; and he sent out many distinguished pupils, among whom may be mentioned Hitzig, Schrader, Nöldeke, Dietzel and Dillmann. His disciples were not all of one school, but many eminent scholars who apparently have been untouched by his influence have in fact developed some of the many ideas which he suggested. His numerous writings, from 1833 onwards, were the reservoirs in which the entire energy of a life was stored. His Hebrew Grammar inaugurated a new era in biblical philology. All subsequent works in that department have been avowedly based on his, and to him will always belong the honour of having been, as Hitzig has called him, “the second founder of the science of the Hebrew language.” As an exegete and biblical critic no less than as a grammanian he has left his abiding mark. His Geschichte des Volkes Israel, the result of thirty years’ labour, was epoch-making in that branch of research. While in every line it bears the marks of dividing itself into three general periods, a product highly characteristic of the age, and even of the decade, in which it appeared. If it is obviously the outcome of immense learning on the part of its author, it is no less manifestly the result of the speculations and researches of many laborious predecessors in all departments of history, theology and philosophy. Taking up the idea of a divine education of the human race, which Lessing and Herder had made so familiar to the modern mind, and firmly believing that each of the leading nations of antiquity a special task had been providentially assigned, Ewald felt no difficulty about Israel’s place in universal history, the manner in which he regarded it, and the age to which it was assigned.
EWALD

Morgenlandes, began in 1837; and he frequently contributed on various subjects to the Götting. gelehrte Anzeigen. He was also the author of many pamphlets of an occasional character.

The following translations are: Hebrew Grammar, by John Nicholson (from 2nd German edition) (London 1836); Introductory Hebrew Grammar (from 3rd German edition) (London, 1876); History of Israel, 5 vols. (corresponding to vols. i-iv. of the German edition, and containing the work, 1867-1874); Antiquities of Israel, by H. S. Solly (London, 1876); Commentary on the Prophecy of the Old Testament, by J. Frederic Smith (2 vols. London, 1876-1877); Isaiah the Prophet, chaps. i-xxxiii., by O. Glover (London, 1869); Life of Jesus Christ, also by O. Glover (London, 1865).

See the article in Herzog's Hauck; T. Witton Davies, Heinrich Ewald, in Crusi, 1876; R. Chyne, Founders of Old Testament Criticism (1893); F. Lichtenberger, History of German Theology in the Nineteenth Century (1896).

Ewald, Johannes (1743-1781), the greatest lyrical poet of Denmark, was the son of a melancholy and sickly chaplain at Copenhagen, where he was born on the 18th of November 1743. At the age of eleven he was sent to school at Schleswig, his father's birthplace, and returned to the capital only to enter the university in 1758. His father was by that time dead, and in his manner of life and fortune, he found neither sympathy nor moral support. At fifteen he fell passionately in love with Areuse Hulegaard, a girl whose father afterwards married the poet's mother; and the romantic boy resolved on various modes of making himself admired by the young lady. He began to learn Abyssinian, for the purpose of going out as a missionary to Africa, but this scheme was soon given up, and he persuaded a brother, four years older than himself, to run away that they might enlist as husars in the Prussian army. They managed to reach Hamburg just when the Seven Years' War was commencing and were allowed to enter a regiment. But the elder brother soon got tired and ran away, while the poet, after a series of extraordinary adventures, deserted to the Austrian army, where from being drummer he rose to being sergeant, and was only not made an officer because he was a Protestant. In 1760 he was weary of a soldier's life and deserted again, getting safe back to Denmark. For the next two years he worked with great diligence at the university, but the Areuse for whom he had gone through so much hardship and taken so much pains married another man almost immediately after Ewald's final and very successful examination. The disappointment was one from which he never recovered, but his own weakness of will was largely to blame for it. He plunged into dissipation of every kind, and gave his serious thoughts only to poetry.

In 1763 his first work, a perfunctory dissertation, De pyrologia sacra, first saw the light. In 1764 he made a considerable success with a short prose story in the popular manner of Snedorf, Lykkens Tempel (The Temple of Fortune), which was translated into German and Icelandic. On the death of Frederick V., however, Ewald first appeared prominently as a poet; he published in 1766 three Elegies over the dead king, which were received with universal acclamation, and of which one, at least, is a poetical masterpiece. But his dramatic poem Adam og Eva (Adam and Eve), by far the finest imaginative work produced in Denmark up to that time, was rejected by the Society of Arts in 1767 and was not published until 1769. At the latter date, however, its merits were perceived. In 1770 Ewald attained success with Philet, a narrative and lyrical poem, and still more with his splendid Rolf Krage, the first original Danish tragedy. For the next ten years Ewald was occupied in producing one brilliant poetical work after another, in rapid succession. In 1771 he published De brutale Klöppers (The Brutal Clappers), a tragico-comic poem of three acts. He was the first to bring into play the critics and the manager of the Royal Theatre; in 1772 he translated from the German the lyrical drama of Philemon and Baucis, and brought out his versified comedy of Harlequin Patriot, a satire on the passion for political scribbling created by Struensee's introduction of the liberty of the press. In 1773 he published Pebersendene (Old Bachelors), a prose comedy. In 1771 he had already collected some of his lyrical poems under the title of Adskilligt af Johannes Ewald (Miscellanies). In 1774 appeared the heroic opera of Balder's Død (Balder's Death), and in 1779 the finest of his works, the lyrical drama Fiskerne (The Fishers), which contains the Danish National Song, "King Christian stood by the high Mast," his most famous lyric. In the two poems last mentioned, however, Ewald passed beyond contemporary taste, and these great works, the pride of Danish literature, were coldly received. But while the new poetry was slowly winning its way into popular esteem, the poet did not lack admirers, and at the head of these he found in 1775 the Danish Literary Society, who bestowed upon him the title of "Great Poets," which made the study of Ewald a cult. But the poet's health had broken; when he was writing Rolf Krage he was already an inmate of the consumptive hospital, and when he seemed to be recovering, his health was shattered again by a night spent in the frosty streets. He embittered his existence by the lacklessness of his private life, and finally, through a fall from a horse, he ended by becoming a complete invalid. His last ten years were full of acute suffering; his mother treated him with cruelty, his family with neglect, and but few even of his friends showed any malice or generosity towards him. In 1774 he was placed in the house of an inspector of fisheries at Rungsted, where Anna Hedevig Jacobsen, the daughter of the house, tended the wasted poet with infinite tenderness and skill. He stayed in this house for three years, and wrote there some of his finest later lyrics. Meanwhile he had fallen deeply in love with the charming solace of his sufferings and won her consent to a marriage. This step, however, was prevented by his family, who roughly removed him to their own keeping near Kronborg. Here he was treated so infamously that he insisted on being taken back to Copenhagen in 1777, where he found an old, but no less tender nurse, in Ane Kristine Skou. Here he wrote Fiskerne (The Fishers), with his imagination full of the familiar shore at Hornbaek near Rungsted. In 1780 he was a little better, and managed to be present at the theatre at the first performance of his poem. But this excitement hastened his end, and after months of extreme agony he died on the 17th of March 1781, and was carried to the grave by a large assembly of his admirers, since he was now just recognized by the public for the first time as the greatest national poet. Among his papers were found fragments of three dramas, two on old Scandinavian subjects, entitled Fride and Helge, and the third a tragedy on the story of Caius, which he meant to treat in a way wholly distinct from Shakespeare's.

Ewald belongs to the race of poetical reformers who appeared in all countries of Europe at the end of the 18th century; but it is interesting to observe that in point of time he preceded all of them. He was born six years earlier than Goethe and Alferi, sixteen years before Schiller, nine years before André Chénier, and twenty-seven years earlier than Wordsworth, but he did for Denmark what each of these poets did for his own country. Ewald found Danish literature given over to tasteless rhetoric, and without art or vigour. He introduced vivacity of style, freshness in imagery, and form, and an imaginative study of nature which was then unprecedented. But perhaps his greatest claim to notice is the fact that he was the first person to call the attention of the Scandinavian peoples to the treasures of their ancient history and mythology, and to suggest the use of these in imaginative writing. With a colouring more distinctly modern than that of Collins and Gray, his lyrics yet resemble the odes of these English contemporaries more closely than those of any continental poet; from another point of view his ballads remind us of those of Schiller, which they preceded. His dramas, which had an immense influence on the Danish stage, show chiefly of self- interest, with the exception of "The Fishers," which marked that must always live as a great national poem. In personal character and in fate Ewald seems to have been unlike Heinrich Heine.

The first collected edition of Ewald's works began to appear in his lifetime. It is in four volumes, 1780-1784. His works have constantly been reprinted, but the standard edition is that of Liebenberg, in 8 vols., 1850-1855. The best biographies of him are those by C. Molbech (1831), Hammerich (1860) and Andreas Dolellis (1900).
EWART—EWING

EWART, WILLIAM (1798–1869), English politician, was born in Liverpool on the 1st of May 1798. He was educated at Eton and Christ Church, Oxford, gaining the Newdigate prize for English verse. He was called to the bar at the Middle Temple in 1827, and the next year entered parliament for the borough of Evesham in Sussex. He subsequently sat for Liverpool from 1830 to 1837, for Wigorn in 1839, and for Dumfries Burghs from 1841 until his retirement from public life in 1868. He died at Broadleas, near Devizes, on the 23rd of January 1869. Ewart, who was an advanced liberal in politics, was responsible during his long political career for many useful measures. In 1834 he carried a bill for the abolition of hanging in chains, and in 1837 he was successful in getting an act passed for abolishing capital punishment for cattle-stealing and other offences. In 1850 he carried a bill for establishing free libraries supported out of the rates. At in 1864 he was instrumental in getting an act passed for legalizing the use of the metric system of weights and measures. He was always a strong advocate for the abolition of capital punishment, and on his motion in 1864 a select committee was appointed to consider the subject. Other reforms which he advocated and which have since been carried out were an annual statement on education, and the examination of candidates for the civil service and army.

EWE, a group of Negro peoples of the Slave Coast, West Africa. By the natives their country is called Ebe-eme, "Land of brothers"; and Ewe is also the language spoken by the Anlo or Anglawa on the Gold Coast frontier, the Krepi of Anfuch speech, the Jeji, the Dahomeyans and the Mahi.

Ewell, Richard Stoddert (1817–1872), American soldier, lieutenant-general in the Confederate army, was born in Georgetown, now a part of Washington, D.C., on the 2nd of February 1817, and graduated at West Point in 1839. As a cavalry officer he saw much active service in the Mexican War and later in Indian warfare in New Mexico. He resigned his commission at the outbreak of the Civil War, and entered the Confederate service. He commanded a brigade in the first Bull Run campaign, and a division in the famous Valley Campaign of "Stonewall" Jackson, to whom he was next in rank. At Cross Keys he was in command of the forces which defeated General Frémont in the Seven Days and in the campaign of Second Bull Run. At the action of Groveton Ewell lost a leg, but did not on that account retire from active service, though other generals led his men in the sanguinary battles of Antietam (where they lost 47% of their numbers) and Fredericksburg. After the fall of Funkstown Ewell was appointed lieutenant-general and appointed to command the 2nd Corps, with which he had served from the beginning of the Valley Campaign. His promotion set aside General J. E. B. Stuart, the temporary commander of Jackson's corps; that Ewell, crippled as he was, was preferred to the brilliant cavalry leader was a marked testimony to his sterling qualities as a soldier. The invasion of Pennsylvania soon followed, Ewell's corps leading the advance of Lee's army. A federal force was skillfully cut off and destroyed near Winchester, Va., on the 9th of May. Ewell then advanced toward and southern Pennsylvania unchecked. At the battle of Gettysburg the 2nd Corps decided the fighting of the first day in favour of the Confederates, driving the enemy before them; on the second day it fought a desperate action on Lee's left wing. Ewell took part in the closing operations of 1863 and in all the battles of the Wilderness and Petersburg campaigns. In the final campaign of 1865 he and the remnant of his corps were cut off and forced to surrender at Sailor's Creek, a few days before his chief capitulated to Grant at Appomattox. After the war General Ewell lived in retirement. He died near Spring Hill, Maury County, Tennessee, on the 26th of January 1872.

EWING, ALEXANDER (1814–1873), Scottish divine, was born of an old Highland family in Aberdeen on the 25th of March 1814. In October 1838 he was admitted to deacon's orders, and after his return from Italy he took charge of the episcopal congregation at Forres, and was ordained a presbyter in the autumn of 1841. In 1845 he was elected first bishop of the newly restored diocese of Argyll and the Isles, the duties of which position he discharged till his death on the 22nd of May 1871. In 1851 he received the degree of D.C.L. from the university of Oxford. Though hampered by a delicate bodily constitution, he worked in a spirit of buoyant cheerfulness. By the charm of his personal manner and his catholic sympathies he gradually attained a prominent position. In theological discussion he contended for the exercise of a wide tolerance, and attached little importance to ecclesiastical authority and organization. His own theological position had close affinity with that of Thomas Erksine of Linlathen and Frederick Denison Maurice; but his opinions were the fruit of his own meditation, and were coloured by his own individuality. The trend of his teaching and only to be gathered from his numerous publications—letters to the newspapers, pamphlets, special sermons, essays contributed to the series of Present Day Papers, of which he was the editor, and a volume of sermons entitled Revelation considered as Light.

Besides his strictly theological writings, Ewing was the author of the Cathedral or Abbey Church of Iona (1865), the first part of which contains drawings and descriptive letters to the public, and the second a history of the early Celtic church and the mission of St Columba. See Memoir of Alexander Ewing, D.C.L., by A. J. R. Cullen.

EWING, JULIANA HORATIA OBR (1841–1885), English writer of books for children, daughter of the Rev. Alfred Gatty and of Margaret Gatty (q.v.), was born at Ecclesfield, Yorkshire, in 1841. One of a large family, she was accustomed to act as nursery story-teller to her brothers and sisters, and her brother Alfred Scott Gatty provided music to accompany her plays. She was well educated in classics and modern languages, and at an early age began to publish verses, being a contributor to Aunt Judy's Magazine, which her mother started in 1866. The Land of Lost Toys and many other of Juliana's stories appeared in this magazine. In 1867 she married Major Alexander Ewing, himself an author, and the composer of the well-known hymn "Jerusalem the Golden." From this time until her death (13th May 1882), previously to which she had been a constant invalid, Mrs Ewing produced a number of charming children's stories. The best of these are: The Brownies (1870), A Flint-Iron for a Farthing (1873), Lob-lye-by the Fire (1874), The Story of a Short Life (1885) and Jackanapes (1884), the two last-named, in particular, obtaining great success; among others may be mentioned Mrs Over-the-way's Remembrances (1869), Six to Sixteen, Jan of the Windmill (1876), A Great Emergency (1877), Old-Fashioned Jackmanes, A Dog at the Door, The Elves, Brother of Pity (1882), The Doll's Wash, Master Fred, Our Garden, A Soldier's Children, Three Little Nest-Birds, A Week Spent in a Glass-House, A Sweet Little Door, and Blue-Red (1883). Many of these were published by the S.P.C.K. Simple and unaffected in style, and sound and wholesome in matter, with quiet touches of humour and bright sketches of scenery and character, Mrs Ewing's best stories have never been surpassed in the style of literature to which they belong.

EWING, THOMAS (1789–1871), American lawyer and statesman, was born near Westmoreland, Liberty, West Virginia on the 28th of October 1789. His father, Ebenezer Ewing, was a land speculator near Lancaster, Fairfield county, Ohio, in 1792. Thomas graduated at Ohio University, Athens, Ohio, in 1815, and in August 1816 was admitted to the bar at Lancaster, where he won high rank as an advocate. He was a Whig member of the United States senate in 1831–1837, and as such took a prominent part in the legislative struggle over the United States Bank, whose re-chartering he favoured and which he resolutely defended against President Jackson's attack, opposing in able speeches the withdrawal of deposits and Secretary Woodbury's "Specie Circular" of 1836. In March 1841 he became secretary of the treasury in President W. H. Harrison's cabinet. When, however, after President Tyler's accession, the relations between the President and the Whig Party became strained, he retired (September 1841) and was succeeded by Walter Forward (1786–1852).
EXAMINATIONS

Subsequently from March 1849 to July 1850 he was a member of President Taylor's cabinet as the first secretary of the newly established department of the interior. He thoroughly organized the department, and in his able annual report advocated the construction by government aid of a railroad to the Pacific Coast. In 1850-1851 he filled the unexpired term of Thomas Corwin in the U.S. Senate, strenuously opposing Clay's compromise measures and advocating the abolition of slavery in the District of Columbia. He was subsequently a delegate to the Peace Congress in 1861, and was a loyal supporter of President Lincoln's war policy. He died at Lancaster, Ohio, on the 26th of October 1871.

His daughter was the wife of General William T. Sherman. His son, Hugh Boyle Ewing (1836-1905), served throughout the Civil War in the Federal armies, rising from the rank of colonel (1861) to that of brigadier-general (1862) and brevet major-general (1865), and commanding brigades at Antietam and Vicksburg and a division at Chickamauga; and was minister of the United States to the Netherlands in 1866-1870. Another son, Thomas Ewing (1829-1896), studied at Brown University in 1852-1854 (in 1894, by a special vote, he was placed on the list of graduates in the class of 1856); he was a lawyer and a free-state politician in Kansas in 1857-1861, and was the first chief-justice of the Kansas supreme court (1861-1862). In the Civil War he attained the rank of brigadier-general (March 1863) and received the brevet of major-general (1865). He was subsequently a representative in Congress from Ohio in 1877-1881; and from 1882 to 1896 practised law in New York City, where he was long one of the recognized leaders of the bar.

EXAMINATION. The term "examination" (i.e. inspecting, weighing and testing; from Lat. examen, the tongue of a balance) is used in the following article to denote a systematic test of knowledge, and of either special or general capacity or fitness, carried out under the authority of some public body.

1. History.—The oldest known system of examinations in history is that used in China for the selection of officers for the public service (c. 1115 B.C.), and the periodic tests which they undergo after entry (c. 2200 B.C.). See China; also W. A. P. Martin, The Lore of Cuthay (1901), p. 311 et seq.; T. L. Bullock, "Competitive Examinations in China" (Nineteenth Century, July 1894) and Étienne Zi, Pratique des examens lévittaires en Chine (Shanghai, 1894). The abolition of this system was announced in 1906, and, as a partial substitute, it was decided to hold an annual examination in Peking of Chinese graduates educated abroad (Times, 22nd of October 1906).

The majority of examinations in western countries are derived from the university examinations of the middle ages. The first universities of Europe consisted of corporations of teachers and of students analogous to the trade guilds and merchant guilds of the time. In the trade guilds there were apprentices, companions, and masters. No one was admitted to mastery until he had served his apprenticeship (g.e.), nor, as a rule, until he had shown that he could accomplish a piece of work to the satisfaction of the guild.

The object of the universities was to teach; and to the three classes established by the guild correspond roughly the scholar, the bachelor or pupil-teacher (see Rashdall i. 209, note 2, and 221, note 3), and the master or doctor (two terms at first equivalent) who, having served his apprenticeship and passed a definite technical test, had received permission to teach. The early universities of Europe, being under the same religious authority, are animated by the same philosophy, resemble each other very closely in their examinations and examinations, and by the authority of the emperor, or of the pope in most cases, the permission to teach granted by one university was valid in all (jus ubiqueumque docendi).

The earliest university examinations of which a description is available are those in civil and in canon law held at Bologna at a period subsequent to 1219. The student was admitted without examination as bachelor after from four to six years' study, and after from six to eight years' study became qualified as a candidate for the doctorate. He might obtain the doctorate in both branches of law in ten years (Rashdall i. 221-222).

The doctoral examination at Bologna in the 13th-14th centuries consisted of two parts—a private examination which was the real test, and a public one of a ceremonial character (conventus). The candidate first took an "oath that he had complied with all the statutable conditions, that he would give no more than the statutable fees or entertainments to the rector himself, the doctor or his fellow-students, and that he would obey the rector." He was then presented to the archdeacon of Bologna by one or more doctors, who were required to have satisfied themselves of his fitness by private examination. On the morning of the examination, after attending mass, he was assigned by one of the doctors of the assembled college two passages (puncta) in the civil or canon law, which he retired to his house to study, possibly with the assistance of the presenting doctor. Later in the day he gave a lecture on, or exposition of, the prepared passages, and was examined on them by two of the doctors appointed by the college. Other doctors might then put supplementary questions on law arising out of the passages, or might suggest objections to his answers. The vote of the doctors present was taken by ballot, and the fate of the candidate was determined by the majority. The successful candidate, who received the title of licentiate, was, on payment of a heavy fee and other expenses, permitted to proceed to the conventus or final public examination. This consisted in the delivery of a speech and the defence of a thesis on some point of law, selected by the candidate, against opponents selected from among the students. The successful candidate received from the archdeacon the formal "licence to teach" by the authority of the pope in the name of the Trinity, and was invested with the insignia of office. At Bologna, though not at Paris, the "permission to teach" soon became fictitious, only a small number of doctors being allowed to exercise the right of teaching in that university (Rashdall).
The subjects in which the medieval universities examined were (i) those of the trivium and quadrivium in the faculty of arts; (ii) theology; (iii) medicine; and (iv) civil and canon law. The number of subjects in which examinations are held has since grown immensely. We can only sketch in outline the transformations of certain typical university systems of examinations.

At Oxford there is no record of a process of formal examination on books similar to that of Paris (Rashdall, ii. 442 et seq.), disputations being apparently the only test applied in its early history. Examinations were definitely introduced for the B.A. and M.A. degrees by Laud in 1636-1638 (Brodrick, History of Oxford, p. 114), but the standard prescribed was so much beyond the actual requirements of later times that it may be doubted if it was enforced. The studies fell in the 18th century into an "abject state," from which they were first raised by a statute passed in 1800 (Report of Oxford University Commission of 1850-1852, p. 60 et seq.), under which distinctions were first allotted to the ablest candidates for the bachelor's degree. Further changes were made in 1827 and 1825; and in 1830 a distinction was made between honours examinations of a more difficult character, at which successful candidates were divided into four classes, and pass examinations of an easier character. By the statutes of 1839 and 1838 an intermediate "Moderations" examination was instituted between the preliminary examination called "Responsions" and the final examination. Since 1830, although fresh subjects of examination have been introduced, no considerable change of system has been made.

The bachelor's degree at Oxford tended from an early period to be postponed to an advanced stage of studies, while the requirements for the master's degree diminished until, in 1807, the examination for the M.A. was abolished. It is now awarded to bachelors of three years standing on payment of a fee.

Cambridge in early times followed the example of Oxford, and here also the bachelor's degree became more and more important (Bass Mullinger, History of the University of Cambridge from 1535 . . ., p. 414), and the M.A. has been finally reduced to a pass examination, awarded on terms similar to those of the sister university. The standard of examinations was raised in Cambridge at an earlier date than at Oxford, and in the 18th century the tripos "established the reputation of Cambridge as a School of Mathematical Science." The school, however, produced few, if any, great mathematicians between Newton and George Green. It was only between 1830 and 1840 that the standard of the tripos became a high one. At Cambridge there is no intermediate examination between the "Previous Examination" (commonly called "Little-go"), which corresponds to Oxford "Responsions" or "Smalls," and the triposes and examinations for the "Poll" degree. The correspondence to the Oxford final honours and pass examinations respectively. But most of the triposes have been divided into two parts, of which the second is not obligatory in order to obtain a degree. The "senior wrangler" was the first candidate in order of merit in the first part of the mathematical tripos. The abolition of order of merit at this examination was decided on in 1906, and names of candidates appeared in this order for the last time in 1909.

At the Scottish universities the B.A. degree has become extinct, and the M.A., awarded on the results of examination, is the first degree in the faculty of arts.

The incorporation of the university of London in 1836 marks an era in the history of examinations; the teaching and examining functions of a university were dissociated for the first time. Until 1858 the London examinations were open only to students in affiliated colleges, and the teachers had no share in the appointment of the examiners or in determining the curricula for examinations; in 1858 the examinations were thrown open to all comers, and no requirements were insisted on with regard to courses of study except for degrees in the faculty of medicine. The sole function of the university was to examine, and its examinations for matriculation and degrees correspond to those of Oxford, being given by means of written papers not only in London but in many centres in the United Kingdom and the colonies. From the
first the degrees were (unless those of Oxford and Cambridge until 1871) open to all male persons without religious distinctions; and in 1878 they were opened to women. (Tripos examinations were thrown open to women at Cambridge by the grace of 24th Feb. 1881, and at Oxford women were admitted to examinations for honours by statute of 29th April 1884. Proposals to admit women to university degrees were rejected by Oxford and Cambridge in 1886 and 1897 respectively.) The standard of difficulty set by the university of London was a high one, very much higher for its pass degrees than the corresponding standards at Oxford and Cambridge, while the standard for honours was equally high. In medicine the examinations were made both wider in range and more searching than those of any other examining body. But, for reasons dealt with hereafter, some limited improvement was made by the new system. In 1880 the Victoria University, Manchester, was established, in which teaching and examining were again united; and in the universities since established, with the exception of the Royal University of Ireland (which was created in 1880 as an examining body on the model of London, but which was dissolved under the Irish Universities Act 1908, and replaced by the National University of Ireland and the Queen's University of Belfast), the precedent of Victoria has been followed. By an act passed in 1886, of which the provisions came into force in 1900, the university of London was reconstituted as a teaching university, although provision was made for the continuance of the system of examinations in subjects other than divinity, law, medicine, and engineering without attendance at university courses. The examinations of the newer universities, the Victoria University of Manchester, Birmingham, Liverpool, Leeds, Sheffield and Wales, are open only to students at these universities, and are conducted by the teachers in association with one or more external examiners for each subject. In some universities, e.g. Manchester, the M.A. degree is given after examination to students who have taken a pass, and without examination to those who have taken an honours degree.

The universities which have departed furthest from the medieval system of examinations, at any rate in appearance, are those of Germany. The baccalaureate has disappeared, but students cannot be matriculated without having passed the Abiturienten-examen (see below), probably the most severe of all entrance examinations (foreign students may be exempted under certain conditions). The student desiring to proceed to the doctorate is free from examinations thereafter until he presents his thesis for the doctor's degree, when, if it is accepted, he is submitted to a public oral examination not only in his principal subject (Hauptfach), but also as a rule in two other subjects of his choice. Under certain conditions the student may present his thesis to a special committee of examiners in the absence of the public. The doctor's degree does not give the right to teach in a faculty (senia legendi). To acquire this a doctor must present a further thesis (Habilitationsschrift), and must deliver two lectures, one before the faculty, followed by a discussion (colloquium), the other in public; but these lectures seem to be merely secondary and are tending to become so more and more; "scientific productivity is so sharply emphasized among the conditions for admission that it overshadows all the rest" (Paulsen, loc. cit. p. 165).

In France the examination for the baccalauréat, though conducted in part by university examiners, has become a school-leaving examination (see below). The licentiatehip has been preserved in the faculties of arts, science and laws, and is in point of difficulty about equal to the pass degree examinations of the university of London, though differing in the nature of the tests. In the faculty of sciences, the three subjects of examination selected may, under a recent regulation, be taken separately. Until a few years ago the successful candidates at the licentiatehip were arranged in order of merit. For the doctorate in the faculty of letters two theses must be submitted, of which the subject and plan must be approved by the faculty (until recently one of them was required to be written in Latin). Permission to print the theses is given by the rector or vice-rector after recommendation by the professors of the faculty, and they are then discussed publicly by the faculty and the candidate (soutenance de these). In this public discussion the "disputation" of the middle ages survives in its least changed form. The literary theses required by French universities are, as a rule, volumes of several hundred pages, and more important in character even than the German Habilitationsschrift. The possession of the doctorate is a sine qua non for eligibility to a university chair, and to a lectureship in the university of Paris.

In the faculty of sciences a candidate for the doctorate may submit two theses, or else submit one thesis and undergo an oral examination in each of the two subjects of examination.

For the doctorate in law, a thesis and two oral examinations are required.

In the faculty of medicine there is no licentiatehip, but for the doctorate six examinations must be passed and a thesis submitted.

There is also a special doctorate, the "docteur d'Université," awarded on a thesis and an oral examination; and there are diplomas (Diplômes d'Études supérieures) awarded on dissertations and examinations on subjects in philosophy, history and geography, classics or modern languages, selected mainly by the candidate and approved by the faculty.

2. Professional Examinations. (a) Teaching.—University examinations for degrees having ceased to be used as technical tests of teaching capacity, new examinations have been devised for this purpose. The test for German university teachers has been described above. For secondary teachers, W. von Humboldt instituted a special examination in 1810 (Paulsen, Gesch. des gelehrten Unterrichts, i. pp. 283 and 393), and an examination for primary teachers was instituted in Prussia in 1794.

In France there is a competitive examination for secondary teachers the agrégation, originally established in 1766. Agrégés have a right to state employment and they alone can occupy the highest teaching post (châire de professeur) in a state secondary school, other posts being open to licentiates. There are also examinations for primary teachers. The tests for teachers are different for the two sexes.

In England there is no obligatory test for secondary teachers. The universities and the College of Preceptors conduct examinations for teaching diplomas. The Board of Education holds special examinations (Preliminary Certificate examination and Certificate examination, &c.) for primary teachers.

(b) Medicine.—All medical education.

(c) Other Professions.—A system of professional examinations carried on by professional bodies, in some cases with legal sanction, was developed in England during the 19th century. Those in the following subjects are the most important: Accountancy (Institute of Chartered Accountants and Society of Accountants and Auditors), actuarial work (Institute of Actuaries), music (Royal Academy of Music, Royal College of Music, Trinity College of Music, Royal College of Organists, and the Incorporated Society of Musicians), pharmacy (Pharmacetical Society), plumbing (the Plumbers' Company), surveying (Surveyors' Institution), veterinary medicine (Royal College of Veterinary Surgeons), technical subjects, e.g. cotton-spinning, dyeing, motor-manufacture (City & Guilds of London Institute), architecture (Royal Institute of British Architects), commercial
EXAMINATIONS

subjects, shorthand (the Society of Arts and London Chamber of Commerce), engineering (Institutions of Civil Engineers, of Mechanical Engineers, and of Electrical Engineers).

3. School-leaving Examinations.—The faculty of arts in medieval universities covered secondary as well as higher education in the subjects concerned. The division in arts subjects between secondary and university education has been drawn at different levels in different countries. Thus the first two years of the arts curriculum in English and American universities correspond, roughly speaking, to the last two years spent in a secondary school of Germany or France, and the continental "school-leaving examinations" correspond to the last examinations in English, the tests and to the pass examinations for the degree at Oxford and Cambridge (Mark Pattison, Suggestions on Academic Organisation, 1868, p. 238, and Matthew Arnold, Higher Schools and Universities in Germany, 1892, p. 209).

A tabular summary is given (see Tables I, II, III, IV.) of the requirements of the secondary school-leaving examinations of France, Prussia (for the nine-year secondary schools) and Scotland, and of the university of London.

There are in England a number of school-leaving examinations which, under various names, also serve as school-leaving examinations, and give entrance to certain universities, especially the Oxford and Cambridge local examinations (both established in 1858), and the examinations of the Oxford and Cambridge "Joint Board." A movement to reduce the number of entrance examinations and to secure uniformity in their standard was set on foot in 1901. In that year the General Medical Council communicated to the Board of Education a memorial on the subject from the Headmasters' Conference. The memorial was further communicated to various professional bodies concerned. Conferences were held by the consultative committee of the Board of Education in 1903, with representatives of the universities, the Headmasters' Conference, the Association of Head-Masters, the Association of Head-Mistresses, the College of Preceptors, the Private Schools' Association, and with representatives of professional bodies. The committee were of opinion that a central board, consisting of representatives of the Board of Education and the different examining bodies, should be established, to co-ordinate and control the standards of the examinations, and to secure interchangeability of certificates, etc., as soon as a sufficient number of such bodies signified their willingness to be represented on the board. They recommended that the examination should be conducted by external and internal examiners, representing in each case the examining body and the school staff respectively, and that reports on the school work of candidates should be available for reference by the examiners (circular of the Board of Education of 12th of July 1904).

The "accrediting" system in the United States was started by the university of Michigan in 1871. A school desiring to be accredited is submitted to inspection without previous notice. If the inspection is satisfactory, the school is accredited by a university for from one to three years, and upon the favourable report of its principal any of its students are admitted to the university by which it has been accredited without any entrance examination. In practice it is found that many students whom their teachers refuse to certify are able to pass the university entrance examination. The statistics of nine years show that the standard of the certified students is higher than that of non-certified students. Two hundred and fifty schools are accredited by the university of Michigan. In 1904 it was stated that the system was gaining favour in the east, and that it had been adopted more or less by all the Eastern colleges and universities with the exception of Harvard, Yale, Princeton and Columbia.

4. Methods of Examination.—Examinations may test (i.) knowledge, or, more exactly, the power of restating facts and arguments of a kind that may be learnt by rote; (ii.) the power of doing something, e.g. of making a précis of a written document, of writing a letter or a report on a particular subject with a particular object in view, of translating from or into a foreign language, of solving a mathematical problem, of criticizing a passage from a literary work, of writing an essay on an historical or literary subject with the aid of books in a library, of diagnosing the malady of a patient, of analysing a chemical mixture or compound; and (the highest form under the rubric) of making an original contribution to learning or science as the result of personal investigation or experiment. Examinations are carried out at present by means of (1) written papers; (2) oral examinations; (3) practical, including in medicine clinical, tests; (4) theoretical.

In written examinations the candidates are, as a rule, supplied with a number of printed questions, of which they must answer all, or a certain proportion, within a given time, varying, as a rule, from 1½ to 3 hours, the latter being the duration most generally adopted for higher examinations in England. Whereas in France and Prussia the questions are generally few in number and require long answers, showing constructive skill and mastery of the mother-tongue on the part of the candidates, such "essay-papers" are comparatively rare in England. In most of the subjects, the test is brief rather than memory rather than capacity. It has been suggested that sets of questions be answered in writing should as a rule be divided into two parts: (i.) a number of questions requiring short answers and intended to test the range of the candidate's knowledge; (ii.) questions requiring long answers, intended to test its depth, and the candidate's powers of co-ordination and reflection. A necessary condition for the application of the second kind of test is that time should be given for reflection and for rewriting, say one-third or one-quarter of the whole time allowed. A further distinction is important, especially in such subjects as mathematics or foreign languages, in which it is legitimate to ask what precise power on the part of a candidate the passing of an examination shall signify. Owing to a prevailing confusion between tests of memory and tests of capacity, the allowance for chance fairly applied to the former is apt to be unduly extended to the latter. In applying tests of memory, it may be legitimate to allow a candidate to pass who answers correctly from 30 to 50% of the questions; such an allowance if applied to a test of capacity, such as the performance of a sum in addition, the solution of triangles by means of trigonometrical tables, or the translation of an essay, the test of a present, passage from a foreign language, appears to be irrational. A candidate who obtains only 50% of the marks in performing such operations cannot be regarded as being able to perform them; and, if the examination is to be treated as a test of his capacity to perform them, he should be rejected unless he obtains full marks, less a certain allowance (say 10, or at most 20%) in view of the more or less artificial conditions inherent in all examinations.

The oral examination is better suited than the written to discover the range of a candidate's knowledge; it also serves further to distinguish his powers of expression in his mother-tongue, or in a foreign language, and may be used (as in the examination for entrance to the Osborne Naval College) to test the important qualities (hardly tested in any other examinations at present), readiness of wit, common-sense and nerve. It may be objected that candidates are heavily handicapped by nervousness in oral examinations, but this objection does not afford sufficient ground for rejecting the test, provided that it is supplemented by others. Oral tests are used almost invariably in medical examinations; and there is a growing tendency to make them compulsory in dealing with modern languages. Oral examinations are much more used abroad than in England, where the pupils during their school years receive but little exercise in the art of consecutive speaking.

The laboratory examination may be used in subjects like physics, chemistry, geology, zoology, botany, anatomy, physiology, to test powers of manipulation and knowledge of experimental methods. In some cases (e.g. in certain honours

<tr>
<td>Scottish school-leaving examination (established 1888). (See paragraph on the &quot;Leaving Certificate Examination Act&quot; issued by the Scottish Education Department, 1906.)</td>
<td>4 years</td>
<td>Candidates must pass in four subjects on the higher grade standard, and in three subjects on the higher grade standard and two on the lower. A pass in Gaelic is reckoned as a pass on the lower grade. All candidates must have passed in higher English and in either higher or lower grade mathematics. The remaining subjects may be either science with one or more languages (Latin, Greek, French, German, Spanish, or Italian), or languages only. But where two or more languages other than English are taken, the candidate's group must include either higher or lower grade Latin. A pass in Spanish, Italian, or science (in which subjects there is only one examination) is reckoned as a pass on the higher grade standard.</td>
<td></td>
<td>Schools are inspected, and the course of instruction must be approved by the Scottish Education Department, but the examinations are conducted by external examiners with whom teachers are not associated.</td>
<td>The examiners are appointed by the Scottish Education Department.</td>
<td>The examination consists of a written examination and an oral examination, on which stress is laid. The length of the examination varies from 1 to 2½ hours. If the candidate selects on the higher grade, English, Latin, mathematics, and French, the examination extends over 1½ hours.</td>

EXAMINATIONS

1855, and in 1870 the principle of open competition for the civil service was adopted as a general rule. (For further details see Civil Service.)

In the Württemberg civil service candidates are admitted to a year's probation after passing a theoretical examination, at the conclusion of which they must pass an examination of a more practical character (A. Herbert, Sacrifice of Education . . ., 1889, p. 111).

In the award of scholarships, &c., it should be definitely decided whether the scholarship is to be awarded (1) for attainment, in which case the examination-test pure and simple may suffice, or (2) for promise, in which case personal information and a curriculum vitae are necessary. To take a simple instance: a candidate partly educated in Germany may obtain more marks in German at a scholarship examination than another who is more gifted, but whose opportunities have been less; the question at once arises, are the examiners to take the circumstances of the candidate into account or not? It is understood that at the colleges of the older universities such circumstances are considered. It must again be decided whether the financial circumstances of candidates are to be taken into account; are scholarships intended as prizes, or as a means of enabling poor students to obtain a university education? In some cases wealthy students have been known to return the emoluments of scholarships. It many universities of the United States there is a definite understanding that emoluments shall only be accepted by those needing them. It would not be difficult to ask candidates to make a confidential declaration on this subject on entrance and to establish in Great Britain a tradition similar to that of the United States, and steps in this direction have been taken both at Oxford and Cambridge (Lord Curzon of Kedleston, University Reform, p. 86).

A special allowance may be made for age. In certain scholarship examinations held formerly by the London County Council a percentage was added to the marks of each candidate proportionate to the number of months by which his age fell short of the maximum age for entry. The whole subject of entrance scholarships at English schools and universities, and especially their tendency to produce premature specialization, has recently been much discussed.

6. The Organization and Conduct of Examinations.—The organization and conduct of examinations, in such a way that each candidate shall be treated in precisely the same way as every other candidate, is a complex matter, especially where several thousand candidates are concerned. The greatest precautions must be taken to ensure the secrecy of the examination papers before the examination, and the effective isolation of individual candidates during the examination. The supervision should be adequate to remove all temptation to copying. The hygienic conditions should be such as to reduce the strain to a minimum. The question of the mental fatigue produced by examinations has been studied by certain German observers, but has not yet been fully investigated.

7. Marking, Classification and Errors of Detail.—In applying a single test in a qualifying examination it would be sufficient to mark candidates as passing or failing. But examinations comprise a variety of tests and marks are recorded in respect of each test or portion of a test in order to enable the examining body to estimate the performance, considered as a whole, of the candidate. At Oxford the marks are not numerical, but the papers are judged as of this or that supposed "class," and various degrees of merit are indicated by the symbols α, β, γ, δ, to which the signs + or − may be prefixed, according as they are above or below a certain standard within each class. At Cambridge, numerical marks are used. The advantage of numerical marks is that they are more easily manipulated than symbols; the disadvantage that they produce the false impression that merit can be estimated with mathematical accuracy. Professor F. Y. Edgeworth, in two papers on "The Statistics of Examinations" and the "Element of Chance in Competitive Examinations" (Journal of the Royal Statistical Society, 1888 and 1890), has dealt with the subject, although on somewhat limited lines. His investigations show clearly that with candidates near the border-line of failure, which must necessarily be fixed at a given point (subject to certain allowances, where more than one subject is considered), the element of chance necessarily enters largely into the question of pass and failure. The fact may be stated in this way:—the general efficiency of the test being granted, it is true to say that the large majority of those who pass an examination will be superior in efficiency to those who fail; but a few of those who fail may be superior to a few of those who pass. These errors are not peculiar to the examination system, they are inherent in all human judgments. It is necessary to allow for them in considering the failure of an individual candidate as an index of inefficiency.

The element of chance, which prevails in the region on either side of the border between pass and failure, obviously prevails equally on either side of the border between "classes," where candidates are classified; it has been suggested by Dr Schuster that numerical order should accompany classification so as to avoid the creation of an artificial gap between the last candidate in one class and the highest in the next. Edgeworth's objection to such an argument is that the number of uncertainties is far less when candidates are classed than when they are placed in ostensible order of merit.

The difficulties of comparison of marks are far more complicated when students take different subjects and it is necessary to compare their merit by means of marks allotted by different examiners and added together. In a pass examination the question has to be considered how far, if at all, excellence in one subject shall compensate for deficiency in another, a question which is indeterminate until the precise object of the whole examination is formulated. In the competitive examination for the Indian civil service, places are allotted on the aggregate of marks obtained in a number of subjects selected by the candidate from a list of thirty-two. The successful candidates are compared a year later on the results of another examination or set of examinations, in which there is again a choice, though a much more limited one. The order of merit in the two examinations is, as a rule, very different. Two further points may be noted. An examiner may have underestimated the time required to answer the questions which he has set; this will be obvious if with a large number of candidates (say 300 or 400) none approaches the maximum mark. In this case the maximum should be reduced. Again, it is generally recognized to be undesirable to give marks for a smattering. In order to avoid this various devices are adopted.

The difficulty is to award a proportion of marks (say 10 to 15, or even 20%) for "general impression." In E. Fawcett's The Education of the Examinor, Royal Philosophical Society of Glasgow, 1903) shows that frequency-curves deduced from actual investigation of class-marks are not symmetrical, but have two maxima corresponding to the performance of "non-workers" and of "workers." In pass examinations of a well-known character there is a maximum just beyond the pass mark, this being the point of efficiency at which many students aim.

8. The Object and Efficiency of Examinations, and their Indirect Effect.—In order to estimate the efficiency of an examination as a test, the precise question should be asked: what is it intended to test? Much of the evil attributed to, and resulting from, examinations is due to the fact that this question has not been definitely put, and that a test legitimate for certain purposes has been used for others to which it is unsuited. Examinations are suited in the first instance for the
EXAMINATIONS

purposes for which they were originally designed in medieval universities—the test of technical and professional capacity; it has never been proposed to abolish qualifying examinations for doctors, pharmaceutical chemists, &c.; the tests applied are (or should be) directed tests of capacity carried out under conditions as nearly as possible like those of actual practice. If a student can auscultate correctly, or make up a prescription, at an examination, he will in all probability be able to do so in other circumstances.

Examinations as tests of the knowledge of isolated facts are necessarily of relatively small value, because the memory of such facts is transient; and memorization of a large number of facts for examination purposes is generally admitted to be specially transient; the "knowledge-test," considered apart from a test of capacity, is in fact not a test of permanent knowledge, but of the power of retaining facts for a long time—twenty-four hours is impossible to estimate and which with some candidates extends over a few weeks only. When used as tests of "general culture," examinations, in the view of Paulsen, based on a study of German education, not only fail in their purpose, but tend to destroy the faculties which it is desired to develop (Geschichte des gelehrtent Unterrichts. ii. 684 et seq.); to prepare ready answers to the numberless questions which an examiner may ask on a large variety of subjects is to paralyse the natural and free activity of the mind (cf. A. C. Benson on the results of English secondary clerical examinations. From a College Warden, The Oxford University, pp. 154-177). If pushed to its logical conclusion the view of Paulsen must, it is submitted, lead to the complete abandonment at examinations of tests of "knowledge" as distinguished from direct tests of capacity. Thus isolated questions on details of grammar would disappear from papers on the mother-tongue and on foreign languages, in which the test would consist mainly or entirely of composition and translation. Erudition would be tested by the power of writing, at leisure, a dissertation on some subject selected by the examiners or the candidate or, in the case of a teacher, by the delivery of a lecture on the subject. At the French agrégation candidates are given twenty-four hours for the preparation of a lecture of this kind. Such examinations would test the "skill in the manipulation of facts which is the true sign of a trained intelligence" (cf. K. Pearson, "The Function of Science in the Modern State," Ency. Brit., 10th ed. xxii. Prefatory essay). They might possibly be supplemented by easy oral examinations to test both range of knowledge and readiness of mind. But in the case of a pupil who had passed through a good secondary school it would be as safe to rely for supplementary information under this head on the testimony of teachers than on their evidence or anything else with regard to the fundamental and all-important element on which no examination supplies direct information—personal character.

The main arguments of those opposed to the examination system may be summarized as follows: (i.) Examinations tend to destroy natural interests and exclude from the attention of the pupil all matters outside the purview of the examination (they would not do so if examinations were so limited in character that preparation therefor could absorb only a fraction of the pupil's time); (ii.) they tend to cultivate a personal judgment which on the normal basis of judgment is possible, (this argument, directed mainly against the Oxford system, is already stated for examinations in general, but to the character of the subjects set for essays); (iii.) competitive examinations on the home and Indian civil services scheme tend to diffuse mental energy over too many subjects (but see (xvii.) below); (iv.) examinations, especially competitive examinations, tend to become more and more difficult, difficulty being confused with efficiency—this has shown itself with the Cambridge mathematical tripos, in which for years questions of increasing difficulty were set on relatively unimportant subjects, until the examination was reformed (reply: all examinations should be overhauled periodically); (v.) they tend to paralyse the powers of exposition, all statements of knowledge being thrown into a form suitable, not for an uninstructed person, but for one who already possesses it, the examiner (this tendency should be counteracted by definite training in composition); (vi.) the sample of knowledge and capacity yielded at an examination is frequently not a fair sample; it is liable to extreme variations in a favourable sense, if the candidate happens to have prepared the precise questions asked; in an unfavourable sense, if the candidate is suffering from misfortune or from accidental ill-health, the latter, owing to the periodic function, occurring much more frequently in the case of women than of men—the reform of examination methods may remove to a great extent the element of chance in questions set; in a competitive examination it is impossible to allow for ill-health; in a qualifying examination it is difficult to make any allowance unless the examination is definitely conducted in whole or in part by the teachers, and the past record of the candidate is taken into account (cf. Paulsen, The German University, pp. 344-345); (vii.) examinations of several hundred candidates are not logical tests; (viii.) the multiplicity of school examinations required for different reasons produces confusion in our secondary education (there is a growing tendency to admit equivalence of "school-leaving" and entrance examinations; thus entrance examinations at Oxford, Cambridge, and London, and the Northern Universities Joint Board are interchangeable under certain conditions); (ix.) the multiplicity of examinations tends to "underselling" (the success of the London examinations in medicine proves that a high standard attracts candidates as well as a low one; possibly intermediate standards may be killed in the competition; it is by no means obvious that a uniform system of examinations would conduce to efficiency); (x.) examinations produce physical damage to health, especially in the case of women-students (on this point more statistical evidence is needed; see, however, Engelmann quoted by C. Stanley Hall, Adolescence, 1906, i. 488 et seq.); (xi.) examinations have in England mechanically cast the education of women into the same mould as that of men, without reference to the different social functions of the two sexes (the remedy is obvious); (xii.) it is unjustifiable to give a man a university position on the results of his performance in the examination room, a practice common in England though almost unknown on the continent; a just estimate of a man's powers in research or for teaching can only be properly based on his performance. The present system merely leads to the transmission of the sterile art of passing examinations. At Oxford, Cambridge, and London, and Cambridge many fellowships are now awarded on the results of examinations; it is sometimes stated, in defence of this system, that young men cannot be expected to carry out research in classics or philosophy.)

On the other hand, the defenders of examinations reply that (xiii.) examinations are necessary in order to test the efficiency of schools to which grants of public money are given (this argument has become somewhat out of date owing to the recent substitution of "inspection" for examination as a test of the efficiency of schools; a combination of inspection and examination is also sometimes used); (xiv.) they serve as a necessary incentive to study (reply: this is that the incentive is a bad one, and that with efficient teachers it is unnecessary); (xv.) they show both student and teacher where they have failed (unnecessary for efficient teachers); (xvi.) though possibly harmful to the highest class of men, they are good for the mass (reply: no system which damages the highest class of men is tolerable); (xvii.) they are indispensable as an impartial means of selecting men for the civil service; (xviii.) in a difficult examination like the first class civil service examination the qualities of quickness of comprehension, industry, concentration, power of rapidly passing

1 The Oxford commissioners of 1852 reported that "the examinations have become the chief instruments not only for testing the proficiency of the students but also for stimulating and directing the studies of the place" (Report, p. 61).
EXARCH—EXCELLENCY

from one subject to another, good health, are necessary for success, though not tested directly, and these qualities are valuable in any kind of work (this appears to be incontrovertible); (xix.) examination records show that success in examinations is generally followed by success in after-life, and the test is therefore efficient (it does not follow that certain students can consistently pass exams extremely efficiently); (xx.) as a plea for purely "external examinations," teachers cannot be trusted to be impartial and it is better for a boy to "cram" than to curry favour with his teacher (Latham).

The brief comments in brackets, appended above to the arguments, merely indicate what has been said or can be said on the other side. It can scarcely be doubted that in spite of the powerful objections that have been advanced against examinations, they are, in the view of the majority of English people, an indispensable element in the social organization of a highly sophisticated community (Buchanan). It is true that the empire of ideas is divisible into the intellectuals, trusted to make decisions to committees rather than to individuals. But in view of the extreme importance of the matter, and especially of the evidence that, for some cause or other (which may or may not be the examination system), intellectual interest and initiative seem to diminish in many cases very markedly during school and college life in England, the whole subject seems to call for a searching and impartial inquiry.

Exarch (Greek, a person or leader), a title that has been conferred at different periods on certain chief officers or governors, both in secular and ecclesiastical matters. Of these, the most important were the exarchs of Ravenna (q.v.). In the ecclesiastical organization the exarch of a dioecese (the word being here used of the political division) was in the 4th and 5th centuries the same as primate. This dignity was intermediate between the patriarchal and the metropolitamic, the name being restricted after a.d. 451 to the chief bishops of the most important cities (see Patriarch). The title of Exarch was also formerly given in the Eastern Church to a general or superior over several monasteries, and to certain ecclesiastics deputed by the patriarch of Constantinople to collect the tribute payable by the Church to the Turkish government. In the modern Greek Church an exarch is a deputy, or legate a latere, of the patriarch, whose office it is to visit the clergy and churches in the provinces allotted to him. The title of exarch has been borne by the head of the Bulgarian Church (see Bulgaria), since in the beginning of the 13th century, during the Greek exarchate of Constantinople. Hence the names of the politico-religious parties in the recent history of the Near East; "Exarchists" and "Patriarchists."
EXCHANGE

Dukes and counts of the Empire and the Italian reigning princes continued, however, to be "excellencies" for a while longer. In 1593 the bestowal of the title of excellence by Henry IV. of France on the duc de Nevers, his ambassador at Rome, set a precedent that diplomatic service was followed from the time of the treaty of Westphalia (1648). This, together with the reservation in 1640 of the title of "eminence" (g.v.) to the cardinals, led the Italian princes to adopt the style of "highness" (altezza) instead of "excellency." In France, from 1654 onwards, the title of excellence was given to all high civil and military officials, and this example was followed in Germany in the 18th century.

The subsequent fate of the title varies very greatly in different countries. In Great Britain it is borne by the viceroy of India, the lord-lieutenant of Ireland, all governors of colonies and ambassadors of the United States is part of the official style of the governors of states, but not of that of the president; though diplomatic usage varies in this respect, some states (e.g. France) concealing to him the style of "excellency," others (e.g. Belgium) refusing it. The custom of other republics differs: in France the president is addressed as excellence by courtesy; in Switzerland the title is omitted; in the South American republics it is part of the official style (Pradier-Fodéré, Cours de droit diplom. I. 80). In Spain the title of excellencia properly belonged to the grandees and to those who had the right to be covered in the royal presence, but was extended by the king to statesmen, captains-general, lieutenant-general, ambassadors and knights of the Golden Fleece. In Austria the title Excellens belongs properly to privy councillors. It has, however, gradually been extended by custom to all the higher military commands from lieutenant-field-marshals upwards. Ministers, even when not privy councillors, are styled Excellens. In Germany the title is borne by the imperial chancellor, the principal secretaries of state, ministers and Oberpräsidenten in Prussia, by generals from the rank of lieutenant-general upwards, by the chief court officials, and it is also sometimes bestowed as a title, the one in confirmation of the other. The title of excellency is extended to ambassadors, but in addressing envoy, this form is commonly used by courtesy.

W. A. P. EXCHANGE, in general, the act of mutual giving and receiving objects, interests, benefits, rights, &c. The word comes through the French from the Late Lat. excambium (see EXCAMBION). The present article deals with the theory and practice of exchange in monetary transactions, but this may conveniently be prefaced by a brief statement as to the law relating to the exchange of property and other matters. In English law exchange is defined as the mutual grant of equal interest, a term in contravention of the modern common law conveyance had certain restrictions, e.g. identity in quantity of interest, fee-simple for fee-simple, &c., entry to perfect the conveyance, and an implied warranty of title and right of entry by either party in case of eviction. Such exchanges are now effected by monetary conveyances with the usual covenants for title. Exchanges are also frequently made by order of the Board of Agriculture under the Inclosure Acts, and there are also statutes enabling ecclesiastical corporations to exchange benefits with the approval of the ecclesiastical commissioners. The international exchange of territories is affected by treaties. The exchange of prisoners of war is regulated by documents called "cartels" (Med. Lat. cartellus, diminutive of carta, paper, bill), which specify a certain agreed-on value for each rank of prisoners. The practice superseded the older one of ransom at the end of a war. By the Reglementary Exchanges Act 1875 the sovereign may by regulation authorize exchanges by officers from one regiment to another. (For "labour exchanges" see Empleo.)

Exchange in relation to money affairs denotes a species of barter not of goods but of the value of goods, a payment in one place being exchanged for a payment in another place. The popular statement of the theory of exchange represents four principals involved in two transactions. A and B are two persons residing in one place different from the domicile of C and D; A sells goods to C; B buys goods from D; A sells his claim on C to B, who remits it to D in satisfaction of his debt, and D receives the cash from C, so that, assuming the two transactions to be of equal value, one piece of paper satisfies the four parties to these two transactions, and the trouble, expense and risk of sending money from both places are avoided. The place of exchange, which performs the service may be a telegraphic order, cheque or bill of exchange. In this elementary proposition there would be no difficulty of exchange, as the full value of A's claim on C would be paid for by B, who is under the necessity of sending in exactly similar amount of money to D; but it can be seen that in actual practice the claims of one place on another place would not be exactly balanced by the necessities of the one place to meet obligations in the other place; thus arises the complication of exchange, which may best be described as the price of monetary claims, or the discount.

Supposing, for example, that A in London had a claim on C in Edinburgh amounting to £100, and that B in London did not require to remit more than £100 to D in Edinburgh, it is evident that B in London must be offered some inducement to take over the whole of A's claim. B might give A £99; 10: 0, and could then, after satisfying his debt to D, have £10 to his credit in Edinburgh, which he could retain there at interest until he had incurred further liability to D, or he could have the balance of £10 returned him in coin at an expense, say, of sixpence; this would leave B with a profit of sixpence on the transaction, and, assuming the exchange rate of coin in Edinburgh in London would be one shilling discount per £100. Supposing the necessities of B induced him to offer A only £99; 14: 0 for his £100 claim, A would then prefer that C remitted him £100 in coin, which, on the above scale of expenses would cost 2s. and A would receive £99; 15: 0 net. On these premises, exchange on Edinburgh in London cannot fall below 4% discount, and the same circumstances prevent it from rising above 1/2% premium, for B, in no case, would pay more for A's claim than £100 plus the cost of sending coin to Scotland. If this basis is appreciated, all exchange problems between different countries can be mastered, and the quotations in the daily papers of cable payments, sight drafts (cheques) and long bills are then understood and supply an interesting indication of the state of international financial relations. As shown above, the balance of indebtedness must eventually be remitted by coin, and consequently when exchange in any city is quoted at one or other of the limit points given in our example as 1/2% discount or 4% premium, this exchange immediately acquires a very serious importance, because with the development of modern monetary systems under which enormous trade is carried on within the restricted proportion of actual coin, the weakening or strengthening of that foundation is a very vital matter.

While the understanding of the theory is essential for any facile interpretation of an exchange, there are of course innumerable details of practice which require to be known to identify the limit points of exchange in any particular city. The limit points can only be taken advantage of by banking experts, and, although we assume a trader remitting his indebtedness in coin when he is asked to pay too high a price for his bill of exchange, in actual affairs the banker will supply the cheque or bill and himself will do the professional business of sending away bullion. Similarly, we have represented one trader drawing on another trader and selling his draft to a third trader who remits the draft to a fourth. In actual practice, however, No. 1 draws on No. 2 and disposes of his draft to a banker; No. 4 draws on No. 3 and sells his draft to a banker; because, speaking generally, whenever
goods are shipped, the shipper immediately requires his money; he draws a bill against the goods, and it is the function of a banker to help, as a sort of debt-collecting agency, by buying these drafts; and the bank, being a mart for all forms of remittances, gets an immense variety of demand for cable payments, cheques and bills on all centres. This does not affect the theory, for it must be remembered that the banker is a necessary link between the buyer and seller of exchange, because the seller can only sell what he has and the buyer must have exactly what he wants.

To return to the question of limit points: if a universal currency system existed, with the same monetary standard that is used in England, and the coinage kept in a proper condition of weight and fineness, and the coin readily supplied to meet every reasonable claim—if, in fact, the pound sterling were the prevalent coinage of the English banking system—therefore, wherever, then we should find all exchange quotations as simple as our case of London and Edinburgh, that is to say, all exchanges would be quoted at par or a premium or a discount. The limit points in any place of the exchange on London would represent simply and obviously the cost of the transmission of the coin. These limit points would vary at each place according to the distance from London, the cost of freight, the risk involved in the transmission and the local rate of interest. On the continent of Europe some advance has been made in the direction of a universal coinage. Countries subscribing to the Latin Union have agreed on the franc as a common unit, and Belgium, Switzerland, France and Italy quote exchange between themselves at a premium or discount. Greece, Spain and other countries are also parties to the arrangement, but their currencies are in a bad state, and the exchange quotations involve a considerable element of speculation. We have, however, to deal with another factor in international finance, namely, the enormous variety of currency systems; and we have then to discover, in each case, the exchange which represents par and corresponds to our £100 for £100 in the London-Edinburgh example. The United States furnishes perhaps the easiest problem, and we must find out what one dollar in gold contains the amount of the precious metal as is contained in one hundred sovereigns. The answer is 486½, and the arithmetic is a question of the mint laws of the two countries. Gold coin in the United States contains one-tenth alloy and in England one-twelfth alloy. Ten dollars contain 285 grains of gold, nine-tenths fine. One pound contains 123.274 grains of gold, eleven-twelfths fine, consequently £100 is worth $485½, or, to be exact, $485½, and when cable payments between London and New York are quoted at 4-86½ for the £1 sterling, exchange is about par. As a cable payment is an immediate transfer from one coin to another, no charge whatever is involved. Owing to the cost of sending gold as detailed above, the New York cable exchange varies from about 4-84 to 4-80½; at the former point gold leaves London for New York, and at the latter point gold comes to England. Besides insurance, freight, packing, commission and interest, there must also be considered the circumstance that coin taken in bulk is always a little worn and under full weight, and in the process of turning sovereigns into dollars, the result would not bear out the calculation based on the mint regulations: consequently, when taking gold from London, the demand would first fall on the nine-tenths fine, instead of exactly the same from South Africa or Australia to be minted in the United States, then on any stock of American coin the Bank of England might have and be willing to sell by weight (which would be accounted by tale in New York), and lastly the demand would be satisfied by sovereigns taken by tale from the Bank of England and converted by weight in America.

The instance of the American quotation may be further taken to explain some of the numerous points which the study of the exchange involves. In the first place, it will be noted that we have quoted the price in dollars. In London, bills in London, £1, on New York is quoted either in pence or in dollars, that is to say, payments are negotiated for so many dollars either at 49⅞ pence per dollar, or at the equivalent rate $4-88 for the pound. In practice it is much more convenient to quote in London in the money of the foreign country, as it makes comparison with the foreign rate on London very simple. Some foreign countries quote exchange on London in pence, and then, of course, in relation to those countries the same practice will obtain in England, but the majority of the exchange quotations on London are in francs, marks, gulden, lire, kronen or other foreign money. Another point which must be explained is the reason why exchange varies between what we have called the limit points; why there is sometimes so much demand for bills on London and why at other times so many bills are being offered. Similar causes operate on other exchanges, and if we develop the New York case we shall provide explanations for exchange movements in other countries.

At one time the financial relations between England and America were conducted with the principal creditor of the United States, and the latter country had to remit continually very large amounts in payment of interest on English money and profits on English investments, in payment for shipping freight, for banking commissions, insurance premiums and an immense variety of services, besides paying for the large imports which crossed the Atlantic from English ports. In the fall of the year these payments would be more than offset by the enormous exports of food-stuffs, cotton, tobacco, &c., so that during the first half of the year exchange would be at or about the limit of 4½ and gold would have to be sent from New York to supplement the deficiency of bills. In the autumn the produce bills would flood the exchange market and gold would be sent from London as exchange got to the other limit point of 4½. These conditions are still very potent, but latterly another element has entered into the position, and the new development is so powerful as to reverse sometimes what we may call the natural and legitimate movement in the exchange. This new element is the more intimate banking and financial relationship which has been established between the two countries. As American conditions have become more stable, with better security for capital and an assured feeling about the currency of the United States, bankers in London have gladly allowed their banking friends in New York and other large cities to draw bills on London whenever there was a good demand for sterling remittances. We have, therefore, to consider a fresh type of bill of which the drawer has no claim on the drawer, but, on the other hand, incurs a debt to the drawer. To take a very usual method, a banker in Wall Street, New York, will advance money to stockbrokers, investors and speculators against bonds and shares with a 20½ margin. He deposits this security with a trust company in New York which acts both for the American and English banker. The Wall Street banker then draws a bill on New York for 60 days' sight or 90 days' sight on the banker in Lombard Street and sells this draft to supply the money he lends the stockbroker. Two or three months hence the New York banker must send money to London with which to meet the bill, so that, whereas, in the case of a commercial bill, the produce is despatched and in due course the consignee must find the money for the bill, in the case of a finance bill, as it is called, the bill is drawn and in due course the drawer must send the value with which it is to be honoured. In any event the acceptor, the London banker, has to pay the bill, so that it will be easily understood that relations of the United States, bankers in London have gladly allowed their banking friends in New York and other large cities to draw bills on London whenever there was a good demand for sterling remittances. We have, therefore, to consider a fresh type of bill of which the drawer has no claim on the drawer, but, on the other hand, incurs a debt to the drawer. To take a very usual method, a banker in Wall Street, New York, will advance money to stockbrokers, investors and speculators against bonds and shares with a 20½ margin. He deposits this security with a trust company in New York which acts both for the American and English banker. The Wall Street banker then draws a bill on New York for 60 days' sight or 90 days' sight on the banker in Lombard Street and sells this draft to supply the money he lends the stockbroker. Two or three months hence the New York banker must send money to London with which to meet the bill, so that, whereas, in the case of a commercial bill, the produce is despatched and in due course the consignee must find the money for the bill, in the case of a finance bill, as it is called, the bill is drawn and in due course the drawer must send the value with which it is to be honoured. In any event the acceptor, the London banker, has to pay the bill, so that it will be easily understood that relations of the United States, bankers in London have gladly allowed their banking friends in New York and other large cities to draw bills on London whenever there was a good demand for sterling remittances. about ¼% for bill stamps, and 3% for London commission—altogether, 4½%; and as the money is loaned at 5%, there appears to be a 1½% profit to the drawer of the bill. This, however, is on the assumption that the cable rate is still 4.87½% when the bill falls due for payment and that the drawer would have to pay that price to telegraph the money to meet the draft. But exchange on London can go up or down between 4.84 and 4.89½, and if at the end of the three months the cable rate is 4.84, the New York banker will be able to cover his bill at almost the same rate at which he sold it and will only be out of pocket to the extent of the commissions and stamps, so that the accommodation will only cost him 1½% and his profit will be 3½%. If he has to pay more than 4.87½ for his cable at the maturity of the bill, his spread will be less than 3%, and he may even be a loser on the transaction.

It is obvious, then, that a high rate of interest in New York, with a high rate of exchange on London and a low rate of discount in England, would induce the creation of these finance bills. The supply of these bills would prevent New York exchange reaching the limit point at which gold leaves the United States, and the maturity of these bills in the autumn would ensure a demand for the produce bills and possibly prevent exchange from falling to the other limit point at which London has to send gold to New York.

We have pointed out the essential difference between these finance bills and what we have called produce bills, but there is another very striking difference, that of the question of supply. These finance bills are obviously very difficult to limit in their amounts; produce bills are, of course, limited by the extent of the surplus crops of the United States and by the demand for the produce in Europe, but so long as it is mutually satisfactory to the big finance houses in both countries to draw on credit granted in London, so long may these accommodation bills be created, and the pressure of the bills in New York may depress exchange so much that gold leaves London at a time when it is required in other directions. In such a case the embarrassment caused by this artificial drain of the gold reserve would much more than offset the amount of the commission earned by the accepting houses. The Bank of England may have to raise its rate of discount at the expense of the entire home trade; probably, also, with the rise in the value of money, consequent on the diminished resources, all investment securities fall in value and more onerous terms must be submitted to by the government, corporations and colonies, in the issue of any loans they may require. It will, therefore, be appreciated that, although these finance bills may be perfectly safe, their excessive creation is viewed with great disfavour, and considerable apprehension is felt when the speculators in New York make great demands for loans against stocks and shares, and, through the instrumentality of these finance bills, shift the burden on to the shoulders of the London discount market. The effect of this is to level money rates as between New York and London, and in the process the pressure falls on London and the relief goes to America. Eventually, of course, the bills must be met and funds sent for that purpose from across the Atlantic, but in the meanwhile the disturbance of the gold supply is an inconvenience.

We have explained the process of employing credits granted in London to finance Wall Street; there are, also, many other types of bill in which the acceptor lends his name on the assurance that he will in due course be supplied with the funds required to meet the acceptance. In the case of the produce bills, a London banker will accept the bills in order that they may be more easily marketable than if they were drawn direct on the active and liquid commodities, such as cotton, tobacco or wheat. The consignees in Liverpool, &c., pay a commission for this assistance and reimburse the London bank as the produce is gradually disposed of. The transaction appears slightly more complicated when English bankers accept bills for produce shipped from the United States to merchants living in Hamburg, Genoa, Singapore and all other great ports, but the principle is the same, and the influence of such business on the exchange affects, in the first instance, the quotation between America and London, but afterwards, when money must be sent to London with which to honour the bills, the exchanges with Germany, Italy or the Straits Settlements bear their share in the eventual adjustment, the spinners, tobacco manufacturers and corn factors requiring drafts on London where so much of the trade of the world is financed.

We shall have to consider later the reasons which ensure to London this peculiar and predominant position. We have so far used the American exchange as an example to explain causes which produce fluctuations in all the principal exchanges on London and to show the points between which fluctuations are limited. The fact that America is still developing at a much greater rate than the Old World makes an important distinction between the financial position in New York and the financial position of the big capitals in Europe. There is not in America the huge accumulation of savings and investment money which the Old World has collected, so that whereas Europe helps to finance the United States, the latter country has so many home enterprises that she can spare none of her funds to assist Europe. It would not be possible for London to draw on New York such bills as we have described as finance bills, for they could never be discounted there except on the most onerous terms, and there is nothing in America which corresponds to the London money market.

We have to deal with dollars and cents in America, with francs in France, with marks in Germany, and different money units in nearly every country; but, given the mint regulations, the theoretical par of exchange and the theoretical limit points are arrived at by simple arithmetic. An exhaustive statement with reference to every country would involve an amount of tedious repetition, so that for the purposes of this article it is more instructive to consider the essential differences between the important exchanges than to go into the details of calculation, which would appeal rather to the mathematician than to the exchange expert.

The United States, offering as it does a vast field for profitable investment, must annually remit hugely large sums for interest on bonds and shares held by Europeans; coupons and dividend warrants payable in America are offered for sale daily in London, and at the end of the quarters the amount of these claims, coupons and drawn bonds is very large, and a considerable set off to the indebtedness of Europe for American produce. It is often asserted that the United States is rapidly getting sufficiently wealthy to purchase these bonds and shares; but whenever trade conditions are exceptionally good in the States, fresh evidence is forthcoming that assistance from London and Europe is essential to finance the commercial development of the United States. This illustrates a feature common to all new countries, and the fact is that they make annual payments to the older countries and especially to England.

A government loan or other large borrowing arranged abroad will immediately move the exchange in favour of the borrowing country. A tendency adverse to the United States results from the drafts and letters of credit of the large number of holiday makers who cross the Atlantic and spend so much money in Europe. When remittance is made of the incomes of Americans who have taken up their residence in the Old World the exchange is affected in a similar manner.

In one respect the United States stands far superior to most of the older countries. There are no restrictions on the free export of gold when exchange reaches the limit point showing that the demand for bills on London exceeds the supply. New York (with London and India) is a free gold market, and this is undoubtedly one of the reasons why money is so readily advanced to the United States, and all the finance bills, to which we referred above, would not be allowed to the same extent were it not for the fact that New York will remit gold when other forms of remittance are insufficient to satisfy foreign creditors. When exchange between Paris and London reaches the theoretical limit point of 25½ (25 francs 32 centimes for the £ sterling), gold does not leave Paris for London unless the Bank of France is
EXCHANGE

If the Paris cheque falls to 25-12, gold arrivals in the London bullion market will be taken by French bankers unless the profit shown by the exchange on some other country enables other buyers to pay more for the gold than Paris can afford. If the Paris cheque falls still further, it would pay to take sovereigns from the Bank of England for export, and so much would be taken as would satisfy the demand to send money to France, or until the consequent scarcity of money in London made rates of interest so high in England that French bankers would prefer to leave money and perhaps increase their balances. As between London and Paris and Berlin the greatest factor operating the exchanges is the relative value of money in the three centres. There is no great excess of trade balance at any season in favour of Germany or France and against England. On the other hand European relations between the three countries are usually very intimate, and if funds can be very profitably employed in one of these places, there will be a good demand for remittance, and exchange will move in favour of that place, that is to say, exchange will go towards that limit point at which gold will be sent. The great pastoral and agricultural countries like South America, Egypt and India are in a position to draw very largely on London when their crops or other products are ready for shipment. In the early months of the year gold goes freely to South America to pay for the cereals, hides and meat, and in the autumn Egypt and India send such quantities of cotton and wheat that exchange moves heavily in favour of those countries, and gold must go to adjust the trade balances. During the rest of the year the gold tends to return as these countries always require bills on London or some form of payment to meet interest and dividends on European money invested in their government debts, railways and trading enterprises, and to pay for the European manufactures which they import. Exchange then moves in favour of England, and the Bank of England can replenish its reserve. Over the greater part of the world the rate of exchange on London is an indication simply of the trade balance. The greater part of the world receives payment for food stuffs, and has to pay for European manufactures, shipping freights, banking services and professional commissions.

The greatest complication in exchange questions arises when we have to deal with a country employing a silver standard, and, fortunately for the development of trade, this problem has disappeared of late years in the case of India, Ceylon, Japan, Mexico and the Straits Settlements, and now the only important country using silver as a standard is China. When the monetary standard in one country is only a commodity in another country we are as far removed from the ideal of an international currency as can be imagined. We can fix no limit points to the exchange and we cannot draw up a theoretical par of exchange. The price of silver in the gold-using country may vary so much that the gold tends to return as these countries always require bills on London or some form of payment to meet interest and dividends on European money invested in their government debts, railways and trading enterprises, and to pay for the European manufactures which they import. Exchange then moves in favour of England, and the Bank of England can replenish its reserve.

The最容易的解法是解释位置的偏移，从而考虑一个国家或地区的货币标准。例如，金元可以用银元或铜元。前者是国际货币，而后者是国内货币。由于货币价值的差异，国际间的交易会受到影响。例如，如果银元的汇率比金元高，那么人们可能会选择使用银元进行交易。相反，如果金元的汇率比银元高，那么人们可能会选择使用金元进行交易。
prominent exponents could generally be identified either as extremely practical men who were interested in the price of silver, or as very inexperienced theorists. The difficulty of the two standards was successfully solved by discounting the use of silver. But the chief silver-using countries adopted a gold standard which has given greater security for the investment of foreign capital, has simplified business and brought about a large increase of trade.

In the case of a country of which the government has been subject to great financial difficulties, gold has been shipped to satisfy foreign creditors so long as the supply held out, and the exchange with such a country will continue to move adversely with every fresh political embarrassment and any other economic cause reflecting on the national credit. In Japan there is a gold standard, and par of exchange is 25. 09d. for the yen. Brazil, Chile and Argentina have a depreciated paper currency, and the last quotation of 48d. is for the gold dollar equal to five francs, but there is a premium on gold in the River Plate of 127,271% and for the present a gold standard is re-established on this basis. The letters T.T. with the eastern exchanges signify telegraphic transfer or the rate for payments made by cable. The very important New York rates are always given in another part of the daily paper with other details of American commercial interest.

These rates are all quotations for payments in England, and all over the world the exchange on London is the exchange of the greatest importance. This unique position was gained originally, probably, through the geographical position of the United Kingdom, and has been maintained owing to several reasons which secure to London a peculiar position by comparison with any other capital. Britain's colossal trade ensures a supply of the a demand for English re acquisitions. Even when goods or produce are dealt in between foreign countries a credit is opened in London, so that the shipper of the produce can offer in the local market a bill of exchange which is readily saleable. With the highly developed banking system a large amount of deposits is collected in London, and the result is that bills of any usance up to six months can be immediately discounted, and the proceeds, if required, can be handed over in gold. There are in London a great number of wealthy banks and banking houses whose reputation and solidity allow any one of them to accept bills for amounts varying from one to ten millions sterling, whereas in large commercial exchanges.

These four advantages, namely, a free gold market, a huge trade, an enormous accumulation of wealth, and a discount market such as exists nowhere else, have made London an unrivalled financial centre, and consequently bills on London are an international money and the best medium of exchange.

EXCHEQUER. The word "exchequer" is the English form of the Fr. "echiquier", low Lat. "ascalarium", and its primary meaning is a chess-board (see Chess). As the name of a government department dealing with accounts it is derived from the exchequer or the "abacus" by means of which such accounts were kept, such a contrivance being almost universally in use before the introduction of the Arabic notation. In England the department or court of accounts was named originally "the talleys" from the notched sticks or tallies which constituted the primitive means of account-keeping (which were only abolished in 1830), and was only subsequently, probably in the reign of Henry I, named the exchequer from the use of these devices. Both the name and the general features of the institution may reasonably be attributed to Norman influence, since we find both in Normandy and in the Norman kingdom of Sicily, as well as in Scotland and Ireland; the two latter cases being directly due to English example. As a court of law the exchequer owed its existence in England, as elsewhere, to the necessity of deciding legal questions arising from matters of account, and its secondary activities soon overshadowed its original functions.

We cannot say whether the exchequer, as known in England, is older than the beginning of the 12th century. The treasury, which may be regarded as one of its constituents, dates from before the conquest, and the officers of the exchequer who were drawn from the treasury staff can be traced back to Domestacy. But our earliest information about the exchequer itself, apart from that afforded by the pipe rolls (see RECORD), rests on a...
EXCHEQUER

55

treatise (Dialogus de Scaccario) written about A.D. 1179 by Richard, bishop of London and treasurer of England. His father, Nigel, bishop of Ely, had been treasurer of Henry I, and nephew to that king's great financial minister Roger, bishop of Salisbury. Nigel is said to have reconstituted the exchequer after the troubles of Stephen's reign upon the model which he inherited from his uncle. The Anglovin, or rather the Norman, exchequer cannot be regarded in strictness as a permanent department. It consisted of two parts: the lower exchequer, which was closely connected with the permanent treasury and was an office for the receipt and payment of money; and the upper exchequer, which was a court sitting twice a year to settle accounts and thus nearly related to the Curia Regis (q.v.). We dare hardly say that either exchequer existed in vacation; indeed the word (like the word "diet") seems to have been limited at first to the actual sitting of the king's court for financial purposes. The Michaelmas and Easter exchequers were the sessions of this court "at the exchequer" or chess-board as it had previously sat "at the tallies." The constitution of the court was that of the normal Frankish curia. The king was the nominal president, and the court consisted of his great officers of state and his barons, or tenants-in-chief, and it is doubtful due to the fact that the exchequer was originally the curia itself sitting for a special purpose that its unofficial judges retained the name of "barons" until recent times. Of the great officers we may probably find the steward in the person of the justiciar, the normal president of the court. He sat at the head of the exchequer table. The butler was not represented. The chancellor sat on the justiciar's left; he was custodian of office as the seal of the court, and thus responsible for the issue of all writs and summonses, and moreover for the keeping of a duplicate roll of accounts embodying the judgments of the court. On the left of the chancellor, and thus clear of the table, since their services might be required elsewhere at any moment, sat the constable, the two chamberlains and the marshal. The constable was the chief of the outdoor service of the court, and was responsible for everything connected with the army, or with hunting and hawking. The two chamberlains were the lay colleagues of the treasurer, and shared with him the duty of receiving and paying money, and keeping safe the seal of the court, and all the records and other contents of the treasury. The marshal, who was subordinate to the constable, shared his duties, and was specially responsible for the custody of prisoners and of the vouchers produced by accountants. At the head of the table on the justiciar's right sat, in Henry II's time, an extraordinary member of the court, the bishop of Winchester. The treasurer, like the chancellor a clerk, sat at the head of the right-hand side of the table. He charged the accountants with their fixed debts, and dictated the contents of the great roll of accounts (or pipe roll) which embodied the decisions of the court as to the indebtedness of the sheriffs and other accountants. These persons with certain subordinates constituted the court of accounts, or upper exchequer, whereas the lower exchequer, or exchequer of receipt, consisted almost exclusively of the subordinates of the treasurer and chamberlains. In the upper exchequer the justiciar appointed the calculator, who exhibited the state of each account by means of counters on the exchequer table, so that the proceedings of the court might be clear to the presumably illiterate sheriff. The calculator sat in the centre of the side of the table on the president's left. The chancellor's staff consisted of the Magister Scriptorii (probably the ancestor of the master of the rolls), whose duties are not stated; a clerk (the modern chancellor of the exchequer) who settled the form of all writs and summonses, charged the sheriff with all fines and amercements, and acted as a check on the treasurer in the composition of the great roll; and a scribe (afterwards the controller of the pipe), who wrote out the writs and summonses and kept a duplicate of the great roll, known as the chancellor's roll. The constable's subordinates were the marshal and a clerk, who, besides the duty of paying outdoor servants of the crown, had the special task of producing duplicates of all writs issued by the Curia Regis. The treasurer and chamberlains, being colleagues, had a joint staff, the clerical or literate members of which were servants of the treasurer, while the lay or illiterate members depended on the chamberlains. Hence while the treasurer and his clerks kept their accounts by means of rolls, the chamberlains and their serjeants duplicated them so far as possible by means of tallies. Thus the great roll was written by the treasurer's scribe (the engrosser, afterwards the clerk of the pipe), while the payments on account and other allowances to be credited to the sheriff were registered by the tally cutter of the chamberlains.

In the exchequer of receipt the staff was similarly divided between the treasurer and chamberlains; the treasurer having a clerk who kept the issue and receipt rolls (the later clerk of the pipe) and four tellers, while each of the chamberlains was represented by a knight (afterwards the deputy chamberlains), who controlled the clerk's account by means of tallies, and held their lands by this serjeancy; these three had joint control of the treasury, and could not act independently. The other serjeants were the knight or "pesour" who weighed the money, the melder who assayed it, and the ushers of the two exchequers. It should be noted that all the lay offices of the treasury in both exchequers were hereditary. Henry II had also a personal clerk who supervised the proceedings personally in the upper, and by deputy in the lower, exchequer.

The business of the ancient exchequer was primarily financial, although we know that some judicial business was done there and that the court of common pleas was derived from it rather than from the curia proper. The principal accountants were the sheriffs, who were bound, as the king's principal financial agents through the county, to give account of their stewardship twice a year, at the exchequers of Easter and Michaelmas. Half the annual revenue was payable at Easter, and at Michaelmas the balance was exacted, and the accounts made up for the year, and formally enrolled on the pipe roll. The fixed revenue consisted of the farms of the king's demesne lands within the counties, of the county mints, and of certain boroughs (see Borough) which paid annual sums as the price of their liberties. Danegeld was also regarded as fixed revenue, though after the accession of Henry II it was not frequently levied. There were also rents of assarts and pertainures and mining and other royalties. The casual revenue consisted of the profits of the feudal incidents (escheat, warship and marriage), of the profits of justice (amercements, and goods of felons and outlaws), and of fines, or payments made by the king's subjects to secure grants of land, wardships or marriages, and of immunities, as well as for the hastening and sometimes the delaying of justice. Besides this, there were the revenues arising from aids and scutages of the king's military tenants, tallages of the crown lands, customs of ports, and special "gifts," or general assessments made on particular occasions. For the collection of all these the sheriff was primarily responsible, though in some cases the accountants dealt directly with the exchequer, and were bound to make their appearance in person on the day when the sheriff accounted.

We gather both from tradition and from the example of the Scottish exchequer that the farms of demesne lands were originally paid in kind, by way of purveyance for the royal household, and although such farms are expressed even in Domesday Book in terms of money, the tradition that there was a system of customary valuation is a sufficient explanation, and not of itself incredible. At some date, possibly under the administration of Roger of Salisbury, the inconvenience of this arrangement led to the substitution of anxious money payments at the exchequer. The rapid deterioration of a small silver coinage led to successive efforts to maintain the value of these payments, first by a "scale" deduction of 6d. in the £ for wear, then by the substitution of payment by weight for payment by tale, and finally by the reduction of most of such payments to their pure silver value by means of an assay, a process originally confined to payments from particular manors. Only the farms of counties, however, were so treated, and not all of those. The amount to be deducted in these cases was settled by the weighing and assaying of a specimen pound of silver in the presence of the sheriff by the pesour and the melder in the lower exchequer. The casual
EXCHEQUER

revenue was paid by tale, and for the determination of its amount it was necessary to have copies of all grants made in the chancery on which rents were reserved, or fines payable. These were known first as contrabrevia and later as originalia; the profits of justice were settled by the delivery of "estreats" from the justices, while for certain minor casualties the oath of the sheriff was at first the only security. At a later date many of them were determined by copies of inquisitions sent in from the chancery. All this business might be transacted anywhere in England, and the growth completely placed the exchequer first at Winchester (where the treasury was), and afterwards usually at Westminster, it held occasional sessions at other towns even in the 14th century.

The Angevin exchequer, described by Richard the Treasurer, remained the ideal of the institution throughout its history, and the lineaments of the original exemplar were never completely effaced; but the rapid increase both of financial and judicial business led to a multiplication of machinery and a growing complexity of constitution. Even in the time of Henry II. we find that the great officers of state, except the treasurer and chancellor, commonly attended by deputy. In the reign of Henry III. the chancellor had also ceased to attend, and his clerk acquired the title of chancellor of the exchequer. To the same period belongs the institution of the king's and lord treasurer's remembrancers. These at first had common duties and kept duplicate rolls, but by the ordinance of 1233 their functions were differentiated. Henceforward the king's remembrancer was more particularly concerned with the casual, and the lord treasurer's remembrancer with the fixed revenue. The former put all debts in charge, while the latter saw their recovery when they had found their way on to the great roll. Hence their preliminary stages of each account, the receiving and registering of the king's writs to the treasurer and barons, and the drawing up of all particulars of account, lay with the king's remembrancer, and he retained the corresponding vouchers. The lord treasurer's remembrancer exacted the "remanets" of such accounts as had been enrolled, as well as reserved rents and fixed revenue, and so became closely connected with the clerk of the pipe. Before the end of the 14th century these three offices had already crystallized into separate departments.

In the meantime the increasing length and variety of accounts, as well as the growth of judicial business, had led to various efforts at reform. As early as 22 Henry II. it became necessary to remove from the great roll the debts which it seemed hopeless to levy, and further ordinances to the same end were made by statute in 54 Henry III. and in 12 Edward I. By this last a special "examinal roll" was established in which the "desperate debts" were recorded, in order that the sheriff might be reminded of them yearly without their overloading the great roll. But the largest accession of financial business arose from the "foreign accounts," that is to say, the accounts of national services, which did not naturally form part of the account of any county. These did not in the reign of Henry II. form a part of the exchequer business. Such expenses as appear on the pipe roll were paid by the sheriffs, or by the bailiffs of "honours"; payments out of the treasury itself would only appear on the receipt and issue rolls, and the "spending departments" probably drew their supplies from the camera curie, and not directly from the exchequer. In the course of the 13th century the exchequer gradually acquired partial control of these national accounts. Even in 18 Henry II. there is an account for the mint of England, and soon the mint, the wardrobe and the escheat rolls. The undated statute of the exchequer (probably about 1276) provides for escheatrs, the earldom of Chester, the Channel Islands, the customs and the wardrobe. During the reign of Edward I., the wardrobe account became unmanageable, since it not only financed the household, army, navy and diplomatic service, but raised money on the customs independently of the exchequer. The reform of 1323-1326, due to Walter de Stapledon, in remedying this state of things, greatly increased the number of "foreign accounts" by making the great wardrobe (the storekeeping department), the hutler, purveyors, keepers of horses or of the stud, the clerk of the "hamper" of the chancery (who took the fees for the great seal), and the various ambassadors, directly accountable to the exchequer. At the same time the sheriffs' accounts were expedited by the further simplification of the great roll, and by appointing a special officer, the "foreign apposer," to take the account of the "green wax," or estreats, so that two accounts could go on at once. Another haron (the 3rd or curator haron) was appointed, and the whole business of foreign accounts was transferred to a separate building where one haron and certain auditors spent their whole time in settling the balances due on the accounts already mentioned, as well as those of castles, &c., not let to farm, Wales, Gascony, Ireland, aids (clerical and lay), temporalities of vacant hithorship, abbeys, priories and dignities, mines of silver and tin, tinage and so forth. These balances were accounted for in the exchequer itself, and entered on the pipe roll, but the preliminary accounts were filed by the king's remembrancer, and enrolled separately by the treasurer's remembrancer as a supplement to the pipe roll.

The most important change, about the end of the 15th century, was the gradual substitution of special auditors appointed by the crown, known as the auditors of the prests (the successors of the commissioners for auditing public accounts), for the auditors of the exchequer. Accounts when passed by them were presented in duplicate and "declared" before the treasurer, under-treasurer and chancellor. Of the two copies, one, on paper, was retained by the auditors, the other, on parchment, was successively enrolled by the king's and lord treasurer's remembrancers, and finally by the clerk of the pipe, to secure the levying of any "remanets" or "supers" by process of the exchequer.

Besides the two great difficulties of the postponement of financial to legal business, and of preventing the sheriffs from exacting the same debt twice, the exchequer was, as has been seen, hampered in its functions by the interference of other departments in financial matters. Its own branches even acquired a certain independence. The exchequer of the Jews, which came to an end in 18 Edward I., was such a branch. In 27 Henry VIII. the court of augmentations was established to deal with forfeited lands of monasteries. This was followed in 32 & 33 Henry VIII. by the courts of first-fruits and tenths and of general surveyors. These were reabsorbed by the exchequer in 1 Mary, but remained as separate departments within it. But the development of the treasury, which succeeded to the functions of the camera curie or the king's chamber, ultimately reduced the administrative functions of the exchequer to unimportance, and the audit office took over its duties with regard to public accounts. So that when the statute of 3 & 4 William IV. cap. 99, removed the sheriff's accounts also from its competence, and brought to an end the series of pipe rolls which begins in 1330, the ancient exchequer may he said to have come to an end.

In 1854 an act was passed abolishing the old offices of the exchequer, and creating a new exchequer under a comptroller-general, the detailed business of payments formerly made at the exchequer being transferred to the paymaster-general, whose office was further enlarged in 1836 and 1848. And in 1866, as the result of a select committee reporting unfavourably on the system of exchequer control as established in 1834, the exchequer was abolished altogether as a distinct department of state, and a new exchequer and audit department was established.

The ancient term exchequer now survives mainly as the official title of the national banking account of the United Kingdom. This central account is commonly called the exchequer, and its statutory title is "His Majesty's Exchequer." It may also be described with statutory authority as "The Account of the Consolidated Fund of Great Britain and Ireland." This account is, in fact, divided between the Banks of England and Ireland. At the head office of each of these institutions receipts are accepted and payments made on account of the exchequer; but in published documents the two accounts are
EXCHEQUER

consolidated into one, the balances only at the two banks being shown separately.

Operations affecting the exchequer are regulated by the Exchequer and Audit Departments Act 1866. Section 10 prescribes that the gross revenue of the United Kingdom (less drawbacks and repayments, which are not really revenue) is payable, and must sooner or later be paid into the exchequer. Section 11 directs that payments should be made from the fund so formed to meet the current requirements of spending departments. Sections 13, 14, 15 lay down the conditions under which money can be drawn from the exchequer. Drafts on the exchequer require the approval of an officer independent of the executive government, the comptroller and auditor-general. But the description of the formal procedure required by statute cannot adequately express the actual working of the system, or the part it plays in the national finance. The simplicity of the system laid down by the act of 1866 has been disturbed by the diversion of certain branches or portions of revenue from the exchequer to "Local Taxation Accounts," under a system initiated by the Local Government Act 1888, and much extended since.

While the exchequer is, as already stated, the central account, it is not directly in contact with the details of either revenue or expenditure. As regards revenue, the produce of taxes and other sources of income passes, in the first instance, into the separate accounts of the respective receiving departments—mainly, of course, those of the customs, inland revenue and post office. A not inconsiderable portion is received in the provinces, and remitted to London or Dublin by bills or otherwise, and the ultimate transfers to the exchequer are made (in round sums) from the accounts of the receiving departments in London or in Dublin. Thus, there are always considerable sums due to the exchequer by revenue departments; on the other hand, as floating balances are (for the sake of economy) used temporarily for expenses, there are generally amounts due to the exchequer to the receiving departments; such cross claims are adjusted periodically, generally once a month. The finance accounts of the United Kingdom show the gross amounts due to the exchequer from the departments, and likewise the amounts payable out of the gross revenue in priority to the claim of the exchequer. On the expenditure side a similar system prevails. No detailed payments are made direct from the exchequer, but round sums are issued from it to subsidiary accounts, from which the actual drafts for the public services are met. For instance, the interest due to the national debt is paid by the Bank of England from a separate account fed by transfers of round sums from the exchequer as required. Similarly, payments for army, navy and most civil services are met by the paymaster-general out of an account of his own, fed by daily transfers from the exchequer.

This system has two noticeable effects. Firstly, it secures the simplicity and finality of the exchequer accounts, and therefore of all ordinary statements of national finance. Every evening the chancellor of the exchequer can tell his position so far as the exchequer is concerned; on the first day of every quarter the press is able to comment on the national income and expenditure up to the evening before. The annual account is closed on the evening of the 31st of March, and there can be no reopening of the budget of a past year such as may occur under other financial systems. The second effect of the system is to introduce a certain artificiality into the financial statements. Actual facts cannot be reduced to the simplicity of exchequer figures; there is always (as already explained) revenue received by government which has not yet reached the exchequer; and there must always be a considerable outstanding liability in the form of cheques issued but not yet cashed. The suggested criticism is, however, met if it can be shown that, on the whole, the differences between the true revenue and the exchequer receipts, or between the true (or audited) expenditure and the exchequer issues, are not, taking one year with another, relatively considerable. The following figures (ooo's omitted) illustrate this point:

**Expenditure.**

The third column in the above shows the price which has to be paid (in the form of discrepancies between facts and figures) for the simplicity secured to statements and records of the national finance by the present system embodied in the term exchequer. Probably few will think the price too high in consideration of the advantages secured.

The principal official who derives a title from the exchequer in its living sense is, of course, the chancellor of the exchequer. He is the person named second in the patent appointing commissions for executing the office of lord high treasurer of Great Britain and Ireland; but he is appointed chancellor of the exchequer for Great Britain and chancellor of the exchequer for Ireland by two additional patents. Although, in fact, the finance minister of the United Kingdom, he has no statutory power over the exchequer apart from his position as second commissioner of the treasury; but in virtue of his office he is by statute master of the mint, senior commissioner for the reduction of the national debt, a trustee of the British Museum, an ecclesiastical commissioner, a member of the board of agriculture, a commissioner of public works and buildings, local government, and education, a commissioner for regulating the offices of the House of Commons, and has certain functions connected with the office of the secretary of state for India. The only other exchequer officer requiring mention is the
compromiser and auditor-general, whose functions as comptroller-general of the exchequer have been already described.

The ancient name of the national banking account has been attached to two of the forms of unfunded national debt. Exchequer bills, which date from the reign of William and Mary (though they took the place of the tallies, previously used for the same purpose), became extinct in 1897, but exchequer bonds (first issued by Mr Gladstone in 1832) still possess a practical importance. An exchequer bond is a promise by government to pay a specified sum after a specified period, generally three or five years, and meanwhile to pay interest half-yearly at a specified rate on that sum. Government possesses no general power to issue exchequer bonds; such power is only conferred by a special act, and for specified purposes; but when the power has been created, exchequer bonds issued in pursuance of it are governed by the same statutory provisions contained in the Exchequer and Bonds Act 1866, and amending acts. These acts create machinery for the issue of exchequer bonds and for the payment of interest thereon, and protect them against forgery.

Some traces may be mentioned of the ancient uses of the name exchequer which still remain. The chancellor of the exchequer still presides at the ceremony of "pricking the list of sheriffs," which is a quasi-judicial function; and on that occasion he wears a robe of black silk with gold embroidery, which suggests a judicial costume. In England the last judge who was styled a baron of the exchequer (Baron Pollock) in the usual Scottish fashion was the Baroness of the exchequer when the court of session was transferred to the court of session in 1836, but the same act requires the appointment of one of the judges as "lord ordinary in exchequer causes," which office still exists. In Ireland Lord Chief Baron Palles was the last to retain the old title. A street near Dublin Castle is called Exchequer Street, recalling the separate Irish exchequer, which ceased in 1817. The old term also survives in the full title of the treasury representative in Scotland, which is "The King's and the Lord Treasurer's Remembrancer in Exchequer," while his office in the historic Parliament Square is styled "Exchequer Chamber." (S. E. S. R.)

BIBLIOGRAPHY.—For the early exchequer Thomas Maddox's History and Antiquities of the Exchequer (London, 1717) remains the standard authority, and in it the Dialogus de Secentario of Richard the Treasurer (1179) was first printed (edited since by A. Hughes, C. G. Crump and C. Johnson, Oxford, 1902). The publications of the Pipe Roll Society (London, 1884 et seq.), the Pipe Rolls and Chancellor's Records by the Record Commission (London, 1833 and 1844), and H. Hall's edition of the Register Roll of Simon de Lison 31 Henry II. (London, 1899) should also be consulted. A popular account is in H. Hall's Court Life under the Plantagenets (London, 1906), and more freely in W. G. Rossetti's Exchequer and Commissary (London, 1903). For the 13th and 14th centuries H. Hall's edition of the Red Book of the Exchequer (London, Rolls Series, 1890) is essential, as also the Public Record Office List of Foreign Accounts (London, 1889). The publications from the Muniments, List and Index of Declarated Accounts (London, 1893), and from such books as Sir T. Fanshawe's Practice of the Exchequer Court, written about A.D. 1600 (London, 1658); Christopher Vernon's The Exchequer Opening (London, 1661), or Sir Geoffrey Gilbert's Treatise on the Court of Exchequer (London, 1758), as well as from the statutes abolishing various offices in the exchequer. H. Hall's Antiquities of the Exchequer (London, 1891) gives many interesting details of various dates. For the Scottish exchequer The Exchequer Rolls of Scotland (Edinburgh, 1878 et seq.) should be consulted, while Gilbert's book noted above gives some details on that of Ireland. See also Appendix 13 to the great account of Public Income and Expenditure from 1888 to 1899, in three volumes, prepared for parliament by H. W. Chisholm (1896); and for sidelights on the working of the office from 1825 to 1866 the reminiscences of the same author (the last chief clerk of the exchequer) in Temple Bar (January to April 1891).

EXCISE (derived through the Dutch, excis of occis, possibly from Late Lat. accessare,—ad, to, and, census, tax; the word owes something to a confusion with excisum, cut out), a term now well known in public finance, signifying a duty charged on goods passing into the process of their manufacture, or before their sale to the householder, and exercising to the commonwealth somewhat advanced in manufactures, markets and general riches; and it interferes so directly with the industry and liberty of the subject that it has seldom been introduced save in some supreme financial exigency, and has as seldom been borne, even after long usage, with less than the ordinary impatience of taxation. Yet excise duties can boast a respectable antiquity, having a distinct parallel in the dictum "of the Romans. But the Roman excise was mild compared with that of modern nations, having never been more than centesima, or 1% of the value; and it was much shorter lived than the modern examples, having been first imposed by Augustus, reduced for a time one-half by Tiberius, and finally abolished by Caligula, A.D. 38, so that the Roman excise cannot have had a duration of much more than a century. Its remission must have been deemed a great boon in the marts of Rome, since it was commemorated by the Roman with a small brass plate, with the legend Remissis Centesimis, specimens of which are still to be found in collections.

The history of this branch of revenue in the United Kingdom dates from the period of the civil wars, when the republican government, following the example of Holland, established, as a means of defraying the heavy expenditure of the time, various duties of excise, which the royalists when restored to power found too convenient or too necessary to be abandoned, notwithstanding their origin and their general unpopularity. On the contrary, they were destined to be steadily increased both in number and in amount. It is curious that the first commodities selected for excise were those on which the branch of taxation, after great extension, had again in the period of reform and free trade been in a manner permanently reduced, viz. malt liquors, and such kindred beverages as cider perry and spruce beer. The other excise duties remaining are chiefly in the form of licences, such as to kill game and to use and carry guns, to sell gold and silver plate, to pursue the business of appraisers or auctioneers, hawkers or pedlars, pawnbrokers or patent-medicine vendors, to manufacture tobacco or snuff, to deal in sweets or in foreign wines, to make vinegar, to roast malt, or to use a still in chemistry or otherwise. It may be presumed that the policy of the licentiates was at first not much to collect revenue, though in the aggregate they yielded a large sum, as to guard the main sources of excise, and to place certain classes of dealers, by registration and an annual payment to the exchequer, under a direct legal responsibility.

The excise system of the United Kingdom as now pruned and reformed, however, while still the most prolific of all the sources of revenue, is simple in process, and is contentedly borne as compared with what was the case in the 18th, and the beginning of the 19th century. The wars with Bonaparte strained the government resources, and excise duties were multiplied and increased in every practicable form. Bricks, candles, calico prints, glass, hides and skins, leather, paper, salt, soap, and other commodities of home manufacture and consumption were placed, with their respective industries, under excise surveillance and fine. When the duties could no longer be increased in number, they were raised in rate. The duty on British spirits, which had begun at a few pence per gallon in 1660, rose step by step to 11s. 8d. per gallon in 1820; and the duty on salt was augmented to three or fourfold its value.

The old unpopularity of excise, though now somewhat out of date, must have had its effects. It breaks out in English literature, from songs and pasquilles to grave political essays and legal commentaries. Blackstone, in quoting the declaration of parliament in 1649 that "excise is the most easy and indifferent levy that can be laid upon the people," adds on his own authority that "from its first original to the present time its very name has been odious to the people of England" (book i. cap. 8, tenth edition, 1780); while the definition of "excise" gravely inserted by Dr Johnson in the Dictionary, at the imminent risk of subjecting the eminent author to a prosecution for libel—viz. "a hateful tax levied upon commodities, and adjudged not by the common judges of property, but wretches hired by those whom excise is paid"—is hardly to be implied.

The duties of excise in the United Kingdom were, until the passing of the Finance Act 1908, under the control of the
commissions of inland revenue; they are now under the control of the commissioners of customs; the amount raised, apart from changes in the rate, shows a fairly constant tendency to increase, and is usually regarded as one of the best tests of the prosperity of the country in the classes.

The spirit duty is levied according to the quantity of "proof spirit" contained in the product of distillation, and the charge is taken at three different points in the process of manufacture, the trader being liable for the result of the highest of the three calculations. What is known as "proof spirit" is obtained by mixing nearly equal weights of pure alcohol and water, the quantity of pure alcohol being in bulk about 57% of the whole. Owing to the high rate of duty as compared with the volume and intrinsic value of the spirits, the whole process of manufacture is carried on under the close supervision of revenue officials. All the vessels used are measured by them and are secured with revenue locks; the premises are under constant survey; and notice has to be given by the distiller of the materials used and of the several stages of his operations. Though the charge for duty is raised at the time when the process of distillation is completed, the duty is not actually paid until the spirits are required for consumption. In the meanwhile they may be retained in an approved "warehouse," which is also subject to close supervision.

The beer duty dates from 1880, in which year it was substituted for the duty on malt. The specific gravity of the worts depends chiefly on the amount of sugar which they contain, and is ascertained by the saccharometer. Excise licences may be divided into—(a) licences for the sale or manufacture of excisable liquors, (b) licences for other trades, such as tobacco dealers or manufacturers, auctioneers, pawn-brokers, &c.; (c) licences for male servants, carriages, motors and armorial bearings, and (d) gun, game and dog licences. Nearly the whole of the licence duties is paid over to the local taxation account.

The railway passenger duty, which was made an excise duty by the Railway Passenger Duty Act 1847, applies only to Great Britain. It is levied on all passenger fares exceeding 10 per mile, the rate being 4% on urban and 5% on other traffic.

The other items which go to make up the excise revenue are the charges on deliveries from bonded warehouses, and the duties on coffee mixture labels and on chicory.

For more detailed information reference should be made to Highmore's Excise Laws, and the annual reports of the commissioners of inland revenue, especially those issued in 1870 and 1885. See also Taxation; English Finance.

EXCOMMUNICATION (Lat. ex, out of; away from; communis, common), the judicial exclusion of offenders from the rights and privileges of the religious community to which they belong. The history of the practice of excommunication may be traced through (1) pagan analogues, (2) Hebrew custom, (3) primitive Christian practice, (4) medieval and monastic usage, (5) modern survivals in existing Christian churches.

1. Among pagan analogues are the Gr. xeriónomon egerónou (Demosth. 506, 14), the exclusion of an offender from purification with holy water. This exclusion was enforced in the case of persons whose hands were defiled with bloodshed. Its consequances are described Aesch. Choeph. 283, Eum. 624 f., Soph. Oed. Tyr. 236 ff. The Roman exorcistio and diris deovio was a solemn pronouncement of a religious curse by priests, intended to call down the divine wrath upon enemies, and to devote them to destruction by powers human and divine. The Druids claimed the dread power of excluding offenders from sacrifice (Caes. B.G. vi. 13). Primitive Semitic customs recognize that when persons are laid under a ban or taboo (kerem) restrictions are imposed on contact with them, and that the breach of these involves supernatural dangers. Impious sinners, or enemies of the community and its god, might be devoted to utter destruction.

2. Hebrew Custom.—In a theocracy excommunication is necessarily both a civil and a religious penalty. The word used in the New Testament to describe an excommunicated person, ἀσαρνομένος (1 Cor. xvi. 22, Gal. i. 8-9, Rom. ix. 3), is the Septuagint rendering of the Hebrew herem. The word means "set apart" (cf. harem), and does not distinguish originally between things set apart because devoted to God and things devoted to destruction. Lev. xxvii. 33-34 defines the law for things which, "devoted" things, are to be destroyed, and things that a man shall devote unto the Lord, of all that he hath, whether of man or beast, or of the field of his possession, shall be sold or redeemed. None devoted shall be ransomed, he shall surely be put to death." As in Greece and Rome whole cities or nations might be devoted to destruction by pronounce-ment of a ban (Numbers xxi. 2, 3, Deut. ii. 34, iii. 6, vii. 2). Occasionally Israelites as well as aliens fall under the curse (Judg. xxi. 11). A milder form of penalty was the temporary separation or seclusion (niddah) prescribed for ceremonial uncleanness. This was the ordinary form of religious discipline. In the time of Ezra the Jewish "magistrates and judges" among their ecclesiastico-civil functions have the right of pronouncing sentence whether it be unto death, or to "rooting out," or to confiscation of goods, or to imprisonment (Ezra x. 26). There is also a lighter form of excommunication which "devotes" the goods of an offender, but only separates him from the congregation. Both major and minor kinds of excommunication are recognized by the Talmud. The lesser (niddah) involved exclusion from the synagogue for thirty days, and other penalties, and might be renewed if the offender remained impenitent. The major excommunication (kerem) excluded from the Temple as well as from the synagogue and from all association with the faithful. Spinoza was excommunicated (July 16, 1656) for contempt of the law. Seldom (De jure nat. et gen., iv. 7) gives the text of the curse pronounced on the culprit. The Exemplar Humanae Vitae of Uriel d'Acosta also deserves reference. The practice of the Jewish courts in New Testament times may be inferred from certain passages in the Gospels. Luke vi. 22, John ix. 22, xii. 42 indicate that exclusion from the synagogue was a recognized penalty, and that it was probably inflicted on those who confessed Jesus as the Christ. John xvi. 2 ("Whosoever killeth you," &c.) may be the point to the power of inflicting the major penalty. The Talmud itself says that the judgement of capital cases was taken away from Israel forty years before the destruction of the Temple. "Forty" is probably a round number without historical value, but the circumstance recorded by this tradition and confirmed by the evangelist's account of the trial of Jesus is historical, and is to be regarded as one of several restrictions imposed on the Jewish courts in the time of the Roman procurators.

3. Primitive Christian Practice.—The use of excommunication as a form of Christian discipline is based on the precept of Christ and on apostolic practice. The general principles which govern the public exclusion of members of the religious community may be gathered from the New Testament writings. Acts v. 14 prescribes a threefold admonition, first privately, then in the presence of witnesses (cf. Titus iii. 10), then before the church. This is a graded procedure as in the Jewish synagogue and makes exclusion a last resort. Nothing is said as to the nature and effects of excommunication. The tone of the passage when compared with the disciplinary methods of the synagogue indicates that its purpose was to introduce elements of reason and moral suasion in place of stern methods. Its object is rather the protection of the church than the punishment of the sinner. The offender is only treated as a reproach and public when the purity and safety of the church demand it. In the locus classicus on this subject (1 Cor. v. 5) Paul refers to a formal meeting of the Corinthian church at which the incestuous person is "delivered unto Satan for the destruction of the flesh that the spirit may be saved in the day of the Lord Jesus." These are mysterious words implying (1) a formal ecclesiastical censure, (2) a physical penalty, (3) the hope of a spiritual result. The form of penalty which would meet these conditions is not explained. There is a reference in 2 Cor. ii. 6-11 to a case of discipline which may or may not be the same. If it be the same it indicates that the excommunication had not been final; the offender had been received back. If it be not the same it shows the Christian
EXCOMMUNICATION

church exercising discipline independently of apostolic advice. Up to this point there is no established formal practice. 1 Tim. 1. 20 ("Hymenaeus and Alexander whom I delivered unto Satan that they might not taught not to blaspheme") seems to refer to an excommunication, but it does not appear whether the apostle had acted as representing a case not restoration to clothing to explain the exact reasons, should the limits of the deliverance to Satan. 1 Cor. xvi. 22, Gal. i. 8, 9, Rom. ix. 3 refer to the practice of regarding a person as anathema. Taking these passages as a whole they seem to point to an exclusion from church fellowship rather than to a final cutting off from the hope of salvation. In the pastoral letters there is already a formal and recognized method of procedure in cases of church discipline. 1 Tim. v. 19, 20 requires two or three witnesses in the case of an accusation against an elder, and a public reproof. Tit. iii. 20 recognises a fictitious spirit as a reason for excommunication after two admonitions (cf. Tim. vi. and 2 John v. 10). In 3 John v. 10 Diotrephes appears to have secured an excommunication by the action of a party in the church. It is clear from these illustrations that within the New Testament there is development from spontaneous towards strictly regulated methods; also that the use of excommunication is chiefly for disciplinary and protective rather than punitive purposes. A process which is intended to produce penitence and ultimate restoration cannot at the same time contemplate handing the offender over to eternal punishment.

4. Excommunication, in Monastic Usage.—The writings of the church Fathers give sufficient evidence that two degrees of excommunication, the ἄφοροςμός and the ἄφοροςμός παντελής, as they were generally called, were in use during, or at least soon after, the apostolic age. The former, which involved exclusion from participation in the eucharistic service and from the eucharist itself, though not from the so-called "service of the catechumens," was the usual punishment of comparatively light offences; the latter, which was the penalty for graver scandals, involved "exclusion from all church privileges,"—a vague expression which has sometimes been interpreted as meaning total exclusion from the very precincts of the church building (inter hiemantes orare) and from the favour of God (Bingham, Antiquities of Christian Church, xvi. 2. 16). For some sins, such as adultery, the sentence of excommunication was in the 2nd century regarded as παντελής in the sense of being irrevocable. Difference of opinion as to the absolutely "irremissible" character of mortal sins led to the important controversy associated with the names of Zephyrinus, Tertullian, Calistus, Hippolytus, Cyprian and Novatian, in which the stricter and more montanist party held that for those who had been guilty of such sins as theft, fraud, denial of the faith, the consequences should be of a kind that should cut them off from all church fellowship even in the hour of death. On this point the provincial synods of Illyricus (Elvira) in 305 and of Ancyræ in 315 subsequently came to conflicting decisions, the council of Elvira forbidding the reception of offenders into communion during life, and the council of Ancyræ fixing a limit to the penalty in the same cases. But the excommunication was on all hands regarded as being "medicina" in its character. It is noteworthy that the word ἄφοροςμος had fallen into disuse about the beginning of the 4th century, and that, throughout the same period, the judicial use of the phrase παντελεόντος τῷ ἑαυτῷ can be found. A new chapter in the history of the church censure may be said to have begun with the publication of those imperial edicts against heresy, the first of which, De summo trinitate et fide catholica, dates from 380. Till then exclusion from church privileges had been a spiritual discipline merely; thenceforward it was to expose a man to serious temporal risks. Excommunication still continued to be occasionally used in the spirit of genuine Christian fidelity, as by Ambrose in the case of Theodosius himself (396); but the temptation to wield it as an instrument of secular tyranny too often proved to be irresistible. The church fell back on carnal weapons in her warfare and invoked the secular powers to uphold the ecclesiastical. In the formula used by Synesius (410) which is to be found in Bingham's Antiquities, we already find the attention of magistrates specially called to the censured person. The history of the next thousand years shows that the magistrates were seldom slow to respond to the appeal. Even the harshest survey of that long and interesting period enables the student to notice a marked development in the theory and practice of excommunication. One or two points may be especially noted in this connexion. Reformation and the quality of the church life was sacrificed to the quantity of its adherents, the original character of excommunication was lost. The power of excommunication was transferred from the community to the bishop, and was liable to abuse from personal motives: Gregory the Great rehuses a bishop for using for private ends power conferred for the public good (Epist. ii. 34). Excommunication became a common penalty applied in numberless cases (see the Penitential of Archbishop Theodosius: Haddan and Stubbs, Councils and Documents, iii. 1737), and was invested with superstitious terrors. (2) While it had been as an undoubted principle by the ancient church that this sentence could only be passed on living individuals whose fault had been distinctly stated and fully proved, we find the medieval church on the one hand sanctioning the practice of excommunication of the dead (Morinus, De poenit. x. c. 9), and, on the other hand, by means of the papal interdict, excluding whole countries and kingdoms at once from the means of grace. The earliest well-authenticated instance of such an interdict is that which was passed (998) by Pope Gregory V. on France, in consequence of the death of the queen. Further instances are those laid respectively on Germany in 1012 by Gregory VII. (Hildebrand), on England in 1208 by Innocent III., on Rome itself in 1155 by Adrian IV. (3) While in the ancient church the language used in excommunicating had been carefully measured, we find an amazing recklessness in the phraseology employed by the medieval clergy. The curse of Erasmus or Arnulphus of Rochester (c. 1100), often quoted by students of English literature, is a very fair specimen of that class of composition. With it may be compared the formula transcribed by Dr Burton in his History of Scotland (iii. 317 ff.). To the spoken word was added the language of symbol. By means of lighted candles violently dashed to the ground and extinguished the faithful were graphically taught the meaning of the greater excommunication—though in a somewhat misleading way, for it is a fundamental principle of the canon law that disciplina est, excommunicatio, non eradicatio. The first instance, however, of excommunication by "hell, hook and candle" is comparatively late (c. 1190).

5. Modern Survivals in Existing Christian Churches.—At the Reformation the necessity for church discipline did not cease to be felt; but the old forms were abandoned. The whole system of ecclesiastical church discipline has passed through a period of some confusion. In some instances the old episcopal power passed more or less into the hands of the civil magistrate (a state of matters which was highly approved by Erastus and his followers), in other cases it was conceded to the presbyterial courts. In the Anglican Church the bishops (subject to appeal to the sovereign) have the right of excommunicating, and their sentence, if sustained, may in certain cases carry with it civil-consequences. But this right is in practice never exercised. In the law of England sentence of excommunication, upon being properly certified by the bishop, was followed by the writ de excommunicato capiendo for the arrest of the offender. The statute 5 Eliz. c. 24 provided for the better execution of this writ. By the 53 Geo. III. c. 127 (which does not, however, extend to Ireland) it was enacted that "excommunication, together with all proceedings following thereupon, shall in all cases, save those hereafter to be specified, be discontinued." Disobedience to or contumacy of the ecclesiastical courts is to be punished by a new writ, de contumace capiendo, to follow on the certificate of the judge that the defendant is contumacious and in contempt. Sect. 2 provides that nothing shall prevent "any ecclesiastical court from pronouncing or declaring persons to be excommunicate on definite sentences pronounced as spiritual censures for offences of ecclesiastical cognizance." No persons so excommunicated
shall incur any civil penalty or incapacity whatever, save such sentence of imprisonment, not exceeding six months, as the court shall direct and certify to the king in chancery.

In the churches which consciously shaped their polity at or after the Reformation the principle of excommunication is preserved in the practice of church discipline. Calvin devotes a chapter in the Institutes (bk. iv. chap. xii.) to the "Discipline of the Church; its Principal Use in Censure and Excommunication." The three ends proposed by the church in such discipline are there stated to be, (1) that those who lead scandalous lives may not to the dishonour of God be numbered among Christians, seeing that the church is the body of Christ; (2) that the good may not be corrupted by constant association with the wicked; (3) that those who are censured or excommunicated, confounded with shame, may be led to repentance. He differentiates decisively between excommunication and anathema. "When Christ promises that what his ministers bind on earth shall be bound in heaven, he limits the power of binding to the censure of the church; by which those who are excommunicated are not cast into eternal ruin and condemnation, but by having their life and conduct condemned are also certified of their final condemnation unless they repent. For excommunication differs from anathema: anathema which ought to be very rarely, or never, resorted to, in precluding all pardon, executes a person, and deverts him to eternal perdition: whereas excommunication rather censures and punishes his conduct. Yet in such a manner by warning him of his future condemnation it recalls him to salvation" (Inst. bk. iv. chap. xii. 10). The Reformed churches in England and America accepted the distinction between public and private offences. The usual provision is that public offences are to be dealt with according to the rule in Matt. v. 23-24, xviii. 15-17; public offences are to be dealt with according to the rule in 1 Cor. v. 3-5, 13. The public expulsion or suspension of the offender is necessary for the good repute of the church, and its influence over the faithful members. The expelled member may be readmitted on showing the fruits of repentance.

In Scotland three degrees of church censure are recognized—admonition, suspension from sealing ordinances (which may be called temporary excommunication), and excommunication properly so-called. Intimation of the last-named censure may occasionally (but very rarely) be given by authority of a presbytery in a public and solemn manner, according to the following formula:—"Whereas thou hast been by sufficient proof convicted (here mention the sin) and after due admonition and prayer remainest obstinate without any evidence or sign of true repentance: Therefore in the name of the Lord Jesus Christ, and before this congregation, I pronounce and declare thee N. excommunicated, shut out from the communion of the faithful, debar thee from privileges, and deliver thee unto Satan for the destruction of thy flesh, that thy spirit may be saved in the day of the Lord Jesus." This is called the greater excommunication. The congregation thereafter warned to shun all unnecessary converse with the excommunicate (see Form of Process, c. 8). Formerly excommunicated persons were deprived of feudal rights in Scotland; but in 1690 all acts enjoining civil pains upon sentences of excommunication were finally repealed (Burton's History, vii. 435).

The question whether the power of excommunication rests in the church or in the clergy has been an important one in the history of English and American churches. Hooker lays down (Surrey, pt. 3, pp. 33-46) four necessary conditions for the execution of a sentence involving church censure and excommunication: (1) that the sentence be laid open, and publicly and generally presented to the consideration of the congregation. (2) The elders are to go before the congregation in laying open the rule so far as reacheth any particular now to be considered, and to express their judgment and determination thereof, so far as appertaineth to themselves. (3) Unless the people be able to convince them of errors and mistakes in their sentence, they are bound to join their judgment with theirs to the compleating of the sentence. (4) The sentence thus compleatly issued is to be solemnly passed and pronounced upon the delinquent by the ruling Elder whether it be of censure or excommunication." In this passage it is clear that the effective power of discipline is regarded as being wholly in the power of the individual church or congregation. Hooker expressly denies the power of synods to excommunicate: "that there should be Synods, which have potestatem juridicam is nowhere proved in Scripture because it is not a truth" (Surrey, pt. 4, pp. 48, 49).

The confession of faith issued by the London-Amsterdam church (the original of the Pilgrim Fathers' churches) in 1596 declares that the Christian congregation having power to elect its minister has also power to excommunicate him if the case so require (Walker, Creeds and Platforms of Congregationalism, p. 66). In 1603 the document known as "Points of Difference" (i.e. from the established Anglicanism) submitted to James I. sets forth: "That all particular Churches ought to be so constituted as, having their own peculiar Officers, the whole body of every Church may meet together in one place, and jointly perform their duties to God and one towards another. And that the doubts of admission and excommunication be in the same manner executed, for sinne, convicted, and obstinately stood in. This power also to be in the body of the Church whereof the parties so offending and persisting are members." The Cambridge Platform of 1648 by which the New England churches defined their practice, devotes ch. xiv. to "excommunication and other censures." It follows in the main the line of Hooker and Calvin, but adds (§6) an important definition: "Excommunication being a spiritual punishment it doth not prejudice the excommunicate in, nor deprive him of his civil rights, thence toucheth not princes, and other magistrates, in point of their civil dignity or authority. And, the excommunicate being but as a publican and a heathen, heathen being lawfully permitted to come to hear the word in church assemblies; we acknowledge therefore the like liberty of hearing the word, may be permitted to persons excommunicate, that is permitted unto heathen. And because wee are not without hope of his recovery, wee are not to account him as an enemy but to admonish him as a brother." The Savoy Declaration of 1658 defines the theory and practice of the older English Nonconformist churches in the section on the "Institution of Churches and the Order appointed in them by Jesus Christ" (see below). "The Censures so appointed by Christ, are Admonition and Excommunication; and whereas some offences are or may be known only to some, it is appointed by Christ, that those to whom they are so known, do first admonish the offender in private: in publicque offences where any sin, before all; or in case of non-amendment upon private admonition, the offence being related to the Church, and the offender not manifesting his repentance, he is to be duly admonished in the Name of Christ by the whole Church, by the Ministry of the Elders of the Church, and if this Censure prevail not for his repentance, then he is to be cast out by Excommunication with the consent of the Church."

In contemporary English Free Churches the purity of the church is commonly secured by the removal of persons unsuitable for membership from the church books by a vote of the responsible authority.

(D. Mn.)

Excretion (Lat. ex, out of, cernere, creatum, to separate), in plant and animal physiology, the separation from an organ of some substance, also the substance separated. The term usually refers to the separation of waste or harmful products, as distinguished from "secretion," which refers to products that play a useful or necessary part in the functions of the organism.

Execution (from Lat. ex-seguer, executus, follow or carry out), the carrying into effect of anything, whether a rite, a piece of music, an office, &c.; and so sometimes involving a notion of skill in the performance. Technically, the word is used in law in the execution of a deed (its formal signing and sealing), an execution (see below) by the sheriff's officers under a "writ of execution" (the enforcement of a judgment on a debtor's goods); and execution of death has been shortened to the one word to denote Capital Punishment (q.v.).

Civl Execution may be defined as the process by which the
judgments or orders of courts of law are made effectual. In Roman law the earliest mode of execution was the seizure, legalized by the actio per manus injectionem, of the debtor as a slave of the creditor. During the later Republic, imprisonment took the place of slavery. Under the régime of the actio for money due, the creditor had to decide the issue being raised by his finding a substitute (vindex) to conduct the case for him. By the time of Gaius (iv. 25) the actio per manus injectionem had been superseded by the actio judicati, the object of which was to enable the creditor to take payment of the debt or compel the debtor to find security (pignus in causa judicati captum: Cautio judicatum solvi), and in A.D. 320 Constantine abolished imprisonment for debt, unless the debtor were contumacious. The time allowed for payment of a judgment debt was by the XII. Tables 30 days; it was afterwards extended to two months, and ultimately, by Justinian, to four months. The modes of execution are much the same as in the case of bankruptcy either against the will of the bankrupt (missio in bona) or on the application of the bankrupt (cessio bonorum; and see BANKRUPTCY). Lastly, in the time of Antoninus Pius, judgment debts were directly enforced by the seizure and sale of the debtor's property. Slaves, oxen and implements of husbandry were privileged; and movable property was to be exhausted before recourse was had to land (see Hunter, Roman Law, 4th ed. pp. 1039 et seq., Sohn, Inst. Rom. Law, 2nd ed. pp. 302-303).

Great Britain.—The English law of execution is very complicated; there is only a statement of the principal processes here be attempted.

High Court.—Fieri Facias. A judgment for the recovery of money or costs is enforced, as a rule, by writ of fieri facias addressed to the sheriff, and directing him to cause to be made (fieri facias) of the goods and chattels of the debtor a levy of a sum sufficient to satisfy the judgment and costs, which carry interest at 4% per annum. The sheriff in making the levy is entitled to all the proceeds; the property of the debtor, is what is popularly known as "the putting-in" of an execution. The seizure should be carried out with all possible dispatch. The sheriff or his officer must not break open the debtor's house in effecting a seizure, for "a man's house is his castle" (Semayne's Case [1604], 5 Coke Rep. 91); but this principle applies only to a dwelling-house, and a barn or outhouse unconnected with the dwelling-house may be broken into. The sheriff on receipt of the writ endorses it on the day, hour, month and year when he received it; and the writ binds the debtor's goods as at the date of its receipt, except as regards goods sold before seizure in market or at pleasure, or purchased for the value of the goods before actual seizure (Sale of Goods Act 1893, s. 26, which supersedes s. 16 of the Statute of Frauds and s. 1 of the Mercantile Law Amendment Act 1896). This rule is limited to goods, and does not apply to the chattels, either as to the time of their seizure, or as to the nature of the seizure, in which the goods are held when the writ till seized under it (Johnson v. Pickering, Oct. 14, 1907, C.A.).

The mere seizure of the goods, however, although, subject to such exceptions as those just stated, it binds the interest of the debtor in them, is not sufficient. To make an enforced sale, it is necessary for him to sue for the recovery of their possession, or not pass the property in the goods to the sheriff. The goods are in the custody of the sheriff, but the property remains in the debtor who cannot get rid of the execution on payment of the claim and fees of the sheriff as to which see Sheriff Act 1887 s. 20, and order of 21st of August 1888, Annual Practice (1908), vol. ii. p. 276). The wearing apparel, bedding, tools, &c., of the debtor to the value of £5 are protected. Competing claims as to the ownership of the goods seized are brought before the courts by the procedure of "interpleader." After seizure, the sheriff must retain possession, and, in default of payment by the defendant, he may employ a servant to sell. When the goods are sold including legal expenses, exceeds £20, the sale must be by public auction, unless the Court otherwise orders, and must be publicly advertised. The proceeds of sale, after deduction of the sheriff's fees and expenses, become the property of the execution creditor to the extent of his claim. The Bankruptcy Act 1890 (53 & 54 Vict. c. 71, s. 11 [2]) requires the sheriff in case of sale under a judgment decreeing liquidation (futuri jure) to sell any goods in his hands in case of bankruptcy proceedings should be served upon him (see BANKRUPTCY). The form of the writ of fieri facias requires the sheriff to return to the creditor the goods seized unless the execution has been ineffective or there has been delay in the execution of the writ; but the judgment creditor may obtain an order calling on the sheriff to make a return. A sheriff or his officer is not liable to the execution creditor for any delay in the execution of the writ; but the judgment creditor may obtain an order calling on the sheriff to make a return. A sheriff or his officer is not liable to the execution creditor for any delay in the execution of the writ; but the judgment creditor may obtain an order calling on the sheriff to make a return.

Writ of Elegit.—The writ of elegit is a process enabling the creditor to satisfy his judgment debt out of the lands of the debtor. It derives its name from the formula used in the middle ages, "satis is in regno," which is the mode of recovery. It is founded on the Statute of Westminster (1285, 13 Ed. I. c. 18), under which the sheriff was required to deliver to the creditor all the chattels (except oxen and beasts of the plough) and the goods and lands of the debtor, until the day of judgment. The Judgments Act 1838 the remedy was extended to all the debtor's lands, and by the Bankruptcy Act 1883 the writ no longer extends to the debtor's goods. The writ is enforceable against legal interests in property (Foord vs. Cockrath, Cathorpe, 6 Ch. 411), but not against equitable interests in land (Earl of Jersey vs. Uxbridge Rural Sanitary Authority, 1891, 3 Ch. 185). When the judgment debtor is a citizen of a foreign country the writ may be obtained by the appointment of a receiver or to bankruptcy proceedings.

The writ is directed to the sheriff, who, after marking on it the date of its receipt, at once in pursuance of its directions holds an equity or commitment, and, upon his application, the judge, when the debtor in the lands extended under the writ, and delivers to the creditor at a reasonable price and extent in accordance with the writ, the lands of which the debtor was possessed in the bailiff. When the sheriff has delivered the writ and the execution thereof, the execution creditor becomes "tenant to the equity." Where the judgment debtor holds the land as leasehold he acquires the whole of the debtor's interest (Johns vs. Pink, 1900, 1 Ch. 296). The creditor is entitled to hold the land till his debt is satisfied, or enough to satisfy it is rendered to him, and under the Judgments Act 1884 the creditor may obtain an order for sale. Until the land is delivered on execution and the writ which have effected the delivery are registered in the Register of Deeds, the sheriff, under an order of the judge, has power to charge the land so as to let the debtor's power of dealing with it (Deeds and Charges Registration Acts 1888 and 1900. See R.S.C., O. xiii.).

Writs of Possession and Delivery.—Judgments for the recovery of or for the delivery of the possession of land are enforceable by writs of possession. The recovery of specific chattels is obtained by writ of delivery (R.S.C., O. xlvii., xlviii.).

Writ of Sequestration.—Where a judgment directing the payment of money into court, or the performance by the defendant of any act within a limited time, has not been complied with, or where a corporation has willfully disobeyed a judgment, a writ of sequestration may be obtained. It requires the defendant to enter upon the real estate of the party in default, and "sequestrate" the rents and profits until the judgment has been obeyed (R.S.C., O. xiii., r. 6).

Bill of Execution.—Where a judgment creditor is otherwise unable to reach the property of his debtor he may obtain equitable execution, usually by the appointment of a receiver, who collects the rents and profits of the debtor's land for the benefit of the judgment creditor (R.S.C., O. xlvii.). In the old common law, the attachment of interests in personal property belonging to the debtor by virtue of the Judicature Act 1873, s. 25 (8).

Attachment.—A judgment creditor may "attach" debts due by third parties to his debtor by what are known as garnishee proceedings. Stock and shares belonging to a judgment debtor may be charged by a charging order, so as, in the first instance, to prevent transfer of the stock or payment of the dividends, and ultimately to enable the judgment creditor to realise his charge. A writ of attachment of the person of a defaulting debtor or party may be obtained in a variety of cases akin to contempt (e.g. against a person in possession). A person in possession who refuses to allow a sollicita not entering an appearance in an action, in breach of his written undertaking to do so, and in the cases where imprisonment for debt is still preserved by the Debtors Act 1869 (R.S.C., O. xlvii.).

Contempt of Court (q.v.) in its ordinary forms is also punishable by summary committal.

County Courts.—In the county courts the chief modes of execution are writs of execution and writs of sequestration; the execution of a writ of fieri facias is "garnishee proceedings; equitable execution; warrants of possession and delivery, corresponding to the writs of possession and delivery above mentioned; in all these cases the sheriff may, at his discretion, by order of the judge has had, means to pay his debt; and attachment of the person for contempt of court. If the judgment debtor assaults the bailiff or his officer or rescues the goods, he then becomes liable to a fine of £5 and to execution proceedings.

Scotland.—The principal modes of execution of "diligence" in Scots law are (i.) Arrestment and forthcoming, which corresponds to the English garnishee proceedings; (ii.) arrestment juridic和平 fundandae causa, i.e. the seizure of movables within the jurisdiction
to found jurisdiction against their owner, being a foreigner; this procedure, which is not, however, strictly a "delicence," as it does not bind the goods, is analogous to the French "saisie-arrêt," and to the obsolete practice in the mayor's court of London known as "species decressant." (Civ. Pr. (2d ed.), vii. 277.) (ii) arrestment under mediations fugaee warrant, corresponding to the old English writ of ne exeat regno, and applicable in the case of a debtor who intends to leave Scotland to evade payment of a prejudgment debt. (iii) attachment of property, i.e., of land or goods. (v) pondeage, i.e., valuation and sale of the debtor's goods; (vi) sequestration, e.g., of tenant's effects under a landlord's heirship, in order to cover the debts, by which the "heritable" (i.e., real) estate is transferred to his judgment creditor in satisfaction of his debt or security therefor. In Scots law "multiplepounding" is the equivalent of "interpleader." (CodeGuardian, 1905, Orders xii.-xlviii.) is practically the same as in England.

Executive and Administrators, in English law, those persons upon whom the property of a deceased person both real and personal devolves according as he has or has not left a will. Executors differ from administrators both in the mode of their creation and in the date at which their estate vests. An executor can only be appointed by the will of his testator; such appointment may be express or implied, and in the latter case he is said to be an executor "according to the tenor." The estate of an executor vests in him from the date of the testator's death. An administrator on the other hand is appointed by the probate division of the High Court, and he does not vest till such appointment, the title to the property being vested till then in the judge of the probate division. As to whom the court will appoint administrators and the various kinds of administrators see under Administration. Apart from these two points the rights and liabilities of executors and administrators are the same, and they may be indifferently referred to as the representative of the deceased. As to their appointment before the establishment of the court of probate see articles Will and Intestacy.

Before the Land Transfer Act 1897, the real estate of the deceased did not devolve upon the representative until the property had been vesting the probate court of the deceased, and it was provided that the personal representative should be also the real representative, and therefore it may now be said broadly that the representative takes the whole estate of the deceased. There are, however, a few minor exceptions to this rule, of which the most important are lands held in joint tenancy and copyhold lands. As the representative stands in the shoes of the deceased he is entitled to sue upon any contract or for any debt by which the deceased might have sued in his lifetime.

The duties of a representative are as follows: 1. To bury the deceased in a manner suitable to his estate, and to see that the expenses of the funeral and burial are paid. He has the right to bring a personal action against those who may be responsible for the death for such damages as he can prove. 2. To administer the estate of the deceased, whether he has died intestate or by will. He must make a return of the affairs of the estate to the court of probate, and may be examined as to the manner in which he has administered the estate. If he fails in his duties his interest in the estate may be recovered from him. If he has not received any money as a result of the administration of the estate, he may be required to pay a reasonable amount for his services. 3. To bring an action for the recovery of the debts of the deceased. He may also bring an action for the recovery of any moneys which he may have advanced on behalf of the deceased.

The costs of administration may be recovered from the estate of the deceased. If the estate is insufficient to pay the costs of administration, the representative may be held liable for the costs. The representative is also liable for any losses or damages that may be occasioned by his negligence or carelessness in the administration of the estate.

EXEDRA—EXELMANS

judgment recovered against the deceased in any court of record; all such debts are equal among themselves, but a judgment creditor who has sued out execution is preferred to one who has not; another class of debts of record are statutes muster and stall, or recognizances of statute in the probate courts; which, by Hinde Palket's Act (the 29 Geo. II, c. 58), and the Revenue Act, 1806, is chargeable on all the estate, both real and personal, held by the deceased for the time being, and includes the following classes of debts and bonds given for value, rank before voluntary bonds unless assigned for value, and as between simple contract debts those due to the crown have priority. The executor may, if necessary, sell all the estate for the payment of debts; decease is to satisfy to claims, yet as between the various classes of the representative must pay the debts out of assets in the following order: (i) General personal estate not specifically bequested after the residue is disposed of; (ii) debts chargeable to the estate; (iii) debts chargeable to the residue, which are payable either out of the assets of the estate or out of the said residue, as the case may require, and on expiration of the notices he may proceed to divide the estate, though even then the creditor may follow the assets to the person who has received them and recover for himself, the legatees and devisees being entitled to be paid out of the residue, in the order of priority as may appear from the will. The representative is liable for the debts of the deceased himself; and if there be a will, it must be paid to the residuary legatee therein named, and if there be no will the real estate will go to the heir (see Inheritance) and the personality to the next of kin (see Intestacy).

It was held at one time that in default of a residuary legatee the residue fell to the executor himself, but now nothing less than the expressed intention of the testator can give it to him.

The liabilities of the representative may be shortly stated. He is liable in his representative capacity in all cases where the deceased would be liable were he alive. To this general rule there are some exceptions. The representative cannot be sued by the creditors for breach of a contract to which he was not a party or a co-partner, unless the lifetime of the person contracting, nor again can he be sued in a case where unliquidated damages only could have been recovered against the deceased. He is liable in his personal capacity in the following cases to pay a debt due by the deceased: if he had admitted that he had assets in his hands sufficient to pay a debt or legacy which he has misapplied such assets so that he cannot satisfy them; or lastly, byimmersing himself in the vocation or the estate of the deceased he has made himself liable for a devastavit.

The representative is bound to exercise the ordinary care of a business man in administering the estate of the deceased, and he will be liable for the loss to the estate caused by his own negligence, or by the negligence of a co-representative which his act or neglect has rendered possible. Though the general rule of delegatus non patiatur legati holds good of a representative, yet in certain cases he may "act person in good faith in which he is expected to be experienced," e.g. he must employ solicitors to conduct a lawsuit.

The privileges of the representative are these: he may prefer one creditor to another of equal degree; he may retain a debt owing to him from the deceased as against other creditors of equal degree (see Retainer) he may reimburse himself out of the estate all expenses of administration and execution.

An executor de son tort is one who, without any title to do so, wrongfully intermeddles with the assets of the deceased, dealing with them in his own name for his own benefit; in such a case he is subject to all the liabilities and consequences of an executor named in the will, unless he can prove that he is not liable for his act or claim none of the privileges. He may be treated by the creditor as the executor, and, if he is really assuming to act as executor, creditors and debtors have no remedy unless the name is given. Nothing is more misleading than the phrase, "the executor," by the rightful representative for damages for interfering with the property of the deceased.

Second. Executor. In Scots law is more a extensive term than in English. He either compositive or dispositive, the latter appointed by the court and corresponding in most respects to the English administrator. Caution is required from the latter, not from the former. By the common law doctrine of passive representation the heir or executor was liable to be sued for implement of the deceased's obligations. The Roman principle of beneficiarius inventum was first introduced by an act of 1665. As the law at present stands, the heir or executor is liable only to the value of the succession, except where there has been vitius introduction in movables, and in certain points except the personal duties of the heir. The present duty on succession to movables and heritables depends on the Finance Acts 1894-1900 (see Estate Duty). In England the executor is bound to pay out the debts of the deceased in a decent order, but he is not responsible for the payment of other debts of the deceased, but must be satisfied by the representative and all they all rank pari passu except privileged debts (see Privilege).

EXEDRA, or EXHERDA (from Gr. ἔξω, out, and ἑκράχ, a seat), an archaic form originally applied to the seat placed at the back of a drum, intended for conversation. Such recesses were generally semi-circular, as in the important example built by Herodes Atticus at Olympia. In the great Roman thermæ (baths) they were of large size, and like apses were covered with a hemispherical vault. An example of these exists at Pompeii in the Street of the Tombs. From Vitruvius we learn that they were often covered over, and that they were described by him (v. 11) as places leading out of porticos, where philosophers and rhetoricians could debate or harangue.

EXELMANS, RENÉ JOSEPH ISIDORE. Count (1775-1852), marshal of France, was born at Bar-le-Duc on the 13th of November 1775. He volunteered into the 3rd battalion of the Meuse in 1791, became a lieutenant in 1797, and in 1798 was aide-de-camp to General Éblé, and in the following year General Brossier. In his first campaign in Italy he greatly distinguished himself; and in April 1799 he was rewarded for his services by the grade of captain of dragoons. In the same year he took part with honour in the conquest of Naples and was again promoted, and in 1801 he became aide-de-camp to General Murat. He accompanied Murat in the Austrian, Prussian and Polish campaigns of 1806, and in 1807 was appointed inspector-general of Silesian, Saxony and Silesia, grand-officer of the Legion of Honour, and in 1814 he reaped additional glory by his intrepidity and skill in the campaign of France. When the Bourbons were restored, Exelmans retained his position in the army. In January 1815 he was tried on an accusation of having treasonable relations with Murat, but was acquitted. Napoleon on his return from Elba made Exelmans a peer of France and placed him in command of the II. cavalry corps, which he commanded in the campaign of the Pyrenees, and on Napoleon's march on Wavre. In the closing operations round Paris Exelmans won great distinction. After the second Restoration he denounced, in the House of Peers, the execution of Marshal Ney as an "abominable assassination"; thereafter he lived in exile in Belgium and Nassau for some years, till 1819, when he was recalled to France. In 1828 he was appointed inspector-general of cavalry; and after the July revolution of 1830 he received from Louis Philippe the grand cross of the Legion of Honour, and was reinstated as a peer of France. At the revolution of 1848 Exelmans was one of the adherents of Louis Napoleon; and in 1851 he was, in recognition of his long and brilliant military career, raised to the dignity of a marshal of France. His death, which took place on the 10th of July 1852, was the result of a fall from his horse.
EXEQUATUR—EXETER 65

EXEQUATUR, the letter patent, issued by a foreign office and signed by a sovereign, which guarantees to a foreign consul the rights and privileges of his office, and ensures his recognition in the state in which he is appointed to exercise them. If a consul is not appointed by commission he receives no exequatur; and a notice in the Gazette in this case has to suffice. The exequatur may be withdrawn, but in practice, where a consul is obnoxious, an opportunity is afforded to his government to recall him.

EXETER, EARL, MARQUSS AND DUKE OF. These English titles have been borne at different times by members of the families of Holand or Holland, Beaufort, Courtenay and Cecili. The earls of Devon of the family of Beaufort were sometimes called earls of Exeter but the title of Exeter was John (c. 1355–1400), a younger son of Thomas Holand, earl of Kent (d. 1360). John’s mother, Joan (d. 1385), a descendant of Edward, married for her third husband Edward the Black Prince, by whom she was the mother of Richard II., and her son John was thus the king’s half-brother, a relationship to which he owed his high station at the English court. He married Elizabeth (d. 1426), a daughter of John Gaunt, duke of Lancaster, and was constantly in Richard’s train until 1385, when his murder of Ralph Stafford troubled these friendly relations. John then returned to the service of the English army under John of Gaunt; but after his return to England in 1387 he was created earl of Huntingdon, was made admiral of the fleet and chamberlain of England, and was again high in the king’s favour. He was Richard’s chief helper in the proceedings against the lords appellant in 1397, was created duke of Exeter in September of this year, and went with the king to Ireland in 1399. After the accession of his brother-in-law, Henry IV., Holand was tried for his share in the events of 1397, and was reduced to his earlier rank of earl of Huntingdon. He was soon plotting against Henry’s life, and after the projected rising in 1400 had failed he was captured and was probably beheaded at Piesley in Essex on the 16th of January 1400.1 He was afterwards attainted and his titles and lands were forfeited.

In 1416 Thomas Beaufort, earl of Dorset, was created duke of Exeter; but this dignity was only granted for his life, and consequently it expired on his death in 1426.

In 1416 John (1395–1447), son of John Holand, the former duke of Exeter, was allowed to take his father’s earldom of Huntingdon. This nobleman rendered great assistance to Henry V. in his conquest of France, fighting both on sea and on land. He was marshal of England, admiral of the English army under John of Gaunt; but after his return to England in 1387 he was created earl of Huntingdon, was made admiral of the fleet and chamberlain of England, and was again high in the king’s favour. He was Richard’s chief helper in the proceedings against the lords appellant in 1397, was created duke of Exeter in September of this year, and went with the king to Ireland in 1399. After the accession of his brother-in-law, Henry IV., Holand was tried for his share in the events of 1397, and was reduced to his earlier rank of earl of Huntingdon. He was soon plotting against Henry’s life, and after the projected rising in 1400 had failed he was captured and was probably beheaded at Piesley in Essex on the 16th of January 1400.1 He was afterwards attainted and his titles and lands were forfeited.

In 1447 Henry Courtenay, the title of marquess of Exeter was borne by Henry Courtenay (c. 1406–1538), earl of Devon, who was made a marquess in 1525. A grandson of Edward IV., Courtenay was a prominent figure at the court of Henry VIII., until Thomas Cromwell rose to power, when his high birth, his great wealth and his independent position made him an object of suspicion. Some slight discontent in the west of England gave the occasion for his arrest, and he was tried and beheaded on the 9th of December 1538. A few days later he was declared a traitor and his titles were forfeited; although his only son, Edward (c. 1526–1536), who was restored to the earldom of Devon in 1535 and was a suitor for the hand of Queen Mary, is sometimes called marquess of Exeter.

The title of earl of Exeter was first bestowed upon the Cecils (see Cecil: Family) in 1605 when Thomas, 2nd Lord Burghley (1542–1623), the eldest son of William Cecil, Lord Burghley, was made earl of Exeter by James I. Thomas had been a member of parliament during the reign of Queen Elizabeth, who knighted him in 1575, and had fought under the earl of Leicester in the Netherlands. After his father’s death in 1588 he became president of the Council of the North and was made a knight of the Garter. He died on the 7th or 8th of February 1623. His direct descendants continued to bear the title of earl of Exeter, and in 1683 Henry (1574–1684), the 10th earl, was advanced to the dignity of marquess of Exeter, and his son, Henry, was created the first Earl of Exeter. He bore this title until the death of his son, the 2nd Earl of Exeter, in 1714. The title was then assumed by his son, the 3rd Earl of Exeter, who was created the 1st Marquess of Exeter in 1724. His son, the 2nd Marquess of Exeter, was created the 2nd Earl of Exeter in 1751, and his son, the 3rd Earl of Exeter, was created the 3rd Marquess of Exeter in 1771. His son, the 4th Marquess of Exeter, was created the 4th Earl of Exeter in 1793, and his son, the 5th Earl of Exeter, was created the 5th Marquess of Exeter in 1811. His son, the 6th Earl of Exeter, was created the 6th Marquess of Exeter in 1827, and his son, the 7th Earl of Exeter, was created the 7th Marquess of Exeter in 1842. His son, the 8th Earl of Exeter, was created the 8th Marquess of Exeter in 1860, and his son, the 9th Earl of Exeter, was created the 9th Marquess of Exeter in 1881. The title of earl of Exeter is thus held by the 9th Earl of Exeter, who is the present holder of the title.

The title of marquess of Exeter is held by the 9th Marquess of Exeter, who is the present holder of the title.

1 There is some difference of opinion about the place and manner of the earl’s death, and this question has an important bearing upon the privilege of trial by peers of the realm. See L. W. Vernon-Harcourt, *His Grace the Seward and Trial of Peers* (1907).
EXETER

and another of Henrietta, duchess of Orleans, given by her brother Charles II. Both are by Sir Peter Lely. The assize hall and sessions house dates from 1774. The Albert Memorial Museum contains a school of art, an excellent free library, a reading-room, and a museum of natural history and antiquities. There is a good collection of local birds, and some remarkable pottery and bronze relics extracted from barrows near Hinton or found in various parts of Devonshire. Of the castle, called Rouge-mont, the chief architectural remnant is a portion of a gateway tower which may be late Norman. Traces are also seen of the surrounding earthworks, which may have belonged to the original British stronghold. Beneath the castle wall is the pleasant promenade of Northernhay. The churches of Exeter are of little importance, being mostly small, and closely beset with buildings. The modern appearance of St Michael's Cathedral is due to a fire in 1861. The Devon and Exeter Institution, founded in 1813, contains a large and valuable library, and among educational establishments may be noticed the technical and university extension college, the diocesan training college and school; and the grammar school, which was founded under a scheme of Walter de Stapeldon, bishop of Exeter and founder of Exeter College, Oxford, in 1332, and re-founded in 1629, but occupies modern buildings (1886) outside the city. It is endowed with a large number of leaving exhibitions, and about 130 boys are educated. There are two market-houses in the city, many hospitals and many charitable institutions, including the picturesque hospital or almshouse of Miss Wynaars, recorded of Exeter (1430).

Exeter is one of the principal railway centres in the south-west, and it also has some shipping trade, communicating with the sea by way of the Exeter ship-canal, originally cut in the reign of Elizabeth (1564), and enlarged in 1675 and 1827. This canal is an interesting work, being the first canal carried out in the United Kingdom for the purpose of enabling sea-going vessels to pass to an inland port. The river Exe was very early utilized by small craft trading to Exeter, parliament having granted a monopoly of this traffic by a charter of 1299. By the construction of a canal 3 m. long from Exeter to the river; at a later date this canal was extended lower down to the tidal estuary of the Exe. Previous to the year 1820 it was only available for vessels of a draft not exceeding 9 ft., but by deepening it, raising the banks, and constructing new locks, vessels drawing 14 ft. of water were enabled to pass up to a basin and wharves at Exeter. These works were carried out under the advice of Thomas Telford. A floating basin is accessible to vessels of 350 tons. Larger vessels lie at Topsham, at the junction of the canal with the estuary of the Exe; while at the mouth of the estuary is the port of Exmouth. Imports are miscellaneous, while paper, grain, cider and other goods are exported. Brewing, paper-making and iron-founding are carried on, and the city is an important centre of agricultural trade. The parliamentary borough returns one member. The city is governed by a mayor, 14 aldermen and 42 councillors. Area, 3158 acres. The eastern suburb of Heavitree, where is the Exeter city asylum, is an urban district with a population (1901) of 7529.

Exeter was the Romano-British country town of Isca Dumnorix— the most westerly town in the south-west of Roman Britain. Mosaic pavements, potsherds, coins and other relics have been found, and probably traces of the Roman walls survive here and there in the medieval walls. It is said to be the Caer Icse of the Britons, and its importance as a British stronghold is shown by the great earthwork which the Britons threw up to defend it, on the site of which the castle was afterwards built, and by the number of roads which branch from it. Exeter is famous for the number of sieges which it sustained as the chief town in the south-west of England. In 1001 it was unsuccessfully besieged by the Danes, but in the following year was given by King Æthelred to Queen Emma, who appointed as reeve, Hugh, a Frenchman, owing to whose treachery it was taken and destroyed by Sweyn in 1013. In 1050, however, it had recovered, and was chosen by Leofric as the new seat of the bishops of Devon. In 1068, after a siege of eighteen days, Exeter surrendered to the Conqueror, who threw up a castle which was called Rouge-mont, from the colour of the rock on which it stood. Again in 1137 the town was held for Matilda by Baldwin de Redvers for three months and surrendered, at last, owing to lack of water. Three times subsequently Exeter held out successfully for the king—in 1467 against the Yorkists, in 1497 against Perkin Warbeck, and in 1549 against the men of Cornwall and Devon, who rose in defence of the old religion. During the civil wars the city declared for parliament, but was in 1643 taken by the royalists, who held it until 1646. The only other historical event of importance is the entry of William, prince of Orange, in 1688, shortly after his arrival in England. Exeter was evidently a borough by prescription some time before the Conquest, since the burgesses are mentioned in the Domesday Survey. Its incorporation was granted by Henry I, who has left a gladsome record of all the free customs which the citizens of London enjoyed, and was confirmed and enlarged by most of the succeeding kings. By 1229 government by a reeve had given place to that by a mayor and four ballifs, which continued until the Municipal Reform Act of 1835. Numerous trade guilds were incorporated in Exeter, one of the first being the tailors' gild, incorporated in 1466. This by 1482 had become so powerful that it interfered with the government of the town, and was dissolved on the petition of the burgesses. Another powerful gild was that of the merchant adventurers, incorporated in 1550, which is said to have dictated laws to which the mayor and ballifs submitted. From 1595 to 1885 Exeter was represented in parliament by two members, but in the latter year the number of representatives was reduced to one. Exeter was formerly noted for the manufacture of woolen goods, introduced in Elizabeth's reign, and the value of its exports at one time exceeded half a million sterling yearly. The trade declined partly owing to the stringent laws of the trade gilds, and by the beginning of the 19th century had entirely disappeared, although at the time of its greatest prosperity it had been surpassed in value and importance only by that of London.

See Victoria County History, Devon: Richard Izacke, Antiquities of the City of Exeter (1677); George Oliver, The History of the City of Exeter (1861); and E. A. Freeman, Exeter ('Historic Towns' series) (London, 1887), in the preface to which the names of earlier historians of the city are given.

EXETER, a town and one of the county-seats of Rockingham county, New Hampshire, U.S.A., on the Squamscott river, about 12 m. S.W. of Portsmouth and about 51 m. N. by E. of Boston, Mass. Pop. (1890) 4284; (1900) 4922 (1666 foreign-born); (1810) 4897; area, about 17 sq. m. It is served by the Western Division of the Boston & Maine railway. The town has a public library and some old houses built in the colonial period, and is the seat of Phillips Exeter Academy (incorporated in 1781 and opened in 1783). In its charter this institution is described as "an academy for the purpose of promoting piety and virtue, and for the education of youth in the English, Latin and Greek languages, in writing, arithmetic, music and the art of speaking, practical geometry, logic and geography, and such other of the liberal arts and sciences or languages, as opportunity may hereafter permit." It was founded by Dr John Phillips (1719-1795), a graduate of Harvard College, who acquired considerable wealth as a merchant at Exeter and gave nearly all of it to the cause of education. The academy is one of the foremost secondary schools in the country, and among its alumni have been Daniel Webster, Edward Everett, Lewis Cass (born in Exeter in a house still standing), John Parker Hale, George Bancroft, Jared Sparks, John Gorham Palfrey, Richard Hildreth and Francis Bowen. The government of the academy is vested in a board of six trustees, regarding whom the founder provided that a majority should be laymen and not inhabitants of Exeter. In 1900-1910 the institution had 20 buildings, 32 acres of recreation grounds, 16 instructors and 488 students, representing 38 states and territories of the United States and 4 foreign countries. At Exeter also is the Robinson female seminary, 1867, with 8 instructors and 46 students (1889-1891). The river furnishes water-power, and among the manufactures of the town are shoes, machinery, cottons, brass, &c.
The town is one of the oldest in the state; it was founded in 1638 by Rev. John Wheelwright, an Antinomian leader who with a number of followers settled here after his banishment from Massachusetts. For their government the settlers adopted (1639) a plantation covenant. There was disagreement from the first, however, with regard to the measure of loyalty to the king, and in 1643, when Massachusetts had asserted her claim to this region and the other three New Hampshire towns had submitted to her jurisdiction, the majority of the inhabitants of Exeter also yielded, while the minority, including the founder, removed from the town. In 1686 the town became a part of the newly created province of New Hampshire. During the French and Indian wars it was usually protected by a garrison, and some of the garrison houses are still standing. From 1776 to 1784 the state legislature usually met at Exeter.

See C. H. Bell, History of the Town of Exeter (Exeter, 1888).

EXETER BOOK—EXHIBITION

The first modern exhibition was held at London in 1756 by the Society of Arts, which offered prizes for improvements in the manufacture of tapestry, carpets and porcelain, the exhibits being placed side by side. Five years afterwards, in 1761, the same society gave an exhibition of agricultural machinery. In 1797 a collective display of the art factories of France, including those of Sèvres, the Gobelins and the Savonnerie, was made in the palace of St Cloud, and the exhibition was repeated during the following year in the rue de Varennes, Paris. This experiment was so successful that in the last three days of the same year an exhibition, under official auspices, at which private exhibitors were allowed to compete, was held in the Champ de Mars. Four years later, in 1801, there was a second official exhibition in the grand court of the Louvre. Upon that occasion juries of practical men examined the objects shown, and the winners of a gold medal were invited to dine with Napoleon, who was at that time First Consul. In the report of the jury the following remarkable sentence appeared:—"There is not an artist or inventor who, once obtaining thus a public recognition of his ability, has not found his reputation and his business largely increased." The third Paris Exhibition, held in 1802, was the first to publish an official catalogue, which included 500 exhibitors, including J. E. Montgolfier, the first aeronaut, and J. M. Jacquard, the inventor of the loom which bears his name. The fourth exhibition was held in 1806 in the esplanade in front of the Hôtel des Invalides, and attracted 1422 exhibitors. There were no more exhibitions till after the fall of the empire, but in 1819 the fifth was held during the reign of Louis XVIII., with 1622 exhibitors. Others were held at Paris at various intervals, that in 1849 having 4300 exhibitors.

Other exhibitions, though on a smaller scale, were held in Dublin, London, and in various parts of Germany until Paris during the first half of the 19th century—that in 1844, held at Berlin, having 3040 exhibitors. Switzerland, Holland, Belgium, Sweden, Russia, Poland, Italy, Spain and Portugal all held exhibitions, and there was a Free Trade Bazaar of British Manufactures at Covent Garden theatre in 1845, which at the time created a great deal of interest. But all these exhibitions were confined to the products of the country in which they took place, and the first great International Exhibition was held in London in 1851 by the Society of Arts, under the presidency of the prince consort. All nations were invited to compete; a building of 44 acres was erected, with a building 20 acres in extent was erected, after the design of Sir Joseph Paxton, at a cost of £193,168. The exhibition was open for five months and fifteen days. The receipts amounted to £506,100, and the surplus was £186,000. The number of visitors was 6,039,193, and the money taken at the doors was £423,792. The total number of exhibitors was 13,937, of which Great Britain contributed 6861, the British colonies 520 and foreign countries 656. The International Exhibition of 1851 was followed by those of New York and Dublin in 1853, Melbourne and Munich in 1854, and Paris in 1855—this latter was held in the Palais d’Industrie, which remained in existence until pulled down to make room for the two Palais des Beaux Arts, which formed one of the attractions of the 1900 exhibition. The exhibitors numbered 20,839 and the visitors 5,162,339. There were national exhibitions during the following years in several European countries, but the next great world’s fair was held at London in 1862. The total space roofed in amounted to 898,000 sq. ft., 22-65 acres, the number of visitors was 6,211,103, and the amount received at the doors £406,350. The death of the prince consort had a depressing effect upon the enterprise. An exhibition was held at Dublin, in Great Britain proportion of the funds being supplied by Sir Benjamin Lee Guinness. The number of attendances during six months was 900,000, and the exhibition was opened at night. An Italian exhibition was held at Rome in 1862.

The Paris Exhibition of 1867 was upon a far larger scale than that of 1855. It was held, like those that preceded and succeeded it, at the Champ de Mars, and covered 41 acres. The building resembled an exaggerated gasometer. The external ring was
EXHIBITION

devoted to machinery, the internal to the gradual development of civilization, commencing with the stone age and continuing to the present em. A great feature of the exhibition was the park, which was studded with specimens of every style of modern architecture—Turkish mosques, Swedish cottages, English lighthouses, Egyptian palaces and Swiss chalets. The number of attendances was 6,805,969. The exhibitors numbered 43,217, and the total amount received for entrances, concessions, &c., was £407,355. This was the first exhibition at which there were international restaurants. The cost of the exhibition was defrayed partly by the state and partly by private subscriptions, largely for machinery and agricultural products, and hundreds of buildings, erected by different nations, were scattered amongst the woodlands of the Prater. Unfortunately, an outbreak of cholera diminished the attendance of visitors, and the receipts were only £306,477, although the visitors were said to have reached 6,740,500, and the number of exhibitors was 25,760.

None of the International Exhibitions held between 1857 and 1873 had attracted as many as 7,000,000 visitors, but the gradual extension of education amongst the masses, and the greater facilities for locomotion, brought about by the growth of the railway system in all portions of the civilized world, largely increased the attendances at subsequent World's Fairs. The Centennial Exhibition of 1876, to celebrate the one-hundredth anniversary of American Independence, was held at Fairmount Park, Philadelphia. The funds were raised partly by private subscriptions, and partly by donations from the city of Philadelphia, from Pennsylvania and some of the neighbouring states. The central government at Washington made a large loan, which was subsequently repaid. The principal buildings, five in number, occupied an area of 484 acres, and there were several small structures of which the aggregate must have filled half as much space more, the largest being that devoted to the exhibits of the various departments of the United States government, which covered 7 acres. Several novelties in exhibition management were introduced at Philadelphia. Instead of gold, silver and bronze medals, only one description, bronze, was issued, the difference between the merits of the different exhibits being shown by the reports. Season tickets were not issued, and the price of admission, the same on all occasions, was half a dollar, or about 2s. 1d. The exhibition was not open at night or on Sundays, thus following the British, and not the continental, precedent. The number of visitors was 9,822,625, of whom 8,004,214 paid for admission; the balance being exhibitors, officials and attendants. The total receipts amounted to £763,899. Upon one occasion, the Pennsylvania day, 274,919 persons—the largest number that had visited any exhibition up to that date—passed through the turnstiles. The display of machinery was the finest ever made, that of the United States occupying 480,000 sq. ft. The motive-power was obtained from a Corliss engine of 1600 horse-power. At this exhibition the United Kingdom and the British Colonies of Canada, Victoria, New South Wales, New Zealand, Cape Colony and Tasmania made a very fine display, which was only excelled by that of the United States.

The Paris Exhibition of 1878 was upon a far larger scale in every respect than any which had been previously held in any part of the world. The total area covered not less than 66 acres, the main building in the Champ de Mars occupying 34 acres. The French exhibits filled one-half the entire space, the remaining moiety being occupied by the other nations of the world. The United Kingdom, British India, Canada, Victoria, New South Wales, Queensland, South Australia, Cape Colony and some of the British crown colonies occupied nearly one-third of the space set aside for nations outside France. Germany was the only great country which was not represented, but there were a few German paintings. The display of fine arts and machinery was upon a very large and comprehensive scale, and the Avenue des Nations, a street 2400 ft. in length, was devoted to specimens of the domestic architecture of nearly every country in Europe, and of several in Asia, Africa and America. The palace of the Trecedero, or the northern bank of the Seine, was erected for the exhibition. It was a handsome structure, with a portico in height and flanked by two galleries. The rules for admission were the same as those at Philadelphia, and everyone—exhibitor, journalist or official—who had the right of entrance was compelled to forward two copies of his or her photograph, one of which was attached to the card of entry. The ordinary tickets were not sold at the doors, but were obtainable at various government offices and shops, and from numerous pedlars in all parts of the city and suburbs. The buildings were somewhat unfinished upon the opening day, political complications having delayed the completion of the French exhibits. The French paid much attention to the exhibition till about six months before it was opened; but the efforts made in April were prodigious, and by June 1st, a month after the opening, the exhibition was complete, and afforded an object-lesson of the recovery of France from the calamities of 1870-1871. The decisions arrived at by the international juries were accompanied by medals of gold, silver and bronze. The expenditure by the United Kingdom was defrayed out of the consolidated revenue, each British colony defraying its own expenses. The display of the United Kingdom was under the control of a royal commissioner, of which the prince of Wales was president. The number of paying visitors to the exhibition was 13,000,000, and the cost of the enterprise to the French government, which supplied all the funds, was a little less than a million sterling, after allowing for the value of the permanent buildings and the Trocadero Palace, which were sold to the city of Paris. The total number of persons who visited Paris during the time the exhibition was open was 571,705, or 308,974 more than came to the French metropolis during the year 1877, and 46,021 in excess of the visitors during the previous exhibition of 1867. It was stated at the time that, in addition to the lan described to the trade of France, the revenue of the Republique and the city of Paris from customs and octroi duties was increased by nearly three millions sterling as compared with the previous year. Exhibitions on a scale of considerable magnitude were held at Sydney and Melbourne in 1879 and 1880, and many continental and American manufacturers took advantage of them in order to bring the products of their industry directly under the notice of Australian consumers, who had previously purchased their supplies through the instrumentality of British merchants. The United Kingdom and India made an excellent display at both cities, but the effect of the two great Australian exhibitions was to give a decided impetus to German, American, French and Belgian trade. One of the immediate results was that lines of steamers to Melbourne and Sydney commenced to run from Marseilles and Bremen; another, that for the first time in the history of the Australian colonies, branches of French banks were opened in the two principal cities. The whole cost of these exhibitions was defrayed by the local governments. Exhibitions were held at Turin and Brussels during 1880, and smaller ones at Newcastle, Milan, Lahore, Adelaide, Perth, Moscow, Ghent and Lille during 1881 and 1882, and at Zurich, Bordeaux and Caracas in Venezuela during 1883. The next of any importance was held at Amsterdam in the latter year. On that occasion a new departure in exhibition management was made. The government of the Netherlands was to a certain extent responsible for the administration of the exhibition, but the funds were obtained from private sources, and a charge was made to each nation represented for the space it occupied. The United Kingdom, India, Victoria and New South Wales
EXHIBITION 69
took part in the exhibition, but there was no official representation of the mother country. Exhibitions on somewhat similar lines were held at Nice and Calcutta in the winter of 1883 and 1884, and at Antwerp in 1895.

A series of exhibitions, under the presidency of the then prince of Wales, and managed by Sir Cunliffe Owen, was commenced at South Kensington in 1883. The first was devoted to a display of the various industries connected with fishing; the second, in 1884, to objects connected with hygiene; the third, in 1885, to inventions; and the fourth, in 1886, to the British colonies and India. These exhibitions attracted a large number of visitors and realized a substantial profit. They might have been continued indefinitely if it had not been that the buildings in which they were held had been either dilapidated or inadequate, and that the ground covered by them was required for other purposes. There was no examination of the exhibits by juries, but a tolerably liberal supply of instrumental music was supplied by military and civil bands. The Crystal Palace held a successful International Exhibition in 1884, and there was an Italian Exhibition at Turin, and a Forestry Exhibition at Edinburgh, during the same year. A World's Industrial Fair was held at New Orleans in 1884-1885, and there were universal Exhibitions at Montenegro and Antwerp in 1885, at Edinburgh in 1886, Liverpool, Adelaide, Newcastle and Manchester in 1887, and at Glasgow, Barcelona and Brussels in 1888. A Mediterranean International Exhibition in 1888-1889 to celebrate the Centenary of Australia. Great Britain, Germany, France, Austria, and the United States were officially represented, and an expenditure of £237,784 was incurred by the local government.

The Paris Exhibition of 1889 marked an important change in the policy which had previously characterized the management of these gatherings. The funds were contributed partly by the state, which voted 17,000,000 francs, and by the municipality of Paris, which gave 8,000,000. A guarantee fund amounting to 23,124,000 francs was raised, and on this security a sum of 18,000,000 francs was obtained and paid into the coffer of the administration. The bankers who advanced this sum recouped themselves by the issue of 1,200,000 "bons," each of 25 francs. Every bond contained 25 admissions, valued at 1 franc, and certain privileges in the shape of participation in a lottery, the grand prize being 50,000 francs. The calculations of the promoters were tolerably accurate. The attendances reached the unprecedented number of 32,350,207, of whom 25,558,609 paid in entrance tickets and 6,793,667 entered by season tickets. A sum of 2,307,999 francs was obtained by concessions for restaurants and "side-shows," upon which the administration relied for much of the attractiveness of the exhibition. The total expenditure was 44,000,000 francs, and there was a small surplus. The space covered in the Champ de Mars, the Trocadero, the Palais d'Industrie, the Invalides and the Quai d'Orsay was 72 acres, as compared with 66 acres in 1878 and 41 acres in 1867. Amongst the novelties was the Eiffel Tower, 1000 ft. in height, and a faithful reproduction of a street in Cairo. The system of international juries was continued, but instead of gold, silver and copper medals, diplomas of various merits were granted, each entitling the holder to a uniform medal of bronze. Some of the foreign exhibits, though of great beauty and successes, did not add to the dignity of the exhibition. The date at which it was held, the Centenary of the French Revolution, did not commend it to several European governments. Austria, Hungary, Belgium, China, Egypt, Spain, Great Britain, Italy, Luxembourg, Holland, Peru, Portugal, Rumania and Russia took part, but not officially, while Germany, Sweden, Turkey and Montenegro were conspicuous by their absence. On the other hand, Argentina, Bolivia, Chili, the United States, Greece, Guatemala, Morocco, Mexico, Nicaragua, Norway, Paraguay, Salvador, New South African Republic, Switzerland, Uruguay and Venezuela sent commissioners, who were accredited to the government of the French Republic. The total number of exhibitors was 61,722, of which France contributed 33,937, and the rest of the world 27,785. The British and colonial section was under the management of the Society of Arts, which obtained a guarantee fund of £16,800, and, in order to recoup itself for its expenditure, made a charge to exhibitors of 2s. per sq. ft. for the space occupied. There were altogether 1149 British exhibitors, of whom 429 were in the Fine Arts section. One of the features of the exhibition was the number of congresses and conferences held in connexion with it.

During the year 1890 there was a Mining Exhibition at the Crystal Palace, and a Military Exhibition in the grounds of Chelsea Hospital; in 1891 a Naval Exhibition at Chelsea and an International at Jamaica. In 1891-1892 there were exhibitions at Palermo and at Launceston in Tasmania; in 1892, a Naval Exhibition at Liverpool, and one of Electrical Appliances at the Crystal Palace. A series of small national exhibitions under private management was held at Earl's Court between 1887 and 1891. The first of the series was that of the United States—Italy followed in 1888, Spain in 1889, France in 1890 and Germany in 1891.

The next exhibition of the first order of magnitude was at Chicago in 1893, and was held in celebration of the 400th anniversary of the discovery of America by Columbus. The financial arrangements were undertaken by a company, with a capital of £2,000,000. The central government at Washington allotted £20,000 for the purposes of foreign exhibits, and £500,000 for the erection and administration of a building for exhibits from the various government departments. The exhibition was held at Jackson Park, a place for public recreation, 580 acres in extent, situated on the shore of Lake Michigan, on the southern side of the city, with which it was connected by railways and tramways. Special provision was made for locomotion in the grounds themselves by a continuous travelling platform and an elevated electric railway. The proximity of the lake, and of some artificial canals which had been constructed, rendered possible the service of electric and steam launches. The exhibition remained open from the 1st of May to the 30th of October, and was visited by 21,477,712 persons, each of whom paid half a dollar (25 cts. rd.) for admission. The largest number of visitors on any one day was 716,881. In addition to its direct vote of £3,000,000, Congress granted £500,000 to the exhibition in a special coining, which sold at an enhanced price. The receipts from admissions were £2,120,000; from concessions, £750,000; and the miscellaneous receipts, £1,590,000: total, £5,399,000. The total expenses were £5,222,000. Of the sums raised by the Company, £400,000 was returned to the subscribers. Speaking roughly, it may be said that the total outlay on the Chicago Exhibition was six millions sterling, of which three millions were earned by the U.S., the women's industries supported by Chicago and a million provided by the United States government. The sums expended by the participating foreign governments were estimated at £1,440,000. The total area occupied by buildings at Chicago was as nearly as possible 200 acres, the largest building, that devoted to manufactures, being 1867 ft. by 787, and 30-2 acres. The funds for the British commission, which was under the control of the Society of Arts, were provided by the imperial government, which granted £600,000. The number of British exhibitors was 2236, of whom 597 were Industrial, 501 Fine Arts and 1138 Women's. A large number of exclusive buildings, held by a number of foreign governments, were erected by the United States government. Canada and New South Wales had separate buildings, which covered 100,140 and 30,957 sq. ft. respectively; and Cape Colony occupied 5320, Ceylon 27,574, British Guiana 3367, Jamaica 4150, Trinidad 3400 and India 3584 sq. ft. in the several buildings. The total space occupied by the British Colonies was therefore 103,660 sq. ft. The system of awards was considered extremely unsatisfactory. Instead of international juries, a single judge was appointed for each class, and the recompenses were all of one grade, a bronze medal and a diploma, on which was stated the reasons which induced the
EXHIBITION

judge to make his decision. Some judges took a high standard, and refused to make awards except to a small proportion of selected exhibits; others took a low one, and gave awards indiscriminately. About 1,183 awards were made to British exhibitors. The French refused to accept any awards. The value of the British goods exhibited was estimated, exclusive of Fine Arts, at £450,000, and the expenses of showing them at £90,000. A large expenditure was incurred in the erection of buildings, which were more remarkable for their beauty and grandeur than for their suitableness to the purposes for which they were intended. Considerable areas were devoted to "side-shows," and the Midway Plaisance, as it was termed, resembled a gigantic fair. Every country in the world contributed something. There were sights and shows of every sort from everywhere. The foreign countries represented were Argentine, Austria, Belgium, Bolivia, Brazil, Bulgaria, Chile, Colombia, Costa Rica, Cuba, Curacao, Denmark, Dutch West Indies, Ecuador, France, Germany, Greece, Guatemala, Honduras, Hayti, Japan, J ohore, Korea, Liberia, Mexico, Monaco, Netherlands, Norway, Orange Free State, Paraguay, Persia, Portugal, Russia, Siam, Spain, Sweden, Turkey, United Kingdom and Colonies, Uruguay and Venezuela.

Exhibitions were held at Antwerp, Madrid and Bucharest in 1894; Hobart in 1894-1895; Bordeaux, 1895; Nizhni Novgorod, Berlin and Buda-Pest in 1896; Brussels and Brisbane in 1897. A series of exhibitions, under the management of the London Exh i t i on s Company, commenced at Earl's Court in 1898, and continued in successive years.

The Paris Exhibition of 1900 was larger than any which had been previously held in Europe. The buildings did not cover so much ground as those at Chicago, but many of those at Paris had two or more floors. In addition to the localities occupied in 1889, additional space was obtained at the Champs Elysees, the park of Vincennes, on the north bank of the Seine between the Place de la Concorde, and at the Trocadero. The total superficial area occupied was as follows: Champ de Mars, 124 acres; Esplanade des Invalides, 30 acres; Trocadero Gardens, 40 acres; Champs Elysees, 37 acres; quays on left bank of Seine, 13 acres; quays on right bank of Seine, 23 acres; park at Vincennes, 279 acres; total, 540 acres. The space occupied by buildings and covered in amounted to 4,865,328 sq. ft., 1,111 acres. The French section covered 2,691,000 sq. ft., the foreign 1,829,880, and those at the park of Vincennes 344,448 sq. ft. About one hundred French and seventy-five foreign pavilions and detached buildings were erected in the grounds in addition to the thirty-six official pavilions, which were for the most part along the Quai d'Orsay. Funds were raised upon the same system as that adopted in 1889. The French government granted £800,000, and a similar sum was contributed by the municipalities of half the 2,400,000 was raised by the issue of 3,250,000 "bons," each of the value of 20 francs, and containing 20 tickets of admission to the exhibition of the face value of one franc each, and a document which gave its holder a right either to a reduced rate for admission to the different "side-shows" or else to a diminution in the railway fare to and from Paris, together with a participation in the prizes, amounting to six million francs, drawn at a series of lotteries. Permission to erect restaurants, and to open places of amusement in buildings erected for that purpose, were sold at high prices, and for these privileges, which only realised 2,307,999 francs in 1889, the concessionnaires agreed to pay 880,000 francs. The results did not justify the expectations which had been formed, and the administration finally consented to receive a much smaller sum. The administration calculated that they would have 65,000,000 paying visitors, though there were only 13,000,000 in 1878 and 25,398,609 in 1889. A very few weeks after the opening day, April 15th, it became evident that the estimated figures would not be reached, since a large number of holders of "bons" threw them on the market, and the selling price of an admission ticket declined from the par value of one franc to less than half that amount, or from 30 to 50 centimes. The proprietor of the restaurants and "side-shows" discovered that they had paid too much for their concessions, that the buildings they had erected were far too handsome and costly to be profitable, and that the public preferred the exhibition itself to the so-called attractions. The exhibition was largely visited by foreigners, but various causes kept away many persons of wealth and position. Although many speculators were ruined, the exhibition itself was successful. The attendance was unprecedentedly large, and during the seven months the exhibition was open, 39,000,000 persons paid for admission with 47,000,000 tickets, since from two to five tickets were demanded at certain times of the day and on certain occasions. The entries of exhibitors, attendants and officials totalled 9,000,000. The receipts were 114,456,213 francs (£4,578,249), and the expenditure 116,500,000 francs (£4,660,000), leaving a deficiency of rather more than two million francs (£80,000). It was calculated that the expenditure of the foreign nations which took part in the exhibition was six millions sterling, and of the French exhibitors and concessionnaires three millions sterling.

A new plan of classifying exhibits was adopted at Paris, all being displayed according to their nature, and not according to their country of origin, as had been the system at previous exhibitions. One-half the space in each group was allotted to France, so that the exhibitors of that nation were enabled to overwhelm their rivals by the number and magnitude of the objects displayed by them. All the agricultural implements, whatever their nationality, were in one cell, all the ceramics in another, so that there was no exclusively British and no exclusively German court. The one exception to this rule was the pageant of Egypt, which was subdivided; the countries were arranged in their proper alphabetical order, the class being called Egyptian, Arab, or African. The British Colonies, Algeria, Tunisia, Siberia, the South American Republics, China and Japan were allowed to erect at their own cost separate pavilions. The greater number of the nationalities represented had palaces of their own in the rue des Nations along the Quai d'Orsay, in which thoroughfare were to be seen the buildings erected by Italy, Turkey, the United States, Denmark, Portugal, Austria, Bosnia, Herzegovina, Peru, Hungary, the United Kingdom, Persia, Belgium, Norway, Luxemburg, Finland, Germany, Spain, Bulgar ia, Monaco, Sweden, Rumania, Greece, Servia and Mexico. Scattered about the grounds, in addition to those in the Trocadero, were the buildings of San Marino, Morocco, Ecuador and Korea. Nearly every civilized country in the world was represented at the exhibition, the most conspicuous absentees being Argentina, Brazil, Chile, and some other South and Central American Republics, and a number of the British colonies. The most noteworthy attractions of the exhibition were the magnificent effects produced by electricity in the palace devoted to it in the Chateau d'Eau and in the Hall of Illusions, the two palaces of the Fine Arts in the Champs Elysees, and the Bridge over the Seine dedicated to the memory of Alexander II. These permanent Fine Art palaces were devoted, the one to modern painting and sculpture, the other to the works of French artists and art workmen who flourished from the dawn of French art up to the end of the 18th century.

The United Kingdom was well but not largely represented both in Fine Arts and Manufactures, the administration of the section being in the hands of a royal commission, presided over by the prince of Wales. The British pavilion contained an important collection of paintings of the British school, chiefly by Reynolds, Gainsborough and their contemporaries, and by Turner and Burne-Jones. Special buildings had been erected by the British colonies and by British India. Canada, West Australia and Mauritius occupied the former, India and Ceylon the latter. For the first time since the war of 1870 Germany took part in a French International Exhibition, and the exhibits showed the great industrial progress which had been made since the foundation of the empire in 1870. The United States made a fine display, and fairly divided the honours with Germany. Remarkable progress was manifested in the exhibits of Canada and Hungary. France maintained her superiority in all the objects in which good taste was the first consideration, but the more utilitarian exhibits were more remarkable for their number than...
EXHUMATION—EXILE

their quality, except those connected with electrical work and display, automobiles and iron-work. The number of exhibitors in the industrial section from the British empire, including India and the colonies, was 1250, who obtained 1647 awards, as many persons exhibited in several classes. There were, in addition, 465 awards for "collaborators," that is, assistants, engineers, foremen, craftsmen and workmen who had co-operated in the production of the exhibits. In the British Fine Arts section there were 495 exhibits by 282 exhibitors and 173 awards.

In later years, important international exhibitions have been held at Glasgow, London, Buffalo, New York, in 1901, at St. Louis, commemorating the Louisiana Purchase in 1904, at Liège in 1905, at Milan in 1906, at Dublin in 1907, and in London (Franco-British), 1908. In the artistic taste and magnificence of their buildings and the interest of their exhibits these took their cue from the great Paris Exhibition, and even in some cases went beyond it, notably at Buffalo (q.v.), St. Louis (q.v.) and London. And it might well be thought that the evolution of this type of public show had reached its limits. (G. C. L.)

EXHUMATION (from Med. Lat. exhumar; ex, out of, and humus, ground), the act of digging up and removing an object from the ground. The word is particularly applied to the removal of a dead body from its place of burial. For the offence of exhuming a body without legal authority, and the process of obtaining such authority, see BURIAL AND BURIAL ACTS.

EXILARCH, in Jewish history, "Chief or Prince of the Captivity." The Jews of Babylon, after the fall of the first temple, were termed by Jeremiah and Ezekiel the people of the "Exile." Hence the head of the Babylonian Jews was the exilarch (in Aramaic Rosh Golbalta). The office was hereditary and carried with it considerable power. Some traditions regarded the last king of Davidic descent (Jehoiachin) as the first exilarch, and all the later holders of the dignity claimed to be scions of the royal house of Judah. Under the Arsacids and Sassanids the office continued. In the 6th century an attempt was made to secure by force political autonomy for the Jews, but the exilarch who led the movement (Mar Zu'tra) was executed. For some time thereafter the office was in abeyance, but under Arabic rule there was a considerable revival of its dignity. From the middle of the 7th till the 11th centuries the exilarchs were all descendants of Bostanai, through whom "the splendour of the office was renewed and its political position made secure" (Bacher). The last exilarch of importance was David, son of Zakki, whose court is mentioned (see above). Hezekiah (c. 1040) was the last Babylonian exilarch, though the title left its traces in later ages. Benjamin of Tudela (Itinerary, p. 61) names an exilarch Daniel b. Hisdai in the 12th century. Petajah (Travels, p. 17) records that this Daniel's nephew succeeded to the office jointly with a R. Samuel. The latter, according to Petajah, had a learned daughter who "gave instruction, through a window, remaining in the house while the disciples were below, unable to see her."

Our chief knowledge of the position and function of the exilarch concerns the period beginning with the Arab conquest in Persia. It is of marked importance that the exilarch was noted for the stately retinue that accompanied him, the luxurious banquets given at his abode, and the courtly etiquette that prevailed there. A brilliant account has come down of the ceremonies at the installation of a new exilarch. Homage was paid to him by the rabbinical heads of the colleges (each of whom was called Gaon, q.v.); rich gifts were presented; he visited the synagogue in state, where a costly canopy had been erected over his seat. The exilarch then delivered a discourse, and in the benediction or doxology (Qoddish) his name was inserted. Thereafter he never left his house except in a carriage of state and in the company of a large retinue. He would frequently have audiences of the king, by whom he was graciously received. He derived a revenue from taxes which he was empowered to exact. The exilarch could communicate, and no doubt had considerable jurisdiction over the Jews. A spirited description of the glories of the exilarch is given in D'Sraeli's novel Abroy.
EXIL—EXMOUTH

from the symbols of civic communion, or from "the marks of a pure society, which the criminal would defile by his further use of them." Subsequently (probably at the time of the Gracchi) it became a recognized legal penalty, practically equivalent to "exile," taking the place of capital punishment. The criminal was permitted to withdraw from the city after sentence was pronounced; but in order that this withdrawal might as far as possible be the character of a punishment, his departure was sanctioned by a decree of the people which declared his exile permanent. Authorities are not agreed whether this exile by interdiction entailed loss of civilitas; according to some this did not ensue until (as in earlier times) the criminal had assumed the citizenship of the state in which he had taken refuge and thereby lost his rights as a citizen of Rome, while others hold that it was not until the time of Tiberius (A.D. 23) that capitis deminutio media became the direct consequence of trial and conviction. Interdictio was the punishment for treason, murder, arson and other serious offences which came under the cognizance of the quaestiones pretorii (permanent judicial commissions for certain offences); confiscation of property was only inflicted in extreme cases.

Under the Empire interdictio gradually fell into disuse and a new form of banishment, introduced by Augustus, called deportatio, generally in insulam, took its place. For some time the two probably existed side by side. Deportatio consisted in transportation for life to an island (or some place prescribed on the mainland, not of Italy), accompanied by loss of civilitas and all civil rights, and confiscation of property. The most dreaded places of exile were the islands of Gyarus, Sardinia, an oasis in the desert (quasi in insulam) of Libya; Crete, Cyprus and Rhodes were considered more tolerable. Large bodies of persons were also transported in this manner; thus Tiberius sent 4000 freedmen to Sardinia for Jewish or Egyptian superstitious practices. Deportatio was originally inflicted upon political criminals, but in course of time became more particularly a means of removing those whose wealth and popularity rendered them objects of suspicion. It was also a punishment for the following offences: adultery, murder, poisoning, forgery, embezzlement, sacrilege and certain cases of immorality. Relegatio was a milder form of deportatio. It either excluded the person banished from one specified district only, with permission to choose a residence elsewhere, or the place of exile was fixed. Relegatio could be either temporary or for life, but it did not in either case carry with it loss of civilitas or property, nor was the exile under military surveillance, as in the case of deportatio. Thus, Ovid, when in exile at Tomi, says (Tristia, v. 11): "I lie (i.e. the emperor) has not deprived me of life, nor of wealth, nor of the rights of a citizen... he has simply ordered me to leave my home." He calls himself relegatus, not exsul.

In later writers the word exsulium is used in the sense of all its three forms—exsule et ignis interdictio, deportatio and relegatio.

In England the first enactment legalising banishment dates from the reign of Elizabeth (39 Eliz. c. 4), which gave power to banish from the realm "such rogues as are dangerous to the inferior people." A statute of Charles II. (18 Car. II. c. 3) gave power to execute or to transport to America for life the moostroopers of Cumberland and Northumberland. Banishment or transportation for criminal offences was regulated by an act of 1824 (5 Geo. IV. s. 84) and finally abolished by the Penal Servitude Acts 1853 and 1857 (see further DEPORTATION). The word exile has sometimes, though wrongly, been applied to the sending away from France in the several cases of exile, but who may be temporary or even permanent residents in it (EHILLEN; EXPIRATION; EXPULSION).

Léevavrin and G. Humbert).

EXILI, an Italian chemist and poisoner in the 17th century. His real name was probably Nicolò Geggì or Eggidio. Few authentic details of his life exist. Tradition, however, credits him with having been originally the salaried poisoner at Rome of Olympia Maldachina, the mistress of Pope Innocent X. Subsequently he became a gentleman in waiting to Queen Christina of Sweden, whose taste for chemistry may have influenced this appointment. In 1665, his presence in France aroused the suspicions of the French government, and he was imprisoned in the Bastille. Here he is said to have made the acquaintance of Godin de Sainte-Croix, the lover of the marquise de Brinvilliers (q.v.). After three months' imprisonment, powerful influences secured Exili's release, and he left France for England. In 1681 he was again in Italy, where he married the countess Fantaguzzi, second cousin of Duke Francis of Modena.

EXMOOR FOREST, a high moorland in Somersetshire and Devonshire, England. The uplands of this district are bounded by the low alluvial plain of Sedgemoor on the east, by the lower basin of the Exe on the south, by the basin of the Taw (in part) on the west, and by the Bristol Channel on the north. The area thus defined, however, includes not only Exmoor but the Brendon and Quantock Hills east of it. Excluding these, the total area of the district lying at an elevation exceeding 1000 ft. is about 320 sq. m. The geological formation is Devonian. The ancient forest had an area of about 20,000 acres, and was enclosed in 1815. Large tracts are still uncultivated; and the wild red deer and native Exmoor pony are characteristic of the district. The highest point is Dunkery Beacon in the east (1707 ft.), but the height of the south-west is only 1618 ft., and a height of 1500 ft. is exceeded at several points. The Exe, Barle, Lyn and other streams, traversing deep picturesque valleys except in their uppermost courses, are in favour with trout fishermen. The few villages, such as Exford, Withypool and Simonsbath, with Lynton and Lynmouth on the coast, afford centres for tourists and sportsmen. Exmoor is noted for its stag hunting. The district has a further fame through Richard Blackmore's novel, Lorna Doone.

EXMOUTH, EDWARD PELLEW, 1ST VISCOUNT (1755–1833), English admiral, was descended from a family which came originally from Normandy, but had for many centuries been settled in the west of Cornwall. He was born at Dover, on the 19th of April 1757. At the age of thirteen he entered the navy, and even then his smartness and activity, his feats of daring, and his spirit of resolute independence awakened remark, and pointed him out as one specially fitted to distinguish himself in his profession. He had, however, no opportunity of active service till 1776, when, at the battle of Lake Champlain, his gallantry, promptitude and skill, not only saved the "Carleton"—whose command had devolved upon him during the progress of the battle—from imminent danger, but enabled her to take a prominent part in sinking two of the enemy's ships. For his services on this occasion he obtained a lieutenant's commission, and the command of the schooner in which he had so bravely done his duty. The following year, in command of a brigade of seamen, he shared in the hardships and perils of the American campaign of General Burgoyne. In 1782, in command of the "Pelican," he attacked three French privateers inside the Île de Batz, and compelled them to run themselves on shore—a feat for which he was rewarded by the rank of post-capitan. On the outbreak of the French War in 1793, he was appointed to the "Nymph," a frigate of 36 guns; and, notwithstanding that she was the saker, he obtained the command of the "French frigate "La Cleopâtre," a vessel of equal strength. For this act he obtained the honour of knighthood. In 1794 he received the command of the "Arethusa" (38), and in a fight with the French frigate squadron off the Île de Batz he compelled the "Pomona" (44) to surrender. The same year the western squadron was increased and its command divided, the second squadron being given to Sir Edward Pellew in the "Indefatigable" (44). While in command of this squadron he, on several occasions, performed acts of great personal daring;
EXMOUTH—EXODUS, BOOK OF

and for his bravery in boarding the wrecked transport "Dutton," and his promptitude and resolution in adopting measures so as to save the lives of all on board, he was in 1796 created a baronet. In 1798 he joined theChannel fleet, and in command of the "Impétueux" (74) took part in several actions with great distinction. In 1802 Sir Edward Pelley was elected member of parliament for Dunstable, and during the time that he sat in the Commons he was a strenuous supporter of Pitt. In 1804 he was made rear-admiral of the blue, and appointed commander-in-chief in India, where, by his vigilance and rapidity of movement, he entirely cleared the seas of French cruisers, and secured complete protection to English commerce. He returned to England in 1809, and in 1810 was appointed commander-in-chief in the North Sea, and in 1811 commander-in-chief in the Mediterranean. In 1814 he was created Baron Exmouth of Camperdown, and in the following year was made K.C.B., and a little later G.C.B.

When the day of Algiers, in 1816, violated the treaty for the abolition of slavery, Exmouth was directed to attack the town. Accordingly, on the 26th of August, he engaged the Algerine battery and fleet, and after a severe action of nine hours' duration, he set fire on the arsenal and every vessel of the enemy's fleet, and shattered the sea defences into ruins. At the close of the action the day apologized for his conduct, and agreed to a renewal of the treaty, at the same time delivering up over three thousand persons of various nationalities who had been Algerine slaves. For this partial victory Exmouth was advanced to the dignity of viscount. Shortly before his death, which took place on the 23rd of January 1833, he was made vice-admiral.

He had married Susan (d. 1837), daughter of James Frowde of Knoyle, Wiltshire, who bore him four sons and two daughters. His eldest son, Pownoll Bastard Pelley (1786–1833), became 2nd Viscount Exmouth, and his descendant, Edward Addington Hargreaves Pelley (b. 1890), became the 6th viscount in 1890.

Exmouth's second son, Sir Fleetwood Broughton Reynolds Pelley (1789–1861), was like his father an admiral. The third son was George Pelley (1793–1866), author and divine, who married Frances (d. 1870), daughter of the prime minister Lord Sidmouth, and wrote his father-in-law's life (The Life and Correspondence of Henry Addington, 1st Viscount Sidmouth, 1847).

Exmouth had a brother, Sir Ismel Pelley (1758–1832), also an admiral, who was present at the battle of Trafalgar.

A Life of the 1st viscount, by Edward Oster, was published in 1835.

EXMOUTH, a market-town, sea-port and watering-place in the Honiton parliamentary division of Devonshire, England, at the mouth of the river Exe, 103 m. S.E. by S. of Exeter by the London & South-Western railway. Pop. of urban district (1901) 4,992. It is the chief sea port of the county, and is a valuable resort for sea-bathing. The sea is within three miles of the town. The town is entered by two gates, one on each side of the river. The sea defences are composed of brick and tile and are named "Forty Years." The town is a market for dairy produce, and is supplied with coal from Weymouth. The sea front is a popular watering-place for the invalids of Devon and Cornwall, and the sea-bathing season is from June to August. The town is supplied with good water. The sea-bathing season is from June to August.

EXODUS, BOOK OF, in the Bible, a book of the Old Testament which derives its name, through the Greek, from the event which forms the main portion of the history it narrates, viz. the deliverance of Israel from Egypt. Strictly speaking, however, this title is applicable to the first half only, which comprises the portion of the book, and takes no account of those chapters which describe the giving of the Law on Mt Sinai, nor of those which deal with the Tabernacle and its furniture. By the Jews it is usually styled after its opening words ספר תרי"ש (Sifre Téria'h), or more briefly, ספר (Shémot). In its present form the book sets forth (a) the oppression of the Israelites in Egypt (ch. i.), (b) the birth and education of Moses, and his flight to the land of Midian (ch. ii.), (c) the theophany at Mt Horeb (the Burning Bush), and the subsequent commission of Moses and Aaron (iii. i–iv. 17), (d) the return of Moses to Egypt, and his appeal to Pharaoh which results in the further oppression of Israel (iv. 18–vii. 7), (e) the plagues of Egypt (viii. 7–ix. 10), (f) the institution of the Passover and of the Feast of Unleavened Cakes, the last plague, and Israel's departure from Egypt (xii. 1–xiii. 16), (g) the crossing of the Red Sea and the discomfiture of the Egyptians, the Song of Triumph, the sending of the manna and other incidents of the journeying through the wilderness (xiii. 17–xviii. 26), (h) the giving of the Law, including the Decalogue and the so-called Book of the Covenant, on Sinai-Horeb (xix.–xxiv.), (i) directions for the building of the Tabernacle and for the consecration of the priests (xxv.–xxx.), (j) the sin of the Golden Calf, and another earlier version of the first legislation (xxxii.–xxxiv.), (k) the construction of the Tabernacle and its erection (xxxv.–xxxvi.).

The book of Exodus, however, like the other books of the Hexateuch, is a composite work which has passed, so to speak, through many formations; hence the order of events given above cannot lay claim to any higher authority than that of the latest editor. Moreover, the documents from which the book has been compiled belong to different periods in the history of Israel, and each of them, admittedly, reflects the standpoint of the age in which it was written. It follows that the contents of the book are not of equal historical value; and though the claim of a passage to be considered historical is not necessarily determined by the age of the source from which it is derived, yet, in view of the known practice of Hebrew writers, greater weight naturally attaches to the earlier documents in those cases in which the narrative has been altered in consequence. Therefore, at restoring the actual course of history must be preceded by an inquiry into the source of the various contents of the book.

The sources from which the book of Exodus has been compiled are the same as those which form the basis of the book of Genesis, while the method of composition is very similar. Here, too, the strongly marked characteristics of P, or the Priestly Document, as opposed to JE, enable us to determine the extent of that document with comparative ease; but the absence, in some cases, of conclusive criteria prevents any final judgment as to the exact limits of the two strands which have been united in the composite JE. The JE version of the book may be divided into the legislative portions of the book: in the historical sections the separation of the two sources gives rise to fewer difficulties. It does not, however, lie within the scope of the present article to examine the various sources underlying the narrative with any minuteness, but rather to sum up those results of modern criticism which have been generally accepted by Old Testament scholars. To this end it will be convenient to treat the subject-matter of the book under three main heads: (a) the historical portion (ch. i.–xviii.), (b) the sections dealing with the giving of the Law (xix.–xxiv.), once more with one, and (c) the construction of the Tabernacle and its furniture (xxxv.–xxxvi.).

(a) Israel in Egypt and the Exodus (ch. i.–xviii.). (1) i.–vii. 13.

—The analysis of these chapters shows that the history, in the main, has been derived from the two sources J and E, chiefly the former, and that in a latter editor has inserted certain passages from P, besides introducing a slight alteration of the original order and other re-dactional changes. The combined narrative of JE sets forth the rise of a new king in Egypt, who endeavoured to check the growing strength of the children of Israel; then the birth of Moses, his early life in Egypt, his flight to Midian and marriage with Zipporah, the theophany at Mt. Horeb, and his divine commission to deliver Israel from Egypt. At the very outset the editors of the two latter portions of the narrative portray their divergent origin and point of view. According to J (i. 6, 8, 12–20) the Israelites dwell apart in the province of Goshen, and their numbers become so great as to call for severe measures of repression, the method of which was Nicolau, on the other hand (i. 15–200...
21, 22), represents them as living among the Egyptians, and so few in number that two midwives satisfy their requirements. It is to this latter source that we owe the account of the birth of Moses and his subsequent career at the court of Pharaoh. In manhood Moses openly displays his sympathy with his brethren by slaying an Egyptian, and has, in consequence, to flee to Midian, where he marries Zipporah, the daughter of the priest of Midian (2). In the main these Vss. 1-18 are the result of a twofold origin (iii. 24-25, 5, 7, 8, 16-18; iv. 1-12 (13-16), 29-31; E iii. 1, 46, 9, 14, 21, 22; iv. 17, 18, 20b, 27, 28). These two sources present striking points of difference, which can be satisfactorily explained. According to E, Moses with Aaron is to demand from Pharaoh the release of Israel, which will be effected in spite of his opposition; in assurance thereof the promise is given that they shall serve God upon the very spot where they are standing. But another document, viz. "three days' journey into the wilderness"; their departure from Egypt is a hurried one. Yet another difficulty, which disappears as soon as the composite character of the narrative is recognized, is that in J there is only a single passage of recognizably reserving Moses, only one of which is withdrawn with the rod (iv. 1-9), but in iv. 17 (E) the reference is clearly to entirely different signs, probably the plagues of Egypt, which according to E were invariably wrought by "the rod of God." Further, it is questionable whether the passage iv. 13-16 really forms part of the original narrative of J, and is not rather to be ascribed to the redactor of JE. The narrative of J has the advantage of having been retained in the account of the plagues of frogs (viii. 12), and the only passage in which Aaron is represented as taking an active part is iv. 29-31, where the mention of his name causes no little difficulty. In E, on the other hand, Aaron is sent by God to meet Moses at Mt. Horeb, after the latter had taken leave of Jethro, and later on, accompanied him into the presence of Pharaoh. The succeeding narrative (v. 1-vi. 1) is mainly taken from J, though E's account of the escape of Jethro is borrowed (Num. x. 29). Both the account of Moses' departure and the description of the plagues (vii. 1, 2, 4) are E. Moses and the elders ask leave to go three days' journey into the wilderness to sacrifice to Yahweh, a request which is met by an equally remarkable promise. The passage "we have not before heard the like," and the Israelites have to provide their own straw. The people complain bitterly to Moses, who appeals to Yahweh and is assured by him of the future deliverance of Israel by a strong hand. With the exception of the genealogical list (i. 5-6) and the brief notices of the increase of Israel (i. 7) and of its oppression under the hands of the Egyptians (i. 13; 14; ii. 23b-25), the narrative so far exhibits no traces of P. But in vi. 2-7.13 we are confronted with a different narrative, which we may at least assume to be that of Moses in iv. 16-18, E, is to a different source for those verses from that of iii. 1 f. Elsewhere J speaks of "Hobab, the son of Reuel the Midianite, Moses' father-in-law" (Num. x. 29), and the additions made in the (secondary) passages iii. 1, xvii. 1 (E). Probably RJE omitted the name in ii. 16 and added "the priest of Midian" in iii. 1, xvii. 1, from harmonizing motives. Further, vi. 15-22 speak of Aaron being born to Moses at this period, a statement which is borne out by iv. 29, 25 ("sons" in iv. 20 is obviously a correction), whereas ch. xviii. (E) mentions two sons. Moses is not, however, mentioned in J seems to have been as follows: after the death of Pharaoh (ii. 532); the Septuagint repeats this notice before iv. 19) Moses returns to Egypt with his wife and son (iv. 19, 20) in obedience to Yahweh's command. On the way he is visited by Yahweh, who promises him a deliverance, explaining that he has not been circumcised and seeks to avert by circumcising her son (iv. 24-26). The scene of the theophany, therefore, according to J, is to be placed on the way from Midian to Goshen. Probably the reference is to iv. 29, 24-25, where Aaron is said to have been thus enabled to combine the two narratives of the theophany. 2 Cf. iv. 30; Aaron had received no command to do the signs, and the words "and he did the signs" are mostly naturally referred to Moses. 3 The explanation in iii. 8c. 15, 17b; iv. 22, 23, are probably the work of a Deuteronomic redactor. 4 The genealogy of Moses and Aaron (xvi. 14-27) appears to be a later addition.
further description of the striving of the people for water at Meribah that the double name Massah-Meribah arose, xvii. 16-7 (ie belongs to P), though Deut. xxxii. 8 makes it clear that Massah and Meribah were simply different names for the same place (where the incident occurs alone): P's version of striving at Meribah, in which traces of J's account have been preserved, is given at Num. xx. 1-13.

xviii. The Battle with Amalek at Rephidim.—This incident is derived from E, but E, like P, had no direct access to the present context. Its close connexion with the end of the wanderings is shown by (a) the description of Moses as an infirm old man; (b) the rôle played by the pillar of cloud (cf. xvii. 8, 9); (c) that P, who is introduced as a young man and Moses' minister; and (d) the references elsewhere to the home of the Amalekites: according to Num. xiii. 20, 21, xiv. 25, xlii. 45, they dwelt in the S. or S.W. of Judah near the city of Beer-sheba.

xviii. The visit of Jehoshaphat to Moses and the appointment of judges. —This story, like the preceding one, is mainly derived from E and is also known in another form. All that is said in the chapter itself point unmistakably to a time just before the death of Moses. The story is, however, apparently confirmed both by Deut. i. 9-16 and by the parallel account of J in Num. x. 29-32. The narrative, however, displays signs of compilation, and it is not improbable that E has incorporated in it 7-11 part of J's account of the visit of Moses' father-in-law (cf. the use of Yahweh).

(b) Ch. xix.-xxiv., xxxii.-xxxiv.—The contents of these chapters, which are contributed to the book by their compilers, form the most important part of the book of Exodus, may be briefly analysed as follows. In ch. xix. we have a twofold description of the theophany on Mt. Sinai (or Horeb) followed by a two-fold account of the giving of the law. In ch. xx. we pass to the departure. In ch. xx.-xxii. 17, in contrast to the present writer, it has been argued that the composition employed by Hebrew editors, or revisers, it is possible in this case, as in others, not only to determine the source of each individual passage, but also to trace with considerable confidence the various stages in the process by which it reached its final form and position. It must, however, be admitted that the evidence at our disposal is, in some cases, capable of more than one interpretation. Hence a final conclusion can hardly be expected, but with certain modifications in definition the following solution of the problem may be accepted as representing the point of view of recent criticism.

Ch. xix. contains two parallel accounts of the theophany on Horeb. These two accounts, respectively, outline the E and P's narratives, and deal with different aspects of the same event. We have a double examination of the law (xvi. 1-25; xx. 19-24), and a double account of the departure of the people (xx. 1-13, xxii. 1-19). The connexion of the two accounts is further indicated by the story of the presentation of Aaron and Miriam to Yahweh, which in itself is a sub-invention. In this connexion we have a double description of the law, but here in ch. xxi. (E) and in xxii.-xxiv. 17 (P's version). The account of the departure of the people is in two stages, the first being xxii. 1-19, the second xxii. 20-xxiv. 16. Of these two stages, the second, viz. xxii. 20-xxiv. 16, has been written by E, and xxii. 1-19 has been written by P. In ch. xxiv., the only factor in the narrative is the sacrificial rite.
of the mountain, but that Moses alone was permitted to approach Yahweh. Then followed the theophany, and, as the text stands, the whole period (ch. xxiii.-xlvii.) is an original. The narrative is given in ch. xxxiv., which describes how Moses hewed two tables of stone at Yahweh's command, and went up to the top of the mountain, where he received the words of the covenant and wrote them on the tablets. As a result, however, this chapter represents the legislation which it contains as a renewal of a former covenant, also written on tables of stone, which had been broken (ib. 448). But the document, as a whole, is a later composition. Further, a revision of the table text, while the previous references to tables of stone and to Moses' breaking them belong to the parallel narrative of E. Moreover, the covenant here set forth (v. 10 f.) is clearly a new one, and contains no hint of the former covenant. The revised legislation, therefore, was not a renewal of the former covenant, but was added by a later redactor. Mention should be made of the fact that this redactor, with his later date, has preserved the people's interest in their ancient heritage. 

The legislation contained in xxxiv. 10-26, which may be described as the oldest legal code of the Hexateuch, is almost entirely religious. It prohibits the making of molten images (v. 17), the use of idols in sacrifice (25), the retention of the sacrifices inclusive of the male (27), and the seething of a kid in its mother's milk (26); and enjoins the observance of the three annual feasts and the Sabbath (17-22), of the religious festival of the first-born (19, 20), derived from xiii. 11-15, and of the first-fruits (26). The parallel collection of p is preserved in xx. 2-26, xxiii. 10-19, to which we should probably add xxii. 29-31 (for which xxii. 19 was substituted by p). The latter is very close to this text, another so closely, both in form and extent, that they can only be regarded as two versions of the same code. H. has, however, preserved certain additional regulations with regard to the building of altars (xx. 24-26) and the observance of the seventh day (xxi. 10, 11), and omits the prohibition of molten images (xx. 22, 23, appear to be the work of a redactor); xxiii. 20-33, the promises attached to the observance of the sabbath (xxiii. 20); and regulations xxi. 2-25, probably formed no part of the original code, but were added by the Deuteronomic redactor; e. g. especially vv. 23-25a, 27, 28, 31b-33. The narrative of b relative to the delivery of these laws has disappeared, but xxx-14, without the promise, is preserved by no less than three redactors (ch. xxxiv., 5). The parallel collections are practically limited to the explanatory comments attached to the 2nd, 4th, 5th and 10th commandments; and the majority of critics are now agreed that these comments were added at a later date, and that these additions were inserted without their original context clearly point back to some such narrative. These verses describe how Moses wrote all the words of the Lord in a book and recited them to the people (v. 7) as the basis of a covenant, which was to be ratified by the sprinkling of the blood of the accompanying sacrifices.

In the existing text the covenant laws of E (xx. 24-26, xxii. 29-31, xxiii. 10-19) are combined with a mass of civil and other legislation; hence the title "Book of the Covenant" (referred to above, xxxiv. 25), which has usually been applied to the whole section, xx. 22-xxiii. 33. But this section includes three distinct elements: (a) the "words of " (Gen. xvii. 7), which are preserved in xxii. 1-10; (b) another "collection of commandments" (xxvii. 1-26), which are expressed in a hypothetical form, consist of a number of legal decrees, and are preserved in xxxiv. 1-7; and (c) the "judgments," which are expressed in a metaphorical form, consist of a number of legal decrees, and are preserved in xxxiv. 1-7. These three collections can be divided into five divisions: (1) The rights of slaves, xxx. 11-21; (2) capital offences, xxx. 12-16 (v. 17 has probably been added later); (3) injuries inflicted by man or beast, xxx. 16-22; (4) laws incurred by culpable negligence or theft, xxx. 23-xxi. 6; (5) cases arising out of deposits, loans, seduction, xxiii. 7-17. It is obvious, from their very nature, that these legal precedents could not have been included in the covenant which the people (xxxiv. 3) promised to observe, and it is generally admitted that the words and the judgments (which are missing in c. i b) have been inserted in xxxiv. 36 by the redactor, who is responsible for the composition of this section.

The majority of critics, therefore, adopt Kuenen's conjecture that the judgments were originally delivered by Moses on the borders of Moab, and that when D's revised version of Ex. xxii.-xxiii. was compiled, the materials included in these chapters were inserted at the beginning, and a new introduction was written at the end. The original material at the end of Ex. xii.-xxiii. must have run, "That I may give thee the tables of stone which I have written, and may teach thee the law and the commandment." For further details see Bacon, "triple tradition of Exodus", pp. 111 f., 132 f.; and the references given there.
EXODUS

(1) The Sin of the People.—According to J (xxxiii. 25-29) the people, during the absence of Moses, "break loose," i.e., mutiny. The narrative is a fragmentary description of a number of incidents which responded to his appeal the sons of Levi arm themselves and slay a large number of the people, as a reward for their services they are bidden to consecrate themselves to Yahweh. The fragmentary form of the story is due to the interpolation of material of Aarons (xxxiii. 1-5, 16-26), a tale of its own, but has no connexion with the movement. At the instigation of the people Aaron makes a molten calf out of the golden ornaments brought from Egypt; Moses and Joshua, on their return to the camp, find the people holding festival in honour of the calf. They seize the golden image, but, however, the idol which he is carrying: he then demolishes the golden calf, and administers a severe rebuke to Aaron. The punishment of the people is briefly recorded in xxxv. 5. This latter narrative, which is obviously interpolated, though its historicity is not in doubt, could have been brought in at a later period. In its present form, however, it can hardly be original, but must have been revised in accordance with the later Deuteronomic conception which represented the sin committed by the people as a breach of the 2nd commandment. Possibility xxxii. 7-14 are also to be treated as a Deuteronomic expansion (cf. Deut. ix. 12-14). Though they show clear traces of J, it is extremely difficult to fit them into that narrative in which they are contained, and of his intercession in ch. xxxvii.; in any case, xxxv. 8 and 13 must be regarded as redactional.

(2) Aaron’s Intercession.—The time for departure from the Sacred Mountain had now arrived, and Moses is accordingly bidden to lead the people to the promised land. Yahweh himself refuses to accompany Israel owing to their disobedience; but in response to Moses’ supplication represents the people as his instrument. The account of Moses’ intercession has been preserved in J, though the narrative has undergone considerable dislocation. The true sequence of the narrative appears to be as follows: Moses is commanded to send the people to Canaan (xxxii. 1-3); he pleads that he is unequal to the task (Num. xi. 10, 27, 12, 14, 15), and, presumably, asks for assistance, which is promised (omitted). Moses then asks for a fuller knowledge of Yahweh and his ways (xxxii. 12, 13); this request also is granted (vs. 17), and is acceded to by "I will make he may see the glory of Yahweh; Yahweh replies that his prayer only can be granted in part, for "man shall not see me and live"; a partial revelation is then vouchsafed to Moses (xxxiii. 18-23, xxxiv. 6-8); finally, Moses beseeches Yahweh to go to the midst of his people, and is assured that Yahweh’s presence shall accompany them (xxxv. 9, xxxiii. 14-16). The passage from Numbers xli., which has been improperly placed in its present context (the story of the quails), and supplies in part the necessary antecedent to Ex. xxxiii. 12, 13; the passage is now separated from Ex. xxxii. by Ex. xxxiv. 1), which has been wrongly transferred to the priestly legislation of Ex. xxxv.- xl., Leviticus and Num. i.-x.; but originally it must have stood in close connexion with that chapter. A similar dislocation is also exhibited in the connexion with the narrative of the tree of the knowledge of good and evil, which clearly forms the sequel to xxxii. 17-23. The latter passage, however, can hardly represent the conclusion of the interview, which is found more naturally in xxxiii. 14-16. E’s account of Moses’ intercession in xxxiii. 10-17 has been modified, possibly and to some extent, by a later stratum, and the passage has probably been revised by a later hand; in any case its position before instead of after the dismissal would seem to be a better interpretation. It is a plausible conjecture that the original narratives of J and E also contained directions for the construction of an ark, as a substitute for the personal presence of Yahweh, and also for the erection of a tent of meeting outside the camp, and that these commands were omitted by R in favour of the more elaborate instructions given in ch. xxv.-xxxix. (P). The subsequent narrative of J (Num. x. 33-36, xiv. 44) implies an account of the making of the ark, while the account of Ex. xxv. 27-31 and xxxi. 2-15 of the Yahwistic (E) of Moses in regard to the "tent of meeting" is more clearly related to an earlier statement as to the making of this tent. The omission of its own acts by J is doubtless concluded with the visit of Moses’ father-in-law and the appointment of judges (ch. xvii.), the departure from the mountain and the battle with Amalek (xviii. 8-16).

(3) The Construction of the Tabernacle and its Furniture (ch. xxv.- xxxvi., xxxvii.-xxvii.).—It has long been recognized that the elaborate description of the Tabernacle and its furniture, and the accompanying directions for the dress and consecration of the priests, contained in ch. xxv.-xxxix., was a product of the historical development of the Mosaic Tabernacle and its service. The language, style and contents of this point unmistakably to the hand of P or its immediate literary influence. The name Yahweh, the first part of an ideal representation of the post-exilic ritual system, which has been transferred to the Mosaic age. According to this

1 According to Deut. x. 1 f., which is in the main a verbal excerpt from Ex. xxxiv. 1 f., Yahweh ordered Moses to make an ark of acacia wood before he ascended the mountain.

2 To the same hand are to be ascribed also xxvii., 6, 20, 21; xxviii. 41; xxxi. 21, 38-41.

3 See the articles on the books in question.
troubled Palestine in the 13th century are no other than Hebrews (the Bible) who were fleeing Egypt. But although the evidence of the Amarna tablets might thus support the biblical tradition in its barest outlines, the view in question, if correct, would necessitate the rejection of a great mass of the biblical narratives as wholly false.

In the absence of external evidence the study of the Exodus of Israel must be based upon the Israelite records, and divergent or contradictory views must be carefully noticed. Regarded simply as a journey from Egypt into Palestine it is the most probable of occurrences: the difficulty arises from the actual narratives. The first stage is the escape from the land of Goshen (q.v.), the district allotted to the family of Jacob (Gen. xli. 28-34, xlvii. 1, 4, 6). As to the route taken across the Red Sea (Yam Suph) scholars are not agreed (see W. M. Müller, Enzy. Bibl. col. 1436 sqq.); it depends upon the view held regarding the second stage of the journey, the road to the mountain of Sinai or Horeb and thence to Kadesh. The last-mentioned place is identified with Ain Kadi, about 30 m. south of Beersheba; but the identification of the mountain is uncertain, and it is possible that tradition confused two distinct places. According to one favourite view, the journey was taken across the Sinaitic peninsula to Midian, the home of Jethro. Others plead strongly for the traditional site Jebel Musâ or Serbâl in the south of the peninsula (see J. R. Harris, Dict. Bible, iv. pp. 536 sqq.; H. Winckler, Enzy. Bibl. col. 4641). The latter view implies that the oppressed Israelites left Egypt for one of its dependencies, and both theories find only conjectural identifications in the various stages of the Hebrew migration to the land of Canaan, the date of which, corresponding to the years of wandering, is from a post-exilic source, and may be based merely upon a knowledge of caravan-routes; even if it be of earlier origin, it is of secondary value since it represents a tradition differing notably from that in the earlier narratives themselves, and these on inspection confirm Judg. xi. 16 sq., where the Israelites proceed immediately to Kadesh.

Ex. xvi. xviii. presuppose a settled encampment and a law-giving, and thus belong to a stage after Sinai had been reached (Ex. xix. sqq.). They are closely related, as regards subject matter, to the narratives in Num. i. 29-xi. 1-13 (Sinai to Kadesh), and the initial step is the recognition that the latter is their original context (see G. F. Moore, Enzy. Bibl. col. 1443 [v.]). Further, internal peculiarities assigning events now at Sinai-Horeb to those at Kadesh support the view that Kadesh was their true scene, and it is to be noticed that in Ex. xvi. 22 seq. the Israelites already reach the wilderness of Paran; it is obvious that Kadesh had been their original aim (cf. Ex. iii. 18, v. iii. 27). The wilderness of Shur (Gen. vii. 7, xx. 1; Sam. xv. 7, xxvii. 8) is the natural scene of conflicts with Amaelekites (Ex. xvii. 8 sqq.), the sanctuary of Kadesh or En Mishpat ("well of judgment") (Gen. xiv. 7) was doubtless associated with traditions of the giving of statutes and ordinances. The detour to Sinai-Horeb appears to have led to a later stage of the tradition, and is connected with the introduction of laws and institutions of relatively later formation. It is foreshadowed by the injunction to avoid the direct way into Palestine (see Ex. xiii. 17-19), since on reaching Kadesh the Israelites would be within reach of hostile tribes, and the conflict with which it was supposed to avoid actually ensued.4 The forty years of wandering in the wilderness is characteristic of the Deuteronomistic and post-exilic narratives; in the earlier sources the fruitful oasis of Kadesh is the centre, and even after the detour to Sinai-Horeb had been developed, only a brief period is spent at the holy mountain.

From Kadesh spites were sent into Palestine, and when the people were dismayed at their tides and incurred the wrath of Yahweh, the penalty of the forty years' delay was pronounced in.

1 There is a lacuna between the oldest traditions in Genesis and those in Exodus: the latter beginning simply "and there arose a new king over Egypt which knew not Joseph." The interval between Jacob's arrival in Egypt and the Exodus is given varying amounts of 400 or 430 years (Gen. xv. 13, Ex. xii. 40 seq., Acts vii. 6); but the Samaritan and Septuagint versions allow only 215 years (Ex. loc. cit.), and a period of only four generations is presupposed in Gen. xv. 16 (cf. the length of the genealogies between the contemporaries of Joseph and those of Moses in Ex. vi. 16-20).
EXOGAMY

79

(Num. xiii. seq.). Originally Caleb alone was exempted and for his faith received a blessing; later tradition adds Joshua and in Deut. i. 37 seq. alludes to some unknown offence of Moses. According to Num. xxi. 1-3 the Israelites (a generalizing amplification) captured Hormah, on the way to Beersheba, and subsequently the clan Caleb and the Kenites (the clan of Moses' father-in-law) are found in Judah (Judg. i. 19). Although the traditions regard their efforts as part of a common movement (from Gilgal, see below), it is more probable that these (notably Caleb) escaped the punishment which befell the rest of the Israelites, and made their way direct from Kadesh into the south of Palestine. 1 On the other hand, according to the prevailing tradition, the attempt to break northwards was frustrated by a defeat at Hormah (Num. xiv. 40-49), an endeavour to pass Edom failed, and the people turned back to the ‘Yam Sāḥēb’ (here at the head of the Gulf of Akabah) and proceeded up to the east of Edom and Moab. Conflicting views are represented (on which see MoAB), but at length Shittim was reached and preparations were made to cross the Jordan into the promised land. This having been effected, Gilgal became the base for a series of operations in which the united tribes took part. But again the representations disagree, and to the overwhelming campaigns depicted in the book of Joshua most critics prefer the account of the more gradual process as related in the opening chapter of the book of Judges (see Jews: History, § 8).

Thus, whatever evidence may be supplied by archaeological research, the problem of the Exodus must always be studied in the light of the biblical narratives. That the religious life of Egypt proper during dates from this remote period cannot be maintained against the results of excavation or against the later history, nor can we picture a united people in the desert when subsequent vicissitudes represent the union as the work of many years, and show that it lasted for a short time only under David and Solomon. During the centuries in which the narratives were taking shape many profound changes occurred to affect the traditions. Developments associated with the Deuteronomist reform and the reorganization of Judaism in post-exilic days can be unmistakably recognized, and it would be unsafe to assume that other vicissitudes have not also left their mark. Allowance must be made for the shifting of boundaries or of spheres of influence (Egypt, Edom, Moab), for the incorporation of tribes and of their own tribal traditions, and in particular for other movements (e.g. from Arabia). 2 If certain clans moved direct from Kadesh into Judah, it is improbable that others made the lengthy detour from Kadesh by the Gulf of Akabah, but this may well be an attempt to fuse the traditions of two distinct migrations. Among the Joseph-tribes (Ephraim and Manasseh), the most important of Israelite divisions, the traditions of an ancestor who had lived and died in Egypt would be a cherished possession, but although most writers agree that not all the tribes were in Egypt, it is impossible to determine their number with any certainty. At certain periods, intercourse with Egypt was especially intimate, and there is much in favour of the view that the name Mizraim (Egypt) extended beyond the borders of Egypt proper. Reference has already been made to other cases of geographical vagueness, and one must recognize that in a body of traditions such as this there was room for the inclusion of the most diverse elements which it is almost hopeless to separate, in view of the scantiness of relevant evidence from other sources, and the literary nature of the traditions. That various different beliefs have influenced the tradition is apparent from what has been said above, and is especially noticeable from a study of the general features. Thus, although the Israelites possessed cattle (Ex. xvii. 3, xix. 13, xxiv. 5, xxii. 4, xxxiv. 3; Num. xx. 19), allusion is made to their lack of meat in order to magnify the wonders of the journey, and among divinity sent aids to guide and direct the people upon the march not only does Moses require the assistance of a human helper (Jethro or Hobab), but the angel, the ark, the pillar of cloud and of fire and the mysterious hornet are also supplied.

In addition to the references already given, see J. W. Coelho, Perinquique and Bets of Joshua (an internal note to Deut. 2. 9-10). According to Aller Test. im Lichte d. alt. Orients (pp. 402 seqq., on later references in Manetho, &c., with which cf. also R. H. Charles, Jubilees, p. 243 seqq.; art. "Exodus" in Encyc. Bib.; Ed. Meyer, Israeliten in Ägypten; W. F. Albright, Ancient Israelites at Tell el-Maskhoh, pp. 223-240); the last-mentioned author, in the histories of Israel and commentaries on the book of Exodus. Among the numerous special works, mention may be made of G. E. Wright, South Canaan, South Egypt, and the Delta; F. G. M. Palmed, Desert of the Exodus O. A. Toftten, The Historic Exodus (fuller); of McClennan’s, which, the "captured" woman the only wife in the modern sense of the term. In the beginnings of human society children were related only to their mother; and the women of a tribe were common property. Thus no man might appropriate any female or attempt to maintain proprietary rights over her. With women of other tribes it would be different, and a warrior who captured a woman who doubtless pass unchallenged in his claim to possession her absolutely. Infanticide, the evil physical effects of in-and-in 3 breeding, the natural strength of the impulse to possess on the man's part, and the greater feeling of security and a tendency to family life and affections on the woman’s part, would combine to make exogamy increase and marriages within the tribe decrease. A natural impulse would in a few generations tend to become a law or a custom, the violation of which would be looked on with horror. Physical capture, too, as soon as increasing civilization and tribal intercommunication removed the necessity for violence, became symbolic of the more permanent and individual relations of the sexes. An additional explanation of the prevalence of exogamy may be found in the natural tendency of exogamous tribes to increase in numbers and strength at the expense of those communities which moved towards decadence by in-breeding. Thus tradition would have to be a prejudice, strong as a principle of religion, and exogamy would become the inviolable it is found to be among many races. In Australia, Sir G. Grey writes: “One of the most remarkable facts connected with the natives is that they are divided into certain great families, all the members of which bear the same name . . . these family names are common over a great portion of the continent and a man cannot marry a woman of his own family name.” In eastern Africa, Sir K. Burton says: “The Tswa will not marry the same, or even of a consanguineous family, and the Bakalahari have the same rule. Paul B. du Chaillu found exogamy the rule and blood marriages regarded as an abomination throughout western Equatorial Africa. In India the Khasias, Juangs, Waralis, Oraons, Hos and other tribes are strictly exogamous. The Kalmucks are divided into hordes, and no man may marry a woman of the same horde. Circassians and Samoyedes have similar rules. The Ostlaks regard endogamy (marriage within the clan) as a crime, as do the Yakuts of Siberia. Among the Indians of America severe rules prescribing exogamy prevail. The Tsimshean Indians of British Columbia are divided into

2 An instructive parallel to the last-mentioned is afforded by Diodor’s account of the migration of Arab tribes into Palestine in the 1st century a.d. (Revue biblique, July 1903).
3 An instructive parallel to the last-mentioned is afforded by Diodor’s account of the migration of Arab tribes into Palestine in the 1st century a.d. (Revue biblique, July 1903).
tribes and totems, or "crests which are common to all the tribes," says one writer. "The crests are the whale, the porpoise, the eagle, the coon, the wolf and the frog. . . . The relationship existing between persons of the same crest is nearer than that between members of the same tribe. . . . Members of the same tribe may marry, but those of the same crest are not allowed to under any circumstances; that is, a whale may not marry a porpoise. . . . They are both the Mayas of Yucatan and the Indians of Guiana are exomognous, observing a custom which is thus seen to exist throughout Africa, in Siberia, China, India, Polynesia and the Americas.

EXORCISM (Gr. ἔξορκισις, to conjure out), the expulsion of evil spirits from persons or places by incantations, magical rites or other means. As a corollary of the animistic theory of diseases and of belief in Possession (q.v.), we find widely spread customs whose object is to get rid of the evil influences. These customs may take the form of a general expulsion of evils, either once a year or at irregular intervals; the evils, which are often regarded as spirits, sometimes as the souls of the dead, may be expelled, according to primitive philosophy, either immediately by spells, purifications or some form of coercion; or they may be put on the back of a scapegoat or other material vehicle. Among the means of conquering the evil spirits are assaults with warlike weapons or sticks, the noise of musical instruments or of the human voice, the use of masks, the invocation of more powerful good spirits, &c.; both fire and water are used to drive them out, and the use of iron is a common means of holding them at bay.

The term exorcism is applied more especially to the freeing of an individual from a possessing or disease-causing spirit; the means adopted are frequently the same as those mentioned above; in the East Indies the sufferer sometimes dances round a small ship, into which the spirit passes and is then set adrift. The patient may be beaten or means may be employed whose efficiency depends largely on their suggestive nature. Among the Dakota Indians the medicine-man chants hi-lei-li-lah at the bed of the sick man and accompanies his chant with the rattle; he then picks at the affected part till the possessing spirit is supposed to come out and take its flight, when men fire guns at it from the door of the tent. The Zulus believe that they can get rid of the souls of the dead, which cause diseases, by sacrileges of cattle, or by expostulating with the spirits; so too the shaman or medicine-man in other parts of the world offers the possessing spirit objects or animals.

The professional exorcist was known among the Jews; in Greece the art was practised by women, and it is recorded that the mothers of Epicurus and Aeschines belonged to this class; both were bitterly reproached, the one by the Stoics, the other by Demosthenes, with having taken part in the practices in question. The prominence of exorcism in the early ages of the Christian church appears from its frequent mention in the writings of the fathers, and by the 3rd century there was an order of exorcists (see EXORCIST). The ancient rite of exorcism in connection with baptism is still retained in the Roman ritual, as is also a form of service for the exorcising of possessed persons. The exorcist signs the possessed person with the figure of the cross, desires him to kneel, and sprinkles him with holy water; after which the exorcist asks the devil his name, and abjures him by the holy mysteries of the Christian religion not to afflic the person possessed any more. Then, laying his right hand on the demoniac's head, he repeats the form of exorcism as follows:

"I exorcise thee, unclean spirit, in the name of Jesus Christ; tremble, O Satan, thou enemy of the faith, thou foe of mankind, who hast brought death into the world, who hast deprived men of life, and hast rebelled against justice, thou seducer of men, in whom is the root of evil, thou source of avarice, discord and envy. Houses and other places supposed to be haunted by unclean spirits are likewise to be exorcised with similar rites, and in general exorcism has a place in all the ceremonies for consecrating and blessing persons or things (see BENEDICTION). See Tylor, Primitive Culture; Skeat, Malay Magic, p. 427 seq.; Frazer, Golden Bough, vol. iii. 180; Kraft, Ausführliche Historie von Exorzismus; Koldewey, Der Exorcismus im Herzogtum Braunschweig; Brecher, Das Transcendentalen, Magie, etc. im Talmud, pp. 195-203; Zeitschr. für Assyriologie (Dec. 1893, April 1894); Herzog: "On the Exorcismus"; Waldseim, Anthropology, p. 64; L. W. King, Border Magic; McLennan, La Magie; R. C. Thompson, Devils and Evil Spirits of Babylonia.

EXORCIST (Lat. exorcista, Gr. ἔξορκιστής), in the Roman Catholic church, the third grade in the minor orders of the clergy, between those of acolyte and reader. The office, which involves the right of ceremonially exorcising devils (see EXORCISM), is actually no more than a preliminary stage of the priesthood. The earliest record of the special ordination of exorcists is the 7th council of the council of Carthage (A.D. 296). When they are ordained, it runs, "they receive from the end of the bishop a little book in which the exorcisms are written, receiving power to lay hands on the energumeni, whether baptized or catechumens." Whatever its present position, the office of exorcist was, until comparatively recent times, by no means considered a sinecure. "The exorcist a terror to demons" (Paulinus, Epist. 24) survived the Reformation among Protestants, with the belief, expressed by Firmilianus in his epistle to St Cyprian, that "through the exorcists, by the voice of man and the power of God, the devil may be whipped, and burnt and tortured." EXOTIC (Gr. ξένος, foreign, from ξένος, of foreign origin, or belonging to another country. The term is now used in the restricted sense of something not indigenous or native, and is mostly applied to plants introduced from foreign countries, which have not become aclimatized. Figuratively, "exotic" is used to convey the sense of something rare, delicate or extravagant.

EXPATRIATION (from Late Lat. expatriare, to exile, and patria, native land), a term used in a general sense for the banishment of a person from his own country. In international law the term is the renunciation or change of allegiance to one's native or adopted country. It may take place either by a voluntary act or by operation of law. Some countries, as France and England, disclaim their subjects if they become naturalized in another country, others, again, passively permit expatriation whether a new nationality has been acquired or not; others, as Germany, make expatriation the consequence of continued absence from their territory. (See Alien; Allegiance; Naturalization.)

EXPERT (Lat. experius, from esperi, to try), strictly, skilled, or one who has special knowledge; as used in law, an expert is a person called on to give evidence by a party to a cause, to give his opinion on some point in issue with which he is peculiarly conversant. In Roman law questions of disputed handwriting were referred to experts; and in France, whenever the court considers that a report by experts is necessary, it is ordered by a judgment clearly setting forth the objects of the expertise (Code Proc. Civ. art. 302). Three experts are then to be appointed, unless the parties agree upon one only (art. 303). The experts are required to take an oath (art. 303), but in practice this requirement is frequently dispensed with. They may be challenged on the same grounds as witnesses (art. 310). The necessary documentary and other evidence is laid before them (art. 317), and they make a single report to the court, even if they express different opinions: in that case the grounds only of the different opinions are to be stated, and not the personal opinion of each of the experts (art. 318). If the court is not satisfied with the report, new experts may be appointed (art. 322); the judges are not bound to adopt the opinion of the experts (art. 323). "This procedure in regard to experts is common to both the civil and commercial courts, but it is much more frequently resorted to in the commercial court than in the civil court, and the evidence customarily included by special experts officially attached to each of these courts" (Bodington, French Law of Evidence, London, 1904, p. 102).
A similar system is to be found in force in many other European countries; see e.g. Codes of Civil Procedure of Holland, arts. 222 et seq.; Belgium, arts. 302 et seq.; Italy, arts. 252 et seq.; as well as in those colonies where French law has been followed (Codes of Civil Procedure of Quebec, arts. 392 et seq.; St Lucia, arts. 286 et seq.). In Mauritius the articles of the French law, summarized above, are still nominally in force; but in practice each side calls its own expert evidence, as in England.

There is some evidence that in England the courts were in early times in the habit of summoning to their assistance, apparently as assessors, persons specially qualified to advise them on matters of a scientific or technical question that required to be determined. Thus "in an appeal of maileuth (i.e. wounding) . . . the court did not know how to adjudge because the wound was new, and then the defendant took issue and prayed the court that the maileuth might be examined, on which a writ was sent to the sheriff to cause to come medicos chirurgiaco de melioribus London, ad inforamandum dominum regem et curiam de his quaes ex parte domini regis injungentur" (Year Book, 21 Hen. VII. pl. 30, p. 33). The practice of calling in expert assistance in judicial inquiries was not confined to cases of civil law but extended to criminal cases. "If matters arise . . . referring to the question. . . 'which concern other faculties, we commonly apply for the aid of that science or faculty which it concerns,' English procedure, however, being litigious, and not, like continental European procedure, inquisitorial, in its character, the expert soon became, and still is, simply a witness to speak to matters of opinion.

There is a considerable body of law in England as to expert evidence. Only a few points can be touched upon here. (1) An expert is permitted to refresh his memory in regard to any fact by referring to anything written by himself or under his direction at the time when the fact occurred or at a time when it was fresh in his memory. This is also law generally in the United States (see e.g. New York Civil Code, s. 1843). In Scotland, medical and other scientific reports are lodged in process before the trial, and the witness reads them as part of his evidence and is liable to be examined or cross-examined on their contents. (2) In strictness, an expert will not be allowed in cases of alleged insanity, to say that a litigating or incriminated party is insane of the reverse, and so to usurp the prerogative of the court or jury. But he may be asked whether certain symptoms, or data, are or are not indicative of insanity. But in practice this rule is relaxed both in England and in Scotland, and (where it exists) to a still greater extent in America. (3) Foreign law can only be proved in English courts — and the same rule applies in Scotland—(a) by obtaining an opinion on the subject from a superior court of the country whose laws are in dispute under the Foreign Law Act 1861 or the British Law Act 1859, or (b) by the evidence of a lawyer of the country whose law is in question, or who has studied it in that country, or of an official whose position requires, and therefore presumes, a sufficient knowledge of that law. (4) The weight of authority both in England and in America supports the view that an expert is not bound to give evidence as to matters of opinion unless upon an undertaking by the party calling him to pay a reasonable remuneration for his evidence.

Statutory provision has been made in England for the summoning of expert assistance by the legal tribunals in various cases. In the county courts the judge may, if he thinks fit, on the application of either party, call in as assessor one or more persons of skill and experience as to the matters in dispute (County Courts Act 1888, s. 108), and special provision is made for calling in an assessor in employers' liability cases (act of 1880, s. 6) and admiralty matters (see County Courts Admiralty Jurisdiction Acts of 1868 and 1860). In the High Court and court of appeal one or more specially qualified assessors may be called in to assist in the hearing of any case or matter except a criminal proceeding by the crown (Judicature Acts 1873, s. 59), and a like power is given to both these courts and the judicial committee of the privy council in patent cases (Patents, &c., Act 1883, s. 28). Maritime causes, whether original or on appeal from county courts, are usually taken in the presence of Elder Brethren of the Trinity House, who advise the judge without having any right to control or any responsibility for his decision (see the "Beryl," 1884, 9 P.D. 1), and on appeal in maritime causes, nautical assessors are usually called in by the court of appeal, and may be called in by the House of Lords (Judicature Act 1873, s. 3); a like provision is made as to maritime causes in Scottish courts (Nautical Assessors [Scotland] Act 1894). The judicial committee of the privy council, besides its power to call in assessors in patent cases, is authorized to call them in ecclesiastical causes (Appellate Jurisdiction Act 1876, s. 14).

EXPLOSIVES, a general term for substances which by certain treatment "explode," i.e. decompose or change in a violent manner so as to generate force. From the manner and degree of violence of the decomposition they are classified into "propellants" and "detonators," but this classification is not capable of sharp delimitation. In some cases the same substance may be employed for either purpose under altered external conditions; but there are some which are explosive, while others may be exploded only as propellants, and others which can scarcely be induced to explode in the manner known as "detonation." A propellant may be considered as a substance that on explosion produces such a disturbance that neighbouring substances are thrown to some distance; a detonator or disruptor may produce an extremely violent disturbance within a limited area without projecting substances to any great distance. Time is an important, perhaps the most important, factor in this action. A propellant generally acts by burning in a more or less rapid and regular manner, producing from a comparatively small volume of gas some time of heat. If an explosion in which, being expended mostly on the gaseous products, causes a further expansion. The noise accompanying an explosion is due to an air wave, and is markedly different in the case of a detonator from a real propellant. Some cases of ordinary combustion can be accelerated into explosions by increasing the area of contact between the combustible and the oxygen supplier, for instance, ordinary gas or dust explosions. Neither temperature nor quantity of heat energy necessarily gives an explosive action. Some metals, e.g. aluminium and magnesium, will, in oxidizing, produce a great thermal effect, but unless there be some explosive product, will not produce an explosion. Explosives may be mechanical mixtures of substances capable of chemical interaction with the production of large volumes of gases, or definite chemical compounds of a peculiar class known as "endothermic," the decomposition of which is also attended with the evolution of gases in large quantity.

All chemical compounds are either "endothermic" or "exo-thermic." In endothermic compounds energy, in some form, has been taken up in the act of formation of the compound. Some of this energy has become potential, or rather the compound formed has been raised to a higher potential. This case occurs when certain elements can be united only under some compulsion such as a very high temperature, by the aid of an electric current, or spark, or as a secondary product whilst some other, other elements combine only under the influence of an electric spark, and carbon and calcium in the electric furnace. The formation of chlorates by the action of chlorine on boiling potash is a good instance of a complex compound (potassium chlorate), being formed in small quantity as a secondary product whilst a large quantity of primary and simpler products (potassium chloride and water) is forming. In chlorate formation the greater part of the oxygen and nitrogen formed come from the decomposition of the explosive compounds, with only a small yield of an endothermic substance. Another idea of the meaning of endothermic is obtained from acetylene. When 26 parts by weight of this substance are burnt, the heat produced will warm up 310,450 parts of water 1° C. Acetylene consists of 24 parts of carbon and 2 hydrogen by weight. The 24 parts of carbon will, if in the form of pure coal, heat 902,000 parts of water 1°, and the 2 parts of hydrogen will heat 68,000 parts of water 1°. The total heat production being 260,000 heat units. Thus 26 grams of acetylene give an excess of 50,450 units over the amount given by the constituents. This excess of
heat energy is due to some form of potential energy in the compound which becomes actual heat energy at the moment of dissociation of the chemical union. The manner in which a substance is endothermic is of importance as regards the practical employment of explosives. Some particular endothermic state or form results from the breaking up of the internal structure of the molecule. Physical structure alone can be the cause of a relative endothermic state, as in the glass bulbs known as Rupert's drops, &c., or even in chilled steel. Rupert's drops fly in pieces on being scratched or cut to a certain depth. The cause is undoubtedly to be ascribed to the molecular state of the glass brought about by chilling from the melted state. The molecules have not had time to separate or arrange themselves in easy positions. In steel when melted the carbide of iron is no doubt diffused throughout the liquid. When cooled slowly some carbide separates out more or less, and the steel is soft or annealed. When chilled the carbide is dissolved in the volume of the chilled glass or steel differs slightly from that in the annealed state.

Superfused substances are probably in a similar state of physical potential or strain. Many metallic salts, and organic compounds especially, will exhibit this state when completely melted and then allowed to cool in a clean atmosphere. On touching with a little of the same substance in a solid state the liquids will begin to crystallize, at the same time becoming heated almost up to their melting-points. The metal gallium shows this excellently well, keeping liquid for years until touched with the solid metal, when there is a considerable rise of temperature as solidification takes place.

All carbon compounds, excepting carbon dioxide, and many if not all compounds of nitrogen, are endothermic. Most of the explosives in common use contain nitrogen in some form.

The explosives actually employed at the present time include mixtures, such as gunpowders and some chlorate compositions, the ingredients of which separately may be non-explosive; compounds used singly, as guncotton, nitroglycerin (in the form of dynamite), picric acid (as lyddite or melinitene), trinitrotoluene, nitroresols, mercury fulminate, &c.; combinations of some explosive compounds, such as cordite and the smokeless propellants in general use for military purposes; and, finally, blasting and detonating or igniting compositions, some of which contain inert diluting materials as well as one or more explosives. Many igniting compositions are examples of the last type. Combining of a high explosive diluted with a neutral substance, and frequently accompanied in admixture in some composition which is inflamed by the explosion of the diluted high explosive, the flame in turn igniting the actual propellant.

Explosive Mixture.—The explosive mixture longest known is undoubtedly gunpowder (q.v.) in some form—that is, a mixture of charcoal with sulphur and nitre, the last being the oxygen provider. Besides the nitrates of metals and ammonium nitrate, there is a limited number of other substances capable of serving in a sufficiently energetic manner as oxygen providers. A few chlorates, perchlorates, permanganates and chromates almost complete the list. Of these the sodium, potassium and barium chlorates are best known and have been actually tried, in admixture with some combustible substances, as practical explosives. Most other metallic chlorates are barred from practical employment owing to instability, deliquescence or other property.

Of the chlorates those of potassium and sodium are the most stable, and mixtures of either of these salts with sulphur or sulphides, phosphorus, charcoal, sugar, starch, finely-ground cellulose, coal or almost any kind of organic, i.e. carbon, compound hermaphrodite in character, contain an explosive mixture. In many cases these mixtures are not only fired or nitroglycerin by being mixed to a certain temperature, heating to a certain temperature, but also by quite moderate friction or percussion. Consequently there is much danger in manufacture and storage, and however these mixtures have been made up, they are quite out of the question as propellants on account of their great tendency to explode in the manner of a detonator. In addition they are not smokeless, and leave a considerable residue which in a gun would produce serious fouling.

Mixtures of chlorates with aromatic compounds such as the nitro- or dinitro-benzenes or even napthalene make very powerful blasting agents. The violent action of a chlorate mixture is due first to the rapid evolution of oxygen, and also to the fact that a chlorate can be detonated when alone. A detailed sulphuric acid will start the combustion of a chlorate mixture. In admixture with sulphur and especially phosphorus, chlorates give extremely sensitive compositions, some of which form the basis of friction tube and firing mixtures. Potassium and sodium perchlorates and permanganates make similar but slightly less sensitive explosive mixtures with the above-mentioned substances. Finely divided metals such as aluminium or magnesium give also with permanganates, chlorates or perchlorates sensitive and powerful explosives. Bichromates, although containing much available oxygen, form but feeble explosive mixtures, but some compounds of chromic acid with dinitroprusside and some acetylene are extremely powerful as well as sensitive. Ammonium bichromate is a self-combustible after the type of ammonium nitrate, but scarcely an explosive.

Explosive Compounds.—Nearly all the explosive compounds in actual use either for blasting purposes or as propellants are nitrogen compounds, and are obtained more or less directly from nitric acid. Most of the propellants at present employed consist essentially of nitrates of some organic compound, and may be viewed theoretically as nitric acid, the hydrogen of which has been replaced by a carbon complex; such compounds are expressed by M-ONO, which indicates that the carbon group is in some manner united by means of oxygen to the nitrogen group. Guncotton and nitroglycerin are of this class. Another large class of explosives is formed by a more direct attachment of nitrogen to the carbon complex, as represented by M-NO₂. A number of explosives of the detonating type are of this class. They contain the same proportions of oxygen and nitrogen as nitrates, but are not nitrates. They have been termed nitro-derivatives for distinction. One of the simplest and longest-known members of this group is nitrobenzene, C₆H₄(NO₂), which is obtained by treating aromatic compounds with nitrous acid. The nitrobenzenes, C₆H₄(NO₂)ₙ, made from it are solids which are somewhat extensively employed as constituents of some sporting powders, and in admixture with ammonium nitrate form a blasting powder of a "flameless" variety which is comparatively safe in dusty or "gassy" coal seams. Picric acid or trinitrophenol, C₆H₄-OH(NO₂)₃, is employed as a high explosive for shell, &c. It requires, however, either to be enclosed and heated, or to be started by a powerful detonator to develop its full effect. Its compounds with metals, such as the potassium salt, C₆H₅-OK(NO₂), are when dry very easily detonated by friction or percussion and always on heating, whereas picric acid itself will burn very quietly when set fire to under ordinary conditions. Trinitrotoluene, C₆H₅-CH₃(NO₂), is a high explosive resembling picric acid in the manner of its explosion (to which in fact it is a rival), but differs therefrom in not forming salts with metals. The nitroanilines, C₆H₄-(NO₂)₃, nitrobenzenes, and higher nitration products may be counted in the list. Their salts with metals behave much like the picrates.

All these nitro compounds can be reduced by the action of sodium hydroxide to substances called amines (q.v.), which are not always explosive in themselves. Certain cases can form nitrates of a self-combustible nature. Amino-acetic acid, for instance, will form a nitrate which burns rapidly but quietly, and might be employed as an explosive. By the action of nitrous acid at low temperatures on aromatic amines, e.g. aniline, C₆H₅-NH₂, diazo compounds are produced. These are all highly explosive, and when in a dry state are for the most part also extremely sensitive to friction, percussion or heat. As many of these diazo compounds contain no oxygen their explosive nature must be ascribed to the peculiar state of union of the nitrogen. This state is attempted to be shown by the formulæ such as, for
EXPLOSIVES

instance, \( \text{CH}_2\text{N}_2\text{N}_2\text{X} \), which may be some compound of diazo- 
benzene. Probably the most vigorous high explosive at present 
known is the substance called hydrazoic acid or azomide (g.v.). 
It forms salts with metals such as \( \text{Ag}_2\text{N}_2 \), which explode in a 
peculiar manner. The ammonium compound, \( \text{NH}_4\text{N}_2 \), may 
become a practical explosive of great value.

Mercuric fulminate, \( \text{HgC}_2\text{N}_2\text{O}_3 \), is one of the most useful 
high explosives known. It is formed by the action of a solution 
of mercuric nitrate, containing some nitric acid, on alcohol. 
It is a white crystalline substance almost insoluble in cold water 
and requiring \( 150 \) times its weight of boiling water for solution. 
It may be heated to \( 180^\circ \text{C} \) before exploding, and the explosion 
so brought about is much milder than that produced by per-
cussion. It forms the principal ingredient in cap compositions, 
in many fuses and in detonators. In many of these compositions 
the fulminate is diluted by mixture with certain quantities of 
inert powders so that its sensitiveness to friction or percussion 
is just so much lowered, or slowed down, that it will fire another 
mixture capable of burning with a hot flame. For detonating 
dynamite, guncotton, &c., it is generally employed without 
addition of any other ingredients.

Smokeless Propellants.—Gunpowders and all other explosive 
mixtures or compounds containing metallic salts must form 
smoke on combustion. The solids produced by the resolution 
of the compounds are in an extremely finely-divided state, and on 
being ejected into the atmosphere become more or less attached 
to water vapour, which is so precipitated, and consequently adds 
to the smoke. The simplest examples of propellants of the smoke-
less class are compressed gases. Compressed air was the 
propellant for the Zalinski dynamite gun. Liquefied carbon dioxide 
has also been proposed and used to a slight extent with the same 
idea. It is scarcely practical, however, because when a quantity 
of a gas liquefied by pressure passes back again into the gaseous 
state, there is a great absorption of heat, and any remaining 
liquid, and the containing vessel, are considerably cooled. Steam 
guns were tried in the American Civil War in 1864; but a steam 
gun is not smokeless, for the steam escaping from the long tube 
or gun immediately condenses on expansion, forming white mist 
or smoke.

At the earliest stage of the development of guncotton the 
advantage of its smokeless combustion was fully appreciated 
(see GUNCOTTON). That it did not at once take its position 
as the smokeless propellant, was simply due to its physical 
state—a fibrous porous mass—which burnt too quickly or even 
detonated under the pressure required in fire-arms of any kind. 
In the early eighties of the 19th century it was found that several 
substances would partly dissolve or at least gelatinize guncotton, 
and the moment when guncotton proper was obtained as a 
colloid or jelly was the real start in the matter of smokeless 
propellants.

Guncotton is converted into a gelatinous form by several 
substances, such as esters, e.g. ethyl acetate or benzolate, acetone 
and other ketones, and many benzene compounds, most of which 
are volatile liquids. On contact with the guncotton a jelly is 
formed which stiffens as the evaporation of the gelatinizing 
agent proceeds, and finally hardens when the evaporation is 
complete. Whilst in a stiff pasty state it may be cut, moulded 
or pressed into any desired shape without any danger of ignition. 
In fact guncotton in the colloidal state may be handled on an 
avil, and, as a rule, only the portion struck will detonate or fire.

Guncotton alone makes a very hard and somewhat brittle mass 
after treatment with the gelatinizing agent and complete drying, 
and small quantities of camphor, vaseline, castor oil and other 
substances are incorporated with the gelatinous guncotton to 
make it fit for hand and bottle use.

All the smokeless powders, of which gelatinized guncottons 
or nitrated celluloses are the base, are moulded into some con-
veniently shaped grain, e.g. tubes, cords, rods, disks or tablets, 
so that the rate of burning may be controlled as desired. The 
Vielie powder, invented in 1887 and adopted in France for a 
magazine rifle, consisted of gelatinized guncotton with a little 
picric acid. Later a mixture of two varieties of guncotton 
gelatinized together was used. In addition to guncottons other 
inexplosive or non-explosive substances are contained in some 
of these powders. Guncotton alone in the colloidal state burns very 
slowly if in moderate-sized pieces, and when subdivided or made 
to thin rods or strips it is still very mild as an explosive, partly 
from a chemical reason, viz. there is not sufficient oxygen in it 
to burn the carbon to dioxide. Many mixtures are consequently 
in use, and many more have been proposed, which contain some 
metallic salt capable of supplying oxygen, such as barium or 
ammonium nitrate, &c., the idea being to accelerate the rate of 
burning of the guncotton and if possible avoid the production of 
smoke.

The discovery by A. Nobel that nitroglycerin could be incor-
porated with collodion cotton to form blasting gelatin (see 
DYNAMITE) led more or less directly to the invention of ballistite, 
which differs from blasting gelatin only in the relative amounts 
of collodion, or soluble nitrated cotton, and nitroglycerin. Ballis-
tite was adopted by the Italian government in 1890 as a military 
powder. Very many substances and mixtures have been 
proposed for smokeless powder, but the two substances, gunc-
notton and nitroglycerin, have for the most part kept the field 
to themselves, and formed the basis of most smokeless powders.

Nitroglycerin contains a slight excess of oxygen over that necessary 
to convert the whole of the carbon into carbon dioxide; it burns in 
a more energetic manner than guncotton; the two can be 
incorporated together in any proportion whilst the guncotton 
is in the gelatinous state; also all the liquids which gelatinize 
guncotton dissolve nitroglycerin, and, as these gelatinizing 
liquids evaporate, the nitroglycerin is left entangled in the 
guncotton jelly, and then shares more or less its colloidal character. 
In burning the nitroglycerin is protected from detonation by the 
gelatinous state of the guncotton, but still adds to the rate of 
burning and produces a higher temperature.

Desirable Qualities.—Smokelessness is one only of the desirable 
properties of a propellant. All the present so-called smokeless 
powders produce a little fume or haze, mainly due to the conden-
sation of the steam which forms one of the combustion products. 
There is often also a little vapour from the substances, such as oil, 
mineral jelly, vaseline or other hydrocarbon added for lubrication or 
to render the finished material pliable, &c. The gases produced 
should neither be very poisonous nor exert a corrosive action on 
metals, &c. The powder itself should have good keeping qualities, 
that is, not be liable to chemical changes within ordinary ranges 
of temperature or in different climates when stored for a few years. 
In these powders slight chemical changes are generally followed 
by plastic changes. The well-known plastic changes of the gelatinized 
propellants of the present day produce some oxide of nitrogen, traces of 
which hang about the gun after firing and change rapidly into nitrous 
and nitric oxides. Acids or other corrosive substances added to 
the powder, as it acts as a carrier of oxygen. The fouling from modern 
smokeless powders is a slight deposit of acid grease, and the remedy 
consists in washing out the bore of the piece with an alkaline liquid. 
The copper, iron, or lead bullet when added to smokeless powders are 
supposed to act as lubricants to some extent. They are not as effective 
in this respect as mineral salts, and the filling of both small-arms and ordnance using smokeless 
powders is severely gribbed by the metal of the projectile. The 
alkaline fouling produced by the black and brown powders acted 
as a preventive of rusting to some extent, as well as a lubricant in the 
barrel.

Danger in Manufacture.—In the case of the old gunpowders, the 
most dangerous manufacturing operation was incorporation. 
With the modern colloidal propellants the most dangerous operations 
are the physical preparation of the propellant in the powder 
factory, the grinding and drying of guncotton, &c. After once the gelatinizing solvent 
has been added, all the mechanical operations can be conducted, practi-
cally; with perfect safety. This statement appears to be correct for all 
modern nitrate, nitrocellulose, and nitrated celluloses, whether 
saturated with nitroglycerin or other substances. Should they become ignited, which 
is possible by a rise of temperature (to say \( 180^\circ \text{C} \)) or contact with a 
flame, they give the most intense burning. Some smokeless powders are often reserved for 
the direction of the shot, for rods or pieces of some smokeless powders mightpossibly 
under considerable pressure, producing larger pieces and thus 
altering the rate of burning. Most smokeless powders are fairly
insensitive to shock. All these gelatinized powders are a little less easily ignited than black powders. A slightly different cap composition is used for ball- and cannon-cartridges, and generally require a small primer or starter of powdered black gunpowder.

It is desired that a propellant shall produce the maximum velocity with the minimum pressure. The pressure should start gently so that the inertia of the projectile is overcome without any undue local strain on the breech near the powder chamber, and more especially that as more and more space is given to the gases by the movement of the projectile up the gun to the muzzle, gas should be produced with sufficient rapidity to keep the pressure nearly uniform or slightly increasing along the bore. The leading idea for improving the pressure of the gaseous propellant is to obtain the greatest possible pressure regularly developed, and at the same time the lowest temperatures. (W. R. E. II.)

Law.—In 1860 an act was passed in England "to amend the law concerning the making, keeping and carriage of gunpowder and compositions of an explosive nature, and concerning the manufacture and use of fireworks" (23 & 24 Vict. c. 139), whereby previous acts on the same subject were repealed, and minute and stringent regulations introduced. Amending acts were passed in 1861 and 1862. In 1875 was passed the Explosives Act (38 & 39 Vict. c. 17), which repealed the former acts, and dealt with the whole subject in a more comprehensive manner. This act, containing 122 sections, and applying to Scotland and Ireland, as well as to England, constitutes, with various orders in council and home office orders, a complete code.

The act of 1875 was based on the report of a committee of the House of Commons, public opinion having been greatly excited on the subject by a terrible explosion on the Regent's Canal in 1874. Explosives are thus defined: (1) Gunpowder, nitroglycerin, dynamite, gun-cotton, blasting powders, fulminate of mercury or of other metals, coloured fires, and every other substance, whether similar to those above-mentioned or not, used or manufactured with a view to produce a practical effect by explosion or a pyrotechnic effect, and including (2) fog-signals, fireworks, fuses, rockets, percussion caps, detonators, cartridges, ammunition of all descriptions, and every adaptation or preparation of an explosive as above defined. Part i. deals with gunpowder, providing that it shall be manufactured only at factories lawfully existing or licensed under the act; that it shall be kept (except for private use) only in existing or new magazines or stores, or in registered premises, licensed under the act. Private persons may manufacture for their own use to the value of thirty pounds. The act also prescribes rules for the proper keeping of gunpowder on registered premises. Part ii. deals with nitroglycerin and other explosives; part iii. with inspection, accidents, search, &c.; part iv. contains various supplementary provisions. By order in council the term "explosive" may be extended to any substance which appears to be specially dangerous to life or property by reason of its explosive properties, or to any process liable to explosion in the manufacture thereof, and the provisions of the act then extend to such substance just as if it were included in the term "explosive" in the act. The act lays down minute and stringent regulations for the sale of gunpowder, restricting the sale thereof in public thoroughfares or places, or to any child apparently under the age of thirteen; requiring the sale of gunpowder to be in closed packages labelled; it also lays down general rules for conveyance, &c. The act also gives power by order in council to define, from time to time, the composition, quality and character of any explosive, and to classify explosives, and such orders in council are frequently made including new substances; those in force will be found in the Statutory Rules and Orders, tit. "explosive substances." The Merchant Shipping Act 1854 imposes restrictions on the carriage of dangerous goods in a British or foreign vessel, "dangerous goods" meaning aquafortis, nitric acid, phlogiston, benzine, gelatinized powder, lucifer matches, nitro-glycerin, petrolatum and any explosive within the meaning of the Explosives Act 1875. The act is administered by the home office, and an annual report is published containing the proceedings of the inspectors of explosives and an account of the working of the act. Each annual report gives a list of explosives at the time authorized for manufacture or importation, and appendices containing information as to accidents, experiments, &c.

Practically every European country has legislated on the lines of the English act of 1875, Austria taking the lead, in 1877, with a new explosives ordinance almost identical with the English act. The United States, in 1890, made the law concerning the manufacture, storage and importation of explosives. (See also PETROLEUM.) (T. A. I.)

Weaver, Notes on Military Explosives (New York, 1906); M. Eisler, The Modern High Explosive (New York, 1907); and The Theory of Explosives, by J. S. Eissler, published by order of the secretary of state for war (London, 1907). Most of the literature on modern explosives, e.g. dynamite, &c., is to be found in papers contributed to scientific journals on the subject. An index to those which have appeared in the Journal of the Society of Chemical Industry is to be found in the decennial index (1908) compiled by F. W. Renant.

EXPRESS (through the French from the past participle of the Lat. exprimere, to press out, by transference used of representing objects in painting or sculpture, or of thoughts, &c. in words), a word signifying that which is clearly and definitely set forth or represented, explicit, and thus used of a meaning, a law, a contract and the like, being specially contrasted with "implied." Thus in law, malice, for which there is actual evidence, as apart from that which may be inferred from the acts of the person charged, is known as "express." The word is most frequently used with the idea of something done with a definite purpose; the term "express train," now meaning one that travels at a high speed over long distances with few intermediate stoppages, is in the early days of railways, applied to what is now usually called a "special," i.e. a train not running according to the ordinary time-tables of the railway company, but for some specific purpose, or engaged by a private person. About 1845 this term became used for a train running to a particular place without stopping. Similarly in the British postal service, express delivery is a special and immediate delivery of a letter, parcel, &c., by an express messenger at a particular increased rate. The system was adopted in 1891.

In the United States of America, express companies for the rapid transmission of parcels and luggage and light goods generally perform the function of the post office or the railways in the United Kingdom and the continent of Europe. Not only do they deliver goods, but by the cash on delivery system (see Cash) the express companies act as agents both for the purchaser and seller of goods. They also serve as a most efficient agency for the transmission of money, the express money order being much more easily convertible than the postal money orders, as the latter can only be redeemed at offices in large and important towns. The system dates back to 1839, when one William Frederick Harnen (1813-1845), a corn contractor, started his own business by his own account the carrying of small parcels and the performance of small commissions. Obliged to leave the company's service or abandon his enterprise, he started an "express" service between Boston and New York, carrying parcels, executing commissions and collecting drafts and bills. Alvin Adams followed in 1840, also between Boston and New York. From 1840 to 1845 the system was adopted by many others between the more important towns
EXPROPRIATION—EXTENSION 85

throughout the States. The attempt to carry letters also was
stopped by the government as interfering with the post office.
In 1854 began the amalgamation of many of the
companies. Thus under the name of the Adams Express Company the
services started by Hamden and Adams were consolidated. The
lines connecting the west and east by Albany, Buffalo and the
lakes were consolidated in the American Express Company,
under the direction of William G. Fargo (q.v., Henry Wells, Fargo &
Co., operated on the Pacific coast. The celebrated "Pony
Express" was started in 1860 between San Francisco and St.
Joseph, Missouri, the time scheduled being eight days. The
service was carried on by relays of horses, with stations
25 m. apart. The charge made for the service was $2.50 per
4:]. The completion of the Pacific Telegraph Company line
in 1861 was followed by the discontinuance of the regular
service.

The name "express" is applied to a rifle having high velocity,
flat trajectory and long fixed-sight range; and an "express-
bullet" is a light bullet with a heavy charge of powder used in
such a rifle (see Rifle).

EXPROPRIATION, the taking away or depriving of property
(Late Lat. expropriare, to take away, proprium, i.e. that which
is one's own). The term is particularly applied to the compulsory
acquisition of private property by the state or other public
authority.

EXFUSION (Lat. expulsio, from expellere), the act of driving
out, or of removing a person from the membership of a body
or the holding of an office, or of depriving him of the right of
attending a meeting, &c. In the United Kingdom the House of
Commons can by resolution expel a member. Such resolution
cannot be questioned by any court of law. But expulsion is
only resorted to in cases where members are guilty of offences
rendering them unfit for a seat in the House, such as being in
open rebellion, being guilty of forgery, perjury, fraud or breach
of trust, misappropriation of public money, corruption, conduct
unbecoming the character of an officer and a gentleman, &c. It
is customary to order the member, if absent, to attend in his
place, before an order is made for his expulsion (see May, Para-
liamentary Practice, 1906, p. 56 seq.). Municipal corporations or
other local government bodies have no express power to expel a
member of their body. The governor of New York, by a statute,
was authorized to expel a member of the state assembly who had
not vacated his seat, or who power is given by
statute to declare the member's seat vacant. In the cases of
officers and servants of the crown, tenure varies with the nature
of the office. Some officials hold their offices ad vitam aut
culpam or dum bene se gesserunt, others can be dismissed at any
time and without reason assigned and without compensation.
In the case of membership of a voluntary association (club, &c.)
the right of expulsion depends upon the rules, and must be
exercised in good faith. Courts of justice have jurisdiction to
prevent the improper expulsion of the member of a voluntary
association where that member has a right of property in the
association. In the case of meetings, where the meeting is one
of a public body, any person not a member of the body is
to be entitled to be present only on sufferance, and may be expelled
on a resolution of the body. In the case of ordinary public
meetings those who convene the meeting stand in the position
of licensors to those attending and may revoke the licence and
expel any person who creates disorder or makes himself otherwise
objectionable.

Expulsion of Aliens.—Under the Naturalization Act of 1870,
the Act of 1871, and the various disqualifications affecting aliens in England
was removed. The political disqualifications, however, remained
only applied to electoral rights. In the very exceptional cases in
which it was retained in the statute book, expulsion was considered
as having fallen into desuetude, but it has been revived by the
Aliens Act of 1905 (5 Edw. VII. c. 13). Under
this act powers are given to the secretary of state to make an order
requiring an alien to leave the United Kingdom within a time
fixed by the order and thereafter to remain outside the United
Kingdom, subject to certain conditions, provided it is certified
to him that the alien has been convicted of any felony or mis-
demeanour or other offence for which the court has power to
impose imprisonment without the option of a fine, &c., or that
he has been sentenced in a foreign country with which there is
an extradition treaty, for the crime not being an offence of a
political character. There are also provisions applicable within
one year after the alien has entered the United Kingdom in the
case of pauper aliens. Precautions are taken to prevent, as
far as possible, any abuse of the power of expulsion. Under
the French law of expulsion (December 3, 1849) there are no such
precautions, the minister of the interior having an absolute
discretion to order any foreigner as a measure of public policy
to leave French territory and in fact to have him taken immedi-
ately to the frontier.

EXTENSION (Lat. ex, out; tendere, to stretch), in general,
the action of straining or stretching out. It is usually employed
metaphorically (cf. the phrase an "extension of time," a period
allowed in excess of what has been agreed upon). It is used
as a technical term in logic to describe the total number of
objects to which a given term may be applied; thus the meaning
of the term "King." In extension means the kings of England,
Italy, Spain, &c. (cf. Denotation), while in "intension" it
means the attributes which taken together make up the idea
of kinghood (see Connotation). In psychology the literal sense
of extension is retained, i.e. "spread-outness." The perception
of space by the senses of sight and touch, as opposed to semi-
spatial perceptions by smell and hearing, is that of "continuous
expanses composed of positions separated and connected by
distances" (Stout); to this the term "extension" is applied.
The perception of separate objects involves position and distance,
but these taken together are not extension, which necessarily
implies continuity. To move one's finger along the keys of a
piano gives both the position and the distance of the keys;
to move it along the frame gives the idea of extension. By
expanding this idea we obtain the conception of all space as
an extended whole. To this perception are necessary both form
and material. It should be observed the actual quality of a
stimulus (rough, smooth, dry, &c.) has nothing to do with the
spatial perception as such, which is concerned purely with what
is known as "local signature." The elementary undifferentiated
sensation excited by the stimuli exerted by a continuous whole
is justly called "extension," "extension of a thing," or "extension"
Thus the term has to do not with the kind of object which excites the
sensation, but simply with the vague massiveness of the latter.
As such it is distinguishable in thought from extension, though
it is not easy to say whether and if so how far the quantitative
aspect of space can exist apart from spatial order. Extensity
as an element in the complex of extension must be carefully
distinguished from intensity. Mere increase of pressure implies
increase of intensity of sensation; to increase the extensity the
area, so to speak, of the exciting stimulus must be increased.
Thus the extensity (also called "voluminosity," or "massive-
ness") of the sensation produced by a roll of thunder is greater
than that produced by a whistle or the bark of a dog. It should
be observed that this application of the idea of extensity to
sensation in general, rather than to the matter which is the
exciting stimulus, is only an analogy, an attempt to explain
a common psychic phenomenon by terminology which is
intrinsically suitable to the physical. As a natural consequence
the term represents different shades of meaning in different
treatises, verging sometimes towards the physical, sometimes
towards the psychic, meaning.

With extension elaborate psycho-physical experiments have been
conducted, e.g. with the object of comparing the accuracy of tactual and visual perception and discovering
what are the least differences which each can observe. At
a distance two lights appear as one, just as two stars distinguishable
through a telescope are one to the naked eye (see Vision):
against the points of a compass are brought close together
and pressed lightly on the skin the sensation, though vague and
diffused, is a single one.

See Psychology and works there quoted; also Space and Time.
EXTENUATING CIRCUMSTANCES. This expression is used in law with reference to crimes, to describe cases in which, though an offence has been committed without legal justification or excuse, its gravity, from the point of view of punishment or moral opprobrium, is mitigated or reduced by reason of the facts leading up to or attending the commission of the offence. According to English procedure, the jury has no power to determine the punishment to be awarded for an offence. The sentence, with certain exceptions in capital cases, is within the sole discretion of the judge, subject to the statutory prescriptions as to the kind and maximum of punishment. It is common practice or judicial discretion, granting extenuating circumstances, ailder, a reader recommending the accused to mercy on the ground of grave provocation received, or other circumstances, which in their view should mitigate the penalty. This form of reader is often added on a verdict of guilty of wilful murder, a crime as to which the judge has no discretion as to punishment, but the recommendation is sent to the Home Office for consideration in advising as to exercise of the prerogative of mercy. Quite independently of any recommendation by the jury, the judge is entitled to take into account matters proved during the trial, or laid before him as a guide to him in determining the quantum of punishment.

Under the French law (Code d'Instruction criminelle, art. 345), it is the sole right and the duty of a jury in a criminal case to pronounce whether or not the commission of the offence was attended by extenuating circumstances (circonstances atténuantes). They are not bound to say anything about the matter; but the whole or the majority may qualify the verdict by finding extenuation, and if they do, the powers of the court to impose the maximum punishment are taken away and the sentence to be pronounced is reduced in accordance with the scale laid down in art. 469 of the Code pénal. The most important result of this rule is to enable a jury to prevent the infliction of capital punishment for murder. In cases of what is termed “crime passional,” French juries, when they do not acquit, almost invariably find extenuation; and a like verdict has become common even in the case of cold-blooded and sordid murders, owing to objections to capital punishment.

EXTERJORITY, a term of international law, used to denominate certain immunities from the application of the rule that every person is subject for all acts done within the boundaries of that state to its local laws. It is also employed to describe the quasi-exterritorial position of the agents of the government of the dwelling-place of an accredited diplomatic agent, and of the public ships of one state while in the waters of another. Lastly its sense has been extended to all cases in which states refrain from enforcing their laws within their territorial jurisdiction. The cases recognized by the law of nations relate to: (1) the persons and belongings of foreign sovereigns, whether incognito or not; (2) the persons and belongings of ambassadors, ministers plenipotentiary, and other accredited diplomatic agents and their suites (but not consuls, except in some non-Christian countries, in which they sometimes have a diplomatic character); (3) public ships engaged in commerce. Exterritoriality has also been granted by treaty to the subjects and citizens of contracting Christian states resident within the territory of certain non-Christian states. Lastly, it is held that when armies or regiments are allowed by a foreign state to cross its territory, they necessarily have exterritorial rights. “The ground upon which the immunity of sovereign rulers from process in our courts," said Mr Justice Wills in the case of Mighell v. Sultan of Johore, 1894, “is recognized by our law, is that it would be absolutely inconsistent with the status of an independent sovereign that he should be subject to the process of a foreign tribunal,” unless he deliberately submits to its jurisdiction.

It has, however, been held where the foreign sovereign was also a British subject (Duke of Brunswick v. King of Hanover, 1844), that he is amenable to the jurisdiction of the English Courts in respect of transactions done by him in his capacity as a subject. A “foreign sovereign” may be taken to include the president of a republic, and even a potentate whose independence is not complete. Thus in the case, cited above, of Mighell v. Sultan of Johore, the sultan was ascertain to have abandoned all right to contract with foreign states, and to have placed his territory under British protection. The court held that he was, nevertheless, a foreign sovereign in so far as immunity from British jurisdiction was concerned. The immunity of a foreign diplomatic agent, as the direct representative of a foreign sovereign (or state), is based on the same grounds as that of the sovereign authority itself. The international practice in the case of Great Britain was confirmed by an act of parliament of the reign of Queen Anne, which is still in force. The preamble to this act states that “the persons and property of foreigners in a most outrageous manner had insulted the person of the then ambassador of his Czarish Majesty, emperor of Great Russia,” by arresting and detaining him in custody for several hours, “in contempt to the protection granted by Her Majesty, contrary to the law of nations, and in prejudice of the rights and privileges which ambassadors and other public ministers, authorized and received as such, have at all times been thereby possessed of, and ought to be kept sacred and inviolable.” This preamble has been repeatedly held by our courts to be declaratory of the English common law. The act provides that, for the purposes of this law, “null and void,” and that any person violating these provisions shall be punished for a breach of the public peace. Thus a foreign diplomatic agent cannot, like the sovereign he represents, waive his immunity by submitting to the British jurisdiction. The diplomatic immunity necessarily covers the residence of the diplomatic agent, which some writers describe as assimilated to territory of the state represented by the agent; but there is no consideration which can justify any extension of the immunity beyond the needs of the diplomatic mission resident within it. It is different with public ships in foreign waters. In their case the exterritoriality attaches to the vessel. Beyond its bulwarks captain and crew are subject to the ordinary jurisdiction of the state upon whose territory they happen to be. By a foreign public ship is now understood any ship in the service of a foreign state. It was even held in the case of the “Parlement Belge” (1880), a packet belonging to the Belgian government, that the character of the vessel as a public ship was not affected by its carrying passengers and merchandise for hire. In a more recent case an action brought by the owners of a Greek vessel against a vessel belonging to the state of Rumania was dismissed, though the agents of the Rumanian government had entered an appearance unconditionally and had obtained the release of the vessel on bail, on the ground that the Rumanian government had not authorized acceptance of the British jurisdiction (The “Jassy,” 1906, 75 L.J.P. 93).

Writers frequently describe the exterritoriality of both embassies and ships as absolute. There is, however, this difference, that the exterritoriality of the latter not being, like that of embassies, a derived one, there seems to be no ground for exterritorialism of it. It was, nevertheless, laid down by the arbitrators in the “Alabama” case (Cockburn dissenting), that the privilege of exterritoriality accorded to vessels had not been admitted into the law of nations as an absolute right, but solely as a proceeding founded on the principle of courtesy and mutual deference between different nations, and that it could therefore “never be appealed to for the protection of acts done in violation of neutrality.”

The exterritorial settlements in the Far East, the privileges of Christians under the arrangements made with the Ottoman Porte, and other exceptions from local jurisdictions, are subject to the conditions laid down in the treaties by which they have been created. There are also cases in which British communities have grown up in barbarous countries without the consent of any local authority. All these are regulated by orders in council, issued now in virtue of the Foreign Jurisdiction Act 1890, an act enabling the crown to exercise any jurisdiction it may have “within a foreign country” in as ample a manner
as if it had been acquired "by cession or conquest of territory." A very exceptional case of exterritoriality is that granted to the pope under a special Italian enactment. (T. Ba.)

EXTORTION (Lat. extorsio, from exterquirre, to twist out, to take away by force), in English law the term applied to the exaction by public officers of money or money's worth not due at all, or in excess of what is due, or before it is due. Such exaction, unless made in good faith (i.e. in honest mistake as to the sum properly payable), is a misdemeanour by the common law and is punishable by fine and (or) imprisonment. Besides the punishment above stated, an action for twice the value of the thing extorted lies against officers of the king (1275, 3 Edw. I. c. 26). There are numerous provisions for the punishment of particular officers who make illegal exactions or take illegal fees: e.g. sheriffs and their officers (Sheriffs Act 1887), county court bailiffs (County Courts Act 1888), clergymen of courts of justice, and gaolers who exact fees from prisoners. A gaoler is also punishable for detaining the corpse of a prisoner as security for debt. The term "public officer" is not limited to officers under the crown; and there are old precedents of criminal punishment for extortion against churchwardens, and against millers and ferrymen who demand tolls in excess of what is customary under their franchise.

The term extortion is also applied to the exaction of money or money's worth by menaces of personal violence or by threats to accuse of crime or to publish defamatory matter about another person. These offences fall partly under the head of robbery and partly under blackmail, or what in French is termed chantage.

EXTRACT (from Lat. extrahere, to draw out), in pharmacy, the name given to preparations formed by evaporating or concentrating solutions of active principles; tintures are solutions which have not been subjected to any evaporation. "Liquid extracts" are those of a syrupy consistency, and are generally prepared by treating the drug with the solvent (water, alcohol, &c.) and concentrating the solution until it attains the desired consistency. "Ordinary extracts" are thick, tenacious and sometimes even dry preparations; they are obtained by evaporating solutions as obtained above, or the juices expressed from the plants.

Extraction, in chemical technology, is a process for separating one substance from another by taking advantage of the varying solubility of the components in some chosen solvent. The term "lixiviation" is used when water is the solvent. In laboratory practice all the common solvents are employed. With small quantities it may suffice to shake the substance with the solvent, the mixture being heated if necessary, filter and dilute or otherwise remove the solvent from the distillate. For larger quantities continuous extraction is advisable. This may be carried out in many forms of apparatus; one of the most convenient is the Soxhlet extractor, in which the extract siphons into the flask containing the solvent, and so maintains the quantity of available solvent practically constant. Continuous extraction is generally the practice in technology. One of the most important applications is in the fat and gelatin industries.

EXTRADITION (Lat. ex, out, and tradite, handing over), the surrender of an alleged criminal for trial by a foreign state where he has taken refuge, to the state against which the alleged offence has been committed. When a person who has committed an offence in one country escapes to another, what is the duty of the latter with regard to him? Should the country of refuge try him in its own courts according to its own laws, or deliver him up to the country whose laws he has broken? To the general question international law gives no certain answer. Some jurists, Grotius among them, incline to hold that a state is bound to give up fugitive criminals, but the majority appear to deny the obligation as a matter of right, and prefer to put it on the ground of comity. And the universal practice of nations is to surrender criminals only in consequence of some special treaty with the country which demands them.

There are two practical difficulties about extradition which have probably prevented the growth of any uniform rule on the subject. One is the variation in the definitions of crime adopted by different countries. The second is the possibility of the process of extradition being employed to get hold of a person who is wanted by his country, not really for a criminal, but for a political offence. In modern states, and more particularly in England, offences of a political character have always been carefully excluded from the operation of the law of extradition.

1. UNITED KINGDOM.—The Extradition Acts 1870-1873 (3 & 4 Vict. cc. 62, and 36 & 37 Vict. c. 60) and the Fugitive Offenders Act 1881 (44 & 45 Vict. c. 69) deal with different branches of the same subject, the recovery and surrender of fugitive criminals. The Extradition Acts apply in the case of countries with which Great Britain has extradition treaties. The Fugitive Offenders Act applies—(i) as between the United Kingdom and any British possession, (2) as between any two British possessions, and (3) as between the United Kingdom or a British possession and certain foreign countries, such as Turkey and China, in which the crown exercises foreign jurisdiction.

Conditions of Surrender.—In spite of some earlier authorities it has long been settled that in English law there is no power to surrender fugitive criminals to a foreign country without express statutory authority. Such authority is now given by the Extradition Acts 1870-1873, but only in the case of the offences therein specified, and with regard to countries with which an arrangement has been entered into, and to which the acts have been applied by order in council. The acts are further to be applied, subject to such "conditions, exceptions and qualifications as may be deemed expedient" (§ 2), and these conditions, &c., are invariably to be found in the extradition treaty which is so to say, the order in council applying the Extradition Acts to a particular country. To support a demand for extradition from Great Britain it is therefore necessary to show that the offence is one of those enumerated in the Extradition Acts, and also in the particular treaty, and that the acts charged amount to the offence according to the laws both of Great Britain and of the state demanding the surrender.

Surrender of Subjects.—A further question arises where a state is called on to surrender one of its own subjects. Some of the treaties, such as those with France and Germany, stipulate that neither contracting party shall surrender its own subjects, and in such cases a British subject cannot be surrendered to his own country. The treaties with Spain, Switzerland and Luxemburg provide for the surrender by Great Britain of her own subjects, but there is no reciprocity. Other treaties, such as those with Austria, Belgium, Russia and the Netherlands, give each party the option of surrendering or refusing to surrender its own subjects in each particular case. Under such treaties British subjects are surrendered unless the secretary of state intervenes to forbid it. Lastly, some treaties, such as that with the United States, contain no restriction of this kind, and the subjects of each other are freely surrendered to the other. Surrender by Great Britain is also subject to the following restrictions contained in s. 3 of the Extradition Act 1870—(1) that the offence is not of a political character, and the requisition has not been made with a view to try and punish for an offence of a political character; (2) that the prisoner shall not be liable to be tried for any but the specified extradition offences; (3) that he shall not be surrendered until he has been tried and served his sentence for offences committed in Great Britain; and (4) that he shall not be actually given up until fifteen days after his committal for extradition, so as to allow of an application to the courts.

Political Offences.—The question as to what constitutes a political offence is one of some nicety. It was discussed in Re Caslioni (1890, 1 Q.B. 149), where it was held, following the opinion of Mr Justice Stephen in his History of the Criminal Law, that to give an offence a political character it must be "incidental to and form part of political disturbances." Extradition was accordingly refused for homicide committed in the course of an armed rising against the constituted authorities. In the more
recent case of In re Moulier (1894, 2 Q.B. 415); an Anarchist was charged with causing two explosions in Paris—one at the Café Very—resulting in the death of two persons, and the other at certain barracks. It was not contended that the outrage at the café was a political crime, but it was argued that the explosion at the barracks came within the description. The court, however, held that to constitute a political offence there must be two or more parties in the state, each seeking to impose a government of its own choice on the other, which was not the case with regard to Anarchist crimes. The party of anarchy was the enemy of all governments, and its effects were directed primarily against the general body of citizens. The test applied in the earlier case is perhaps the more satisfactory of the two.

With regard to the provision that surrender shall not be granted if the requisition has in fact been made with a view to try and punish for an offence of a political character, it was decided in the case of Arton (1896, 1 Q.B. 108) that a mere suggestion, that after his surrender for a non-political crime, the prisoner would be interrogated on political matters (his alleged complicity in the Panama scandal), and punished for his refusal to answer, was not enough to bring him within the provision. The court also held that it had no jurisdiction to entertain a suggestion that the request of the French government for his extradition was not made in good faith and in the interests of justice.

Extradition Offences.—The following is a list of crimes in respect of which extradition may be provided for under the Extradition Acts 1870-1873, and the Slave Trade Act 1873.

Extradition Act 1870—(1) Murder; (2) Attempt to murder; (3) Conspiracy to murder; (4) Manslaughter; (5) Counterfeiting and altering money, uttering counterfeit or altered money; (6) Forgery, counterfeiting, and altering and uttering what is forged or counterfeited or altered; (7) Embezzlement and larceny; (8) Obtaining money or goods by false pretences; (9) Crimes by bankrupts against bankruptcy law; (10) Fraud by a bailee, banker, agent, factor, trustee or director, or member or public officer of any company made criminal by any law for the time being in force; (11) Rape; (12) Abduction; (13) Child-stealing; (14) Burglary and housebreaking; (15) Arson; (16) Robbery with violence; (17) Threats by letter or otherwise with intent to extort; (18) Crimes committed at sea: (a) Piracy by the law of nations; (b) Sinking or destroying a vessel at sea, or attempting or conspiring to do so; (c) Assault on a ship on the high seas, with intent to destroy life or to do grievous bodily harm; (d) Revolt, or conspiring to revolt, by two or more persons on board a ship on the high seas against the authority of the two; (19) Bribery. Extradition Act 1873—(20) Kidnapping and false imprisonment; (21) Perjury and subornation of perjury. This act also extends to indictable offences under 24 & 25 Vict. cc. 96, 97, 98, 99, 100, and amending and substituting acts. Among such offences included in various extradition treaties are the following:—(22) Obtaining valuable securities by false pretences; (23) Receiving any money, valuable security or other property, knowing the same to have been stolen or unlawfully obtained; (24) Falsification of accounts (see In re Arton, 1896, 1 Q.B. 409). (25) Malicious injury to the property of another. An offence is rape; (26) Knowingly making, without lawful authority, any instrument, tool or engine adapted and intended for the counterfeiting of coin of the realm; (27) Abandoning children; exposing or unlawfully detaining them; (28) Any malicious act done with intent to endanger the safety of any person in a railway train; (29) Wounding or inflicting grievous bodily harm; (30) Assault occasioning actual bodily harm; (31) Assaulting a magistrate or peace or public officer; (32) Indecent assault; (33) Unlawful carnal knowledge, or any attempt to have unlawful carnal knowledge, of a girl under age; (34) Bigamy; (35) Administering drugs or using instruments with intent to procure the miscarriage of women; (36) Any indictable offence under the laws for the time being in force in relation to bankruptcy. Slave Trade Act 1873 (36 & 37 Vict. c. 88, s. 27):—(37) Dealing in slaves in such manner as to constitute a criminal offence against the laws of both states.

The United Kingdom has extradition treaties with practically all civilized foreign countries; and though it is not practicable to state which of the statutory extradition offences are included in each, it may be said generally that crimes 1 to 17 inclusive are covered in all, though Rumania has reserved the right to refuse, and Portugal does refuse, to surrender for a crime punishable with death.

The act of 1873 provides for the surrender of accessories before and after the fact to extradition crimes, and most of the treaties contain a clause by which extradition is to be granted for participation in any of the crimes specified in the treaty, provided that such participation is punishable by the laws of both countries. Several of the treaties also contain clauses providing for optional surrender in respect of any crime not expressly mentioned for which extradition can be granted by the laws of both countries.

It is further to be noted that the restrictions on surrender in the Extradition Acts apply only to surrender by Great Britain. Foreign countries may surrender fugitives to Great Britain without any treaty, if they are willing to do so and their law allows of it, and such surrenders have not infrequently been made. But when surrendered for an extradition crime, the prisoner cannot be tried in England for any other crime committed before or after his arrest, or held if he had an opportunity of returning, to the foreign state from which he was extradited.

Procedure.—To obtain from a foreign country the extradition of a fugitive from the United Kingdom, it is necessary to procure a warrant for his arrest, and to send it, or a certified copy, to the home secretary together with such further evidence as is required by the treaty with the country in question. In most cases an information or deposition containing evidence which would justify a committal for trial in Great Britain will be required. The home secretary will then communicate through the foreign secretary and the proper diplomatic channels with the foreign authorities, and in case of urgency will ask them by telegraph for a provisional arrest. For the arrest in the United Kingdom of fugitive criminals whose extradition is requested by a foreign state, two procedures are provided in ss. 7 and 8 of the act of 1870:—(1) On a diplomatic requisition supported by the warrant of arrest and documentary evidence, the home secretary, if he thinks the crime is not of a political character, will order the chief magistrate at Bow Street to proceed; and such magistrate will then issue a warrant of arrest on such evidence as would be required if the offence had been committed in the United Kingdom. (2) More summarily, any magistrate or justice of the peace may issue a provisional warrant of arrest on evidence which would support such a warrant if the crime had been committed within his jurisdiction. In practice a sworn information is required, but this may be based on a telegram from the foreign authorities. The magistrate or justice must then report the issue of the warrant to the home secretary, who may cancel it and discharge the prisoner. When arrested on the provisional warrant, the prisoner will be brought up before a magistrate and remanded to Bow Street, and will then be further remanded. A magistrate at Bow Street is notified that a formal requisition for surrender has been made; and unless such requisition is made in reasonable time the prisoner is entitled to be discharged. The examination of the prisoner prior to his committal for extradition ordinarily takes place at Bow Street. The magistrate is required to hear evidence that the alleged offence is of a political character or is not an extradition crime. If satisfied in these respects, and if the foreign warrant of arrest is duly authenticated, and evidence is given which according to English law would justify a committal for trial, if the prisoner has not yet been tried, or would prove a conviction if he has already been convicted, the magistrate will commit him for extradition. Under the Extradition Act 1893 the home secretary, if of opinion that removal to Bow Street would be dangerous to the prisoner's life, or prejudicial to his health, may order the case to be taken by a magistrate at the place where the prisoner was apprehended, or then is, and the magistrate may order the
EXTRADOS—EXTREME UNCTION

prisoner to be detained in such place. After committal for extradition, every prisoner has fifteen days in which to apply for habeas corpus, and after such period, or at the close of the habeas corpus proceedings if they are unsuccessful, the home secretary issues his warrant for surrender, and the prisoner is handed over to the officers of the foreign government.

The Extradition Acts apply to the British colonies, the governor being authorized for the Secretary of State. Their operation may, however, be suspended by order in council, as in the case of Canada, where the colony has passed an Extradition Act of its own (see Statutory Rules and Orders).

Fugitive Offenders Act.—There are no extradition treaties with certain countries in which the crown exercises foreign jurisdiction, such as Cyprus, Turkey, Egypt, China, Japan, Corea, Zanzibar, Morocco, Siam, Persia, Somali, &c. In these countries the Fugitive Offenders Act 1881 (44 & 45 Vict. c. 69) has been applied, pursuant to s. 36 of that statute, and the measures for obtaining surrender of a fugitive criminal are the same as in a British colony. The act, however, only applies to persons over whom the crown has jurisdiction in these territories, and generally is expressly restricted to British subjects.

Under this act a fugitive from one part of the king's dominions to another, or to a country where the crown exercises foreign jurisdiction, may be brought back by a procedure analogous to extradition, but applicable only to treason, piracy and offences punishable with twelve months' imprisonment with hard labour or more. The original warrant of arrest must be endorsed by one of several authorities where the offenders happen to be,—in practice by the home secretary in the United Kingdom, the governor in the United States, or a warrant of arrival of the original warrant a provisional arrest may be made, as under the Extradition Acts. The fugitive must then be brought up for examination before a local magistrate, who, if the endorsed warrant is duly authenticated, and evidence is produced "which, according to the law administered by the magistrate, raises a strong or probable presumption that the offender committed the offence, and that the act applies to it," may commit him for return. An interval of fifteen days is allowed for habeas corpus proceedings, and (s. 10) the court has a large discretion to discharge the prisoner, or impose such fine as the court thinks the case frivolous, or that the return would be unjust or oppressive, or too severe a punishment. The next step is for the home secretary in the United Kingdom, and the governor in a colony, to issue a warrant for the return of the prisoner. He must be removed within a month, in the absence of reasonable cause to the contrary. If not prosecuted within six months after arrival, or if acquitted, he is entitled to be sent back free of cost.

In the case of fugitive offenders from one part of the United Kingdom to another, it is enough to get the warrant of arrest backed by a magistrate having jurisdiction in that part of the United Kingdom where the offender happens to be. A warrant issued by a metropolitan police magistrate may be executed, without backing, by a metropolitan police officer anywhere, and there are certain other exceptions, but as a rule a warrant cannot be executed without being backed by a local magistrate.

2. United States.—Foreign extradition is purely an affair of the United States, and not for the individual states themselves. Upon a demand upon the United States for extradition, there is a preliminary examination before a commissioner or judge before there can be a surrender to the foreign government (United States, Title LXVI.; 22 Statutes at Large, 215). It is enough to show probable guilt (Ornelas v. Ruiz, 161 United States Reports, 502). An extradition treaty covers crimes previously committed. If a Power, with which the United States have such a treaty, surrenders a charged with a crime not included in the treaty, he may be tried in the United States for such crime. Inter-state extradition is regulated by act of Congress under the Constitution of the United States (Article IV. s. 2; United States Revised Statutes, s. 3578). A surrender may be demanded of one properly charged with an act which constitutes a crime under the laws of the demanding state, although it be no crime in the other state. A party improperly surrendered may be released by writ of habeas corpus, either from a state or United States court (Robb v. Conolly, 111 U.S. Reports, 624). On his return to the state from which he fled, he is subject to prosecution for any crime, though on a foreign extradition the law is otherwise (Loscelles v. Georgia, 148 U.S. Reports, 537). (S. E. B.).

Extending the Sir E. Cave, Treatise upon the Law of Extradition (ed., 1904); Birnai and Chalmers, Law and Practice of Extradition (1903). EXTRADOS (extra, outside, Fr. dos, back), the architectural term for the outer boundary of the vousoirs of an arch (q.v.).

EXTREME UNCTION, a sacrament of the Roman Catholic Church. In James v. 14 it is ordained that, if any believer is sick, he shall call for the elders of the church; and they shall pray over him, anointing him with oil in the name of the Lord; and the prayer of faith shall save him that is sick, and the Lord shall raise him up; and if he has committed sins, it shall be forgiven him.

Origin.—Reputed medical art on the ground that the prescription here cited is enough; modern faith-healers and Peculiar People have followed in his wake. The Catholic Church has more wisely left physicians in possession, and elevated the anointing of the sick into a sacrament to be used only in cases of mortal sickness, and even then not to the exclusion of the healing art. It has been general since the 9th century. The council of Florence A.D. 1439 thus defined it:

"The fifth sacrament is extreme unction. Its matter is oliv" oil produced by a bishop. It shall not be given except to a sick person whose death is apprehended. He shall be anointed in the following places: the eyes, ears, nostril, mouth, hands, feet, reins. The form of the sacrament is this: Through this anointing of thee and through its most pious mercy, be forgiven all thy sins of sight, &c., and so in respect of the other organs. A priest can administer this sacrament. But its effect is to make whole the mind, and, so far as it is expedient, the body as well."

The sacrament supplants that of penance (viz. remission of post-baptismal sin) in the sense that any guilt unconfessed or left over after normal penances imposed by confessors is purged thereby. It was discussed in the 12th century whether this sacrament is indelible like baptism, or whether it can be repeated; and the latter view, that of Peter Lombard, prevailed.

It was a popular opinion in the middle ages that extreme unction extinguishes all ties and links with this world, so that he who has received it must, if he recovers, renounce the eating of fresh and matrimonial relations. A few peasants of Lombardy still believe that one who has received extreme unction ought to be left to die, and that any one who has received it may be prevented to death through the withholding of food on superstitious grounds. Such opinions, combated by bishops and councils, were due to the influence of the consolamentum of the Cathars (q.v.). In both sacraments the death-bed baptism of an earlier age seems to survive, and they both fulfil a deep-seated need of the human spirit.

Some Gnostics sprinkled the heads of the dying with oil and water to render them invisible to the powers of darkness; but in the East generally, where the need to compete with the Cathar sacrament of Consolatio was less acutely felt, extreme unction is unknown. The Latinizing Armenians adopted it from Rome in the crusading epoch. At an earlier date, however, it was usual to anoint the dead."

In the Roman Church the bishop blesses the oil of the sick used in extreme unctions on Holy Thursday at the Chismal Mass, using the following prayer of the sacramentaries of Gelasius and Hadrian:

"Send forth, we pray Thee, O Lord, Thy holy spirit, the Paraclete from Heaven, into this fatness of oil, which Thou hast deemed fit to produce from the gourd of its seed, to the refreshment of mind and body; and through Thy holy benediction may it be for all that anoint, taste, touch, a protection of mind and body, of soul and spirit, unto the easy eauay of all pain, all weakness, all sickness of mind and body; wherefore Thou hast anointed priest, kings and prophets and martyrs with thy chrism, perfected by Thee, O Lord, blessed and abiding in our bowels in the name of our Lord Jesus Christ." Sec L. Duchesne, Origins du Culte Chrétien (Paris, 1898). (F. C. C.)

1 The oil left over from the year before is burnt.
EYBESCHÜTZ, JONATHAN (1600–1764), German rabbi, was from 1750 rabbi in Altona. He was a man of erudition, but he owed his fame chiefly to his personality. Few men of the period so profoundly impressed their mark on Jewish life. He became specially notorious because of a curious controversy that arose concerning the amulets which Eysbeschutz was suspected of issuing. These amulets recognized the Messianic claims of Sabbatai Sebi (q.v.), and a famous rabbinic contemporary of Eysbeschutz, Jacob Emden, boldly accused him of having fostered controversy on a momentous incident in the Jewish life of the period, and though there is insufficient evidence against Eysbeschutz, Emden may be credited with having crushed the lingering belief in Sabbatai current even in some orthodox circles.

EYCK, VAN, the name of a family of Flemish painters in whose works the rise and mature development of art in western Flanders are represented. Though bred in the valley of the Meuse, they finally established their professional domicile in Ghent and in Bruges; and there, by skill and inventive genius, they changed the traditional habit of the EARLIER SCHOOL, and, by the introduction of FLEMISH design, and created an entirely new spirit in the technical methods of execution familiar to their contemporaries.

1. HUBERT (Huybrecht) VAN EYCK (? 1366–1426) was the eldest and most remarkable of this race of artists. The date of his birth and the records of his progress are lost; but the ruins of the earlier civilization of the valley of the Meuse. He was born about 1366, at Maeseyc, under the shelter or protection of a Benedictine convent, in which art and letters had been cultivated from the beginning of the 9th century. But after a long series of wars—when the country became invaded by the schools which had flourished in the towns decayed—he wandered to Flanders, and there for the first time gained a name. As court painter to the hereditary prince of Burgundy, and as client to one of the richest of the Ghent patricians, Hubert is celebrated. Here, in middle age, between 1409 and 1420, he signalled himself as the inventor of a new method of painting. Here he lived in the pay of Philip of Charolais till 1421. Here he painted pictures for the corporation, whose chief magistrate honoured him with a state visit in 1424. His principal masterpiece, the "Worship of the Lamb," commissioned by Joboduc Vijdts, lord of Pamele, at the foot of the Ghent school, to which we possess all the parts dispersed from St. Bavon in Ghent to the galleries of Brussels and Berlin,—one upon which Hubert laboured till he died, leaving it to be completed by his brother. Almost unique as an illustration of contemporary feeling for Christian art, this great composition can only be matched by the "Fount of Salvation," in the museum of Madrid. It represents, on numerous panels, Christ on the judgment seat, with the Virgin and St. John the Baptist at his sides, bearing the songs of the angels, and contemplated by Adam and Eve, and, beneath him, the Lamb shedding his blood in the presence of angels, apostles, prophets, martyrs, knights and hermits. On the outer sides of the panels are the Virgin and the angel annunciate, the sibyls and prophets who foretold the coming of the Lord, and the donors in prayer at the feet of the Baptist and Evangelist. After this great work was finished it was placed, in 1435, on an altar in St. Bavon of Ghent, with an inscription on the framework describing Hubert as "maior quo nemo repentus," and setting forth, in colours as imperishable as the picture itself, that Hubert began and John afterwards brought it to perfection. John van Eyck certainly wished to guard against an error which ill-posted piety showed itself but too prone to foster, the error that he alone had composed and carried out an altarpiece executed jointly by Hubert and himself. His contemporaries may be credited with full knowledge of the truth in this respect, and the facts were equally well known to the duke of Burgundy or the chiefs of the corporation of Bruges, who visited the painter's house in state in 1432, and the members of the chamber of rhetoric at Ghent, who reproduced the Agnus Dei as a tableau vivant in 1436. Yet a later generation of Flemings forgot the claims of Hubert, and gave the honours that were his due to his brother John exclusively.

The solemn grandeur of church art in the 15th century never found, out of Italy, a nobler exponent than Hubert van Eyck. His representation of Christ as the judge, between the Virgin and St. John, affords a fine display of realistic truth, combined with pure drawing and gorgeous colour, and a happy union of earnestness and simplicity with the deepest religious feeling. In contrast with earlier productions of the Flemish school, it shows a singular degree of knowledge and an extreme of detail. Finishing with surprising skill, it is executed with the new oil medium, of which Hubert shared the invention with his brother, but of which no rival artists at the time possessed the secret,—a medium which consists of subtle mixtures of oil and varnish applied to the moistening of pigments after a fashion, only kept secret for a time from gildsmen of neighbouring cities, but unrevealed to the Italians till near the close of the 15th century. When Hubert died on the 18th of September 1426 he was buried in the chapel on the altar of which his masterpiece was placed. According to the most remarkable of all 14th-century names in the school, that is preserved as a relic in a casket above the portico of St. Barbara, at Ghent. During a life of much apparent activity and surprising successes, he taught the elements of his art to his brother John, who survived him.

2. JOHN (Jan) van eyck (? 1385–1440). The date of his birth is not more accurately known than that of his elder brother, but he was born much later than Hubert, who took charge of him and made him his "disciple." Under this tuition John learnt to draw and paint, and mastered the properties of colours from Pliny. Later on, Hubert admitted him into partnership, and John became one of the able court painters to Philip of Charolais. After the breaking up of the prince's household in 1421, John became his own master, left the workshop of Hubert, and took an engagement as painter to John of Burgundy, at that time resident at the Hague as count of Holland. From the Hague he returned in 1424 to take service with Philip, now duke of Burgundy, at a salary of 100 livres per annum, and from that time till his death John van Eyck remained the faithful servant of his prince, who never treated him otherwise than graciously. He was frequently employed in missions of trust, and following the fortunes of a chief who was always in the saddle, he appears for a time to have been in ceaseless motion, receiving orders of secret services at Leiden, drawing his salary at Bruges, yet settled in a fixed abode at Lille. In 1428 he joined the embassy sent by Philip the Good to Lisbon to beg the hand of Isabella of Portugal. His portrait of the bride fixed the duke's choice. After his return he settled finally at Bruges, where he married, and his wife bore him a daughter, known in after years as a nun in the convent of Maeseyc. At the christening of this child the duke was sponsor, and this was but one of many distinctions by which Philip the Good rewarded his painter's merits. Numerous altarpieces and portraits now give proof of van Eyck's extensive practice. As finished works of art and models of conscientious labour they are all worthy of the name they bear, though not of equal excellence, none being better than those which were completed about 1432. Of an earlier period, a "Consecration of Thomas à Becket" has been preserved, and may now be seen at Chatsworth, bearing the date of 1421; no doubt this picture would give a fair representation of van Eyck's talents at the moment when he started as an independent master, but that time and accidents of omission and commission have altered its state to such an extent that no conclusive opinion can be formed respecting it. The panels of the "Worship of the Lamb" were completed nine years later. They show that John van Eyck was quite able to work in the spirit of his brother. He had not only the lines of Hubert's compositions to guide him, he had also those parts to look at and to study which Hubert had finished. He continued the work with almost as much vigour as his master. His own experience had been increased by travel, and he had seen the finest varieties of landscape in Portugal and the Spanish provinces. This enabled him to transfer to his pictures the charming scenery of lands
more sunny than those of Flanders, and this he did with accuracy and not without poetic feeling. We may ascribe much of the success which attended his efforts to complete the altarpiece of Ghent to the cleverness with which he reproduced the varied aspect of changing scenery, reminiscent here of the orange groves of Cintra, there of the bluffs and crags of his native valley. In all these backgrounds, though we miss the scientific rules of perspective with which the van Eycks were not familiar, we find such delicate perceptions of gradations in tone, such atmosphere, yet such minuteness and perfection of finish, that our admiration never flags. Nor is the colour less brilliant or the touch less firm than in Hubert's panels. John only differs from his brother in being less masculine and less sternly religious. He excels in two splendid likenesses of Jodocus Vijdts and his wife Catherine Broul. The same vigorous style and coloured key of harmony characterizes the small "Virgin and Child" of 1432 at Ince, and the "Madonna," probably of the same date, at the Louvre, executed for Rollin, chancellor of Burgundy. Contemporary with these, the male portraits in the National Gallery, and the "Man with the Pinks," in the Berlin Museum (1432-1434), show no relaxation of power; but later creations display no further progress, unless we accept as progress a more searching delicacy of finish, counterbalanced by an excessive softness of rounding in flesh contours. An unaltering minuteness of hand and great tenderness of treatment may be found, combined with an angularity of drapery and some awkwardness of attitude in the full-length portrait couple (John Arnolfini and his wife, 1384) and in that small gallery of one of St George (1434). From first to last van Eyck retains his ability in portraiture. Fine specimens are the two male likenesses in the gallery of Vienna (1436), and a female, the master's wife, in the gallery of Bruges (1439). His death in 1440/41 at Bruges is authentically recorded. He was buried in St Donat. Like many great artists he formed but few pupils. Hubert's disciple, Jodocus of Ghent, hardly does honour to his master's teaching, and only acquires importance after he has thrown off some of the peculiarities of Flemish teaching. Petrus Cristus, who was taught by John, remains immeasurably behind him in everything that relates to art. But if the personal influence of the van Eycks was small, that of their works was immense, and it is not too much to say that their example, taken in conjunction with that of van der Weyden, determined the current and practice of painting throughout the whole of Europe north of the Alps for nearly a century.

**EYE**, a market-town and municipal borough in the Eye parliamentary division of Suffolk; England; 943 m. N.E. from London by the Great Eastern railway, the terminus of a branch from the Ipswich-Norwich line. Pop. (1901) 2004. The church of St Peter and St Paul is mainly of Perpendicular flint work, with Early English portions and a fine Perpendicular rood screen. It was formerly attached to a Benedictine priory. Slight fragments of a Norman castle crown a mound of probably earlier construction. There are a town hall, corn exchange, and grammar school founded in 1566. Brewing is the chief industry. The town is governed by a mayor, 4 aldermen and 12 councillors. Area, 4410 acres.

**Eyes** (Hyes, Aye) was once surrounded by a stream, from which it is supposed to have derived its name. Leland says it was situated in a marsh and had formerly been accessible by river vessels from Cromer, though the river was then only navigable to Burston, 12 m. from Eye. From the discovery of numerous bones and Roman urns and coins it has been thought that the place was once the cemetery of a Roman camp. William I. gave the lordship of Eye to Robert Malet, a Norman, who built a castle and a Benedictine monastery which was at first subordinate to the abbey of Bernay in Normandy. Eye is a borough by prescription. In 1205 King John granted to the townsman a charter freeing them from various tolls and customs and from the jurisdiction of the shire and hundred courts. Later charters were granted by Elizabeth in 1558 and 1574, by James I. in 1604, and by William III. in 1697. In 1574 the borough was newly incorporated under two bailiffs, ten chief and twenty-four inferior burgesses, and an annual fair on Whitsunday and a market on Saturday were granted. Two members were returned to each parliament from 1571 till 1832, when the Reform Act reduced the membership to one. By the Redistribution Act of 1885 the representation was merged in the Eye division of the county. The making of pillow-lace was formerly carried on extensively, but practically ceased with the introduction of machinery.

**EYE** (O. Eng. edge, Ger. Augz; derived from an Indo-European root also seen in Lat. oc ulus, the organ of vision (q.v.).

**ANATOMY.**—The eye consists of the eyeball, which is the true organ of sight, as well as of certain muscles which move it, and of the lachrymal apparatus which keeps the front of it in a moist condition. The eyeball is contained in the front of the orbit and is a sphere of about an inch (24 mm.) in diameter. From the front of this a segment of a lesser sphere projects slightly and forms the cornea (fig. 1, co). There are three coats to the eyeball, an external (protective), a middle (vascular), and an internal (sensory). There are also three refracting media, the aqueous humour, the lens and the vitreous humour or body.

The protective coat consists of the sclerotic in the posterior five-sixths and the cornea in the anterior sixth. The sclerotic (fig. 1, Sc) is a firm fibrous coat, forming the "white of the eye," which posteriorly is pierced by the optic nerve and blends with the sheath of that nerve, while anteriorly it is continued into the cornea at the corneo-scleral junction. At this point a small canal, known as the canalis Schlemm, runs round the margin of the cornea in the substance of the sclerotic (see fig. 1). Between the sclerotic and the subjacent choroid coat is a lymph space traversed by some loose pigmented connective tissue,—the

- ch: Choroid.
- pC: Ciliary processes.
- mC: Ciliary muscle.
- gc: Optic nerve.
- R: Retina.
- I: Iris.
- J: Humour.
- ac: Anterior chamber of aqueous posterior epithelium.
The cornea is quite continuous with the sclerotic but has a greater convexity. Under the microscope it is seen to consist of five layers. Most anteriorly there is a layer of stratified epithelium, then an anterior elastic layer, then the substantia propria of the cornea which is fibrous with spaces in which the stellate corneal corpuscles lie, while behind this is the posterior elastic layer and then a delicate layer of endothelium. The transparency of the cornea is due to the fact that all these structures have a refractive index.

The middle or vascular coat of the eye consists of the choroid, the ciliary processes and the iris. The choroid (fig. 1, ch) does not come quite as far forward as the corneo-scleral junction; it is composed of numerous blood-vessels and pigment cells bound together by connective tissue and, superficially, is lined by a delicate layer of pigmentated connective tissue called the lamina suprachoridea in contact with the already-mentioned peripheral choroidal lymphoid space. On the deep surface of the choroid is a structureless basal lamina.

The ciliary processes are some seventy triangular ridges, radially arranged, with their apices pointing backward (fig. 1, pc), while their bases are level with the corneo-scleral junction. They are as vascular as the rest of the choroid, and contain in their interior the ciliary muscle, which consists of radiating and circular fibres. The radiating fibres (fig. 1, mc) rise, close to the canal of Schlemm, from the margin of the posterior elastic lamina of the cornea, and pass backward and outward into the ciliary processes and anterior part of the choroid, which they pull forward when they contract. The circular fibres lie just internal to these and are few or wanting in short-sighted people.

The iris (fig. 1, i) is the colored diaphragm of the eye, the centre of which is pierced to form the pupil; it is composed of a connective tissue stroma containing blood-vessels, pigment cells and muscle fibres. In front of it is a reflection of the same layer of endothelium which lines the back of the cornea, while behind both it and the ciliary processes is a double layer of epithelium, deeply pigmented, which really belongs to the retina. The pigment in the substance of the iris is variously coloured in different individuals, and is often deposited after birth, so that, in newly-born European children, the colour of the eyes is often slate-blue or blue. In blue-eyed people very little interstitial pigment is formed, while in Albinos the posterior pigment is also absent and the blood-vessels give the pink coloration. The muscle fibres of the iris are described as circular and radiating; though it is still uncertain whether the latter are really muscular rather than elastic. On to the front of the iris, at its margin, the posterior layer of the posterior elastic lamina is continued as a series of ridges called the ligamentum pectinatum iridis, while between these ridges are depressions known as the spaces of Fontana.

The inner or sensory layer of the wall of the eyeball is the retina; it is a delicate transparent membrane which becomes thinner as the front of the eye is approached. A short distance behind the ciliary processes the nervous part of it stops and forms a scalloped border called the ora serrata, but the pigmented layer is continued on behind the ciliary processes and iris, as has been mentioned, and is known as the pars ciliaris retinae and pars iridica retinae. Under the microscope the posterior part of the retina is seen to consist of two layers; in its passage from the lens and vitreous the light reaches these layers in the following order:—(1) Layer of nerve fibres; (2) Layer of ganglion cells; (3) Inner molecular layer; (4) Inner nuclear layer; (5) Outer molecular layer; (6) Outer nuclear layer; (7) Layer of rods and cones; (8) Pigmented layer.

The layer of nerve fibres (fig. 2, 4) is composed of the axis-cylinders only of the fibres of the optic nerve which pierce the sclerotic, choroid and all the succeeding layers of the retina to radiate over its surface.

The ganglionic layer (fig. 2, 2) consists of a single stratum of large ganglion cells, each of which is continuous with a fibre of the preceding layer which forms its axon. Each also gives off a number of finer processes (dendrites) which arborize in the next layer.

The inner molecular layer (fig. 2, 3) is formed by the interlacement of the dendrites of the last layer with those of the cells of the inner nuclear layer which converge toward it.

The inner nuclear layer (fig. 2, 5) contains three different kinds of cells, but the most important and numerous are large bipolar cells, which send one process into the inner molecular layer, as has just been mentioned, and the other into the outer molecular layer, where they arborize with the ends of the rod and cone fibres.

The outer molecular layer (fig. 2, 6) is very narrow and is formed by the arborizations just described. The outer nuclear layer (fig. 2, 7) contains the inner consists of oval cells, which are of two kinds. The rod granules are transversely striped, and are connected externally with the rods, while internally processes pass into the outer molecular layer to end in a knob around which the arborizations of the inner nuclear cells lie. The cone granules are situated more externally, and are in close contact with the cones; internally their processes form a foot-plate in the outer molecular layer from which arborizations extend.

The layer of rods and cones (fig. 2, 9) contains these structures, the rods being more numerous than the cones. The rods are spindle-shaped bodies, of which the inner segment is thicker than the outer. The cones are thicker and shorter than the rods, and resemble Indian clubs, the handles of which are directed outward and are transversely striped. In the outer part of the rods the visual purple or rhodopin is found.

The pigmented layer consists of a single layer of hexagonal cells containing pigment, which is capable of moving towards the rods and cones when the eye is exposed to light and away from them in darkness.

Supporting the delicate nervous structures of the retina are a series of connective tissue rods known as the fibres of Müller (fig. 2, Cl); these run through the thickness of the retina at right angles to its surface, and are joined together on the inner side of the layer of nerve fibres to form the inner limiting membrane. More externally, at the bases of the rods and cones, they unite again to form the outer limiting membrane.

When the retina is looked at with the naked eye from in front two small marks are seen on it. One of these is an oval depression about 3 mm. across, which, owing to the presence of pigment, is of a yellow colour and is known as the yellow spot (macula lutea); it is situated directly in the antero-posterior axis of the eyeball, and at its margin the nerve fibre layer is thinned and the ganglion layer thickened. At its centre, however, both these layers are wanting, and in the layer of rods and cones only the cones are present. This central part is called the fovea centralis and is the point of acute vision. The second mark is situated a little below and to the inner side of the yellow spot; it is a circular disk with raised margins and a depressed centre and is called the optic disk; in structure it is a complete contrast to the yellow spot, for all the layers except that of the nerve fibres are wanting, and consequently, as light cannot be appreciated here, it is known as the "blind spot." It marks the point of entry of the optic nerve, and at its centre the retinal artery appears and divides into branches. An appreciation of the condition of the optic disk is one of the chief objects of the ophthalmoscope.

The crystalline lens (fig. 1, L) with its ligament separates the aqueous from the vitreous chamber of the eye; it is a biconvex lens the posterior surface of which is more curved than the anterior. Radiating from the anterior and posterior poles are three faint lines forming a Y, the posterior Y being erect and the anterior inverted. Running from these figures are a series of lamellae, like the layers of an onion, each of which is made up of a number of fibrils called the lens fibres. On the anterior surface of the lens is a layer of epithelial cells, which, towards the margin or equator, gradually elongate into lens fibres. The whole lens is enclosed in an elastic structureless membrane, and, like the
The orbit contains seven muscles, six of which rise close to the optic foramen. The levator palpebrae superioris is the highest, and passes forward to the superior tarsal plate and fornix of the conjunctiva. The superior and inferior recti are inserted into the upper and lower surfaces of the eyeball respectively; they make the eye look inward as well as up or down. The external and internal recti are inserted into the sides of the eyeball and make it look outward or inward. The superior oblique runs forward to a pulley in the inner and front part of the roof of the orbit, round which it turns to be inserted into the outer and back part of the eyeball and forms the upper oblique muscle. It turns the 2, Lachrymal canal. 3, Lachrymal duct. 6, Lachrymal sac. 7, Angular artery. 8, Photograph of posterior part of eyeball.

The superior oblique arises from the inner and front part of the floor of the orbit, and is also inserted into the outer and back part of the eyeball. It directs the glance upward and outward. Of all these muscles the superior oblique is supplied by the fourth cranial nerve, the external rectus by the third and the rest by the third.

The posterior part of the eyeball and the anterior parts of the muscles are enveloped in a lymph space, known as the capsule of Tenon, which assists their movements.

EMBRYOLOGY.—As is pointed out in the article BRAIN, the optic vesicles grow out from the fore-brain, and the part nearest the brain becomes constricted and elongated to form the optic stalk (see figs. 4 and 5, β). At the same time the ectoderm covering the side of the head thickens and becomes invaginated to form the lens vesicle (see figs. 4 and 5, δ), which later loses its connexion with the surface and approaches the optic vesicle, causing that structure to become cupped for its reception, so that what was the optic vesicle becomes the optic cup and consists of an external and an internal layer of cells (fig. 6 β and δ). Of these the outer cells become the retinal pigment, while the inner form the other layers of the retina. The invagination of the optic cup extends, as the choroidal fissure (not shown in the diagrams), along the lower and back part of the optic stalk, and into this slit sinks some of the surrounding mesoderm to form the vitreous body and the hyaloid arteries, one of which persists. When this has happened the fissure closes up. The anterior epithelium of the lens vesicle remains, but from the posterior the lens fibres are developed and these gradually fill up the cavity. The superficial layer of head ectoderm, from which the lens has been invaginated and separated, becomes the anterior
epithelium of the cornea (fig. 6, 4), and between it and the lens the mesoderm sinks in to form the cornea, iris and anterior chamber of the eye, while surrounding the optic cup the mesoderm forms the sclerotic and choroid coats (fig. 7, 9 and 3). Up to the seventh month the pupil is closed by the membra pupillaris, derived from the capsule of the lens which is part of the mesodermal ingrowth through the choroidal fissure already mentioned. The hyaloid artery remains, as a prolongation of the retinal artery to the lens, until just before birth, but after that its sheath forms the canal of Stilling. Most of the fibres of the optic nerve are centripetal and begin as the axons of the ganglionic cells of the retina; a few, however, are centrifugal and come from the nerve cells in the brain.

The eyelids are developed as ectodermal folds, which blend with one another about the third month and separate again before birth in Man (fig. 7, 8). The lachrymal sac and duct are formed from solid ectodermal thickenings which later become canalized.

It will thus be seen that the optic nerve and retina are formed from the brain itself; the lens, anterior epiblanchium of the cornea, skin of the eyelids, conjunctiva and lachrymal apparatus from the superficial ectoderm; while the sclerotic, choroid, vitreous and aqueous humours as well as the iris and cornea are derived from the mesoderm.

Comparative Anatomy.—The Acrania, as represented by Amphioxus (the lancelet), have a patch of pigment in the fore part of the brain which is regarded as the remains of a degenerated eye. In the Cyclostomata the hag (Myxine) and larval lamprey (Ammomcoetes) have ill-developed eyes lying beneath the skin and devoid of lens, iris, cornea and sclerotic as well as eye muscles. In the adult lamprey (Petromyzon) these structures are developed at the metamorphosis, and the skin becomes transparent, rendering sight possible. Ocular muscles are developed, but, unlike most vertebrates, the inferior rectus is supplied by the sixth nerve while all the others are supplied by the third. In all vertebrates the retina consists of a layer of sensorial-neural cells, the rods and cones, separated from the light by the other layers which together represent the optic ganglia of the invertebrates; in the latter animals, however, the sensorial-neural cells are nearer the light than the ganglia.

In fishes the eyeball is flattened in front, but the flat cornea is compensated by a spherical lens, which, unlike that of other vertebrates, is adapted for near vision when at rest. The iris in some bony fishes (Teleostei) is not contractile. In the Teleostei, too, there is a process of the choroid which projects into the vitreous chamber and runs forward to the lens; it is known as the processus falciformis, and, besides nourishing the lens, is concerned in accommodation. This specialized group of fishes is also remarkable for the possession of a so-called choroid gland, which is really a rete mirabile (see Arteries) between the choroid and sclerotic. The sclerotic in fishes is usuallyochondrified and sometimes calcified or ossified. In the retina the rods and cones are about equal in number, and the cones are very large. In the cartilaginous fishes (Elasmobranchii) there is a silvery layer, called the tapetum lucidum, on the retinal surface of the choroid.

In the Amphibia the cornea is more convex than in the fish, but the lens is circular and the sclerotic often chondrified. There is no processus falciformis or tapetum lucidum, but the class is interesting in that it shows the first rudiments of the ciliary muscle, although accommodation is brought about by shifting the lens. In the retina the rods outnumber the cones and these latter are smaller in any other animals. In some Amphibians colored oil globules are found in connexion with the cones, and sometimes two cones are joined, forming double or twin cones.

In Reptilia the eye is spherical and its anterior part is often protected by bony plates in the sclerotic (Lacertilia and Chelonia). The ciliary muscle is striated, and in most reptiles accommodation is effected by relaxing the ciliary ligament in higher vertebrates, though in the snakes (Ophidia) the lens is shifted as it is in the lower forms. Many lizards have a vascular projection of the choroid into the vitreous, foreshadowing the pecten of birds and homologous with the choroidal infundibums of fishes. In the retina the rods are scarce or absent.

In birds the eye is tubular, especially in nocturnal and raptorial forms: this is due to a lengthening of the ciliary region, which is always protected by bony plates in the sclerotic. The pecten, already mentioned in lizards, is a pleated vascular projection from the optic disk towards the lens which in some cases it reaches. In Apteryx this structure disappears. In the retina the cones outnumber the rods, but are not as numerous as in the reptiles. The ciliary muscle is of the striped variety.

In the Mammalia the eye is largely enclosed in the orbit, and bony plates in the sclerotic are only found in the monotremes. The cornea is convex except in aquatic mammals, in which it is flattened. The lens is biconvex in diurnal mammals, but in nocturnal and aquatic it is spherical. There is no pecten, but the numerous hyaloid arteries which are found in the embryo represent it. The iris usually has a circular pupil, but in some ungulates and kangaroos it is a transverse slit. In the Cetacea this transverse opening is kidney-shaped, the hilum of the kidney being above. In many carnivores, especially nocturnal ones, the slit is vertical, and this form of opening seems adapted to a feeble light, for it is found in the owl, among birds. The tapetum lucidum is found in Ungulata, Cetacea and Carnivora. The ciliary muscle is unstriped. In the retina the rods are more numerous than the cones, while the macula lutea only appears in the Primates in connexion with binocular vision.

Among the accessory structures of the eye the retractor bulbi muscle is found in amphibians, reptiles, birds and many mammals; its nerve supply shows that it is probably a derivative of the external or posterior rectus. The nictitating membrane or third eyelid is well-developed in amphibia, reptiles, birds and some few sharks; it is less marked in mammals, and in Man only is represented by the little plica semilunaris. When functional it is drawn across the eye by special muscles derived from the retractor bulbi, called the bursalis and pyramidalis. In connexion with the nictitating membrane the Harderian gland is developed, while the lachrymal gland secretes fluid for the other eyelids to spread over the conjunctiva. These two glands are specialized parts of a row of glands which in the Urodela (tailed amphibia) are situated along the lower eyelid; the outer or posterior part of this row becomes the lachrymal gland, which in higher vertebrates shifts from the lower to the upper eyelid, while the inner or anterior part becomes the Harderian gland. Below the amphibia glands are not necessary, as the water keeps the eye moist.

The lachrymal duct first appears in the tailored amphibia; in snakes and gecko lizards, however, it opens into the mouth.

Eye Diseases.—The specially important diseases of the eye are those which temporarily or permanently interfere with
sight. In considering the pathology of the eye it may be remembered that (1) it is a double organ, while (2) either eye may have its own trouble.

1. The two eyes act together, under normal conditions, for all practical purposes exactly as if there were but one eye placed in the middle of the face. All impressions made upon either retina, to the one side of a vertical line through the centre, the _fovea centralis_, before giving rise to conscious perception cause a stimulation of the same area in the brain. Impressions formed simultaneously, for instance, on the right side of the right retina and on corresponding areas of the right side of the left retina, are conveyed to the same spots in the right occipital lobe of the brain. Pathological processes, therefore, which are localized in the right or left occipital lobes, or along any part of the course of the fibres which pass from the right or left optic tracts to the visual centres, result in half-blindness as a function of the right or left halves of the two retinas. _Hemianopsia_, or half-blindness, arising from these pathological changes, is of very varying degrees of severity, according to the nature and extent of the particular lesion. The blind areas in the two fields of vision, corresponding to the outward projection of the paralysed retinal areas, are always symmetrical both in shape and degree. The central lesion may for instance be very small, but at the same time destructive to the nerve tissue. This will be revealed as a sector-shaped or insular symmetrical complete blindness in the fields of vision to the opposite side. Or a large central area, or an area comprising many or all of the nerve fibres which pass to the visual centre on one side, may be involved in a lesion which causes impairment of function, but no actual destruction of the nerve tissue. There is thus caused a symmetrical weakening of vision (_amblyopia_) in the opposite fields. In such cases the colour vision is so much more evidently affected than the sense of form that the condition has been called _hemiacromatopsia_ or half-colour blindness. Hemianopsia may be caused by haemorrhage, by embolism, by tumour growth which either directly involves the visual nerve elements or affects them by compression and by inflammation. Transitory hemianopsia is rare and is no doubt most frequently of toxic origin, or haemorrhage.

The two eyes also act as if they were one in accommodating. It is impossible for the two eyes to accommodate simultaneously to different extents, so that where there is, as occasionally happens, a difference in focus between them, this difference remains the same for all distances for which they are adapted. In such cases, therefore, both eyes cannot ever be accurately adapted at the same time, though either may be alone. It often happens as a consequence that the one eye is used to receive the sharpest images of distant, and the other of near objects. Any pathological change which leads to an interference in the accommodation of one eye must have its origin in a lesion which lies peripherally to the nucleus of the other nerve. Such a lesion is usually one of the third nerve itself. Consequently, a unilateral accommodation paresis is almost invariably associated with pareses of some of the oculo-motor muscles. A bilateral accommodation paresis is not uncommon. It is due to a nuclear or more central cerebral disturbance. Unlike a hemianopsia, which is mostly permanent, a double accommodation paresis is frequently transitory. It is often a post-diphtheritic condition, appearing alone or associated with other pareses.

Both eyes are also normally intimately associated in their movements. They move in response to a stimulus or a combination of stimuli, emanating from different centres of the brain, but one which is always equally distributed to the corresponding muscles in both eyes, so that the two lines of fixation meet at the succession of points on which attention is directed. The movements are thus associated in the same direction, to the right or left, upwards or downwards, &c. In addition, owing to the space which separates the two eyes, convergent movements, caused by stimuli equally distributed between the two internal recti, are required for the fixation of nearer and nearer lying objects. These movements would not be necessary in the case of a single eye. It would merely have to accommodate.

The converging movements of the double eye occur in association with accommodation, and thus a close connexion becomes established between the stimuli to accommodation and convergence. All combinations of convergent and associated movements are constantly taking place normally, just as if a centrally-placed eye were moved in all directions and altered its accommodation according to the distance, in any direction, of the object which is fixed.

Associated and convergent movements may be interfered with pathologically in different ways. Cerebral lesions may lead to their impairment or complete abolition, or they may give rise to involuntary spasmodic action, as the result of paralyzing or irritating the centres from which the various co-ordinated impulses are controlled or emanate. Lesions which do not involve the centres may prevent the response to associated impulses in one eye alone by interfering with the functional activity of one or more of the nerves along which the stimuli are conveyed. Paralysis of oculo-motor nerves is thus a common cause of defects of association in the movements of the double eye. The great advantage of simultaneous binocular vision—viz. the appreciation of depth, or stereoscopic vision—is thus lost for some, or it may be all directions of fixation. Instead of seeing singly with two eyes, there is then double-vision (_diplopia_). This persists so long as the defect of association continues, or so long as the habit of mentally suppressing the image of the faulty-directed eye is not acquired.

In the absence of any nerve lesions, central or otherwise, interfering with their associated movements, the eyes continue throughout life to respond equally to the stimuli which cause these movements, even when, owing to a visual defect of the one eye, binocular vision has become impossible. It is otherwise, however, with the proper co-ordination of convergent movements. These are primarily regulated by the unconscious desire for binocular vision, and more or less firmly associated with accommodation. When one eye becomes blind, or when binocular vision for other reasons is lost, the impulse is gradually, as it were, unlearned. This is the cause of _divergent concomitant squint_. Under some circumstances one eye is allowed to persist in an extra degree of convergence, which is in excess of the requirements of fixation, may be acquired from different causes. This gives rise to _convergent concomitant squint_.

For _Astigmatism_, &c., see the article _Vision_.

2. Taking each eye as a single organ, we find it to be subject to many diseases. In some cases both eyes may be affected in the same way, e.g. where the local disease is a manifestation of some general disturbance. Apart from the fibrous coat of the eye, the sclera, which is little prone to disease, and the external muscles and other adnexa, the eye may be looked upon as consisting of two parts, (a) the _dioptric media_, and (b) the parts more or less directly related to the nervous and pathological conditions affecting either of these elements may interfere with sight.

The dioptric media, or the transparent portions which are concerned in the transmission of light to, and the formation of images upon, the retina, are the following: the _cornea_, the _aqueous humour_, the _crystalline lens_, and the _vitreous humour_. Loss of transparency in any of these media leads to blurring of the retinal images of external objects. In addition to loss of transparency the cornea may have its curvature altered by pathological processes. This necessarily causes imperfection of sight. The crystalline lens, on the other hand, may be dislocated, and thus cause image distortion.

The _Cornea_.—The transparency of the cornea is mainly lost by inflammation (_keratitis_), which causes either an infiltration of its tissues with leucocytes, or a more foci, more destructive ulcerative process. Inflammation of the cornea may be primary or secondary, i.e. the inflammatory changes meet with in the corneal tissue may be directly connected with one or more foci of inflammation in the cornea itself or the focus or foci may be in some other part of the eye. Only the very superficial forms of primary keratitis, those confined to the epithelial layer, leave no permanent change;
there is otherwise always a loss of tissue resulting from the inflammation and this loss is made up for by more or less densely intransperant connective tissue (neubila, leucoma). These according to their site and extent cause greater or less visual disturbances. Primary keratitis may be ulcerative or non-ulcerative, superficial or deep, diffuse or circumscribed, vascularized or non-vascularized. It may be complicated by deeper inflammations of the eye such as iritis and cyclitis. In some cases the anterior chamber is invaded by pus (kyphopyon). The healing of a corneal ulcer is characterized by the disappearance of pain and redness. The formation of a scar may be due to the regeneration of new tissue, or to the remaining of the basal membrane. The scar may be epithelial, or it may be a cicatrix, formed by the scarred cornea.

Certain non-ulcerative and degenerative changes are met with in the cornea. Of these may be mentioned keratoconus or conical cornea, in which, owing to some disturbance of vitality, the cornea becomes altered to something more of a yellowish or brownish grey. The process is usually hereditary. The cornea loses its transparency, becomes opaque, changes in colour, and in thickness in different parts of the eye, and usually only met with in old people: transverse calcareous film, consisting of a finely punctiform opacity extending, in a tolerably uniformly wide band, occupying the zone of the cornea which is left uncovered when the lids are half closed.

The principal causes of primary keratitis are trauma and infection from the conjunctiva. Trauma is most serious when the body causing the wound is not aseptic or when microorganisms from some wound enter the cornea. Often the cause of the conjunctiva to which the cornea is next in the eye is more intimate than the actual penetration. On the other hand, the conjunctiva is frequently the seat of a great deal of irritation and thus interfere with healing. On this account it is important to be able to recognize when healing is taking place, for as soon as this is the case, rest, along with frequent irrigation of the conjunctiva with sterilized water at the body temperature, and occasionally mild antiseptic irrigation of the nasal mucous membrane is all that is required. It is a common and dangerous mistake to let it seep.

Of local antiseptics which are of no use may be mentioned the actual cautery, which is too strong for such use, often silver nitrate or protargol, and the yellow oxide of mercury. These different agents are of course not equally applicable in any given case; it depends upon the severity as well as upon the nature of the inflammation which is the most suitable. For instance, the actual cautery is employed only in the case of the deeper septic or malignant ulcers, in which the destruction of tissue is already considerable and tending to spread further. Again the yellow oxide of mercury should only be used in the more superficial, strumous forms of inflammation. Many other substances are also in use, but not need here be referred to.

Secondary keratitis takes the form of an interstitial deposit of leukocytes between the layers of the cornea as well as of vascularization, sometimes intense, from the deeper network of vessels (anterior ciliary) surrounding the cornea. The duration of a secondary keratitis is usually prolonged, often lasting many months. More or less complete restoration of transparency is the rule, however, eventually.

No local treatment is called for except the shading of the eyes and in most cases the use of a mydriatic to prevent synchiae when the iris is involved. Often it is advisable to do something for the general health. In young people there is probably nothing better than cod-liver oil and syrup of the iodide of iron. Inherited syphilis, tuberculous and other inflammations are the causes of secondary keratitis.

Neuro-paralytic Keratitis.—When the fifth nerve is paralysed there is a tendency for the cornea to become inflamed. Different forms of inflammation may then occur which all, besides anaesthesia, show a marked slowing in healing. The main cause of neuro-paralytic keratitis lies in the greater vulnerability of the cornea. The prognosis is necessarily bad. The treatment consists in as far as possible protecting the eye from external influences, by keeping it tied up, and by frequently irrigating with antiseptic lotions.
disease in the deeper parts of the eye. The modified epithelial structure of which the lens is composed is always being added to throughout life. The older portions of the lens are consequently the more central. They are harder and less elastic. This arrangement seems to predispose to difficulties of nutrition. In many people, in the absence altogether of general or local disease, the transparency of the lens is lost owing to degeneration of the incompletely-nourished fibres. This idiopathic cataract mostly occurs in old people; hence the term senile cataract. So-called senile cataract is not, however, necessarily associated with any general senile changes. An idiopathic uncompli
cated cataract is also met with as a congenital defect due to faulty development of the crystalline lens. A particular and not uncommon form of this kind of cataract, which may also develop during infancy, is lamellar or zonular cataract. This is a partial and stationary form of cataract in which, while the greater part of the lens retains its transparency, some of the lamellae are intransparent. Traumatic cataract occurs in two ways: by laceration or rupture of the lens capsule, or by nutritional changes consequent upon injuries to the deeper structures of the eye. The transparency of the lens is dependent upon the integrity of its capsule. Penetrating wounds of the eye involving the capsule, or rupture of the capsule from severe blows on the eye without perforation of its coats, are followed by rapidly-developing cataract. Severe non-penetrating injuries, which do not cause rupture of the capsule, are sometimes followed, after a time, by slowly-progressing cataract. Secondary cataract is due to abnormalities in the nutrient matter supplied to the lens owing to disease of the ciliary body, choroid or retina. In some diseases, as diabetes, the altered general nutrition tells in the same way on the crystalline lens. Cataract is then rapidly formed. Cases of cataract in diabetes are not, however, necessarily true diabetic cataracts in the above sense. Disloca
tions of the lens are traumatic or congenital. In old-standing disease of the eye the suspensory ligament may yield in part, and thus lead to lens dislocation. The lens is practically always cataractous before this takes place.

The Vitreous Humour.—The vitreous humour loses its trans
parency owing to exudation from the inflamed ciliary body or choroid. The exudation may be fibrinous or purulent; the latter only as a result of injuries by which foreign bodies or sepsis may get into the eye. The transparency of the lens is dependent upon the integrity of its capsule. Penetrating wounds of the eye such as those from severe blows on the eye without perforation of its coats, are followed by rapidly-developing cataract. Severe non-penetrating injuries, which do not cause rupture of the capsule, are sometimes followed, after a time, by slowly-progressing cataract. Secondary cataract is due to abnormalities in the nutrient matter supplied to the lens owing to disease of the ciliary body, choroid or retina. In some diseases, as diabetes, the altered general nutrition tells in the same way on the crystalline lens. Cataract is then rapidly formed. Cases of cataract in diabetes are not, however, necessarily true diabetic cataracts in the above sense. Dislocations of the lens are traumatic or congenital. In old-standing disease of the eye the suspensory ligament may yield in part, and thus lead to lens dislocation. The lens is practically always cataractous before this takes place.

The Vitreous Humour.—The vitreous humour loses its trans
parency owing to exudation from the inflamed ciliary body or choroid. The exudation may be fibrinous or purulent; the latter only as a result of injuries by which foreign bodies or sepsis may get into the eye. The transparency of the lens is dependent upon the integrity of its capsule. Penetrating wounds of the eye such as those from severe blows on the eye without perforation of its coats, are followed by rapidly-developing cataract. Severe non-penetrating injuries, which do not cause rupture of the capsule, are sometimes followed, after a time, by slowly-progressing cataract. Secondary cataract is due to abnormalities in the nutrient matter supplied to the lens owing to disease of the ciliary body, choroid or retina. In some diseases, as diabetes, the altered general nutrition tells in the same way on the crystalline lens. Cataract is then rapidly formed. Cases of cataract in diabetes are not, however, necessarily true diabetic cataracts in the above sense. Dislocations of the lens are traumatic or congenital. In old-standing disease of the eye the suspensory ligament may yield in part, and thus lead to lens dislocation. The lens is practically always cataractous before this takes place.

Diseases of the Iris and Ciliary Body.—Inflammation of the iris, iritis, arises from different causes. The various idiopathic forms have relations to constitutional disturbances such as rheumatism, gout, albuminuria, tuberculosis, fevers, syphilis, gonorrhoea and others, or they may come from cold alone. Traumatic and infected cases are attributable to accidents, the presence of foreign bodies, operations, &c. In addition, iritis may be secondary to keratitis, scleritis or choroiditis. The beginning of an attack of inflammation of the iris is char
acterized by alterations in its colour due to hyperaemia and by circumcorneal injection. Later on, exudation takes place into the substance of the iris, causing thickening and also a loss of gloss of its surface. According to the nature and severity of the exudation there may be deposits formed on the back of the cornea, attachments between the iris and lens capsule (synchiae), or even gelatinous-looking coagulations or pus in the anterior chamber.

The subjective symptoms to which the inflammation may give rise are dread of light (photophobia), pain, generally most severe at night and often very great, also more or less impairment of sight. Along with the pain and photophobia there is lacryma
tion. An acute attack of iritis usually lasts about six weeks. Some cases become chronic and last much longer. Others are chronic from the first, and in one clinical type of iritis, in which the ciliary body is also at the same time affected, viz. iritis serosa, there is usually comparatively little injection of the eye or pain, so that the patient's attention may only be directed to the eye owing to the gradual impairment of sight which results. In some cases, and more particularly in men, there is a tendency to the recurrence at longer or shorter intervals of attacks of iritis (recurrent iritis). In these cases, as well as in all cases of plastic iritis which have not been properly treated, serious consequences to sight are apt to follow from the binding down of the lens capsule and the occlusion of the pupil by exudation.

Inflammation of the ciliary body, cyclitis, is frequently asso
ciated with iritis. This association is probable in all cases where there are deposits on the posterior surface of the cornea. It is certain where there are changes in the intra-ocular tension. Often in cyclitis there is a very marked diminution in tension. Cyclitis is also present when the degree of visual disturbance is greater than can be accounted for by the visible changes in the pupil and anterior chamber. The exudation may, as in iritis, be fibrinous. It should however be remembered that two free surfaces of the ciliary body into the posterior aqueous, and into the vitreous, chambers. This produces, what is a constant sign of cyclitis, more or less intransparency of the vitreous humour. Where there has been excessive exudation into the vitreous, subsequent shrinking and liquefaction take place, leading to detachment of the retina and consequent blindness.

The treatment of iritis necessarily differs to some extent according to the cause. The general treatment applicable to all cases need only be here considered. What should be aimed at, at the time of the inflammation, is to put the eye as far as possible at rest, to prevent the formation of synchiae and alleviate the pain. An attempt should be made to get the pupil thoroughly dilated with atropine. The dilatation should be kept up as long as any circumcorneal injection lasts. If a case of iritis be left to itself or treated without the use of a mydriatic, posterior synchiae almost invariably form. Some fibrinous exudation may even organize into a membrane stretching across, and more or less completely occluding, the pupil. Synchiae, though not of themselves causing impairment of vision, increase the risk that the eye runs from subsequent attacks of iritis. It should however be remembered that as the main call for a mydriatic is to prevent synchiae, the latter are d'être for its use no longer exists when, having been begun too late, the pupil cannot properly be dilated by it. Under these conditions it may even do harm. The eyes should also be kept shaded from the light by the use of a shade or neutral-tinted glasses. During an attack any use of the eyes for reading or sewing or work of any kind calling for accommodation must be prohibited. This applies equally to the case of inflammation in one eye alone and in both.

Pain is best relieved by hot fomentations, cocaine, and in many cases the internal use of salicyl or phenacetin. The treatment sometimes required for cases of old iritis is iridectomy. The operation is called for in two different classes of cases. In the first place, to improve vision where the pupil is small, and to a great extent occluded, though the condition has not so far led to serious nutritive changes; and in the second place, with the object as well of preventing the complete destruction of vision which either the existing condition or the danger of recurrence of the inflammation has threatened. Iridectomy for iritis should be performed when the inflammation has entirely subsided. The portion of iris excised should be larger. The operation is urgently called for where the condition of iris bombans exists.

Iris tumours, either simple or malignant, are of rare occurrence. A frequent result of a severe blow on the eye is a separation of a portion of the iris from its peripheral attachment (iridodi
yalysis). Of congenital anomalies the most commonly met with are coloboma and more or less persistence of the foetal pupillary membrane. The most serious form of irido-cyclitis is that which may follow penetrating wounds of the eye. Under certain conditions, as in,
conditions this leads to a similar inflammation in the other eye. This so-called *sympathetic ophthalmitis* is of a malignant type, causing destruction of the sympathizing eye.

The Retina.—Choroidal inflammations are generally patchy, various foci of inflammation being scattered over the choroid. These patches may in course of time become more or less confluent. The effect upon vision depends upon the extent to which the external or peripapillary elements of the retina become involved. It is especially serious when the more central portions of the retina are thus affected (*choroidal-reinitis centralis*).

A peculiar and grave pathological condition of the eye is what is known as *glaucoma*. A characteristic of this condition is an extremely gentle tenderness of the optic nerve, which has a deleterious effect on the optic nerve end and its ramifications in the retina. The cause of the rise of tension is partly congestive, partly mechanical. The effect of glaucoma, when untreated, is to cause ever-increasing loss of sight, although the time occupied by the process before it leads to complete blindness varies within such extraordinary wide limits as from a few hours to many years. The usual tract may be the site of *sarcoma*.

The retina is subject to inflammation, to detachment from the choroid, to haemorrhages from the blood-vessels and to tumour. Retinal inflammation may primarily affect either the nerve element or the connective tissue framework. The former is usually associated with some general disease such as albuminuria or diabetes and is bilateral. The tissue changes are oedema, the formation of exudative patches, and haemorrhage. Where the connective tissue elements are primarily affected, the condition is a slow one, similar to *sclerosis* of the central nervous system. The gradual blindness which this causes is due to compression of the retinal nerve elements by the connective tissue hyperplasia, which is always associated with characteristic changes in the disposition of the retinal pigment. This retinal sclerosis is consequently generally known as *retinitis pigmentosa*, a disease to which there is a hereditary predisposition. Besides occurring during inflammation, haemorrhages into the retina are met with in phlebitis of the central retinal vein, which is almost invariably unilateral, and in certain conditions of the blood, as pernicious anaemia, when they are always bilateral.

The optic nerve is subject to inflammation (optic neuritis) and atrophy. Double optic neuritis, affecting, however, only the intra-ocular ends of the nerves, is an almost constant accompaniment of brain tumour. Unilateral neuritis has a different causation, depending upon an inflammation, mainly neuritis, of the nerve in the orbit. It is analogous to peripheral inflammation of other nerves, such as the third, fourth, sixth and seventh cranial nerves.

Diseases of the Conjunctiva.—These are the most frequent diseases of the eye with which the surgeon has to deal. They generally lead to more or less interference with the functional activity of the eye and often indeed to great impairment of vision owing to the tendency which there is for the cornea to become implicated.

Many different micro-organisms are of pathogenetic importance in connexion with the conjunctiva. Microbes exist in the normal conjunctival sac. These are normally harmless, though it is usual to find at any rate a small proportion of others which are known to be pyogenic. This fact is of great importance in connexion both with problems of etiology and the practical question of operations on the eye.

Hyperaemia.—When the conjunctiva becomes hyperaemic its colour is heightened and its transparency lessened. Sometimes too it becomes thickened and its surface altered in appearance. The often marked heightening of colour is due to the very superficial position of the dilated vessels. This is specially the case with that part of the membrane which forms the transition fold between the palpebral and the ocular conjunctiva. Consequently it is there that the redness is most marked, while it is seen to diminish towards the cornea. An important diagnostic mark is thus furnished between purely conjunctival hyperaemia and what is called circumcorneal congestion, which is always an indication of more deep-seated vascular dilatation. It also differs materially from a scleral injection, in which there is a visible dilatation of the superficial scleral vessels.

When a conjunctival hyperaemia has existed for some time the papillae become swollen, and small blebs form on the surface of the membrane: sometimes too, lymph follicles begin to show. The enlargement and compression of adjacent papillae give rise to a velvety appearance of the surface.

Hyperaemia of the conjunctiva where not followed by inflammation causes more or less lacrimation but no alteration in the character of its secretion. The hyperaemia may be acute and transitory or chronic. Much depends upon the cause as well as upon the persistence of the irritation which sets it up.

Trauma is, the presence of foreign bodies in the conjunctival sac, or the irritations of superficial chalkey infarcts in the Melibomian ducts, cause more or less severe transitory congestion. Continued subjection to irritating particles such as flour, stones, dust, &c., causes a more continued hyperaemia which is often circumscribed and less pronounced. Bad air in schools, barracks, workhouses, &c., also causes a chronic hyperaemia in which it is common to find a follicular hyperplasia. Long exposure to too intense light, astigmatism and other ocular defects which cause asthenopia lead also to chronic hyperaemia. Anaemic individuals are often subject to discomfort from hyperaemia of this nature. In ocular concomitant circumscribed conjunctival hyperaemia usually consists in the removal of the cause when it can be discovered. Often this is difficult. In addition the application of hot sterilized water is useful and soothing.

 Conjunctivitis.—When the conjunctiva is actually inflamed the congested membrane is brought into a condition of heightened secreting action. The secretions become more copious and more or less altered in character. A sufficiently practical though by no means sharply defined clinical division of cases of conjunctivitis is arrived at by taking into consideration the character of the secretion from the inflamed membrane and the visible tissue alterations which the membrane thus undergoes. Varieties of conjunctivitis which may thus be distinguished are the following: (a) *Catarrhal conjunctivitis*, (b) *Purulent conjunctivitis*, (c) *Phlyctenular conjunctivitis*, (d) *Granular conjunctivitis*, and (e) *Diphtheritic conjunctivitis*.

However desirable a truly etiological classification might appear to be, it is doubtful whether such could satisfactorily be made. So much is certain at all events, that not only can identically the same clinical appearance result from the actions of quite different pathogenetic organisms, but that various concomitant circumstances may lead to very different clinical signs being set up by one and the same microbe. As regards *contagion* there is no doubt that the secretion in the case of a true conjunctivitis (i.e. not merely a hyperaemia) is always more or less contagious. The degree of virulence varies not only in different cases, but the effect of contagion from the same source may be different in different individuals. Healthy conjunctivae may thus react differently, not only as regards the degree of severity, but even according to different clinical types, when infected by secretion from the same source. There are no doubt different reasons for this, such as the stage at which the inflammation is arrested, the specific character of the eye from which the secretion is derived, differences in the surroundings and in the susceptibility of the infected individuals, the presence of dormant microbes of a virulent type in the healthy conjunctiva which has been infected, &c. Many points in this connexion are very difficult to investigate and much remains to be elucidated. Contagion usually takes place directly and not through the air. Often in this way one eye is first affected and may in some cases, when sufficient care is afterwards taken, be the only one to suffer.

The treatment in all severer forms of conjunctivitis should be undertaken with the primary object in view of preventing any impairment of the cornea.

*Catarhal conjunctivitis*, which is characterized by an increased mucoid secretion accompanying the hyperaemia, is usually bilateral and may be either acute or chronic. Acute conjunctivitis lasts as a rule only for a week or two: the chronic type may persist, with or without occasional exacerbations, for
years. The subjective symptoms vary in intensity with the severity of the inflammation. There is always more or less troublesome "burning" in the eyes with a tired heavy feeling in the lids. This is aggravated by reading, which is most distressing in a close or smoky atmosphere and by artificial light. In acute cases, indeed, reading is altogether impossible. In all cases of catarrhal conjunctivitis the symptoms are also more marked if the eyes have been tied up, even though this may produce temporary relief.

A curious variety of acute catarrhal conjunctivitis, in which the hyperaemia and lacrimation are the predominant features, is the so-called hay-fever. In this condition the mucous membrane of the nose and throat are similarly affected, and there is at the same time more or less constitutional disturbance. Hay-fever is due to irritation from the pollen of many plants, but principally from that of the different grasses. Some people are so susceptible to it that they invariably suffer every year during the early summer months. Here it is difficult to remove the cause, but many cases can be cured and almost all are alleviated by means of a special antitoxin applied locally.

Other etiologic causes of catarrhal conjunctivitis which have been studied are mostly microbial. Of these the most common are the Morax-Axenfeld and the Koch-Weeks conjunctivitis.

The Morax-Axenfeld bacillus sets up a conjunctivitis which affects individuals of all ages and conditions and which is contagious. The inflammation is usually chronic, at most subacute. It is often sufficiently characteristic to be recognized without a microscopical examination of the secretions. In typical cases the lid margin, palpebral conjunctiva, and it may be a patch of ocular conjunctiva at the outer or inner angle are alone hyperemic: the secretion is not copious and is mostly found as a greyish coagulum lying at the inner lid-margin. The subjective symptoms are usually slight. Complications with other varieties of catarrhal conjunctivitis are not uncommon. This mild form of conjunctivitis generally lasts for many months, subject to more or less complete disappearance followed by recurrences. It can be rapidly cured by the use of an oxide of zinc ointment, which should be continued for some time after the appearances have altogether passed off.

The conjunctivitis caused by the Koch-Weeks microbe is still more common. It is a more acute type, affects mostly children, and is very contagious and often epidemic. Here the hyperemia involves both the ocular and the palpebral conjunctiva, and usually there is considerable swelling of the lids and a copious secretion. Both eyes are always affected. Occasionally the engorged conjunctival vessels give way, causing numerous small extravagations (ecchymoses). Complications with phlyctenulae (side infra) are common in children. The acute symptoms last for a week or ten days, after which the course is more chronic. Treatment with nitrate of silver in solution is generally satisfactory.

Other less frequent microbial causes of catarrhal conjunctivitis yield to the same treatment. A form of epidemic mucous-purulent conjunctivitis is not uncommon, in which the swelling of the conjunctival folds and lids is much more marked and the secretions copious. It is less amenable to treatment and also apt to be complicated by corneal ulceration. The microbe which gives rise to this condition has not been definitely established. This inflammation is also known as school ophthalmia. This is extremely contagious, so that isolation of cases becomes necessary. The treatment with the Wash solution, as before, provided there be no corneal complication, and subsequently with a weak solution of tannic acid, may be recommended.

Purulent Conjunctivitis.—Some of the severer forms of catarrhal conjunctivitis are accompanied not only by a good deal of swelling of both conjunctiva and lids but also by a decidedly muco-purulent secretion. Nevertheless there is a sufficiently sharply-defined clinical difference between the catarrhal and purulent types of inflammation. In purulent conjunctivitis the edema of the lids is always marked, often excessive, the hyperaemia of the whole conjunctiva is intense: the membrane is also infiltrated and swollen (chemosis), the papillae enlarged and the secretion almost wholly purulent. Although this variety of conjunctivitis is principally due to infection by gonococci, other microbes, which more frequently set up a catarrhal type, may lead to the purulent form.

All forms are contagious, and transference of the secretion to other eyes usually sets up the same type of severe inflammation in a way in which the former infection mostly takes place by direct transference by means of the hands, towels, &c., of secretions containing gonococci either from the eye or from some other mucous membrane. The poison may also sometimes be carried by flies. The dried secretion loses its virulence.

In new-born children (ophthalmitis neonatorum) infection takes place from the maternal passages during birth. Notwithstanding the great changes which occur during the progress of a purulent conjunctivitis, there is on recovery a complete restitution ad integrum so far as the conjunctiva is concerned. Owing to the tendency to severe ulceration of the cornea, more or less serious destructions of that membrane, and consequently more or less interference with sight, may result before the inflammation has passed off. This is a special danger in the case of adults. For this reason when only one eye is affected the first point to be attended to in the treatment is to secure the second eye from contamination by efficient occlusion. The appliance known as Buller's shield, a watch-glass strapped down by plaster, is the best for this purpose. It not only admits of the patient seeing with the sound eye, but allows the other to remain under direct observation. The treatment otherwise consists in frequent removal of the secretions from the affected eyes and the use of nitrate of silver solution as a bactericide applied directly to the conjunctival surface; sometimes it is necessary to cut away the chemoic conjunctiva immediately surrounding the cornea. When the cornea has become affected efforts may be made with the thermo-cautery or otherwise to limit the area of destruction and thus admit of something being done to improve the vision after all inflammation has subsided. The greatest cleanliness as well as proper antiseptic precautions should of course be observed by every one in any way connected with the treatment of such cases.

Phlyctenular conjunctivitis is an acute inflammation of the ocular conjunctiva, in which little blebs or phlyctenules form, more particularly in the vicinity of the corneal margin, as well as on the epithelial continuation of the conjunctiva which covers the cornea. The inflammation is characterized by being distributed in little circumscribed foci and not diffused as in all other forms of conjunctivitis. In it the conjunctival secretion is not altered, unless there should exist at the same time a complication with some other form of conjunctivitis. This condition is most frequent in children, particularly such as are ill-nourished or are recovering from some illness, e.g. measles. The susceptibility occurs in fact mainly where there exists what used to be called a "strumous" diathesis. In many cases, therefore, there is some kind of tubercular basis for the manifestations. This basis has to do with the susceptibility only, at all events to begin with. The local changes are not tuberculous; their exact origin has not been clearly established. They are in all probability produced by staphylococci.

Many children suffering from phlyctenular conjunctivitis get after a short time an eczematous excoriation of the skin of the nostrils. This excoriated, scabby area contains crowds of staphylocoyi (Phlyctena spasm), which is one of the likely causes for this disturbance. Indeed, this is the chief reason for the use of some ointment to heal the area and to avoid the irritation.
local application is the yellow oxide of mercury as used as an ointment.

Phlyctenular conjunctivitis, and the corneal complications with which it is so often associated, constitute a large proportion (from 1/2 to 3/4) of all eye affections with which the surgeon has to deal.

Granular Conjunctivitis.—This disease, which also goes by the name of trachoma, is characterized by an inflammatory infiltration of the adenoid tissue of the conjunctiva. The inflammation is accompanied by the formation of so-called granules, and at the same time by a hyperplasia of the papillae. The changes further extend in the course of time to cicatrial Transformations, so that a gradual and progressive atrophy of the conjunctiva results. The disease takes its origin most frequently in the conjunctival fold of the upper lid, but eventually as a rule involves the cornea and the deeper tissues of the lid, particularly the tarsus.

The etiology of trachoma is unknown. Though a perfectly distinctive affection when fully established, the differential diagnosis from other forms of conjunctivitis, particularly those associated with much follicular enlargement or which have begun as purulent inflammation, may be difficult. Trachoma is mostly chronic. When occurring in an acute form it is more amenable to treatment and less likely to end in cicatricial changes. Fully half the cases of trachoma which occur are complicated by panus, which is the name given to the affection when it has spread to the cornea. Panus is a superficial vascularized infiltration of the cornea. The veilng which it produces causes more or less defect of sight.

Various methods of treatment are in use for trachoma. Expression by means of roller-forceps or repeated gratage are amongst the more effective means of surgical treatment, while local applications of copper sulphate or of alum are certainly useful in suitable cases. The most beneficial results are obtained by the injection of 2% of a dilute solution of penicillin. The penetration of the inflammatory process at this stage is considerable, and the results of treatment are usually satisfactory. It is important to remember that in many cases the disease is not primarily due to trachoma, but rather to some other specific or nonspecific etiologic factor that may determine the development of severe exacerbations.

Diphtheritic conjunctivitis is characterized by an infiltration into the conjunctival tissues which, owing to great coagulability, rapidly interferes with the nutrition of the invaded area and thus leads to necrosis of the diphtheritic membrane. Conjunctival diphtheria may or may not be associated with diphtheria of the throat. It is essentially a disease of early childhood, not more than 10% of all cases occurring after the age of four. The cornea is exposed to great risk, more particularly during the first few days, and may be lost by necrosis. So frequent ulceration is not uncommon, but may often be arrested before complete destruction has taken place.

The disease is generally confined to one eye, and complicated by swelling of the preauricular glands of that side. It may prove fatal. In true conjunctival diphtheria the exciting cause is the Klebs-Löffler bacillus. The inflammation occurs in very varying degrees of severity. The secretion is at first thin and scant, afterwards purulent and more copious. In severe cases there is great chemosis with much tense swelling of the lids, which are often of an ash-grey colour. A streptococcus infection produces somewhat similar and often quite as disastrous results. The disease must be promptly treated by antitoxin and local with antiseptics. Of rarer forms of conjunctivitis may be mentioned Parinaud's conjunctivitis and the so-called spring catarrh.

Non-inflammatorv Conjunctival Affections.—These are of less importance than conjunctivitis, either on account of their comparative infrequency or because of their harmlessness. The following conditions may be shortly referred to.

Amyloid degeneration, in which waxy-looking masses grow from the palpebral conjunctiva of both lids, often attaining very considerable dimensions. The condition is not uncommon in China and elsewhere in the East.

Essential Shrinking of the Conjunctiva.—This is the result of pemphigus, in which the disease has attacked the conjunctiva and led to its atrophy.

Pterygium is a hypertrophic thickening of the conjunctiva of triangular shape firmly attached by its apex to the superficial layers of the cornea. It is a common condition in warm climates owing to exposure to sun and dust, and often calls for operative interference.

Tumours of the Conjunctiva.—These may be malignant or benign, also syphilitic and tubercular. (G. A. Br.)

EYEMOUTH, a police burgh of Berwickshire, Scotland. Pop. (1901) 2436. It is situated at the mouth of the Eye, 71 m. N.N.W. of Berwick-on-Tweed by the North British railway via Burnmouth. Its public buildings are the town hall, library and masonic hall. The main industry is the fishing and allied trades. The harbour was enlarged in 1857, and the bay is easily accessible and affords good anchorage. Owing to the rugged and rocky nature of the coast many of the vessels cambiar and the whole district was once infested with smugglers. The promontory of St Abb's Head is 3 m. to the N.W.

EYLAU (Preussisch-Eylau), a town of Germany, in east Prussia, on the Pasmar, 23 m. S. by E. of Königsberg by rail on the line Pillau-Prostken. It has an Evangelical church, a teachers' seminary, a hospital, foundries and saw mills. Pop. 3300. Eylau was founded in 1336 by Arnold von Ellenstein, a knight of the Teutonic Order. It is famous as the scene of a battle between the army of Napoleon and the Russians and Prussians commanded by General Bennigsen, fought on the 8th of February 1807.

The battle was preceded by a severe general engagement on the 7th. The head of Napoleon's column (cavalry and infantry), advancing from the south-west, found itself opposed at the outlet of the Grünhöfen defile by a strong Russian rearguard which held the (frozen) lakes on either side of the Eylau road, and attacked at once, dislodging the enemy after a sharp conflict. The French turned both wings of the enemy, and Bagration, who commanded the Russian rearguard, retired through Eylau to the main army, which was now arrayed for battle east of Eylau. Barclay de Tolly made a strenuous resistance in Eylau itself, and in the churchyard, and the Eylau position changed its several times before remaining finally in possession of the French. It is very doubtful whether Napoleon actually ordered this attack upon Eylau, and it is suggested that the French soldiers were encouraged to a premature assault by the hope of obtaining quarters in the village. There is, however, no reason to suppose that this attack was prejudicial to Napoleon's chance of success, for his own army was intended to pin the enemy in front, while the outlying "masses of manoeuvre" closed upon his flanks and rear (see NAPOLEONIC CAMPAIGNS). In this case the vigour of the "general advanced guard" was superfluous, for Bennigsen stood to fight of his own free will.

The foremost line of the French bivouacs extended from Rothenen to Freibeth, but a large proportion of the army spent the night in quarters farther back. The Russian army on the other hand spent the night bivouacked in order of battle, the right at Schloditten and the left at Serpallen. The cold was extreme, 2° F. being registered in the early morning, and food was scarce in both armies. The ground was covered at the time of battle with deep snow, and all the lakes and marshes were frozen, so that troops of all arms could pass everywhere, so far as Napoleon's corps (Davout and Ney) were still absent, and Ney did not receive his orders until the morning of the 8th. His task was to descend upon the Russian right, and also to prevent a Prussian corps under Lestocq from coming on to the battlefield. Davout's corps advancing from the south-east on Mollwiten was destined for the attack of Bennigsen's left wing about Serpallen and Klein Sausgarten. In the meantime Napoleon with his forces at and about Eylau made the preparations for the frontal attack. His infantry extended from the windmill, through Eylau, to Rothenen, and the artillery was deployed along the whole front; behind each infantry corps and on the wings stood the cavalry. The Guard was in second line south of Eylau, and an army reserve stood near the Waschkeiten lake. Bennigsen's army was drawn up in line from Schloditten to Klein Sausgarten, the front likewise covered by guns, in which arm he was numerically much superior. A detachment occupied Serpallen.

The battle opened in a dense snowstorm. About 8 A.M.
Bennigsen's guns opened fire on Eylau, and after a fierce but undecided artillery fight the French delivered an infantry attack from Eylau. This was repulsed with heavy losses, and the Russians advanced towards the windmill in force. Thereupon Napoleon ordered his centre, the VII. corps of Augereau, to move forward from the church against the Russian front, the division of St Hilaire on Augereau's right participating in the attack. If we conceive of this first stage of the battle as the action of the “general advanced guard,” Augereau must be held to have overdone his part. The VII. corps advanced in dense masses, but in the fierce snowstorm lost its direction. St Hilaire attacked directly and unsupported; Augereau's corps was still less fortunate. Crossing obliquely the front of the Russian line, as if making for Schloditten, it came under a feu d'enfer and was practically annihilated. In the confusion the Russian cavalry charged with utmost fury downhill and with the wind behind them. Three thousand men only out of about fourteen thousand appeared at the evening parade of the corps. The rest were killed, wounded, prisoners or dispersed. The marshal and every senior officer was amongst the killed and wounded, and one regiment, the 14th of the Line, cut off in the midst of the Russians and refusing to surrender, fell almost to a man. The Russian counterstroke penetrated into Eylau itself and Napoleon himself was in serious danger. With utmost coolness, however, he judged the pace of the Russian advance and ordered up a battalion of the Guard at the exact moment required. In the streets of Eylau the Guard had the Russians at their mercy, and they escaped. Still the situation for the French was desperate and the battle had to be maintained at all costs. Napoleon now sent forward the cavalry along the whole line. In the centre the charge was led by Murat and Bessières, and the Russian horsemen were swept off the field. The Cuirassiers under D'Hautpoult charged through the Russian guns, broke through the first line of infantry and then through the second, penetrating to the woods of Ankappen.

The shock of a second wave of cavalry broke the lines again, and though in the final retirement the exhausted troopers lost terribly, they had achieved their object. The wreck of Augereau's and other divisions had been reformed, the Guard brought up into first line, and, above all, Davout's leading troops had occupied Serpallen. Thence, with his left in touch with Napoleon's right (St Hilaire), and his right extending gradually towards Klein Sausgarten, the marshal pressed steadily upon the Russian left, rolling it up before him, until his right had reached Kutschitten and his centre Ankappen. By that time the troops under Napoleon's immediate command, pivoting their left on Eylau church, had wheeled gradually inward until the general line extended from the church to Kutschitten. The Russian army was being driven westward, when the advance of Lestocq gave them fresh steadiness. The Prussian corps had been fighting a continuous flank-guard action against Marshal Ney to the north-west of Althof, and Lestocq had finally succeeded in disengaging his main body, Ney being held up at Althof by a small rearguard, while the Prussians, gathering as they went the fugitives of the Russian army, hastened to oppose Davout. The impetus of these fresh troops led by Lestocq and his staff officers from Schlabendorf was such as to check even the famous divisions of Davout's corps which had won the battle of Auerstedt single-handed. The French were now gradually forced back until their right was again at Sausgarten and their centre on the Krege Berg.

Both sides were now utterly exhausted, for the Russians also had been marching and fighting all day against Ney. The battle died away at nightfall, Ney's corps being unable effectively to intervene owing to the steadiness of the Russian detachment left to oppose him, and the extreme difficulty of the roads. A severe conflict between the Russian extreme right and Ney's vanguard, which appeared at last on the field at Schloditten ended the battle. Bennigsen retreated during the night through Schmolitten, Lestocq through Kutschitten. The numbers engaged in the first stage of the battle may be taken as—Napoleon, 50,000; Bennigsen, 67,000, to which later were added on the one side Ney and Davout, 29,000, on the other Lestocq, 7000. The losses were roughly, 15,000 men to the French, 18,000 to the Allies, or 21 and 27%, respectively of the troops actually engaged. The French lost 5 eagles and 7 other colours, the Russians 16 colours and 8 guns.

**EYRA—** *Eulon eyra*, a South American wild cat, of weasel-like build, and uniform coloration, varying in different individuals from reddish-yellow to chestnut. It is found in Brazil, Guiana and Paraguay, and extends its range to the Rio del Norte, but is rare north of the isthmus of Panama. Little is known of its habits in a wild state, beyond the fact that it is a forest-dweller, active in movement and fierce in disposition. Several have been exhibited in the London Zoological Gardens, and some have grown gentle in captivity. Don Felix de Azara wrote of one which he kept on a chain that it was "as gentle and playful as any kitten could be." The name is sometimes applied to the jaguarundi.

**EYRE, EDWARD JOHN** (1815-1901), British colonial governor, the son of a Yorkshire clergyman, was born on the 5th of August 1815. He was intended for the army, but delays having arisen in producing a commission, he went out to New South Wales, where he engaged in the difficult but very necessary undertaking of transporting stock westward to the new colony of South Australia, then in great distress, and where he became magistrate and protector of the aborigines, whose interests he warmly advocated. Already experienced as an Australian traveller, he undertook the most extensive and difficult journeys in the desert country north and west of Adelaide, and after encountering the greatest hardships, proved the possibility of land communication between South and West Australia. In 1845 he returned to England and published the narrative of his travels. In 1846 he was appointed lieutenant-governor of New Zealand, where he served under Sir George Grey. After successively governing St Vincent and Antigua, he was in 1862 appointed acting-governor of Jamaica and in 1864 governor. In October 1865 a negro insurrection broke out and was repressed with laudable vigour, but the unquestionable severity and alleged illegality of Eyre's subsequent proceedings raised a storm at home, which induced the government to suspend him and to despatch a special commission of investigation, the effect of whose inquiries, declared by his successor, Sir John Peter Grant, to have been "admirably conducted," was that he should not be reinstated in his office. The government, nevertheless, saw nothing in Eyre's conduct to justify legal proceedings; indictments preferred by amateur prosecutors at home against him and military officers who had acted under his direction, resulted in failure, and he retired upon the pension of a colonial governor. As an
EYRE, SIR J. — EZEKIEL

explorer Eyre must be classed in the highest rank, but opinions are always likely to differ as to his action in the Jamaica rebellion. He died on the 30th of November 1901.

EYRE, SIR JAMES (1734—1799), English judge, was the son of the Rev. Thomas Eyre, of Wells, Somerset. He was educated at Winchester College and St John's College, Oxford, however, he left without taking a degree. He was called to the bar at Gray's Inn in 1753, and commenced practice in the lord mayor's and sheriffs' courts, having become by purchase one of the four counsel to the corporation of London. He was appointed recorder of London in 1755. He was employed for the plaintiff in the case of Wilkes v. Wood, and made a brilliant speech in condemnation of the execution of general search warrants. His refusal to voice the remonstrances of the corporation against the exclusion of Wilkes from parliament earned him the recognition of the ministry, and he was appointed a judge of the exchequer in 1772. From June 1792 to January 1793 he was chief commissioner of the great seal. In 1793 he was made chief justice of the common pleas, and presided over the trials of Horne Tooke, Thomas Crosfield and others, with great ability and impartially. He died on the 1st of July 1799 and was buried at Ruscombe, Berkshire.

EYRIE, the alternative English form of the words Aerie or Aery, the lofty nest of a bird of prey, especially of an eagle, hence any lofty place of abode; the term is also used of the brood of the bird. The word derives from the Fr. aire, of the same meaning, which comes from the Lat. area, an open space, but was early connected with aereus, high in the air, airy, a confusion that has affected the spelling of the word. The form "eary" or "eery" date from a 17th century attempt to derive the word from the Teutonic eyr, an egg.

EZEKIEL (abilidade, "God strengthens" or "God is strong"); Sept. יֶשֶׁכֶל; Vulg. Ezechiel), son of Buzi, one of the most vigorous and impressive of the older Israelite thinkers. He was a priest of the Jerusalem temple, probably a member of the dominant house of Zadok, and doubtless had the literary training of the cultivated priesthood of the time, including acquaintance with the national historical, legal and ritual traditions and with the contemporary history and customs of neighbouring peoples. In the year 597 (being then, probably not far from thirty years of age), he was carried off to Babylonia by Nebuchadrezzar with King Jehoiachin and a large body of nobles, military men and artisans, and there, it would seem, he spent the rest of his life. His prophecies are dated from this year ("our captivity," xl. 1), except in i. 1, where the meaning of the date "thirtieth year" is obscure; it cannot refer to his age (which would be otherwise expressed in Hebrew), or to the return of Josiah, 621 (which is not elsewhere employed as an epoch); possibly the reference is to the era of Nabopolassar (626 according to the Canon of Ptolemy), or to the fall of the empire of Babylonia, 588 (i. xxiv.); after the fall of the city (386) his tone changed to one of consolation (xxxiii.—xxxiv.)—the destruction of the wicked magaspolished, he turned to the task of reconstruction. He identifies the safe and happy epochs that are survivals of old recognized customs: in ch. xxii, he mentions "eating with the blood" along with murder, and failure to observe ritual regulations along with oppression of the fatherless and the widow; the old customary law permitted marriage with a half-sister (father's daughter), with a daughter-in-law, and with a father's wife (Gen. xx. 12, xxxviii. 26; 2 Sam. xvi. 21, 22), but the more refined 1

1 The Assyrian term abušu is used of the great primeval deluge (in the Gilgamesh epic), and also of the local floods common in the country.

2 So we must read (as Robertson Smith has pointed out) in xii. 9 and xviii. 6, instead of "eating on the mountains."
feeling of the later time frowned on the custom, and Ezekiel treats it as adultery.\(^1\) However, notwithstanding the insistence on ritual, natural in a priest, his moral standard is high; following the prescription of Ex. xxii. 21 [20] he regards oppression of resident aliens (a class that had not then received full civil rights) as a crime (xxii. 7), and in his new constitution (xxiii. 22, 23) gives them equal rights with the born. His strongest denunciation is reserved against the religious practices of the time in Judaea—the worship of the Canaanite local deities (the Baals), the Phoenician Tammuz, and the sun and other Babylonian and Assyrian gods (vi., viii., xvi., xxiii.); he maintained vigorously the prophetic struggle for the sole worship of Yahweh. Probably he believed in the existence of other gods, though he does not express himself clearly on this point; in any case he held that the worship of other deities was destructive to Israel. His conception of Yahweh shows a mingling of the high and the low. On the one hand, he regards him as supreme in power, controlling the destinies of Babylonia and Egypt as well as those of Israel, and as infallibly just in dealing with ordinary affairs, against morality. But he conceives of him, on the other hand, as limited locally and morally—as having his special abode in the Jerusalem temple, or elsewhere in the midst of the Israelite people, and as dealing with other nations solely in the interests of Israel. The bitter invectives against Ammon, Moab, Edom, Philistia, Tyre, Sidon and Egypt, put into Yahweh’s mouth, are based wholly on the fact that these peoples are regarded as hostile and hurtful to Israel; Babylonia, though nowise superior to Egypt morally, is favoured and applauded because it is believed to be the instrument for securing ultimately the prosperity of Yahweh’s people. The administration of the affairs of the world by the God of Israel is represented, in a word, as determined not by ethical considerations but by personal preferences. There is no hint in Ezekiel’s writings of the grandiose conception of Isa. xl.-lv., that Israel’s mission is to give the knowledge of religious truth to the other nations of the world; he goes so far as to say that Yahweh’s object in restoring the fortunes of Israel is to establish his reputation among the nations as a powerful deity (xxxvi. 20-23, xxxvii. 28, xxxix. 23). The prophet regards Yahweh’s administrative control as immediate: he has no angels or other subordinate superintendencies—a- the cherubs and the “men” of ix. 2 and xl. 3 are merely imaginative symbols or representations of divine activity. His high conception of God’s transcendence, it may be supposed, led him to ignore intermediary agencies, which are common in the popular literature, and later, under the influence of this same conception of transcendence, are freely employed.

The relations between the writings of Ezekiel and those of Jeremiah is not clear. They have so much in common that they must have drawn from the same current bodies of thought, or there must have been borrowing in one direction or the other. In one point, however, the attitude toward the ritual—the two men differ radically. The finer mind of the nation, represented mainly by the prophets from Amos onward, had denounced unsparingly the superficial non-moral popular cult. The struggle between ethical religion and the current worship became acute toward the end of the 7th century. There were two possible solutions of the difficulty. The ritual books of our Pentateuch were not then in existence, and the sacrificial cult might be treated with contempt as not authoritative. This is the course taken by Jeremiah, who says boldly that God requires only obedience (Jer. vii. 21 ff.). On the other hand, the better party among the priests, believing the ritual to be necessary, might undertake to moralize it; of such a movement, begun by Deuteronomy, Ezekiel is the most eminent representative. Priest and prophet, he sought to unify the national religious consciousness by preserving the sacrificial cult, discarding its abuses and vitalizing it ethically. The event showed that he judged the situation rightly—the religious scheme announced by him, though not accepted in all its details, became the dominant policy of the later time, and he has been justly called “the father of Judaism.” He speaks as a legislator, citing no authority; but he formulates, doubtless, the ideas, and perhaps the practices of the Jerusalem priesthood. His ritual code (xiii.-xxvi.), which in elaborateness stands midway between that of Deuteronomy and that of the middle books of the Pentateuch (resembling most nearly the code of Lev. xvii.-xxvi.) shows good judgment. Its most noteworthy features are two. Certain priests of idolatrous Judean shrines (distinguished by him as “Levites”) he deprives of priestly functions, degrading them to the rank of temple menials; and he takes from the civil ruler all authority over public religion, permitting him merely to furnish material for sacrifices. He is, however, much more than a ritual reformer. He is the first to express clearly the conception of a sacred nation, isolated by its religion from all others, the guardian of divine law and the abode of divine majesty. This kingdom of God he conceives of as mortal: Yahweh is to put his own spirit into the people,\(^2\) creating in them a disposition to obey his commandments, which are moral as well as ritual (xxxvi. 26, 27). The conception of a nation controlled the whole succeeding Jewish development; if it was narrow in its exclusive regard for Israel, its intensity saved the Jewish religion to the world.

Text and Authorship.—The Hebrew text of the book of Ezekiel is not in good condition—it is full of scribal inaccuracies and additions. Many of the errors may be corrected with the aid of the Septuagint (e.g. the 430—390-40 of iv. 5, 6 to be changed to 190), and none of them affect the general thought. The substantial genuineness of the discourses is now accepted by the Talmudic tradition (Bab.Cal. 14b) that the men of the Great Synagogue “wrote” Ezekiel, may refer to editorial work by later scholars.\(^3\) There is no validity in the objections of von Zunn (Gottesdienst. Vortr.) that the specific prediction concerning Zedekiah (xii. 12 f.) is non-Prophetic, and that the drawing-up of a new constitution soon after the destruction of the city and the mention of Noah, Daniel, Job and Persia are improbable. The prediction in question was doubtless added by Ezekiel after the event; the code belongs precisely in his time, and the constitution was natural for a priest; Noah, Daniel and Job are old legendary Hebrew affairs; and it is not probable that the prophet’s “Persia” is our “Persia.” Havet’s contention (in La Modernité des prophètes) that Gog represents the Parthians (40 b.c.) has little or nothing in its support. There are additions made post eventum, as in the case mentioned above and in xxix. 17-20, and the description of the commerce of Tyre (xxvii. 96-256), which interrupts the comparison of the city to a ship, looks like an insertion whether by the prophet or by some other; but there is no good reason to doubt that the book is substantially the work of Ezekiel. Ezekiel’s style is generally impetuous and vigorous, somewhat smoother in the consolatory discourses (xxviii., xxxvi., xxxvii.); he produces a great effect by the cumulation of details, and is a master of invective; he is fond of symbolic pictures, proverbs and allegories; his “visions” are elaborate literary productions, his prophecies show less spontaneity than those of any preceding prophet (he receives his revelations in the form of a book, ii. 9), and in their present shape were largely pronounced in public—a fact that seems to be hinted at in the statement that he was “dumb” till the fall of Jerusalem (lil. 26, xxiii. 22); in private interviews the people did not take him seriously (xxiii. 30-33). His book was accepted early as part of the sacred literature; Ben-Sira (c. 180 b.c.) mentions him along with Isaiah and Jeremiah (Eccles. xix. 8); he is not quoted directly in the New Testament, but his imagery is employed largely in the Apocalypse and elsewhere. His divergences from the Pentateuchal code gave rise to serious doubts, but, after prolonged study, the discrepancies were explained, and the book was finally canonized (Shab. 136). According to

---

\(^{1}\)The stricter marriage law is formulated in Lev. xviii. 8-15, xx. 11 ff.

\(^{2}\)Yahweh’s spirit, thought of as Yahweh’s vital principle, as man’s spirit is man’s vital principle, is to be breathed into them, as the life of the body, Gen. ii. 7. The notion of introducing the life of the body is, however, foreign to the Biblical idea. The spirit in the Old Testament is a refined material thing that may come or be poured out on men.

\(^{3}\)The “Great Synagogue” is semi-mythical.
The book divides itself naturally into three parts: the arrangement of Jerusalem (i.-xxiv.); denunciation of foreign enemies (xxv.-xxxii.); consolatory construction of the future (xxxiii.-xxxvii.). The opening "vision" (i.), an elaborate symbolic picture, is of the national religion and character. The ensuing prophecies, probably the farewell discourses of the prophet's life. Out of the north (the Babylonian sacred mountain) comes a bright cloud, wherein appear four Creatures (formed on the model of Babylonian composite figures), each with four faces (man, lion, ox, eagle), and four wings. And these four Creatures (the white eyes, and move straight forward, impelled by the spirit dwelling in the Creatures (the spirit of Yahweh). Supported on their heads is something like a crystalline firmament, above which is a form like a sapphire throne (cf. Ex. xxi. 10), and on the throne a man-like form (Yahweh) surrounded by a rainbow brightness. The wheels symbolize divine omniscience and control, and the whole vision represents the coming of Yahweh to take up his abode among the exiles. The prophet then receives his call (ii., iii.) in the shape of a roll of a book, which he is required to eat (an indication of the literal form now taken by prophecy). He is informed that the people's conscience is reawakened, and while that yearning impels his opinion of the people, and gives the keynote of the following discourses; he is appointed watchman to warn men when they sin, and is to be held responsible for the consequences of their sinning. This is the chief conception of a preacher's function: the prophet was faithful throughout his career. Next follow minatory discourses (iv.-vii.) predicting the siege and capture of Jerusalem—perhaps a common event, but which is descriptive of the siege. One of these (iv. 4 ff.) gives the duration of the national punishment in loose chronological reckoning: 40 years (a round number) for Judah, and 150 more (according to the corresponding number of years Judah was left to follow his course) for Israel. The day 722, the date of the capture of Samaria, the procedure described in 1., 8 is not to be understood literally. In vi., the idolatry of the nation is pictured in darkest colours. Next follows (viii.-xii.) a detailed description, in the form of a vision, of the siege and fall of Jerusalem; these visions within the temple-area elders and other beings are worshipping beasts, Tammuz and the sun (probably actual cults of the time); 1men see the temple in ruins; 2the city is captured; and the city is burned. In ch. x. the imagery of ch. i. reappears, and the Creatures are identified with the cherubim of Solomon's temple. This appears to be an independent form of the vision, which has been brought into connexion with that of i. by a harmonizing editor. There follows a symbolic prediction of the exile (xii.) and a denunciation of non-moral prophets and prophetesses (xiii.),—though Yahweh deceive a prophet, yet he and those who consult him will be punished; and that the crowd of a load on the good men will not save it (xiv.). A comparison of II. to a worthless wild vine (xv.) comes two allegories, one portraying idolatry, the other the unfaithfulness of Yahweh, the latter describing the fate of Zedekiah (xvii.). The fine insistence on individual moral responsibility in xvi. (cf. Deut. xiv. 16, Jer. xxvi. 29 f.), while it is a protest against a superficial current view, is in keeping with the national relations of the time and the successive generations. This latter question had not presented itself to the prophet's mind; his object was simply to correct the opinion of the people that their present misfortunes were due not to their own faults but to the measures of their predecessors. A more sympathetic attitude appears in two elegies (xix.), one on the kings Jehoahaz and Jehoiachin, the other on the nation. These are followed by a scattering sketch of Israel's religious career (xx. 1-29), in which, contrary to the view of earlier prophets, it is declared that the nation had always been disobedient. From this point to the end of xiv. there is a mingling of threat and promise.6 The agony of the nation is treated in xvi., 1-18; the future age of Israel. The section is relatively treated with favour, while in the former it (Aholah) is involved in the same condemnation as that of Jerusalem. At this point is introduced (xxv.-xxxii.) the series of discourses directed against the seven kings of the nations (Egypt, Asia Minor, etc.); the conscious dependence, using different Babylonian material; the text is corrupt. The section dealing with Egypt is one of remarkable imaginative power and rhetorical vigour: the king of Egypt is compared to a magnified cherub; he "sends his messenger" (in Deut. xiii. 14) to the dragon of the Nile, and the picture of his descent into Sheol is intensely tragic. Whether these discourses were all uttered between the investment of Jerusalem and its fall, or were here inserted by Ezekiel or by a scribe, it is not possible to say. The function of the prophecies is perhaps at least in part an expanded description of the destruction of the city. The news of the capture of the city is received. The following chapters (xxxv.-xxxvii.) are devoted to reconstruction: Edom, the detested enemy of Israel, is to be given up to desolation. The king is to be dead, with North and South united (xxxviii.), is to be established under a Davidide king; a final assault, made by Gog, is to be succumbed to. For the time the people are to dwell in peace for ever; this Gog section is regarded by some as the beginning of Jewish apocalyptic writing. In the last section (xli.-xlvi.), put as a vision, the temple is to be rebuilt, in dimensions and arrangement, as described in the temple of Solomon; but Gog and the sacrifices and festivals and the functions of priests and princes are prescribed, a stream issuing from under the temple to vivify the Dead Sea and fertilize the land (this is meant literally), the land is divided into parallel strips and assigned to the tribes of Israel. The prophet's thought is summed up in the name of the city: Yahweh Shammah, "Yahweh is there," God dwelling for ever in the midst of his people.

Ezra (from a Hebrew word meaning "help"), in the Bible, the famous scribe and priest at the time of the return of the Jews in the reign of the Persian king Artaxerxes I. (485 b.c.). His book and that of Nehemiah form one work (see Ezra and Nehemiah, Books of), apart from which we have little trustworthy evidence as to his life. Even in the beginning of the 2nd century b.c., when Ben Sira praises notable figures of the exilic and post-exilic age (Zerubbabel, Josua and Nehemiah), Ezra is placed over them (xx. 3-6) and is mentioned in a still later and somewhat fanciful description of Nehemiah's work (2 Macc. i. 18-36). Already well known as a scribe, Ezra's labours were magnified by subsequent tradition. He was regarded as the father of the scribes and the founder of the Great Synagogue. According to the apocryphal fourth book of Ezra (or 2 Esdras xiv.) he restored the law which had been lost, and rewrote all the sacred records (which had been destroyed) in addition to no fewer than seventy apocryphal works. The former theory recurs elsewhere in Jewish tradition, and may be associated with the representation in Ezra-Nehemiah which respects him. The story of these literary efforts, like the more modern conjecture that he closed the canon of the Old Testament, rests upon no ancient basis. See Sometimes, see the Codices, Cantor and Historiam (231 seq.). The apocryphal books, called 1 and 2 Esdras (the Greek form of the name) in the English Bible, are dealt with below as Ezra, Third Book of, and Ezra, Fourth Book of, or, in the: Book of, the Books of. 1 Esdras is with Ezra and Nehemiah.

Ezra, Third Book of [I. Esdras]. The titles of the various books of the Ezra literature are very confusing. The Greek, the Old Latin, the Syriac, and the English Bible from 1560

1 In viii. 17 the unintelligible expression "they put the branch to their nose" is the rendering of a corrupt Hebrew text; a probable emendation is: "they are sending a stool to my nostrils.

2 The chiasmus of Daniel (chs. 11-14) is later taken by the author of the book of Daniel as his hero.

3 For a reconstruction of the poem in xx. 10, 11, see the English Ezekiel in Haupt's Sacred Books.
onwards designate this book as 1 Esdras, the canonical books Ezra and Nehemiah being 2 Esdras in the Greek. In the Vulgate, however, our author was, through the action of Jerome, degraded into the third place and called 3 Esdras, whereas the canonical books Ezra and Nehemiah (see Ezra and Nehemiah, Books of, below) were called 1 and 2 Esdras, and the Apocalypse of Esra 4 Esdras. Thus the nomenclature of our book follows, and possibly wrongly, the usage of the Vulgate.1 In the Ethiopian version a different usage prevails. The Apocalypse is called 1 Esdras, our author 2 Esdras, and Ezra and Nehemiah 3 Esdras, or 3 and 4 Esdras. Throughout this article we shall use the best attested designation of this book, i.e., 3 Esdras.

Contents.—With the exception of one original section, namely, that of Darius and the three young men, our author contains essentially the same materials as the canonical Ezra and some sections of 2 Chronicles and Nehemiah. To the various explanations of this phenomenon we shall recur later. The book may be divided as follows (the verse division is that of the Cambridge LXX):

Chap. i.—=Chron. xxxv. 1-xxxvi. 21.—Great passover of Josiah: his death at Megiddo. His successors down to the destruction of Jerusalem and the Captivity. (Verses i. 21-22 are not found elsewhere, though the LXX of 2 Chron. xxxv. 20 exhibits a very distant parallel.)

Chap. ii. 1-14 = Ezra i.—The edict of Cyrus. Restoration of the sacred vessels through Sanballas to Jerusalem.

Chap. ii. 15-25 = Ezra iv. 6-24.—First attempt to rebuild the Temple: opposition of the Samaritans. Decree of Artaxerxes: work along till the second year of Darius.

Chap. iii. 1-v. 6.—This section is peculiar to our author. The contest between the three pages waiting at the court of Darius and thestory of the Jewish youth "Zerubbabel," to whom as a reward Darius decrees the return of the Jews and the restoration of the Temple and worship. Partial list of those who returned with "Joschim, son of Zerubbabel."

Chap. iv. 5.—List of exiles who returned with Zerubbabel. Work on the Temple begun. Offer of the Samaritans co-operation rejected. Suspension of the work through their intervention till the reign of Darius.

Chap. v. 1-vi. 18.—Work resumed in the second year of Darius. Correspondence between Sisines and Darius with relation to the building of the Temple. Darius' favourable decree. Completion of the work by Zerubbabel.

Chap. vii. 10-15 = Ezra vi. 19-22.—Celebration of the completion of the Temple.

Chap. vii. 18-ix. 36 = Ezra vii-x.—Return of the exiles under Ezra and Nehemiah forbidden.

Thus, apart from iii. 1-v. 3, which gives an account of the pages' contest, the contents of the book are doublets of the canonical Ezra and portions of 2 Chronicles and Nehemiah. The beginning of the book seems imperfect, with its abrupt opening "And Josiah held the passover": its conclusion is mutilated, as it breaks off in the middle of a sentence. As Thackray suggests, it probably continued the history of the feast of Tabernacles described in Neh. viii.—a view that is supported by Joseph. Ant. xi. 5. 5, who describes that feast using an Esdras word θεραποθησις and... having hitherto followed Esdras as his authority passes on to the Book of Nehemiah."

Claims to Canonicity.—It would seem that even greater value was attached to 1 Esdras than to the Hebrew Ezra. (1) For in the best MSS. (BA) it stands before 2 Esdras—the verbal translation of the Hebrew Ezra and Nehemiah. (2) It is used by Josephus, who in fact does not seem aware of the existence of 2 Esdras. (3) 1 Esdras is frequently quoted by the Greek fathers—Clem. Alex., Origen, Eusebius, and by the Latin Church! Cyprian, Augustine. The adverse judgment of the church of the 4th and 5th centuries, who, from his firm attachment to the Hebrew Old Testament, declined to translate the "dreams" of 3 and 4 Esdras. This judgment influenced alike the Council

1 At the Council of Trent (when the Septuagint Canon was virtually accepted as authoritative), by a most curious aberration, Esdras iii. and iv. and the Epistle of Manasseh were alone excluded from the canon and remitted to an appendix.—"Howorth, " Unconventional Views on the Text of the Bible," in the P.S.B.A., 1901, p. 149.

of Trent and the Lutheran church in Germany; for Luther also refused to translate Esdras and the Apocalypse of Ezra.

Origin and Relation to the Canonical Ezra.—Various theories have been given as to the relation of the book and the canonical Ezra.

1. Some scholars, as Kell, Bissell and formerly Schürer, regarded 1 Esdras as a free compilation from the Greek of 2 Esdras (2 Chron. and Ezra-Nehemiah). This theory has now given place to others more accordant with the facts of the case.

2. Others, as Ewald, Hist. of Isr. v. 126-128, and Thackray in Hastings' Bible Dictionary, assume a lost Greek version of Chronicles, Ezra and Nehemiah, from which were derived 1 Esdras—a free redaction of the former and 2 Esdras. Thackray claims that we have "a satisfactorily explanation of the coincidences in translation and deviation from the Hebrew in 1 Esdras and 2 Esdras, if we suppose both are to some extent dependent on a lost Greek original." But later in the same article Thackray is compelled to modify this view and admit that 1 Esdras is not a mere redaction of a no longer extant version of the canonical books, but shows not only an independent knowledge of the Hebrew text but also of a Hebrew text superior to that of the LXX, and allusions and passages to the Massoretic text, where 2 Esdras gives either an inaccurate version or a version reproducing the secondary Massoretic text.

3. Others like Michaelis, Trendelenburg, Pohlmann, Herzfeld, Fritzsche hold it to be a direct and independent translation of the Hebrew. There is much to be said in favour of this view. It presupposes in reality two independent recensions of the Hebrew text, such as we cannot reasonably doubt existed at one time of the Book of Daniel. Against this it has been urged that the story of the three pages was written originally in Greek (Ewald, Schürer, Thackray). The only grounds for this theory are the closeness of the Greek style and the paraphrasing in iv. 62 ἀνωτώς καὶ κατωτέρως. But the former is no real objection, and the latter may be purely accidental. On the other hand there are several unclouded Semiticisms. Thus we have two instances of the split relative οὖθε... αἰτωρί. v. 5; οὖθε... εἰς αὐτούς iv. 63 and the phrase pointed out by Fritzsche ῥα δικαίου τελευταὶ εἰς ἄνωσιν. It must, however, be admitted that there are fewer Hebraisms in this section of the book than in the rest.

4. Sir H. H. Howorth in the treatises referred to at the close of this article has shown cogent grounds for regarding 1 Esdras as the original and 2 Esdras the Septuagint and as the Greek version as probably that of Theodotion. For this view headduces among others the following grounds: (i.) Its use by Josephus, who apparently was not acquainted with 2 Esdras. (ii.) Its precedence of 2 Esdras in the great uncials. (iii.) Its origin at a time when Chronicles, Ezra and Nehemiah formed a single work. (iv.) Its preservation of a better Hebrew text in many instances than 2 Esdras. (v.) The fact that 1 Esdras and the Septuagint of Daniel go back to one and the same translator, as Dr Gwynn (Dict. Christ. Bibliog. iv. 977) has pointed out (cf. 1 Esdr. vi. 31, and Dan. vi. 5).

This contention of Howorth has been accepted by Nestle, Cheyne, Bertholet, Ginsburg and other scholars, though they regard the question of an Aramaic original of chapters iii. 1-v. 6 as doubtful. Howorth's further claim that he has established the historical credibility of the book as a whole and its chrono logical accuracy as against the canonical Ezra has not as yet met with acceptance; but his arguments have not been fairly met and answered.

5. Vökel (Encyc. Bibl. ii. 1490) thinks that the solution of the problem is to be found in a different direction. The text is of unequal value, and the inequalities are so great as to exclude the supposition that the Greek version was produced aus einem Guss. iii. 1-v. 3 is an independent narrative written originally in Greek and itself a composite production, the praise of truth being an addition. vi. 1-vii. 15, ii. 15-256 is a fragment of an Aramaic narrative. Some in Josephus (Ant. xi. 4-9) an account of Samaritan intrigues is introduced immediately after 1 Esdras vii. 15, it is natural to infer that something of the same kind
has fallen out between vii. and ii. 15-25. The Aramaic text behind 1 Esdras here is better than that behind the canonical Ezra. Next, vii.-ix. is from the Ezra document (= Ezra viii.-x.; Neh. vii. 73, viii. 1 sqq.), though implying a different Hebrew of the Second Ezra; i.e. from 2 Chron. xxxiv.-vi. 2 Esdras being at the same time before the translation.

Date.—The book must be placed between 300 B.C. and A.D. 100, when it was used by Josephus. It is idle to attempt any nearer limits until definite conclusions have been reached on the chief problems of the book.

MSS. and Versions.—The book is found in B and A. The latter seems to have preserved the more ancient form of the text, as it is generally that followed by Josephus. The Old Latin in two recensions is published by Sabatier, Bibliorum sacrorum Latinae versiones antiquae, iii. Another Latin translation is given in Lagarde (Septuag. Studien, ii, 1892). In Syriac the text is found only in the Syro-Hexaplar of Paul of Tella (A.D. 616). See Walton's Polyglot. There is also an Ethiopic version edited by Dillmann (Bibl. Vet. Test. Aeth. v., 1894) and an Armenian.

LITERATURE.—Exegesis: Fritzche, Essegel. Handb. zu den Apokr. (1851); Zöckler, Die Apokryphen; 155-161 (1891); Bunsell in Lange-Schumann's Die altTEST. BIBL. (1880); Luton in Speaker's Com. (1881); Buttrrose in F. A. Tischendorf's Apocryphal and Pseudepigraphical Books of the Old Testament, xi. 117, 198-232 (1886); Dillmann, in the Berliner Zeitschrift for die neutestamentliche Wissenschaft und die Kunde des christlichen Altertums, iv. 55-66 (1887-8). A chief point of controversy is the derivation of Ezra, and it is generally found in the west as: Ezra, Esdras, a translation of Ezr., and is repeated from that point to such a mistranslation as vii. 33, "longanimitas congregatibus," where for "congregatibus" (= Eza.) we require "evanescest," which is another and the actual meaning of the Hebrew verb in this passage. The same mistranslation is found in the Vulgate in Hosen iv. 3. Gunkel has adopted this view in his German translation of the book in Kautzsch's Apok. und Pseud. des A. Testaments, ii. 332-333, and brought forward in confirmation the following remarkable instance in vii. 23, where though the Latin, Syriac, Ethiopic, Arabic and Armenian Versions read testificatur, the Second Arabic version and the Apostolic Constitutions have mikra elis ron aijuna, which are to be explained as translations of (q) 'el qaynu. Another interesting case is found in xiv. 3, where the Latin and all other versions but Arabic read super rubrum and the Arabic in monte Sinai. Here there is a corruption of the "bush" into "rubi "Sinai.

Latin Version.—All the older editions of this version, as those of Fabricius, Sabatier, Volkma, Hilgenfeld, Fritzsche, as well as in the older editions of the Bible, are based ultimately on only one MS., the Codex Sangermanensis (written A.D. 822), as Gideon (1893). It is the latest of the MSS. preserved in 1883, and has been adopted by Hilgenfeld and Sabatier, and was only discovered, as has been published by Bensly-James, op. cit. This edition has taken all of the important MSS. known, save one at Leon in Spain. The translation is full, accurate and excellent. According to the English Revised Version, this MS. was translated into Latin by Ceriani, Monumenta sacra et profana, i. 12. pp. 69-124 (1866). Two years later this scholar edited the Syriac text, op. cit. v. i. pp. 4-111, and in 1883 reproduced the MS. by photo-lithography (Translatio Syra Peshito V.T. ii. iv. pp. 555-572). Hilgenfeld incorporated Ceriani's Latin translation in his Messias Judaearum. This translation needs revision and correction.

Arabic Version.—The First Arabic version was translated from a MS. in the Bodleian Library into English by Ockley (in Whiston's PopularRepository, 1767, 1811). The Arabic text was used by Steiner, who published it in 1876, and corrected by Steiner for Hilgenfeld's Mess. Jud. The Second Arabic version, which is independent of the first, has also been edited from a MS. by Ockley and is found in Whiston's PopularRepository (1772). Armenian Version.—First printed in the Armenian Bible (1805). Translated into Latin by Peterman for Hilgenfeld's Mess. Jud.; next with Armenian text and English translation by Issaverdian in Z. Bibl. u. neu Testaments, xxviii. 5, pp. 488 sqq. (Venice, 1901).

Georgian Version.—According to F. C. Conybeare an accurate Georgian version made from the Greek exists in the 11th century MS. at Jerusalem.

Relatio of the above Versions.—These versions stand in the order of worth as follows: Latin, Syriac, Ethiopic. The remaining versions are paraphrastic and less accurate, and are guilty of additions and omissions. All the versions, save the Second Arabic one, go back to the same Greek version. The Second Arabic version presupposes a second Greek version.

Interpretations.—These versions are now antiquated, except those in the Variorum Apocrypha and the Revised Version of the Apocrypha, and even these are far from satisfactory. Similarly, all the German versions are behindhand, except the excellent Gunkel in Apok. u. Pseud. ii. 252-401, which, however, needs occasional correction.

Contents.—The book (iil-xiv.) consists of seven visions or parts, like the apocalypse of Baruch. They are: (1) iil. i-19; (2) v. 20-vi. 34; (3) vi. 35-vi. 25; (4) vii. 26-viii. 60; (5) xi. 1-xii. 51; (6) xiii. 1-xiv. 7, with (1) religious and eschatological speculations and (2) eschatological questions. The first three are devoted to the discussion of religious problems affecting in the main the individual. The presuppositions underlying these are in many cases the same as those in the Pauline Epistles. The next three visions are principally concerned with eschatological problems which relate to the nation. The seventh vision
is a fragment of the Ezra Saga recounting the rewriting of the Scriptures, which had been destroyed. This has no organic connexion with what precedes.

First Vision. iii.-v. 19—In the thirteenth year after the ruin of the city I Salathiel (the same is Ezra) was in Babylon and lay troubled upon my bed. In a long prayer Ezra asks how the desolation of Sion and the prosperity of Babylon can be in the same sense. The angel Uriel answers that God's ways are unsearchable and past man's understanding. When Ezra asks when the end will be and what are the signs of it, the angel answers that the end is at hand and that the signs of it are

Thus the chief champion of the unity of the book makes so many concessions as to its dependence on previously existing sources, that to the student of eschatology, there is little to choose between his view and that of Kabisch. In fact, if the true meaning of the borrowed materials is to be discovered, the false meaning or the borrowed materials itself is to be disentangled. Hence the need of some such analysis as that of Kabisch (Das vierte Buch Ezra, 1889; S: an Apocalypse of Salathiel, c. A.D. 100, preserved in a fragmentary condition, iii. 1-37, iv. 1-51, v. 136-190, vi. 27, vii. 45-viii. 62, ix. 13-x. 57, xii. 40-48, xiv. 28-35, E: an Ezra Apocalypse, c. 31 B.c., iv. 52-v. 132, vi. 13-28, vii. 26-44, viii. 63-xii. 12. A: an Eagle Vision, c. A.D. 90, x. 60-xii. 35, M: a Son of Man Vision, xii. Ez: an Ezra fragment, c. A.D. 100, xiv. 1-17a, 18-27, 36-47. All these, according to Kabisch, were edited by a Zealot, c. 120, who supplied the corresponding texts and made many small additions. In the main this analysis is excellent. If we assume that the editor was also the author of S, and that such a vigorous stylist, as he shows himself to be, recast to some extent the materials he borrowed, there remains but slight difference between the views of Kabisch and Gunkel. Neither view, however, is quite satisfactory, and the problem still awaits solution. Other attempts, such as Ewald's (Gesch. d. Volkes Israel*, viii. 69-83) and De Faye's (Apocalypses juives, 155-163), make no contribution.

School of the Author.—The author or final redactor of the book was a pessimist, and herein his book stands in strong contrast with the Apocalypse of Baruch. Thus to the question propounded in the New Testament—"Are there few that be saved?"—he has no hesitation in answering, "There be many created, but few that be saved" (viii. 3). "An evil heart hath grown up in us which hath led us astray... and that not a few only but wellnigh all that have been created" (vii. 48). In the Apocalypse of Baruch on the other hand it is definitely maintained that not a few shall be saved (xii. 11). Moreover, the sufferings of the wicked are so great in the next world it were better, according to 4 Ezra (as also to the school of Shammai), that man had not been born. It is much better (for the increase of the field) than for us; for the increase of the field and know not of torments" (vii. 66) yet "it would have been best not to have given a body to Adam, or that being done, to have restrained him from sin; for what profit is there that man should in the present life live in heaviness and after death look for punishment" (vii. 116, 117). In iv. 12 the nucleus of life, sin and suffering just referred to, is put still more strongly: "It were better we had not been at all than that we should be born and sin and suffer." The different attitude of these two writers towards this question springs from their respective views on the question of free will. The author of Baruch declares (iv. 15, 16): "For through Adam sinned and brought upon us death and destruction upon all, yet of those who were born from him each one of them prepared for his own soul torment to come, and again each one of them has chosen for himself glory to come... each one of us has been the Adam of his own soul." Though the writer of Ezra would admit the possibility of a few Israelites attaining to salvation through the most strenuous endeavour, yet he holds that man is all but predoomed through his original evil disposition or through the fall of Adam (vii. 118). "O Adam, what hast thou done: for though it was thou that sinned, the evil is not fallen on thee alone, but upon all of us that come of thee." Another contrast between the two books is that while Baruch shows some mercy to the Gentiles (lxxii. 4-6) in the Messianic period, none according to 4 Ezra and the Shammaites (Joseph. Sanh. xiii. 2) will be extended to them, iii. 30, ix. 22 sq., xii. 34, xiii. 37 sq).

On the above grounds it is not unreasonable to conclude that whereas the Apocalypse of Baruch owes its leading characteristics to a pupil of Hillel's school, 4 Ezra shows just as clearly its derivation from that of Shammai. Kohler (Jewish Enoch.

In the Apocalypse of Baruch, x. 6, we find a similar expression:

"In the Apocalypse of Baruch, x. 6, we find a similar expression: But here death is said to be preferable to witnessing the present woes of Jerusalem.
EZRA AND NEHEMIAH

References

1 References to Ezra in this article are to the book discussed above as Ezra, Third Book of.

2 With Neh. xi. 4-19 cf. 1 Chron. ix. 3-17; with the list xii. 1-7 cf. 1 Chron. xxii. 21 and x. 9-9; and with xiii. 10 sq. cf. 1 Chron. vi. 21-15 (to which it forms the sequel). See further Smed, Listen d' Ezra u. Neh. (1881).

3 Sometimes wrongly styled Chaldee (q.v.); see Semitic Languages.

v. 221) points out that the view of 4 Ezra that the Ten Tribes will return was held by the Shammaites, whereas it was denied by Aquila. The Apocalypse of Baruch is silent on this point.

Time and Place.—The work was written towards the close of the 1st century (iii. 1, 29), and somewhere in the east.

Literature.—In addition to the authorities mentioned above, see Dillmann, Herzog's Real-Enzyklopädie, ii. 335 sqq.; Schürer, Geschichte des jüdischen Volkes im Volkesbuch und in the Encyclopaedia Biblica by Thackerny and James respectively.

EZRA AND NEHEMIAH, BOOKS OF, in the Old Testament. The two canonical books entitled Ezra and Nehemiah in the English Bible 1 correspond to the i and ii Esdras of the Vulgate, to the 2 Esdras of the Septuagint, and to the Ezra and Nehemiah of the Masoretic (Hebrew) text. Though for many centuries they have thus been treated as separate compositions, we have abundant evidence that they were originally regarded as forming but one book, and a careful examination proves that together with the book of Chronicles they constitute a single work. The two books may therefore be conveniently treated together.

1. Position and Date.—Origen (Euseb., H.E. vi. 25), expressly enumerating the twenty-two books of the old covenant as acknowledged by the Jews and accepted by the Christian church, names "the First and Second Ezra in one book." Millot in Sardis (Euseb. H.E. vi. 26) in like manner mentions the book of Ezra only. So also the Talmud (in Bābā bathrā' 14. 2), nor can it be supposed that Josephus in his enumeration (c. Ap. i. 8) reckoned Nehemiah as apart from Ezra. That the Jews themselves recognized no real separation is shown by the fact that no Massoretic notes are found after Ezra x., but at the end of Nehemiah the contents of both are reckoned together, and it is stated that Neh. iii. 22 is the middle verse of the book. Their position in the Hebrew Bible before the book of Chronicles is, however, illogical. The introductory verses of Ezra i. are identical with the conclusion of 2 Chron. xxiv., while in the version of 1 Esdras no less than two chapters (2 Chron. xxxvi. sqq.) overlap. The cause of the separation is probably to be found in the late reception of Chronicles into the Jewish canon. Further proof of the unity of the three is to be found in the general similarity of style and treatment. The same linguistic criteria occur, and the interest in lists and genealogies, in priests and Levites, and in the temple service point unmistakably to the presence of the same hand (the so-called "chonicler") in Chronicles—Ezra—Nehemiah. See Bible (sect. Canon); Chronicles.

The period of history covered by the books of Ezra and Nehemiah extends from the return of the exiles under Zerubbabel in 537-536 B.C. to Nehemiah's return to Jerusalem in 432 B.C. In their present form, however, the books are considerably later, and allusions to Nehemiah in the past (Neh. xii. 26, 47), to the days of Jaddua (the grandson of Nehemiah's contemporary Joiada; ib. xii. 11), to Darius (Nehus 423 B.C. or rather Codonmanus 336 B.C., ib. v. 22), and the use of the term "king of Persia," as a distinctive title after the fall of that empire (332 B.C.), are enough to show that, as a whole, they belong to the same age as the book of Chronicles.

2. Contents.—Their contents may be divided into four parts:

(a) The events preceding the mission of Ezra (i. vii.). —In the first year of his reign Cyrus was inspired to grant a decree permitting the Jews to return to build the temple in Jerusalem (i.); a list of families is given (ii.). The altar of burnt-offering was set up, and in the second year of the return the foundations of the new temple were laid with great solemnity (iii.). The "adversaries of Judah and Benjamin" offered to assist but were repulsed, and they raised such opposition to the progress of the work that it ceased until the second year of Darius (521-520 B.C.). Aroused by the prophets Haggai and Zechariah the building was then resumed, and despite fresh attempts to hinder the work it was completed, consecrated and dedicated in the sixth year of that king (vi.). The event was solemnized by the celebration of the Passover (cf. 2 Chron. xxx., Hezekiah; xxxv. Josiah).

(b) An interval of fifty-eight years is passed over in silence, and the rest of the book of Ezra comprises his account of his mission to Jerusalem (vii.-x.). Ezra, a scribe of repute, well versed in the laws of Moses, returns with a band of exiles in Artaxerxes, 458 B.C.) he instituted a great religious reform, viz. the prohibition of intermarriage with the heathen of the land (cf. already vii. 21). In spite of some opposition (x. 15 obscurely worded) the reform was accepted, and the foundations of a new community were laid.

(c) Twelve years elapse before the return of Nehemiah, whose description of his work is one of the most interesting pieces of Old Testament narrative (Neh. i.-vi.). In the twentieth year of Artaxerxes (445 B.C.), Nehemiah the royal cup-bearer at Shushan (Susah; the palace) was visited by friends from Judah and was overcome with grief at the tiding of the miserable condition of Jerusalem and the pitiful state of the Judean remnant which had escaped the captivity. He obtained permission to return, and on reaching the city made a secret survey of the ruins and called upon the nobles and rulers to assist in repairing them. Much opposition was caused by Sanballat the Horonite (i.e. the Moabite Horonaim or Beth-horon, about 15 m. N.W. of Jerusalem), Tobiah the Ammonite, Geshem (or Gashmu) the Arabian, and the Ashodites, whose virulence increased as the rebuilding of the walls continued. But not without the might of God and the gifts of his people had Nehemiah succeeded. On the approach of the chief and upon the life of Nehemiah, and in spite of the intrigues among certain members of the Judean section, in fifty-two days the city walls were complete (Neh. vi. 15). The hostility, however, did not cease, and measures were taken to ensure the safety of the city (vi. 16—vii. 4). A valuable account is given of Nehemiah's economical reforms, illustrating the internal social conditions of the period and the general character of the former governors who had been placed in charge (v., cf. the laws codified in Lev. xxv. 35 sqq.).

(d) The remaining chapters carry on the story of the labours of both Ezra and Nehemiah. The list of those who returned under the decree of Cyrus is repeated (Neh. vii.), and leads up to the reading of the Law by Ezra, a great national confession of guilt, and a solemn undertaking to observe the new covenant, the provisions of which are detailed (x. 28-39). After sundry lists of the families dwelling in Jerusalem and its neighbourhood (xi. 1 sqq., apparently a sequel to vii. 1-4), 2 and of various priests and Levites, an account is given of the dedication of the walls (xii. 24-43), the arrangements for the Levitical organization (xiv. 44-47), and a fresh separation from the heathen (Moabites and Ammonites, xiii. 1-5; cf. Deut. xxiii. 3 sqq.). The book concludes with another extract from Nehemiah's memoirs dealing with the events of a second visit, twelve years later (xiii. 34-31). On this occasion he vindicated the sanctity of the temple by expelling Tobiah, reorganized the supplies for the Levites, took measures to uphold the observance of the Sabbath, and protested energetically against the foreign marriages. In the course of his reforms he thrust out a son of Joiada (son of Eliashib, the high-priest), who had married the daughter of Sanballat, an incident which had an important result (see Samaritans).

That these books are the result of compilation (like the book of Chronicles itself) is evident from the many abrupt changes; the inclusion of certain documents written in an Aramaic dialect (Ezra. iv. 8-18, vii. 12-26); the character of the name-lists; the lengthy gaps in the history; the use made of two distinct sources, attributed to Ezra and Nehemiah respectively, and from the varying form in which the narratives are cast. The
The Criticism under Chap. xi.

Nehemiah’s mission was delayed for twelve years, and, finally, under the auspices of Zerubbabel, Nehemiah’s work of social and religious reorganization succeeded. These topics raise serious historical problems (see Jews: History, § 21).

3. Criticism of Ezra i.—vi.—The chronicler’s account of the destruction of Jerusalem, the seventy years’ interval (2 Chron. xxxvi. 20 sq.; cf. Jer. xxv. 11, xxix. 10, also Is. xxiii. 17), and the return of 42,360 of the exiles (Ezr. ii. 64 sqq.) represent a special view of the history of the period. The totals, as also the detailed figures, in Ezr., Neh. and 1 Esdr. v. vary considerably; the number is extremely large (contrast Jer. iii. 30); it includes the common people (contrast 2 Kings xxiv. 14, xxv. 12), and ignores the fact that Judah was not conquered, that the Jews had been carried to other places besides Babylon and that many remained behind in Babylon. According to this view, Judah and Jerusalem were practically deserted until the return. The list in Ezr. ii. is that of families which returned “every man unto his city” under twelve leaders (including Nehemiah, Azariah [cf. Ezra], Zerubbabel and Jeshua); it recurs with many variations in a different and apparently more original context in Neh. vii., and in 1 Esdr. v. is ascribed to the time of Darius. The families (to judge from the northwards extension of Judaean territory) are probably those of the population in the later Persian period. The family of Judah, represented only those who returned the previous year; these are the sons of their ancestors (see C. F. Kent, Israel’s Hist. and Biblical Narratives, p. 379). The offerings which are for the temple-service in Neh. vii. 70-72 (cf. 1 Chron. xxix. 6-8) are for the building of the temple in Ezr. ii. 68-70; and since the walls are not yet built, the topographical details in Neh. vii. r. (see 1 Esdr. v. 47) are adjusted, and the event of the seventh month is not the reading of the Law amid the lamentations of the people (Neh. vii.; see vv. 9-11) but the erection of the altar by Jeshua and Zerubbabel under inauspicious circumstances (cf. Ezr. iii. 3 with 1 Esdr. v. 56 sqq.).

The chronologically misplaced account of the successful opposition in the time of Ahasuerus (i.e. Xerxes) and Artaxerxes (the son and grandson of Darius respectively) breaks the account of the temple under Cyrus and Darius, and is concerned with the city walls (iv. 6-23); there is some obscurity in vv. 7-9: Rchum and Shimshai evidently take the lead, Tabeel may be an Aramaized equivalent of Tobiah. A recent return is implied (iv. 12) and the record hints that a new decree may be made (v. 21). The account of the unsuccessful opposition to the temple in the time of Darius (v. sqq.; for another account see Jos. Anti. xi. 4, 9) is independent of iv. 7-23, and throws another light upon the dynasty of Cyrus (vi. 3-5, contrast i. 2-4). It implies that Bushbazzar, who had been sent with the temple vessels in the time of Cyrus, had laid the foundations and that the work had continued without cessation (v. 16, contrast iv. 5, 24). The beginning of the reply of Darius is wanting (vi. 6 sqq.), and the decree which had been sought in Babylon is found at Ecbatana. Chap. vi. 15 sqq. follow more naturally upon v. 1-2, but v. 14 with its difficult reference to Artaxerxes now seems to presuppose the decree in iv. 21 and looks forward to the time of Ezra or Nehemiah. As regards this section (Ezr. i.—vi.) as a whole, there is little doubt that i. vi. 1—iv. 5, vi. 15-23 are from the chronicler, whose free treatment of his material is seen in the use he has made of ch. ii. Notwithstanding the unimpeachable evidence for the tolerant attitude of Persian kings and governors towards the religion of subject races, it is probable that the various decrees incorporated in the book (cf. also 1 Esdr. iv. 42 sqq.) have been reshaped from a Jewish standpoint. A noteworthy example appears in the account of the unique powers entrusted to Ezra (vii. 11-26), the introduction to whose memoirs, at all events, is quite in the style of the chronicler.

The Memoirs of Nehemiah and Ezra.—The memoirs of Ezra and Nehemiah do not appear to have been incorporated without some adjustment. The lapse of time between Neh. i. and ii. is noteworthy, and with the prayer in i. 5-11 cf. Ezr. ix. 6-15, Dan. ix. 4 sqq. (also parallels in Deuteronomy); chap. i. in its present form may be a compiler’s introduction. The important topographical list in ch. iii. is probably from another source; the style is different, Nehemiah is absent, and the high-priest is unusually prominent.2 Chap. v., where Nehemiah reviews his past conduct as governor, turns aside to economic reforms and scarcely falls within the fifty-two days of the building of the walls which forms the chapter. Chap. xxiii. is closely associated with the contents of xii. and breaks the account of the opposition. Anticipated already in ii. 10, the hostility partly arises from the repudiation of Samaritan religious claims (ii. 20; cf. Ezr. iv. 3) and is partly political. It is difficult to follow its progres clearly, and the account ceases abruptly in vi. 17-19 with the notice of the conspiracy of Tobiah and the nobles of Judah. The chronicler’s style can be recognized in vi. 1-5 (in its present form), where steps are taken to protect and to people Jerusalem; the older sequel is now found in ch. xi. Whilst the account of the dedication of the walls is marked by the use of the pronoun “I” (chap. iv. 25 sqq.), it is probably now done on behalf of the Chronicler, and when the more trustworthy memoirs of Nehemiah are resumed (xiii. 4 sqq.) the episodes, although placed twelve years later (ver. 6), are intimately connected with the preceding reforms (cf. xii. 44-46, xiii. 2 with xii. 10 sqq., 23 sqq.).3 Nehemiah’s attitude towards intermarriage is markedly moderate in contrast to the drastic measures of Ezra, whose mission and work the simpler and perhaps earlier narratives of Nehemiah originally ignored, and the relation between the two is complicated further by the literary character of the memoir of Ezra.

To the last mentioned (a) the scribe’s genealogy, which traces him back to Aaron and names as his immediate ancestor, Seruiah, who had been slain 130 years previously (Ezr. vii. 2-9), and (b) an independent account of the return (vv. 6-10) with a reference to Ezra’s renown, obviously not from the hand of Ezra himself. Whatever the original prelude to Ezra’s thanksgiving may have been (vii. 27 sqq.), we now have the essentially Jewish account of the letter of Artaxerxes with its uncertain conclusions.4 The list of those who returned amounts to the moderate total of 1456 males (vii. ii. 690 in 1 Esdr. viii. 50 sqq.). Ezra’s mission was obviously concerned (xii. 38, 46) and probably not more than 15-20 years (Ezr. vi. 10, 14 sqq., 25; viii. 17, 24-39, 33 sqq.), but four months elapse between his return in the fifth month (vii. 9) and the preparations for the marriage reforms in the ninth (x. 9), and there is a delay of twelve years before the Law is read (Neh. viii.). The Septuagint version (1 Esdr. ix.; cf. Josephus, Antiq. xi. 5, 5 and some modern scholars) would place

1 Its real position in the history of this period is not certain. Against the supposition that the names refer to Cambyses and Pseudo-Smerdis who reigned after Cyrus and before Darius, see H. E. Ryle, Camb. Bible, "Ezra and Neh.,“ p. 65 sqq. Against the view that Darius is D. i. Nothus of 423-404 B.C., see G. A. Smith, Minor Prophets, ii. 191 sqq. The ignorance of the compiler regarding the sequence of the kings finds a parallel in that of the author of the book of Daniel (see); see C. C. Torrey, Amer. Journ. of Sem. Lang. (1907), p. 178, n. 1.

2 See further H. G. Mitchell, Journal of Bibl. Lit. (1903), pp. 88 sqq. The chronological difficulties will be seen from xii. 6 (“before this”) and xii. 5 sqq. (“when he would have fasted,” etc.) The occasion of Nehemiah’s later visit (see G. A. Smith, Expositor, July 1906, p. 12). His previous departure is perhaps foreshadowed in vi. 2.

3 See Encyc. Bibl. col. 1480. Papyri from a Jewish colony in Elephantine (407 B.C.) clearly show the form which royal permits could take, and what the Jews were prepared to give in return: the points of resemblance are extremely interesting, but compared with the biblical documents the papyri reveal some striking differences.
The latter after Ezr. x., but more probably this event (dated in the seventh month) should precede the great undertaking in Ezr. ix. That the adjustment was attended with considerable revision of the passages appears from a careful comparison of Neh. viii. sq. with Ezr. ix. sq. With Ezra's confession (ix. 6 sq.) compare the prayer in Neh. ix. 5 sq., which the Septuagint ascribes to him. In Ezr. x. (written in the third person) the number of those that had intermarried with the heathen is relatively small considering the general trend of the preliminaries, and the list bears a marked resemblance to that in ch. ii. It ends abruptly and obscurely (x. 44; cf. i. Esdr. ix. 33), and whilst as the whole memoirs of Ezra put to ideas later than those of Nehemiah, the present close literary connexion between them is seen in the isolated reference to Johanan (the son of Eliahush) in Ezr. x. 6, which seems to be connected with Neh. xiii. 7, and (after W. R. Smith) in the suitability of xii. x. 2 between Ezr. x. 9 and 10. The list of signatories in Neh. x. 1-27 should be compared with the names in xii. and 1 Chron. xxiv.; the true connexion of x. 38 is very obscure, and the relation to Ezr. ix. seq. is complicated by the reference to the separation from the heathen in Neh. ix. 2. The description of the covenant (Neh. x. 28 sqq., marked by the use of "we") is closely connected with xii. 43-xiii. 3 (from the same or an allied source), and anticipates the parallel though somewhat preliminary measures detailed in the more genuine memoirs (Neh. xiii. 4 sqq.). Finally, the specific allusion in xii. 43-44 to Ammon and Moab is possibly intended as an introduction to the references to Tobiah and Sanballat respectively in x. 1 sqq.

Summary.—The literary and historical criticism of Ezra-Nehemiah is closely bound up with that of Chronicles, whose characteristic features it shares. Although the three formed a unit at one stage it may seem doubtful whether two so closely related chapters as i. Chron. ix. and Neh. xi. would have appeared in one single work, while the repetition of Neh. vii. 6-viii. 1 in Ezr. ii. 1-5 is less unnatural if they had originally appeared in distinct sources. Thus other hands apart from the compiler of Chronicles may have helped to shape the narratives, either before their union with that of Ezra and Nehemiah.

The present INTRODUCTION is also due partly to specific historical theories regarding the post-exilic period. Here the recension in i Esdras especially merits attention for its text, literary structure and for its variant traditions. Its account of a return in the time of Darius scarcely arose after Ezr. i.-iii. (Cyprus); the reverse seems more probable, and the possibility of some confusion or of an intentional adjustment to the earlier date is emphasized by the relation between the popular feeling in Ezr. iii. 12 (Cyprus) and Hag. ii. 3 (Darius), and between the grant by Cyrus in iii. 7 (it is not certain that he held Phoenicia) and the permit of Darius in iv. 17-18 (see section 2). According to the list of names which reappears in Ezr. ii. (Cyprus) but from the independent testimony of Haggai and Zechariah it is doubtful whether the chronicle's account of the return under Cyrus is at all trustworthy. The list in i Esdr. v., Ezr. iii., as already observed, appears to be in its more original context in Neh. vii., i.e. in the time of Artaxerxes, and it is questionable whether the earliest of the surviving detailed traditions in Ezra-Nehemiah went back before this reign. It is precisely at this age that there is evidence for a return, apparently other than that of Ezra or Nehemiah (see Ezr. iv. 12), yet it seems to be preserved unless the records were used for the history of earlier periods (cf. generally Ezr. iii. 12 sqq. with Neh. xii. sqq.).

1 C. C. Torrey, Comp. and Hist. Value of Ezra-Neh. (Beih. of Zeit. f. altl. Wissens., 1896), pp. 30-34; C. F. Kent, Israel's Hist. and Biblical Narratives, pp. 32, 359. Since Neh. vii. 70-73 is closely joined to viii., the suggested transposition would place its account of the return at the temple in a more appropriate context (cf. Ezr. vii. 24-30, 33 sq.).

2 For linguistic evidence reference should be made to J. Geissler, Die Literarischen Beziehungen d. Esramemoiren (Chemnitz, 1896).

This is the sixth letter of the English alphabet as it was of the Latin. In the ordinary Greek alphabet the symbol has disappeared, although it survived far into historical times in many Greek dialects as F, the digamma, the use of which in early times was inductively proved by Bentley, when comparatively little was known of the local alphabets and dialects of Greece. The so-called stigma ϕ, which serves for the numeral 6, is all that remains to represent it. This symbol derives its name from its resemblance in medieval MSS. to the abbreviation for ϕ. The symbol occupying the same position in the Phoenician alphabet was Vau (𐤃𐤄), which seems to be represented by the Greek Τ, the Latin V, at the end of the early alphabet. Many authorities therefore contend that F is only a modification of the preceding symbol E and has nothing to do with the symbol Vau. In some early Latin inscriptions F is represented by I, as E is by II. It must be admitted that the resemblance between the sixth symbol of the Phoenician alphabet and the corresponding symbol of the European alphabet is not striking. But the position of the limbs of symbols in early alphabets often varies surprisingly. In Greek, besides F we find for j in Pamphylia (the only Greek district in Asia which possessed the alphabet ΙΑ), and in Boeotia, Thessaly, Tarentum, and on Chalcidian vases of Italy the form E, though except at Cumae and on the vases the form F exists contemporaneously with E or even earlier. At the little town of Falerii (Civita Castellana), whose alphabet is undoubtedly of the same origin as the Latin, F takes the form ʃ. Though uncertain, therefore, it seems not impossible that the original symbol of the Phoenician alphabet, which was a consonant like the English w, may have been differentiated in Greek into two symbols, one indicating the consonant value w and retaining the position of the Phoenician consonant Vau, the other having the vowel value u, which ultimately most dialects changed to a modified sound like French v or German ß. Be this as it may, the value of the symbol F in Greek was w, a bilabial voiced sound, not the labio-dental unvoiced sound which we call j. When the Romans adopted the Greek alphabet they took over the symbols with their Greek values. But Greek had no sound corresponding to the Latin j, for φ was pronounced p-h, like the final sound of lip in ordinary English or the initial sound of pig in Irish English. Consequently in the very old inscription on a gold fibula found at Pracneste and published in 1887 (see Alphabet) the Latin j is represented by FB. Later, as Latin did not use F for the consonant written as ϕ in ϕιτ, &c., F was dropped and F received a new special value in Latin as representative of the unvoiced labio-dental spirant. In the Osco and Umbrian alphabets, whose alphabet was borrowed from Etruscan, a special form appears for j, viz. 8, the old form E being kept for the other consonant v (i.e. English w). The S has generally been asserted to be developed out of the second element in the combination FB, its upper and lower halves being first converted into lozenges, 8, which naturally changed to 8 when without writing the incising or incising implement. Recent discoveries, however, make this doubtful (see Alphabet).

FABBRONI, ANGELO (1732–1809), Italian biographer, was born at Marradi in Tuscany on the 25th of September 1732. After studying at Faenza he entered the Roman college founded for the education of young Tuscans. On the conclusion of his studies he continued his stay in Rome, and having been introduced to the celebrated Jansenist Bottari, received from him the canony of Santa Teresa in Trastevere. Some time after this he was chosen to preach a discourse in the pontifical chapel before Benedict XIV. and made such a favourable impression that the pontiff settled on him an annuity, with the possession of which Fabbroni was able to devote his whole time to study. He was intimate with Leopold I., grand-duke of Tuscany, but the Jesuits disliked him on account of his Jansenist views. Besides his other literary labours he began at Pisa in 1771 a literary journal, which he continued till 1796. About 1772 he made a journey to Paris, where he formed the acquaintance of Condorcet, Diderot, d’Alembert, Rousseau and most of the other eminent Frenchmen of the day. He also spent four months in London. He died at Pisa on the 22nd of September 1803. The following are his principal works:—Vita Italorum doctrina excelluntum qui saeculis XVII. et XVIII. floreuntur (20 vols., Piss. 1778–1799, 1804–1806), the last two vols., published posthumously, contain a life of the author; Laurentii Medici Magni Vitae (2 vols., Piss. 1794), and Elogi di Dante Alighieri, di Angelo Poliziano, di Ludovico Ariosto, e di Torqu. Tasso (Parma, 1800).

FABER, the name of a family of German lead-pencil manufacturers. Their business was founded in 1760 at Stein, near Nuremberg, by Kaspar Faber (d. 1784). It was then inherited by his son Anton Wilhelm (d. 1819). Georg Leonhard Faber succeeded in 1810 (d. 1839), and the business passed to Johann Lothar von Faber (1817–1856), the great-grandson of the founder. At the time of his assuming control about twenty hands were employed, under old-fashioned conditions, and owing to the invention of the French crayons Contés of Nicolas Jacques Conté (q.v.), competition had reduced the entire Nuremberg industry to ebb (see Faber, Pius). Johann introduced improvements in machinery and methods, brought his factory to the highest state of efficiency, and it became a model for all the other German and Austrian manufacturers. He established branches in New York, Paris, London and Berlin, and agencies in Vienna, St Petersburg and Hamburg, and made his greatest coup in 1856, when he contracted for the exclusive control of the graphite obtained from the East Siberian mines. Faber had also branched out into the manufacture of water-colour and oil paints, inks, slates and slate-pencils, and engineers' and architects' drawing instruments, and built additional factories to house his various industries at New York and at Noyaux-le-Sec, near Paris, and had his own cedar mills in Florida. For his services to German industry he received a patent of nobility and an appointment as councillor of state. After the death of his widow (1803) the business was inherited by his grand-daughter Countess Ottile von Faber-Castell and her husband, Count Alexander.

FABER, BASIL (1520–c. 1576), Lutheran schoolmaster and theologian, was born at Sorau, in lower Lusatia, in 1520. In 1538 he entered the university of Wittenberg, studying as pauper gratis under Melanchthon. Choosing the schoolmaster's profession, he became successively rector of the schools at Nordhausen, Tennstadt (1555), Magdeburg (1557) and Quedlinburg (1560). From this last post he was removed in December 1570 as a Crypto-Calvinist. In 1571 he was appointed to the Raths-gymnasium at Erfurt, not as rector, but as director (Vorsteher). In this situation he remained till his death in 1575 or 1576. His translation of the first twenty-five chapters of Luther's commentary on Genesis was published in 1557; in other ways he promoted the spread of Lutheran views. He was a contributor to the first four of the Magdeburg Centuries. He is best known by his Thesaurus eruditionis schoolis, improved by J. H. Leich, 1749, folio, 2 vols.; this was followed by his Libellus de disciplina scholastica (1572).

See Wagenmann and G. Miiller in Herzog-Hauck's Realencyclopaedie (A. Go. *)

FABER, FREDERICK WILLIAM (1814–1863), British hymn writer and theologian, was born on the 26th of June 1814 at Calverley, Yorkshire, of which place his grandfather, Thomas Faber, was vicar. He attended the grammar school of Birstow, Yorkshire, for a short time, but a large portion of his boyhood was spent in Westmorland. He afterwards went to Harrow
and to Balliol College, Oxford. In 1835 he obtained a scholarship at University College; and in 1836 he gained the Newdigate prize for a poem on "The Knights of St John," which elicited special praise from Keble. Among his college friends were Dean Stanley and Roundell Palmer, 1st earl of Selborne. In January 1837 he was elected fellow of University College. Meanwhile he had given up the Calvinistic views of his youth, and had become an enthusiastic follower of John Henry Newman. In 1841 a travelling tutorship took him to the continent; and on his return a book appeared called Sights and Thoughts in Foreign Churches and among Foreign Peoples (London, 1842), with a dedication to his friend the poet Wordsworth. He accepted the rectory of Elton in Huntingdonshire, and was consecrated as a priest in 1849. He studied theological works, and edited the Oratory Lives of the Saints. He was an eloquent preacher, and a man of great charm of character. It is mainly as a hymn-writer, however, that Faber is remembered. Among his best-known hymns are: "The Greatness of God," "The Will of God," "The Eternal Father," "The God of my Childhood," "Jesus is God," "The Pilgrims of the Night," "The Land beyond the Sea," "Sweet Saviour, bless us ere we go," "I was wandering and weary," and "The Shadow of the Rock." The hymns are largely used in Protestant collections. In addition to many pamphlets and translations, Faber published the following volumes: The Precious Blood; Bethlehem; The Blessed Sacrament; The Creator and the Creature; Growth of Holiness; Spiritual Conferences; The Foot of the Cross (8 vols., London, 1853–1860).

See his Life and Letters, by Father J. E. Bowden (London, 1860), and A Brief Sketch of the Early Life of the late F. W. Faber, D.D., by his brother the Rev. F. A. Faber (London, 1869).

FABER, FABRI or FABRY (surnamed StAUPULJENSES), JACOBUS (Jacques Le livre d'étapes (c. 1455–c. 1536), a pioneer of the Protestant movement in France, was born of humble parents at Étaples, near Boulogne, in Picardy, about 1455. He appears to have been possessed of considerable means, for he had a brother, and was ordained priest when he entered the University of Paris for higher education. Hermonys of Sparta was his master in Greek. He visited Italy before 1486, for he heard the lectures of Argyropulos, who died in that year; he formed a friendship with Paulus Aemilios of Verona. In 1492 he again travelled in Italy, studying in Florence, Rome and Venice, making himself familiar with the writings of Aristotle, though greatly influenced by the Platonic philosophy. Returning to Paris, he became professor in the college of Cardinal Lemoine. Among his famous pupils were F. W. Vatale and Farel; his connection with the latter drew him to the Calvinistic side of the movement of reform. At this time he began the publication, with critical apparatus, of Boëthus (De Aristimetica), and Aristotle's Physics (1492), Ethics (1497), Metaphysics (1501) and Politics (1506). In 1507 he took up his residence in the Benedictine Abbey of St Germain de Prés, near Paris; this was due to his connexion with the family of Briçonnet (one of whom was the superior), especially with William Briçonnet, cardinal bishop of St Malo (Meaux). He now began to give himself to Biblical studies, the first-fruit of which was his Quintiupsel Psalterium: Gallicum, Romanae, Hebraicum, Vetus, Conciliaitum (1509); the Conciliaitum was his own version. This was followed by S. Pauli Epistolae xiv. ex vulgata editio, adiecta intelligentia ex Graeco cum commendaris (1512), a work of great independence and judgment. His De Maria Magdalena et triduo Christi disceptatio (1517) provoked violent controversy and was condemned by the Sorbonne (1521). He had left Paris during the whole of 1520, and, removing to Meaux, was appointed (May 7, 1523) vicar-general to Bishop Briçonnet, and published his French version of the New Testament (1523). This (once temporary with Luther's German version) has been the basis of all subsequent translations into French. From this, in the same year, he extracted the versions of the Gospels and Epistles "à l'usage du diocèse de Meaux." The prefaces and notes to both these expressed the view that Holy Scripture is the only rule of doctrine, and that justification is by faith alone. He incurred much hostility, but was protected by Francis I and the princess Margaret. Francis being in captivity after the battle of Pavia (February 25, 1529), Faber was condemned and his works suppressed by commission; he was again allowed to return to his country, to study the methods of the Roman Catholic Church; and after a prolonged mental struggle he joined the Roman Catholic communion in November 1545. He founded a religious community at Birmingham, called Wilfridians, which was ultimately merged in the oratory of St Philip Neri, with John Henry Newman as Superior. In 1849 a branch of the oratory—subsequently independent—was established in London, first in King William Street, and afterwards at Brompton, over which Faber presided till his death on the 26th of September 1863. In spite of his weak health, an almost incredible amount of work was done by him during these years. He published many theological works, and edited the Oratorio Lives of the Saints. He was an eloquent preacher, and a man of great charm of character. It is mainly as a hymn-writer, however, that Faber is remembered. Among his best-known hymns are: "The Greatness of God," "The Will of God," "The Eternal Father," "The God of my Childhood," "Jesus is God," "The Pilgrims of the Night," "The Land beyond the Sea," "Sweet Saviour, bless us ere we go," "I was wandering and weary," and "The Shadow of the Rock." The hymns are largely used in Protestant collections. In addition to many pamphlets and translations, Faber published the following volumes: The Precious Blood; Bethlehem; The Blessed Sacrament; The Creator and the Creature; Growth of Holiness; Spiritual Conferences; The Foot of the Cross (8 vols., London, 1853–1860).

See his Life and Letters, by Father J. E. Bowden (London, 1860), and A Brief Sketch of the Early Life of the late F. W. Faber, D.D., by his brother the Rev. F. A. Faber (London, 1869).

FABER, ABRAHAM DE (1599–1660), marshal of France, was the son of Abraham Fabert, seigneur de Moulins (d. 1638), a famous printer who rendered great services, civil and military, to Henry IV. At the age of fourteen he entered the Gardes françaises, and in 1618 received a commission in the Piedmont regiment, becoming major in 1627. He distinguished himself repeatedly in the constant wars of the period, notably in La Rochelle and at the siege of Exilles in 1630. His bravery and engineering skill were again displayed in the sieges of Avesnes and Maubeuge in 1637, and in 1642 Louis XIII. raised him governor of the recently-acquired fortress of Sedan. In 1651 he became lieutenant-general, and in 1654 at the siege of Stenay he introduced new methods of siegecraft which anticipated in a measure the great improvements of Vauban. In 1658 Fabert was made a marshal of France, being the first commoner to attain that rank. He died at Sedan on the 17th of May 1660.
FABIAN—FABIUS

See Histoire du maréchal de Faveri (Amsterdam, 1697); P. Barre, Vie de Faveri (Paris, 1752); A. Felliet, Le Premier Maréchal de France plébéien (Paris, 1889); Bourelly, Le Maréchal Faveri (Paris, 1880).

FABIAN [FABIANUS], SAINT (d. 250), pope and martyr, was chosen pope, or bishop of Rome, in January 236 in succession to Martinus (Hist. Eccl. xi. 32). Throughout the 3rd century the Western Church was divided in sympathy, Rome having assembled in Rome to elect a new bishop, saw a dove alight upon the head of Fabian, a stranger to the city, who was thus marked out for this dignity, and was at once proclaimed bishop, although there were several famous men among the candidates for the vacant position. Fabian was martyred during the persecution under the emperor Decius, his death taking place on the 20th of January 250, and was buried in the catacomb of Callixtus, where a memorial has been found. He is said to have baptized the emperor Philip and his son, to have done some building in the catacombs, to have improved the organization of the church in Rome, to have appointed officials to register the deeds of the martyrs, and to have founded several churches in France. His deeds are thus described in the Liber Pontificalis: "Hic regiones dividit diaconibus et fecit vii subdiaconos, qui vii notaribus imminenter, ut gestas martyrum integro fidelter colligerent, et multas fabulas per cymetria fieri praecipit." Although there is very little authentic information about Fabian, there is evidence that his episcopate was one of great importance in the history of the early church. He was highly esteemed by Cyprian, bishop of Carthage; Novatian refers to his nobiltissimae memoriae, and he corresponded with Orig. One authority refers to him as Faveri.

See the article on "Fabian" by A. Harnack in Herzog-Hauck's Realencyklopädie, Band v. (Leipzig, 1896).

FABIUS, the name of a number of Roman soldiers and statesmen. The Fabian gens was one of the oldest and most distinguished patrician families of Rome. Its members claimed descent from Hercules and a daughter of the Arcadian Evander. From the earliest times it played a prominent part in Roman history, and was one of the two gentes exclusively charged with the management of the most ancient festival in Rome—the Lupercalia (Ovid, Fasti, ii. 375). The chief family names of the Fabian gens or clan, in republican times, were Vibulanus, Ambustus, Maximus, Buteco, Pictor, Dorso, Labeo; with surnames Verrucosus, Rullianus, Gorges, Aemilianus, Allobrogus (all of the Maximus branch). The most important members of the family are the following:

1. Marcus Fabius Ambustus, pontifices maximus in the year of the capture of Rome by the Gauls (306). His three sons, Quintus, Numerius and Caexo, although they had been sent as ambassadors to the Gauls when they were besieging Clusium, subsequently took part in hostilities (Livy v. 35). The Gauls thereupon demanded their surrender, on the ground that they had violated the law of nations; the Romans, by way of reply, selected them consular tribunes in the following year. The result was the march of the Gauls upon Rome, the battle of the Allia, and the capture of the city (Livy vi. 1).

2. Q. Fabius Maximus, surnamed Rullianus or Rutilus, master of the horse in the second Samnite War to L. Papirius Cursor, by whom he was degraded for having fought the Samnites contrary to orders (Livy viii. 28), but in spite of the fact that he gained a victory. In 315, when dictator, he was defeated by the Samnites at Lautulae (Livy ix. 23). In 310 he defeated the Etruscans at the Vadimonian Lake. In 205, consul for the fifth time, he defeated, at the great battle of Sentinum, the combined forces of the Etrurians, Umbrians, Samnites and Gauls (see Rome: History. II. "The Republic"). As censor (304) he altered the arrangement of Appius Claudius Caecus, whereby the freedmen were taken into all the tribes, and limited them to the four city tribes. For this he is said to have received the title of Maximus, as the deliverer of the comitia from the rule of the mob (Livy ix. 46), but there is reason to think that this title was first conferred on his grandson. It is probable that his achievements are greatly exaggerated by historians favourable to the Fabian house.

3. Quintus Fabius Maximus, surnamed Verrucosus (from a wart on his lip), Ovulica ("the lamb," from his mild disposition), and Cunctator ("the delay," from his cautious tactics in the war against Hannibal, grandson of the preceding. He served his first consularship in Liguria (235 B.C.), was censor (230) and consul for the second time (228). In 218 he was sent to Carthage to demand satisfaction for the attack on Saguntum (Livy xxii. 18). According to the well-known story, he held up a fold of his toga and offered the Carthaginians the choice between peace and war. When they declared themselves indifferent, he let fall his toga with the words, "Then take war." After the disastrous campaign on the Trebia, and the defeat on the banks of the Trasimene Lake, Fabius was named dictator (Livy calls him pro-dictator, since he was nominated, not by the consul, but by the people) in 217, and began his tactics of "masterly inactivity." Maneuvering among the hills, where Hannibal's cavalry were useless, he cut off his supplies, harassed him incessantly, and did everything except fight. His steady adherence to his plan caused dissatisfaction at Rome and in his own camp, and aroused the suspicion that he was merely endeavouring to prolong his command. Minucius Rufus, his master of the horse, seized the opportunity, during the absence of Fabius at Rome, to make an attack upon the enemy which proved successful. The people, more than ever convinced that a forward movement was necessary, divided the command between Minucius and Fabius (Livy xxii. 15, 24; Polybius iii. 88). Minucius was led into an ambuscade by the proconsul arrival of Fabius. Minucius confessed his mistake and henceforth submitted to the orders of Fabius (Livy xxii. 35). At the end of the legal time of six months Fabius resigned the dictatorship and the war was carried on by the consuls. The result of the abandonment of Fabian tactics was the disaster of Cannae (216). In 215 and 214 (as consul for the third and fourth times) he was in charge of the operations against Hannibal together with Claudius Marcellus (Livy xxii. 39). He laid siege to Capua, which had gone over to Hannibal after Cannae, and captured the important position of Casilinum; thereupon he consented to Hannibal's request that the town should be occupied by Hannibal for three years (Livy xxvii. 15; Polybius xiii. 4; Plutarch, Fabius). He died in 203. Fabius was a strenuous opponent of the new aggressive policy, and did all he could to prevent the invasion of Africa by Scipio. He was distinguished for calmness and prudence, while by no means lacking in courage when it was required. In his later years, however, he became morose, and showed jealousy of rising young men, especially Scipio (Life by Plutarch; Livy xx—xxx.; Polybius iii. 87—106).

4. Q. Fabius Maximus Aemilius, eldest son of L. Aemilius Postumus, was adopted by Fabius Cunctator. He served in the last Macedonian War (168), and, as consul, defeated Viriathus in Spain (Livy, Epit. 52). He was the pupil and patron of Polybius (Polybius xviii., xxix. 6, xxxi. 8—10; Livy xlv. 35).

5. Q. Fabius Maximus Allobrogius, son of the above, consul 121 in Gaul. He obtained his surname from his victory over the Allobroges and Arverni in that year (Vell. Pat. ii. 10; Eutropius iv. 22). As censor (168) he erected the first triumph arch.

6. Q. Fabius Vibulenus, with his brothers Caeso and Marcus, first the consulship, two years in succession (485—483 B.C.). In the last year there was a reaction against the family, in consequence of Caeso espousing the cause of the plebeians. Thereupon the Fabii—to the number, it is said, of 306 patricians, with some 5000 dependents—emigrated from Rome under the leadership of Caeso, and settled on the banks of the Cramera, a few miles above Rome. For two years the exiles continued to be the city's chief defence against the Veientes, until at last they were surprised and cut off. The only survivor of the gens was Quintus, the son of Marcus, who apparently took no part in the battle. The story that he had been left behind at Rome on account of his youth cannot be true, as he was consul ten years afterwards. This Quintus was consul in 467, 465 and 459, and a member of the second decemvirate in 450, on the fall of which he went into voluntary exile (Livy ii. 42, 48—49, iii. 1, 9, 41, 58, vi. 1; Dion. Halic. viii. 82—86, ix. 14—22; Ovid, Fasti, ii. 195).
The Fabian name is met with as late as the 2nd century A.D. A complete treatment of the Fabians will be found in de Vit's Onomasticon; see also W. N. de Ried, Dizionario di Gentile Fabia (1850), containing an account of 57 members of the family.

FABIIUS PICTOR, QUINTUS, the father of Roman history, was born about 254 b.c. He was the grandson of Galus Fabius, who received the surname Pictor for his painting of the temple of Salus (302). He took an active part in the subjugation of the Gauls in the year 297 B.C. He also took part in the battle of Cannae (216) employed by the Romans to proceed to Delphi in order to consult the oracle of Apollo. He was the earliest prose writer of Roman history. His materials consisted of the Annales Maximi, Commentariorum Consularum, and similar records; the chronicles of the great Roman families; and his own experiences in the Second Punic War. He is also said to have made much use of the Greek historian Dioecles of Paphrustes. His work, which was written in Greek, began with the arrival of Aeneas in Italy, and ended with the Hannibalic war. Although Polybius and Dionysius of Halicarnassus frequently found fault with him, the first uses him as his chief authority for the Second Punic War. A Latin version of the work was in existence in the time of Cicero, but it is doubtful whether it was by Fabius Pictor or by a later writer with whom he was confused—Q. Fabius Maximus Servilianus (consul 142); or there may have been two annalists of the name of Fabius Pictor.

Fragments in H. Peter, Historiarum Romanorum Fragmenta (1883); see also Avinio and Livy, and Teuffel-Schwarz, History of Roman Literature, § 116.

FABLE (Fr. fable, Lat. fabula). With certain restrictions, the necessity of which will be shown in the course of the article, we may accept the definition of "fable" which Dr Johnson proposes in his Life of Gay: "A fable or apologue seems to be, in its genuine state, a narrative in which beings irrational, and sometimes inanimate (arbores loquentes, non tantum ferae), are, for the purpose of moral instruction, feigned to act and speak with human interests and passions." The description of La Fontaine, the greatest of fabulists, is a poetic rendering of Johnson's definition:

3 Fables in sooth are not what they appear;
Our moralists are mice, and such small deer.
We yawn at sermons, but we gladly turn
To moral tales, and so amused we learn.

The fable is distinguished from the myth, which grows and is not made, the spontaneous and unconscious product of primitive fancy as it plays round some phenomenon of natural or historical fact. The literary myth, as for instance, the legend of Pandora in Hesiod or the tale of Er in the Republic of Plato, is really an allegory, and differs from the fable in so far as it is self-interpreting; the story and the moral are intermingled throughout. Between the parable and the fable there is no clear line of demarcation, and theologians like Trench have unwarrantably confused the function of the fable with that of the New Testament. The soundest distinction is drawn by Neander. In the fable human passions and actions are attributed to beasts; in the parable the lower creation is employed only to illustrate the higher life and never transgresses the laws of its kind. But whether Jotham's apologue of the trees choosing a king, perhaps the first recorded in literature, should be classed as a fable or a parable is hardly worth disputing. Lastly, we may point out the close affinity between the fable and the proverb. A proverb is often a condensed or fossilized fable, and not a few fables are amplified or elaborated proverbs.

The history of the fable goes back to the remotest antiquity, and Aesop has even less claim to be reckoned the father of the fable than has Homer to be entitled the father of poetry. The fable has its origin in the universal impulse of men to express their thoughts in concrete images, and is strictly parallel to the use of metaphor in language. It is the most widely diffused if not the most primitive form of literature. Though it has fallen from its high place it still survives, as in J. Chandler Harris's Uncle Remus and Rudyard Kipling's Jungle Book. The Arab of to-day will invent a fable at every turn of the conversation as the readiest form of entertainment. Of ancient Rome Patmore it is told how an impromptu fable of his about the pious dormouse found its way into Catholic books of devotion.

With the fable, as we know it, the moral is indispensable. As La Fontaine puts it, an apologue is composed of two parts, body and soul. The body is the story, the soul the morality. But if we revert to the earliest type we shall find that this is no longer the case. In the primitive beast-fable, which is the direct progenitor of the Aesopian fable, the story is told simply for its own sake, and is as innocent of any moral as the fairy tales of Little Red Riding-Hood and Jack and the Beanstalk. Thus, in a legend of the Flathead Indians, the Little Wolf found in cloud-land his grandsires the Spiders with their grizzled hair and long crooked nails, and they spun balls of threat to let him down to earth; when he came down and found his wife the Speckled Duck, whom the Old Wolf had taken from him, she fled in confusion, and this is why she lives and dives alone to this very day. Such animal myths are as common in the New World as in the Old, and abound from Finland and Kamchatka to the Hottentots and Australasians. From the myth-inventor, as the one gave, quoted, to account for some peculiarity of the animal world, or told as a pure exercise of the imagination, just as a sailor spins a yarn about the sea-serpent, to the moral apologue the transition is easy; and that it has been effected by savages unaided by the example of higher races seems sufficiently proved by the tales quoted by E. B. Tylor (Primitive Culture, vol. i. p. 411). From the beast-fables of savages we come next to the Oriental apologues, which we still possess in their original form. The East, the land of myth and legend, is the natural home of the fable, and Hindu-stan was the birthplace, if not of the original of these tales, at any rate of the earliest of those in the collection of the Arabian Nights. The Tastra (2nd century B.C.), or fables of the Brahma Vishnu Sarman, have been translated from Sanskrit into almost every language and adapted by most modern fabulists. The Kâllilah and Dimnah (names of two jackals), or fables of Bidpai (or Pilpay), passed from India to western Europe through the successive stages of Pahlavi (ancient Persian), Arabic, Greek, Latin. By the end of the 10th century there were Italian, French and English versions. There is an excellent Arabic edition (Paris, 1816) with an introduction by Sylvestre de Sacy. The Hitopadesa, or "literally interpreted," is a modernized form of the same work, and of it there are three translations into English by Dr Charles Wilkins, Sir William Jones and Professor F. Johnson. The Hitopadesa is a complete chaplet of fables loosely strung together, but connected so as to form something of a continuous story, with moral reflections freely interspersed, purporting to be written for the instruction of some dissolute young princes. Thus, in the first fable a flock of pigeons see the grains of rice which a Fowler has scattered, and are about to descend on them, when the king of the pigeons warns them by telling the fable of a traveller who being greedy of a bracelet was devoured by a tiger. They neglect the warning and the king, having transgressed "Aesop's law," is devoured by the king of the mice, who tells the story of the Deer, the Jackal and the Crow, to show that no real friendship can exist between the strong and the weak, the beast of prey and his quarry, and so on to the end of the volume. Another book of Eastern fables is well worthy of notice, Buddhaghoša's Parables, a commentary on the Dhammapada or Buddha's Path of Virtue. The original is in Pali, but an English translation of the Burmese version was made by Captain T. Rogers, R.E.

From Hindustan the Sanskrit fables passed to China, Tibet and Persia, and from thence they have reached Greece at an early age, for many of the fables which passed under the name of Aesop are identical with those of the East. Aesop to us is little more than a name, though, if we may trust a passing notice in Herodotus (ii. 134), he must have lived in the 6th century B.C. Probably his fables were never written down, though several are ascribed to him by Xenophon, Aristotle, Plutarch and other Greek writers, and Plato represents Socrates as beguiling his last days by versifying such as he remembered. Aristophanes alludes to them as merry tales, and Plato, while excluding the poets from his ideal republic, admits Aesop as a moral teacher. Of the Hebrew texts of the Old Testament, that of the Rembrandt manuscript is that of Babrius or Babrias, a Greek probably of the 3rd century A.D., who rendered them in choliambic verse. These,
which were long known in fragments only, were recovered in a MS. found by M. Minas in a monastery on Mount Athos in 1842, now in the British Museum. An inferior version of the same in Latin iambics was made by Phaedrus, a slave of Thracian origin, brought to Rome in the time of Augustus and manumitted by him. Phaedrus professed to polish in Latin verse the rough-hewn blocks from Aesop’s quarry; but the numerous allusions to contemporary events, as, for example, his hit at Sejanus in the Frogs and the Sun, which brought upon the author disgrace and imprisonment, show that many of them are original or free adaptations. For some time scholars doubted as to the genuineness of Phaedrus’s fables, but their doubts have been lately dispelled by a closer examination of the MSS. and by the discovery of two verses of a fable on a tomb at Apulum in Dacia. Phaedrus’s style is simple, clear and brief, but dry and unpoetical; and, as Lessing has pointed out, he often falls into absurdities when he deserts his original. For instance, in Aesop the dog with the meat in his mouth sees his reflection in the water as he passes over a bridge; Phaedrus makes him see it as he swims across the river.

To sum up the characteristics of the Aesopian fable, it is artless, simple and transparent. It affects no graces of style, and we hardly need the text with which each concludes, ο μίθος ἡδύς δεῖ, κ.λ. The moral inculcated is that of Proverbal Philosophy and Poor Richard’s Almanacks. Aesop is no maker of phrases, but an orator who wishes to gain some point or induce some course of action. It is the Aesopian type that Aristotle has in view when he treats of the fable as a branch of rhetoric, not of poetry.

The Latin race was given to moralizing, and the language lent itself to crisp and pointed narrative, but they lacked the free play of fancy, the childlike “make-believe,” to produce a national body of fables. With the doubtful exception of Phaedrus, we possess nothing but solitary examples, such as the famous apologue of Menenius Agrippa to the Plebs and the exquisite Town Mouse and Country Mouse of Horace’s Satires.

The fables of the rhetorician Aphithonius about a.d. 400 in Greek prose, and those in Latin elegiac verse by Avianus, used for centuries as a text-book in schools, form in the history of the apologue a link between classical and medieval times. In a Latin dress, sometimes in prose, sometimes in regular verse, and sometimes in rhymed stanzas, the fable contributed, with other kinds of narratives, to make up the huge mass of stories which has been bequeathed to us by the monastic libraries. These served more uses than one. They were at once easier and safer reading than the classics. To the lazy monk they stood in place of novels; to the more industrious and gifted they furnished an exercise on a par with Latin verse composition in our public schools; the more original transformed them into fabliaux, or embodied them in edifying stories, as in the Gesta Romanorum. It is not in the Speculum Doctrinale of Vincent de Beauvais, a Dominican of the 12th century, nor in the collection of his contemporary Odo de Cerinon, an English Cistercian, nor in Planudes of the 14th century, whose one distinction is to have added to the fables a life of Aesop, that the direct lineage of La Fontaine must be traced. It is the fabliaux that inspired some of his best fables—the Lion’s Court, the Young Widow, the Coach and the Fly.

As the supremacy of Latin declined and modern languages began to be turned to literary uses, the fable took a new life. Not only were there numerous adaptations of Aesop, known as Marie de France in the 13th century composed many original fables, some rivalling La Fontaine’s simplicity and gracefulness. Later, also, fables were not wanting, though not numerous, in the English tongue. Chaucer has given us one, in his Nonne Preste’s Tale, which is an expansion of the fable Don Coc et don Werpil of Marie de France; another is Lygdgate’s tale of The Churl and the Bird.

Several of Odo’s tales, like Chaucer’s story, can be ultimately traced to the History of Reynard the Fox. This great beast-epic has been referred by Grimm as far back as the 10th century, and is known to us in three forms, each with independent episodes, but all woven upon a common basis. The Latin form is probably the earliest, and the poems Rénaudus and Ysenogrinus date from the 12th or 13th century. The most ancient, that of a minnesinger Heinrich of Glichisen (probably a Swabian), was analysed and edited by Grimm in 1840. The French poem of more than 30,000 lines, the Roman du Rénard, belongs probably to the 13th century. In 1488 appeared Renée de Voss, almost a literal version in Low Saxon of the Flemish poem of the 12th century, Rénaeart de Vos. Hence the well-known version of Goethe into modern German hexameters was taken. The poem has been well named “an unholy world Bible.” In it the Aesopian fable received a development which was in several respects quite original. We have here no short and unconnected stories. Materials, partly borrowed from older apologues, but in a much greater proportion new, are worked up into one long and systematic tale. The moral, so prominent in the fable proper, shrinks so far into the background, that the epic might be considered a work of pure fiction, an animal romance. The attempts to discover in it personal satire have signally failed; some critics deny even the design to represent human conduct at all; and we can scarcely get nearer to its signification than by regarding it as being, in a general way, what Carlyle has called “a parody of human life.” It represents a contest maintained successfully, by selfish craft and audacity, against enemies of all sorts, in a half-barbarous and ill-organized society. With his weakest foes, like Chaunteclere the Cock, Reynard uses brute-force; over the weak who are protected, like Kiward the Hare and Belin the Ram, he is victorious by uniting violence with cunning; Bruin, the dull, strong, formidable Bear, is humbled by having greater power than his own enlisted against him; and the most dangerous of all the fox’s enemies, Isergrin, the obstinate, greedy and implacable Wolf, after being baffled by repeated strokes of malicious ingenuity, forces Reynard to a single combat, but even thus is not a match for his dexterous adversary. The knavish fox has allies worthy of him in Grimmart the watchful badger, and in his own aunt Dame Rukenawe, the learned She-ape; and he plays at his pleasure on the simple credulity of the Lion-King, the image of an impatient feudal sovereign. The characters of these and other brutes are kept up with a rude kind of consistency, which gives them great liveliness; many of the incidents are devised with much force of humour; and the sly hits at the weak points of medieval polity and manners and religion are incessant and palpable.

It is needless to trace the fable, or illustrations borrowed from fables, that so frequently occur as incidental ornaments in the older literature of Europe and other countries. It has appeared in every modern tongue. In the 16th it has nowhere become more important, and has hardly ever exhibited much originality either of spirit or of manner. In English, Prior transplanted from France some of La Fontaine’s ease of narration and artful artlessness, while Gay took as his model the Contes rather than the Fables. Gay’s fables are often political satires, but some, like the Fox on his Deathbed, have the true ring, and in the Hare with many Friends there is genuine pathos. To Dryden’s spirited remodelings of old poems, romances and fabliaux, the name of fables, which he was pleased to give them, is quite inapplicable. In German, Hagedorn and Gellert, both famous in their day and the latter extolled by Goethe, are quite forgotten; and even Lessing’s fables are read by few but schoolboys. In Spanish, Yriarte’s fables on literary subjects are sprightly and graceful, but the critic is more than the fabulist. A spirited version of the best appeared in Blackwood’s Magazine, 1839. Among Italians Pignotti is famous for versatility and command of rhythm, as amongst Russians is Kriloff for his keen satire on Russian society. He has been translated into English by Ralston.

France alone in modern times has attained any pre-eminence in the fable, and this distinction is almost entirely due to one man. Marie de France in the 12th century, Gilles Corrozet, Guillaume Haudent and Guillaume Guerout in the 16th, are now
studied mainly as the precursors of La Fontaine, from whom he may have borrowed a stray hint or the outline of a story. The unique character of his work has given a new word to the French language: other writers of fables are called fabulistes, La Fontaine is named le fablier. He is a true poet; his verse is exquisitely chaste, his love of nature often reminds us of Virgil, as do his tenderness and pathos (see, for instance, The Two Pigeons and Death and the Woodcutter). He is full of sly fun and delicate humour; like Horace he satirizes without wounding, and "plays around the heart." Lastly, he is a keen observer of men. The whole society of the 17th century, its greatness and its foibles, its luxury and its squalor, from Le grand monarque to the poor manant, from his majesty the lion to the courtier of an ape, is painted to the life. To borrow his own phrase, La Fontaine's fables are "une ampe comédie à cont-acte de rîvers." Rousseau, in his best to discredit the Fables as immoral and corruptors of youth, and in spite of Émile they are studied in every French school and are more familiar to most Frenchmen than their breviary. Among the successors of La Fontaine the most distinguished is Florian. He justly estimates his own merits in the pretty apologue that he prefixed to his Fables. He asks a sage whether a fabulist writing after La Fontaine would not be wise to consign his work to the flames. The sage replies by a question: "What would you say did some sweet, ingenuous Maid of Athens refuse to let herself be seen because there was once a Helen of Troy?"

The form of Lessing represents the revolt against the French school of fabulists. "With La Fontaine himself," says Lessing, "I have no quarrel, but against the imitators of La Fontaine I enter my protest." His attention was first called to the fable by Gellert's popular work published in 1746. Gellert's fables were closely modelled after La Fontaine's, and were a vehicle for lively railings against the fair sex, and hits at contemporary follies. Lessing's early essays were in the same style, but his subsequent study of the history and theory of the fable led him to discard his former model as a perversion of later times, and the "Fabeln," published in 1766 and 1770, displays his wiser views. Lessing's fables, like all that he wrote, display his vigorous common sense. He has, it is true, little of La Fontaine's curioso felicitas, his sly humour and lightness of touch; and Frenchmen would say that his criticism of La Fontaine is an illustration of the fable of the sour grapes. On the other hand, he has the rare power of looking at both sides of a moral problem; he holds a brief for the stupid and the feeble, the ass and the lamb; and in spite of his formal protest against poetical ornament, there is in not a few of his fables a vein of true poetry, as in the Shepherd (li. 13) and Jupiter and the Shepherd (li. 19). But the monograph which introduced the Fabeln is of more importance than the fables themselves. According to Lessing the ideal fable is that of Aesop. All the elaborations and refinements of later authors, from Phaedrus to La Fontaine, are perversions of this original. The fable is essentially a moral precept illustrated by a single example, and it is the lesson thus enforced which gives to the fable its unity and makes it a work of art. The illustration must be either an actual occurrence or represented as such, because a fictitious case invented ad hoc can appeal but feebly to the reader's judgment. Lastly, the fable requires a story or connected chain of events; any abstract will not make a fable, but is only an emblem. We thus arrive at the following definition:--"A fable is a relation of a series of changes which together form a whole. The unity of the fable consists herein, that all the parts lead up to an end, the end for which the fable was invented being the moral precept."

We may notice in passing a problem in connexion with the fable which had long been debated, but never satisfactorily resolved till Lessing took it in hand—Why should animals have been almost universally chosen as the chief dramatis personæ? The reason, according to Lessing, is that animals have distinct characters which are known and recognized by all. The fabulist who writes of Britannicus and Nero appeals to the few who know Roman history. The Wolf and the Lamb come home to every one whether learned or simple. But, besides this, human sympathies obscure the moral judgment; hence it follows that the fable, unlike the drama and the epos, should abstain from all that is likely to arouse our prejudices or our passions. In this respect the Wolf and the Lamb of Aesop is a more perfect fable than the Rich Man and the Poor Man's Ewe Lamb of Nathan. We wish to know not what the moral of the fable is, but the definition of the fable, though he seems himself unconscious of the soundness of his clear distinction. The death-warrant. The beast-fable arose in a primitive age when men firmly believed that beasts could talk and reason, and that any wolf they met might be a were-wolf, that a peacock might be a Pythagoras in disguise, and an ox or even a cat a being worthy of their worship. To this succeeded the second age of the fable, which belongs to the same stage of culture as the Hebrew proverbs and the gnomic poets of Greece. That honesty is the best policy, that death is common to all, seemed to the men of that day profound truths worthy to be embalmed in verse or set off by the aid of story or anecdote. Last comes an age of high literary culture which tolerates the trite morals and hackneyed tales for the sake of the exquisite setting, and is amused at the wit which introduces topics and characters of the day under the transparent veil of animal life. Such an artificial product can be nothing more than the fashion of a day, and must, like pastoral poetry, die a natural death. A serious moralist would hardly choose that form to inculcate, like Mandeville in his Fable of the Bees, a new doctrine in morals, for the moral of the fable must be such that he who runs may read. A true poet will not care to masquerade as a fable writer, though the character is one of the old-world maxims. Yet Taine in France, Lowell in America, and Jane A. Froude in England have proved that the fable as one form of literature is not yet extinct, and is capable of new and unexpected developments.

FABLIAU. The entertaining tales in eight-syllable rhymed verse which form a marked section of French medieval literature are called fabliaux, the word being derived by Littere from fabel, a diminutive of fable. It is a mistake to suppose, as is frequently done, that every legend of the middle ages is a fabliau. In the middle of the 13th century a clear distinction is drawn between songs of chivalry, war or love, and fabliaux, which are recitals of laughter. A fabliau always related an event; it was usually brief, containing not more than 400 lines; it was neither sentimental, religious nor supernatural, but comic and gay. MM. de Montaiglon and Raynaud, who have closely investigated this class of literature, consider that about 150 fabliaux have come down to us more or less intact; a vast number have doubtless disappeared. It appears from a phrase in the writings of the trouvère, Henri d' Andeli, that the fabliau was not thought worth of being copied out on parchment. This wonder, then, is that so many of these ephemeral compositions have been preserved. Arguments brought forward by M. Joseph Bédier, however, tend to show that we need not regret the disappearance of the majority of the fabliaux, as those which were copied into MSS. were those which were felt to be of the greatest intrinsic value. As early as the 8th century fabliaux must have existed, since the faithful are forbidden to take pleasure in these fabulas inanes by the Paenitentiale of Egbert. But it appears that all the early examples are lost.

In the opinion of the best scholars, the earliest surviving fabliau is that of Richest, which dates from 1159. This is a rough and powerful study of the coarse life of the day, with little plot, but engaged with a realistic picture of manners.
Such poems, but of a more strictly narrative nature, continued to be produced, mainly in the north and north-east of France, until the middle of the 14th century. Much speculation has been expended on the probable sources of the tales which the trouvères told. The Aryan theory, which saw in them the direct influence of India upon Europe, has now been generally abandoned. It does not seem probable that any ancient or exotic influences were brought to bear upon the French jongleurs, who simply invented or adapted stories of that universal kind which springs unsown from every untilled field of human society. More remarkable than the narratives themselves is the spirit in which they are told. This is full of the national humour and the national irony, the true esprit gauleux. A very large section of these popular poems deals satirically with the pretensions of the learned scholars. Yet are the famous Prêre aux mères, the Prêre qui dit la Passion and Les Perdris. Some of these are innocently merry; others are singularly depraved and obscene. Another class of fabliaux is that which comprises jests against the professions; in this, the most prominent example is Le Vilain Mire, a satire on doctors, which curiously predicts the Médicin malgré lui of Molière. There are also tales whose purpose is rather voluptuous than witty, and whose aim is to excuse libertinage and render marriage ridiculous. Amongst these are prominent Court Manet and medieval France. It is true that if we try to reproduce this strain of irony or oddity, such familiar classical stories as those of Narcissus, and Pyramus and Thisbe. It is rarely that any elevation of tone raises these poems above a familiar and even playful level, but there are some that are almost idealistic. Among these the story of a sort of Sisyphus errant, Le Chevalier de Barulé, offers an ethical interest which lifts it in certain respects above all other surviving fabliaux. An instance of the pathetic fabliau is Housse Partie, a kind of primitive version of the story of King Lear.

In composing these pieces, of very varied character, the jongleurs were perhaps less interested in the art which was in many respects rudimentary, but sincere and simple. The student of language finds the rich vocabulary of the fabliaux much more attractive to him than the conventionality of the serious religious and amatory poems of the same age. The object of the writer was the immediate amusement of his audience; by reference to familiar things, they hoped to arouse a quick and genuine merriment. Hence their incorrectness and their negligence are balanced by a delightful ease and absence of pedantry, and in the fabliaux we get closer than elsewhere to the living diction of medieval France. One is tempted to add that if we attempt a judgment to these pieces, we may find ourselves obliged to condemn them altogether. An instructed French critic, vexed with their faults, has gone so far as to say that “the subjects of these tales are degrading, their inspiration nothing better than flat and cruel derision, their distinguishing features rascality, vulgarity and platitude of style.” From one point of view, this condemnation of the fabliau is hardly too severe. But such scholars as Gaston Paris and Paul Meyer have not failed to emphasize other sides to the question. They have praised, in the general laity of style and garrulity of the middle ages, the terseness of the jongleurs; in the period of false ornament, their fidelity to nature; in a time of general vagueness, the sharp and picturesque outlines of their art. One feature of the fabliaux, however, cannot be praised and yet must not be overlooked. In no other section of the world’s literature is the scorn and hatred of women so prominent. It is difficult to account for the anti-feminine rage which pervades the fabliaux, and takes hideous shapes in such examples as Le Valet aux deux femmes, Le Pêcheur de Pont-sur-Seine and Chiffoncette et Bigorne. Probably this was a violent reaction against the extravagant cult of woman as expressed in the contemporary lois as well as in the legends of saints. The exaggeration was not greater in the one case than in the other, and it is probable that the exaltation was made endurable to those who listened to the trouvères by the corresponding degradation. We must remember, too, that those who listened were not nobles or clerks, they were the common people. The fabliaux were fabliae ignobilium, little stories told to amuse persons of low degree, who were irritated by the moral pretensions of their superiors.

The names of about twenty of the authors of fabliaux have been preserved, although Fabri, to his old home at Bédarieux, lived in comfort and security, but most of the professional jongleurs seem to have spent their years in a Bohemian existence, wandering among the clergy and the merchant class, alternately begging for money and food and reciting their mocking verses.

The principal authorities for the fabliaux are MM. Anatole de Monzie and A. S. Bedarieux, who published the first collection, in 1832-1850. This edition corrected and supplemented the valuable labours of Méon (1805-1823) and Jubinal (1824-1842). The works of Henri d’Andelis were edited by M. A. Héron of Bourges, and those of Fabri and others by MM. Meyer and other modern scholars. M. Joseph Bedier’s Les Fabliaux (1895) is a useful summary of critical opinion upon the entire subject.

FABRE, FERDINAND (1830-1898), French novelist, was born at Bédarieux, in Hérault, a very picturesque district of the south of France, which he made completely his own in literature. He was the son of a local architect, who failed in business, and Ferdinand was brought up by his uncle, the Abbé Fulcan Fabre, at Camplong among the mountain woods. He spent his childhood and early youth he has given a charming account in Ma Vocation (1886). He was destined to the priesthood, and was sent for that purpose to the seminary of St Pons de Thomières, where, in 1848, he had, as he believed, an ecstatic vision of Christ, who warned him “It is not the will of God that thou shouldst be a priest.” He had now to look little towards a profession, and, after attempting medicine at Montpellier, he was articled as a lawyer’s clerk in Paris. In 1853 he published a volume of verses, Petites de Terre, which drew down, in health, and crept back, humble and apparently insignificant, to the Bédarieux of his childhood. After some eight or nine years of country life he reappeared in Paris, with the MS. of his earliest novel, Les Courbezon (1862), in which he treated the subject which was to recur in almost all his books, the daily business of country priests in the Cevennes. This story enjoyed an immediate success with the literary class of readers; George Sand praised it, Sainte-Beuve hailed it in his author “the strongest of the disciples of Balzac,” and it was crowned by the French Academy. From this time forth Fabre settled down to the production of novels, of which at the time of his death he had published about twenty. Among these the most important were Le Chevrier (1866), unique among his works as written in an experimental mixture of Cevenol dialect and French of the 17th century; L’Abbé Tigrane, candidat à la papauté (1875), by common consent the best of all Fabre’s novels, a very powerful picture of unscrupulous priestly ambition; Mon Oncle Célestin (1881), a study of the entirely single and tender-hearted country abbé; and Lucifer (1884), a marvellous gallery of serious clerical portraits. In 1883 Fabre was appointed curator of the Mazarin Library, with rooms in the Institute, where, on 11th February 1898, he died, after a brief attack of pneumonia. Ferdinand Fabre occupies in French literature a position somewhat analogous to that of Mr Thomas Hardy amongst English writers of fiction. He deals almost exclusively with the population of the mountain villages of Hérault, and particularly with its priests. He loved most of all to treat of the celibate virtues, the strictly ecclesiastical passions, the enduring tension of the young soul drawn between the spiritual
Fabre d'Eglantine—Fabricius, Gaius

vocation and the physical demands of nature. Although never a priest, he preserved a comprehension of and a sympathy with the clerical character, and he always indignantly denied that he was hostile to the Church, although he stood just outside her borders. Fabre possessed a limited and a monotonous talent, but within his own field he was as original as he was wholesome and unassuming.

See also J. Lemaître, Les Contemporains, vol. ii.; G. Pellissier, Études de littérature contemporaine (1898); E. W. Gosse, French Profiles (1905).

FABRE D'ÉGLANTINE, PHILIPPE FRANÇOIS NAZAIRE (1750–1794), French dramatist and revolutionist, was born at Car cassonne on the 28th of July 1750. His real name was still playing the "Fabre d'Églantine" being added in commemoration of his receiving the golden eagle medal of Clémence Isfraise from the academy of the floral games at Toulouse. After travelling through the provinces as an actor, he came to Paris, and produced an unsuccessful comedy entitled Les Gens de lettres, or le provincial à Paris (1787). A tragedy, Augûsta, produced at the Théâtre Français, was also a failure. One only of his plays, Philtine, ou la suite du Misanthrope (1790), still preserves its reputation. It professes to be a continuation of Molière's Misanthrope, but the hero of the piece is of a different character from the nominal prototype—an impersonation, indeed, of Pierre Leniaut, the rival of Edme Methon. On the first performance the drama was introduced by a preface, in which the author mercilessly satirizes the Optimitistes of his rival J. F. Collin d'Harleville, whose Chateaux en Espagne had gained the applause which Fabre's Présomptueux (1789) had failed to win. The character of Philtine had much political significance. Alceste received the highest praise, and evidently represents the citizen patriot, while Philtine is a dangerous aristocrat in disguise. Fabre was president and secretary of the club of the Cordeliers, and belonged also to the Jacobin club. He was chosen by Danton as his private secretary, and sat in the National Convention. He voted for the king's death, supporting the maximum and forny in connection with the affairs of the Compagnie des Indes. Documents still existing prove that he was a bitter enemy of the Girondins. After the death of Marat he published a Portrait de l'Ami du Peuple. On the abolition of the Gregorian calendar he sat on the committee entrusted with the formation of the republican substitute, and to him was due a large part of the new nomenclature, with its poetical Prærial and Floréal, its prosaic Primiði and Duódi. The report which he made on the subject, on the 24th of October, has some scientific value. On the 12th of January 1794 he was arrested by order of the committee of public safety on a charge of puré malversation and forgery in connexion with the affairs of the Compagnie des Indes. Documents still existing prove that the charge was altogether groundless. During his trial Fabre showed the greatest calmness and sang his own well-known song of Il pleut, il pleut, bergère, rentre tes blons moutons. He was guillotined on the 5th of April 1794. On his way to the scaffold he distributed his manuscript poems to the people.

A posthumous play, Les Précepteurs, steeped with the doctrines of Rousseau's Émile, was performed on the 17th of September 1794, and met with an enthusiastic reception. Among Fabre's other plays are the gay and successful Comaises de qualité (1791), and L'Intrigue épistolère (1791). In the latter Fabre is supposed to have drawn a portrait of the painter Jean Baptiste Greuze.

The author's Œuvres mêlées et posthumes were published at Paris 1802, 2 vols. See Albert Maurin, Galerie hist. de la Révolution française, tome 11; Jules Janin, Histo. de la litt. dram.; Chénier, Tableau de la litt. française; F. A. Aulard in the Nouvelle Revue (July 1885).

FABRETTI, RAPHAEL (1618–1700), Italian antiquary, was born in 1618 at Urbino in Umbria. He studied law at Cagli and Urbino, where he took the degree of doctor at the age of eighteen. While in Rome he attracted the notice of Cardinal Lorenzo Imperiali, who employed him successively as treasurer and auditor of the papal legation in Spain, where he remained thirteen years. Meanwhile, his favourite classical and antiquarian studies were not neglected; and on his return journey he made important observations of the relics and monuments of Spain, France and Italy. At Rome he was appointed judge of appellation of the Capitol, which post he left to be auditor of the legation at Urbino. After three years he returned to Rome, on the invitation of Cardinal Carpegna, vicar of Innocent XI, and devoted himself to antiquarian research, examining with minute care the monuments and inscriptions of the Campagna. He always rode a horse which his friends nicknamed "Marco Polo," after the Venetian traveller. By Innocent XII. he was made keeper of the archives of the castle St Angelo, a charge which he retained till his death. He died in Rome, the 7th of January 1700. His collection of inscriptions and monuments was purchased by Cardinal Stoppaìi, and placed in the ducal palace at Urbino, where they may still be seen.

His work De Aquis et Aqueductibus veteris Romae (1680), three dissertations on the topography of ancient Latium, is inserted in Graevius's Thesaurus, iv. (1677). His interpretation of certain passages in Livy and other classical authors involved him in a dispute with Gronovius, which bore a strong resemblance to that between Milton and Salmasius, Gronovius addressing Fabretti as Faber Rusticus, and the latter, in reply, speaking of Gronovius and his titillatia. In this controversy Fabretti used the pseudonym Iasitheus, which he afterwards took as his pastoral name in the Academy of the Arcadians. His other works, De Colonna Traiani Syntagma (Rome, 1683), and Inscriptionum Antiquarum Explicatio (Rome, 1699), throw much light on Roman antiquity. In the former is to be found his explication of a bas-relief, with inscriptions, now in the Capitol at Rome, representing the war and taking of Troy, known as the Iliac table. Letters and other shorter works of Fabretti are to be found in publications of the time, as the Journal des Savants.

See Cresciembi, La Vie degli Arcadi illustri; Fabroni, Vita Italorum, vi. 174; Niccron, iv. 372; J. Lainius, Memoriae Italorum eruditione praestantium (Florence, 1742–1748).

FABRIANI, SEVERINO (1792–1849), Italian author and teacher, was born at Spilamberto, Italy, on the 7th of January 1792. Entering the Church, he took up educational work, but in consequence of complete loss of voice he resolved to devote himself to teaching deaf mutes, and founded a small school especially for them. This school the duke of Modena made into an institute, and by a special authority from the pope a teaching staff of nuns was appointed. Fabriani's method of instruction is summed up in his Logical Letters on Italian Grammar (1847). He died on the 27th of April 1849.

FABRIANO, a town of the Marches, Italy, in the province of Ancona, from which it is 44 m. S.W. by rail, 1066 ft. above sea-level. Pop. (1901) town 9586, commune 22,996. It has been noted since the 13th century for its paper mills, which still produce the best paper in Italy. A school of painting arose here, one of the early masters of whom is Allegrìo Nusti (1398–1385); and several of the churches contain works by him and other local masters. His pupil, Gentile da Fabriano (1370–1428), was a painter of considerably greater skill and wider knowledge; but there are no important works of his at Fabriano. The sacristy of S. Agostino also contains some good frescoes by Ottaviano Nelli of Gubbio. The municipal picture gallery contains a collection of pictures, and among them are some primitive frescoes, attributable to the 12th century, which still retain traces of Byzantine influence. The Archivio Comunale contains documents on watermarked paper of local manufacture going back to the 11th century. The Ponte dell' Aca, a bridge of the 15th century, is noticeable for the ingenuity and strength of its construction. The hospital of S. Maria Buon Gesù is a fine work of 1456, attributed to Rossellino.

See A. Zonghi, Antiche Carte Fabrianesi. (T. As.)

FABRICIUS, GAIUS LUSCINUS (i.e. "the one-eyed"), Roman general, was the first member of the Fabrician gens who settled in Rome. He migrated to Rome from Aletrium (Liviy ix. 43), one of the Hernic towns which was allowed to retain its independence as a reward for not having revolted. In 88 B.C. he was one of the ambassadors sent to the Tarentines to dissuade them from making war on the Romans. In 82 (when consul) he defeated the Bruttians and Lucanians, who had besieged
Thurii (Livy, Epit. 12). After the defeat of the Romans by Pyrrhus at Heraclea (280), Fabricius was sent to treat for the ransom and exchange of the prisoners. All attempts to bribe him were unsuccessful, and Pyrrhus is said to have been so impressed that he released the prisoners without ransom (Polyb. 24.6). This is the story of Pyrrhus attributed to frighten Fabricius by the sight of an elephant probably as a fiction. In 278 Fabricius was elected consul for the second time, and was successful in negotiating terms of peace with Pyrrhus, who sailed away to Sicily. Fabricius afterwards gained a series of victories over the Samnites, the Lucanians and the Bruttians, and on his return to Rome received the honour of a triumph. Notwithstanding the offices he had filled he died poor, and provision had to be made for his daughter out of the funds of the state (Val. Max. iv. 4, 10). Fabricius was regarded by the Romans of later times as a model of ancient simplicity and incorruptible integrity.

FABRICIUS, GEORG (1516–1571), German poet, historian and archaeologist, was born at Chemnitz in upper Saxony on the 23rd of April 1516, and educated at Leipzig. Travelling in Italy with one of his pupils, he made an exhaustive study of the antiquities of Rome. He published the results in his Roma (1559), in which the correspondence between every discoverable relic of the old city and the references to them in ancient literature was traced in detail. In 1546 he was appointed rector of the college of Meissen, where he died on the 17th of July 1571. In his sacred poems he affected to avoid every word with the slightest suggestion of panegyric, and he blamed the poets for their allurements to pagan paganism; and on the deathbed D. F. Schmid’s (1516–1571), of which he accompanied his patron to Sweden; and the second day his return to Hamburg, not long afterwards, he became a candidate for the chair of logic and philosophy. The suffrages being equally divided between Fabricius and Sebastian Edzardus, one of his opponents, the appointment was decided by lot in favour of Edzardus; but in 1609 Fabricius succeeded Vincent Placcius in the chair of rhetoric and ethics, a post which he held till his death, refusing invitations to Greifswald, Kiel, Giesen and Wittenberg. He died at Hamburg on the 30th of April 1736. Fabricius is credited with 128 books, but very few of them were only books which he had edited. One of the most famous and laborious of these is the Bibliotheca Latina (1697, republished in an improved and amended form by J. A. Ernesti, 1773). The divisions of the compilation are—the writers to the age of Tiberius; thence to that of the Antonines; and thirdly, to the decay of the language; a fourth gives fragments from old authors, and chapters on early Christian literature. A supplementary work was Bibliotheca Latina medicea et unius alteatis (1734–1736; supplementary volume by C. Schöttgen, 1746; ed. Mansi, 1754). His chief-d’œuvre, however, is the Bibliotheca Graeca (1705–1728, revised and continued by G. B. Gruber in 1776), and the Bibliotheca Hebraica, 1705–1752. These are still considered indispensable as an authority on apocryphal Christian literature.

The last years of the life of Fabricius are to be found in De Vita et Scriptis J. A. Fabricii Commentarii, by his son-in-law, H. S. Reimarus, the well-known editor of Dio Cassius, published at Hamburg, 1737; see also C. F. Bähr in Erach and Gruber’s Allgemeine Enzyklopädie, and J. F. E. фон Schmidthäsor’s Bibliotheca Latina (1773–1788). Danish entomologist and economist, was born at Tondern in Schleswig on the 7th of January 1745. After studying at Altona and Copenhagen, he was sent to Upsala, where he attended the lectures of Linnaeus. He devoted his attention professionally to political economy, and, after lecturing on that subject in 1769, was appointed in 1775 professor of natural history, economy and finance at Kiel, in which capacity he wrote various works, chiefly abridged from Tillotson’s History of the Rise and Progress of the Reformed Church 1661. He also published a few other works on general and natural history, botany and travel (including Reise nach Norwegen, 1779), and, although his professional stipend was small, he extended his personal researches into every town in northern and central Europe where a natural history museum was to be found. It is as an entomologist that his memory survives, and for many years his great scientific reputation rested upon the system of classification which he founded upon the structure of the mouth-organs instead of the wings. He had a keen eye for specific differences, and possessed the art of terse and accurate description. He died on the 3rd of March 1798.

A complete list of his entomological publications (31) will be found in Hagen’s Bibliotheca Entomologica; the following are the chief:—Systema Entomologiae (1775); Genera Insectorum (1776); Philosophia Entomologica (1778); Species Insectorum (1781); Mani tissa Insectorum (1787); Entomologia Systematica (1792–1794), with a supplement (1798); Species Eleutheratorum (1801), Rhyngiolorum (1804), Psiasiorum (1805), and Antidorum (1806). He was a naturalist of the highest order, and his full particulars of his life will be found, with a portrait, in the Transactions of the Entomological Society of London (1845), 4, pp. i–xvi, where his autobiography is translated from the Danish.

FABRIZI, NICOLA (1804–1885), Italian patriot, was born at Modena on the 4th of April 1804. He took part in the Modena insurrection of 1831, and attempted to succour Ancona, but was captured and executed. He was a member of the French Republican party, and was at Marseilles. Afterwards he organized with Mazzini the ill-fated Savoy expedition. Taking refuge in Spain, he fought against the Carlists, and was decorated for valour on the battlefield (18th July 1837). At the end of the Carlist War he established a
centre of conspiracy at Malta, endeavoured to dissuade Mazzini from the Bandiera enterprise, but aided Crispi in organizing the Sicilian revolution of 1848. With a company of volunteers he distinguished himself in the defence of Venice, afterwards proceeding to Rome, where he took part in the defence of San Pancrazio. Upon the fall of Rome he returned to Malta, accumulating arms and stores, which he conveyed to Sicily, after having, in 1839, worked with Crispi to prepare the Sicilian revolution of 1848. While Garibaldi was sailing from Genoa towards Marsala, Papadopoli landed at Pizzolo, and, after severe fighting, joined Garibaldi at Palermo. Under the Garibaldian dictatorship he was appointed governor of Messina and minister of war. Returning to Malta after the Neapolitan plebiscite, which he had vainly endeavoured to postpone, he was recalled to aid Cialdini in suppressing brigandage. While on his way to Sicily in 1862, to induce Garibaldi to give up the Aspromonte enterprise, he was arrested at Naples by Lamarmora. During the war of 1866 he became Garibaldi's chief of staff, and in 1867 fought at Mentana. In parliament he endeavoured to promote agreement between the chiefs of the Left, and from 1875 onwards worked to secure the return of Crispi to power, but died on the 31st of March 1885, two years before the realization of his object. His whole life was characterized by ardent patriotism and unimpeachable integrity.

(H. W. S.)

FABROT, CHARLES ANNIBAL (1580–1659), French jurist, was born at Aix in Provence on the 15th of September 1580. At an early age he made great progress in the ancient languages and in the civil and the canon law; and in 1602 he received the degree of doctor of law, and was made avocato to the parlement of Aix. In 1609 he obtained a professorship in the university of his native town. He is best known by his translation of the Basilica, which may be said to have formed the code of the Eastern empire till its destruction. This work was published at Paris in 1647 in 7 vols. 4to., and obtained for its author a considerable pension from the chancellor, Pierre Seguier, to whom it was dedicated. Fabrot likewise rendered great service to the science of jurisprudence by his edition of Cujas, which comprised several treatises of that great jurist previously unpublished. He also edited the works of several Byzantine historians, and was besides the author of various antiquarian and legal works. He died at Paris on the 16th of January 1659.

FABYAN, ROBERT (1400–1452), English chronicler, belonged to an Essex family, members of which had been connected with trade in London. He was a member of the Drapers company, alderman of Farringdon Without, and served as sheriff in 1433–1434. In 1496 he was one of those appointed to make representations to the king on the new impositions on English cloth in Flanders. Next year he was one of the aldermen employed in keeping watch at the time of the Cornish rebellion. He resigned his aldermannry in 1503, on the pretext of poverty, apparently in order to avoid the expense of mayorality. He had, however, acquired considerable wealth with his wife Elizabeth Pake, by whom he had a numerous family. He spent his latter years on his estate of Halstedys at Theydon Garnon in Essex. He died on the 28th of February 1513 (Inquisitiones post mortem for London, p. 29, edited by G. S. Fry, 1890; his will, dated the 11th of July 1511, was proved on the 12th of July 1513. Fabyan’s Chronicle was first published by Richard Pynson in 1516 as The new chronicles of England and of France. In this edition it ends with the reign of Richard III., and this probably represents the work as Fabyan left it, though with the omission of an autobiographical note and some religious verses, which form the Epistles of his history. The notes and verses are first found in the second edition, printed by John Pethybridge in 1533 with continuations down to 1500. A third edition appeared in 1542, and a fourth in 1559 with additions to that year. The only modern edition is that of Sir Henry Ellis, 1811.

In the note above mentioned Fabyan himself says: “and here I make an ende of the vii. parte and hole werke, the vii. day of November in the yere of our Lord Jesu Christes Incarnation M.vc. and iiij.” This seems conclusive that in 1504 he did not contemplate any extension of his chronicles beyond 1458. The continuations printed by Rastell are certainly not Fabyan’s work. But Stow in his Collections (ap. Survey of London, ii. 303–306, ed. C. L. Kingsford) states that Fabyan wrote “a Chronicle of London, England and of France, beginning at the creation and endynghe in the third year of Henry VIII., which both I have in written hand.” In his Survey of London (i. 191, 200, ii. 55, 110) Stow several times quotes Fabyan as his authority for statements which are not to be found in the printed continuations of Rastell. Some further evidence may be found in other notes of Stow’s (ap. Survey of London, ii. 280, 283, 365–366) and in the citation by Hakluyt of an unprinted work of Fabyan as the authority for his note of Cabot’s voyages. That Fabyan had continued his Chronicle to 1531 may be accepted as certain, but no trace of the manuscript can now be found.

It is only the seventh part of Fabyan’s Chronicle, from the Norman Conquest onwards, that possesses any historical value. For his French history he followed chiefly the Compendium super Francorum gestis of Robert Gaguin, printed at Paris in 1497. For English history his best source was the old Chronicles of London, from which he borrowed also the arrangement of his work in civic form. From 1440 to 1485 he follows, as a rule with great fidelity, the original of the London Chronicle in Cotton MS. Vitellius A. XVI. (printed in Chronicles of London, 1905, pp. 153–264).

Fabyan’s own merits are little more than those of an industrious compiler, who strung together the accounts of his various authorities without any critical capacity. He says expressly that his work was “gaderyd without understandyng,” and speaks of himself as “of cunnyngg full destitute.” Nevertheless he deserves the praise which he has received as an early worker, and for having made public information which Hall and Holinshed has become the common property of later historians, and has only recently been otherwise accessible. Bale alleges that the first edition was burnt by order of Cardinal Wolsey because it reflected on the wealth of the clergy; this probably refers to his version of the Lollards Bill of 1410, which Fabyan extracted from one of the London Chronicles.

(C. L. K.)

FAÇADE, a French architectural term signifying the external face of a building, but more generally applied to the principal front.

FACCIOUBATI, JACOPO (1658–1769), Italian philologist, was born at Torriglia, in the province of Padua, in 1658. He owed his admission to the seminary of Padua to Cardinal Barberigo, who had formed a high opinion of the boy’s talents. As professor of logic, and regent of the schools, Facciolati was the ornament of the Paduan university during a period of forty-five years. He published improved editions of several philological works, such as the Thesaurus Ciceronianus of Nizozius, and the polyglot vocabulary known under the name of Calepino. The latter work, if not actually composed by his pupil Egidio Forcellini, he completed in four years—1715 to 1719. It was written in seven languages, and suggested to the editor the idea of his opus magnum, the Totius Latinitatis Lexicon, which was ultimately published at Cardinal Priole’s expense, 4 vols. fol., Padua, 1771 (revised ed. by de Vit, 1858–1887). In the compilation of this work the chief burden seems to have been borne by Facciolati’s pupil Forcellini, to whom, however, the lexicographer allows a very scanty measure of justice. Perhaps the best testimony to the learning and industry of the compiler is the well-known observation that in the whole body of Latinity, if it were to be preserved, a most considerable part is borrowed from this lexicon. Facciolati’s mastery of Latin style, as displayed in his epistles, has been very much admired for its purity and grace. In or about 1730 Facciolati undertook the continuation of Papadopoli’s history of the university of Padua, carrying it on to his own day. Facciolati was known over all Europe as one of the most enlightened and zealous teachers of the time; and among the many flattering invitations which he received, but always declined, was one from the king of Portugal, to accept the directorship of a college at
Lisbon for the young nobility. He died in 1769. His history of the university was published in 1757, under the name Fasti Gymnasiae Palatini. In 1868 a volume containing nine of his Epistles, never before published, was issued at Padua.

FACTOR (from Lat. facere, to make, or from a root fae-, meaning "appear"); cf. Gr. φαινειν, a word whose various meanings of surface, front, expression of countenance, look or appearance, are adaptations of the application of the word to the external part of the head, usually taken to extend from the top of the forehead to the point of the chin, and from ear to ear (see Anatomy: Superficial and Artistic; and Physiognomy).

FACTION (through the French, from Lat. factio, a company of persons combined for action, facere, to do; from the other French derivative le facon comes "fashion"), a term, used especially with an opprobrious meaning, for a body of partisans who put their party aims and interests above those of the state or public, and employ unscrupulous or questionable means; it is thus a common term of reciprocal abuse between parties. In the history of the Roman and Later Roman empires the factions (factiones) of the circus and hippodrome, at Rome and Constantinople, played a prominent part in politics. The factiones were properly the four companies into which the charioteers were divided, and distinguished by the colours they wore. Originally at Rome there were only two, white (albata) and red (russata), which early by a process of assimilation to two chief colors, for the green (prasina) and blue (veneta) were added. At Constantinople the last two absorbed the red and white factions.

For a brilliant description of the factions at Constantinople under Justinian, and the part they played in the celebrated Nika riot in January 532, see Gibbon's Decline and Fall, ch. xl.; and J. B. Bury's Appendix 10 in vol. iv. of his edition (1898), for a discussion of the relationship between the factiones and the demes of Constantinople.

FACTOR (from Lat. facere, to make or do), strictly "one who makes "; thus in ordinary parlance, anything which goes to the composition of anything else is termed one of its "factors," and in mathematics the term is used of those quantities which, when multiplied together, produce a given product. In a special sense, however—and that to which this article is devoted—"factor" is the name given to a mercantile agent (of the class known as "general agents") employed to buy or sell goods for a commission. When employed to sell, the possession of the goods is entrusted to him by his principal, and when employed to buy it is his duty to obtain possession of the goods and to consign them to his principal. In this he differs from a broker (q.v.), who has no title to the possession of his commission, which is distinguished by characteristic which gave rise in England to the series of statutes known as the Factors Acts. By these acts, consolidated and extended by the act of 1880, third parties buying or taking pledges from factors are protected as if the factor were in reality owner; but these enactments have in no way affected the contractual relations between the factor and his employer, and it will be convenient to define them before discussing the position of third parties as affected by the act.

I. FACTOR AND PRINCIPAL

A factor is appointed or dismissed in the same way as any other agent. He may be employed for a single transaction or to transact all his principal's business of a certain class during a limited period or till such time as his authority may be determined. A factor's duty is to sell or buy as directed; to carry out with care, skill and good faith any instructions he may receive; to receive or make payment; to keep accounts, and to hand over to his principal the balance standing to his principal's credit, without any deduction save for commission and expenses. All express instructions he must carry out to the full, provided they do not involve fraud or illegality. On any point not covered by his express instructions he must follow the usual practice of his particular business, if not inconsistent with his instructions or his position as factor. Many usages of businesses in which factors are employed have been proved in court, and may now be regarded as legally established. For instance, he may, unless otherwise directed, sell his own name, give warranties as to goods sold by him, sell by sample (in most businesses), give such credit as is usual in his business, receive payment in cash or as customary, and give receipts in full discharge, sell by indorsement of title to the things, and in some cases take delivery of goods. It is his duty to clear goods at the customs, take charge of them and keep them safely, give such notices to his principal and others as may be required, and if necessary take legal proceedings for the protection of the goods. On the other hand, he has not authority to delegate his employment, or to barter; and as between himself and his principal he has no right to pledge the goods, although as between the principal and the pledge, an unauthorized pledge made by the factor may by virtue of the Factors Act 1889 be binding upon the principal. It is, moreover, inconsistent with his employment as agent that he should buy or sell on an account from or to his principal. A factor has no right to follow any usage which is inconsistent with the ordinary duties and authority of a factor unless his principal has expressly or impliedly given his consent.

On the due performance of his duties the factor is entitled to his commission, which is usually a percentage on the value of the goods sold or bought by him on account of his principal, regulated in amount by the usages of each business. Sometimes the factor makes himself personally responsible for the solvency of the persons with whom he deals, in order that his principal may avoid the risk of the goods being sold, and in such a case the factor is said to be employed on dei credere terms, and is entitled to a higher rate of commission, usually 2½% extra. Such an arrangement is not a contract of guarantee within the Statute of Frauds, and therefore need not be in writing. Besides his remuneration, the factor is entitled to be reimbursed by his principal for any expenses, and to be indemnified against any liabilities which he may have properly incurred in the execution of his principal's instructions. For the purpose of enforcing his rights a factor has, without legal proceedings, two remedies. Firstly, by virtue of his general lien (q.v.) he may hold any of his principal's goods which come to his hands as security for the payment to him of any commission, out-of-pocket expenses, or even general balance of account in his favour. Although he cannot sell the goods, he may refuse to give them up until he is paid. Secondly, where he has consigned goods to his principal but not been paid, he may "stop in transit" subject to the same rules of law as an ordinary vendor; that is to say, he must exercise his right before the transit ends; and his right may be defeated by his principal transferring the document of title to the goods to some third person, who takes it in good faith and for valuable consideration (Factors Act 1889, section 10). If the factor does not exercise his right to stop goods within the time allowed, to his principal's cost he will lose his right to recover the goods, and if it be shown that he stopped them out so negligently or unskilfully that his principal gets no benefit thereby, the factor loses his commission and his right to reimbursement and indemnity. If by such failure or negligence the principal suffers any loss, the latter may recover it as damages. So too if the factor fails to render proper accounts his principal may by proper legal proceedings obtain an account and payment of what is found due; and threatened breaches of duty may be summarily stopped by an injunction. Criminal acts by the factor in relation to his principal's goods are dealt with by section 75 of the Larceny Act 1861.

II. PRINCIPAL AND THIRD PARTY

(a) At Common Law.—The actual authority of a factor is defined by the same limits as his duty, the nature of which has been just described; i.e. firstly, by his principal's express instructions; secondly, by the rules of law and usages of trade, in view of which those instructions were expressed. But his power to bind his principal as regards third parties is often wider than the actual authority; for it would not be reasonable to suppose that third parties should be prejudiced by secret instructions, given in derogation of the authority ordinarily conferred by the custom of trade; and, as regards them, the factor is said to have "apparent" or "ostensible" authority, or to be held out as having
authority to do what is customary, even though he may in fact have been expressly forbidden to do by his principal. But this rule is subject to the proviso that if the third party have notice of the factor's actual instructions, the 'apparent' authority will not be greater than the actual. The general principle of law," said Lord Blackburn in the case of Cole v. North-Western Bank, 1875, 1 L.R. 10, C.P. 363, "is that when the true owner has clothed any one with apparent authority to act as his agent, he is bound to those who deal with the agent on the assumption that he really is an agent and that authority, to the same extent as if the apparent authority were real." Under such circumstances the principal is for reasons of common fairness precluded, or, in legal phraseology, estopped, from denying his agent's authority. On the same principle of estoppel, but not by reason of any trade usages, a course of dealing which has been followed between a factor and a third party with the assent of the principal will give the factor apparent authority to continue dealing on the same terms even after the principal's assent has been withdrawn; provided that the third party has no notice of the withdrawal. Such apparent authority binds the principal both as to acts done in the factor's name as to actual authority and also when the actual authority has entirely ceased. For instance, A.B. receives goods from C. D. with instructions not to sell below 1s. per lb; A. B. sells at 10d., the market price; the buyer is entitled to the goods at 10d., because A. B. had apparent authority, although he exceeded his actual authority. On the same principle the buyer would get a good title by buying from A. B. goods entrusted to him by C. D., even though at the time of the sale C. D. had revoked A. B.'s authority and instructed him not to sell at all. In either case the factor is held out as having authority to sell, and the principal cannot afterwards make a declaration to the contrary. As in the course of his business the factor must necessarily make representations preliminary to the contracts into which he enters, so the principal will be bound by any such representations as may be within the factor's actual or apparent authority to the same degree as by the factor's contracts.

(b) Under the Factors Acts 1889.—The main object of the Factors Acts, in so far as they relate to transactions carried out by factors, has been to add to the number of cases in which third parties honestly buying or lending money on the security of goods may get a good title, because from factors whose possession the goods are in at the time of the consent, actual or apparent, of the real owners, thus calling in aid the principle of French law that "possession est titre" as against the doctrine of the English common law that "nemo dat quod non habet." The chief change in the law relating specially to factors has been to put pledges by factors on the same footing as sales, so as to bind a principal to third parties by his factor's pledge as by his factor's sale. The Factors Acts 1889 in part re-enacts and in part extends the provisions of the earlier acts of 1823, 1825, 1842 and 1877; and, is, so far as it relates to sales by factors, in large measure declaratory of the law as it previously existed. Its most important provisions concerning factors are as follows:

Section I., s.s. 1. The expression mercantile agent shall mean a mercantile agent having in the customary course of his business as such agent authority either to sell goods, or to consign goods for the purpose of sale, or to buy goods, or to raise money on the security of goods;

2. A person shall be deemed to be in possession of goods or of the documents or title to goods when the goods or documents are in his actual custody or are held by any other person subject to his control or for him on his behalf.

4. The expression "document of title" shall include any bill of lading, warehouse certificate, and warrant or order for the delivery of goods, and any other document used in the ordinary course of business as proof of the possession or control of goods, or authorizing or purporting to authorize, either directly or indirectly, the possession of the document of transfer or receive goods thereby represented.

Section II., s.s. 1. Where a mercantile agent is, with the consent of the owner, in possession of goods or of the documents or title to goods, any sale, pledge or other disposition of the goods made by him when acting in the ordinary course of business of a mercantile agent shall, subject to the provisions of this act, be as valid as if he were expressly authorized by the owner of the goods to make the same; provided that the person taking under the disposition acts in good faith, and has not at the time of the disposition notice that the person making the disposition has not authority to make the same.

2. Where a mercantile agent has, with the consent of the owner, been in possession of goods or of the documents of title to goods, any sale, pledge or other disposition which would have been valid if the consent had continued shall be valid notwithstanding the determination of the consent; provided that the person taking under the disposition has not at the time thereof notice that the consent has been determined.

3. Where a mercantile agent has obtained possession of any documents of title to goods by reason of his being or having been, with the consent of the owner, in possession of the goods represented thereby, or of any other documents of title to the goods, his possession of the first-mentioned documents shall, for the purposes of the act, be deemed to be with the consent of the owner.

III. ENFORCEMENT OF CONTRACTS

1. Where a factor makes a contract in the name of his principal and himself signs as agent only, he drops out as soon as the contract is made, and the principal and third party alone can sue or be sued upon it. As factors usually contract in their own name this is not a common case. It is characteristic of brokers rather than of factors. Where a factor makes a contract for the principal without disclosing his principal's name, the third party may, on discovering the principal, elect whether he will treat the factor or his principal as the party to the contract; provided that if the factor contract expressly as factor, so as to exclude the idea that he is personally responsible, he will not be liable. The principal may sue upon the contract, so also may the factor, unless the principal first intervene.

Where a factor makes a contract in his own name without disclosing the existence of his principal, the third party may, on discovering the existence of the principal, elect whether he will sue the factor or the principal. Either factor or principal may sue the third party upon the contract. But if the factor has been permitted by the principal to hold himself out as the principal, and the person dealing with the factor has believed that the factor was the principal and has acted on that belief before ascertaining his mistake, then in an action by the principal the third party may set up any defences he would have had against the factor if the factor had brought the action on his own account as principal.

4. Where a factor has a lien upon the goods and their proceeds are disposed of to the principal it will be no defence to an action by him for the third party to plead that he has paid the principal, unless the factor by his conduct led the third party to believe that he agreed to a settlement being made with his principal.

5. The factor who acts for a foreign principal will always be personally liable unless it is clear that the third party has agreed to look only to the principal.

6. If a factor contract by deed under seal he alone can sue or be sued upon the contract; but mercantile practice makes contracts by deed uncommon.

FACTORY ACTS, the name given generally to a long series of acts constituting one of the most important chapters in the history of English labour legislation (see LABOUR LEGISLATION); the term "factory" itself being short for manufactury, a building or collection of buildings in which men or women are employed in industry.

FACTULA (diminutive of faci, Lat. for "toch ") in astronomy, a minute shining spot on the sun's disk, markedly brighter than the photosphere in general, usually appearing in groups. Faculae are most frequent in the neighbourhood of spots. (See SUN.)

FACTULY (through the French, from the Lat. facultus, ability to do anything, from facilius, easy, facere, to do; another form of the word in Lat. facilias, facility, ease, keeps the original meaning), power or capacity of mind or body for particular kinds
of activity, feeling, &c. In the early history of psychology the term was applied to various mental processes considered as causes or conditions of the mind—a treatment of “class concepts of mental phenomena as if they were real forces producing these phenomena (G. F. Stout, Analytic Psychology, vol. i. p. 17).

In medieval Latin facultas was used to translate δυνάμεια in the Aristotelian application of the word to a branch of learning or knowledge, and thus it is particularly applied to the various departments of knowledge as taught in a university and to the body of teachers of the particular art or science taught. The principal “faculties” in the medieval universities were theology, canon and civil law, medicine and arts (see Universities). A further extension of this use is to the body of members of any particular profession.

In law, “faculty” is a dispensation or licence to do that which is not permitted by the common law. The word in this sense is used only in ecclesiastical law. A faculty may be granted to be ordained deacon under twenty-three years of age; to hold two livings at once (usually called a licence or dispensation, but granted under the seal of the office of faculties; see BENEFICE); to be married at any place or time (usually called a special licence; see MARRIAGE; LICENCE); to act as a notary public (q.v.). Any alteration in a church, such as an addition or diminution in the fabric or the utensils or ornaments of the church, cannot strictly be made without the legal sanction of the ordinary, which can only be expressed by the issue of a faculty. So a faculty would be required for a vault, for the removal of a body, for the purpose of erecting a monument, for the apportionment of a seat, &c. Cathedrals, however, are exempt from the necessity for a faculty before making alterations in the fabric, utensils or ornaments.

The court of faculties is the court of the archbishop for granting faculties. It is a court in which there is no litigation or holding of pleas. Its chief officer is called the master of faculties, and he is one and the same with the judge of the court of arches. Attached to the court of faculties are a registrar and deputy registrars, a chief clerk and record-keeper, and a seal keeper.

In Scotland the business of the court of arches, and local bodies of legal practitioners, are described as faculties.

FAED, THOMAS (1826-1900), British painter, born in Kirkcudbrightshire, was the brother of John Faed, R.S.A., and received his art education in the school of design, Edinburgh. He was elected an associate of the Royal Scottish Academy in 1849, came to London three years later, was elected an associate of the Royal Academy in 1861, and academician in 1864, and retired in 1893. He had much success as a painter of domestic genre, and had considerable executive capacity. Three of his pictures, "The Silken Gown," "Faulds on Both Sides," and "The Highland Mother," are in the National Gallery of British Art.

See William D. McKay, The Scottish School of Painting (1906).

FAENZA (anc. Faventia), a city and episcopal see of Emilia, Italy, in the province of Ravenna, from which it is 31 m. S.W. by rail, 110 ft. above sea-level. It is 31 m. S.E. of Bologna by rail, on the line from Bologna to Rimini, and it is the junction of a line to Florence through the Apennines. Pop. (1901) 21,809 (town), 39,757 (commune). The town is surrounded by walls which date from 1456. The cathedral of S. Costanzo stands in the spacious Piazza Vittorio Emanuele in the centre of the town. It was begun in 1474 by Giuliano da Maiano; the facade is, however, incomplete. In the interior is the beautiful early Renaissance tomb of S. Savinus with reliefs showing scenes from his life, of fine and fresh execution, by Benedetto da Maiano; and later tombs by P. Barlotti, a local sculptor. Opposite the cathedral is a fountain with bronze ornamentation of 1583-1621. The clock tower alongside the cathedral belongs to the 17th century. Beyond it is the Palazzo Comunale, formerly the residence of the Manfredi, but entirely reconstructed. The other churches of the town have been mostly restored, but S. Michele (and the Palazzo Manfredi opposite it) are fine early Renaissance buildings in brickwork. The municipal art gallery contains an altar-piece by Girolamo da Treviso (who also painted a fresco in the Chiesa della Commedia), a wooden St Jerome by Donatello, and a bust of the young St John by Antonio Rossellino (?), and some fine specimens of majolica, a variety of which, falence, takes its name from the town. It was largely manufactured in the 15th and 16th centuries, and the industry has been revived in modern times with success.

The ancient Faentia on the Via Annia, which is named from its name founded by the Romans and had the citizenship before the Social War. It was the scene of the defeat of C. Papirius Carbo and C. Norbanus by Q. Caecilius Metellus Pius in 82 B.C. In the census of Vespasion a woman of Faentia is said to have given her age as 135. Pliny speaks of the whiteness of its linen, and the productiveness of its vines is mentioned. It is noticeable that some of the fields in the territory of the ancient Faentia still preserve the exact size of the ancient Roman centuria of 200 iugera (E. Bormann in Corp. Inscrip. Lat. xi., Berlin, 1888, p. 121). When the exarchate was established, the town became part of it, and in 748 it was taken by Liutprand.

Desiderius gave it to the church with the duchy of Ferrara. In the 11th century it began to increase in importance. In the wars of the 12th and 13th centuries it at first took the imperial side, but in 1240 it stood a long siege from Frederick II. and was only taken after eight months. After further struggles between Guelfs and Ghibellines, the Manfredi made themselves masters of the place early in the 14th century, and remained in power until 1501, when the town was taken by Caesar Borgia and the last legitimate members of the house of the Manfredi were expelled. It came under the hands of the Venetians, which became a part of the Venetians, in the 15th century. (T. As.)

FAEROE (also written FAROE or THE FAEROES, Danish Færøerne or Færoerne, "the sheep islands"), a group of islands in the North Sea belonging to Denmark. They are situated between Iceland and the Shetland Islands, about 200 m. N.W. of the latter, about the intersection of 7° E. with 62° N. The total land area of the group is 511 sq. m., and there are twenty-one islands (excluding small rocks and reefs), of which seventeen are inhabited. The population in 1880 amounted to 11,220, and in 1900 to 15,230. The principal islands are Streymoy, on which is the chief town, Thorshavn, with a population of 1656; Osterø, Suderø, Vagø, Sandø and Bordø. They consist throughout of rocks and hills, separated from each other by narrow valleys or ravines; but, though the hills rise abruptly, there are often on their summits, or at different stages of their ascent, plains of considerable magnitude. Almost everywhere they present to the sea perpendicular cliffs, broken into fantastic forms, affording at every turn, to those who sail along the coast, the most picturesque and varied scenery. The highest hills are Skjáttar-Iður in Osterø, and Kopende and Skellingfjord in Strømø, which rise respectively to 2804, 2592 and 2520 ft. The sea pierces the islands in deep fjords, or separates them by narrow inlets through which tidal currents set with great violence, at speeds up to seven or eight knots an hour; and, as communications are maintained almost wholly by boat, the natives have need of expert seamanship. There are several lakes in which trout are abundant, and char also occur; the largest is Stórvág Lake in Vagø, which is close to the sea, and discharges into it by a sheer fall of about 160 ft. Trees are scarce, and there is evidence that they formerly flourished where they cannot do so now.

The fundamental formation is a series of great sheets of columnar basalt, 70 to 100 ft. thick, in which are intercalated thin beds of tuff. Upon this basalt rests a so-called coalformation, 35 to 200 ft. thick; the lower part of this is mainly fireclay and sandstone, the upper part is weathered clay with thin layers of brown coal and shale. The coal is found in Súderó and in some of the other islands in sufficient quantity to make it a matter of exploitation. Above these beds there are layers of dolerite, 15 to 20 ft. thick, with nodular segregations and abundant cavities which are often filled with water, and the roof of the rocks is composed of basaltic lava. The islands of the group only the basalts or dolerite are visible. The crater from which the volcanic rocks were erupted probably lies off the Faeroe Bank some distance to the south-west of the basaltic. The basalt flows which formed the basis of the land
FAESULAE

upon which grew the vegetation which gave rise to the coals; the efflorescence of dolerite which covered up the Coal formation was subaerial. Ty the existing land features, with the fjords, are due to ice erosion in the glacial period.

The climate is oceanic; fogs are common, violent storms are frequent at all seasons. July and August are the only true summer months, but the winters are not very severe. It seldom freezes for more than one month, and the harbours are rarely ice-bound. The methods of agriculture are extremely primitive and less than 3% of the total area is under cultivation. As the plough is ill-suited to the rugged surface of the land, the ground is usually turned up with the spade, care being taken not to destroy the grass, as hay is the principal crop. Horses and cows are few, and the productive little milk, in consequence of the coarse hay upon which they are fed. The number of sheep, however, justifies the name of the islands, some individuals having flocks of from three to five hundred, and the total number in the islands considerably exceeds ten thousand. The northern hare (Lepus alpinus) is pretty abundant in Strömö and Osterö, having been introduced into the islands about 1840–1850. The catching of the numerous sea-birds which build their nests upon the faces of the cliffs forms an important source of income for the inhabitants. Sometimes the fowler is led down from the top of the cliff, at other times he climbs the rocks, or, where possible, is pushed upwards by poles made for the purpose. The birds and the contents of the nests are taken in nets mounted on poles; shooting is not practised, lest it should permanently scare the birds away. Fowling has somewhat decreased in modern times, as the fisheries have risen in importance. The puffin is most commonly taken for its feathers. The cod fishery is especially important, dried fish being exported in large quantity, and the swim-bladders made into gelatine, and also used and exported for food. The whaling industry came into importance towards the close of the 19th century, and stations for the extraction of oil and whalebone have been established at several points, until the careful regulations designed to mitigate the pollution of water, the danger to livestock from eating the blubber, &c. The finer whale is the species most commonly taken.

The trade of the Faeroe Islands was for some time a monopoly in the hands of a mercantile house at Copenhagen, and this monopoly was afterwards assumed by the Danish government, but by the law of the 21st of March 1855 all restrictions were removed. The development of the whaling and fishing industries, woolen goods, lamb skins and other articles, are the chief exports, while in Thorshavn the preserving of fish and the manufacture of carpets are carried on to some extent. Thorshavn is situated on the S.E. side of Strömö, upon a narrow tongue of land, having creeks on each side, where ships may be safely moored. It is the seat of the chief government and ecclesiastical officials, and has a government house and a hospital. The houses are generally built of wood and roofed with birch bark covered with turf. The character of the people is marked by simplicity of manners, kindness and hospitality. They are healthy, and the population increases steadily. The Faeroes form an amt (county) of Denmark. They have also a local parliament (lagthing), consisting of the anmann and nineteen elected members. Among other duties, this body elects a representative to the upper house of parliament (landsting) in Denmark; the people choose by vote a representative in the lower house (folketing). The islands are included in the Danish bishopric of Zealand.

History.—The early history of the Faeroes is not clear. It appears that about the beginning of the 9th century Grim Kambach, a Norwegian emigrant who had left his country to escape the Danes, and Harold Haafager, settled in the islands. It is said that a small colony of Irish and Scottish monks were found in Súðerö and dispersed by him. The Faeroes then already bore their name of Sheep Islands, as these animals had been found to flourish here exceedingly. Early in the 11th century Sigmund or Sigismund Bresterson, whose family had flourished in the southern islands but had been almost extirpated by

FAFNIR—FA-HIEN

FAFNIR, in Scandinavian mythology, the son of the giant Hreidmar. He was the guardian of the hoard of the Nibelungs and was killed by Sigurd.

FAGGING (from "fag," meaning "weary"; of uncertain etymology), in English public schools, a system under which, generally with the full approval of the authorities, a junior boy performs certain duties for a senior. In detail this custom varies slightly in the different schools, but its purpose—the maintenance of discipline among the boys themselves—is the same. Dr Arnold of Rugby defined fagging as "the power given by the supreme authorities of the school to the Sixth Form, to be exercised by them over the lower boys, for the sake of securing a regular government among the boys themselves, and avoiding the evils of anarchy; in other words, of the lawless tyrants and night-fags that used to be before 1837." Fagging as a custom in Rugby school became known to the public when, in 1847, he was appointed to the principalship of Eton and Winchester in the 16th century, and is probably a good deal older. That the advantages of thus granting the boys a kind of autonomy have stood the test of time is obvious from the fact that in almost all the great public schools founded during the 19th century, fagging has been deliberately adopted by the authorities. The right to fag carries with it certain well-defined duties. The fag-master is the protector of his fags, and responsible for their happiness and good conduct. In cases of bullying or injustice their appeal is to him, not to the form or house master, and, except in the gravest cases, all such cases are dealt with by the fag-master on his own responsibility and without report to the master. Until recent years a fag's duties included such humble tasks as blacking boots, brushing clothes, and cooking breakfasts, and there was no limit as to hours; almost all the fag's spare time being so monopolized. This is now changed. Fagging is now restricted to such light tasks as running errands, bringing tea to the "master's" study, and fagging at cricket or football. At Eton there is no cricket fagging, and at most schools it is made lighter by all the fags taking their turn in regular order for one hour, so that each boy has to "fag" but once in so many weeks. At Rugby there is "study-fagging"—two fags being assigned to each Sixth Form boy and made responsible for the sweeping out and tidying up of his study alternately each week,—and "night-fagging"—running errands for the Sixth between 8.30 and 9.30 every evening,—and each boy can choose whether he will be a study-fag or night-fag. The right to fag is usually restricted to the Sixth Form, but at Eton the privilege is also granted the Fifth, and at Marlborough and elsewhere the Eleven have a right to fag at cricket, whether in the Sixth or not.

FAGGOT, a bundle of sticks used for firewood. The word is adapted from the Fr. fagot, and appears in Italian as fagotto, the name given to the hosepipe of the Roman fagotto. Fagot is frequently used with reference to the burning of heretics, and recanted heretics wore an embroidered fagot on the arm as a symbol of the punishment they had escaped. In the 18th century the word is used of a "dummy" soldier, appearing on the rolls of a regiment. It is this use, coupled with the idea of a bundle of sticks as being capable of subdivision, that appears in the expression "faggot-vote," a vote artificially created by the minute splitting up of property so as to give a bare qualification for the franchise.

FAVE CHARLES (1842— ), French historian and economist, was born in Paris on the 6th of October 1842. Trained at the Ecole des Chartes and the Ecole des Hautes Études, he made his first appearance in the world of scholarship as the author of an excellent book called Études sur l'industrie et la classe industrielle à Paris au XIIIe et au XIVe siècle (1877). This work, composed almost entirely from documents, many unpublished, opened a new field for historical study. Twenty years later he supplemented this book by an interesting collection of Documents relatifs à l'histoire de l'industrie et du commerce en France (2 vols., 1898-1900), and in 1897 he published L'Économie sociale de la France sous Henri IV, a volume containing the results of very minute research. He did not, however, confine himself to economic history. His Le Père Joseph et Richelieu (1894), though somewhat frigid and severe, is based on a mass of unpublished information, and shows remarkable psychological grasp. In 1878 his Journal parisiens de Jean de Maupoint, prieur de Ste Catherine-de-la-Couture was published in vol. iv. of the Mémoires de la société de l'histoire de Paris et de l'Île de France. He wrote numerous articles in the Revue historique (of which he was co-director with Gabriel Monod for some years) and in other learned reviews, such as the Revue des questions historiques and the Journal des savants. In 1901 he was elected member of the Académie des Sciences Morales et Politiques.

FAGUET, ÉMILE (1847— ), French critic and man of letters, was born at La Roche sur Yon on the 17th of December 1847. He was educated at the normal school in Paris, and after teaching for some time in La Rochelle and Bordeaux he came to Paris. After acting as assistant professor of poetry in the university of Paris, he became one of the most active members of the Academy of France in 1900, and received the ribbon of the Legion of Honour in the next year. He acted as dramatic critic to the Soleil; from 1892 he was literary critic to the Revue bleue; and in 1896 took the place of M. Jules Lemaitre on the Journal des débats. Among his works are monographs on Flaubert (1890), André Chénier (1902), Zola (1903); an admirably concise Histoire de la littérature française depuis le XVIIe siècle jusqu'à nos jours; series of literary studies on the 17th, 18th and 19th centuries; Questions politiques (1896); Propos littéraires (3 series, 1902-1903); Le Libéralisme (1902); and L'Anticléricalisme (1906).

See A. Séchel, Émile Faguet (1904).

FA-HIEN (fl. A.D. 399-414), Chinese Buddhist monk, pilgrim-traveller, and writer, author of one of the earliest and most valuable Chinese accounts of India. He started from Changgan or Si-gan-fu, then the capital of the Tsin empire, and passing the Great Wall, crossed the 'River of Sand' or Gobi Desert beyond, that home of 'evil demons and hot winds,' which he vividly describes,—where the only way-marks were the bones of the dead, where no bird appeared in the air above, no animal on the ground below. Arriving at Khotan, the traveller witnessed a great Buddhist festival; here, as in Yarkand, Afghanistan and other parts thoroughly Islamized before the close of the middle ages, Fa-Hien shows us Buddhism still prevailing. India was reached by a perilous descent of "ten thousand cubits" from the "wall-like hills" of the Hindu Kush into the Indus valley (about A.D. 402); and the pilgrim passed the next ten years in the "central" Buddhist realm,—making journeys to Peshawur and Afghanistan (especially the Kabol region) on one side, and to the Ganges valley on another. His especial concern was the exploration of the scenes of Buddha's life, the copying of Buddhist texts, and converse with the Buddhist monks and sages whom the Brahmin reaction had not yet driven out. Thus we find him at Buddha's birthplace on the Kshinna, north-west of Benares; in Patna and on the Vulture Peak near Patna; at the Jetvana monastery in Oudh; as well as at Muttra on the Jumna; at Kanauj, and at Tamulk near the mouth of the Hugi. But now the narrative, which in its earlier portions was primarily historical and geographical, becomes mystical and theological; miracles-stories and meditations upon Buddhist morals and sacred memories almost entirely replace matters of fact. From the Ganges delta Fa-Hien sailed with a merchant ship, in fourteen days, to Ceylon, where he transcribed all the sacred books, as yet unprinted in China; and there he found; witnessed the festival of the exhibition of Buddha's tooth; and remarked the trade of Arab merchants to the island, two centuries before Mahomet. He returned by sea to the mouth of the Yangtse-Kiang, changing vessels at Java, and narrowly escaping shipwreck or the fate of Jonah.

Fa-Hien's work is valuable evidence to the strength, and in many places to the dominance, of Buddhism in central Asia and in India at the time of the collapse of the Roman empire in western Europe. His tone throughout is that of the devout, learned, sensible, rarely hysterical pilgrim-traveller. His record is careful and accurate, and most of his positions can be identified; his devotion is so strong that it leads him to depreciate China as a "border-land," India the home of Buddha being the true "middle kingdom" of his creed.
See James Legge, Record of Buddhist Kingdoms, being an account by the Chinese monk Hsüan-tsang of his travels in India and Ceylon, translated and edited, with map, etc. (Oxford, 1886); S. Beal, Travels of Fa-Hsiian and Sung-Yuan, Buddhist pilgrims from China to India, 400 and 518 A.D., translated, with map, etc. (1866); C. R. Beazley, Dawn of Modern Geography, vol. i (1897), pp. 479-485.

FAHLCRANTZ, CHRISTIAN ERIK (1790-1866), Swedish author, was born at Stora Tuna in Sweden on the 30th of August 1790. His brothers, Carl Johan (1774-1851), the landscape-painter, and Axel Magnus (1780-1854), the sculptor, became hardly less distinguished than himself. In 1804 he entered the university of Upsala; in 1821 he became tutor in Arabic, and in 1825 professor of Oriental languages. In 1828 he entered the church, but earlier than this, in 1825, he published his Nousch Ark, a successful satire on the literary and social life of his time, followed in 1826 by a second part. In 1835 Fahlcrantz brought out his largest part of his works. A second part was completed in 1846, in 14 cantos. In 1842 he was made a member of the Swedish Academy, and in 1849 he was made bishop of Vesterås, his next literary work being an archaeological study on the beautiful ancient cathedral of his diocese. In the course of the years 1858-1861 appeared the five volumes of his Rom for och nu (Rome as it was and is), a theological polemic, mainly directed against the Jesuits. He died on the 6th of August 1866. His works complete (7 vols., Örebro, 1863-1866) were issued mainly under his own superintendence.

FAHRENHEIT, GABRIEL DANIEL (1686-1736), German physicist, was born in Danzig on the 14th of May 1686. For the most part he lived in England and Holland, devoting himself to the study of physics and making a living, apparently, by the manufacture of meteorological instruments. He was the author of important improvements in the construction of thermometers, and he introduced the thermometric scale known by his name and still extensively used in Great Britain and the United States (see THERMOMETER). He also invented an improved form of hygrometer, a description of which, together with accounts of various observations and experiments made by him, was published in the Phil. Trans. for 1724. He died in Holland on the 16th of September 1736.

FAIDHERBE, LOUIS LÉON CÉSAR (1818-1889), French general and colonial administrator, was born on the 3rd of June 1818, at Lille, received his military education at the École Polytechnique and at Metz, and entered the engineers in 1840. From 1844 to 1847 he served in Algeria, then two years in the West Indies, and again in Algeria, taking part in many expeditions against the Arabs. In 1852 he was transferred to Senegal as sub-director of engineers, and in 1854 was promoted chef de bataillon and appointed governor of the colony. He held this post with one brief interval until July 1863. The work he accomplished in West Africa constitutes his most enduring monument. At that time France possessed in Senegal little more than the town of St Louis and a strip of coast. Explorers had, however, made known the riches and possibilities of the Niger regions, and Faidherbe formed the design of adding those countries to the French dominions. He even dreamed of creating a French African empire stretching from Senegal to the Red Sea. To accomplish even the first part of his design he had very inadequate resources, especially in view of the aggressive action of Omar Al-Hadjji, the Moslem ruler of the countries of the middle Niger. By boldly advancing the French outposts on the upper Senegal Faidherbe steamened the Moslem advance, and by an advantageous treaty with Omar in 1860 brought the French possessions into touch with the Niger. He also brought into subjection the country lying between the Senegal and Gambia. When he resigned his post French rule had been firmly established over a very considerable and fertile area and the foundation laid upon which his successors built up the predominant position occupied now by France in West Africa. In 1863 he became general of brigade. From 1867 to the early part of 1870 he commanded the subdivision of Bona in Algeria, and was commanding the Constantine division at the commencement of the Franco-German War. Promoted general of division in November 1870, he was on the 3rd of December appointed by the Government of National Defence to be commander-in-chief of the army of the North. In this post he showed himself to be possessed of the highest military talents, and the struggle between the 1st German army and that commanded by Faidherbe, in which were included the hard-fought battles of Pont Noyelles, Bapaume and St Quentin, was perhaps the most memorable to the French army in the whole of the People's War. Even with the inadequate force of which he disposed he was able to maintain a steady resistance up to the end of the war. Elected to the National Assembly for the department of the Nord, he resigned his seat in consequence of its reactionary proceedings. For his services he was decorated with the grand cross, and made chancellor of the order of the Legion of Honour. In 1872 he went on a scientific mission to Upper Egypt, where he studied the monuments and inscriptions. An enthusiastic geographer, philologist and archaeologist, he wrote numerous works, among which may be mentioned Collection des inscriptions numismatiques (1879), Épigraphie phénicienne (1873), Essai sur la langue paul (1853), and Le Zénaga des tribus séngalaises (1877), the last a study of the Berber language. He also wrote on the geography and history of Senegal and the Sahara, and La Campagne de l'armée du Nord (1872). He was elected a senator in 1879, and, in spite of failing health, continued to the last a close student of his favourite subjects. He died on the 29th of September 1889, and received a public funeral. Statues and monuments to his memory were erected at Lille, Bapaume, St Quentin and St Louis, Senegal.

FAIJENCE. properly the French term for the porcellana di Faenza, a fine kind of glazed and painted earthenware of Faenza in Italy, hence a term applied generally to all kinds of pottery other than unglazed pottery or porcelain. It is often particularly applied to the translucent earthenware made in Persia (see CERAMICS).

FAILY, PIERRE LOUIS CHARLES DE (1810-1892), French general, was born at Rozoy-sur-Serre (Aisne) on the 21st of January 1810, and entered the army from St Cyr in 1828. In 1831 he had risen to the rank of colonel, and Napoleon III., with whom he was a favourite, made him general of brigade in 1854 and general of division in 1855, after which for a time De Faily was his aide-de-camp. In the war of 1859 De Faily commanded a division, and in 1867 he defeated Garibaldis at Mentana, this action being the first in which the chassepot was used. In 1870 De Faily commanded the V. corps. His inactivity at Bitsch on the 6th of August while the I. corps on his right and the II. corps on his left were crushed at Würth and Spichern respectively, gave rise to the greatest indignation in France, and his military career ended, after the V. corps had been severely handled at Beaumont on the 30th of August, with the catastrophe of Sedan. The rest of his life was spent in retirement. De Faily wrote Campagne de 1870, Opérations et marche du 5º corps jusqu'au 30 août (Brussels, 1872).

FAING, AGATHON JEAN FRANÇOIS (1778-1837), French historian, was born in Paris on the 11th of January 1778. Having gained admittance to the offices of the Directory, he became head of a department. Under the Consulate he entered the office of the secretary of state, in the department of the archives. In 1806 he was appointed secretary and archivist to the cabinet particulier of the emperor, whom he attended on his campaigns and journeys. He was created a baron of the empire in 1809, and, on the fall of Napoleon, was first secretary of the cabinet and confidential secretary. Compelled by the second Restoration to retire into private life, he devoted his leisure to writing the history of his times, an occupation for which his previous employments well fitted him. He published successively Manuscrit de 1814, contenant l'histoire des six derniers mois du règne de Napoléon (1823; new edition with illustrations, 1906); Manuscrit de 1813, contenant le précis des événements de cette année pour servir à l'histoire de l'empereur Napoléon (1824); Manuscrit de 1812 (1827); and Manuscrit de l'an iii. (1794-1795), contenant les premières transactions de l'Empire avec la république françoise et le tableau des derniers événements du régime conventionnel (1839), all of which are remarkable for accuracy and wide range of knowledge, and are a very valuable source for the history of
FAIR

127

Napoleon I. Of still greater importance for the history of Napoleon are Fain's Mémoires, which were published posthumously in 1908; they relate more particularly to the last five years of the empire, and give a detailed picture of the emperor at work on his correspondence among his confidential secretaries. Immediately after the overthrow of Charles X., King Louis Philippe appointed Fain first secretary of his cabinet (August 1830). Fain was a member of the council of state and deputy from Montargis from 1834 until his death, which occurred in Paris on the 16th of September 1837.

PAIR, a commercial institution, defined as a "greater species of market recurring at more distant intervals"; both "fair" and "market" (q.v.) have been distinguished by Lord Coke from "mart," which he considers as a greater species of fair; and all three may be defined as periodic gatherings of buyers and sellers in an appointed place, subject to special regulation by law or custom. Thus in England from a strictly legal point of view there can be no fair or market without a franchise; and a franchise of fair or market can only be exercised by right of a grant from the crown, or by the authority of parliament or by prescription presupposing a grant. In the earliest times periodical trading in special localities was necessitated by the difficulties of communication and the dangers of travel. Public gatherings, whether religious, military or judicial, which brought together widely scattered populations, were utilized as opportunities for commerce. At the festivals of Delos and at the Olympic games traders from all countries were admitted; in India in 377 B.C. there was an annual general assembly at the temple of Volsinna served at the same time as a fair and was regularly attended by Roman traders. Instances of a similar nature might be multiplied; but it was above all with religious festivals which recurred with regularity and convoked large numbers of persons that fairs, as distinguished from markets, are most intimately associated.

The most commonly accepted derivation of the word "fair" is from the Latin feria, a name which the church borrowed from Roman custom and applied to its own festivals. A fair was generally held during the period of a saint's feast and in the precincts of his church or abbey, but in England this desecration of church or churchyard was first forbidden by the Statute of Winton (c. Edward I.). Most of the famous fairs of medieval England and Europe, with their tolls or other revenues, and, within certain limits of time and place, their monopoly of trade, were grants from the sovereign to abbots, bishops and other ecclesiastical dignitaries. Their "holy day" associations are preserved in the German word for fairs, Messen; as also in the kirmis, "church mass," of the people of Brittany. So very intimate was the connexion between the fair and the feast of the saint that the former has very commonly been regarded as an off-shoot of the latter. In England the creation of a fair by a lord or by a council was a matter of great importance, and it is necessary to suppose that fairs were already existing national institutions, long before the church turned or was privileged to turn them to her own profit.

The first charter of the great fair of Stourbridge, near Cambridge, was granted by King John for the maintenance of a leper hospital; but the origin of the fair itself is ascribed to Carausius, the rebel emperor of Britain, A.D. 207. At all events, it may be seen from the data given in Herbert Spencer's Descriptive Sociology that the country had then arrived at the stage of development where fairs might have been recognized as a necessity. The Romans also appear to have elaborated a market-law similar to that in force throughout medieval Europe;—though it must be observed that the Roman nudinæ, which some have regarded as fairs, were weekly markets. It has also been supposed that the ancient fairs of Lyons were a special privilege granted by the Roman conquerors; and Sidonius Apollinaris, A.D. 427, alludes to the fairs of the district afterwards known as the county of Champagne, as if they were then familiarly known institutions. Fairs, in a word, would not only have arisen naturally, wherever the means of communication between individual centres of production and consumption were felt to be inadequate to the demand for an interchange of commodities; but, from their very nature, they might be expected to show some essential resemblances, even in points of legislation, and where no international transmission of custom could have been possible. Thus, the fair courts of pre-Spanish Mexico corresponded very closely to those of the Bourgeois fairs; they resembled the English courts of piepowder. The Spaniards, when first they saw the Mexican fairs, were reminded of the like institutions in Salamanca and Granada. The great fair or market at the city of Mexico is said to have been attended by about 40,000 or 50,000 persons, and is thus described by Prescott:—

"Officers patrolled the square, whose business it was to keep the peace, to collect the dues imposed on the various kinds of merchandise, to see that no false measures or fraud of any kind were used, and to bring offenders at once to justice. A court of twelve judges sat in one part of the tianguis clothed with those ample and summary powers which, in despotic countries, are often delegated even to petty tribunals. The extreme severity with which they exercised those powers, in more than one instance, proves that they were not a dead letter."

But notwithstanding the great antiquity of fairs, their charters are comparatively modern—the oldest known being that of St Denys, Paris, which Dagobert, king of the Franks, granted (A.D. 642) to the monks of the place "for the glory of God, and the honour of St Denys at his festival."

In England it was only after the Norman conquest that fairs became of capital importance. Records exist of 2800 grants of franchise markets and fairs between the years 1190 and 1483. More than half of these were made during the reign of John and Henry III., when the power of the church was in ascendancy. The first recorded grant, in 1147, is to the Conqueror by the bishop of Winchester, for leave to hold an annual "free fair" at St Giles's hill. The monk who had been the king's jester received his charter of Bartholomew fair, Smithfield, in the year 1133. And in 1248 Henry III. granted a like privilege to the abbot of Westminster, in honour of the "translation" of Edward the Confessor. Sometimes fairs were granted to towns as a means for enabling them to recover from the effects of war and other disasters. Thus, Edward III. granted a "free fair" to the town of Burnley in Rutland, just as, in subsequent times, Charles VII. favoured Bordeaux after the English wars, and Louis XIV. gave fair charters to the towns of Dieppe and Toulon. The importance attached to these old fairs may be understood from the inducements which, in the 14th century, Charles IV. held out to traders visiting the great fair of Frankfort-on-Main. The charter declared that both during the continuance of the fair, and for eighteen days before and after it, merchants would be exempt from imperial taxation, from arrest for debt, or civil process of any sort, except such as might arise from the transactions of the market itself and within its precincts. Philip of Valois' regulations for the fair of Paris were similar; and the fairs of Venice are typical of all subsequent fair-legislation of the kingdom, but even of the English and German laws on the subject. The fair had its staff of notaries for the attestation of bargains, its court of justice, its police officers, its sergeants for the execution of the market judges' decrees, and its visitors—of whom we may mention the prud'hommes,—whose duty it was to examine the quality of goods exposed for sale, and to confiscate those found unfit for consumption. The confiscation required the consent of five or six representatives of the merchant community at the fair. The effect of these great "free fairs" of England and the continent on the development of society was indeed great. They helped to familiarize the western and northern countries with the banking and financial systems of the Lombards and Florentines, who resorted to them under the protection of the sovereign's "firm peace," and the ghostly terrors of the pope. They usually became the seat of foreign agencies. In the names of her streets Provins preserved the memory of her 12th-century intercourse with the agents and merchants of Germany and the Low Countries, and long before that time the Syrian traders at St Denys had established their powerful association in Paris. A merchant's trade required a "pass," and a "certificat," and a "commission," and a "commission," and a "commission," and a "commission," and a "commerce," all of which words are derived from the Latin com, together; and the commercial order evoked and cherished the international spirit. And during long ages, when commercial "protection" was regarded
as indispensable to a nation's wealth, and the merchant was compelled to "fight his way through a wilderness of taxes," they were the sole and, so far as they went, the complete substitute for the free trade of later days.

Their privileges, however, were from their very nature, destined to grow more oppressive and intolerable the more the towns were multiplied and the means of communication increased. The people of London were compelled to close their shops during the days when the abbot of Westminster's fair was open. But a more curious and complete instance of such an ecclesiastical monopoly was that of the St Giles's fair, at first granted for the customary three days, which were increased by Henry III. to sixteen. The bishop of Winchester was, as we have seen, the lord of this fair. On the eve of St Giles's feast the magistrates of Winchester surrendered the keys of the city gates to the bishop, who then appointed his own mayor, bailiff and coroner, to hold office until the close of the fair. During the same period, Winchester and Southampton also—though it was then a thriving trading town—were forbidden to transact their ordinary commercial business, except within the bishop's fair, or with his special permission. The bishop's officers were posted along the highways, with power to forfeit to his lordship all goods bought and sold within 7 m. of the fair—in whose centre stood "the pavilion," or bishop's court. It is clear, from the curious record of the *Establishmeni et Expenses of the Household* of Percy, 5th earl of Northumberland, that fairs were the chief centre of country traffic even as late as the 16th century. They began to decline rapidly after 1759, when good roads had been constructed and canal communication established between Liverpool and the towns of Yorkshire, Cheshire and Lancashire. In the great towns their extinction was hastened in consequence of their evil effects on public morals. All the London fairs were abolished as public nuisances before 1835—the last year of the ever famous fair of St Bartholomew; and the fairs of Paris were swept away in the storm of the Revolution.

**English Fairs and Markets.**—For the general reasons apparent from the preceding sketch of fairs in England, as in France and Germany, they have very largely given way to markets for specialties. Even the live-stock market of the metropolis is being superseded by the dead-meat market, a change which has been encouraged by modern legislation on cattle disease, the movements of home stock and the importation of foreign animals. Agricultural markets are also disappearing before the "agencies" and the corn exchanges in the principal towns. Still there are some considerable fairs yet remaining. Of the English fairs for live stock, those of Weyhill in Hampshire (October 10), St Faith's, near Norwich (October 17), as also several held at Devizes, Wiltshire, are among the largest in the kingdom. The firstnamed stands next to none for its display of sheep. Horncastle, Lincolnshire, is the largest horse fair in the kingdom, and is regularly visited by American and continental dealers. The other leading horse fairs in England are Howden in Yorkshire (well known for its hunters), Woodbridge (on Lady Day) for Suffolk horses, Barnet in Hertfordshire, and Lincoln. Exeter December fair has a large display of cattle, horses and most kinds of commodities. Large numbers of Scotch cattle are also brought to the fairs of Carlisle and Ormskirk. Nottingham has a fair for geese. Ipswich has a fair for lambs on the 1st of August, and for butter and cheese on the 1st of September. Gloucester fair is also famous for the last-named commodity. Falkirk fair, or tryst, for cattle and sheep, is one of the largest in Scotland; and Ballinsloe, Galway, holds a like position among Irish fairs. The Ballinsloe cattle are usually fed for a year in Leinster before they are considered fit for the Dublin or Liverpool markets.

**French Fairs.**—In France fairs and markets are held under the authority of the prefects, new fairs and markets being established by order of the prefects at the instance of the commune interested. Before the Revolution fairs and markets could only be established by *seigneurs justiciers*, but only two small markets had been established by 1790. These are exceptional to the general rule, market rights, namely, the *Marché Ste Catherine* and the *Marché des enfants rouges*, both in Paris. Under the present system markets and fairs are held in most of the towns and villages in France; and at all such gatherings entertainments form an important feature. The great fair of Beaucaire instituted in 1268 has steadily declined since the opening of railway communication, and now ranks with the fairs of ordinary provincial towns. Situated at the junction of the Rhône and the Canal du Midi, and less than 40 m. from the sea, it at one time attracted merchants from Spain, from Switzerland and Germany, and from the Levant and Mediterranean ports, and formed one of the greatest temporary centres of commerce on the continent. One trade firm alone, it is said, rarely did less than 1,000,000 francs worth of business during the fortnight that the fair lasted.

**German Fairs.**—In Germany the police authorities are considered the market authorities, and to them in most cases is assigned the duty of establishing new fairs and markets, subject to magisterial decision. The three great fairs of Germany are those of Frankfort-on-Main, Frankfort-on-Oder and Leipzig, but, like all the large fairs of Europe, they have declined rapidly in importance. Those of Frankfort-on-Main begin on Easter Tuesday and on the nearest Monday to September 8 respectively, and their legal duration is three weeks, though the limit is regularly extended. The fairs of the second-named city are *Reminis- score*, February or March; *St Margaret*, July; *St Martin*, November. Ordinarily they last fifteen days, which is double the legal term. The greatest of the German fairs are those of Leipzig, whose display of books is famous all over the world. Its three fairs are dated January 1, Easter, and Michaelmas. The first is the book fair, which is attended by all the principal booksellers of Germany, and by many more from the adjoining countries. Most German publishers have agents at Leipzig. As many as 2,000 new publications have been entered in a single Leipzig catalogue. As in the other instances given, the Leipzig fairs last for three weeks, or nearly their allotted duration. Here no days of grace are allowed, and the holder of a bill must demand payment when due, and protest, if necessary, on the same day, otherwise he cannot proceed against either drawer or endorser.

**Russian Fairs.**—The fairs occur held by local authorities. Local proprietors may also hold fairs on their estates subject to the sanction of the local authorities; but no private tolls may be levied on commodities brought to such fairs. In Siberia and the east of Russia, where more primitive conditions foster such centres of trade, fairs are still of considerable importance. Throughout Russia generally they are very numerous. The most important, that of Nijni Novgorod, held annually in July and August at the confluence of the rivers Volga and Kama, was instituted in the 17th century by the tsar Michael Fedoro- vitch. In 1882 it was calculated that the trade to the value of 450,000,000 roubles was carried on within the limits of the fair. It still continues to be of great commercial importance, and is usually attended by upwards of 100,000 persons from all parts of Asia and eastern Europe. Other fairs of consequence are those of Irib in Perm, Kharkoff (January and August), Poltava (August and February), Korennaia in Koursk, Ourloupinskaia in the Don Cossack country, Krolevetz in Tchernigoff, and a third fair held at Poltava on the feast of the Ascension.

**Indian Fairs.**—The largest of these, and perhaps the largest in Asia, is that of Hurdwar, on the upper course of the Ganges. The visitors to this holy fair number from 200,000 to 300,000; but every twelfth year there occurs a special pilgrimage to the sacred river, when the numbers may amount to a million or upwards. Those who go solely for the purposes of trade are Nepalese, Mongolians, Tibetans, central Asians and Mahom- medan peddlars from the Punjab, Sind and the border states. Persian shawls and carpets, Indian silks, Kashmir shawls, cottons (Indian and English), preserved fruits, spices, drugs, &c., together with immense numbers of cattle, horses, sheep and camels, are brought to this famous fair.

**American Fairs.**—The word "fair," as now used in the United States, appears to have completely lost its Old World meaning, and it has been exclusively applied to industrial exhibitions, and to what in England are called fancy bazaars. Thus, during the Civil War, large sums were collected at the "sanitary fairs."
for the benefit of the sick and wounded. To the first-named class belong the state and county fairs, as they are called. Among the first and best-known of these was the New York World's Fair, opened in 1853 by a company formed in 1851. (See Exhibition.)

Law of Fairs.—As no market or fair can be held in England without a royal charter, or right of prescription, so any person entering or using the place of such fair without authority is liable to be sued in any court of record, by a writ of *Quo warranto,* by any one to whose property the said market may be injurious. Nor can a fair or market be legally held beyond the time specified in the grant; and by 5 Edward III. c. 5 (1339) all selling goods after a legal expiry of the fair forfeited double their value. To be valid, a sale must take place in "market-ovet" (open market); "it will not be binding if it carries with it the forfeiture by insufficient regulations of a market in the sale," transfers a complete property in the thing sold to the vendor; so that however injurious or illegal the title of the vendor may be, yet the vendor's is good against all men except the king. (In *The Market Leases* 1st ed. London, 1850.)

FAIRBAIRN, A. M.—FAIRBAIRN, W. 129

If, however, by 21 Henry VIII. c. 2 (1529) it was enacted that, "if any felon rob or take away money, goods, or chattels, and be indicted and found guilty, or otherwise attainted upon evidence given by the owner or party robbed, or by any other person for procuration, the owner or party robbed shall be restored to his money, goods or chattels," but only those goods were restored which were specified in the complaint; now recoverable for a bona fide purchaser in market-ovet who had sold the goods before conviction. For obvious reasons the rules of market-ovet were made particularly stringent in the case of horses. Thus, by 2 Philip and Mary c. 13 (1780) no horse which a horse was legal which had not satisfied the following conditions:— Public exposure of the animal for at least an hour between sunrise and sunset; identification of the vendor by the market officer, or generally accepted mark or identification; one of these entries of the specifics, together with a description of itself, and a statement of the price paid for it, in the market officer's book. Even then the vendor could lose 20/- on the spot in spite of all precautions, and the owner could recover only if he claimed within six months, produced witnesses, and tendered the price paid to the vendor. Tolls were not a "necessary incident" of a fair,—i.e., they were not legally recoverable, nor were they recoverable by custom. As a rule, they were paid only by the vendor, and to the market clerk, whose record of the payment was an attestation to the genuineness of the purchase. By 2 & 3 Philip & Mary c. 7 even *the right to *hold a horse in market-ovet was exclusive to the area of the market. In *Judgments* (1826) it was laid down that the right to enter a market belonged to the person whose property had the right to be sold in market-ovet, and not to the owner of the land on which it stood. The market ground, as in medieval times, was the centre of the whole town, and the prospect of the fair attracted to the city from all around the hawker and pedlar. The law of Fairs has been thus described:—" ... des fairs, lute pedlar. 1st ed. London, 1848; vol. ii. (Paris, 1870); *Whereas the Dictionary of Commerce* (1860—1871); *Wharton's History of English Poetry,* pp. 185, 186 of edition of 1870 (London, Murray & Son), for a description of the Winchester Fair, &c.; a note by Professor Henry in his *Dictionary of English and American Biography,* vol. viii. (1889); *Grafton's History of the Borough of London,* London, 1876; *P. Huelin's Bartholomew Fair* (1897); *Report of the Royal Commission on Market Rights and Tolls,* London, vol. i. (1889), xiv. (1891); *Final Report* (1891); *Walford's Fairs, Past and Present* (1883); *The Law relating to Markets and Fairs,* by Pease and Chitty (London, 1890).

FAIRBAIRN, ANDREW MARTIN (1838—1922) was a British Non-conformist divine, was born near Edinburgh on the 4th of November 1858. He was educated at the universities of Edinburgh and Berlin, and at the Evangelical Union Theological Academy in Glasgow. He entered the Congregational ministry and held pastorates at Bathgate, West Lothian, and at Aberdeen. From 1877 to 1886 he was principal of Airedale College, Bradford, a post which he gave up to become the first principal of Mansfield College, Oxford. In the transference to Oxford under that name of Spring Hill College, Birmingham, he took a considerable part, and he has exercised influence not only over generations of his own students, but also over a large (Ember of un. M. Cadet) in the university generally. He was graded the degree of M.A. by a decree of Convocation, and in 1903 received the honorary degree of doctor of literature. He was also given the degree of doctor of divinity of Edinburgh and Yale, and doctor of laws of Aberdeen. His activities were not limited to his college work. He delivered the Muir lectures at Edinburgh University (1878—1882), the Gifford lectures at Aberdeen (1892—1894), the Lyman Beecher lectures at Yale (1891—1892), and the Haskell lectures in India (1898—1899). He was a member of the Royal Commission of Secondary Education in 1894—1895, and of the Royal Commission on the Endowments of the Welsh Church in 1895. In 1883 he was chairman of the Congregational Union of England and Wales. He is a prolific writer on theological subjects. He resigned his position at Mansfield College in the spring of 1909.

Among his works are—*Studies in the Philosophy of Religion and History* (1876); *Studies in the Life of Christ* (1881); *Religion in History* and *in Modern Life* (1884; rev. 1893); *Christ in Modern Thought* (1893); *Christian Doctrine* (1895); *The Roman Catholic* and Anglican (1896); *Philosophy of the Christian Religion* (1902); *Studies in Religion and Theology* (1909).

FAIRBAIRN, SIR WILLIAM, Bart. (1759—1874), Scottish engineer, was born on the 19th of February 1759 at Kelso, Roxburghshire, where his father was a farm-bailiff. In 1803 he obtained work at three shillings a week as a mason's labourer on a new bridge then being built by John Rennie at Kello; but within a few days he was incapacitated by an accident. Later in the same year, his father having been appointed steward on a farm connected with Percy Main Colliery near North Shields, he obtained employment as a carter in connexion with the colliery. In March 1804 he was bound an apprentice to a millwright at Percy Main, and then found time to supplement the deficiencies of his early education by systematic private study. It was at Percy Main that he made the acquaintance of George Stephenson, who then had charge of an engine at a neighbouring colliery. For some years he devoted himself to the study of the engine. In 1811 he lived a somewhat roving life, seldom remaining long in one place and often reduced to very hard straits before he got employment. But in 1812 he entered into partnership with a shopmate, James Liddle, with whose aid he hired an old shed in High Street, Manchester, where he set up a lathe and began business. The firm quickly secured a good reputation, contracts, "slander of wares," attestations, the preservation of order.

*J. M.; Ev. C.*

In Med. Lat. *pede-palmarum* meant an itinerant merchant or pedlar. In Scotch law the term *marchand de ville* and *marchand* are identical.

X. 5
and the improvements in mill-work and water-wheels introduced by Fairbairn caused its fame to extend beyond Manchester to Scotland and even the continent of Europe. The partnership was dissolved in 1832.

In 1830 Fairbairn had been employed by the Forth and Clyde Canal Company to make experiments with the view of determining whether it was possible to construct steamers capable of traversing the canal at a speed which would compete successfully with that of the railway; and the results of his investigation were published by him in 1831, under the title Remarks on Canal Navigation. His plan of using iron boats proved inadequate to overcome the difficulties of this problem, but in the development of the use of this material both in the case of merchant vessels and men-of-war he took a leading part. In this way also he was led to pursue extensive experiments in regard to the strength of iron. In 1833 he established, in conjunction with his Manchester business, a shipbuilding yard at Millwall, London, where he constructed several hundred vessels, including many for the royal navy; but he ultimately found that other engagements prevented him from paying adequate attention to the management, and at the end of fourteen years he disposed of the concern to a great extent. In 1837 he was consulted by the sultan of Turkey in regard to machinery for the government workshops at Constantinople. In 1845 he was employed, in conjunction with Robert Stephenson, in constructing the tubular railway bridges across the Conway and Menai Straits. The share he had in the undertaking has been the subject of some dispute; his own version is contained in a volume he published in 1849, An Account of the Construction of the Britannia and Conway Tubular Bridges. In 1849 he was invited by the king of Prussia to submit designs for the construction of a bridge across the Rhine, but after various negotiations, another design, by a Prussian engineer, which was a modification of Fairbairn's, was adopted. Another matter which engaged much of Fairbairn's attention was steam boilers, in the construction of which he effected many improvements. Amid all the cares of business he found time for varied scientific investigation. In 1852 his fertility and readiness of invention greatly aided an inquiry carried out at his Manchester works by Sir William Thomson (Lord Kelvin) and J. P. Joule, at the instigation of William Hopkins, to determine the melting points of substances under great pressure; and from 1861 to 1865 he was employed to guide the experiments of the government committee appointed to inquire into the "application of iron to defensive purposes." He died at Moor Park, Surrey, on the 18th of August 1874.

Fairbanks was a member of many learned societies, both British and foreign, and in 1861 served as president of the British Association. He declined a knighthood in 1861, but accepted a baronetcy in 1869.

His youngest brother, Sir Peter Fairbairn (1799–1861), founded a large machine manufacturing business in Leeds. Starting on a small scale with flax-spinning machinery, he subsequently extended his operations to the manufacture of textile machinery in general, and finally to that of engineering tools. He was knighted in 1858.

See The Life of Sir William Fairbairn, partly written by himself and edited and completed by Dr William Pole (1877).

**FAIRBANKS, ERASTUS** (1792–1864), American manufacturer, was born in Brimfield, Massachusetts, on the 28th of October 1792. He studied law but abandoned it for mercantile pursuits, finally settling in St Johnsbury, Vermont, where in 1824 he formed a partnership with his brother Thaddeus for the manufacture of stoves and ploughs. Subsequently the scales invented by Thaddeus were manufactured extensively. Erastus was a member of the state legislature in 1836–1838, and governor of Vermont in 1832–1833 and 1866–1867. During his second term he returned valuable aid in the equipment and despatch of troops in the early days of the Civil War. His son Horace (1820–1888) became president of E. & T. Fairbanks & Co. in 1874, and was governor of Vermont from 1876 to 1878.

His brother, Thaddeus Fairbanks (1796–1886), inventor, was born at Brimfield, Massachusetts, on the 17th of January 1796. He early manifested a genius for mechanics and designed the models from which he and his brother manufactured stoves and ploughs at St Johnsbury. In 1826 he patented a cast-iron plough which was extensively used. The growing of hemp was an important industry in the vicinity of St Johnsbury, and in 1831 Fairbanks invented a hemp-dressing machine. By the old contrivances then in use, the weighing of loads of hemp-straw was tedious and difficult, and in 1831 Fairbanks invented his famous compound-lever platform scale, which marked a great advance in the construction of machines for weighing bulky substances.

He subsequently obtained more than fifty patents for improvements in the manufacture of machinery and, in particular, in machinery used in their manufacture, the last being granted on his ninetieth birthday. His firm, eventually known as E. & T. Fairbanks & Co., went into the manufacture of scales of all sizes, in which these inventions were utilized. He, with his brothers, Erastus and Joseph P., founded the St Johnsbury Academy. He died at St Johnsbury on the 27th of April 1886.

The latter's son Henry, born in 1830 at St Johnsbury, Vermont, graduated at Dartmouth College in 1853 and at Andover Theological Seminary in 1857, and was professor of the classics at Andover for a few years. In 1865 he married Mary G. Bartlett, and in the following year he patented a grain-scale and therefrom devoted himself to the scale manufacturing business of his family. Altogether he obtained more than thirty patents for mechanical devices.

**FAIRFAX, EDWARD** (c. 1580–1635), English poet, translator of Tasso, was born at Leeds, the second son of Sir Thomas Fairfax of Denton (father of the 1st Baron Fairfax of Cameron). His legitimacy has been called into question, and the date of his birth has not been ascertained. He is said to have been only about twenty years of age when he published his translation of the Gerusalemme Liberata, which would place his birth about the year 1590. He preferred a life of study and retirement to the military service in which his brothers were distinguished. He married a sister of Walter Laycock, chief alnager of the northern counties, and lived on a small estate at Fewston, Yorkshire. There his time was spent in his literary pursuits, and in the education of his children and those of his elder brother, Sir Thomas Fairfax, afterwards baron of Cameron. His translation appeared in 1600—Godfrey of Bulloigne, or the Recovery of Jerusalem, done into English heroicall Verse by Edw. Fairfax, Gent., and was dedicated to the queen. It was enthusiastically received. In the same year in which it was published from it were printed in England's Parnassus. Edward Phillips, the nephew of Milton, in his Theatrum Parnassorum, warmly eulogized the translation. Edmund Waller said he was indebted to it for the harmony of his numbers. It is said that it was King James's favourite English poem, and that Charles I. entertained himself in prison with its pages. Fairfax employed the same number of lines and stanzas as his original, but within the limits of each stanza he allowed himself the greatest liberty. Other translators may give a more literal version, but Fairfax alone seizes upon the poetical and chivalrous character of the poem. He presented, says Mr Courthope, "an idea of the chivalrous past of Europe, as seen through the medium of Catholic orthodoxy and classical humanism." The sweetness and melody of many passages are scarcely excelled even by Spenser. Fairfax made no other appeal to the public. He wrote, however, a series of elegues, twelve in number, the fourth of which was published, by permission of the family, in Mrs Cooper's Muse's Library (1737). Another of the elegues and a Discourse on Witchcraft, as it was acted in the Family of Mr Edward Fairfax of Fusione in the county of York in 1621, edited from the original copy by Lord Houghton, appeared in the Miscellanies of the Philobiblon Society (1858–1860). Fairfax was a firm believer in witchcraft. He fancied that two of his children had been bewitched, and he had the poor wretches whom he accused brought to trial, but without obtaining a conviction. Fairfax died at Fewston and was buried there on the 27th of January 1635.

**FAIRFAX OF CAMERON, FERDINANDO FAIRFAX. 2nd Baron (1584–1648), English parliamentary general, was a son of Thomas Fairfax of Denton (1610–1640), who in 1627 was**
created Baron Fairfax of Cameron in the peerage of Scotland. Born on the 29th of March 1584, he obtained his military education in the Netherlands, and was member of parliament for Boroughbridge during the six parliaments which met between 1614 and 1629 and also during the Short Parliament of 1640. In May 1640 he succeeded his father as 3rd Baron Fairfax. Being a Scottish peer he sat in the English House of Commons as one of the representatives of Yorkshire during the Long Parliament from 1640 until his death; he took the side of the parliament, but held moderate views and desired to maintain the peace. In the first Scottish war Fairfax had commanded a regiment in the king's army; then on the outbreak of the Civil War in 1642 he was made commander of the parliamentary forces in Yorkshire, with Newcastle as his opponent. Hostilities began after the repudiation of a treaty of neutrality entered into by Fairfax with the Royalists. At first he met with no success. He was driven from York, where he was besieging the Royalists, to Selby; then in 1643 to Leeds; and after beating off an attack at that place he was totally defeated on the 30th of June at Adwalton Moor. He escaped to Hull, which he successfully defended against Newcastle from the 2nd of September till the 11th of October, and by means of a brilliant cavalry caused the siege to be raised. Fairfax was victorious at Selby on the 11th of April 1644, and joining the Scots besieged York, after which he was present at Marston Moor, where he commanded the infantry and was routed. He was subsequently, in July, made governor of York and charged with the further reduction of the county. In December he took the town of Pontefract, but failed to secure the castle. He resigned his command on the passing of the Self-denying Ordinance, but remained a member of the committee for the government of Yorkshire, and was appointed, on the 24th of July 1645, steward of the manor of Pontefract. He died from an accident on the 14th of March 1648 and was buried at Bolton Percy. He was twice married, and by his first wife, Mary, daughter of Edmund Sheffield, 3rd Lord Sheffield (afterwards 1st Earl of Mulgrave), he had six daughters and two sons, Thomas, who succeeded him as 3rd baron, and Charles, a colonel who was killed at Marston Moor. During his command in Yorkshire, Fairfax engaged in a paper war with Newcastle, and wrote The Answer of Ferdinando, Lord Fairfax, to a Declaration of William, Earl of Newcastle (1642; printed in Rushworth, pt. iii. vol. ii. p. 139); he also published A Letter from ... Lord Fairfax to ... Robert, Earl of Essex (1643), describing the victorious cavalry at Hull.

FAIRFAX OF CAMERON, THOMAS FAIRFAIR, 3rd BARON FAIRFAIR (1612-1671), parliamentary general and commander-in-chief during the English Civil War, the eldest son of the 2nd lord, was born at Denton, near Otley, Yorkshire, on the 17th of January 1612. He studied at St. John's College, Cambridge (1626-1629), and then proceeded to Holland to serve as a volunteer with the English army in the Low Countries under Sir Horace Vere. This connexion led to one still closer; in the summer of 1637 Fairfax married Anne Vere, the daughter of the general.

The Fairfax, father and son, though serving at first under Charles I. (Thomas commanded a troop of horse, and was knighted by the king in 1640), were opposed to the arbitrary prerogative of the crown, and Sir Thomas declared that "his judgment was for the parliament as the king and kingdom's great and safest council." When Charles endeavoured to raise a guard for his own person at York, intending it, as the event afterwards proved, to form the nucleus of an army, Fairfax was employed to present a petition to his sovereign, entreating him to hearken to the voice of his parliament, and to discontinue the raising of troops. This was at a great meeting of the freeholders and farmers of Yorkshire convened by the king on Heworth Moor near York. Charles evaded receiving the petition, pressing his horse forward, but Fairfax followed him and placed the petition on the pommel of the saddle. The incident occurs as the last act of the actors in the scene. War broke out, Lord Fairfax was appointed general of the Parliamentary forces in the north, and his son, Sir Thomas, was made lieutenant-general of the horse under him. Both father and son distinguished themselves in the campaigns in Yorkshire (see Great Rebellion). Sometimes severely defeated, more often successful, and always energetic, prudent and resourceful, they contrived to keep up the struggle until the crisis of 1644, when York was held by the marquess of Newcastle against the combined forces of the English Parliamentarians and the Scots, and Prince Rupert hastened with all available forces to its relief. A gathering of eager national forces within a few square miles of ground naturally led to a battle, and Marston Moor (q.v.) was decisive of the struggle in the north. The younger Fairfax bore himself with the greatest gallantry in the battle, and though severely wounded managed to join Cromwell and the victorious cavalry on the other wing. One of his brothers, Colonel Charles Fairfax, was killed in the action. But the marquess of Newcastle fled the kingdom, and the Royalists abandoned all hope of retaining their affairs. The city of York was taken, and nearly the whole north submitted to the parliament.

In the south and west of England, however, the Royalist cause was still active. The war had lasted two years, and the nation began to complain of the contributions that were exacted, and the excesses that were committed by the military. Dissatisfaction was expressed with the military commanders, and, as a preliminary step to reform, the Self-denying Ordinance was passed. This involved the removal of the earl of Essex from the supreme command, and the reconstruction of the armed force of the parliament. Sir Thomas Fairfax was selected as the new lord general with Cromwell as his lieutenant-general and cavalry commander, and after a short preliminary campaign the "New Model" justified its existence, and the 'rebels' new brutish general," as the king called him, his capacity as commander-in-chief in the decisive victory of Naseby (q.v.). The king fled to Wales. Fairfax besieged Leicester, and was successful at Taunton, Bridgewater and Bristol. The whole west was soon reduced.

Fairfax arrived in London on the 13th of November 1645, and his first step was to proceed to Oxford, where there was a strong garrison, but, ever vacillating, he withdrew secretly, and proceeded to Newark to throw himself into the arms of the Scots. Oxford capitulated; and by the end of September 1646 Charles had neither army nor garrison in England. In January 1647 he was delivered up by the Scots to the commissioners of parliament. Fairfax met the king before Nottingham, and, on the 29th of May, accompanied him to Holmby, treating him with the utmost consideration in every way. "The general," said Charles, "is a man of honour, and keeps his word which he had pledged to me." With the collapse of the Royalist cause came a confused period of negotiations between the parliament and the king, between the king and the Scots, and between the Presbyterians and the Independents in and out of parliament. In these negotiations the New Model Army soon began to take a most active part. The lord general was placed in the unpleasant position of intermediary between the army officers and parliament. To the grievances, usual in armies of that time, concerning arrears of pay and indemnity for acts committed on duty, there was quickly added the political propaganda of the Independents, and in July the remonstrance of the army was seized by Joyce, a subaltern of cavalry—an act which sufficiently demonstrated the hopelessness of controlling the army by its articles of war. It had, in fact, become the most formidable political party in the realm, and pressed straight on to the overthrow of parliament and the punishment of Charles. Fairfax was more at home in the field than at the head of a political committee, and, finding events too strong for him, he taught his colleagues that the cause was lost, and the Hobes however, persuaded to retain it. He thus remained the titular chief of the army party, and with the greater part of its objects
he was in complete, sometimes most active, sympathy. Shortly before the outbreak of the second Civil War, Fairfax succeeded his father in the barony and in the office of governor of Hull. In the field against the English Royalists in 1648 he displayed his former energy and skill, and his operations culminated in the successful siege of Colchester, after the surrender of which place he approved the execution of the Royalist leaders Sir Charles Lucas and Sir George Lisle, holding that these officers had broken their parole. At the same time Cromwell's great victory of Preston crushed the Scots, and the Independents became practically all-powerful.

Mississippi was a son written during the siege of Colchester, called upon the lord general to settle the kingdom, but the crisis was now at hand. Fairfax was in agreement with Cromwell and the army leaders in demanding the punishment of Charles, and he was still the effective head of the army. He approved, if he did not take an active part in, Pride's Purge (December 6th, 1648), but on the last and gravest of the questions at issue he set himself in deliberate and open opposition to the policy of the officers. He was placed at the head of the judges who were to try the king, and attended the preliminary sitting of the court. Then, convinced at last of his king's desire to make peace, in calling over the court, when the crier pronounced the name of Fairfax, a lady in the gallery called out "that the Lord Fairfax was not in that person, that he would never sit among them, and that they did him wrong to name him as a commissioner." This was Lady Fairfax, who could not forbear, as Whitelocke says, to exclaim aloud against the proceedings of the High Court of Justice. His last service as commander-in-chief was the suppression of the Leveller mutiny at Burford in May 1649. He had given his adhesion to the new order of things, and had been reappointed lord general. But he merely administered the affairs of the army, and when in 1651 the Scots had declared for Charles II., and the council of state resolved to send an army to Scotland in order to prevent an invasion of England, Fairfax resigned his commission. Cromwell was appointed his successor, "captain-general and commander-in-chief of all the forces raised or to be raised by authority of parliament within the commonwealth of England." Fairfax received a pension of £5,000 a year, and lived in retirement at his Yorkshire home of Nunappleton till after the death of the Protector. The troubles of the later Commonwealth recalled Lord Fairfax to political activity, and in 1659, when through his influence in arms helped to shape the future of the country, when Monk invited him to assist in the operations about to be undertaken against Lambert's army. In December 1659 he appeared at the head of a body of Yorkshire gentlemen, and such was the influence of Fairfax's name and reputation that 1,000 horse quitted Lambert's colours and joined him. This was speedily followed by the breaking up of all Lambert's forces, and that day secured the restoration of the monarchy. A "free" parliament was called; Fairfax was elected member for Yorkshire, and was put at the head of the commission appointed by the House of Commons to wait upon Charles II. at the Hague and urge his speedy return. Of course the "merry monarch, scandalous and poor," was glad to obey the summons, and Fairfax provided the horse on which Charles rode at his coronation. The remaining eleven years of the life of Lord Fairfax were spent in retirement at his seat in Yorkshire. He must, like Milton, have been sorely grieved and shocked by the scenes that followed—the brutal indignities offered to the remains of his companions in arms, Cromwell and Ireton, the sacrifice of Sir Harry Vane, the neglect or desecration of all that was great, noble or grateful in England, and the flood of immorality which, flowing from Whitehall, sapped the foundations of the national strength and honour. Lord Fairfax died at Nunappleton on the 12th of November 1671, and was buried at Bilborough, near York. As a soldier he was exact and methodical in planning, in the heat of battle "so highly transported that scarce any one durst speak a word to him" (Whitelocke), chivalrous and punctilious in his dealings with his own men and the enemy. Honour and conscientiousness were equally the characteristics of his private and public character. But his modesty and distrust of his powers made him less effectual as a statesman than as a soldier, and above all he is placed at a disadvantage by being both in war and peace overshadowed by his associate Cromwell.

Lord Fairfax had a taste for literature. He translated some of the Psalms, and wrote poems on solitude, the Christian warfare, the shortness of life, &c. During the last year or two of his life he wrote two "Memorials" which have been published—one on the northern actions in which he was engaged in 1642-1644, and another on some events in his tenure of the chief command. At York and at Oxford he endeavoured to save the libraries from pillage, and he enriched the Bodleian with some valuable MSS. His only daughter, Mary Fairfax, was married to George Villiers, the profligate duke of Buckingham of Charles II.'s court.

His correspondence, edited by G. W. Johnson, was published in 1848-1849 in four volumes (see note thereon in "Dict. Nat. Biog.,") and a life of him by Clements R. Markham in 1870. See also S. R. Gardiner, History of the Great Civil War (1893).

His descendant Thomas, 6th baron (1602-1782), inherited from his mother, the heiress of Thomas, 2nd Baron Culpeper, large estates in Virginia, U.S.A., and having sold Denton Hall and his Yorkshire estates he retired there about 1746, dying a bachelor. He was a friend of George Washington, and formed his cousin William Fairfax settled in Virginia, and made him his agent, and Bryan (1732-1802), the son of William Fairfax, eventually inherited the title, becoming 8th baron in 1793. His claim was admitted by the House of Lords in 1800. But it was practically dropped by the American family, until, shortly before the coronation of Edward VII., the successor in title was discovered in Albert Kirby Fairfax (b. 1830), a descendant of the 8th baron, who was an American citizen. In November 1908 Albert's claim to the title as 12th baron was allowed by the House of Lords.

FAIRFAX, a township in Fairfield county, Connecticut, U.S.A., near Long Island Sound, adjoining Bridgeport on the E. and Westport on the W. Pop. (1890) 8368; (1900) 4480 (1041 being foreign-born); (1910) 6134. It is served by the New York, New Haven & Hartford railway. The principal villages of the township are Fairfield, Southport, Greenfield Hill and Stratfield. The beautiful scenery and fine sea air attract to the township a considerable number of summer visitors. The township has the well-equipped Pequot and Fairfield memorial libraries (the former in the village of Southport, the latter in the village of Fairfield), the Fairfield fresh air homes, the annual fair between New York during each summer season), and the Gould home for self-supporting women. The Fairfield Historical Society has a museum of antiquities and a collection of genealogical and historical works. Among Fairfield's manufactures are chemicals, wire and rubber goods. Truck-gardening is an important industry of the township. In the Pequot Swamp within the present Fairfield a force of Pequot Indians was badly defeated in 1637 by some whites, among whom was Roger Ludlow, who, attracted by the country, founded the settlement in 1639 and gave it its present name in 1645. Within its original limits were included what are now the townships of Redding (separated, 1767), Weston (1787) and Easton (formed from part of Weston in 1843), and parts of the present Westport and Bridgeport. During the colonial period Fairfield was a place of considerable importance, but subsequently it was greatly surpassed by Bridgeport, to which, in 1870, a portion of it was annexed. On the 8th of July 1779 Fairfield was burned by the British and Hessians under Governor William Tryon. Among the prominent men who have lived in Fairfield are Roger Sherman, the first President Dwight of Yale (who described Fairfield in his "Travels" and in his book on "Greenfield Hill"), Chaceellor James Kent, and Joseph Bartle Sheffield.

FAIRHAVEN—FAIRÜZĀBĀDI 133

negroes; (1805) 5000; (1810) 4070. Area, about 2-25 sq. m. Fairfield is served by the Chicago, Burlington & Quincy, and the Chicago, Rock Island & Pacific railways. The city is in a blue grass country, in which much live stock is bred; and it is an important market for draft horses. It is the seat of Pacific College (Presbyterian, co-educational, 1873), endowed by Lewis Baldwin Parsons, Sr. (1798-1855), a merchant of Buffalo, N.Y. The college offers classical, philosophical and scientific courses, and has a school of music and an academic department; in 1907-1908 it had 10 instructors and 257 students, of whom 93 were in the college and 97 were in the school of music. Fairfield has a Carnegie library (1892), and a museum with a collection of Indian relics. Immediately E. of the city is an attractive Chatauqua Park, of 30 acres, with an auditorium capable of seating about 4000 persons; and there is an annual Chatauqua assembly. The principal manufactures of Fairfield are farm wagons, farming implements, drain-tile, malleable iron, cotton gloves and mittens and cotton garments. The municipality owns its waterworks and an electric-lighting plant. Fairfield was settled in 1839; was incorporated as a town in 1847; and was first chartered as a city in the same year.

See Charles H. Fletcher, Jefferson County, Iowa: Centennial History of Fairfield.

FAIRHAVEN, a township in Bristol county, Massachusetts, U.S.A., on New Bedford Harbor, opposite New Bedford. Pop. (1890) 2919; (1890) 3597 (900 being foreign-born); (1905, state census) 4235; (1910) 5122. Area, about 13 sq. m. Fairhaven is served by the New York, New Haven & Hartford railroad and by electric railway to Mattapoisett and Marion, and is connected with New Bedford by two bridges, by electric railway, and by the New York, New Haven & Hartford ferry line. The principal village is Fairhaven; others are Oxford, Nasketucket and Sconset Neck. As a summer resort Fairhaven is widely known. Among the principal buildings are the following, presented to the township by Henry H. Rogers (1840-1900), a native of Fairhaven and a large stockholder and long vice-president of the Standard Oil Co.; the town hall, a memorial of Mrs Rogers, the Rogers public schools; the Millicent public library (17,500 vols. in 1908), a memorial to his daughter; and a fine granite memorial church (Unitarian) with parish house, a memorial to his mother; and there is also a public park, of 13 acres, the gift of Mr Rogers. From 1830 to 1857 the inhabitants of Fairhaven were chiefly engaged in whaling, and the fishing interests are still important. Among manufactures are coal-tacks, percale, iron goods, loom-cranks, glass, yachts and boats, and shoes.

Fairhaven, originally a part of New Bedford, was incorporated as a separate township in 1812. On the 5th of September 1778 a fleet and armed force under Earl Grey, sent to punish New Bedford and what is now Fairhaven for their activity in privateering, burned the shipping and destroyed much of New Bedford. The troops then marched to the head of the Acushnet river, and down the east bank to Sconset Neck, where they camped till the 7th of September, when they re-embarked, having meanwhile dismantled a small fort, built during the early days of the war, on the east side of the river at the entrance to the harbour. On the evening of the 8th of September a landing force from the fleet, which had begun to set fire to Fairhaven, was driven off by a body of about 150 minute-men commanded by Major Israel Fearing; and on the following day the fleet departed. The fort was at once rebuilt and was named Fort Fearing, but as early as 1784 it had become known as Fort Phoenix; it was one of the strongest defences on the New England coast during the war of 1812. The township of Acushnet was formed from the northern part of Fairhaven in 1860.

See James L. Cushing and others, A Brief History of the Town of Fairhaven, Massachusetts (Fairhaven, 1903).

FAIRHOLT, FREDERICK WILLIAM (1814-1866), English antiquary and wood engraver, was born in London in 1814. His father, who was of a German family (the name was originally Farholz), was a tobacco manufacturer, and for some years Fairholt himself was employed in the business. For a time he was a drawing-master, afterwards a scene-painter, and in 1835 he became assistant to S. Sly, the wood engraver. Some pen

ink copies made by him of figures from Hogarth's plates led to his being employed by Charles Knight on several of his illustrated publications. His first published literary work was a contribution to Horace's Art-Book in 1831. His life was one of almost uninterrupted quiet labour, carried on until within a few days of death. Several works on civic pageantry and some collections of ancient unpublished songs and dialogues were edited by him for the Percy Society in 1842. In 1845 he was elected fellow of the Society of Antiquaries. He published an edition of the dramatic works of Lely in 1856. His principal independent works are Tobacco, its History and Association (1859); Gog and Magog (1860); Up the Nile and Home Again (1862); many articles and serials contributed to the Art Journal, some of which were afterwards separately published, as Costume in England (1840); Dictionary of Terms & Art. With accounts of these works are illustrated by numerous cuts, drawn on the wood by his own hand. His pencil was also employed in illustrating Evans's Coins of the Ancient Britons, Madden's Jewish Coinage, Hallwell's folio Shakespeare and his Sir John Mandeville, Roach Smith's Richmond, the Miscellanea Graphica of Lord Londoishorough, and many other works. He died on the 3rd of April 1866. His books relating to Shakespeare were bequeathed to the library at Stratford-on-Avon; those on civic pageantry (between 200 and 300 volumes) to the Society of Antiquaries; his old prints and works on costume to the British Museum; his general library he desired to be sold and the proceeds devoted to the library fund.

FAIRMONT, a city and the county-seat of Marion county, West Virginia, U.S.A., on both sides of the Monongahela river, about 75 m. S.E. of Wheeling. Pop. (1890) 1023; (1900) 5655, of whom 283 were negroes and 182 foreign-born; (1910) 9711. It is served by the Baltimore & Ohio railway. Among its manufactures are glass, machinery, flour and furniture, and it is an important shipping point for coal mined in the vicinity. The city is the seat of one of the West Virginia state normal schools. Fairmont was laid out in 1845. In 1919 a new county-seat was newly established, and Marion county, in 1842, received its present name about 1844, and was chartered as a city in 1850.

FAIR OAKS, a station on a branch of the Southern railway, 6 m. E. of Richmond, Virginia, U.S.A. It is noted as the site of one of the battles of the Civil War, fought on the 31st of May and the 1st of June 1862, between the Union (Army of the Potomac) under General G. B. McClellan and the Confederate forces (Army of Northern Virginia) commanded by General J. E. Johnston. The attack of the Confederates was made at a moment when the river Chickahominy divided the Federal army into two unequal parts, and was, moreover, swollen to such a degree as to endanger the bridge. General Johnston stationed part of his troops along the river to prevent the Federals sending aid to the smaller force south of it, upon which the Confederate attack, commanded by General Longstreet, was directed. Many accidents, due to the inexperience of the staff officers and to the difficulty of the ground, hindered the development of Longstreet's attack, but the Federals were gradually driven back with a loss of ten guns, though at the last moment reinforcements managed to cross the river and re-establish the line of defence. At the close of the day Johnston was severely wounded, and General G. W. Smith succeeded to the command. The battle was renewed on the 3rd of June but not fought out. At the close of the action General R. E. Lee took over the command of the Confederates, which he held till the final surrender in April 1865. So far as the victory lay with either side, it was with the Union army, for the Confederates failed to achieve their purpose of destroying the almost isolated left wing of McClellan's army, and after the battle they withdrew into the lines of Richmond. The Union losses were 5931 in killed, wounded and missing; those of the Confederates were 6134.

The battle is sometimes known as the battle of Seven Pines.

FAIRÚZABĀDI [Abūl-ʿĀṭāʾīr Ibn Ibrahim Majd ud-Dīn ul-Farrūqī] (1239-1314), Arabian lexicographer, was born at Kārazān near Shiraz. His student days were spent in Shiraz, Wāṣīt, Bagdad and Damascus. He taught for ten years in
JERUSALEM, and afterwards travelled in western Asia and Egypt. In 1268 he settled in Mecca, where he remained for fifteen years. He next visited India and spent some time in Delhi, then remained in Mecca another ten years. The following three years were spent in Bagdad, in Shiraz (where he was received by Timur), and in Ta'iz. In 1305 he was appointed chief cadi (qadi) of Yemen, married a daughter of the sultan, and died at Zabid in 1314. During this last period of his life he converted his house at Mecca into a school of Mālikī law and established three teachers in it. He wrote a large lexicographical work of 60 or 100 volumes uniting the dictionaries of Ibn Sīda, a Spanish scholar (d. 1066), and of Şāfī (d. 1232). A digest of or any extract from this last work is his famous dictionary al-Qāmūs ("the Ocean"), which has been published in Egypt, Constantinople and India, has been translated into Turkish and Persian, and has itself been the basis of several later dictionaries. (G. W. T.)

FAIRY (Fr. fée, faerie; Prov. fada; Sp. hada; Ital. fata; med. Lat. fatere, to enchant, from Lat. fatum, fate, destiny), the common term for a supposed race of supernatural beings who magically intermeddle in human affairs. Of all the minor creatures of mythology the fairy is the most perfect embodiment of the poetic, the most memorable in literature. Like all organic growths, whether of nature or of the fancy, they are not the immediate product of one country or of one time; they have a pedigree, and the question of their ancestry and affiliation is one of wide bearing. But mixture and connexion of races have in this as in many other cases so changed the original folk-product that it is difficult to disengage and separate the different strains that have gone to the making or moulding of the result as we have it.

It is not in literature, however ancient, that we must look for the early forms of the fairy belief. Many of Homer's heroes have fairy lemmas, called nymphs, fairies taken up into a higher region of poetry and religion; and the fairy leman is notable in the story of Athamas and his cloud bride Nephele, but this character is as familiar to the unpoetical Eskimo, and to the Red Indians, with their bird-bride and beaver-bride (see A. Lang's Custom and Myth, "The Story of Cupid and Psyche"), the Gandharvas of Sanskrit poetry are also fairies.

One of the interesting facts about fairies is the wide distribution and long persistence of the belief in them. They are the "elves and fairy" in ancient Egyptian, they are the "faeries" in the old Arthurian tradition. Here they dwell in the "raths," old earth-forts, or earthen bases of later palisaded dwellings of the Norman period, and in the subterranean houses, common also in Scotland. They are an organized people, often called "the army," and their life corresponds to human life in all particulars. They carry off children, leaving changelings substitutes, transport men and women into fairyland, and are generally the causes of all mysterious phenomena. Whirls of dust are caused by the fairy marching army, as by the being called Kutchi in the Dieri tribe of Australia. In 1907, in northern Ireland, a farmer's house was troubled with flying stones (see Poltergeist). The neighbours said that the fairies caused the phenomenon, as the man had swept his chimney with a bough of holly, and the holly is a "gentle tree," dear to the fairies. The fairy changing belief also exists in some districts of Argyll, and a fairy boy dwelt long in a small farm-house in Glencoe, now unoccupied.

In Ireland and the west Highlands neolithic arrow-heads and flint chips are still fairy weapons. They are dipped in water, which is given to ailing cattle and human beings as a sovereign remedy for diseases. The writer knows of a "little lassie in green" who is a fairy and, according to the percipients, haunts the banks of the Mukumar pool on the Lochy. In Glencoe is a fairy hill where the fairy music, vocal and instrumental, is heard in still weather. In the Highlands, however, there is much more interest in second sight than in fairies, while in Ireland the reverse is the case. The best book on Celtic fairy lore is still that of the minister of Aberfoyle, the Rev. Mr Kirk (ob. 1692). His work on The Secret Commonwealth of Elves, Fauns and Fairies, left in MS. and incomplete (the remainder is in the Laing MSS, Edinburgh University Library), was published (a hundred copies) in 1815 by Sir Walter Scott, and in the Bibliothèque de Carabas (Lang) there is a French translation. Mr Kirk is said (though his tomb exists) to have been carried away by fairies. He appeared to a friend and said that he would come again, when the friend must throw a dirk over his shoulder and he would return to this world. The friend, however, lost his nerve and did not throw the dirk. In the same way a woman appeared to her husband in Glencoe in the last generation, but he was wowing another lass and did not make any effort to rescue her. The dirk therefore lost in the glen.

It is clear that in many respects fairyland corresponds to the pre-Christian abode of the dead. Like Persephone when carried to Hades, or Wainamönen in the Hades of the Finns (Manala), a living human being must not eat in fairyland; if he does, he dwells there for ever. Tamlaine in the ballad, however, was "fat and fair of flesh," yet was rescued by Janet: probably he had not abstained from fairy food. He was to be given as the kane to Hell, which shows a distinction between the beliefs in hell and in the place of fairies.

It is a not uncommon notion that the fairies survive in legend from the persistence of a pigmy people dwelling in the subterranean earth-houses, but the contents of these do not indicate an age prior to the close of the Roman occupation of Britain; nor are pigmy bones common in neolithic sepulchres. The "people of peace" (Daoinn Shié) of Ireland and Scotland are usually of ordinary stature, indeed not to be recognized as varying from mankind except by their proceedings (see J. Curtin, Irish Folk-tales).

The belief in a species of lady faerie, deadly to their human lovers, was found by R. L. Stevenson to be as common in Samoa (see Lionel Lewis' Entingi) as in Strathfinnis or on the banks of Loch Awe. In New Caledonia a native friend of J. J. Atkinson (author of Primal Law) told him that he had met and caressed the girl of his heart in the forest, that she had vanished and must have been a fairy. He therefore would die in three days, which (Mr Atkinson informs the writer) he punctually did. The Greek sires of Homer are clearly a form of these deadly fairies, as the Nereids and Oreads and Nymphs are fairies of wells, mountains and the sea. The fairy women who come to the births of children and foretell their fortunes (Fata, Moeræ, ancient Egyptian Hathors, Féa, Déméter Foulées), with their turret of white bows and the speech and song of the fairies, are refractions of the human "sae-women" (in the Scots term) who attend at birth and derive omens of the child's future from various signs. The custom is common among savage races, and these women, represented in the spiritual world by Fafa, bequeath to us the French fée, in the sense of fairy. Perrault also uses féé for anything that has magical quality; "the key was féé," had mana, or wakan, savage words for the supposed "power," or ether, which works magic or is the vehicle of magical influences.

Though the fairy belief is universally human, the nearest analogy to the shape which it takes in Scotland and Ireland—the "pixies" of south-western England—is to be found in Jân or Jinnis of the Arabs, Moors and people of Palestine. In stories which have passed through a literary medium, like The Arabian Nights, the genii or Jân do not so much resemble our fairies as they do in the popular superstitions of the East, orally collected. The Jân are now a subterranean commonwealth, now they reside in ruinous places, like the fairies in the Irish rhymes. Like the fairies they go about in whirls of dust, or the dust-whirls themselves are Jân. They carry off men and women, "to their own herd," in the phrase of Mr Kirk, and are kind to mortals who are kind to them. They chiefly differ from our fairies in their greater tendency to wear animal forms; though, like the fairies, when they choose to appear in human shape they are not to be distinguished from men and women of mortal mould. Like the fairies everywhere they have amours with mortals, such as that of the Queen of Faery with Thomas of Ercildoune. The herb rue is potent against them, as in British folk-lore, and a man long captive among the Jân escaped from them by observing their avoidance of rue, and by plucking two handfuls
Fairy Ring—Faith Healing

Thereof. They, like the British brownies (a kind of domesticated fairy), are the causes of strange disappearances of things. To preserve houses from their influences, rue, that “herb of grace,” is kept in the apartments, and the name of Allah is constantly invoked. If this is omitted, things are stolen by the Jōn.

They often bear animal names, and it is dangerous to call a cat or dog without pointing at the animal, for a Jōnni of the same name may be present and may take advantage of the invocation. A man, in fun, called to a girl to escort his wife on a walk: he did not point at the goat, and the wife disappeared.

A Jōnni had carried her off, and her husband had to seek her at the court of the Jōn. Euphemistically they are addressed as musbārakin, “blessed ones,” as we say “the good folk” or “the people of peace.” As our fairies give gold which changes into withered leaves, the Jōn give onion peels which turn into gold. Like our fairies the Jōn can apply an ointment, kohl, to human eyes, after which the person so favoured can see Jōn, or fairies, which are invisible to other mortals, and can see treasure wherever it may be concealed (see Folk-lore of the Holy Land, by J. E. Hanauer; 1907).

It is plain that fairies and Jōn are practically identical, a curious proof of the uniformity of the working of imagination in peoples widely separated in race and religion. Fairies naturally won their way into the poetry of the middle ages. They take lovers from among men, and are often described as of delicate, unearthly, ravishing beauty. The enjoyment of their charms is, however, generally qualified by some restriction or compact, the breaking of which is the cause of calamity to the lover and all his race, as in the notable tale of Melusine.

This fay by enchantment built the castle of Lusignan for her husband. It was her nature to take every week the form of a serpent from the waist below. The hebdomadal transformation being once, contrary to compact, witnessed by her husband, she left him with much wailing, and was said to return and give warning by her appearance and great shrieks whenever one of the race of Lusignan was about to die. At the birth of Ogier le Danois six fairies attend, five of whom give good gifts, which the sixth overrides with a restriction. Gervaise of Tilbury, writing early in the 14th century, has in his Otia Imperialia a chapter, De lambris et nocturnis larvis, where he gives it out, as proved by individuals beyond all exception, that men have been lovers of beings of this kind whom they call Fadas, who did not exact the price for their favours but inflicted terrible—loss of goods and even of life. There seems little in the characteristics of these fairies of romance to distinguish them from human beings, except their supernatural knowledge and power. They are not often represented as diminutive in stature, and seem to be subject to such human passions as love, jealousy, envy and revenge. To this class belong the fairies of Boiardo, Ariosto and Spenser.

There is no good modern book on the fairy belief in general. Keightley’s Fairy Mythology is full of interesting matter. Ryh’s Celtic Mythology is especially copious about Welsh fairies, which are practically identical with those of Ireland and Scotland. The works of Mr Jeremiah Curtin and Dr Douglas Hyde are useful for Ireland. Scotland, Kirk’s Secret Commonwealth has already been quoted. Scott’s dissertation on fairies in The Border Minstrelsy is rich in lore, though necessarily Scott had not the wide field of comparative study opened by more recent researches. That the full truth is not known is suggested by the evidence of Jeanne d’Arc at her trial (1431) in Quicherat’s Procès de Jeanne d’Arc, vol. i. pp. 67, 68, 187, 209, 212, vol. ii. pp. 390, 404, 450. (A.L.)

Fairy Ring, the popular name for the circular patches of a dark green colour that are to be seen occasionally on permanent grass-land, either lawn or meadow, on which the fairies were supposed to hold their midnight revels. They mark the area of growth of some fungus, starting from a centre of other plants. The mycelium produced from the spores dropped by the fungus or from the “spawn” in the soil, radiates outwards, and each year’s successive crop of fungi rises from the new growth round the circle. The rich colour of the grass is due to the fertilizing quality of the decaying fungi, which are peculiarly rich in nitrogenous substances. The most common and symmetrical grass rings are formed by Marasmius oreades, the fairy ring champignon, but the mushroom and many other species occasionally form rings, both on grass-lands and in woods. Observations were made on a ring in a pine-wood for a period of nine years, and it was calculated that it increased from centre to circumference about 83 in. each year. The fungus was never found growing within the circle during the time the ring was under observation, the decaying vegetation necessary for its growth having become exhausted.

Faithfull, Emily (1831–1885), English philanthropist, was the youngest daughter of the Rev. Ferdinand Faithfull, and was born at Headley Rectory, Surrey, in 1833. She took a great interest in the conditions of working-women, and with the object of extending their sphere of labour, which was then painfully limited, in 1860 she set up in London a printing establishment for women. The “Victoria Press,” as it was called, soon obtained quite a reputation for its excellent work, and Miss Faithfull was shortly afterwards appointed printer and publisher in ordinary to Queen Victoria. In 1863 she began the publication of a monthly organ, The Victoria Magazine, in which for eighteen years she continuously and earnestly advocated the claims of women to remunerative employment. In 1868 she published a novel, Change upon Change. She also appeared as a lecturer, and with the object of furthering the interests of her sex, lectured widely and successfully both in England and the United States, which latter she visited in 1872 and 1882. In 1888 she was awarded a civil list pension of £50. She died in Manchester on the 31st of May 1895.

Faith Healing, a form of “mind cure,” characterized by the doctrine that while pain and disease really exist, they may be neutralized and dispelled by faith in Divine power; the doctrine known as Christian Science (q.e.) holds, however, that pain is only an illusion and seeks to cure the patient by instilling into him this belief. In the Christian Church the tradition of faith healing dates from the earliest days of Christianity; under the miracles of the New Testament follow cases of healing, first by the Apostles; then by their successors; but faith healing proper is gradually, from the 3rd century onwards, transformed into trust in relics, though faith cures still occur sporadically in later times. Catherine of Siena is said to have saved Father Matthew from dying of the plague, but in this case it is rather the healer than the healed who was strong in faith. With the Reformation faith healing proper reappears among the Moravians and Waldenses, who, like the Peculiar People of our own day, placed their trust in prayer and anointing with oil. In the 17th century we find faith cures recorded of Luther and other reformers, in the next century of the Baptists, Quakers and other Puritan sects, and in the 18th century the faith healing of the Methodists in this country was paralleled by Pietism in Germany, which drew into its ranks so distinguished a man of science as Stahl (1660–1734). In the 19th century Prince Hohenlohe-Waldenburg-Schillingsfürst, canon of Grosswardien, was a famous healer on the continent; the Mormons and Irvingites were prominent among English-speaking peoples; in the last quarter of the 19th century faith healing became popular in London, and Bethesda homes were opened in 1881, and since then it has found many adherents in England.

Under faith healing in a wider sense may be included (1) the cures in the temples of Aesculapius and other deities in the ancient world; (2) the practice of touching for the king’s evil, in vogue from the 11th to the 18th century; (3) the cures of Valentine Greatrakes, the “Stroker” (1629–1683); and (4) the miracles of Lourdes, and other resorts of pilgrims, among which may be mentioned St Winifred’s Well in Flintshire, Trefes with its Holy Grave, the grave of the Jansenist F. de Paris in the 18th century, the little town of Kevelaer from 1641 onwards, the tombs of St Louis, Francis of Assisi, Catherine of Siena and others.

An animistic theory of disease was held by Pastor J. Ch. Blumhardt, Dorothea Trudel, Boltz and other European faith healers. Used in this sense faith healing is indistinguishable from much of savage leech-craft, which seeks to cure disease by expelling the evil spirit in some portion of the body. Although
it is usually present, faith in the medicine man is not essential for the efficacy of the method. The same may be said of the linear descendant of savage medicine—the magical leech-craft of European folklore; cures for toothache, warts, &c., act in spite of the disbelief of the sufferer; how far incredulity on the part of the healer would result in failure is an open question.

From the psychological point of view all these different kinds of faith healing, as indeed all kinds of mind cure, including those of Christian Science and hypnotism, depend on suggestion (q.v.). In faith healing proper not only are powerful direct suggestions used, but the religious atmosphere and the auto-suggestions of the patient co-operate, especially where the cures take place during a period of religious revival or at other times when large assemblies and strong emotions are found. The suggestibility of large crowds is markedly greater than that of individuals, and to this and the greater faith must be attributed the greater success of the fashionable places of pilgrimage.

FAITHORNE, WILLIAM (1625 or 1626—1691), English painter and engraver, was born in London and was apprenticed to Robert Peake, a painter and printseller, who received the honour of knighthood from Charles I. On the outbreak of the Civil War he accompanied his master into the king's service, and being made prisoner at Basinghouse, he was confined for some time to Aldersgate, where, however, he was permitted to follow his profession of engraver, and among other portraits did a small one of the first Villiers, duke of Buckingham. At the earnest solicitation of his master he very soon regarded his liberty, but only on condition of retiring to France. There he was so fortunate as to receive instruction from Robert Nanteuil. He was permitted to return to England about 1659, and took up a shop near Temple Bar, where, besides his work as an engraver, he carried on a large business as a printseller. In 1680 he gave up his shop and retired to a house in Blackfriars, occupying himself chiefly in painting portraits from the life in crayons, although still occasionally engaged in engraving. It is said that his life was shortened by the misfortunes, dissipation, and early death of his son William. Faithorne is especially famous as a portrait engraver. Among those on whom he exercised his art were a large number of eminent persons, including Sir Henry Spelman, Oliver Cromwell, Henry Somerset, the marquis of Worcester, John Milton, Queen Catherine, Prince Rupert, Cardinal Richelieu, Sir Thomas Fairfax, Thomas Hobbes, Richard Hooker, Robert second earl of Essex, and Charles I. All his works are remarkable for their combination of freedom and strength with softness and delicacy, and his crayon paintings unite to these the additional quality of clear and brilliant colouring. He is the author of a work on engraving (1622).

His son WILLIAM (1655-1689) was a mezzotint engraver, at an early age gave promise of attaining great excellence, but became idle and dissipated, and involved his father in money difficulties. Among persons of note whose portraits he engraved are Charles II., Mary princess of Orange, Queen Anne when princess of Denmark, and Charles XII. of Sweden.

The best account of the Faithornes is that contained in Walpole's Anecdotes of Painting. A life of Faithorne the elder is preserved in the British Museum; among the papers of Mr. Bayford, librarian to Lord Oxford, and an intimate friend of Faithorne.

FAIZABAD, a town of Afghanistan, capital of the province of Badakhshan, situated on the Kokcha river. In 1821 it was destroyed by Murad Beg of Kunduz, and the inhabitants removed to Kunduz. But since Badakhshan was annexed by Abdur Rahman, the town has recovered its former importance, and is now a considerable place of trade. It is the chief cantonment for eastern Afghanistan and the Pamir region, and is protected by the British.

FAJARDO, a district and town on the E. coast of Porto Rico, belonging to the department of Humacao. Pop. (1890) of the district, 16,782; and of the town, 3414. The district is highly fertile and is well watered, owing in great measure to its abundant rainfall. Sugar production is its principal industry, but some attention is also given to the growing of oranges and pineapples. The town, which was founded in 1774, is a town and the centre standing 1½ m. from a large and well-sheltered bay, at the entrance to which is the cape called Cabeza de San Juan. It is the market town for a number of small islands off the E. coast, some of which produce cattle for export.

FAIKH UD-DIN RAZI (1149-1209), Arabian historian and theologian, was the son of a preacher, himself a writer, and was born at Rai (Rei, Rhagae), near Tehran, where he received his earliest training. Here and at Maragha, whither he followed his teacher Majd ud-Din ul-Jili, he studied philosophy and theology. He was a Shafiite in law and a follower of Ashari (q.v.) in theology, and became renowned as a defender of orthodoxy. During a journey in Khwarizm and Mawara'l-nahr he preached both in Persian and Arabic against the sects of Islam. After this tour he returned to his native city, but settled later in Herat, where he died. His dogmatic positions may be seen from his work Kitab ud-Mubassal, which is analysed by Schmölders in his Essai sur les écoles philosophiques des Arabes (Paris, 1842). Extracts from his History of the Dynasties were published by Jourdain in the Fundgruben des Orients (vol. v.), and by D. R. Liethmann (St. Petersburg, 1828). His greatest work is the Majdul Ul-Adam ("the Mystery"), an extensive commentary on the Koran published at Cairo (8 vols., 1809) and elsewhere; it is specially full in its exposition of Ash'tarite theology and its use of early and late Mu'tazilite writings.

For an account of his life see F. Wüstenfeld's Geschichte der arabischen Arzte, No. 200 (Göttingen, 1840); for a list of his works cf. C. Brockelmann's Gesch. der arabischen Literatur, vol. 1 (Weimar, 1898), pp. 506 ff. An account of his teaching is given by M. Schreiner in the Zeitschrift der deutschen morgenländischen Gesellschaft (vol. 52, pp. 955 ff.).

FAIKIR (from Arabic faqr, "poor"), a term equivalent to Dervish (q.v.) or Mahomedan religious mendicant, but which has come to be specially applied to the Hindu devotees and ascetics of India. There are two classes of these Indian Fakirs, (1) the religious orders, and (2) the nomad roguies who infest the country. The ascetic orders resemble the Franciscans of Christianity. The bulk lead really excellent lives in monasteries, which are centres of education and poor-relief; while others go out to visit the poor as Gurus or teachers. Strict celibacy is not enforced among them. These orders are of very ancient date, owing their establishment to the ancient Hindu rule, followed by the Buddhists, that each "twice-born" man should lead in the woods the life of an ascetic. The second class of Fakirs are simply disreputable beggars who wander round extorting, under the guise of a religious mission, the charitable and practicing the superstitions of the villagers. As a rule they make no real pretence of leading a religious life. They are said to number nearly a million. Many of them are known as "Jogi," and lay claim to miraculous powers which they declare have become theirs by the practice of abstinence and extreme austerities. The tortures which some of these wretches will inflict upon themselves are almost incredible. They will hold their arms over their heads till the muscles atrophy, will keep their fists clenched till the nails grow through the palms, will lie on beds of nails, cut and stab themselves, drag, week after week, enormous chains loaded with masses of iron. This is the means near enough to scorch. Most of them are inexpressibly filthy and verminous. Among the filthiest are the Aghoris, who preserve the ancient cannibal ritual of the followers of Siva, eat flesh, and use a human skull as a drinking-vessel. Formerly the fakirs were always nude and smeared with ashes; but now they are compelled to wear some pretence of clothing. The natives do not really respect these wandering friars, but they dread their curses.

See John Campbell Oman, The Mystics, Ascetics and Saints of India (1903), and Indian Census Reports.

FAILASE, a town of north-western France, capital of an arrondissement in the department of Calvados, on the right bank of the Ante, 10 m. S. by E. of Caen by road. Pop. (1906)
FALASHAS—FALCÃO

I 37

The principal object of interest is the castle, now partly in ruins, but formerly the seat of the dukes of Normandy and the birthplace of William the Conqueror. It is situated on a lofty crag overlooking the town, and consists of a square mass defended by towers and flanked by a small donjon and a lofty tower added by the English in the 15th century; the rest of the castle dates chiefly from the 12th century. Near the castle, in the Place de la Trinité, is an equestrian statue in bronze of William the Conqueror, to whom the town owed its prosperity. The churches of La Trinité and St Gervais combine the Gothic and Renaissance styles of architecture, and St Gervais also includes Romanesque workmanship. A street passes by way of a tunnel beneath the choir of La Trinité. Falaise has populous suburbs, one of which, Gouville, contains its fair horses, cattle and wool, which has been held in August since the 13th century. The town is the seat of a subprefecture and has tribunals of first instance and commerce, a chamber of arts and manufacture, a board of trade-arbitrators and a communal college. Tanning and important manufactures of hosiery are carried on.

From 1417, when after a siege of forty-seven days it succumbed to Henry V, king of England, till 1450, when it was retaken by the French, Falaise was in the hands of the English.

FALASHAS (i.e. exiles; Ethiopic falsas, a stranger), or "Jews of Abyssinia," a tribe of Hamitic stock, akin to Galla Somalian and Beja, through whom they propagated the Jewish religion. They claim to be descended from the ten tribes banished from the Holy Land. Another tradition assigns them as ancestor Menelek, Solomon's alleged son by the queen of Sheba. There is little or no physical difference between them and the typical Abyssinians, except perhaps that their eyes are a little more oblique; and they may certainly be regarded as Hamitic. It is uncertain when they became Jews; one account suggests in Solomon's time; another, at the Babylonian captivity; a third, during the 1st century of the Christian era. That one of the earlier dates is correct seems probable from the fact that they have preserved nothing of either the Babylonian or Jerusalem Talmud, make no use of phylacteries (tefillin), and observe neither the feast of Purim nor the dedication of the temple. They possess—not in Hebrew, of which they are altogether ignorant, but in Ethiopic (or Geez)—the canonical and apocryphal books of the Old Testament; a volume of extracts from the Pentateuch, with comments given to Moses by God on Mount Sinai; the Te-csa-sa Sanbat, or laws of the Sabbath; the Ardis, a book of secrets revealed to twelve saints, which is used as a charm against disease; lives of Abraham, Moses, &c.; and a translation of Josephus called Sana Albud. A copy of the Ort or Mosaic law is kept in the houses of either the Babylonian or Jerusalem Talmud, make no use of phylacteries (tefillin), and observe neither the festival of Purim nor the dedication of the temple. Various pagan observances are mingled in their ritual: every newly-built house is considered uninhabitable till the blood of a sheep or fowl has been spilt in it; a woman guilty of a breach of chastity has to undergo purification by leaping into a flaming fire; the Sabbath has been defined, and, as the goddess Sanbat, receives adoration and sacrifice and is said to have ten thousand times ten thousand angels to wait on her commands. There is a monastic system, introduced it is said in the 4th century A.D. by Aba Zébra, a pious man, who retired from the world and lived in the cave of Hohara, in the suburbs of Jerusalem. The monks must prepare all their food with their own hands, and no lay person, male or female, may enter their houses. Celibacy is not practised by the priests, but they are not allowed to marry a second time, and no one is admitted into the order who has eaten bread with a Christian, or is the son or grandson of a man thus contaminated. Belief in the evil eye or shadow is universal, and spirit-raisers, soothsayers and rain-doctors are in repute. Education is in the hands of the monks and priests, and is confined to boys. Fasts, obligatory on all above seven years of age, are held every Monday and Thursday, on every new moon, and at the passover (the 21st or 22nd of April). The annual festivals are the passover, the harvest feast, the Baala Mazalat or feast of tabernacles (during which, however, no booths are built), the day of covenant or assembly and Abraham's day. It is believed that after death the soul remains in a place of darkness till the third day, when the first sacrifice for the dead is offered; prayers are read in the synagogue for the repose of the departed, and for seven days a formal lament takes place every morning in his house. No coffins are used, and a stone vault is built over the corpse so that it may not come into direct contact with the earth.

The Falashas are an industrious people, living for the most part in villages of their own, or, if they settle in a Christian or Mahomedan town, occupying a separate quarter. They had their own kings, who, they pretend, were descended from David, from the 10th century until 1800, when the royal race became extinct, and then they became subject to the Abyssinian kingdom of Tigre. They do not mix with the Abyssinians, and never marry Abyssinian women. They are even forbidden to enter the houses of Christians, and from such a pollution have to be purified before entering their own houses. Polygamy is not practised; early marriages are rare, and their morals are generally better than those of their Christian masters. Unlike most Jews, they have no liking for trade, but are skilled in agriculture, in the manufacture of pottery, ironwork and cloth, and are good masons. Their numbers are variously estimated at from one hundred to one hundred and fifty thousand.

FALCÃO, CHRISTOVÃO DE SOUSA (? 1521–1557), Portuguese poet, came of a noble family settled at Portalegre in the Alemtejo, which had originated with John Falcon or Falconet, one of the Englishmen who went to Portugal in 1386 in the suite of Philippa of Lancaster. His father, João Vaz de Almada Falcão, was an upright public servant who had held the capitanía of Elmina on the West African coast, but died, as he had lived, a poor man. There is a tradition that in boyhood Christovão fell in love with a beautiful child and rich heiress, D. Maria Brandão, and in 1526 married her clandestinely, but parental opposition prevented the ratification of the marriage. Family pride, it is said, drove the father of Christovão to keep his son under strict surveillance in his own house for five years, while the lady's parents, objecting to the youth's small means, put her into the Cistercian convent of Lorvão, and there endeavoured to wear her heart from him by the accusation that he coveted her fortune more than her person. Their arguments were unavailing; the 1534 D. Maria left the convent to marry D. Luís de Silva, captain of Tangier, while the broken-hearted Christovão told his sad story in some beautiful lyrics and particularly in the eclogue Christifá. He had been the disciple and friend of the poets Bernardim Ribeiro and Sá de Miranda, and when his great disappointment came, Falcão laid aside poetry and entered on a diplomatic career. There is documentary evidence that he was employed at the Portuguese embassy in Rome in 1542, but he soon returned to Portugal, and we find him at court again in 1548 and 1551. The date of the death of his wife and of his father is disputed. According to Dr Teophilo Braga, the historian of Portuguese literature, but Senhor Guimarães shows that the first part is doubtful, and, putting aside the testimony of a contemporary and grave writer, Diogo do Couto, he even denies the title of poet to Christovão Falcão, arguing from internal and other evidence that Chrišfá is the work of Bernardim Ribeiro; his destructive criticism is, however, stronger than his constructive work. The eclogue, with its 104 verses, is the very poem of saudade, and its simple, direct language and chaste and tender feeling, enshrined in ephemeral sounds and verses, has won for its author lasting fame and a unique position in Portuguese literature. Its influence on later poets has been very considerable, and Camoens used several of the verses as proverbs.

The poetical works of Christovão Falcão were published anonymously, owing, it is supposed, to their personal nature and allusions,
and, in part or in whole, they have been often reprinted. There
is a modern critical edition of Chrysaf and a Carta (letter) by A. Epiphanio da Silva Dias under the title Obras de Christovão Falção (Oporto, 1893), and one of the Cantigas and Esparat by the same
scholar appeared in the Revista Lusitana, vol. 4, pp. 142-179 (Lisbon,
1896), under the name Fragmento de um Cancioneiro do Século X VI. See Bernardim Ribeiro e o Boalismo, by Dr. T. Braga (Oporto, 1897),
and Bernardim Ribeiro (O Poeta Cristal), by Delítio de Abreu (Lisbon, 1908).

FALCK, ANTON REINHARD (1777–1843). Dutch statesman,
who was born at Utrecht on the 19th of March, 1777, at the university of Leiden, and entered the Dutch diplomatic service, being appointed to the legation at Madrid. Under
King Louis Napoleon he was secretary-general for foreign affairs, but
resigned office on the annexation of the Batavian republic to
France. He took a leading part in the revolt of 1813 against
French domination, and had a considerable share in the organiza-
tion of the new kingdom of the Netherlands. As minister of education under William I. he reorganized the universities of
Ghent, Louvain and Liège and the Royal Academy of Brussels.
Side by side with his activities in education he directed the
departments of trade and the colonies. Falck was called in
Holland the king’s good genius, but William I. presently tired
of his counsels and he was superseded by Van Maanen. He
was ambassador in London when the disturbances of 1830 convinced
him of the necessity of the separation of Belgium from Holland.
He consequently resigned his post and lived in close retirement
until 1839, when he became the first Dutch minister at the Belgian
court. He died at Brussels on the 10th of March 1843. Besides
some historical works he left a corresponsendence of considerable
political interest, printed in Brieven van A. R. Falck, 1795–1843
(1856 ed. The Hague, 1861), and Ambtswrachten van A. R. Falck
(ibid. 1873).

FALCÓN, the most northern state of Venezuela, with an
extensive coast line on the Caribbean Sea and Gulf of Venezuela.
Pop. (1905 est.) 173,968. It lies between the Caribbeans on the
N. and the state of Lara on the S., with Zulia and the Gulf of
Venezuela on the W. Its surface is much broken by irregular ranges of low mountains, and extensive areas on the coast are
sandy plains and tropical swamps. The climate is hot, hot,
being tempered by the trade winds, is not considered unhealthy
except in the swampy districts. The state is sparsely settled
and has no large towns, its capital, Coro, being important
chiefly because of its history, and as the entrepôt for an extensive
inland district. The only port in the state is La Vela de Coro,
on a small bay of the same name, 7 m. E. of the capital, with
which it is connected by railway.

FALCON (Lat. Falco; Fr. Faucon; Teutonic, Falk or Valken),
a word now restricted to the high-coureged and long-winged
birds of prey which take their quarry as it moves; but formerly
it had a very different meaning, being by the naturalists of the
18th and even of the 19th century extended to a great number
of birds comprised in the genus Falco of Linnaeus and writers of
his day, while, on the other hand, by falconers, it was,
and still is, technically limited to the female of the birds
employed by them in their vocation (see Falconry), whether
"long-winged" and therefore "noble," or "short-winged" and
"ignoble."

According to modern usage, the majority of the falcons, in the
sense first given, may be separated into five very distinct groups:
(1) the falcons pure and simple (Falco proper); (2) the large
northern falcons (Hiérofallo, Cuvier); (3) the "desert falcons"
(Gennaco, Kaup); (4) the merlins (Aedalon, Kaup); and (5)
The hoolis (Hypotrichos, Beie). A sixth group, the kestrels
(1) Unknown to classical writers, the earliest use of this word is said
to be by Servius Honoratus (circa a.d. 390-460) in his notes on Aen. 
X. 145. It seems possibly to be the?-worded form of the Teutonic
Falk, though fals is commonly accounted its root.

The nomenclature of nearly all the older writers on this point
is extremely confused. What many of them, even so lately as Pen-
nant’s time, termed the “gentle falcon” is certainly the bird we
now call the goshawk (i.e. goose-hawk), which name itself may
have been transferred to the Astur palumbarius of modern ornith-
ologists, from one of the long-winged birds of prey.

(Finnunculus, Vieillot), is often added. This, however, appears
to have been justifiably reckoned a distinct genus.

The typical falcon is by common consent allowed to be that
almost cosmopolitan species to which unfortunately the English
epithet "peregrine" (i.e. strange or wandering) has been
attached. It is the Falco peregrinus of Tunstall (1771) and
most recent ornithologists, though some prefer the specific name
commonis applied by J. F. Gmelin a few years later (1768) to
a bird which, if his diagnosis he correct, could not have been a true
falcon at all, since it had yellow irides—a colour never met with
in the eyes of any bird now called by naturalists a “falcon.”

This species inhabits suitable localities throughout the greater
part of the globe, though examples from North America have
by some received specific recognition as F. anatum (the "duck-
hawk" ), and those from Australia have been described as distinct
under the name of F. melanogyns. Here, as in so many other
cases, it is almost impossible to decide as to which forms should,
and which should not, be accounted merely local races. In size
not surpassing a raven, this falcon (fig. 1) is perhaps the most
powerful bird of prey for its bulk that flies, and its courage is
not less than its power. It is the species, in Europe, most commonly
trained for the sport of hawking (see Falconry). Volumes have
been written upon it, and to attempt a complete account of it is,
within the limits now available, impossible. The plumage of
the adult is generally blackish-blue above, and white, with a more
or less deep cream-coloured tinge, beneath—the lower parts, except
the chin and throat, being harled transversely with black, while
a black patch extends from the bill to the ear-coverts, and
descends on either side beneath the mandible. The young have
the upper parts deep blackish-brown, and the lower white, more
or less strongly tinged with ochraceous-brown, and striped
longitudinally with blackish-brown. From Port Kennedy, the
most northern part of the American continent, to Tasmania,
and from the shores of the Sea of Okhotsk to Mendoza in the
Argentine territory, there is scarcely a country in which this
falcon has not been found. Specimens have been received from
the Cape of Good Hope, and it is only a question of the technical
differentiation of species whether it does not extend to Cape
Horn. Fearless as it is, and adapting itself to almost every
circumstance, it will form its eyry equally on the sea-washed
ciffs, the craggy mountains, or (though more rarely) the drier
spots of a marsh in the northern hemisphere, as on trees (says
H. Schlegel) in the forests of Java or the waterless ravines of
Australia. In the United Kingdom it was formerly very common,
and hardly a high rock from the Shetlands to the Isle of Wight

FIG. 1.—Peregrine Falcon.
but had a pair as its tenants. But the British gamekeeper has long held the mistaken faith that it is his wont for, and the number of pairs now allowed to rear their brood unmolested in the British Islands is very small. Yet its utility to the game-preserver, by destroying every one of its most precious wards that shows any sign of infirmity, can hardly be questioned by reason, and G. E. Freeman (Falconry) has earnestly urged its claims to protection.1 Nearly allied to this falcon are several species, such as F. barbarus of Mauretania, F. minor of South Africa, the Asiatic F. babylonicus, F. peregrinator of India (the shahineen), and perhaps F. cassini of South America, with some others.

Next to the typical falcons comes a group known as the "great northern" falcons (Hiero falco). Of these the most remarkable is the gyrfalcon (F. gyrfalco), whose homes are in the Scandinavian mountains, though the young are yearly visitors to the plains of Holland and Germany. In plumage it very much resembles F. peregrinus, but its flanks generally have a bluer tinge, and its superiority in size is at once manifest. Nearly allied to it is the Iceland (F. islandia), which externally differs in its paler colouring and in almost entirely wanting the black mandibular patch. Its proportions, however, differ a good deal, its body being elongated. Its country is shown by its name, but it also inhabits south Greenland, and not unfrequently makes its way to the British Islands. Very close to this comes the Greenland falcon (F. candicans), a native of north Greenland, and perhaps of other countries within the Arctic Circle. Like the last, the Greenland falcon from time to time occurs in the United Kingdom, but it is always to be distinguished by wearing a plumage in which at every age the prevailing colour is pure white. In north-eastern America these birds are replaced by a kindred form (F. labradorus), first detected by Audubon and subsequently recognized by Dresser (Orn. Miscell. i. 135). It is at once distinguished by its very dark colouring, the lower parts being occasionally almost as deeply tinted at all ages as the upper.

All the birds hitherto named possess one character in common. The darker markings of their plumage are longitudinal before the first real moult takes place, and for ever afterwards are transverse. In other words, when young the markings are in the form of stripes, when old in the form of bars. The variation of tint is very great, especially in F. peregrinus; but the experience of falconers, whose business it is to keep their birds in the very highest condition, shows that a falcon of either of these groups if light-coloured in youth is light-coloured when adult, and if dark when young is also dark when old—age, after the first moult, making no difference in the complexion of the bird. The next group is that of the so-called "desert falcons" (Gemnace), wherein the difference just indicated does not obtain, for long as the bird may live and often as it may moult, the original style of markings never gives way to any other. Foremost among these are to be considered the lanner and the saker (commonly termed F. lanarius and F. sacer), both well known in the palmy days of falconry, but only since about 1845 readmitted to full recognition. Both of these birds belong properly to south-eastern Europe, North Africa and south-western Asia. They are, for their bulk, less powerful than the members of the preceding group, and though they may be trained to high flights are naturally captors of humbler game. The precise number of species is very doubtful, but among the many candidates for recognition are especially to be named the lugger (F. jugger) of India, and the prairie (F. mexicanus) of the western plains of North America.

The systematist finds it hard to decide in what group he should place two somewhat large Australian species (F. hypoleucus and F. subniger), both of which are rare in collections—the latter especially.

A small but very beautiful group comes next—the merlins 2 (Aesalon of some writers, Lithofalco of others). The European merlin (F. aestivalis) is perhaps the boldest of the Accipitres, not hesitating to attack birds of twice its own size, and even on occasion threatening human beings. Yet it readily becomes tame, if not affectionate, when reclaimed, and its ordinary prey consists of the smaller Passeres. Its "pinion of glossy blue" 3 has become almost proverbial, and a deep rusty blush suffuses its lower parts; but these are characteristic only of the male—the female maintaining very nearly the sober brown plumage she wore when as a nestling she left her lowly cradle in the heather. Very close to this bird comes the pigeon-hawk (F. columbarius) of North America—so close, indeed, that none but an expert ornithologist can detect the difference. The turumti of Anglo-Indians (F. chicquero), and its representative from southern Africa (F. ruficollis), also belong to this group, but they are considerably larger than either of the former.

Lastly, the Hobbies (Hypotriorchis) comprise a greater number of forms—though how many seems to be doubtful.

---

1 It is not to be inferred, as many writers have done, that falcons habitually prey upon birds in which disease has made any serious progress. Such birds meet their fate from the less noble Accipitres or predatory animals of many kinds. But when a bird is first affected by any disorder, its power of taking care of itself is at once impaired, and hence in the majority of cases it may become an easy victim under circumstances which would enable a perfectly sound bird to escape from the attack even of a falcon.

2 French, Emérillon; Icelandic, Smirill.

---

They are in life at once recognizable by their bold upstanding position, and at any time by their long wings. The type of this group is the English hobby (F. subbuteo), a bird of great power of flight, chiefly shown in the capture of insects, which form its
ordinary food. It is a summer visitant to most parts of Europe, including the British Islands, and is most wantonly and needlessly destroyed by gamekeepers. A second European species of the group is the beautiful *F. eleonorae*, which hardly comes farther north than the countries bordering the Mediterranean, and, though in some places abundant, is an extremely local bird. The largest species of this section seems to be the Neotropical *F. femoralis*, for *F. divoleucus* though often ranked here, is now supposed to belong to the group of typical falcons. (A. N.)

**FALCONE, ANIELLO** (1600–1665), Italian battle-painter, was the son of a merchant. His name was Giovanni Andrea Falcone. He was of an artistic tendency at an early age, received some instruction from a relative, and then studied under Ribera (Lo Spagnoletto), of whom he ranks as the most eminent pupil. Besides battle-pictures, large and small, taken from biblical as well as secular history, he painted various religious subjects, which, however, count for little in his general reputation. He became, as a battle-painter, almost as celebrated as Borgognone (Courtois), and was named "L’Oracolo delle Battaglie." His works have animation, variety, truth to nature, and careful colour. Falcone was bold, generous, and perhaps too indulgent to his pupils. A spirited engraving by *Rosa* of Masaniello (1647) he resolved to be bloodied avenged for the death, at the hands of two Spaniards, of a nephew and of a pupil in the school of art which he had established in Naples. He and many of his scholars, including Salvator Rosa and Carlo Coppola, formed an armed band named the *Compagnia della Morte* ("Company of Death"); see *Rosa, Salvator*.

They scoured the streets by day, exulting in slaughter; at night they were painters again, and handled the brush with impetuous zeal. Peace being restored, they had to decamp. Falcone and Rosa made off to Rome; here Borgognone noticed the works of Falcone, and became his friend, and a French gentleman induced him to go to France, where Louis XIV. became one of his patrons. Ultimately Colbert obtained permission for the painter to return to Naples, and there he died in 1665. Two of his battle-pieces are to be seen in the Louvre and in the Naples museum; he painted a portrait of Masaniello, and engraved a few plates. Among his principal scholars, besides Rosa and Coppola (whose works are sometimes ascribed to Falcone himself), were Domenico Gargiulo (named Mico Spadaro), Paolo Porpora and Andrea di Lion.

**FALCONER, HUGH** (1808–1862), British palaeontologist and botanist, descended from an old Scottish family, was born at Forres on the 29th of February 1808. In 1826 he graduated at Aberdeen, where he manifested a taste for the study of natural history. He afterwards studied medicine in the university of Edinburgh, taking the degree of M.D. in 1829; during this period he zealously attended the botanical classes of Prof. R. Graham (1786–1843), and those on geology by Prof. R. Jameson. Proceeding to India in 1830 as assistant-surgeon on the Bengal establishment of the East India Company, he made on his arrival an examination of the fossil bones from Ava in the possession of the Asiatic Society of Bengal, and he described the collection, published soon afterwards, gave him a recognized position among the scientists of India. Early in 1831 he was appointed to the army station at Meerut, in the North-Western Provinces, but in the same year he was asked to officiate as superintendent of the botanic garden of Saharanpur, during the ill-health and absence of Dr. J. F. Royle; and in 1832 he succeeded to this post. He was thus placed in a district that proved to be rich in palaeontological remains; and he set to work to investigate its natural history and geology. In 1834 he published a geological description of the Siwalik hills, in the **Tertiary strata** of which he had in 1833 discovered bones of crocodiles, tortoises and other animals; and subsequently, with conjoint labourers, he brought to light a sub-tropical fossil fauna of unexampled extent and richness, including remains of *Mastodon*, the colossal ruminant *Sivathæros*, and the enormous tortoise *Colossoskelus Atlas*. For these valuable discoveries he and Captain (afterwards Sir Proby T.) Cautley (1802–1871) received in 1837 the Wollaston medal in duplicate from the Geological Society of London. In 1834 Falconer was appointed to inquire into the fitness of India for the growth of the plant, and it was on his recommendation that it was introduced into that country.

He was compelled by illness to leave India in 1842, and during his stay in England he occupied himself with the classification and arrangement of the Indian fossils presented to the British Museum and East India House, chiefly by himself and Sir Proby T. Cautley. He then set to work to edit the great memoir by Cautley and himself, entitled *Fauna Antiqua Siva- lensis*, of which Part I. text was issued in 1846, and a series of plates of the Indian fossils was published the same year. Unfortunately his work, owing partly to Dr. Falconer’s absence from England and partly to ill-health, was never completed. He was elected F. R. S. in 1845. In 1847 he was appointed superintendent of the Calcutta botanical garden, and professor of botany in the medical college; and on entering on his duties in the following year he was at once employed by the Indian government and the Agricultural and Horticultural Society as their adviser on all matters connected with the vegetable products of India. He prepared an important report on the teak forests of Tenasserim, in which he gave the English reader a view of India, saving them from destruction by reckless felling; and through his recommendation the introduction of the cinchona bark was introduced into the Indian empire. Being compelled by the state of his health to leave India in 1855, he spent the remainder of his life chiefly in examining fossil species in England and the Continent corresponding to those which he had discovered in India, notably the species of mastodon, elephant and rhinoceros; he also described some new mammalia from the Purbeck strata, and he reported on the bone-caves of Sicily, Gibraltar, Gower and Brixham. In the course of his researches he became interested in the question of the antiquity of the human race, and actually commenced a work on “Primeval Man,” which, however, he did not live to finish. He died on the 31st of January 1865. Shortly after his death a committee was formed for the promotion of a “Falconer Memorial.” This took the shape of a marble bust, which was placed in the rooms of the Royal Society of London, and of a Falconer scholarship of the annual value of £100, open for competition to graduates in science or medicine of the university of Edinburgh.

Dr. Falconer’s botanical notes, with 430 coloured drawings ofKnown and Indian plants, have been deposited in the library of Kew Gardens, and his *Palaeontological Memoirs and Notes*, comprising all his papers read before learned societies, have been edited, with a biographical sketch, by Charles Murchison, M.D. (London, 1868). Many reminiscences of Dr. Falconer, and a portrait of him, were published by his niece, Grace, Lady Prestwich, in her *Essays descriptive and biographical* (1901).

**FALCONER, WILLIAM** (1732–1769), British poet, was born in Edinburgh on the 11th of February 1732. His father was a wig-maker, and carried on business in one of the small shops with wooden fronts at the Netherbow Port, an antique castellated structure which remained till 1794, dividing High Street from the antquity of the human race, and actually commenced a work on “Primeval Man,” which, however, he did not live to finish. He died on the 31st of January 1865. Shortly after his death a committee was formed for the promotion of a “Falconer Memorial.” This took the shape of a marble bust, which was placed in the rooms of the Royal Society of London, and of a Falconer scholarship of the annual value of £100, open for competition to graduates in science or medicine of the university of Edinburgh.

Dr. Falconer’s botanical notes, with 430 coloured drawings of Known and Indian plants, have been deposited in the library of Kew Gardens, and his *Palaeontological Memoirs and Notes*, comprising all his papers read before learned societies, have been edited, with a biographical sketch, by Charles Murchison, M.D. (London, 1868). Many reminiscences of Dr. Falconer, and a portrait of him, were published by his niece, Grace, Lady Prestwich, in her *Essays descriptive and biographical* (1901).

to enter the royal navy, and before the end of 1762 the poet-sailor was rated as a midshipman on board the “Royal George.” But as this ship was paid off at the peace of 1763, Falconer received an appointment as purser of the “Glory” frigate, a situation which he held until that vessel was laid up on ordinary at Chatham. In 1764 he published a new and enlarged edition of The Shipwreck, and in the same year a rhymed political tirade against John Wilkes and Charles Churchill, entitled The Demagogue.

In 1769 appeared his Universal Marine Dictionary, in which 

*recreio* is defined as a French manoeuvre, “not properly a term of the British marine.” While engaged on this dictionary, J. Murray, a bookseller in Fleet Street, father of Byron’s munificent publisher and correspondent, wished him to join him as a partner in business. The poet declined the offer, as he became purser of the “Aurora” frigate, which had been commissioned to carry out to India certain supervisors or superintendents of the East India Company. Besides his nomination as purser, Falconer was promised the post of private secretary to the commissioners. Before sailing he published a third edition of his *Shipwreck*, which had again undergone “correction,” but not improvement. The poet died in the “Aurora” from Spithed on the 20th of September 1769. The vessel arrived safely at the Cape of Good Hope, and left on the 27th of December. She was never more heard of, having, as is supposed, foundered at sea. The *Shipwreck*, the poem with which Falconer’s name is connected, had a great reputation at one time, but the fine passages which pleased the earlier critics have not saved it from general oblivion.

See his *Poetical Works* in the “Aldine Edition” (1836), with a life by J. Mitford.

FALCONET, ÉTIENNE MAURICE (1716–1791), French sculptor, was born in Paris. His parents were poor, and he was at first apprenticed to a carpenter, but some of his clay-figures, with the making of which he occupied his leisure hours, attracted the notice of the sculptor Lemoine, who made him his pupil. He found time to study Greek and Latin, and also wrote several *breviers* and articles on the secular arts, and on the decorative arts, and on the decorative arts, being characterized by the same defects as his writings, for though manifesting considerable cleverness and some power of imagination, they display in many cases a false and fantastic taste, the result, most probably, of an excessive striving after originality. One of his most successful statues was one of Milo of Crotona, which secured his admission to the membership of the Academy of Fine Arts in 1754. At the invitation of the empress Catherine he went in 1766 to St Petersburg, where he executed a colossal statue of Peter the Great in bronze. In 1788 he became director of the French Academy of Painting. Many of Falconet’s works, being placed in churches, were destroyed at the time of the French Revolution. His *Nymphé descendante ou bain* is in the Louvre.

Among his writings are *Récitton sur la sculpture* (Paris, 1768), and *Observations sur la statue de Marc-Aurèle* (Paris, 1771). The whole were collected under the title of *Ouvres littéraires* (6 vols., Lausanne, 1781–1782; 3 vols., Paris, 1878).

FALCON (Fr. *fauconnerie*, from Late Lat.* falco*, falcon), the art of employing falcons and hawks in the chase, often termed Hawking. Falconry was for many ages one of the principal sports of the richer classes, and, since many more efficacious methods and appliances for the capture of game undoubtedly existed, it is probable that it has always been carried on as a pure sport. The antiquity of falconry is very great. There appears to be little doubt that it was practised in Asia at a very remote period, for which we have the concurrent testimony of various Chinese and Japanese works, some of the latter being most quaintly and yet spiritedly illustrated. It appears to have been known in China some 2000 years B.C., and the records of a king Wen Wang, who reigned over a province of that country 689 B.C., prove that the art was at that time in very high favour. In Japan it appears to have been known at least 600 years B.C., and probably at an equally early date in India, Arabia, Persia and Syria. Sir A. H. Layard, in his *Minoes and Babylon*, considered that there is relief found by him in the ruins of Khorsabad “there appeared to be a falconer bearing a hawk on his wrist,” from which it would appear to have been known there some 1700 years B.C. In all the above-mentioned countries of Asia it is practised at the present day.

Little is known of the early history of falconry in Africa, but from very ancient Egyptian carvings and drawings it seems to have been known there many ages ago. It was probably also in vogue in the countries of Morocco, Oran, Algiers, Tunis and Egypt, at the same time as in Europe. The older writers on falconry, English and continental, often mention Barbary and Tunisian falcons. It is still practised in Egypt.

Perhaps the oldest records of falconry in Europe are supplied by the writings of Pliny, Aristotile and Martial. Although their notices of the sport are slight and somewhat vague, yet they are quite sufficient to show clearly that it was practised in their times—the years 264 B.C. and A.D. 40. It was probably introduced into England in the time of Alfred, A.D. 870, and from that time down to the middle of the 17th century falconry was followed with an ardour that perhaps no English sport has ever called forth, not even fox-hunting. Stringent laws and enactments, notably in the reigns of William the Conqueror, Edward III., Henry VIII. and Elizabeth, were passed from time to time in its interest. Falcons and hawks were allotted to degrees and orders of men according to rank and station—for instance, to the emperor the eagle and vulture, to royalty the jay, to a peer the peregrine, to a yeoman the goshawk, to a priest the sparrow-hawk, and to a knave or servant the useless blue jay. The writings of Shakespeare furnish ample testimony to the high and universal estimation in which it was held in his days. About the middle of the 17th century falconry began to decline in England, to revive somewhat at the Restoration. It never, however, completely recovered its former favour, a variety of causes operating against it, such as enclosure of waste lands, agricultural improvements, and the introduction of fire-arms into the sporting field, till it fell, as a national sport, almost into oblivion. Yet it has never been even temporarily extinct, and it is successfully practised even at the present day.

In Europe, a “quarry” at which hawks are engaged, consists of grouse (confined to the British Isles), black-game, pheasants, partridges, quails, sandpipers, ducks, teal, woodcocks, snipes, herons, rooks, crows, gulls, magpies, jays, blackbirds, thrushes, larks, hares and rabbits. In former days geese, cranes, kites, ravens and bustards were also flown at. Old German works make much mention of the use of the Iceland falcon for taking the great bastard, a flight scarcely alluded to by English writers. In Asia the list of quarry is longer, and, in addition to all the foregoing, or their Asiatic representatives, various kinds of bustards, sand grous, storks, ibises, spoonbills, pea-fowl, jungle-fowl, kites, vultures and gazelles are captured by trained hawks. In Mongolia and Chinese Tartary, and among the nomad tribes of central Asia, the sport still flourishes; and though some late accounts are not satisfactory either to the falconer or the naturalist, yet they leave no doubt that a species of eagle is still trained in those regions to take large game, as antelopes and wolves.

Mr Atkinson, in his account of his travels in the country of the Amur, makes particular mention of the sport, as does also Mr Shaw in his work on Yarkand; and in a letter from the Yarkand embassy, under Mr Forsyth, C.B., dated Camp near Yarkand, Nov. 27, 1783, the following passage occurs:—

“Hawking appears also to be a favourite amusement, the golden eagle taking the place of the falcon or hawk. This novel sport seemed very successful.” It is questionable whether the bird here spoken of is the golden eagle. In Africa gazelles are taken, and also partridges and wildfowl.

The hawks used in England are the three great northern falcons, viz. the Greenland, Iceland and Norway falcons, the peregrine falcon, the hobby, the merlin, the goshawk and the sparrow-hawk. In former days the saker, the lanner and the Barbary or Tunisian falcon were also employed. (See Falcon.)

Of the foregoing the easiest to keep, most efficient in the field, and most suitable for general use are the peregrine falcon and the goshawk.

In all hawks, the female is larger and more powerful than the male.
FALCONRY

Hawks are divided by falconers all over the world into two great classes. The first class comprises "falcons," i.e. "long-winged hawks," or hawks of the lure, distinguished by Eastern falconers as "dark-eyed hawks." In these the wings are pointed, the second feather in the wing is the longest, and the iris is of a dark, dark-brown hue. Merlins must, however, be excepted; and here it would seem that the Eastern distinction is the better, for though merlins are much more falcons than they are hawks, they differ from falcons in having the third feather in the wing the longest, while they are certainly "dark-eyed hawks."

The second class is that of "hawks," i.e. "short-winged hawks," or "hawks of the fist," called by Eastern falconers "yellow (or rose) eyed hawks." In these the wings are rounded, the fourth feather is the longest in the wing, and the iris is yellow or deep-orange.

The following glossary of the principal terms used in falconry may assist the reader in perusing this notice of the practice of the art. Useless or obsolete terms are omitted:

Australro. — A falconer.

Bate. — A hawk is said to "late" when she flutters off from the fist, perch or block, whether from wildness, or for exercise, or in the attempt to chase.

Bewit. — Straps of leather by which the bells are fastened to a hawk's legs.

Bind. — A hawk is said to "bind" when she seizes a bird in the air and clings to it.

Block. — The conical piece of wood, of the form of an inverted flower-pot, used for hawks to sit upon; for a peregrine it should be about 10 to 12 in. high, 5 to 6 in diameter at top, and 8 to 9 in diameter at base.

Brail. — A thong of soft leather used to secure, when desirable, the wing of a hawk. It has a slit to admit the pinion joint, and the ends are tied together.

Cadge. — The wooden frame on which hawks, when numerous, are carried to the field.

Cadger. — The person who carries the cadge.

Calling off. — Luring a hawk (see Lure) from the hand of an assistant.

Carry. — A hawk is said to "carry" when she flies away with the quarry on the approach of the falconer.

Cast. — Two hawks which may be used for flying together are called "cast," not necessarily a pair.

Casting. — The oblong or egg-shaped ball, consisting of feathers, bones, &c., which all hawks (and insectivorous birds) throw up after the nutritious part of their food has been digested. Also the fur or feathers given them to assist the process.

Cere. — The naked wax-like skin above the beak.

Check. — A hawk is said to "check" at "cherry," when she flies at a bird other than the intended object of pursuit.

Clutching. — Taking the quarry in the feet as the short-winged hawks do. Hawks occasionally "clutch."

Come to. — A hawk is said to "come to" when she begins to get tame.

Coping. — Cutting the beak or talons of a hawk.

Crab. — To fight.

Cress. — A long line or string.

Crop, to put away. — A hawk is said to "put away her crop" when the food passes out of the crop into the stomach.

Deck feathers. — The two centre tail-feathers.

Eyes. — A hawk which has been brought up from the nest (nyas, from Fr. niais).

Eyry. — The nest of a hawk.

Foot. — A hawk is said to "foot" well or to be a "good footer" when she is successful in killing. Many hawks are very fine fliers without being "good footers."

Frounce. — A disfigurement in the back part of the throat of hawks.

Get in. — To go up to a hawk when she has killed her quarry.

Hack. — The state of partial liberty in which young hawks must always at first be kept.

Haggard. — A wild-caught hawk in the adult plumage.

Hood. — (See fig.)

Hoodshy. — A hawk is said to be "hoodshy" when she is afraid of, or resists, having her hood put on.

Hunger brace. — A hawk with a defect in the tail feathers, denoting a weak point; generally due to temporary starvation as a nestling.

Imp. — The process of mending broken feathers is called "imping." (See fig.)

Imping needle. — A piece of tough soft iron wire from about 1½ to 2½ in. long, rough filed so as to be three-sided and tapering from the middle to the end. (See fig.)

Intermediate. — A hawk moulting in confinement is said to be "intermewed."

Jack. — Mate of the merlin.

Jerkin. — Mate of the jehfalcon.

Jesses. — Strips of light but very tough leather, some 6 to 8 in. long, which always remain on a hawk's legs—one on each leg. (See fig.)

Junk. — To sleep.

Leash. — A strong leather thong, some 24 to 3 ft. long, with a knot or button at one end, used to secure a hawk. (See fig.)

Lure. — The instrument used for calling long-winged hawks—a dead pigeon, or an artificial lure made of leather and feathers or wings of birds, tied to a string, with meat attached to it.

Mail. — The breast feathers.

Make hoke. — A hawk is called a "make hawk" when, as a thoroughly trained and steady hawk, she is flown with young ones to teach them their work.

Man a hawk. — To tame a hawk and accustom her to strangers.

Jack.—Mate of the merlin.
Jerkin.—Mate of the jehfalcon.
Jesses.—Strips of light but very tough leather, some 6 to 8 in. long, which always remain on a hawk’s legs—one on each leg. (See fig.)
Junk.—To sleep.
Leash.—A strong leather thong, some 24 to 3 ft. long, with a knot or button at one end, used to secure a hawk. (See fig.)
Lure.—The instrument used for calling long-winged hawks—a dead pigeon, or an artificial lure made of leather and feathers or wings of birds, tied to a string, with meat attached to it.
Mail.—The breast feathers.
Make hoke.—A hawk is called a “make hawk” when, as a thoroughly trained and steady hawk, she is flown with young ones to teach them their work.
Man a hawk.—To tame a hawk and accustom her to strangers.

Jack.—Mate of the merlin.
Jerkin.—Mate of the jehfalcon.
Jesses.—Strips of light but very tough leather, some 6 to 8 in. long, which always remain on a hawk’s legs—one on each leg. (See fig.)
Junk.—To sleep.
Leash.—A strong leather thong, some 24 to 3 ft. long, with a knot or button at one end, used to secure a hawk. (See fig.)
Lure.—The instrument used for calling long-winged hawks—a dead pigeon, or an artificial lure made of leather and feathers or wings of birds, tied to a string, with meat attached to it.
Mail.—The breast feathers.
Make hoke.—A hawk is called a “make hawk” when, as a thoroughly trained and steady hawk, she is flown with young ones to teach them their work.
Man a hawk.—To tame a hawk and accustom her to strangers.
Plume.—A hawk is said to "plume" a bird when she pulls off the feathers.

Point.—A hawk "makes her point" when she rises in the air over the spot where quarry has saved itself from capture by diving into a hedge, or has otherwise secreted itself.

Passes.—A hawk's claws.

Pull through the hood.—A hawk is said to pull through the hood when she eats with it on.

Put in.—A bird is said to "put in" when it saves itself from the hawk by flying directly to a covert or other place of security.

Quarry.—The bird or beast flown at.

Rake out.—A hawk is said to "rake out" when she flies, while waiting on (see Wait on), too far and wide from her master.

Ranag.—A hawk.

Red hawk.—Hawks of the first year, in the young plumage, are called "red hawks."

Ringing.—A bird is said to "ring" when it rises spirally in the air.

Rise on.—An unhooded hawk, not, however, convenient for hooding and unhooding—used only for hawks when first captured. (See fig.)

Salt.—The wings of a hawk.

Seeing.—Closing the eyes by a fine thread drawn through the lid of each eye, the threads being then twisted together above the head—a practice long disused in England.

Serving a hawk.—Driving out quarry which has taken refuge, or has "put in."

Steep.—The hawk's rapid plunge upon the quarry.

Take the air.—A bird is said to take the air when it seeks to equalise the higher point of the horizon.

Tercel.—The male of various falcons, particularly of the peregrine, also tarsal, tarsell or tord; the term is also applied to the male of various owls.

Trussing.—A hawk is said to "truss" a bird when she catches it in the air, and comes to the ground with it in her talons. This term is not applied to large quarry. (See Bird.)

Varied weather.—Generally of some wetness, unknown to the end of the jesses, and engraved with the owner's name.

Wait on.—A hawk is said to "wait on" when she flies above her master waiting till game is sprung.

Weathering.—Hawks are "weathered" by being placed unhooded in the open air. Passage hawks which are not sufficiently reclaimed to be left out by themselves unhooded on blocks are "weathered" by being put out for an hour or two under the falconer's eye.

Yarab.—An Eastern term, generally applied to short-winged hawks. When a hawk is keen, and in hunting condition, she is said to be "in yarab."

The training of hawks affords much scope for judgment, experience and skill on the part of the falconer, who must carefully observe the temper and disposition as well as the constitution of each bird. It is through the appetite principally that hawks, like most wild animals, are tamed; but to fit them for use in sport, management, perseverance, gentleness and care must be used. Slowly taming necessitates starving, and low condition and weakness are the result. The aim of the falconer must be to have his hawks always keen, and the appetite when they are brought into the field should be such as would induce the bird in a state of nature to put forth its full powers to obtain its food, with, as near as possible, a corresponding condition as to flesh.

The following is an outline of the process of training hawks, beginning with the management of a wild-caught peregrine falcon. When first taken, a rufet hood should be put on her head, and she must be furnished with jessies, swivel, leach and bell. A thick glove or other gauntlet must be worn on the left hand (Eastern falconers always carry a hawk on the right), and she must be carried about as much as possible, late into the night, every day, being constantly stroked with a bird's wing or feather, very lightly at first. At night she should be tied to a perch in a room with the window darkened, so that no light can enter in the morning. The perch should be a padded pole placed across the room, about 4½ ft. from the ground, with a canvas screen underneath. She will easily be induced to feed in most cases by dressing a piece of beefsteak over her feet, brushing her legs at the time with a wing, and now and then, as she snaps, slipping a morsel into her mouth. Care must be taken to make a peculiar sound with the lips or tongue, or to use a low whistle as she is in the act of swallowing; she will very soon learn to associate this sound with feeding, and it will be found that directly she hears it, she will gripe with her talons, and bend down to feed for food. When the falconer perceives this and other signs of her "coming to," that she no longer starts at the voice or touch, and steps quietly up from the perch when the hand is placed under her feet, it will be time to change her rufet hood for the ordinary hood. This latter should be very carefully chosen—an easy fitting one, in which the braces draw closely and yet easily and without jerking. An old one previously worn is to be recommended. The hawk should be taken into a very dark room—one absolutely dark is best—and the change should be made if possible in total darkness. After this she must be brought to feed with her hood off; at first she must be fed every day in a darkened room, a gleam of light being admitted. The first day, the hawk is ringed and led to pull at it freely, the hood must be gently slipped off; after she has eaten a moderate quantity, it must be replaced as slowly and gently as possible, and she should be allowed to finish her meal through the hood. Next day the hawk may be twice removed, and so on; day by day the practice should be continued, and more light gradually admitted, until the hawk will feed freely in broad daylight, and suffer the hood to be taken off and replaced without opposition. Next she must be accustomed to see and feed in the presence of strangers and dogs, &c. A good plan is to carry her in the streets of a town at night, at first where the gas-light is not strong, and where persons passing by are few, unhooding and hooding her from time to time, not letting her get frightened. Up to this time she should be fed on lean beefsteak with no castings, but as soon as she is tolerably tame and submits well to the hood, she must occasionally be fed with pigeons and other birds. This should be done not later than 3 or 4 P.M., and when she is placed on her perch for the night in the dark room, she must be unhooded and left so, of course being carefully tied up. The falconer should enter the room about 7 or 8 A.M. next day, admitting as little light as possible, or using a candle. He should first observe if she has thrown her casting; if so, he will slip on the food, and he then should give her a bite of food, and re-hood her. If her casting is not thrown it is better for him to retire, leaving the room quite dark, and come in again later. She must now be taught to know the voice—the shout that is used to call her in the field—and to jump to the fist for food, the voice being used every time she is fed. When she comes freely to the fist she must be made acquainted with the lure. Kneeling down with the hawk on his fist, and gently unhooding her, the falconer casts out a lure, which may be either a dead pigeon or an artificial lure garnished with long black tippets of string, to a distance of a couple or three feet in front of her. When the lure has been dangled a little above the ground, and the falconer should allow it to catch a little on it—the voice being used—the receiving morsels from the falconer's hand; and before her meal is finished she must be taken off to the hand, being induced to forsake the lure for the hand by a tempting piece of meat. This treatment will help to check her inclination hereafter to carry her quarry. This lesson is to be continued till the falcon feeds very boldly on the lure on the ground, in the falconer's presence—till she will suffer him to walk round her while she is feeding. All this time she will have been held by the leash only, but in the next step a strong, but light creance must be made fast to the lead, and an assistant holding the hawk should unhood her, as the falconer, standing at a distance of 5 to 10 yds., calls her by shouting and casting out the lure. Gradually day after day the distance is increased, till the hawk will come 30 yds., or so without hesitation; then she may be trusted to fly to the lure at liberty, and by degrees from any distance, say 1000 yds. This accomplished, she should learn to stoop at the lure. Instead of allowing the hawk to seize upon it as she comes up, the falconer should snatch the lure away and let her pass by, and immediately put it out that she may readily seize it when she turns round to look for it. This should be done at first only once, and then progressively until she will stoop backwards and forwards at the lure as often as desired. Next she should be entered at her quarry. Should she be intended for rooks or herons, two or three of these birds should be procured. One should be given her from the hand, then one should be released close to her, and a third at a considerable distance. If she takes these keenly, she may be flown at a wild bird. Care must, however, be taken to
let her have every possible advantage in her first flights—wind and weather, and the position of the quarry with regard to the surrounding country, must be considered.

Young hawks, on being received by the falconer before they can fly, must be put into a sheltered place, such as an outhouse or shed. Their basket or hamper should be filled with straw. A hamper is best, with the lid so placed as to form a platform for the young hawks to come out upon to feed. This should be fastened to a beam or prop a few feet from the ground.

The young hawks must be most plentifully fed on the best fresh food obtainable—good beefsteak and fresh-killed birds; the falconer when feeding them should use his voice as in lure. As they grow old enough they will come out, and perch about the roof of their shed, by degrees extending their flights to neighbouring buildings or trees, never failing to come at feeding time to the place where they are fed. Soon they will be continually on the wing, playing or fighting with one another, and later the falconer will observe them chasing other birds, as pigeons and rooks, which may be passing by. As soon as one fails to come for a meal, it must be at once caught with a bow net or a snare the first time it comes back, or it will be lost. It must be borne in mind that the longer hawks can be left at hack the better they are for it; in fact, when the falconer has become a good judge of hawks, he finds that the best which have preyed a few times for themselves before being caught. Of course there is great risk of losing hawks when they begin to prey for themselves. When a hawk is so caught she is said to be "taken up" from hack. She will not require a rutherford hood, but a good deal of the management described for the passage falcon will be necessary. She must be carefully tamed and broken to the hood in the same manner, and so taught to know the lure; but, as might be expected, very much less difficulty will be experienced. As soon as the eyasu knows the lure sufficiently well to come to it sharp and straight from a distance, she must be taught to "wait on." This is effected by letting the hawk loose in an open place, such as a down. It will be found that she will circle round the falconer looking for the lure she has been accustomed to see—perhaps mount a little in the air, and advantage must be taken of a favourable moment when the hawk is at a little height, her head being turned in towards the falconer, to let go a pigeon which she can easily catch. When the hawk has taken two or three pigeons in this way, and mounts immediately in expectation, in short, begins to wait on, she should see no more pigeons, but be tried at game as soon as possible. Young eyases should be done at grouse first in preference to partridges, not only because the season commences earlier, but because, grouse being the heavier birds, they are not so much tempted to "carry" as with partridges.

The training of the great northern falcons, as well as that of merlins and hobbies, is conducted much on the above principles, but the jerfalcon (gerfalcon or gyrfalcon) will seldom wait on well, and merlins will not do it at all.

The training of short-winged hawks is a simpler process. The first, like falcons, be provided with jesses, swivel, hood, and bell. In these hawks a bell is sometimes fastened to the tail. Sparrow-hawks can, however, scarcely carry a bell big enough to be of any service. The hood is seldom used for short-winged hawks—never in the field. They must be made as tame as possible by carriage on the fist and the society of man, and taught to come to the fist freely when required—at first to jump to it in a room, and then out of doors. When the goshawk comes freely and without hesitation from short distances, she ought to be called from long distances from the hand of an assistant, but not oftener than twice in each meal, until she will come at least 1000 yds., on each occasion being well rewarded with some food she likes very much, as a fresh-killed bird, warm. When she does this freely, and endures the presence of strangers, dogs, &c., a few bagged rabbits should be given to her, and she will be ready to take the field. Some accustom the goshawk to the use of the lure, for the purpose of taking her if she will not come to the fist in the field when she has taken stand in a tree after being baulked of her quarry, but it ought not to be necessary to use it.

FALCONRY

Falconry

Falconry is a form of hunting that involves the use of birds of prey, particularly hawks or falcons, to capture game. It is a tradition that dates back thousands of years and is practiced in various cultures around the world. Falconry enthusiasts often train young hawks or falcons to hunt and capture game, such as small mammals or birds, using a method that is both ethical and sustainable.

In the traditional practice of falconry, the falconer plays an important role. They are responsible for training and caring for the birds, as well as guiding them during hunts. The falconer must possess a deep understanding of bird behavior and habitat to effectively utilize the hawks or falcons for hunting purposes.

The process of training a young falcon begins with feeding the bird small pieces of meat to build trust and establish a bond. As the falcon grows older, it is introduced to various objects and sounds to desensitize it to potential distractions during hunting. Once the falcon is comfortable with its surroundings, it is trained to respond to commands and signals from the falconer.

During a hunt, the falconer uses a variety of techniques to guide the falcon's flight and focus its attention on the desired prey. This may include the use of a lure or a dummy, which the falconer presents to attract the bird's attention. The falconer's skill and experience are crucial in successfully conducting a hunt.

In addition to hunting, falconry also involves the appreciation and study of birds of prey. Many falconers are dedicated to the conservation of these magnificent creatures, working to protect their habitats and ensuring their continued survival.

The traditional practice of falconry is not just about hunting, but also about the bond and connection between the falconer and the bird. It requires patience, skill, and a deep respect for these magnificent creatures. Whether for hunting, training, or simply for the love and beauty of these birds, falconry continues to be an enduring and fascinating tradition.
FALCONRY

The flying order goes up at once to a good pitch in the air—the higher she flies the better—and follows her master from field to field, always ready for a stoop when the quarry is sprung. Hawks that have been successfully broken and judiciously worked become wonderfully clever, and soon learn to regulate their flight by the movements of their master. Eysées were not held in esteem by the old falconers, and it is evident from their writings that these hawks have been very much better understood and managed in the 19th century than in the middle ages. It is probable that the old falconers procured their passage and wild-caught hawks with such facility, having at the same time more scope for their use in days when quarry was more abundant and there was more waste land than there now is, that they did not find it necessary to trouble themselves about every eye. Here may be quoted a few lines from one of the best of the old writers, which may be taken as giving a fair account of the estimation in which eyases were generally held, and from which it is evident that the old falconers did not understand flying hawks at hack. Simon Latham, writing in 1633, says of eyases:

"They will be more easily brought to familiaritie with the man, not in the house only, but also abroad, hooded or unhooded; nay, many of them will come of themselves when undressed, when hooded, for if a man doe but stirre or speake in their hearing, they will crie and bate as though they did desire to see the man. Likewise of some being unhooded when they the man will be the more readily hearing thereby their exceeding fondness and fawning love towards him..."

These kind of hawks are all (for the most part) taken out of the young, and may be brought to do so, from whence they are put into a close house, whereas they are alwayes fed and familiarly brought up by the man, until they bee able to flie, when as the summer approaching verie suddenly they are continued and trained up in the same, the weather being alwayes warm and temperate; thus they are still inured to familiaritie with the man, not knowing from whence besides to fetch their relief or sustenance. When the summer is ended they bee commonly put up into a house again, or else kept in some warm place, for they cannot endure the cold wind to blow upon them... But leaving to speak of these kind of scratching hawks that I never did love should come too near my fingers, and to return unto the faire conditioned haggard faulcon..."

The author here describes with accuracy the condition of unhackeyd eyases, which no modern falconer would trouble himself to keep. Many English falconers in modern times have had eyases which have killed grousse, ducks and other quarry in a style almost equalling that of passage hawks. Rooks also have been most successfully flown, and some herons on passage have been taken by eyases. No sport is to be had at game without hawks that wait on well. Moors, downs, open country where the hedges are low and weak are best suited to game hawks. Partridges or partridges may be used to find game, or the hawk may be let on coming to the ground where game is known to lie, and suffered, if an experienced one, to "wait on" till game is flushed. However, the best plan with most hawks, young ones especially, is to use a dog, and to let the hawk go when the dog points, and to flush the birds as soon as the hawk is at her pitch. It is not by any means necessary that the hawk should be near the birds when they rise, provided she is at a good height, and that she is watching; she will come at once with a rush out of the air at great speed, and either cut one down with the stoop, or the hawk may have itself by putting in, when every exertion must be made, especially if the hawk be young and inexperienced, to "serve" her as soon as possible by driving out the bird again while she waits overhead. If this be successfull done she is nearly certain to kill it at the second flight. Perhaps falcons are best for grouse and partridges for partridges.

Magpies afford much sport. Only tiercels should be used for hunting magpies. A field is necessary—at the very least 4 or 5 runners to beat the magpie out, and perhaps the presence of a horseman is an advantage. Of course in open flight a magpie would be almost immediately caught by a tiercel peregrine, and here would be no sport, but the magpie makes up for his want of power of wing by his cunning and shiftiness; and he is, moreover, never to be found except where he has shelter under his lee for security from a passing peregrine. Once in a hedge or tree he is perfectly safe from the wild falcon, but the case is otherwise when the falconer approaches with his trained tiercel, perhaps a cast of tiercels, waiting on in the air, with some active runners in his field. Then driven from hedge to hedge, from one kind of shelter to another, stopped at every instant when he shows himself ever so little away from cover by the watchful tiercels overhead, his egg-stealing days are brought to an end by a fatal stroke—sometimes not before the field is pretty well exhausted with running and shouting. The magpie always manœuvre towards some thick wood, from which it is the aim of the field to cut him off. At first hawks must be flown in easy country, but when they understand their work well they will kill magpies in very enclosed country—with a smart active field a magpie may even be pushed through a wood. Magpie hunting affords excellent exercise, not only for those who run to serve the hawks, but for the hawks also; they get a great deal of flying, and learn to hunt in company with men—any number of people may be present. Blackbirds may be hunted with tiercels in the same way. Woodcock afford capital sport where the country is tolerably open. It will generally be found that after a hawk has made one stoop at a woodcock, the cock will at first try to escape by taking the air, and will show a very fine flight. When beaten in the air it will try to get back to covert again, but when once a hawk has outflown a woodcock, he is pretty sure to kill it. Hawks seem to pursue woodcock with great keenness; something in the flight of the cock tempts them to exertion. The laziest and most useless hawks—hawks that will scarcely follow a slow pigeon—will do their best at woodcock, and will very soon, if the sport is continued, be improved in their style of flying. Snipe may be killed by first-class tiercels in favourable localities. Wild duck and teal are only to be flown at when they can be found in small pools or brooks at a distance from much water—where the fowl can be suddenly flushed by men or dogs while the falcon is flying at her pitch overhead. For duck, falcons should be used; tiercels will kill too small a bird.

The merlin is used for flying at larks, and there does not seem to be any other use to which this pretty little falcon may fairly be put. It is very active, but far from being, as some authors have stated, the swiftest of all hawks. Its flight is greatly inferior in speed and power to that of the peregrine. Perhaps its diminutive size, causing it to be soon lost to view, and a limited acquaintance with the flight of the wild peregrine falcon, have led to the mistake.

The hobby is far swifter than the merlin, but cannot be said to be efficient in the field; it may be trained to wait on beauti-ful game, such as partridges, to take larks; it is very much given to the fault of "carrying.""The three great northern falcons are not easy to procure in proper condition for training. They are very difficult to break to the hood and to manage in the field. They are flown, like the peregrine, at herons and rooks, and in former days were used for kites and hares. Their style of flight is magnificent; they are considerably swifter than the peregrine, and are a most deadly "footers." They seem, however, to lack somewhat of the spirit and dash of the peregrine.

With the short-winged hawks an open country is not required; indeed they may be flown in a wood. Goshawks are flown at hares, rabbits, pheasants, partridges and wild-fowl. Only very strong females are able to take hares; rabbits are easy quarry for any female goshawk, and a little too strong for the male. A good female goshawk may kill from 10 to 15 rabbits in a day, or more. For pheasants the male is to be preferred, certainly for partridges; either sex will take duck and teal, but the falconer must get close to them before they are flushed, or the goshawk will stand a poor chance of killing. Rabbit hawking may be practised by ferreting, and flying the hawk as the rabbits bolt, but care must be taken or the hawk will kill the ferret. Where rabbits sit out on grass or in turnip fields, a goshawk may be used with success, even in a wood when the holes are not too near. From various causes it is impossible, or nearly so, to have goshawks in England in the perfection to which
they are brought in the East. In India, for instance, there is a far greater variety of quarry suited to them, and wild birds of a much more approachable kind, moreover, there are advantages for training them which do not exist in England. Unmolested—and scarcely noticed except perhaps by others of his calling or tastes—the Eastern falconer carries his hawk by day and night in the crowded bazaars, till the bird becomes perfectly indifferent to men, horses, dogs, carriages, and, in short, becomes as tame as the domestic animals.

The management of sparrow-hawks is much the same as that of goshawks, but they are far more delicate than the latter. They are found in England at blackbirds, thrushes and other small birds; good ones will take a bred fowl till they get too wild, and strong with the advancing season. In the East large numbers of quail are taken with sparrow-hawks.

It is of course important that hawks from which work in the field is expected should be kept in the highest health, and they must be carefully fed; no bad or tainted meat must on any account be given to them—at any rate to hawks of the species used in England. Peregrines and the great northern falcons are best kept on beefsteak, with a frequent change in the shape of fresh-killed pigeons and other birds. The smaller falcons, the merlin and the hobby, require more variety of food; for a long time it is an advantage to keep them to the bath. Goshawks should be fed like peregrines, but rats and rabbits are very good as change of food for them. The sparrow-hawk, like the small falcons, requires small birds. All hawks require castings frequently. It is true that hawks will exist, and often appear to thrive, on good food without castings, but the seeds of probable injury to their health are becoming the whole time they are so kept. If there is difficulty in procuring birds, and it is more convenient to feed the hawks on beefsteak, they should frequently get the wings and heads and necks of game and poultry. In addition to the castings which they swallow, treading these is good exercise for them, and biting the bones prevents the beaks from overgrowing. Most hawks, peregrines especially, require the bath. The end of a cask, sawn off to give a depth of about 6 in., makes a very good bath. Peregrines which are used for waiting on require a bath at least twice a week. If this be neglected, they will not wait long before going off in search of water to bathe, however hungry they may be.

The most agreeable and the best way, where practicable, of keeping hawks is to have them on blocks on the lawn. Each hawk’s block should stand in a circular bed of sand or loam in which the hay is mown; this is very convenient for keeping them clean. Goshawks are generally placed on bow perches, which ought not to be more than 8 or 9 in. high at the highest part of the arc. It will be several months before passage or wild-caught falcons can be kept out of doors; they must be fastened to a perch in a darkened room, hooded, but by degrees as they get thoroughly tame may be brought to sit on the lawn. In England (especially in the south) peregrines, the northern falcons and goshawks may be kept out of doors all day and night in a sheltered situation. In very wild boisterous weather, or in snow or sharp frost, it will be advisable to move them to the shelter of a shed, the floor of which should be laid with sand to a depth of 3 or 4 in. Merlins and hobbies are too tender to be kept much out of doors. An eastern aspect is to be preferred—all birds enjoy the morning sun, and it is very beneficial to them. The more hawks confined to blocks out of doors see of persons, dogs, horses, &c., moving about the better, but of course only when there is no danger of their being frightened or molested, or of food being given to them by strangers. Those who have only seen wretched ill-fed hawks in cages as in zoological gardens or menageries, plaing for exercise, with batted and plumaged toes, shoulders and bloating cores, from dashing against their prison bars, and overgrown beaks from never getting bones to break, can have little idea of the beautiful and striking-looking birds to be seen pluming their feathers and stretching their wings at their ease at their blocks on the falconer’s lawm, watching with their large bright keen eyes everything that moves in the sky and everywhere else within the limits of their view. Contrary to the prevailing notion, hawks show a good deal of attachment when they have been properly handled. It is true that by nature they are in a great measure tamed and controlled, and the same may be said of all undomesticated and many domesticated animals. And instinct prompts all wild creatures when away from man’s control to return to their former shyness, but hawks certainly retain their tameness for a long time, and their memory is remarkably retentive. Wild-caught hawks have been retaken, either by their coming to the lure or upon quarry, from 2 to 7 days after they had been lost, and eyases after 3 weeks. As one instance of retentiveness of memory displayed by hawks we may mention the case of a wild-caught falcon which was recaptured and trained well the same evening, and is now, after a few days flight, flying with the jesses which were cut short close to the leg at the time she was released; in five days she was flying at the lure again at liberty, and was found to retain the peculiar ways and habits she was observed to have in her former existence as a trained hawk. It is useless to bring a hawk into the field unless she has a keen appetite; if she has not, she will neither hunt effectually nor follow her master. Even wild-caught falcons, however, may sometimes be seen so attached to their owner that, when sitting on their blocks on a lawn with food in their crops, they will not eat, and when the owner leaves the grounds can get up and follow him, till he either go up to them and allow them to jump up to his hand or withdraw from their sight. Goshawks are also known to evince attachment to their owner. Another prevailing error regarding hawks is that they are supposed to be lazy birds, requiring the stimulus of hunger to stir them to action. The reverse is the truth; they are birds of very active habits, and exceedingly restless, and the notion of their being lazy has been propagated by those who have seen little or nothing of hawks in their wild state. The wild falcon requires an immense deal of exercise, and to be in wind, in order to exert the speed and power of flight necessary to capture her prey when hungry; and to this end instinct prompts her to spend hours daily on the wing, soaring and playing about in the air in all weathers, often chasing birds merely for play or exercise. Sometimes she takes a siesta when much gorged, but unless she fills her crop late in the evening she is soon moving again—before half her crop is put over. Goshawks and sparrow-hawks, too, habitually soar in the air at about 9 or 10 a.m., and remain aloft a considerable time, but these birds are not of such active habits as the falcons. The frequent baking of thoroughly tame hawks from the time when not hungry or frightened, proves their restlessness and impatience of repose. So does the wretched condition of the caged falcon (before alluded to), while the really lazy buzzards and kites, which do not in a wild state depend on activity or power of wing for their sustenance, maintain themselves for years, even during confinement if properly fed, in good case and plumage. Such being the habits of the falcon in a state of nature, the falconer should endeavour to give the hawks under his care as much flying as possible, and he should avoid the very common mistake of keeping too many hawks. In this case a favoured few are sure to get all the work, and the others, possibly equally good if they had fair play, are spoiled for want of exercise.

The larger hawks may be kept in health and working order for several years—15 or 20— barring accidents. The writer has known peregrines, shaaens and goshawks to reach ages between 15 and 20 years. Goshawks, however, never fly well after 4 or 5 seasons, when they will no longer take difficult quarry; they may be used at rabbits as long as they live. Shaheens may be seen in the East at an advanced age, killing wild-fowl beautifully. The shaheel is a falcon of the peregrine type, which does not travel, but the peregrine, all over the world. It appears that the jefarfoles also may be worked to a good age. Old Simon Latham tells us of these birds—"I myself have known one of them an excellent Hearner (killer of herons), and to continue her goodness very near twenty yeares, or full out that time."
Harting (1891), gives a complete bibliography. See Coursing and Falconry in the Badminton Library; Coursing and The Art and Practice of Horse-hunting, by E. B. Michell (1900), the best modern book on the subject. Perhaps the most useful of the old works are The Book of Faulconry or Hawking, by George Turberville (1578), and The Falcon’s Lure and Core, by Simon Latham (1835). (E. D. R.)

FALDSTOOL (from the O.J.H. Ger. falden or fahlen, to fold, and stud, Mod. Ger. Stuhl, a stool; from the medieval Latin faldistulum is derived, through the old form fauststul, the Mod. Fr. faustuil, properly a folding seat for the use of a bishop when not occupying the throne in his own cathedral, or when officiating in a cathedral or church other than his own; hence any movable folding stool used for kneeling in divine service. The small desk or stand from which the Litany is read is sometimes called a faldstool, and a similar stool is provided for the use of the sovereign. The corona regia probably means footstool.

FALERI (from the Latin Civitas Castellana, q.v.), one of the twelve chief cities of Etruria, situated about 1 m. W. of the ancient Via Flaminia, 1 32 m. N. of Rome. According to the legend, it was of Argive origin; and Strabo’s assertion that the population, the Falisci (q.v.), were of a different race from the Etruscans is proved by the language of the earliest inscriptions which have been found here. Wars between Rome and the Falisci appear to have been frequent. To one of the first of them belongs the story of the schoolmaster who wished to betray his boys to Camillus; the latter refused his offer, and the boys were rescued by the citizens of Rome. At the end of the First Punic War, the Falisci rose in rebellion, but were soon conquered (241 B.C.) and lost half their territory. Zonaras (viii. 18) tells us that the ancient city, built upon a precipitous hill, was destroyed and another built on a more accessible site on the plain. The description of the two sites agrees well with the usual theory that the original city occupied the site of the present Civita Castellana, and that the ruins of Faleri (as the place is now called) are those of the Roman town which was thus transferred 3 m. to the north-west. After this time Falerii hardly appears in history. It became a colony (Junonia Faleria) perhaps in 307 B.C. under the auspices of Quintus Fabius, though according to the inscriptions apparently not until the time of Gallienus. There were bishops of Falerii up till 1034, when the desertion of the place in favour of the present site began, and the last mention of it dates from a.d. 1064.

The site of the original Falerii is a plateau, about 1100 yds. by 400, not higher than the surrounding country (475 ft.) but separated from it by gorges over 200 ft. in depth, and only connected with it on the western side, which was strongly fortified with a mound and ditch; the rest of the city was defended by walls constructed of the blocks of which some remains still exist. Remains of a temple were found at Lo Scasato, at the highest point of the ancient town, in 1888, and others have been excavated in the outskirts. The attribution of one of these to Juno Quiritis is uncertain. These buildings were of wood, with fine decorations of coloured terracotta (Notizie degli scavi, 1887, p. 92; 1888, p. 414). Numerous tombs hewn in the rock are visible on all sides of the town, and important discoveries have been made in them; many objects, both from the temples and from the tombs, are in the Museo di Villa Giulia at Rome. Similar finds have been made at Falerii Novi, Falerii Veteri, and Acinipo, m. N.W. The site of the Roman Faleri is now entirely abandoned. It lay upon a road which may have been (see H. Nissen, Italiische Landeskunde, ii. 361) the Via Aania, a by-road of the Via Cassia; this road approached it from the south passing through Nepet, while its prolongation to the north certainly bore the name Via Amerina. The circuit of the city is about 2250 yds., its shape roughly triangular, and the walls are a remarkably fine and well-preserved specimen of Roman military architecture. They are constructed of rectangular blocks of tufa two Roman ft. in height; the walls themselves reach in places a height of 55 ft. and are 7 to 9 ft. thick. There were about 80 towers, some 50 of which are still preserved, as also the bastions, eight, are noteworthy. Of the buildings within the walls hardly anything is preserved above ground, though the forum and theatre (as also the amphitheatre, the arena of which measured 80 by 108 ft. outside the walls) were all excavated in the 19th century. Almost the only edifice now standing is the 12th-century abbey church of S. Maria. Recent excavations have shown that the plan of the whole city could easily be recovered, though the buildings have suffered considerable devastation (Notizie degli scavi, 1905, 14).

FALERIO (mod. Fa lerone), an ancient town of Picenum, Italy, about 10 m. S.E. of Urbis Salvia. We know almost nothing of the place except from inscriptions, from which, and from the remains of its buildings, it appears to have been of some importance. It was probably founded as a colony by Augustus after his victory at Actium. A question arose in the time of Domitian between the inhabitants of Falero and Firmum as to land which had been taken out of the territory of the latter (which was recolonized by the triumvirs), and, though not distributed to the new settlers, had not been given back again to the people of Firmum. The emperor, by a rescript, a copy of which in bronze was found at Falero, decided in favour of the people of Falero, that the occupiers of this land should remain in possession of it (Th. Mommsen in Corp. Inscript. Latin. i., Berlin, 1883, No. 5, 420). Considerable remains of a theatre in concrete faced with brickwork, erected, according to an inscription, in 43 B.C., and 161 ft. in diameter, were excavated in 1878, and are still visible; and an amphitheatre, less well preserved, also exists, the arena of which measures about 180 by 150 ft. Between the two is a water reservoir (called Bagno della Regina) connected with remains of baths.

See G. de Minicis in Giornale Aracodico, iv. (1832), 160 seq.; Annoti dell’ Istituto (1839), 529 seq.

FALGUIÈRE, JEAN ALEXANDRE JOSEPH (1813-1900), French sculptor and painter, was born at Toulouse. A pupil of the École des Beaux Arts he won the Prix de Rome in 1859; he was awarded the medal of honour at the Salon in 1868 and was appointed officer of the Legion of Honour in 1878. His first bronze statue of importance was the “Victor of the Cock-Fight” (1864), and “Tarsicu the Christian Boy-Martyr” followed in 1867; both are now in the Luxembourg Museum. His more important monuments are those to Admiral Courbet (1890) at Abbeville and the famous “Joan of Arc.” Among more ideal works are “The Eve,” “Diana” (1859), “Galatea,” “The Peacock,” and “The Poet,” astride his Pegasus spreading wings for flight. His “Triumph of the Republic” (1881-1880), a vast quadriga for the Arc de Triomphe, Paris, is perhaps more amazingly full of life than others of his works, all of which reveal that quality of vitality in superlatively degree. To these works should be added his monuments to “Cardinal Lavergere” and “General de La Fayette” (the latter in Washington), and his statues of “Lamartine” (1876) and “St Vincent de Paul” (1879), as well as the “Balzac,” which he executed for the “Société des gens de lettres on the rejection of that by Rodin; and the busts of “Carus-Duran” and “Gueux,” “cadet” (1896).

Falguière was a painter as well as a sculptor, but somewhat inferior in merit. He displays a fine sense of colour and tone, added to the qualities of life and vigour that he instils into his plastic work. His “Wrestlers” (1875) and “Fan and Dagger” (1882; a defiant Spanish woman) are in the Luxembourg, and other pictures of importance are “The Beheading of St John the Baptist” (1857), “The Sphinx” (1883), “Acis and Galatea” (1885), “Old Woman and Child” (1886) and “In the Bull’s House” (1887). He became a member of the Institute (Académie des Beaux-Arts) in 1882. He died in 1900.

See Léonce Bénédicte, Alexandre Falguière, Librairie de l’art (Paris).
FALIERO (or FALIER), MARINO (1279-1352), doge of Venice, belonged to one of the oldest and most illustrious Venetian families and had served the republic with distinction in various capacities. In 1346 he commanded the Venetian land forces at the siege of Zara, where he was attacked by the Hungarians under King Louis the Great and totally defeated; this victory led to the surrender of the city. In September 1354, while absent on a mission to Pope Innocent IV. at Avignon, Faliero was elected doge, an honour which apparently he had not sought. His reign began, as it was to end, in disaster, for very soon after his election the Venetian fleet was completely destroyed by the Genoese off the island of Sapienza, while plague and a declining commerce aggravated the situation. Although a capable commander and a good statesman, Faliero possessed a violent temper, and after his election developed great ambition. The constitutional restrictions of the ducal power, which had been further curtailed under his predecessor, the Council of Ten proceeded to arrest the doge, and to place armed guards all over the town. Several of the conspirators were condemned to death and others to various terms of imprisonment. The doge's complicity having been discovered, he was himself arrested; at the trial he confessed everything and was condemned and executed on the 17th of April 1355.

The story of the insult written by Michele Steno on the doge's chair is a legend of which no record is found in any contemporary authority. The motives of Faliero are not altogether clear, as his past record, even in the judgment of the poet Petrarch, showed him as a wise, clear-headed man of no unsavoury tincture. But possibly the attitude of the aristocracy and the example offered by the tyrants of neighbouring cities may have induced him to attempt a similar policy. The only result of the plot was to consolidate the power of the Council of Ten.

BIBLIOGRAPHY.—An account of Marino Faliero's reign is given in S. Romani's Storia documentaria di Venezia, lib. ix. cap. ii. (Venice, 1822); M. Sanudo, La Vite de' dogi in new edition of 1892; M. Faliero, La Congiura (1897). The most recent essay on the subject is contained in Horatio Brown's Studies in Venetian History (London, 1907), wherein all the authorities are set forth. (L. V. P.)

FALISCI, a tribe of Sabine origin or connexions, but speaking a dialect closely akin to Latin, inhabited the territory of Falerii (q.v.), as well as a considerable tract of the surrounding country, probably reaching as far south as to include the small town of Capena. But at the beginning of the historical period, i.e. from the beginning of the 5th century B.C., and no doubt earlier, the dominant element in the town was Etruscan; and all through the wars of the following centuries the town was counted a member, and sometimes a leading member, of the Etruscan league (cf. Livy iv. 23, v. 17, vii. 17).

In spite of the Etruscan domination, the Faliscans preserved many traces of theirItalic origin, such as the worship of the deities Juno Quiritis (Ovid, Fasti, vi. 49) and Feronia (Livy xxi. 11), the cult of Dis Soranus by the Hiripi or fire-leaping priests on Mount Soracte (Pliny, Nat. Hist. vii. 2, 19; Servius, ad Aen. xi. 785, 787), above all their language. This is preserved for us in some 36 short inscriptions, dating from the 3rd and 2nd centuries B.C., and is written in a peculiar alphabet derived from the Etruscan, and written from right to left, but showing some traces of the influence of the Latin alphabet. Its most characteristic signs are—

As a specimen of the dialect may be quoted the words written round the edge of a picture on a patera, the genuineness of which is established by the fact that they were written before the glaze was put on: "foied vino pipafo, cra carefo," i.e. in Latin "hodie vinum bibam, cras carebo" (R. S. Conway, Italic Dialects, p. 112). This shows some of the phonetic characteristics of the Faliscan dialect, viz.—

1. The retention of medial f which in Latin became b;
2. The representation of an initial Ind.-Eur. gh by f (foied, contrast Latin hodie);
3. The palatalization of d + consonant i into some sound denoted by t— the central sound of foid, from foedum;
4. The loss of final s, at all events before certain following sounds (eso beside Latin ers);
5. Other characteristics, appearing elsewhere, are:
   a. The retention of the velars (Fal. quando = Latin quando; contrast Umbrian pan(u)s);
   b. The assimilation of some final consonants to the initial letter of the next word: "pretend de zaneto sanentia" (Zaneto for sanusos, an archaic genitive). For further details see Conway, ib. pp. 370 ff., especially pp. 384-385, where the relation of the names Falisci, Falerii to the local hero Halaesus (e.g. Ovid, Fasti, iv. 73) is discussed, and where reason is given for thinking that the change of initial f (from an original bh or dh) into an initial b was a genuine mark of Faliscan dialect.

It seems probable that the dialect lasted on, though being gradually permeated with Latin, till at least 150 B.C.

In addition to the remains found in the graves (see Falerii), which belong mainly to the period of Etruscan domination and give ample evidence of material prosperity and refinement, the earlier strata have yielded more primitive remains from the Italic epoch. A large number of inscriptions consisting mainly of proper names may be regarded as Etruscan rather than Faliscan, and they have been disregarded in the account of the dialect just given. It should perhaps be mentioned that there was a town Feronia in Sardinia, named probably after their native goddess by Faliscan settlers, from some of whom we have a votive inscription found at S. Maria di Falieri (Conway, ib. p. 335).

Further information may be sought from W. Deedeke, Die Falisiker (a useful but somewhat uncritical collection of the evidence accessible in 1888); E. Bornmann, in C.I.L. xx. pp. 465 ff., and Conway, op. cit.

FALK, JOHANN DANIEL (1768-1826), German author and philanthropist, was born at Danzig on the 28th of October 1768.

After attending the gymnasium of his native town, he entered the university of Halle with the view of studying theology, but preferring a non-professional line, gave up his theological studies and went to live at Weimar. There he published a volume of satire which won him the approbation of his patron, the Duke of Wieland, and gave promise of greater future excellence than was ever completely fulfilled; his later pieces, directed more against individuals than the general vices and defects of society, gradually degenerated in quality. In 1806 Falk founded a critical journal under the title of Elysium und Tartarus. He also contributed largely to contemporary journals. He enjoyed the acquaintance and intimate friendship of Goethe, and his account of their intercourse was posthumously published under the title Goethe aus näherem persönlichen Umgange dargestellt (1832) (English by S. Austin). Falk died on the 14th of February 1826.

Falk's Satirische Werke appeared in 7 vols. (1817 and 1820); his Annalen der Auslands-Schriften (3 vols., 1819). See Johannes Falk; Erinnerungsblatter aus Briefen und Tagebuehern, gesammelt von dessen Tocher Rosalie Falk (1868); Heinzelmann, Johanns Falk und die Gesellschaft der Freunde in der Not (1879); A. Stein, J. Falk (1881); E. Hultze, Falk und Goethe (1900).
FALK—FALKLAND

FALK, Paul Ludwig Adalbert (1827-1900), German politician, was born at Matschkau, Silesia, on the 10th of August 1827. In 1847 he entered the Prussian state service, and in 1853 became public prosecutor at Lyck. In 1858 he was elected a deputy, joining the Old Liberal party. In 1868 he became a privy-councillor in the ministry of justice. In 1872 he was made minister of education, and in connexion with Bismarck's policy of the Kultur-kampf he was responsible for the famous May Laws against the Catholics (see Germany: History). In 1873 his position became untenable, owing to the weight of Pius IX. and the change of German policy with regard to the Vatican, and he resigned his office, but retained his seat in the Reichstag till 1882. He was then made president of the supreme court of justice at Hamburg, where he died in 1900.

FALKE, Johann Friedrich Gottlieb (1823-1876), German historian, was born at Ratzeburg on the 20th of April 1823. Entering the university of Erlangen in 1843, he soon began to devote his attention to the history of the German language and literature, and in 1848 went to Munich, where he remained five years, and diligently availed himself of the use of the government library for the purpose of prosecuting his historical studies. In 1856 he was appointed secretary of the German museum at Nuremberg, and in 1859 keeper of the manuscripts. With the aid of the manuscript collections in the museum he now turned his attention chiefly to political history, and, with Johann H. Müller, established an historical journal under the name of Zeitschrift für deutsche Kulturgeschichte (4 vols., Nuremberg, 1856-1859). To this journal he contributed a history of German taxation and commerce. On the latter subject he published separately Geschichte der deutschen Handelstrafiken (2 vols., Leipzig, 1859-1860) and Die Huns aus als deutsche See-und Handels-macht (Berlin, 1862). In 1862 he was appointed secretary of the state archives at Dresden, and, a little later, keeper. He there began the study of Saxon history, still devoting his attention chiefly to the history of commerce and economy, and published Die Geschichte des Kurfürsten August von Sachsen in volks-wirthschaftlicher Beziehung (Leipzig, 1868) and Geschichte des deutschen Zollwesens (Leipzig, 1869). He died at Dresden on the 2nd of March 1876.

FALKIRK, a municipal and police burgh of Stirlingshire, Scotland. Pop. (1831) 10,769; (1901) 29,280. It is situated on high ground overlooking the fertile Carse of Falkirk, 1 m. S.E. of Stirling, and about midway between Edinburgh and Glasgow. Grangemouth, its port, lies 3 m. to the N.E., and the Forth & Clyde Canal passes to the north, and the Union Canal to the south of the town. Falkirk now comprises the suburbs of Laurieston (E.), Grahamston and Bainsford (N.), and Camelon (W.). The principal structures include the burgh and county buildings, town hall, the Dollar free library and Camelon fever hospital. The present church, with a steeply 146 ft. high, dates only from 1811. In the churchyard are buried Sir John Graham, Sir John Stewart who fell in the battle of 1208, and Sir Robert Munro and his brother, Dr Duncan Munro, killed in the battle of 1746. The town is under the control of a council with provost and bailies, and combines with Airdrie, Hamilton, Lanark and Linlithgow (the Falkirk group of burghs) to return a member to parliament. The district is rich in coal and iron, which supply the predominant industries, Falkirk being the chief seat of the light casting trade in Scotland; but tanning, flour-milling, brewing, distilling and the manufacture of explosives (Nobel's) and chemicals are also carried on. Trysts or sales of cattle, such as were held in 1707 and 1709 (September and October) on Stenhousemuir, 3 m. N.W. They were transferred hither from Crieff in 1777, and were formerly the most important in the kingdom, but have to a great extent been replaced by the local weekly auction marts. Carron, 2 m. N.N.W., is famous for the iron-works established in 1760 by Dr John Roebuck (1718-1794), whose advising engineers were successively John Smeaton and James Watt. The short iron guns of large calibre designed by General Robert Melville, and first cast in 1779, were called cannonades from this their place of manufacture. Falkirk is a town of considerable antiquity. Its original name was the Gaelic Eaghais brec, "church of speckled or motled stone," which Simeon of Durham (fl. 1130) translatiterd as Egglebresh. By the end of the 13th century appears the form Faukirke (the present local pronunciation), which is merely a translation of the Gaelic Fau or Faw, meaning "dun," "pale red." The first church was built by Malcolm Canmore (d. 1093). Falkirk was made a burgh of barony in 1060 and a burgh of regality in 1646, but on the forfeiture of the earl of Linlithgow in 1715 its superiority was vested in the crown. Callander House, immediately to the S., was the seat of the earl and his ancestors. The mansion was visited by Queen Mary, captured by Cromwell, and occupied by Generals Monk and Hawley. The wall of Antoninus runs through the grounds, and the district is rich in Roman ruins, Camelon, about 2 m. W., being the site of a Roman settlement; Merchiston Hall, to the N.W., was the birthplace of Admiral Sir Charles Napier. The eastern suburb of Laurieston was first called Langtoune, then Merchiston, and received its present name after Sir Lawrence Dundas of Kerse, who had promoted its welfare. At Polmont, farther north, gives the title of baronet to the Duke of Hamilton, is the school of Blair Lodge, besides coal-mines and other industries.

Battles of Falkirk.—The battle of the 22nd of July 1298 was fought between the forces of King Edward I. of England and those of the Scottish national party under Sir William Wallace. The latter, after long baffling the king's attempts to bring him to battle, had taken up a strong position south of the town behind a morass. They were formed in four deep and close masses ("schiltron") of pikemen, the light troops screening the front and sides, and a body of men-at-arms standing in reserve. It was perhaps hoped that the English cavalry would plunge into the morass, for no serious precautions were taken as to the flanks, but in any case Wallace desired no more than to receive an attack at the halt, trusting wholly to his massed pikes. The English right wing first appeared, tried the morass in vain, and then set out to turn it by a long détour; the main battle under the king halted in front of it, while the left wing under Antony Bec, bishop of Durham, was able to reach the head of the marsh without much delay. Once on the enemy's side of the obstacle the bishop halted to wait for Edward, who was now following him, but his disciplined barons, shouting "Tis not for thee, bishop, to teach us war. Go say mass!" drove off the Scottish archers and men-at-arms and charged the nearest square of pikes, which repulsed them with heavy losses. On the other flank the right wing, its flank march completed, charged with the same result. But Edward, who had now joined the bishop with the centre or "main battle," peremptorily ordered the cavalry to stand fast, and, taught by his experience in the Welsh wars, brought up his archers. The longbow here scored its first victory in a pitched battle. Before long gaps appeared in the close ranks of pike heads, and, after sufficient preparation Edward again launched his men-at-arms to the charge. The shaken masses then gave way one after the other, and the Scots fled in all directions.

The second battle of Falkirk, fought on the 17th of January 1746 between the Highlanders under Prince Charles and the British forces under General Hawley, resulted in the defeat of the latter. It is remarkable only for the bad conduct of the British dragons and the steadiness of the infantry. Hawley retreated to Linlithgow, leaving all his baggage, 7oo prisoners and seven guns in the enemy's hands.

FALKLAND, Louis de, Viscount (c. 1610-1643), son of Sir Henry Cary, afterwards 1st Viscount Falkland (d. 1633), a member of an ancient Devonshire family, who was lord deputy of Ireland from 1622 to 1629, and of Elizabeth (1585-1639), only daughter of Sir Lawrence Tanfield, chief baron of the exchequer, was born either in 1609 or 1610, and was educated at Trinity College, Dublin. In 1625 he inherited from his grandfather the manors of Great Tew and Burford in Oxfordshire, and, about the age of 21, married Lettice, daughter of Sir Richard Morrison, of Tooley Park in Leicestershire. Involved in a quarrel with his father, whom he failed to propitiate by
offering to hand over to him his estate, he left England to take service in the Dutch army, but soon returned. In 1633, by the death of his father, he became Viscount Falkland. His mother had embraced the Roman Catholic faith, to which it was now sought to attract Falkland himself, but his studies and reflections led him, under the influence of Chillingworth, to the interpretation of religious problems rather by reason than by tradition or authority. At Great Tew he enjoyed a short but happy period of study, and he assembled round him many gifted and learned men, whom the near neighbourhhood of the university and his own brilliant qualities attracted to his house. He was the friend of Hales and Chillingworth, was celebrated by Jonson, Suckling, Cowley and Waller in verse, and, in prose by Clarendon, who is eloquent in describing the virtues and genius of the "incomparable" Falkland, and draws a delightful picture of his society and hospitality.

Falkland's intellectual pleasures, however, were soon interrupted by war and politics. He felt it his duty to take part on the king's side as a volunteer under Essex in the campaign of 1639 against the Scots. In 1640 he was returned for Newport in the Isle of Wight to the Short and Long Parliaments, and took an active part on the side of the opposition. He spoke against the exaction of shipmoney on the 7th of December 1640, denouncing the servile conduct of Lord Keeper Finch and the judges. He supported the prosecution of Strafford, at the same time endeavouring on more than one occasion to moderate the measures of the Commons in the interests of justice, and voted for the lord reading. At the adjournment of the 21st of April 1641. On the great division of the church he urged that "the interference of the clergy in secular matters, the encroachments in jurisdiction of the spiritual courts, and the imposition by authority of unnecessary ceremonies, should be prohibited. On the other hand, though he denied that episcopacy existed jure divino, he was opposed to its abolition; fearing the establishment of the Presbyterian system, which in Scotland had proved equally tyrannical. Triennial parliaments would be sufficient to control the bishops, if they meditated any further attacks upon the national liberties, and he argued that "where it is not necessary to change, it is necessary not to change." Even Hampden still believed that a compromise with the episcopal principle was possible, and assured Falkland that if the bill taken up to the Lords on the 1st of May 1641, excluding the bishops from the Lords and the clergy from secular offices, were passed, "there would be nothing more attempted to the prejudice of the church." Accordingly the bill was supported by Falkland. The times, however, were not favourable to compromise. The bill was lost in the Lords, and on the 27th of May the Root and Branch Bill, for the total abolition of episcopacy, was introduced in the House of Commons. This measure Falkland opposed, as well as the second bill for excluding the bishops, introduced on the 21st of October. In the discussion on the Grand Remonstrance he took the part of the bishops and the Arminians. He was now opposed to the whole policy of the opposition, and, being reproached by Hampden with his change of attitude, replied "that he had formerly been persuaded by that worthy gentleman to believe many things which he had since found to be untrue, and therefore he had changed his opinion in many particulars as well as to things as to persons."

On the 1st of January 1642, immediately before the attempted arrest of the five members, of which, however, he was not cognizant, he was offered by the king the secretaryship of state, and was persuaded by Hyde to accept it, thus becoming involved directly in the king's policy, though evidently possessing little influence in his counsels. He was one of the peers who signed the protestation against making war, at York on the 17th of June 1642. On the 5th of September he carried Charles's overtures for peace to the parliament, when he informed the leaders of the opposition that the king consented to a thorough reformation of religion. The secret correspondence connected with the Waller plot passed through his hands. He was present with the king at Edgehill and at the siege of Gloucester. By this time the hopelessness of the situation had completely overwhelmed him. The aims and principles of neither party in the conflict could satisfy a man of Falkland's high ideals and intellectual vision. His royalism could not suffer the substitution, as the controlling power in the state, of a parliament for the monarchy, nor his conservatism the revolutionary changes in church and state now insisted upon by the opposite faction. The fatal character and policy of the king, the most incapable of men and yet the man upon whom all depended, must have been by now thoroughly understood by Falkland. Compromise had long been out of the question. The victory of either side could only bring misery; and the prolongation of the war was a prospect equally unhappy. Nor could Falkland find any support or consolation in his own inward convictions or principles. His ideals and hopes were now destroyed, and he had no definite political convictions such as inspired and strengthened Strafford and Pym. In fact his sensitive nature shrank from contact with the practical politics of the day and prevented his rise to the place of a leader or a statesman. Clarendon has recorded his final relapse into despair. "Sitting amongst his friends, often, after a deep silence and frequent sighs (he) would with a shrill and sad accent ingenerate the word Peace, Peace, and would passionately profess that the very agony of the war, and the view of the calamities and desolation the kingdom did and must endure, took his sleep from him and would shortly break his heart." At Gloucester he had in vain exposed himself to risks. On the morning of the battle of Newbury, on the 20th of September 1642, he went to visit his friends who would not dissuaded him from taking part in the fight, that "he was weary of the times and foresaw much misery to his own Country and did believe he should be out of it ere night." He served during the engagement as a volunteer under Sir John Byron, and, riding alone at a gap in a hedge commanded by the enemy's fire, was immediately killed.

His death took place at the early age of 33, which should be borne in mind in every estimate of his career and character. He was succeeded in the title by his eldest son Lucius, 3rd Viscount Falkland, his male descent becoming extinct in the person of Anthony, 4th viscount, in 1694, when the viscountcy passed to Lucius Henry (1687-1750), a descendant of the first viscount, and the present peer is his direct descendant.

Falkland wrote a Discourse of Infallibility, published in 1646 (Thomson Tracts, E 361 [i]), reprinted in 1650, in 1651 (E 634 [i]) ed. by Triplet with replies, and in 1660 with the addition of two discourses on episcopacy by Falkland. This is a work of some importance in theological controversy, the general argument being that "to those who follow their reason in the interpretation of the Scriptures God will either give his grace for assistance to find the truth or his pardon if they mistake it. And this he supposed necessity of an infallible guide (with the supposed damnation for the want of it) fall together to the ground." Also A Letter ... 30 Sept. 1642 concerning the late conflict before Worcester (1642); and Poems, in which he shows himself a follower of Ben Jonson, edited by A. B. Grosart in Miscellanea of the Fuller Worthies Library, vol. iii. (1871).

The chief interest in Falkland does not lie in his writings or in the incidents of his career, but in his character and the distinction of his intellectual position, in his isolation from his contemporaries seeking reformation in the inward and spiritual life of the church and state and not in the revolution of church and state which now insisted upon by the opposite faction. His character and chief of rationalism in an age dominated by violent intolerance and narrow dogmatism. His personal appearance, according to Clarendon, was insignificant, "in no degree attractive or promising. His stature was low and smaller than most men; his motion not graceful ... but that little person and small stature was quickly found to contain a great heart ... all mankind could not but admire and love him."

**FALKLAND**, a royal and police burgh of Fifeshire, Scotland. Pop. (1891) 809. It is situated at the northern base of the hill of Falkland, and was first incorporated by charter granted by King James V., 1478, to the then baron, but only two are of considerable size; the largest of these, East Falkland, is 95 m. in extreme length, with an average width of 40 m., and the smaller, West Falkland, is 80 m. long and about 25 m. wide. The area of East Falkland is about 3000 sq. m., and that of West Falkland 2300. Most of the others are mere islets, the largest 16 m. long by 8 m. wide. The two principal islands are separated by Falkland Sound, a narrow strait from 18 to 24 m. in width, running nearly N.E. and S.W. The general appearance of the islands is not unlike that of one of the outer Hebrides. The general colouring, a faded brown, is somewhat dreary, but the mountain heights and promontories are of the same brown and brownish-red, in size and shape, as those of principal mountain range, the Hornby Hills, of the west, and it is a grandeur of outline. The coast line of both main islands is deeply indented and many of the bays and inlets form secure and well-protected harbours, some of which, however, are difficult of access to sailing ships.

East Falkland is almost bisected by two deep fijdors, Choisel and Brenton Sounds, which leave the northern and southern portions connected only by an isthmus a mile and a half wide. The northern portion is hilly, and is crossed by a rugged range, the Wickham Heights, running east and west, and rising in some places to a height of nearly 2000 ft. The remainder of the island consists chiefly of low undulating ground, a mixture of pasture and moor, and mountains, with many shallow freshwater tarns, and many streams running in the valleys. Two fine inlets, Berkeley Sound and Port William, run far into the land at the north-eastern extremity of the island. Port Louis, formerly the seat of government, is at the head of Berkeley Sound, but the anchorage there having been found rather too exposed, about the year 1824 a town was laid out, and the necessary public buildings were erected on Stanley Harbour, a sheltered recess within Port William. West Falkland is more hilly near the east island; the principal mountain range, the Hornby Hills, runs north and south parallel with Falkland Sound. Mount Adam, the highest hill in the islands, is 2315 ft. high.

The little town of Stanley is built along the south shore of Stanley harbour and stretches a short way up the slope; it has a population of little more than 900. The houses, mostly white with coloured roofs, are generally built of wood and iron, and have glazed porches, gay with fuchsias and pelargonias. Government House, grey, stone-built and slated, called to mind a manse in Shetland or Orkney. The government barrack is a rather imposing structure in the middle of the town, as is the cathedral church to the east, built of stone and buttressed with granite, and some nineteen miles from the sea. The largest town on East Falkland is Darwin on Choisel Sound—a village of Scottish shepherds and a station of the Falkland Island Company.

The Falkland Islands consist entirely, so far as is known, of the older Palaeozoic rocks, Lower Devonian or Upper Silurian, slightly metamorphosed and a good deal crumpled and distorted, in the low grounds clay slate and soft sandstone, and on the ridges hardenened sandstone passing into the conspicuous white quartzites. There do not seem to be any minerals of value, and the rocks are not such as to indicate any probability of their discovery. Galena is found in small quantity, and in some places it contains a large percentage of silver. The dark bituminous layers of slate, which occur intercalated among the quartzites, have led, here as elsewhere, to the hope of coming upon a seam of coal, but it is contrary to experience that coal of any value should be found in rocks of that age.

The town's most distinguished native was Richard Cameron, the Covenant. His house—a three-storied structure with yellow-tiled front and thatched roof—still stands on the south side of the square in the main street. The Hackstons of Rathillet also had a house in Falkland.

**FALKLAND ISLANDS** (Fr. Malouines; Span. Malvinas), a group of islands in the South Atlantic Ocean, belonging to Britain, and lying about 250 m. E. of the nearest point in the mainland of South America, between 51° and 53° S., and 57° 40' and 61° 25' W. With the uninhabited dependency of South Georgia Island, to the E.S.E., they form the most southerly colony of the British empire. The islands, inclusive of rocks and reefs, exceed 100 in number and have a total area of 6500 sq. m.; but only two are of considerable size; the largest of these, East Falkland, is 95 m. in extreme length, with an average width of 40 m., and the smaller, West Falkland, is 80 m. long and about 25 m. wide. The area of East Falkland is about 3000 sq. m., and that of West Falkland 2300. Most of the others are mere islets, the largest 16 m. long by 8 m. wide. The two principal islands are separated by Falkland Sound, a narrow strait from 18 to 24 m. in width, running nearly N.E. and S.W. The general appearance of the islands is not unlike that of one of the outer Hebrides. The general colouring, a faded brown, is somewhat dreary, but the mountain heights and promontories are of the same brown and brownish-red, in size and shape, as those of principal mountain range, the Hornby Hills, of the west, and it is a grandeur of outline. The coast line of both main islands is deeply indented and many of the bays and inlets form secure and well-protected harbours, some of which, however, are difficult of access to sailing ships.

East Falkland is almost bisected by two deep fijdors, Choisel and Brenton Sounds, which leave the northern and southern portions connected only by an isthmus a mile and a half wide. The northern portion is hilly, and is crossed by a rugged range, the Wickham Heights, running east and west, and rising in some places to a height of nearly 2000 ft. The remainder of the island consists chiefly of low undulating ground, a mixture of pasture and moor, and mountains, with many shallow freshwater tarns, and many streams running in the valleys. Two fine inlets, Berkeley Sound and Port William, run far into the land at the north-eastern extremity of the island. Port Louis, formerly the seat of government, is at the head of Berkeley Sound, but the anchorage there having been found rather too exposed, about the year 1824 a town was laid out, and the necessary public buildings were erected on Stanley Harbour, a sheltered recess within Port William. West Falkland is more hilly near the east island; the principal mountain range, the Hornby Hills, runs north and south parallel with Falkland Sound. Mount Adam, the highest hill in the islands, is 2315 ft. high.

The little town of Stanley is built along the south shore of Stanley harbour and stretches a short way up the slope; it has a population of little more than 900. The houses, mostly white with coloured roofs, are generally built of wood and iron, and have glazed porches, gay with fuchsias and pelargonias. Government House, grey, stone-built and slated, called to mind a manse in Shetland or Orkney. The government barrack is a rather imposing structure in the middle of the town, as is the cathedral church to the east, built of stone and buttressed with granite, and some nineteen miles from the sea. The largest town on East Falkland is Darwin on Choisel Sound—a village of Scottish shepherds and a station of the Falkland Island Company.

The Falkland Islands consist entirely, so far as is known, of the older Palaeozoic rocks, Lower Devonian or Upper Silurian, slightly metamorphosed and a good deal crumpled and distorted, in the low grounds clay slate and soft sandstone, and on the ridges hardenened sandstone passing into the conspicuous white quartzites. There do not seem to be any minerals of value, and the rocks are not such as to indicate any probability of their discovery. Galena is found in small quantity, and in some places it contains a large percentage of silver. The dark bituminous layers of slate, which occur intercalated among the quartzites, have led, here as elsewhere, to the hope of coming upon a seam of coal, but it is contrary to experience that coal of any value should be found in rocks of that age.
Many of the valleys in the Falklands are occupied by pale glistening masses which at a little distance much resemble small glaciers. Examined more closely these are found to be vast accumulations of blocks of quartzite, irregular in form, but having a tendency to a rude diamond shape, from 2 to 20 ft. in length, and hills as much in width, and of a thickness corresponding with that of the quartzite ridges on the hills above. The blocks are angular, and rest irregularly one upon another, supported in all positions by the angles and edges of those beneath. The whole mass looks as if it were, as it is, slowly sliding down the valley to the sea. These “stone runs” are looked upon with great wonder by the shifting population of the Falklands, and they are shown to visitors with many strange speculations as to their mode of formation. Their origin is attributed by some to the moraine formation of former glaciers. Another out of many theories is that the hard beds of quartzite are denuded by the disintegration of the softer layers. Their support being removed they break away in the direction of natural joints, and the fragments fall down the slope upon the vegetable soil. This soil is spongy, and, undergoing alternate contraction and expansion from being alternately comparatively dry and saturated with moisture, allows the heavy blocks to slip down by their own weight into the valley, where they become piled up, the valley stream afterwards removing the soil from among and over them.

The Falkland Islands correspond very nearly in latitude in the southern hemisphere with London in the northern, but the climatic influences are very different. The temperature is equable, the average of the two midsummer months being about 47° Fahr., and that of the two midwinter months 37° Fahr. The extreme frosts and heats of the English climate are unknown, but occasional heavy snow-falls occur, and the sea in shallow inlets is covered with a thin coating of ice. The sky is almost constantly overcast, and rain falls, mostly in a drizzle and in frequent showers, on about 250 days in the year. The rainfall is not great, only about 20 in., but the mean humidity for the year is 80, saturation being 100. November is considered the only dry month. The prevalent winds from the west, south-west and south blow continuously, at times approaching the force of a hurricane. “A region more exposed to storms both in summer and winter it would be difficult to mention” (Fitzroy, Voyages of “Adventure” and “Beagle,” ii. 228). The fragments of many wrecks emphasize the dangers of navigation, which are increased by the absence of beacons, the only lighthouse being that maintained by the Board of Trade on Cape Pembroke near the principal settlement. Kelp is a natural danger-signal, and the sunken rock, “Uranie,” is reputed to be the only one not buoyed by the giant seaweed.

Of aboriginal habitation there is no trace in the Falklands, and the land fauna is very scanty. A small wolf, the loup-renard of de Bougainville, is extinct, the last having been seen about 1875 on the West Falkland. Some herds of cattle and horses run wild; but these were, of course, introduced, as were also the wild hogs, the numerous rabbits and the less common hares. All these have greatly declined in numbers, being profitably replaced by sheep. Land-birds are few in kind, and are mostly strays from South America. They include, however, the snipe and military starling, which on account of its scarlet breast is locally known as the robin. Sea-birds are abundant, and poultry from the islands having been comparatively lately peopled, they are singularly tame. Guillemot and airplane birds abound in large variety; three kinds of penguin have their rookeries and breed here, migrating yearly for some months to the South American mainland. Stray specimens of the great king penguin have been observed, and there are also molsumaks (a kind of albatross), Cape penguins and many carrion birds. Kelp and upland geese abound, the latter being edible; and their shooting affords some sport. The Falkland Islands form essentially a part of Patagonia, with which they are connected by an elevated submarine plateau, and their flora is much the same as that of Antarctic South America. The trees which form dense forest and scrub in southern Patagonia and in Fuegia are absent, and one of the largest plants on the islands is a gigantic woolly ragweed (Senecio conditans) which attains in some places a height of 3 to 4 ft. A tall-hurled yam (V. decumbens) is found in some parts, and has also received cultivation. The greater part of the “camp” (the open country) is formed of peat, which in some places is of great age and depth, and at the bottom of the bed very dense and bituminous. The peat is different in character from that of northern Europe; cellular plants enter but little into its composition, and it is formed almost entirely of the roots and stems of Empetrum rubrum, a variety of the common crow-berry of the Scottish hills with red berries, called by the Falklanders the “diddle-dee” berry; of Myrtus nummularia, a little creeping myrtle whose leaves are used by the shepherds as a substitute for tea; of Caltha appendiculata, a dwarf species of marsh-marigold; and of some sedges and sedge-like plants, such as Azellia pumila, Gaimardia australis and Bothea grandiflora. Peat is largely used as fuel, coal being obtained only at a cost of $3 a ton.

Two vegetable products, the “balsam bog” (Bolar globaria) and the “tuossock grass” (Dactylis caespitosa) have been objects of curiosity and interest ever since the first accounts of the islands were given. The first is a huge mass of a bright green colour, living to a great age, and when dead becoming of a grey and stony appearance. When cut open, it displays an infinity of tiny leaf-buds and stems, and at intervals there exist a thick aromatic resin, which from its astringent properties is used by the shepherds as a vulnerary, but has not been converted to any commercial purpose. The “tuossock grass” is a wonderful and most valuable natural production, which, owing to the introduction of stock, has become extinct in the two main islands, but still flourishes elsewhere in the group. It is a reed-like grass, which grows in dense tufts from 6 to 10 ft. high from stool-like root-crowns. It forms excellent fodder for cattle, and is regularly gathered for that purpose. It is of beautiful appearance, and the almost tropical profusion of its growth may have led to the early erroneous reports of the densely wooded nature of these islands.

The population slightly exceeds 2000. The large majority of the inhabitants live in the East Island, and the predominating element is Scottish—Scottish shepherds having superseded the South American Gauchos. In 1867 there were no settlers on the west island, and the government issued a proclamation offering leases of grazing stations on very moderate terms. In 1886 all the available land was occupied. These lands are fairly healthy, the principal drawback being the virulent form assumed by simple epidemic maladies. The occupation of the inhabitants is almost entirely sheep-rearing, the principal industry is sheep-farming. Wool forms by far the largest export, and tallow, hides, bones and frozen mutton are also exported. Trade is carried on almost entirely with the United Kingdom; the approximate annual value of exports is £120,000, and of imports a little more than half that sum. The Falkland Islands Company, having its headquarters at Stanley and an important station in the camp at Darwin, carries on an extensive business in sheep-farming and the dependent industries, and in the general import trade. The development of this undertaking necessitated the establishment of stores and workshops at Stanley, and ships can be repaired and provided in every way; a matter of importance since not a few vessels, after suffering injury during heavy weather off Cape Horn, call on the Falklands in distress. The maintenance of the requisite plant and the high wages current render such repairs somewhat costly. A former trade in oil and sealskin has decayed, owing to the smaller number of whales and seals remaining about the islands. Communications are maintained on horseback and by water, and there are no roads except at Stanley. There is a monthly mail to and from England, the passage occupying about four weeks.

The Falkland Islands are a crown colony, with a governor and executive and legislative councils. The legislative council

1 See B Secchele in Münchener geographische Studien, xx (1906), and Geographical Journal (December 1907),
consists of the governor and three official and two unofficial nominated members, and the executive of the same, with the exception that there is only one unofficial member. The colony is self-supporting, the revenue being largely derived from the drink duties, and there is no public debt. The Falklands are the seat of a colonial bishop. Education is compulsory. The government maintains schools and travelling teachers; the Falkland Islands Company also maintains a school at Darwin, and there is one for those of the Roman Catholic faith in Stanley. There is also on Keppel Island a Protestant missionary settlement for the training in agriculture of imported Fuegians. Stanley was for some years a naval station, but ceased to be so in 1904.

The Falkland Islands were first seen by Davis in the year 1592, and Sir Richard Hawkins sailed along their north shore in 1594. The claims of Amerigo Vespucci to a previous discovery are doubtful. In 1608 Sebaldr de Wert, a Dutchman, visited them, and called them the Sebald Islands, a name which they bear on some Dutch maps. Captain Strong sailed through between the two principal islands in 1600, landed upon one of them, and called the passage Falkland Sound, and from this the group afterwards took its English name. In 1763 the French explorer De Bougainville took possession of the islands on behalf of his country, and established a colony at Port Louis on Berkeley Sound. But in 1767 France ceded the islands to Spain. De Bougainville being employed as intermediary. Meanwhile in 1765 Commodore Byron had taken possession on the part of England on the ground of prior discovery, and had formed a settlement at Port Egmont on the small island of Saunders. The Spanish and English settlers remained in ignorance, real or assumed, of each other's presence until 1790-1797, when Byron's action was nearly the cause of a war between England and Spain, both countries having armed fleets to contest the barren sovereignty. In 1771, however, Spain yielded the islands to Great Britain by convention. As they had not been actually colonized by England, the republic of Buenos Aires claimed the group in 1820, and subsequently entered into a dispute with the United States of America concerning the rights to the products of these islands. On the representations of Great Britain the Buenos Aires withdrew, and the British flag was once more hoisted at Port Egmont in 1835, and since that time the Falkland Islands have been a British possession.

In 1843 Mr. S. Lafone, a wealthy cattle and hide merchant on the river Plate, obtained from government a grant of the southern portion of the island, a peninsula 600,000 acres in extent, and possession of all the wild cattle on the island for a period of six years, for a payment of £10,000 down, and £2,000 in ten years from January 1, 1852. In 1853 Mr. Lafone's interest in Lafonia, as the peninsula came to be called, was purchased for £30,000 by the Falkland Islands Company, which had been incorporated by charter in the same year.

FALLIÈRES—FALLMERAYER

(a) fallacy of Four Terms (Quaternio terminorum); (b) of Undistributed Middle; (c) of Illicit process of the major or the minor term; (d) of Negative Premises.

Of other classifications of Fallacies in general the most famous are those of Francis Bacon and J. S. Mill. Bacon (Novum Organum, Aph. i. 33, 38 sqq.) divided fallacies into four Idola (Idols, i.e. False Appearances of Truth), which summarize the various kinds of mistakes to which the human intellect is prone (see Bacon, Francis). With these should be compared the Offendicula of Roger Bacon, contained in the Opus majus, pt. i. (see Bacon, Roger). J. S. Mill discussed the subject in book v. of his Logic, and Jeremy Bentham's Book of Fallacies (1824) contains valuable remarks.

See Rd. Whately's Logic, bk. v.; A. de Morgan, Formal Logic (1847); A. Schopenhauer, Fallacies (1869) and other texts. See also article Logic, and for fallacies of Induction, see Induction.

FALLIÈRES, CLÉMENT ARMAND (1831—), president of the French republic, was born at Mézin in the department of Lot-et-Garonne, where his father was clerk of the peace. He studied law and became an advocate at Nérac, beginning his public career there as municipal councillor (1868), afterwards mayor (1871), and as councillor-general of the department of Lot-et-Garonne (1871). Being an ardent Republican, he lost his position in May 1873 upon the fall of Thiers, but in February 1876 was elected deputy for Nérac. In the chamber he sat with the Republican Left, signed the protestation of the 18th of May 1877, and was re-elected in October by his constituency. In 1880 he resigned, but was re-elected in December of the same year, and entered the interior in the Juresy fence ministry (May 1880 to November 1881). From the 7th of August 1882 to the 20th of February 1883 he was minister of the interior, and for a month (from the 29th of January 1883) was premier. His ministry had to face the question of the expulsion of the pretenders to the throne of France, owing to the proclamation by Prince Jérôme Napoleon (January 1883), and M. Fallières, who was ill at the time, was not able to face the storm of opposition, and resigned when the senate rejected his project. In the following November, however, he was chosen as minister of public instruction by Jules Ferry, and carried out various reforms in the school system. He resigned with the ministry in March 1885. Again becoming minister of the interior in the Rovier cabinet in May 1887, he exchanged his portfolio in December for that of justice. He returned to the ministry of the interior in February 1889, and finally took the department of justice from March 1890 to February 1892. In June 1890 his department (Lot-et-Garonne) elected him to the senate by 417 votes to 23. There M. Fallières remained somewhat apart from party struggles, although maintaining his influence among the Republicans. In March 1895 he accepted the post of senator of the department of Aveyron until January 1906, when he was chosen by a union of the groups of the Left in both chambers as candidate for the presidency of the republic. He was elected on the first ballot by 449 votes against 371 for his opponent, Paul Doumer.

FALL-LINE, in American geology, a line marking the junction between the hard rocks of the Appalachian Mountains and the softer deposits of the coastal plain. The pre-Cambrian and metamorphic rocks of the mountain mass form a continuous ledge parallel to the east coast, where they are subject to denudation and form a series of "falls" and rapids in the river courses all along this line. The relief of the land below the falls is very slight, and this low country rarely rises to a height of 200 ft., so that the rivers are navigable up to the falls, while the falls themselves are a valuable source of power. A line of cities may be traced upon the map whose position will thus be readily understood in relation to the economic importance of the fall-line. They are Trenton on the Delaware, Philadelphia on the Schuylkill, Georgetown on the Potomac, Richmond on the James, and Augusta on the Savannah. It will be readily understood that the softer and more recent rocks of the coastal plain have been modified by erosion, while the harder, more resistant rocks, owing to differential denudation, are left standing high above them, and that the trend of the edge of this great lenticular mass of ancient rock is roughly parallel to that of the Appalachian system.

FALLMERAYER, JAKOB PHILIPP (1790–1861), German traveller and historical investigator, best known for his opinions in regard to the ethnology of the modern Greeks, was born, the son of a poor peasant, at Tschötsch, near Brixen in Tirol, and was educated at the cathedral school in Brixen and made his way to Salzburg, where he supported himself by private teaching while he studied theology, the Semitic languages, and history. After a year's study he sought to assure to himself the peace and quiet necessary for a student's life by entering the abbey of Kremmünster, but difficulties put in his way by the Bavarian officials prevented the accomplishment of this intention. At the university of Landshut, to which he removed in 1812, he first applied himself to jurisprudence, but soon devoted his attention exclusively to history and philology. His immediate needs were provided for by a rich patron. During the Napoleonic wars he joined the Bavarian infantry as a subaltern in 1813, fought at Hanau (30th October 1813), and served throughout the campaign in France. He remained in the army of occupation on the banks of the Rhine until Waterloo, where he spent six months at Orleans as adjutant to General von Spreti. Two years of garrison life at Lindau on Lake Constance after the peace were spent in the study of modern Greek, Persian and Turkish.

Resigning his commission in 1818, he was successively engaged as a teacher in the gymnasium at Augsburg and in the gymnasiums of Innsbruck and Munich. In 1824 he was appointed to the chair of Greek at Munich, and began the publication of his great work, Geschicht des Kaisertums von Trapezunt, based on patient investigation of Greek and oriental MSS. at Venice and Vienna. The strictures on priestcraft contained in the preface to this book gave offence to the authorities, and his position was not improved by the liberal views expressed in his Geschichte der Halbinsel Morea während des Mittelalters (Stuttgart, 1832–1836, 2 pts.). The three years from 1831 to 1834 he spent in travel with the Russian count Osiernmann Tolstoy, visiting Egypt, Palestine, Syria, Cilicia, Rhodes, Constantinople, Greece and Naples. On his return he was elected in 1835 a member of the Royal Bavarian Academy of Sciences, but he soon left the country again on account of political troubles, and spent the greater part of the next four years in travel, spending the winter of 1839–1840 with Count Tolstoy at Geneva. Constantinople, Trebizond, Athos, Macedonia, Thessaly and Greece were visited by him during 1840–1841; and after some years' residence in Munich he returned in 1847 to the East, and travelled in Palestine, Syria and Asia Minor. The authorities continued to regard him with suspicion, and university students were forbidden to attend the lectures he delivered at Munich. He entered, however, into friendly relations with the crown prince Maximilian, but this intimacy was destroyed by the events following on 1848. At that period he was appointed professor of history in the Munich University, and made a member of the national congress at Frankfort-on-Main. He there joined the left or opposition party, and in the following year he accompanied the rump-parliament to Stuttgart, a course of action which led to his expulsion from his professorate. During the winter of 1849–1850 he was an exile in Switzerland, but the amnesty of April 1850 enabled him to return to Munich. He died on the 20th of April 1861.

His contributions to the medieval history of Greece are of great value, and though his theory that the Greeks of the present day are of Albanian and Slav descent, with hardly a drop of true Greek blood in their veins, has not been accepted in its entirety by other investigators, it has served to modify the opinions of even his greatest opponents. A criticism of his views will be found in Hopf's Geschichte Griechenlands (reprinted from Erich and Gruber's Encycl.) and in Finlay's History of Greece in the Middle Ages. Another theory which he proposed and defended with great vigour was that of the capture of Constantinople by Russia was inevitable, and would lead to the absorption by the Russian empire of the whole of the Balkan and Grecian
ALFRED COMTE (1811-1857) was a French politician, an economist, and social philosopher. He is often associated with the concept of the "sabbath rest" and is known for his work on the development of the European states. He studied pharmacy at the University of Paris and later became a prominent figure in the French Revolution. His ideas were influential in the development of modern social sciences and have had a lasting impact on the way we understand society.

Theodor von Thiers was a French politician, diplomat, and a key figure in the French Revolution. He was involved in the early stages of the revolution and played a significant role in the establishment of the First French Republic. Thiers was known for his support of the Napoleonic Wars and his moderation in foreign policy.

FALMOUTH

generally less in 1905, principal in Penryn, having by frequent transportation, and water power is thus remarkable, and accounts in great part for the city's rapid growth. The waters of the North Watuppa Lake (which is fed by springs and drains out a very small area) are also exceptionally pure and furnish an excellent water-supply. The Fall River runs directly through the city (passing beneath the city hall), and along its banks are long rows of cotton mills; formerly many of these were run by water power, and their wheels were placed directly in the stream bed, but steam power is now used almost exclusively. According to the special census of manufactures of 1905, the value of the factory products for the calendar year 1904 was $43,473,195, of which amount $35,442,831, or 81.5%, consisted of cotton goods and dyeing and finishing, making Fall River the largest producer of cotton goods among American cities.1 A large hat manufacturer (the Marshall Brothers' factory) furnishes the United States army with hats. Until forced by the competition of mills in the Southern states to direct attention to finer products, the cotton manufacturers of Fall River devoted themselves almost exclusively to the making of print cloth, in which respect the city was distinquished from Lawrence and Lowell, whose products were more varieties. To a greater extent the number of spindles increased from 265,338 in 1865 to 1,269,043 in 1875, 3,000,000 in 1900, and to about 3,500,000 in 1906. Excellent drainage and sewerage systems contribute to the city's health. The birth-rate was in 1900 the highest (38.75) of any city in the country of above 30,000 inhabitants (three of the four next highest being Massachusetts towns). The social conditions and labour problems of Fall River have long been exceptional. The mills supplement the public schools in the mingling of races and the work for Americanization, and labour disturbances, for which Fall River was once conspicuous, have become less frequent and less bitter, the great strike of 1904-1905—perhaps the greatest in the history of the textile industry in the United States—being marked by little or no violence. Fall River has become a "city of homes," and tenements are giving way to dwellings for two or three families. The lists of the city's corporation stockholders show more than 10,000 names. The municipal police is controlled (as nowhere else in the state save in Boston) by a state board; this arrangement is generally regarded as having worked for better order. Lowell was about three times as large as Fall River in 1870, and Lawrence was larger until after 1870. Fall River was originally a part of Freetown; it was incorporated as a township in 1833 (being known as "Troy" in 1804-1834), and was chartered as a city in 1854. In 1861 it was increased by certain territory secured from Rhode Island,

numbers. Fall River is served by the New York, New Haven & Hartford railway, and has good steamer connexions with Providence, Newport and New York, notably by the "Fall River Line," which is much used, in connexion with the N.Y., N.H. & L. railway, by travellers between New York and Boston. The harbour is large, deep and easy of access. The city lies on a plateau and on slopes that rise rather steeply from the river, and is irregularly laid out. Granite underlying the city furnishes excellent building material; among the principal buildings are the state armory, the county court house, the B.M.C. Hall, the high school, the custom house, the Powder Dam, the church of Notre Dame, the church of St. Anne, the Central Congregational church and the public library. The commonwealth aids in maintaining a textile school (the Bradford Durfee textile school), opened in 1904. The city library contained in 1908 about 78,000 volumes. There is considerable commerce, but it is as a manufacturing centre that Fall River is best known. Above the city, on the plateau, about 2 m. from the bay, are the Watuppa Lakes, 7 m. long and on an average three-fourths of a mile wide, and from them runs the Fall (Quequchuan) river, with a fall and descending near its mouth through 127 ft. in less than half a mile. There are more variations of transportation and water power is thus remarkable, and accounts in great part for the city's rapid growth. The waters of the North Watuppa Lake (which is fed by springs and drains out a very small area) are also exceptionally pure and furnish an excellent water-supply. The Fall River runs directly through the city (passing beneath the city hall), and along its banks are long rows of cotton mills; formerly many of these were run by water power, and their wheels were placed directly in the stream bed, but steam power is now used almost exclusively. According to the special census of manufactures of 1905, the value of the factory products for the calendar year 1904 was $43,473,195, of which amount $35,442,831, or 81.5%, consisted of cotton goods and dyeing and finishing, making Fall River the largest producer of cotton goods among American cities.1 A large hat manufacturer (the Marshall Brothers' factory) furnishes the United States army with hats. Until forced by the competition of mills in the Southern states to direct attention to finer products, the cotton manufacturers of Fall River devoted themselves almost exclusively to the making of print cloth, in which respect the city was distinguished from Lawrence and Lowell, whose products were more varieties. To a greater extent the number of spindles increased from 265,338 in 1865 to 1,269,043 in 1875, 3,000,000 in 1900, and to about 3,500,000 in 1906. Excellent drainage and sewerage systems contribute to the city's health. The birth-rate was in 1900 the highest (38.75) of any city in the country of above 30,000 inhabitants (three of the four next highest being Massachusetts towns). The social conditions and labour problems of Fall River have long been exceptional. The mills supplement the public schools in the mingling of races and the work for Americanization, and labour disturbances, for which Fall River was once conspicuous, have become less frequent and less bitter, the great strike of 1904-1905—perhaps the greatest in the history of the textile industry in the United States—being marked by little or no violence. Fall River has become a "city of homes," and tenements are giving way to dwellings for two or three families. The lists of the city's corporation stockholders show more than 10,000 names. The municipal police is controlled (as nowhere else in the state save in Boston) by a state board; this arrangement is generally regarded as having worked for better order. In 1861 it was increased by certain territory secured from Rhode Island,

1 The above figures do not show adequately the full importance of Fall River as a cotton manufacturing centre, for during the six months of the census year the great strike was in progress; this strike, caused by a reduction in wages, lasted from the 25th of July 1904 to the 18th of January 1905.
had long been a subject of debate in the House of Commons, was settled in 1832, by uniting Penryn with Falmouth for parliamentary purposes and assigning two members to the united boroughs. By the Redistribution of Seats Act 1835, the number of members was reduced to one. The seats granted in 1860 are no longer held, and a Saturday market has superseded the chartered market. In the 17th and 18th centuries Falmouth grew in importance owing to its being a station of the Packet Service for the conveyance of mails.

**FALSE POINT**, a landlocked harbour in the Cuttack district of Bengal, India. It was reported by the famine commissioners in 1867 to be the best harbour on the coast of India from the Hugli to Bombay. It derives its name from the fact that vessels proceeding up the Bay of Bengal frequently mistook it for Point Palmyras, a degree farther north. The anchorage is safe, roomy and completely landlocked, but large vessels are obliged to lie out at some distance from its mouth in an exposed roadstead. The capabilities of False Point as a harbour remained long unknown, and it was only in 1860 that the port was opened. It was rapidly developed, owing to the construction of the Orissa canals. Two navigable channels lead inland across the Mahanadi delta, and connect the port with Cuttack city. The trade of False Point is chiefly with other Indian harbours, but a large export trade in rice and oil-seeds has sprung up with Mauritius, the French colonies and France. False Point is now a regular port of call for Anglo-Indian coasting steamers. Its capabilities were first appreciated during the Orissa famine of 1866, when it afforded almost the only means by which supplies of rice could be brought into the province. A lighthouse is situated a little to the south of the anchorage, on the point which screens it from the southern monsoon.

**FALSE PRETENCES**, in English law, the obtaining from any other person by any false pretence any chattel, money or valuable security, with intent to defraud. It is an indictable misdemeanour under the Larceny Act of 1861. The broad distinction between this offence and larceny is that in the former the owner intends to part with his property, in the latter he does not. This offence dates as a statutory crime practically from 1756. At common law the only remedy originally available for an owner who had been deprived of his goods by fraud was an indictment for the crime of cheating, or a civil action for deceit. These remedies were insufficient to cover all cases where money or other properties had been obtained by false pretences, and the offence was first partially created by a statute of Henry VIII. (1541), which enacted that if any person should falsely and deceitfully obtain any money, goods, &c., by means of any false token or counterfeit letter made in any other man's name, the offender should suffer any punishment other than death, at the discretion of the judge. The scope of the offence was enlarged to include practically all false pretences by the act of 1756, the provisions of which were embodied in the Larceny Act 1861.

The principal points to notice are that the pretence must be a false pretence of some existing fact, made for the purpose of inducing the prosecutor to part with his property (e.g. it was held not to be a false pretence to promise to pay for goods on delivery, though the person could not be held to have obtained them) or for the property, &c. The property, too, must have been actually obtained by the false pretence. The owner must be induced by the pretence to make over the absolute and immediate ownership of the goods, otherwise it is "larceny by means of a trick." It is not always easy, however, to draw a distinction between the various classes of offences. In the case where a man goes into a restaurant and orders a meal, and, after consuming it, says that he has no means of paying for it, it was usual to convict for obtaining food by false pretences. But R. v. Jones, 1859, L.R. 1 Q.B. 119 decided that it is neither larceny nor false pretences, but an offence under the Debtor's Act 1869, of obtaining credit by fraud. (See also CHEATING; FRAUD; LARCENY.)

**United States.—**American statutes on this subject are mainly copied from the English statutes, and the courts there in a general way follow the English interpretations. The statutes of each state must be consulted. There is no Federal statute, though there are Federal laws providing penalties for falsepersonation of the lawful owner of public stocks, &c., or of persons entitled to pensions, prize money, &c. (U.S. Rev. Stats. § 5439), or the false making of any order purporting to be a money order (id. § 5433).

In Arizona, obtaining money or property by falsely personating another is punishable as for larceny (Penal Code, 1901, § 470). Obtaining credit by false pretences as to wealth and mercantile character is punishable by six months' imprisonment and a fine not exceeding three times the value of the money or property obtained (id. § 481).

In Illinois, whether by any false representation or writing signed or done by him, of his own respectability, wealth or mercantile correspondence or connexions, obtains credit and thereby defrauds any person of money, goods, chattels or any valuable thing, or who procures another to make a false report of his honesty, wealth, &c., shall return the money, goods, &c., and be fined and imprisoned for a term not exceeding one year (Crim. Code, 1903, ch. xxxviii. §§ 96, 97). Obtaining money or property by bogus cheques, the "confidence game" (Dorr v. People, 1907, 722, Ill. 216), or "three card monte," sleight of hand, fortune-telling, &c., is punishable by imprisonment for one to ten years (id. §§ 98, 106). Obtaining goods from warehouse, mill or wharf on a fraudulent receipt wrongly stating amount of goods deposited—by imprisonment for not less than one nor more than ten years (id. § 114). Fraudulent use of railroad passes is a misdemeanour (id. 125a).

In Massachusetts it is simple larceny to obtain by false pretences the money or personal chattel of another (Rev. Laws, 1902, ch. cxcvii. § 20). Obtaining by a false pretence with intent to defraud the signature of a person to a written instrument, the false making whereof would be forgery, is punishable by imprisonment in a state prison or by fine (id. § 27).

In New York, obtaining property by false pretences, felonious breach of trust and embezzlement are included in the term "larceny" (Penal Code, § 528; Paul v. Dumar, 126 N.Y. 508; People v. Tuttleken, 1907, 104 N.Y. Supp. 803), but the methods of proof required to establish each crime remain as before the code. Obtaining lodging and food on credit at hotel or lodging house with intent to defraud is a misdemeanour (Pen. Code, § 382). Purchase of property by false pretences as to person's means or ability to pay is not criminal when in writing signed by the party to be charged (Pen. Code, § 544).

**FALITCHEKI** (Falitchen), the capital of the department of Suceava, Romania, situated on a small right-hand tributary of the Sereth, among the hills of north-west Moldavia, and 2 m. S.E. of the frontier of Bukovina. Pop. (1900) 9643, about half being Jews. A branch railway runs for 15 m. to join the main line between Czernowitz in Bukovina, and Galatz. The Suceava department (named after Suceava or Suciava, its former capital, now Suczawa in Bukowina) is densely forested; its considerable timber trade centres in Falticheni. For five weeks, from the 20th July onwards, Russians and Austro-Hungarians, as well as Rumans, attend the fair which is held at Falticheni, chiefly for the sale of horses, carriages and cattle.

**FALUN**, a town of Sweden, capital of the district (läne) of Kopparberg, 153 m. N.W. of Stockholm by rail. Pop. (1900) 9606. It is situated in a bare and rocky country near the western shore of lake Runn. Here are the oldest and most celebrated copper mines in Europe. Their produce has gradually decreased since the 17th century, and is now unimportant, but sulphate of copper, iron pyrites, and some gold, silver, sulphur and sulphuric acid, and red ochre are also produced. The mines belong to the Kopparberg Mining Company (Stora Kopparbergs Bergslags Aktiebolag, formerly Kopparbergslagen). This is the oldest industrial corporation in Sweden, and perhaps the oldest still existing in the world; it is known to have been established before 1347. Since its reorganization as a joint-stock company in 1890 many of the shares have been held by the crown, philanthropic institutions and other public bodies. The company also owns iron mines, limestone and quartz quarries, large iron-works at Domnarvet and elsewhere, a great extent of forests and
saw-mills, and besides the output of the copper mines it produces manufactured iron and steel, timber, wood-pulp, bricks and charcoal. Falun has also railway rolling-stock factories. There are museums of mineralogy and geology, a lower school of mining, model room and scientific library. The so-called "Gothenburg System" of municipal control over the sale of spirits was actually devised at Falun as early as 1580.

**FAMA** (Gr. Φήμη, "Ossa"). In classical mythology, the personification of Rumour. The Homeric equivalent *Ossa* (Hidad, ii. 93) is represented as the messenger of Zeus, who spreads reports with the rapidity of a sound of thunder. Homer does not properly name *Pheme*, which is merely a presage drawn from human utterances, whereas *Ossa* (until later times) is associated with the idea of divine origin. A more definite character is given to Pheme by Hesiod (Works and Days, 764), who calls her a goddess; in Sophocles (Oed. Tyr. 158) she is the immortal daughter of golden Hope and is styled by the orator Aeschinus (Contra Timarchum, § 128) one of the mightiest of goddesses. According to Pausanias (i. 17. 1) there was a temple of Pheme at Athens, and at Smyrna (ib. ix. 11. 7), whose inhabitants were especially fond of seeking the aid of divination, there was a sanctuary of Cledonides (sounds for oracles) at Lemnos.

There does not seem to have been any cult of Fama among the Romans, by whom she was regarded merely as "a figure of poetical religion." The Temple of Fame and Omen (Pheme and Cledon) mentioned by Plutarch (Moralia, p. 319) is due to a confusion with Alus Locutius, the divinity who warned the Romans of the coming attack of the Gauls. There are well-known descriptions of Fame in Virgil (Aeneid, iv. 173) and Ovid (Metam. xii. 39); see also Valerius Flaccus (ii. 110), Statius (Thebais, iii. 472). An unfavourable idea gradually became attached to the name, thus Ennius speaks of Fama as the personification of "evil" reputation and the opposite of Gloria (cp. the adjective famosus, which is not used in a good sense till the post-Augustan age). Chaucer in his *House of Fame* is obviously imitating Virgil and Ovid, although he is also indebted to Dante's *Divina Commedia*.

**FAMAGUSTA** (Gr. Ἀμμοχώστος), a town and harbour on the east coast of Cyprus, 24 m. S. of the ruins of Salamis. The population in 1901 was 818, nearly all being Moslems who live within the walls of the fortress; the Christian population has migrated to a suburb called Varosia (pop. 3948). The foundation of the town was ascribed to Teucer; it was the most important town in early Cyprus. The revolt of the Jews under Trajan, and earthquakes in the time of Constantius and Constantine the Great helped in turn to destroy it. It was restored by Fl. Constantius II. (A.D. 337-361) as Constantia. Another town a little to the south, built by Ptolemy Philadelphus in 274 B.C., and called Arsinoe in honour of his sister, received the refugees driven from Constantia by the Arabs under Mu'awiyah, became the seat of the orthodox archbishopric, and was eventually known as Famagusta. It received a large accession of population at the fall of Acre in 1291; was annexed by the Genoese in 1376; reunited to the throne of Cyprus in 1464; and surrendered, after an investment of nearly a year, to the Turks in 1571. The fortifications, remodelled by the Venetians after 1489, the castle, the grand cathedral church of St Nicolas, and the remains of the palace and many other churches make Famagusta a place of unique interest. Acts ii. and v. of Shakespeare's *Othello* pass there. In 1903 measures were taken to develop the fine natural harbour of Famagusta. Basins were dredged to give depths of 15 and 24 ft. respectively at ordinary low tides, and commodious jetties and quays were constructed.

**FAMILIAR** (through the Fr. *familier*, from Lat. *familiares*, of or belonging to the *familia*, family), an adjective, properly meaning belonging to the family or household, but in this sense the word is rare. The more usual meanings are: friendly, intimate, well known; and from its application to the easy relations of intimate friends the term may be used in an invidious sense of "free and easy" conduct on the part of any one not justified by any close relationship, friendship or intimacy.

"Familiar" is, however, also used as a substantive, especially of the spirit or demon which attended on a wizard or magician, and was summoned to execute his master's wishes. The idea underlies the notion of the Christian guardian angel and of the Roman *genius natalis* (see DEMONOLOGY; WITCHCRAFT). In the Roman Church the term is applied to persons attached to the household of the pope or of bishops. These must actually do some domestic service. They are supported by their patron, and enjoy privileges which in the case of the papal familiars are considerable. "Familiars of the Holy Office" were lay officers of the Inquisition, whose functions were chiefly those of police, in making arrests, &c., of persons charged.

**FAMILISTS**, a term of English origin (later adopted in other languages) to denote the members of the *Familia Caritatis* (*Hus der Liefen; Huis der Liefde; Haus der Liebe; "Family of Love"), founded by Hendrik Niclaes (born on the 9th or 10th of January 1501 or 1502, probably at Münster; died after 1570, not later than 1581, probably in 1580). His calling was that of a merchant, in which he and his son Franz prospered, becoming ultimately wealthy. Not till 1540 did he appear in the character of one divinely endowed with "the spirit of the true love of God and of Jesus Christ." For twenty years (1530-1550) he wandered and lingered in the headquarters at once of his merchandise and of his propaganda; but he travelled in both interests to various countries, visiting England in 1552 and 1553. To this period belong most of his writings.

His primary work was *Den Spiegel der Gerechtigheid der Geist der Liefde und den vergodten Mensch H.N. uif de hemelmsche Warheit betegen*. It appeared in an English form with the author's revision, as *An Introduction to the holy Understanding of the Glasse of Righteousness* (1572; reprinted in 1649). None of his works bear his name in full; his initials (J.N.) were mystically interpreted as standing for *Homo Novus*. His "glass of righteousness" is the spirit of Christ as interpreted by him. The remarkable fact was brought out by G. Arnold (and more fully by F. Nippold in 1862) that the printer of Niclaes's works was Christopher Plantin, of Antwerp, a specially privileged printer of Roman Catholic theology and liturgy, yet secretly a steadfast adherent of Niclaes. It is true that Niclaes claimed to hold an impartial attitude towards all existing religious parties, and his mysticism, derived from David Joris, was undogmatic. Yet he admitted his followers by the rite of adult baptism, and set up a hierarchy among them on the Roman model where his Evangelium Regni, in English *A Joyful Message of the Kingdom*, 1574; reprinted, 1650). The pantheism had an antinomian drift; for himself and his officials he claimed impecceableness; but, whatever truth there may be in the charge that among his followers were those who interpreted "love" as licence, no such charge can be sustained against the morals of Niclaes and the other leaders of the sect. His chief apostle in England was Christopher Vetal, a native of Delft, an "illuminated elder," living at Colchester and Southwark, who ultimately recanted. The society spread in the eastern counties, in spite of repressive measures; it revived under the Commonwealth, and lingered into the early years of the 18th century; the leading idea of its "service of love" was the submission and tenderness for the moral and spiritual edification of its members. Thus, in an age of strife and polemics, it seemed to afford a refuge for quiet, gentle spirits, and meditative temperaments.

**FAMILY**, a word of which the etymology but partially illustrates the meaning. The Roman *familia*, derived from the Oscan *famel* (servus), originally signified the servile property, the thralls, of a master. Next, the term denoted other domestic property, in things as well as in persons. Thus, in the fifth of the laws of the Twelve Tables, the rules are laid down: *sinistrato* *moritur*: cut; *suus* *heres*: nec; *sit* *agnatus*:
FAMILY

PROXIMUS · FAMILIAM · HABETO, and SH·AGNATUS·NEC·ESCIT·GENTILIS·FAMILIAM·NANCITOR; that is, if a man die intestate, leaving no natural heir who had been under his potestas, the nearest agnate, or relative tracing his connexion with the deceased exclusively through males, is to inherit the familia, or family fortune of every sort. Failing an agnate, a member of the gens of the dead man is to inherit. In a third sense, familia was applied to all the persons who could prove themselves to be descended from the same ancestor, and thus the word almost corresponded to our own use of it in the widest meaning, as when we say that a person is "of a good family" (Ulpian, Dig. 50. 16, 195 fin.).

1. Leaving for awhile the Roman terms, to which it will be necessary to return, we may provisionally define Family, in the modern sense, as the common name of the community formed by the union of one man with one woman, and by the increase of children born to them. These in modern times, and in most European countries, constitute the household, and it has been almost universally supposed that little natural associations of this sort are the germ-cell of early society. The Bible presents the growth of the Jewish nation from the one household of Abraham. His patriarchal family differed from the modern family in being polygamous, but, as female chastity was one of the conditions of the patriarchal family, and as descent through males was therefore recognized as certain, the plurality of wives makes no real difference to the argument. In the same way the earliest formal records of Indian, Greek and Roman society present the family as firmly established, and generally regarded as the most primitive of human associations. Thus, Aristotle derives the first household (οίκια γονέων) from the combination of man's possession of property—in the slave or in domesticated animals—with man's relation to woman, and he quotes Hesiod: οἶκον μὲν πάτριας γυναῖκας δὲ βοῶν τέρων (Politics, 1. 2. 5). The village, again, with him is a colony or offshoot of the household, and monarchical government in states is derived from the monarchy of the eldest male member of the family. Now, though certain ancient terms, introduced by Aristole in the chapters to which we refer, might have led him to imagine a very different origin of society, his theory is, on the face of it, natural and plausible, and it has been almost universally accepted. The beginning of society, it has been said a thousand times, is the family, a natural association of kindred by blood, composed of father, mother and their descendants. In this family, the father is absolute master of his wife, his children and the goods of the little community; at his death his eldest son succeeds him; and in course of time this association of kindred, by natural increase and by adoption, develops into the clan, gens, or γένος. As generations multiply, the more distant relations split off into other clans, and these clans, which have not lost the sense of primitive kinship, unite once more into tribes. The tribes again, as civilization advances, acknowledge themselves to be subjects of a king, in whose veins the blood of the original family runs purest. This, or something like this, is the common theory of the growth of society.

2. It was between 1866 and 1880 that the common opinion began to be seriously opposed. John Ferguson McLennan, in his Primitive Marriage and his essays on The Origin of Primitive Kinship (second series), drew attention to the wide prevalence of the custom of inheriting the kinship name through mothers, not fathers; and to the law of "Exogamy" (q.v.). The former usage he attributed to archaic uncertainty as to fatherhood; the natural result of absolute sexual promiscuity, or of Polyandry (q.v.). Either practice is inconsistent, prima facie, with the primitive existence of the Family, whether polygamous or monogamous, whether patriarchal or modern. The custom of Exogamy, again,—here taken to mean the unwritten law which makes it incest, and a capital offence, to marry within the real or supposed kin denoted by the common name of the kinship,—pointed to an archaic condition of family affairs all unlike our Table of prohibited degrees. This law of Exogamy was found, among many savage races, associated with Totemics; that is plants, animals and other natural objects which give names to the various kinships, and are themselves, in various degrees, revered by members of the kinships. (See Totem and Totemism.)

Traces of such kinships, and of Totemism, also of alleged promiscuity in ancient times, were detected by McLennan in the legends, folk-lore and institutions of Greece, Rome and India. Later, Prof. Robertson Smith found similar survivals, or possible survivals, among the Semitic races (Kinship in Early Arabia). Others have followed the same trail among the Celts (S. Reinach, Cultes, mythes et religions, 1904).

If arguments founded on these alleged survivals be valid, it may be that the most civilized races have passed through the stages of Exogamy, Totemism and reckoning descent in the female line. McLennan explained Exogamy as a result of scarcity of women, of affection for female infants. When being scarce, the men of a group would steal them from other groups, and it would become shameful, and finally a deadly sin, for a man to marry within his own group-name, or name of kinship, say Wolf or Raven. Meanwhile, owing to scarcity of women, one woman would be the mate of many husbands (polyandry); hence, paternity being undetermined, descent would be reckoned through mothers.

Such are the outlines of McLennan's theory, which, as a whole, has been attacked by many writers, and is now, perhaps, accepted by none. McLennan's was the most brilliant and pioneer work; but his supply of facts was relatively scanty, and his friend Charles Darwin stated objections which to many seem final, as regards the past existence of a stage of sexual promiscuity. C. N. Starcke (The Primitiue Family, 1889), Edward Alexander Westermarck (History of Human Marriage, 1891), Ernest Crawley (The Mystic Rose), Herbert Spencer, Emile Durkheim, Lord Avebury and many others, have criticized McLennan, who, however, in coining the term Exogamy, and drawing scientific attention to Totemism, and reckoning of kin through mothers, founded the study of early society for us. It is now generally agreed that "Matriarchate" (q.v.) is a misleading term, as is "Gynaeocracy," for the custom of deducing descent on the spindle side. Women among totemistic and exogamous savages are in a degraded position, nor does the deriving and inheriting of the kinship name, or anything else, on the spindle side, imply any ignorance of paternal relations; even where, as among Central Australian tribes, the facts of rcproduction are said to be unknown.

3. Simultaneous with McLennan's researches and speculations were the works of Lewis H. Morgan. He was the discoverer of a custom very important in its bearing on the history of society. This custom, used by two-thirds of the globe's persons in addressing a kinsman do not discriminate between grades of relationship. All these grades are merged in large categories. Thus, in what Morgan calls the "Malayan system," "all consanguinei, near or far, fall within one of these relationships—grandparent, parent, brother, sister, child and grandchild." No other blood-relationships are recognized (Ancient Society). This at once reminds us of the Platonic Republic. "We devised means that no one should ever be able to know his own child, but that all should imagine themselves to be of one society, and should regard siblings and sisters those who were within a certain limit of age; and those who were of an elder generation they were to regard as parents and grandparents, and those who were of a younger generation as children and grandchildren" (Timeaeus, 18, Jowett's translation, first edition, vol. ii., 1871). This system prevails in the Polynesian groups and in New Zealand. Next comes what Morgan chooses to call the Turanian system. "It was universal among the North American aborigines," whom he styles Ganowanians. "Traces of it have been found in parts of Africa" (Ancient Society), and "it still prevails in South India among the Hindus, who speak the Dravidian languages" and also in North India, among other Hindus. The system, Morgan says, "is simply stupendous." It is not exactly the same among all his miscellaneous "Turians," but, on the whole, assumes the following shapes. Suppose the speaker to be a male, he will style his nephew and
niece in the male line, his brother's children, "son" and "daughter," and his grand-nephews and grand-nieces in the male line, "grandson" and "granddaughter." Here the Turanian and the Malay system agree. But change the sex; let the male speaker address his nephews and nieces in the female line,—the children of his sister,—he salutes them as "nephew" and "niece," and they hail him as "uncle." Now, in the Malay system, nephews and nieces on both sides, brother's children or sisters, are alike named "children" of the uncle. If the speaker be a female, using the Turanian style, these terms are reversed. Her sister's sons and daughters are called by her as "son" and "daughter," her brother's children she calls "nephew" and "niece." Yet the children of the persons thus styled "nephew" and "niece" are not recognized in conversation as "grand-nephew" and "grand-niece," but as "grandson" and "granddaughter." It is impossible here to do more than indicate these features of the classificatory nomenclature, from which the others may be inferred. The reader is referred for particulars to Morgan's Systems of Consanguinity and Affinity of the Human Race.

The existence of the classificatory system is not an entirely novel discovery. Nicolaus Damascenus, one of the inquirers into early society, who lived in the first century of our era, noticed this mode of address among the Galatophagi. Lafitau found it among the Iroquois. To Morgan's perception of the importance of the facts, and to his energetic collection of reports, we owe our knowledge of the wide prevalence of the system. From an examination of the degrees of kindred which seem to be indicated by the "Malayan" and "Turanian" modes of address, he has worked out a theory of the evolution of the modern family. A brief comparison of this with other modern theories will close our account of the family. The main points of the theory are shortly stated in Systems of Consanguinity, &c., and in Ancient Society. From the latter work we quote the following description of the five different and successive forms of the family:

"I. The Consanguine Family.—It was founded upon the inter-marriage of brothers and sisters, own and collateral, in a group.

"II. The Punaluan Family.—It was founded upon the inter-marriage of several sisters, own and collateral, with each other's husbands, in a group—the joint husbands not being necessarily kinsmen of each other; also, on the inter-marriage of several brothers, own and collateral, with each other's wives in a group; the wives not being necessarily kin to each other, although often the case in both instances (sic). In each case the group of men were jointly married to the group of women.

"III. The Patriarchal Family.—It was founded upon marriage between single pairs, but without an exclusive cohabitation. The marriage continued during the pleasure of the parties.

"IV. The Monogamous Family.—It was founded upon marriage between single pairs with an exclusive cohabitation.

"Three of these forms, namely, the first, second, and fifth, were radical, because they were sufficiently general and influential to create three distinct systems of consanguinity, all of which still exist in living forms. Convincingly, these systems are sufficient of themselves to prove the antecedent existence of the forms of the family, and of marriage with which they severally stand connected."

Morgan makes the systems of nomenclature proofs of the existence of the Consanguine and Punaluan families. Unhappily, there is no other proof, and the same systems have been explained on a very different principle (McClemann, Studies in Ancient History). Looking at facts, we find the Consanguine family notion, and cannot easily imagine how early groups abstained from infanticide, or, rather, casually married of brothers and sisters. St Augustine, however (De civ. Dei, xv. 16), and Archius in his Thessalica (Odyssey, xi. 7, scholia B, Q) agree more or less with Morgan. Next, how did the Consanguine family change into the Punaluan? Morgan says (Ancient Society) brothers ceased to marry their sisters, because "the evils of it could not for ever escape human observation." Thus the Punaluan family was hit upon, and "created a distinct system of consanguinity" (Ancient Society), the Turanian.

Again, "marriages in Punaluan groups explain the relationships in the system." But Morgan provides himself with another explanation, "the Turanian system owes its origin to marriage in the group and to the gentle organization." He calls exogamy "the gentle organization," though, in point of fact, the only gentes we know, the Roman gentes, show scarcely a trace of exogamy. Again, "the change of relationships which resulted from substituting Punaluan in the place of Consanguine marriage turns the Malayan into the Turanian system." On the same page Morgan attributes the change to the "gentile organization," and to "the ancient" and "the favourite" brother, whom he met in the heart of the problem. Now, if the Punaluan marriage is a sufficient explanation, we do not need the "gentile organization." Both, in Morgan's opinion, were efforts of conscious moral reform.

In Systems of Consanguinity the gentle organization (there called tribal), that is, exogamy, is said to have been "designed to work out a reformation in the intermarriage of brothers and sisters." But the Punaluan marriage had done that, otherwise it would not have produced (as Morgan says it did) the change from the Malayan to the Turanian system, the difference in the two systems, as exemplified in Seneca and Tamil, being "in the relationships which depended on the intermarriage of non-intermarriage of brothers and sisters" (Ancient Society). Yet the Punaluan family, though itself a reform in morals and in "breeding," "did not furnish adequate motives to reform the Malay system," which, as we have seen, it did reform. The Punaluan family, it is suspected, "frequently involved own brothers and sisters;" had it not been so, there would have been no need of a fresh moral reformation,—"the gentle organization." Yet even in the Punaluan family (Ancient Society) "brothers ceased to marry their own sisters." What, then, did the "gentile organization" do for them? As they had already ceased to marry their own sisters, and, under the gentle organization, they were still able to marry their half-sisters, the reformatory "ingenious" of the inventors of the organizations was at once superfluous and useless. It is impossible to understand the Punaluan system. Its existence is inferred from a system of nomenclature which it does (and does not) produce; it admits (and excludes) own brothers and sisters. Morgan has intended, apparently, to represent the Punaluan marriage as a long transition to the definite custom of exogamy, but it will be seen that his language is not very clear nor his positions assured. He does not adduce a single fact of the Punaluan system to the "Egyptian" or "Pathan" institution, even in Hawaii.

There is, if possible, a greater absence of historical testimony to the existence of the Consanguine family. It is difficult to believe that exogamy was a conscious moral and social reformation, because, ex hypothesi, the savages had no moral data, nothing to cause disgust at relations which seem revolting to us. It is as improbable that they discovered the supposed physical evils of breeding in and in. That discovery could only have been made after a long experience, and in the Consanguine family that experience was impossible. Thus, setting moral reform aside as inconceivable, we cannot understand how the Consanguine families ever broke up. Morgan's ingenious speculations as to a transitional step towards the gens (as he calls what we style the totem-kindred), supposed to be found in the "classes" and marriage laws of the Kamilaroi, are vitiated by the weakness and contradictory nature of the evidence (see Pritchard; J. D. Lang's Queensland, Appendix; Proceedings of American Academy of Arts, &c., vol. viii. 412; Nature, October 29, 1874). Further, though Morgan calls the Australian "gentile organization" "incipient," he admits (Ancient Society) that the Narrinyeri have totem groups, in which "the children are of the family or institution," and that they are on the footing of the ghotra of Hindu custom. Lastly, though Morgan frequently declares that the Polynesians have not the gens (for he thinks them not sufficiently advanced), W. W. Gill (Myths and Songs from the South Pacific, London, 1876) has shown that unmistakable traces of the totem survive in Polynesian mythology.

4. Morgan's theory was opposed by McClemann (Studies in Ancient History, 1876), who maintained that the names for
relationships, in the "classificatory system," were merely terms of address, as among ourselves when a preacher calls any adult male brother, when an old woman is addressed as "mother" when an elder man calls a junior, "my son." He also showed that his own system accounted for the terms. The controversy is still alive; one set of writers regarding the savage terms of relationship as indicating a state of things in which human beings dwelt in a "horde," with promiscuous intercourse; another set holding that the terms do not indicate consanguineous kinship, but degrees of age, status, and reciprocal obligations in a local tribe, and therefore that they do not yield any presumption that there was a past of promiscuity or of what is called "group marriage." On Morgan's side (not of course accepting all his details) are L. Fison and A. W. Howitt, and Baldwin Spencer and F. J. Gillen. Against him are Starcke, Westermarck, A. Lang, Dr Durkheim, apparently, Crawley and many others.

5. A second presumption in favour of original promiscuity has been drawn by the eminent Australian students, Baldwin Spencer and F. J. Gillen, and by A. W. Howitt, from the customs of some Australian aborigines. In each tribe, owing to customary laws which are to be examined later, only men and women of a given status are intermarriageable (nu po, nu atau) with each other. Though child-betrothals are usual, and though the woman is specialized to one man, who protects and nourishes her and all her children, and though their union is immediately preceded by an extended (such as Herodotus describes among the Nasamones), yet, among certain tribes, the following customary prevail. At great meetings the tribal leaders assign a woman as paramour (with what amount of permanence remains obscure) to a man (pirrauru); one woman may have several pirrauru men, one man several pirrauru women, in addition to their regularly betrothed (tippa malku) wives and husbands. The husband occasionally shows fight, and bitter jealousies prevail, but, at the great ceremonial meetings, complaisance is enforced under penalty of strangling. Thenceforth, if the husband permits, the male pirrauru has matrimonial rights over the other man's tippa malku wife when they meet. A symbolic ceremony of union precedes the junction of the pirrauru people. This institution, as far as reported, is peculiar to a group of tribes near Lake Eyre, the Dieri, Urabunna, and their congeners, or perhaps to all who have the same "phratry" names as the Dieri and Urabunna (Kiarra and Matorra, in various dialectic forms).

Elsewhere the pirrauru custom is not known: but almost everywhere there are licentious festivals, in which all marriage rules except those which forbid incest (in our sense of the word, namely between the closest relations) are thrown to the winds. Also permanent or semi-permanent matrimony of the usual types of feasts of licence, or Saturnalia, which have their analogies among many people, ancient and modern. Pirrauru is no more a survival of and a proof of primitive promiscuity, than is the legalized incest of ancient Egypt or ancient Peru. If these views be correct the argument for primitive promiscuity derived from pirrauru falls to the ground.

6. The question as it obviously are, was mankind originally promiscuous, with no objections to marriage between persons of the nearest kin; and was the first step in advance the prohibition of marriage (or of amatory intercourse) between brothers and sisters; or did mankind originally live in very small groups, under a jealous sire, who imposed restrictions on intercourse between the young males, his sons, and all the females of the "hearth-circle," who constituted his harem? The problem has been studied, first, in the institutions of savages, notably of the most backward savages, the black natives of Australia; and next, in the light of the habits of the higher mammal.

As regards Australian matrimonial institutions, it has been known since the date of the Journals of two Expeditions of Discovery, by Sir George Grey (1837–1839), that they are very complex and peculiar, in points strongly resembling the customary laws of the more backward Red Indian tribes of North America. Information came in, while McLennan was working, from G. Taplin (The Narringi, 1874), from A. W. Howitt and L. Fison, and many other inquirers (in Brough Smyth's Aboriginals of Victoria, 1878), from Howitt and Fison again (in Kamaroles and Kunara, 1880), and many essays by these authors, and finally, in Native Tribes of Central Australia (1890) and Northern Tribes of Central Australia (1904), by Baldwin Spencer and F. J. Gillen; and in Howitt's Native Tribes of South-East Australia (1904), with R. Roth's North-West Central Queensland Aborigines (1897). All of these are works of very high merit. Knowledge is now much more wide, minute and securely based than it was when McLennan's Studies in Ancient History, second series, was posthumously published (1896). We know with certainty that in Australia, among archaic savages who have neither metals, agriculture, pottery nor domesticated animals, a graduated scale of matrimonial institutions exists. First there are local tribes, each tribe having its own dialect; holding a recognized area of territory; and living on friendly terms with neighbouring tribes. Territorial conquest is never attempted. In many cases a knot of tribes of allied dialects and kindred rites may be, or at least, is spoken of as a "nation" by our authorities.

7. Customary law is administered by the Seniors, the wise, the magically skilled, who in many cases are "headmen" of local groups or of sets of kindred. As to marriage, customary restrictions may well extend within the local tribe, or into a neighbouring local tribe, at will, provided that they do not infringe the restrictions of customary law. The local tribe is not an exogamous or endogamous group, any more than is an English county. The restrictions, except where they have become obsolete, fall into six main categories:

1. In the most primitive, each tribe consists of two intermarrying and exogamous divisions, which are often styled phratries. Each such division has a name, which, when it can be translated, is the name of an animal: in the majority of cases, however, the meaning of the phratrie name is lost. In one instance, that of the Euahlayi tribe of north-west New South Wales, the phratrie names are said (by Mrs Langlois Parker) to mean "Light Blood" and "Dark Blood." This, as in the theory of the Rev. J. Mathews, Eagle and Crow, might be taken to indicate a blending of two distinct races.

Taking, for the sake of clearness, tribes whose phratrie names mean "Crow" and "Eagle Hawk," every member of the tribe belongs either to Eagle Hawk phratrie or to Crow phratrie: if to Crow, the man or woman can only marry an Eagle Hawk, if to Eagle Hawk, can only marry a Crow. The children invariably belong to the phratrie of the mother, in this most primitive type. Within Eagle Hawk phratrie is one set of totem kins, named usually after various species of animals and plants; within Crow phratrie is another set of totem kins, named always (except in one region of Central Australia) after a different set of plants and animals. With the exception mentioned (that of the Arunta
"nation"), in no tribe does the same totem ever occur in both phratries. Totems and totem names are inherited by the children from the mother, in this primitive type. Thus a man, Eagle Hawk by totem, marries a woman Crow by phratry, Black Duck by totem. His children by her are of phratry Crow, of totem Black Duck. Obviously no person can marry another of his or her own totem, because, in the phratry into which he or she must marry, no man or woman of his or her totem exists. The prohibition extends to members of alien and remote tribes, if of the same totem name.

The same rules exist in the more primitive North American tribes, but as the phratry there has generally, though not always, decayed, the rule, where this has occurred, merely forbids marriage of kith and kin.

(2) We find this type of organization, where the child inherits phratry and totem from the father, not from the mother.

(3) We find tribes in which phratry and totem are inherited from the mother, but an additional rule prevails: the rule of "Matrimonial Classes." By this device, in phratry "Dibi," there are two classes, "Muri" and "Kubi." In phratry "Kapath," there are two classes, "Ipai" and "Kumbo." (All these names are of unknown meaning). Each child inherits its mother's phratry name and totem name, and also the name of that class of the two in the mother's phratry which the mother belongs to.

No person may marry into his or her own class—practically into his or her own generation: the rule makes parental and filial marriages impossible,—but these never occur even among more primitive tribes which have not the institution of classes. Suppose that the class names are really names of animals and other objects in nature—as in a few cases they actually are. Then the rules, where classes exist, would amount to this: no person may marry another who, by phratry, totem or generation, owns the same hereditary animal name as himself or herself. In practice, where phratries exist, a man who knows a family phratry name knows whether or not he may marry her. Where class names exist (even though the phratry name be lost), a man who knows a woman's class name knows whether or not he may marry her. Nothing can be simpler in practice.

(4) The same rules as under (3) exist, but the phratry, totem and class are inherited through the father: the class of the child of course not being the father's, but the linked class in his phratry.

(5) In the fifth category (Central North Australia), while phratry name (if not lost) and totem name are inherited from the father, by a refinement of law which is spreading southwards there are four classes in each phratry (or main exogamous division unnamed), and the choice of a partner in life is thus more restricted than in more primitive tribes.

(6) Finally we reach the institutions of the group of tribes called, from the name of the most powerful tribe in the set, the Arunta nation. They occupy the MacDonnell Ranges and other territory in the very centre of Australia. The Arunta reckon kinship in the male line: their phratry names they have forgotten, in place of phratries eight matrimonial classes regulate marriage. In these respects they resemble most of the central and north tribes, but present this unique peculiarity, that the same totems may and do exist in both of the opposed intermarrying exogamous divisions consisting of four classes each. It thus results that a man, in the Arunta tribe, may marry a woman of his own totem, if she be in the class with which he may intermarry. This licence is unknown in every other part of the totemic world, and even in the Kaitish tribe of the Arunta nation interetotropic marriages, in practice, almost never occur.

Among the Arunta the totems are only prominent in magical ceremonies (unknown in South-Eastern Australia. At these ceremonies (Intichima) the men of the totem do co-operative magic for the benefit of their plant or animal, as part of the tribal food-supply. The members of the totem taste it sparingly on these occasions, apparently under the belief that to do so increases their magical power: the rest of the tribe eat freely. But, as far as denoting kinship or regulating marriage is concerned, the totems, among the Arunta, have no legally important existence. Men and women of the same totem may intermarry, their children need not belong to the totem of either father or mother.

The process by which Arunta totems came thus to differ from those of all other savages is easily understood. Like the other tribes from the centre to the north (including the Urabunna nation, which reckons descent through women), the Arunta believe that the souls of the primal semi-besial ancestors of the Alcheninga or "dream time" are perpetually reincarnated. This opinion does not affect by itself the usual exogamous character of totemism among the other tribes. The Arunta nation, however, cultivates an additional myth, namely that the primal ancestors intermarried, with the result that they had certain oval stone slabs, with archaic markings, called churinga nanja, or "sacred things of the nanja." The nanja, again, is a tree or rock, fabled to have risen up to mark the spot where a group of primal ancestors, all of one and the same totem in each case (Cats here, Grubs there, Ducks elsewhere), "went into the ground." The souls of these ancestors haunt such spots, especially they haunt the nanja tree or rock, and the stone churinga nanja. Each district, therefore, has its own oknanikilla (or local totem centre of the ghosts), Cat ghosts, Grub ghosts, Duck ghosts, and so on. These ghosts, or nanja, are raised, married, and are born as children. When a child comes to birth, the mother names the oknanikilla in which she conceived it, and, whatever the ghost totem of that place may be, it is the child's totem. Its mother may be a Grub, its father may be a Crow, but if the child was conceived in a Duck, or Cat, or Opossum or Kangaroo locality, it is, by totem, a Cat, Opossum, Duck or Kangaroo. The churinga nanja of its primal ancestor is sought for at the place of the child's conception, and is put into the sacred repository of such objects.

Thus the child does not inherit its totem from father, or from mother, but does inherit the right to do ceremonies for the paternal totem: a proof that, of old, totems were inherited, as elsewhere, and that in the male line. If totems among the Arunta, as everywhere else, were once arranged on the plan that the same totem never occurs in both exogamous moieties, that arrangement has been destroyed, as was inevitable, by the existing method of allotting totems to children,—not by inheritance,—but at haphazard. By this means (a consequence of the unique Arunta belief about churinga nanja) the same totems have got into both exogamous moieties, so that persons of the same totem, but of appropriate matrimonial classes, may marry. This licence is absolutely confined to the limited region in which stone churinga nanja occur.

The whole system is impossible except where descent is reckoned in the male line, for there alone is local totemism possible, and the Arunta system is based on local totemism, plus the churinga nanja and reincarnation beliefs. With reckoning of descent in the female line, no locality can possibly have its local totem: all the totems indiscriminately distributed everywhere; and thus no woman can say in what totemic locality her child was conceived, for there is not and cannot be, with female descent, any totemic locality. Now it is admitted that reckoning by female descent is the earlier method, and it is granted that in rites and ceremonies the Arunta are of a relatively advanced and highly organized pattern. Their social organization is local, and they have a kind of local magistracies, hereditary in the male line.

In spite of these facts, Spencer and Gillen conceive that the peculiar totemism of the Arunta is the most primitive type extant (cp. Spencer, J.A.I. (N.S.), vol. i. 275-281; and Frazer, ibid. 281-288). It is not easy to understand this position, as, without male kinship and consequent local totemism (which are not primitive), and without the churinga nanja (which exist only in a strictly limited area), the Arunta system of non-exogamous totems cannot possibly exist. Again, the other tribes cannot have passed through the Arunta stage, for, if they had, their totems would have existed, as among the Arunta, in both exogamous moieties, and would there remain when they came to be inherited;
so that the totems of all these tribes would still be non-exogamous, like those of the Arunta. But this is not the case. Once more, it is clear that the Arunta system has but recently reached their neighbours, the Kaitish, for though they have the chauringa nangara belief, and the haphazard method of acquiring totems by local accident, these things have not yet overcome the old traditional reluctance to marry within the totem name. It is not unlawful among the Kaitish; but it is hardly ever done.

Despite these objections, however, Spencer and Gillen hold, as we have said, that, originally, there were no restrictions (or no known restrictions) on marriage. Totems were merely the result of the formation of co-operative magical societies, in the interest of the tribal food supply. Then, in some unknown way, regulations as to marriage were introduced for some unknown purpose, or were involved in some manner not understood. "The traditions of the Arunta," says Spencer, "point to a very definite introduction of an exogamous system long after the totemic groups were fully developed, and further, they point very clearly to the fact that the introduction was due to the deliberate action of certain ancestors. Our knowledge of the natives leads us to the opinion that it is quite possible that this really took place, that the exogamous groups were deliberately introduced so as to regulate marital relations."

Thus the wisdom of men living promiscuously as regards marriage, but organized in magical societies for the benefit of the common food supply of the local tribe (a complex institution postulated as already in being at this early stage), induced them to introduce regulations by which they should suffer no harm they saw in their promiscuity, we are not informed. Spencer goes on, "by this we do not mean that the regulations had anything whatever to do with the idea of incest, or of any harm accruing from the union of individuals who were regarded as too nearly related. . . . There was felt the need of some kind of organization, and this gradually resulted in the development of exogamous groups." But as "it is quite possible that the exogamous groups were deliberately introduced to regulate marital relations," and as they could only do so by introducing exogamy, we do not see how that system can be the result of the gradual development of an organization quodcumque—a rank nature. A magical organization already existed (Journal of the Anthropological Institute, New Series, i. pp. 284-285).

The traditions of the Arunta seem here to be first accepted: "quite possibly" they are correct in stating that an exogamous system was purposely introduced, long after totemic groups had arisen, by "the deliberate action of certain ancestors," and then that my myth is rejected, in favour of the gradual development of exogamy, "out of some form of organization," unknown.

People who, like the Arunta, have lost memory of the very names of the phratries, cannot concisely remember the nature of the origin of exogamy. All manner as they now are to tribal councils which introduce new rules, they fancy that, in the beginning, new rules were thus introduced.

Meanwhile the working of magic for the behoof of the totem animals and plants, or rather for the name-giving animals of magical societies, is not known to Howitt among the tribes of primitive social organization, while it is well known among agricultural natives of the Torres Strait Islands and among the advanced Sioux and Omaha of North America. The practice seems to belong rather to the precedence than to the dawn of totemism. On the whole, then, there seems to be insurmountable difficulties in the way of Spencer's hypothesis that mankind were promiscuous, as regards marriage, but were organized into cooperative magical groups, thwarth which came, in some unexplained way, the rule of exogamy; while, when it did come, all savages except the Arunta arranged matters so that totem kins were exogamous. The reverse was probably the case, totem kins were originally exogamous, and ceased to be so, and even to be kins among the Arunta, in consequence of the chauringa nangara creed, becoming co-operative magical societies (Hartland, Marett, and others).

8. Spencer and Gillen leave the origin of exogamy an open question. Howitt supposes that, in the shape of the phratric division of the tribe into two exogamous moieties, the scheme may have been introduced to the tribal headmen by a medicine man announcing to his fellow headman a command received from some supernatural being . . . . (Natives of South-East Australia, pp. 86, 90). The Council so to speak, of 'headmen' accept the divine decree, and the assembled tribe pass the Act. This explanation explains nothing. Why did the prophet wish to introduce exogamy? Why were names of animals given, in so many cases, to the two exogamous divisions? As Howitt asks (op. cit. p. 153), "How was it that men assumed the names of objects, which in fact must have been the commencement of totemism?"

It is apparent that any theory which begins by postulating the existence of early mankind in promiscuous groups or hordes, into which exogamous moieties are introduced by tribal decree, takes for granted that the tribe, with its headman, councils and great meetings (not to mention its inspired prophet, with the tribal "All Father" who inspires him), existed before anything regulating "marital relations" were evolved. Even if all this were probable, we are not told why a promiscuous tribe thought good to establish exogamous divisions. Some native myths attribute the institution to certain wise ancestors; some to the supernatural "All Father," say Baiaime; some to a treaty between Eagle Hawk and Crow, beings of cosmogonic legend, who give names to the phratries. Such myths are mere hypotheses. It is impossible to imagine how early savages, ex hypothet: promiscuous, saw anything to reform in their state of promiscuity. They did not think certain unions wrong, because they are forbidden: they were not forbidden, originally, because they were thought wrong.

Westermarck has endeavoured to escape the difficulty thus: "Among the ancestors of man, as among other animals, there was no doubt a time when blood relationship was no bar to sexual intercourse. But variations here, as elsewhere, would naturally present themselves, and those of our ancestors who avoided in and in breeding would survive," while the others would die out. This appears to be orthodox evolutionary language, but it carries us no further. Human societies are not animals or plants, in whose structures various favourable "accidents" occur, producing better types, which survive. We ask why in human society did "variations present themselves"; why did certain sets of human beings "avoid in and in breeding"? We are merely told that some of our ancestors became exogamous and survived, while others remained promiscuous and perished. No light is thrown on the problem,—wherefore did some of our ancestors avoid in and in breeding, and become exogamous? Nothing is gained by saying "thus an instinct would be developed which would be powerful enough, as a rule, to prevent injurious unions." There is no "instinct," there is a tribal law of exogamy. If there had been an "instinct," it might account for the avoidance of "in and in breeding"—that is, it might account for exogamy, ab initio. But that is left unaccounted for by the theory which, after maintaining that the avoidance produced the instinct, seems to argue that the instinct produced the avoidance. Westermarck goes on to say that "exogamy, as a natural extension of the instinct, would arise when single families united in small hordes." But, if the single families already had the "instinct," they would not marry within the family: they would be exogamous,—they would naturally be united into other families—before they were united in small hordes. The difficulty of accounting for exogamy does not seem to have been overcome, and no attempt is made to explain the animal names of totem kins and phratries. Westermarck, however, says that "there is no reason why we should assume, as so many anthropologists have done, that primitive men lived in small endogamous groups, practise incest in every degree," although, as he also says, "there was no doubt a time when blood relationship was no bar to sexual intercourse.

If there was no bar, people would 'practise incest in every degree,'—what was there to prevent them? (History of Human Marriage, pp. 352, 353 (1891)).
So far we have seen no luminous and consistent account of how mankind became exogamous, if they began by being Durkheim's promiscuous. The theories rest on the idea that man, dwelling in an "undivided horde" (except so far as it was divided into co-operative magical societies), biassed it into two exogamous intermarrying societies. Durkheim had forgotten to a theory which is not at all points easily understood. He supposes that, "at the beginning of societies of men, incest was not prohibited ... before each horde (peuplade) divided itself into two primitive 'clans' at least" (L'Année sociologique, i. pp. 62, 63). Each of the two "clans" claimed descent from a different animal, which was its totem, and its "god." The two clans were exogamous,—out of respect to the blood of their totem (with which every member of the clan is mystically one), and, being hostile, the two clans raided each other for women. Each clan threw off colonies, which took new totems, new "gods," though still owning some regard to their original clan, from which they had seceded, while abandoning its "god." When the two "primary clans" made alliance and connubium, they became the phratries in the local tribe, and their colonies became the totem kins within the phratries.

We are not told why the original horde was disrupted into two hostile and intermarrying "clans": we especially wonder why the horde, if it wanted an animal god, did not choose one animal for the whole community; and we may suspect that a difference of taste in animal "gods" caused the hostility of the two clans. Nor do we see why, if things occurred thus, the totem kind should not represent twenty or thirty differences of religious taste, in the original horde, as to the choice of animal gods. If the horde was going to vary in opinion, it is unlikely that only two factions put forward animal candidates for divinity. Again, a "clan" (a totem kin, with exogamy and descent derived through mothers) cannot overflow its territorial area and be therefore obliged to send out colonies, for such a clan (as Durkheim himself remarks) has no territorial area to overflow. It is not a local institution at all.

While these objections cannot but occur, Durkheim does provide a valid reason for the existence of exogamy. When once the groups (however they got them) had totems, with the usual taboos on any sort of use of the totem by his human kinsfolk, the women of the kin would be tabooed to the men of the same kin. In marrying a maiden of his own totem, a man inevitably violates the sanctity of the blood of the totem (L'Année sociologique, i. pp. 47-57. Cf. Reinach, Cultes, mythes et religions, vol. i. pp. 162-166).

Here at last we have a theory which accounts for the "religious horror" that attaches to the violation of the rule of totemic exogamy in any mysterious entity, the totem, is hence offensive. But how did totems, animals, persons, objects be mystically solidaire with their human namesakes and kinsmen? We do not observe that Dr Durkheim ever explains why two divisions of one horde chose each a different animal god, or why the supposed colonies thrown off by these primary clans deserted their animal gods for others, or why, and on what principle, they all chose new "gods,"—fresh animals, plants and other objects. His hereditary totem is, in practice, the last thing that a savage changes. The only case of change on record is a recent attempt to increase the range of legal marriages in a waning Australian tribe, on whose lands certain species of animals are perishing.

Theories based on a supposed primal state of promiscuity certainly encounter, when explaining the social organization of Australian savages, difficulties which they do not surmount. But Howitt has provided (apparently without fully realizing the merit of his own suggestions) a way out of the perplexities caused by the conception of early mankind dwelling promiscuously in "undivided communes." The way out is practically to say that, in everyday life, they lived in nothing but "hunts." Howitt writes (Native Tribes of South-East Australia, p. 173): "A study of the evidence which has led me to the conclusion that the state of society among the early Australians was that of an 'Undivided Commune.' . . . It is, however, well to guard this expression. . . . I do not desire to imply necessarily the existence of complete and continuous communism between the sexes. The character of the country, the necessity of moving from one point to another in search of game and vegetable food, would cause any Undivided Commune, provided it assumed dimensions greater than the immediate locality could provide with food, to break up into two or more Communes of the same character. In addition to this it is clear . . . that in the past as now, individual likes and dislikes must have existed, so that, admitting the existence of common rights between the members of the Commune, these rights would remain in abeyance, so far as the separated parts of the Commune were concerned. But at certain gatherings . . . or on great ceremonial occasions, all the segments of the original Commune would reunite, and would behave in the fashion now common in great licentious festivity meetings.

In the early ages contemplated, how can we postulate "great ceremonial occasions" or even peaceful assemblies at fruit-bearing spots? How can we postulate a surviving Primitive sense of solidarity among the scattered segments of the Commune, obviously very small, owing to lack of improbability, and perpetually disintegrated? But, taking the original groups as very small, and as ruled by likes and dislikes, by affection and jealousy, we are no longer concerned with a promiscuous horde, but with a little knot of human beings, in whom love, parental affection and the jealousy of sisters, would probably make discriminations against the marriage of a person, as regards sexual privileges. Thus we have edged away from the hypothesis of the promiscuous indiscriminating horde to the opinion of Darwin. "We may conclude," he says, "from what we know of the jealousy of all male quadrupeds, armed as many of them are with special weapons for battling with their rivals, that promiscuous intercourse in a state of Nature is extremely improbable. . . . The most probable view is that Man originally lived in small communities, each (man) with a single wife, or, if powerful, with several, whom he jealously guarded against all other men. But, in a community of this early type, to guard women jealously would mean constant battle, at least when Man became an animal which makes love all the year round. So Darwin adds: "Or man may not have been a social animal, and yet have lived with several wives, like the Gorilla,—for all the natives agree that but one adult male is seen in a band; when the young male grows up a contest takes place for the mastery, and the strongest, by killing or driving out the others, establishes himself as head of the Community. Younger males, being thus expelled and wandering about, would, when at last successful in finding a partner, prevent too close interbreeding with the limits of the same family" (Descent of Man, ii. pp. 361, 363 (1871)).

Here, then, we have practical Exogamy, as regards unions of brothers and sisters, among man still brutish, while the Sire is husband of the whole harem of females, probably unchecked as regards his daughters.

On this Darwinian text J. J. Atkinson builds his theory of the evolution of exogamy and of savage society in his Primal Law (Social Origins and Primal Law, by Lang and Atkinson, 1903). Paternal jealousy "gave birth to Primal Law," prohibiting marriage between certain members of a family or local group, and thus, in natural sequence, led to forced nunnal selection beyond its circle, that is, led to Exogamy . . . as a habit, not as an expressed law. . . ." The "expressed law" was necessarily a later development; conditioned by the circumstances which produced totemism, and sanctioned, as on Durkheim's scheme, by the totemic taboo. Atkinson worked out his theory by a minute study of customs of avoidance between near kin by blood or affinity; by observations on the customs of animals, and by hypotheses as to the very gradual evolution of human restrictions through many modifications. He also gave a theory of the "classificatory" system of names for relations as opposed to that of Morgan. The names are based mainly "on reference to the validity of age of a class in relation to the group." The exogamous moieties of a tribe (phratries) are not
the result of a reformatory legislative bisection of the tribe, but of the existence of "two intermarrying totem clan groups." The whole treatise, allowing for defects caused by the author's death before the book was printed, is highly original and ingenious. The author, however, did not touch on the evolution of totemism.

9. The following system, as a means of making intelligible the evolution of Australian totemic society, is proposed by the present writer. We may suggest that men originally lived in the state of a Cyclopean family, or clan, and that, Dee, a single male, containing but one adult male, with the females, the adolescent males being driven out, to find each a female mate, or mates, elsewhere if they can. With increase of skill, improvements in implements and mitigation of ferocity, such groups may become larger, in a given area, but men may retain the habit of seeking mates outside the limits of the group of contiguity; the "avoidance" of brothers and sisters may already have arisen. Among the advanced Arunta, now, a man may speak freely to his elder sisters; to younger sisters, or "tribal sisters," he may not speak, or at least, at such a distance that the features are indistinguishable. This archaic rule of avoidance would be a step facilitating the permission to adult males to dwell in their paternal group, avoiding their sisters. Such groups, whether habitually exogamous or not, will require names for each other, and various reasons would yield a preference to names derived from animals. These are easily signalled in gesture language; are easily presented in pictographs and tattooing; are even now, among savages and boys, the most usual sort of personal nicknames; and are widely employed as group names of villagers in European folk-lore. Among European races such group sobriquets are usual, but are represented. The savage, with his ideas of the equality or superiority of animals to himself, sees nothing to resent in an animal sobriquet, and the names, originally group sobriquets, would not find more difficulty in being accepted than "Whig," "Tory," "Huguenot," "Cavalier," "Christian," "Cameronian," —all of them originally nicknames given from without. Again, "Wry Nose" and "Crooked Mouth" are derive nicknames, but they are the translations of the ancient Celtic clan names Cameron and Campbell. The nicknames "Naked Dogs," "Liars," "Buffalo Dung," "Men who do not laugh," "Big Topknots," have been thoroughly accepted by the "gentes" of the Blakfotk体系, and are part of every phase ofLocalemism (Grinnell, Blackfoot Lodge Talks, pp. 208-225).

As Howitt writes, "the assumption of the names of objects by men must in fact have been the origin of totemism." Howitt does not admit the theory that the totem names came to arise in this way, but this way is a vera causa. Names must be given either from within or from without. A group, in savagery, has no need of a name for itself; "we" are "we," or are "The Men"; for all other adjacent groups names are needed. The name of one totem, Thabala, "The Laughing Boy" totem, among the Warramunga and another tribe, is quite transparently a nickname, as is Karit, "The Grown-up Men" (Spencer and Gillen, Northern Tribes of Central Australia, p. 207).

There is nothing, prima facie, which renders this origin of animal, plant, and other such names for early savage groups at all improbable. They would not even be resented, as now are the animal names for villagers in the Orkeys, the Channel Islands, France, Cornwall, and in ancient Israel (for examples see Social Origins, pp. 295-301). The names once accepted, and their origin forgotten, would be inevitably regarded as implying a mystic rapport between the beastial and the human namesakes, Crow, Eagle, Hawk, Grub, Bandicoot, Opossum, Emu, Kangaroo and so on (see Name). On this subject it is enough to cite J. G. Frazer, in The Golden Bough (2nd ed., vol. i. pp. 494-446). Here will be found a rich and satisfactory collection of proof that community of name implies mystic rapport. Professor Rhys is quoted for the statement that probably "the whole Aryan race believed at one time not only that the name was a part of the man, but that it was that part of him which is termed the soul." In such a mental stage the men "Crows" identify themselves with the actual Crow species: the birds are now of their flesh," are fabled to be their ancestors, or the men have been evolved out of the birds. The Crow is sacro-sanct, a friend and protector, and a centre of taboos, one of which is the prohibition preventing a Crow man from intercourse with a Crow woman, "however far apart their hunting grounds may have been." All men and women Crows are recognized as brothers and sisters in the Crow, and are not intermarriageable.

On these lines the prohibition to infringe the totem taboo by marriage within the totem name is intelligible, but the system of phratries has yet to be accounted for. It is obvious that the names could only have been given originally to local groups: the people who held this or that local habitation received the name. Suppose that the rule of each such group, or heart circle, had been "no marriage within the local group or camp," as in Atkinson's scheme. When the groups accept their new names, the rule becomes, "no marriage within local group Eagle Hawk, group Crow," and so on. So far the animal giving the group name may not yet have become a revered totem. The result of the rule would inevitably be, in three or four generations, that in groups Crow, Eagle Hawk, there were no Crows or Eagle Hawks by descent, if the children took the names of descent from their mothers; for the sake of differentiation: the Ant woman's children in local group Crow being Ants, the Grub woman's children being Grubs, the Eagle Hawk woman's children being Eagle Hawks,—all in local group Crow, and inheriting the names of the local groups whence their mothers were brought into local group Crow.

By this means (indicated first by McLennan) each member of a local group would have a local group name, say Eagle Hawk, and a name by female descent, say Kangaroo, in addition, as now, to his or her personal name. In this way, all members of each local group would find, in any other local group, people of his name of descent, and, as the totem belief grew to maturity, kinsmen of his in the totem. When this fact was realized, it would inevitably make for peace among all contiguous groups. In place of taking women by force, at the risk of shedding kindred blood, peaceful betrothals between men and women of different local group names and of different names by descent could be arranged. Say that local groups Eagle Hawk and Crow took the lead in this arrangement of alliance and cannibalism, so that they they parted out of Totemism (Grinnell, Blackfoot Lodge Tales, pp. 208-225).

As Howitt writes, "the assumption of the names of objects by men must in fact have been the origin of totemism." Howitt does not admit the theory that the totem names came to arise in this way, but this way is a vera causa. Names must be given either from within or from without. A group, in savagery, has no need of a name for itself; "we" are "we," or are "The Men"; for all other adjacent groups names are needed. The name of one totem, Thabala, "The Laughing Boy" totem, among the Warramunga and another tribe, is quite transparently a nickname, as is Karit, "The Grown-up Men" (Spencer and Gillen, Northern Tribes of Central Australia, p. 207).

There is nothing, prima facie, which renders this origin of animal, plant, and other such names for early savage groups at all improbable. They would not even be resented, as now are the animal names for villagers in the Orkeys, the Channel Islands, France, Cornwall, and in ancient Israel (for examples see Social Origins, pp. 295-301). The names once accepted, and their origin forgotten, would be inevitably regarded as implying a mystic rapport between the beastial and the human namesakes, Crow, Eagle, Hawk, Grub, Bandicoot, Opossum, Emu, Kangaroo and so on (see Name). On this subject it is enough to cite J. G. Frazer, in The Golden Bough (2nd ed., vol. i. pp. 494-446). Here will be found a rich and satisfactory collection of proof that community of name implies mystic rapport. Professor Rhys is quoted for the statement that probably "the whole Aryan race believed at one time not only that the name was a part of the man, but that it was that part of him which is termed the soul." In such a mental stage the

FAMILY
FAMINE

One of the causes of famine is the lack of food due to climatic factors, and the resulting scarcity of food can lead to widespread suffering and death. In many cases, famine occurs when a region is unable to produce enough food to meet the needs of its population, or when crops fail due to drought or other environmental factors.

In some cases, famine can be caused by conflicts or wars, which can disrupt the food supply chains and lead to shortages. In other cases, famine can be caused by natural disasters such as floods, hurricanes, or earthquakes, which can destroy crops and infrastructure and disrupt food production.

In many cases, famine is a result of poverty and social inequalities, as people who are poor and marginalized are more likely to suffer from famine.

In order to prevent famine, it is important to ensure that food is available and accessible to everyone, and to address the root causes of poverty and inequality. This may include efforts to improve food production and distribution, to provide assistance to those in need, and to address the underlying social and economic factors that contribute to famine.

In conclusion, famine is a serious problem that affects many people around the world, and it is important to take action to prevent and address this crisis.
crops in another. In tropical countries drought is the commonest cause of a failure in the harvest, and where great droughts are not uncommon—as in parts of India and Australia—the hydraulic engineer comes to the rescue by devising systems of water-storage and irrigation. It is less easy to provide against the evils of excessive rainfall and of frost, hail and the like. The experience of the French in Algiers shows that it is possible to stamp out a plague of locusts, such as is the greatest danger to the farmer in many parts of Argentina. But the ease with which food can nowadays be transported from one part of the world to another minimizes the danger of famine from natural causes, as we can hardly conceive that the whole food-producing area of the world should be thus affected at once.

The artificial causes of famine have mostly ceased to be operative on any large scale. Chief among them is war, which may cause a shortage of food-supplies, either by its direct ravages or by depleting the supply of agricultural labour. But only local famines are likely to arise from this cause. Legislative interference with agricultural operations or with the distribution of food-supplies, currency restrictions and failure of transport, which have all been instruments of the past, are unlikely thus to operate again; nor is it probable that the modern speculators who attempt to make "corners" in wheat could produce the evil effects contemplated in the old statutes against forestallers and regrators.

Such local famines as may occur in the 20th century will probably be attributable to natural causes. It is impossible to regulate the rainfall of any district, or wholly to supply its failure by any system of water-storage. Irrigation is better able to bring fertility to a naturally arid district than to avert the failure of crops in one which is naturally fertile. The true palliative of famine is to be found in the improvement of methods of transport, which make it possible rapidly to convey food from one district to another. But the efficiency of this preventive stops short at the point of saving human life. It cannot prevent a rise in prices, with the consequent suffering among the poor. Still, every year makes it less likely that the world will see a renewal of the great famines of the past, and it is only the countries where civilization is still backward that are in much danger of even a local famine.

**Great Famines.**—Amongst the great famines of history may be named the following:

| B.C. 436 | Famine at Rome, when thousands of starving people threw themselves into the Tiber. |
| A.D. 42 | Great famine in Egypt. |
| 650 | Famine throughout India. |
| 874 | Universal famine. |
| 941, 1022 | Great famines in India, in which entire provinces and 1033 were depopulated and man was driven to cannibalism. |
| 1005 | Famine in England. |
| 1016 | Famine throughout Europe. |
| 1064-1072 | Seven years' famine in Egypt. |
| 1148-1159 | Eleven years' famine in India. |
| 1162 | Universal famine. |
| 1344-1345 | Great famine in India, when the Mogul emperor was unable to obtain the necessaries for his household. The famine continued for years and thousands upon thousands of people perished of want. |
| 1396-1407 | The Durga Devi famine in India, lasting twelve years. |
| 1386 | Famine in England which gave rise to the Poor Law system. |
| 1661 | Famine in India, when not a drop of rain fell for two years. |
| 1769-1770 | Great famine in Bengal, when a third of the population (10,000,000 persons) perished. |
| 1783 | The famine in Bengal, which extended from the eastern edge of the Benares province to Lahore and Jammu. |
| 1790-1792 | The Doji Bura, or skull famine, in India, so-called because the people died in such numbers that they could not be buried. According to tradition this was one of the severest famines ever known. It extended over the whole of Bombay into Hyderabad and affected the northern districts of Madras. Relief works were first opened during this famine in Madras. |

**A.D. 1838** Intense famine in North-West Provinces (United Provinces) of India; 800,000 perished.

1846-1847 Famine in Ireland, due to the failure of the potato-crop. Famine relief were made by parliament amounting to £10,000,000.

1861 Famine in North-West India.

1866 Famine in Bengal and Rajputana; one million perished.

1869 Intense famine in Rajputana; one million and a half perished. The government initiated the policy of saving life.

1874 Famine in Behar, India. Government relief in excess of the needs of the people.

1876-1878 Famine in Bombay, Madras and Mysore; five millions perished. Relief insufficient.

1877-1878 Severe famine in north China. Nine and a half millions said to have perished.

1887-1889 Famine in China.

1891-1892 Famine in Russia.

1899-1901 Famine in India. One million people perished. Estimated loss to India £50,000,000. The government spent £10,000,000 on relief, and at one time there were 4,500,000 people on the relief works.

1905 Famine in Russia.

**Famines in India.**—The above statement of its tropical situation and its almost entire dependence upon the monsoon rains, India is more liable than any other country in the world to crop failures, which upon occasion deepen into famine. Every year sufficient rain falls in India to secure an abundant harvest if it were evenly distributed over the whole country; but as a matter of fact the distribution is so uneven and so uncertain that every year some district suffers from insufficient rainfall. In fact, famine is, to all intents and purposes, endemic in India, and is a problem to reckon with every year in some portion of that vast area. The people depend so entirely upon agriculture, and the harvest is so entirely destroyed by a single monsoon failure, that wherever a total failure occurs the landless labourer is immediately thrown out of work and remains out of work for the whole year. The question is thus one of lack of employment, rather than lack of food. The food is there, perhaps at a slightly enhanced price, but the unemployed labourer has no money to buy it. The problem is very much the same as that met by the British Poor Law system. Every year in England a poor rate of some £22,000,000 is expended for a population of 40 millions; while it is only in an exceptional year in India that £10,000,000 are spent on a population of 300 millions.

Famines seem to have taken place at periodical intervals, which have been held to be in some way dependent on the sun-spot period. Every five or ten years the annual scarcity widens its area and becomes a recognized famine; every fifty or a hundred years whole provinces are involved, loss of life becomes widespread, and a great famine is recorded. In the 140 years since Warren Hastings initiated British rule in India, there have been nineteen famines and five severe scarcities. For the period preceding British rule the records have not been so well preserved, but there is ample evidence to show that famine was just as frequent in its incidence and infinitely more deadly in its effects under the native rulers of India. In the great Bengal famine of 1769-1770, which occurred shortly after the foundation of British rule, but while the native officials were still in power, a third of the population, or ten millions out of thirty millions, perished. From this it may be guessed what occurred in the centuries under Mogul rule, when for years there was no rain, when famine lasted for three, four or twelve years, and entire cities were left without an inhabitant. In the famine of 1907, the worst of recent years, the loss of life in British districts was 3% of the population affected, as against 33% in the Bengal famine of 1770.

The native rulers of India seem to have made no effort to relieve the sufferings of their subjects in times of famine; and even down to 1866 the British government had no settled famine policy. In that year the Orissa famine awakened the public conscience, and the commission presided over by Sir George Campbell laid down the lines upon which subsequent famine-relief was organized. In the Rajputana famine of 1869 the humane principle of saving every possible life was first
enunciated. In the Behar famine of 1874 this principle was even carried to an extreme, the cost was enormous, and the people were in danger of being pauperized. The resulting reaction caused a regrettable loss of life in the Madras and Bombay famine of 1876-1878; and the Famine Commission of 1880, followed by those of 1898 and 1901, laid down the principle that every possible life must be spared, but that the wages on relief works must be so regulated in relation to the market rate of wages as not to undermine the independence of the people. The experience gained in the great famines of 1898 and 1901 has been garnered by these commissions, and stored up in the "famine codes" of each separate province, where rules are provided for the treatment of famine directly a crop failure is seen to be probable. The first step is to open test works; and directly they show the necessity, regular relief works are established, in which the people may earn enough to keep them from starvation, until the time comes to sow the next crop.

As a result of the severe famine of 1878-1879, Lord Lytton's government instituted a form of insurance against famine known as the Famine Insurance Grant. A sum of Rs. 1,500,000 was to be yearly set aside for purposes of famine relief. This scheme has been widely misunderstood; it has been assumed that an entirely separate fund was created, and that in years when the specified sum was not paid into this fund, the purpose of the government was not carried out. But Sir John Strachey, the author of the scheme, explains in his book on India that the original intention was nothing more than the transfer in the year to year of the necessary wage, the purpose of the indicated amount, to purposes of famine relief; and that when the country was free from famine, this sum should be regularly devoted to the discharge of debt, or to the prevention of debt which would otherwise have been incurred for the construction of railways and canals. The sum of $1 c rores is regularly set aside for this purpose, and is devoted as a rule to the construction of protective irrigation works, and for investigating and preparing new projects falling under the head of protective works.

The measures by which the government of India chiefly endeavored to reduce the liability of the country to famine are the promotion of railways; the extension of canal and well irrigation; the reclamation of waste lands, with the establishment of fuel and fodder reserves; the introduction of agricultural improvements; the multiplication of industries; emigration; and finally the improvement where necessary of the revenue and rent systems. In times of famine the function of the railways in distributing the grain is just as important as the function of the irrigation canals in increasing the amount grown. There is always enough grain within the boundaries of India for the needs of the people; the only difficulty is to transport it to the tracts where it is required, at a particular time. Owing to the extension of railways, in the famines of 1898 and 1901 there was never any dearth of food in any famine-stricken tract; and the only difficulty was to find enough rolling-stock to cope with the demand. Irrigation protects large tracts against famine, and has immensely increased the wheat output of the Punjab; the Irrigation Commission of 1903 recommended the addition of $4 million acres to the irrigated area of India, and that recommendation is being carried out at an annual cost of $1.5 millions sterling for twenty years, but at the end of that time the list of works that will return a lucrative interest on capital will be practically exhausted. Local conditions do not make irrigation everywhere possible.

As five-sixths of the whole population of India are dependent upon the land, any failure of agriculture becomes a national calamity. If there were more industries and manufactures in India, the dependence on the land would not be so great and the liability to lack of occupation would not be so uniform in any particular district. The remedy for this is the extension of factories and home industries; but European capital is difficult to obtain in India, and the native capitalist prefers to lend his money to the running of industries, therefore, is a work of time. It is sometimes alleged by native Indian politicians that famines are growing worse under British rule, because India is becoming exhausted by an excessive land revenue, a civil service too expensive for her needs, military expenditure on imperial objects, and the annual drain of some £15,000,000 for "home charges." The reply to this indictment is that the British land revenue is £16,000,000 annually, whereas Aurangzeb's over a smaller area, allowing for the difference in the value of the rupee, was £110,000,000; though the Indian Civil Service is expensive, its cost is more than covered by the fact that India, under British guarantee, obtains her loans at 3% as against 10% or more paid by native rulers; though India has a heavy military burden, she pays no contribution to the British navy, which protects her seaboard from invasion; the drain of the home charge cannot be very great, as India annually absorbs 6 millions sterling of the precious metals; in 1899-1900, a year of famine, the net imports of gold and silver were 175 million rupees. Finally, it is estimated by the census commissioners that in the famine of 1901 three million people died in the native states and only one million in British territory.

**FAN** (Lat. *vatus*; Fr. *éventail*), in its usually restricted meaning, a light implement used for giving motion to the air in order to produce coolness to the face; the word is, however, also applied to the winnowing fan, for separating chaff from grain, to various engineering appliances for ventilation, &c. Ventilabrum and flabellum are names under which ecclesiastical fans are mentioned in old inventories. Fans for cooling the face have been in use in hot climates from remote ages. A base-relief in the British Museum represents Sennacherib with female figures carrying feather fans. They were attributes of royalty along with horse-hair fly-flappers and umbrellas. Examples may be seen in plates of the Egyptian sculptures at Thebes and other places, and also in the ruins of Persepolis. In the museum of Bouik, near Cairo, a wooden fan handle showing feathers is still preserved. It is from the tombs of Amenemhat III and IV in Dahshur that an Indian fan was also attributed of men in authority, and sometimes sacred emblems. A heart-shaped fan, with an ivory handle, of unknown age, and held in great veneration by the Hindus, was given to King Edward VII. when prince of Wales. Large pankhas or screens, moved by a servant who does nothing else, are in common use in hot countries, and particularly India.

Fans were used in the early middle ages to keep flies from the sacred elements during the celebrations of the Christian mysteries. Sometimes they were round, with bells attached—of silver or silver gilt. Notices of fans in the 17th century in France are rare. In India fans were also attributes of men in authority, and sometimes sacred emblems. A heart-shaped fan, with an ivory handle, of unknown age, and held in great veneration by the Hindus, was given to King Edward VII. when prince of Wales. Large pankhas or screens, moved by a servant who does nothing else, are in common use in hot countries, and particularly India.

compliment in China to invite a friend or distinguished guest to write some sentiment on your fan as a memento of any special occasion, and this practice has continued. A fan that has some celebrity in France was presented by the Chinese ambassador to the comtesse de Clauzel at the coronation of Napoleon I. in 1804. When a site was given in 1635, on an artificial island, for the settlement of Portuguese merchants in Nippo in Japan, the space was laid out in the form of a fan as emblematic of an object agreeable for general use. Men and women of every rank both in China and Japan carry fans, even artisans using them with one hand while working with the other. In China they are often made of carved ivory, the sticks being plates very thin and sometimes carved on both sides, the intervals between the carved parts pierced with astonishing delicacy, and the plates held together by a ribbon. The Japanese make the two outer guards of the stick, which cover the others, occasionally of beaten iron, extremely thin and light, damascened with gold and other metals.

Fans were used by Portuguese ladies in the 14th century, and were well known in England before the close of the reign of Richard II. In France the inventory of Charles V. at the end of the 14th century mentions a folding ivory fan. They were brought into general use in that country by Catherine de' Medici, probably from Italy, then in advance of other countries in all matters of personal luxury. The court ladies of Henry VIII.'s reign in England were used to handling fans. A lady in the "Dance of Death" by Holbein holds a fan. Queen Elizabeth is painted with a round feather fan in her portrait at Gorhambury; and as many as twenty-seven are enumerated in her inventory (1660). Coryat, the English traveller, in 1608 describes them as common in Italy. They also became of general use from that time in Spain. In Italy, France and Spain fans had special conventional uses, and various actions in handling them grew into a code of signals, by which ladies were supposed to convey hints or signals to admirers or to rivals in society. A paper in the Spectator humorously proposes to establish a regular drill for these purposes.

The chief seat of the European manufacture of fans during the 17th century was Paris, where the sticks or frames, whether of wood or ivory, were made, and the decorations painted on mounts of very carefully prepared vellum (incorrectly called chicken skin)—a material stronger and tougher than paper, which was used in Paris. Paris fan-makers exported fans unpainted to Madrid and other Spanish cities, where they were decorated by native artists. Many were exported complete; of old fans called Spanish a great number were in fact made in France. Louis XIV. issued edicts at various times to regulate the manufacture. Besides fans mounted with parchment, Dutch fans of ivory were imported into Paris, and decorated by the heraldic painters in the process called "Vernis Martin," after a famous carriage painter and inventor of colourless lac varnish. Fans of this kind belonging to Queen Victoria and the baroness de Rothschild were exhibited in 1870 at Kensington. A fan of the date of 1660, representing sacred subjects, is attributed to Philippe de Champagne, another to Peter Oliver in England in the 17th century. Cano de Arevalo, a Spanish painter of the 17th century, devoted himself to fan painting. Some harshe expressions of Queen Christina to the young ladies of the French court are said to have caused an increased ostentation in the splendour of their fans, which were set with jewels and mounted in gold. Rosalba Carriera was the name of a fan painter of celebrity in the 17th century. Le Brun and Romanell were much employed during the same period. Klingstet, a Dutch artist, enjoyed a considerable reputation in the latter part of the 18th century. He had a lively fancy for the fan-cover.

The revocation of the edict of Nantes drove many fan-makers out of France to Holland and England. The trade in England was well established under the Stuart sovereigns. Petitions were addressed by the fan-makers to Charles II. against the importation of fans from India, and a duty was levied upon such fans in consequence. This importation of Indian fans, according to Savary, extended also to France. During the reign of Louis XV. carved Indian and China fans displaced to some extent those formerly imported from Italy, which had been painted on swanskin parchment prepared with various perfumes.

During the 18th century all the luxurious ornamentation of the day was bestowed on fans as far as they could display. The sticks were made of mother-of-pearl or ivory, carved with extraordinary skill in France, Italy, England and other countries. They were painted from designs of Boucher, Watteau, Lancret and other "genre" painters; Hébert, Rau, Chevalier, Jean Boquet, Mme. Vérité, are known as fan-painters. These fashions were followed in most countries of Europe, with certain national differences. Taffeta and silk, as well as fine parchment, were used for the mounts. Little circles of glass were let into the stick to be looked through, and small telescopic glasses were sometimes contrived at the pivot of the stick. They were occasionally mounted with the finest point lace. An interesting fan (belonging to Madame de Thiac in France), the work of Le Flamand, was presented by the municipality of Dieppe to Marie Antoinette on the birth of her son the dauphin. From the time of the Revolution the old luxury expended on fans died out. Fine examples ceased to be exported to England and other countries. The painting on them represented scenes or personages connected with political events. At a later period fan mounts were often printed coloured by hand. The events of the day mark the date of many examples found in modern collections. Among the fan-makers of modern days the names of Alexandre, Duvelleroy, Fayet, Vanier became well known in Paris; and the designs of Charles Conder (1868-1909) have brought his name to the front in this art. Painters of distinction often design and paint the mounts, the best designs being figure subjects. A great impulse was given to the manufacture and painting of fans in England after the exhibition which took place at South Kensington in 1878. Modern collections of fans take their date from the emigration of many noble families from France at the time of the Revolution. Such objects were given as souvenirs, and occasionally sold by families in straitened circumstances. A large number of fans of all sorts, principally those of the 18th century, French, English, German, Italian, Spanish, &c., have been bequeathed to the South Kensington (Victoria and Albert) Museum.

The sticks of folding fans are called in French brins, the two outer guards panaches, and the mount feuille.

**FANCY** (a shortened form, dating from the 15th century, of "fantasy," which is derived through the O. Fr. fantaisie, modern fantaisie, from the Latinized form of the Gr. φαντασία, φαντασία, to show), display, showing forth, as a philosophical term, the presentative power of the mind. The word "fancy" and the older form "fantasy," which is now chiefly used poetically, was in its early application synonymous with imagination, the mental faculty of creating representations or images of things not present to the senses; it is more usually, in this sense, applied to the lighter forms of the imagination. "Fancy," also commonly means inclination, whim, caprice. The more learned form "phantasy," as also such words as "phantom" and "phantasm," is chiefly confined to visionary imaginings.

**FANG** (Fan, Fanwe, Fanwe, Pahouin, Paouen, Mpangwe), a powerful African people occupying the Gabun district north of the Ogowe river in French Congo. Their name means "men." They call themselves Fa'we, Fa'we and Fa with highly nasalized n. They are a finely-made race of chocolate colour; some are very dark, but these are of slave origin. They have bright expressive oval faces and prominent cheek-bones. Many of them file their teeth to points. Their hair, which is woolly, is worn by the women long, reaching below the nape of the neck. The men wear it in a variety of shapes, often building it up over a wooden base. The growth of the hair appears abundant, but that on the face is usually removed. Little clothing is worn; the men wear a bark waist-cloth, the women a plaited girdle, sometimes with a bustle of dried grass. A chief wears a leopard's skin round the shoulders. Both sexes tattoo and paint the body,
and delight in ornaments of every kind. The men, whose sole occupations are fighting and hunting, all carry arms—muskets, spears for throwing and stabbing, and curious throwing-knives with blades broader than they are long. Instead of bows and arrows they use crossbows made of ebony, with which they hunt apes and birds. In battle the Fang used to carry elephant hide shields; these have apparently been discarded.

When first met by T. E. Bowdich (1815) the Paamways, as he calls the Fang, were an inland people inhabiting the hilly plateau north of the Ogoué affluents. Now they have become the neighbours of the Mpongwe (q.v.) of Glass and Libreville on the Komo river, while south of the Gabun they have reached the sea at several points. Their original home is probably to be placed somewhere near the Congo. Their language, according to Sir R. Burton, is rich and sweet, and a contrast to their harsh voices, and the vocabulary collected proved it to be of the Bantu-Negroid linguistic family. W. Winwood Reade (Sketch Book, i. p. 108) states that "it is like Mpongwe (a pure Bantu idiom) cut in half; for instance, njina (gorilla) in Mpongwe is njî in Fan." The plural of the tribal name is formed in the usual Bantu way, Ba-Fang.

Morally the Fang are superior to the negro. Mary Kingsley writes: "The Fan is full of fire, temper, intelligence and go, very teachable, rather difficult to manage, quick to take offence, and utterly indifferent to human life. This latter characteristic has made the Fang cannibalism called by them their idol worship. They noted cannibals, and ferocious in nature. Prisoners are badly treated and are often allowed to starve. The Fang are always fighting, but the battles are not bloody. After the fall of two or three warriors the bodies are dragged off to be devoured, and their friends disperse. Burton says that their cannibalism is limited to the consumption of slain enemies; that the sick are not devoured; and that the dead are decently buried, except slaves, whose bodies are thrown into the forest. Mary Kingsley, on the other hand, believed their cannibalism was not limited. She found the Fang did not eat their own, that they were not tied up in bundles called ncte, ten to a bundle; these are used chiefly in the purchase of wives. They are energetic traders and are skilled in pottery and in gardening. Their religion appears to be a combination of primitive animism and ancestor worship, with a belief in sympathetic magic.

FANO (anc. Fomum Fortunae, q.v.), a town and episcopal see of the Marches, Italy, in the province of Pesaro and Urbino, 8 m. S.E. of the former by rail, and 46 ft. above sea-level, on the N.E. coast of Italy. Pop. (1901), town 10,555, commune 24,730. The cathedral has a 13th century portal, but the interior is unimportant. The vestibule of S. Francesco contains the tombs of some members of the Malatesta family. S. Croce and S. Maria Nuova are decorated by all Attavanti, and the latter is the predecessor of one of which is attributed to Raphael. S. Agostino contains a painting of S. Angelo Custode ("the Guardian Angel"), which is the subject of a poem by Robert Browning. The fine Gothic Palazzo della Ragione (1999) has been converted into a theatre.

The palace of the Malatesta, with fine porticos and Gothic windows, was much damaged by an earthquake in 1874. S. Michele, built against the arch of Augustus, is an early Renaissance building (1475-1490), probably by Matteo Nuzio di Fano, with an ornate portal. The façade has an interesting relief showing the colonnade added by Constantine as an upper storey to the arch of Augustus and removed in 1463.

Fano in the middle ages passed through various political vicissitudes, and in the 14th century became subject to the Malatesta. In 1458 Fius II. added it to the states of the Church. Julius II. established here in 1514 the first printing press with movable Arabic type. The harbour was restored by Paul V. but is now unimportant.

Fanshawe, Sir Richard, Bart. (1608-1666), English poet and ambassador, son of Sir Henry Fanshawe, remembrancer of the exchequer, of W. Park, Herefordshire, and of Edisley, daughter of Thomas Smith or Smythe, was born early in June 1608, and was educated in Cripplegate by the famous schoolmaster, Thomas Faraby. In November 1623 he was admitted fellow-commoner of Jesus College, Cambridge, and in January 1626 he entered the Inner Temple; but the study of the law being distasteful to him, he travelled in France and Spain. On his return, an accomplished linguist, in 1635, he was appointed secretary to the English embassy at Madrid under Lord Aston. At the outbreak of the Civil War he joined the king, and while at Oxford, in 1644, remarkable for his John Harrison of Balls, Hertfordshire. About the same time he was made second secretary at war to the prince of Wales, with whom he set out in 1645 for the western counties, Scilly, and afterwards Jersey. He compounded in 1646 with the parliamentary authorities, and was allowed to live in London till October 1647, visiting Charles I. at Hampton Court. In 1647 he published his translation of the Pastor Fido of Guarini, which he reissued in 1648 with the addition of several other poems, original and translated. In 1648 he was appointed treasurer to the navy under Prince Rupert. In November of this year he was in Ireland, where he actively engaged in the royalist cause till the spring of 1650, when he was despatched by Charles II. on a mission to obtain help from Spain. This was refused, and he joined Charles in Scotland as secretary. On the 2nd of September 1650 he had been created a baronet. He accompanied Charles in the expedition into England, and was taken prisoner at the battle of Worcester on the 3rd of September 1651. After a confinement of some weeks at Whitehall, he was allowed, with restrictions, and under the supervision of the authorities, to choose his own place of residence. He published in 1652 his Selected Parts of Petrarch, compiled from the Latin in imitation of the French, remarkable for his fidelity and elegance. In 1654 he completed translations of two of the comedies of the Spanish poet Antonio de Mendoza, which were published after his death, Querer per solo querer: To Love only for Love's Sake, in 1670, and Fiestas de Aranjuez in 1671. But the great labour of his retirement was the translation of the Lusiad, by Camoens, published in 1655. It is in ottava rima, with the translation prefixed to it of the Latin poem Furor Petroniensis. In 1658 he published a Latin version of the Faithful Shepherdess of Fletcher.

Fanshawe was in England for Paris, re-entered Charles's service and accompanied him to England at the Restoration, but was not offered any place in the administration. In 1661 he was returned to parliament for the university of Cambridge, and the same year was sent to Portugal to negotiate the marriage between Charles II. and the infanta. In January 1662 he was made a privy councillor of Ireland, and was appointed ambassador again to Portugal in August, where he remained till August 1663. He was sworn a privy councillor of England on the 1st of October. In January 1664 he was sent as ambassador to Spain, and arrived at Cadiz in February of that year. He signed the first draft of a treaty on the 17th of December, which offered advantageous concessions to English trade, but of which one condition was that it should be confirmed by his government before a certain date. In January 1666 Fanshawe went to Lisbon to procure the adherence of Portugal to this agreement. He
returned to Madrid, having failed in his mission, and was almost immediately recalled by Clarendon on the plea that he had exceeded his instructions. He died very shortly afterwards before leaving Madrid, on the 20th of June 1666. He had a family of fourteen children, of whom five only survived him, Richard, the youngest, succeeding as second baronet and dying unmarried in 1711.

As a translator, whether from the Italian, Latin, Portuguese, or Spanish, Fanshawe has a considerable reputation. His Pastor Fido and his Lustiai have not been surpassed by later scholars, and his rendering of the latter is praised by Southey and Sir Richard Burton. As an original poet also the few verses he has left are sufficient evidence of exceptional literary talent.

**AUTHORITIES.**—Memoirs of Lady Fanshawe, written in 1676 and published 1829 (from an inaccurate transcript); these were reprinted from the original manuscript and edited by H. C. Fanshawe (London, 1907); article in the Dict. of Nat. Biography and authorities there quoted; Biographia Brit. (Kippis); Original Letters of Sir R. F. (2 vols., 1724), the earlier edition of 1702 with portrait being only vol. i. of this edition; Notes Genealogical and Historical of the Fanshawe Family (1686–1872); funeral sermon by H. Bagshaw; Nicholas Papers (Camden Society); Quarterly Review, xxvii. 1; Macmillan's Mag. bll. 27; Camden's Life and Lusitudes, by Sir F. Burton, i. 135; Clarendon's State Papers, Calendars of State Papers, Autobiography and Hist. of the Rebellion; Athenaeum (1883), i. 121; Add. MSS., British Museum, 15,226 (poems); Harl. MSS., British Museum (letters); (P. C. Y.)

**FANTAN,** a form of gambling highly popular among the Chinese. The game is simple. A square is marked in the centre of an ordinary table, or a square piece of metal is laid on it, the sides being marked 1, 2, 3 and 4. The banker puts on the table a double handful of small coins—in China "cash"—or similar articles, which he covers with a metal bowl. The players bet on the numbers, setting their stakes on the side of the square which bears the number selected. When all have staked, the bowl is removed, and the banker or croupier with a small stick removes coins from the heap, four at a time, till the final batch is reached. If it contains four coins, the backer of No. 4 wins; if three, the backer of No. 3 wins, and so on. Twenty-five per cent is deducted from the stake by the banker, and the winner receives five times the amount of his stake thus reduced. In Macao, the Monte Carlo of China, play goes on day and night, every day of the week, and bets can be made from 5 cents to 500 dollars, which are the limits.

Fantan is also the name of a card game, played with an ordinary pack, by any number of players up to eight. The deal decided, the cards are dealt singly, any that are left over forming a stock, and being placed face downwards on the table. Each player contributes a fixed stake or "ante." The first player can enter if he has an ace; if he has not he pays an "ante" and takes the stock; the second player is then called upon and acts similarly till an ace is played. This (and the other aces when played) is put face upwards on the table, and the piles are built up from the ace to the king. The pool goes to the player who first gets rid of all his cards. If a player fails to play, having a playable card, he is fined the amount of the ante for every card in the other players' hands.

**FANTASIA** (Italian for "fantasy," a causing to be seen, from Greek, *éanw* to show), a name in music sometimes loosely used for a composition which has little structural form, and appears as an illustration of musical ideas. A melody of familiar airs connected together with original passages of more or less brilliancy. The word, however, was originally applied to more formal compositions, based on the madrigal, for several instruments. Fantasias appear as distinct compositions in Bach's works, and also joined to a fugue, as in the "Great Fantasia and Fugue" in A minor, and the "Fantasia cromatica" in D minor. Brahms used the name for his shorter piano pieces. It is also applied to orchestral compositions "not long enough to be called symphonic poems and not formal enough to be called overtures" (Sir C. Hubert Parry, in G. D. (1866).) It is used in Tunisia, Algeria and Morocco, with the meaning of "showing off," for an acrobatic exhibition of horsemanship by the Arabs.

The riders fire their guns, throw them and their lances into the air, and catch them again, standing or kneeling in the saddle, all at full gallop.

**FANTI, MANFREDO** (1806–1866), Italian general, was born at Carpi and educated at the military college of Modena. In 1831 he was implicated in the revolutionary movement centred in the Po Plain, and was condemned to death and hanged in effigy, but escaped to France, where he was given an appointment in the French corps of engineers. In 1833 he took part in Mazzini's abortive attempt to invade Savoy, and in 1835 he went to Spain to serve in Queen Christina's army against the Carlists. There he remained for thirteen years, distinguishing himself in battle and rising to a high staff appointment. But on the outbreak of the war between Piedmont and Austria in 1848 he hurried back to Italy, and although at first his services were rejected both by the Piedmontese government and the Lombard provisional government, he was afterwards given the command of a Lombard brigade.

In the general confusion following on Charles Albert's defeat on the Mincio and his retreat to Milan, where the people rose against the unhappy king, Fanti's courage and tact saved the situation. He was elected member of the Piedmontese chamber in 1849, and on the renewal of the campaign he again commanded a Lombard brigade under General Ramorino. After the Piedmontese defeat at Novara (23rd of March) peace was made, but a rising broke out at Genoa, and Fanti with great difficulty quelled it. He retired to his Lombards from taking part in it. But he was suspected as a Mazzinian and a soldier of fortune by the higher Piedmontese officers, and they insisted on his being court-martialled for his operations under Ramorino (who had been tried and shot). Although honourably acquitted, he was not employed again until the Crimean expedition of 1855. In the second Austrian war in 1859 Fanti commanded the 2nd division, and contributed to the victories of Palestro, Magenta and San Martino. After the peace of Villafranca he was sent to organize the army of the Central Italian League (composed of the provisional governments of Tuscany, Modena, Parma and Romagna), and contributed to the establishment of its army in 1860, at which time the forces were assembled of 45,000 men, whose function was to be ready to intervene in the papal states on the outbreak of a revolution. He showed statesmanlike qualities in steering a clear course between the exaggerated prudence of Baron Ricasoli, who wished to recall the troops from the frontier, and the impetuosity of Garibaldi, his second-in-command, who was anxious to invade Romagna prematurely, even at the risk of Austrian intervention. Fanti's firmness led to Garibaldi's resignation. In January 1860 Fanti became minister of war and marine under Cavour, and incorporated the League's army in that of Piedmont. In March Garibaldi had invaded Sicily with his Thousand and King Victor Emmanuel decided at last that he too must intervene; Fanti was given the chief command of a strong Italian force which invaded the papal states, seized Ancona and other fortresses, and defeated the papal army at Castelfidardo, where the enemy's commander, General Lamoricière, was captured. In three weeks Fanti had conquered the Marche and Umbria and taken 28,000 prisoners. When the army entered Neapolitan territory the king took the chief command, with Fanti as chief of the staff. After defeating a large Neapolitan force at Mola and organizing the siege operations round Gaeta, Fanti returned to the war office at Turin to carry out important army reforms. His attitude in opposing the admission of Garibaldi's 7,000 officers into the regular army with their own grades made him the object of great unpopularity for a time, and led to a severe reprimand from Cavour. On the death of the latter (7th of June 1861) he resigned office and took command of the VII. army corps. But his health had now broken down, and after four years' suffering he died in Florence on the 5th of April 1865. His loss was greatly felt in the war of 1866.

**FANTI,** a nation of Negroes, inhabiting part of the seaboard of the Gold Coast colony, British West Africa, and about 20,000
sq. m. of the interior. They number about a million. They have many traditions of early migrations. It seems probable that the Fanti and Ashanti were originally one race, driven from the north-east towards the sea by another powerful race, possibly the ancestors of Fula and Hausa. There are many words in Fanti for plants and animals not now existing in the country, but which abound in the Gurunsi and Moshi countries farther north. These regions have been always haunted by slave-raiders, and possibly these latter may have influenced the exodus. At any rate, the Fanti were early driven into the forests from the open plains and slopes of the hills. The name Fanti, an English version of *Mfantso*, is supposed to be derived from *fan*, a wild cabbage, and *á*, to eat; the story being that upon the exile of the tribe they had nothing to eat except such plants. They are divided into seven tribes, obviously totemic, and with rules as to exogamy still in force. (1) *Kwonna*, buffalo; (2) *Etluru*, leopard; (3) *Eso*, bush-cat; (4) *Nitchau*, dog; (5) *Nnuna*, parrot; (6) *Ebradsi*, lion; and (7) *Abrutu*, corn-stalk; these names are obsolete, though the meanings are known. The tribal marks are three gashes in front of the ear on each side in a line parallel to the jaw-bone. The Fanti language has been associated by A. B. Ellis with the Ashanti speech as the principal descendant of an original language, possibly the *Tshi* (pronounced *Tchwi*), which is generally considered as the parent of Ashanti, Fanti, Akan, Ewe, and modern Tshi.

The average Fanti is of a dull brown colour, of medium height, with negroid features. Some of the women, when young, are quite pretty. The women use various perfumes, one of the most usual being prepared from the excrement of snakes. There are no special initiatory rites for the youthful Fanti, only a short seclusion for girls when they reach the marriageable age. Marriage is a mere matter of sale, and the maidens are tricked out in all the family finery and walk round the village to indicate that they are ready for husbands. The marriages frequently end in divorce. Marriage is universal, and the expert weavers of the children is left exclusively to the mothers, who are regarded by the Fanti with deep veneration, while little attention is paid to the fathers. Wives never eat with their husbands, but always with the children. The rightful heir in native law is the eldest nephew, i.e. the eldest sister's eldest son, who invariably inherits wives, children and all property. As to tenure of land, the source of ownership of land is derived from the possession of the chief's "stool," which is, like the throne of a king, the symbol of authority, and not even the chief can alienate the land from the stool. Females may succeed to property, but generally only when the acquisition of such property is the result of the offspring of the stool of a chief. The Fanti are not permanent cultivators of the soil. Three or at most five years will cover the period during which land is continuously cultivated. The commonest native dishes are palm-oil chop, a bowl of palm oil, produced by boiling freshly ground palm nuts, in which a fowl or fish is then cooked; and *faʃa*, "white," a boiled mass of yams or plantains. The Fanti have a taste for shark-flesh, called locally "stink-fish." It is sliced up and partly sun-dried, and is eaten in a putrid state. The Fanti are skilful sailors and fishermen, build excellent canoes, and are expert weavers. Pottery and goldsmithtry are trades also followed. Their religion is fetishism, every Fanti having his own "fetish" or familiar spirit, but there is a belief in a beneficent Creative Being. Food is offered the dead, and a ceremony of purification is said to be indulged in at funerals, the bearers and mourners plunging into the sea or river after the interment.

**FANTIN-LATOUR—FĀRĀBĪ**

(1806–1904), French artist, was born at Grenoble on the 14th of January 1836. He studied first with his father, a pastel painter, and then at the drawing school of Lecocq de Boisbaudran, and later under Couture. He was the friend of Ingres, Dalsacroix, Corot, Courbet and others. He exhibited in the Salon of 1861, and many of his more important canvases appeared on its walls in later years, though 1863 found him with Harpignies, Manet, Legros, and Whistler in the Salon des Refusés. Whistler introduced him to English artistic circles, and he lived for some time in England, many of his portraits and flower pieces being in English galleries. He died on the 28th of August 1904. His portrait groups, arranged somewhat after the manner of the Dutch masters, are as interesting from their subjects as they are from the artistic point of view. "Hommage à Delacroix" showed portraits of Whistler and Legros, Baudelaire, Chapleurely and himself; "Un Atelier à Batignolles" gave portraits of Monet, Manet, Zola and Renoir, and is now in the Luxembourg; "Un Coin de Table" presented Verlaine, Rimbaud, Camille Peladan and others, and "Autour du Piano" contained portraits of Chabrier, D'Indy and other musicians. His paintings of flowers are perfect examples of the art, and form perhaps the most famous section of his work in England. In his later years he devoted much attention to lithography, which had occupied him as early as 1892, but his examples were then considered so revolutionary, with their strong lights and black shadows, that the printer refused to execute them. After "L'Anniversaire" in honour of Berlioz in the Salon of 1876, he regularly exhibited lithographs, some of which were excellent examples of delicate portraiture, others being elusive and imaginative drawings illustrating the music of Wagner (who was visiting Paris as early as 1864), Berlioz, Brahms and other composers. He illustrated Adolphe Jullien's Wagner (1886) and Berlioz (1888). There are excellent collections of his lithographic work at Dresden, in the British Museum, and a practically complete set given by his widow to the Louvre. Some were also exhibited at South Kensington in 1898–1899, and at the Dutch gallery in 1904.

**FANUM FORTUNARUM** (mod. Fano), an ancient town of Umbria, Italy, at the point where the Via Flaminia reaches the N. coast of Italy. Its name shows that it was of Roman origin, but of its foundation we know nothing. It is first mentioned, with Pisaurum and Ancona, as held by Julius Caesar in 49 B.C. Augustus planted a colony there, and round it constructed a wall (of which some remains exist), as is recorded in the inscription on the triple arch erected in his honour at the entrance to the town (A.D. 16–17), which is still standing. Vitruvius tells us that there was a temple of Augustus's lifetime, a temple in his honour and a temple of Jupiter, and describes a basilica of which he himself was the architect. The arch of Augustus bears a subsequent inscription in honour of Constantine, added after his death by L. Turcius Secundus, corrector Flamianiae et Piceni, who also constructed a colonnade above the arch. Several Roman statues and heads, attributable to members of the Julio-Claudian dynasty, were found in the convent of S. Filippo in 1899. These and other objects are now in the municipal museum (E. Brizio in *Notizie degli scavi*, 1899, 249 seq.). Of the temple of Fortune from which the town took its name no traces have been discovered.

(T. As.)

**FAN VAULT,** in architecture, a method of vaulting used in the Perpendicular style, of which the earliest example is found in the cloisters of Gloucester cathedral, built towards the close of the 14th century. The ribs are all of one curve and equidistant, and their divergence, resembling that of an open fan, has suggested the name. One of the finest examples, though of later date (1649), is the vault over the staircase of Christ Church, Oxford. For the origin of its development see VaulT.

**FARABI** [Abū Nasr al-Fārābī] (ca. 870–950), Arabic philosopher, was born of Turkish stock at Fārāb in Turkestan, where also he spent his youth. Thence he journeyed to Bagdad, where he learned Arabic and gave himself to the study of mathematics, medicine and philosophy, especially the works of Aristotle. Later he went to the court of the Ḥamdānī Saʿīd addaula, from whom he received a warm welcome and a small pension. Here he lived a quiet if not an ascetic life.
He died in Damascus, whither he had gone with his patron. His works are very clear in style, though aphoristic rather than systematic in the treatment of subjects. Unfortunately the success of Avicenna seems to have led to the neglect of much of his work. In Europe his compendium of Aristotle's Rhetoric was published at Venice, 1484. Two of his smaller works appear in Alpharabii opera omnia (Paris, 1638), and two are translated in F. A. Schmödlers Documenta philosophiae Arabum (Bonn, 1836). More recently Fr. Dieterich has published at Leiden: Alfarabi's philosophische Abhandlungen (1890; German trans. 1892); Alfarabi's Abhandlung des Musterstaates (1893; German trans. with an essay on Über den Zusammenhang der arabischen und der griechischen Philosophie," 1900; Die Staatstheorie von Alfarabi in German, with an essay on "Das Wesen der arabischen Philosophie" (1904).

FARADAY, MICHAEL (1791-1867), English chemist and physicist, was born at Newington, Surrey, on the 22nd of September 1791. His parents had migrated from Yorkshire to London, where his father worked as a blacksmith. His mother, who had been a school-mistress, had herself become apprenticed to a bookbinder. The letters written to his friend Benjamin Abbott at this time give a lucid account of his aims in life, and of his methods of self-culture, when his mind was beginning to turn to the experimental study of nature. In 1812 Mr. Dance, a custodian of his master, took him to hear four lectures by Sir Humphry Davy. Faraday took notes of these lectures, and afterwards wrote them out in a fuller form. Under the encouragement of Mr. Dance, he wrote to Sir H. Davy, enclosing these notes. "The reply was immediate, kind and favourable." He continued to work as a journeyman blacksmith till 1813, when he was appointed assistant in the laboratory of the Royal Institution of Great Britain on the recommendation of Davy, whom he accompanied on a tour through France, Italy and Switzerland from October 1813 to April 1815. He was appointed director of the laboratory in 1825; and in 1833 he was appointed Fullerian professor of chemistry in the institution for life, without the obligation to deliver lectures. He thus remained in the institution for forty years. He died at Hampton Court on the 25th of August 1867.

Faraday's earliest chemical work was in the paths opened by Davy, to whom he acted as assistant. He made a special study of chlorine, and discovered two new chlorides of carbon. He also made the first rough experiments on the diffusion of gases, a phenomenon first pointed out by John Dalton, the physical importance of which was more fully brought to light by Thomas Graham and Joseph Loschmidt. He succeeded in liquefying several gases; he investigated the alloys of steel, and produced several new kinds of glass intended for optical purposes. A specimen of one of these heavy glasses afterwards became historically important: it was the substance in which Faraday detected the rotation of the plane of polarization of light when the glass was placed in the magnetic field, and also as the substance which was first repelled by the poles of the magnet. He also endeavoured with some success to make the general methods of chemistry, as distinguished from its results, the subject of special study and of popular exposition. See his work on Chemical Manipulation.

But Faraday's chemical work, however important in itself, was soon completely overshadowed by his electrical discoveries. The first experiment which he has recorded was the production of an electric pile of a voltaic pile with seven halfpence, seven disks of sheet zinc, and six pieces of paper moistened with salt water. With this pile he decomposed sulphate of magnesia (first letter to Abbott, July 12, 1812). Henceforward, whatever other subjects might from time to time claim his attention, it was from among electrical phenomena that he selected those problems to which he applied the full force of his mind, and which he kept persistently in view, even when year after year his attempts to solve them had been baffled.

Faraday's first notable discovery was the production of the continuous rotation of magnets and of wires conducting the electric current round each other. The consequences deducible from the great discovery of H. C. Oersted (21st July 1820) were still in 1821 apprehended in a somewhat confused manner even by the foremost men of science. Dr. W. H. Wollaston indeed had formed the expectation that he could make the conducting wire rotate on its own axis, and in April 1821 he came with Sir H. Davy to the laboratory of the Royal Institution to make an experiment. Faraday was not there at the time, but coming in afterwards he heard the conversation on the expected rotation of the wire.

In July, August and September of that year Faraday, at the request of R. Phillips, the editor of the Annals of Philosophy, wrote for that journal an historical sketch of electro-magnetism, and he repeated almost all the experiments he described. This led him in the beginning of September to discover the method of producing the continuous rotation of the wire round the magnet, and of the magnet round the wire. He did not succeed in making the wire or the magnet revolve on its own axis. This first success of Faraday in electro-magnetic research became the starting-point of his work, and the magnet and wire were inseparably connected, so that whatever tendency there is for one pole to circulate the current in one direction is opposed by the equal tendency of the other pole to go round the other way, and thus the one pole can neither drag the other round and round the wire nor yet leave it behind. The thing cannot be done unless we adopt in some form Faraday's ingenious solution, by causing the current, in some part of its course, to divide into two channels, one on each side of the magnet, in such a way that during the revolution of the magnet the current is transferred from the channel in front of the magnet to the channel behind it, so that the middle of the magnet can pass across the current without stopping it, just as Cyrus caused his army to pass dryshod over the Gyrnes by diverting the river into a channel cut for it in his rear.

We must now go on to the crowning discovery of the induction of electric currents.

In December 1824 he had attempted to obtain an electric current by means of a magnet, and on three occasions he had made elaborate but unsuccessful attempts to produce a current in one wire by means of a current in another wire or by a magnet. He still persevered, and on the 20th of August 1821 he obtained the first evidence that an electric current can induce another in a different circuit. On the 23rd of September he writes to his friend R. Phillips: "I am busy just now again on electro-magnetism, and think I have got hold of a good thing, but can't say. It may be a weed instead of a fish that, after all my labour, I may at last pull up." This was his first successful experiment. In nine more days of experimenting he had arrived at the results described in his first series of "Experimental Researches" read to the Royal Society on the 24th of November 1821. By the intense application of his mind he had thus brought the new idea, in less than three months from its first development, to a state of perfect maturity.

During his first period of discovery, besides the induction of electric currents, Faraday established the identity of the electrification produced in different ways; the law of the definite electrolytic action of the current; and the fact, upon which he
laid great stress, that every unit of positive electrification is related in a definite manner to a unit of negative electrification, so that it is impossible to produce that Faraday called "an absolute charge of electricity" of one kind not to an equal charge of the opposite kind. He also discovered the difference of the capacities of different substances for taking part in electric induction. Henry Cavendish had before 1773 discovered that glass, wax, resin and shellac have higher specific inductive capacities than air, and had actually determined the numerical ratios of these capacities, but this was unknown both to Faraday and to all other electricians of his time, since Cavendish's Electrical Researches remained unpublished till 1779.

The first period of Faraday's electrical discoveries lasted ten years. In 1841 he found that he required rest, and it was not till 1845 that he entered on his second great period of research, in which he discovered the effect of magnetism on polarized light, and the phenomena of diamagnetism.

Faraday had for a long time kept in view the possibility of using a ray of polarized light as a means of investigating the condition of transparent bodies when acted on by electric and magnetic forces. Dr Bence Jones (Life of Faraday, vol. i. p. 362) gives the following note from his laboratory book on the 10th of September 1822:—

"Polarized a ray of lamplight by reflection, and endeavoured to ascertain whether any depolarizing action (was) exerted on it by water placed between the poles of a voltaic battery in a glass chamber; once a ray of light passed through; transparent deposited were pure water, weak solution of sulphate of soda, and strong sulphuric acid; none of them had any effect on the polarized light, either when put to the polarized glass, or when put to the internal side of a polarizing plate, so that no particular arrangement of particles could be ascertained in this way."  

Eleven years afterwards we find another entry in his notebook on the 2nd of May 1833 (Life, by Dr Bence Jones, vol. ii. p. 26). He then tried not only the effect of a steady current, but the effect on making and breaking contact.

"I do not think, therefore, that decomposing solutions or substances will be found to have (as a consequence of decomposition or arrangement of their parts) any effect on the polarized ray. Should now try non-decomposing bodies, as solid nitre, nitrate of silver, borax, glass, &c., whilst solid, to see if any internal state induced, in which decomposition is destroyed, i.e. whether, when they cannot decompose, any state of electrical tension is present. My borate of glass good, and common electricity better than voltaic."  

On the 6th of May he makes further experiments, and concludes:—"Hence I see no reason to expect that any kind of structure or tension can be rendered evident, either in decomposing or non-decomposing bodies, in insulating or conducting states."  

At last, in 1845, Faraday attacked the old problem, but this time with complete success. Before we describe this result we may mention that in 1862 he made the relation between magnetism and light the subject of his very last experimental work. He endeavoured, but in vain, to detect any change in the lines of the spectrum of a flame when the flame was acted on by a powerful magnet.

This long series of researches is an instance of his persistence. His energy is shown in the way in which he followed up his discovery in the single instance in which he was successful. The first evidence which he obtained of the rotation of the plane of polarization of light under the action of magnetism was on the 13th of September 1845, the transparent substance being his own heavy glass. He began to work on the 30th of August 1845 on polarized light passing through electrotypes. After three days he worked with common electricity, trying glass, heavy optical glass, quartz, Iceland spar, all without effect, as on former trials. On the 13th of September he worked with lines of magnetic force. Air, flint, glass, rock-crystal, calcareous spar were examined, but without effect.

"Heavy glass was experimented with. It gave no effects when the same magnetic poles or the contrary poles were on opposite sides (as respects the course of the polarized ray), nor when the same poles were on the same side, or when the same poles were on the opposite sides. But when contrary magnetic poles were on the same side there was an effect produced on the polarized ray, and thus magnetic force and light were proved to have relations to each other. This fact will most likely prove exceedingly fertile, and of great value in the investigation of the conditions of natural force."

He immediately goes on to examine other substances, but with no effect,” and he ends by saying, “Have got enough for to-day.” On the 18th of September he “does an excellent day's work.” During September he had four days of work, and in October six, and on the 6th of November he sent in to the Royal Society the nineteenth series of his Experimental Researches, in which the whole consequences of the phenomena are fully specified. The negative rotation in ferromagnetic media is the only fact of importance which remained to be discovered afterwards (by M. E. Verdet in 1846).

But his work for the year was not yet over. On the 3rd of November a new horseshoe magnet came home, and Faraday immediately began to experiment on the action in the polarized ray through gases, but with no effect. The following day he repeated an experiment which had given no result on the 6th of October. A bar of heavy glass was suspended by silk between the poles of the new magnet. "When it was arranged, and had come to rest, I found I could affect it by the magnetic forces and give it position." By the 6th of December he had sent in to the Royal Society the twentieth, and on the 24th of December the twenty-first, series of his "Researches," in which the properties of diamagnetic bodies are fully described. Thus these two great discoveries were elaborated, like his earlier one, in about three months.

The discovery of the magnetic rotation of the plane of polarized light, though it did not lead to such important practical applications as some of Faraday's earlier discoveries, has been of the highest value to science. For it furnishes complete dynamical evidence that wherever magnetic force exists there is matter, small portions of which are rotating about axes parallel to the direction of that force.

We have given a few examples of the concentration of his efforts in seeking to identify the apparently different forces of nature, of his far-sightedness in selecting subjects for investigation, of his persistence in the pursuit of what he set before him, of his energy in working out the results of his discoveries, and of the accuracy and completeness with which he made his final statement of the law of the phenomenon.

These characteristics of his scientific spirit lie on the surface of his work, and are manifest to all who read his writings. But there was another side of his character, to the cultivation of which he paid at least as much attention, and which was reserved for his friends, his family and his church. His letters and his conversation were always full of whatever could awaken a healthy interest, and free from anything that might rouse ill-feeling. When, on rare occasions, he was forced out of the region of science into that of controversy, he stated the facts and let them make their own way. He was entirely free from pride and undue self-assertion. During the growth of his powers he always thankfully accepted a correction, and made use of every expedient, however humble, which would make his work more effectual in every detail. When at length he found his memory failing and his mental powers declining, he gave up, without ostentation or complaint, whatever parts of his work he could no longer carry on according to his own standard of efficiency. When he was no longer able to apply his mind to science, he remained content and happy in the exercise of those kindly feelings and warm affections which he had cultivated with less care than his scientific powers, but with more constant devotion.

The parents of Faraday belonged to the very small and isolated Christian sect which is commonly called after Robert Sandeman. Faraday himself attended the meetings from childhood; at the age of thirty he made public profession of his faith, and during two different periods he discharged the office of elder. His opinion with respect to the relation between his science and his religion is expressed in a lecture on mental education delivered in 1854, and printed at the end of his Researches in Chemistry and Physics.

"Before entering upon the subject, I must make one distinction which, however it may appear to others, is to me of the utmost importance. High as man is placed above the creatures around
him, there is a higher and far more exalted position within his view; and the ways are infinite in which he occupies his thoughts about the fears, or hopes, or expectations of a future life. I believe that the truth of that future cannot be brought to his knowledge by any exertion of his mental powers, however exalted they may be; that it is made known to him by other teaching than his own, and is received through simple belief of the testimony given. Let no one suppose that the self-education I am about to commend, in respect of the things of this life, is not extended to considerations of the hope set before us, as if man by reasoning could find out God. It would be improper here to enter upon this subject further than to claim an absolute distinction between religious and ordinary belief. I shall be reproached with the weakness of refusing to apply those mental operations which I think good in respect of high things to the very highest. I am content to bear the reproach; and I believe that a great many things visible to men from the creation of the world are clearly seen, being understood by the things that are made, even His eternal power and Godhead; and I have never seen anything incompatible between those things of man which can be known by the spirit of man which is within him and those higher things concerning his future, which he cannot know by that spirit.

Faraday gives the following note as to this lecture:—

"These observations were delivered as a lecture before His Royal Highness the Prince Consort and the members of the Royal Institution on the 6th of May 1854. They are so immediately connected in their nature and origin with my own experimental life, considered either as cause or consequence, that I have thought the close of his volume of space for their reproduction.

As Dr Bence Jones concludes—

"His standard of duty was supernatural. It was not founded on any intuitive ideas of right and wrong, nor was it fashioned upon any outward experiences of time and place, but it was formed entirely on what he held to be the revelation of the will of God in the Word of God, and throughout all his life his faith led him to act up to the very letter of it."

Richard and John Edward Taylor, vols. i. and ii. (1833); Experimental Researches in Chemistry and Physics, Taylor and Francis, London, 1834; The Chemical Dictionary of a Living Author (edited by W. Crookes) (Griffin, Bohn & Co., 1861); On the Various Forces in Nature (edited by W. Crookes) (Chatto & Windus, no date).

Biographies.—Faraday as a Discoverer, by John Tyndall (Longmans, 1st ed. 1868, 2nd ed. 1870); The Life and Letters of Faraday, by Dr Bence Jones, secretary of the Royal Institution, in 2 vols. (Longmans, 1870); Michael Faraday, by J. H. Gladstone, Ph. D., F. R. S. (Macmillan, 1872); Michael Faraday; his Life and Work, by S. P. Thompson (1896). (J. C. M.)

**Farah**

A river of Afghanistan. It rises in the southern slopes of Shah-Koh, which forms the southern wall of the valley of Herat. It is used by the inhabitants for their water; and is contained in the Seistan Hamun. At the town of Farah it has a width of 150 yds. in the dry season with 2 ft. of water and a clear swift stream. It is liable to floods, when it becomes impassable for weeks. The lower valley of the Farah Rud is fertile and well cultivated.

**Farah**

A town of Afghanistan. It is situated on the river that bears its name on the main road between Herat and Kandahar, 160 m. S. of Herat and 225 m. W. of Kandahar. It is a place of some strategic importance, as it commands the approaches to Indus and Seistan from Herat. The town (24,600 ft. above sea-level) was the capital of the Khalifate dictionary of a long was the middle of the plain, surrounded with a walled rampart. Owing to its unhealthiness it is now almost deserted, being only occupied by the Afghan regiment quartered there. It is a place of great antiquity, being probably the Phra mentioned by Isidore of Charax in the 1st century A.D. It was sacked by the armies of Jenghiz Khan, and the survivors transported to a position farther north, where there are still great ruins. The population returned to the original site after the destruction of the medieval city by Shah Abbas, and the city prospered again until its bloody siege by Nadir Shah. Subsequently under constant attacks it declined, and in 1837 the population amounting to 6,000 was carried off to Kandahar. The sole industry of the town at present is the manufacture of gunpowder. In the districts east of Farah are to be found the most fanatical of the Durani Afghan tribes.

**Farazdaq** [Hammām ibn Ghālib ibn Sa‘sa‘, known as al-Farazdaq (ca. 641-ca. 728), Arabian poet, was born at Basra. He was of the Dārīm, one of the most respected divisions of the bani Tamīm, and his mother was of the tribe of Dabhar. His grandfather Sa‘sa‘ was a Bedouin of great repute, his father Ghālib followed the same manner of life until Basra was founded, and was famous for his generosity and hospitality. At the age of fifteen Farazdaq was known as a poet, and though checked for a short time by the advice of the caliph Alī to devote his attention to the study of the Koran, he soon returned to making verse. In the true Bedouin spirit he devoted his talent largely to satire and attacked the bani Nashāh and the bani Fuqmān. When Ziyād, a member of the latter tribe, became governor of Basra, he ordered Farazdaq to flee, fearing that the poesy, if he stayed, might have been attributed to Sa‘d ibn ul-Asi. Here he remained about ten years, writing satires on Bedouin tribes, but avoiding city politics. But he lived a prodigal life, and his amorous verses led to his expulsion by the caliph Merwan I. Just at that time he learned of the death of Ziyād and returned to Basra, where he secured the favour of Ziyād's successor 'Obaidallah ibn Ziyād. Much of his poetry was now devoted to his matrimonial affairs. He had taken advantage of his position as guardian and married his cousin Nawār against her will. She sought help in vain from the court Basra and with great difficulty the dissensions were averted. When the poet's popularity was at its height, the caliph Alī ibn al-Husayn, who was still too near Ziyād, to Medina, where he was well received by Sa‘d ibn ul-Asi. He maintained a good name for a time, writing satires. At last she fled to Mecca and appealed to the pretender 'Abdallah ibn Zobair, who, however, succeeded in inducing her to consent to a confirmation of the marriage. Qurra'ans soon arose again. Farazdaq took a second wife, and after her death a third, to annoys Nawār. Finally he committed to a divorce pronounced by Hassan al-Baqūr. Another subject occasioned a long series of vcrses, namely his feud with his rival Jarīf (q.v.) and his tribe the bani Kulaib. These poems are published as the Nakā'īd of Jarīf and al-Farazdaq (ed. A. A. Bevan, Leiden, 1906 ff). In political life Farazdaq was prevented by fear from taking a large part. He seems, however, to have been attracted to the house of Ali. During the reign of Moawiya I. he avoided politics, but later gave his allegiance to 'Abdallah ibn Zobair. The fullest account of his life is contained in J. Hell's Das Leben Farazdaq nach seinen Gedichten (Leipzig, 1905); Arabian stories of him in the Kitāb al-Aghāni and in Ibn Khallīkān. A portion of his poems was edited with French translation by R. Boucher (Paris, 1870); the remainder have been published by J. Hell (Munich, 1900).

**Farce**, a form of the comic in dramatic art, the object of which is to excite laughter by ridiculous situations and incidents rather than by imitation with intent to ridicule, but usually of the province of burlesque, or by the delineation of the play of character upon character, which is that of comedy. The history of the word is interesting. Its ultimate origin is the Latin farcire, to stuff, and with the meaning of "stuffing" or forcement it appears in old cookery books in English. In medieval Latin fora and foraria were applied to the expansion of the Kyrie eleison in litanies, &c., by interpolating words and phrases between those two words; later, to words, phrases and rhymed verses, sometimes in the vernacular, also interpolated in various parts of the service. The French farce, the form to which we are here referring, the original "gags" that developed in the medieval drama inserted into their parts, generally to meet the popular demand for a lightening of humour or luffoonery. It has thus been used for the lighter form of comic drama (see Drama), and also figuratively for a piece of idle luffoonery, sham, or mockery.

**Fareham**, a market town in the Fareham parliamentary division of Hampshire, England, 76 m. S.W. from London by the London & South Western railway. Pop. of urban district (1901) 8246. It lies at the head of a creek opening into the north-western corner of Portsmouth harbour. The principal industries are the manufacture and from various tribes. Alchemy, coarse earthenware, terra-cotta, tobacco-pipes and leather. Fareham has a considerable trade in corn, timber and coal; the creek being accessible to vessels of 300 tons. Three miles E. of Fareham, on Portsmouth harbour, are the interesting ruins of Porchester.
CASTLE, an extensive walled enclosure retaining its Norman keep, and exhibiting in its outer walls considerable evidence of Roman workmanship; Professor Haverfield, however, denies that it occupies the site of the Roman Portus Magnus. The church of St Mary has some fine Norman portions. It belonged to an Augustinian priory founded by Henry I. At Titchfield, 3 m. W. of Fareham, are ruins of the beautiful Tudor mansion, Place House, built on the site of a Premonstratensian abbey of the 13th century, of which there are also fragments.

The fact that Fareham (Fernham, Ferham) formed part of the original endowment of the priory gives its existence certainty as early as the 9th century. It is mentioned in the Domesday Survey as subject to a reduced assessment on account of its exposed position and liability to Danish attacks. There is evidence to show that Fareham had become a borough before 1264, but no charter can be found. It was a mesne borough held by the bishop of Winchester, but it is probable that during the 18th century the privileges of the burgesses were allowed to lapse, as by 1835 it had ceased to be a borough. Fareham returned two members to the parliament of 1366, but two years later it petitioned against representation on the ground of expense. A fair on the 1st of October and the two following days was held under grant of Henry III. The day appears to have been afterwards changed to the 20th of June, and in the 18th century was mainly important for the sale of toys. It was abolished in 1871. Fareham owed its importance in medieval times to its facilities for commerce. It was a free port and had a considerable trade in wool and wine. Later its shipping declined and in the 16th century it was little more than a fishing village. Its commercial prosperity in modern times is due to its nearness to Portsmouth.

FAREL, GUILLAUME (1480–1565), French reformer, was born of a noble family near Gap in Dauphine in 1480. His parents meant him for the military profession, but his bent for study he was allowed to enter the university of Paris. Here he came under the influence of Jacobus Faber (Stapulensis), on whose recommendation he was appointed professor in the college of Cardinal Lemoine. In 1521, on the invitation of Bishop Bripontet, he repaired to Meaux, and took part in efforts of reform within the Roman communion. The persecuting measures of 1523, from which Faber found a refuge at Meaux, determined Farel to leave France. Oecolampadius welcomed him to Basel, where in 1524 he put forth thirteen theses sharply antimarian. On the 30th of June 1525 the council of two hundred defended with great ability, but with so much heat that Erasmus jumped in demanding his expulsion from the city. He thought of going to Wittenberg, but his first halt was at Strassburg, where Bucer and Capito received him kindly. At the call of Duke Ulrich of Württemberg he went as preacher to Montbéliard. Displaying the same qualities which had driven him from Basel, he was forced to leave Montbéliard in the spring of 1525.

He retraced his steps to Strassburg and Basel; and, at the end of 1526, obtained a preacher's post at Aigle, then a dependency of Bern. Deeming it wise to suppress his name, he adopted the pseudonym Ursinus, with reference to his protection by Bern. Despite strenuous opposition by the monastic orders, he obtained in 1528 a licence from the authorities to preach anywhere within the canton of Bern. He extended his labours to the cantons of Neuchâtel and Vaud. His vehement missionary addresses were met by mob violence, but he persevered with undaunted zeal. In October 1530 he broke into the church of Neuchâtel with an iconiclastic mob, thus planting the Reformation in that city. In 1532 he visited the Waldensians. On the return journey he halted at Geneva, then at a crisis of political and religious strife. On the 30th of June 1532 the council of two hundred had ordained that in every church and cloister of the city "the pure Gospel " should be preached; against this order the bishop's vicar led the opposition. Reaching Geneva in October 1532, Farel (described in a contemporary monastic chronicle as "un chétif malheureux prédicant, nommé maître Guillaume") at once began to preach in a room of his lodging, and soon attracted "un grand nombre de gens qui estoient adverdis de sa venue et déjà infects de son hérésie." Summoned before the bishop's vicar, his trial was a scene of insult and clamour, ending in his being violently thrust from the court and hidden to leave the city within three hours. He escaped with difficulty to Orbe by boat.

Through the intervention of the government of Bern, liberty of worship was granted on the 28th of March 1533 to the Reformation party in Geneva. Farel, returning, achieved in a couple of years a complete supremacy for his followers. On New Year's Day 1534 the bishop interdicted all preaching unauthorized by himself, and ordered the burning of all Protestant Books. This was the signal for public disputations in which Farel and his followers met its expression side, with the result that by decree of the 27th of August the Reformation was suppressed and the reformed religion established. Calvin, on his way to Basel for a life of study, touched at Geneva, and by the importunity of Farel was there detained to become the leader of the Genevan Reformation. The severity of the disciplinary measures which followed procured a reaction under which Farel and Calvin were banished the city in 1538. Farel was called to Neuchâtel in July 1538, but his position there was made untenable, though he remained at his post during a visitation of the plague. When (1541) Calvin was recalled to Geneva, Farel also returned; but the two missionaries were in the meantime fixed on the Reformation there. It is said that when he preached in the Dominican church of Metz, the bells were rung to drown his voice, but his voice outdid the bells, and on the next occasion he had three thousand hearers. His work was checked by the active hostility of the duke of Lorraine, and in 1544 he returned to Neuchâtel. No one was more frequently and confidentially consulted by Calvin. When the trial of Servetus was in progress (1533), Calvin was anxious for Farel's presence, but he did not arrive till sentence had been passed. He accompanied Servetus to the stake, vainly urging him to a recantation at the last moment. A coolness with Calvin was created by Farel's marriage, at the age of sixty-nine, with a refugee widow from Rouen, of unsuitable age. By her, six years later, he had one son, who died in infancy. The vigour and fervency of his preaching were unabated by length of years. Calvin's death, in 1564, affected him deeply. Yet in his last year he revisited Metz, preaching amid great enthusiasm, with all his wonted fire. The effort was too much for him; he left the church exhausted, took to his bed, and died at Metz on the 13th of September 1565.

Farel wrote much, but usually in haste, and for an immediate purpose. He took part in the conciliar commissions. Thus, in 1542 he went to London, and obtained the marriage of a man of activity rather than of speculation or of much insight. His Sommaire was re-edited from the edition of 1554 by J. G. Baum in 1867. Others of his works (all in French) were his treatise on purgatory (1544), on the Lord's Prayer (1543), on the Supper (1553). He "was remarkable for boldness and energy both in preaching and prayer" (M. Young, Life of Paleseiro). As an orator, he was denunciatory rather than suasive; thus while on the one hand he powerfully impressed, on the other hand he stimulated opposition. A monument to him was unveiled at Neuchâtel on the 4th of May 1876.

Lives of Farel are numerous; it may suffice to mention C. Ancillon, Vie de G. Farel (1691); the article in Bayle; M. Kirehofer, Das Leben W. Frels (1831–1833); Ch. Schmidt, Études zur Farel (1834); J. J. Ypsilantis, Farel (1893); J. J. Herzog, in Herzog-Hauck's Realencyklopädie (1898).

PAREY, JOHN (1766–1826), English geologist, was born at Woburn in Bedfordshire in 1766. He was educated at Halifax in Yorkshire, and showed such aptitude in mathematics, drawing and surveying, that he was brought under the notice of John Smeton (1724–1792). In 1792 he was appointed agent to the duke of Bedford for his Woburn estates. After the decease of the duke, Parey in 1802 removed to London, and settled there as a consulting surveyor and geologist. That he was enabled to take this step was due largely to his acquaintance with William Smith (q.v.), who in 1801 had been employed by the duke of Bedford in works of draining and irrigation. The duke, appreciating Smith's knowledge of the strata, commissioned him to explore the margin of the chalk-hills south of Woburn in order to determine the true succession of the strata; and he instructed Parey to accompany him. Parey has remarked
that Smith was his "Master and Instructor in Mineral Surveying," and his subsequent publications show how well he had profited by the teachings he received. Farey prepared the General View of the Agriculture and Minerals of Derbyshire in two vols. (1811-1813) for the Board of Agriculture. In the first of these volumes (1811) he gave an able account of the upper part of the British series of strata, and a masterly exposition of the Carboniferous and other strata of Derbyshire. In this classic work, and in a paper published in the Phil. Mag. vol. li. 1818, p. 173, on "Mr Smith's Geological Claims stated," he zealously called attention to the importance of the discoveries of William Smith. Farey died in London on the 6th of January 1826.

See Biographical Notice, by W. S. Mitchell, in Geol. Mag. 1873, p. 25.

FARGO, WILLIAM GEORGE (1818-1881), pioneer American expressman, was born in Pompey, New York, on the 20th of May 1818. From the age of thirteen he had to support himself, obtaining little schooling, and for several years he was a clerk in grocery stores in Syracuse. He became a freight agent for the Auburn & Syracuse railway company at Auburn in 1841, an express messenger between Albany and Buffalo a year later, and in 1843 a resident agent in Buffalo. In 1844 he organized, with Henry Wells (1805-1878) and Daniel Dunning, the first express company (Wells & Co.; after 1845 Livingston & Fargo) to engage in the carrying business west of Buffalo. The lines of this company (which first operated only to Detroit, via Cleveland) were rapidly extended to Chicago, St Louis, and other western points. It was Hayes Otis who, in March 1846, when through a consolidation of competing lines the American Express Company was formed, on the recommendation of Wells became president and Fargo secretary. In 1851, with Wells and others, he organized the firm of Wells, Fargo & Company to conduct an express business between New York and San Francisco by way of the Isthmus of Panama and on the Pacific coast, where it long had a virtual monopoly. In 1861 Wells, Fargo & Co. bought and reorganized the Overland Mail Co., which had been formed in 1857 to carry the United States mails, and of which Fargo had been one of the original promoters. From 1862 to 1866 he was mayor of Buffalo, and from 1868 to his death, in Buffalo, on the 3rd of August 1881, he was president of the American Express Company, with which in 1868 the Merchants Union Express Co. was consolidated. He was a director of the New York Central and of the Northern Pacific railways.

FARGO, a city and the county-seat of Cass county, North Dakota, U.S.A., about 254 m. W. of Duluth, Minnesota. Pop. (1890) 5664; (1900) 9396, of whom 2564 were foreign-born; (1910) census 14,531. It is served by the Northern Pacific, the Great Northern, and the Chicago, Milwaukee & St Paul railways. The city is situated on the W. bank of the Red river of the North, which in 1809 had a navigable depth of only about a foot, except in the state having the navigation of which was obstructed at various places by fixed bridges. In the city are Island and Oakgrove parks, the former of which contains a statue (erected by Norwegians in 1906) of Henrik Arnold Wergeland, the Norwegian poet. Fargo is the seat of the North Dakota agricultural college (coeducational), founded in 1890 under the provisions of the Federal " Morrill Act " of 1862; it receives both Federal and state support (the former under the Morrill Act of 1862), and in connection with it a United States Agricultural Experiment Station is maintained. In 1907-1908 the college had 1888 students in the regular courses (including the students in the Academy), 117 in the summer course in steam engineering, and 68 in correspondence courses. At Fargo, also, are Fargo College (nons sectarian, 1887; founded by Congregationalists), which has a college department, a preparatory department, and a conservatory of music, and in 1908 had 310 students, of whom 211 were in the conservatory of music; the Oak Grove Lutheran ladies' seminary (1906) and the Sacred Heart Academy (Roman Catholic). The city is the see of both a Roman Catholic bishop and a Protestant Episcopal bishop; and it is the centre of Masonic bodies in the state, having a fine Masonic temple. There are a public library and a large Y.M.C.A. building. St John's hospital is controlled by Roman Catholic sisters, and St Luke's hospital by the Lutheran Church. Fargo is in a rich agricultural (especially wheat) region, is a busy grain-trading and jobbing centre, is one of the most important wholesale distributing centres for agricultural implements and machinery in the United States, and has a number of manufactures, notably flour. The total value of the city's factory products in 1905 was $1,160,832. Fargo, named in honour of W. G. Fargo of the Wells Fargo Express Company, was first settled as a tent city in 1871, when the Red river was crossed by the Northern Pacific, but was not permanently settled until after the extinction in 1873 of the Indian title to the reservation on which it was situated. It was chartered as a city in 1875. The Milwaukee railway was completed to Fargo in 1884. In June 1893 a large part of the city was destroyed by fire, the loss being more than $3,000,000.

FARIA Y SOUSA, MANUEL DE (1590-1649), Spanish and Portuguese historian and poet, was born in an—possibly Jewish family, probably at Pombério, on the 18th of March 1590, attended the university of Braga for some years, and when about fourteen entered the service of the bishop of Oporto. With the exception of about four years from 1621 to 1624, during which he was a member of the Portuguese embassy in Rome, the greater part of his later life was spent at Madrid, and there he died, after much suffering, on the 3rd of June 1649. He was a laborious, peaceful man; and a happy marriage with Catharina Machado, the Albani of his poems, enabled him to lead a studious domestic life, divesting his cares and affections between his children and his books. His first important work, an Epitome de las historias Portuguezas (Madrid, 1628), was favourably received; but some passages in his enormous commentary upon Os Lusíadas, the poem of Luís de Camoens, excited the suspicion of the inquisitors, caused his temporary incarceration, and led to the permanent loss of his official salary. In spite of the enthusiasm which is said to have prescribed to him the daily task of twelve folio pages, death overtook him before he had completed his greatest enterprise, a history of the Portuguese in all parts of the world. Several portions of the work appeared at Lisbon after his death, and the editorship of Captain Faria y Sousa—Europa Portuguezas (Madrid, 1875), and translated and completed the Nobiliario de the count of Barbadillo.

There are English translations by J. Stevens of the History of Portugal (London, 1698), and of Portuguezas Asla (London, 1695).

FARIBAULT, a city and the county-seat of Rice county, Minnesota, U.S.A., on the Cannon river, at the mouth of the Straight river, about 45 m. S. of St Paul. Pop. (1890) 6529; (1900) 7868, of whom 1586 were foreign-born; (1910) 8279; (1920) 9001. Faribault is served by the Chicago Great Western, the Chicago, Milwaukee & St Paul, and the Chicago, Rock Island & Pacific railways. The city is attractively situated near a lake region widely known for its summer resorts. Faribault is the seat of the Minnesota Institute for defectives, embracing the state school for the deaf (1863), the state school for the blind (1874), and the state school for the feeble-minded (1879); of three institutions under control of the Protestant Episcopal Church—the Seabury divinity school (incorporated 1866), the Shattuck school (1867; incorporated in 1905), a military school for boys, and St Mary's hall (1866), a school for girls, founded by Bishop Whipple; and of the Roman Catholic (Dominican) Bethlehem Academy for girls. In the city are the cathedral of our Merciful Saviour (1869-1869), the first Catholic church in the United States; and the University of St Mary's, as a cathedral from its opening; and the hospital and nurses' training school of the Minnesota District of the Evangelical
Synod. The city has a public library, and owns and operates its own water-supply system. There is a good water power, and among the city's manufactures are flour, beer, shoes, furniture, rattan-ware, warehouse cars, canned goods, cane sugar, waggon and carriages, gasoline engines, wind-mills, pianos and woolen goods. Faribault, named in honour of Jean Baptiste Faribault, a French fur-trader and pioneer who made his headquarters the in the region in the latter part of the 18th century, was permanently settled about 1848, and was chartered as a city in 1872. A French millwright, N. La Croix, introduced here, about 1850, a new process of making flour, which revolutionized the industry in the United States, but his mill was soon destroyed by flood and he removed to Minneapolis, where the process was developed. Faribault is traversed by navigable rivers; the average depth is 12 ft. It is bounded by the Renville, St. Peter, and St. James railroads with an increase of 5% in the decade. The north of the district is crossed by the line of the Eastern Bengal railway to Goalanda, the port of the Brahmaputra steamers, and a branch runs to Faridpur town. But most of the trade is conducted by river.

The city is one of the chief of the state of India in the Punjab. It ranks as one of the Cis-Sutlej states, which came under British influence in 1800. Its area is 642 sq. m., and its population in 1901 was 124,912. It is bounded on the W. and N.E. by the British district of Ferozepore, and on the S. by the S. Hbatia state. During the Sikh wars in 1845 the chief, Raja Pakh Singh, exerted himself and his territory was rewarded with an increase of territory.

In the Mutiny of 1857, 100, his son and successor, Wazir Singh, did good service by guarding the Suraj near--jells, and in attacking a notorious rebel, whose stronghold he destroyed. The estimated gross revenue is £28,300; there is no tribute. The territory is traversed by the Rewari-Ferozepore railway, and also by the eastern railways. The town, which has a railway station, stands on an old channel of the Ganges. Pop. (1901) 11,640. There are a Baptist mission and a government high school. The district comprises an area of 238 sq. m. The general aspect is flat, tamed and uninteresting, although in the northern tract the land is comparatively high, with a light sandy soil, covered with water during the rainy season, but dry during the cold and hot weather. From the town of Faridpur the ground slopes, in the south, on the confines of Baghargan, it becomes one immense swamp, never entirely drained. During the height of the inundations the whole district may be said to be under water. The villages are built on artificially raised sites, or on the banks of the deltaic streams. Among many of the larger rivers the line of hamlets is unbroken for miles together, so that it is difficult to say where one ends and another begins. The huts, however, except in markets and bazaars, are seldom close together, but are scattered amidst small garden plots, and groves of mango, date and betel-nut trees. The plains between the villages are almost invariably more or less depressed towards the centre, where usually a marsh, or lake, or deep lagoon is found. These marshes, however, are gradually filling up by the silt deposited from the rivers; in the north of the district there now only remain two or three large swamps, and in them the process may be seen going on. The climate of Faridpur is damp, like that of the other districts of eastern Bengal; the average annual rainfall is 66 in. and the average mean temperature 76° F.

The principal rivers of Faridpur are the Ganges, the Ariaz Khan and the Harighata. The Ganges, or Padma as it is locally called, touches the extreme north-west corner of the district, flows along its northern boundary as far as Goalanda, where it receives the waters of the Jamuna or main stream of the Brahmaputra, and whence the united stream turns southwards and forms the eastern boundary of the district. The river is navigable by large cargo boats throughout the year, and has an average breadth during the rainy season of 1600 yds. Rice is the great crop of the district. In 1901 the population was 1,037,646, showing an increase of 5% in the decade. The north of the district is crossed by the line of the Eastern Bengal railway to Goalanda, the port of the Brahmaputra steamers, and a branch runs to Faridpur town. But most of the trade is conducted by river.
FARINA—FARINI

179

FARINA, SALVATORE (1846— ), Italian novelist, was born in Sardinia, and after studying law at Turin and Pavia devoted himself to a literary life at Milan. Farina has often been compared as a sentimental humorist with Dickens, and his style of writing has given him a special place in modern Italian fiction. His masterpiece is Il Signor Ito (1888), a delightful portrait of an egotist; Don Chisciotino, Amore bendato, Capelli biondi; Oro nascosto, Il Tesoro di Dominika, Amore a cent'occhi; Mio figlio I numero 12, are some of his other volumes.

FARINATO, PAOLO (1522-1606), Italian painter and architect, was a native of Verona. He is sometimes named Farinato degli Uberti, as he came from the ancient Florentine stock to which the Ghibelline leader Farinata degli Uberti, celebrated in Dante's Convivio, belonged. He flourished at the same time that the art of Verona obtained its greatest lustre in the works of Paolo Cagliari (Paul Veronese), succeeded by other members of the Cagliari family, of whom most or all were outvied by Farinato. He was instructed by Niccolò Giolino, and probably by Antonio Badile and Domenico del Riccio (Brusasorci). Proceeding to Venice, he formed his style partly on Titian and Giorgione, though he was never conspicuous as a colourist, and in form he learned more from the works of Giulio Romano. His nude figures show knowledge of the antique; he affected a bronzed tone in the complexion, harmonizing with the general gravity of his colour, which is more laudable in fresco than in oil-painting. Vasari praised his thronged compositions and merit of draughtsmanship. His works are to be found not only in Venice and principally in Verona, but also in Mantua, Padua and other towns belonging or adjacent to the Venetian territory. He was a prosperous and light-hearted man, and continually progressed in his art, passing from a comparatively dry manner into a larger and bolder one, with much attraction of drapery and of landscape. The "Miracle of the Loaves and Fishes," painted in the church of S. Giorgio in Verona, is accounted his masterpiece; it was executed at the advanced age of seventy-nine, and is of course replete with figures, comprising those of the painter's own family. A salon was painted by him in S. Maria in Organo, in the same city, with the subjects of "Michael expelling Lucifer" and the "Assassinage of the Innocents"; in Padua is a "St Sixthus;" in Berlin a "Presentation in the Temple," and in the communal gallery of Turin one of his prime works, the "Marriage of St Catherine." Farinato executed some sculptures, and various engravings sacred and mythologic subjects; his works of all kinds were much in request, including the wax models which he wrought as studies for his painted figures. He is said to have died at the same hour as his wife. His son Orazio was also a painter of merit.

Farinelli (1705-1782), whose real name was CARLO BROSCHI, one of the most extraordinary singers that ever lived, was born on the 24th of January 1705, at Naples. He was the nephew of Cristiano Farinelli, the composer and violinist, whose name was so closely identified with Farinello's career of which he was soon admitted, under the instruction of N. A. Porpora, a voice of marvellous beauty, and became famous throughout southern Italy as il ragazzo (the boy). In 1722 he made his first appearance at Rome in his master's Eunene, creating the greatest enthusiasm by surpassing a popular German trumpet-player, for whom Porpora had written an obligato to one of the boy's songs, in holding and swelling a note of prodigious length, purity and power, and in the variations, roulades and trills which he introduced into the air. In 1724 he appeared at Vienna, and at Venice in the following year, returning to Naples shortly afterwards. He sang at Milan in 1726, and at Bologna in 1727, where he first met and acknowledged himself vanquished by the singer Antonio Bernacchi (b. 1700), to whose instruction he was much indebted. With ever-increasing success and fame Farinelli appeared in nearly all the great cities of Italy; and returned a third time to Vienna in 1731. He now modified his style; it is said on the advice of Charles VI., from mere bravura of the Porpora school to one of pathos and simplicity. He visited London in 1734, arriving in time to lend his powerful support to the faction which in opposition to Handel had set up a rival opera with Porpora as composer and Senesino as principal singer. But not even his aid could make the undertaking successful. His first appearance at the Lincoln's Inn Fields theatre was in Ariaserse, much of the music of which was by his brother, Riccardo Broschi. His success was instantaneous, and the prince of Wales and the court loaded him with favours and presents. Having spent three years in England, Farinelli set out for Spain, staying a few months on the way in France, with the intention of severing his connection with the English opera. In Spain he stayed more than a year, and then proceeded to Naples, where he had only meant to stay a few months, he ended by passing nearly twenty-five years. His voice, employed by the queen to cure Philip V. of his melancholy madness, acquired for him an influence with that prince which gave him eventually the power, if not the name, of prime minister. This power he was wise and modest enough to use discreetly. For ten years, night after night, he had to sing to the king the same six songs, and never anything else. Under Ferdinand VI. he held a similar position, and was decorated (1750) with the cross of Calatrava. He utilized his ascendency over this king by persuading him to establish an opera at Madrid, which was a success. After the accession of Charles III. Farinelli retired with the fortune he had amassed to Bologna, and spent the remainder of his days there in melancholy splendour, dying on the 15th of July 1782. His voice was of large compass, possessing seven or eight notes more than those of ordinary singers, and was sonorous, equal and clear; he also possessed a great knowledge of music.

FARINGDON, properly GREAT FARINGDON, a market town in the Abingdon parliamentary division of Berkshire, England, 17 m. W.S.W. of Oxford by road. Pop. (1901) 2900. It lies on the southwestern end of the downs which border the valley of the Thames on the south. It is the terminus of a branch of the Western railway from Uffington. The church of All Saints is a large cruciform building with low central tower. Its period is mainly Transitional Norman and Early English, and though considerably altered by restoration it contains some good details, with many monuments and brasses. Faringdon House, close to the church, was built by Henry James Pye (1745-1813), poet laureate from 1790 to 1813, who also caused to be planted the conspicuous group of fir-trees on the hill east of the town called Faringdon Clump, or locally (like other similar groups) the Fothergill Clump; the produce of Faringdon is agricultural.

Farinini, Luigi Carlo (1812-1866), Italian statesman and historian, was born at Rieti, near Ravenna, on the 22nd of October 1812. After completing a brilliant university course at Bologna, which he interrupted to take part in the revolution of 1831 (see Carbonari), he practised as a physician at Rieti and at Ravenna. He acquired a considerable reputation, but in 1843 his political opinions brought him under the suspicion of the police and caused his expulsion from the papal states. He resided successively in Florence and Paris, and travelled about Europe as a private physician to Prince Jerome Bonaparte, but when Pius IX. was restored to the papal throne in 1846, he returned to Rome, and reigned with apparently Liberal and nationalist tendencies, Farinini returned to Italy and was appointed secretary-general to G. Recchi, the minister of the interior (March 1848). But he held office for little more than a month, since like all the other Italian Liberals he disapproved of the pope's change of front in refusing to allow his troops to fight against Austria, and resigned with the rest of the ministry on the 29th of April. Pius, wishing to counteract the effect of this policy, sent Farini to Charles Albert, king of Sardinia, to hand over the command of the papal contingent to him. Elected member of parliament for Farnese, he was again appointed secretary to the ministry of the interior in the Mammiani cabinet, and later director-general of the public health department. He resigned office on the proclamation of the republic after the flight of the pope to Gaeta in 1849, resumed it for a while when Pius returned to Rome with the protection
of French arms, but when a reactionary and priestly policy was instituted, he went into exile and took up his residence at Turin. There he became convinced that it was only through the House of Savoy that Italy could be liberated, and he expounded his views in Cavour’s paper Il Risorgimento, in La Frusta and Il Piemonte, of which latter he was at one time editor. He also wrote his chief historical work, Lo Stato Romano dal 1815 al 1839, in four volumes (Turin, 1859). In 1831 he was appointed minister of public instruction in the D’Azeglio cabinet, an office which he held till May 1832. As a member of the Sardinian parliament, and later in Parliament, Carpi was one of the most ardent supporters of Cavour (pp.), and strongly favoured the proposal that Piedmont should participate in the Cisalpine War, if indeed he was not actually the first to suggest that policy (see G. B. Ercolani’s letter in E. Parri’s memoir of Farini). In 1836 and 1837 he published two letters to Mr Gladstone on Italian affairs, which created a sensation, while he continued to propagate his views in the Italian press. When on the outbreak of the war of 1859 Francis V., duke of Modena, was expelled and a provisional government set up, Farini was sent as Piedmontese commissioner to that city; but although recalled after the peace of Villafranca, he continued in the work of the annexation of central Italy to Piedmont and remained behind, becoming a Modenese citizen and dictator of the state. He negotiated an alliance with Parma, Romagna and Tuscany, when other provisional governments had been established, and entrusted the task of organizing an army for this central Italian league to General Fanti (q.v.). Annexation to Piedmont having been voted by plébiscite and the opposition of Napoleon III. having been overcome, Farini returned to Turin, when the king conferred on him the order of the Annunziata and Cavour appointed him minister of the interior (June 1861), and subsequently viceroy of Naples: but he soon resigned on the score of ill-health. Cavour died in 1861, and the following year Farini succeeded Rattazzi as premier, in which office he endeavoured to carry out Cavour’s policy. Over-exertion, however, brought on the softening of the brain, which compelled him to resign office on the 24th of March 1863, and ultimately resulted in his death on the 1st of August 1866. He was buried at Turin, but in 1875 his remains were removed to his native village of Russi.

His son Domenico Farini had a distinguished political career and was at one time president of the chamber.

The term FARM-BUILDINGS is applied to all buildings, and to the group of buildings, that are found on farms, or on land leased for the purpose of agriculture, and variously described as farmsteads, farms, farmhouses, farmstead buildings, and agricultural buildings. 

The term is used generally to denote any building on a farm, or any building on land leased or held for the purpose of agriculture.

The term is used to denote any building or group of buildings on a farm, or on land leased or held for the purpose of agriculture.

FARMER, RICHARD (1735-1797). Shakespearian commentator, the son of a rich malster, was born at Leicester on the 28th of August 1735. He was educated at the free grammar school of his native town, and at Emmanuel College, Cambridge. He graduated in 1757 a senior optime; three years later he proceeded M.A. and became classical tutor, and in 1775 master of his college, in succession to William Richardson, the biographer of the English bishops. In the latter year also he was appointed vice-chancellor, and three years afterwards chief librarian of the university. In 1780 he was appointed to a prebendal stall in Lichfield, and two years later to one at Canterbury; but the second office he exchanged in 1788 for that of a canon residuary of St Paul's. A Cambridge, where he usually resided, was indebted to him for improvements in lighting, paving and watering; but perhaps London and the nation have less reason to be grateful for his zealous advocacy of the custom of erecting monuments to departed worthies in St Paul's. In 1765 he issued a prospectus for a history of the town of Leicester; but this work, based on materials collected by Thomas Stevaley, he never even began; it was carried out by the learned printer John Nichols. In 1766 he published his famous Essay on the Learning of Shakespeare, in which he proved that the poet's acquaintance with ancient and modern Continental literature was exclusively gained from publications, of which he copied even the blunders. "Shakespeare," he said, "wanted not the stilts of language to raise him above all other men." "He came out of nature's hand, like Pallas out of Jove's head, at full growth and maturity." "One might," he said—by way of ridiculing the Shakespearian criticism of the day—"with equal wisdom, study the Talmud for an exposition of Tristram Shandy." The essay fully justifies the author's description of himself in the preface to the second edition: "I may consider myself as the pioneer of the commentators; I have removed a deal of learned rubbish, and pointed out to them Shakespeare's true track in the very pleasant paths of nature," Farmer died at Cambridge on the 8th of September 1797. He was, it appears, twice offered a bishopric by Pitt, but declined the preferment. Farmer was immensely popular in his own college, and loved, it was said, above all other things, old port, old clothes and old books.

FARMERS' MOVEMENT, in American political history, the general name for a movement between 1867 and 1896 remarkable for a radical socio-economic propaganda that came from what was considered the most conservative class of American society. In this movement there were three periods, popularly known as Granger, Alliance and Populist.

The Grange, or Order of the Patrons of Husbandry (the latter the official name of the national organization, while the former was the name of local chapters, including a supervisory National Grange at Washington), was a secret order founded in 1867 to advance the social needs and combat the economic backwardness of farm life. It grew remarkably in 1873-1874, and in the latter year attained a membership of perhaps 800,000. In the causes of its growth—much broader than those that issued in the financial crisis of 1873—a high tariff, railway freight-rates and other grievances were mingled with agricultural troubles like the fall of wheat prices and the increase of mortgages. The condition of the farmer seemed desperate. The original objects of the Grange were primarily educational, but these were soon overborne by an anti-middleman, co-operative movement. Grange agents bought everything from farm machinery to women's dresses; hundreds of grain elevators and cotton and tobacco warehouses were bought, and even steamboat lines; mutual insurance companies were formed and joint-stock stores. Nor was co-operation limited to distributive processes; crop-reports were circulated, co-operative dairies multiplied, flour-mills were operated, and patents were purchased, that the Grange might manufacture farm machinery. The outcome in some states was ruin, and the name Grange became a reproach. Nevertheless these efforts in co-operation were exceedingly important both for the results obtained and for their wider significance. Nor could politics be excluded, though officially tattoced; for economics must be considered by social idealists, and economics everywhere ran into politics. Thus it was with the railway question. Railways had been extended into frontier states, and heavy crops in sparsely settled regions where freight-rates were high, so that—given the existing distributive system—there were "over production" and waste; there was notorious stock manipulation and discrimination in rates; and the farmers regarded "absentee ownership" of railways by New York capitalists much as absentee ownership of land has been regarded in Ireland. The Grange officially declared enmity to railways; but though the organization did not attack them, the Grangers—through political "farmers' clubs" and the like—did. About 1867 began the efforts to establish regulation of the railways, as common-carriers, by the states. Superficially in the old guise "Granger laws," and in such economic principles, soon endorsed (1876) by the Supreme Court of the United States, have become an important chapter in the laws of the land. In a declaration of principles in 1874 Grangers were declared to be "not enemies of railroads," and their cause to stand for "no communism, no agrarianism." To conservatives, however, co-operation seemed communistic, and "Granger laws" agrarianism; and thus in 1873-1874 the growth of the movement aroused extraordinary interest and much uneasiness. In 1874 the order was reorganized, membership being limited to those desiring to improve and advance the agricultural interests of the country. By 1880 a million manufacturers' Grange on Broadway, and after this there were constant quarrels in the order; moreover, in 1875 the National Grange largely lost control of the state Granges, which discredited the organization by their disastrous co-operation ventures. Thus by 1876 it had already ceased to be of national political importance. About 1880 a renascence began, particularly in the Middle States and New England; this revival was marked by a recurrence to the original social and educational objects. The national Grange and state Granges (in all, or nearly all, of the states) were still active in 1905, especially in the old curia "Grangerism" and in such economic movements—notably the improvement of highways—as most directly concern the farmers. The initiative and-referendum, and other proposals of reform politics in the direction of a democratic advance, also enter in a measure into their propaganda.

The Alliance carried the movement farther into economics. The "National Farmers' Alliance and Industrial Union," formed in 1889, embraced several originally independent organizations formed from 1873 onwards; it was largely confined to the South and was secret. The "National Farmers' Alliance," formed in 1880, went back similarly to 1877, was much smaller, Northern and non-secret. The "Colored Farmers' National Alliance and Co-operative Union" (formed 1888, merged in the above "Southern" Alliance in 1890) was the second greatest organization. With these three were associated many others, state and national, including an annual, non-partisan, deliberative and advisory Farmers' National Congress. The Alliance movement reached its greatest power about 1890, in which year twelve national farmers' organizations were represented in conventions in St Louis, and the six leading ones alone probably had a membership of 5,000,000.

As with the Grange, so in the ends and declarations of the whole later movement, concrete remedial legislation for agricultural or economic ills was mingled with principles of vague radical tendency and with lofty idealism. Among the principles

1. Membership usually included males or females above 16 years of age.
2. Thus, the "Southern" Alliance in 1890 (the chief platforms were the operation of Ocala, Florida, and that of 1889 at St Louis, in conjunction with the Knights of Labor) declared its objectives to be:
   (1) To labour for the education of the agricultural classes in the science of economical government in a strictly non-partisan way, and to bring about a more perfect union of such classes. To
advocated about 1890, practically all the great organizations demanded the abolition of national banks, the free coinage of silver, a "sufficient" issue of government paper money, tariff revision, and a secret ballot (the last was soon relatively, if not less commonly demanded) was an income tax, taxation of evidence of debt, and government loans on lands. All of these were principles of the two great Alliances (the Northern and the Southern), as were also pure food legislation, abolition of landholding by aliens, reclamation of unused or unearned land grants (to railways, e.g.), and either rigid federal regulation of railways and other means of communication or government ownership thereof. The "Southern" Alliance put in the forefront a "subsidiary" scheme according to which cheap loans should be made by government from local sub-treasuries on non-perishable farm products (such as grain and cotton) stored in government warehouses; while the "Northern" Alliance demanded restriction of the liquor traffic and (for a short time) woman suffrage. Still other issues were a modification of the patent laws (e.g. to prevent the purchase of patents to stifle competition), postal currency exchange, the eight-hour day, inequitable taxation, the single-tax on land, "trusts," educational qualification for suffrage, direct popular election of federal judges, of senators, and of the president, special-interest lobbying, &c.

In 1885–1890 the political (non-partisan) movement developed astonishing strength; it captured the Republican stronghold of Kansas, brought the Democratic Party to vassalage in South Carolina, re-established legislature control in the West (albeit temporarily) like Massachusetts, and seemed likely completely to dominate the South and West. All its work in the South was accomplished within the old-party organizations, but in 1890 the demand became strong for an independent third party, for which various consolidations since 1887 had prepared the way, and by 1892 a large part of the strength of the farmers' organizations, with that of various industrial and radical orders, was united in the People's Party (perhaps more generally known as the Popular Party), which had its beginnings in Kansas in 1890, and received national organization in 1892. This party emphasized free silver, the income tax, eight-hour day, reclamation of land grants, government ownership of railways, telephones and telegraphs, popular election of federal senators, and the initiative and referendum. In the presidential election of 1892 it cast 1,041,021 votes (in a total of 12,036,089), and elected 22 presidential electors, the first chosen by any third party since 1856.

In 1896 the People's Party "fused" with the Democratic Party (q.v.) in the presidential campaign, and again in 1900; during this period, indeed, the greatest part of the People's Party was reabsorbed into the two great parties from which its membership had been originally drawn;—in some northern states apparently largely by the Republican rank and file to the Democratic Party, to which it gave a powerful radical impulse.

The Farmers' movement was much misunderstood, abused and ridiculed. It accomplished a vast amount of good. The movement—and especially the Grange, for on most important points the later movements only followed where it had led—contributed the initial impulse and prepared the way for the establishment of travelling and local rural libraries, reading courses, lyceums, farmers' institutes (a steadily increasing influence) and rural free mail delivery (inaugurated experimentally in 1896 and incorporated as part of the permanent postal system of the country in 1902); for agricultural exhibits and an improved agricultural press; for encouragement to and increased profit from the work of agricultural colleges, the establishment (1882) and great services of the United States Department of Agriculture,—in short, for an extraordinary lessening of rural isolation and betterment of the farmers' opportunities; for the irrigation of the semi-arid West, adopted as a national policy in 1902, the World's fairs of 1900, the interstate-cummerce law of 1887, the railway-rate laws of 1901 and 1906, even the great Bureau of Commerce-and-Labor law of 1903, and the Anti-trust laws of 1901 and later. The Alliance and Populist movements were bottomed on the idea of "ethical gains through legislation." In its local manifestations the whole movement was often marked by eccentric ideas, narrow prejudices and weaknesses in economic reasoning. It is not to be forgotten that owing to the movement of the frontier the United States has always been "at once a developed country and a primitive one. The same political questions have been put to a society advanced in some regions and undeveloped in others. . . . On specific political questions each economic area has reflected its peculiar interest"

(F. J. Turner). That this idea must not, however, be over-emphasized, is admirably enforced by observing the great mass of farmer radicalism that has, since about 1896, become an accepted Democratic and Republican principle over the whole country. The Farmers' movement was the beginning of widespread, effective protest against the "menace of privilege" in the United States.

FARNABY (or Farnaby), Thomas (c. 1547–1647), English grammarian, was the son of a London carpenter; his grandfather, it is said, had been mayor of Truro, his great-grandfather an Italian musician. Between 1590 and 1595 he appears successively as a student of Merton College, Oxford, a pupil in a Jesuit college in Spain, and a follower of Drake and Hawkins. After some military service in the Low Countries he "made shift," says Wood, "to be set on shore in the western part of England; where, after some wandering to and fro under the name of Tho. Bainrale, the anagram of his surname, he settled at Martock, in the county of Somerset, and built the grammar school there and had great success with time. After he had gotten some feathers at Martock, he took his flight to London," and opened a school in Goldsmiths' Rents, Creeklegate. From this school, which had as many as 300 pupils, there issued, says Wood, "more churchmen and statesmen than from any school taught by one man in England." In the course of his London career he "was made master of arts of Cambridge, and soon after incorporated at Oxon." Such was his success that he was enabled to buy an estate at Otford near Sevenoaks, Kent, to which he retired from London in 1636, still, however, carrying on his profession of schoolmaster. In course of time he added to his Otford estate and bought another near Horsham in Sussex. In politics he was a royalist; and, suspected of participation in the rising near Tunbridge, 1643, he was imprisoned in Ely House, Holborn. He died at Sevenoaks on the 12th of June 1647.

The details of his life were derived by Anthony Wood from Francis, Farnaby's son by a second marriage (see Wood's Athenae Oxonienses, ed. Bliss, iii. 213). His works chiefly consisted of annotated editions of Latin authors—Juvenal, Persius, Seneca, Martial, Lucan, Virgil, Ovid and Terence, which enjoyed extraordinary popularity. His Systema graministocum iconice was published in 1641. On the 6th of April 1632, Farnaby was presented with a royal patent granting him, for the space of twenty-one years, the sole right of printing and publishing certain of his works.

FARNSBOROUGH, Horace, Baron, of Farnborough (1815–1886), English Constitutional historian, was born in London on the 8th of February 1815 and educated at Bedford grammar school. In 1831 he was nominated by Manns Sutton, speaker of the House of Commons, to the post of assistant librarian, so that his long connexion with parliament began in his youth.
He studied for the bar, and was called at the Middle Temple in 1838. In 1844 he published the first edition of his Treatise on the Law, Privilege, Proceedings and Usage of Parliament. This work, which has passed through many editions, is not only an invaluable mine of information for the historical student, but it is known as the text-book of the law by which parliament governs its proceedings. In 1846 Erskine May was appointed examiner of petitions for private bills, and the following year taxing-master of the House of Commons. He published his Remarks to Facilitate Public Business in Parliament in 1849; a work On the Consolidation of Election Laws in 1850; and his Rules, Orders and Forms of the House of Commons was printed by command of the House in 1854. In 1856 he was appointed clerk assistant at the table of the House of Commons. He received the companionship of the Bath in 1860 for his parliamentary services, and became a knight commander in 1866. His important work, The Constitutional History of England since the Accession of George III. (1760-1860), was published in 1867-1863, and it received frequent additions in subsequent editions. In 1871 Sir Erskine May was appointed clerk of the House of Commons. His Democracy in Europe: a History appeared in 1877, but it failed to take the same rank in critical esteem as his Constitutional History. He retired from the post of clerk to the House of Commons in April 1886, having for fifteen years discharged the onerous duties of the office with as much knowledge and energy as unfailing tact and courtesy. Shortly after his retirement from office he was raised to the peerage under the title of Baron Farnborough of Farnborough, in the county of Southampton, but he only survived to enjoy the dignity for a few days, and died in London on 17th of May 1886, and as he left no issue the title became extinct.

FARNBOROUGH, an urban district in the Basingstoke parliamentary division of Hampshire, England, 33 m.s.w. by W. from London, on the London & South Western and the South Eastern & Chatham railways. Pop. (1901) 11,500 (including 5070 military). The church of St Peter ranges from Early English to Perpendicular in style. St Michael's Catholic memorial church, erected in 1887 by the ex-empress Eugénie, contains the remains of Napoleon III. and the prince imperial. An adjoining abbey is occupied by Benedictine fathers of the French congregation; the convent is a ladies' boarding-school. Aldershot North Camp is within the parish.

FARNE ISLANDS [also FEARNE, FERN, or THE STAPLES], a group of rocky islands and reefs off the coast of Northumberland, England, included in that county. In 1601 they had only eleven inhabitants. They extend in a line of some 6 m. in a north-easterly direction from the coast, on which the nearest villages are Bamborough and North Sunderland. The Fairway, 14 m. across, separates the largest island, Farne, or House, from the mainland. Farne is 16 acres in area, and has precipitous cliffs up to 50 ft. in height on the east, but the shore is otherwise low. The other principal islets are Staple, Brownsmain, North and South Wamseys, Longstone and Big Harcar. On Farne is a small ancient chapel, with a square tower near it built for purposes of defence in the 15th century. The chapel is believed to occupy the site of St Cuthbert's hermitage, whither he retired from the priory on the neighbouring Holy Island or Lindisfarne. He was with difficulty persuaded to leave it on his elevation to the bishopric of Lindisfarne, and returned to it to die (687). Longstone rock, with its lighthouse, is famous as the scene of the bravery of Grace Darling in rescuing some of the survivors of the wreck of the "Forfarshire." The rocks abound in sea-birds, including eider duck.

FARNSE, the name of one of the most illustrious and powerful Italian families, which besides including eminent prelates, statesmen and warriors among its members, ruled the duchy of Parma for two centuries. The early history of the family is involved in obscurity, but they are first heard of as lords of Farneto or Farnese, a castle near the lake of Bolsena, and they played an important part as consuls and signori of Orvieto. They seem to have always been Guelphs, and in the civil broils of Orvieto they sided with the Montalteschi faction against the Ghibelline Filippeschi. One Pietro Farnese commanded the papal armies under Paschal II. (1099-1118); another Pietro led the Florentines to victory against the Pisans in 1363. Ranuccio Farnese served Eugene IV. so well that the pope endowed him with large fiefs, and is reported to have said, "The Church is ours because Farnese has given it back to us."

The family derived further advantages at the time of Pope Alexander VI., who was the lover of the beautiful Giulia Farnese, known as Giulia Bella, and created her brother Alessandro a cardinal (1493). The latter was elected pope as Paul III. in 1534, and it is from that moment that the great importance of the family dates. An unblushing nepotist, he alienated immense fiefs belonging to the Holy See in favour of his natural children. Of these the most famous was Pierluigi Farnese (1503-1547), who served in the papal army in various campaigns, but also took part in the sack of Rome in 1527. On his father's elevation to the papacy he was made captain-general of the Church, and received the duchy of Castro in the Maremma, besides Frascati, Nepi, Montalto and other fiefs. A shameless rake and a man of uncontrollable temper, his massacre of the people of Perugia after a rebellion in 1540 and the unspeakable outrage he committed on the bishop of Fano are typical of his character. In 1545 his father conferred on him the duchy of Parma and Piacenza, which likewise belonged to the Holy See, and his rule proved cruel and tyrannical. He deprived the nobles of their privileges, and forced them to dwell in the towns, but to some extent he improved the conditions of the lower classes. Pierluigi being an uncompromising opponent of the emperor Charles V., Duke Ferdinand of Bourbon, the imperial governor of Milan, was ever on the watch for a pretext to deprive him of Piacenza, which the emperor greatly coveted. When the duke proceeded to build a castle in that town in order to overawe its inhabitants, the nobles were furiously indignant, and a plot to murder him was organized by the marquis Anguissola and others with the support both of Gonzaga and of Andrea Doria (q.v.), Charles's admiral, who wished to be revenged on Pierluigi for the part he had played in the Fiesco conspiracy (see Fiesco). The deed was done while the duke was superintending the building of the above-mentioned citadel, and his corpse was flung into the street (Nov. 20th, 1547). Piacenza was thereupon occupied by the imperialists.

Pierluigi had several children, for all of whom Paul made generous provision. One of them, Alessandro (1540-1589), was created cardinal at the age of fourteen; he was a man of learning and artistic tastes, and lived with great splendour surrounded by scholars and artists, among whom were Annibal Caro, Paolo Giovio, Mons. Della Casa, Becari, Basari, &c. It was he who completed the magnificent Farnese palace in Rome. He displayed diplomatic ability on various missions to foreign courts, but failed to get elected to the papacy.

Orazio, Pierluigi's third son, was made duke of Castro when his father became duke of Parma, and married Diane, a natural daughter of Henry II. of France. Ottavio, the second son (1521-1586), married Margaret, the natural daughter of Charles V. and widow of Alessandro de' Medici, at the age of fifteen, she being a year older; at first she disliked her youthful bridegroom, but when he returned wounded from the expedition to Algiers in 1541 her aversion was turned to affection (see Margaret of Austria). Ottavio had been made lord of Camerino in 1540, but he gave up that fief when his father became duke of Parma. New permission to murder the latter in 1547, Piacenza was occupied by the imperialists, Paul determined to make an effort to regain the city; he set aside Ottavio's claims to the succession of Parma, where he appointed a papal legate, giving him back Camerino in exchange, and then claimed Piacenza of the emperor, not for the Farnesi, but for the Church. But Ottavio would not be put off; he attempted to seize Parma by force, and having failed, entered into negotiations with Gonzaga. This unnatural rebellion on the part of one grandson, combined with the fact that it was supported by the other grandson, Cardinal Alessandro, hastened the pope's death, which occurred on the 10th of November 1549. During the interregnum that followed Ottavio
again tried to induce the governor of Parma to give up the city to him, but met with no better success; however, on the election of Giovanna Maria Ciochi (Julius III.) the duchy was conferred on him (1531). This did not end his quarrel with the emperor, for Gonzaga refused to give up Piacenza and even threatened to occupy Parma, so that Ontario was driven into the arms of France. Julius, who was anxious to be on good terms with Charles on account of the council of Trent which was then sitting, ordered Farnese to hand Parma over to the papal authorities once more, and on his refusal hurled censures and admonitions at his head, and deprived him of his Roman fiefs, while Charles did the same with regard to those in Lombardy. A French army came to protect Parma, war broke out, and Gonzaga at once laid siege to the city. But the duke came to an arrangement with his father-in-law, by which he regained Piacenza and his other fiefs. The rest of his life was spent quietly at home, where the moderation and wisdom of his rule won for him the affection of his people. At his death in 1586 he was succeeded by his son Alessandro Farnese (1545–1592), the famous general of Philip II. of Spain, who spent the whole of his reign in the Flemish wars.

The first years of the reign of his son and successor Ranuccio I. (1569–1622), who had shown much spirit in a controversy with Pope Sixtus V., were uneventful, but in 1611 a conspiracy was formed against him by a group of discontented nobles supported by the dukedoms of Modena and Mantua. The plot was discovered and the conspirators were barbarously punished, many being beheaded. After Ranuccio's death, his son Ranuccio was a reserved and gloomy bigot; he instituted savage persecutions against supposed witches and heretics, and lived in perpetual terror of plots. His eldest son Alessandro being dead and dumb, the succession devolved on his second son Odoardo (1612–1646), who fought on the French side in the war against Spain. His failure to pay the interest of the money borrowed in Rome, and the desire of Urban VIII. to obtain Castro for his relatives the Barberini (q.v.), resulted in a war between that pope and Odoardo. His son and successor Ranuccio II. (1647–1706), also had a war with the Holy See about Castro, which was eventually razed to the ground. His son Francesco Maria (1678–1729) suffered from the wars between Spain and Austria, the latter's troops devastating his territory; but although this obliged him to levy some burdensome taxes, he was a good ruler and practised economy in his administration. Having no children, the succession devolved at his death on his brother Antonio (1679–1731), who was also childless. The powers had agreed that at the death of the latter the duchy should pass to Don Carlos of Bourbon, son of King Philip V. of Spain by Elisabetta Farnese (1692–1760), granddaughter of Francesco Maria, who died in 1731, and with him the line of Farnese came to an end.

The Palazzo Farnese in Rome, one of the finest specimens of Roman Renaissance architecture, was begun under Paul III., while he was cardinal, by Antonio da San Gallo, and completed by his nephew Cardinal Alessandro under the direction of Michelangelo (1556). It was inherited by Don Carlos, afterwards king of Naples and Spain, and most of the pictures were removed to Naples. It now contains the French embassy to the Italian court, as well as the French school of Rome.

Re Mattioli gives a detailed history of the family in P. Litta's Famiglia celebri italiane, vol. x. (Milan, 1868), to which an elaborate bibliography is appended, including manuscript sources; a more recent bibliography is S. Lottici and G. Sitti, Bibliografia generale per la storia parmense (Parma, 1904); much information will be found in A. von Reumont's Geschichte der Stadt Rom, vol. iii. (Berlin, 1868), and in F. Gregorovius's Geschichte der Stadt Rom (Stuttgart, 1872).

FARNESI, ALEXANDER (1545–1592), duke of Parma, general, statesman and diplomatist, governor-general of the Netherlands under Philip II. of Spain, was born at Rome on the 27th of August 1545, and died at the abbey of St Waast, near Arras, on the 3rd of December 1592. He was the son of Ottavio Farnese, duke of Parma, and Margaret of Austria, natural daughter of Charles V. He accompanied his mother to Brussels when she was appointed governor of the Netherlands, and in 1565 his marriage with the princess Maria of Portugal was celebrated in Brussels with great splendour. Alexander Farnese had been brought up in Spain with his cousin, the ill-fated Don Carlos, and his uncle Don John of Austria, both of whom were about the same age as himself, and after his marriage he took up his residence at the court of Madrid. He fought with much personal distinction under the command of Don John in 1571 at the battle of Lepanto. It was seven years, however, before he had again an opportunity for the display of his great military talents. In the meantime the provinces of the Netherlands had revolted against the arbitrary and oppressive Spanish rule, and Don John of Austria, who had been sent as governor-general to restore order, had found himself helpless in face of the superior talent and personal influence of the prince of Orange, who had succeeded in uniting all the provinces in common resistance to the civil and foreign tyranny of Philip. In the autumn of 1577 Farnese was sent to join Don John at the head of reinforcements, and it was mainly his prompt decision at a critical moment that won the battle of Gemblours (1578). Shortly afterwards Don John, whose health had broken down through disappointment and ill-health, died, and Farnese was appointed to take his place.

It is scarcely possible to exaggerate the difficulties with which he found himself confronted, but he proved himself more than equal to the task. In military ability the prince of Parma was inferior to none of his contemporaries, as a skillful diplomatist he outshone all, and as a ruler he was quiet and capable, and, like most of the leading statesmen of his day, was scrupulous as to the means he employed so long as he achieved his ends. Perceiving that there were divisions and jealousies in the ranks of his opponents between Catholic and Protestant, Fleming and Walloon, he set to work by persuasion, address and bribery, to foment the growing discord, and bring back the Walloon provinces to the allegiance of the king. He was successful, and by the treaty of Arras, January 1579, he was able to secure the support of the "Malcontents," as the Catholic nobles of the south were styled, in the royal cause. The reply to the treaty of Arras was the Union of Utrecht, concluded a few weeks later between the seven northern provinces, who abjured the sovereignty of King Philip and bound themselves to use all their resources to maintain their independence of Spanish rule.

Farnese, as soon as he had obtained a secure basis of operations in Hainaut and Artois, set himself in earnest to the task of reconquering Brabant and Flanders by force of arms. Town after town fell into his power. Tournai, Maastricht, Breda, Bruges and Ghent opened their gates, and finally he laid siege to the great seaport of Antwerp. The town was open to the sea; the south was styled, the royal cause. The reply to the treaty of Arras was the Union of Utrecht, concluded a few weeks later between the seven northern provinces, who abjured the sovereignty of King Philip and bound themselves to use all their resources to maintain their independence of Spanish rule. of the Northern Provinces. Never was there a better opportunity than the end of 1586 for an invading army to march through the country almost without opposition. The misgovernment and lack of high statesmanship of the earl of Leicester had caused faction to be rampant in the United Provinces; and on his return to England he left the country without organized forces or experienced generals to oppose an advance of a veteran army under the greatest commander of his time. But Philip's whole thoughts and energies were already directed to the preparation of an Invincible Armada for the conquest of England, and Parma was ordered to collect an enormous flotilla of transports and to keep his army concentrated and trained for the projected invasion of the island realm of Queen Elizabeth. This fleet was scattered and dispersed by unforeseen storms, and had finally dispersed the defeated remnants of the Great Armada the Dutch had found a general, in the youthful Maurice of Nassau, worthy to be the rival in military genius even of Alexander of Parma. Moreover, the accession to the throne of France of Henry of Navarre had altogether altered the situation of affairs, and relieved the pressure upon the Dutch by creating a diversion, and placing Parma and his army between hostile forces. The ruinous expenditure upon the Great Armada had also depleted the Spanish treasury and Philip found himself virtually bankrupt. In 1590 the Abdullahion of the Spanish troops had become intolerable. Farnese could get no regular supplies of money from the king for the payment of the soldiery, and he had to pledge his own jewels to meet the demand. A mutiny broke out, but was suppressed. In the midst of these difficulties Parma received orders to abandon the task on which he had spent himself for so many years, and to raise the siege of Paris, which was blockaded by Henry IV. He left the Netherlands on the 3rd of August 1590 at the head of 15,000 troops. By brilliant generalship he outwitted Henry and succeeded in relieving Paris; but owing to lack of money and supplies he was compelled immediately to retreat to the Netherlands, abandoning the scattered remnants of the soldiery and wounded, who were killed by the peasantry, and leaving all the positions he had taken to be recaptured by Henry.

Again in 1591, in the very midst of a campaign against Maurice of Nassau, sorely against his will, the duke of Parma was obliged to give up the engrossing struggle and march to relieve Rouen. He was again successful in his object, but was wounded in the arm before Caudebec, and was finally compelled to withdraw his army with considerable losses through the privations the troops had to undergo. He himself was shattered in health by so many years of continuous campaigning and marching, and by the cares and disappointments which had befallen him. He died at Arras on the 3rd of December 1592, in the forty-seventh year of his age. The feeling that his immense services had not won for him either the gratitude or confidence of his sovereign hastened his end. He was honoured by a splendid funeral at Brussels, but his body was interred at his own capital city of Parma. He left two sons, Ranucio, who succeeded him, and Edward, who was created a cardinal in 1591 by Pope Gregory XIV. His daughter Margaret married Vincent, duke of Mantua.

See L. P. Gachard, Correspondance d'Alexandre Farnese, Prince de Parme, par l'intermédiaire de son fils Philippe II, 1575-1579 (Brussels, 1850); Fra Pietro, Alessandro Farnese, duca di Parma (Rome, 1836).

FARNSE—ELIZABETH (1562–1576), queen of Spain, born on the 25th of October 1562, was the only daughter of Odoardo II., prince of Parma. Her mother educated her in strict seclusion, but seclusion altogether failed to tame her imperious and ambitious temper. At the age of twenty-one (1714) she was married by proxy at Parma to Philip V. of Spain. The marriage was arranged by Cardinal Alberoni (q.v.), with the concurrence of the Princess des Ursins, the Cámara Mayor. On arriving at the borders of Spain, Elizabeth was met by the Princess des Ursins, but received her sternly, and, perhaps in accordance with a plan previously concerted with the king, at once ordered her to be removed from her presence and from Spain. Over the weak king Elizabeth quickly obtained complete influence. This influence was exerted altogether in support of the policy of Alberoni, one chief aim of which was to recover the ancient Italian possessions of Spain, and which actually resulted in the seizure of Sardinia and Sicily. So vigorously did she enter into this policy that, when the French forces advanced to the Pyrenees, she placed herself at the head of one division of the Spanish army. But Elizabeth's ambition was grievously disappointed. The Triple Alliance thwarted her plans, and at length in 1720 the allies made the banishment of Alberoni a condition of peace. Sicily also had to be evacuated. And finally, all her entreaties failed to prevent the abdication of Philip, who in 1724 gave up the throne to his heir, and retired to the palace of La Granja. This event caused the cardinal's death. However, at the death of the young king recalled him to the throne. During his later years, when he was nearly imbecile, she directed the whole policy of Spain so as to secure thrones in Italy for her sons. In 1726 she had the satisfaction of seeing her favourite scheme realized in the accession of her son Don Carlos (afterwards Charles III. of Spain) to the throne of the Two Sicilies and his recognition by the powers in the treaty of Vienna. Her second son, Philip, became duke of Parma. Elizabeth survived her husband twenty years, dying in 1746.

See Mémoires pour servir à l'histoire d'Espagne sous le règne de Philippe V, by the Marquis de St Philippe, translated by Maudave (London, 1796); Memoirs of Elizabeth Farnese (London, 1746) by E. Armstrong, Elizabeth Farnese, the Tergamant of Spain (1892).

FARHAM, a market town in the Guildford parliamentary division of Surrey, England, 37½ m. S.W. by W. from London by the London & South Western railway. Pop. of urban district (1901) 6124. It lies on the left bank of the river Wey, on the southern slope of a hill rising about 700 ft. above the sea-level. The church of St Andrew is a spacious transitional Norman and Early English building, with later additions, and was formerly a chapel of ease to Waverley Abbey, of which a crypt and fragmentary remains, of Early English date, stand in the park attached to a modern residence of the same name. This was the earliest Cistercian house in England, founded in 1128 by William Gifford, bishop of Winchester. The Annales Waveriensis, published by Gale in his Scriptores and afterwards in the Record series of Chronicles, are believed to have suggested to Sir Walter Scott the name of his first novel. Farnham Castle, on a hill north of the town, the seat of the bishops of Winchester, was first built by Henry de Blois, bishop of Winchester, and brother of King Stephen; but it was razed by Henry III. It was rebuilt and garrisoned for Charles I. by Denham, from 1643 to 1646, in 1645 by Sir W. Waller; and having been dismantled, it was restored by George Morley, bishop of Winchester (1662–1684). Farnham has a town hall and exchange in Italian style (1866), a grammar school of early foundation, and a school of science and art. It was formerly noted for its cloth manufacture. Hops of fine quality are grown in the vicinity. William Cobbett was born in the parish (1760), and is buried in the churchyard of St Andrew's. The neighbouring mansion of Moor Park was the residence of Sir William Temple (d. 1699), and Swift worked here as his secretary. Hester Thrale, Swift's " Stella," was the daughter of Temple's steward, whose cottage still stands. The town has a great favourite as a residential centre from the proximity of Aldershot Camp (5 m. N.E.).

Though there is evidence of an early settlement in the neighbourhood, the town of Farnham (Ferneham) seems to have grown up round the castle of the bishops of Winchester, who possessed the manor at the Domesday Survey. Its position at the junction of the Pilgrim's Way and the road from Southampton to London was important. In 1205 Farnham had bailliage, and in 1207 it was definitely a mese borough under the bishops of Winchester. In 1245 the bishop granted the first charter, giving among other privileges, a fair on All Saints' Day. The burgesses surrendered the proceeds of the borough court and other rights in 1365 in return for respite of the fee farm rent; these were recovered in 1405 and rent again paid. Bishop Waynflete is said to have confirmed the original charter in 1452, and in 1566 Bishop Horne
granted a new charter by which the burgesses elected 2 bailiffs and 12 burgesses annually and did service at their own courts every three weeks, the court leet being held twice a year. In resisting an attack made by the bishop in 1600 on their right of toll, the burgesses could only claim Farnham as a borough by prescription as their charters had been mislaid, but the charters were subsequently found, and after some litigation their rights were established. In the 18th century the corporation, a close body, declined, its duties being performed by the vestry, and in 1789 the one survivor resigned and handed over the town papers to the bishop. Farnham sent representatives to parliament in the 13th and 14th centuries, on both occasions being practically the bishop’s pocket borough. In accordance with the grant of 1247 a fair was held on All Saints’ day and also on Holy Thursday; the former was afterwards held on All Souls’ Day. Farnham was early a market of importance, and in 1216 a royal grant changed the market day from Sunday to Thursday in each week. It was famous in the early 17th century for wheat and oats; hop-growing began in 1597.

**Farnworth**, an urban district in the Radcliffe-cum-Farnworth parliamentary division of Lancashire, England, on the S. bank of the River Irwell, is 6 miles N.W. of Bolton and 8 miles N.E. of Manchester. Pop. (1901) 25,925. Cotton mills, iron foundries, brick and tile works, and collieries employ the large industrial population.

**Faro**, the capital of a district bearing the same name, in southern Portugal; at the terminus of the Lisbon-Faro railway, and on the Atlantic Ocean. Pop. (1900) 11,789. Faro is an episcopal see, with a Renaissance cathedral of great size, an ecclesiastical seminary, and a ruined castle surrounded by Moorish fortifications. Its broad but shallow harbour is protected on the south by the long island of Cais, and a number of sandy islets, which, being constantly enlarged by silt from the small river Fornoço, render the entrance of large vessels impossible. Fishing is an important industry, and fish, with wine, fruit, cork, baskets and sumach, are the principal articles of export. Little has been done to develop the mineral resources of the district, which include tin, lead, antimony and auriferous quartz. Faro was taken from the Moors by Alphonso III. of Portugal (1248-1279). It was sacked by the English in 1596, and nearly destroyed by an earthquake in 1755.

The administrative district of Faro coincides with the ancient kingdom and province of Algarve (q.v.); pop. (1900) 255,191; area, 1,937 sq. m.

**Faro** (from Pharaoh, a picture of the Egyptian king appearing on a card of the old French pack), a game of cards, played with a full pack. Originally the pack was held in the dealer’s left hand, but nowadays very elaborate and expensive implements are used. The dealer places the pack, after shuffling and cutting, in a dealing-box face upwards, and the cards are taken from the top of the box in couples through a slit in the side. The exposed card on top is called *soda*, and the last card left in the box is in *hoc*. The implements include counters of various colours and values, a dealing-box, a case or frame manipulated by a “case-keeper,” upon which the cards already played are arranged in sight, a shuffling-board, and score-sheets for the players. Upon the table is the “lay-out,” a complete suit of spades enamelled on green cloth, upon or near which to place the stakes. The dealer takes two cards from the box, placing the first one near it and the second close beside it. Each deal of two cards is called a *turn*, and there are twenty-five such, *soda* and *hoc* not counting. The players stake upon any card they please, or in such manner as to take in several cards, reducing the amount, but increasing the chances of winning, as at roulette. The dealer, having waved the hand, after which no more bets may be made, deals the turn, and then proceeds to gather in the stakes won by him, and to pay those he has lost. The chances as between dealer and punters, or players, are equal, except that the banker wins half the money staked on the cards of a turn should they chance to be alike. Faro is played considerably in parts of the United States, whither it is said to have been taken from France, where it had a great vogue during the reign of Louis XIV. Owing to the dishonest methods of many gambling “clubs” the game is in disrepute.

**Farquhar, George** (1677-1707), British dramatist, son of William Farquhar, a clergyman, was born in Londonderry, Ireland, in 1677. When he was seventeen he was entered as a sizar at Trinity College, Dublin, under the patronage of Dr Wiseman, bishop of Dromore. He did not long continue his studies, being, according to one account, expelled for a profane joke. Thomas Wilkes, however, states that the abrupt termination of his studies was due to the death of his patron. He became an actor on the Dublin stage, but in a few scenes in Dryden’s *Indian Emperor* he forgot to exchange his sword for a thong with results which narrowly escaped being fatal to a fellow-actor. After this accident he never appeared on the boards. He had met Robert Wilks, the famous comedian, in Dublin. Though he did not, as generally stated, go to London with Wilks, it was at his suggestion that he wrote his first play, *Love and a Bottle*, which was performed at Drury Lane, perhaps through Wilks’s interest, in 1698. He received from the earl of Orrery a lieutenant in his regiment, then in Ireland, but in two letters of his dated from Holland in 1700 he says nothing of military service.

The plays of Farquhar: *The Constant Couple*; or *A Trip to the Jubilee* (1699), ridiculing the preparations for the pilgrimage to Rome in the Jubilee year, met with an enthusiastic reception. Wilks as Sir Harry Wildair contributed substantially to its success. In 1701 Farquhar wrote a sequel, *Sir Harry Wildair*. Leigh Hunt says that Mrs Oldfield, like Wilks, played admirably well in it, but the original Lady Lurewell was Mrs Verbruggen. Mrs Oldfield is said to have been the "Penelope" of Farquhar’s letters. In 1702 Farquhar published a slight volume of miscellaneous—*Love and Business*; in a Collection of Occasional Verse and Epistolary Prose—containing, among other things, *A Discourse on Comedy in reference to the English Stage,* in which he defends the English neglect of the dramatic unities. *"The rules of English comedy,"* he says, "do not lie in the compass of Aristotle or his followers, but in the pit, box and galleries."

In 1702 he borrowed from Fletcher’s *Wild Goose Chase, The Inconstant, or the Way to win Him*, in which he followed his original fairly closely except in the last act. In 1703 he married, in the expectation of a fortune, but found too late that he was deceived. It is said that he never reproached his wife, although the marriage increased his liabilities and the rest of his life was a constant struggle against poverty. His other plays are: *The Stage Coach* (1704), a one-act farce adapted from the French of Jean-Francois Motteux; *The Twin Rivals* (Drury Lane, 1703); *The Recruiting Officer* (Drury Lane, 1706); and *The Beaux’ Stratagem* (Haymarket, 1707). The Recruiting Officer was suggested to him by a recruiting expedition (1705) in Shropshire, and is dedicated to his "friends round the Wrekin." The Beaux’ Stratagem is the best of all his plays, and long kept the stage. Genest notes nineteen revivals up to 1782. Two embarrassed gentlemen travel in the country disguised as master and servant in the hope of mending their fortune. The play gives vivid pictures of the Lichfield inn with its rascally landlord, and of the domestic affairs of the Sullens, Archer, the supposed valet, whose adventurous spirit secures full play, was one of Garrick’s best parts.

Meanwhile one of his patrons, said to have been the duke of Ormond, had advised Farquhar to sell out of his regiment, and had promised to give him a captaincy in his own. Farquhar sold his commission, but the duke’s promise remained unfulfilled. Before he had finished the second act of The Beaux’ Stratagem he knew that he was stricken with a mortal illness, but it was necessary to persevere and to be "consumedly lively to the end." He had received in advance 350 for the copyright from Linot the bookseller. The play was staged on the 5th of March, and Farquhar lived to have his third night, and there was an extra benefit on the 29th of April, the day of his death. He left two children to the care of his friend Wilks. Wilks obtained a benefit at the theatre for the dramatist’s widow, but he seems to have done little for the children. They were apprenticed to a mantua-maker, and one of them was, as late as 1764, in
FARR—FARRAGUT

receipt of a pension of $20 solicited for her by Edmund Chaloner, a patron of Farquhar. She was then described as a maidservant and possessed of sentiments "fitted to her humble situation.

The plots of Farquhar's comedies are ingenious in conception and skilfully conducted. He has no pretensions to the brilliance of Congreve, but his amusing dialogue arises naturally out of the situation, and its wit is never strained. Sergeant Kite in The Recruiting Officer, Scrub, Archer and Boniface in The Beaux' Stratagem are distinct, original characters which had a great success on the boards, and the unexpected incidents and adventures in which they are mixed up are represented in an irresistibly comic manner by a man who thoroughly understood the resources of the stage. Many of the parts of these plays in which his adventurous heroes are drawn have suggested that in his favourite type he was describing himself. His own disposition seems to have been most lovable, and he was apparently a much gayer person than the reader might be led to suppose from the "Portrait of Himself" quoted by Leigh Hunt. The code of morals followed by these characters is open to criticism, but they are human and genial in their roguery, and compare far from unfavourably with the cynical creations of contemporary drama. The advance which he made on his immediate predecessors in dramatic construction and in general moral tone is more striking when it is remembered that he died before he was thirty.

Farquhar's dramatic works were published in 1728, 1742 and 1772, and by Thomas Wilson with a biographical account in 1775. They were included in the Dramatic Works of Wycherley, Congreve, Vanbrugh and Farquhar (1849), with biographical and critical notices, by Leigh Hunt. See also The Dramatic Works of George Farquhar, with Life and Notes, by A.C. Earle (2 vols, 1893); The Best Plays of George Farquhar (Mermaid series, 1906), with biographical and critical introductions, by William Archer; The Beaux' Stratagem, edited (1898) by H. Macaulay Fitzgibbon for "The Temple Dramatists"; and D. Schmidt, "George Farquhar, sein Leben und seine Original-Dramen" (1904) in Wiener Beiträge zur engl. Philol.

FARR, WILLIAM (1807-1858), English statistician, was born at Kenley, in Shropshire, on the 26th of November 1807. When nineteen he became the pupil of a doctor in Shrewsbury, also acting as dresser in the infirmary there. He then went to Paris to study medicine, but after two years returned to London, where, in 1832, he qualified as L.S.A. Next year he began to practise, but without very brilliant results, for five years later he definitely abandoned the exercise of his profession on accepting the post of compiler of abstracts in the registrar-general's office. The commissioners for the 1841 census consulted him on several points, but did not in every case follow his advice. For the next two decennial censuses he acted as assistant-commissioner; for that of 1851 he was commissioner, and he was the greater part of the reports of all. He had an ambition to become registrar-general; and when that post became vacant in 1870, he was so disappointed at the selection of Sir Brydges Henniker instead of himself, that he refused to stay any longer in the registrar's office. He died of paralysis of the brain a year or two later, on the 14th of April 1883. A great part of Farr's literary production is to be found in the papers which, from 1839 to 1850, he wrote for each annual report of the registrar-general on the cause of the year's deaths in England. He was also the author of many papers on general statistics and on life-tables for insurance, some read before the Royal Statistical Society, of which he was president in 1871 and 1872, some contributed to the Lancer and other periodicals. A selection from his statistical writings was published in 1885 under the editorship of Mr Noël Humphreys.

FARRAGUT, DAVID GLASGOW (1801-1870), first admiral of the United States navy, was the son of Major George Farragut, a Catalan by descent, a Minorquin by birth, who had emigrated to America in 1776, and, after the peace, had married a lady of Scottish family and settled near Knoxville, in Tennessee; there Farragut was born on the 28th of March 1814. He afterwards served on board the Washington (74) carrying the broad pennant of Commodore Chauncey in the Mediterranean, and pursued his professional and other studies under the instruction of the chaplain, Charles Folsom, with whom he contracted a lifelong friendship. Folsom was appointed from the "Washington" as U.S. consul at Tunis, and obtained leave for his pupil to pay him a lengthened visit, during which he studied not only mathematics, but also French and Italian, and acquired a familiar knowledge of Arabic and Turkish. He is said to have had a great natural aptitude for languages and in after years to have spoken several fluently.

After more than four years in the Mediterranean, Farragut returned to the States in November 1820. He then passed his summer on board of the frigate "Congress", which he had assumed command of. In 1822 he was appointed to the "United States", a frigate, and was ordered to the coast of Brazil, and was again appointed to the yard at Norfolk.

It is needless to trace the ordinary routine of his service step by step. The officers of the U.S. navy have one great advantage which British officers are without; when on shore they are not necessarily parted from the service, but are employed in their several ranks in the different dockyards, escaping thus not only the private grievance and pecuniary difficulties of a very narrow half-pay, but also, what from a public point of view is much more important, the loss of professional aptitude, and of that skill which comes from unceasing practice. On the 8th of September 1841 Farragut was appointed to the rank of commander, and held his commission as such till September 1855 to that of captain.* At this time he was in charge of the navy yard, Mare Island, California, from which post he was recalled in 1858, and appointed to the "Brooklyn" frigate, the command of which he held for the next two years. When the war of secession broke out in 1861, he was "waiting orders" at Norfolk. By birth and marriage he was a Southerner, and the citizens of Norfolk counted on his throwing in his lot with them; but professional pride, and affection for the flag under which he had served for more than fifty years, held him true to his allegiance; he passionately rejected the proposals of the Confederate States, and as it was more than hinted that his longer stay in Norfolk might be dangerous, he hastily quitted that place, and offered his services to the government at Washington. These were at once accepted; he was requested to sit on the Naval Retiring Board—a board then specially constituted for clearing the navy of unfit or disloyal officers—and a few months later was appointed to the command of the "Western Gulf Blockading Squadron," with the rank of flag-officer, and ordered to proceed forthwith, in the "Hartford," to the Gulf of Mexico, to collect such vessels as could be spared from the blockade, to pressed up the coast, and to co-operate in the defences which guarded the approaches to New Orleans, and to take and hold the city. All this Farragut executed to the letter, with a skill and caution that won for him the love of his followers, and with a dash and boldness that gained him the admiration of the public and the popular name of "Old Salamander." The passage of the Mississippi was forced on the 24th of April 1862, and New Orleans surrendered on the 29th; this was immediately followed by the operations against Vicksburg, from which, however, Farragut was compelled to withdraw, having learnt the old lesson that against heavy earthworks, crowning hills, sufficient height, a purely naval attack is unavailing; it was not till the following summer, and after a long siege, that Vicksburg surrendered to a land force under General Grant. During this time the service on the Mississippi continued both difficult and irksome; nor until the river was cleared could
FARRANT—FARREN, ELIZABETH

Farragut seriously plan operations against Mobile, a port to which the fall of New Orleans had given increased importance. Even then he was long delayed by the want of monitors with which to oppose the ironclad vessels of the enemy. It was the end of July 1864 before he was joined by these monitors; and on the 5th of August, undismayed by the loss of his leading ship, the monitor "Tecumseh," sunk by a torpedo, he forced the passage into the bay, destroyed or captured the enemy's ships, including the ram "Tennessee" bearing Admiral Buchanan's flag, and took possession of the forts. The town was not occupied till the following April; but with the loss of its harbour it ceased to have any political or strategical importance.

With this Farragut's active service came to an end; for though in September 1864 he was offered the command of the force intended for the reduction of Wilmington, the state of his health, after the labours and anxieties of the past three years, in a trying climate, compelled him to decline it and to ask to be recalled. He accordingly returned to New York in December, and was received with the wildest display of popular enthusiasm. It was then that the Government instituted the rank of vice-admiral, previously unknown in the American service. Farragut was promoted to it in July, and in December 1864 he was further raised to the rank of admiral. In 1867, with his flag flying in the "Franklin," he visited Europe. The appointment was an honourable distinction without political or naval import: the "Franklin" was, to all intents, for the time being, a yacht at Farragut's disposal; and her arrival in the different ports was the signal for international courtesies, entertainments and social gaiety. She returned to America in 1868, and Farragut retired into private life. Two years later, on the 14th of August 1870, he died at Portsmouth, New Hampshire.

Farragut was twice married, and left, by his second wife, a son, Loyall Farragut, who, in 1878, published a Life of his father "embodying his Journal and Letters." Another Life (1892), by Captain A. T. Mahan, though shorter, has a greater value from the professional point of view, by reason of the critical appraisal of Farragut's services.

FARRANT, RICHARD, composer of English church music, flourished during the 16th century. Very little is known about him. Félibes gives 1530 as the date of his birth, but on what authority does not appear. He became a gentleman of the Chapel Royal in the reign of Edward VI., but resigned his post in 1556 on being appointed master of the children of St George's chapel, Windsor. In his capacity he presented a play before the queen at Shrovetide 1568, and again at Christmas of the same year, receiving on each occasion the sum of £6: 13: 4d. In November 1569 he was reinstated as gentleman of the Chapel Royal. It is stated by Hawkins (History of Music, vol. iii. 279) that Farratt was also one of the clerks and organists of St George's chapel, Windsor, and that he retained these posts till his death. Many of his compositions are printed in the collections of Barnard and Boyce. Among the most admired of them are a service in G minor, and the anthems "Call to remembrance," and "Hid not thou thy face." It is doubtful whether Farratt is entitled to the credit of the authorship of the beautiful anthem "Lord, for thy tender mercies sake." No copy of the music under his name appeared in print till 1800, although it had been earlier attributed to him. Some writers have named John Hilton, and others Thomas Tallis, as the composer. From entries in the Old Check Book of the Chapel Royal (edited for the Camden Society by Dr Rimbaud) it appears that Farratt died, not in 1585, as Hawkins states, but on the 30th of November 1580 or 1581.

FREDERICK WILLIAM (1831-1903), English divine, was born on the 7th of August 1831, in the Fort of Bombay, where his father, afterwards vicar of Sidcup, Kent, was then a missionary. His early education was received in King William's College, Castletown, Isle of Man, a school whose external surroundings are reproduced in his historical schoolboy tale, Eriç; or, Little by Little. In 1847 he entered King's College, London. Through the influence of F. D. Maurice he was led to the study of Coleridge, whose writings had a profound influence upon his faith and opinions. He proceeded to Trinity College, Cambridge, in October 1851, and in the following year took the degree of B.A. at the university of London. In 1854 he took his degree as fourth junior optime, and fourth in the first class of the classical tripos. In addition to other college prizes he gained the chancellor's medal for the English prize poem on the search for Sir John Franklin in 1852, the Le Bas prize and the Norrison prize. He was elected fellow of Trinity College in 1856.

On leaving the university Farrar became an assistant-master under G. E. L. Cotton at Marlborough College. In November 1855 he was appointed an assistant-master at Harrow, where he remained for fifteen years. He was elected a fellow of the Royal Society in 1864, university preacher in 1868, honorary chaplain to the queen in 1889 and Hulsean lecturer in 1870. In 1871 he was appointed headmaster of Marlborough College, and in the following year he became chaplain-in-ordinary to the queen.

In 1876 he was appointed canon of Westminster and rector of St Margaret's, Westminster. He took his D.D. degree in 1874, the first under the new regulations at Cambridge. Farrar began his literary labours with the publication of his schoolboy story Eric in 1858, succeeded in the following year by Julian Home and Lyrics of Life, and in 1862 by St Winifred's; or the World as Seen by a Child. From 1867 to 1878, he worked on The Origin of Language, and followed it up by a series of works on grammar and scholastic philology, including Chapters on Language (1865); Greek Grammar Rules (1865); Greek Syntax (1866); and Families of Speech (1866). He edited Essays on a Liberal Education in 1868; and published Seekers after God in the Sunday Library (1868). It was by his theological works, however, that Farrar attained his greatest popularity. His Hulsean lectures were published in 1870 under the title of The Witness of History to Christ. The Life of Christ, which was published in 1874, speedily passed through a great number of editions, and is still in much demand. It reveals considerable power of imagination and eloquence, and was partly inspired by a personal knowledge of the sacred localities depicted. In 1877 appeared In the Days of My Youth, sermons preached in the chapel of Marlborough College; and during the same year his volume of sermons on Eternal Hope—in which he called in question the dogma of everlasting punishment—caused much controversy in religious circles and did much to mollify the harsh theology of an earlier age. There is little doubt that his boldness and liberality of thought barred his elevation to the episcopate. Of these appeared Farrar's Only a Workman, which succeeded in 1882 by The Early Days of Christianity. Then came in order of publication the following works: Everyday Christian Life; or, Sermons by the Way (1885); Lives of the Fathers (1888); Sketches of Church History (1889); Darkness and Dawn, a story of the Neronian persecution (1891); The Voice from Sinai (1892); The Life of Christ as Represented in Art (1894); a work on Daniel (1895); Gathering Clouds, a tale of the days of Chrysostom (1896); and The Bible, Its Meaning and Supremacy (1896). Farrar was a copious contributor of articles to various magazines, encyclopaedias and theological commentaries. In 1883 he was made archdeacon of Westminster and rural dean; in 1885 he was appointed Bampton lecturer at Oxford, and took for his subject "The History of Interpretation." He was appointed dean of Canterbury in 1895. From 1890 to 1895 he was chaplain to the speaker of the House of Commons, and in 1894 he was appointed deputy-clerk of the closet to Queen Victoria. He died at Canterbury on the 22nd of March 1903.

As a theologian Farrar occupied a position midway between the Evangelical party and the Broad Church; while as a somewhat rhetorical preacher and writer he exerted a commanding influence over wide circles of readers. He was an ardent temperance and social reformer, and was one of the founders of the institution known as the Anglican Brotherhood, a religious band with modern aims and objects.

See his Life, by his son R. Farrar (1904).

FARRER, ELIZABETH (c. 1759-1829), English actress, was the daughter of George Farrar, an actor. Her first London appearance was in 1777 as Miss Hardcastle in She Stoops to Conquer. Subsequent successes established her reputation
and she became the natural successor to Mrs Abingdon when the latter left Drury Lane in 1782. The parts of Hermione, Olivia, Portia and Juliet were in her repertory, but her Lady Betty Modish, Lady Townly, Lady Fancifull, Lady Teazle and similar parts were her favourites. In 1797 she married Edward, 12th earl of Derby (1752-1834).

FARR, WILLIAM (1786-1861), English actor, was born on the 13th of May 1786, the son of an actor (b. 1725) of the same name, who played leading roles from 1784 to 1795 at Covent Garden. His first appearance on the stage was at Plymouth at the Theatre Royal, then under the management of his brother, in Love in a Village. But his first London appearance was in 1818 at Covent Garden as Sir Peter Teazle, a part with which his name is always associated. He played at Covent Garden every winter until 1828, and began in 1824 a series of summer engagements at the Haymarket which also lasted some years. At these two theatres he played an immense variety of comedy characters. From 1828 until 1837 he was at Drury Lane, where he essayed a wider range, including Polonius and Caesar. He was again at Covent Garden for a few years, and next joined Benjamin Webster at the Haymarket, as stage-manager as well as actor. In 1843 at the close of his performance of the title-part in Mark Ferrers, the Old Partizan, he retired, and strived in the secular line. He was, however, able to reappear the following year, and he remained at the Haymarket ten years more, though his acting never again reached its former level. For a time he managed the Strand, and, 1850-1853, was lessee of the Olympic. During his later years he confined himself to old men parts, in which he was unrivalled. In 1855 he made his final appearance at the Haymarket, as Lord Ogleby in a scene from the Clandestine Marriage. He died in London on the 24th of September 1861. In 1825 he married the actress Mrs Faunt, mother of Miss Helena Saville Faunt (Lady Martin), and he left two sons, Henry (1825-1869) and William (1825-1906), both actors. The former was the father of Ellen [Nellie] Farr (1848-1904), long famous for boy’s parts in Gaiety musical burlesques, in the days of Edward Terry and Fred Leslie. As Jack Sheppard, and in similar roles, she had a unique position at the Gaiety, and was an unrivalled public favourite. From 1892 her health failed, and her retirement, coupled with Fred Leslie’s death, brought to an end the type of Gaiety burlesque associated with them.

FARRER, THOMAS HENRY FARRER, 1st Baron (1815-1889), English civil servant and statistician, was the son of Thomas Farrer, a solicitor in Lincoln’s Inn Fields. Born in London on the 24th of June 1819, he was educated at Eton and Balliol College, Oxford, where he graduated in 1840. He was called to the bar at Lincoln’s Inn in 1844, but retired from practice in the course of a few years. He entered the public service in 1850 as secretary to the naval (renamed in 1853 the marine) department of the Board of Trade. In 1865 he was promoted to be one of the joint secretaries of the Board of Trade, and in 1867 became permanent secretary. His tenure of this office, which he held for upwards of twenty years, was marked by many reforms and an energetic administration. Not only was he an advanced Liberal in politics, but an uncompromising Free-trader of the strictest school. He was created a baronet for his services at the Board of Trade in 1883, and in 1886 he retired from office. During the same year he published a work entitled Free Trade versus Fair Trade, in which he dealt with an economic controversy then greatly agitating the public mind. He had already, in 1883, written a volume on The State in its Relation to Trade. In 1889 he was co-opted by the Progressives an alderman of the London County Council, of which he became vice-chairman in 1890. His efficiency and ability in this capacity were warmly recognized; but in the course of time divergencies arose between his personal views and those of many of his colleagues. The tendency towards socialism legislation which became apparent was quite at variance with his principles of individual enterprise and responsibility. He consequently resigned his position. In 1893 he was raised to the peerage. From this time forward he devoted much of his energy and leisure to advocating his views at the Cobden Club, the Political Economy Club, on the platform, and in the public press. Especially were his efforts directed against the opinions of the Fair Trade League, and upon this and other controversies on economic questions he wrote able, clear, and uncompromising letters, which left no doubt that he still adhered to the doctrines of free trade as advocated by its earliest exponents. In 1898 he published his Studies in Currency. He died at Abinger Hall, Dorking, on the 11th of October 1899. He was succeeded in the title by his eldest son Thomas Cecil (b. 1859).

FARRIER, and FARRIERY (from Lat. ferrarius, a blacksmith, ferrum, iron). Farrier is the name given generally either to a practitioner of veterinary art; to a practitioner of the veterinary art; and farriery is the term for his business. Primarily the art of farriery is identical with that of the blacksmith, in so far as he makes and fixes shoes on horses (see Horse-Shoes); he is liable in law for negligence, as one who holds himself out as skilled; and he has a lien on the animal for his expenses. William the Conqueror is supposed to have introduced horse-shoeing into England, and the art had an important place through the middle ages, the days of chivalry, and the later developments of equitation. In modern times it has been closely allied with the general progress in veterinary science; and in the knowledge of the anatomy and physiology of the horse’s foot and hoof.

See Fisher, The Farrier (1893); Langwitz, Text-Book of Horse-shoeing (Eng. trans., 1898).

FARS (the name Faristan is not used), one of the five mammal-like (great provinces) of Persia, extending along the northern shore of the Persian Gulf and bounded on the west by Arabistan, on the north by Isfahan and on the east by Kerman. It lies between 49° 30’ and 30° 15’ E. and 26° 30’ and 31° 45’ N. and has an area of nearly 60,000 sq. m. Fars is the same word as the Greek Persis, and, originally the name of only a part of the Persian empire (Iran), has become the name which Europeans have applied to the whole (see Persis). The province is popularly, but not for administrative purposes, divided according to climate into gersdir and sardstr, or the warm and cold regions. The former extends from the sea to the central chain of hills and contains all the lowlands and many mountainous districts, some of the latter rising to an elevation of between 3000 and 4000 ft. and the sardstr comprises the remaining and northern districts of the province.

In Arian’s relation of the voyage of Nearcush (India, 40), these two regions are well described. “The first part of Persia which lies along the Persian Gulf is hot, sandy and barren and only the date palm thrives there. The other part comprehends inner Persia lying northwards; it enjoys a pleasant climate and has fertile and well-watered plains, gardens with trees of all kinds, rich pasturages and forests abounding with game; with the exception of the olive all fruits are produced in profusion, particularly the vine. Horses and other draught animals are reared in the province, and there are several lakes frequented by water-fowl, and streams of clear water flow through it, for instance the Kyros (Kur) formed by the junction of the Medos and Araxes.”

The mountains of Fars may be considered as a continuation of the Zagros and run parallel to the shores of the Persian Gulf. They comprise several ranges which the roads from the sea to the interior have to cross at right angles, thereby rendering communication and transport very difficult. The highest of the mountains of Fars (14,000 ft.) is the Kuh Dina in the north-western part of the province. Of the rivers of Fars only three important ones flow into the sea: (1) the Mand (Arrian’s Sitakos), Kanganagh in its upper course; (2) the Shapur or Khisht river (Granie); (3) the Tab (Oroatis). Some rivers, notably the Kur (Kyros, Araxes) which flows into the Bakhtegan lake east of Shiraz, drain into inland depressions or lakes.

The capital of the province is Shiraz, and the subdivision in districts, the chief places of the districts and their estimated population, and the number of inhabited villages in each as they appear in lists dated 1884 and 1905 are shown on the following page.

* Are forming separate administrative division of "Persian Gulf Ports."

The above sixty districts are grouped into eighteen sub-provinces under governors appointed by the governor-general of Fars, but the towns of Bushire, Lingāh and Bander Abbāsī together with the villages in their immediate neighbourhood, form a separate government known as that of the "Persian Gulf Port" (Benādīr i Khalīj i Fārs), under a governor appointed from Tehran. The population of the province has been estimated at 750,000 and the yearly revenue it pays to the state amounts to about £150,000. Many districts are fertile, but some, particularly those in the south-eastern part of the province, do not produce sufficient grain for the requirements of the sparse population. In consequence of droughts, ravages of locusts and misgovernment by local governors the province has been much impoverished and hundreds of villages are in ruins and deserted. About a third of the population is composed of turbulent and lawless nomads who, when on the march between their winter and summer camping grounds, frequently render the roads insecure and occasionally plunder whole districts, leaving the inhabitants without means of subsistence.

The province produces much wheat, barley, rice, millet, cotton, but the authorities every now and then prohibiting the export of cereals, the people generally sow just as much as they think will suffice for their own wants. Much tobacco of excellent quality, principally for consumption in Persia, is also grown (especially in Fessā, Darāb and Jahrom) and a considerable quantity of opium, much of it for export to China, is produced. Salt, lime and gypsum are abundant. There are also some oil

* Persian census in 1884: 25,284 males, 28,323 females.
well at Daliki, near Bushire, but several attempts to tap the oil have been unsuccessful. There are no valuable oyster-banks in Persian waters, and all the Persian Gulf pearls are obtained from banks on the coast of Arabia and near Bahrain. 186 (A. H. S.)

FARTHING (A.S. forotha, fourth, +ing, diminutive), the smallest English coin, equal to the fourth of a penny. It became a regular part of the coinage from the reign of Edward I., and was, up to the reign of Mary, a silver coin. No farthing was struck in the reign of Elizabeth, but a silver three-farthings piece was issued in that reign, with a profile bust of the queen crowned, with a rose behind her head, and inscribed " E.D.G. Rosa sinea spina." The copper farthing was first introduced in the reign of James I., a patent being given to Lord Harrington of Exton in 1608 for the issue of copper tokens of this denomination. It was nominally of six grains' weight, but was usually heavier. Properly, however, the copper farthing dates from the reign of Charles II., in whose reign also was issued a tin farthing, with a small copper plug in the centre, and an inscription on the edge, " Nummorum famulus 1684." No farthings were actually issued in the reign of Queen Anne, though a number of patterns were prepared (see NUMISMATICS: medieval section, England). In 1806 the copper farthing was superseded by one struck in bronze. In 1842 a proclamation was issued giving currency to half-farthings, and there were several issues, but they were demonetized in 1869. In 1897 the practice was adopted of darkening farthings before issue, to prevent their being mistaken for half-sovereigns.

FARTHINGALE (from the O. Fr. verdagalle, or vertegalle, a corruption of the Spanish name of the article, verdagado, from verdagio, a rod or stick), a case or hoop, originally of bent rods, but afterwards made of whalebone, upon which were hung the voluminous skirts of a woman's dress. The fashion was introduced into England from Spain in the 16th century. In its most exaggerated shape, at the beginning of the 17th century, the top of the farthingale formed a flat circular surface projecting an underilage. (See Petticoat.)

FARUKHABAD, FARRAKHABAD, or FARRUKHABAD, a city and district of British India in the Agra division of the United Provinces. The city is near the right bank of the Ganges, 87 m. by rail from Cawnpore. It forms a joint municipality with Fategharh, the civil headquarters of the district with a military cantonment. Pop. (1901) 67,338. At Fategharh is the government gun-carrying factory; and other industries include cotton-printing and the manufacture of gold lace, metal vessels and tents.

The District of Farukhabad has an area of 1685 sq. m. It is a flat alluvial plain in the middle Doab. The principal rivers are: the Ganges, which has a course of 87 m., which rises on or passing through the district, but is not at all times navigable by large boats throughout its entire course; the Kali-nadi (84 m.), and the Isan-nadi (42 m.), both tributaries of the Ganges; and the Arind-nadi, which, after a course of 20 m. in the south of the district, passes into Cawnpore. The principal products are rice, wheat, barley, millets, pulses, cotton, sugar-cane, potatoes, &c. The grain crops, however, are insufficient for local wants, and grain is largely imported from Oudh and Rohilkhand. The district is, therefore, liable to famine, and it was severely visited by this calamity six times during the 19th century—in 1857-1860, 1861-1866, 1872-1875, 1877-1878, 1880-1889, and 1897-1900. Farukhabad is one of the healthiest districts in the Doab, but fevers are prevalent during August and September. The average annual mean temperature is almost 85° F.; the average annual rainfall, 29-4 in.

In the early part of the 18th century, when the Mogul empire was breaking up, Mohammed Khan, a Bangash Afghan from a village near Kaimganj, governor of Allahabad and later of Malwa, established a considerable state of which the present district of Farukhabad was the nucleus, founding the city of Farukhabad in 1714. After his death in 1743, his son and successor Kaim Khan was embroiled by Safdar Jang, the nawab wazir of Oudh, with the Rohillas, in battle with whom he lost his life in 1749. In 1750 his brother, Ahmad Khan, recovered the Farukhabad territories; but Safdar Jang called in the Maharratas, and a struggle for the possession of the country began, which ended in 1771, on the death of Ahmad Khan, by its becoming tributary to Oudh. In 1801 the nawab wazir ceded to the British his lands in this district, with the title due from the nawab of Farukhabad, who gave up his sovereign rights in 1802. In 1804 the Maharratas, under Holkar, ravaged this tract, but were utterly routed by Lord Lake at the town of Farukhabad. During the mutiny Farukhabad shared the fate of other districts, and passed entirely out of British hands for a time. The native troops, who had for some time previously evinced a sedition spirit, finally broke into rebellion on the 18th of June 1857, and placed the titular nawab of Farukhabad on the throne. The English military residents took shelter in the fort, which was unoccupied until the fort being undermined, they endeavoured to escape by the river. One boat sank in reaching Cawnpore, but only to fall into the hands of Nana. Its occupants were made prisoners, and perish in the massacre of the roth of July. The other boat was stopped on its progress down the river, and all those in it were captured or killed, except four who escaped. The prisoners were conveyed back to Fategharh, and murdered there by the nawab on the 10th of July. The rebels were defeated in several engagements, and on the 3rd of January 1858 the English troops recaptured Fategharh fort; but it was not till May that order was thoroughly re-established. In 1858 the population was 935,812, showing an increase of 8% in one decade. Part of the district is watered by distributaries of the Ganges canal; it is traversed throughout its length by the Agra-Cawnpore line of the Rajputana railway, and is also served by a branch of the East Indian system. Tobacco, opium, potatoes and fruit, cotton-prints, scent and saltpetre are among the principal exports.

FASCES, in Roman antiquities, bundles of elm or birch rods from which the head of an axe projected, fastened together by a red strap. Nothing is known of their origin, the tradition that represents them as borrowed by one of the kings from Eturia resting on insufficient grounds. As the symbol of official authority, they were carried by the licensors, in the left hand and on the left shoulder, before the higher Roman magistrates; at the funeral of a deceased magistrate they were carried behind the bier. The licensors and the fasces were so inseparably connected that they came to be used as synonymous terms. The fasces originally represented the power over life and limb possessed by the kings, and after the abolition of the monarchy, the consuls, like the kings, were preceded by twelve fasces. Within the precincts of the city the axe was removed, in recognition of the right of appeal (pro vocatio) to the people in a matter of life and death; outside Rome, however, each consul retained the axe, and was preceded by his own licensors, not merely by a single accessorius (supernumerary), as was originally the case within the city when he was not officiating. Later, the licensors preceded the officiating consul, and walked behind the other. Valerius Publicola, the champion of popular rights, further established the custom that the fasces should be lowered before the people, as the real representatives of sovereignty (Livy ii. 7; Florus i. 9; Plutarch, Publicola, 10); lowering the fasces was also the manner in which an inferior saluted a superior magistrate. A tradition, on taking the place of an officiating consul, had 24 fasces (including the axe even within the city); most of the other magistrates had fasces varying in number, with the exception of the censors, who, as possessing no executive authority, had none. Fasces were given to the Flamen Diaulis and (after 42 B.C.) even to the Vestals. During the times of the republic, a victorious general, who had been saluted by the title of imperator by his soldiers, had his fasces crowned with laurel (Cicero, Pro Ligario, 3). Later, under the emperor, when the emperor received the title for life on his accession, it became restricted to him, and the laurel was regarded as distinctive of the imperial fasces (see Antiquitates, Römischer Stadtschreiber, ii. 1889, p. 373).

FASCIA (Latin for a bandage or fillet), a term used for many objects which resemble a band in shape; thus in anatomy it is applied to the layers of fibrous connective tissue which sheathe...
the muscles or cover various parts or organs in the body, and in zoology, and particularly in ornithology, to bands or stripes of colour. In architecture the word is used of the bands into which the architrave of the Ionic and Corinthian orders is subdivided; their origin would seem to have been derived from the superimposing of two or more beams of timber to span the opening between columns and to support a superincumbent weight; the upper beam projected slightly in front of the lower, and similar projections were continued in the stone or marble beam though in one block. In the Roman Corinthian order the fascia still projecting one in front of the other, were subdivided by small moldings sometimes carved. The several bands are known as the first or upper fascia, the second or middle fascia and the third or lower fascia. The term is sometimes applied to flat projecting bands in Renaissance architecture when employed as string courses. It is also used, though more commonly in the form “facia,” of the band or plate over a shop-front, on which the name and occupation of the tradesman is written.

FASCINATION (from Lat. fascinare, to bewitch, probably connected with the Gr. ἕφασκω, to speak ill of, to bewitch), the art of enchanting or bewitching, especially through the influence of the “evil eye,” and so properly the power of this evil influence over the reason or will. The word is thus used of the supposed paralysing attraction exercised by some reptiles on their victims. It is also applied to a particular hypnotic condition, marked by muscular contraction, but with consciousness and power of remembrance left. In a quite general sense, fascination means the exercise of any charm or strong attraction. FASCINE (from the Lat. fascina, fascis, a bundle of sticks), a large faggot of brushwood used in the revetments of earthworks and for other purposes of military engineering. The British service pattern of fascine is 18 ft. long; it is tied as tightly as possible at short intervals, and the usual diameter is 2 in. Similar bundles of wood formed part of the foundations of the early lake-dwellings, and in modern engineering fascines are used in making rough roads over marshy ground and in building river and sea walls and breakwaters.

FASHION (adapted from Fr. façon, Lat. facio, making, facere, to do or make), the action of making, hence the shape or form which anything takes in the process of making. It is thus used in the sense of the pattern, kind, sort, manner or mode in which a thing is done. It is particularly used of the common or customary way in which a thing is done, and so is applied to the manner of custom prevalent at or characteristic of a particular period, especially of the manner of dress, &c., current at a particular period in any rank of society, for which the French term is modes (see COSTUME).

FASHODA (renamed, 1904, KODOK), a post on the west bank of the Upper Nile, Anglo-Egyptian Sudan, in 9° 53' N., 32° 8' E., 459 m. S., by river, of Khartum. It is the headquarters of the mudiria (province) of the Upper Nile. The station is built on a flat peninsula connected by a narrow strip of land with a ridge which runs parallel with the river. The surrounding country is mostly deep swamp and the station is most unhealthy; mosquitoes are present in millions. The climate is always damp and the temperature rarely below 98° in the shade. The government offices are well-built brick structures. In front of the station is a long low island, and when the Nile is at its lowest this channel becomes dry. Several roads from Kordofan converge on the Nile at this point, and near the station is the residence of the mek, or king, of the Shilluk tribe, whose designation of the post was adopted when it was decided to abandon the use of Fashoda. At Lu, 18 m. farther up stream, is an Austrian Roman Catholic mission station. An Egyptian military post was established at Fashoda in 1865. It was then a trading station of some importance, slaves being the chief commodity dealt in. In 1883-1884 the place fell into the hands of the Mahdists. On the 10th of July 1888 it was occupied by a French force from the Congo under Commandant J. B. Marchand, a circumstance which gave rise to a state of great tension between Great Britain and France. On the 11th of December following the French force withdrew, returning home via Abyssinia (see AFRICA, § 5, and EGYPT: History, and Military Operations).

FAST AND LOOSE, a cheating game played at fairs by sharpeners. A strap, usually in the form of a belt, is rolled or doubled up with a loop in the centre, and laid edgewise on a table. The swindler then bets that the loop cannot be caught with a stick or skewer as he unrolls the belt. As this looks to be easy to do the bet is often taken, but the sharper unrolls the belt in such a manner as to make the catching of the loop practically impossible. Centuries ago it was much practised by gypsies, but this game was alluded to by Shakespeare in Anthony and Cleopatra (iv. 12):

"Like a right gipsy, hath, at fast and loose.  
Beguiled me to the very heart of love."

From this game is taken the colloquial expression “to play fast and loose.” At the present day it is called “prick the garter” or “prick the loop.

Fasti, in Roman antiquities, plural of the Latin adjective fastus, but more commonly used as a substantive, derived from fas, meaning what is binding, or allowable, by divine law, as opposed to fasus, or human law. Fasti dies thus came to mean those days on which law-harmonies might be transgressed without impurity, corresponding to our own “legal days”; the opposite of the dies fasti were the dies nefasti, on which, on various religious grounds, the courts could not sit. The word fasti itself then came to be used to denote lists or registers of various kinds, which may be divided into two great classes.

1. Fasti Diurni, divided into urbani and rustici, a kind of official year-book, with dates and directions for religious ceremonies, court-days, market-days, divisions of the month, and the like. Until 304 a.C. the calendar remained the exclusive and lucrative monopoly of the priesthood; but in that year Gnaeus Flavius, a pontifical secretary, introduced the custom of publishing in the forum tables containing the requisite information, besides brief references to victories, triumphs, prodigies, &c. This list was the origin of the public Roman calendar, in which the days were divided into weeks of eight days each, and indicated by the letters A-H. Each day was marked by a certain letter to show its nature; thus the letters F., N., N.P., F.P., Q. Rex C.F., C., EN., stood for fastus, nefastus, nefastus in some unexplained sense, fastus priore, quando rex (sacrorum) comitavit fastus, comitatis and inericius. The dies inericius were partly fasti and partly nefasti. Ovid's Fasti is a fragmentary description of the Roman calendar in six months, written to illustrate the Fasti published by Julius Caesar after he remodelled the Roman year. Upon the cultivators fewer feasts, sacrifices, ceremonies and holidays were enjoined than on the inhabitants of cities; and the rustic fasti contained little more than the ceremonies of the calends, nones and ides, the fairs, signs of zodiac, increase and decrease of the days, the tutelary gods of each month, and certain directions for rustic labours to be performed each month.  
2. Fasti Magistrales, Annales or Historici, were concerned with the several feasts, and everything relating to the gods, religion and the magistrates; to the emperors, their birthdays, offices, days consecrated to them, with feasts and ceremonies established in their honour or for their prosperity. They came to be denominated magni, by way of distinction from the bare calendar, or fasti diurni. Of this class, the fasti consulares, for example, were a chronicle or register of time, in which the several years were denoted by the respective consuls, with the principal events which happened during their consulates. The fasti triumphales and sacrorumtitles contained a list in chronological order of persons who had obtained a triumph, together with the name of the conquered people, and of the priests. The word fasti thus came to be used in the general sense of "annals" or "historical records." A famous specimen of the same class are the fasti Capiolini, so called because they were deposited in the Capitol by Alexander Farnese, after their excavation from the Roman forum in 1547. They are chiefly a nominal list of statesmen, victorics, triumphs, &c., from the expulsion of the kings to the death of Augustus. A considerable number of fasti
of the first class have also been discovered; but none of them appear to be older than the time of Augustus. The Praenestine calendar, discovered in 1770, arranged by the famous grammarian Verrius Flaccus, contains the months of January, March, April and December, and a portion of February. The tablets give an account of festivals, as also of the triumphs of Augustus and Tiberius. There are still two complete calendars in existence, an official list by Furius Dionysius Philocolus (A.D. 334), and a Christian version of the official calendar, made by Polemius Silvius (A.D. 448). But some kinds of fasts included under the second general head were, from the very beginning, written for publication. The Annales Pentitici—different from the calendario properly so called—were “annually exhibited in public on a white table, on which the memorable events of the year, with special mention of the prodigies, were set down in the briefest possible manner.” Any one was allowed to copy them. Like the pontifices, the augurs also had their books, libri augulares. In fact, all the state offices had their fasti corresponding in character to the consular fasti named above.

For the best text and account of the fragments of the Fasti see Corpus Inscriptionum Latinarum, i. (2nd ed.); on the subject generally, Teufel-Schwabe, Hist. of Roman Literature, §§ 74, 75, and article by Bouché-Leclercq in Darmerein and Saglio, Dictionnaire des Ouprons.

Fasting (from fast,” derived from old Teutonic fastijan; synonyms being the Gr. voreleve, late Lat. jejunare), an act which is most accurately defined as an abstention from meat, drink and all natural food for a determined period. So it is defined by the Church of England, in the 16th homily, on the authority of the Council of Chalcedon and of the primitive church generally. In a looser sense the word is employed to denote abstention from certain kinds of food merely; and this meaning, which in ordinary usage is probably the more prevalent, seems to be least tolerated by the Church of England when it speaks of “fast or abstinence days,” as if fasting and abstinence were synonymous. More vaguely still, the word is occasionally used as an equivalent for moral self-restraint generally. This secondary and metaphorical sense (voreleve kathrynno) occurs in one of the fragments of Empedocles. For the physiology of fasting, see Dietetics; Nutrition; also Corpsulence.

Starvation itself (see also Hunger and Thirst) is of the nature of a disease which may be prevented by diet; nevertheless there are occasions on which a few days of some kind of fasting may be of practical interest. “Inedia,” as it is called in the nomenclature of diseases by the London College of Physicians, is of two kinds, arising from want of food and from want of water. When entirely deprived of nutriment the human body is ordinarily capable of supporting life under ordinary circumstances for little more than a week. In the spring of 1860 this was tried on the person of a “fasting girl” in South Wales. The parents made a show of their child, decking her out like a bride on a bed, and asserting that she had eaten no food for two years. Some reckless enthusiasts for truth set four trustworthy hospital nurses to watch her; the Celtic obstinacy of the parents was roused, and in defence of their imposture they allowed death to take place in eight days. Their trial and conviction for manslaughter may be found in the daily periodicals of the date; but, strange to say, the experimental physiologists and nurses escaped scot-free. There is no doubt that in this instance the unnatural quietude, the grave-like silence, and the dim religious light in which the victim was kept contributed to defer death.

One thing which remarkably prolongs life is a supply of water. The Fathers assembled there . . . decreed in that council that every person, as well as in his private life, public fast, should continue all the day without meat and drink, till after the evening prayer. And whoever did eat or drink before the evening prayer was ended should be accounted and reputed not to consider the purity of his fast. This canon heightens so evidently how far fasting was used in the primitive church as by words it cannot be more plainly expressed: "(Of Good Works; and first of Fasting.)" As indeed they are, etymologically; but, prior to the Reformation, a conventional distinction between abstinentia and jejunium naturale had long been recognized. "Exceptio edulorum quot- rundam portionale jejunium est" (Tertullian).

Dogs furnished with as much as they wished to drink were found by M. Chossat (Sur l'inanition, Paris, 1843) to live three times as long as those who were deprived of solids and liquids at the same time. Even wetting the skin with sea-water has been found useful by shipwrecked sailors. Four men and a boy of fourteen who got shut in the Tynwydd mine near Porth, in South Wales, in the winter of 1876-1877 for ten days without food, were not only alive when released, but several of them were able to walk, and all subsequently recovered. The thorough saturation of the narrow space with aqueous vapour, and the presence of drain warm in the cutting, do their chief preservation—assisted by the high even temperature always found in the deeper headings of coal mines, and by the enormous compression of the confined air. This doubtless prevented evaporation, and retarded vital processes dependent upon oxidation. The accumulation of carbonic acid in the breathed air would also have a similar arresting power over destructive assimilation. These prisoners do not seem to have felt any of the severer pangs of hunger, for they were not tempted to eat their candles. With the instinctive feeling that darkness adds a horror to death, they preferred to use them for light. At the wreck of the "Mona" frigate in 1874, fifteen people survived on a raft for thirteen days without food.

It is a paradoxical fact, that the supply of the stomach even from the substance of the starving individual's body should tend to prolong life. In April 1874 a case was recorded of exposure in an open boat for 32 days of three men and two boys, with only ten days' provisions, exclusive of old boots and jelly-fish. They had a fight in their delirium, and one was severely wounded. As the blood gushed out he lapped it up; and instead of suffering the fatal weakness which might have been expected from the haemorrhage, he seems to have done well. Experiments were performed by a French physiologist, M. Teuffel-Schwabe, in gén. de médecine, 1860, vol. i. p. 1069, with the object of trying to preserve the lives of dogs by what he calls "automatic auto-phagy." He fed them on the blood taken from their own veins daily, depriving them of all other food, and he found that the fatal cooling incident to starvation was thus postponed, and existence prolonged. Life lasted till the emaciation had proceeded to six-tenths of the animal's weight, as in Chossat's experiments, extending to the fourteenth day, instead of ending on the tenth day, as was the case with other dogs which were not supplied with blood.

Various people have tried, generally for exhibition purposes, how long they could fast from food with the aid merely of water or some medicinal preparation; but these exhibitions cannot be held to have proved anything of importance. A man named Jacques in this way fasted at Edinburgh for thirty days in 1888, and in London for forty-two days in 1890, and for fifty days in 1891; and an Italian named Succi fasted for forty days in 1890. Religiosa Fasti.—Fasting is of special interest when considered as a discipline voluntarily submitted to for moral and religious ends. As such it is very widely diffused. Its modes and motives vary considerably according to climate, race, civilization, and other circumstances; but it would be difficult to name any religious system of any description in which it is wholly unrecognized. The origin of the practice is very obscure. In his Principles of Sociology Herbert Spencer collected, from the accounts we have of various savage tribes in widely separated countries, Confucianism perhaps ought to be namely as one. Zoroastrianism is frequently given as another, but hardly correctly. In the Liber Sudan, indeed (Porta xxv.), we read: "Caurvam nam a mane ad vesperam minimo elomire non est hominem in religione nostra," but according to the Père de Chinnon (Lyon, 1671) the Persian religion hangs upon the priesthood at least, no fewer than five yearly fasts. See Hyde, Veterum Persarum religio, pp. 449, 458 (ed. 1700).

During the middle ages the prevalent notion was that it had its origin in the Paradise, the length of which is to be found in Tertullian, who says: "Accipiter Adam a Deo legem non sustinendi de arbores agnitionis boni et mali, moriturus si suggestioner et ipse in psyclicum reversus..." facilius ventri quam Deo ceasit, pabulo potiss quan praeceps annuit, solutum gula veneris, manucavit denique et perit, salvis alioquin si uni arbusculae jejunare maluisset" (De jejunii, c. 3).
FASTING

parts of the globe, a considerable body of evidence, from which he suggested that it may have arisen out of the custom of providing refreshments for the dead, either by actually feeding the corpse, or by leaving eatables and drinkables for its use. It is suggested that the fasting which was at first the natural and inevitable result of such sacrifice on behalf of the dead may eventually have come to be regarded as an indispensable concomitant of sacrifice, and so have survived as a well-established usage long after the original cause had ceased to operate. But this theory is repudiated by the best authorities; indeed its extreme precariousness at once becomes evident when it is remembered that, now at least, it is usual for religious fasts to precede rather than to follow sacrificial and funeral feasts, if observed at all in connexion with these. Spencer himself (p. 284) admits that “probably the practice arises in more ways than one,” and proceeds to supplement the theory already given by another—that adopted by E. B. Tylor—to the effect that it originated in the desire of the primitive man to bring on at will certain abnormal nervous conditions favourable to the seeing of those visions and the dreaming of those dreams which are supposed to give the soul direct access to the objective realities of the spiritual world. Probably, if we leave out of sight the very numerous and obvious cases in which fasting, originally the natural reflex result of grief, fear or other strong emotion, has come to be the usual conventional symbol of these, we shall find that the practice is generally resorted to, either as a means of somewhow exalting the higher faculties at the expense of the lower, or as an act of homage to some object of worship. The example of the Amazulu, that “the continually stuffed body cannot see secret things,” meets even now with pretty general acceptance; and if the notion that it is precisely the food which the worshipper forgoes that makes the deity more vigorous to do battle for his human friend be confined only to a few scattered tribes of savages, the general proposition that “fasting is a work of reverence toward God” may be said to be an article of the Catholic faith.

Although fasting as a religious rite is to be met with almost everywhere, there are comparatively few religions, and those only of the more developed kind, which appoint definite public fasts, and make them binding at fixed seasons upon all the faithful. Brahmanism, for example, does not appear to enforce any stated fast upon the laity. Among the ancient Egyptians fasting seems to have been associated with many religious festivals, notably with that of Isis (Herod. ii. 40), but it does not appear that, so far as the common people were concerned, the observance of these festivals (which were purely local) was compulsory. The soperela on the third day of the Thesmophoria at Athens was observed only by the women attending the festival (who were permitted to eat cakes made of sesame and honey). It is doubtful whether the fast mentioned by Livy (xxxvi. 37) was intended to be general or sacramental merely.

Jewish Fast.-While remarkable for the cheerful, non-asetic character of their worship, the Jews were no less distinguished from all the nations of antiquity by their annual solemn fast appointed to be observed on the 10th day of the 7th month (Tisri), the penalty of disobedience being death. The rules, as laid down in Lev. xvi. 29-34, xxiii. 27-32 and Numb. xxix. 7-11, include a special injunction of strict abstinence (“ye shall afflict your souls”) from evening to evening. This fast was intimately associated with the chief feast of the year. Before that feast could be entered upon, the sins of the people had to be confessed and (sacramentally) expiated. The fast was a suitable concomitant of that contrition which beffited the occasion. The practice of stated fasting was not in any other case enjoined by the law; and it is generally understood to have been forbidden on Sabbath. At the same time, private and occasional fasting, being regarded as a natural and legitimate instinct, was regulated rather than repressed. The only other provision about fasting in the Pentateuch is to be found in Deut. xxiii. 14 (13), to the effect that a vow made by a woman “to afflict her soul” may in certain circumstances be cancelled by her husband.

The history of Israel from Moses to Ezra furnishes a large number of instances in which the fasting instinct was obeyed both publicly and privately, locally and nationally, under the influence of sorrow, or fear, or passionate desire. See, for example, Judg. xx. 26; 1 Sam. vii. 6 (where the national fast was conjoined with the ceremony of pouring out water before the Lord); Jer. xxxvi. 6, 9; and 2 Sam. xii. 16. Sometimes the observance of such fasts extended over a considerable period of time, during which, of course, the stricter jejunium was conjoined with abstinentia (Dan. x. 2). Sometimes they lasted only for a day. In Jonah iii. 6, 7, we have an illustrative example of the rigour with which a strict fast might be observed; and such passages as Joel ii. and Isa. lviii. 5 enable us to picture with some vividness the outward accompaniments of a Jewish fast day before the exile.

During the exile many occasional fasts were doubtless observed by the scattered communities, in sorrowful commemoration of the various sad events which had issued in the downfall of the kingdom of Judah. Of these, four appear to have passed into general use—the fasts of the 10th, 4th, 5th and 7th months commemorating the beginning of the siege of Jerusalem, the capture of the city, the destruction of the temple, the assassination of Gedaliah. As time rolled on they became invested with increasing sanctity; and though the prophet Zechariah, when consulted about them at the close of the exile (Zech. viii. 19), had by no means encouraged the observance of them, the rebuilding of the temple does not appear to have been considered an achievement of sufficient importance to warrant their discontinuance. It is worthy of remark that Ezekiel’s prophetic legislation contains no reference to a day fast; day; the book of Esther (ix. 31), on the other hand, records the institution of a new fast on the 15th of the 12th month.

In the post-exile period private fasting was much practised by the pious, and encouraged by the religious sentiment of the time (see Judith viii. 6; Tob. xii. 8, and context; Sirach xxxiv. 26; Luke ii. 37 and xviii. 12). The last reference contains an allusion to the weekly fasts which were observed on the 2nd and 5th days of each week, in commemoration, it was said, of the ascent and descent of Moses at Sinai. The real origin of these fasts and the date of their introduction are alike uncertain; it is manifest, however, that the observance of them was voluntary, and never made a matter of universal obligation. It is probable that the Sadducees, if not also the Essenes, wholly neglected them. The second book (Seder Moed) of the Mishna contains two tractates bearing upon the subject of fasting. One (Yoma, “the day”) deals exclusively with the rites which were to be observed on the great day of expiation or atonement; the other (Taannith, “fast”) is devoted to the other fasts, and

2 Spencer, Prin. of Sociology, i. 256, &c. For Tylor’s PrimitSuchen Culture, i. 277, 402; lii. 372, &c.
3 Hooker, E.P. v. 72. In the Westminster Assembly’s Larger Catechism fasting is mentioned among the duties required by the second commandment.
4 The Brahmans themselves on the eleventh day after the full moon and the eleventh day after the new moon for sixty hours (from very late evening to the next evening); and they have a special fast every Monday in November. See Picart, The Religion and Manners of the Brahmans.
5 ψυχή is here to be taken as substantially equivalent to “desire,” “appetite.”
6 See Judith viii. 6. “And yet it may be a question whether they (the Jews) did not always fast upon Sabbath,” says Hooker (E.P. v. 72, 7), who gives a curious array of evidence pointing in this direction. See also on the same point Noyes, in the Pepper Noddy, xii. 19, who has been thought to tell the other way. Justinian’s phrase, “Sabbata Judaeorum a Mose in omnem aevo jejunato dicata” (l. xxxvi. c. 27), indicates a broad tradition. A good account of the fact that the day of atonement is called Sabbath Sabattob ("a perfect Sabbath")

There is, as Grai (Gesch. Bücher des AT. p. 41), has pointed out, no dearth of evidence that the fast on the 10th of the 12th month was ever observed before the exile. But the inference which he draws from this silence of the historical books is manifestly a precarious one at best. Bleek calls Lev. xvi. 1 “eindeutsches Beispiel Mosascher Ablassung” (Einleitung, p. 31, ed. 1878).
deals especially with the manner in which occasional fasting is to be gone about if no rain shall have fallen on or before the 17th day of Marcheswain. It is enacted that in such a case the rabbits shall begin with a light fast of three days (Monday, Thursday, Monday), i.e. a fast during which it is lawful to work, and also to wash and anoint the person. Then, in the event of a continued drought, fasts of increasing intensity are ordered; and as a last resort the ark is to be brought into the street and sprinkled with ashes, the heads of the Nasli and Ab-beth-din being at the same time similarly sprinkled. In no case was any fast be allowed to interfere with the next day’s other fixed festival. Another institution treated with considerable leniency in the treatise Tsaunish is that of the ṣew ṣew (ṣirī stationis), who are represented as having been laymen severally representing the twenty-four classes or families into which the whole commonwealth of the laity was divided. They used to attend the temple in rotation, and be present at the sacrifices; and as this duty fell to each in his turn, the men of the class or family which he represented were expected in their several cities and places of abode to engage themselves in religious exercises, and especially in fasting. The suggestion will readily occur that he might have been the father of the Christian fasts. Forgotten are both Tertullian nor any other of the fathers seems to have been aware of the existence of any such institution among the Jews; and very probably the story about it may have been a comparatively late invention. It ought to be borne in mind that the Aramaic portion of the Megillath Tsaunish (a document considerably older than the treatises in the Mishna) gives a catalogue only of the days on which fasting was forbidden. The Hebrew part (commented on by Maimonides), in which numerous fasts are recommended, is of considerably later date. See Reland, Antiq. Hebr, p. iv. c. 10; Dersennich, Hist, de Palestine, p. 439. Practice of the Early Christian Church.—Jesus Himself did not inculcate asceticism in His teaching, and the absence of that distinctive element from His practice was sometimes a subject of hostile remark (Matt. xi. 11). We read, indeed, that on one occasion He fasted forty days and forty nights; but the expression, which is an obscure one, possibly means nothing more than that He endured the privations ordinarily involved in a stay in the wilderness. While we have no reason to doubt that He observed the one great national fast prescribed in the written law of Moses, we have express notice that neither He nor His disciples were in the habit of observing the other fasts which customarily and traditionally had established themselves. See Mark ii. 18. Wherever, therefore, the use of the correct reading appears to be—"The disciples of John, and the Pharisaees, were fasting" (some customary fast). He never formally forbade fasting, but neither did He ever enjoin it. He assumed that, in certain circumstances of sorrow and need, the fasting instinct would sometimes be felt by the community and the individual; what He was chiefly concerned about was to warn His followers against the mistaken aims which His contemporaries were so apt to contemplate in their fasting (Matt. vi. 16-18). In one passage, indeed, He has been understood as practically commanding resort to the practice in certain circumstances. It ought to be noted, however, that Matt. xxi. 21 is probably spurious; and that in Mark ix. 20 the words "and fasting" are omitted by Westcott and Hort as well as by Tischendorf on the evidence of the Cod. Sinaiticus (first hand) and Cod. Vaticanus. The reference to "the fast" in Acts xxvii. 9 has generally been held to indicate that the apostles continued to observe the yearly Jewish fast. But this inference is by no means a necessary one. According to Acts xiii. 2, 3, xiv. 23, they conjoined fasting with prayer at ordinations, and doubtless also on some other solemn occasions; but at the same time the liberty of the Christian "in respect of an holiday, or of the new moon, or of the Sabbath" was strongly insisted on, by one of them at least, who declared that meat whether taken or abstained from commendeth not to God (Col. ii. 16-23; 1 Cor. viii. 8 ; Rom. xiv. 14-22; 1 Tim. iv. 3-5). The fastings to which the apostle Paul alludes in 2 Cor. vi. 5, xii. 21, were rather of the nature of inevitable hardships cheerfully endured in the discharge of his sacred calling. The words which appear to encourage fasting in 1 Cor. vii. 5 are absent from all the oldest manuscripts and are now omitted by all critics; and on the whole the precept and practice of the New Testament, while recognizing the propriety of occasional and extraordinary fasts, seem to be decidedly hostile to the imposition of any of a stated, obligatory and general kind.

The usage of the Christian church during the earlier centuries was in turn regulated by traditional Jewish feeling, and by the force of old habit, quite as much as by any direct apostolic authority or supposed divine command. Habitual temperance was of course in all cases regarded as an absolute duty; and "the bridegroom" being absent, the present life was regarded as being in a sense one continual "fast." Fasting in the stricter sense was not unknown; but it is certain that it did not at first occupy nearly so prominent a place in Christian ritual as to that which it afterwards attained. There are early traces of the customary observance of the Wednesday fasts (John xxi. 36) and the Saturday fasts (Acts vii. 60), and of a "quadragesimal" fast before Easter. But the very passage which proves the early origin of "quadragesima," conclusively shows how uncertain it was in its character, and how unlike the Catholic "Lent." Irenaeus, quoted by Eusebius (v. 24), informs us with reference to the customary yearly celebration of the mystery of the resurrection of our Lord, that disputes prevailed not only with respect to the day, but also with respect to the manner of fasting in connexion with it. "For some think that they ought to fast only one day, some two, some more days; some compute their day as consisting of forty hours night and day; and this diversity existing among those that observe it is not a matter that hinders for true virtuous in our times, but long ago among those before us." It was not pretended that the apostles had legislated on the matter, but the general and natural feeling that the anniversaries of the crucifixion and the resurrection of Christ ought to be celebrated by Christians took expression in a variety of ways according to the differing tastes of individuals. No other stated fasts, besides those already mentioned, can be adduced from the time before Irenaeus; but there was also a tendency—not unnatural in its issue also already sanctioned by Jewish practice—to fast by way of preparation for any season of peculiar privilege. Thus, according to Justin Martyr (Apol. ii. 93), catechumens were accustomed to fast before baptism, and the church fasted with them. To the same feeling the quadragesimal fast which (as already stated) preceded the joyful feast of the resurrection, is to be, in part at least, attributed. As early as the time of Tertullian it was also usual for communicants to prepare themselves by fasting for receiving the eucharist. But that Christian fasts had not yet attained to the exaggerated importance which they afterwards assumed is strikingly shown in the well-known Shepherd of Hermas (lib. iii. sim. v), where it is declared that "with merely outward fasting nothing is lost; for the believer is exhorted chiefly to abstain from evil and seek to cleanse himself from feelings of covetousness, and impurity, and revenge: "on the day that thou fastest content thyself with bread, vegetables and water, and thank God for these. But reckon up on this day what thy meal would otherwise have cost thee, and give the amount that it comes to to some poor widow or orphan, or to the poor." The right of bishops to ordain special fasts, "ex aliqua sollicitudinis ecclesiasticae causa "(Tertullian), was also recognized. Later Practice of the Church.—According to an expression preserved by Eusebius (H.E. v. 18), Montanus was the first to give laws (to the church) on fasting. Such language, though rhetorical in form, is substantially correct. The treatise of Tertullian, Concerning Fasting: against the Carnal, written as

1The idea, however, is found in the Clementine Homilies, ix. 9. Compare Tertullian De jejunitis, c. 8. "Docuit etiam adversus diriora daemonia jejunis praebenda."
it was under Montanist influence, is doubly interesting, first
as showing how free the practice of the church down to that
time had been, and then as foreshadowing the burdensome legislation
which was destined to succeed. In that treatise (c. 15) he
approves indeed of the church practice of not fasting on Saturdays
and Sundays (as elsewhere, De corona, c. 3), he had expressed
his concurrence in the other practice of observing the entire
period between Easter and Pentecost as a season of joy) but otherwise
he evinces great dissatisfaction with the indifference
of the church as to the number, duration and severity of her
fasts. The church thus came to be more and more involved in
discussions as to the number of days to be observed, especially
in "Lent," as fast days, as to the hour at which a fast ought to
terminate (whether at the 3rd or at the 9th hour), as to the
rigour with which each fast ought to be observed (whether
by abstinence from flesh merely, abstinentia, or by abstinence from
lacticiina, xerophagia, or by literal jejunium), and as to the
penalties by which the laws of fasting ought to be enforced.
Almost a century, however, elapsed between the composition
of the treatise of Tertullian (c. 212) and the first recorded
instances of ecclesiastical legislation on the subject. These,
while far from indicating that the church had attained unanimity
on the points at issue, show progress in the direction of the later
practice of catholicism. About the year 306 the synod of
Ilibinis in its 26th canon decided in favour of the observance
of the Saturday fast. The council of Ancona in 314, on the other
hand, found it necessary to legislate in a somewhat different
direction,—by its 14th canon enjoining its priests and clerks
to at least taste meat at the love feasts. The synod of Laodicea
framed several rules with regard to the observance of "Lent," such as that "during Lent the bread shall not be offered except
on Saturday and Sunday" (can. 49), that "the fast shall not be
relaxed on the Thursday of the last week of Lent, thus dishonouring
the whole season; but the fast shall be kept throughout the whole period" (can. 50), that "during the fast no feasts of the martyrs shall be celebrated" (can. 51), and that "no wedding or birthday feasts shall be celebrated during Lent" (can. 52).
The synod of Hippo (393 A.D.) enacted that the sacrament of the altar should always be taken fasting, except on the Thursday
before Easter. Protests in favour of freedom were occasionally
raised, not always in a very wise manner, or on very wise grounds, by
various individuals such as Eutychianus, St. Scholasticus (c. 356),
St. Basil (Epist. 171, 82), and John Chrysostom (c. 423).
The Eustathians, for example (whose connexion with Eusta-
thusius can hardly be doubted), the complaint was made that "they
fast on Sundays, but eat on the fast-days of the church." They
were condemned by the synod of Gangra in Paphlogonia in the
following canons:—Can. 19, "If any one fast on Sunday, let him be anathema." Can. 20, "If any one do not keep the fasts universally commanded and observed by the whole church, let him be anathema." Jovinian was very moderate. He "did not allow himself to be hurried on by an inconsiderate zeal to condemn
fasting, the life of celibacy, monachism, considered purely in
themselves. He merely sought to show that men were

1 Quinam isti (adversarii) sint, semel nominabo: exteriores et
interiores botuli psichiorum. ... Arguam nos quod jejunia prepra
vestigationem, quod stationes eurbarum, in qua sermones producamus.

dquo; quod etiam xerophagias observemus, sicuti cibum ab omni carne
et omni jurulenta et vidiiobius quibusque poniis, nec quid visinatis
vel elusmus vel potens; lavacri quodie abstinentiam congregunt et
substituunt."

2 The language of the canon is ambiguous; but this interpretation
seems to be preferable, especially in view of canon 23, which
enacts that believers are to abstain from fish and wine, and in a similar
manner, except July and August. See Hefele, Councils, i. 148 (Engl. trs).

3 Compare the 52nd [51st] of the Apostolical canons. If any
bishop or presbyter or deacon, or indeed any one of the sacerdotal
catalogue, abstains from flesh and wine, not for his own exercise,
but out of hatred of the things, forgetting that all things were good
... either let him reform, or let him be deprived and be cast
out of the church. So also a layman. To this particular canon
Hefele is disposed to assign a very early date.

4 Compare canon 64 of the (supposed) fourth synod of Carthag:
"He who fasts on Sunday is not accounted a Catholic" (Hefele, ii.
415).

wrong in recommending so highly and indiscriminately the life
of celibacy and fasting, though he was ready to admit that both
under certain circumstances might be good and useful" (Neander).
He was nevertheless condemned (390) both by Pope
Siricius at a synod in Rome, and by Ambrose at another in Milan.
The views of Aurus, according to the representations of his
bitter opponent Epiphanius (Hiero. 75, "Adv. Aeriurn"), seem
on this head at least, though unpopular, to have been character-
ized by great wisdom and sobriety. The church, thus
fasting altogether, but thought that it ought to be resorted to
in the spirit of gospel freedom according as each occasion should
arise. He found fault with the church for having substituted
for Christian liberty a yoke of Jewish bondage.

Towards the beginning of the 5th century we find Socrates
(c. 439) enumerating (H.E. v. 22) a long catalogue of the different
fasting practices of the church. The Romans fasted three weeks
continuously before Easter (Saturdays and Sundays excepted).
In Illyria, Achalz and Alexandria the quadragesimal fast lasted
six weeks. Others (the Constantinopolitans) began their fasts
seven weeks before Easter, but fasted only on alternate weeks,
five days at a time. Corresponding differences as to the manner
of abstinence occurred. Some abstained from all living creatures;
others ate fish; others fish and fowl. Some abstained from eggs
and fruit; some confined themselves to bread; some would not
take even that. Some fasted till three in the afternoon, and
then took whatever they pleased. "Other nations," adds the
historian, "observe other customs in their fasts, and that for
various reasons. And since no one can show any written rule
about this, it is plain the apostles left this matter free to every
one's liberty and choice, that no one should be compelld to do
a good thing out of necessity and fear." When Leo the Great
became pope in 440, a period of more rigid uniformity began.
The imperial authority of Valentinian helped to bring the whole
West at least into submission to the see of Rome; and ecclesi-
astical enactments had, more than formerly, the support of the
civil power. Though the introduction of the four Ember seasons
was not entirely due to him, as has sometimes been asserted,
it is certain that their widespread observance was due to his
influence, and to that of his successors, especially of Gregory the
Great. The tendency to increased rigour may be discerned in
the 2nd canon of the synod of Orleans (541), which declares that
every Christian should observe the fast of Lent; and in the
case of failure to do so, is to be punished according to the laws of
the church by his spiritual superior; in the 9th canon of the
synod of Toledo (653), which declares the eating of flesh during Lent
to be a mortal sin; in Charlemagne's law for the newly con-
quered Saxony, which attaches the penalty of death to wanton
disregard of the holy season. Baronius mentions that in the
11th century those who ate flesh during Lent were liable to have
their teeth knocked out. But it ought to be remembered that
this severity of the law early began to be tempered by the power
to grant dispensations. The so-called Butler Towers (Tours de
beurre) of Rouen, 1485-1507, Bourses and other cities, are said
to have been built with money raised by sale of dispensations
to ejecticiin on fast days.

It is probable that the apparent severity of the medieval Latin Church on this subject was largely due to the strictness of the Greek Church, which, under the patriarch Photius in 864,
had taken what was virtually a new departure in its fasting
praxis. The rigour of the fasts of the modern Greek Church is
well known; and it can on the whole be traced back to that
comparatively early date. Of the nine fundamental laws of that
regime, those bearing on fasting are:—

5 Friscillian, whose widespread heresy evoked from the synod
of Saragossa (418) the canon, "No one shall fast on Sunday, nor may
any one absent himself from church during Lent and hold a fe-
ast, or himself knock out his teeth, or eat flesh and drink wine
on the question of fasting, not to have differed from the Enarrates and various other sects of Manichean
tendency (c. 406).

6 Cap. iii. pro partih. Saxoniæ: "Si quis sanctum quadragesimale
jejunum, quod ostendit spectum Christianitarum, contemperit et
carmen comedet, morte moriturur. Sed tamen consideretur a sacerdote
nec forte causa necessitatis hoc culiibet proveniat, ut carmen comedat." See
Augustus, Chriftische Archvologie, x. p. 374.
church (ἡ ἐκκλησία τῆς ἐκκλησίας) two are concerned with fasting. Besides fasts of an occasional and extraordinary nature, the following are recognized as of stated and universal obligation:—(1) The Wednesday and Friday fasts throughout the year (with the exception of the period between Christmas and Epiphany, the Easter week, the week after Whitsunday, the third week after Epiphany); (2) The great yearly fasts, viz. that of Lent, lasting 28 days, from the Monday of Sexagesima to Easter eve; that of Advent, 39 days, from November 15 to Christmas eve; that of the Theotokos (προσκύνησις τῆς Θεοτόκου), from August 1 to August 15; that of the Holy Apostles, lasting a variable number of days from the Monday before Trinity; (3) The minor yearly fasts before Epiphany, before Whitsunday, and before the feasts of the transfiguration, the invention of the cross, the beheading of John the Baptist. During even the least rigid of these the use of flesh and lacticinia is strictly forbidden; fish, oil and wine are occasionally conceded, but not before two o’clock in the afternoon. The practice of the Coptic church is almost identical with this. A week before the Great Fast (Lent), a fast of three days is observed in commemoration of that of the Ninivites, mentioned in the book of Jonah. Some of the Copts are said to observe it by total abstinence during the whole period. The Great Fast continues fifty-five days; nothing is eaten except bread and vegetables, and that only in the afternoon, when church prayers are over. The Fast of the Nativity lasts for twenty-eight days before Christmas; that of the Apostles for a variable number of days from the Feast of the Ascension; and that of the Virgin for fifteen days before the Assumption. All Wednesdays and Fridays are also fast days except those that occur in the period between Easter and Whitsunday. The Armenians are equally strict; but (adds Rycaut) "the times seem so confused and without rule that they can scarcely be counted, unless by those who live amongst them, and strictly observe those that being the chief care of the priest, whose learning principally consists in knowing the appointed times of fasting and feasting, the which they never omit on Sundays to publish unto the people."

At the council of Trent no more than a passing allusion was made to the subject of fasting. The faithful were simply enjoined to submit themselves to church authority on the subject; and the clergy were exhorted to urge their flocks to the observance of frequent jejunia, as conducive to the mortification of the flesh, and as assuredly securing the divine favour. R. F. R. Bellarmine (De jejunio) distinguishes jejunium spirituale (abstinentia a viisit), jejunium morale (parsimonia et temperantia cibi et potus), jejunium corporis naturale (ab omni prorus cibo et potu, quaeunque ratione sumpso), and jejunium ecclesiasticum. The last he defines simply as an abstinence from food in conformity with the rule of the church. It may be either voluntary or compulsory; and compulsory either because of a vow or because of a command. But the definition given by Alexander Halensis, which is much fuller, still retains its authority:—"Jejunium est abstinentia a cibo et potu secundum formam ecclesiae, intuito satisfaciendis pro peccato et acquiredi vitam aeternam." It was to this last clause that the Reformers most seriously objected. They thought not that fasting might be had as an end, nor that they maintain that the church or the authority might not ordain fasts, though they deprecated the imposition of needless burdens on the conscience. What they protested against was the theory of the opus operatum et meritum as applied to fasting. As matter of fact, the Reformed churches in no case gave up the custom of observing fast days, though by some churches the number of such days was greatly reduced. In many parts of Germany the seasons of Lent and Advent are still marked by the use of emblems of mourning in the churches, by the frequency of certain phrases (Kyrie eleison, Agnus Dei) and the absence of others (Hallelujah, Gloria in excelsis) in the liturgical services, by abstinence from some of the usual social festivities, and by the non-celebration of marriages. And occasional fasts are more or less familiar. The Church of England has retained a considerable list of fasts; though Hooker (E.P. v. 72) had to contend with some who, while approving of fastings undertaken "of men’s own free and voluntary accord as their particular devotion doth move them thereunto," yet yearly or weekly fasts such as ours in the Church of England they allow no further than as the temporal state of the land doth require the same for the maintenance of seafaring men and preservation of cattle; because the decay of the one and the waste of the other could not well be prevented but by a politic order appointing some such usual change of diet as ours is.

In the practice of modern Roman Catholicism the following are regarded as fasting days, that is to say, days on which one meal only, and that not of flesh, may be taken in the course of twenty-four hours:—The forty days of Lent (Sundays excepted), all the Ember days, the Wednesdays and Fridays in Advent, and the vigils of certain feasts, namely, those of Whitsundine, of St Peter and St Paul, of the Assumption of the Blessed Virgin Mary, of All Saints and of Christmas day. The following are simply days of abstinence, that is to say, days on which flesh at all events must not be eaten:—The Sundays in Lent, the three Rogation days, the feast of St Mark (unless it falls in Easter week), and all Fridays which are not days of fasting. In the Anglican Church, the "days of fasting or abstinence" are the forty days of Lent, the Ember days, the Rogation days, and all the Fridays in the year, except Christmas day. The events or vigils before Christmas, the Purification of the Blessed Virgin Mary, the Annunciation of the Blessed Virgin Mary, Easter day, Ascension day, Pentecost, St Matthias, the Nativity of St John Baptist, St Peter, St James, St Bartholomew, St Matthew, St Simon and St Jude, St Andrew, St Thomas, and All Saints are also recognized as "fast days." By the 6th canon it is enacted that "every parson, vicar or curate, shall in his several charge declare to the people every Sunday at the time appointed in the communion-book (which is, after the Nicene creed has been repeated) whether there be any holy-days or fast-days the week following." The 72nd canon ordains that "no minister or ministers shall, without licence and direction of the bishop under hand and seal, appoint or keep any solemn fasts, either publicly or in any private houses, other than such as by law are or by public authority shall be appointed, nor shall be willingly present at any of them under pain of suspension for the first fault, of excommunication for the second, and of deposition from the ministry for the third." While strongly discouraging the arbitrary multiplication of public or private fasts, the English Church seems to leave to the discretion of the individual conscience every question as to the manner in which the fasts she formally enjoins are to be observed. In this connexion the homily Of Fasting may be again referred to. By a statute of the reign of Queen Elizabeth it was enacted that none should eat flesh on "fish days" (the Wednesdays, Fridays and Saturdays throughout the year) without a licence, under a penalty. In the Scottish Presbyterian churches days of fasting, humiliation and prayer are observed by ecclesiastical appointment in each parish once or twice every year on some day of the week which the congregation, having consulted the minister and after prayer, have decided is suitable for the administration of the sacrament of the Lord's Supper. In some of the New England States, it has been usual for the governor to appoint by proclamation at some time in spring a day of fasting, when religious services are conducted in the churches. National fasts have more than once been observed on special occasions both in this country and in the United States of America.

On the subject of fasting the views of Acrius are to a large extent shared by modern Protestant moralists. R. Rothe, for example, who on this point may be regarded as a representative thinker, rejects the idea that fasting is a thing meritorious in itself, and is very doubtful of its value even as an aid to devotional feeling. Of course when bodily health and other circumstances require it, it becomes a duty; and as a means of self-discipline it may be used with due regard to the claims of other duties, and to the fitness of things. In this last aspect, however, habitual temperance will generally be found to be much more
beneficial than occasional fasting. It is extremely questionable, in particular, whether fasting be so efficient as it is sometimes supposed to be in protecting against temptation to fleshly sin. The practice has a well-ascertained tendency to excite the imagination; and in so far as it disturbs that healthy and well-balanced interaction of body and mind which is the best or at least the normal condition for the practice of virtue, it is to be deprecated rather than encouraged (Theologische Ethiik, sec. 873-875).

Mahomedan Fast.—Among the Mahomedans, the month of Ramadan, in which the first part of the Koran is said to have been received, is by command of the prophet observed as a fast with extraordinary rigor. No food or drink of any kind is permitted to be taken from daybreak until the appearance of the stars at nightfall. Extending as it does over the whole “month of raging heat,” such a fast manifestly involves considerable self-denial; and it is absolutely binding upon all the faithful whether at home or abroad. Should its observance at the appointed time be interfered with by sickness or any other cause, the fast must be kept as soon afterwards as possible for a like number of days. It is the only one which Mahomedanism enjoins; but the doctors of the law recommend a considerable number of voluntary fasts, as for example on the tenth day of the month Muharram. This day, called the “Yom Ashoora,” is held sacred on many accounts:—“because it is believed to be the day on which the first meeting of Adam and Eve took place after they were cast out of paradise;” and that on which Noah went out from the ark; also because several other great events are said to have happened on this day; and because the ancient Arabs, before the time of the prophet, observed it by fasting. But what, in the opinion of most modern Moslems, and especially the Persians, confers the greatest sanctity on the day of Ashoora is the fact of its being that on which El-Hoseyn, the prophet’s grandson, was slain a martyr at the battle of the plain of Karbala.

It is the practice of many Moslems to fast on this day, and some do so on the preceding day also. Mahomet himself called fasting the “gate of religion,” and forbade it only on the two great festivals, namely, on that which immediately follows Ramadan and on that which succeeds the pilgrimage. (See Lane, Modern Egyptians, chap. iii., xxiv.)

FASTOLF, SIR JOHN (d. 1459). English soldier, has enjoyed a most celebrated career in some part the prototype of Shakespear’s Falstaff. He was son of a Norfolk gentleman, John Fastolf of Caister, is said to have been squire to Thomas Mowbray, Duke of Norfolk, before 1398, served with Thomas of Lancaster in Ireland during 1405 and 1406, and in 1408 made a fortunate marriage with Millicent, widow of Sir Stephen Scrope of Castle Combe in Wiltshire. In 1413 he was serving in Gascony, and took part in all the subsequent campaigns of Henry V. in France. He must have earned a good repute as a soldier, for in 1423 he was made governor of Maine and Anjou, and in February 1426 created a knight of the Garter. But later in this year he was superseded in his command by John Talbot. After a visit to England in 1428, he returned to the war, and on the 12th of February 1430 when in charge of the convoy for the English army before Orleans defeated the French and Scots at the “battle of herrings.” On the 18th of June of the same year an English force under the command of Fastolf and Talbot suffered a serious defeat at Patay. According to the French historian Waurin, who was present, the disaster was due to Talbot’s rashness, and Fastolf only fled when resistance was hopeless. Other accounts charge him with cowardice, and it is true that John of Bedford at first deprived him of the Garter, though later he was reinstated. This incident was made unfavourable use of by Shakespeare in Henry VI. (pt. i. act iv. sc. i.). Fastolf continued to serve with honour in France, and was trusted both by Bedford and by Richard of York. He only came home finally in 1440, when past sixty years of age. But the scandal against him continued, and during Cade’s rebellion in 1451 he was charged with having been the cause of the English disasters through minising the garrisons of Normandy. It is suggested that he had made much money in the war by the hire of troops, and in his later days he showed himself a grasping man of business. A servant wrote of him:—“crue and vengible he hath been ever, and for the most part without pity and mercy” (Paston Letters, i. 386). Besides his share in his wife’s property he had large estates in Norfolk and Suffolk, and a house at Southwark, where he also owned the Boar’s Head Inn. He died at Caister on the 4th of November 1459. There is some reason to suppose that Fastolf favoured Lollardy, and this circumstance with the tradition of his bragging cowardice may have suggested the use of his name for the boon companion of Prince Hal, when Shakespeare found it expedient to drop that of Oldcastle. In the first two folios the name of the historical character in the first part of Henry VI. is given as “Falstaffe” not Fastolf. Other points of resemblance between the historic Fastolf and the Falstaff of the dramatist are to be found in their service under Thomas Mowbray, and association with a Boar’s Head Inn. But Falstaff is in no true sense a dramatization of the real soldier.

The facts of Fastolf’s early career are to be found chiefly in the chronicles of Monstrelet and Waurin. For his later life there is much material, including a number of his own letters, in the Paston Letters. There is a full life by W. Oldys in the Biographia Britannica (1st ed., enlarged edition); Gough in Power’s edition of the History of Caister Castle, Scrope’s History of Castle Combe, J. Gairdner’s essay On the Historical Elements in Shakespeare’s Falstaff, ap. Studies in English History, S. Lee’s article in the Dictionary of National Biography, and D. W. Duthie, The Case of Sir John Fastolf (British Historical Studies (1907).)

FAT (O.E. fæt; the word is common to Teutonic languages, cf. Dutch vet, Ger. Fett, &c., and may be ultimately related to Greek πυός and πυόφ, and Sanskrit प्योन), the name given to certain animal and vegetable products which are oily solids at ordinary temperatures, and are chemically distinguished as being the glycerol esters of various fatty acids, of which the most important are stearic, palmitic, and oleic; it is to be noticed that they are non-nitrogenous. Fat is a normal constituent of animal tissue, being found even before birth; it occurs especially in the intra-muscular, the abdominal and the subcutaneous connective tissues. In the vegetable kingdom fats especially occur in the seeds and fruits, and sometimes in the roots. Physiological subjects concerned with the part played by fats in living animals are treated in the articles Connective Tissues; Nutrition; Corpulence; Metabolic Diseases.

FATALISM (Lat. fatum, that which is spoken, decreed), strictly the doctrine that all things happen according to a pre-arranged fate, necessity or inexorable decree. It has frequently been combined with the idea of pre-established harmony (q.v.), which, however, differs from it categorically in assigning a certain function to the will. The essence of the fatalistic doctrine is that it assigns no place at all to the initiative of the individual, or to rational sequence of events. Thus an oriental may believe that he is fated to die on a particular day; he believes that, whatever he does and in spite of all precautions he may take, nothing can avert the disaster. The idea of an omnipotent fate overruling all affairs of man is present in various forms in practically all religious systems. Thus Homer assumes a single fate (Μοῖρα, an impersonal power which makes all human concerns subject to the will of Zeus). It is not necessary that the gods, however, should be always alike. Thus the Romans regarded Zeus as one of a pair of supreme deities (see also Dyonysus), and that to whom he is referred is that of which Hera shared the name, Zeus being spoken of as weighing out the fate of men (H. xxii. 209, vili. 60). This notion is also present in the Homeric epics (Môira), daughters of Night, Clotho, Lachesis and Atropos. In Aeschylus fate is powerful even over the gods. The Epicureans regarded fate as blind chance, while to the Stoics everything is subject to an absolute rational law.

The doctrine of fate appears also in what are known as the higher religions, e.g. Christianity and Mahomedanism. In the
former the ideas of personality and infinite power have vanished, all power being conceived as inherent in God. It is recognized that the moral individual must have some kind of initiative, and yet since God is omnipotent and omniscient man must be conceived as in some sense foreordained to a certain moral, mental and physical development. In the history of the Christian church emphasis has from time to time been laid specially on the latter aspect of human life (cf. the doctrines of election, foreordination, determinism). Even those theologians, however, who have laid special stress on the limitations of the human will have repudiated the strictly fatalistic doctrine which is characteristic of Oriental thought and is the negation of all human initiative (see Predestination; Augustine, Saint; William). In the latter fate is an absolute power, known as Kismet, or Nasib, which is conceived as inexorable and transcending all the physical laws of the universe. The most striking feature of the Oriental fatalism is its complete indifference to material circumstances: men accept prosperity and misfortune with calmness as the decree of fate.

Fate, in Roman mythology, the spoken word (fatum) of Jupiter, the unalterable will of heaven. The plural (Fata, the Fates) was used for the “destinies” of individuals or cities, and for the three goddesses who controlled them. Thus, Fata Scribunda were the goddesses who wrote down a man’s destiny at his birth. In this connexion, however, Fate may be singular, the masculine and feminine Fatus, Fate, being the usual forms in popular and ceremonial language. The Fates were also called Parcae, the attributes of both being the same as those of the Greek Moerai.

Fatehpur, Fatehpur or Fatehpoor, a town and district of British India, in the Allahabad division of the United Provinces. The town is 73 m. by rail N.W. of Allahabad. Pop. (1901) 19,781. The district has an area of 1618 sq. m. It is situated in the extreme south-eastern corner of the Doab or tract of country between the Ganges and the Jumna, which respectively mark its northern and southern boundaries. The whole district consists of an alluvial plain formed by the deposits of the two great rivers. The central part is almost perfectly level, and consists of highly cultivated land interspersed with jungle and with tracts impregnated with saltpetre (usar). A ridge of higher land, forming the watershed of the district, runs along it from east to west at an average distance of about 5 m. from the Ganges. Fatehpur therefore consists of two inclined planes, the one 3 m. broad, sloping down rapidly to the Ganges, and the other from 15 to 20 m. broad, falling gradually to the Jumna. The country near the banks of the two rivers is cut up into ravines and nullahs running in all directions, and is almost entirely uncultivable. Besides the Ganges and Jumna the only rivers of importance are the Pandu, a tributary of the Ganges, and the Arind and Nun, which both fall into the Jumna. The climate is more humid than in the other districts of the Doab, and although fevers are common, it is not considered an unhealthy district. The average annual rainfall is 34 in.

The tract in which this district is comprised was conquered in 1194 by the Pathans; but subsequently, after a desperate resistance, it was wrested from them by the Mogul emperors. At the beginning of the 16th century this tract was known as the jahaz of Korah, and was under the government of the wazir of Oudh. In 1736 it was overrun by the Mahrattas, who retained possession of it until, in 1750, they were ousted by the Pathans of Fatehpur. In 1753 it was reconquered by the nawab of Oudh. In 1765, by a treaty between the East India Company and the nawab, Korah was made over to the Delhi emperor, who retained it till 1774, when it was again restored to the nawab wazir’s dominions. Finally in 1801, the nawab, by treaty, reconveyed it to the Company in commutation of the amount which he had stipulated to pay in return for the defence of his country. In June 1857 the district rose in rebellion, and the usual murder of Europeans took place. Order was established after the fall of Lucknow, on the return of Lord Clyde’s army to Cawnpore. In 1901 the population was 686,931, showing a decrease of 2% in the decade. The district is traversed by the main line of the East Indian railway from Allahabad to Cawnpore. Trade is agricultural but the town of Fatehpur is noted for the manufacture of ornamental whips, and Jalafangji for artistic curlicues, &c.

Fatehpur Sikri, a town in the Agra district in the United Provinces of India, on the road from Agra to Jaipur. Pop. (1901) 7147. It is a ruined city, and is interesting only from an archaeological point of view. It was founded by Akbar in 1569 as a thank-offering for the birth of a son, Selim, afterwards the emperor Jahangir, foretold by Selim Chisti, a famous Mahomedan saint. The principal building is the great mosque, which is said by Fergusson to be hardly surpassed by any in India. It measures 550 ft. east and west by 470 ft. north and south, covered with its massive roof. The mosque itself, 250 ft. by 50 ft., is crowned by three domes. In its courtyard, which measures 350 ft. by 150 ft., stand two tombs. One is that of Selim Chisti, built of white marble, and the windows with pierced trellis of the most exquisite geometrical patterns. It possesses besides a deep cornice of marble, supported by brackets of the most elaborate design. The other tomb, that of Nawab Islam Khan, is sober and in excellent taste, but quite eclipsed by its surroundings. Even these parts, however, are surpassed in magnificence by the southern gateway. As it stands on a rising ground, when looked at from below its appearance is noble beyond that of any portal attached to any mosque in India, perhaps in the whole world.” Among other more noteworthy buildings the following may be mentioned. The palace of Jodh Bai, the Rajput wife of Akbar, consists of a courtyard surrounded by a gallery, above which rise buildings roofed with blue enamel. A rich gateway gives access to a terrace on which are the “houses of Birbal and Mirza”; and beyond these is another courtyard, where are Akbar’s private apartments and the exquisite palace of the Turkish sultana. Here are also the Panch Mahal or five-storeyed building, consisting of five galleries in tiers, and the audience chamber. The special feature in the architecture of the city is the softness of the red sandstone, which could be carved almost as easily as wood, and so lent itself readily to the elaborate Hindu embellishment. Fatehpur Sikri was a favourite residence of Akbar throughout his reign, and his establishment here was of great magnificence. After Akbar’s death Fatehpur Sikri was deserted within 50 years of its foundation. The reason for this was that frequent cause in the East, lack of water. The only water obtainable was so brackish and corroding as to cause great mortality among the inhabitants. The buildings are situated within an enclosure, walled on three sides and about 7 m. in circumference. They are all now more or less in ruins, and merely elaborate painting and other decoration has largely perished, but some modern restoration has been effected.

Father, the begetter of a child, the male parent. The word is common to Teutonic languages, and, like the other words for close family relationship, mother, brother, son, sister, daughter, appears in most Indo-European languages. The O. Eng. form is father, and it appears in Ger. Vater, Dutch vader, Gr. pater, Lat. pater, whence Romanic fr. père, Span. padre, &c. The form father is the same as that of other Teutonic male parent, and of ancestors in general. It is applied to God, as the Father of Jesus Christ, and as the Creator of the world, and is thus the orthodox term for the First Person of the Trinity. Of the transferred uses of the word many have religious reference; thus it is used of the Christian writers, usually confined to those of the first five centuries, the Fathers of the Church (see below), of whom those who flourished at the end of, or just after the age of, the apostles are known as the Apostolic Fathers. One who stands as a spiritual parent to another is his “father,” e.g. godfather, or in the title of bishops or archbishops, Right or Most Reverend Father in God. The pope is, in the Roman Church, the Holy Father. In the Roman Church, father is strictly applied to a “regular,” a member of one of the religious orders, and so always in Europe, in English usage, often applied to a confessor, whether regular or secular, and to any Roman priest, and sometimes used of sub-members of a religious society or fraternity.
in the English Church. Of transferred uses, other than religious, may he mentioned the application to the first founders of an institution, constitution, epoch, &c. Thus the earliest settlers of North America are the Pilgrim Fathers, and the framers of the United States constitution are the Fathers of the Constitution. In ancient Rome the members of the senate are the Patres conscripti, the "Conscript fathers." The senior member or doyen of a society is often called the father. Thus the member of the English House of Commons, and similarly, of the House of Representatives in the United States, America, who has sat for the longest period uninterruptedly, is the Father of the House.

FATHERS OF THE CHURCH. The use of the word "father" as a title of respect is found in the Old Testament, where it is applied to Moses (Exod. 24:10; Lev. 24:13; 15:10; Deut. i. 8), priests (Judg. xvii. 10, xviii. 19), prophets (2 Kings viii. 12, vi. 21, xiii. 14), and distinguished ancestors (Ecclus. xlv. 1). In the time of our Lord the scribes claimed the name with an arrogance which He disapproved (Matt. xxiii. 9); in the rabbinic literature "the fathers" are the more eminent of the earlier rabbis whose sayings were handed down for the guidance of posterity.1 The Christian Church, warned perhaps by the words of Christ, appears at first to have avoided a similar use of the term, while St Paul, St Peter and St John speak of their converts as spiritual children (1 Cor. iv. 14 f., Gal. iv. 19, 1 Pet. v. 13, 1 John ii. 12); they did not use it. The first who did so far as we know, was the official style of "fathers in God." Nor is this title found in the age which succeeded to that of the apostles. When Polycarp, bishop of Smyrna, was martyred (A.D. 155), the crowd shouted, "This is the father of the Christians" 2; but the words were probably prompted by the Jews, who took a prominent part in the martyrdom, and who naturally viewed Polycarp in the light of a great Christian rahi, and gave him the title which their own teachers bore. In the next century members of the episcopal order were sometimes addressed in this manner: thus Cyprian is styled papa or popa by his Roman correspondents.3 The bishops who sat in the great councils of the 4th century, and who were generally known as "the 318 fathers" of Nicaea, and "the 150 fathers" of Constantinople. Meanwhile the custom was growing up of appealing to eminent Church writers of a past generation under this name. Thus Athanasius writes (ad Afros vi.): "We have the testimony of fathers (the two Dionysii, bishops of Alexandria and Rome, who wrote in the previous century) for the use of the word ὅμοος." Such quotations were multiplied, as theologians learnt to depend increasingly upon their predecessors, until the testimony of "our holy fathers" Athanasius, or Gregory the Great, or John the Golden-mouthed, came to be regarded as decisive in reference to contested points of faith and practice.

In the narrower sense thus indicated the "fathers" of the Church are the great bishops and other eminent Christian teachers of the earlier centuries, who were conspicuous for soundness of judgment and sanctity of life, and whose writings remained as a court of appeal for their successors. A list of fathers drawn up on this principle will begin with the Christian writers of the 1st century whose writings are not included in the New Testament, and we shall not attempt to exhaust this field, but content ourselves with mentioning those who are best known by name. Thus the Greek Church of the 4th century, in all its parts, is the Church of the "apostolic fathers," i.e. the Church which flourished toward the end of the apostolic age and during the half century that followed it, including Clement of Rome, Ignatius of Antioch, Polycarp of Smyrna and the author known as "Barnabas." Their writings, like those of the apostles, are epistolary; but editions of the apostolic fathers now usually admit also the early Church order known as the Didaché, the allegory entitled The Shepherd, and a short anonymous apology addressed to one Dionetus. A second group, known as the "Greek Apologists," embraces Aristides, Justin, Tatian, Athenagoras and Theophilus; and a third consists of the early polemical writers, Irenaeus and

---

2 In his book De viris illustribus. The term padres apostolici is due to the polemical scholars of the 17th century: see Clemen, De Clementi Romani, i. p. 3. "Sub-apostolic" is perhaps a more accurate designation.
Hippolytus. Next come the great Alexandrians, Clement, Origen, Dionysius; the Carthaginians, Tertullian and Cyprian; the Romans, Minucius Felix and Novatian; the last four laid the foundations of a Latin Christian literature. Even the stormy days of the last persecution yielded some considerable writers, such as Methodius in the East and Lactantius in the West. This list is far from complete; the principal collections of the ante-Nicene fathers include not a few minor and anonymous writers, and the fragments of many others whose works as a whole have perished.

In the post-Nicene period the literary output of the Church was greater. Only the more representative names can be mentioned here. From Alexandria we get Athanasius, Didymus and Cyril; from Cyrene, Synesius; from Antioch, Theodore of Mopsuestia, John Chrysostom and Theodoret; from Palestine, Eusebius of Caesarea and Cyril of Jerusalem; from Cappadocia, Basil, Gregory of Nyssa and Gregory of Nazianzus. The Latin West was scarcely less productive; it is enough to mention Hilary of Poitiers, Ambrose of Milan, Augustine of Hippo, Leo of Rome, Jerome, Rufinus, and a father lately restored to his place in patristic literature, Niceta of Remesiana. 1 Gaul alone has a goodly list of Christian authors to show: John Cassian, Vincent of Lerins, Hilary of Arles, Prosper of Aquitaine, Salvian of Marseilles, Sidonius Apollinarius of Auvergne, Caesarius of Arles, Gregory of Tours. The period ends in the West with two great Italian names, Cassiodorus and Pope Gregory I, after Leo the greatest of papal theologians.

The reader to whom the study is new will gain some idea of the bulk of the extant patristic literature, if we add that in Migne's collection of the twenty-six large volumes are occupied with the Greek fathers from Clement of Rome to John of Damascus, and seventy-six with the Latin fathers from Tertullian to Gregory the Great. 2

For a discussion of the more important fathers the student is referred to the articles which deal with them separately. In this place it is enough to consider the general influence of the patristic writings upon Christian doctrine and biblical interpretation. Can any authority be claimed for their teaching or their exegesis, other than that which belongs to the best writers of every age.

The decree of the council of Trent 3 ( ut nemo ... contra un animum consensum patrum ipsam scripturam sacram interpreteri audeat) is studiously moderate, and yet it seems to rule that under certain circumstances it is not permitted to the Church of later times to carry the science of biblical interpretation beyond the point which it had reached at the end of the patristic period. Roman Catholic writers, 4 however, have explained the prohibition to apply to matters of faith only, and in that case the Tridentine decree is little else than another form of the Vincentian canon which has been widely accepted in the Anglican communion: curandum est ut id teneamus quod ubique, quod semper, quod ab omnibus creditum est. The fathers of the first six or seven centuries, so far as they agree, may be fairly taken to represent the main stream of Christian tradition and belief during the period when the apostolic teaching took shape in the great creeds and dogmatic decisions of Christianthend. The English reformers realized this fact; and notwithstanding their insistence on the unique authority of the canon of Scripture, their appeal to the fathers as representatives of the teaching of the undivided Church was as wholehearted as that of the Tridentine divines. Thus the English canon of 1571 directs preachers 5 to take heed that they do not teach anything in their sermons as though thundered down from heaven; that they do not impose their opinions on the people, save what is agreeable to the doctrine of the Old and New Testaments, and what the Catholic Fathers and ancient Bishops have gathered from that doctrine." Deprecation of the fathers was characteristic, not of the Anglican reformation, but of the 6

1 The editio princeps of Niceta's works was published by Dr A. E. Burn in 1905.
2 The Greek patrology contains, however, besides the text, a Latin translation, and in both patrologies there is much editorial matter.

FATIMITES, or FATIMIDES, the name of a dynasty called after Fatima, daughter of the prophet Mahomet, from whom and her husband the caliph Ali, son of Abu Talib, they claimed descent. The dynasty is also called 'Obaidi (Ulaidi) after Obaidallah, the first sovereign, and 'Alawi, a title which it shares with other dynasties claiming the same ancestry. For a list of sovereigns see EGYPT, section History (Mohammedan period); three, however, must be prefixed who reigned in north-western Africa before the annexation of Egypt: al-Mahdi 'Obaidallah 297 (909); al-Qa'im Mahammed 322 (934); al-Mansur Isma'il 334 (943).

The dynasty owed its rise to the attachment to the family of the prophet which was widespread in the Moslem world, and the belief that the sovereignty was the right of one of its members. Owing, however, to the absence of the principle of primogeniture there was difference of opinion as to the person whose claim should be enforced, and a number of sects arose maintaining the rights of different branches of the family. The Fatimites were supported by those who regarded the sovereignty as vested in Isma'il, son of Ja'far al-Sadiq, great-great-grandson of Ali, through his second son Hosain (Husain). Of this Isma'il the first Fatimite caliph is supposed to be the great-grandson. The line of ancestors between him and Isma'il is, however, variously given, even his father's name being quite uncertain, and in some of the pedigrees even Isma'il does not figure. Apparently when the family first became of political importance their Ali'd descent was not disputed at Bagdad, and the poet al-Sharif al-Radi (d. A.H. 406: A.D. 1015), in whose family the office of Naqib (registrar of the Alids) was hereditary, appears to have acknowledged it (Diuwan, ed. Beirut, p. 972). When their success became a menace to the caliphs of Bagdad, genealogists were employed to demonstrate the falsity of the claim, and a considerable literature, both official and unofficial, rose in consequence. The founder of the dynasty was made out to be a scion of a family of heretics from whom the terrible Carmathian sect had originated: later on (perhaps owing to the rôle played by Isma'il, son of Killi, in bringing the caliph from Egypt), the founder was made out to have been a Jew, either as having been adopted by the heretic supposed to be his father, or as having been made to personate the real 'Obaidallah, who had been killed in captivity. While the stories that make him of either Jewish or Carmathian origin may be neglected, as the product of malice, the uncertainty of the genealogies offered by their partisans renders any positive solution of the problem impossible. What seems to be clear is that secretly within the Abbasid empire propaganda was carried on in favour of one or other Alid aspirant, and the danger which any such aspirant incurred for his life was forward openly disputed at Bagdad, and the poet al-Sharif al-Radi (d. A.H. 406: A.D. 1015), in whose family the office of Naqib (registrar of the Alids) was hereditary, appears to have acknowledged it (Diuwan, ed. Beirut, p. 972). was at the first made the seat of the court, and the Shi'ite doctrines were enforced on the inhabitants, not without encountering some opposition. Revolts which arose in different parts of the Aghlabite kingdom were, however, speedily quelled.

The course followed by 'Obaidallah in governing independently of al-Shi'i soon led to dissatisfaction on the part of the latter, who, urged on it is said by his brother, decided to dethrone their Mahdi, and on the occasion of an expedition to Ténès, which al-Shi'i commanded, organized a conspiracy with that end. The conspiracy was betrayed to 'Obaidallah, who took steps to defeat it, and on the last day of July 911 contrived to assassinate both al-Shi'i and his brother. Thus the procedure which had characterized the accession of the 'Abbasid dynasty was repeated. It has been conjectured that these assassinations lost the Fatimites the support of the Shi'ites, who continued to exist in the East, whence the Carmathians figure as an independent and even hostile community, though they appear to have been amenable to the influence of the African caliph.

'Obaidallah had now to face the dissatisfaction of the tribes whose allegiance al-Shi'i had won, especially the Kutāma, Zenāta and Lawāta: the uprising of the first assumed formidable proportions, and they even elected a Mahdi of their own, one Kādā b. Mu'ārik al-Māwātī, who promulgated a new revelation for their guidance. They were finally defeated by 'Obaidallah's son, Abu'l-Qa'im Mahommēd, who took Constantine, and succeeded in capturing the new Mahdi, whom he brought to Raqqāda. Other opponents were got rid of by 'Obaidallah by ruthless executions. By the middle of the year 913 by his own and his son's efforts he had brought his kingdom into order. After the style of most founders of dynasties he then selected a site for a new capital, to be called after his title Mahdiya (g.v.), on a peninsula called Ḥamāma (Cape Africa) S.S.E. of Kairawān. Eight years were spent in fortifying this place, which in 921 was made the capital of the empire.

After defeating internal enemies 'Obaidallah turned his attention to the remaining 'Abbasid possessions in Africa, and his general Habāsbā b. Yūsuf in the year 913 advanced along the northern coast, taking various places, including the important town of Barca, his progress, it is said, being marked by great cruelty. He then advanced towards Egypt, and towards the end of July 914, being reinforced by Abu'l-Qa'im, afterwards al-Qā'im, entered Alexandria. The danger led to measures of unusual energy being taken by the Bagdad caliph Moqtadīr, an army being sent to Egypt under Mu'nīs, and a special post being organized between that country and Bagdad to convey messages uninterruptedly. The Fatimite forces were defeated, partly owing to the insubordination of the general Habāsbā, in the winter of 914, and returned to Barca and Kairawān with great loss.

A second expedition was undertaken against Egypt in the year 919, and on the 10th of July Alexandria was entered by Abu'l-Qa'im, who then advanced southward, seizing the Fayyum and Ushmnāin (Eshmunain). He was presently reinforced by a fleet, which, however, was defeated at Rosetta in March of the year 920 by a fleet despatched from Tarsus by the 'Abbasid caliph Moqtadīr, most of the vessels being burned. Through the energetic measures of the caliph, who sent repeated reinforcements to Fostat, Abu'l-Qa'im was compelled in the spring of 921 to evacuate the places which he had seized, and return to the west with the remains of his army, which had suffered much from plague as well as defeat on the field. On his return he found that the court had migrated from Raqqāda to the new capital Mahdiya (g.v.). Meanwhile other expeditions had been despatched by 'Obaidallah towards the west, and Nekor (Nakur) and Fez had been forced to acknowledge his sovereignty.

The remaining years of 'Obaidallah's reign were largely spent in dealing with risings in various parts of his dominions, the success of which at times reduced the territory in which he was recognized to a small area.

'Obaidallah died on the 4th of March 933, and was succeeded by Abu'l-Qa'im, who took the title al-Qa'im bi'amir allah. He immediately after his accession occupied himself with the reconquest of Fez and Nekor, which had revolted during the last year of the former caliph. He also despatched a fleet under Ya'qūb b. ʿIshaq, which ravaged the coast of France, took Gran, and plundered the coast of Calabria before returning to Africa. A third attempt made by him to take Egypt resulted in a disastrous defeat at Dhāt al-Humān, after which a large part of the expedition retreated in disorder to Barca.

The later years of the reign of Qa'im were troubled by the uprising of Abū Yazid Makkhid al-Zenāti, a leader who during the former reign had acquired a following among the tribes inhabiting the Jebel Aures, including adherents of the Ḥādi sect. After having fled for a time to Mecca, this person returned in 937 to Tawzar (Touzer), the original seat of his operations, and was imprisoned by Qa'im's order. His sons, aided by the various tribes Zenāti, succeeded in forcing the prison, and releasing their father, who was continued to organize a conspiracy on a vast scale, and by the end of 943 was strong enough to take the field against the Fatimite sovereign, whom he drove out of Kairawān. Abū Yazid proclaimed himself a champion of Sunni doctrine against the Shi'is, and ordered the legal system of Mālik to be restored in place of that introduced by the Fatimites. Apparently the doctrines of the latter has as yet won little popularity, and Abū Yazid won an enormous following, except among the Kutāma, who remained faithful to Qa'im. On the last day of October 944, an engagement was fought between Kairawān, and Mahdia at a place called al-Akhāwan, which resulted in the rout of Qa'im's forces, and the caliph's being shortly after shut up in his capital, the suburbs of which he defended by a trench. Abū Yazid's forces were ill-suited to maintain a protracted siege, and since, owing to the former caliph's forethought, the capital was in a condition to hold out for a long time, many of them deserted and the besiegers gained no permanent advantage. After the siege had lasted some ten months Abū Yazid was compelled to raise it (September 943); the struggle, however, did not end with that event, and for a time the caliph and Abū Yazid continued to fight with fortune, while another remained over most of the caliph's dominions. On the 13th of January 946, Abū Yazid shut up Qa'im's forces in Susa which he began to besiege, and attempted to take by storm.

On the 18th of May 945, while Abū Yazid was besieging Susa, the caliph al-Qa'im died at Mahdia, and was succeeded by his son Ismā'īl, who took the title Maṣūr. He almost immediately relieved Susa by sending a fleet, which, joining with the garrison inflicted a severe defeat on Abū Yazid, who had to evacuate Kairawān also; but though the cities were mainly in the hands of Fatimite prefects, Abū Yazid was able to maintain the field for more than two years longer, while his followers were steadily decreasing in numbers, and he was repeatedly driven from fastnesses of the Sahara. In August 947 his last stronghold was taken, and he died of wounds received in defending it. His sons carried on some desultory warfare against Maṣūr after their father's death. A town called Maṣūrā or Ṣabārā was built adjoining Kairawān to celebrate the decisive victory over Abū Yazid, which, however, did not long preserve its name. The exhausted condition of north-west Africa due to the protracted civil war required some years of peace for recuperation, and further exploits are not recorded for Maṣūr, who died on the 10th of May 952.

His son, Abū Tamīm Maʿadd, was twenty-two years of age at the time, and succeeded his father with the title Mo'izz lidin allah. His authority was acknowledged over the greater part of the region now constituting Morocco, Algeria and Tunisia, as well as Sicily, and he appears to have had serious thoughts of endeavouring to annex Spain. At an early period in his reign he made Jauhar, who had been secretary under the former caliph, commander of the forces, and the services rendered by this person to the dynasty made him count as its second founder after al-Shi'i. In the years 958 and 959 he was sent westwards to reduce Fez and other strongholds where the authority of the caliph had been repudiated, and after a successful expedition advanced as far as the Atlantic. As early as 966 the plan of
attempting a fresh invasion of Egypt was conceived, and preparations made for its execution; but it was delayed, it is said at the request of the caliph's mother, who wished to make a pilgrimage to Mecca first; and her honourable treatment by Kâfûr when she passed through Egypt induced the caliph to postpone the invasion till that sovereign's death.

In August 972 Mo'izz resolved to follow Jahâr's pressing invitation to enter his new capital Cairo. With his arrival there the centre of the Fatimite power was transferred from Mahdiya and Kairawân to Egypt, and their original dominion became a province called al-Maghrib, which immediately fell into the hands of a hereditary dynasty, the Zeïrids, acknowledging Fatimite suzerainty. The first sovereign was Bulukkîn, also called Abu'l-Futûh Yusuf, appointed by Mo'izz as his viceroy on the occasion of their departure for Egypt: separate prefects were appointed for Sicily and Tripoli; and at the first minister of finance was to be an official independent of the governor of the Maghrib. On the death of Bulukkîn in 984 he was succeeded by a son who took the royal title al-Mu'azzam, under whose rule an attempt was made by the Kutâma, instigated by the caliph, to shake off the yoke of the Zeïrids, who originated from the Sanhaja tribe. This attempt was defeated by the energy of Manşûr in 988; and the sovereignty of the Fatimites in the Maghrib became more and more confined to recognition in public prayer and on coins, and the payment of tribute and the giving of presents to the viziers at Cairo. The fourth ruler of the Zeïrid dynasty, called Mo'izz, endeavoured to subdue 'Abbadîd suzerainty for Fatimite: his land was invaded by Arab colonies sent by the Emir to enlist his new capital Cairo. With Mo'izz fought a decisive engagement, after which the dominion of the Zeïrids was restricted to the territory adjoining Mahdiya; a number of smaller kingdoms rising up around them. The Zeïrids were finally overthrown by Roger II. of Sicily in 1148.

After the death of al-Adid, the last Fatimite caliph in Egypt, some attempts were made to place on the throne a member of the family, and at one time there seemed a chance of the Assassins, who formed a branch of the Fatimite sect, assisting in this project. In 1174 a conspiracy for the restoration of the dynasty was organized by 'Umarâh of Yemen, a court poet, with the aid of eight officials of the government: it was discovered and the plotters, who were implicated were executed. Two persons claiming Fatimite descent took the royal titles al-Mu'âqthin billah and al-Hâmîd lillah in the years 1175 and 1176 respectively; and as late as 1192 we hear of pretenders in Egypt. Some members of the family are traceable near the end of the 7th century of Islam.

The doctrines of the Fatimites as a sect, apart from their claim to the sovereignty in Islam, are little known, and we are not justified in identifying them with those of the Assassins, the Carmathians or the Druzes, though all these sects are connected with them in origin. A famous account is given by Maqrîzî of a system of education by which the neophyte had doubts gently instilled into his mind till he was prepared to take the allegorical meaning of the Kûran set before him, and to substitute some form of natural for revealed religion. In most accounts of the early days of the community it is stated that the permission of wine-drinking and licentiousness, and the community of wives and property formed part of its tenets. There is little in the recorded practice of the Fatimite state to confirm or justify these assertions; and they appear to have differed from orthodox Moslems rather in small details of ritual and law than in deep matters of doctrine.

FAUBOURG—FAUCHER

The French name for a portion of a town which lies outside the walls, hence properly a suburb. The name survives in certain parts of Paris, such as the Faubourg St Antoine, and the Faubourg St Germain, &c., which have long since ceased to be suburbs and have become portions of the town itself. The origin of the word is doubtful. The earlier spelling fauz-bourg, and the occurrence in medieval Latin of falsus-burgus (see Ducange, Glossariorum, s.v. "Falsus-Burgus"), was taken as showing its obvious origin and meaning, the sham or quasi-borough. The generally accepted derivation is from the Latin words faustum and burgus (Lat. fortis, outside the gates), and bourg. It is suggested that the word is the French adaptation of the Ger. Pfahlbürger, the burghers of the pale, i.e. outside the walls but within the pale.

FAUCES (a Latin plural word for "throat"); the singular faux is rarely found, in anatomy, the hinder part of the mouth, which leads into the pharynx; also an architectural term given by Vitruvius to narrow passages on either side of the tablinum, through which access could be obtained from the atrium to the peristyliar court in the rear.

FAUCHER, LÉONARD JOSEPH [LÉON] (1803-1854), French poet and economist, was born at Limoges on the 8th of September 1803. When he was nine years old the family removed to Toulouse, where the boy was sent to school. His parents were separated in 1816, and Léon Faucher, who resisted his father's attempts to put him to a trade, helped to support himself and his mother during the rest of his school career by designing embroidery and needlework. As a private tutor in Paris he continued his studies in the direction of archaeology and history, but with the revolution of 1830 he was drawn into active political journalism on the Liberal side. He was on the staff of the Temps from 1830 to 1833, when he became editor of the Courrier de la Constitution en Louisianes. A Sunday journal of his own, Le Bien public, proved a disastrous financial failure; and his political independence having caused his retirement from the Constitutionnel, he joined in 1834 the Courrier français, of which he was editor from 1839 until 1841, when the paper changed hands. Faucher belonged in policy to the dynastic Left, and consistently preached moderation to the more ardent Liberals. On resigning his connexion with the Courrier français he gave his attention chiefly to economic questions. He advocated a customs union between the Latin countries to counterbalance the German Zollverein, and in view of the impracticability of such a measure proposed his proposal in 1847 to a customs union between France and Belgium. In 1843 he visited England to study the English social system, publishing the results of his investigations in a famous series of Études sur l'Angleterre (2 vols., 1843), published originally in the Revue des deux mondes. He helped to organize the Bordeaux association for free-trade propaganda, and it was as an advocate of free trade that he was elected in 1847 to the chamber of deputies for Reims. After the revolution of 1848 he entered the Constituent Assembly for the department of Marne, where he opposed many Republican measures—the limitation of the hours of labour, the creation of the national relief works in Paris, the abolition of the death penalty and others. Under the presidency of Louis Napoleon he became minister of public works, and then minister of the interior, but his action in seeking to influence the coming elections by a circular letter addressed to the prefects was censured by the Constituent Assembly, and he was compelled to resign office on the 14th of May 1849. In 1851 he was again minister of the interior until Napoleon declared his intention of resorting to universal suffrage. After the coup d'état of December he refused a seat in the consultative commission instituted by Napoleon. He had been elected a member of the Academy of Moral and Political Science in 1849, and his retirement from politics permitted a return to his writings on economics. He had been to Italy in search of health in 1854, and was returning to Paris on business when he was seized by typhoid at Marseilles, where he died on the 14th of December 1854.

His miscellaneous writings were collected (2 vols., 1856) as Mélanges d'économie politique et de finance; and his speeches in the legislature are printed in vol. ii. of Léon Faucher, biographie et correspondance (2 vols., 2nd ed., Paris, 1875).
FAUCHET, CLAUDE (1530-1601), French historian and antiquary, was born at Paris on the 3rd of July 1530. Of his early life few particulars are known. He applied himself to the study of the early French chronicles, and proposed to publish extracts which would throw light on the first periods of the monarchy. During the civil wars he lost a large part of his books and manuscripts in a riot, and was compelled to leave Paris. He then settled at Marseilles. Attaching himself afterwards to Cardinal de Tournon, he accompanied him in 1554 to Italy, whence he was several times sent on embassies to the king, with reports on the siege of Kilkenny and services at length procured him the post of president of the chambre des monnaies, and thus enabled him to resume his literary studies. Having become embarrassed with debt, he found it necessary, at the age of seventy, to sell his office; but the king, amused with an epigram, gave him a pension, with the title of historiographer of France. Fauchet has the reputation of an impartial and scrupulously accurate writer; and in his works are to be found important facts not easily accessible elsewhere. He was, however, entirely uncritical, and his style is singularly inelegant. His principal works (1579, 1590) treat of Gaulish and French antiquities, and contain a minute account of the origin of the French language and poetry, of the liberties of the Gallican church, &c. A collected edition was published in 1610. Fauchet took part in a translation of the Annals of Tacitus (1582). He died at Paris about the close of 1601.

FAUCHET, CLAUDE (1744-1793), French revolutionary bishop, was born at Dornes (Nièvre) on the 22nd of September 1744. He was a curate of the church of St Roch, Paris, when he was engaged as tutor to the children of the marquis of Choiseul, brother of Louis XV.'s minister, an appointment which proved to be the first step to fortune. He was successively grand vicar to the bishop of Bourges, preacher to the king, and abbot of Montfort-Lacarré. The "philosophic" tone of his sermons caused his dismissal from court in 1788 before he became a popular speaker in the Parisian societies. He was one of the leaders of the attack on the Bastille, and on the 4th of August 1789 he delivered an eloquent discourse by way of funeral sermon for the citizens slain on the 14th of July, taking as his text the words of St Paul: "Ye have been called to liberty." He blessed the tricolour flag for the National Guard, and in September was elected to the Commune, from which he retired in October 1790. During the next winter he organized in the Palace Royal the "Social Club of the Society of Friends of Truth," presiding over crowded meetings under the self-assumed title of procureur général de la vérité. Nevertheless, events were marching faster than his opinions, and the last occasion on which he carried his public with him was in a sermon preached at Notre Dame on the 14th of February 1791. In May he became constitutional bishop of Calvados, and was presently returned by the department to the Legislative Assembly, and afterwards to the Convention. At the king's trial he voted for the appeal to the people and for the penalty of imprisonment. He protested against the execution of Louis XVI. in the Journal des amis (January 26, 1793), and next month was denounced to the Convention for prohibiting married priests from the exercise of the priesthood in his diocese. He remained secretary to the Convention until the accusation of the Girondists in May 1793. In July he was imprisoned on the charge of supporting the federalist movement at Caen, and of complicity with Charlotte Corday, whom he had taken to see a sitting of the Convention on her arrival in Paris. Of the second of these charges he was certainly innocent. With the Girondist deputies he was brought before the revolutionary tribunal on the 30th of October, and was guillotined on the following day.

Notes Mémoires... ou Lettres de Claude Fauchet (5th ed., 1793); Notes sur Claude Fauchet (Caen, 1842).

FAUCIT, HELENA SAVILLE (1817-1898), English actress, the daughter of John Saville Faucit, an actor, was born in London. Her first London appearance was made on the 5th of January 1836 at Covent Garden as Julia in The Hunchback. Her success in this was so definitely confirmed by her subsequent acting of Juliet, Lady Teazle, Beatrice, Imogen and Hermione, that within eighteen months she was engaged by Macready as leading lady at Covent Garden. There, besides appearing in several Shakespearian characters, she created the heroine's part in Lytton's Duchess de la Vallière (1836), Lady of Lyons (1838), Richelieu (1839), The Sea Captian (1839), Money (1840), and Browning's Stradford (1837). After a visit to Paris and a short season at the Haymarket, she joined the Drury Lane company under Macready early in 1842. There she played Lady Macbeth, Lytton's La Valse, and Shakespeare's Cleopatra, and part in the first production of Westmarston's Patrician's Daughter (1842) and Browning's Blot on the Scutcheon (1843). Among her successful tours was included a visit to Paris in 1844-1845, where she acted with Macready in several Shakespearian plays. In 1851 she was married to Mr (afterwards Sir) Theodore Martin, but still acted occasionally for charity. One of her last appearances was as Beatrice, on the opening of the Shakespeare Memorial at Stratford-on-Avon on the 23rd of April 1879. In 1881 there appeared in Blackwood's Magazine the first of her Letters on some of Shakespeare's Heroines, which were published in book form as Shakespeare's Female Characters (1889). Lady Martin died at her home near LLangollen in Wales on the 31st of October 1898. There is a tablet to her in the Shakespeare Memorial with a portrait figure, and the marble pulpit in the Shakespeare church—with her portrait of Saint Helena—was given in her memory by her husband.

See Sir Theodore Martin's Helenæ Faucit (1900).

FAUJAS DE SAINT-FOND, BARTHÉLEMY (1741-1810), French geologist and traveller, was born at Montélimart on the 17th of May 1741. He was educated at the Jesuits' College at Lyons and afterwards went to Grenoble, applied himself to the study of law, and was admitted a lawyer and a member of the parliament. He rose to be president of the seneschal's court (1765), a post which he honourably filled, but the duties of which became irksome, as he had early developed a love of nature and his favourite relaxation was found in visits to the Alps. There he began to study the forms, structure, composition and superposition of rocks. In 1775 he discovered in the Velay a rich deposit of pozzuolana, which in due course was worked by the government. In 1776 he put himself in communication with Buffon, who was not slow to perceive the value of his labours. This post till he was nearly eighty years of age, retiring in 1807 to his estate of Saint-Fond in Dauphiné. Faujas took a warm interest in the balloon experiments of the brothers Montgolfier, and published a very complete Description des experiences de la machine aérostatique de M. Montgolfier, &c. (1783, 1848). He contributed many scientific memoirs to the Annales and the Mémoires of the museum of natural history. Among his separate works, in addition to those already named are—Histoire naturelle de la province de Dauphiné (1781, 1782); Minéralogie des volcans.
FAULT (Mid. Eng. faute, through the French, from the popular Latin use of fallere, to fail; the original of the Latin being replaced in English in the 15th century), a failing, mistake or defect.

In geology, the term is given to a plane of dislocation in a portion of the earth’s crust; synonyms used in mining are “trouble,” “throw” and “heave”; the German equivalent is Verwerfung, and the French faille. Faults on a small scale are sometimes sharply defined planes, as if the rocks had been sliced through and fitted together again after being shifted (fig. 1). In such cases, however, the harder portions of the dislocated rocks will usually be found “slickensided.” More frequently some disturbance has occurred on one or both sides of the fault. Sometimes in a series of strata the beds on the side which has been pushed up are bent down against the fault, while those on the opposite side are bent up (fig. 2). Most commonly the rocks on both sides are considerably broken, jumbled and crumpled, so that the line of fracture is marked by a belt or wall-like mass of fragmentary rock, fault-rock, which may be several yards in breadth. Faults are to be distinguished from joints and fissures by the fact that there must have been a movement of the rock on one side of the fault-plane relatively to that on the other side. The trace of a fault-plane at the surface of the earth is a line (or belt of fault-rock), which in geological mapping is often spoken of as a “fault-line” or “line of fault.”

represents the plan of a simple fault; quite frequently, however, the main fault subdivides at the extremities into a number of minor faults (fig. 4), or the main fault may be accompanied by lateral subordinate faults (fig. 5), some varieties of which have been termed flake or Blatts.

“Fault-planes” are sometimes perpendicular to the horizon, but more usually they are inclined at a greater or lesser angle. The angle made by the fault-plane with the vertical is the hade of the fault (if the angle of inclination were measured from the horizon, as in determining the “dip” of strata, this would be expressed as the “dip of the fault”). In figs. 1 and 2 the faults are hading towards the right of the reader. The amount of dislocation as measured along a fault-plane is the displacement of the fault (for an illustration of these terms see fig. 18, where they are applied to a thrust fault); the vertical displacement is the throw (Fr. rejet); the horizontal displacement, which even with vertical movement must arise in all cases where the faults are not perpendicular to the horizon and the strata are not horizontal, is known as the heave. In fig. 6 the displacement is equal to the throw in the fault A; in the fault B the displacement is more than twice as great as in A, while the throw is the same in both; the fault A has no heave, in B it is considerable. The rock on that side of a fault which has dropped relatively to the rock on the other is said to be upon the downthrow side of the fault; conversely, the relatively uplifted portion is the upthrow side. The two fault faces are known as the “hanging-wall” and the “foot-wall.”

The relationship that exists between the hade and the direction of throw has led to the classification of faults into “normal faults,” which hade under the downthrow side, or in other words, those in which the hanging-wall has dropped; and “reversed faults,” which hade beneath the upthrow side, that is to say, the foot-wall exhibits a relative sinking. Normal faults are exemplified in figs. 1, 2, and 6; in the latter the masses A and B are on the downthrow sides, C is upthrown. Fig. 7 represents a small reversed fault. Normal faults are so called because they are more generally prevalent than the other type; they are sometimes designated “drop” or “gravity” faults, but these are misleading expressions and should be disunconnected. Normal faults are regarded as the result of stretching of the crust, hence they have been called “tension” faults as distinguished from reversed faults, which are assumed to be due to pressure. It is needful, however, to exercise great caution in accepting this view except in a restricted and localized sense, for there are many instances in which the two forms are intimately associated (see fig. 8), and a whole complex system of faults may be the result of horizontal (tangential) pressure alone or even of direct vertical uplift. It is often tacitly assumed

that most normal and reversed faults are due to simple vertical movements of the fractured crust-blocks; but this is by no means the case. What is actually observed in examining a fault is the apparent direction of motion; but the present position of the dislocated masses is the result of real motion or series of motions, which have taken place along the fault-plane at various angles from horizontal to vertical; frequently it can be shown that these movements have been extremely complicated. The striations and "slickensides" on the faces of a fault indicate only the direction of the last movement.

A single normal fault of large throw is sometimes replaced by a series of close parallel faults, each throwing a small amount in the same direction; if these subordinate faults occur within a narrow width of ground they are known as distribution faults; if they are more widely separated they are called step faults (fig. 9). Occasionally two normal faults have towards one another and intersect, and the rock mass between them has been let down; this is described as a trough fault (fig. 10). A fault running parallel to the strike of bedded rocks is a strike fault; one which runs along the direction of the fault-plane is a dip fault; a so-called diagonal fault takes a direction intermediate between these two directions. Although the effects of these types of fault upon the outcrops of strata differ, there are no intrinsic differences between the faults themselves.

The effect of normal faults upon the outcrop may be thus briefly summarized: a strike fault that hades with the direction of the dip may cause beds to be cut out at the surface on the upthrow side; if it hades against the dip direction it may repeat some of the beds on the upthrow side (figs. 11 and 12). With dip faults the crop is carried forward (down the dip) on the upthrow side. The perpendicular distance between the crop of the bed (dike or vein) on opposite sides of the fault is the "offset." The offset decreases with increasing angle of dip and increases with increase in the throw of the fault (fig. 13).

Faults which run obliquely across the direction of dip, if they hades with the dip of the strata, will produce offset with "gap" between the outcrops; if they hades in the opposite direction to the dip, offset with "overlap" is caused; in the latter case the crop moves forward (down dip) on the denuded upthrow side, in the former it moves backward. The effect of a strike fault of diminishing throw is seen in fig. 14. Faults crossing folded strata cause the outcrops to approach on the upthrow side of a syncline and tend to separate the outcrops of an anticycle (figs. 15, 16, 17).

In the majority of cases the upthrow side of a fault has been so reduced by denudation as to leave no sharp upstanding ridge; but examples are known where the upthrown side still
exists as a prominent cliff-like face of rock, a "fault-scarp"; familiar instances occur in the Basin ranges of Utah, Nevada, &c., and many smaller examples have been observed in the areas affected by recent earthquakes in Japan, San Francisco and other places. But although there may be no sharp cliff, the effect of faulting upon topographic forms is abundantly evident wherever a harder series of strata has been brought in juxtaposition to softer rocks. By certain French writers, the upstanding side of a faulted piece of ground is said to have a regard, thus the faults of the Jura Mountains have a "regard français," and in the same region it has been observed that in curved faults the convexity is directed the same way as the regard. Occasionally one or more parallel faults have let down an intervening strip of rock, thereby forming "fault valleys" or Gruben (Grabensenken); the Great Rift Valley is a striking example. On the other hand, a large area of rock is sometimes lifted up, or surrounded by a system of faults, which have let down the encircling ground; such a fault-block is known also as a horst; a considerable area of Green- land stands up in this manner.

Faults have often an important influence upon water-supply by bringing impervious beds up against pervious ones or allowing water to flow away that would otherwise be conserved. Springs often rise along the outcrop of a fault. In coal and metal mining it is evident from what has already been said that faults must act sometimes beneficially, sometimes the reverse. It is a common occurrence for fault-fissures and fault-rock to appear as valuable mineral lodes through the infilling or impregnation of the spaces and broken ground with mineral ores.

In certain regions which have been subjected to very great crustal disturbance a type of fault is found which possesses a very low hade—sometimes only a few degrees from the horizontal—and, like a reversed fault, hides beneath the upthrown mass; these are termed thrusts, overthrusts, or overthrust faults (Fr. recouvrements, failles de chevauchement, charriages; Ger. Überbewegungen, Übersprünge, Wechsel, Fallen- erwerfungen). Thrusts should not be confused with reversed faults, which have a strong hade. Thrusts play a very important

part in the N.W. highlands of Scotland, the Scandinavian high- lands, the western Alps, the Appalachians, the Belgian coal region, &c. By the action of thrusts enormous masses of rock have been pushed almost horizontally over underlying rocks, in some cases for several miles. One of the largest of the Scandinavian thrust

**Figure 19**—Section of a very large thrust in the Durness Eriboll district, Scotland.
masses is 1120 m. long, 80 m. broad, and 5000 ft. thick. In Scotland three grades of thrusts are recognized, maximum, major, and minor thrusts; the last have very generally been truncated by those of greater magnitude. Some of these great thrusts have received distinguishing names, e.g., the Moine thrust (fig. 19) and the Ben More thrust; similarly in the coal basin of Mons and Valenciennes we find the faille de Beauss and the Grande faille du midi. Overturned folds are frequently seen passing into thrusts. Bayley Willis has classified thrusts as (1) Shear thrusts, (2) Break thrusts, (3) Stretch thrusts, and (4) Erosion thrusts.

D. E. Marr ("Notes on the Geology of the English Lake District," Proc. Geol. Assoc., 1900) has described a type of fault which may be regarded as the converse of a thrust fault. If we consider a series of rock masses A, B, C—of which A is the oldest and undermost—undergoing thrusting, say from south to north, should the mass C be prevented from moving forward as rapidly as B, a low-hanging fault may form between C and B and the mass C may lag behind; similarly the mass B may lag behind A. Such faults Dr. Marr calls "lag faults." A mass of rock suffering thrusting or lagging may yield unequally in its several parts, and those portions tending to travel more rapidly than the adjoining masses in the fault zone may be cut off by fractures. Thus the faster-moving blocks will be separated from the slower ones by faults approximately normal to the plane of movement: these are described as "tear faults."

Faults may occur in rocks of all ages; small local dislocations are observable even in glacial deposits, alluvium and loess. A region of faulting may continue to be so through more than one geological period. Little is known of the mechanism of faulting or of the causes that produce it; the majority of the text-book explanations will not bear scrutiny, and there is room for extended observation and research. The sudden yielding of the strata along a plane of faulting is a familiar cause of earthquakes.

(À. G.; J. A. H.)

**FAUNA**, the name, in Roman mythology, of a country goddess of the fields and cattle, known sometimes as the sister, sometimes as the wife of the god Faunus; hence the term is used collectively for all the animals in any given geographical area or geological period, or for an enumeration of the same. It thus corresponds to the term "flora" in respect to plant life.

**FAUNTERLYO**, HENRY (1785–1824), English banker and forger, was born in 1785. After seven years as a clerk in the London bank of Marsh, Sibbald & Co., of which his father was one of the founders, he was taken into partnership, and the whole business of the firm was left in his hands. In 1824 the bank suspended payment. Fauntleroy was arrested on the charge of appropriating trust funds by forging the trustees' signatures, and was committed for trial, it being freely rumoured that he had appropriated £250,000, which he had squandered in debauchery. He was tried at the Old Bailey, and, the case against him having been proved, he admitted his guilt, but pleaded that he had used the missappropriated funds to pay his firm's debts. He was found guilty and sentenced to be hanged. Seventeen merchants and bankers gave evidence as to his general integrity at the trial, and after his conviction powerful influence was brought to bear on his behalf, and his case was twice argued before judges on points of law. An Italian named Angeli even offered to take Fauntleroy's place on the scaffold. The efforts of his many friends were, however, unavailing, and he was executed on the 30th of November 1824. A wholly unfounded rumour was widely credited for some time subsequently to the effect that he had escaped strangulation by inserting a silver tube in his throat, and was living comfortably abroad.

See A. Griffith's Chronicles of Newgate, ii. 294-300, and Pierce Egan's Account of the Trial of Mr Fauntleroy.

**FAUNUS** (i.e. the "kindly," from Lat. favus, or the "speaker," from furus), an old Italian rural deity, the bestower of fruitfulness on fields and cattle. As such he is akin to or identical with Inus ("fructifier") and Lupercus (see LUPERCALIA). Faunus also revealed the secrets of the future by strange sounds from the woods, or by visions communicated to those who slept within his precincts in the skin of sacrificed lambs; he was then called Fatusus, and with him was associated his wife or daughter Fatua. Under Greek influence he was identified with Pan, and just as there was supposed to be a number of Panisci, so the existence of many Faunus was assumed—misshapen and mischievous goberni of the forest, with painted ears, tails and goat's feet, and would leap to torment sleepers with hideous nightmares. In a poetic tradition Faunus is an old king of Latium, the son of Picus (Mars) and father of Latinus, the teacher of agriculture and cattle-breeding, and the introducer of the religious system of the country, honoured after death as a tutelary divinity. Two festivals called Faunalia were celebrated in honour of Faunus, one on the 13th of February in his temple on the island in the Tiber, the other in the country on the 4th of December (Ovid, Fasti, li. 193; Horace, Odes, iii. 18. 10). At these goats were sacrificed to him with libations of wine and milk, and he was implored to propitious to fields and flocks. The peasants and shepherds also at the same time amused themselves with dancing in the meadows.

**FAURE, FRANCOIS PÉLIX** (1841–1899), President of the French Republic, was born in Paris on the 30th of January 1841, being the son of a small furniture maker. Having started as a tanner and merchant at Havre, he acquired considerable wealth, was elected to the National Assembly on the 21st of August 1881, and took his seat as a member of the Left, interesting himself chiefly in matters concerning economies, railways and the navy. In November 1882 he became under-secretary for the colonies in M. Ferry's ministry, and retained the post till 1885. He held the same post under M. Thirard's ministry in 1888. In 1885 he was made vice-president of the chamber. In 1894 he obtained cabinet rank as minister of marine in the administration of M. Dupuy. In the January following he was unexpectedly elected president of the Republic upon the resignation of M. Casimir-Périers. The principal cause of his elevation was the determination of the various sections of the moderate republican party to exclude M. Brisson, who had had a majority of votes on the first ballot, but had failed to obtain an absolute majority. To accomplish this end it was necessary to unite among themselves, and union could only be secured by the nomination of some one who offended nobody. M. Faure answered perfectly to this description. His fine presence and his tact on ceremonial occasions rendered the state some service when in 1896 he received the Tsar of Russia at Paris, and in 1897 returned his visit, after which meeting the momentous Franco-Russian alliance was publicly announced. The latter days of M. Faure's presidency were embittered by the Dreyfus affair, which he was determined to regard as chose jugde. But at a critical moment in the proceedings his death occurred suddenly, from apoplexy, on the 16th of February 1899. With all his faults, and in spite of no slight amount of personal vanity, President Faure was a shrewd political observer, and a good politician and diplomat.

After his death, some alleged extracts from his private journals, dealing with French policy, were published in the Paris press.

See E. Maillard, Le Président F. Faure (Paris, 1897); P. Bluyens, Félix Faure intime (1898); and F. Martin-Ginouvier, F. Faure devant l'histoire (1895).

**FAURE, GABRIEL** (1845– ), French musical composer, was born at Pamiers on the 13th of May 1845. He studied at the school of sacred music directed by Niedermeyer, first under Dietrich, and subsequently under Saint-Saëns. He became "maître de chapelle" at the church of the Madeleine in 1877, and served as organist in 1896. His works include a symphony in D minor (Op. 40), two quartets for piano and strings (Op. 15 and 45), a suite for orchestra (Op. 12), sonata for violin and piano (Op. 13), concerto for violin (Op. 14), berceuse for violin, ëlége for violoncello, pavane for orchestra, incidental music for Alexandre Dumas' Caligula and De Hararouc's Shylock,
FAURIEL—FAUST

a requiem, a cantata, The Birth of Venus, produced at the Leeds festival in 1808, a quantity of piano music, and a large number of songs. Fauré occupies a place by himself among modern French composers. He delights in the imprévu, and loves to wander through labyrinthine harmonies. There can be no denying the intense fascination and remarkable originality of his music. His muse is essentially aristocratic, and suggests the surroundings of the boudoir and the perfume of the hot-house.

FAURIEL, CLAUDE CHARLES (1772–1844), French historian, philologist and critic, was born at St Étienne on the 21st of October 1772. Though the son of a poor joiner, he received a good education in the Oratorian colleges of Tournon and Lyons. He was twice in the army—at Perpignan in 1793, and in 1796–1797 at Briançon, as private secretary to General J. Servan de Gerbe (1741–1808); but he preferred the civil service and the companionship of his friends and his books. In 1794 he returned to St Étienne, where, but only for a short period, he filled a municipal office; and from 1797 to 1799 he devoted himself to strenuous study, more especially of the literature and history, both ancient and modern, of Greece and Italy. Having paid a visit to Paris in 1799, he was introduced to Fouché, minister of police, who induced him to become his private secretary. Though he discharged the duties of this office to Fouché’s satisfaction, his strength was overtasked by his continued application to study, and he found it necessary in 1801 to recruit his health by a three months’ trip in the south. In resigning his office in the following year he was actuated as much by these considerations as by the schemes he put forward in serving longer under Napoleon, when the latter, in violation of strict republican principles, became consul for life. This is clearly shown by the fragments of Memoirs discovered by Ludovic Lalanne and published in 1886.

Some articles which Fauriel published in the Décade philosophique (1800) on a work of Madame de Staël’s—De la littérature considérée dans ses rapports avec les institutions sociales—to an intimate friendship with her. About 1802 he contracted with Madame de Condorcet a liaison which lasted till her death (1822). It was said of him at the time that he gave up all his energies to love, friendship and learning. The salon of Mme de Condorcet was throughout the Consulate and the first Empire a rallying point for the dissident republicans. Fauriel was introduced by Madame de Staël to the literary circle of Auteuil, which gathered round Destutt de Tracy. Those who enjoyed his closest intimacy were the physiologist Cabanis (Madame de Condorcet’s brother-in-law), the poet Manzoni, the publicist Benjamin Constant, and Guizot. Later Tracy introduced him to Aug. Thierry (1821) and perhaps Thiers and Miguet. During his connexion with Auteuil, Fauriel’s attention was naturally turned to philosophy; and for some years he was engaged on a history of Stoicism, which was never completed, all the papers connected with it having accidentally perished in 1814. He also studied Arabic, Sanskrit and the old South French dialects. He published in 1810 a translation of the Parthenais of the Danish poet Baggesen, with a preface on the various kinds of poetry; in 1823 translations of two tragedies of Manzoni, with a preface “Sur la théorie de l’art dramatique”; and in 1824–1825 his translation of the popular songs of modern Greece, with a “Discours préliminaire” on popular poetry.

The Revolution of July, which put his friends in power, opened to him the career of higher education. In 1830 he became professor of foreign literature at the Sorbonne. The Histoire de la Gaude méridionale sous la domination des conquérants germaniques (4 vols., 1836) was the only completed section of a general history of southern Gaul which he had projected. In 1836 he was elected a member of the Academy of Inscriptions, and in 1837 he published (with an introduction the conclusions of which would not now all be endorsed) a translation of a Provençal poem on the Albigensian war. He died on the 15th of July 1844. After his death his friend Mary Clarke (afterwards Madame J. Mühl) published his Histoire de la littérature provençale (3 vols., 1846)—his lectures for 1831–1832. Fauriel was biased in this work by his preconceived and somewhat fanciful theory that Provence was the cradle of the chansons de geste and even of the Round Table romances; but he gave a great stimulus to the scientific study of Old French and Provençal. 

Dante et les origines de la langue et de la littérature italiennes (2 vols.) was published in 1854.

Fauriel’s Mémoires, found with Condorcet’s papers, are in the Institute library. They were written at latest in 1804, and include some interesting fragments on the close of the consolate, Moreau, &c. Though anonymous, Lalanne, who published them (Les Derniers Jours du Consulat, 1886), proved them to be in the same handwriting as the Fauriel in 1857. The same library has Fauriel’s corres-pondence, catalogued by Ad. Régnier (1900). Benjamin Constant’s letters (1802–1823) were published by Victor Glachant in 1895. For Fauriel’s correspondence with Guizot see Nouvelle Rev. (Dec. 1, 1904, by V. Glachant), and his letter to Miss Clarke (1822–1844) the Revue des deux mondes (1908–1909) by E. Rod.) See further Sainte-Beuve, Portraits contemporains, ii.; Antoine Guillot, Le Salon de Mme Hélénius (1894) and La Marquise de Condorcet (1897); O’Meara, Un Salon à Paris: Mme Möhl (undated); and J. B. Galley, Claude Fauriel (1909).

FAUST, or FAUSTUS, the name of a magician and charlatan of the 16th century, famous in legend and in literature. The historical Faust forms little more than the nucleus round which a great mass of legendary and imaginative material gradually accumulated. That such a person existed there is, however, sufficient proof. He is first mentioned in a letter, dated August 20, 1507, of the learned Benedictine Johann Trithem or Trithe-mus (1452–1516), abbot of Spanheim, to the mathematician and astrologer Johann Windung, at Hassfurt, who had apparently written about him. Trithemius, himself reputed a magician, and the author of a mystical work (published at Darmstadt in 1621 under the title of Sleganographica and burnt by order of the Spanish Inquisition), speaks contemptuously of Faust, who called himself Magister Georgius Sabellicus Faustus Junior, as a fool rather than a philosopher (fatuum non philosophum), a vain babbler, vagabond and mountebank who ought to be whipped, and who had fled from the city rather than confront him. The insane conceit of the man was proved by his boast that, were all the works of Aristotle and Plato blotted from the memory of men, he could restore them with greater elegance, and that Christ’s miracles were nothing to marvel at, since he could do the like whenever and as often as he pleased; his debased character by the fact that he had been forced to flee from the school of which he had been appointed master by the discovery of his unnatural crimes. The same unflattering estimate is contained in the second extant notice of Faust, in a letter of the jurist and canon Konrad Mudt (Mutianus Rufus), of the 3rd of October 1513, to Heinrich Urbanus. Mudt, like Trithemius, simply regards Faust as a charlatan. Similar is the judgment of another contemporary, Philipp Begardi, who in the fourth chapter of his Index sanctorum (Worms, 1539) ranks Faust, with the name of Faustus of Paris, among the “wicked, cheating, useless and unlearned doctors.”

It was Johann Gass (d. 1572), a worthy Protestant pastor of Basel, who like Mudt claims to have come into personal contact with Faust, who in his Sermones convivales (Basel, 1543) first credited the magician with genuine supernatural qualities. Gast, a man of some learning and much superstition, believed Faust to be in league with the devil, by whom about 1525 he was ultimately carried off, and declared the performing horse and dog by which the necromancer was accompanied to be familiar and evil spirits. Further information was given to the world by Johann Mannel or Manlius (d. 1560), councillor and historian to the emperor Maximilian II., in his Locorum communium collectanea (Basel, undated). Manlius reports a conversation of Melanchthon, which there is no reason to suspect of being other than genuine, in which the Reformer speaks of Faust as “a disgraceful beast and sewer of many devils,” as having been born at Kundling (Kundlingen or Knittlingen), a little town near his own native town of (Breiten), and as having studied magic at Cracow. The rest of the information given can hardly be regarded as historical, though Melanchthon, who, like Luther, …

1 The opinion, long maintained by some, that he was identical with Johann Fust, the printer, is now universally rejected.
was no whit less superstitious than most people of his time, evidently believed it to be so. According to him, among other marvels, Faust was killed by the devil wringing his neck. While he lived he had taken about with him a dog, which was really a devil. A similar opinion would seem to have been held of Faust by Luther also, who, in Widmann’s Faust-book is mentioned as having declared that, by God’s help, he had been able to ward off the evils which Faust with his sorceries had sought to put upon him. The passage, with the omission of Faust’s name, occurs word for word in Luther’s Table-talk (ed.C.E. Förstemann, vol. i. p. 50). It is not improbable, then, that Widmann, in supplying the name of the necromancer omitted in the Table-talk, may be giving a fuller account of the conversations between Bebel and Faust. Lastly, in his Theatrum de beneficis (Frankf., 1560) mentions Faust as one of those “of whom the Scriptures speak, in various places, calling them magi.” Lastly Johann Weiher, Wierus or Piscinarius (1574–1588)–a pupil of Cornelius Agrippa, body physician to the duke of Cleves and a man of enlightenment, who opposed the persecution of witches—in his De praecariis daemonum (Basel, 1563, &c.), speaks of Faust as a drunken vagabond who had studied magic at Cracow, and before 1540 had practised “this beautiful art shamelessly up and down Germany, with unspirable deceit, many lies and great effect.” He goes on to tell how the magicians had bewitched him on an unhappy parish priest, who had refused to supply him any longer with drink, by giving him a depilatory which removed not only the beard but the skin, and further, how he had insulted a poor wretch, for no better reason than that he had a black beard, by greeting him as his cousin the devil. Of his superhuman powers Weiher evidently believes nothing, but he tells the tale of his being found dead with his neck wrung, after the whole house had been shaken by a terrific din.

The sources above mentioned, which were but the first of numerous works on Faust, of more or less value, appearing throughout the next two centuries, give a sufficient picture of the man as he appeared to his contemporaries in his wandering charlatan who lived by his wits, cheiromantist, astrologer, diviner, spiritualist medium, alchemist, or, to the more credulous, a necromancer whose supernatural gifts were the outcome of a soul pact with the enemy of mankind. Whatever his character, his efforts to secure a widespread notoriety had, by the time of his death, certainly succeeded. By the latter part of the 16th century he had become the necromancer par excellence, and all that legend had to tell about the great wizards of the middle ages, Virgil, Pope Silverstre, Roger Bacon, Michael Scot, or the mythic Klingsor, had become for ever associated with his name. When in 1587, the oldest Faust-book was published, the Faust legend was, in all essential particulars, already complete.

The origin of the main elements of the legend must be sought far back in the middle ages and beyond. The idea of a compact with the devil, for the purpose of obtaining superhuman power or knowledge, is of Jewish origin, dating from the centuries immediately before and after the Christian era which produced the Talmud, the Kabbalah and such magical books as that of Enoch. In the mystical rites—in which blood, as the seat of life, played a great part—that accompanied the incantations with which the Jewish magicians evoked the Satanim—the lowest grade of those elemental spirits (shdmun) who have their existence beyond the dimensions of time and space—we have the prototypes and originals of all the ceremonies which occupy the books of magic down to the various versions of the Hallewewung ascribed to Faust. The other principle underlying the Faust legend, the belief in the essentially evil character of purely human learning, has existed ever since the triumph of Christianity set divine revelation above human science. The legend of Theophilus—a Cilician archdeacon of the 6th century, who sold his soul to Satan for no better reason than to clear himself of a false charge brought against him by his bishop—was immensely popular throughout the middle ages, and in the 8th century formed the theme of a poem in Latin hexameters by the nun Hroswitha of Gandersheim, who, especially in her description of the ritual of Satan’s court, displays a sufficiently lively and original imagination. Equally widespread were the legends which gathered round the great name of Gerbert (Pope Silvester II). Gerbert’s vast erudition, like Roger Bacon’s, was far in advance of his age, naturally cast upon him the suspicion of traffic with the infernal powers; and in due course the suspicion developed into the tale, embellished with circumstantial and harrowing details, of a compact with the arch-fiend, by which the scholar had obtained the summit of earthly ambition at the cost of his immortal soul. These are but the two most notable of many similar stories, and, in an age when the belief in witchcraft and the ubiquitous activity of devils was still universal, it is natural that they should have been retold in all good faith by many a notorious wizard who was himself at no pains to deny their essential truth. The Faust legend, however, owes something of its peculiar significance also to the special conditions of the age which gave it birth: the age of the Renaissance and the Reformation. The opinion that the religious reformers were the champions of liberty of thought against the obscurantism of Rome is the outgrowth of later experience. To themselves they were the protagonists of “the pure Word of God” against the corruptions of a church defied by the world and the devil, and the sceptical spirit of Italian humanism was as abhorrent to them as to the Catholic reactionaries by whom it was again trampled under foot. If then, in Goethe’s drama, Faust ultimately develops into the type of the unsatisfied, yearning of the human intellect for “more than earthly meat and drink,” this was because the great German humanist deliberately infused into the old story a spirit absolutely opposed to that by which it had originally been inspired. The Faust of the early Faust-books, of the ballads, the dramas and the puppet-plays innumerable which grew out of them, is irrevocably damned because he deliberately prefers human to “divine” knowledge; “he laid the Holy Scriptures behind the door and under the bench, refused to be called doctor of Theology, but preferred to be styled doctor of Medicine.” The orthodox moral of the earliest versions is preserved to the last in the puppet plays: “Let not man or woman be tempted by the Devil, who is abhorrent as a worm, and trampled under foot. When he has triumphed over man he has no rights.” Two “new” editions, one in German and one in Latin, were published by Spies at Frankfurt in 1587, and a version in low German by J. J. Balhorn at Lübeck. Reprints and amended versions continued to appear in Germany every year, till they culminated in the pedantic compilation of Georg Rudolf Widmann, who obscured the dramatic interest of the story by an excessive display of erudition and by his well-meaning efforts to elaborate the orthodox moral. Widmann’s version of 1599 formed the basis of that of Johann Nicholous Pfister, published at Nuremberg in 1674, which passed through six editions, the last appearing in 1726. Like Widmann, Pfister was more zealous for imparting information than for perfecting a work of art, though he had the good taste to restore the episode of the evocation of Helen, which Widmann had expunged as unfit for Christian readers. Lastly there appeared, about 1625, many are given in Kiesewetter’s Faust, p. 112, &c.
1715, what was to prove the most popular of all the Faust-books: The League with the Devil established by the world-famous Arch
neromancer and Wizard Dr Johann Faust. By a Christian
Believer (Christlich Meyndenen). This version, which bore
the obviously false date of 1525, passed through many editions,
and was circulated at all the fairs in Germany. Abroad the
success of the story was scarcely less striking. A Danish version
appeared in 1588; in England the History of the Damnable
Lifc and Deserved Death of Dr John Faustus was published some
time between 1588 and 1594; in France the translation of
Victor Palma Cayet was published at Paris in 1592 and, in the
course of the next two hundred years, went through fifteen
editions; the oldest Dutch and Flemish versions are dated
1592; and in 1612 a Czech translation was published at Prague.

Besides the popular histories of Faust, all more or less founded
on the original edition of Spie's, numerous ballads on the same
subject were also in quick circulation. Of these the most interest-
ing for the English reader is A Ballad of the life and death of Dr
Faustus the great conger, published in 1588 with the imprimatur
of the learned Aylmer, bishop of London. This ballad is supposed
to have preceded the English version of Spie's Faust-book,
mentioned above, on which Marlowe's drama was founded.

To Christopher Marlowe, it would appear, belongs the honour
of first realizing the great dramatic possibilities of the Faust
legend. The Tragicall History of D. Faustus as it hath bene
acted by the Right Honorable the Earle of Nottingham his servants
was first published by Thomas Bushall at London in 1604. As
Marlowe died in 1593, the play must have been written shortly
after the appearance of the English version of the Faust story
on which it was based. The first recorded performance was on
the 30th of September 1594.

As Marlowe's Faustus is the first, so it is incomparably the
finest of the Faust dramas which preceded Goethe's masterpiece.
Like most of Marlowe's work it is, indeed, very unequal. At
certain moments the poet seems to realize the great possibilities
of the story, only to sacrifice them to the necessity for humouring
the prevailing public taste of the age. Faustus, who in one
scene turns disillusioned from the ordinary fountains of know-
ledge, or flies in a dragon-drawn chariot through the Empyrean
to search out the mysteries of the heavens, in another is made
to use his superhuman powers to satisfy the taste of the ground-
lings for senseless buffoonery, to swindle a horse-dealer, or cheat
an ale-wife of her score; while Protestant orthodoxy is concili-
ated by irrelevant insults to the Roman Church and by the final
catastrophe, when Faustus pays for his revolt against the Word of
God by the forfeit of his soul. This conception, which followed
that of the popular Faust histories, underlay all further develop-
ments of the Faust drama for nearly two hundred years. Of
the serious stage plays founded on this theme, Marlowe's Faustus
remains the sole authentic example of the 16th century; but there is plenty of evidence to prove that in
Germany the Comedy of Dr Faust, in one form or another,
was and continued to be a popular item in the repertoires of
theatrical companies until far into the 18th century. It is
supposed, with good reason, that the German versions were
based on those introduced into the country by English strolling
players early in the 17th century. However this may be, the
dramatic versions of the Faust legend followed much the same
course as the prose histories. Just as these gradually degener-
ated into chap-books hawked at fairs, so the dramas were replaced
by puppet-plays, handed down by tradition through genera-
tions of showmen, retaining their original broad characteristics,
but subject to infinite modification in detail. In this way, in
the puppet-shows, the traditional Faust story retained its popu-
larity until far into the 19th century, long after, in the sphere of
literature, Goethe had for ever raised it to quite another plane.

It was natural that during the literary revival in Germany
in the 18th century, when German writers were eagerly on the
look-out for subjects to form the material of a truly national
literature, the Faust legend should have attracted their attention.
Lessing was the first to point out its great possibilities; and
he himself wrote a Faust drama, of which unfortunately only
a fragment remains, the MS. of the completed work having been
lost in the author's lifetime. None the less, to Lessing, not to
Goethe, is due the new point of view from which the story was
approached by most of those who, after about the year 1770,
took up the Faust legend. The traditional Faust legend represented
the sternly orthodox attitude of the Protestant reformers.
Even the mitigating elements which the middle ages had per-
mitted had been banished by the stern logic of the theologians of
the New Religion. Theophilus had been saved in the end by
the intervention of the Blessed Virgin; Pope Silvester, according
to one version of the legend, had likewise been snatched from
the jaws of hell at the last moment. Faust was irrevocably
damned, since the attractions of the studium theologicum
proved insufficient to counteract the fascinations of the classic
Helen. But if he was to become, in the 18th century, the type
of the human intellect face to face with the deep problems of
human life, it was intolerable that his struggles should issue
in eternal repARATION. Error and heresy had ceased to be regarded as crimes; and stereotyped orthodoxy, to the age of
the Encyclopaedists, represented nothing more than the atrophy
of the human intellect. Es irt der Massch so lang er stebr,
which sums up in one pregnant line the spirit of Goethe's Faust,
sums up also the spirit of the age which killed with ridicule the
last efforts of persecuting piety, and saw the birth of modern
science. Lessing, in short, proclaimed that the final end of Faust
must be, not his damnation, but his salvation. This revolution-
ary conception is the measure of Goethe's debt to Lessing.
The essential change of the Faust legend introduced into the
story is in the nature of the pact between Faust and Mephis-
topheles, and in the character of Mephistopheles himself.
The Mephistopheles of Marlowe, as of the old Faust-books, for
all his brave buffoonery, is a melancholy devil, with a soul above
the unsavoury hell in which he is forced to pass a hopeless existence. "Tell me," says Faust, in the puppet-play, to
Mephistopheles, "what would you do if you could attain to
everlasting salvation?" And the devil answers, "Hear and
despair! Were I able to attain everlasting salvation, I would
mount to heaven on a ladder, though every rung were as razor
edge." Goethe's Mephistopheles would have made no such
reply. There is nothing of the fallen angel about him; he is
perfectly content with his past, his present and his future;
and he appears before the throne of God with the same easy
insolence as he exhibits in Dame Martha's back-garden. He
is, in fact, according to his own definition, the Spirit of Denial,
the impersonation of that utter scepticism which can see no
distinction between high and low, between good and bad, and
is therefore without aspiration because it knows no "divine
discontent." And the compact which Faust makes with this
spirit is from the first doomed to be void. Faustus has bartered
away his soul for a definite period of pleasure and power. The
conception that underlies the compact of Faust with Mephis-
topheles is far more subtle. He had sought happiness vainly
in the higher intellectual and spiritual pursuits; he is content
to seek it on a lower plane since Mephistopheles gives him the
chance; but he is confident that nothing that "such a poor
devil" can offer him could give him that moment of supreme
satisfaction for which he craves. He goes through the traditional
mummery of signing the bond with scornful submission; for
he knows that his damnation will not be the outcome of any
formal compact, but will follow inevitably, and only then, when
his soul has grown to be satisfied with what Mephistopheles can
purrve him.

"Canst thou with lying flattery rule me
Untill self-pleased myself I see,
Canst thou with pleasure mock and fool me,
Let that hour be last for me the last.
When thus I hall the moment flying:
Ah, still delay, thou art so fair!
Then bind me in thy chains undying.
My final ruin then declare!

It is because Mephistopheles fails to give him this self-satisfaction

1 Bayard Taylor's transl.
or to absorb his being in the pleasures he provides, that the compact comes to nothing. When, at last, Faust cries to the passing moment to remain, it is because he has forgotten self in enthusiasm for a great and toilful work, in a state of mind the very antithesis of all that Mephistopheles represents. In the old Faust-books, Faust had been given plenty of opportunity for repentance, but the inducements had been no higher than the exhibition of a throne in heaven on the one hand and the tortures of hell on the other. Goethe's Faust, for all his Christian setting, departs widely from this orthodox standpoint. Faust shows no signs of "repentance"; he simply emerges by the innate force of his character from a lower into a higher state. The triumph, foretold by the Lord in the opening scene, was inevitable from the first, since through "he whose hour as he is striving, / A good man through obscure aspiration / Is ever conscious of the one true way."

A man, in short, must be judged not by the sins and follies which may be but accidents of his career, but by the character which is its essential outcome.

This idea, which inspired also the kindred theme of Browning's Paracelsus, is the main development introduced by Goethe into the Faust legend. The episode of Gryphius, for instance, is the only one in the whole that is not at all; and it is difficult to deny the pertinency of Charles Lamb's criticism, "What has Margaret to do with Faust?" Yet in spite of all that may be said of the irrelevances, and of the discussions of themes of merely ephemeral interest, with which Goethe overloaded especially the second part of the poem, his Faust remains for the modern world the final form of the legend out of which it grew, the magnificent expression of the broad humanism which, even in spheres accounted orthodox, has tended to replace the peculiar studium theologicum which inspired the early Faust-books.

See Karl Engel, Zusammendstellung der Faust-Schriften vom 16. Jahrhundert bis Mitte 1884—a second edition of the Bibliotheca Faustiana (1874)—(Oldenburg, 1885), a complete bibliography of all published matter, even every letter, even with Faust; Goethe's edition, with introduction and notes by K. J. Schröer (2nd ed., Heilbronn, 1886); Carl Kiesewetter, Faust in der Geschichte und Tradition (Leipzig, 1893). The last book, besides being a critical study of the material for the historical and legendary story of Faust, aims at estimating the relation of the Faust-legend to the whole subject of occultism, ancient and modern. It is a mine of information on necromancy and its kindred subjects, as well as on eminent theologians, wizards, crystal-gazers, other geniuses of all ages.

FAUSTINA, ANNIA GALERIA, the younger, daughter of Antoninus Pius, and wife of Marcus Aurelius Antoninus. She is accused by Dio Cassius and Capitoulins of gross profligacy, and was reputed to have instigated the revolt of Avidius Cassius against her husband. She died in 175 or 176 (so Clinton, Faustina) at Halâs, near Laon. Some manuscripts of Orosius, who accompanied Aurelius. Charitable schools for orphan girls (hence called Faustinianae) were founded in her honour, like those established by her father Antoninus in honour of his wife, the elder Faustina. Her statue was placed in the temple of Venus, and she was numbered among the tutelary deities of Rome. From the fact that Aurelius was always devoted to her and was heartbroken at her death, it has been inferred that the unfavourable estimate of the historians is prejudiced or at least mistaken. See Capitoulins, M. E. le Thiers, Don Cassius lxxxi, 22, liv. 3; E. Renan, in Mélanges d'histoire et des voyages, 169-105.

FAVARA, a town of Sicily, in the province of Girgenti, 5 m. E. of Girgenti by road. Pop. (1901) 20,398. It possesses a fine castle of the Chiaramonte family, erected in 1280. The town has a considerable agricultural trade, and there are sulphur and other mines in the neighbourhood.

FAVART, CHARLES SIMON (1710-1792), French dramatist, was born in Paris on the 13th of November 1710, the son of a pastry-cook. He was educated at the college of Leu-le-Grand, and after his father's death carried on the business for a time. His first success in literature was La France débâtie par la Pucelle d'Orléans, a poem which obtained a prize of the Académie des Jeux Flor us. After the production of his first vaudeville, Les Deux Januelles (1734), circumstances enabled him to relinquish business and devote himself entirely to the drama. He provided many pieces anonymously for the lesser theatres, and first put his name to La Charogne d'Esprit, which was produced in 1741. Among his most successful works were Annette et Lubin, Le Cog du village (1743), Ninette à la cour (1753), Les Trois Sultanes (1761) and L'Anglais à Bordeaux (1763). Favart became director of the Opéra Comique, and in 1745 married MARIE JUSTINE BENOÎTE DURONCEAUX (1727-1772), a beautiful young dancer, singer and actress, who as "Mlle Chantilly" had made a successful début the year before. By their united talents and labours the Opéra Comique rose to such a height of success that it aroused the jealousy of the rival Comédie Italienne and was suppressed. Favart, left thus, without resources, accepted the proposal of Marie de Saxe, and undertook the direction of a troupe of comedians which was to accompany his army into Flanders. It was part of his duty to compose from time to time impromptu verses on the events of the campaign, amusing and stimulating the spirits of the men. So popular were Favart and his troupe that the enemy became desirous of hearing his company and sharing his services, and permission was given to gratify them, battles and comedies thus curiously alternating with each other. But the marshal, who was an admirer of Mme Favart, began to persecute her with his attentions. To escape him she went to Paris, but the watch of Soubise was sent to seize her; her husband was issued against him, but he fled to Strasbourg and found concealment in a cellar. Mme Favart meanwhile had been established by the marshal in a house at Vaugirard; but as she proved a fickle mistress she was suddenly arrested and confined in a convent, where she was brought to unconditional surrender in the beginning of 1756. Before the year was out the marshal died, and Mme Favart reappeared at the Comédie Italienne, where for twenty years she was the favourite actress. To her is largely due the beginnings of the change in this theatre to performances of a lyric type adapted from Italian models, which developed later into the genuine French comic opera. She was also a bold reformer in matters of stage costume, playing the peasant with bare arms, in wooden shoes and linen dress, and not, as heretofore, in court costume with enormous hoops, diamonds and long white kid gloves. With her husband, and other authors, she collaborated in a number of successful pieces, and one—La Fille mal gardé—she produced alone.

Favart survived his wife twenty years. After the marshal's death in 1750 he had returned to Paris, and resumed his pursuits as a dramatist. It was at this time that the abbé de Voisenon became interested in his work; but the book which had been promised to him was never published. He had grown nearly blind in his last days, and died in Paris on the 12th of May 1792. His plays have been several times republished in various editions and selections (1765-1777, 12 vols.; 1810, 3 vols.; 1813-1853). His correspondence (1759-1765) with Count Durazzo, director of theatres at Vienna, was published in 1808 as Mémoires et correspondance littéraire, dramatique et anecdotique de C. S. Favart. It furnishes valuable information on the state of the literary and theatrical worlds in the 18th century.

Favart's second son, CHARLES NICOLAS JOSEPH JUSTIN FAVART (1740-1806), was an actor of moderate talent at the Comédie Française for fifteen years. He wrote a number of successful plays:—Le Diable boiteux (1782), Le Mariage singulier (1787) and, with his father, La Vieillesse d'Anneite (1791). His son Antoine Pierre Charles Favart (1780-1867) was in the diplomatic service, and assisted in editing his grandfather's memoirs; he was a playwright and painter as well.

FAVERSHAM, a market town and river-port, member of the Cinque Port of Dover, and municipal borough in the Faversham parliamentary division of Kent, England, on a creek of the Swale, 9 m. W.N.W. of Canterbury on the South-Eastern & Chatham railway. Pop. (1901) 11,290. The church of St Mary of Charity, restored by Sir G. G. Scott in 1874, is of Early English architecture, and has some remains on one of the columns of frescoes of the same period, while the 14th-century paintings in the chancel are in better preservation. Some of the brasses are very fine, and there is one commemorating King Stephen, as well as
Favorinus-Favre

FAVORINUS-FAVRE

Favorinus, Thomas de Mahy, Marquis de (1744-1790), French royalist, was born on the 26th of March 1744, at Blois. He belonged to a poor family whose nobility dated from the 12th century. At seventeen he was a captain of dragons, and saw some service in the closing campaign of the Seven Years' War. In 1772 he became first lieutenant of the Swiss guards of the count of Provence (afterwards Louis XVIII). Unable to meet the expenses of his rank, which was equivalent to the grade of colonel in the army, he retired in 1775. He married in 1776 Victoria Hedwig Caroline, princess of Anhalt-Bernburg-Schaumburg, whose mother, deserted by her husband Prince Carl Ludwig, fled with her daughter to the house of Marshal Soubise. After his marriage he went to Vienna to press the restitution of his wife's rights, and spent some time in Warsaw. In 1787 he was authorized to raise a patriotic legion to help the Dutch against the stadholder William IV. and his Prussian allies. Returning to Paris at the outbreak of the Revolution, he became implicated in schemes for the escape of Louis XVI. from Paris and the dominance of the National Assembly. He was commissioned by the count of Provence through one of his gentlemen, the comte de la Châtre, to negotiate a loan of two million francs from the bankers Schaumel and Sartorius. Favorinus had before虎 there certain officers by whom he was betrayed; and, with his wife, he was arrested on Christmas Eve 1789 and imprisoned in the Abbaye. A fortnight later they were separated, Favoris being removed to the Châtelet. It was stated in a leaflet circulated throughout Paris that Favoris had organized a plot of which the count of Provence was the moving spirit. A force of 30,000 was to be raised, La Fayette and Bailly, the mayor of Paris, were to be assassinated, and Paris was to be starved into submission by cutting off supplies. The count hastened publicly to denounce Favoris. A speech delivered before the commune of Paris and in a letter to the National Assembly, although there is no reasonable doubt of his complicity in the plot that did exist. In the course of a trial of nearly two months' duration the witnesses disagreed, and even the editor of the Résolutions de Paris (No. 30) admitted that the evidence was insufficient; but an armed attempt of the Royalists on the Châtelet on the 26th of January, which was defeated by La Fayette, roused the suspicious temper of the Parisians to fury, and on the 18th of February 1790, in spite of the courageous defence of his counsel, Favoris was condemned to be hanged. He refused to give any information of the alleged plot, and the sentence was carried out on the Place de Grève the next day, to the delight of the populace, since it was the first instance when no distinction in the mode of execution was allowed between noble and commoner. Favoris was generally regarded as a martyr to his refusal to implicate the count of Provence, and Madame de Favoris was pensioned by Louis XVI. She left France, and her son Charles de Favoris served in the Austrian and the Russian armies. He received an allowance from Louis XVIII. Her daughter Caroline married Rüdiger, Freiherr von Stillfried Ratениц, in 1865.

The official dossier of Favoris's trial for high treason against the nation disappeared from the Châtelet, but its substance is preserved in the papers of a clerk.

Tournoux, Bibli de l'histoire de Paris pendant la Révolution Française (vol. i., pp. 196-198, 1890). His brother, M. Mahy de Cormérie, published a Mémoire justificatif in 1790 and a Justification in 1791. See also a memoir by Édouard, Freiherr von Stillfried Ratениц (Vienna, 1881), and an article by Alexis de Valon in the Revue des deux mondes (15th June 1851).

FAVRE, Jean Alphonse (1815-1890), Swiss geologist, was born at Geneva on the 31st of March 1815. He was for many years professor of geology in the academy at Geneva, and afterwards president of the Federal Commission with charge of the geological map of Switzerland. Many of his papers were on the Anécracites and the Alps (1841), and later he gave special attention to the geology of Savoy and of Mont Blanc, and to the ancient glacial phenomena of those Alpine regions. His elucidation of the geological phenomena demonstrated that
certain anomalous occurrences of fossils were due to repeated interfoldings of the strata and to complicated overfolded faults. In 1867 he published *Recherches géologiques dans les parties de la Savoie, du Piémont et de la Suisse voisines du Mont Blanc*. He died at Geneva in June 1890.

His son Ernest Favre (b. 1845) has written on the paleontology and geology of Galicia, Savoy and the Fribourg Alps, and of the Caucasus and Crimea.

Favre, Jules Claude Gabriel (1809-1880), French statesman, was born at Lyons on the 21st of March 1809, and began his career as an advocate. From the time of the revolution of 1830 he openly declared himself a republican, and in political trials he seized the opportunity to express his opinions. After the revolution of 1848 he was elected deputy for Lyons to the Constituent Assembly, where he sat among the moderate Republicans, voting against the Socialists. When Louis Napoleon was elected President of France, Favre made himself conspicuous by his opposition, and on the 2nd of December 1851 he tried with Victor Hugo and others to organize an armed resistance in the streets of Paris. After the coup d'état he withdrew from politics, resumed his profession, and distinguished himself by his defence of Felice Orsini, the perpetrator of the attack against the life of Napoleon III. In 1856 he was elected deputy for Paris, and was one of the few who gave the signal for the retreat of his party. In 1863 he became the head of his party, and delivered a number of addresses denouncing the Military expedition and the occupation of Rome. These addresses, eloquent, clear and incisive, won him a seat in the French Academy in 1867. With Thiers he opposed the declaration of war against Prussia in 1870, and at the news of the defeat of Napoleon III. at Sedan he demanded from the Legislative Assembly the deposition of the emperor. In the government of National Defence he became vice-president under General Trochu, and minister of foreign affairs, with the onerous task of negotiating with Germany for the restoration of the Empire. In 1866 he became at the head of his party, and delivered a number of addresses denouncing the Memorandum, and expelled several irreparable blunders. His famous statement on the 6th of September 1870 that he "would not yield to Germany an inch of territory nor a single stone of the fortresses" was a piece of oratory which Bismarck met on the 19th by his declaration to Favre that the cession of Alsace and of Lorraine was the indispensable condition of peace. He also made the mistake of not having an assembly elected which would have more regular powers than the government of National Defence, and of opposing the reorganization of the government from Paris during the siege. In the peace negotiations he allowed Bismarck to get the better of him, and arranged for the armistice of the 28th of June 1871 without knowing the situation of the armies, and without consulting the government at Bordeaux. By a grave oversight he neglected to inform Gambetta that the army of the East (80,000 men) was not included in the armistice, and it was thus obliged to retreat to neutral territory. He gave no proof whatever of diplomatic skill in the negotiations for the treaty of Frankfort, and it was Bismarck who imposed all the conditions. He withdrew from the ministry, discredited, on the 2nd of August 1871, but remained in the chamber of deputies. Elected senator on the 30th of January 1876, he continued to support the government of the republic against the reactionary opposition, until his death on the 20th of January 1880.

His works include many speeches and addresses, notably *La Liberté de la Presse* (1839), *Défense de F. Orsini* (1860), *Discours de réception à l'Académie française* (1869), *Discours sur la liberté intérieure* (1869). In *Le Gouvernement de la Défense Nationale*, 3 vols., 1871-1875, he explained his rôle in 1870-1871. After his death his family published his speeches in 8 volumes.

Favus (Lat. for honeycomb), a disease of the scalp, but occurring occasionally on any part of the skin, and even on mucous membranes. The uncomplicated appearance is that of a number of yellowish, circular, cup-shaped crusts (scutula) grouped in patches like a piece of honeycomb, each about the size of a split pea, with a hair projecting in the centre. These increase in size and become crusty over, so that the characteristic lesion can only be seen round the edge of the scab. Growth continues to take place for several months, when scab and scutulum come away, leaving a sloughy bare patch destitute of hair. The disease is essentially chronic, lasting from ten to twenty years. It is caused by the growth of a fungus, and pathologically is the reaction of the tissues to the growth. It was the first disease in which a fungus was discovered—by J. L. Schönlein in 1839; the discovery was published in a brief note of twenty lines in *Mullers Archiv* for that year (p. 82), the fungus having been subsequently named by R. Remak and Schönlein after its discoverer. The achorion consists of slender, mycelial threads mettled together, bearing oval, nuclediate gonidia either free or jointed. The spores would appear to enter through the unbroken cutaneous surface, and to germinate mostly in and around the hair-follicle and sometimes in the shaft of the hair. In 1892 two other species of the fungus were described by P. G. Unna and Frank, the *Favus griseus*, giving rise to greyish-yellow scutula, and the *Favus sulphureus celeror*, causing sulphur-yellow scutula of a rapid growth. *Favus* is commonest among the poorer Jews of Russia, Poland, Hungary, Galicia and the East, and among the speckled mice of Turkish milking. The disease is more common in Persia, Egypt, Algiers, &c. It is not rare in the southern departments of France, in some parts of Italy, and in Scotland. It is spread by contagion, usually from cats, often, however, from mice, fowls or dogs. Lack of personal cleanliness is an almost necessary factor in its development, but any one in delicate health, especially if suffering from phthisis, seems especially liable to contract it. Before treatment can be begun the scabs must be removed by means of carbolic oil, and the head thoroughly cleansed with soft soap. The cure is then brought about by the judicious use of parasiticides. If the nails are affected surgery will probably be needed before the disease can be reached.

Fawcett, Henry (1833-1884), English politician and economist, was born at Salisbury on the 25th of August 1833. His father, William Fawcett, a native of Kirkby Lonsdale, in Westmorland, started life as a draper's assistant at Salisbury, opened a draper's shop on his own account in the market-place there in 1825, married a solicitor's daughter of the city, became a prominent local man, took a farm, developed his north-country sporting instincts, and displayed his shrewdness by successful agricultural speculation. His second son, Henry, inherited a full measure of his shrewdness, along with his masculine energy, his straightforwardness, his perseverance and his fondness for fishing. The father was active in electioneering matters, and his wife was an ardent reformer. Henry Fawcett was educated locally and at King's College school, London, and proceeded to Peterhouse, Cambridge, in October 1852, migrating in 1853 to Trinity Hall. He was seventh wrangler in 1856, and was elected to a fellowship at his college.

He had already attained some prominence as an orator at the Cambridge Union. Before he left school he had formed the ambition of entering parliament, and, being a poor man, he resolved to approach the House of Commons through a career at the bar. He had already entered Lincoln's Inn. His prospects, however, were shattered by a calamity which befell him in September 1858, when two stray pellets from his father's fowling-piece passed through the glasses he was wearing and blinded him for life. Within ten minutes after his accident he had made up his mind to stick to his old pursuits as much as possible. He kept up all recreations contributing to the enjoyment of life; he fished, rowed, skated, took abundant walking and horse exercise, and learnt to play cards with marked packs. Soon after his accident he established his headquarters at Trinity Hall, Cambridge, entered cordially into the social life of the college, and came to be regarded by many as a typical Cambridge man. He gave up mathematics (for which he had little aptitude), and specialized in political economy. He paid comparatively little attention to economic history, but he was in the main a
devout believer in economic theory, as represented by Ricardo and his school. The later philosophy of the subject became to be summed up in one book, Mill's Principles of Political Economy, which he regarded as the indispensable "vade-mecum" of every politician. He was not a great reader, and Mill probably never had a serious rival in his regard, though he was much impressed by Buckle's History of Civilization and Darwin's Origin of Species when they severally appeared. He made a great impression in 1859 with a paper at the British Association, and soon became a familiar figure there and at various lecture halls in the north as an exponent of orthodox economic theory. Of the sincerity of his faith he gave the strongest evidence by his desire at all times to give a practical application to his views and to turn them to the direct advantage of his country. Mill's disciples he was, no doubt, far inferior as an economic thinker to Cairnes, but as a popularizer of the system and a demonstrator of its principles by concrete examples he had no rival. His power of exposition was illustrated in his Manual of Political Economy (1863), of which in twenty years as many as 20,000 copies were sold. Alexander Macmillan had suggested the book, and it appeared just in time to serve as a credential, when, in the autumn of 1863, Fawcett stood and was elected for the Chair of Political Economy at Cambridge. The appointment attached him permanently to Cambridge, gave him an index, and quickly overcame the inconveniences consequent upon his being compelled to discharge duties from which a blind man is often considered to be debarr'd. He was already a member of the Political Economy Club, and was becoming well known in political circles as an advanced Radical. In January 1863, after a spirited though abortive attempt in Southwark, he was only narrowly beaten for the borough of Cambridge. Early in 1864 he was adopted as one of the Liberal candidates at Brighton, and at the general election of 1865 he was elected by a large majority. Shortly after his election he became engaged to Millicent, daughter of Mr. Newson Garrett of Alderbury, Suffolk, and in 1867 he was married. Mrs. Fawcett (b. 1847) became well known for her social and literary work, and especially as an advocate, in the press and on the platform, of women's suffrage and the higher education and independent employment of women. And after her husband's death, as well as during his lifetime, she was a prominent leader in these movements.

Fawcett entered parliament just in time to see the close of Palmerston's career and to hail the adoption by Gladstone of a programme of reform to which most of the laissez-faire economists gave assent. He was soon known as a forcible speaker, and quickly overcame the obstacles of his youth. In the academic and doctrinaire, though it is true that a certain monotony in delivery often gave a slightly too didactic tone to his discourses. But it was as the uncompromising critic of the political shifts and expedients of his leaders that he attracted most attention. He constantly insisted upon the right of exercising private judgment, and being especially devoted himself to the defence of causes which, as he thought, were neglected both by his official leaders and by his Radical comrades. Re-elected for Brighton to the parliament of 1866-1874, he greatly harped upon the government by his persistence in urging the abolition of clerical fellowships and the payment of the maintenance expenses out of the rates, and by opposing the "permissive compulsion" clauses of the Elementary Education Bill, and the exclusion of agricultural children from the scope of the act. His hatred of weak concessions made him the terror of parliamentary wirepullers, and in 1871 he was not undeservedly spoken of in The Times as the most "thorough Radical now in the House." His liberal ideals were further shocked by the methods by which Gladstone achieved the abolition of Army Purchase. His disgust at the slowness of the cabinet in dealing with the problems of Indian finance and the growing evil of Commons Enclosures were added to the catalogue of grievances which Fawcett drew up in a powerful article, "On the Present Position of the Government," in the Fortnightly Review for November 1871. In 1867 he had opposed the expenses of a ball given to the sultan at the India office being charged upon the Indian budget. In 1870 he similarly opposed the taxation of the Indian revenue with the cost of presents distributed by the duke of Edinburgh in India. In 1871 he went alone into the lobby to vote against the dowry granted to the princess Louise. The soundness of his principles was not impeached, but his leaders looked askance at him, and from 1871 he was severely shunned by the government whips. Their suspicion was justified when in 1873 Fawcett took a leading share in opposing Gladstone's scheme for university education in Ireland as too denominational, and so contributed largely to a conclusive defeat of the Gladstone ministry.

From 1869 to 1880 Fawcett concentrated his energies upon two important subjects which had not hitherto been deemed of much importance to his party—first the financial, and then the educational. In the former case it was the preservation of commons, especially those near large towns; and the second was the responsibility of the British government for the amendment of Indian finance. In both cases the success which he obtained exhibited the sterling sense and shrewdness which made up such a great part of Fawcett's character. In the first case Fawcett's great triumph was the enforcement of the general principle that each annual Enclosure Act must be scrutinized by parliament and judged in the light of its conformity to the interests of the community at large. Probably no individual did more than he to prevent the disafforestation which was one of the Newcastrian ideas. At the same time he regularly attended the meetings of the Commons Preservation Society, and he remained to the end one of its staunchest supporters. His intervention in the matter of Indian finance, which gained him the sobriquet of the "member for India," led to no definite legislative achievements, but it called forth the best energies of his mind and helped to rouse an apathetic and ignorant public to its duties and responsibilities. Fawcett was defeated at Brighton in February 1874. Two months later, however, he was elected for Hackney, and retained the seat during 1874 and 1875. He was in the same year appointed to the Indian Finance Committee, and continued his searching inquiries with a view to promote a stricter economy in the Indian budget, and a more effective responsibility in the management of Indian accounts.

As an opponent of the Disraelian government (1874-1880) Fawcett came more into line with the Liberal leaders. In foreign politics he gave a general adhesion to Gladstone's views, but he continued to devote much attention to Indian matters, and it was during this period that he produced two of his best publications. His Free Trade and Protection (1878) illustrated his continued loyalty to Cobdenite ideas. At the same time his admiration for Palmerston and his repugnance to schemes of Home Rule show that he was not by any means a peace-at-any-price man. He thought that the Cobdenites had deserved well of their country, but he always maintained that their foreign policies were biased to excess by purely commercial considerations. As beffited a writer whose linguistic gifts were of the slendest, Fawcett's English was a sound bonespun, clear and unpretentious. In a vigorous employment of the vernacular he approached Cobbett, whose writing he justly admired. The second publication was his Indian Finance (1880), three essays reprinted from the Nineteenth Century, with an introduction and appendix. When the Liberal party returned to power in 1880 Gladstone offered Fawcett a place in the new government as postmaster-general (without a seat in the cabinet). On Egyptian and other questions of foreign policy Fawcett was often far from being in full harmony with his leaders, but his position in the government naturally enforced reserve. He was, moreover, fully absorbed by his new administrative functions. He gained the sympathy of a class which he had hitherto done little to conciliate, that of public officials, and he showed him a most capable head of a public department. To his readiness in adopting suggestions, and his determination to push business through instead of allowing it to remain permanently in the stage of preparation and circumspection, the public is mainly indebted for five substantial postal reforms:—(1) The parcels post, (2) postal orders, (3) sixpenny telegrams, (4) the banking
of small savings by means of stamps, (5) increased facilities for life insurance and annuities. In connexion with these last two improvements Fawcett, in 1880, with the assistance of Mr James Cardin, took great pains in drawing up a small pamphlet called Aids to Thrift, of which over a million copies were circulated gratis. A very useful minor innovation of his provided for the announcement on every pillar-box of the time of the "next collection." In the post office, as elsewhere, Fawcett was an advocate of the employment of women. Proportional representation and the extension of franchise to women were both political doctrines which he adopted very early in his career, and never abandoned. Honours were showered upon him during his later years. He was made an honorary D.C.L. of Oxford, a fellow of the Royal Society, and was in 1883 elected lord rector of Glasgow University. But the stress of departmental work soon began to tell upon his health. In the autumn of 1882 he had a sharp attack of diptheria complicated by typhoid, from which he never properly recovered. He resumed his activities, but on the 6th of November 1884 he succumbed to a somewhat earlier attack of congestion of the lungs. He was buried in Trumpington churchyard, near Cambridge, and to his memory were erected a monument in Westminster Abbey, a statue in Salisbury market-place, and a drinking fountain on the Thames embankment.

In economic matters Fawcett's position can best be described as transitional. He believed in co-operation almost as a panacea. In other matters he clung to the old laissez-faire theorists, and was a strong anti-socialist, with serious doubts about free education, though he supported the Factory Acts and wished their extension to agriculture. Apparent inconsistencies were harmonized to a great extent by his dominating anxiety to increase the well-being of the poor. One of his noblest traits was his kindliness and genuine affection for the humble and oppressed, country labourers and the like, for whom his sympathies seemed always on the increase. Another was his disposition to interest himself in and to befriend younger men. In the great affliction of his youth Fawcett bore himself with a fortitude which it would be difficult to parallel. The effect of his blindness was, as the event proved, the reverse of calamitous. It brought the young man to his senses, to a better knowledge of himself; and made him of an earlier date than would otherwise have been possible, and it had a mellowing influence upon his character of an exceptional and beneficent kind. As a youth he was rough and canny, with a suspicion of harshness. The kindliness evoked by his misfortune, a strongly reciprocated family affection, a growing capacity for making and keeping friends—these and other causes tended to ripen all that was best, and apparently that only, in a strong but somewhat stern character. His acerbity passed away, and in later life was reserved exclusively for official witnesses before parliamentary committees. Frank, helpful, conscientious to a fault, a shrewd gossip, and a staunch friend, he was a man whom no one could help liking. Several of his letters to his father and mother at different periods of his career are preserved in Leslie Stephen's admirable Life (1885), and show a goodness of heart, together with a homely simplicity of nature, which is most touching. In appearance Fawcett was gaunt and tall, over 6 ft. 3 in. in height, large of bone, and massive in limb.

Fawcett, John (1768–1837), English actor and playwright, was born on the 26th of August 1768, the son of an actor of the same name (d. 1793). At the age of eighteen he ran away from school and appeared at Margate as Courtall in The Belle's Stratagem; afterwards he joined Tate Wilkinson's company and turned from tragedy to low comedy parts. In 1791 he appeared at Covent Garden, and in 1794 at the Haymarket. Colman, then manager of that house, wrote a number of parts designed to suit his talents, and two of Fawcett's greatest successes were as Dr. Pangloss in The Heir at Law (1797) and as Dr Olksped in The Poor Gentleman (1798). He retired from the stage in 1830.

Fawkes, Francis (1720–1777), English poet and divine, was born at Warmworth, near Doncaster, Yorkshire, where his father was rector, and was baptized on the 4th of April 1720. After studying at Jesus College, Cambridge, where he graduated M.A. in 1745, he took holy orders, and was successively curate of Bramham, curate of Croydon, vicar of Orpington, and rector of Hayes, and finally was made one of the chaplains to the princess of Wales. His first publication is said to have been Brabham Park, a Poem, in 1745; a volume of poems and translations appearing in 1751 and Partridge Shooting, an elegy, in 1764. His translations of the minor Greek poets began in 1750, Bion and Moschus, Theocritus and Apollonius—acquired for him considerable fame, but they are less likely to be remembered than his fine song, "Dear Tom, this brown jug, that now foams with mild ale." Fawkes died on the 26th of August 1777.

Fawkes, Guy (1570–1606), English "gunpowder plot" conspirator, son of Edward Fawkes of York, a member of a good Yorkshire family and advocate of the archbishop of York's consistory court, was baptized at St Michael le Belfrey at York on 16th April 1570. His parents were Protestants, and he was educated at the free school at York, where, it is said, John and Christopher Wright and the Jesuit Tesimond alias Greenway, afterwards implicated in the conspiracy, were his schoolfellows. On his father's death in 1579 he inherited his property. Soon afterwards his mother married, as her second husband, Dionis Baynbrige of Scotton in Yorkshire, to which place the family removed. Fawkes's stepfather was connected with many Roman Catholic families, and was probably a Roman Catholic himself, and Fawkes himself became a zealous adherent to Flaminio's cause. After he had come of age he disposed of his property, and in 1593 went to Flanders, in the Spanish army, assisting at the capture of Calais by the Spanish in 1590 and gaining some military reputation. According to Father Greenway he was "a man of great piety, of exemplary temperance, of mild and cheerful demeanour, an enemy of broils and disputes, a faithful friend and remarkable for his punctual attendance upon religious observances," while his society was "sought by all the most distinguished in the arch duke's camp for nobility and virtue." He is described as "tall, with brown hair and auburn beard." The instance of Catesby, in whose mind the gunpowder plot had now taken definite shape, introduced himself to Fawkes in Flanders; and as "a confidential gentleman," "best able for this business," brought him on to England as assistant in the conspiracy. Shortly afterwards he was initiated into the plot, after taking an oath of secrecy, meeting Catesby, Thomas Winter, Thomas Percy and John Wright at a house behind St Clement's (see GUNPOWDER PLOT and CATESBY, ROBERT). Owing to the fact of his being unknown in London, to his exceptional courage and coolness, and probably to a position in Flanders at sieges, the actual accomplishment of the design was entrusted to Fawkes, and when the house adjoining the parliament house was hired in Percy's name, he took charge of it as Percy's servant, under the name of Johnson. He acted as sentinel while the others worked at the mine in December 1604, probably directing their operations, and on the discovery of the adjoining cellar, situated immediately beneath the House of Lords, he arranged in it the barrels of gunpowder, which he covered over with firewood and coals and with iron bars to increase the force of the explosion. When all was ready in May 1605 Fawkes was despatched to Flanders to acquaint Sir William Stanley, the betrayer of Deventer, and the intriguier Owen with the plot. He returned in August and brought fresh gunpowder into the cellars to replace any which might be spoil by damp. A slow match was prepared which would give him a quarter of an hour in which to escape from the explosion. On Saturday, the 26th of October, Lord Montague (q.v.) received the mysterious letter which revealed the conspiracy and of which the conspirators received information the following day. They, nevertheless, after some hesitation, hoping that the government would despire the warning, determined to proceed with their plans, and were encouraged in their resolution by Fawkes, who visited the cellar on the 30th and
reported accordingly to his lonely and perilous vigil on the 4th of November. On that day the earl of Suffolk, as lord chamberlain, visited the vault, accompanied by Montaigle, remarked the quantity of faggots, and asked Fawkes, now described as "a very tall and undersized fellow," who it was that rented the cellar. Percy's name, which Fawkes gave, aroused fresh suspicions and they retired to inform the king. At about ten o'clock Robert Keyes, a watchman from the City, observed that he might know how the anxious hours were passing, and very shortly afterwards he was arrested, and the gunpowder discovered, by Thomas Kyvett, a Westminster magistrate. Fawkes was brought into the king's bedchamber, where the ministers had hastily assembled, at one o'clock. He maintained an attitude of defiance and of "Roman resolution," smiled scornfully at his questioners, making no secret of his intentions, replied to the king, who asked why he would kill him, that the pope had excommunicated him, that "dangerous diseases require a desperate remedy," adding fiercely to the watchman who surrounded him that "one of his objects was to blow hack the Scots into Scotland." His only regret was the failure of the scheme. "He carried himself," writes Salisbury to Sir Charles Cornwallis, ambassador at Madrid, "without any fear or perturbation... under all this action he is no more dismayed, nay scarce any more troubled than if he was taken for a poor robberry upon the highway," declaring "that he is ready to die, and rather wisheth 10,000 deaths, than willingly to accuse his master or any other."

He refused stubbornly on the following days to give information concerning his accomplices; on the 8th he was taken to the Tower of London, but was not till the 9th, when the fugitive conspirators had been taken at Holbeche, that torture could wring from him their names. His imperfect signature to his confession of this date, consisting only of his Christian name and written in a faint and trembling hand, is probably a ghastly testimony to the severity of the torture ("per gradus ad ima") which James had ordered to be applied if he would not otherwise confess and the "gentler tortures" were unavailing,—a horrible practice unrecognized by the law of England, but usually employed and justified at this time in cases of treason to obtain information. He was tried, together with the two Winters, John Grant, Ambrose Rokewod, Robert Keyes and Thomas Bates, before a special commission in Westminster Hall on the 27th of January 1606. In this case there could be no defence and he was found guilty. He suffered death in company with Thomas Winter, Rokewod and Keyes on the 31st, being drawn on a hurdle from the Tower to the Parliament House, opposite which he was executed. He made a short speech on the scaffold, expressing his repentance, and mounted the ladder last and with assistance, being weak from torture and illness. The usual harangues practised upon him after he had been cut down from the gallows were inflicted on a body from which all life had already fled.

Jardine (1857); Calendar of State Pap. Dom. 1603–1610; State Trials, ed. C. Macara, xiii. 1907; R. Wigswood's Memorials, Notes and Queries, vi. ser. 233, viii. 136; The Fawkeses of York in the 16th Century, by R. Davies (1895); Dict. of Nat. Biog., and authorities cited thereto. The official account (trustworthy, in detail) is the True and Perfect Relation of the Whole Proceedings against the late most Barbarous Traitors (1606), reprinted by Bishop Barlow of Lincoln as The Gunpowder Treason (1679). See also GUNPOWDER PLOT.**

The lantern said to be Guy Fawkes's is in the Bodleian library at Oxford.

**FÁY, ANDRÁS** (1786–1864), Hungarian poet and author, was born on the 30th of May 1786, at Kohnágy in the county of Zemplin, and was educated for the law at the Protestant college of Sárospatak. His Mesék (Fables), the first edition of which appeared at Vienna in 1820, evinced his powers of satire and invention, and won him the well-merited applause of his countrymen. These fables, which, on account of their originality and simplicity, caused Fáy to be regarded as the Hungarian Aesop, were translated into German by Petz (Raab, 1825), and partly into English by E. D. Butler, Hungarian Poems and Fables (London, 1877). Fáy wrote also numerous poems, the chief of which are to be found in the collections Bokréta (Nosegay) (Pest, 1807), and Fris Bokréta (Fresh Nosegay) (Pest, 1818). He also composed plays and romances and tales. In 1835 Fáy was elected to the Hungarian diet, and was for a time the leader of the opposition party. It is to him that the Pest Savings Bank, called the first national bank of Hungary, owes its origin, and among the founder of the Hungarian national theatre. He died on the 26th of July 1864. His earlier works were collected at Pest (1843–1844, 8 vols.). The most noteworthy of his later works is a humorous novel entitled Jásor orosz és Bakatő Ambrosz szolgái (Jásor the Doctor and his servant Ambrose Bakató), (Pest, 1855, 2 vols.).

**FAYAL (Faoil), a Portuguese island in the Atlantic Ocean, forming part of the Azores archipelago. Pop. (1900) 22,262; area, 63 sq. m. Fayal, i.e. "the heech wood," was so called from the former abundance of the Myrica faya, which its discoverers mistook for heech trees. It is one of the most frequented of the Azores, for it lies directly in the track of vessels crossing the Atlantic, and has an excellent harbour at Horta (q.v.), a town of 6574 inhabitants. Cedros (3278) and Fêteira (2002) are the other chief towns. The so-called "Fayal wine," which was largely exported from the Azores in the 19th century, was really the produce of Pico, a larger island lying to the east. The women of Fayal manufacture fine lace from the agave thread. They also execute carvings in snow-white fig-tree pitch, and carry on the finer kinds of basket-making. A small refinery of silver, called the so-called "Nosegay," perpetuates the name of the Flemish settlers, who have left their mark on the physical appearance of the inhabitants. (See Azores.)

**FAYETTEVILLE, a city and the county-seat of Washington county, Arkansas, U.S.A., about 150 m. N.W. of Little Rock. Pop. (1890) 2942; (1900) 4061; (1910) 4471. It is served by the St Louis & San Francisco railway. The city lies about 1400 ft. above the sea, in the Ozark Mountain region. There is much fine scenery in the neighbourhood, there are mineral springs near by, and the place has become known as a summer resort. Fayetteville is the seat of the University of Arkansas (incorporated 1871; opened 1872; co-educational), which includes the following departments: at Fayetteville, a college of liberal arts, science and engineering, a conservatory of music and art, a preparatory school, and an agricultural college and agricultural experiment station; at Little Rock, a medical school and a law school, and at Pine Bluff, the Branch Normal College for negroes.

In 1908 the university had 122 instructors and a total enrolment of 1725 students. In Fayetteville there are a National cemetery with 1236 soldiers' graves (782 "unknown") and a Confederate cemetery with 715 graves and a memorial monument. In the vicinity of Fayetteville there are deposits of coal; and the city is in a fine fruit-growing region, apples being the principal crop. Much of the surrounding country is still covered with timber. Among manufactures are lumber, spokes, handles, wagons, lime, evaporated fruit and flour.

The first settlement on the site of what is now Fayetteville was made between 1800 and 1825; when Washington county was created in 1828 the place became the county-seat, and it was called Washington Court-house until 1829, when it received its present name. The citizens of Fayetteville were mainly Quakers and sympathizers; Fayetteville was named by Federal cavalry on the 14th of July 1862, and was permanently occupied by Federal troops in the autumn of the same year. Confederate cavalry under Brigadier-General William Lewis Cabell attacked the city on the 18th of April 1863, but were driven off. The town was burned in August 1863, and shelled on the 3rd of November 1864, after the battle of Pea Ridge, by a detachment of General Price's army. Fayetteville was incorporated as a town in 1841, and in 1859 received a city charter, which was abolished by act of the Legislature in 1867; under a general law of 1869 the town was re-incorporated; and in 1906 it became a city of the first class.

**FÁYETTEVILLE**
FAYETTEVILLE, a city and the county-seat of Cumberland county, North Carolina, U.S.A., on the W. bank of the Cape Fear river (at the head of steamboat navigation), about 80 m. N.W. of Wilmington. Pop. (1890) 4222; (1900) 4670, including 2221 negroes; (1910) 7045. It is served by the Atlantic Coast Line railway and the short Raleigh & Southport railway, and by steamboat lines to Wilmington. A scheme was set on foot for the improvement by canalization of the Cape Fear river above Wilmington under a Federal project of 1902, which provided for a channel 9 ft. deep at low water from Wilmington to Fayetteville. Before Cross Creek mouth the river is below tide, and the channel is about 500 ft. wide and 16 ft. deep, was completed in 1889, and the project of 1889 provided for an increase in depth to 20 ft. Pine forests surround the town, and oaks and elms of more than a century's growth shade its streets. Fayetteville has two hospitals (each with a training school for nurses), and is the seat of a state coloured normal school and of the Donaldson military school. Several creeks and the upper Cape Fear river furnish considerable water-power, and in or near Fayetteville are manufactories of cotton goods, silk, lumber, wooden-ware, turpentine, carriages, wagons, ploughs, cotton mills, etc. In 1761, near Fayetteville was a great inland market for the western part of the state, for eastern Tennessee and for south-western Virginia. There is a large vineyard in the vicinity; truck-gardening is an important industry in the surrounding country; and Fayetteville is a shipping centre for small fruits and vegetables, especially lettuce, melons and berries. The municipality owns its water-works and its electric-lighting plant. The vicinity was settled between 1720 and 1747 by Highlanders, the settlement called Cross Creek lying within the present limits of Fayetteville. In 1762, by an act of the assembly, a town was laid out including Cross Creek, and was named Campbelltown (or "Campbellton"); but in 1784, when Lafayette visited the town, its name was changed in his honour to Fayetteville, though the name Cross Creek continued to be used locally for many years. Flora McDonald, the famous Scottish heroine, came to Campbelltown in April 1775 with her husband and children, and here she seems to have lived during the remainder of that year. The general assembly of the state met at Fayetteville in 1787, 1788 and 1789 (Newbern, Tarboro, Hillsboro and Fayetteville all being rivals at this time for the honour of becoming the permanent capital); and in 1789 the Federal constitution was here ratified for the North Carolina. In 1811 most of the town was burned. At the outbreak of the Civil War, the state authorities seized the United States Arsenal at Fayetteville, which contained 37,000 muskets and a complete equipment for a battery of light artillery. In March 1863 General W. T. Sherman and his army took possession of the town, destroyed the arsenal, and did considerable damage to property. Fayetteville was chartered as a city in 1803. A serious flood occurred in August 1908.

FAYREA, SIR JOSEPH, Bart. (1824-1907), English physician, was born at Plymouth on the 6th of December 1824. After studying medicine at Charter's Cross hospital, London, he was in 1847 appointed medical officer of H.M.S. "Victory," and soon afterwards accompanied the 3rd Lord Mount-Edgcumbe on a tour through Europe, in the course of which he saw fighting at Palermo and Rome. Appointed an assistant surgeon in Bengal in 1850, he went through the Burmese campaign of 1852 and was political assistant and Residency surgeon at Lucknow during the Mutiny. From 1859 to 1872 he was professor of surgery at the Medical College of Calcutta, and when the prince of Wales made his tour in India he was appointed to accompany him as physician. Returning from India, he acted as secretary of the Medical Board of the India office from 1872 to 1895, and in 1896 he was created a baronet. Sir Joseph Fayrer, who became a fellow of the Royal Society in 1877, wrote much on subjects connected with the practice of medicine in India, and it was especially known for his studies on the poisonous snakes of that country and on the physiological effects produced by their virus (Thanatophidia of India, 1872). In 1900 appeared his Recollections of My Life. He died at Falmouth on the 21st of May 1907.

FAYUM, a munitur (province) of Upper Egypt, having an area of 490 sq. m. and a population (1907) of 441,583. The capital, Medinet-el-Fayum, is 81 m. S.S.W. of Cairo by rail. The Fayum proper is an oasis in the Libyan Desert, its eastern border being about 15 m. west of the Nile. It is connected with that river by the Bahr Yusuf, which reaches the oasis through a gap in the hills separating the province from the Nile Valley. South-west of the Fayum, and forming part of the munitur, is the Ghurak depression. Another depression, entirely barren, the Wadi Rayan, covering 890 sq. m., lies west of the Ghurak. The only water to be had at all is the Fayum lake, and save notably the lake mentioned is encircled by the Libyan hills. The lowest part of the province, the north-west end, is occupied by the Birket el Kerun, or Lake of the Horns, whose surface level is 140 ft. below that of the sea. The lake covers about 78 sq. m.

Differing from the typical oasis, whose fertility depends on water obtained from springs, the cultivated land in the Fayum is formed of Nile mud brought down by the Bahr Yusuf. From this channel, 15 m. in length from Lake Hrun, at the entrance of the gap in the hills, to Medina, several canals branch off and by their means the province is irrigated, the drainage water flowing into the Birket el Kerun. Over 400 sq. m. of the Fayum is cultivated, the chief crops being cereals and cotton. The completion of the Assuan dam by ensuring a full supply of water enabled 20,000 acres of land, previously unirrigated and untaxed, to be brought under cultivation in the three years 1903-1905. Three crops are obtained in twenty months. The province is noted for its figs and grapes, the figs being of exceptionally good quality. Olives are also cultivated. Rose trees are very numerous and most of the attar of roses of Egypt is manufactured in the province. The Fayum also possesses an excellent breed of sheep. Lake Kerun abounds in fish, notably the "buli" (Nile carp), of which considerable quantities are sent to Cairo.

Medinet el-Fayum (or Medina), the capital of the province, is a great agricultural centre, with a population which increased from 26,000 in 1882 to 37,360 in 1907, and has several large bazaars, mosques, baths and a much-frequented weekly market. The Bahr Yusuf runs through the town, its banks lined with houses. There are two bridges over the stream: one of three arches, which carries the main street and bazaar, and one of two arches over which is built the Kait Bey mosque. Mounds north of the town mark the site of Arsinoé, earlier Crocodilopolis, where was worshipped the sacred crocodile kept in the Lake of Moeris. Besides Medina there are several other towns in the province, among them Senurus and Tomia to the north of Medina and Senara and Abuksa on the road to the lake, all served by railways. There are also, especially in the neighbourhood of the lake, many ruins of ancient villages and cities. The Fayum is the site of the Lake of Moeris (q.v.) of the ancient Egyptians—a lake of which Birket el Kerun is the shrunken remnant.

See The Fayum and Lake Moeris, by Major (Sir) R. H. Brown, R.E. (London, 1892), a valuable contribution as to the condition of the province at that date, its connexion with Lake Moeris and its possibilities in the future; The Assuan Reservoir and Lake Moeris (London, 1905), by Sir William Willcock—"with text in English, French and German—"a consideration of the irrigation possibilities; The Topography and Geology of the Fayum Province of Egypt, by H. J. L. Beadnell (Cairo, 1905).

FAZOGLI, or FAZOLI, a district of the Anglo-Egyptian Sudan, cut by 17°N. and bounded E. and S. by Abyssinia. It forms part of the foot-hills of the Abyssinian plateau and is traversed by the Blue Nile and its affluent the Tumut. Immediately south is the affurious Beni Shangul country. The chief gold-washings lie (in Abyssinian territory) on the west slope of the hills draining to the White Nile. Here is the steep Jebel-Dul, which appears to contain rich gold-bearing reefs, as gold is found in all the ravines on its flanks. The affururous region extends into Sudanese territory, gold dust being found in all the kholes coming from Jebel Farangé on the S.E. frontier. The inhabitants of Fazogli, who are governed, under the Sudan administration, by their own mese or kings, are Berta and other Shangalla tribes with an admixture of Funj blood, the country having been conquered by the Funj rulers of Sennar at the close of the 15th
FEA—FEASTS AND FESTIVALS

FEA, CARLO (1753–1836), Italian archaeologist, was born at Pigna in Piedmont on the 2nd of February 1753, and studied law in Rome. He received the degree of doctor of laws from the university of La Sapienza, but archaeology gradually absorbed his attention, and, with the view of obtaining better opportunities for his researches in 1790 he took orders. For political reasons he was obliged to take refuge in Florence; on his return in 1799 he was imprisoned by the Neapolitans, at that time in occupation of Rome, as a Jacobin, but shortly afterwards liberated and appointed Commissario delle Antichità and librarian to Prince Chigi. He died at Rome on the 18th of March 1836.

FEA revised, with notes, an Italian translation of J. J. Winckelmann's Geschichte der Kunst; and also added notes to some of G. L. Bianconi's works. Among his original writings the principal are: Miscellanea filosofica, critica, e antiquaria; L'Integrità del Panteon rivendicata a M. Agrippa; Frammenti di fasti consolari; Iscrizioni di monumenti epigrafici e della Descrizione di Roma.

PEARNE, CHARLES (1742–1794), English jurist, son of Charles Pearne, judge-advocate of the admiralty, was born in London in 1742, and was educated at Westminster school. He adopted the legal profession, but, though well fitted by his talents to succeed as a barrister, he neglected his profession and devoted most of his attention and his patrimony to the prosecution of scientific experiments, with the vain hope of achieving discoveries which would reward him for his pains and expense. He died in 1794, leaving his widow and family in necessitous circumstances. His Essay on the Learning of Contingent Remains and Executory Decrees, the work which has made his reputation as a legal authority, and which has passed through numerous editions, was called forth by a decision of Lord Mansfield in the case of Perrin v. Blake, and had the effect of reversing that decision.

A volume entitled Pearne's Posthumous Works was published by subscription in 1797 for the benefit of his widow.

FEASTS AND FESTIVALS. A festival or feast is a day or series of days specially and publicly set apart for religious observances. Whether its occurrence be casual or periodic, whether its ritual be grave or gay, carnal as the orgies of Baal and Astarte, or spiritual as the worship of a Puritan Sabbath, it is to be regarded as a festival or "holy day" as long as it is professedly held in the name of religion.

To trace the festivals of the world through all their variations would be to trace the entire history of human religion and human civilization. Where no religion is, there can of course be no festivals; and without civilization any attempt at festival-keeping must necessarily be fitful and comparatively futile. But as religion develops, festivals develop with it, and assume their distinctive character; and an advancing civilization, at least in its earlier stages, will generally be found to increase their number, enrich their ritual, fix more precisely the time and order of their recurrence, and find the area of their observance.

Some uncivilized tribes, such as the Jungs of Bengal; the Fuegians and the Andamanese, have been described as having no word for God, no idea of a future state, and consequently no religious ceremonies of any kind whatever. But such cases, doubtful at the best, are confessedly exceptional. In the vast majority of instances observed and recorded, the religiosity of the savage is conspicuous. Even when incapable of higher manifestations, it can at least take the form of reverence for the dead; the grave-heaps can become an altar on which offerings for food of the dead may be placed, and where in acts of public and private worship the gifts of survivors may be accompanied with praises and with prayers. That the custom of ghost-propitiation by some sort of sacrifice is even now very widely diffused among the lower races at least, and that there are also many curious "survivals" of such a habit to be traced among highly civilized modern nations, has been abundantly shown of late by numerous collectors of folk-lore and students of sociology; and indications of the same phenomena can be readily pointed out in the Rig-Veda, the Zend-Avesta and the Pentateuch, as well as in the known usages of the ancient Egyptians, Greeks and Romans. In many cases the ceremonial observed is of the simplest; but it ever tends to become more elaborate; and above all it calls for repetition, and repetition, too, at regular intervals. Whenever this last demand has made itself felt, a calendar begins to take shape. The simplest calendar is obviously the lunar. "The Naga tribes of Assam celebrate their funeral feasts month by month, laying food and drink on the graves of the departed." But it soon comes to be combined with the solar. Thus the Karens, "while habitually making oblations, have also annual feasts for the dead, at which they ask the spirits to eat and drink." The natives of the Mexican valley in November lay animals, edibles and flowers on the graves of their dead relatives and friends. The common people in China have similar customs on the arrival of the winter solstice. The ancient Peruvians had the custom of periodically assembling the embalmed bodies of their dead emperors in the great square of the capital to be feasted in company with the people. The Athenians had their annual Nekyria or Neukoreia and the Romans their Feralia and Lemuralia. The Egyptians observed their three "festivals of the seasons," twelve "festivals of the month," and twelve "festivals of the half-month," in honour of their dead. The Parsees, too, were required to render their afromans (blessings which were to be recited over a meal to which an angel or the spirit of a deceased person was invited) at each of the six seasons of the year, and also on certain other days.

In the majority of recorded instances, the religious feeling of the savage has been found to express itself in other forms besides that of reverence towards the dead. The oldest literatures of the world, at all events, whether Aryan or Semitic, embody a religion of a much higher type than ancestor worship. The hymns of the Rig-Veda, for example, while not without traces of the other, yet indicate chiefly a worship of the powers of nature, connected with the regular recurrence of the seasons. Thus in iv. 57 we have a hymn designed for use at the commence- ment of the summer, and ploughing time; and in v. 24, the earliest treatise on Hindu ceremonial, we already find a complete series of satras or sacrificial sessions exactly following the course of the solar year. They are divided into two distinct sections, each consisting of six months of thirty days each. The sacrifices are allowed to commence only at certain lucky con- stellations and in certain months. So, for instance, as a rule, no great sacrifice can commence during the sun's southern progress. The great sacrifices generally take place in spring, in the months of April and May. In the Parsee Scriptures the year is divided into six seasons or ghanabars of two months each, concluding with February, the season at which "great expiatory sacrifices were offered for the growth of the whole creation in the last two months of the year." We have no means of knowing precisely what were the arrangements of the Phoenician calendar, but it appears that during the "Easter" or "Redemion of the Rig-Veda;" Max Müller's Chips from a German Workshop, i. 115.

is generally admitted that the worship was solar, the principal festivals taking place in spring and in autumn. Among the most characteristic celebrations of the Egyptians were those which took place at the ἀπαντάμενοι or disappearance of Osiris in October or November, at the search for his remains, and their discovery about the winter solstice, and at the date of his supposed entrance into the moon at the beginning of spring. The Phrygian festivals were also arranged on the theory that the deity was asleep during the winter and awoke during the summer; in the autumn they celebrated his returning to rest, and in spring with mirth and revelry they received him from his slumbers. The seasonal character of the Teutonic Ostern, the Celtic Beltane and the Scandinavian Yule is obvious. Nor was the habit of observing such festivals peculiar to the Aryan or the Semitic race. The Mexicans, who were remarkable for the perfection of their calendar, in addition to this had an elaborate system of movable and immovable festivals distributed over the entire year; the principal festivals, however, in honour of their chief gods, Tezcatlipoca, Huitzilopochtli and Tlaloc, were held in May, June and December. Still more plainly connected with the celebration of the sun were the public worship of the ancient Peruvians, who, besides the ordinary feast at each new moon, observed four solar festivals annually. Of these the most important was the Yntip-Raymi (Sun-feast), which, preceded by a three days' fast, began with the summer solstice, and lasted for nine days. Its ceremonies have been often described. A similar but less important festival was held at the winter solstice. The Cusqui-Raymi, held after seetide, as the maize began to appear, was celebrated with sacrifices and banquetes, music and dancing. A fourth great festival, called Citua, held on the first new moon after the autumnal equinox, was preceded by a strict fast and special observances intended for purposes of purification and execution, and after which the festivities lasted until the moon entered her second quarter.

Greek Festivals.—Perhaps the annual Athenic festival in honour of Erechtheus alluded to in the Iliad (ii. 550) ought to be regarded as an instance of ancestor-worship; but the seasonal character of the ἀρπη or new-moon feast in Od. xx. 156, and of the θαλασσα or harvest-festival in Il. ix. 533, is generally acknowledged. The older Homeric poems, however, give no such express indications of a fully-developed system of festivals as are to be met with in the so-called "Homeric" hymns, in the Works and Days of Hesiod, in the pages of Herodotus, and so abundantly in most ancient MSS of other periods; and it is manifest that the calendar of Homer or even of Herodotus must have been a much simpler matter than that of the Tarentines, for example, came to be, of whom we are told by Strabo that their holidays were in excess of their working days. Each demos of ancient Greece during the historical period had its own local festivals (ἐποχαί δημοτικαί), often largely attended and splendidly solemnized, the usages of which, though essentially alike, differed very considerably in details. These details have in many cases been wholly lost, and in others have reached us only in a very fragmentary state. But with regard to the Athenian calendar the most important fact, of all, over which much information is fortunately very copious. It included some 50 or 60 days on which all business, and especially the administration of justice, was by order of the magistrates suspended. Among these ἑορτασίαι were included—in Gamelion (January), the Lenaea or festival of vats in honour of Dionysus; in Anthesterion (February), the Anthesteria, also in honour of Dionysus, lasting three days (Pithoigia, Choes and Chytiri); the Diathes in honour of Zeus, and the lesser Eleusinia; in Elaphobollion (March), the Pandia (? of Zeus), the Elaphobolia of Artemis and the greater Dionysia; in Mounychia, the Munychia of Artemis as the moon goddess (Mousynchia) and the Delphinia of Apollo; in Thargelion (May), the Thargelia of Apollo and the Pnyteria and Callantyneria of Athena; in Scirophorion (June), the Diopolia of Zeus and the Scirophoria of Athena; in Hekatombaion, hecatombs were offered to Apollo the summer-god, and the Cronia of Cronus and the Panathenaea.

1 Plutarch, De Iside et Osiride; Macrobius, Saturnalia, i. 21.

of Athena were held; in Metageitnion, the Metageitnia of Apollo; in Bökdromion, the Bödromia of Apollo the ruler,2 the Nekusia or Nemesis (the festival of the dead), and the greater Eleusinia; in Pyanepion, the Pyanepesia of Apollo, the Oschophoria of Dionysus (probably), the Chalkeia or Athenma of Athena, the Thesmophoria of Demeter, and the Apaturia; in Maimacterion, the Maimactia of Zeus; and in Poseideon (December), the lesser Dionysia. Of these some are commemorative of historical events, and one at least may perhaps be regarded as a relic of ancestor-worship. But the greater majority of the great festivals, associating themselves in the manner that has already been indicated with the phenomena of the seasons, the equinoxes and the solstices.3 In addition to their numerous public festivals, the Greeks held various family celebrations, also called ἄνθροι, in connexion with weddings, births and similar domestic occurrences. For the great national ἀργυρόμεναι—Olympian, Pythian, Nemean and Isthmian—see the article Games, Classical.

Roman Festivals.—For the purpose of holding comitia and administering justice, the days of the Roman year were regarded as being either the dies fasti or the dies nefasti. The dies fasti being the days on which it was lawful for the pratores to administer justice in the public courts, while on the dies nefasti neither courts of justice nor meetings of comitia were allowed to be held. Some days were fasti during one portion and nefasti during another; these were called dies intercali. For the purposes of religion a different division of the year was made; the days were treated as fasti or as profesti,—the former being consecrated to acts of public worship, such as sacrifices, banquetes and games, while the latter (whether fasti or nefasti) were not specially claimed for religious purposes. The dies fasti or feriae publicae were either the statiove, conceptiove or imperatiae. The statiove were such as were observed regularly, each one of them being the conceptiove were observed annually on days fixed by the authorities for the time being; the imperatiae were publicly appointed as occasion called for them. In the Augustan age the feriae statiove were very numerous, as may be seen from what we possess of the Fasti of Ovid. The number was somewhat fluctuating. Festivals frequently fell into desuetude or were revived, were increased or diminished, were shortened or prolonged at the will of the emperor, or under the caprice of the popular taste. Thus Augustus restored the Compitalia and Lupercalia; while Marcus Antonius in his turn found it expedient to diminish the number of holidays. The following is an enumeration of the stated festivals as given by Ovid and contemporary writers. The first day of January was observed somewhat as is the modern New Year's day: clients sent presents to their patrons, slaves to their masters, friends and relatives to one another. On the 9th the Agonalia were held, apparently in honour of Janus. On the 11th the Carmentalia were kept as a half-holiday, but principally by women; so also on the 13th. On the 15th of February were the Februalia, on the 15th the Lupercalia, on the 17th the Iovi Alaei, on the 18th the Quirinalia, on the 19th the Parilia, on the 23rd (at one time the last day of the Roman year) the Terminalia, on the 24th the Regifugium or Fugalia, and on the 27th the Equilia (of Mars). On the 1st of March were the Matrialia, on the 14th a repetition of the Equilia, on the 15th the festival of Anna Perenna, on the 17th the Liberalia or Agonalia, and from the 19th to the 23rd the Quinquatriginta (of Minerva). On the 4th of April were the Megalesia (of Cybele), on the 12th the Cerialia, on the 21st the Palesia, on the 23rd the Vinalia, on the 25th the Robigalia, and on the 28th the Floralia. The 1st of May was the festival of the Lares, the Flumen was called, and on the 9th, 11th and 13th the Lemuria were celebrated; on the 12th the Ludi Martiales, and on the 13th those of Mercury. June 5 was sacred to Seno Sancus; the Vestalia occurred on the 9th, the Matralia on the 11th, and the

1 In this month the anniversaries of the battle of Marathon, and of the downfall of the thirty tyrants, were also publicly celebrated.

2 See Schœmann, Griechische Altertümer, i. 439 seq.: Mommsen, Histioriogliche.

3 Feriae privatae, such as anniversaries of births, deaths and the like, were observed by separate clans, families or individuals.
Quinquagintas Minusculae on the 13th. The Ludi Apollinares were on the 5th, and the Nuptialia on the 23rd of July. On the 13th of August were the Nemoralia, in honour of Diana; on the 19th the Consualia, on the 19th the Vinalia Rustica, and on the 23rd the Vinalia Animarum. The Ludi Magni, in honour of Jupiter, Juno and Minerva, began on September 4. The Meditrinalia (new wine) were on the 11th of October, the Fannalia on the 17th, and the Equiria on the 15th. The Epulum Iovis was on 15th November. The December festivals were—on the 5th Fannalia, and towards the close Opalia, Saturnalia, Larentalia.

The calendar as it stood at the Augustan age was known to contain many comparatively recent accessions, brought in under the influence of two closely allied powers, the foreign priest and the foreign cook (Mommsen). The Megalesia, for example, had been introduced 204 B.C. The Ludi Apollinares could not be traced farther back than 208 B.C. The Floralia and Cerialia had not come in much earlier. Among the oldest feasts were undoubtedly the Lupercalia, in honour of Lupercus, the god of fertility; the Equiria, in honour of Mars; the Palilia; the great September festival; and the Saturnalia.

Among the feriae conceptivae were the very ancient feriae Latinae, held in honour of Jupiter on the Alban Mount, and attended by all the higher magistrates and the whole body of the senate. The time of their celebration greatly depended on the state of affairs at Rome, as the consuls were not allowed to take the field until they had held the Latinae, which were regarded as a break in the business of state. The first Latinae were held in the spring, and the Ambarsalia in autumn, both in honour of Ceres. The Paganalia of each pagus, and the Compitalia of each vicus were also conceptivae. Of feriae imperatoriae,—that is to say, festivals appointed by the senate, or magistrates, or higher priests to commemorate some great event or avert some threatened disaster,—the best known is the Novemdale, which used to be celebrated as often as stoves fell from heaven (Livy xx. 62, xxv. 7, &c.). In addition to all those already mentioned, there occasionally occurred ludi satiri, which were celebrated in fullness of a vow; ludi funebres, sometimes given by private persons; and ludi sacrales, to celebrate certain periods marked off in the Etrusco-Roman religion.

Feasts of the Jews.—By Old Testament writers a festival or feast is generally called either a (compare the Arabic Hadj), from מִצְבַּח to rejoice, or מִצְבָּה, from מִצְבָּה, to appoint. The words מִצְבַּח and מִצְבָּה are also occasionally used. In the Talmud the three principal feasts are called הַמִּשְׁתֶּחֶץ, after Exod. xxiii. 14. Of the Jewish feasts which are usually traced to a pre-Mosaic origin the most important and characteristic was the weekly Sabbath, but special importance was also attached from a very early date to festivals of the calendar, of which the Passover was the most celebrated. These were for the most part fixed by the civil authorities, but a few of the festivals were religious in character only. The Passover was the principal festival of the year (the Feast of Trumpets) is followed by a great day of rest, the day of Atonement (which, however, was hardly a festival in the strictest sense of the word), by the Feast of Tabernacles, and by a great concluding day (Lev. xxiii. 36; John vii. 37). If the feast of the Passover be excepted, it will be seen that all these celebrations or commemorations associate themselves more readily with natural than with historical events. There was 1 also a considerable number of post-Mosaic festivals, of which the principal were that of the Dedication (described in 1 Mac. iv. 52-59; comp. John x. 22) and that of Purim, the origin of which is given in the book of Esther (ix. 20 seq.). It has probably no connection with the Persian festival Purūdīn (see Esther).2 Earlier Christian Festivals.—While making it abundantly manifest that Christ and his disciples observed the appointed Jewish feasts, the New Testament nowhere records the formal institution of any distinctively Christian festival. But we have unambiguous evidence of the actual observance, from a very early period, of the first day of the week as a holy day (John xx. 19, 26; 1 Cor. xvi. 2; Acts xx. 7; Rev. i. 10). Pliny in his letter to Trajan describes the Christians of Bithynia as meeting for religious purposes on a set day; that this day was Sunday is put beyond all reasonable doubt by such a passage as that in the Apg. of Justin Martyr, where he says that "on Sunday (ἡμέρα τοῦ θεοῦ λεγομένη Σάββατον) all the Christians living either in the city or the country met together." The Jewish element, in some churches at least, and especially in the East, was strong enough to secure that, along with the dies domino, the seventh day should continue to be kept holy. Thus in the Apostolic Constitutions (li. 59) we find the Saturday specially mentioned along with the Sunday as a day for the assembling of the church; in v. 15 it is ordained that there shall be no fasting on Saturday, while in viii. 33 it is added that both on Saturday and Sunday slaves are to have rest from their labours. The 16th canon of the council of Laodicea (undated, but probably about 208) demands that "the public service was to be held on Saturday as well as on Sunday. In other quarters, however, the tendency to regard both days as equally sacred met with considerable resistance. The 36th canon of the council of Illiberis, for example, deciding that Saturday should be observed as a fast-day, was doubtless intended to enforce the distinction between Saturday and Sunday. At Milan in Ambrose’s time Saturday was observed as a festival; but Pope Innocent is found writing to the bishop of Eugubium to urge that it should be kept as a fast. Ultimately the Christian church came to recognize but one weekly festival.

The numerous yearly festivals of the older Christian church, when historically investigated, can be traced to very small beginnings. Indeed, while it appears to be tolerably certain that Jewish Christians for the most part retained all the festivals which had been instituted under the old dispensation, it is not at all probable that either they or their Gentile brethren recognized any yearly feasts as of distinctively Christian origin or obligation. It cannot be doubted, however, that gradually, in the course of the 2nd century, the universal church came to observe the anniversaries of the death and resurrection of Christ—the πάσχα εἰκόνων and the πάσχα λατρευτήν, as they are named by the council of Laodicea (undated, but probably about 208). Long afterwards Whitsunday also came to be fixed in the usage of Christendom as a great annual festival. Even Origen (in the 8th book Against Celsus) enumerates as Christian festivals the Sunday, the υπαρχάν, the Passover with the feast of the Resurrection, and Pentecost; under which latter term, however, he includes the whole period between Easter and Whitsuntide. About Cyprian’s time we find individual Christians commemorating their departed friends, and whole churches commemorating their martyrs; in particular, there are traces of a local and partial observance of the festival of the Innocents. Christmas and Epiphany were among the later introductions, the feast of the Epiphany being somewhat the earlier of the two. Both are alluded to indeed by Clemens Alexandrinus (i. 340), but only in a way which indicates that even in his time the precise date of Christ’s birth was unknown, that its anniversary was not usually observed, and that the day of his baptism was kept as a festival only by the followers of Basilides (see EPHYPANY)

When we come down to the 4th century we find that, among the 50 days between Easter and Pentecost, Ascension Day has

1 On the whole subject of Jewish festivals see Reland, Antiq. Hebr.; Knobel, Leviticus (c. 23); George, Die judischen Feste; Edersheim, The Temple: its Ministry and Services; Ewald, Allerk. des Volkes Israel; articles in Bible dictionaries.

2 The council of Laodicea almost certainly means that solemn public service was to be held on Saturday as well as on Sunday.
FEASTS AND FESTIVALS

come into new prominence. Augustine, for example, enumerates as anniversaries celebrated by the whole church those of Christ's passion, resurrection and ascension, along with that of the outpouring of the Holy Ghost, while he is silent with regard to Christmas and Epiphany. The general tendency of this and the following centuries was largely to increase the festivals of the Church, and by legislation to make them more fixed and uniform. Many passages, indeed, could be quoted from Chrysostom, Jerome and Augustine to show that these fathers had not by any means forgotten that comparative freedom with regard to outward observances was one of the distinctive excellences of Christianity as contrasted with Judaism and the various heathen systems (compare Socrates, H.E. v. 22). But there were many special circumstances which seemed to the leaders of the Church at that time to necessitate the permission and even legislative sanction of a large number of new festivals. The innovations of heretics sometimes seemed to call for rectification by the institution of more orthodox observances; in other instances the propensity of rude and uneducated converts from paganism to cling to the festal rites of their forefathers proved to be invincible, and the Church was bound to submit to the old usages to the new worship rather than to abolish them altogether; moreover, although the empire had become Christian, it was manifestly expedient that the old holidays should be recognized as much as possible in the new arrange-
ments of the calendar. Constantine soon after his conversion enacted that on the dies dominica there should be no suits or trials in law; Theodosius the Great added a prohibition of all public shows on that day, and Theodosius the younger extended the prohibition to Epiphany and the anniversaries of martyrdoms, which at that time included the festivals of St Stephen, and of St Peter and St Paul, as also that of the Maccabees. In the 21st
canon of the council of Agde (506), besides Easter, Christmas, Epiphany, Ascension and Pentecost, we find the Nativity of John the Baptist already mentioned as one of the more important festivals on which attendance at church was regarded as oblig-
atory. To these were added, in the centuries immediately following, the feasts of the Annunciation, the Purification, and the Assumption of the Virgin; as well as those of the Circum-
cision, of St Michael and of All Saints.

Festivals were in practice distinguished from ordinary days in the following ways: all public and judicial business was sus-
hended; in some cases every kind of game or amusement which might interfere with devotion; the churches were specially decorated; Christians were expected to attend public worship, attired in their best dress; love feasts were celebrated, and the rich were accustomed to show special kindness to the poor; fasting was strictly forbidden, and public prayers were said in a standing posture.

Later Practice.—In the present calendar of the Roman Catholic Church the number of feast days is very large. Each is cele-
brated by an appropriate office, which, according to its character, is either duplex, semi-duplex or simplex. A duplex again may be either of the first class or of the second, or a major, or a minor. The distinctions of ritual for each of these are given with great minuteness in the general rubrics of the breviary; they turn chiefly on the number of Psalms to be sung and of lessons to be read, on the manner in which the antiphons are to be given and on similar details. The duplicita of the first class are the Nativity, the Epiphany, Easter with the three preceding and two following days, the Ascension, Whitsunday and the two following days, Corpus Christi, the Nativity of John Baptist, Saints Peter and Paul, the Assumption of the Virgin, All Saints, and, for each church, the festival proper to the particular title and the feast of its dedication. The duplicita of the second class are the Circum-
cision, the feast of the Holy Name of Jesus, of the Holy Trinity, and of the Most Precious Blood of Christ, the feasts of the Purifica-
tion, Annunciation, Visitation, Nativity and Conception of the Virgin, the Natallitia of the Twelve Apostles, the feasts of the Evangelists, of St Stephen, of the Holy Innocents, of St Joseph and of the Patronicinn of Joseph, of St Lawrence, of the Inven-
tion of the Cross and of the Dedication of St Michael. The Dominaecae majores of the first class are the first Sunday in Advent, the first in Lent, Passion Sunday, Palm Sunday, Easter Sunday, Dominica in Albis, Whitsunday and Trinity Sunday; the Dominaecae majores of the second class are the second, third and fourth in Advent, Septuagesima, Sexagesima and Quinquages-
ima Sundays, and the second, third and fourth Sundays in Lent.

In the canons and decrees of the council of Trent repeated allusions are made to the feast days, and their fitness, when properly observed, to promote piety. Those entrusted with the cure of souls are urged to see that the feasts of the Church be devoutly and religiously observed, the faithful are enjoined to attend public worship on Sundays and on the greater festivals at least, and parish priests are bidden to expound to the people on such days some of the things which have been read in the Office for the day. Since the council of Trent the practice of the Church with respect to the representation of the feasts has varied considerably in different Catholic countries, and even in the same country at different times. Thus in 1557, in the diocese of Lyons, there were almost forty annual festivals of a compulsory character. By the concordat of 1802 the number of such festivals was for France reduced to four, namely, Christmas day, Ascension day, the Assumption of the Virgin, and All Saints day.

The calendar of the Greek Church is even fuller than that of the Latin, especially as regards the ἐορταὶ ἰωύ. Thus on the last Sunday in Advent the feast of All Saints of the Old Covenant is celebrated; while Adam and Eve, Job, Elijah, Isaiah, &c., have separate days. The distinctions of ritual are analogous to those in the Western Church. In the Coptic Church there are seven great festivals, Christmas, Epiphany, the Annunciation, Palm Sunday, Easter Sunday, Ascension and Whitsunday, on all of which the Copts "wear new clothes (or the best they have), feast and give alms" (Lane). They also observe, as minor festivals, Maundy Thursday, Holy Saturday, the feast of the Apostles (11th July), and that of the Discovery of the Cross.

In communion with most of the churches of the Reformation, the Church of England retained a certain number of festivals besides all Sundays in the year. They are, besides Monday and Tuesday both in Easter-week and Whitsun-week, as follows: the Circumcision, the Epiphany, the Conversion of St Paul, the Purification of the Blessed Virgin, St Matthias the Apostle, the Annunciation of the Blessed Virgin, St Mark the Evangelist, St Philip and St James (Apostles), the Ascension, St Barnabas, the Nativity of St John Baptist, St Peter the Apostle, St James the Apostle, St Bartholomew, St Matthew, St Michael and all Angels, St Luke the Evangelist, St Simon and St Jude, All Saints, St Andrew, St Thomas, Christmas, St Stephen, St John the Evangelist, the Holy Innocents. The 13th canon enjoins that all manner of persons within the Church of England shall from henceforth celebrate and keep the Lord's day, commonly called Sunday, and other holy days, according to God's holy will and pleasure, and the orders of the Church of England prescribed in that behalf, that is, in hearing the Word of God read and taught, in private and public prayers, in acknowledging their offences to God and amendment of the same, in reconciling themselves charitably to their neighbours where displeasure hath been, in oftentimes receiving the communion of the body and blood of Christ, in visiting of the poor and sick, using all godly and sober conversation. (Compare Hooker, E.P. v. 70.) In the Directory for the Public Worship of God which was drawn up by the West-
minster Assembly, and accepted by the Church of Scotland in 1645, there is an appendix which declares that there is no day commanded in Scripture to be kept holy under the gospel but the Lord's day, which is the Christian Sabbath; festival days, vulgarly called holy-days, having no warrant in the Word of God,
FEATHER

are not to be continued; nevertheless it is lawful and necessary, upon special emergent occasions, to separate a day or days for public fasting or thanksgiving, as the several eminent and extraordinary dispensations of God's providence shall administer cause and opportunity to his people.

Several attempts have been made at various times in western Europe to reorganize the festival system on some other scheme than the Christian. Thus at the time of the French Revolution, during the period of Robespierre's ascendency, it was proposed to substitute a tenth day (Décadi) for the weekly rest, and to introduce the following new festivals: that of the Supreme Being and of Nature, of the Human Race, of the French people, of the Benefactors of Mankind, of Freedom and Equality, of the Martyrs of Freedom, of the Republic, of the Freedom of the World, of Patriotism, of Hatred of Tyrants and Traitors, of Truth, of Justice, of Modesty, of Fame and Immortality, of Friendship, of Temperance, of Heroism, of Fidelity, of Unselfishness, of Stoicism, of Love, of Conjugal Fidelity, of Filial Affection, of Childhood, of Youth, of Manhood, of Old Age, of Misfortune, of Agriculture, of Industry, of our Forefathers, of Posternity and Felicity. The proposal, however, was never fully carried out, and soon fell into oblivion.

Mahomedan Festivals.—These are chiefly two—the 'Eed es-Sagheer (or minor festival) and the 'Eed el-Kebur (or great festival), sometimes called 'Eed el-Kurban. The former, which lasts for three days, immediately follows the month of Ramadan, and is generally the more joyous of the two; the latter begins on the tenth of Zul-Hijjeh (the last month of the Mahommedan year), and lasts for three or four days. Besides these festivals they usually keep the first ten days of Muharram (the first month of the year), especially the tenth day, called Yom Ashoora; the birthday of the prophet, on the twelfth day of the third month; the birthday of El-Hoseyn, in the fourth month; the anniversary of the prophet's miraculous ascension into heaven, in the seventh month; and one or two other anniversaries. Friday, called the day of El-Gumah (the assembly), is a day of public worship; but it is not usual to abstain from public business on that day except during the time of prayer.

Hindu and Buddhist Festivals.—In modern India the leading popular festivals are the Holi, which is held in March or April and lasts for five days, and the Dasahara, which occurs in October. Although in its origin Buddhism was a deliberate reaction against all ceremontial, it does not now refuse to observe festivals.

By Buddhists in China, for example, three days in the year are especially observed in honour of the Buddha,—the eighth day of the second month, when he left his home; the eighth day of the fourth month, the anniversary of his birthday; and the eighth of the twelfth, when he attained to perfection and entered Nirvâna. In Siam the eighth and fifteenth days of every month are considered holy, and are observed as days for rest and worship. At Trat, the festival of the close of the year, visiting and play-going are universal. The new year (January) is celebrated for three days; in February is another holiday; and in April is a sort of Lent, ushering in the rainy season; on the last day of June presents are made of cakes of the new rice; in August is the festival of the angel of the river, "whose forgiveness is then asked for every act by which the waters of the Meinam have been rendered impure." See Bowring's Slâm and Carné's Travels in Indo-China and the Chinese Empire. Copious details of the elaborate festival-system of the Chinese may be found in Doolittle's Social Life of the Chinese.

LITERATURE.—For Christian feasts see K. A. H. Kellner, Heertologie (Freiburg im Breisgau, 1906); Hippolyte Delachay, Les Légendes lapongraphiques (Brussels, 1905); J. Kendell Harris, The Cult of the Heavenly Twins (Cambridge, 1905); de Rossi-Duchesne, Martyrologium Hieronymianum.

FEATHER (O. Eng. fether, Ger. Feder, from an Indo-European root seen also in Gr. περιόν, and πετεσθαι, to fly), a horny outgrowth of the skin of birds homologous with the scale of the reptile. The body-covering of birds is, without exception, comprised of feathers, and by this character alone birds may be distinguished from all other animals.

The most perfect form of feather is made up of a long, tapering rod, fringed on either side, for the greater part of its length, by a secondary series of slender and tapering rods forming a more or less acute angle with the central axis. This fringe is known as the vexillum or "vane" (fig. 1 a). The central axis is divisible into two distinct parts,—a hollow, cylindrical, transparent calamus, or "quill," the base of which is inserted into the skin, and a solid, quadrangular rachis or "shaft," which supports the vane. At the lower end of the quill is a small hole,—the lower umbilicus—through which the nutritive pulp passes during the growth of the feather; while at the upper end, where it passes into the shaft, a similar hole will be found,—the upper umbilicus—and from this the last remains of the capsules which contained the nutritive pulp may sometimes be seen protruding. If the quill is cut open a series of these capsules will be found fitting one into the other throughout the whole length of the tubular chamber.

![Diagrams of Feather-Barbs](image_url)

a. Outline of a feather showing the relation of the bars and barbules to the central axis or shaft.
b. Section across two of the bars shown in a, highly magnified.
c. Two barbules of the posterior series—seen only in cross-section in b.
d. A barbule of the anterior series.
e. Section across the base of three anterior barbules showing attachment to barb.
f. A portion of the hooklet of the anterior series showing the method of interlocking with the barbules of the posterior series.

The rods comprising the lateral fringe, or vane, are known as the rami or the "bars," and will be found, on microscopic examination, to be lath-shaped and to taper to a point. Further, each barb supports a double series of smaller outgrowths known as the radii, or "barbules"; so that each barb may be likened to a feather in miniature. These "barbules," however, differ markedly in structure on the two sides of the barb, those pointing towards the tip of the feather—the "anterior barbules"—being ribbon-shaped from the base outwards for about half their length, when they become cut up to form a series of long and very delicate hooklets (fig. 1 d). On the opposite side of the barb the barbules are also ribbon-shaped for about half their length, but the ribbon is curved trough-fashion, so that the whole series of posterior barbules forms a number of deep valleys, and into these the hooklets are thrust so as to catch hold of the upper edges of the troughs, which are set so that the
upper edge is towards the upper, and the lower edge towards the under surface of the feather. The manner in which this beautiful mechanism works may be seen in fig. 16.

In one of the primary or "quill" feathers of the wing of a crane, each barb of the inner side of the vane was found to bear about 600 pairs of barbules, which would make about 800,000 barbules for the inner web of the vane alone, or more than a million for the whole feather (H. F. Gadow). It is to the agency of these hooklets alone that the closely-knit, elastic vanes of the flight feathers and the body feathers are due. Where these hooklets are wanting the barbs do not adhere together, resulting in a loose "discontinuous" vane such as, for example, is found in the plumes of the ostrich.

Many feathers, in addition to the main axis, bear a second, generally much shorter axis, supporting a loose discontinuous vane; this shorter branch is known as the "afterhaft" and arises from the under surface of the feather. Only in the cassowary and emu among adult birds is the afterhaft as large as the main shaft.

There are several different kinds of feathers—contour feathers, semiplumes, down-feathers, filoplumes and powder-down. Contour feathers, as their name implies, are those which form the contour or outline of the body, and are all that can generally be seen. Those which form the "flight feathers" of the wing, and the tail feathers, are the most perfectly developed. Semiplumes are degenerate contour feathers. The down-feathers are generally completely hidden by the contour feathers: they form in many birds, such as guilis and ducks, a thick under-clinging covering, the underfur of mammals such as the seals. In all cases they are of a loose, soft, "fluffy" structure, the barbs being of great length and slenderness, while the barbules are often long and provided with knob-like thickenings answering to the hooklets of the more perfectly developed contour feathers; these thickenings help to "felt" the separate down-feathers together, the barbs of one down-feather interlocking with those of its neighbour. Down-feathers differ from semiplumes both in their relation to contour feathers and in that they do not possess a main axis, all the barbs arising from a common centre.

Filoplumes are degenerate structures having a superficial resemblance to hairs, but they always bear a minute vane at the tip. They occur in all birds, in clusters of varying number, about the bases of contour feathers. In some birds they attain a great length, and may project beyond the contour feathers, sometimes forming conspicuous white patches, as for example in the necks of cormorants. In their early stages of development they often possess a large aftershaft made up of a number of barbs, but these quickly disappear, leaving only the degenerate main shaft. The eyelashes and bristles round the mouth found in many birds arise in the same way, the short hairs of the eye being firmly adhering to the eye of the bird; in the common Europe and the North American birds, such as the parrots, the seeds of these feathers are scattered singly over the greater part of the body.

The nature of the covering of nesting birds is of a more complex character than has hitherto been suspected. The majority of young birds, as is well known, either emerge from the egg clotted in down-feathers, or develop these within a day or two afterwards. But this covering, though superficially similar in all, may, as a matter of fact, differ widely in its constitution, even in closely related forms, while only in a very few species can the complete history of these feathers be made out.

The brown or tawny owl (Syrnium aluco) is one of these. At hatching, the young of this species is thickly clad in white, woolly down-feathers, of the character known as umbelliform, that is to say, the central axis or main shaft is wanting, so that the barbs all start from a common centre. These feathers are occupied by the position of the ultimate contour feathers. They are newly replaced by a second down-like covering, superficially resembling, and generally regarded as, true down. But they differ in that their barbs spring from a central axis as in typical contour feathers. Feathers of this last description indeed have now made their appearance in the shape of the "flight" or quill feathers (remiges) and of the tail feathers. This plumage is worn until the autumn, when the downy feathers give place to the characteristic adult plumage. The down feathers which appear at hatching-time are known as pre-remiges, or pre-plumulae, as the case may be; the first generation of pre-remiges, in the case of the tawny owl for example, is made up of protoplumes, while the succeeding plumage is made up of mesoptyles, and these in turn give place to the teleoptyles or adult feathers. The two forms of nesting plumage—pre-remiges and pre-plumulae—may be collectively called "neoptyles," a term coined by H. F. Gadow to distinguish the plumage of the nestling from that of the adult—the "tekoptyle" plumage.

As a rule the nestling develops but one of these generations of neoptyles, and this generally answers to the mesoptyle plumage, though this is of a degenerate type. In some birds, as in the Megapodes, the "tekoptyle" or first of these two generations of pre-remiges is developed and shed while the chick is yet in the shell, so that at hatching the mesoptyle plumage is well developed. But in the majority of birds, probably, the mesoptyle plumage only is developed, while the earlier, and apparently more degenerate, dress is suppressed. In the penguins both of these nestling plumages are developed, but the mesoptyle dress has degenerated so that the umbelliform feathers now take the place of feathers having a central axis.

The Anatidae show traces of the earlier, first generation of feathers in one or two species only, e.g. Cloephaga rubidiceps. In all the remaining species mesoptyles only occur. And this is true also of the game-birds. In both the Tinamous, the duck tribe and the game-birds this mesoptyle plumage shows, in different species, every gradation between feathers having a well-developed main shaft and aftershaft, and those which are mere umbelliform tufts.

As development proceeds and the contour feathers make their appearance they thrust the mesoptyle feathers out of their follicles—the pockets in the skin in which they were rooted—and these will often be found adhering to the tips of the contour feathers for many weeks after the bird has left the nest. This occurs because the development of the contour feather begins before that of the mesoptyles has completed.

The plumage in nesting birds is still further complicated by the fact that it may be almost, or entirely, composed of pre-plumulae; that is to say, of down-feathers which are later succeeded by "down-down-feathers," a case among the accipitrids, e.g. the owls, for example, and thereby it differs entirely from that of the birds which develop neither pre-plumulae nor adult down. The cormorants are, so far as is known, the only birds which have a nestling plumage composed entirely of pre-plumulae.

In variety and brilliancy the colours of birds are not surpassed by those of any other group of animals. Yet the pigments to which these colours are due are but few in number, while a large number of the most resplendent hues are produced by structural peculiarities of the colourless horny surface of the feathers, and hence are known as subjective or optical colours.

The principal colour pigments are (a) melanin pigments, derived possibly from the haemoglobin of the blood, but more probably from the blood plasma, and (b) lipochrome or "fat" pigments, which are regarded as reserve products; though in the case of birds it is exceedingly doubtful whether they have this significance.

The melanin pigments (sooelmelamin) occur in the form of granules and give rise to the black, brown and grey tones; or they may combine with those of the lipochrome series.

The lipochrome pigments (sooeythrom and sooewanth) tend to be diffused throughout the substance of the feather, and give rise respectively to the red and yellow colours.
In addition to these must be reckoned turacin, a reddish-purple pigment consisting of the same elements as zoomelanin, but remarkable for the fact that it contains from 5 to 8% of copper, which can be extracted by a weak alkaline solution, such as ammonia, and with the addition of acetic acid it can be filtered off as a metallic red or blue powder. The presence of metallic copper is indicated by the green tinge of these red feathers when burnt. Turacin was discovered by Sir A. H. Church in the quill-feathers of the wings of Turaecos or "plantain eaters." These feathers, he showed, lose their colour after they have become wet, but regain it on drying. But turacin is not, as was supposed, confined to the feathers of the plantain eaters, since it has been obtained from a cuckoo, Dasylophus superciliosus.

What effect food may have on colour in birds in a wild state we have no means of knowing, but it is significant that flamingoes and linnets in confinement never regain their bright hues after their first moult in captivity. If cayembe pepper be mixed with the food of certain strains of canaries, from the time the birds are hatched onwards, the yellow colour of the feathers becomes intensified, till it takes on a deep orange hue. Bullfinches, if fed on hemp-seed, turn black. According to Darwin, the natives of the Amazonian region feed the common green parrot on the fat of large Siluroid fishes, and as a result the feathers become beautifully variegated with red and yellow. Similarly, in the Malay Archipelago, the natives of Giliolo change the colours of another parrot.

But with rare exceptions bright colours are confined to the exposed portions of the plumage, but in some of the Bustards the down is of a bright pink colour.

Structural colours include all metallic or prismatic colours, blue, green, white, some yellows, and, in part, glossy black. In metallic feathers the radii (barbules) are modified in various ways, frequently to form flattened, overlapping plates or tiles, while the surfaces of the plates are either smooth, finely striated or pitted. But, save only in the case of white feathers, beneath this colourless, glazed outer coat there is always a layer of pigment.

The only green pigment known to occur in feathers is turcovirdis, found in the feathers of the plantain eaters; it contains a relatively large amount of iron, but no copper. In all other cases the green colour of feathers is due to yellow, orange or greyish-brown pigment occurring with a special superstructure consisting of narrow ridges, as in some parrots and pittas (ant-thrushes), or the surface of the barbs and barbules is smooth and transparent, while between it and the pigment there exists a layer of small polygonal, colourless bodies having highly refractory, and often striated, surfaces.

Blue is unknown as a pigment in feathers. Blue feathers contain only orange or brownish pigment (Gadow), the blue colour being caused by the combination of pigment corpuscules and colourless striated polygonal bodies, as in green feathers.

While in many birds the coloration takes the form either of a uniform hue or of bands and patches of colour more or less brilliant, in others the coloration is sombre, and made up of dark longitudinal stripes or transverse bars on a lighter ground. The latter is the more primitive, and there seems good reason to believe that longitudinal stripes preceded transverse bars. This is indicated by the fact that the nestlings of the more primitive groups are longitudinally striped, and that young hawks in their first plumage are so striped, while the adults are barred.

There is also evidence to show that the evolution of brilliant plumage began with the males, and has, in many cases, been more or less perfectly acquired by the females, and also by the young, as for example in the kingfishers, where parents and offspring wear the same livery. Often, where the parents are alike in plumage, the young wear a different and duller livery, as in the case of the common stirling (Sturnus vulgaris). But where the female differs from the male in coloration the young resemble the female parent.

The physiological explanation of complete disappearance of pigment in adult life, e.g. gannet, is not yet apparent.

At least once annually birds renew their feathers completely by a process known as a moult. Until the new feathers have attained at least half their full length they are invested in a soft sheath, and, as development proceeds, the sheath breaks up from the tip of the feather downwards, so that soon the new feathers have almost a brush-like appearance.

Generally this replacement takes place gradually, new and old feathers occurring side by side. And on this account it is not always possible to see whether a moult is proceeding without raising the old feathers.

The "quill" feathers of the wing and tail are renewed in pairs, so that flight is little, if at all, impaired, the change taking place in the wing from the region of the wrist inwards, as to the primaries, and from the body outwards, towards the tip of the wing, as to the secondaries. In certain birds, however, as in the duck tribe and the rails, for example, all the quill-feathers of the wing are shed at once, so that for some time flight is impossible.

In the penguins this simultaneous method of mouling is carried still further. That is to say, the old feathers covering the body are not replaced gradually, but en masse. This method of ecysis is, however, still further remarkable in that the old feathers do not drop out, to be succeeded by spine-like stumps which, later, split at the tip, liberating the barbs of the new feathers. They are, on the contrary, thrust out upon the tips of the new feathers, the barbs of which are never enclosed within an envelope such as that just described. When their growth has practically been completed, and not till then, the old feathers are removed in large patches by the aid of the bird's beak, exposing thereby a perfectly developed plumage. In the cassowary, and emu, the old feathers similarly adhere for a time to the tips of the new; but in these birds the feathers are moulted singly as in other birds.

Some birds moult twice within the year, the additional moult taking place in the spring, as in the case of the "warblers" (Sylvildae) and Limicolae, for example. But when this is the case the spring moult is only partial, since the quill feathers of the wings and the tail feathers are not renewed.

At this spring moult a special "nuptial" plumage is often assumed, as for example in many of the Limicolae, e.g. godwits, knots, dunlin, rufa.

The sequel to this habit of assuming a nuptial dress is an interesting one. Briefly, this plumage, at first assumed at the mating period by the males only, and dosed soon after the young appear, has become retained for longer and longer periods, so that the succeeding plumage, often conspicuously dull compared with the nuptial dress, is worn only for a few weeks, instead of many months, as in the case of many of the ducks, for example; and it may take twice, and be not till then, the old feathers are hatched. Hence what C. Waterton has aptly called an "eclipse" dress. This, instead of being worn till the following spring, as in the waders, is shed again in the autumn and replaced by what answers to the waders' "nuptial" dress. In the game-birds but a trace of this "eclipse" plumage remains; and this, apparently, only in jungle-fowl, the common grey partridge (Perdix cinerea) and the blackcock (Lyurus), in whose case the head and neck for a short period following the breeding season are clothed only by dull feathers. Further, this more highly developed plumage becomes transferred, first to the female, then to the young, so that in many groups, the dull phase of plumage is entirely eliminated.

But the assumption at the breeding season of a conspicuously brilliant plumage is not always due to a moult. In many birds, notably many Passerines, this change is brought about by shedding the tips of the feathers, which are of a duller hue than the rest of the feather. In this way the bright rose pink of the linnet's breast, the blue and black head of the chaffinch, and the black throat and chestnut-and-black markings of the back of the sparrow, are assumed—to mention but a few instances. These birds moult but once a year, in the breeding season, but the new feathers have broad brown fringes; as the spring advances these drop off, and with them the barbicles from the barbules.
of the upper surface of the feather, thus revealing the hidden tints.

According to some sources, however, some birds acquire a change of colour without a moult by the ascent of pigment from the base of the feather. The black head assumed by many gulls in the spring is, for example, said to be gained in this way. There is, however, not only no good evidence in support of the contention, but the whole structure of the feather is against the probability of any such change taking place.

Feathers correspond with the scales of reptiles rather than with the hairs of mammals, as is shown by their development. They make their first appearance in the developing chick at about the sixth day of incubation, in the shape of small papillae. In section each papilla is found to be made up of a series of normal cells—that is to say, of cells of the deeper layer of the skin—capped by cells of the epidermis. These last form a single superficial layer of flattened cells—the *epithriculum*—overlying the cells of the Malpighian layer, which are cylindrical in shape and rapidly increase to form several layers. As development proceeds the papillae assume a cone-shape with its apex directed backwards, while the base of this cone sinks down into the skin. Rather is carried down by the growth of the nail follicle formed by the dermis. This mass constitutes the nutritive pulp for the development of the growing feather, and is highly vascularized. The Malpighian cells within the cone now get differentiated into three layers. (1) An inner, extremely thin, forming a delicate sheath for the pulp, and found in the fully developed feather in the form of a series of hollow, transparent caps enclosing the Malpighian layer; (2) a third layer which forms the sheath of the feather itself; and (3) a thin layer which forms the investing sheath of the feather. It is this sheath which gives the curious spine-like character to many nesting birds and in moult. As growth proceeds the cells of this middle layer arrange to form longitudinal rows to form the barbs, while the barbules are formed by a secondary splitting. At these bases these rudimentary barbs may be found a cluster of Malpighian cells—what is to say, of cells of the feather itself—and a secondary sheath in which three separate generations of feathers are developed. The process of this development differs from that just outlined chiefly in this: that of the longitudinal rows which in the down-feather form the barbs, two or three on the dorsal and two on the ventral aspect of the interior of the cylinder become stronger than the rest, combining to form the main- and after-shaft respectively. The remainder of the rows form the body or shaft of the feather. The reproductive power of the feather follicle appears to be almost inexhaustible, since it is not diminished appreciably by age, nor restricted to definite moulting periods, as is shown by the cruel and now prohibited practice of plucking birds for use in the dry-goods trade annually, for the sake of their feathers. The growth of the feathers is, however, certainly affected by the general health of the bird, mal-nutrition causing the appearance of peculiar transverse V-shaped grooves, at more or less regular intervals, along the whole length of the feather. These are known as "hunger-marks," a name given by falconers, to whom this defect was well known.

It would seem that while the feather germ may be artificially stimulated to produce three successive generations of feathers within a year, it may, on the other hand, be induced artificially to maintain a continuous activity extending over long periods. That is to say, the number of successive generations of metatarsals may be exceeded so that the feather maintains a steady and continuous growth till it attains a length of several feet. The only known instance of this kind is the barbule as in the down-feather. The domestic fowl known as the "Japanese long-tailed fowls" or the "Yokohama," is the only breed the "upper tail covert is in some way, as yet unknown to Europeans, induced to go on growing until they have attained a length of from 12 to 18 or even 20 ft. In this abnormal growth the "hackle," the lower part of the back also share, though they do not attain a similar length.

The feathers of birds are not uniformly distributed over the body, but grouped into definite tracts, known as pterylae, leaving bare spaces or *apteria*. These pterylae differ considerably, in their conformation in different groups of birds, and hence are of some interest in ornithology.

The principal pterylae are as follows:—

1. The head tract (pt. *capitis*), which embraces the head only.
2. The spinal tract (pt. *spinalis*), which extends the whole length of the backbone, and is variable in number of branches, especially in so far as the region from the base of the neck to the tail is concerned. In its simplest form it runs down the back in the form of a band of almost uniform width, but generally it expands considerably in the lumbar region, as in Passeres. Frequently it is divided into two portions: an upper, terminating in the region of the middle of the back in a fork, and a lower, which runs backwards as a central line on the back, or as a median line, e.g. swifl, auk. While, as a rule, the dorsal region of this tract is relatively narrow, it is of great breadth in the penguin, etc.

3. The ventral tract (pt. *ventralis*), which presents almost as many variations as the spinal tract. In its simplest form it runs from the throat backwards in the form of a median band as far as the base of the neck where it divides, sending a branch to each side of the breast. This branch commonly again divides into short, broad outer feathers, which lodge the "flank" feathers, and a long, narrow, inner branch which runs backwards to join its fellow of the opposite side in the cloacal aperture. This branch lodges the abdominal and are composed respectively of long, quill-like feathers forming the fusion of the dorsal and ventral tracts, e.g. flamingo, Anseres, Ciconiades, Pygopodes.

4. The humeral tract (pt. *humeralis*), which gives rise to the "scapular" feathers.
5. The femoral tract (pt. *femoralis*), which forms an oblique band across the thigh.
6. The crural tract (pt. *cruralis*), which clothes the rest of the leg, tail tract (pt. *caudalis*), including the tail feathers and their coverts; and
7. The wing tract (pt. *alaris*). The wing tract presents many peculiar features. Each segment—arm, forearm and hand—bears feathers essential to flight, and these are divided into remiges, or "quill" feathers, and tectrices, or "coverts."

The remiges of the arm, more commonly described as "tertaries," are, technically, collectively known as the *paraquerno* and *paepeherno*, the former arranged along the upper, and the latter along the lower aspect of the humerus. They serve to fill up the gap which a long-winged bird would otherwise occur during flight through the quill-feathers of the forearm and the body, a gap which would make flight impossible. In short-winged birds these two series are extremely reduced.

The length of a remige is numbered from 16, as in humming-birds, to 48 as in the albatross, according, in short, to the length of the wing. But these numerical differences depend, in flying birds, rather upon the length of the forearm, since the quills of the hand never exceed 12 and never fall below 10, though the tenth may be reduced to a mere vestige.

The quills of the forearm are known as "secondaries," those of the hand as "primaries." The former are attached by their bases at relatively wide distances apart, until the primaries are crowded close together and attached to the skeleton of the hand. The six or seven which rest upon the fused metacarpals II—III, are known as "metacarpals"; the next succeeding feather is borne by the phalanx I. of digit II, and hence known as the addigital. Phalanx I. of digit II. always supports two quills, the "middigital," while the remaining feathers—one or two—are borne by the last phalanx of digit III, and hence known as the metacarpal digital.

In their relation one another the remiges, it must be noted, are always so placed that they overlap one another, the free edge of each, when the wing is seen from its upper surface, being turned towards the tip of the wing. Thus, in flight, the air passes through the wing as it is raised, while in the downstroke the feathers are forced together to form a hemisphere. Birds which fly much have the outer primaries of great length, giving the wing a pointed shape, as in swifts, while in species which fly but little, or frequent thickets, the outer primaries are very short, giving the wing a rounded or convex shape. This adaptation to environment is commonly lost sight of by taxonomists, who not infrequently use the form of the wing as a factor in classification.

Pterylae, or cover feathers of the wing, are arranged in several series, decreasing in size from behind forwards. The number of rows on the dorsal aspect and the method of their overlap, afford characters of general importance in classification.
The first row of the series is formed by the major coverts; these, like the primaries, have their free-edges directed towards the tip of the hand, the distal and overlapping ends pointing distally. This is the median coverts. These, on the forearm, commonly overlap as to the outer half of the row distally, and as to the inner half proximally. On the hand this series is incomplete. Beyond the median coverts the major and median coverts of the wing are composed; these have either a proximal or a distal overlap. The remaining rows of small feathers are known as the marginal coverts, and they all are of the bastard-wing.

The three or four large quill-like feathers borne by the thumb form what is known as the "bastard-wing," *ala spuria.*

The coverts of the under side of the wing are somewhat different. A major and median coverts have what answers to the dorsal surfaces of the feather turned towards the body, and what answers to the ventral surface of the feather turned towards the under surface of the wing. In the major and median coverts however, the ventral surfaces of these feathers are turned ventrally, which is to say, in the extended wing they, like the remiges, have the ventral surfaces turned downwards or towards the body.

But the most remarkable fact in connection with the pterylosis of the wing is the fact that in all, save the Passerine and Galliform types, and some few other isolated exceptions, the secondary series of Remiges is wanting. The wing, in particular the inner half of the wrist, is without, inasmuch as, when such wings are examined, there is always found, in the place of the fifth rema, a pair of major coverts only, while throughout the rest of the series each such pair of coverts emerged as two or more.

This extraordinary fact was first discovered by the French naturalist Z. Gerbe, and was later rediscovered by R. S. Wray. 

Nineteen years ago, Z. Gerbe was able to publish a significant paper on this subject. This, however, has since been attempted, simultaneously, by P. C. Mitchell and W. P. Pycraft. The former has aptly coined the word *diastatic* to denote the gap in the series, and *enuliac* to denote such wings as have an uninterrupted series of quills. While both authors agree that there is no evidence of any loss in the number of the quills in diastatic wings, they differ in the interpretation of the condition. Mitchell regards it as a primitive and the means by which the gap has been brought about.

According to Mitchell the diastatic is the more primitive condition, and he has conclusively shown a way in which diastatic wings may become eutaxic. Pycraft on the other hand contends that the diastatic wing has been derived from the eutaxic type, and has produced evidence showing, on the one hand, the method by which this transition is effected, and on the other that by which the diastatic wing may again recover the eutaxic condition, though in this last particular the evidence added by Mitchell is much more complete. The matter is, however, one of considerable difficulty and needs further investigation.

The wings of struthious birds differ from those of the Carinatae, just described, in many ways. All are degenerate and quite useless as organs of flight. In some cases indeed they have become reduced to mere vestiges.

Those of the ostrich and Rhea are the least degraded.

In the ostrich ankylosis has prevented the flexion of the hand at the wrist joint so that the quills—primitives and secondaries—form an unbroken series of about forty in number. Of these sixteen belong to the primary or metacarpal-series digital, a number exceeding that of any other bird. Whatever the significance of this may be with regard to the primitive wing it is impossible to say at present. The coverts, in their disposition, bear a general resemblance to those of Carinatae wings; but they differ on account of the great length of the feathers and the absence of any definite overlap.

The wings of the South American Rhea more nearly resembles that of flying birds since the hand can be flexed at the wrist joint, and the primaries are twelve in number, as in grebes and some storks, for example.

The quills, as in the African ostrich, are remarkable for their great length, those representing the major series being as long as the remiges, a fact probably due to the shortening of the latter. They arise, however, joined or combined in quinques, as is the rule among the Carinatae, but in parallel, transverse rows, in which respect they resemble the owls.

In both ostrich and Rhea, as well as in all the other struthious birds, the coverts are directed towards the tip of the hand, the distal and overlapping ends pointing distally. These wing feathers are known as the major coverts, and they all are of the bastard-wing.

Remiges in the cassowary are represented by a few spine-like shafts—three primaries and two secondaries. These are really hypertrophied calami. This is shown by the fact that in the nestling these feathers are curled up, and the calamus is turned outwards, while the quill becomes enormously prolonged and solid.

In the emu the wing is less atrophied than in the cassowary,
and less downy than are those of the natatorial birds generally. Feathers which possess strong or stiff shafts cannot without some preliminary preparation be used for stuffing purposes, as the stiff points they present would not only be highly uncomfortable, but would also pierce and cause the escape of the feathers from any covering in which they might be enclosed. The bars are therefore stripped or cut from these feathers, and when so prepared they, in common with soft feathers and downs, undergo a careful process of drying and cleaning, without which they would become of offensive smell, readily attract damp, and harbour vermin. The drying is generally done in highly heated apartments or stoves, and subsequently the feathers are smartly beaten with a stick, and shaken in a sieve to separate all dust and small debris.

Quills for Writing.—The earliest period at which the use of quill feathers for writing purposes is recorded is the 6th century; and from that time till the introduction of steel pens in the early part of the 19th century they formed the principal writing implements of civilized communities. It has always been from the goose that quills have been chiefly obtained, although the swan, crows, eagle, owl, hawk, turkey and ostrich all have more or less been laid under contribution. Swan quills, indeed, are better and more costly than are those from the goose, and for fine lines crow quills have been much employed. Only the five outer wing feathers of the goose are useful for writing, and of these the second and third are the best, while left-wing quills are also generally more esteemed than those of the right wing, from the fact that they curve outward and away from the writer using them. Quills obtained in spring, by plucking or otherwise, from living birds are by far the best, those taken from dead goose, more especially if fattened, being comparatively worthless. To make the quills ready to attract damp they are first softened in the bosom pellicles of skin, and to give the necessary qualities of hardness and elasticity, quills require to undergo some processes of preparation. The essential operation consists in heating them, generally in a fine sand-bath, to from 130° to 180° F. according to circumstances, and scraping them under pressure while still soft from heat, whereby the outer skin is removed and the inner shrivelled up. If the heating has been properly effected, the quills are found on cooling to have become hard, elastic and somewhat brittle. While the quills are soft and flexible they may be fashioned into ornamental designs, and names are easily and permanently impressed on them by pressure with suitable instruments or designs in metal stamps.

Ornamental Feathers.—Feathers do not appear to have been much used, in Europe at least, for ornamental purposes till the close of the 15th century. They are found in the conical caps worn in England during the reigns of Edward III. and Richard II.; but not till the period of Henry V. did they take their place as a part of military costume. Towards the close of the 15th century the fashion of wearing feathers in both civil and military life was carried to an almost ludicrous excess. In the time of Henry VIII. they first appeared generally in the bosom pellicles of skin, and during Elizabeth’s reign feathers began to occupy an important place as head-dress ornaments of women. From that time down to the present, feathers of endless variety have continued to be leading articles of ornamentation in female head-dress; but, except for military plumes, they have long ceased to be worn in ordinary male costume. At the present day, the feathers of numerous birds are, in one way or another, turned to account by ladies for the purpose of personal ornament. Ostrich feathers, however, hold, as they have always held, a pre-eminent position among ornamental feathers; and the ostrich is the only bird which may be said to have something exclusively for the sake of its feathers. Ostrich farming is one of the established industries of South Africa, and is also practised in Kordofan and other semi-desert regions of North Africa, in Argentina, and in Arizona and California in North America. The feathers are generally plucked from the living animal—a process which does not appear to cause any great inconvenience. In the male bird, the long feathers of the rump and wings are white, and the short feathers of the body are jet black; while the rump and wing feathers of the female are white tinged with a dusky grey, the general body colour being the latter hue. The feathers of the male are consequently much more valuable than those of the female, and they are separately classified in commerce. The art of the plumassier embraces the cleaning, bleaching, dyeing, curling and making up of ostrich and other plumes and feathers. White feathers are simply washed in bundles in hot soapy water, run through pure warm water, exposed to sulphurous fumes for bleaching, thereafter blued with indigo solution, rinsed in pure cold water, and hung up to dry. When the dry feathers are pared or scraped down to give the feathers greater flexibility, and the bars are curled by drawing them singly over the face of a blunt knife or by the cautious application of a heated iron. Dull-coloured feathers are usually dyed black. Feathers which are dyed light colours are first bleached by exposure in the open air. Much ingenuity is displayed in the making up of plumes, with the general result of producing the appearance of full, rich, and long feathers from inferior varieties and from scraps and fragments of ostrich feathers; and so dexterously can factitious plumes be prepared that only a skilled eye can be detected the fabrication. In addition to those of the ostrich, the feathers of other birds form articles of steady commercial demand. Among these are the feathers of the South American ostrich, Rhea americana, the marabout feathers of India obtained from Leptoptilus argala and L. javanica, the aigrettes of the heron, the feathers of the various species of birds of paradise, and of numerous species of humming-birds. Swan-down and the skins of various penguins and grebes and of the albatross are used, like fur, for muffls and collarlets.

The Chinese excel in the preparation of artificial flowers and other ornaments from bright natural-coloured or dyed feathers; and the French also skilfully work fragments of feathers into bouquets of artificial flowers, imitation butterflies, &c.

Miscellaneous Applications of Feathers.—Quills of various sizes are extensively employed as holders for the sable and camel hair brushes used by artists, &c. Feather brushes and dusters are made from the wing-feathers of the domestic fowl and other birds; those of a superior quality, under the name of vulture dusters, being really made of American ostrich feathers. A minor application of feathers is found in the dressing-up of artificial fly-bobbins for the steel pens came into general use it became an object of considerable importance to find applications for the supplanted goose-quills, and a large field of employment for them was found in the preparation of toothpicks.

( J. Pa; W. P. P.)

FEATHERSTONE, an urban district in the Osbgoldcross parliamentary division of the West Riding of Yorkshire, England, 6 m. E. of Wakefield on the Lancashire & Yorkshire railway. Pop. (1901) 12,053. The industrial population is employed in large collieries in the vicinity; and here, on the 7th of September 1893, serious riots during a strike resulted in the destruction of some of the colliery works belonging to Lord Masham, and were not quelled without military intervention and some bloodshed.

FEATLEY (or FAIRCLOUGH) DANIEL (1582–1649), English divine, was born at Charlton, Oxforshire, on the 15th of March 1582. He was a scholar of Corpus Christi College, Oxford, and probationer fellow in 1602, after which he went to France as chaplain to the English ambassador. For some years he was domestic chaplain to George Abbot, archbishop of Canterbury, and held also the rectories of Lambeth (1610), Allhallows, Bread Street (c. 1622), and Acton (1627), this last after leaving the archbishop’s service in 1625. His varied activities included a “scholastick duel” with James I. in 1635, and the publication of (1) the report of a conference with some Jesuits in 1624, (2) a devotional manual entitled Ancilla Pietatis (1626), (3) Mystica Clavis, a Key opening divers Difficult Texts of Scripture in 70 Sermons (1636). He was appointed provost of Chelsea College in 1630, and in 1641 was one of the sub-committee “to settle religion.” In the course of this work he had a dispute with four Baptists at Southwark which he commemorated in his book
FEBRONIANISM

The derived reconstitution to dealt not, all) those bring and, known In of these abuses
tation these national so sovereignty originality.

As Church Roman of sovereignty
cursus...primacy...et legum potestas Romani pontificis. This book, which roused a vast amount of excitement and controversy at the time, exercised an immense influence on opinion within the Roman Catholic Church, and the principles it proclaimed were put into practice by the rulers of that Church in various countries during the latter part of the 18th and the beginning of the 19th century.

The main propositions defended by "Febronius" were as follows. The constitution of the Church is not, by Christ's institution, monarchical, and the pope, though entitled to a certain precedence, is subordinate to the universal Church. Though as the "centre of unity" he may be regarded as the guardian and champion of the ecclesiastical law, and though he may propose laws, and send legates on the affairs of his primacy, his sovereignty (principatus) over the Church is not one of jurisdiction, but of order and collaboration (ordines et consociationes). The Roman (ultramontane) doctrine of papal infallibility is not accepted "by the other Catholic Churches" and, moreover, "has no practical utility." The Church is based on the one episcopey common to all bishops, the pope being only primus inter pares. It follows that the pope is subject to general councils, in the absence of which he needs his colleagues (conjudices), not merely his consuls; nor has he the exclusive right to summon such councils. The decrees of general councils need not be confirmed by the pope nor can they be altered by him; on the other hand, appeal may be made from papal decisions to a general council. As for the rights of the popes in such matters as appeals, reservations, the confirmation, translation and deposition of bishops, these belong properly to the bishops in provincial synods, and were usurped by the papacy gradually as the result of a variety of causes, notably of the False Decretals. For the health of the Church it is therefore necessary to restore matters to their condition before the False Decretals, and to give to the episcopate its due authority. The main obstacle to this is not the pope himself, but the Curia, and this must be fought by all possible means, especially by thorough popular education (primum adversus abuser ecclesiasticale potestatis remedium), and by the assembling of national and provincial synods, the neglect of which is the main cause of the Church's woes. If the pope will not move in the matter, the princes, and notably the emperor, must act in co-operation with the bishops, summon national councils even against the pope's will, defy his excommunication, and in the last resort refuse obedience in those matters over which the papacy has usurped jurisdiction.

It will be seen that the views of Febronius had but little originality. In the main they were those that predominated in the great general councils of Constance and Basel in the 15th century; but they were backed by him with such a wealth of learning, and they fitted so well into the intellectual and political conditions of the time, that they found a widespread acceptance. The book, indeed, was at once condemned at Rome (February 1764), and by a brief of the 21st of May the pope commanded all the bishops of Germany to suppress it. The papal condemnation met with a very mixed reception; in some dioceses the order to prohibit the book was ignored, in others action upon it was postponed pending an independent examination, in yet others (nine in all) it was at once obeyed "for political reasons," though even in these the forbidden book became the "breviary of the governments." The Febronian doctrine, in fact, exactly fitted the views of the German bishops, which were by no means disinterested. It must be remembered that the bishops were at this time most secular princes rather than the Catholic prelates; with rare exceptions, they made no pretense of carrying out their spiritual duties; they shared to the full in the somewhat shallow "enlightenment" of the age. As princes of the Empire they had asserted their practical independence of the emperor; they were irked by what they considered the unjustifiable interference of the Curia with their sovereign prerogatives, and wished to establish their independence of the pope also. In the ranks of the hierarchy, then, selfish motives combined with others more respectable to secure the acceptance of the Febronian position. Among secular rulers the welcome given to it was even less equivocal. Even so devout a sovereign as Maria Theresa refused to allow "Febronius" to be forbidden in the Habsburg dominions; her son, the emperor Joseph II., applied the Febronian principles with remorseless thoroughness. In Venice, in Tuscany, in Naples, in Portugal, they inspired the vigorous efforts of "enlightened despots" to reform the Church from above; and they gave a fresh impetus to the movement against the Jesuits, which, under pressure of the secular governments, culminated in the suppression of the Society by Pope Clement XIV. in 1773. "Febronius," too, inspired the proceedings of those noble ecclesiastical assemblies, both held in the year 1786. The reforming synods which met at Pistoia under the presidency of the bishop, Scipione de' Ricci, is dealt with elsewhere (see Pistoia). The other was the so-called congress of Ems, a meeting of the delegates of the four German archbishops, which resulted, on the 25th of August, in the celebrated "Punctuation of Ems," subsequently ratified and issued by the archbishops. This document was the outcome of several years of controversy between the archbishops and the papal nuncios, aroused by what was considered the unjustifiable interference of the latter in the affairs of the German princes. In this chapter these documents and replies of the Archbishops of Mainz, Cologne and Treves (Trier) had drawn up in thirty articles their complaints against the Curia, and after submitting them to the emperor Joseph II., had forwarded them to the new pope, Clement XIV. These articles, though "Febronius" was prohibited in the archdioceses, were wholly Febronian in tone; and, indeed, Bishop von Honthem himself took an active part in the diplomatic negotiations which were their outcome. In drawing up the "Punctuation" he took no active part, but it was wholly inspired by his principles. It consisted of XXIII. articles, which may be summarized as follows. Bishops have, even more than the sovereign powers, full authority over the dioceses in all matters of dispensation, patronage and the like; papal bulls, briefs, &c., and the decrees of the Roman Congregations are only of binding force in each diocese when sanctioned by the bishop; nunciatures, as hitherto conceived, are to cease; the oath of allegiance to the pope demanded of bishops since Gregory VII.'s time is to be altered so as to bring it into conformity with episcopal rights; annates and the fees payable for the pallium and confirmation are to be lowered and, in the event of the pallium or confirmation being refused, German archbishops and bishops are to be free to exercise their office under the protection of the emperor; with the Church tribunals of first and second instance (episcopal and metropolitan) the nuncios are not to interfere, and, though appeal to Rome is allowed under certain "national" safe-guards, the opinion is expressed that it would be better to set up in each archdiocese a final court of appeal representing the provincial synod; finally the emperor is prayed to use his influence with the pope to secure the assembly of a national council in order to remove the grievances left unredressed by the council of Trent.

Whether this manifesto would have led to a reconstitution of the Roman Catholic Church on purely Febronian lines must for ever remain doubtful. The French Revolution intervened; the German Church went down in the storm; and in
1803 the secularizations carried out by order of the First Consul put an end to the temporal ambitions of its prelates. Febronianism, indeed, survived. Karl Theodor von Dalberg, prince primate of the Confederation of the Rhine, upheld its principles throughout the Napoleonic epoch and hoped to establish them in the new Germany to be created by the congress of Vienna. He sent to this assembly, as representative of the German Church, Bishop von Wessenberg, who in his diocese of Constance had not hesitated to apply Febronian principles in reforming, on his own authority, the services and discipline of the Church. But the times were not favourable for such experiments. The tide of reaction after the Revolutionary turmoil was setting strongly in the direction of traditional authority, in religion as in other spheres. Constance, an archbishopric, was not even then the century was ended, was to dominate the Church, was already showing signs of vigorous life. Moreover, the great national German Church of which Dalberg had a vision—with himself as primate—did not appeal to the German princes, tenacious of their newly acquired status as European powers. One by one these entered into concordats with Rome, and Febronianism from an aggressive policy subsided into a speculative opinion. As it survived strongly, especially in the universities (Bonn especially had been, from its foundation in 1774, very Febronian), and it reasserted itself vigorously in the attitude of many of the most learned German prelates and professors towards the question of the definition of the dogma of papal infallibility in 1870. It was, in fact, against the Febronian position that the decrees of the Vatican Council were deliberately directed, and their promulgation marked the triumph of the ultramontane view (see VATICAN COUNCIL, ULTRAMONTANISM, PAPACY). In Germany, indeed, the struggle against the papal monarchy was carried on for a while by the governments on the so-called Kulturkampf, the Old Catholics representing militant Febronianism. The latter, however, since Bismarck went to Canossa, have sunk into a respectable but comparatively obscure sect, and Febronianism, though it still has some hold on opinion within the Church in the chapters and universities of the Rhine provinces, is practically extinct in Germany. Its revival under the guise of so-called Modernism grew from Pope Pius X. in 1908 the scathing condemnation embodied in the encyclical Pascendi gregis.

AUTHORITIES.—See Justinus Febronius, De statu ecclesiæ et legibus pontificum (Bullion, 1765), second and enlarged edition with notes appended to Pope Pius XI., to Christian kings and princes, to the bishops of the Catholic Church, and to doctors of theology and canon law; three additional volumes published in 1773, 1774 and 1774 at Frankfurt, are devoted to vindications of the orthodox position against the critics of the Revue des deux mondes for July 1903 (xvi. p. 266) is an interesting article under the title of "L'Allemagne Catholique," from the pen of the celebrated German philosopher Franz von Baader. For the contemporary discussion, see Herzog-Hauck, Realencyclopädie (Leipzig, 1868), s. v. Emser Kongreß. Further references are given in the article on Honthem (q.v.).

FEBRUARY, the second month of the modern calendar. In ordinary years it contains 28 days; but in bisextile or leap year, by the addition of the intercalary day, it consists of 29 days. This month was not in the Romilian calendar. In the reign of Numa two months were added to the year, namely, January at the beginning, and February at the end; and this arrangement was continued until 452 B.C., when the decemvirs placed February after January. The ancient name of Februarius was derived from februe, to purify, or from februa, the Roman festival of general expiation and purification, which was celebrated during the latter part of this month. In February also the Lupercalia were held, and women were purified by the priests of Pan Lyceus at that festival. The Anglo-Saxons called this month Spectual-Kale, from the spreading of the cabbages in this season. Later it was known as Solmonath, because of the return of the sun from the low latitudes. The most generally noted days of February are the following:—the 2nd, Candlemas day, one of the fixed quarter days used in Scotland; the 14th, St Valentine's day; and the 24th, St Matthias. The church festival of St Matthias was formerly observed on the 29th of February in bisextile years, but it is now invariably celebrated on the 24th.

FEBVRE, ALEXANDRE FRÉDÉRIC (1835— ), French actor, was born in Paris, and after the usual apprenticeship in the provinces and in several Parisian theatres in small parts, was called to the Comédie Française in 1856, where he made his début as Philip II. in Don Juan d'Autriche. He soon became the most popular leading man in Paris, not only in the classical répertoire, but in contemporary novelties. In 1894 he toured the principal cities of Europe, and, in 1895, of America. He was also a composer of light music for the piano, and published several books of varying merit. He married Mlle Harville, daughter of one of his predecessors at the Comédie Française, herself a well-known actress.

PÉCAM, a seaport and bathing resort of northern France, in the department of Seine-et-Indre, 28 m. N.N.E. of Havre on the Western railway. Pop. (1906) 1,176. The church is situated on the English Channel at the mouth of the small river Fécamp, consists almost entirely of one street upwards of 2 m. in length. It occupies the bottom and sides of a narrow valley opening out towards the sea between high cliffs. The most important building is the abbey church of La Trinité, dating for the most part from 1175 to 1225. The central tower and the south portal (13th century) are the chief features of its simple exterior; in the interior, the decorative work, notably the chapel-screens and some fine stained glass, is remarkable. The hotel-de-ville with a municipal museum and library occupy the remains of the abbey buildings (18th century). The church of St Étienne (16th century) and the Benedictine liqueur distillery, a modern building which also contains a museum, are of some interest. A tribunal and chamber of commerce, a board of arbitrators and a navigation school, are among the public institutions. The port consists of an entrance channel nearly 400 yds. long leading to a tidal harbour and docks capable of receiving ships drawing 26 ft. at spring-tide, 19 ft. at neap-tide. Fishing for herring and mackerel is carried on and the town equips a large fleet for the codbanks of Newfoundland and the Grand Banks, and the chief exports are fish and fish-meal. The chief liqueur is Maret's Brandy. Imports include coal, timber, tar and hemp. Steam sawing, metal-founding, fish-salting, shipbuilding and repairing, and the manufacture of ship's biscuits and fishing-nets are among the industries.

The town of Fécamp grew up round the nunnery founded in 658 to guard the relic of the True Blood which, according to the legend, was found in the trunk of a fig-tree drifted from Palestine to this spot, and which still remains the most precious treasure of the church. The original convent was destroyed by the Northmen, but was re-established by Duke William Longsword as a house of canons regular, which shortly afterwards was converted into a Benedictine monastery. King Richard I. greatly enlarged this, and rebuilt the church. The town achieved some prosperity under the dukes of Normandy, who improved its harbour, but after the annexation of Normandy to France it was overshadowed by the rising port of Havre.

FECHNER, GUSTAV THEODOR (1801—1887), German experimental psychologist, was born on the 10th of April 1801 at Gross-Sächen, near Muskau, in Lower Lusatia, where his father was pastor. He was educated at Somau and Dresden and at the university of Leipzig, in which city he spent the rest of his life. In 1836 he was appointed professor of physics, but in 1841 he contracted an affection of the eyes while studying the phenomena of colour and vision, and, after much suffering, resigned. Subsequently recovering, he turned to the study of mind and the relations between body and mind, giving public lectures on the subjects of which his books treat. He died at Leipzig on the 18th of November 1887. Among his works may be mentioned: Das Büchlein vom Leben nach dem Tode (1836, 5th ed., 1903), which has been translated into English; Nanna, oder über das Seelenleben der Pflanzen (1838, 3rd ed., 1903); Zendavesta, oder...
über die Dinge des Himmels und des Jenseits (1851, 2nd ed. by Lasswitz, 1901); Über die physikalische und philosophische Atomenlehre (1853, 2nd ed., 1864); Elemente der Psychophysik (1860, 2nd ed., 1880); Vorschule der Ästhetik (1876, 2nd ed., 1898); Die Tagesansicht gegenüber der Nachtansicht (1879). He also published chemical and physical papers, and translated chemical works by J. B. Biot and L. J. Thénard from the French. A different but essential side of his character is seen in his poems and humorous pieces, such as the Vergleichende Anatomie der Engel (1829), written under the pseudonym of Dr. Mises. Fechner's epoch-making work was his Elemente der Psychophysik (1860). He starts from the Spinozistic thought that bodily facts and conscious facts, though not reducible one to the other, are different sides of one reality. His originality lies in trying to discover an exact mathematical relation between them. The most famous outcome of his inquiries is the law known as Weber's law. Fechner's law may be expressed as follows:—

"In order that the intensity of a sensation may increase in arithmetical progression, the stimulus must increase in geometrical progression." Though holding good within certain limits only, the law has been found immensely useful. Unfortunately, from the tenable theory that the intensity of a sensation increases by definite additions of stimulus, Fechner was led on to postulate a unit of sensation, so that any sensation s might be regarded as composed of n units. Sensations, he argued, thus being representable by numbers, psychology may become an exact science, susceptible of mathematical treatment. His general formula for getting at the number of units in any sensation is s = n, where n stands for the number of sensations, a quantity numerically estimated, and c for a constant that must be separately determined by experiment in each particular order of sensibility. This reasoning of Fechner's has given rise to a great mass of controversy, but the fundamental mistake in it is simple. Though stimuli are composite, sensations are not. "Every sensation," says Professor James, "presents itself as an indivisible unit; and it is quite impossible to read any clear meaning into the notion that they are masses of units combined." Still, the idea of the exact measurement of sensation has been a fruitful one, and mainly through his influence on Wundt, Fechner was the father of that "new" psychology of laboratories which investigates human faculties with the aid of exact scientific apparatus. Though he has had a vast influence in this special department, the disciples of his general philosophy are few. His world-conception is highly anomalous. He feels the thrill of life everywhere, in plants, earth, stars, the total universe. Man stands midway between the souls of plants and the souls of stars, who are angels. God, the soul of the universe, must be conceived as having an existence analogous to men. Natural laws are just the modes of the unfolding of God's perfection. In his last work Fechner, aged but full of hope, contrasts the joyous "daylight view" of the world with the dead, dreary "night view" of materialism. Fechner's work in aesthetics is also important. He conducted experiments to show that certain abstract forms and proportions are naturally pleasing to our senses, and gave some new illustrations of the working of aesthetic association. Fechner's position in reference to predecessors and contemporaries is not very sharply defined. He was remotely a disciple of Schelling, learnt much from Herbert and Weisse, and decidedly rejected Hegel and the monadism of Lotze.

FECHER, CHARLES ALBERT (1824—1879), Anglo-French actor, was born probably in London, on the 23rd of January 1824, of French parents, although his mother was of Piedmontese and his father of German extraction. The boy would probably have devoted himself to a sculptor's life but for the accident of a striking success made in some private theatricals. The result was an engagement in 1841 to play in a travelling company that was going to Italy. The tour was a failure, and the company broke up; whereupon Fecher returned home and worked assiduously at sculpture. At the same time he attended classes at the Conservatoire with the view of gaining admission to the Comédie Française. Late in 1844 he won the grand medal of the Académie des Beaux-Arts with a piece of sculpture, and was admitted to make his début at the Comédie Française as Seide in Voltaire's Mahomet and Valère in Molière's Tartuffe. He acquitted himself with credit; but, tired of the small parts he found himself condemned to play, returned again to his sculptor's studio in 1846. In that year he accepted an engagement to play with a French company in Berlin, where he made his first decisive success as an actor. On his return to Paris in the following year he married the actress Éléonore Rabut (d. 1859). Previously he had appeared for some months in London, in a season of French classical plays given at the St James's theatre. In Paris for the next ten years he fulfilled a series of successful engagements at various theatres, his chief triumph being his creation at the Vaudeville on the 2nd of February 1852 of the part of Armand Duval in La Dame aux camélias. For nearly two years (1857—1858) Fecher was manager of the Odéon, where he produced Tartuffe and other classical plays. Having received tempting offers to act in English at the Princess's theatre, London, he made a diligent study of the language, and appeared there on the 27th of October 1858 in an English version of the Iago in Othello and August van Hul in Bias. This was followed by Corsonic Brothers and Don César de Bazan; and on the 20th of March 1861 he first attempted Hamlet. The result was an extraordinary triumph, the play running for 115 nights. This was followed by Othello, in which he played alternately the Moor and Iago. In 1863 he became lessee of the Lyceum theatre, which he opened with The Duke's Motto; this was followed by The King's Butlery, The Mountebank (in which his son Paul, a boy of seven, appeared), The Roadside Inn, The Master of Ravenswood, The Corsican Brothers (in the original French version, in which he had created the parts of Louis and Fabian del Franchi) and The Lady of Lyons. After this he appeared at the Adelphi (1868) as Obenreiner in No Thoroughfare, by Charles Dickens and Wilkie Collins, as Edmund Dantes in Monte Cristo, and as Count de Leyrv in Black and White, a play in which the actor himself collaborated with Wilkie Collins. In 1870 he visited the United States, where (with the exception of a visit to London in 1872) he remained till his death. His first appearance in New York was at Niblo's Garden in the title rôle of Ruy Bias. He played in the United States between 1870 and 1876 in most of the parts in which he had won his chief triumphs in England, making 16 times attempts at management, but rarely successful, owing to his ungovernable temper. The last three years of his life were spent in seclusion on a farm which he had bought at Rockland Centre, near Quakertown, Pennsylvania, where he died on the 5th of August 1879. A bust of the actor by himself is in the Garrick Club, London.

FECKENHAM, JOHN (c. 1515—1584), English ecclesiastic, last abbot of Westminster, was born at Feckenham, Worcestershire, of ancestors who, by their wills, seem to have been substantial yeomen. The family name was Howman, but, according to the English custom, Feckenham, on monastic profession, changed it for the territorial name by which he is always known. Learning his letters first from the parish priest, he was sent at an early age to the claustral school at Evesham and thence, in his eighteenth year, to Gloucester Hall, Oxford, as a Benedictine student. After taking his degree in arts, he returned to the abbey, where he was professed; but he was at the university again in 1537 and took his B.D. on the 11th of June 1539. Returning to Evesham he was there when the abbey was surrendered to the king (27th of January 1540); and then, with a pension of £ 10 a year, he once more returned to Oxford, but soon after became chaplain to Bishop Bell of Worcester and then served Bonner in that same capacity from 1543 to 1540.
In 1544 Bonner gave him the living of Solihull; and Feckenham established a reputation as a preacher and a disputant of keen intellect but unvarying charity. About 1549 Cranmer sent him to the Tower of London, and while there “he was burned out of prison” to take part in seven public disputations against Hooper, Jewel and others. Released by Queen Mary (5th of September 1553), he returned to Bonner and became prebendary of St Paul’s, rector of Finchley, then of Greenford Magna, chaplain and confessor to the queen, and dean of St Paul’s (10th of March 1554). He took part, with much charity and meekness, in the Oxford disputes against Cranmer, Latimer and Ridley; but he had no liking for the fierce bigotry and bloody measures then in force against Protestants. Feckenham used all his influence with Mary “to procure pardon of the faults or mitigation of the punishment for poor Protestants” (Fuller), and he was sent by the queen to prepare Lady Jane Grey for death. When Elizabeth was sent to the Tower (18th of March 1554), Feckenham interceded for her life and liberty, even at the cost of displeasing the queen.

The royal abbey of Westminster having been restored to its primitive use, Feckenham was appointed abbott, and the old life began again within its hallowed walls on the 21st of November 1556. The abbey school was reopened and the shrine of St Edward restored. On the accession of Elizabeth Feckenham consistently opposed all the legislation for changes in religion, and, when the hour of trial came, he refused the oath of supremacy, rejecting also Elizabeth’s offer to remain with his monks at Westminster if he would conform to the new laws. The abbey was dissolved (12th of July 1559), and within a year Feckenham was sent by Archbishop Parker to the Tower (20th of May 1560), according to Jewel, “for having obstinately refused attendance on public worship and everywhere decrying and railing against that religion which we now profess” (Parker Society, first series, p. 79). Henceforth, except for some brief periods when he was a prisoner at large, Feckenham spent the rest of his life in confinement either in some recognized prison, or in the more distasteful and equally rigorous keeping of the bishops of Winchester and Ely. After fourteen years’ confinement, he was released on bail and lived in Holborn, where his benevolence was shown by all manner of works of charity.

“[He] relieved the poor wheresoever he came, so that files lock not thicker in charity than beggars constantly crowd about him” (Fuller). He set up a public aqueduct in Holborn, and a hospice for the poor at Bath; he distributed every day to the sick the milk of twelve cows, took care of orphans, and encouraged mainly sports on Sundays among the youth of London by giving prizes. In 1577 he was committed to the care of Cox of Ely with strict rules for his treatment; and the bishop (1578) could find no fault with him except that “he was a gentle person but in the popish religion too, too obstinate.” In 1580 he was removed to Wisbeach Castle, and there exercised such an influence of charity and peace among his fellow-prisoners that was remembered when, in after-years, the notorious Wisbeach Stirra broke out under the Jesuit Weston. Even here Feckenham found a means of doing public good; at his own cost he repaired the road and set up a market cross in the town. After twenty-four years of suffering for his conscience he died in prison and was buried in an unknown grave in the parish church at Wisbeach on the 16th of October 1584.

The fullest account of Feckenham is to be found in E. Taunton’s English Black Monks of St Benedict (London, 1897), v. ii. pp. 96-100, and E. T. Tuck’s “A. Feckenham.”

FEDCHENKO, ALEXIS PAVLOVICH (1844-1873). Russian naturalist and traveller, well known for his explorations in central Asia, was born at Irkutsk, in Siberia, on the 7th of February 1844; and, after attending the Gymnasium of his native town, proceeded to the university of Moscow, for the study more especially of zoology and geology. In 1868 he travelled through Turkestan, the district of the lower Syr-Darya and Samarkand; and shortly after his return he set out for Khkand, where he visited a large portion of territory till then unknown. Soon after his return to Europe he perished on Mont Blanc while engaged in an exploring tour in Switzerland, on the 15th of September 1873.

Accounts of the explorations and discoveries of Feckenho have been published by the Russian government, his Journeys in Persia in 1874, his Khoonat in Khokand in 1875, and Botanical Discoveries in 1876. See Petermann’s Mittheilungen (1872-1874).

FEDERAL GOVERNMENT (Lat. foedus, a league), a form of government of which the essential principle is that there is a union of two or more states under one central body for certain permanent common objects. In the most perfect form of federation the states are to agree to a supreme federal government to perform certain public functions inherent in themselves in their sovereign or separate capacity, and the federal government, in turn, in the exercise of those specific powers acts directly, not only on the communities making up the federation, but on each individual citizen. So far as concerns the residue of powers unallotted to the central or federal authority, the separate states retain unimpaired their individual sovereignty, and the citizens of a federation consequently owe a double allegiance, one to the state, and the other to the federal government. They live under two sets of laws, the laws of the state and the laws of the federal government. This form of government is found in numerous cases, especially in India, where the British government is the central or federal government and the Indian provinces are the separate states.

The history of federal government practically begins with Greece. This, however, is due to the fact that the Greek federations are the only ones of which we have any detailed information. The obvious importance, especially to scattered villages or tribes, of systematic joint action in the face of a common danger makes it reasonable to infer that federation in its elementary forms was a widespread device. This view is strengthened by what we can gather of the conditions obtaining in such districts as Aetolia, Acarnania and Samnium, as in modern times among primitive peoples and tribes. The relatively detailed information which we possess concerning the federal governments of Greece makes it necessary to pay special attention to them.

In ancient Greece the most striking tendency of political development was the maintenance of separate city states, each striving for absolute autonomy, though all spoke practically the same language and shared to some extent in the same traditions, interests and dangers. This centrifugal tendency is most marked in the cases of the more important states, Athens, Sparta, Argos, Corinth, but Greek history is full of examples of small states deliberately sacrificing what must have been obvious commercial advantage for the sake of a precarious autonomy. Such examples as existed of even semi-federal union were very loose in structure, and the selfishness of the component units was the predominant feature. Thus the Spartan hegemony in the Peloponnesian was not really a federation except in the broadest sense. The states did, it is true, meet occasionally for discussion, but their relation, which had no real existence save in cases of immediate common danger, was really that between a paramount leader and unwilling and suspicious allies. The Athenian empire again was a thinly disguised autocracy. The synod (see DELIAN LEAGUE) of the “allies” soon degenerated into a mere form; of comprehensive unified policy there was none, at all events after the League had achieved its original purpose of expelling the Persians from Europe.

None less the it is possible, even in the early days of political development in Greece, to find some traces of a tendency towards united action. Thus the unions of individual villages, known as synoecisms, such as took place in Attica and Elis in early times were partly of a federal character; they resulted in the establishment of a common administration, and no doubt in some degree of commercial and military unity. On the other hand, it is likely that these unions lacked the characteristic of federation in that the units could hardly be described as having any sovereign power; at the most they had some municipal autonomy as in the case of the Cleisthenic demes. The union was rather national than federal. Again the Amphictyonic unions had one of the
characteristic elements of federation, namely that they were free sovereign states combining for a particular purpose with an elaborate system of representation (see Amphictyony). But these unions, at all events in historic times, were mainly concerned with religion, and the authority of the councils did not seriously affect the autonomy of the individual states.

Thus among the city-states as well as among scattered villages the principle of cohesion was not unknown. On the other hand the golden mean between an easily dissolable relationship, more like an alliance than a federation, and a national system resulting from synoecism was practically never attained in early Greek history. There are, however, examples in Greece proper, and one, Lycia in Asia Minor, of real federal unions. The chief Greek federations were those of Thessaly, Boeotia, Acharania, Olynthus, Arcadia, Aetolia, Achaia, the most important as well as the most complete in respect of organization being the Aetolian League and the Achaean League.

1. The Thessalian League originated in the deliberate choice by village aristocracies of a single monarch who belonged from time to time to several of the so-called Heracleid families. Soon after the Persian War this monarchy (dynasty of the Aeoleudai, Herod. v. 63 and vii. 6) disappeared, and in 424 we find Athens in alliance with a sort of democratic federal council representing τὸ κοινὸν Λεγεῖν (cf. Thuc. i. 102, ii. 22, iv. 78), and probably composed of delegates from the towns. The local feudal nobles, however, seem to have put an end to this government by council, and it lapsed (logos) was appointed, with authority over the whole military force of the federation. Three such officers, Lycomphon, Jason and Alexander, all of Pherae, endeavoured vainly to administer the collective affairs of the federation, the last by means of a revived republican council. The final failure of this scheme coincided with the disappearance of Thessaly as a sovereign state (see Thessaly).

2. The form and the history of the Boeotian federation are treated fully under Boeotia (q.v.). It may probably have originated in religious associations, but the guiding power throughout was the imperial policy of Thebes, especially during its short-lived supremacy after 376 B.C.

3. The federation of Acharania is of peculiar interest as being formed by scattered villages or tribes, without settled, still less fortified, habitation. In the early part of the 4th century a κοινὸν τῶν Λακονίων met at Stratius (Xen. Hell. iv. 6. 4). Late in the same century towns began to form, without, however, disturbing the federation, which existed as late as the 2nd century B.C., governed by a representative council (βουλή), and a common assembly (κοινὸν) at which any citizen might be present.

4. The foundation of the Olynthian federation was due to the need of protection against the northern invaders (see Olynthus). It was in many respects based on liberal principles, but Olynthus did not hesitate to exercise force against recalcitrants such as Acanthus.

5. The 4th century Aecadian league, which was no doubt a revival of an older federation, was the result of the struggle for supremacy between Thebes and Sparta. The defeat of Sparta at Leuctra removed the pressure which had kept separate the Arcadian tribes, and τὸ κοινὸν τῶν Αρκαδῶν was established in the new city, Megalopolis (q.v., also Arcadia).

6 and 7. The Aetolian and Achaean leagues (see Aetolia, and Achaeian League) were in all respects more important than the preceding and constitute a new epoch in European politics. Both belong to a period in Greek history when the great city states had exhausted themselves in the futile struggle against Macedon and Rome, and both represent a conscious popular determination in the direction of systematic government. This characteristic is curious in the Aetolian tribes which were famous in all time for habitual brigandage; there was, however, among them the strong link of a racial feeling. The governing council (τὸ κοινὸν τῶν Αττικῶν) was the permanent representative body; there was also a popular assembly (παραλατόνοι), partly of a primary, partly of a representative kind, any one being free to attend, but each state having only one official representative and one vote. Of all the federal governments of Greece, this league was the most certainly democratic in constitution. There was a complete system of federal officers, at the head of whom was a Strategus entrusted with powers both military and civil. This officer was annually elected, and, though the chief executive authority, was strictly limited in the federal deliberations to presidential functions (cf. Livy xxxv. 25, "ne praetor, quum de bello consulisset, ipse sententiam diceret"). The Achaean League was likewise highly organized; joint action was strictly limited, and the individual cities had sovereign power over internal affairs. There were federal officers, all the military forces of the cities were controlled by the league, and federal finance was quite separate from city finance.

8. Of the Lycian federation, its origin and duration, practically nothing is known. We know of it in 188-168 B.C. as dependent on Rhodes, and, from 168 till the time when the emperor Claudius absorbed it in the provincial system, as an independent state under Roman protection. The federation was a remarkable example of a typical Hellenic development among a non-Hellenic people. Strabo (p. 665) informs us that the federation, composed of twenty-three cities, was governed by a council (συνεδρία) which assembled from time to time at that city which was most convenient for the purpose in hand. The cities were represented according to size by one, two or three delegates, and bore proportionate shares in financial responsibility. The Lycian league was, therefore, in this respect rather national than federal.

An ancient federal government outside Greece we know very little. The history of Italy supplies a few examples, of which the chief is perhaps the league of the cities of Latium (q.v.; see also Etruria).

See A. Freeman, Federal Government in Greece and Rome (2nd ed., 1893, J. B. Bury), and works quoted in the special articles.

Among the later European confederations the Swiss republic is one of the most interesting. As now constituted it consists of twenty-two sovereign states or cantons. The government is vested in two legislative chambers, a senate or council of state (Ständerat), and a national council (Nationalrat), constituting the federal assembly. The federal council (Bundesrat) of seven members elects the president and vice-president for a term of three years (see Switzerland: Government). Before the French Revolution the German empire was a complex confederation, with the states divided into electoral colleges, consisting—(1) of the ecclesiastical electors and of the secular electors, including the king of Bohemia; (2) of the spiritual and temporal princes of the empire next in rank to the electors; and (3) of the free imperial cities. The emperor was elected by the first college alone. This imposing confederation came to an end by the conquests of Napoleon; and the Confederation of the Rhine was established in 1806 with the French emperor as protector. But in 1815 the Germanic confederation (Deutscher Bund) was established by the congress of Vienna, which in its turn has been displaced by the present German empire. This, in its new organization, conferred on Germany the long-looked for unity and coherence the lack of which had been a source of weakness. The constitution dates, in its latest form, from the treaties entered into at Versailles in 1871. A federation was then organized with the king of Prussia as president, under the hereditary title of German emperor. Delegates of the various federated governments form the Bundesrat; the Reichstag, or popular assembly, is directly chosen by the people by universal suffrage; and the two assemblies constitute the federal parliament. This body has power to legislate for the whole empire in reference to all matters connected with the army, navy, postal service, customs, coinage, &c., all political laws affecting citizens, and all general questions of commerce, navigation, passports, &c. The emperor represents the federation in all international relations, with the chancellor as first minister of the empire, and has power, with consent of the Bundesrat, to declare war in name of the empire.

The United States of America more nearly resembles the Swiss confederation, though retaining marks of its English origin. The original thirteen states were colonies wholly independent of each
other. By the Articles of Confederation and Perpetual Union adopted by the Continental Congress in 1777, and in effect in 1781-1789, the states bound themselves in a league of common defence. By the written Constitution, drafted in 1787 and in operation since 1789, a stronger and more centralized union was established—in theory a federal republic formed by the voluntary combination of sovereign states. A common citizenship was recognized for the whole union; but the federal government was to exercise only those powers as were expressly delegated to it (Amendment of 1791). The powers of the central government are entrusted to three distinct authorities—executive, legislative and judicial. The president, elected for a term of four years by electors chosen for that purpose by each state, is the executive head of the republic. The vice-president, ex officio president of the Senate, assumes the presidency in case of resignation or death. Legislative power is vested in a Congress, consisting of two Houses: a Senate, composed of two members elected by each state for a term of six years; and a House of Representives, consisting of representatives in numbers proportionate to the population of each state. Holding their seats for two years. The supreme judicial authority is vested in a Supreme Court, which consists of a chief justice and eight associate justices, all appointed for life by the president, subject to confirmation by the Senate.

The extension of responsible constitutional government by Great Britain to her chief colonies, under a governor or viceregal representative of the crown, has been followed in British North America by the union of the Canadian, maritime and Pacific provinces under a federal government—with a senate, the members of which are nominated by the crown, and a house of commons elected by the different provinces according to their relative population. The governor-general is appointed by the crown for a term of five years, and represents the sovereign in all matters of federal government. The lieutenant-governors of the provinces are nominated by him; and all local legislation is carried on by the provincial parliaments. The remarkable federation of the Dominion of Canada which was thus originated presented the unique feature of a federal union of provinces practically exercising sovereign rights in relation to all local self-government, and sustaining a constitutional autonomy, while cherishing the colonial relationship to Great Britain.

The Commonwealth of Australia (founded in 1901) is another interesting example of self-governing states federating into a united whole. There is, however, a striking difference to be observed in the powers of the federal governments of Canada and Australia. The federal parliament of Canada has jurisdiction over all matters not specially assigned to the local legislatures, while the federal parliament of Australia has only such jurisdiction as is expressly vested in it or is not expressly withdrawn from the local legislatures. This jurisdiction is undoubtedly extensive, comprising among others, power to legislate concerning trade and industry, criminal law, taxation, quarantine, marriage and divorce, weights and measures, legal tender, copyrights and patents, and naturalization and aliens. There was also an early attempt to federate the South African colonies, and an act was passed for that purpose (South African Act 1877), but it expired on the 18th of August 1882, without having been brought into effect by the sovereign in council; in 1908, however, the closer Union movement (see South Africa) ripened, and in 1909 a federating Act was successfully passed.

See also Bluntschli, The Theory of the State; W. Wilson, The State; Wheaton, International Law.

FEDERALIST PARTY, in American politics, the party that organized the national government of the United States under the constitution of 1787. It may be regarded as, in various important respects, the lineal predecessor of the American Whig and Republican parties. The name Federalists (see Anti-Federalists) was first given to those who championed the adoption of the Constitution. They brought to the support of that instrument the areas of intercourse and wealth (Libby), the influence of the commercial towns, the greater planters, the army officers, creditors and property-holders generally;—in short, of interests that had felt the evils of the weak government of the Confederation,—and also of some few true nationalists (few, because there was as yet no general national feeling), actuated by political principles of centralization independently of motives of expediency and self-interest. Most of the Federalists of 1787-1788 became members of the later Federalist Party.

The Federalist Party, which may be regarded as definitely organized practically from 1791, was led, leaving Washington aside, by Alexander Hamilton (q.v.) and John Adams. A new and more extensive form of the central government to the full extent warranted by a broad construction of the powers granted to it by the constitution, and a correspondingly strict construction of the powers reserved to the states and the citizens, were the basic principles of Hamilton's policy. The friends of individual liberty and local government naturally found in the assumption by the central government of even the minimum of its granted powers constant stimulus to their fears (see Democratic Party); while the financial measures of Hamilton—whose wish for extreme centralization was nowise satisfied by the government actually created in 1787—were calculated to force an immediate and firm assumption by that government, to the limit, of all power it could be held to possess. To the Republicans (Democratic Republicans) they seemed intended to cause a usurpation of powers ungranted. Hence these measures became the issues on which the first American parties were formed. Their effect was supplemented by the division into French and British sympathizers; the Republicans approving the aims and condoning the excesses of the French Revolution, the Federalists siding with British reaction against French democracy. The Federalists controlled the government until 1801. They, having the great opportunity of initiative, organized it in all its branches, giving it an administrative machinery that in the main endures to-day; they established the doctrine of national neutrality toward European conflicts (although the variance of Federalist and Republican opinion on this point was largely fictitious); and fixed the practice of a liberal construction of the Constitution,—not only by Congress, but above all by the United States Supreme Court, which, under the lead of John Marshall (who had been appointed chief-justice by Pres. John Adams), impressed enduringly on the national system large portions of the Federalist doctrine. These are the great claims of the party to memory. After 1801 it became weaker and more divided within itself; it steadily declined into a party which, however, in its rank and file, became a party of reaction; it maintained its influence in the political life of the States; and it organized a number of independent and state parties which, it was generally regarded as the political base or foundation of the Democratic party. The Democratic party was born of the radical division of the Federalist Party, which took place toward the close of the administration of President Jefferson (1829-1832). It is sometimes said that Federalism died because the Republicans took over its principles of nationality. Rather it fell because its great leaders, John Adams and Alexander Hamilton, became bitter enemies; because neither was even distantly comparable to Jefferson as a party leader; because the party could not hold the support of its original commercial, manufacturing and general business elements; because the party opposed sectionalism to a growing nationalism on the issues that ended in the war of 1812; and, above all, because the principles of the party's leaders (e. g. of Hamilton) were out of harmony, in various respects, with American ideals. The conservatism became an increasingly reactionary fear of democracy; indeed, it is not a shallow construction of the times to regard the entire Federalist period from the American point of view as reactionary—a reaction against the doctrines of natural rights, individualism, and states' rights, and the financial looseness of the period of the War of Independence and the succeeding years of the Confederation. The Federalists were charged by the Republicans with being aristocrats and monarchists, and it is certain that their leaders

1 Even the Democratic party has generally been liberal; although less so in theory (hardly less so in practice) than its opponents.
FEHMANN, an island of Germany, belonging to the Prussian province of Schleswig-Holstein, in the Baltic, separated from the mainland by a narrow strait. The island is of least consequence, and is known by the name of the Fehmarn-Sund, less than a quarter of a mile in breadth. It is a gently undulating tract of country, about 120 sq. m. in area, bare of forest but containing excellent pasture-land, and rears cattle in considerable numbers. Pop. 10,000.

FEHMIC COURTS (Ger. Fehrgerichte, or Vehmggerichte, of disputed origin, but probably, according to J. Grimm, from O. High Ger. feme or feime, a court of justice), certain tribunals which, during the middle ages, exercised a powerful and sometimes sinister jurisdiction in Germany, and more especially in Westphalia. Their origin is uncertain, but is traceable to the period of the old Teutonic free courts. They were, indeed, also known as free courts (Freigerichte), a name due to the fact that all free-born men were eligible for membership and also to the fact that they claimed certain exceptional liberties. Their jurisdiction they owed to the emperor, from whom they received the power of life and death (Blutbann) which they exercised in his name. The sessions were often held in secret, whence the names of secret court (heimliches Gericht, Stillsgericht, &c.); and these the uninitiated were forbidden to attend, on pain of death, which led to the designation forbidden courts (verbotene Gerichte). Legend and romance have combined to exaggerate the sinister reputation of the Fehmic courts; but modern historical research has largely discounted this, proving that they never employed torture, that their sittings were only sometimes secret, and that
their meeting-places were always well known. They were, in fact, a survival of an ancient and venerable German institution; and if, during a certain period, they exercised something like a reign of terror over a great part of Germany, the cause of this lay in the sickness of the times, which called for some powerful organization to combat the growing feudal anarchy. Such an organization the Westphalian free courts, with their disciplined terror and elaborate system of secret service, were well calculated to supply. Everywhere else the power of life and death, originally reserved to the emperor alone, had been usurped by the territorial nobles; only in Westphalia, called "the Red Earth" because here the imperial blood-ban was still valid, were capital sentences passed and executed by the Fehmic courts in the emperor's name alone.

The system, though ancient, began to become of importance only after the division of the duchy of Saxony on the fall of Henry the Lion, when the archbishop of Cologne, duke of Westphalia from 1180 onwards, placed himself as representative of the emperor at the head of the Fehme. The organization now rapidly spread. Every free man, born in lawful wedlock, and neither excommunicate nor outlaw, was eligible for membership. Princes and nobles were initiated; and in 1429 even the emperor Sigismund himself became "a true and proper Freischöffe of the Holy Roman Empire." By the middle of the 14th century these Freischöffen (Latin scabini), sworn associates of the Fehme, were scattered in thousands throughout the length and breadth of Germany, known to each other by secret signs and pass-words, and all of them pledged to serve the summons of the secret courts and to execute their judgment.

The organization of the Fehme was elaborate. The head of each centre of jurisdiction (Freistuhl), often a secular or spiritual prince, sometimes a civic community, was known as the Stuhl herr, the archbishop of Cologne being, as stated above, supreme over all (Obersstuhlherr). The actual president of the court was the Freigraf (free count) chosen for life by the Stuhl herr from among the Freischöffen, who formed the great body of the initiated. Of these the lowest rank were the Freonoten or Freifrones, charged with the maintenance of order in the courts and the duty of carrying out the commands of the Freigraf. The immense development of the Fehme is explained by the privileges of the Freischöffen; for they were subject to no jurisdiction but those of the Westphalian courts, whether as accused or accuser they had access to the secret sessions, and they shared in the discussions of the general chapter as to the policy of the society. At their initiation these swore to support the Fehme with all their powers, to guard its secrets, and to bring before its tribunal anything within its competence that they might discover. They were then initiated into the secret signs by which members recognized each other, and were presented with a rope and a knife on which were engraved the mystic letters S.S.G.G., supposed to mean Stein, Stein, Gras, Grin (rope, stone, grass, grain).

The procedure of the Fehmic courts was practically that of the ancient German courts generally. The place of session, known as the Freistuhl (free seat), was usually a hillock, or some other well-known and accessible spot. The Freigraf and Schöffen occupied the bench, before which a table, with a sword and rope upon it, was placed. The court was held by day and, unless the session was declared secret, all freemen, whether initiated or not, were admitted. The accusation was in the old German form; but only a Freigraf, or a court, could act as an accuser. If the offence came under the competence of the court, i.e. was punishable by death, a summons to the accused was issued under the seal of the Freigraf. This was not usually served on him personally, but was nailed to his door, or to some convenient place where he was certain to pass. Six weeks and three days' grace were allowed, according to the old Saxon law, and the summons was thrice repeated. If the accused appeared, the accuser stated the case, and the investigation proceeded by the examination of witnesses as in an ordinary court of law. The judgment was put into execution on the spot if that was possible. The secret court, from whose procedure the whole institution has acquired its evil reputation, was closed to all but the initiated, although these were so numerous as to secure quasi-publicity; any one not a member on being discovered was instantly put to death, and the members present were bound under the same penalty not to disclose what took place. Crimes of a serious nature were specially investigated; and in addition to the financial investigation—such as heresy and witchcraft—fell within its jurisdiction, as also did appeals by persons condemned in the open courts, and likewise the cases before those tribunals in which the accused had not appeared. The accused if a member could clear himself by his own oath, unless he had revealed the secrets of the Fehme. If he were one of the initiated it was necessary for him to bring forward witnesses to his innocence from among the initiated, whose number varied according to the number on the side of the accuser, but twenty-one in favour of innocence necessarily secured an acquittal. The only punishment which the secret court could inflict was death. If the accused appeared, the sentence was carried into execution at once; if he did not appear, it was quickly made known to the whole body, and the Freischöffe who was the first to meet the condemned was bound to put him to death. This was usually done by hanging, the nearest tree serving for gallows. A knife with the cabalistic letters was left beside the corpse to show that the deed was not a murder.

That an organization of this character should have outlived its usefulness and issued in intolerable abuses was inevitable. With the growing power of the territorial sovereigns and the gradual improvement of the ordinary courts of justice, the functions of the Fehmic courts were superseded. By the action of the emperor Maximilian and of other German princes they were, in the 16th century, once more restricted to Westphalia, and there, too, they were brought under the jurisdiction of the ordinary courts, and finally confined to mere police duties. With these functions, however, but with the old forms long since robbed of their impressiveness, they survived into the 19th century. They were finally abolished by order of Jerome Bonaparte, king of Westphalia, in 1811. The last Freigraf died in 1835.

Leipzig, 1906), p. 401; also sup. bibliographical vol. (1897), p. 78.

FEHRBELLIN, a town of Germany, in the kingdom of Prussia, on the Rhine, 40 m. N.W. from Berlin on the railway to Neu- ruppin. Pop. (1905) 1602. It has a Protestant and a Roman Catholic church and some small industries, among them that of wooden shoes. Fehrbellin is memorable in history as the scene of the famous victory gained, on the 18th of June 1675, by the great elector, Frederick William of Prussia, over the Swedes under Field-Marshall Wrangel. A monument was erected in 1879 on the field of battle, near the village of Hakenberg, to commemorate this great feat of arms.

See A. von Witzleben and P. Hassell, Zum 200-jährigen Gedenktag von Fehrbellin (Berlin, 1876); G. Sello, "Fehrbellin," in Deutsche Zeitschrift für Geschichtswissenschaften, vii.; M. Jähns, "Der Grosse Kurfürst bei Fehrbellin, &c.," in Hohenzollern Jahrbuch, i.;
FULTON, and Feijóo's services to the cause of knowledge were universally recognized long before his death, which took place at Oviedo on the 26th of September 1764. He was not a great genius, nor a writer of transcendent merit; his name is connected with no important discovery, and his style is undistinguished. But he uprooted many popular errors, awakened interest in scientific methods, and is justly regarded as the initiator of educational reform in Spain.

FEITH, RHIJNVS (1753–1824), Dutch poet, was born of an aristocratic family at Zwolle, the capital of the province Overijssel, on the 7th of February 1753. He was educated at Harderwijk and at the university of Leiden, where he took his degree in 1779. In 1772 he settled at his birthplace, and married. In 1785, in his twenty-third year, he became burgomaster of Zwolle. He built a luxurious villa, which he named Boschwijk, in the outskirts of the town, and there he lived in the greatest comfort. His first important production was Julia, in 1783, a novel written in emulation of Werther, and steeped in Wielischmera and despair. This was followed by the tragedy of Thirsa (1784); Ferdinand and Constantia (1785), another Werther novel; and The Patriots (1784), a tragedy. Bilderdijk and other writers attacked his morbid melancholy, and Johannes Kinker (1764–1843) parodied his novels, but his vogue continued. In 1791 he published a tragedy of Lady Jane Grey; in 1792 a didactic poem, The Grave, in four cantos; in 1793 Inez de Castro; in 1795 to 1800 the volumes of Odes and Miscellaneous Poems; and in 1802 Old Age, in six cantos. He died at Zwolle on the 8th of February 1824.

His works were collected (Rotterdam, 11 vols.) in 1824, with a biographical notice by N. G. van Kampen.

FEIJER, GEORGY (1766–1851), Hungarian author, was born on the 23rd of April 1766, at Keszthely, in the county of Zala. He studied philosophy at Pest, and theology at Pressburg; eventually, in 1805, he obtained a theological professorship at Pest University. Ten years later (1816) he became chief director of the educational circle of Raab, and in 1824 was appointed librarian to the university of Pest. Feijer's works, which are nearly all written either in Latin or Hungarian, exceed one hundred and eighty in number. His most important work, Codex diplomaticus Hungarice ecclesiasticus ac civilis, published from 1829 to 1844, in eleven so-called tomes, really exceeds forty volumes. It consists of old documents and charters from A.D. 104 to the end of 1439, and forms an extraordinary monument of patient industry. This work and many others relating to Hungarian national history have placed Feijer in the foremost rank of Hungarian historians. He died on the 2nd of July 1851. His latest works were A kunok eredete (The Origin of the Hans), and A politikai forradalmak okai (The Causes of Political Revolutions), both published in 1850. The later production, on account of its liberal tendencies, was suppressed by the Austrian government.

See Magyar Irók: Életrája-gyűjteménye (Pest, 1856), and A magyar nemzeti írásmondottáé vádata (Pest, 1861).

FELANITX, or Felaniche, a town of Spain, in the south-east of the island of Majorca, Balearic Islands; about 5 m. inland from its harbour, Puerto Colon. Pop. (1900) 11,294. A range of low hills intervenes between Felanitx and the Mediterranean; upon one summit, the Puig de San Sebastian, stands a Moorish castle with a remarkable series of subterranean vaults. From the 3rd century a.C., and possibly for a longer period, earthenware water-cookers and other pottery have been manufactured in the town, and many of the vessels produced are noteworthy for their beauty of form and antiquity of design. There is a thriving trade in wine, fruit, wheat, cattle, brandy, chalk and soap.

FELDKIRCH, a small town in the Austrian province of the Vorarlberg, some 20 m. S. of the S. end of the Lake of Constance. It is situated in a green hollow, on the Ill river, between the two narrow rocky gorges through which it flows out into the broad valley of the Rhine. Hence, though containing only about 4000 inhabitants (German-speaking and Romanist), the town is of great military importance, since it commands the entrance into Tirol from the west, over the Arlberg Pass (5912 ft.), and has been the scene of many conflicts, the last in 1799, when the French, under Oudinot and Masséna, were driven back by the Austrians under Hotze and Jellachich. It is a picturesque little town, overshadowed by the old castle of Schattenburg (now a poor-house), built about 1200 by the count of Montfort, whose descendant in 1375 sold it to the Habsburgs. The town contains many administrative offices, and is the residence of a suffragan bishop, who acts as vicar-general of the diocese, the bishop of Brixen. Among the principal buildings are the parish church, dating from 1487, and possessing a "Descent from the Cross" (1521), which has been attributed to Holbein, the great Jesuit educational establishment called "Stella Matutina," and a Capuchin convent and church. There is a considerable amount of transit trade at Feldkirch, which by rail is 11 m. from Buchs (Switzerland), through the principality of Liechtenstein, 24 m. from Innsbruck, and 17 m. from Innsbruck, by the Arlberg Pass. The town also possesses numerous industrial establishments, such as factories for cotton-spinning, weaving, bell-founding, dyeing, etc.

(F. W. A. C.)

FÉLIX, ANDRÉ (1619–1695), surned des Avaux et de Javercy, French architect and historiographer, was born at Chartres in May 1619. At the age of fourteen he went to Paris to continue his studies; and in 1647 he was sent to Rome in the capacity of secretary of embassy to the Marquis de Marueil. His residence at Rome he turned to good account by diligent study of its ancient monuments, by examination of the literary treasures of its libraries, and by cultivating the acquaintance of men eminent in literature and in art, with whom he was brought into contact through his translation of Cardinal Barberini's Life of Pius V. Among his friends was Nicholas Foussin, whose counsels were of great value to him. On his return to France he married, and was ultimately induced, in the hope of employment and honours, to settle in Paris. Both Fouquet and Colbert in their turn recognized his abilities; and he was one of the first members (1663) of the Academy of Inscriptions. Three years later Colbert procured him the appointment of historiographer to the king. In 1671 he was named secretary to the newly-founded Academy of Architecture, and in 1672 he was made a member of the cabinet of antiquities in the palace of Brion. To these offices was afterwards added by Louis XIV. that of deputy controller-general of roads and bridges. Felix found time in the midst of his official duties for study and research, and produced many literary works. Among these the best and the most generally known is the Entretiens sur les vie et sur les ouvrages des plus excellents peintres anciens et modernes, which appeared in successive livraisons, the first in 1666, and the fifth in 1688. It was republished with several additions at Amsterdam in 1706, and again at Trévoux in 1723. Félix wrote also Origine de la peinture (1666), Principes de l'architecture, de la sculpture, de la peinture, &c. (1676–1699), and a history of the pictures and statues of the royal residences. Among other literary works, he edited the Conférences of the Academy of Painting, and translated the Castle of the Soul from the Spanish of St Theresa. His personal character commanded the highest esteem, agreeing with the motto which he adopted—Bene facere et vero dicere. He died in Paris on the 11th of June 1695.

His son, Jean François Félix (c. 1658–1733), was also an architect who left a number of works on his subject; and a younger son, Michel Félix (c. 1666–1710), was a Benedictine of Saint Germain-des-Prés whose fame rests on his Histoire de l'abbaye royale de S. Denis en France, and also his L'Histoire de la ville de Paris in 5 vols., a work indispensable to the student of Paris.

FELIX, the name of five popes.

Felix I., pope from January 269 until his death in January 274. He has been claimed as a martyr, and as such his name is given in the Roman calendar and elsewhere, but his title to this honour is by no means proved, and he has been probably confused with another bishop of the same name. He appears in connexion with the dispute in the church of Antioch between Paul of Samosata, who had been deprived of his bishopric by the Council of Nicaea for heresy, and his successor Domnus. Paul refused to give way, and in 272 the emperor Aurelian was asked to decide between the
rivals. He ordered the church building to be given to the bishop who was "recognized by the bishops of Italy and of the city of Rome" (Felix). See Eusebius, Hist. Ecc. vii. 30.

FELIX II., antipope, was in 356 raised from the archdeaconate of Rome to the papal chair, when Liberius was banished by the emperor Constantius for refusing to subscribe the sentence of condemnation against Athanasius. His election was contrary to the wishes both of the clergy and of the people, and the consecration ceremony was performed by certain prelates belonging to the court. In 357 Constantius, at the urgent request of an influential deputation of Roman ladies, agreed to the release of Liberius on condition that he signed the semi-Arian creed. Constantius also issued an edict to the effect that the two bishops should rule conjointly, but Liberius, on his entrance into Rome in the following year, was received by all classes with so much enthusiasm that Felix found it necessary to retire at once from Rome. Regarding the remainder of his life little is known, and the accounts handed down are contradictory, but he appears to have spent the most of it in retirement at his estate near Porto. He died in 365.

FELIX III., pope, was descended from one of the most influential families of Rome, and was a direct ancestor of Gregory the Great. He succeeded Simplicius in the papal chair on the 2nd of March 483. His first act was to repudiate the Henotician, a deed of union, originating in the controversy of their successors, with Acacius, patriarch of Constantinople, and published by the emperor Zeno with the view of allaying the strife between the Monophysites and their opponents in the Eastern church. He also addressed a letter of remonstrance to Acacius; but the latter proved refractory, and sentence of deposition was passed against him. As Acacius, however, had the support of the emperor, a schism arose between the Eastern and Western churches, which lasted for 34 years. Felix died in 492.

FELIX IV., pope, a native of Eneventum, was, on the death of John in 526, raised to the papal chair by the emperor Theodoric in order to fill the position of the late pope Anastasius. His election was followed by serious riots. To prevent a recrudescence of these, Felix, on his death-bed, thought it advisable to nominate his own successor. His choice fell upon the archdeacon Boniface (pope as Boniface II.). But this proceeding was contrary to all tradition and roused very serious opposition. Out of two old buildings adapted by him to Christian worship, Felix made the church of SS. Cosimo and Damiano, near the Via Sacra. He died in September 530.

FELIX V., the name taken by Amadeus (1387-1431), duke of Savoy, when he was elected pope in opposition to Eugene IV. in 1439. Amadeus was born at Chambéry on the 4th of December 1387, and succeeded his father, Amadeus VII, as count of Savoy in 1391. Having added largely to his patrimonial possessions he became very powerful, and in 1446 the German king Sigismund erected Savoy into a duchy; after this elevation Amadeus added Piedmont to his dominions. Then suddenly, in 1434, the duke retired to a hermitage at Ripalle, near Thonon, resigning his duchy to his son Louis (d. 1465), although he seems to have taken some part in its subsequent administration. It is said, but some historians doubt the story, that, instead of leading a life of asceticism, he spent his revenues on indulging his passion for luxury and enjoyment. In 1439, when Pope Eugene IV. was deposed by the council of Basel, Amadeus, although not in orders, was chosen as his successor, and was crowned in the following year as Felix V. In the stormy conflict between the rival popes which followed, the German king, Frederick IV., after some hesitation sided with Eugeneus, and having steadily lost ground Felix renounced his claim to the pontificate in 1449 in favour of Nicholas V., who had been elected on the death of Eugeneus. He induced Nicholas, however, to appoint him as apostolic vicar-general in Savoy, Piedmont and other parts of his own dominions, and to make him a cardinal. Amadeus died at Geneva on the 7th of January 1451.

FELIX, a missionary bishop from Burgundy, sent into East Anglia by Honorius of Canterbury (605-631). Under King Siegbert his mission was successful, and he became first bishop of East Anglia, with a see at Dunwich, where he died and was buried, 647-648. It is noteworthy that the Irish monk Furseus preached in East Anglia at the same time, and Bede notices the admiration of Felix for Aidan.

See Bede, Hist. Eccl. (Plummer), ii. 15, iii. 18, 20, 25; Saxon Chronicle (Earle and Plummer), s.a. 636.

FELIX, of Urgella (fl. 8th century), Spanish bishop, the friend of Eilipandus and the propagator of his views in the great Adoptian controversy (see Adoptianism).

FELIX, of Valois (1127-1121), one of the founders of the monastic order of Trinitarians or Redemtionists, was born in the district of Valois, France, on the 10th of April 1127. In early manhood he became a hermit in the forest of Galereuse, where he remained till his sixty-first year, when his disciple Jean de Matha (1166-1213) suggested to him the idea of establishing an order of monks who should devote their lives to the redemption of Christian captives from the Saracens. They journeyed to Rome about the end of 1197, obtained the sanction of the pope, and on their return to France founded the monastery of Cerfroi in Picardy. Felix remained to govern and propagate the order, while Jean de Matha superintended the foreign journeys. A subordinate establishment was also founded by Felix in Paris near a chapel dedicated to St Mathurin, on which account his monks were also called St Mathurins. He died at Cerfroi on the 4th of November 1199. His feast is celebrated on 25th November.

FELIX, ANTONIU S, Roman procurator of Judaea (A.D. 50-60), in succession to Ventidius Cumanus. He was a freedman either of the emperor Claudius—according to which theory Josephus (Antiq. xx. 7) calls him Claudius Felix—or more probably of the empress Antonia. On entering his province he induced Drusilla, wife of Aizius of Homs (Emesa), to leave her husband and live with him as his wife. His cruelty and licentiousness, coupled with his accessibility to bribes, led to a great increase of crime in Judaea. To put down the Zealots he favoured an even more violent sect, the Sicarii (Dagger-men), by whose aid he procured the murder of the high-priest Jonathan. The period of his rule was marked by internal feuds and disturbances, which he put down with severity. The apostle Paul, after being apprehended in Jerusalem, was sent to be judged before Felix at Caesarea, and kept in custody for two years (Acts xxiv.). On returning to Rome, Felix was accused of having taken advantage of a dispute between the Jews and Syrians of Caesarea to slay and plunder the inhabitants, but through the intercession of his brother, the freedman Pallas, who had great influence with the emperor Nero, he escaped punishment.

See Josephus, Antiq. vii. 5, 4; Plutarch, His. v. 9; Suetonius, Claudius, 28; E. Schürer, History of the Jewish People (1890-1891); an article in Hastings' Dict. of the Bible (A. Robertson); commentaries on the New Testament (A.-W. M. Ramsay, St Paul the Traveler; C. W. Weizäcker, Apostolic Age (Eng. trans., 1894)); art. JEWS.

FÉLIX, LIA (1383-1391), French actress, was the third sister and the pupil of the great Rachel. She had hardly been given any trial when, by chance, she was called on to create the leading woman's part in Lamartine's Tousant Louverture at the Porte St Martin on the 6th of April 1830. The play did not make a hit, but the young actress was favourably noticed, and several important parts were immediately entrusted to her. She soon came to be recognized as one of the best comedien of Paris. Rachel took Lia to America with her to play second parts, and on returning to Paris she played at several of the principal theatres, although her health compelled her to retire for several years. When she reappeared at the Gaîté in the title-role of Jules Barbier's Jeanne d'Arc she had an enormous success.

FELIXSTOWE, a seaside resort of Suffolk, England; fronting both to the North Sea and to the estuary of the Orwell, where there are piers. See the urban district of Felixstowe and Walton (q.v.). It is 85 m. N.E. by E. from London by a branch line from Ipswich of the Great Eastern railway; and is in the Woodbridge parliamentary division of the county. It has good golf links, and is much frequented by visitors for its bracing climate and sea-bathing. There is a small dock, and phosphate of lime is extensively dug in the neighbourhood and
FELL, JOHN (1625-1686), English divine, son of Samuel Fell, dean of Christ Church, Oxford, was born at Longworth in Berkshire and received his first education at the free school at Thame in Oxfordshire. In 1636 he obtained a studentship at Christ Church, and in 1640 he was specially allowed by Archbishop Laud on account of his "known desert," when wanting one term's residence, to proceed to his degree of B.A. He obtained his M.A. in 1643 and took holy orders (deacon 1647, priest 1649). During the Civil War he bore arms for the king and held a commission as ensign. In 1648 he was deprived of his studentship by the parliametary visitors, and during the next few years he resided chiefly at Oxford with his brother-in-law, Dr T. Willis, at whose house opposite Merton College he and his friends Allestre and Dolben kept up the service of the Church of England through the Commonwealth.

At the Restoration Fell was made prebendary of Chichester, canon of Christ Church (July 27, 1660), dean (Nov. 30, 1701), and master of St Oswald's Hospital, Worcester, chaplain to the king, and D.D. He filled the office of vice-chancellor from 1666 to 1669, and was consecrated bishop of Oxford, in 1676, retaining his deanship in commendam. Some years later he declined the primacy of Ireland. Fell showed himself a most capable and vigorous administrator in his various high employments, and a worthy disciple of Archbishop Laud. He restored in the university the good order instituted by the archbishop, which in the Commonwealth had given place to anarchy and a general disregard of authority. He ejected the intruders from his college or else "fixed them in loyal principles." He was the most zealous man of his time for the Church of England," says Wood, "and that I yet know of did go beyond him in the performance of the rules belonging thereunto." He attended chapels of divine service without distinction, not out of some opposition, the organ and surplice, and insisted on the proper academical dress which had fallen into disuse. He was active in recovering church property, and by his directions a children's catechism was drawn up by Thomas Marshall for use in his diocese. "As he was among the first of our clergy," says Burnet, "that apprehended the design of bringing in popery, so he was one of the most zealous against it." He was forward in making converts from the Roman Catholics and Nonconformists. On the other hand, it is recorded to his honour that he opposed successfully the incorporation of Titus Oates as D.D. in the university in October 1675, and according to the testimony of William Nichols, his secretary, disapproved of the Exclusion Bill. He excluded the undergraduates, whose presence had been irregularly permitted, from convocation. He obliged the students to attend lectures, instituted reforms in the performances of the public exercises in the schools, kept the examiners up to their duties, and himself attended the examinations. He encouraged the students to act plays. He entirely suppressed "coursing," i.e. disputations in which the rival parties "ran down opponents in arguments," and which commonly ended in blows and disturbances. He was an excellent disciplinarian and possessed a special talent for the education of young men, many of whom he received into his own family and watched over their progress with paternal care. Tom Browne, author of the Dialogues of the Dead, about to be expelled from Oxford for some offence, was pardoned by Fell on the condition of his translating extempore the 33rd epigram from Martial:

4) Non amo te, Sabibi, nec possum dicere quae
Hoc tibi narrabo: possum dicere quae.

To which he immediately replied with the well-known lines:

1) Do not love you, Dr Fell,
But why, I cannot tell,
But this I know full well,
Do not love you, Dr Fell."

1 J. T. Browne, Works (9th ed. by J. Drake), iv. 99-100; T. Forde, Virtus rediviva (1661), 106.

Delinquents, however, were not always treated thus mildly by Fell, and Acton Cremer, for the crime of courting a wife while only a bachelor of arts, was set as an imposition the translation into English of the whole of Scheffer's history of Lapland. As vice-chancellor, Fell himself visited the drinking taverns and ordered out the students. In the university elections he showed great energy in suppressing corruption.

Fell's building operations almost rivalled the plans of the great ecclesiastical architects of the middle ages. In his own college he completed in 1665 the north side of Wolsey's great quadrangle, already begun by his father but abandoned during the Commonwealth; he rebuilt in 1672 the east side of the Chaplain's quadrangle 1 with a straight passage under it leading from the cloister into the field, 2 occupied now by the new Logan Buildings; the lodgings of the canon of the 3rd stall in the passage leading the way to Peckwater Hall (c. 1674); a long building joining the Chaplain's quadrangle on the east side in 1677-1678; and lastly the great tower gate, begun in June 1681 on the foundation laid by Wolsey and finished in November 1682, to which the bell "great Tom," after being recast, was transferred from the cathedral in 1683. In 1670 he planted and laid out the Broad Walk. He spent large sums of his own on these works, gave £500 for the restoration of Banbury church, erected a church at St Oswald's, Worcester, and the parsonage house at Woodstock at his own expense, and rebuilt Cuddesdon chapel. Fell disapproved of the use of St Mary's church for secular purposes. He sent for type and printers from Holland, declaring that "the foundation of all success must be laid in doing things well, which I am sure will not be done with English letters." Many works, including a Bible, editions of the classics and of the early fathers, were produced under his direction and editing, and his press became noted not only in England but abroad. He published annually one work, generally a classical author annotated by himself, which he distributed to all the students of his college on New Year's day. On one occasion he surprised the Press in printing surreptitiously Aretino's Postures, when he seized and destroyed the presses and drudged the plates and impressions. Ever "an eager defender and maintainer of the university and its privileges," he was hostile to the Royal Society, which he regarded as a possible rival, and in 1686 he gave an absolute refusal to Obadiah Walker, afterwards the Roman Catholic master of University College, though licensed by James II., to print books, declaring he would as soon "part with his bed from under him " as his press. He conducted it on strict business principles, and to the criticism that more great works were not produced replied that they would not sell. He was, however, not free from fads, and his new spellings of (nominally) archaic words were "the substitution of ı for y in such words as oes, dates, maestis) much with great disapprobation."

Fell also did much to encourage learning in the university. While still a young man at Christ Church he had shown both his zeal and his charity by reading gratuitously with the poor and neglected students of the college. He bore himself a high reputation as a Grecian, a Latinist and a philologist, and he found time, in spite of his great public employments, to bring out with the collaboration of others his great edition of St Cyprian in 1682, an English translation of The Unity of the Church in 1681, editions of Nemesius of Epesa (1671), of Aretas and of Erato-

FELL, JOHN

Grammatica rationis sive institutiones logicae (1673 and 1685), and a critical edition of the New Testament in 1675. The first volumes of Rerum Anglicarum scriptores and of Historiae Britannicae, &c. were compiled under his patronage in 1685. He had the MSS. of St. Augustine in the Bodleian and other libraries at Oxford generously collated for the use of the Benedictines at Paris, then preparing a new edition of the father.

Fell spent such large sums in his building, in his noble patronage of learning, and in charities, that sometimes there was little left for his private use. Occasionally in his schemes he showed greater zeal than prudence. He was the originator of a mission to India which was warmly taken up by the East India Company. He undertook himself to train as missionaries four scholars at Oxford, procured a set of Arabic types, and issued from these the Gospels and Acts in the Malay language in 1677. But this was scarcely the best method of communicating the gospel to the natives of India, and the mission collapsed. He affected to despise public opinion, and was masterful and despotic in his dealings with others, especially with those upon whom he was conferring favours. Having generously undertaken at his own charge to publish a Latin version of Wood's History and Antiquities of the University of Oxford, with the object of presenting the history of the university in a manner worthy of the great subject to European readers, and of extending its fame abroad, he arrogated to himself the right of editing the work. "He would correct, add to, and alter everything that pleased him. He was a great man and carried all things at his pleasure." In particular he struck out all the passages which Wood had inserted in praise of Hobbes, and substituted some disparaging epithets. He called the philosopher's Leviathan "monstroussinus" and "publico damno notissimus." To the printed remonstrance of Hobbes, Fell inserted an insulting reply in the History to "irribilus illud et vanissimum Malmesburiense animal," and to the complaint of Wood at this usage answered only that Hobbes was "an old man, had one foot in the grave; that he should mind his mind, and that Oxford was any man's." In small things as in great he loved to rule and direct. "Let not Fell," writes R. South to R. Bathurst, "have the fingering and altering of them (i.e. his Latin verses), for I think that, bating the want of siquidem and quinetiam, they are as good as his Worship can make." Wood styles him "a valde vult person." He was not content with ruling his own college, but desired to govern the whole university. He prevented Gilbert Ironsides, who was "not pliable to his humour," from holding the office of vice-chancellor. He "endeavoured to carry all things by a high hand; scorn'd in the least to court the Masters when he had to have anything past the conversation. He went to other colleges, blind as to his own, very partial and with good words, and flatterers and tell-tales could get anything out of him." According to Bishop Burnet, who praises his character and his administration, Fell was "a little too much heated in the matter of our disputes with the dissenters." He had much zeal for reforming abuses, and managed it perhaps with too much heat and in too peremptory a way." But," he adds, "we have so little of that among us that no wonder if such men are censured by those who love not such patterns nor such severe task-masters. And Wood was a warning to us all to remember a little on account of the personal dispute,—after declaring that Fell was "exceeding partial in his government even to corruption; went thro' thick and thin; grasped at all yet did nothing perfect or effectually; cared not what people said of him, was in many things very rude and in most pedantic and pedagogical,"—concludes with the acknowledgment, "yet still aimed at the public good." Roger North, who paid Fell a visit at Oxford, speaks of him in terms of enthusiasm:—"The great Dr Fell, who was truly great in all his circumstances, capacities, undertakings and learning, and above all for his superabundant public spirit and goodwill, (O the felicity of that age and place when his authority swayed)!"

In November 1684, at the command of the king, Fell deprived Locke, who had incurred the royal displeasure by his friendship with Shaftesbury, and was suspected as the author of certain seditious pamphlets, of his studentship at Christ Church, summarily and without hearing his defence. Fell had in former years cultivated Locke's friendship, had kept up a correspondence with him, and in 1663 had written a testimonial in his favour; and the ready compliance one who could on occasion offer a stout resistance to any invasion of the privileges of the university has been severely criticised. It must, however, be remembered in extenuation that the legal status of a person on the foundation of a collegiate body had not then been decided in the law-courts. With regard to the justice of the proceeding Fell had evidently some doubts, and he afterwards expressed his regret for the step which he was now compelled to take. But such scruples, however strong, would, with a man of Fell's political and religious opinions, yield immediately to an order from the sovereign, who possessed special authority in this case as a visitor to the college; and such moral submissiveness, however strange to modern notions, would probably only be considered natural and proper at that period.

Fell, who had never married, died on the 10th of July 1686, worn out, according to Wood, by his overwhelming public duties. He was buried in the divinity chapel in the cathedral, below the seat which he had so often occupied when living, where a monument and an epitaph, now moved elsewhere, were placed to his memory. "His death," writes John Evelyn, "was an extraordinary losse to the poor church at this time"; but for himself Fell's learned works already mentioned by him in a few months more of life would have necessitated a choice, most painful to a man of his character and creed, between fidelity to his sovereign and to his church. With all his faults, which were the defects which often attend eminent qualities such as his, Fell was a great man, "the greatest governor," according to Speaker Onslow, "that has ever been since his time in either of the universities," and of his own college, to which he left several exhibitions for the maintenance of poor scholars, he was a second founder. He was a worthy upholder of the Laudian policy, as an enlightened and untrifling patron of learning, and a man of exemplary moral and private virtue which remained unsullied in the midst of a busy life and much contact with the world. A sum of money was left by John Cross to perpetuate Fell's memory by an annual speech in his praise, but the Fellii laudes have been discontinued since 1866. There are two interesting pictures of Fell at Christ Church, one where he is represented with his two friends Alstree and Dolben, and another by Vandyck. The statue placed on the N.E. angle of the Great Quadrangle bears no likeness to the bishop, who is described by Hearne as a "thin grave man." A generous patronage named Fell wrote the lives of his friends Dr Henry Hammond (1661), Richard Alstree, prefixed to his edition of the latter's sermons (1684), and Dr Thomas Willis, in Latin. His Seasonable advice to Protestants showing the necessity of maintaining the Established Religion in opposition to Popery was published in 1688. Some of his sermons, which Evelyn found dull, were printed, including Character of the Last Dales, preached before the king, 1675, and a Sermon preached before the House of Peers Dec. 22, 1680, The Interest of England stated (1699), advocating the restoration of the king, 1 and Oration and Speech at the public opening of the university, 1691, a critical piece. Some of the commentaries on him Fell probably had some share in the composition of The Whole Duty of Man, and in the subsequent works published under the name of the author of The Whole Duty, which included Reasons of the Decay of Christian Piety, The Ladies Calling, The Gentleman's Calling, The Government of the Tongue, The Art of Contentment, and The Lively Oracles given us, all of which were published in one volume with notes and a preface by Fell in 1684.

FELL—FELLER

University by Dr J. Fellel (1605); Notes and Queries, ser. vi. 2, and ser. vii. 166; Calendars of State Papers, Dom. Series (1660–1675). Feller's books and papers were bequeathed by his nephew Henry Jones to the Bodleian library. A few of his letters are to be found in Add. MSS. Brit. Mus., 10846, and some are printed in Lyle of James II., by Ch. J. Fox, Appendix; Gent. Mag. 77, p. 633; Academy, 8, p. 141; Athenaeum for 1887 (2), p. 311; J. Gutch, Collectanea Curiosa, i. 266; and in Cal. of State Papers, Dom. Series. (F. C. Y.)

FELL. (1) (Through the O. Fr. fel, from Low Lat. fella, felon), savage, ruthless, deadly; only used now in poetry. (2) (Of Scandinavian origin, cf. Danish feld, probably connected with a Teutonic root appearing in German fels, rock), a hill, as in the names of mountains in the Lake District in England, e.g. Scafell; also a lofty moorland down. (3) (A word belonging to Teutonic languages, cf. Ger. fell, and Dutch vel, cognate with Lat. pellis, skin), the pelt or hide of an animal, with the hair or wool and skin; also used of any thick shaggy covering, like a matted fleece. (4) To cause to "fall," a word common to Teutonic languages and akin to the root of the Lat. fallere and Gr. ἀφελεν, to cause to stumble, to deceive. As a substantive "fell" is used of a flat seam laid level with the surface of the fabric; also, in weaving, of the end of the web.

FELLAH (pl. Fellahin), Arabic for "ploughman" or "tiller," the word used in Arabic-speaking countries to designate peasants. It is employed especially of the peasants of Egypt, "Fellah" in modern English usage being almost equivalent to "Egyptians." In Egypt the name is applied to the peasantry as opposed to the Arabs of the desert (and even those who have settled on the land), the Turks and the townsfolk. Fellah is used by the Arabs as a term of reproach, somewhat like the English "boor," but rather implying a slavish disposition; the fellahin, however, are not ashamed of the name and may pride themselves on being of good fellah descent, as a "fellah of a fellah." They may be classified as Hamito-Semitic, and preserve to some extent the blood of the ancient Egyptians. They form the bulk of the population of Egypt and are mainly Mahommedan, though some villages in Upper Egypt are almost exclusively Copt (Christian). Their hybridism is well shown by their great divergence of colour, fellahin in the Delta being sometimes lighter than Arabs, while in Upper Egypt the prevailing complexion is dark brown. The average fellah is somewhat above medium height, big-boned, of clumsy but powerful build, with head and face of fine oval shape, cheek-bones high, forehead broad, short flattish nose with wide nostrils, and black but not woolly hair. The eyebrows are always straight and smooth, never bushy. The mouth is thick-lipped and large but well formed. The eyes are large and black, and are remarkable for the closeness of the eyelashes. The women and girls are particularly noted for their graceful and slender figures and their fine carriage, due to the custom of carrying burdens, especially water-jars, on their heads. The men's heads are usually shaved. The women are not as a rule closely veiled: they generally paint the lips a deep blue, and tattoo a floral device on the chin, sometimes on the forehead and other parts of the body. All but the poorest wear necklaces of cheap pearls, coins or gilt disks. The men wear a blue or brown cotton shirt, lined drawers and a plain skull-cap, or on occasion the tarbush or fez, and when kept company abroad, the tarbush is wound; the women wear a single cotton smock. The common fellah's home is a mere mud hut, roofed with durra straw. Inside are a few mats, a sheepskin, baskets and some earthenware and wooden vessels. He lives almost entirely on vegetables, millet bread, beans, lentils, dates and onions. But some of the sheikhs are wealthy, and have large houses built of crude brick and whitewashed with lime, with courtyard, many apartments and good furniture. The fellah is laborious in the fields, and abominates absence from his occupations, which generally means loss of money to him. Military service on the old oriental plan was both ruinous and distasteful to him; hence voluntary mutilations to avoid conscription were formerly common and the ingrain prejudice against military service remains. Trained by British officers, the fellahin make, however, excellent soldiers, as was proved in the Sudan campaigns of 1896–98. The fellah is intelligent, cheerful and sober, and as hospitable as his poverty allows. (See COPRIS and EVREY.)

FELLENBERG, PHILIPP EMANUEL VON (1771–1844), Swiss educationist, was born on the 27th of June 1771 at Bern, in Switzerland. His father was of patrician family, and a man of importance in his canton, and his mother was a granddaughter of the Dutch admiral Van Tromp. From his mother and from Pfeffel, the blind poet of Colmar, he received a better education than falls to the lot of most boys, while the intimacy of his father with Pestalozzi gave to his mind that bent which it afterwards followed. In 1790 he entered the university of Tübingen, where he distinguished himself by his rapid progress in his studies. He conducted an agricultural experiment, and took a walking tour in Switzerland and the adjoining portions of France, Swabia and Tirol, visiting the hamlets and farm-houses, mingling in the labours and occupations of the peasants and mechanics, and partaking of their rude fare and lodging. After the downfall of Robespierre, he went to Paris and remained there long enough to be assured of the storm impending over his native country. This he did his best to avert, but his warnings were disregarded, and Switzerland was lost before any efficient means could be taken for its safety. Fellenberg, who had hastily raised a levy en masse, was proscribed; a price was set upon his head and he was compelled to fly into Germany. Shortly afterwards, however, he was recalled by his countrymen, and sent on a mission to Paris to remonstrate against the rapacity and cruelty of the agents of the French republic. But in this and other diplomatic offices which he held for a short time, he was witness to so much corruption and intrigue that his mind revolted from the idea of a political life, and he returned home with the intention of devoting himself wholly to the education of the young. With this resolution he purchased in 1790 the estate of Hofwyl, near Bern, intending to make agriculture the basis of a new system which he had projected, for elevating the lower and rightly training the higher orders of the state, and welding them together in a closer union than had hitherto been deemed attainable. For some time he carried on his labours in conjunction with Pestalozzi, but incompatibility of disposition soon induced them to separate. The scheme of Fellenberg at first excited a large amount of ridicule, but gradually it began to attract the notice of foreign countries; and pupils, some of them of the highest rank, began to flock to him from every country in Europe, both for the purpose of studying agriculture and to profit by the high moral training which he associated with his educational system. For forty-five years Fellenberg, assisted by his wife, continued his educational labours, and finally raised his institution to the highest point of prosperity and usefulness. He died on the 21st of November 1844. See Hamm, Fellenberg's Leben und Wirken (Bern, 1849); and Schoni, Der Stifter von Hofwyl, Leben und Wirken Fellenberg's.

FELLER, FRANÇOIS XAVIER DE (1735–1802), Belgian author, was born at Brussels on the 18th of August 1735. In 1752 he entered a school of the Jesuits at Reims, where he manifested a great aptitude for mathematics and natural science. He commenced his novitiate two years afterwards, and in testimony of his admiration for the apostle of India added Xavier to his surname. On the expiry of his novitiate he became professor at Luxembourg, and afterwards at Liège. In 1764 he was appointed to the professorship of theology at Tyrnau in Hungary, but in 1771 he returned to Belgium and continued to discharge his professorial duties at Liège till the suppression of the Jesuits in 1773. The remainder of his life he devoted to study, travel and literature. On the invasion of Belgium by the French in 1794 he went to Paderborn, and remained there two years, after which he took up his residence at Ratisbon, where he died on the 23rd of May 1802.

Feller's works exceed 120 volumes. In 1773 he published, under the assumed name Flexier de Reval (an anagram of Xavier de Feller), his Cachétisme philosophique; and his principal work, Dictionnaire historique et littéraire (published in 1781 at Liège in 8 volumes, and afterwards several times reprinted and continued
down to 1848), appeared under the same name. Among his other works the most important are Cours de morale chrétienne et de littérature religieuse et his Coup d'œil sur congrès d'Enns. The Journal historique et littéraire, published at Luxembourg and Liége from 1774 to 1794 in 70 volumes, was edited and in great part written by him.

**FELLING,** an urban district in the Jarrow parliamentary division of Durham, England, forming an eastern suburb of Gateshead. Pop. (1901) 22,457. Its large industrial population is employed in the neighbouring collieries and the various attendant manufactures.

**FELLOE,** the outer rim of a wheel, to which the spokes are attached. The word is sometimes spelled and usually pronounced "felly." It is a Teutonic word, in O. Eng. felg, cognate with Dutch telge, Ger. Felge; the original Teutonic root from which the word has been derived is *m-* felle, meaning "to fit together.

**FELLOW,** properly and originally a partner or associate, hence a companion, comrade or mate, as in "fellow-man," "fellow-countryman," etc. The word from the 15th century has also been applied, generally and colloquially, to any male person, often in a contemptuous or pitying sense. The Old English *fælge* meant a partner in a business, i.e. one who pays (fae) money or property (fæh, fee) together for a common purpose. The word was, therefore, the natural equivalent for *socius,* a member of the foundation of an incorporated college, as Eton, or a college at a university. In the earlier history of universities both the senior and junior members of a college were known as "scholars," but later, as now, "scholar" was restricted to those members of the foundation still in *status pupillari,* and "fellow" to those senior graduate members who have been elected to the foundation by the corporate body, sharing in the government and receiving a fixed emolument out of the revenues of the college. It is in this sense that "fellow" is used at the universities of Oxford and Cambridge and Trinity, Dublin. At these universities the college teaching is performed by those fellows who are also "tutors." At other universities the term is applied to the members of the governing body or to the holders of certain sums of money for a fixed number of years. The modern "fellowship" is thus a translation of "socius." The word is also used of the members of various learned societies and institutions.

**FELLOWS, SIR CHARLES** (1799–1860), British archaeologist, was born in August 1799 at Nottingham, where his family had an estate. When fourteen he drew sketches to illustrate a trip to the ruins of Newstead Abbey, which afterwards appeared on the title-page of Moore's *Life of Lord Byron.* In 1820 he settled in London, where he became an active member of the British Association. In 1825 he discovered the modern ascent of Mont Blanc. After the death of his mother in 1832 he purchased the greater portion of the property in Italy, Greece and the Levant. The numerous sketches he executed were largely used in illustrating *Childe Harold.* In 1838 he went to Asia Minor, making Smyrna his headquarters. His explorations in the south led him to districts practically unknown to Europeans, and he thus discovered ruins of a number of ancient cities. He entered Lycia and explored the Xanthus from the mouth at Patara upwards. Nine miles from Patara he discovered the ruins of Xanthus, the ancient capital of Lycia, finely situated on hills, and abounding in magnificent remains. About 15 m. farther up he came upon the ruins of Tlos. The district was visited by the sketches of the most interesting objects and copying a number of inscriptions, he returned to Smyrna through Caria and Lydia. The publication of *A Journal written during an Excursion in Asia Minor* (London, 1839) roused such interest that Lord Palmerston, at the request of the British Museum authorities, asked the British consul at Constantinople to get leave from the sultan to ship a number of the Lycian works of art. Late in 1839 Fellows, under the auspices of the British Museum, again set out for Lycia, accompanied by George Scharf, who assisted him in sketching. This second visit resulted in the discovery of thirteen ancient cities, and in 1841 appeared *An Account of Discoveries in Lycia,* being a *Journal kept during a Second Excursion in Asia Minor.* A third visit was made late in 1841, after Fellows had obtained a *farrman* by personal application at Constantinople. He shipped

a number of works of art for England, and in the fourth and most famous expedition (1844) twenty-seven cases of marbles were despatched to the British Museum. His chief discoveries were at Xanthus, Pinara, Patara, Tlos, Myra and Olympia. In 1844 he presented to the British Museum his portfolios, accounts of the expeditions, and specimens of natural history illustrative of Lycia. In 1845 he was appointed by the British Government in the removal of the Xanthian antiquities to this country." He paid his own expenses in all his journeys and received no public reward. Fellows was twice married. He died in London on the 8th of November 1860.

In addition to the works above mentioned, Fellows published the following: The Xanthian Marbles; their Acquisition and Transmission to England (1845), a refutation of false statements that had been published; An Account of the Ionic Trophy Monument excavated at Xanthus (1848); a cheap edition of his two Journals, entitled Travels and Researches in Asia Minor, particularly in the Province of Lycia (1852); and Coins of Ancient Lycia before the Reign of Alexander; with an Essay on the Relative Dates of the Lycian Monuments in the British Museum (1853). See C. Brown's *Lives of Notting-hamshire Worthies* (1852), pp. 532-535, and *Journ. of Roy. Geog. Soc.,* 1861.

**FELO DE SE** (M.L. a felon, i.e. murderer, of himself), one who commits murder upon himself. The technical conditions of murder apply to this crime; e.g., "if one commits any unlawful malicious act, the consequence of which is his own death, as if attempting to kill another he runs upon his antagonist's sword, or shoots or stabs at another but the gun bursts and he is killed," he is a *felo de se.* The horror of the crime is expressed by the term, but the punishment of an "ignominous burial on the highway, with a stake driven through the body." This was abolished by an act of 1823, which ordered the burial of the body of a person found to be *felo de se* within 24 hours after the coroner's inquest, between the hours of 9 and 12 at night, and without Christian rites of sepulture. This act was again superseded in 1882 by the Interments (*Felo de se*) Act, which permits the interment of any *felo de se* in the churchyard or other burial ground of the parish or place in which by the law of custom England he might have been buried but for the verdict. The law has carried out in accordance with the Burial Laws Amendment Act 1860 (see BURIAL AND BURIAL Acts). The act does not authorize the performance of any of the rites of Christian burial, but a special form of service may be used. Formerly the goods and chattels, but not the land, of a *felo de se* were forfeited to the crown, but such forfeitures were abolished by the Forfeiture Act 1870. (See also SUICIDE.)

**FELONY** (O. Fr. felonie, from felon, a word meaning "wicked," common to Romano languages, cf. Italian fello, felonè, the Latin *felle,* the Teutonic *felle,* etc., in a sense obscure, but is possibly connected either with Lat. fel, gall, or fellone, the "thief," or with the "felled"—"fell" cruel or fierce, is also connected; and the Greek φηλός, an impostor, has also been suggested). Legal writers have sought to throw light on the nature of felony by examining the supposed etymology of the word. Coke says it is *crimen animo fello perpetram* [a crime committed with malicious or evil intent (see John)] Spelman connects it with the word *fæo,* signifying fæ or fed; and felony in this way would be equivalent to *pretium feandi,* an act for which a man lost or gave up his fee (see Stephen's *Commentaries*, vol. iv. p. 7). And acts involving forfeiture were termed felony at the very lowest. But they had carried out a criminal character about them. A breach of duty on the part of the vassal, neglect of service, delay in seeking investiture, and the like were felonies: so were injuries by the lord against the vassal. Modern writers are now disposed to accept Coke's definition. In English law, crimes are usually classified as treason, felony, misdemeanor and summary offence. Some writers—and with some justice—treat treason merely as a grave form of felony and it is so dealt with in the Juries Detention Act 1897. But owing to legislation in and since the time of William and Mary, the procedure for the trial of most forms of treason differs from that of felony. The expression summary offence is ambiguous. Many offences which are at common law or by statute felonies, or misdemeanours indictable at common law or by statute, may under certain conditions be tried by a court
FELSITE

of summary jurisdiction (q.e.), and many merely statutory offences which would ordinarily be punishable summarily may at the election of the accused be tried by a jury on indictment (Summary Jurisdiction Act 1879, s. 17).

The question whether a particular offence is felony or misdemeanour can be answered only by reference to the history of the offence and not by any logical test. For instance, killing a horse in an unlicensed place is still felony under a statute of 1786. But most crimes described as felonies are or have been capital offences at common law or by statute, and have also entailed on the offender attaint and forfeiture of goods. A few felonies were not punishable by death, e.g. petty larceny and maiming. Where an offence is declared a felony by statute, the common law punishments and incidents of trial attach, unless other statutory provision is made (Blackstone, Commentaries, iv. 94).

The chief common law felonies are: homicide, rape, larceny (i.e. in ordinary language, theft), robbery (i.e. theft with violence), burglary and kindred offences. Counterfeiting the coin has been made a felony instead of being treason; and forgery of most documents has been made a felony instead of being, as it was at common law, a misdemeanour. At the beginning of the 19th century felony was almost equivalent to capital crime; but during that century capital punishment was abolished as to all felonies, except willful murder, piracy with violence (7 W. IV & 1 Vict. c. 88, s. 2) and offences against the Dockyards, &c., Protection Act 1772; and by the Forfeiture Act 1870, a felon no longer forfeits land or goods on conviction, though forfeiture on outlawry is not abolished. The usual punishment for felony under the present law is penal servitude or imprisonment with or without hard labour. Every person convicted of any felony for which no punishment is specially provided by the law in force for the time being is liable upon conviction thereof to be sentenced to penal servitude for any period not exceeding seven years, or to be imprisoned with or without hard labour for any term not exceeding two years (Stephen, Dig. Cr. Law (6th ed.), art 18, Penal Servitude Act 1891). A felon may not be fined or whipped on conviction nor put under recognizance to keep the peace or be of good behaviour except under statutory provision. (See Offences against the Person Act 1861, ss. 5. 71.)

The result of legislative changes is that at the present time the only practical distinctions between felony and misdemeanour are—.

1. That a private person may arrest a felon without judicial authority and that bail on arrest is granted as a matter of discretion and not as of right. Any one who has obtained a drove of oxen or a flock of sheep by false pretences may go quietly on his way and no one, not even a peace officer, can apprehend him without a warrant, but if a man offers to sell another a bit of dead fence supposed to have been stolen, he not only may but is required to be apprehended by that person (Greaves, Criminal Law Consolidation Acts). (See Arrest, Bail.)

2. That on an indictment for felony counts may not be joined for different felonies unless they form part of the same transaction.

3. That on a trial for felony the accused has a right peremptorily to challenge, or object to, the jurors called to try him, up to the number of twenty. (See Jury.)

4. That a felon cannot be tried in absentia, and that the jury who try him may not separate during the trial without leave of the court, which may not be given in cases of murder.

5. That a special jury cannot be empannelled to try a felony.

6. That peers charged with felony are tried in a special manner. (See Peerage.)

7. That the costs of prosecuting all felonies (except treason felony) are paid out of public funds: and that a felon may be condemned to pay the costs of his prosecution and to compensate up to £100 for any loss of property suffered by any person through or by means of the felony. In the Criminal Code Bills of 1878–1880 it was proposed to abolish the term felony altogether: and in the Queensland Criminal Code 1890 the term “crime” is substituted, and within its connotation are included not only treason and piracy but also perjury.

8. That a sentence of a felon to death, or to penal servitude or imprisonment with hard labour or for over twelve months, involves loss of and disqualification for certain offices until the sentence has been served or a free pardon obtained. (Forfeiture Act 1870.)

It is a misdemeanour (i.) to compound a felony or to agree for valuable consideration not to prosecute or to show favour in such prosecution; (ii.) to omit to inform the authorities of a felony known to have been committed (see MISPRISION), and, (iii.) not to assist in the arrest of a felon at the call of an officer of the law. (See CRIMINAL LAW; MISDemeanour; MISPRISION.)

FELSITE, in petrology, a term which has long been generally used by geologists, especially in England, to designate fine-grained igneous rocks of acid (or subacid) composition. As a rule their ingredients are not determinable by the unaided eye, but they are principally felspar and quartz as very minute particles. The rocks are pale-coloured (yellowish or reddish as a rule), hard, splintery, much jointed and occasionally nodular. Many felsites contain porphyritic crystals of clear quartz in rounded blebs, more or less idiomorphic felspar, and occasionally biotite. Others are entirely fine-grained and micro-crystalline. Occasionally they show a fluidal banding; they may also be spherulitic or vesicular. Those which carry porphyritic quartz are known as quartz-felsites; the term soda-felsite has been applied to similar fine-grained rocks rich in soda-felspar.

Although there are few objections to the employment of felsite as a field designation for rocks having the above characters, it lacks definiteness, and has been discarded by many petrologists as unsuited for the exact description of rocks, especially when their microscopic characters are taken into consideration. The felsites accordingly are broken up into "granite-porphyrites," "orthophyres," "soda-porphyrites," "keratophyres," "microfelsites," &c. But felsite or microfelsite is still the generally accepted designation for that very fine-grained, almost cryptocrystalline substance which forms the ground-mass of so many rhyolites, dacites and porphyrites.

In the hand specimen it is a dull, lustreless, stony-looking aggregate. Under the microscope even with high powers and the very thinnest modern sections, it often cannot be resolved into its components. In places it may contain determinable minute crystals of quartz; less commonly it may show grains which can be proved to be felspar, but usually it consists of an ultra-microscopic aggregate of fibres, needles and grains, which react to polarized light in a feeble and indefinite manner. Spherulitic, spotted, streaky and fluidal structures may appear in it, and many different varieties have been established on such characters as these but without much validity.

Its association with the acid rocks, its hardness, method of weathering and chemical composition, indicate that it is an intermixture of quartz and felspar, and the occasional presence of these two minerals in well-defined grains confirms this. Moreover, in many dikes, while the ground-mass is microfelsitic (or even crystalline and felsitose) there is a felspar near the centre of the mass, towards the margins, where it has been rapidly chilled by contact with the cold surrounding rocks, it is felsitic. The very great viscosity of acid magmas prevents their molecules, especially when cooling takes place suddenly, from arranging themselves to form discrete crystals, and is the principal cause of the production of felsitic ground-masses. In extreme cases these conditions hinder crystallization altogether, and glassy rocks result. Some rocks are felsitic in parts but elsewhere glassy; and it is not always clear whether the felsite is an original substance or has arisen by the devitrification of primary glass.

The presence of perlitic structure in some of these felsites points to the latter conclusion, and the results of an examination of ancient glasses and of artificial glass which has been slowly cooled are in accordance with this view. It has been argued that felsite is a eutectic mixture of quartz and felspar, such that when solidification takes place and the excess of felspar (or quartz) has
crystallized out it remains liquid till the temperature has fallen to its freezing point, and then consolidates simultaneously. This may be so, but analyses show that it has not always the same composition and consequently that the conditions which determine its formation are not quite simple. Felsitic rocks are sometimes silicified and have their matrix replaced by granular aggregates of quartz, felspar, or hornfels. (J. S. F.)

**FELSPAR, or Felspar**, a name applied to a group of mineral silicates of much importance as rock-constituents. The name, taken from the Ger. Feldspath, was originally written with a “f” but in 1794 it was written “felspar” by R. Kirwan, on the assumption that it denoted a mineral of the “field” rather than of the “field,” and this corrupted form is now in common use in England. By some of the earlier mineralogists it was written “felspar,” from the Swedish form *felspat*.

The felspar-group is divided into two subgroups according to the symmetry of the crystals. Although the crystals of all felspars present a general resemblance in habit, they are usually regarded as belonging to two systems, some felspars being monoclinic and others orthoclinal. Figures of the crystals are given in the articles on the different species. Two cleavages are generally well marked. In the monoclinic or monosymmetric felspars these, being parallel to the basal pinacoid and clino-pinacoid, necessarily make an angle of 90°, whence the name orthoclase applied to these minerals; whilst in the anorthic or symmetrical felspars the corresponding angle is never exactly 90°, and from this obliquity of the principal cleavages they are termed plagioclase (see ORTHOCLINIC and PLAGIOCLASE). There are consequently two series of felspars, one termed orthoclase or orthoclinous, and the other plagioclase or clinoclinous. F. E. Mallard suggested that all felspars are really asymmetrical, and that orthoclase presents only a pseudo-monosymmetric habit, due to twinning. Twin-crystals are very common in all the felspars, as explained under their respective headings.

The two divisions of the felspar-group founded on differences of crystalline symmetry are subdivided according to chemical composition. All the felspars are silicates containing aluminium with some other metallic base or bases, generally potassium, sodium or calcium, rarely barium, but never magnesium or iron. The monoclinic series includes common potash-felspar or orthoclase (KAlSiO₃) and hyalophane, a rare felspar containing barium (K₂Ba₂Al₂Si₆O₁₈). The anorthic series includes at one end the soda-felspar albite (NaAlSiO₃) and at the other end the lime-felspar anorthite (CaAl₂Si₆O₁₈). It was suggested by G. Tschermak in 1864 that the other plagioclasic felspars are isomorphous mixtures in various proportion of albite (Ab) and anorthite (An). These intermediate members are the lime-soda felspars known as oligoclase, andesine, labradorite and bytownite. There are also placed in the anorthic class a potash-felspar called microcline, and a rare soda-potash-felspar known as anorthoclase.

The specific gravity of the felspars has been shown by G. Tschermak and V. Geldschmiedt to vary according to: their chemical composition, rising steadily from 2.57 in orthoclase to 2.75 in anorthite. All the felspars have a hardness of 6 to 6.5, being therefore rather less hard than quartz. Pure felspar is colourless, but the mineral is usually white, yellow, red or green. Certain felspars are used as ornamental stones on account of their colour (see Amazon Stone). Other felspars are prized for their pearly opalescence (see Moonstone), or for their play of iridescent colours (see Labradorite), or for their spangled appearance, like aventurine (see Aventurine), which is important in the manufacture of porcelain by reason of its fusibility. In England the material employed is mostly orthoclase from Scandinavia, often known as “Swedish spar.”

The high transluency of “ivory porcelain” depends on the large proportion of felspar in the body. The mineral is also an important constituent of most ceramic glazes. The melting points of felspars have been investigated by Prof. J. Joly, Prof. C. A. Doelter y Cistericher and especially by A. L. Day and E. T. Allen in the Geophysical Laboratory of the Carnegie Institution at Washington.

Among the applications of felspar is that of pure orthoclase in the manufacture of artificial teeth.

Felspar readily suffers chemical alteration, yielding kaolin (q.v.). The turbidity of orthoclase is usually due to partial kaolization. Secondary mica is also a common result of alteration, and among other products are piritne, epidote, saussurite, chlorite, wollastonite, and various zeolites. (J. S. F.)

**FELT** (cognate with Ger. *Fütz*, Du. *vilt*, Swed. and Dan. *fåt*; the root is unknown; the word has given Med. Lat. *filrum*, “filter”), a fabric produced by the “matting” or “felting” together of fibrous materials such as wool, hairs, furs, &c. Most textile fibres (see Fibres) possess the quality of matting to some extent, but wools, furs and some few hairs are the only fibres which can be felted satisfactorily. It is probable that the quality of felting must be attributed to the scale structure and waviness of the wools, furs and hairs referred to. When it is desired to incorporate non-feltling fibres in felt cloths, wool must be employed to “carry” them.

There are two distinct classes of felts, viz. woven or “thread-structure” felts, and “fibre” or true felts. In the manufacture of thread-structure felts, wools possessing the quality of felting in a high degree are naturally selected, carefully scoured so that the felting quality is not seriously damaged, spun into woolen yarn possessing the necessary fibre arrangement and twist, woven into cloth of such a character that subsequently satisfactory shrinking or felting may be effected, and finally scoured, milled in the stocks of machine of both, dyed and finished on the lines of an ordinary woven fabric. The lighter styles of woven felts may be composed of a single cloth only, but for the heavier styles two or more cloths are woven, one on top of the other, at one and the same time, arrangements being made to stitch the cloths together during the weaving operation.

Fibre felts are exceedingly interesting from the historical point of view. It is now generally admitted that the art of
weaving preceded that of spinning, and it must further be conceded that the art of felting preceded that of weaving, so that the felt fabric is probably one of the oldest of the various styles of recognized fabrics. The inhabitants of the middle and northern regions of Asia seem to have employed felt from time immemorial, as clothing and also as a covering for their habitations. Most of the classical writers refer to it and some of them actually describe its manufacture. Felt was also largely employed by the ancients for their hats, outer garments, and sometimes as a species of armour.

Fibre felts may be divided into three classes, viz. ordinary felts; hat felts; and impregnated felts. As all felts are based upon the ordinary felt, the process of manufacture of this will first be described. Of the wools employed the principal are:—East Indian, German or mid-European, New Zealand cross-breds, and Australian. Carded and blended are the following merinos. Vegetable fibres and silk are also employed, but wool must be used to "carry" them; thus a good felting wool may be made to carry its own weight of cotton, hemp, &c. Hairs and furs are principally used in the hat felts. The average loss upon the wool from the raw state to the finished felt is 40 to 50%. The order of the manufacturing processes is as follows:—mixing, willowing, teasing, scribbling and carding. It is interesting to note that it is not usual to scour felting wools. This is not because they are really clean—some are dirty—but because the felting property is liable to be interfered with in the scouring operation. Some wools, however, must be scoured to ensure satisfactory working in the machines. From the card the wool is delivered as a gossamer-like film from 50 to 60 in. wide on to an endless sheet from 30 to 50 yds. long, upon which the felt is built up and compressed until the required thickness—perhaps 4 in.—is obtained. To harden this somewhat tender sheet of felt it is now passed through an ironing process, effected by either steam-heated rollers—to which a rotatory and vibratory motion is given—by which the毡 is drawn down through the iron. Soaping, fulling or " felting " and the ordinary finishing operations—including dyeing and printing if desirable—now follow, so that ultimately a strong firm fabric is turned out. It must be admitted, however, that the strength is much greater lengthwise than cross-wise, owing to the parallelization of the fibres induced in the scribbling and carding operations. Of course, the true felting or contraction occurs in the fulling or felting stock, the fabric being perpetually "hammered" in the presence of fulling agents such as soap, fuller's earth, &c., for a considerable time. The reduction in width, length, and thickness is remarkably great. This may be controlled within certain limits. The principal styles of ordinary fibre-felts are—linings for coats, furniture and rubber shoes; saddlery; seatings for carriages and gowns; carpets, and under-felts for carpets; mantles, dresses and table-cloths; felt-slippers; mattress felts; chest-preservers, and shoulder-pads; steam-engine packing, motor-car and anti-vibration felts, shipbuilding felts; drawing-roller felts and gun-wad felts.

Hat felts may be divided into two classes, viz. those made from wool and fur respectively. Wool "bodies" used for the lower quality hats are manufactured in the same way as ordinary felts, but the "shape" upon which the felt issuing from the carder is built up takes the form of a double cone and thus approximates to the shape of the two hats ultimately formed. The shape is further controlled and developed in the fulling or felting operation. In the fur hat felts an air-blast is employed to carry the finely separated fibres on to the shape required, upon which shape the fibres are held in position by suction until the required thickness is obtained. The structure is then further developed and "stiffened," i.e. impregnated with certain stiffening agents according to requirements. If desirable the exterior fibres blown on to any shape may be of a different material from the body fabric.

Impregnated felts are simply felts made in the ordinary way but subsequently impregnated with certain agents which give a special quality to the fabric. Messrs McNeill & Co., of London, were the originators of "asphalted-felt" for roofing and, among other styles, place on the market sheathing felt, inodorous felt, dry hair felt, foundation felt, &c., &c. A later development, however, is the impregnated iron-felt manufactured by Messrs Mitchells, Ashworth, Stansfield & Co., of Waterfoot, near Manchester, who not only produce from 70 to 50% of the ordinary felts manufactured in Great Britain, but also place on the market several specialities of which this "iron-felt" is largely used in the construction of bridges, &c., and as a substitute for rubber, it being apparently more durable. (A. F. B.)

FELTHAM, or FELTHAM, OWEN (d. 1668), English moralist, was the son of Thomas Feltham or Feltham of Mutford in Suffolk. The date of his birth is variously as 1602 and 1609. He is famous chiefly as the author of a volume entitled Resolves, Divine, Moral and Political, containing one hundred short and pithy essays. To later issues of the Resolves Feltham appended Lusoria, a collection of forty poems. Hardyly anything is known of his life except that T. Randolph, the adopted "son" of Ben Jonson, addressed a poem of compliment to him, and became his friend, and that Feltham attacked Ben Jonson in an ode shortly before the aged poet's death, but contributed a flattering eulogy to the Jonsonus Virtus in 1638. Early in life Feltham visited Flanders, and published observations in 1652 under the title of A Brief Character of the Low Countries. He was a strict high-churchman, and a republican; he even described Charles I. as "Christ the Second." Hallam stigmatized Feltham as one of our worst writers. He has not, indeed, the elegance of Bacon, whom he emulated, and he is often obscure and affected; but his copious imagery and genuine penetration give his reflections a certain charm. To the middle classes of the 17th century he seemed a heaven-sent philosopher and guide, and was only less popular than Francis Quarles the poet.

Eleven editions of the Resolves appeared before 1700. Later editions by James Cumming (London, 1866; much garbled; has his personal application that he could not be without a captnancy Buckingham replied harshly "that he might hang." Whether he
took part in the expedition to Rêh in 1627 is uncertain, but there
is no doubt that he continued to be refused promotion, and that
even his scanty pay earned during the Cadiz adventure was not
received. Exasperated by his ill-treatment, his discontent
sharpened by poverty, and his hatred of Buckingham intensified
by a study of the Commons' Remonstrances of the previous
June, and by a work published by Eglisham, the physician of
James I., in which Buckingham was accused of poisoning the king,
Felton determined to effect his assassination. He bought a
tempenny knife on Tower Hill, and on his way through Fleet
Street he left his name in a church to be prayed for as "a man
much discontented in mind." He arrived at Portsmouth at
9 o'clock in the morning of the 23rd of August 1628, and immedi-
ately proceeded to No. 10 High Street, where Buckingham was
lodged. Here mingling with the crowd of applicants and un-
noticed he stabbed the duke, who immediately fell dead. Though
escape would have been easy he confessed the deed and was
seized and conveyed to the Tower, his journey thither, such was
the unpopularity of the duke, being accompanied by cries of
"God bless thee!" from the people. Charles and Laud desired he
should be racked, but the illegal torture was prevented by the
judges. He was tried before the king's bench on the 27th of
November, pleaded guilty, and was hanged the next day, his
body being exposed in chains subsequently at Portsmouth.

FELTRE, MORTO DA—FENCING

FELTRE, MORTO DA, Italian painter of the Venetian school,
who worked at the close of the 15th century and beginning of the
16th. His real name appears to have been Pietro Luzzo; he is also
known by the name of Vero Zardo, a name from the city of Verona
beneath his father, a surgeon, was in Zara during the
son's childhood: whether he was termed Morto (dead) from his
joyless temperament is a disputed point. He may probably
have studied painting first in Venice, but under what master is
uncertain. At an early age he went to Rome, and investigated
the ancient, especially the subterranean remains, and thence to
Pozzuoli, where he painted from the decorations of antique crypts
or "grotesks." The style of fanciful arabesque which he formed for
himself from these studies gained the name of "grottesche,"
whence comes the term "grotesque." Not, indeed, that Morto
was the first painter of "grotesques," in the Italian Renaissance, for
art of this kind had, apart from his influence, been fully developed,
both in painting and in sculpture, towards 1480, but he may have
powerfully aided its diffusion southwards. His works were
received with much favour in Rome. He afterwards went to
Florence, and painted some fine grotesques in the Palazzo
Pubblico. Retuming to Venice towards 1505, he assisted
Giorgione in painting the Fondaco del Tedeschi, and seems to
have remained with him till 1511. If we may trust Ridolfi,
Morto eloped with the mistress of Giorgione, whose grief at this
transaction brought him to the grave; the elopement, however,
is hardly reconcilable with other accounts. It may have been
in 1515 that Morto returned to his native Feltre, then in a very
ruinous condition from the ravages of war in 1509. There he
executed various works, including some frescoes, still partly
extant, and considered to be almost worthy of the hand of
Raphael, in the loggia beside San Stefano. Towards the age of
forty-five, Morto, unquiet and dissatisfied, abandoned painting
and took to soldiering in the service of the Venetian republic.
He was made captain of a troop of two hundred men; and fighting
valiantly, he is said to have died at Zara in Dalmatia, in 1519.
This story, and especially the date of it, are questionable; there is
some reason to think that Morto was painting as late as 1522.
One of his pictures is in the Berlin museum, an allegorical subject
of "Peace and War." Andrea Feltrini was his pupil and assistant
as a decorative painter.

FELTRE (anc. Feltria), a town and episcopal see of Venetia,
Italy, in the province of Belluno, 20 m. W.S.W. of it by rail,
situated on an isolated hill, 885 ft. above sea-level. Pop. (1901)
5468 (town), 15,243 (commune). The cathedral has a light
polygonal apse of the 16th century. The Palazzo del Consiglio,
also of the 16th century, is a beautiful building. To Palladio, the
chief square of the town, the Piazza Maggiore, is the city by which
the town is supplied with water, and a large fountain. There
are some remains of the medieval castle. The ancient Feltria,
which lay on the road (Via Claudia) from Opitergium to Triden-
tum, does not seem to have been a place of any importance under
the Romans. Vittorio della Barbolandi da Feltre (1378-1446)
was a famous educator and philosopher of his time.

FELUCCA (an Italian word; in forms like the Span. faluca,
Fr. folouque, it appears in other languages; it is probably of
Arabic origin, cf. fulk, a ship, and falaka, to round; the
modern Arabic form is falakah), a type of vessel used in the
Mediterranean for coasters or fishing-boats. It is a long, low
and narrow undecked vessel, built for speed, and propelled by
oars or sails. The sails are lateen-shaped and carried on one or
two masts placed far forward (see Box).

FEMALE, the correlative of "male," the sex which performs
the function of conceiving and bearing as opposed to the begot-
ting of young. The word in Middle English is *female*, adopted
from the French from the Lat. *femina*, which is a diminutive,
and an artificial Latin used strictly as such, of *femino*, a woman.
The present termination in English is due to a connexion in
ideas with "male." In various mechanical devices, where two
corresponding parts work within the other, the receiving part is
often known as the "female," as for example in the "male" and
"female" screw. The O. Fr. *feme*, modern *femme*, occurs in
legal phraseology in *feme covert*, a married woman, i.e. one
protected or covered by a husband, and in *feme sole*, one not so
protected, a widow or spinster (see Women and Husband and Wife).

FEMRELL, properly Fumerell (from O. Fr. *fumerelle*, Lat.
*fumus*, smoke), the old English term given to the lantern
in the ridge of a hall roof for the purpose of letting out the smoke
of the fire kindled on a central hearth.

FENCING. If by "fencing"—the art of fence, *i.e.* of defence
or offence—were meant generally the dexterous use of the sword,
the subject would be wide indeed; as wide, in fact, as the history
of the sword (q.e.) itself. But, in its modern acceptance, the
meaning of the word has become considerably restricted. The
scope of investigation must therefore be confined to one kind
of swordsmanship only: to that which depends on the regulated,
artificial conditions of "single combat." It is indeed this play,
hemmed in by many restrictions, which we have come to mean
more specially by "fencing." It differs, of course, in many
respects, from what may be called the art of fighting in the light
of nature. But as its restrictions are among the very elements
which work to the perfection of the play, it is undoubtedly
in the history of swordsmanship as applied to duelling (see
Duel) that we shall trace the higher development of the art.

It may be said that the history of fencing, therefore, would be
tantamount to the history of private duelling. Now, this is an
ethical subject; one, again, which would carry the investigation
too far; and it need not be taken up farther back than the middle
of the 16th century, when, on the disuse of the medieval
wager of battle, the practice of private duelling began to take
an assured footing in a warlike society. It is curious to mark
that the first cultivation of refined cunning in fence dates from
that period, which corresponds chronologically with the general
disuse of armour, both in battle and in more private encounters.
It is still more curious to note that, in order to fit himself to
meet what was an illegal but aristocratic obligation, the gallant
of those days had to appeal to a class of men hitherto little
considered: to those plebeian adepts, in fact, who for generations
had cultivated skill in the use of hand weapons, on foot and
without armour. Thus it came to pass that the earliest masters
of fence in all countries, namely, the masters of the art of
conducting skilfully what was essentially considered as an honourable
encounter, were almost invariably to be found among a somewhat
dishonoured gentry—gladiators, free companions, professional
champions, more or less openly recognized, or bravoes of the
most uncompromising character.

At Germany, which is considered in other lands to be the cradle of systematic swordsmanship, these teachers of the sword had, as early as the 15th century, formed themselves into gilds; among which the best known were the Marsbräder, or the Associates of St. Marcus.
of Löwenberg, who had their headquarters at Frankfort, and branches in all the more important towns. Similarly, in Spain and in northern Italy, professional swordsmen were at various times allowed to form themselves into recognized or at least tolerated associations.

In England "swordmen" had been looked upon with especial disfavour by the powers that were, until Henry VIII., who was a great lover of all manly exercises, found it likewise advisable to turn their obnoxious existence to a disciplined and profitable channel by regularizing their position. The most retractable masters were allowed to form themselves into a company, with powers to increase their numbers with suitable and duly tried men, in imitation of the world-famed German Maestri, or Marcusbrüder. Under these conditions they were granted the status and privilege of teaching the art of fencing in England. The enormous privileges that the king, in course of time, conferred on his Corporation of Masters of Defence very soon enabled it to put down or absorb all the more ferocious of independent swashbucklers, and thereby to impart to the profession a moderate degree of respectability under the coat of arms granted by the royal heralds: gules a sword pendant argent.

It was in the midst of such corporations and in the fighting dens of independent swordsmen, therefore, that sprouted the first buds of systematic swordsmanship. Among the professional fencers, curiously and happily for the historian, there seem to have been a few with a literary turn of mind. The oldest manuscripts of fence belong to Italy and Germany. They deal with the methods of carrying out single combats on foot, with any of the most generally accepted weapons—long sword and short sword, dagger and every kind of knives, mace, long and short staff, axes, &c., and with the tricks of wrestling recommendable therefor. Among the most comprehensive in their scope may be mentioned Il Fior di Battaglia di Maestro Fiore dei Liberi da Premariaio; a work which, although illustrated with truly Italianate, Lo Trattato d’Eplee (1566). This work, which is exceedingly rare, is a very complete exposition of the ways of wielding long and short blades to the utmost of their lethal capacity. It was reproduced (under various titles, very confusing to the bibliographer) in Frankfort, Augsburg, Strassburg, and finally done into French under the name of La Noble science des joueurs d’épée, published in Paris and Antwerp, 1535.

Following the Germans, the oldest printed books of fence are Italian. The first French book on the sword is known to be a translation from the German. Curiously enough, the second, and the first book to appear in French, Le Traité de l’épee seule, mère de toutes armes, of the Sieur de St. Didier, published in Paris in 1568, can be shown to be a transparent adaptation of two Italian treatises, the Trattato di scienza d’arme of Camillo Agrippa, and Grassi’s Raggio di adoperar sicuramente l’arme, &c.

It is about this time, namely, the latter half of the 16th century, that swordsmanship pure and simple may be said to find its origin; for then a great change is perceptible in the nature and tendency of fence books: they dissociate themselves from indecorous wrestling tricks, and approximate more and more to the consideration of what we understand by swordsmanship. The older works expounded the art of fighting generally; taught the reader a number of valuable, if not "gentlemanlike," dodges for overcoming an adversary at all manner of weapons: now the lucubrations of fence-masters deal almost exclusively with the walking sword, that is, the duelling weapon—with the rapier in fact, both with and without its lieutenant, the dagger.

It must be remembered that at this period private duelling and other quarrelsomeness amounted to a perfect mania. The fencing master was no longer merely a teacher of efficacity, if rascally, tricks; he was becoming a model of gallant deportment; in many cases he was even a recognized arbiter on matters of honour. He was often a gentleman himself: at all events he posed as such.

Although the Germans were always redoubtably adepts at the rougher games of swordsmanship, it is in Italy that is to be found development of that nimble, more regulated, more cunning, better controlled, kind of play which we have learned to associate with the term "fencing." It was from Italy that the art of fencing spread over Europe: not from Spain, as it has been asserted by many writers. The temporary if we take their early books as evidence, and the fact that their phraseology was adopted by all Europe—were the first to perceive (as soon as the point as armour-breaking ceased to be the most important in the point) the superior efficiency of the point. They accordingly reduced the breadth of their sword, modified the hilt portion thereof to admit of ready thrust action, and relegated the cut to quite a secondary position in their system. With this lighter weapon they devised in course of time that brilliant cunning play known as rapier fence.

The rapier was ultimately adopted everywhere by men of courtly habit; but, in England at least, it was not accepted without murmur and vituperation from the older fighting class of swordsmen, especially from the members and admirers of the English Corporation of Defence Masters. As a body Englishmen were as conservative then as they are now. They knew the value of what they had as their own, and distrusted innovations, especially from foreign quarters. The old sword and the buckler were reckoned as your true English weapons: they always went together—in fact sword and buckler play in the 16th century was the fully held to be as national a game as boxing came to be in a later age. Many are the allusions in contemporary dramatic literature to this characteristic national distrust of continental innovations. There is the well-known passage in Porter’s play, The Two Angry Women of Abingdon, for instance: “Sword and buckler fight,” says a sturdy Briton (in much the same tone of disgust as a British lover of fists might now assume when talking of a French “Mouneer’s” foil play), “begins to grow out of use. I am sorry for it. I shall never see good manhood again. If it be once gone, this poking fight with rapier and dagger will come up. Then the tall man (that is, a courageous man and a good rapid-and-buckler man) will be as much of a man as his rabbit.” The long sword, that is, the two-hander, was also an essentially national weapon. It was a right-down pleasing and sturdy implement, recalling in good steel the vernacular quarterstaff of old. It required thaws and sinews, and, incidentally, much beef and ale. The long-sword man looked perhaps with even greater disfavour than the smaller swashbuckler upon the new-fangled “bird-splitt.” “Tut, man,” says Justice Shallow, typical laudator of the good bygone days, on hearing of the ridiculous Frenchman’s skill with his rapier, “I could have told you more. I could have told you more. In these times you stand on distance, your passes, stockade, and I know not what; ‘tis the heart, Master Page; ‘tis here, ‘tis here. I have seen the time, with my long-sword, I would have made you four tall fellows skip like rats.”

Now, sword-and-buckler and long-sword play was no doubt a manly pursuit and a useful. But, as an every-day companion, the long-sword was incongruous to a fastidious cavalier; and, again, the buckler, indispensable adjunct to the broad swashing blade of home production, was hardly more suitable. In Elizabethan days it soon became obvious that the buckler was inadmissible as an item of gentlemanly attire. It was accordingly left to the body attendant; and the gallant took kindly to the fine rapier of Milanese or Toledo make. On the other hand, it is not difficult to understand the rapid popularity gained among the gentry by this nimble rapier, so much reviled by the older fighting men. The rapier, in fact, came in with the taste for “cavaliero”
style, and may be looked upon as its fit outward symbol already in the days of Queen Mary. In Elizabeth's reign it was firmly established as your only gentlemanlike weapon.

The rapier was decidedly a foreigner; yet it suited the Elizabethan age, for it was decorative as well as practical. Its play was picturesque, fantastic—almost euphonic, one might say—in comparison with the matter-of-fact hanger of older days. Its phraseology had a quaint, rich, southern smack, which connoted outlandish experience and gave those conversant with its intricate distinctions that marvellous character, at once precious and ruffling, which was so highly appreciated by the cavalier youth of the time. The rapier in its heyday was an admirable weapon to look at, a delicious one to wield. And, besides, in proper hands, it was undoubtedly one that was most conclusive. It was, in short, as elegant and deadly as its predecessors were sturdy and brutal.

By the time that the most perfect, namely, the Italian, rapier fence came to be generally taught in England—that is, during the last third of Elizabeth's reign—the theory of swordmanship, as applied to a single combat, after having passed through many phases of imperfection, was already tolerably simple and practical. (The exact story of its evolution may be found in a work now included in Bohn's Libraries, Schools and Masters of Fencing.) What may be considered as one of the cardinal actions of regulated sword-play on foot, namely, the lunge, had already been discovered. Although a great many movements which, according to modern notions, would be considered not only unnecessary but actually pernicious, still formed part of the system, it may be doubted whether, in considering the character of the weapon, anything very much better could be devised, even in our present state of knowledge.

For it must be remembered that the evolution of the forms of the sword and of the theories concerning its most efficient use are closely connected. It is, in fact, sometimes difficult to decide whether the change in the shape of the weapon was the result of a development of a theory; or whether new theories were elaborated to fit alterations in these shapes due to fashion or any other reason.

The systematic fence came over to England it was already much simplified (it should be noted that improvement in the art, from its earliest days down to the present time, seems always to have been in the direction of simplification); yet, for more than a century from the appearance of the first real treatise, simplification never reached that point which would render impossible a belief in the undoubtedly efficacious of those "secret thrusts," of that "universal parry," of those ineluctable passes, which every master professed to teach. These precious secrets remain long, among a certain shabby class of swordsmen, an object of untried study, carried on with much the same faith and zest as the quest of the alchemist for his powder of projection, or of the Merchant Adventurer for El Dorado. There can, of course, be no such thing as an insuperable pass, a secret thrust or parry; every attack can be parried, every parry can be deceived by suitable movements. Yet there was some justification for the belief in the existence of secrets of swordsmanship in days when, as a rule, lessons of fence were given in jealous privacy; constant practice at one particular pass, especially with the long rapier, which required a great deal of muscular strength, might render any peculiarly fierce, sudden and audacious stroke excessively dangerous to one who did not happen to have opposed that stroke before. Undoubtedly there was little in Elizabethan fencing-schools of what we understand in modern days by loose-play between the pupils; practice was almost invariably conducted between scholar and teacher in private; and thus the opportunities for watching or testing any particular fencer's play were few. Such an opportunity would, as a rule, only occur on occasions of an earnest fight; and the possessor of a specially handy thrust (if it came off at all) would of course take good care that his opponent should not live to ponder over the secret. The moral was, remember, that an almost superstitious belief in "secret foyennes," in the botte secrete of certain practised duelists, should arise.

Be that as it may, there is no doubt that towards the end of the 16th century there were many free-lances in the field of arms who professed to teach, in exchange for much gold, strokes that were not to be parried. From one traitorous personage, whom Brantôme mentions, Tappa the Milanese, you could learn how to cut (if it so took your fancy) both eyes out of your adversary's face with a rincoso londo, or circular "reverse of the point." From Caizo, another Italian teacher, at one time much favoured by the French court, lessons were to be had in the special art of ham-stringing. Caizo's botte secrete seems to have been nothing more nor less than a falso manco, that is, a left-handed drawing cut, at the inside of the knee. But, as practised and taught by him, it was infallible. This stroke has come down to us as le coup de Jarneac—a stroke, be it said, which, notwithstanding its bad name, was quite as fair as any in rapier fence. One Le Flamand, a French master in Paris, was reputed the inventor of a jerky time-thrust at the adversary's brows, which was a certainty. This special foyenne, which was merely an imbrocata at the head, has become legendary in the fencing world as la botte de Nevers. English fencers have their own legends about "the very butcher of a silk button," and this brings us to the first writer on the rapier in England, Vincenzo Saviolo, the great exponent of that Italianated fence which was so obnoxious to the old masters, withal so much admired of Elizabethan courtiers; the man, in short, who—there seems to be much internal evidence to show it—was Shakespeare's fencing master.

Vincenzo was not the only foreign master of note established in London during the latter part of Elizabeth's reign. One, Signor Rocco, had, we hear, been head of a academy in Warwick Lane, near St Paul's, where he coined money rapidly at the expense of gulls and gallants alike. But this man came to grief ultimately in an encounter with the long-sword with an old-fashioned English master of defence. Another popular teacher was a certain "Geronimo," but he also met with a melancholy and premature end by the hands of one Cheefe, "a tall man in his fight and natural English," says George Silver, the champion of the Corporation of Masters of Defence. Saviolo, however, seems to have remained unconquered. In his work "Vincenzo Saviolo, his practise, in two books, that is, the fencing of the use of the Rapier and Dagger, the second of Honor and honorable Quarrels. London. Printed by John Wolfe, 1599" are expounded in a most typical manner the principles of rapier play.

The fencing phraseology of Elizabethan times is highly picturesque, but with difficulty intelligible in the absence of practical demonstration. Without going into technical details it may be pointed out that the long Elizabethan rapier, however admirably balanced it might otherwise be, was still too heavy to admit of quick parrying, or to give the blade itself. Thrusts, as a rule, had to be avoided by body movements, by ducking, or by a vault aside (incartata), or beaten away with the left hand, the hand being protected with a gauntlet or armed with a dagger. In fact, one may say that the chief characteristic of Elizabethan sword-play was the concerted action of the left hand parrying while the right delivered the attack. Bennvillo's description of Tybalt's fight is graphic:—

With piercing steel he tilts at bold Mercutio's breast, Who, all as hot, turns deadly point to point, And with a martial scorn, with one hand beats Cold death aside, and with the other Sends it back to Tybalt, whose dexterity Retorts it . . .

Of these body movements, in Saviolo's days, the most approved were: the incartata, just mentioned; the pass (the "passado," in the ruffling Anglo-Italian jargon), that is, passing of one foot in front of the other whilst delivering the attack; the bota lunga, or lungè; and the cariada, which was a far-reaching combination of the two. Of systematic sword movements there were six: stoaca, a thrust delivered with nails upwards; imbrocata, with nails down; puntà-reverso, any thrust delivered from the left side of the body; mandrità, a cut from the right; rinsèrò, one from the left; stramasonè, a right-down blow with the point of the sword.
The new art of fence, as systematized by the principles of rapier play, was on the whole already accepted in England during the last decade of the 16th century, and was, as we know, destined to endure. Nevertheless, there were still many partisans of the older school: lovers of the national short-sword and the buckler. Their tenets are to be found embodied, in very strenuous language, by the George Silver mentioned above, a member, it would seem, of the now dwindling company of Masters of Defence, in his small work: Paradoxe of Defence, wherein is proved the true ground of fight to be in the short ancient weapons, etc. Published in London, 1599. (The work has been reprinted by Messrs George Bell & Sons.)

The Italians were undoubtedly the leaders in sword-play; but, towards the beginning of the 17th century, the Spaniards developed a peculiar school of their own, which for a short while was all the mode in England as well as in France. The last trace, be it stated, of that school is now extinct. Yet the Spaniard of cavalier days was undoubtedly a formidable duellist; that was no doubt owing to the quality of the man, not of his art. The Italian’s fence was artistic; the Spaniard’s dexterity was essentially scientific. In Spain were to be found typically those “Captains of Complements,” who not only understood in their most intricate mazes the proper “dependencies” for the cartel, but also the mathematical certainties for the “reason demonstrative.” These Spanish books are marvellously pedantic; one may as well say it, frankly ridiculous. Spanish masters instructed their scholars on mathematical lines, with the help of diagrams drawn on the floor within a circle, the radius of which bore a certain proportion to the length of his arm and Spanish swords. The circle was inscribed in squares and intersected by sundry chords bearing occult but, it was held, incontrovertible relations to probabilities of strokes and parries. The scholar was to step from certain intersections to certain others. If this stepping was correctly done the result was a foregone victory. “A villain,” exclaims Mercutio, indignantly, “who fights by the book of arithmetic.” Elizabethan comedies bring us many an echo of its great exponent of mathematical swordsmanship, the magnificent Carranza, the primer inventor de la Ciencia de la Arma, the writer of treatises so abstruse on “the first and second cause,” in questions of honour and swording, that they have never been quite understood to this day.

Perhaps the most curious matter in connexion with the Spanish fence is that the most splendid treatise of the sword published in the French language is in reality purely Spanish (we have seen that the first was German, and the second an adaptation of Italian treatises). This third work, Académie de l’épée de Girard Thibault, d’Amers, etc., is indeed a monument; one of the biggest books ever printed, and beyond compare the biggest book of fence. It was issued in 1628 by the Leiden Erasmian press, and took fifteen years to complete. Nine reigning princes and a vast number of private gentlemen subscribed to meet its stupendous expenses.

This work was spoken of as a “monument.” It may, in some respects, be looked upon as the funeral monument of the old rapier fence; for soon after that period rose an entirely new school, one adapted to the use of a less portentous weapon, the small-sword of French pattern; a school destined to endure, and to lead to the perfection of our modern escrime.

The evolution of this new school is an instance of the influence of fashion upon the shape of the sword, and hence upon theories concerning its use. The French school of fencing may be said to owe its origin to the adoption, under Louis XIV., of the short court-sword in place of the over-long wide-hilted rapier of the older style. With a weapon of such reduced dimensions, of such reduced weight, the advantage of the dagger as a fencing adjunct at once ceased to be felt. The dagger, last Gothic remnant, disappeared accordingly; and there arose rapidly a new system of play, in which most of the defensive actions were performed by the blade alone; in which, at the same time (the reduction in the size and weight of the weapon rendering the efficiency of the edge almost nugatory in comparison with that of the point), all cutting action was ultimately discarded.

It is from that date, namely, from the last third of the 17th century, that the sword, as a fighting implement, becomes differentiated into two very different directions. The military weapon becomes the back-sword or sabre; the walking companion and duelling weapon becomes what we now understand by the small-sword. Two utterly different kinds of fence are practised: one, that of the back-sword; the other, what we would now call foil-foil.

The magnificent old cut and thrust rapier still flourished, it is true, in parts of Italy and Spain; but by the end of the 17th century it had already become an object of ridicule in the eyes of all persons addicted to bon ton—and it must be remembered that bon ton, on the Continent everywhere and even in England, at that time, was French ton. The walking sword, fit for a gentleman’s side, was therefore the small-sword of Versailles pattern. Its use had to be learnt from French masters of deportment; the old magnificent Italo-Spanish rapier jargon was forgotten; French terms, barbarized into carte, tierce, sagoen, flasquemadel, and so forth, were alone understood. In fact, French fencing became as indispensable an accomplishment to the Georgian gentlemen as the fine Italianated foying had been to the Elizabethan.

The new French sword-play was, it must be owned, very neat, quiet, precise, and, if anything, even more deadly than the old fence. It was perfect as a decorative mode of fight, and as well suited to the lace ruffles, to the high perruque and the red heels of the “beau” as the long cup-hilted rapier had been to the booted and spurred “cavalier.” The essence of its play was nimbleness, a sort of quivering lightness of movement in muscular vigour. It is to be noted, however, that the same sort of popular opposition met the invasion of French fencing, in post-Restoration days, that had been offered to the new-fangled Italian rapier a century earlier. During the Parliamentary period the rapier and its attendant dagger had practically disappeared; they were not true warlike weapons, their chief virtue was for duelling or sudden encounters. But the stout English back-sword survived; and with it a very definite school of back-sword play. Under Charles II., the amusement of stage prize-fighting with swords had become de la mode. Courteous assaults at many weapons, of course rebated, had been frequent functions under the auspices of the Corporation of Masters of Defence during the second half of the 17th century; it is (be it remarked) in such sword-matches on the scaffold that we find the origin of our modern prize-fights at fisticuffs. The first instance known of a challenge at sharps on the fighting stage is seen in a cartel sent by George Silver and Toby his son, as champions of the Corporation of Masters of Defence, to the obnoxious “Signors” Saviolo and Geronimo. As a matter of fact, the latter, having apparently no wish to improve their excellent social position or to risk forgetting it, declined this invitation to a public trial of skill. But the idea was right martial and pleasing to the English mind, and the fashion of prize-fighting took the firm hold it retained on English minds till stringent legislation, not so very long ago, was brought to bear upon it. Be it as it may, this prize-fighting with swords endured until middle Georgian days; when, under the impetus given to fistic displays then by the renowned Figg (who was at one and the same time the most formidable of English fencers and the first on the long list of English pugilistic champions), back-swording became relegated to the provinces, and ultimately dwindled into our bastard “single-stick.”

Fencing, in its restricted sense of purely thrusting play, was always an “academic” art in England. The first great advocate and exponent of the new small-sword fence, as taught by the new French school, was Sir William Hope of Balcomy, at one time deputy governor of Edinburgh Castle, who wrote a great number of quaint treatises of great interest to the “operative” as well as to the “speculative” fencer. Yet, oddly enough, Sir William Hope was instrumental in endeavouring to push through parliament a bill for the establishment of a court of honour, the office of which was to have been the deciding of honourable quarrels, whenever possible, without appeal to fencing skill. The House,
FENCING

However, being at the time excited and busy on the question of the union of Scotland and England, the bill never became act.

To resume: since it began to be practised as a regulated art one may say broadly that sword play has already passed through four main phases. The first belongs to the early Tudor days of sword and buckler encounters, whereof, if the best theoretical treatises appeared in Italy, the most practicable exponents were probably found in the British Isles. Then came the age of the rapier, coeval with the general disuse of the buckler. There may be discerned the dawn of fencing proper, which will fully arise when, in Caroline times, the outrageous length of the tucke will at last be sufficiently reduced no longer to require the dagger as a helpmate. The third was the age of the small-sword. With its light, elegant and deadly practice we enter a new atmosphere, so to speak, on fencing ground. Supplesness of wrist and precision of fingering replace the ramping and traversing, the heavy forcing play, of the Elizabethan. If the rapier age was well exemplified by Vincent Saviolo, this one was typified, albeit perhaps at a time when it was already somewhat on the wane, by the admirable Angelo Tremamondo Malevolti.

In the early days of the small-sword age men still fenced in play as they fought in earnest. But presently there appeared on the scene (during the last years of the 18th century) an implement destined to revolutionize the art and hopefully to divide the practice of the school from that of the field: that was the fencing mask. Before this invention, small-sword play in the master's room was performed comparatively cautiously, correct, sure and above all deliberate. The long, excited, argumentative phrases of modern assaults, which is considered when it is played with rapier, were almost inevitably consequent scrimmage. But under the protection of the fencing mask a new school of foil-play was evolved, one in which swiftness and inventiveness of attack and parry, of riposte, remise, counter-riposte and reprise, assumed an all-important character. With the new style began to assert itself that utter recklessness of "chance hits" which in our days so markedly differentiates foil-practice from actual duelling. And this brings us to the fourth phase, the fencing art, to what may be called the age of the foil.

If anything were required to demonstrate that foil-play has nowadays passed into the state of what may be called fine art in athleticism, it would be found in the rise of the method which French masters particularize as le jeu du terrain, as duelling play in fact; a play which differs so essentially from academic foil-fencing as cross-country riding in an unknown district from the haute école of horsemanship in the manege. By fencing, nowadays, that is by foil-play, we have come to mean not simply fighting for hits, but a strictly regulated game which, being quite conventional, does not take accidental hits into consideration at all. This game requires for its perfect display a combination of artificial circumstances, such as even floors, featherweight weapons, and an unconditional condition of a number of traditional conventions. Now, for the more utilitarian purposes of duelling, the major part of the foil fencer's special achievement and brilliancy has to be uncompromisingly sacrificed in the presence of the brutal fact that thrusters in the face, or below the waist, do count, insomuch as they may kill; that accidental hits in the arm or the leg cannot be disregarded, for they may, and generally do, put a premature stop to the bout. The "rub on the green" must be accepted, perform, and indeed often plays as important a part in the issue of the game as the player's skill. The fact is, however, the Pea的身体 meets all conventions which determine the value of a hit vanish, does not in any way justify the notion, prevalent among many, that a successful hit justifies any method of planting the same; and that the mere discarding of all convention in practical sword-play is sufficient to convert a bad fencer into a dangerous duellist.

It is the recognition of this fact (which, oddly enough, only came to be generally admitted, and not without reluctance, by the masters of the art during the last quarter of the 19th century) which has led to the elaboration of the modified system of small-sword fence now known as épée play. The new system, after passing through various rather extravagant phases of its own, gradually returned to the main principle of sound foil-play, but shorn of all futile conventions as to the relative values of hits. In épée play a hit is a hit, whether correctly delivered or reckless, whether intentional or the result of mere chance, and must, at the cost of much caution and patience, be guarded against.

Per contra the elaboration by the devotees of the épée of a really practical system of fence, that is, one applicable to trials in earnest, has reacted upon the teaching of foil-play by the best masters of the present day—a teaching which, without ceasing to be academical up to a certain point, takes now cognisance of the necessity of defending every part of the body as sedulously as the target of the breast, and, moreover, of warding the many possibilities of chance hits in contremtemps.

In both plays—in the highly refined, complicated and brilliant fence of the first-class "foil," as well as in the simpler and more cautious operations of the practised duellist—the one golden rule remains, that one so quality expressed by M. Jourdain's maître d'armes in Mollière's comedy: "Tout le secret des armes ne consiste qu'en deux choses, à donner et à ne point recevoir."

The point most usually lost sight of by sanguine and self-reliant scorers of conventionalities is that, although with the sword it may be comparatively easy at any time "to give," it is by no means easy to make sure of "giving without receiving." The mutual simultaneous hit—the coup-double—is, in fact, the dread pitfall of all sword-play. For this reason, in courteous bouts, a hit has no real value, not only when it is actually cancelled by a counter, but when it is delivered in such a way as to admit of a counter. In short, the experience of ages and the many successful duellists have taught the first point of every make-believes and restrictions that go to make sound foil-play. These restrictions are destined to act in the same direction as the warning presence of a sharp point instead of a button; and thus, as far as possible, to prevent those mutual hits—the contremtemps of the old masters—which mar the greater number of assaults. The proper observance of those conventions, other things being equal, distinguishes the good from the indifferent swordsmen, the man who uses his head from him who rushes blindly where angels fear to tread. So much for foil-play.

In modern sword-play, on the other hand, is seen the usual tendency of arts which have reached their climax of complication to return to comparative simplicity. With reference to actual duelling, it is a recognized thing that it would be the height of folly to attempt, sword in hand, the complex attacks, the full-length lunges, the neat but somewhat weak parries of the foil; so much so, that many have been led to assert that, for its ultimate practical purpose (which logically is that of duelling), the refined art of the foil, requiring so many years of assiduous and methodical work, is inconsiderate. It is alleged, as a proof, that many successful duellists have handed down the two counterfeit performers on the fencing floor. Some even maintain that a few weeks' special work in that restricted—very restricted—play, which alone can be considered safe on the field of honour, will produce as good a practical swordsman as any who have walked the schools for years. Nothing can be further from the truth: were it but on the ground that the greater includes the less; that the foil-fencer of standing who can perform with ease and accuracy all the intricate movements of the assailant, who has trained his hand and eye to the lightning speed of the well-handled foil, must logically prove more than a match for the more purely practical but less trained devotees of the épée de combat. The only difference for him in the two plays is that the latter is incomparably slower in action, simpler; that it demands above all things patience and caution; and that especially, that instead of protecting his breast only, the épée fencer must beware of the wily attack, or the chance hit, at every part of his body, especially at his sword-hand.

The difference which still exists between the French and Italian schools of small-sword fence—by no means so wide, in point of theory, as popularly supposed—is mainly due to the dissimilarity of the weapons favoured by the two countries. The quillons, which are retained to this day in the Italian
fleuret and spada, conduce to a freer use of wrist-play and a straight arm. The French, on the other hand, having long ago adopted the plain grip both for fleuret and épée, have come to rely more upon finger-play and a semi-bent arm. Both schools have long lapsed claims to an overwhelming superiority, on theoretical ground, over their rivals—claims which were unwarrentable. Indeed, of later days, especially since the evolution of a special "duelling play," the two schools show a decided tendency, notwithstanding the difference in the grip of the weapons, towards a mutual assimilation of principles.

As a duelling weapon—as one, is to say, the practice of which under the restrictive influence of conventions could become elaborated into an art—the sabre (see SABRE-FENCING) returned to favour in some countries at the close of the Napoleonic wars. Considered from the historical point of view, the modern sabre, albeit now a very distant cousin of the small-sword, is as direct a descendant as the latter itself of the old cut-and-thrust rapier. It is curious, therefore, to note that, just as the practice of the "small" or thrusting sword gave rise to two rival schools, the French and the Italian, that of the sabre or cutting sword (it can hardly be called the broadsword, the blade, for the purposes of duelling play, having been reduced to slenderest proportions) became split up into two main systems, Italian and German. And further it is remarkable that the leading characteristics of the latter should still be, in a manner, "severity" and steadfastness; and that the former, the Italian, should rely, as of yore, specially upon agility and insidious combination.

Concerning the latter-day evolution of that special and still more conventional system of fence, the Schlager or Hau-rapier play favoured by the German student, from that of the ancestral rapier, the curious will find a critical account in an article entitled "Schlägerei" which appeared in the Saturday Review, 5th of December 1885.

See also the separate articles on CANE-FENCING (casne); ÉPEE-DE-COMBAT; FOIL-FENCING; SABRE-FENCING; and SINGLE-STICK.

AUTHORITY.—The bibliography of fencing is a copious subject; but it has been very completely dealt with in the following works: Bibliotheca dimicatoria, in the "Fencing, Boxing and Wrestling" volume of the Bodleian library (Longmans); A Bibliography of Fencing and Duelling, by Carl A. Thimm (John Lane). For French works more especially: La Bibliographie de l'esrime, by Vignetc (Paris, Mottoz); and Ma Collection d'esrime, by the same (Paris, Quatremère de Quincy). French: Livro de arte de l'esc rerma, by Gelli (Firenza, Niccolà). For Spain and Portugal: Libro de esrima españoles y portugueses, by Leguina (Madrid, Los Huérfanos). Both M. Vignetc's and Cav. Gelli's works deal with the fencing and rapier generally; but their entries are only critical, or even tolerably accurate, in the case of books belonging to their own countries. Concerning the history of the art, Egerton Castle's Schools and Masters of Fence (George Bell); Hutton's The Sword and the Seventeenth Century French Diplomatist, came of an old family of Joueurs d'épée à travers les âges (Paris, Flammari) cover the ground, technically and ethically. As typical exponents of the French and Italian schools respectively may be mentioned here: La Théorie de l'escrerma, by Préovost (Paris, de Brunofh) (this is the work which adopted in the Badminton volume on Fencing, and Traité teorico-pratico della scherma, by Parisc (Rome, Voghera). (E. CA.)

FENDER, a metal guard or defence (whence the name) for a fire-place. When the open hearth with its logs burning upon dogs or andirons was replaced by the closed grate, the fender was devised as a finish to the smaller fire-places, and as a safeguard against the dropping of cinders upon the wooden floor, which was now much nearer to the fire. Fenders are usually of steel, brass or iron, solid or pierced. Those made of brass in the latter part of the 18th and the earlier part of the 19th centuries are by far the most elegant and artistic. They usually had three claw feet, and the pierced varieties were often cut into arabesques or conventional patterns. The lyre and other motives of the Empire style were much used during the prevalence of that fashion. The modern fender is much lower and is often little more than a kerb; it is now not infrequently of stone or marble, fixed to the floor.

FÉNELON, BERTRAND DE SALIGNAC, seigneur de la Mothe (1533-1586). French diplomatist, came of an old family of Périgord. After serving in the army he was sent ambassador to England in 1566. At the request of Charles IX. he endeavoured to excuse to Elizabeth the massacre of St. Bartholomew as a necessity caused by a plot which had been laid against the life of the king of France. For some time after the death of Charles IX. Fénélon was continued in his office, but he was recalled in 1575 when Catherine de' Medici wished to bring about a marriage between Elizabeth and the duke of Alençon, and thought that another ambassador would have a better chance of success in the negotiation. In 1582 Fénélon was charged with a new mission to England, then to Scotland, and returned to France in 1583. He opposed the Protestants until the end of the reign of Henry III., but espoused the cause of Henry IV. He died in 1586. His nephew in the sixth degree was the celebrated archbishop of Cambrai.

FÉNELON is the author of a number of writings, among which the most remarkable are a general introduction to "Anglers et la Suisse, ou Sommaire de la négociation faite en Angleterre," l'an 1571 (containing a number of the letters of Charles and his mother, relating to Queen Elizabeth, Queen Mary and the Bartholomew massacre), published in the Mémoires de Castelnau (Paris, 1656); Négociations de la Mothe Fénélon et de Michel, sieur de Maunviusse, en Angletere, et Dépêches de M. de la Mothe Fénélon. Instructions au sieur de la Maunviusse, both contained in the edition of Castelnau's Memoires de Castelnau (Paris, 1666). The book published in 1738 the life and works of Fénélon was published at Paris in 1838-1841, in 7 vols. 8vo. See Letters de Catherine de Médici, edited by Hector de la Fare, (1886 seq.) in the Collection de documents inédits sur l'histoire de France.

FÉNELON, FRANÇOIS DE SALIGNAC DE LA MOTHE (1656-1715). French writer and archbishop of Cambrai, was born at the château of Fénélon in Périgord on the 6th of August 1651. His father, Pons, comte de Fénélon, was a country gentleman of ancient lineage, large family and small estate. Owing to his delicate health the boy's early education was carried on at home; though he was able to spend some time at the neighbouring university of Cahors. In 1666 he came to Paris, under charge of his father's brother, Antoine, marquis de Fénélon, a retired soldier of distinction, well known for his religious zeal. Three years later he entered the famous theological college of Saint Sulpice. Here, while imbibing the somewhat mystic piety of the house, he had an excellent chance of carrying on his beloved classical studies; indeed, at one time he proposed to couple sacred and profane together, and go on a missionary journey to the Levant. 'There I shall once more make the Apostle's voice heard in the Church of Corinth. I shall stand on that Areopagus where St. Paul preached to the sages of this world an unknown God. But I do not scorn to descend thence to the Piraeus, where Socrates sketched the plan of his republic. I shall mount to the double summit of Parnassus; I shall revel in the joys of Tempe. Family opposition, however, put an end to the elaborate prospect.' Fénélon retained at Saint Sulpice until 1679, when he was made "superior" of a "New Catholic" sisterhood in Paris—an institution devoted to the conversion of Huguenot ladies. Of his work here nothing is known for certain. Presumably it was successful; since in the winter of 1685, just after the revocation of the edict of Nantes, Fénélon was put at the head of a number of priests, and sent on a mission to the Protestants of Saintonge, the district immediately around the famous Huguenot citadel of La Rochelle. To Fénélon such employment was clearly uncongenial; and if he was rather too ready to employ unsavoury methods—such as bribery and espionage—among his proselytes, his general conduct was kindly and statesmanlike in no slight degree. But neither in his actions nor in his writings is there the least trace of that belief in liberty of conscience ascribed to him by 18th-century philosophers. Tender-hearted he might be in practice; but toleration he declares synonymous with "cowardly indulgence and false compassion."

Meanwhile the marquis de Fénélon had introduced his nephew into the devout section of the court, dominated by Mme de Maintenon. He became a favourite disciple of Bossuet, and at the bishop's instance undertook to refute certain metaphysical errors of Father Malebranche. Followed thereon an independent philosophical Treatise on the Existence of God, wherein Fénélon wrote Descartes in the spirit of St. Augustine. More important
were his Dialogues on Eloquence, wherein he entered an eloquent plea for greater simplicity and naturalness in the pulpit, and urged preachers to take the scriptural, natural style of Bossuet as their model, rather than the coldly analytic eloquence of his great rival, Bourdaloue. Still more important was his Treatise on the Education of Girls, being the first systematic attempt ever made to deal with that subject as a whole. Hence it was probably the most influential of all Fénélon's books, and gained the French ideas on the question all through the 18th century. It holds a most judicious balance between the two opposing parties of the time. On the one side were the précieuses, enthusiasts for the "higher" education of their sex; on the other were the heavy Philistines, so often portrayed by Molière, who thought that the less girls knew the better they were likely to be. Fénélon sums up in favour of the cultivated housewife; his first object was to persuade the mothers to take charge of their girls themselves, and fit them to become wives and mothers in their turn.

The book brought its author more than literary glory. In 1689 Fénélon was gazetted tutor to the duke of Burgundy, eldest son of the dauphin, and eventual heir to the crown. The character of this strange prince has been drawn once for all by Saint-Simon. Shortly it may be said that he was essentially a mass of contradictions—brilliant, passionate to the point of mania, but utterly weak and unstable, capable of developing into a saint or a monster, but quite incapable of becoming an ordinary human being. Fénélon assailed him on the religious side, and managed to transform him into a devotee, exceedingly affectionate, earnest, and religious, but with no common sense. In justice, however, it should be added that his health was being steadily undermined by a mysterious internal complaint, and that Fénélon's tutorship came to an end on his disgrace in 1697, before the pupil was fifteen. The abiding result of his tutorship is a code of carefully graduated moral lessons—the Fables, the Dialogues of the Dead (a series of imaginary conversations between departed heroes), and finally Télémaque, where the adventures of the son of Ulysses in search of a father are made into a political novel with a purpose. Not, indeed, that Fénélon meant his book to be the literal paper Constitution some of his contemporaries thought it. Like other Utopias, it is an easy-going compromise between dreams and possibilities. Its one object was to broaden Burgundy's mind, and ever keep before his eyes the "great and holy maxim that kings exist for the sake of their subjects, not subjects for the sake of kings." Here and there Fénélon carries his philanthropy to lengths curiously prophetic of the age of Rousseau—servile denunciation of war, belief in nature and fraternity of nations. And he has a truly 18th-century belief in the all-efficiency of institutions. Mentor proposes to change the tastes and habits of the whole people, and build up again from the very foundations. Fénélon is on firmer ground when he leads a reaction against the "mercantile system" of Colbert, with its crushing restrictions on trade; or when he sings the praises of agriculture, in the hope of bringing back labour to the land, and thereby ensuring the physical efficiency of the race. Valuable and far sighted as were these ideas, they fitted but ill into the scheme of a romance. Seldom was Voltaire wider of the mark than when he called Télémaque a Greek poem in French prose. It is too mollié, too full of ingenious contrivances, to be really Greek. As, in Fénélon's own opinion, the great merit of Homer was his "amiable simplicity," so the great merit of Télémaque is the art that gives to each adventure its hidden moral, to each scene some sly reflection on Versailles. Under stress of these preoccupations, however, organic unity of structure went very much to the wall, and Télémaque is a grievous offender against its author's own canons of literary taste. Not that it altogether lost thereby. There is a curious richness in this prose, so full of rhythm and harmony, that breaks at every moment into verse, as it drags itself along its slow and weary way, half-fainting under an overload of epithets. And although no single feature of the book is Greek, there hangs round it a moral fragrance only to be called forth by one who had fulfilled the vow of his youth, and learnt to breathe, as purely as on "the double summit of Parnassus," the very essence of the antique. Télémaque was published in 1699. Four years before, Fénélon had been appointed archbishop of Cambrai, one of the richest benefices in France. Very soon afterwards, however, came the great calamity of his life. In the early days of his tutorship he had met the Quietist apostle, Mme Guyon (q.v.), and had been much struck by some of her ideas. These he adopted, without the limits of his own, where Christian Neoplatonism curiously mingled with theories of chivalry and disinterestedness, borrowed from the précieuses of his own time. His mystical principles are set out at length in his Maxims of the Saints, published in 1607 (see QUETELET). Here he argues that the more love we have for ourselves, the less we can spare for our Maker. Perfection lies in getting rid of self-love altogether—in never thinking of ourselves, or even of the relation in which God stands to us. The saint does not love Christ as his Redeemer, but only as the Redeemer of the human race. Bossuet (q.v.) attacked this position administered with great strictness, and yet on broad and liberal lines. There was no bureaucratic fastidiousness, no seeking after popularity; but every man, whether great or small, was treated exactly as became his station in the world. And Saint-Simon bears the same witness to his government of his palace. There he lived with all the piety of a true pastor, yet with all the dignity of a great nobleman, who was still on excellent terms with the world. But his magnificence made no one angry, for it was kept up chiefly for the sake of others, and was exactly proportionate to his place. With all its luxuries and courtly ease, his house remains the true bishop's palace, breathing the strictest discipline and restraint. And of all this chastened dignity the archbishop was himself the ever-present, ever-inimitable model—in all that he did the perfect churchman, in all the high-bred noble, in all things, also, the author of Télémaque.
