HINDU KUSH, a range of mountains in Central Asia. Throughout 500 m. of its length, from its roots in the Pamir regions till it fades into the Koh-i-Baba to the west of Kabul, this great range forms the water-divide between the Kabul and the Oxus basins, and therefore the natural dividing line between the two. In the receding westwards, the southern boundary of Afghanistan. It may be passed through the eye-opening ridges by rifts which break across their axes. The Hindu Kush is, in fact, but the face of a great upheaved mass of plateau-land lying beyond it northwards, just as the Himalaya forms the southern face of the great central table-land of Tibet, and its general physiography, exhibiting long, narrow, steep-sided valleys and transverse lines of "antedate" drainage, is

KAFIRISTAN.

Physiography.—For the first 100 m. of its length the Hindu Kush is comparatively flat, though the range of considerable width, permitting the formation of small lakes on the head of considerable peaks. It is crossed by many passes, varying in height from 12,500 ft. to 17,500 ft., the lowest and the easiest being the well-known pass of Barfalah, which from the base immemorially offered a line of approach from High Asia to Chitaral and Jalalabad. As the Hindu Kush gradually recedes from the Af-Panja and turns south-westwards it gains in altitude, and we find prominent peaks on the crest which measure more than 24,000 ft., above sea-level. Even here, however, the main central water-divide, or axis of the chain, is apparently not the line of highest peaks, which must be sought in the south-western portion. The celebrated Tirach Mir dominates Chitaral from a southern spur. For some 150 or 50 m. of this south-western bend, bearing away from the Oxus, where the Hindu Kush overlooks the mountain wilderness of Badakshan to the west, the crest of the range which is the most important is the Dorah group (including the Minjan and the Mandal), which rise to about 15,000 ft., and which are, under the conditions, practicable links between the Oxus and Chitaral basins.

From the Dorah to the Khawar pass (or group of passes, for it includes that one line of approach only is to be found across the Hindu Kush), which is between 11,000 and 12,000 ft., in altitude, the water-divide overlooks Kafiristan and Badakshan. Here its exact position is matter of conjecture, but is likely to lie along the inaccessible rim of one of the nunataks, which is bound by a series of sharp brecciated ridges extending for some miles and is certainly nowhere less than 15,000 ft. above sea-level. There is a tradition that Timur attempted the passage of the Hindu Kush by one of the unmapped passes hereabouts, and that, having failed, he left a record of his failure engraved on a rock in the pass.

The Khawar, at the head of the Panjshir tributary of the Kabul river, leading straight from Badakshan to Charikar and the city of Kabul, is now an excellent kafila route, the road having been engineered under the amir Abdur Rahman , direction, and it is said to be available for traffic throughout the year. From Panjshir the road descends to the north-west of Kabul, flows north-east to meet the Panjshir near Charkhar, whence it runs united into the plains of Kafiristan, and having entered the Hindu Kush at its highest point, which, which, rising to the north-west of Kabul, flows north-east to meet the Panjshir near Charkhar, whence it runs united into the plains of Kafiristan, and having entered the Hindu Kush at its highest point, which, which, rising to the north-west of Kabul, and issuing from the Hindu Kush, is at the heart of Afghanistan.

The conformation of the Hindu Kush system south of the Khawar, no less than its topography, is subject to geographical rules, so that it is subject to the conditions under which construction is carried on, and its construction under the same conditions of upheaval and subsequent denudation as are common to the western Himalaya and the whole of the trans-Indus borderland.
similar. There are few passes across the southern section of the Hindu Kush (and this section is, from the politico-geographical point of view, more important to India than the whole Himalayan system) which have not to surmount a succession of crests or ridges as big as the Oxus. Rightly Tindari and the Afghan frontier are considered as the two main centres of Paropamisus; this accounts for the great Asiatic Paranasus of Aristotle, and the Plato-stw-a of Hsiian Tsang.

The name Hindu Kush is used by Ibn Batuta, who crossed (c. 1332) from Anderab, and he gives the explanation of the name which, however doubtful, is still popular, as (Pers.) Hindu-Killer, "because of the number of Indian slaves who perished in passing" its snows. Baber always calls the range Hindu Kush, and the way in which he speaks of it shows clearly that it was a range that was meant, not a solitary pass or peak (according to modern local use, as alleged by Elphinstone and Burns). Probably, however, the title was connived to the section of Khawak to Koh-i-Baha. The name has by some later Oriental writers been modified into Hindu Koh (mountain), but this is factitious, and throws no light on the origin of the title. The name seems to have become known to European geomorphists by the Oriental translations of the two Petis de la Croix, and was taken up by Delisle and D'Anville. Rennell and Elphinstone familiarized it. Burns first crossed the range (1832). A British force was stationed at Bannian beyond it in 1840, with an outpost at Saiganh.

The Hindu Kush, formidable as it seems, and often as it has been the limit between petty states, has hardly ever been the subject of a separate study. The Greeks, White Huns, Samanides of Bokhara, Ghaznavides, Mongols, Timur and Timuridues, down to Sadzi ozas and Barakazis, have ruled both sides of this great alpine chain.

AUTHORITIES.—Information about the Hindu Kush and Chiral is now comparatively exact. The Russo-Afghan Boundary Commission of 1884 and the Chitridal expedition of 1895 opened up a vast area for geographical investigation, and the information collected is to be found in the reports and gazetteers of the Indian government. The following are the chief recent authorities:—Report of the Russo-Afghan Boundary Commission (1886); Report of Lockhart’s Mission (1886); Report of Amur Boundary Commission (1889); Report of Pamir Boundary Commission (1889); J. Biddulph, Tribes of the Hindu Kush (Calcutta, 1880); W. M’Nair, “Visit to Kafiristan,” vol. iv. R.G.S. Proc., 1884; F. Youngusband, “Journeys on the Pamirs, &c,” vol. xiv. R.G.S. Proc., 1892; Colonel Durand, Making a Frontier (London, 1899); Sir G. Robertson, Chiral (London, 1899).

HINDUR, or NALAGORE, one of the Simla hill states, under the government of the Punjab, India. Pop. (1901) 52,551; area, 256 sq. m.; estimated revenue, £6,500. The country was overrated at the beginning of the 19th century, but the tribes were subdued in 1815, when they were driven out by the British, and the raja was confirmed in possession of the territory. The principal products are grain and opium.

HINGHAT, a town of British India in Wardha district, Central Provinces, 21 m. S.W. of Wardha town. Pop. (1901) 12,662. It is a main seat of the cotton trade, the cotton here produced in the rich Wardha valley having given its name to one of the best indigenous staples of India. The principal native traders are Marwaris, many of whom have large transactions and export on their own account; but the greater number act as middle-men. There are two cotton-mills and general spinning and weaving factories.

HINGE (in Mid. Eng. henge or heong, from hengen, to hang), a movable joint, particularly that by which a door or window "hangs" from its side-post, or by which a lid or cover is attached to that which it closes; also any device which allows two parts to be joined together and move upon each other (see JOINERY). Figuratively the word is used of that on which something depends, a cardinal or turning point, a crisis.

HINGHAM, a township of Plymouth county, Massachusetts, U.S.A., on Massachusetts Bay. Pop. (1890) 4564; (1900) 5209 (960 being foreign-born); (1905, state census) 4519; (1910) 5062, about 30 sq. m. The township is traversed by the New York, New Haven & Hartford railway, and contains the villages of Hingham, West Hingham, Hingham Center, and South Hingham. Derby Academy, a co-educational school.
founded and endowed with about £12,000 in 1784 by Sarah Derby (1714-1790), was opened in 1791. Hingham has a public library (1868), with 12,000 volumes in 1908. The Old Meeting House, erected in 1681, is one of the oldest church buildings in the country used continuously. Manufactures were relatively much more important in the 17th and 18th centuries than since. There were settlers here as early as 1633, some of them—notably Edmund Griswold and his son Birecourt John Henry Hobart,—being natives of Hingham, Norfolk, England, whence the name; and in 1635 common land called Barecove became the township of Hingham.

HINRICHS, HERMANN FRIEDRICH WILHELM (1794-1861), German philosopher, studied theology at Strassburg, and philosophy at Heidelberg under Hegel (q.v.), who wrote a preface to his Religion im Innern Verhältniss zur Wissenschaft (Heidelberg, 1723). He became a Pfarrerat in 1819, and held professorships at Breslau (1823) and Halle (1824).

HINSCHIUS, PAUL (1835-1868), German jurist, was the son of Franz Hinschius (1803-1877), and was born in Berlin on the 29th of December 1835. His father was not only a scientific jurist, but also a lawyer in large practice in Berlin. After working under his father, Hinschius in 1852 began to study jurisprudence at Heidelberg and Berlin, the teacher who had most influence upon him being Aemilios Ludwig Richter (1808-1864), to whom he afterwards ascribed the great revival of the study of ecclesiastical law in Germany. In 1855 Hinschius took the degree of doctor jurispruds and in 1859 was admitted to the juridical faculty of Berlin. In 1863 he went as publican extraordinary to Halle, returning in the same capacity to Berlin in 1865; and in 1868 became professor ordinarius at the university of Kiel, which he represented in the Prussian Upper House (1870-1871). He also assisted his father in editing the Prenussische Anwaltszeitung from 1862 to 1866 and the Zeitschrift für Gesetzgebung und Rechtspflege in Preussen from 1867 to 1871. In 1872 he was appointed professor ordinarius of ecclesiastical law at Berlin. In the same year he took part in the conferences of the ministry of ecclesiastical affairs, which issued in the famous "Falk Law." In connexion with the developments of the Kulturkampf which resulted from the "Falk laws," he wrote several treatises: e.g., on "The Attitude of the German State Governments toward the Decrees of the Vatican Council" (1871), on "The Prussian Church Laws of 1873" (1873), "The Prussian Church Laws of the years 1874 and 1875" (1873), and "The Prussian Church Law of 14th July 1880" (1881). He sat in the Reichstag as a National Liberal from 1872 to 1875, and again in 1881 and 1882, and from 1889 onwards he represented the university of Berlin in the Prussian Upper House. He died on the 17th of December 1888.

The two great works by which Hinschius established his fame are the Decretales Pseudo-Isidorianae et capitula Angilrami (2 parts, Leipzig, 1863) and Das Kirchenrecht der Katholiken und Protestanten in Deutschland, vols. i.-v. (Berlin, 1869-1877). The first of these, for which during 1860 and 1861 he had gathered materials in Italy, Spain, France, England, Scotland, Ireland, Holland and Belgium, was the first critical edition of the False Decretals. His most monumental work, however, is the Kirchenrecht, which remains incomplete. The six volumes actually published ("System des Katholischen Kirchenrechts") cover only book i. of the work as planned; they are devoted to an exhaustive historical and analytical study of the Roman Catholic hierarchy and its government of the church. The work is planned with special reference to Germany; but in fact its scheme embraces the whole of the Roman Catholic organization in its principles and practice. Unfortunately even this part of the work remains incomplete; two chapters of book i. and the whole of book ii., which was to have dealt with "the rights and duties of the members of the hierarchy," remain unwritten; the most notable omission is that of the ecclesiastical law in relation to the regular orders. Incomplete as it is, however, the Kirchenrecht remains a work of the highest scientific authority. Epoch-making in its application of the modern method of ecclesiastical law in its theory and practice, it has become the model for the younger school of canonists.

See the articles s.w. by E. Seckel in Herzog-Hauck, Realencyclo-\pi disie (3rd ed., 1900), and by Ulrich Steitz in Die allgemeine deutsche Biographie, vol. 50 (Leipzig, 1905).

HINTERLAND (German for "the land behind"), the region lying behind a coast or river line, or a country dependent for trade or commerce on any other region. In the purely physical sense "interior" on "back country" is more commonly used, but the word has gained a distinct political significance. It first came to prominence during 1833-1855, when Germany insisted that she had a right to exercise jurisdiction in the territory behind those parts of the African coast that she had occupied. The "doctrine of the hinterland" was that the possessor of the littoral was entitled to as much of the back country as geographically, economically or politically was dependent upon the coast lands, a doctrine which, in the space of ten years, led to the partition of Africa between various European powers.

HINTON, JAMES (1822-1879), English surgeon and author, son of John Howard Hinton (1791-1873), Baptist minister and author of the History and Topography of the United States and other works, was born at Reading in 1822. He was educated at his grandfather's school near Oxford, and at the Nonconformist school at Harpenden, and in 1838, on his father's removal to London, was apprenticed to a woollen-draper in Whitechapel. After retaining this situation about a year he became clerk in an insurance office. His evenings were spent in intense study, and this, joined to the ardour, amounting to morbidity, of his interest in moral problems, so affected his health that in his nineteenth year he resolved to seek refuge from his own thoughts by running away to sea. His intention having, however, been discovered, he was sent, on the advice of the physician who was consulted regarding his health, to St Bartholomew's Hospital to study for the medical profession. After receiving his diploma in 1847, he was for some time assistant surgeon at Newport, Essex, but the same year he went out to Sierra Leone to take medical charge of the free labourers on their voyage thence to Jamaica, where he stayed some time. He returned to England in 1850, and entered into partnership with a surgeon in London, where he soon had his interest awakened specially in aural surgery, and gave also much of his attention to physiology, in which he was appointed a lecturer. He published papers on physiological and ethical subjects to the Christian Spectator; and in 1859 he published Man and his Dwelling-place. A series of papers entitled "Physiological Riddles," in the Cornhill Magazine, afterwards published as Life in Nature (1862), as well as another series entitled Thoughts on Health (1871), proved his aptitude for popular scientific exposition. After being appointed aural surgeon to Guy's Hospital in 1863, he speedily acquired a reputation as the most skilful aural surgeon of his day, which was fully borne out by his works. As Atlas of Diseases of the membrana tympani (1874), and Questions of Aural Surgery (1874). But his health broke down, and in 1874 he gave up practice; and he died at the Azores of acute inflammation of the brain on the 16th of December 1875. In addition to the works already mentioned, he was the author of The Mystery of Pain (1866) and The Place of the Physician (1874). On account of their fresh and vigorous discussion of many of the important moral and social problems of the time, his writings had a wide circulation on both sides of the Atlantic. His Life and Letters, edited by Ellice Hopkins, with an introduction by Sir W. G. Gull, appeared in 1878.

HIJOJO [Hyojo], a town of Japan in the province of Settsu, Nippon, on the western shore of the bay of Osaka, adjoining the foreign settlement of Kobe, 21 m. of Osaka by rail. The
HIP-HIPPED ROOF

growth of its prosperity has been very remarkable. Its population, including that of Kobe, was 135,639 in 1891, and 283,002 in 1903. From 1884 to the close of the century its trade increased nearly eightfold, and the increase was not confined to a few staples of commerce, but was spread over almost the whole trade, in silk and cotton fabrics, floor-mats, straw-plaits, matches, and cotton yarns are especially important. Kobe owes much of its prosperity to the fact of serving largely as the shipping port of Osaka, the chief manufacturing town in Japan. The foreign community, exclusive of Chinese, exceeds 1000 persons. Kobe is considered the brightest and healthiest of all the places assigned as foreign settlements in Japan, its pure, dry air and granite subsoil constituting special advantages. It is in railway communication with all parts of the country, and wharves admit of steamers of large size loading and discharging cargo without the aid of lighters. The area originally appropriated for a foreign settlement soon proved too restricted, and foreigners received permission to lease lands and houses direct from the Japanese owners beyond the treaty limits, a privilege which, together with that of building villas on the hills behind the town, ultimately involved some diplomatic complications. Kobe has a shipbuilding yard, and docks in its immediate neighbourhood.

Hiogio has several temples of interest, one of which has near it a huge bronze statue of Buddha, while by the Minatogawa, which flows into the sea between Hiogio and Kobe, a temple commemorates the spot where Kusunoki Masashige, the mirror of Japanese loyalty, met his death in battle in 1356. The temple of Ikuta was erected on the site of the ancient fune built by Jingó on account of its being in the entrance of the sea. Hiogio’s original name was Bako. Its position near the entrance of the Inland Sea gave it some maritime importance from a very early period, but it did not become really prominent until the 12th century, when Kiyomori, chief of the Taira clan, transferred the capital from Kioto to Fukuhara, in Hiogio’s immediate neighbourhood, and undertook various public works for improving the place. The change of capital was very brief, but Hiogio benefited permanently from the distinction.

HIP. (1) (From O. Eng. kyhe, a word common in various forms to many Teutonic languages; cf. Dutch khep, and Ger. Hiehe), the projecting part of the body formed by the top of the thigh-bone and the side of the pelvis, in quadrupeds generally known as the haunch (see JOINTS). (2) (O. Eng. hiepe, from same root as M.H. Ger. hiele, a thorn-bush), the fruit of the dog-rose (Rosa canina); “hips” are usually joined with “haws,” the fruit of the Hawthorn.

HIP-KNOB, in architecture, the finial on the hip of a roof, between the barge-boards of a gable.

HIPPARCOS (fl. 140-126 B.C.), Greek astronomer, was born at Nicaea in Bithynia early in the 2nd century B.C. He observed in the island of Rhodes probably from 161, certainly from 146 until about 126 B.C., and made the discovery of the precession of the equinoxes in 120 (see Astronomy: History). The outburst of a new star in 134 B.C. is stated by Pliny (Hist. nat. ii. 26) to have prompted the preparation of his catalogue of 1080 stars, substantially embodied in Ptolemy’s Almagest. Hipparchus founded trigonometry, and compiled the first table of chords. Scientific geography originated with his invention of the method of fixing terrestrial positions by circles of latitude and longitude. There can be little doubt that the fundamental part of his astronomical knowledge was derived from Chaldæa.

None of his many works has survived except a Commentary on the Phaenomena of Aratus and Eudoxus, published by F. Voss in 1569, and included by D. Petauus in his Uranologium (Paris, 1630). A new edition was published by Carolus Manilius (Leipzig, 1894).

HIPPOSUS OF METAPONTUM, Pythagorean philosopher, was one of the earliest of the disciples of Pythagoras. He is mentioned both by Diogenes Laërtius and by Iamblichus, but nothing is known of his life. Diogenes says that he left no writings, but other authorities make him the author of a Pythagorici Meyos directed against the Pythagoreans. According to Aristotle (Methaph., ii. 22), he was the originator of the Heraclitean fire-doctrine, whereas the Pythagoreans maintained the theory that number is the principle of everything. He seems to have regarded the soul as composed of igneous matter, and so approximates the orthodox Pythagorean doctrine of the central fire, or Hestia, to the more detailed theories of Heraclitus. In spite of this divergence, Hipposus is always regarded as a Pythagorean.

See Diogenes viii. 84; Brandis, History of Greek and Roman Philosophy; also Pythagoras.

HIPPEASTRUM, in botany, a genus of the natural order Amaryllidaceae, containing about 50 species of bulbous plants, natives of tropical and sub-tropical South America. In cultivation they are generally known as Amaryllis. The handsome funnel-shaped flowers are borne in a cluster of two to many, at the end of a short hollow scape. The species and the numerous hybrids which have been obtained artificially, show a great variety in size and colour of the flower, including the richest deep crimson and blood-red, white, or with striped, mottled or blended colours. They are of easy culture, and free-blooming habit. Like other bulbs they are increased by offsets, which should be carefully removed when the plants are at rest, and should be allowed to attain a fair size before removal. These young bulbs should be potted singly in February or March, in mellow loamy soil with a moderate quantity of sand, about two-thirds of the bulb being kept above the level of the soil, which should be made quite solid. They should be removed to a temperature of 60° by night and 70° by day, very carefully watered until the roots have begun to grow freely, after which the soil should be kept moderately moist. As they advance the temperature should be raised to 70° at night, and to 80° or higher with sun heat by day. They do not need shading, but should have plenty of air, and be syringed daily in the afternoon. When growing they require a good supply of water. After the decay of the flowers they should be returned to a brisk moist temperature of from 70° to 80° by day during summer to perfect their leaves, and then be ripened off in autumn. Through the winter they should have less water, but must not be kept entirely dry. The minimum temperature should now be about 55°, to be increased to 60° or 15° in spring. As the bulbs get large they will occasionally need shifting into larger pots. Propagation is also readily effected by seeds for raising new varieties. Seeds are sown when ripe in well drained pans of sandy loam at a temperature of about 65°. The seedlings when large enough to handle are placed either singly in very small pots or several in a pot or shallow pan, and put in a bottom heat, in a moist atmosphere with a temperature from 60° to 70°. H. Ackermannii, with large, handsome, crimson flowers—itself a hybrid—is the parent of many of the large-flowered forms; H. cestre (Barbados lily), with yellowish-green flowers tipped with scarlet, has also given rise to several handsome forms; H. auricum (flowers crimson and green), H. perdium (flowers creamy-white spotted with crimson), and H. vittatum (flowers white with red stripes, a beautiful species and the parent of many varieties), are stowe or warm greenhouse plants. These kinds, however, are now only regarded as botanical curiosities, and are rarely grown in private or commercial establishments. They have been ousted by the selected and generally accepted looking hybrids, which have been in cultivation in Europe during the past 100 years. H. Jonkent is named after a Lancashire watchmaker who raised it in 1790 by crossing H. Reginae with H. vittatum. Since that time other species have been used for hybridizing, notably H. reticulatum, H. auricum, H. solandiflorum, and sometimes H. cestre and H. psitticinum. The finest forms since 1886 have been evolved from H. Leoaldi and H. perdium. (J. W.)

HIPPED ROOF, the name given in architecture to a roof which slopes down on all four sides instead of terminating on
two sides against a vertical gable. Sometimes a compromise is made between the two, half the roof being hipped and half resting on the vertical wall; this gives much more room inside the roof, and externally a most picturesque effect, which is one of the great attractions of domestic architecture in the south of England, and is rarely found in other countries.

HIPPEL, THEODOR GOTTLIEB VON (1741-1796), German satirical and humorous writer, was born on the 31st of January 1741, at Gerdauen in East Prussia, where his father was rector of a school. He enjoyed an excellent education at home, and in his sixteenth year he entered Konigsberg university as a student of theology. Interrupting his studies, he went, on the invitation of a friend, to St Petersburg, where he was introduced at the brilliant court of the empress Catherine II. Returning to Königsberg he became a tutor in a private family; but, falling in love with a young lady of high position, his ambition was aroused, and giving up his tutorship he devoted himself with enthusiasm to legal studies. He was successful in his profession, and in 1780 was appointed chief burgomaster in Königsberg, and in 1786 privy councillor of war and president of the town. As he rose in the world, however, his inclination for matrimony vanished, and the lady who had stimulated his ambition was forgotten. He died at Königsberg on the 23rd of April 1796, leaving a considerable fortune. Hippeil had extraordinary talents, rich in wit and fancy; but his was a character full of contrasts and contradictions. Causticness and ardent passion, dry pedantry and piety, morality and sensuality; simplicity and ostentation composed his nature; and, hence, his literary productions never attained artistic finish. In his Lebensläufe nach aufsteigender Linie (1778-1781) he intended to describe the lives of his father and grandfather, but he eventually confined himself to his own. It is an autobiography, in which persons well known to him are introduced, together with a mass of heterogeneous reflections on life and philosophy. Kreuz- und Querseiten des Ritters Tater (1793), is a diary; and his later works, the follies of the age—ancestral pride and the thirst for orders, decoration and the like. Among others of his better known works are Über die Ehe (1774) and Über die bürgerliche Verbesserung der Weiber (1792). Hippeil has been called the fore-runner of Jean Paul Richter, and has some resemblance to this author, in his constant digressions and in the intertwaving of scientific matter in his narrative. Like Richter he was strongly influenced by Laurence Sterne.

In 1825-1858 a complete edition of Hippeil’s works in 14 vols., was issued at Berlin. Über die Ehe has been edited by E. Bremm (1872), and the Lebensläufe nach aufsteigender Linie has in a number of editions by E. von Königsgarten (1878), gone through several editions. See J. Czerny, Sterne, Hippeil, and Jean Paul (Berlin, 1904). HIPPIAS OF ELIS, Greek sophist, was born about the middle of the 5th century B.C. and was thus a younger contemporary of Protagoras and Socrates. He was a man of great versatility and won the respect of his fellow-citizens to such an extent that he was sent to various towns on important embassies. At Athens he made the acquaintance of Socrates and other leading thinkers. With an assurance characteristic of the later sophists, he claimed to be regarded as an authority on all subjects, and lectured, at all events with financial success, on poetry, grammar, history, politics, archaeology, mathematics and astronomy. He boasted that he was more popular than Protagoras, and was prepared at any moment to deliver an extempore address on any subject to the assembly at Olympia. Of his abilities there is no question, but it is equally certain that he was superficial. His writings show that the epidemic of the plague was preying with the weapons of argument, to make them fertile in discussion on all subjects alike. It is said that he boasted of wearing nothing which he had not made with his own hands. Plato’s two dialogues, the Hippias major and minor, contain an expose of his methods, exaggerate no doubt for purposes of argument but written with full knowledge of the man and the class which he represented. Arist justifies their authenticity, but they must have been written by a contemporary writer (as they are mentioned in the literature of the 4th century), and undoubtedly represent the attitude of serious thinkers to the growing influence of the professional Sophists. There is, however, no question that Hippias did a real service to Greek literature by insisting on the meaning of words, the value of rhythm and literary style. He is credited with an excellent work on Homer, collections of Greek and foreign literature, and archaeological treatises, but nothing remains except the barest notes. He forms the connecting link between the first great sophists, Protagoras and Prodicus, and the innumerable eristics who brought their name into disrepute.

For the general atmosphere in which Hippias moved see Sophists; also histories of Philosophy (e.g. Windelband, Eng. trans. by Tufts, pt. 1, c. 2, §§ 7 and 8).

HIPPO, a Greek philosopher and natural scientist, classed with the Ionian or physical school. He was probably a contemporay of Archelaus and lived chiefly in Athens. Aristotle declared that he was unworthy of the name of philosopher, and, while comparing him with Thales in his main doctrine, adds that his intellect was too shallow for serious consideration. He held that the principle of all things is moisture (rëí ὕδωρ); that fire develops from water, and from fire the material universe. Further he denied all existence save that of material things as known through the senses, and was, therefore, classed among the "Atheists." The gods are merely great men canonized by popular tradition. It is said that he composed an own epitaph, wherein he claims for himself a place in the list of "the greatest of all." His writings wereiset against his own epitaph, wherein he claims for himself a place in the list of "the greatest of all." His writings were composed in verse, and were called "Weiber," or "Feminine." In the physical sciences he showed a considerable amount of knowledge.

HIPPOCRATES, an old medicinal drink or cordial, made of wine mixed with spices—such as cinnamon, ginger and sugar—and strained through woolen cloths. The early spellings usual in English was ἰποκράται, or ypocras. The word is an adaptation of the Med. Lat. Vinum Hippocraticum, or wine of Hippocrates, so called, not because it was supposed to be a receipt of the physician, but from an apothecary’s name for a strainer or sieve, “Hippocrates’ sieve” (see W. W. Skeat, Chaucer, note to the Merchant’s Tale).

HIPPOCRATES, Greek philosopher and writer, termed the "Father of Medicine," was born, according to Soranus, in Cos, in the first year of the 80th Olympiad, i.e. in 460 B.C. He was a member of the family of the Asclepiadae, and was believed to be either the nineteenth or seventeenth in direct descent from Aesculapius. It is also claimed for him that he was descended from Hercules through his mother, Phaenarete. He studied medicine under Heraclides, his father, and Herodicus of Selymbria; in philosophy Gorgias of Leontini and Democritus of Abdera were his masters. His earlier studies were prosecuted in the famous Asclepion of Cos, and probably also at Cnidus. He travelled extensively, and taught and practised his profession at Athens, probably also in Thrace, Thessaly, Delos and his native island. He died at Larissa in Thessaly, his age being variously stated as 85, 90, 104 and 109. The incidents of his life are shrouded by uncertain traditions, which naturally sprang up in the absence of any authentic record; the earliest biography was by one of the Sorani, probably Soranus the younger of Ephesus, in the 2nd century; Suidas, the lexicographer, wrote of him in the 11th, and Tzetzes in the 12th century. In all these biographies there is internal evidence of confusion; many of the incidents related are elsewhere told of other persons, and certain of them are quite irreconcilable with his character, so far as it can be judged of from his writings and from the opinions expressed of him by his contemporaries; we may safely reject, for instance, the legends that he set fire to the library of the Temple of Health at Cnidus, in order to destroy the evidence of plagiarism, and that he refused to visit Persia at the request of Artaxerxes Longimanus, during the Persian Wars, because he thought that he would in so doing be assisting an enemy. He is referred to by Plato (Protag. p. 283; Phaedr. p. 211) as an eminent military authority, and his opinion is also quoted by Aristotle. The veneration in which he was held by the Athenians serves to dissipate the calumnies which have been thrown on his character by Andreas, and the whole tone of his writings bespeaks a man of the highest integrity and purest morality.

Born of a family of priest-physicians, and inheriting all its traditions and prejudices, Hippocrates was the first to cast
superstition aside, and to base the practice of medicine on the principles of inductive philosophy. It is impossible to trace directly the influence exercised upon him by the great men of his time, but one cannot fail to connect his emancipation of medicine from superstition with the widespread power exercised over Greek life and thought by the living work of Socrates, Plato, Aeschylus, Sophocles, Euripides, Herodotus and Thucydides. It was a period of great intellectual development, and it only needed a powerful mind such as his to bring to bear upon medicine the same influences which were at work in other sciences. It must be remembered that his training was not altogether bad, although superstition entered so largely into it. He had a great master in Democritus, the originator of the doctrine of atoms, and there is every reason to believe that the various "asclepias" were very carefully conducted hospitals for the sick, possessing a curious system of case-books, in the form of votive tablets, left by the patients, on which were recorded the symptoms, treatment and result of each case. He had these records at his command; and he had the opportunity of observing the system of training and the treatment of injuries in the gymnasia. One of his great merits is that he was the first to dissociate medicine from priest-craft, and to direct exclusive attention to the natural history of disease. How strongly his mind revolted against the use of charms, amulets, incantations and such devices appears from his writings; and he has expressly recorded, as underlying all his practice, the conviction that, however diseases may be regarded from the religious point of view, they must all be scientifically treated as subject to natural laws (De aet., 29). Nor was he anxious to maintain the connexion between philosophy and medicine which had for long existed in a confused and confusing fashion. His knowledge of anatomy, physiology and pathology was necessarily defective, the respect in which the dead body was held by the Greeks precluding him from practising dissection; thus we find him writing of the tissues without distinguishing between the various textures of the body, confusing arteries, veins and nerves, and speaking vaguely of the muscles as "flesh." But when we come to study his observations on the natural history of disease as presented in the living subject, we recognize at once the presence of a great clinical physician. Hippocrates based his principles and practice on the theory of the existence of a spiritual restoring essence or principle, physis, the vita medicatrix naturens, in the management of which the art of the physician consisted. This art could, he held, be only obtained by the application of experience, not only to disease at large, but to disease in the individual. He strongly deprecated blind empiricism; the aphorism "η τέρτα σαφείρει, η ρίζαλ καλείται" (whether it be his or not), tersely expresses his position. Holding firmly to the principle, νόσους φύσεις ιστροί, he did not allow himself to remain inactive in the presence of disease; he was not a merely expectant" physician; as Sydenham puts it, his practice was "the support of enfeebled and the coercion of outrageously nature." He largely employed powerful medicines and blood-letting both ordinary and by cupping. He advices, however, great caution in their application. He placed great dependence on diet and regimen, and here, quaint as many of his directions may now sound, not only in themselves, but in the reasons given, there is much which is still adhered to at the present day. His treatise Περὶ ἀθροκών, ἡδάκτων, καὶ τόπων (Air, Waters, and Places) contains the first enunciation of the principles of public health. Although the treatises Περὶ κραίματων cannot be accepted as authentic, we find in the Προστατωτικά evidence of the acuteness of observation in the manner in which the occurrence of critical days in disease is enunciated. His method of reporting cases is most interesting and instructive. We can read how thoroughly he had separated himself from the priest-physician. Laennec, to whom we are indebted for the practice of auscultation, freely admits that the idea was suggested to him by study of Hippocrates, who, treating of the presence of morbid fluids in the thorax, gives very particular directions, by

1 "Hippocrates Caus, primus quidem ex omnibus memoria dignus, ab studio sapientiae disciplinam hanc separavit, vir et arte et facundia insigne" (Celsus, De medicina).

means of succussion, for arriving at an opinion regarding their nature. Laennec says, "Hippocrate avait tenu l'auscultation immediate." Although the treatise Περὶ νοσῶν is doubtfully from the pen of Hippocrates, it contains strong evidence of having been the work of his grandson, representing the views of the Father of Medicine. Although not accurate in the conclusions reached at the time, the value of the method of diagnosis is still preserved in the Hippocratic idea of \"the art of \" listening\" and its practice of \"Hippocratic succussion.\" The power of graphic description of phenomena in the Hippocratic writings is illustrated by the retention of the term \"facies Hippocratica\" applied to the appearance of a moribund person, pictured in the Prognostics. In surgery his writings are important and interesting, but they do not bear the same character of caution as the treatises on medicine; for instance, in the essay On Injuries of the Head, he advocates the operation \"of trephining\" more strongly and in wider classes of cases than would be warranted by the experience of later times.

The Hippocratic Collection consists of eighty-seven treatises, of which a part only can be accepted as genuine. The collection has been submitted to the closest criticism in ancient and modern times by a large number of commentators (for full list of the early commentators, see Adams, History of Medicine, 2nd ed., 1855; London, 1855). It is divided into four main sections: (1) genuine; (2) those consisting of notes taken by students and collected after the death of Hippocrates; (3) essays by disciples; (4) those utterly spurious. Littré accepts the following distinct treatises: (1) Περὶ τῶν μεγάλων ἑργάσεων τῶν Νακτήων (Hippocratic), book iii. of the Prognostics, (2) Περὶ τῶν φριστῶν ἱστρών; (3) The Aphorisms (Ἀφορίσματα); (4) The Epitomés, i. and iii. (Ἑμερολόγιοι); (5) On Regimen in Acute Diseases (Περὶ διατηρήσεως θεραπείας; (6) On Airs, Waters, and Places (Περὶ ἀθροκών, ἡδάκτων, καὶ τόπων); (7) On the Articulations (Περὶ ἀθροκών); (8) On Fractures (Περὶ γυρνώματος); (9) The Injuries of the Head (Περὶ τῶν κεφαλικῶν τραυμάτων); (10) The Oath (Ομολογία). Of these, only the Oath appears as certainly genuine the 2nd, 6th, 5th, 3rd, 7th, 8th, 9th, and 12th, and as \"provisionally accepted\" in regard to at least one several, the 1st, 10th, and 13th, and, in addition, (14) On Ulcers (Περὶ ιθών); (15) On Fistulae (Περὶ ἀφορίσμων); (16) On Hemorrhoids (Περὶ ἀσθενείας); (17) On the Scurvy (Περὶ τοῦ οίκουρρατος). Here the treatise is somewhat subjective criticism of Ermerins, the whole collection is to be regarded as spurious except Epitomés, books i. and iii. (with a few interpolations), On Airs, Waters, and Places, On Injuries of the Head, and somewhat Ermerin's of the \\"Injuries of the Head\"; the forty-one other portions of the treatise On Regimen in Acute Diseases, and the \"obviously Hippocratic\" fragments of the Canon Prognostics. Perhaps also the Oath may be accepted as genuine; its comparative antiquity is not denied. The Aphorisms are certainly late and inferior, and the other non-Hippocratic writings Ermerin may think he can distinguish the hands of no fewer than nineteen different authors, most of them anonymous, and some of them very late.

The earliest Greek edition of the Hippocratic writings is that which was published by Aldus and Aslanus at Venice in 1526 (folio); it was speedily followed by that of Probus, which is much more accurate and complete. A second, published at Venice, in 1535 (2nd and 3rd editions), and the subsequent editions, probably the best, was that of Focesia (Frankfort, 1595, 1621, Geneva, 1657), until the publication of the great works of Littre, θεωρίας κομμάτων, in 1855, followed, from 1855 to 1892, by a number of other editions, both in French and in Latin, and in all languages. These editions, accompanied by an introduction, of commentaries, medical, of these philologicales, and of proiectis philologicales, of the Epicurean and the Socratic, of the Ancient Rulers and the Ancient Philosophy, and others, as well as the treatise On the Nature and Place of Diseases, Περὶ ἀθροκών, book iii. of the Prognostics, On Airs, Waters, and Places, Epidemics, books i. and iii., Regimen, and Aphorisms. Of the works so attributed to Hippocrates the editions and translations are almost innumerable; the most recent is the edition of the Aphorisms there are said to exist as many as three hundred. For some notice of the Arabic, Syriac and Hebrew translations of works
professedly by Hippocrates (Ibukrat or Bukrat), the number of which greatly exceeds that of the extant Greek originals, reference may be made to Flügel's contribution to the article. 1 Hippocrates in the *Enyclopedia* of Ersch and Gruber. They have been partially catalouged by Fabriecius in his Bibliotheca Graeca. (J. B. T.)

**Hippocrates** (the "fountain of the horse," ὅ ἐνπο τοῦ κρήνη), the spring on Mt Helicon, in Boeotia, the site of which, like the spring there, Agrippipe, was sacred to the Muses and Apollo, and hence taken as the source of poetic inspiration. The spring, surrounded by an ancient wall, is now known as Κρυπεγοδαi or the cold spring. According to the legend, it was produced by the stamping of the hoof of Bellerophon's horse Pegasus. The same story accounts for the Hippocrene in Trozen and the spring Peirene at Corinth.

**Hippodamus**, of Miletus, a Greek architect of the 5th century B.C. It was he who introduced order and regularity into the planning of cities, in place of the chaos of intrigue and confusion. For Pericles he planned the arrangement of the harbour-town Peiraeus at Athens. When the Athenians founded Thurii in Italy he accompanied the colony as architect, and, afterwards, in 408 b.c., he superintended the building of the new city of Rhodes. His schemes consisted of series of broad, straight streets, cutting one another at right angles.

**Hippodrome** (Gr. ἱππόδρομον, from ἱππος, horse, and δρόμο, racecourse), the course provided by the Greeks for horse races. It corresponds to the Roman *circus*, except that in the latter only four chariots ran at a time, whereas ten or more contended in the Greek games, so that the width was far greater, being about 400 ft., the course being 600 to 700 ft. long. The Greek hippodrome was usually set out on the slope of a hill, and the ground taken from one side served to form the embankment on the other side. One end of the hippodrome was semicircular, and the other end square with an extensive portico, in front of which, at a lower level, were the stands for the horses and chariots. The modern hippodrome is more for equestrian and other displays than for horse racing. The Hippodrome in Paris somewhat resembles the Roman amphitheatre, being open in the centre to the sky, with seats round on rising levels.

**Hippolytus**, in Greek legend, son of Theseus and Hippolyte, queen of the Amazons (or of her sister Antiope), a famous hunter and charioteer and favourite of Artemis. His stepmother Phaedra became enamoured of him, but, finding her advances rejected, she hanged herself, leaving a letter in which she accused Hippolytus of having raped her. (The letter was found upon her body when the body was taken to an amphitheatre, Hippolytus having driven his son from his presence with curses and called upon his father Poseidon to destroy him. While Hippolytus was driving along the shore at Trozen (the scene of the Hippolyte of Euripides), a sea-monster (a bull or phoca) sent by Poseidon emerged from the waves; the horses were scared, Hippolytus was thrown out of the chariot, and was dragged along, entangled in the reins, until he died. According to a tradition of Epidauros, Asclepius restored him to life at the request of Artemis, who removed him to Italy (see Vaurius). At Trozen, where he had a special sanctuary and priest, and was worshipped with divine honours, the story of his death was denied. He was said to have been rescued by the gods at the critical moment, and to have been placed amongst the stars as the Charioteer (Auriga). It was also the custom of the Troizenian maidens to cut off a lock of their hair and to dedicate it to Hippolytus before marriage (see Frazer on Pausanias ii. 32. 1). Well-known classical parallels to the main theme are Bellerophon and Antea (or Theseein) and Peleus and Astydameia. The story was the subject of two plays by Euripides, in both of which the latter is represented by a tragedy by Seneca and of Racine's *Phèdre*. A trace of it has survived in the legendary death of the apocryphal Hippolytus, a Roman officer who was torn to pieces by wild horses as a convert to Christianity (see J. J. Döllinger, *Hip- polytus and Callistus*, Eng. tr. by A. Plummer, 1876, pp. 28-39, 51-60).

According to the older explanations, Hippolytus represented the sun, which sets in the sea (cf. the scene of his death and the story of Phaethon), and Phaethon the moon, which travels behind the sun, but is unable to overtake it. It is more probable, however, that he was a local hero famous for his chastity, perhaps originally a priest of Artemis, worshipped as a god at Trozen, where he was closely connected and sometimes confounded with Asclepius. It is noteworthy that, in a speech put into the mouth of Theseus by Euripides, the father, who of course believes his wife's story and regards Hippolytus as a hypocrite, throws up his son's pretended misogyny and asceticism (Orphism) in his teeth. This seems to point to a struggle between a new ritual and that of Poseidon, the chief deity of Trozen, in which the representative of the intruding religion meets his death through the agency of the offended god, as Orpheus (q.v.) was torn to pieces by the votaries of the jealous Dionysus. According to S. Reinach (*Archiv für Religionswissenschaft*, x., 1907, p. 47), the Trozenian Hippolytus was a horse, the hypostasis of an equestrian divinity periodically torn to pieces by the faithful, who called themselves, and believed themselves to be, horses. Death was followed by resuscitation, as in the similar myths of Adonis (the sacred boar), Orpheus (the fox), Pentheus (the fawn), Phaethon (the white sun-horse).

See Wilamowitz-Moellendorff's Introduction to his German translation of Euripides' *Hippolytus* (1891); A. Kalkmann, *De Hippolytus Euripidii* (Bonn, 1870); and Der *Darstellung der Hippolytussage* in *Archäologische Zeitung* (1883); J. E. Harrison, *Mythology and Monuments of Ancient Athens* (1891).

**Hippolytus**, a writer of the early Church. The mystery which enveloped the persons and writings of Hippolytus, 1 one of the most prolific ecclesiastical writers of early times, had some light thrown upon it for the first time about the middle of the 19th century by the discovery of the so-called *Philosophumenae* (see below). Assuring this writing to be the work of Hippolytus, the information given in it as to the author and his times can be combined with other traditional dates to form a tolerably clear picture. Hippolytus must have been born in the second half of the 2nd century, probably in Rome. Photius describes him in his *Bibliotheca* (cod. 121) as a disciple of Irenaeus, and from the context of this passage it is supposed that we may conclude that Hippolytus himself so styled himself. But this is not certain, and even if it were, it does not necessarily imply that Hippolytus enjoyed the personal teaching of the celebrated Gallic bishop; it may perhaps merely refer to that relation of his theological system to that of Irenaeus which can easily be traced in his writings. As a presbyter of the church at Rome under Bishop Calixtus I (189-217), Hippolytus was, it seems, a valuable as a teacher, and his work in the field of dogma and the church was marked by firmness and eloquence. It was at this time that Origen, then a young man, heard him preach (Hieron. *Vit. ill.* 61; cp. Euseb. *H. E.* vi. 14, 10). It was probably not long before questions of theology and church discipline brought him into direct conflict with Zephyrinus, or at any rate with his successor Calixtus I (q.v.). He accused the bishop of favouring the Christological heresies of the Monarchians, and, further, of subverting the discipline of the Church by his lax action in receiving back into the Church those guilty of gross offences. The result was a schism, and for perhaps over ten years Hippolytus stood as bishop at the head of a separate church. Then came the persecution under Maximinus the Thracian. Hippolytus and Pontius, who was then bishop, were transported in 235 to Sardinia, where it would seem that both of them died. From the so-called chronograph of the year 354 (*Catalogus Liberianus*) we learn that on the 13th of August, probably in 235, the bodies of the exiles were interred in Rome and that of Hippolytus in the cemetery on the Via Tiburtina. So we must suppose that before his death the schismatic was received again into the bosom of the Church, and this is confirmed by the fact that his memory was henceforth celebrated in the Church as that of a holy martyr. Pope Damasus I. dedicated to him one of his famous epigrams, and Prudentius (*Peristephanon*, 11) drew a highly coloured picture of his gruesome death, the details of which are certainly purely legendary: the myth of Hippolytus the son of Theseus was transferred to the Christian martyr. Of the historical Hippolytus little remained in the memory of after

1 According to the legend St Hippolytus was a Roman soldier who was converted by St Lawrence.
HIPPOLYTUS, CANONS OF

David and Goliath. A great part of the original of the Chronicle has been published by Adolf Bauer (Leipzig, 1905) from the Codex Mosaicus Graecus. The Regesta, however, are still dependent on the editions of Miller (Oxford, 1851), Duncker and Schneidewin (Göttingen, 1859), and Cruice (Paris, 1860). An English translation is to be found in the Ante-Nicene Christian Library (Edinburgh, 1868-1869).

(Leipzig, 1902); Adhemar d’Als, La Théologie de Saint Hippolyte (Paris, 1906).

HIPPOLYTUS, THE CANONS OF

This book stands at the head of a series of Church Orders, which contain instructions in regard to the choice and ordination of Christian ministers, regulations as to widows and virgins, conditions of reception of converts from heathenism, preparation for and administration of baptism, rules for the celebration of the eucharist, for fasting, daily prayers, charity suppers, memorial meals, first-fruits, &c. We shall give (1) a description of the book as we have it at present; (2) a brief statement of its relation to allied documents; (3) some remarks on the evidence for its date and authorship.

1. We possess the Canons of Hippolytus only in an Arabic version, itself made from a Coptic version of the original Greek. Attention was called to the book by Wansleben and Ludolf towards the end of the 17th century, but it was only in 1870 that it was edited by Haneberg, who added a Latin translation, and so made it generally accessible. In 1891 H. Achelis reproduced the Canons in the form of a German translation, embodying it in a synopsis of allied documents. He has rejected the traditional arrangement of the order, and consequently rearranged its contents with a free hand. In 1900 a German translation was made by H. Riedel, based on fresh MSS. These showed that the book, as hitherto edited, had been thrown into disorder by the displacement of two pages near the end; they also removed other difficulties upon which the theory of interpolation had been based. Further discoveries, to be spoken of presently, have added to our materials for the study of the book.

The book is attributed to “Hippolytus, the chief of the bishops of Rome,” and is divided into thirty-eight canons, to which short headings are prefixed. This division is certainly not original, but it is convenient for purposes of reference. Canon i. is prefatory; it contains a brief confession of faith in the Trinity, and especially in the Word, the Son of God; and it speaks of the expulsions from the temple for not teaching the people their duties, and the selection and ordination of bishops, presbyters and deacons. The bishop is chosen by the whole congregation: “one of the bishops and presbyters” is to lay hands upon him and say a prayer which he is to repeat. Afterwards he is to take his place among the other clergy. He is to offer the eucharistic service at the point where the sursum corda comes in. A presbyter is “to be ordained with the same prayer on the top with the exception of the word bishop,” but he is given no power of ordination. For bishops and deacons see c. 2. The duties of a deacon are described, and the prayer of his ordination follows (5). Canons 6-9 deal with various classes in the Church. One who has suffered punishment for the fault (6) is to be counted a presbyter without ordination: “his confession is his ordination.” Readers and sub-deacons (7) are given the Gospel, but are not ordained by laying-on of hands. A claim to ordination on the ground of great age (8) is to be rejected. Bishops are clear and the healing is from God. Widows are not ordained (9); “ordination is for men only.” Canons 10-15 describe consequences of the admission of converts. Certain occupations are incompatible with Christian life: only under compulsion may a Christian be a soldier. Canons 16-18 deal chiefly with regulations concerning women. Canon 19 is a long dealing with catechumens, and their admission to the eucharist for the newly baptized. The bishop is to be accompanied: anointed first, with the oil of exorcism, after he has said, with his face westward, “I renounce thee, O devil, and all thy following;” then with the oil of chrismation. Immediately after the immersion in the water, he declares his faith in response to an interrogatory creed; and after each of the three clauses he is immersed. After the second anointing the bishop gives thanks “for that Thou hast made ready in us the great mystery of our salvation, Thy Holy Ghost upon them, so that they may belong, each one of them, to the body of the Church”: he signs them with the cross on their foreheads, and blesses them. The eucharist then proceeds: “the bishop gives them of the body of Christ and says: This is the body of Christ, and they answer Amen”; and similarly for the cup.
Milk and honey are then given to them as being "born a second time as little children." A warning is added against eating anything before communicating with fasted and fasted three times the fast of the passover-week. Canon 23 seems as if it closed the series, speaking, as it does, of "our brethren the bishops" who in their cities have made regulations according to the commands of their predecessors: "let none of our successors alter them; because it saith that the teaching is greater than the sea, and hath no end." We pass on, however, to regulations about the sick (24) who are to be visited by the bishop, "because it is a great thing that the sick who the high-priest should visit them (for the shadow of Peter healed the sick)." Canons 25-27 deal again with prayers and church-services. The "seven hours" are specified, with the exception of the "subject-matter of poverty." It seems, however, that the subject matters of the fast are excluded at "the mysteries" (37); and a command to watch during the night of the resurrection (38). The last canon hereupon passes into a general exhortation to right living, which forms a sixth part of the whole; and the concluding remarks extend at the same time as a connected whole. It falls into two parts, and describes, first, the true life of ordinary Christians, warning them against an over-simplification and laying down many precepts of morality; and then it addresses itself to the "ascetic" who "wishes to belong to the rank of the angels," and who lives a life of solitude and poverty. He is encouraged by an exposition, on somewhat strange lines, of the temptations of our Lord, and is specially warned against spiritual pride and contempt of other men. The book closes with an appeal for love and mutual service, based on the parables in St. Matthew xxv.

It is impossible to estimate the position of the Canons of Hippolytus without some reference to allied documents (see APOSTOLICAL CONSTITUTIONS). (a) The most important of these is what is now commonly called the Egyptian Church Order. This is preserved to us in Coptic and Aethiopic versions, of which Achelis, in his synopsis, gives German translations. The subject-matter and arrangement of these canons correspond generally to those of Hippolytus; but many of the details are modified to bring them into accord with a later practice. A new light was thrown on the criticism of this work by Haug, who considered the Coptic version (published by Lagarde, and of which Rahmani (1890) has given us the whole.) It professes to contain instructions given by our Lord to the prophets after the resurrection. After an introduction containing apocalyptical matter, it passes on to give elaborate directions for the ordering of the Church, embodying, in a much-expanded form, the Egyptian Church Order, and showing a knowledge of the whole of the Greek Constitutions and of the Canons of Hippolytus. It cannot be placed with probability earlier than the latter part of the 4th century. (c) The Apostolic Constitutions is a composite document, which probably belongs to the end of the 4th century. Its first six books are an expanded edition of a Didascalia which we have already mentioned: its seventh book similarly expands and modifies the Didascalia; its eighth book begins by treating of "spiritual gifts," and then in c. 3 passes on to expand in like manner the Egyptian Church Order. The hand which has wrought up all these documents has been shown to be that of the interpreter of the Ignatian Epistles in the longer Greek recension. (d) The Canons of Basil is the title of an Arabic work, of which a German translation has been given us by Riedel, who thinks that they have come through Coptic from an original Greek book. They embody, in a modified form, considerable portions of the Canons of Hippolytus.

3. We now approach the difficult questions of date and authorship. Much of the material has been quite recently brought to light, and criticism has not had time to investigate and pronounce upon it. Some provisional remarks, therefore, are all that can prudently be made. It seems plain that we have two lines of tradition: (i) The Canons of Hippolytus, followed by the Canons of Basil; (ii) the Egyptian Church Order, itself represented (b) by the Latin version, the Testament of the Lord, and the Apostolic Constitutions, which are linked together by the same preface (or portions of it); (b) by the Coptic and Aethiopic versions. Now, the preface of the Latin version points to a time when the canons were embodied in a corpus of similar materials, or, at the least, were preceded by a work on "Spiritual Gifts." The Canons of Hippolytus have a wholly different preface, and also a long exhortation at the close. The question which criticism must endeavour to answer is, whether the Canons of Hippolytus are the original from which the Egyptian Church Order is derived, or whether an earlier body of canons lies behind them both. At present it is probably wise to assume that the latter is the true explanation. For the Canons of Hippolytus appear to contain contradictory regulations (e.g. cc. 2 and 4 of the presbyters), and also suggest that they have received a considerable supplement (after c. 23). There is, however, no doubt that they present us with a more primitive stage of Church life than we find in the Egyptian Church Order. The mention of subdeacons (which, after Riedel's fresh manuscript evidence, cannot now be dismissed as due to interpolation) makes it difficult to place them much earlier than the middle of the 3rd century.

The Puritan severity of the canons well accords with the temper of the writer to whom the Arabic title attributes them; and it is to be noted that the exhortation at the close contains a quotation from 2 Peter actually attributed to the apostle, and Hippolytus is perhaps the earliest author who can with certainty be said to have used this epistle. But the general style of Hippolytus, which is simple, straightforward, and strong in its language, is that of a copyist of the ancient orthodox canons; and the closing passage of the canons; moreover, his mind, as presented to us in his extant writings, appears to be a much larger one than that of the writer of these canons; it is as difficult to think of Hippolytus as it would be to think of Origen in such a connexion. How, then, are we to account for the attribution? There is evidence to show that Hippolytus was highly revered throughout the East; his writings, which were in Greek, were known, but his history was entirely unknown. He was supposed to be a "pupil (γνωρίσκως) of apostles" (Palladius, 4th century), and the Arabic title calls him "chief of the bishops of Rome," i.e. archbishop of Rome. It is hard to trust this attribution more than the attribution of a Coptic discourse on the Dormition Marisæ to "Eudovis, archbishop of the great city Rome, who was the second after Peter the apostle" (Texts and Studies, iv. 244)—Eudovis being by tradition first bishop of Antioch. A whole group of books on Church Order bears the name of Clement of Rome; and the attribution of our canons to Hippolytus may be only an example of the same tendency. The fact that Hippolytus writes in the Coptic language, and that such some treatise is not only referred to in the Latin preface to the Egyptian Church Order, but is actually found at the beginning of book viii. of the Apostolic Constitutions, introduces an interesting complication; but we cannot here pursue the matter further. Dom Morin's ingenious attribution of the canons to Dionysius of Alexandria (on the ground of Eusebius, H.E. vi. 45, cannot be accepted in view of the broader church policy which that writer represents. If the Hippolytian authorship be given up, it is probable that Egypt will make
the strongest claim to be the locality in which the canons were compiled in their present form.

The authorities of chief practical importance are H. Achelis, Texte u. Unters. vi. 4 (1891); Rahmani, Testamentum Domini (1899); Hauler, Didascalie Apostolorum (1900); Riedel, Kirchen- rechtsquellen des Patriarchats Alexandrinum (1900).

HIPPONAX, of Ephesus, Greek iambic poet. Expelled from Ephesus in 540 B.C. by the tyrant Athenagoras, he took refuge in Chazomenae, where he spent the rest of his life in poverty. His deformed figure and malicious disposition exposed him to the caricature of the Chian sculptors Bupalus and Athenis, upon whom he revenged himself by issuing against them a series of satires. They are said to have hanged themselves like Lycurgus and his daughters when assailed by Archilochus, the model and predecessor of Hipponax. His coarseness of thought and feeling, his rude vocabulary, his want of grace and taste, and his numerous allusions to matters of merely local interest prevented his becoming a favourite in Attica. He was considered the inventor of parody and of a peculiar metre, the sazon or choliambus, which substitutes a spondee for the final iambus of an iambic senarius, and is an appropriate form for the burlesque character of his poems.

Fragments in Bergk, Poesie lyrici Graeci; see also B. J. Peltzer, De paradoxo Gracorum poesi (1855), containing an account of Hipponax and the fragments.

HIPPOPOTAMUS ("river-horse," Gr. ἄρος, horse and ποραυδός, river), the name of the largest representative of the non-ruminating artiodactyle ungulate mammals, and its living and extinct relatives. The common hippopotamus (Hippopotamus amphibius), which formerly inhabited all the great rivers of Africa but whose range has now been much restricted, is most likely the behemoth of Scripture, and may very probably in Biblical times have been found in the Jordan valley, since at a still earlier (Pleistocene) epoch it ranged over a large part of Europe. It typifies not only a genus, but likewise a family, Hippopotamidae, distinguished from its relatives the pigs and sound; the eyes are placed high up on the head, but little below the level of the ears; while the gape is wide, and the upper lip thick and bulging so as to cover over even its large tusks when the mouth is closed. The molars, which show trefoil-shaped grinding-surfaces are well adapted for masticating vegetable substances, while the formidable array of long spear-like incisors and curved chisel-edged canines or tusks root up rank grass like an agricultural implement. The legs are short, so that the body is but little elevated above the ground; and the feet, which are small in proportion to the size of the animal, terminate in four short toes each bearing a small hoof. With the exception of a few tufts of hair on the lips, and a line of hairs on the head and neck, and at the extremity of the short robust tail, the skin of the hippopotamus, some portions of which are 2 in. in thickness, is destitute of covering. Hippopotamuses are gregarious animals, living in herds of from 20 to 40 individuals on the banks and in the beds of rivers, in the neighbourhood of which they most readily find appropriate food. This consists chiefly of grass and of aquatic plants, of which these animals consume enormous quantities, the stomach being capable of containing from 5 to 6 bushels. They feed principally by night, remaining in the water during the day, although in districts where they are little disturbed they are less exclusively aquatic. In such remote quarters, they put their heads boldly out of the water to blow, but when removed suspicious they become exceedingly cautious in this respect, only exposing their nostrils above the water, and even this they prefer doing amid the shelter of water plants. In spite of their enormous size and uncouth form, they are expert swimmers and divers, and can remain easily under the water from five to eight minutes. They walk on the bottoms of rivers, beneath at least 1 ft. of water. At nightfall they come on land to feed; and when, as often happens on the banks of the Nile, they reach cultivated ground, they do immense damage to growing crops, destroying by their ponderous tread even more than they devour. To man away these unwelcome visitors the natives in such districts are in the habit of kindling fires at night. Although hippopotamuses do not willingly go far from the water on which their existence depends, they occasionally travel long distances by night in search of food, and in spite of their clumsy appearance are able to climb steep banks and precipitous ravines with ease. Of a wounded hippopotamus which Sir S. Baker saw leaving the water and galloping inland, he writes: "I never could have imagined that so unwieldy an animal could have exhibited such speed. No man could have had a chance of escape." The hippopotamus does not confine itself to rivers and lakes, but has been known to prefer the waters of the ocean as its home during the day. Of a mild and inoffensive disposition, it seeks to avoid collision with man; when wounded, however, or in defence of its young, it exhibits great ferocity, and native canoes are capsized and occasionally demolished by its infuriated attacks; the bellowing grunt then becoming loud enough to be heard a mile away. As among elephants, so also among hippopotamuses there are "rogues"—old bulls which have become sour in solitude, and are at all times dangerous. Assuming the offensive on every occasion, they attack all and sundry without shadow of provocation; and the natives avoid their haunts, which are usually well known.

The only other living species is the pygmy hippopotamus, H. (Choeropsis) liberiensis, of West Africa, an animal not larger than a clumsily made pig of full dimensions, and characterized by having generally one (in place of two) pair of incisors. It is much less aquatic than its giant relative, having, in fact, the habits of a pig.

A small extinct species (H. lemerlei) inhabited Madagascar at a comparatively recent date; while other dwarf kinds were natives of Crete (H. minitus) and Malta and Sicily (H. penlandi) during the Pleistocene. A large form of the ordinary species (H. amphibius major) was distributed over Europe as far north as Yorkshire at the same epoch; while an allied species (H. palaeindicus) inhabited Pleistocene India. Contemporary with the latter was, however, a species (H. namadicus) with three pairs of incisors; and "hexaproodont" hippopotamuses are

The Hippopotamus (Hippopotamus amphibius).
also characteristic of the Pliocene of India and Burma (H. sivalensis and H. triverticidus), and of Algeria, Egypt and southern Europe (H. hippocinessus).

For the ancestral genera of the hippopotamus line, see Artiodactyla (R. L.).

**Hippuric Acid** (Gr. ἱππος, horse, ἱππόρος, urine), benzoyl glycocol or benzoyl amideoxyceic acid, C₇H₈NO₃ or C₇H₈CO-NH-CH₂-CO₂H, an organic acid found in the urine of horses and other herbivores. It is excreted when many aromatic compounds, such as benzonic acid and toluene, are taken internally. J. v. Liebig in 1839 showed that it differed from benzonic acid, and in 1839 determined its constitution, while in 1853 V. Dessainges (Ann. 87, p. 337) synthesized it by acting with benzoyl chloride on glycocollic acid. It also takes part in heating benzoyl anhydride with glycocol (Th. Curtius, Ber., 1884, 17, p. 1662), and by heating benzamide with monochloracetic acid. It crystallizes in rhombic prisms which are readily soluble in hot water, melt at 187° C. and decompose at about 240° C. It is readily hydrolysed by hot caustic alkalis to benzonic acid and glycocol. Nitrous acid converts it into benzoyl glycolic acid, C₇H₈CO-O-CH₂-CO₂H. Its ethyl ester reacts with hydrangea to form hippuryl hydrangea, C₇H₈CO-NH-CH₂-CO₂NH₂, which was used by Curtius for the preparation of azemide (q.v.).

**Hirurnias**, a tribe of South American Indians, 2000 or 3000 in number, living on the river Purus, western Brazil. Their houses are long, low and narrow; the side walls and roof are one, poles being fixed in the ground and then bent together so as to meet and form a pointed arch for the cross-sections. They use small bark canoes. Their chief weapons are poisoned arrows. They have a native god called Guinintir.

**Hira**, the capital of an Arabian kingdom, founded in the 2nd century A.D., on the western edge of Irak, was situated at 35° N., 44° 20′ E., about 4 m. S.E. of modern Nejef, by the Sa'ade canal, on the shore of the Bahr Nejef or Assyrium Stagnum. Its kings governed the western shore of the lower Euphrates and of the Persian Gulf, their kingdom extending inland to the confines of the Nejef. This Lakhmid kingdom was more or less independent, during the four centuries of its existence, on the Sassanian empire, to which it formed a sort of buffer state towards Arabia. After the battle of Osakaia and the founding of Kuwa by the Arabs, Hira lost its importance and fell into decay. The ruin mounds covering the ancient site, while extensive, are insignificant in appearance and give no indications of the existence of important buildings.

**Hirado**, an island belonging to Japan, 103 m. long and 6 m. wide, lying off the west coast of the province of Hiizu, Kishiu, in 13° 15′ N. and 129° 25′ E. It is celebrated as the site of the original Dutch factory—often erroneously written Firanido—and as the place where one of the finest blue-and-white porcelains of Japan (Hiradoyaki) was produced in the 17th and 18th centuries. The kilns are still active.

**Hire-Purchase Agreement**, in the law of contract, a form of bailment of goods, on credit, which has extended very considerably of late years. Originally applied to the sale of the more expensive kinds of goods, such as pianos and articles of furniture, the hire-purchase agreement has now been extended to almost every description. The agreement is usually in writing, with a stipulation that the payments to purchase shall be by weekly, monthly or other instalments. The agreement is virtually one to purchase, but in order that the vendor may be able to recover the goods at any time on non-payment of an instalment, it is treated as an agreement to let and hire, with a provision that when the last instalment has been paid the goods shall become the property of the hirer. A clause provides that in case of default of any instalment, or breach of any part of the agreement, all previous payments shall be forfeited to the lender, who can forcibly recover the goods. Such agreements, therefore, do not pass the property in the goods, which remains in the lender until all the instalments have been paid. But the terms of the agreement are such that if the hire-purchase company limits the principles of the transaction between the parties, where, for example, the hire-purchase is merely to create a security for money. In such a case a judge will look to the true nature of the transaction. If it is not a real letting and hiring, the agreement will require registration under the Bills of Sale Acts. If the agreement contains words to the effect that the hirer has "bought or agreed to buy" goods, the transaction comes under the Factors Act 1889, and the person in possession of the goods may dispose of them and give a good title. The doctrine of repledged ownership, by which a bankrupt is deemed the reputed owner of goods in his apparent possession, has been somewhat modified by trade customs, in accordance with which property is frequently let out on the hire-purchase system (see Bankruptcy).

**Hiring** (from O. Eng. *hýrian*, a word common to many Teutonic languages cf. Ger. *heuern*, Dutch *huren*, &c.), in law, a contract by which one man grants the use of a thing to another in return for a certain price. It corresponds to the locatio-conducatio of Roman law. That contract was either a letting of a thing (locatio-conducatio rei) or of labour (locatio operorum). The distinguishing feature of the contract was the price. Thus the contracts of *mutuum*, commodatum, depositum and mandatuum, which are all gratuitous contracts, become, if a price is fixed, cases of locatio-conducatio. In modern English law the term can scarcely be said to be used in a strictly technical sense. The contract by which the Roman owner or proprietor transferred the head of locatio-conducatio—such as those of landlord and tenant, master and servant, &c.—are not in English law treated as cases of hiring but as independent varieties of contract. Neither in law books nor in ordinary discourse could a tenant farmer be said to hire his land. Hiring would generally be applied to contracts in which the services of a man or the use of a thing are engaged for a short time.

**Hiring Fairs**, or Statute Fairs, still held in Wales and some parts of England, were formerly an annual fixture in every country town. These fairs served to bring together masters and servants. The men and maidens seeking work stood in rows, the males together and the females together, while masters and mistresses walked down the lines and selected those who suited them. Originally these hiring-fairs were always held on Martinmas Day (11th of November). Now they are held on different dates in different towns, usually in October or November. In Cumberland the men seeking work stood with straws in their mouths. In Lincolnshire the bargain between employer and employed was closed by the giving of the "fasten-penny," the earnest money, usually a shilling, which "fastened" the contract for a twelvemonth. Some few days after the Statute Fair it was customary to hold a second called a Mop Fair or Runaway Mop. "Mop" (from Lat. *mappa*, napkin, or small cloth) meant in Old English a tuft or tassel, and the fair was so called, it is suggested, in allusion to tufts or badges worn by those seeking employment. Thus the carter wore whipcord on his hat, the cowherd a tuft of cow's hair, and so on. Another possible explanation would be to take the word "mop" in its old provincial slang sense of "a fool," mop fair being the fools' fair, a sort of last chance offered to those who were too dull or slovenly-looking to be hired at the statute fair. Perhaps "runaway" suggests the idea of those absent through drunkenness, or those who simply feared to face the ordeal of the larger hiring and so ran away.

**Hirosaki**, a town of Japan in the province of Michimoku or Rikuchu, north Nippon, 22 m. S.W. of Aomori by rail. Pop. about 37,000. The fine isolated cone of Iwakisan, a mountain of pilgrimage, rises to the west. Hirōsaki is a very old place, formerly residence of a great daimio (or daimyo) and capital of a vast principality, and still the seat of a high court with jurisdiction over the surrounding districts of Aomori and Akita. Like most places in north Nippon, it is built with continuous verandas extending from house to house, and affording a promenade completely sheltered from the snows of winter. Apples of fine flavour grow in the district, which also enjoys some reputation for its peculiar green lacquer-ware.}
HIROSHIMA—HIRSCH, M. DE

HIROSHIMA, a city and seaport of Japan, capital of the government of its name in central Nippon. (Pop. 1903) 113,545. It is very beautifully situated on a small plain surrounded by hills, the bay being studded with islands. In its general aspect it resembles Osaka, from which it is 190 m. W. by rail, and next to that place and Hligo it is the most important commercial centre on the inland Sea. The government has an area of about 3000 sq. m., with a population of about 1,500,000. Hiroshima is famous all over Japan owing to its association with the neighbouring islet of Itaku-shima, "Island of Light," which is dedicated to the goddess Benten and regarded as one of the three wonders of Japan. The chief temple dates from the year 387, and the island, which is inhabited largely by priests and their attendants, is annually visited by thousands of pilgrims. But the hallowed soil is never tilled, so that all provisions have to be brought from the surrounding districts.

HIRPINI (from an Oscan or Sabine stem hirpo—"wolf"), an inland Samnite tribe in the south of Italy, whose territory was bounded by that of the Lucani on the S., the Campani on the S.W., the Appuli (Apuli) and Frentani on the E. and N.E. On the N. we find them, politically speaking, identified with the Pentri and Caraceni, and with them constituting the Samnite alliance in the Wars of the 4th century B.C. (see SAMNITES). The Roman policy of separation cut them off from these allies by the foundation of Beneventum in 266 B.C., and henceforward they are a separate unit; they joined Hannibal in 216 B.C., and retained their independence until, after joining in the Social war, which in their part of Italy can hardly be said to have ceased till the Roman victory at Fidenae, they were incorporated into the Roman franchise. Of their own speech, besides the evidence of their place-names, only a few fragments survive (R. S. Conway, The Italic Dialects, pp. 170 f.; and for hirpo, ib. p. 200). In the ethnology of Italy the Hirpinii appear from one point of view as the purest type of Saanine stock, namely, that in which the proportion of ethnica formed with the suffix -no-is highest, thirty-three out of thirty-six tribal or municipal epithets being formed thereby (e.g. Caudini, Companii) and only one with the suffix -li (Abellinites), where it is clearly secondary. On the significance of this see SABINI. (R. S.C.)

HIRSAU (formerly Hirschau), a village of Germany, in the kingdom of Württemberg, on the Nagold and the Pforzheimer-Horb railway, 2 m. N. of Calw. Pop. 800. Hirsa has some small manufactures, but it owes its origin and historical interest to the former Benedictine monastery, Monasterium Hirsaugensis, at one period one of the most famous in Europe. Its picturesque ruins, of which only the chapel with the library hall are still in good preservation, testify to the primitive grandeur of the establishment. It was founded about 830 by Count Erfalried of Calw, at the instigation of his son, Bishop Noting of Vercelli, who enriched it with, among other treasures, the body of St. Aurelius. Its first occupants (838) were a colony of fifteen monks from Fulda, disciples of Hrabanus Maurus and Walafrid Strabo, headed by the abbot Liudebert. During about a century and a half, under the fostering care of the counts of Calw, it enjoyed great prosperity, and became an important seat of learning; but towards the end of the 11th century the ravages of the pestilence combined with the incapacity of its patrons, and the selfishness and immorality of its inmates, to bring it to the lowest ebb. After it had been desolate and in ruins for upwards of sixty years it was rebuilt in 1596, and under Abbot William—Wilhelm von Hirsa—abbot from 1669 to 1691, it more than regained its former splendour. By his Constitutions Hirsaugienses, a new religious order, the Ordo Hirsaugensis, was formed, the rule of which was afterwards adopted by many monastic establishments throughout Germany, such as those of Blaubeuren, Erfurt and Schaffhausen. The friars and correspondent of Pope Gregory VII., and of Anselm of Canterbury, Abbot William took an active part in the politico-cidential controversies of his time; while a treatise from his pen, De musica et tonis, as well as the Philosophicarum et astronomicarum institutionum libri iii., bears witness to his interest in science and philosophy. About the end of the 12th century the material and moral welfare of Hirsa was again very perceptibly on the decline; and it never afterwards rose into importance. In consequence of the Reformation it was secularised in 1558; in 1692 it was laid in ruins by the French. The Chronicle Hirsaugienses, or, as in the later edition it is called, Annales Hirsaugensienses of Abbot Trihemius (Basel, 1550; St. Gall, 1690), is, although containing much that is merely legendary, an important source of information, not only on the affairs of this monastery, but also on the early history of Germany. The Codex Hirsaugensis was edited by A. F. Gröber and printed at Stuttgart in 1843.

See Steck, Das Kloster Hirsau (1844); Helmsdörfer, Forschungen zur Geschichte des Abts Wilhelm von Hirsau (Göttingen, 1874); Les Führer durch die Geschichte des Klosters Hirsau (Stuttgart, 1868); Siebmacher, Forbach, Das Kloster Hirsau (Halle, 1903); Giese, Die Hirschart während des Investiturstreits (Gotha, 1883); H. Klaiber, Das Kloster Hirsau (Tübingen, 1886); and Buer, Die Hirsauers Bauschule (Freiburg, 1897).

HIRSCH, MAURICE DE, BARON HIRSCH AUF GEREUTH, in the baronage of Bavaria (1831—1896), capitalist and philanthropist (German by birth, Austro-Hungarian by domicile), was born at Munich, 9th December 1831. His grandfather, the first Jewish landowner in Bavaria, was ennobled with the prädikat "auf Gereuth" in 1818; his father, who was banker to the Bavarian king, was created a baron in 1869. The family for generations has occupied a prominent position in the German Jewish community. At the age of thirteen young Hirsch was sent to Brussels to school, but when seventeen years old he went into business. In 1855 he became associated with the banking house of Bischoffstein & Co. in Dresden, and in 1857 with Sulla & Co. of Würzburg, and in 1862 with Dr. Weckesser of Vienna. He took active part in the banking business, and became a large fortune, which he increased by purchasing and working railway concessions in Austria, Turkey and the Balkans, and by speculations in sugar and copper. While living in great splendour in Paris and London and on his estates in Hungary, he devoted much of his time to schemes for the relief of his Hebrew co-religionists in lands where they were persecuted and oppressed. He took a deep interest in the educational work of the Alliance Israélite Universelle, and on two occasions presented the society

HIROSHIMA—HIRSCH, M. DE

color-prints. His family name was Andō Tokitarō; that under which he is known having been, in accordance with Japanese practice, adopted by him in recognition of the fact that he was a pupil of Toyohiro. The earliest reference to him is to the account given by an inhabitant of the Lu-chu islands of a visit to Japan; where a sketch of a procession drawn, with great skill by Hiroshige at the age of ten years only is mentioned as one of the remarkable sights. At the age of fifteen he applied unsuccessfully to be admitted to the studio of the elder Toyokuni; but was eventually received by Toyohiro. On the death of the latter in 1828, he began to practise on his own account, but finding small encouragement at Yedo (Tokyo) he removed to Kiōto, where he published a set of landscapes. He soon returned to Yedo, where his work soon became popular, and was imitated by other artists. He died in that city on the 6th day of the 9th month of the year, Ansei 5th, at the age of sixty-two, and was buried at Asakusa. One of his pupils, Hironobu, received from him the name of Hiroshige II. and another, Andō Tokukubē, that of Hiroshige III. All three were closely associated with the work signed with the name of the master. Hiroshige II. some time after the year 1863 fell into disgrace and was compelled to leave Yedo for Nagasaki, where he died; Hiroshige III. then called himself Hiroshige II. He died in 1856. The earlier prints by these artists, whose work can hardly be separated, are of extraordinary merit. They applied the process of colour block printing to the purposes of depicting landscape, with a breadth, skill and suitability of convention that has been equalled only by Hokusai in Japan, and by no European. Most of their subjects were derived from the neighbourhood of Yedo, or were scenes on the old high road—the 'Tokaidō—that ran from that city to Kiōto. The two elder of the name were competent painters, and pictures and drawings by them are occasionally to be met with.

with gifts of a million francs. For some years he regularly paid the deficits in the accounts of the Alliance, amounting to several thousand pounds a year. In 1889 he capitalized his donations and presented the society with securities producing an annual income of £16,000. On the occasion of the fortieth anniversary of the emperor Francis Joseph’s accession to the Austrian throne he gave £300,000 for the establishment of primary and technical schools in Galicia and the Bukowina. The greatest charitable enterprise in which he embarked was in connexion with the persecution of the Jews in Russia (see Anti-Semitism). He gave £10,000 to the funds raised for the repatriation of the refugees in 1882, but, feeling that this was a very lame contribution to the efforts made in western Europe for the relief of the Russian Jews, he offered the Russian Government £2,000,000 for the endowment of a system of secular education to be established in the Jewish pale of settlement. The Russian Government was willing to accept the money, but declined to allow any foreigner to be concerned in its control or administration. Thereupon Baron de Hirsch resolved to devote the money to the establishment of a colonization scheme which should afford the persecuted Jews opportunities of establishing themselves in agricultural colonies outside Russia. He founded the Jewish Colonization Association as an English society, with a capital of £5,000,000, and in 1892 he presented it a further sum of £7,000,000. On the death of his wife in 1890 the capital was increased to £11,000,000, of which £4,250,000 went to the Treasury, after some litigation, in death duties. This enormous fund, which is probably the greatest charitable trust in the world, is now managed by delegates of certain Jewish societies, chiefly the Anglo-Jewish Association of London and the Alliance Israélite Universelle of Paris, among whom the shares in the association have been divided. The association, which is prohibited from working for profit, possesses large colonies in South America, Canada and Asia Minor. In addition to its vast agricultural work it has a gigantic and complex machinery for dealing with the whole problem of Jewish persecution, including emigration and distributing agencies, technical schools, co-operative factories, savings and loan banks and model dwellings in the congested Russian Jewries. It also subventions and assists a large number of societies all over the world whose work is connected with the relief and rehabilitation of Jewish refugees. Besides this great organization, Baron de Hirsch founded in 1891 a benevolent trust in the United States for the benefit of Jewish immigrants, which he endowed with $400,000. His minor charitable works were on a princely scale, and during his residence in London he distributed over £100,000 among the local hospitals. It was in this manner that he disposed of the wealth he derived from success on the English turf, of which he was a lavish patron. He raced a horse, himself, “for the London hospitals,” and in 1892, when his filthy, La Flecche, won the Oaks, St Leger and One Thousand Guineas, his donations from this source amounted to about £40,000. Baron de Hirsch married on 28th June 1855 Clara, daughter of Senator Bischoffsheim of Brussels (b. 1833), by whom he had a son and daughter, both of whom predeceased him. He died at Ogylina, near Komorn, in Hungary, 21st April 1866. The barrenness, who seconded her husband’s charitable work with great munificence—their total benefactions have been estimated at $18,000,000,—died at Paris on the 1st of April 1890.

For details of Baron de Hirsch’s chief charities see the annual reports of the Alliance Israélite Universelle and of the “Administration Centrale” of the Jewish Colonization Association. (L. W.)

HIRSCH, SAMSON RAPHAEL (1808–1888), Jewish theologian, was born in Hamburg in 1808 and died at Frankfurt-on-the-Main in 1888. He opposed the reform tendency of Geiger (q.v.), and presented Jewish orthodoxy in a new and attractive light. His philosophical conception of tradition, associated as it was with conservatism in ritual practice, created what is often known as the Frankfurt “Neo-Orthodoxy.” Hirsch exercised a profound influence on the Synagogue and undoubtedly stemmed the tide of liberalism. His famous Nineteen Letters (1836), with which the Neo-Orthodoxy began, were translated into English by Drachmann (New York, 1890). Other works by Hirsch were Horeb, and commentaries on the Pentateuch and Psalms. These are marked by much originality, but their exegesis is fanciful. Three volumes of his essays have been published (1902–1908); these were collected as Gesammelte Schriften from his periodical Jeschurun.

HIRSCHBERG, a town of Germany, in the Prussian province of Silesia, beautifully situated at the confluence of the Bober and Zacken, 1120 ft. above the sea-level, 48 m. S.E. of Görlitz, on the railway to Glazt, with branches to Grünthal and Schmildeberg. Pop. (1905) 10,317. It is surrounded by pleasant promenades occupying the site of its former fortifications. It possesses an Evangelical church, the church of the Holy Cross, one of the six Gnaden Kirchen for the Silesian Protestants stipulated for in the agreement at Altranstädt between Charles XII. of Sweden and the emperor Joseph I. in 1707, four Roman Catholic churches, one of which dates from the 14th century, a synagogue, several schools, an orphanage and an asylum. The town is the principal emporium of commerce in the Silesian mountains, and its industries include the carding and spinning of wool, and the manufacture of linen and cotton fabrics, yarn, artificial flowers, paper, cement, porcelain, sealing-wax, blacking, chemicals and cider. There is also a lively trade in corn, wine and agricultural produce. The town is celebrated for its romantic surroundings, including the Cavallenberg, from which there is a splendid view, the Hausberg, the Heilcon, crowned by a small Doric temple, the Kreuzberg, with walks commanding beautiful views, and the Salter ravine, over which there is a railway viaduct. Hirschberg was in existence in the 11th century, and obtained town rights in 1189 from Duke Boleslaus of Poland. It withstood a siege by the Hussites in 1427, and an attack of the imperial troops in 1640. The foundation of its prosperity was laid in the 16th century by the introduction of the manufacture of linen and veils.

Hirschberg is also the name of a town of Thuringia on the Saale, with manufactures of leather and knives. Pop. 2000.

HIRSON, a town of northern France in the department of Ainse, 35 m. by rail N.E. of Lyon, on the Oise. Pop. (1906) 8335. It occupies an important strategic position close to the point of intersection of several railway lines, and not far from the Belgian frontier. For its defence there are a permanent fort and two batteries, near the railway junction. The town carries on the manufacture of glass bottles, tiles, iron and tin goods, wool-spinning and brewing.

HIRTIUS, AULUS (c. 90–33 B.C.), Roman historian and statesman, was with Julius Caesar as legate in Gaul, but after the civil war broke out in 40 he seems to have remained in Rome to protect Caesar’s interests. He was also a personal friend of Cicero. He was nominated with C. Vibius Pansa by Caesar for the consulsiphip of 43; and after the dictator’s assassination in March 44, he and his colleague supported the senatorial party against M. Antonius, with whom Hirtius had at first sided. The consuls set out for Mutina, where Antonius was besieging Decimus Brutus. On the 15th of April, Pansa was attacked by Antonius at Forum Gallorum, about 8 m. from Mutina, and lost his life in the engagement; however, compelled Antonius to retire on Mutina, where another battle took place (or 27th) of April, in which Hirtius was slain. Of the continuations of Caesar’s Commentaries—the eighth book of the Gallic war, the history of the Alexandrian, African and Spanish wars—the first is generally allowed to be by Hirtius; the Alexandrian war is perhaps by him (or Oppius); the last two are supposed to have been written at his request, by persons who had taken part in the events described, with a view to subsequent revision and incorporation in his proposed work on military commanders. The language of Hirtius is good, but his style is monotonous and lacks vigour. The Hirtius and the other continuators of Caesar are discussed in M. Schanz, Geschichte der römischen Literatur, i.; also R. Schneider, Bullarium Augustanum (1905). For the history of the period see under Antonius: Cicero’s Letters to Tyrell and Purser; G. Boies, Cicero and his Friends (Eng. transl., 1879).

HISHM IBN AL-KALBI [Abū al-Mundhir Hishām ibn Māḥommūd ibn us-Sā’īb al-Kalbī] d. c. 819), Arabic historian,
HISPPELLUM—HISSAR

was born in Kufa, but spent much of his life in Bagdad. Like his father, on whose authority he relied largely, he collected information about the genealogies and history of the ancient Arabs. According to the Fihrist (see NaDiM) he wrote 140 works. Although independent works he has almost entirely ceased, but his account of the genealogies of the Arabs is continually quoted in the Kitāb al-Aghani.

Large extracts from another of his works, the Kitāb al-AsnaM, are contained in the Khdīnāt al-Abîb (iii. 242-246) and in the geography of Yāqūt (q.v.). These latter have been translated with comments by J. Wellhausen in his Reste des arabischen Heidentums (2 ed. Berlin, 1891).

HISPPELLUM (mod. Spello, q.v.), an ancient town of Umbria, Italy, 3 m. N. of Fulginia, on the road between it and Perugia, 1303 ft. above sea-level. It does not appear to be mentioned before the time of Augustus, who founded a colony there (Colonia Iulia Hispellum) and extended its territory to the springs of the Clitumnus, which had originally belonged to the territory of Mevania. It received the name of Flavia Constans by a rescript of the emperor Constantine, a copy of which on a marble tablet is still preserved at Spello. The gate by which the town is entered is ancient and is thought to have been the gate of Bochara, who divided the city into two parts and a part of the town, with another gate and a part of the city wall, built of rectangular blocks of local limestone, may still be seen, as also the ruins of what is possibly a triumphal arch (attributed to Augustus) and an amphitheatre, and perhaps, of a theatre, close to the modern high-road, outside the town. (T. As.)

HISSAR, a district in Central Asia, lying between 66° 30' and 70° E. and 36° 15' and 37° N. and dependent on the amir of Bokhara. It forms that part of the basin of the Amu-darya or Oxus which lies on the north side of the river, opposite the Afghan province of Balkh. The western prolongation of the Tian-shan, which divides the basin of the Zarafshan from that of the upper Amu, rising to a height of 12,300 ft., bifurcates in 67° 45' E. The main chain, the southern arm of this bifurcation, designated the Hisar range, but sometimes called Koh-i-tau, forms the N. and N.W. boundaries of Hissar. On the W. it is wholly bounded by the desert; the Amu limits it on the S. and S.E.; and Karateghin and Darvaz complete the boundary on the E. Until 1875 it was one of the least known tracts of Central Asia. Hisar is traversed from north to south by four tributaries of the Amu, viz. the Surkhāb or Vakhsh, Kafirnīnān, Surkhan and Shirabad-darya, which descend from the snowy mountains to the north and form a series of fertile valleys, disposed in a fan-shape, within which lie the principal towns. In the N.W. boundary range between Khuzar and Derbent is situated the defile formerly called the Iron Gate (Caspian Gates, Bāb al-Hasid, Dar Ahanin and in Chinese T‘e-mên-kuan) but now styled Bughol-khana or the Goat-house. It was also called Kohlug, said to be a Mongol word meaning barrier. This pass is described as a deep but narrow chasm in a transverse range, whose rocks overhang and threaten to choke the tortuous and gloomy corridor (in places but five paces wide) which affords the only exit from the valley. In ancient times it was a vantage point of much importance and commanded one of the chief routes between Turkestan and India. Hisan Tāng, the Chinese traveller, who visited China (mod. Khotan) in 242-246 A.D., passed through it in the 7th century, states that there were then two folding doors or gates, cased with iron and hung with bells, placed across the pass. Clavijo, the Spanish ambassador to the court of Timur, heard of this when he passed through the defile nearly 800 years later, but the gates had then disappeared.

The Surkhan valley is highly cultivated, especially in its upper portion. It supplies Bokhara with corn and sheep, but its chief products are rice and flax. The town of Hissar (pop. 15,000) commands the entrance into the fertile valleys of the Surkhan and Kafirnīnān, just as Kabadān at the southern end of the Taghchar Damdefends them from the south. Hisar was very famous for its damascened swords and its silk goods. Kulab produces wheat in abundance, and gold is brought thither from the surrounding districts. Kabadān is a large, silk-producing town, and is surrounded with rice-fields.

The population consists principally of Uzbegs and Tajiks, the former predominating and gradually pushing the Tajiks into the hills. On the banks of the Amu there are Turkomans who work the ferries, drive sheep and accompany caravans. Lyuli (gypsies), Jews, Hindus and Afghans are other elements of the population. The climate of the valleys of Hissar and Kulub is pleasant, as they are protected by mountains to the north and open towards the south. They produce all the cereals and garden plants indigenous to Central Asia. Cotton is grown in the district of Shirabad; and cotton, wheat, flax, sheep and rock-salt are all exported.

HISTORY.—This country was anciently part of the Persian empire of the Achaemenidæ, and probably afterwards of the Graeco-Bactrian kingdom, and then subject to the invading Asiatic tribes who broke up that kingdom, e.g. the Yue-chi. It was afterwards conquered by the Ephthalites or White Huns, who were subdued by the Turks in the early part of the 7th century. It then became subject successively to the Mahomedan invaders from Persia, and after to the Mongol dynasty of Jenghiz Khan, and to Timur and his successors. It subsequently became a cluster of Uzbek states and was annexed to the empire of Timur, or to parts of it, in 1356. It was conquered by the famous Irish adventurer George Thomas, who built a fort and collected inhabitants. It is now chiefly known for its cattle and horse fairs, and has a cotton factory.

The District comprises an area of 5217 sq. m. It forms the western border district of the great Bikanir desert, and consists for the most part of sandy plains dotted with shrub and brushwood, and broken by undulations towards the south, which rise into hills of rock like islands out of a sea of sand. The Ghaggar is its only river, whose supply is uncertain, depending much on the fall of rain in the lower Himalayas; its overflow in times of heavy rain is caught by jhils, which dry up in the hot season. The Western Jumna crosses the district from east to west, irrigating many villages. The soil is in places hard and clayey, and difficult to till; but when sufficiently irrigated it is highly productive. Old mosques and other buildings exist in parts of the district. Hissar produces a breed of large milk-white oxen, which are in great request for the carriages of natives. The district has always been subject to famine. The first calamity of this kind of which there is authentic record was in 1783; and Hissar has suffered severely in more recent famines. Its population in 1901 was 751,717, showing practically no increase in the decade, whereas in the previous decade there had been an increase of 35.5%. The climate is very dry, hot westerly winds blowing from the middle of March till July. Cotton weaving is the principal occupation of the people.

The chief trading centres are Bhiwani, Hansi, Hissar and Sirsa.

Before the Mahomedan conquest, the semi-desert tract of which Hissar district now forms part was the retreat of Chauhan Rajputs. Towards the end of the 18th century the Bhatis of Bhattiana gained ascendancy after bloody struggles. To complete the ruin brought on by these conflicts, nature lent her aid in the great famine of 1783. Hissar passed nominally to the British in 1803, but they could not enforce order till 1816. Early in the mutiny of 1857 Hissar was wholly lost for a time to British rule, and all Europeans were either murdered or compelled to fly. The Bhati rose under their hereditary chiefs, and the majority of the Mahomedan population followed their example. Before Delhi had been recovered, the rebels were utterly routed.
HISTIAEUS—HISTORY

HISTIAEUS (d. 494 B.C.), tyrant of Miletus under the Persian king Darius Hystaspis. According to Herodotus he rendered great service to Darius while he was campaigning in Scythia by persuading his fellow-despots not to destroy the bridge over the Danube by which the Persians must return. Choosing his own reward for this service, he became possibly the first tyrant near Myrcinus (afterwards Amphipolis), rich in timber and minerals. The success of his enterprise led to his being invited to Susa, where in the midst of every kind of honour he was virtually a prisoner of Darius, who had reason to dread his growing power in Ionia. During this period the Greek cities were left under native despots supported by Persia, Aristogoras, son-in-law of Histiaeus, being ruler of Miletus in his stead. This prince, having failed against Naxos in a joint expedition with the satrap Artaphernes, began to stir up the Ionians to revolt, and this result was brought to pass, according to Herodotus, by a secret message from Histiaeus. The revolt assumed a formidable character and Histiaeus persuaded Darius that he alone could quell it. He was allowed to leave Susa, but on his arrival at the coast found himself suspected by the satrap, and was ultimately driven to establish himself (Herodotus says as a pirate; more probably in charge of the Bosporus route) by Byzantium. After the total failure of the revolt at the battle of Lade, he made various attempts to re-establish himself, but was captured by the Persian Harpagus and crucified by Arachtemus at Sandis. His head was embalmed and sent to Darius, who gave it honourable burial.

The theory of Herodotus that the Ionian revolt was caused by the single message of Histiaeus is incredible; there is evidence to show that the Ionians had been meditating since about 512 a patriotic revolt against the Persian domination and the "tyrants" on whom it rested (see Grote, Hist. of Greece, ed. 1907, especially p. 122 note; art. Ionia, and authorities; also S. Heinlein in Klio, 1909, pp. 341-351).

HISTOLOGY (Gr. ἱστολογία, web, tissue, properly the web-beam of the loom, from ἱστός, to make to stand), the science which deals with the structure of the tissues of plants and animals (see CYTOLOGY).

HISTORY. The word "history" is used in two senses. It may mean either the record of events, or events themselves. Originally (see below) limited to inquiry and statement, it was only in comparatively modern times that the meaning of the word was extended to include the phenomena which form or might form their subject. It was perhaps by a somewhat careless transposition that this extension was brought about. Now indeed it is the commoner meaning. We speak of the "history of England" without reference to any literary narrative. We term kings and statesmen the "makers of history," and sometimes say that the historian only records the history which they make. History in this connexion is obviously not the record, but the thing to be recorded. It is unfortunate that such a double meaning of the word should have grown up, for it is productive of not a little confusion of thought.

History in the wider sense is all that has happened, not merely all the phenomena of human life, but those of the natural world as well. It includes everything that undergoes change; and as modern science has shown that there is nothing absolutely static, therefore the whole universe, and every part of it, has its history. The discovery of ether brought with it a reconstruction of our ideas of the physical universe, transferring the emphasis from the mathematical expression of static relationships to a dynamic conception of a universe in constant transformation; matter in equipoise became energy in gradual readjustment. Solids are solids no longer. The universe is in motion in every particle of every part; rock and metal merely a transition stage between crystallization and dissolution. This idea of universal activity has in a sense made physics itself a branch of history. It is the same with the other sciences—especially the biological division, where the doctrine of evolution has induced an attitude of mind which is distinctly historical.

But the tendency to look at things historically is not merely the attitude of men of science. Our outlook upon life differs in just this particular from that of preceding ages. We recognize the unstable nature of our whole social fabric, and are therefore more and more capable of transforming it. Our institutions are no longer held to be inevitable and immutable creations. We do not attempt to fit them to absolute formulate, but continually adapt them to a changing environment. Even modern architecture, so popularly in America, reflects the consciousness of change. The permanent character of ancient or medieval buildings was fitted only to a society dominated by static ideals. Now the architect builds, not for all time, but for a set of conditions which will inevitably cease in the not distant future. Thus our whole society not only bears the marks of its evolution, but shows its growing consciousness of the fact in the most evident of its arts. In literature, philosophy and political science, there is the same historical trend. Criticism no longer judges by absolute standards; it applies the standards of the author's own environment. We no longer condemn Shakespeare for having violated the ancient dramatic laws, nor Voltaire for having objected to the violations. Each age has its own expression, and in judging each we enter the field of history. In ethics, again, the revolt against absolute standards limits us to the relative, and morals are investigated on the basis of history, as largely conditioned by economic environment and the growth of intellectual freedom. Revelation no longer appeals to scientific minds as a source of knowledge. Experience on the other hand is history. As for political science we do not regard the national state as the ultimate and final product which men once saw in the Roman Empire. It has hardly come into being before forces are evident which aim at its destruction. Internationalism has gained ground in Europe in recent years; and Socialism itself, which is based upon a distinct interpretation of history, is regarded by its followers as merely a stage in human progress, like those which have gone before it. It is evident that Freeman's definition of history as "past politics" is miserably inadequate. Political events are mere externals. History enters into every phase of activity, and the economic forces which urge society along are as much its subject as the political result.

In short the historical spirit of the age has invaded every field. The world-picture presented in this encyclopaedia is that of a dynamic universe, of phenomena in process of ceaseless change. Owing to this insistent change all things which happen, or seem to happen, are history in the broader sense of the word. The encyclopaedia itself is a history of them in the stricter sense,—the selection and arrangement of this universal process. This narrower meaning is the subject of the remainder of this article.

The word "history" comes from the Gr. ἱστορία, which was used by the Ionians in the 6th century B.C. for the search for knowledge in the widest sense. It meant inquiry, investigation, not narrative. It was not until two centuries later that the historian, the reciter of stories, superseded the historédos (ἱστορέως), the seeker after knowledge. Thus history began as a branch of scientific research,—much the same as what the Athenians later termed philosophy. Herodotus himself was as much a scientific explorer as a reciter of narrative, and his life-long investigation was historiēi in his Ionian speech. Yet it was Herodotus himself who first hinted at the new use of the word, applied merely to the details accumulated during a long search for knowledge. It is not until Aristotle, however, that we have it definitely applied to the literary product instead of the inquiry which precedes it. From Aristotle to modern times, history (Lat. historia) has been a form of literature. It is only in the scientific environment of today that we recognize once more, with those earliest of the forerunners of Herodotus, that history involves two distinct operations, one of which, investigation, is in the field of science, while the other, the literary presentation, is in the field of art.

The history of history itself is therefore two-fold. History as art flourishes with the arts. It calls upon the imagination and the literary gifts of expression. Its history does not run parallel with the scientific side, but rather varies in inverse ratio with scientific activity. Those periods which have been dominated by the great masters of style have been less interested in the criticism of the historian's methods of investigation than in the beauty of his rhetoric. The scientific historian, deeply interested
in the search for truth, is generally but a poor artist, and his uncoloured picture of the past will never rank in literature beside the splendid distortions which glow in the pages of a Michelet or Macaulay. History the art, in so far as it is conditioned upon genius, has no single traceable line of development. Here the product of the age of Pericles remains unsurpassed still; the works of Hecataeus, Thucydides, and Pheidias are combined, as models for all time. On the other hand, history the science has developed so that it has not only gained recognition among historians as a distinct subject, but it has raised with it a group of auxiliary sciences which serve either as tools for investigation or as a basis for testing the results. The advance in this branch of history in the 19th century was one of its greatest achievements. The vast gulf which lies between the history of Egypt by Herodotus and that by Flanders Petrie is the measure of its achievement. By the mechanism now at his disposal the scientific explorer can read more history from the dust-heaps of Abydos than the greatest traveller of antiquity could gather from the priests of Sals. In tracing the history of history we must therefore keep in mind the double aspect.

History itself, this double subject, the science and the art combined, begins with the dawn of memory and the invention of speech. It is wrong to term those ages *pre-historic* whose history has not come down to us, including in one category the pre-literary age and the literary whose traces have been lost. Even the pre-literary had its history, first in myth and then in saga. The saga, or epos, was a great advance upon the myth, for in it the deeds of men replace or tend to replace the deeds of the gods. But we are still largely in the realm of imagination. Poetry, as Thucydides complained, is a most imperfect medium for fact. The bard will exaggerate or distort his story. True history, as a record of what really has happened, first reached maturity in prose. Therefore, although much of the past has been handed down to us in epic, in ballad and in the legends of folk-lore, we must turn from them to what became history in the narrower sense.

The earliest prose origins of history are the inscriptions. Their inadequacy is evident from two standpoints. Their permanence depends not upon their importance, but upon the durability of the substance on which they are inscribed. A note for a wedding ring baked into the clay of Babylon has been preserved while the history of the greatest events has perished. In the second place they are sealed to all but those who know how to read them, and so they lie forgotten for centuries while oral tradition flourishes, being within the reach of every man. It is only recently that archaeology, turning from the field of art, has undertaken to interpret for us this first written history. The process by which the modern fits together all the obtainable remains of an antiquity, and reconstructs even that past which left no written record, lies outside the field of this article. But such enlargement of the field of history is a modern scientific product, and is to be distinguished from the imperfect beginnings of history-writing which the archaeologist is able to decipher.

Next to the inscriptions, sometimes identical with them, are the early chronicles. These are of various kinds. Family chronicles preserved the memory of heroic ancestors whose deeds in the earliest age would have passed into the keeping of the bards. Such family archives were perhaps the main source for Roman historians. But they are not confined to Rome or Greece. Genealogies also pass from the bald verse, which was the vehicle for oral transmission, to such elaborate tables as those in which Manetho has preserved the dynasties of Egyptian Pharaohs.

In this field the priest succeeds the poet. The temple itself became the chief repository of records. There were simple religious annals, votive tablets recording miracles accomplished at a shrine, lists of priests and priestesses, accounts of benefactions of prodigies and portents. In some cases, as in Rome, the pontiffs kept a kind of register, not merely of religious history, but of important political events as well. Down to the time of the Gracchi (131 B.C.) the Pontifex Maximus inscribed the year's events upon annual tablets of wood which were preserved in the Regia, the official residence of the pontiff in the Forum. These pontifical "annals" thus came to be a sort of civic history. Chronicles of the Greek cities were commonly ascribed to mythical authors, as for instance that of Miletus, the oldest, to Cadmus the inventor of letters. But they were continued and edited by men in whom the critical spirit was awakening, as when the chroniclers of Ionian towns began the criticism of Homer.

The first historians were the logographers of these Ionian cities; men who carried their inquiry (historia) beyond both written record and oral tradition to a study of the world around them. Their "saying" (logos) was gathered mostly from contemporaries; and upon the basis of a widened experience they became critics of their traditions. The opening lines of Hecataeus of Miletus begin the history of the true historic spirit in words which read like a sentence from Voltaire. "Hecataeus of Miletus thus speaks: I write as I deem true, for the traditions of the Greeks seem to me manifold and laughable." Those words mark an epoch in the history of thought. They are the introduction to historical criticism and scientific investigation. Whatever the actual achievement of Hecataeus may have been, from his time onward the scientific movement was set going. Herodotus of Halicarnassus, the first scientific history, also an art, must be treated as the foundation of the whole. Herodotus' inquiry was not simply that of an idle tourist. He was a critical observer, who tested his evidence. It is easy for the student now to show the inadequacy of his sources, and his failure here or there to discriminate between fact and fable. But given the imperfect medium for investigation and the absence of an archaeological basis for criticism, the work of Herodotus remains a scientific achievement, as remarkable for the first approximation to truth as for the vastness of its scope. Yet it was Herodotus' chief glory to have joined to this scientific spirit an artistic sense which enabled him to cast the material into the true literary form. He gathered all his knowledge of the ancient world, not simply for itself, but to mass it around the story of the war between the east and west, the Greeks and the Persians. He is first and foremost a story-teller; his theme is that of the hards, a heroic event. His story is a vast prose epos, in which science is to this extent subordinated to art. "This is the showing forth of the Inquiry of Herodotus of Halicarnassus, to the end that neither the deeds of men may be forgotten by lapse of time, nor the events be hid from posterity. For if these events have been produced, some by Hellenes, some by Barbarians, may lose their renown, and especially that the causes may be remembered for which these waged war with one another" (i.e. the Persian war).

In Thucydides a higher art than that of Herodotus was combined with a higher science. He scorned the story-teller "who seeks to please the ear rather than to speak the truth," and yet his rhetoric is the culmination of Greek historical prose. He withdrew from vulgar applause, conscious that his narrative would be considered "disappointing to the ear," yet he recast the materials out of which he constructed it in order to lift that narrative into the realm of pure literature. Speeches, letters, documents are recorded to be in tone with the rest of the story. It was his art, in fact, which really created the Peloponnesian war out of its separate parts. And yet this art was merely the language of a scientist. The "labourious task" of which he speaks is that of consulting all possible evidence, and weighing conflicting accounts. It is this which makes his rhetoric worth while, "an everlasting possession, not a prize competition which is heard and forgotten."

From the sublimity of Thucydides, and Xenophon's straightforward story, history passed with Theopompus and Ephorus into the field of rhetoric. A revival of the scientific instinct of investigation is discernible in Timaeus the Sicilian, at the end of the 4th century, but his attack upon his predecessors was the text of a more crushing attack upon himself by Polybius, who declares him lacking in critical insight and biased by passion. Polybius' comments upon Timaeus reach the dignity of a treatise upon history. He protests against its use for controversial pamphlets which distort the truth. "Directly a man assumes the moral attitude of an historian he ought to forget all
considerations, such as love of one’s friends, hatred of one’s enemies. Thus he must sometimes praise enemies and blame friends. For as a living creature is rendered useless if deprived of its eyes, so if you take truth from history, which is left but an impracticable tale” (bk. xii. 14). These are the words of a Ranke. Unfortunately Polybius, like most modern scientific historians, was no artist. His style is the very opposite of that of Isocrates and the rhetoricians. It is often only clear in the light of inscriptions, so closely does it keep to the sources. The style found no imitator; history passed from Greece to Rome in the guise of rhetoric. In Dionysius of Halicarnassus the rhetoric was combined with an extensive study of the sources; but the influence of the Greek rhetoric upon Roman prose was negligible from the very point of science. Cicero, although he said that the duty of the historian is to conceal nothing true, to say nothing false, would in practice have written the kind of history that Polybius denounced. He finds fault with those who are non exornatores rerum sed taniunm narratores. History for him is the mine from which to draw argument in oratory and example in education. It is not the subject of a scientific curiosity.

It should be noted before we pass to Rome that with the expansion of Hellenism the subject of historians expanded as well. Universal history was begun by Ephorus, the rhetorician, and formed the theme of Polybius and Diodorus. Exiled Greeks were the first to write histories of Rome worthy of the name. The Alexandrian Enztostenes placed chronology upon the scientific basis of astronomy, and Apollodorus drew up the most important chronica of antiquity.

History-writing in Rome,—except for the Greek writers resident there,—was until the first half of the 1st century B.C. in the form of annals. Then came rhetorical ornamentation, and the Ciceronian era. The first Roman historian who rose on the conception of a science and art combined was Salust, the student of Thucydides. The Augustan age produced in Livy a great popular historian and natural artist and a trained rhetorician (in the speeches), but as uncritical and inaccurate as he was brilliant. From Livy toTacitus the gulf is greater than from Herodotus to Thucydides. Tacitus is at least a consummate artist. His style ranges from the brilliancy of his youth to the sternness and sombre gravity of age, passing almost to poetic expression in its epigrammatic terseness. Yet in spite of his searching study of authorities, his keen judgment of men, and the perception of underlying principles of moral law, his view was warped by the heat of faction, which glows beneath his external objectivity.

After him Roman history-writing speedily degenerated. Suetonius’ Lives of the Caesars is but a superior kind of journalism. But his gossip of the court became the model for historians, whose works, now lost, furnish the main source for the Historia Augusta. The importance to us of this uncritical collection of biographies is sufficient comment on the decline of history-writing in the latter empire. Finally, from the 4th century the epistles of Eutropius and Festus served to satisfy the lessening curiosity in the past and became the handbooks for the middle ages. The single figure of Ammianus Marcellinus stands out of this age as a belated disciple of Tacitus. But the world was changing from antique to Christian ideals just as he was writing, and with him we leave this outline of ancient history.

The 4th and 5th centuries saw a great revolution in the history of history. The story of the pagan past slipped out of mind, and in its place was set by the genius of Eusebius, the story of the world force which had superseded it, Christianity, and of that small fraction of antiquity from which it sprang,—the Jews. Christianity from the first had forced thinking men to recon- struct their philosophy of history, but it was only after the Church’s triumph that its point of view became dominant in historiography. Three centuries more passed before the pagan models were quite lost to sight. But from the 7th century to the 17th—from Isidore of Seville and the English Bede for a thousand years,—mankind was to look back along the line of Jewish priests and kings to the Creation. Egypt was of interest only as it came into Israelite history, Babylon and Nineveh were to illustrate the judgments of Yahweh, Tyre and Sidon to reflect the glory of Solomon. The process by which the “gentiles” have been robbed of their legitimate history was the inevitable result of a religious whose historic books make them lay figures for the history of the Jews. Rejected by the Yahweh who knows the Christian God, they have remained to the present day, in Sunday schools and in common opinion, not nations of living men, with the culture of arts and sciences, but outcasts who do not enter into the divine scheme of the world’s history. When a line was drawn between pagan and Christian back to the creation of the world, it left outside the pale of inquiry nearly all antiquity. But it must be remembered that that antiquity was one in which the Roman nations had no personal interest. Scipio and the Gracchus were essentially unreal to them. The one living organiza- tion with which they came into touch was the Church. So Cicero and Pompey paled before Joshua and Paul. Diocletian, the organizing genius, became a bloodthirsty monster, and Constantine, the murderer, a saint.

Christian history begins with the triumph of the Church. With Eusebius of Caesarea the apologetic pamphlets of the age of persecutions gave way to a calm review of three centuries of Christian progress. Eusebius’ biography of Constantine shows that the conception of the fath of Church history permitted himself, but the Ecclesiastical History was fortunately written for those who wanted to know what really happened, and remains to-day an invaluable repository of Christian antiquities. With the continuations of Socrates, Sozomen and Theodoret, and the Latin manual which Cassiodorus had woven from them (the Historia tripartita), it formed the body of Church history during all the middle ages. An even greater influence, however, was exercised by Eusebius’ Chronica. Through Jerome’s translation and additions, this scheme of this world’s chronology became the basis of all medieval world chronicles. It settled until our own day the succession of years from the Creation to the birth of Christ,—fitting the Old Testament story into that of ancient history. Henceforth the Jewish past,—that one path back to the beginning of the world,—was marked out by the absolute laws of mathematics and revelation. Jerome had marked it out; Sulpicius Severus, the biographer of St Martin, in his Historia sacra, adorned it with the attractions of romance. Sulpicius was admirably fitted to interpret the miraculous Bible story to the middle ages. But there were few who could write like him, and Jerome’s Chronicle itself, or rather portions of it, the History, in the age which followed, a sort of universal preface for the monastic chronicler. For a time there were even attempts to continue “imperial chronicles,” but they were insignificant compared with the influence of Eusebius and Jerome.

From the first, Christianity had a philosophy of history. Its earliest apologists sought to show how the world had followed a divine plan in its long preparation for the life of Christ. From this central fact of all history, mankind should continue war and suffering until the divine plan was completed at the judgment day. The fate of nations is in God’s hands; history is the revelation of His wisdom and power. Whether He intervenes directly by miracle, or merely sets His laws in operation, He is master of men’s fate. This idea, which has underlain all Christian philosophy of history, from the first apologists who prophesied the fall of the Empire and the coming of the millennium, down to our own day, received its classic statement in St Augustine’s City of God. The terrestrial city, whose eternity had been the theme of pagan history, had just fallen before Alaric’s Goths. Augustine’s explanation of its fall passes in review not only the calamities of Roman history—combined with a pathetic perception of its greatness,—but carries the survey back to the origin of evil at the creation. Then over against this civitas terræ he sets the divine city which is to be realized in Christen- dom. The Roman Empire,—the last general form of the earthly city,—gives way slowly to the heavenly. This is the main thread of Augustine’s philosophy of history. The mathematical demonstration of its truth was left by Augustine for his disciple, Paulus Orosius.

Orosius’ Seven Books of Histories against the Paganus, written
as a supplement to the *City of God*, is the first attempt at a Christian "World History." This manual for the middle ages assigned to the rise and fall of empires with convincing exactness. The history of antiquity, according to it, begins with Ninus. His realm was overthrown by the Medes in the same year in which the history of Rome began. From the first year of Ninus' reign until the rebuilding of Babylon by Semiramis there were sixty-four years; the same between the first of Procas and the building of Rome. Eleven hundred and sixty-four years after each city was built, it was taken,—Babylon by Cyrus, Rome by Alaric, and Cyrus' conquest took place just when Rome began the Republic. But before Rome becomes a world empire, Macedon and Carthage intervene, guardians of Rome's youth (*tutor curator*). This scheme of the four world-monarchies, which was to prevail through all the middle ages, was developed through seven books filled with the story of war and suffering. As it was Orosius' aim to show that the world had improved since the coming of Christ, he used Trogus Pompeius' war history, written to extalt Roman triumphs, to show the reverse of victory,—disaster and ruin. Livy, Caesar, Tacitus and Suetonius were plundered for the story of horrors; until finally even the Goths in Spain shine by contrast with the pagan heroes; and through the confusion of the German invasions one may look forward to Christendom,—and its peace. The common form of medieval historical writing was the chronicle, which reaches all the way from monastic annals, mere notes on Easter tables, to the dignity of national monuments. Utterly lacking in perspective, and dominated by the idea of the miraculous, they are for the most part a record of the trivial or the marvellous. Individual historians sometimes recount the story of their own times with sober judgment, but seldom know how to test their sources when dealing with the past. Contradictions are often copied down without the writer noticing them; and since the middle ages forged and falsified so many documents,—monasteries, towns and corporations gaining privileges or titles, and corporations gaining for titles, —it is not to be hoped that,—in spite of their frequent ones,—in spite of J. J. Scaliger's refutation, which was to contain an equal number of volumes of the errors in Baronius. The movement back to the sources in Germany until the Thirty Years' War was a notable one. Collections were made by Simon Schard (1555-1573), Johannes Pistorius (1576-1608), Marquard Freher (1565-1614), Melchior Goldast (1576-1653) and others. After the war Leibnitz began a new epoch, both by his philosophy with its law of continuity in phenomena, and by his systematic attempt to collect sources through an association (1670). His plan to have documents printed as they were, *in situ*, the touchstone of truth, for medieval research. But from Leibnitz until the 19th century German national historiography made little progress,—although church historians like Mosheim and Neander stand out among the greatest historians of all time.

France had not paralleled the activity of Maximilian's Renaissance historians. The father of modern French history, or at least of historical research, was André Duchesne (1584-1640), whose splendid collections of sources are still in use. Jean Bodin wrote the first treatise on scientific history (*Methodus ad faciendum historiarum cognitionem*, 1566), but he did not apply his own principles of criticism; and it was left for the Benedictine monks of the Congregation of St. Maur to establish definitely the new science. The place of this school in the history of history is absolutely without a parallel. Few of those in the audiences of Molière, returning home under the grey walls of St Germain-des-Prés, knew that within that monastery the men whose minds they disturbed were laying the basis for all scientific history; and few of the later historians of that age have been any wiser. But when Luc d'Achery turned from exegetics to patristics and the lives of the saints, as a sort of Christian humanist, he led the way to that vast work of collection and comparison of texts which developed through Mabillon, Montfaucon, Ruinart, Martinse, Bouquet and their associates, into the indispensable implements of modern historians. Here, as in the Reformation, controversy called out the richest product. Jean Mabillon's treatise, *De re diplomatica* (1681), was due to the criticisms of that group of Belgian Jesuits whose *Acta Sanctorum quoque toti orbe coluntur* (1643, etc., see Bollandists) was destined to grow into the greatest repository of legend and biography the world has seen. In reply to D. Papebroch's criticisms of the chronicle of St Denis, Mabillon prepared this manual for the testing of medieval documents. Its canons are the basis, indeed, almost the whole, of the science of diplomatic. Henceforth even the mediocre scholar had a body of technical rules by which to sort out the vast mass of apocrypha in medieval
documentary sources. Scientific history depends upon implements. Without manuals, dictionaries, and easy access to texts, we should go as far astray as any medieval chronicler. The France of the Maurists supplied the most essential of these instruments. One of the great "encyclopaety" of Ducange is still in enlarged editions the indispensable encyclopedia of the middle ages. Chronology and palaeography were placed on a new footing by Dom Bernard de Montfaucon's Palæographia graecæ (1708), the monumental Art de vérifier les dates (3rd ed., 1818-1831, in 38 vols.), and the Nouveau Traité de diplomatique (1750-1765) of Dom Tassin and Dom Toutain. The collections of texts which the Maurists published are too many and too vast to be enumerated here (see C. Langlois, Manuel de bibliographie historique, pp. 233 ff.). Dom Bouquet's Historiens de la Gaule et de la France—the national repository for French historians—is but one of a dozen tasks of similar magnitude. During the 18th century this deep under-work of scientific history continued to advance, though for the most part unseen by the brilliant writers whose untrustworthy generalities passed for history in the salons of the old régime. Interrupted by the Revolution, it revived in the 19th century, and the roll of honour of the French École des Chartes has almost rivalled that of St Germain-des-Prés.

The father of critical history in Italy was L. A. Muratori (1672-1750), the Italian counterpart of Leibnitz. His vast collection of sources (Rerum Italicarum scriptores), prepared amid every discouragement, remains to-day the national monument of Italian history; and it is but one of his collections. His output is perhaps the greatest of any isolated worker in the whole history of historiography. The same haste, but much less care, marked the work of J. D. Mansi (d. 1769), the compiler of the fullest collection of the Councils. Spain, stitied by the Inquisition, produced no national collection of sources during the 17th and 18th centuries, although Nicolas Antonio (d. 1684) produced a national literary history of the first rank.

England in the 16th century kept pace with Continental historiography. Henry VIII's chaplain, John Leland, is the father of English antiquaries. Three of the most precious collections of medieval manuscripts still in existence were then begun by Thomas Bodley (the Bodleian at Oxford), Archbishop Matthew Parker (Corpus Christi at Cambridge), and Robert Cotton (the Cottonian collection of the British Museum). In Elizabeth's reign a serious effort was made to arrange the national records, but until the end of the 18th century they were scattered in not less than fifteen repositories. In the 17th and 18th centuries English scholarship was enriched by such monuments of research as William Dugdale's Monasticon, Thomas Maddox's History of the Esquecher, Wilkins's Concilia, and Thomas Rymer's Foederæ. But these works, important as they were, gave but little idea of the wealth of historical sources which the 19th century was to reveal in England.

In the 19th century the science of history underwent a sort of industrial revolution. The machinery of research, invented by the genius of men like Mabillon, was perfected and set going in all the archives of Europe. Isolated workers or groups of workers grew into national or international associations, producing from archives vast collections of material to be worked up into the artistic form of history. The result of this movement has been to revolutionize the whole subject. These men of the factory—devoting their lives to the cataloguing of archives and libraries, to the publication of material, and then to the gigantic task of indexing what they have produced—have made it possible for the student in an American or Australian college to master in a few hours in his library sources of history which baffled the long years of research of a Martène or Rymer. The texts themselves have mostly become as correct as they can ever be, and manuals and bibliographies guide one to and through them, so that no one need go astray who takes the trouble to make use of the mechanism which is at his hand. For example, since the papal archives were opened, Dom D'Herbelot has appeared that soon it will be possible to follow the letter-writing of the medieval popes day by day for century after century.

The apparatus for this research is too vast to be described here. Archives have been reformed, their contents catalogued or calendared; government commissions have rescued numberless documents from oblivion or destruction, and learned societies have supplemented and criticized this work and co-ordinated the results. Every state in Europe now has published the main sources for its history. The "Rolls" series, the Monumenta Germaniae historica, and the Documents inédits are but the more notable of such national products. A series of periodicals keeps watch over this enormous output. The files and indices of the English Historical Review, Historische Zeitschrift, Revue historique, or American Historical Review will alone reveal the strength and character of historical research in the later 19th century.

Every science which deals with human phenomena is in a way an implement in this great factory system, in which the past is welded together again. Psychology has been drawn upon to interpret the movements of revolutions or religions, anthropology and ethnology furnish a clue to problems to which the key of documents has been lost. Genealogy, heraldry and chronology run parallel with the wider subject. But the real auxiliary sciences to history are those which deal with those traces of the past that still exist, the sciences of manuscript criticism (palaeography), of documents (diplomatic), of seals (numismatics), of weights and measures, and archaeology in the widest sense of the word. These sciences underlie the whole development of scientific history. Dictionaries and manuals are the instruments of this industrial revolution. Without them the literary remains of the race would still be as useless as Egyptian inscriptions to the fellaheen. Archaeology itself remained but a minor branch of art until the modernity was perfected which enabled it to classify and interpret the remains of the "prehistoric" age.

This is the most remarkable chapter in the whole history of history—the recovery of that past which had already been lost when our literary history began. The perspective stretches out as far as the other side of Homer as we are. This is the old "providential" scheme of history disintegrates before a new interest in the "gentile" nations to whose high culture Hebrew sources were unwilling testimony. Biblical criticism is a part of the historic process. The Jewish texts, once the infallible basis of history, are now tested by the libraries of Babylon, from which they were partly drawn, and Hebrew history sinks into its proper place in the wide horizon of antiquity. The finding of the Rosetta stone left us no longer dependent upon Greek, Latin or Hebrew sources, and now fifty centuries of Egyptian history lie before us. The scientific historian of antiquity works on the hills of Crete, rather than in the quiet of a library with the classics spread out before him. There he can reconstruct the splendour of that Minoan age to which Homeric poems look back, as the German epics looked back to Rome or Verona. His discoveries, co-ordinated and arranged in vast corpora inscriptionum, stand now alongside Herodotus or Livy, furnishing a basis for their criticism. Medieval archaeology has, since Quicherat, revealed how men were living while the monks wrote chronicles, and now cathedrals and castles are studied as genuine historic documents.

The immense increase in available sources, archaeological and literary, has remade historical criticism. Ranke's application of the principles of "higher criticism" to works written since the invention of printing (Kritische Reimerk Geschichtsschreiber) was an epoch-making challenge of narrative sources. Now they are everywhere checked by contemporary evidence, and a clearer sense of what constitutes a primary source has discredited much of what had been currently accepted as true. This is true not only of ancient history, where last year's book may be a thousand years out of date, but of the whole field. Hardly an "old master" remains an authoritative book of reference. Gibbon, Grote, Giesebrecht, Guizot stand to-day by reason of other virtues than their truth. Old landmarks drop out of sight, e.g. the fall of the Western Empire in 1470, the coming of the Greeks to Athens in 1450, dates which once enclosed the middle ages. The perspective changes—the Renaissance grows less and the middle
HISTORY

ages more; the Protestant Revolution becomes a complex of economics and politics and religion; the French Revolution a vast social reform in which the Terror was an incident, &c., &c. The result has been a complete transformation of history since the middle of the 18th century.

In the 17th century the Augustinian scheme of world history received its last classic statement in Bossuet's *Histoire universelle*. Voltaire's reply to it in the 18th (Essié sur les moeurs) attacked its limitations on the basis of desism, and its miraculous procedure on that of science. But while there are foreshadowings of the evolutionary theory in this work, neither the *philosophie* historians nor Hume nor Gibbon arrived at a constructive principle in history which could take the place of the Providence they rejected. Religion, though false, might be a real historic force. History became the tragic spectacle of a game of dupes—the real movers being priests, kings or warriors. The pawns slowly accepted philosophy, the physical basis which regulate the moves themselves. But all this failed to give a satisfactory explanation of the laws which determine the direction of this evolution.

Giovanni Battista Vico (1668–1744) was the first to ask why there

is no science of human history. But his lonely life and unrecognised labours leave him apart from the main movement, until his works were discovered again in the 19th century. It was A. L. H. Heeren who, at the opening of the 19th century, first laid that emphasis upon the economic factors in history which is to-day slowly replacing the Augustinian explanation of its evolution. Heeren's own influence, however, was slight. The first half of the century, apart from the speculations of Carlyle (Perz, Guizot, &c.) was largely dominated by the romanticists, with their exaggeration of the individual. Carlyle's "great man theory of history" is logically connected with the age of Scott. It was a philosophy of history which lent itself to magnificent dramatic creations; but it explained nothing. It substituted the work of the genius for the miraculous intervention of Providence, but, apart from certain abstract formulæ such as Truth and Right, knew nothing of why or how. It is but dealing in words to say that the meaning of it all is God's revelation of Himself. Granting that, what is the process? Why does it so slowly reveal the Right of the middle ages (as in slavery for instance) to be the Wrong to-day? Carlyle stands to Bossuet as the sage to the myth. Hegel got no closer to realities. His idealistic scheme of history, which makes religion the keynote of progress, and describes the function of each—Judaism to typify duty, Confucianism order, Mahomedanism justice, Buddhism patience, and Christianity love—does not account for the facts of the history enacted by the devotees. It characterizes, not the real process of evolution, but an ideal which history has not realized. Besides, it does not face the question how far religion itself is a product or a cause, or both combined.

In the middle of the century two men sought to incorporate in their middle of the century two men sought to incorporate the middle of the century. Herder had ignored in his philosophy—recognizing that life is conditioned by an environment and not an abstraction for metaphysics. H. T. Buckle, in his *History of Civilization in England* (1857), was the first to work out the influences of the material world upon history, developing through a wealth of illustration the importance of food, soil and the general aspect of nature upon the formation of society. Buckle did not, as is generally believed, make these three factors dominate all history. He distinctly stated that "the advance of European civilization is characterized by a diminishing influence of physical laws and an increasing influence of mental laws," and "the measure of civilization is the triumph of mind over external agents." Yet his challenge, not only to the theologian, but also to those historians whose indolence of thought or "natural incapacity" prevented them from attempting more than the annalist record of events, called out a storm of protest from almost every side. Now that the controversy has cleared away, we see that despite of Buckle's too confident formulation of his laws, his pioneer work in a great field marks him out as the Augustinian of the scientific age. Among historians, however, Buckle's theory received but little favour for another generation. Meanwhile the economists had themselves taken up the problem, and it was from them that the historians of to-day have learned it. Ten years before Buckle published his history, Karl Marx had already formulated the "economic theory of history." Accepting with reservation Feuerbach's attack on the Hegelian "absolute base," based on materialistic grounds (Der Mensch ist, was er isst), Marx was led to the conclusion that the causes of that process of growth which constitutes the history of society are to be found in the economic conditions of existence. From this he went on to socialism, which bases its militant philosophy upon this interpretation of history. But the truth or falseness of socialism does not affect the theory of history. In 1845 Marx wrote of the Young-Hegelians that to separate history from natural science and industry was like separating the soul from the body, and "finding the birthplace of history, not in the gross material production on earth, but in the misty cloud formation of heaven" (Die heilige Familie, p. 238). In his *Mister de la philosophie* (1843) he set down the principle that social relationships largely depend upon modes of production, and therefore the principles, ideas and categories which are thus evolved are no more eternal than the relations they express, but are historical and transitory products. In the famous Manifesto of the Communist Party (1848) the theory was applied to show how the industrial revolution had replaced feudal with modern conditions. But it had little vogue, except among Socialists, until the third volume of Das Kapital was published in 1864, when its importance was borne in upon continental scholars. Since then the controversy has been almost as heated as in the days of the Reformation. The drum-and-trumpet history has its place like that of art, jurisprudence, science or philosophy. Only now we know that no one of these is more than a single glimpse at a vast complex of phenomena, most of which lie for ever beyond our ken.

This expansion of interest has intensified specialization. Historians no longer attempt to write world histories; they form associations of specialists for the purpose. Each historian chooses his own epoch or century and his own subject, and spends his life mastering such traces of it as he can find. His work there enables him to judge of the methods of his fellows, but his own remains restricted by the very wealth of material which has been accumulated on the single subject before him.

Thus the great enterprises of to-day are co-operative—the Cambridge Modern History, Lavisse and Rambaud's Histoire générale, or Lavisse's Histoire de France, like Hunt and Poole's Political History of England, and Oncken's Allgemeine Geschichte in Einzeldarstellungen. But even these vast sets cover but the merest fraction of their subjects. The Cambridge history passes for the most part along the political crust of society, and seldom glances at the social forces within. This limitation of the professor historian is made up for by the growingly historical treatment of all the sciences and arts—a tendency noted before, to which this edition of the *Encyclopaedia Britannica* itself is a notable witness. Indeed, for a definition of that limitless subject which includes all the phenomena that stand the warp and stress of change, one might adapt a famous epitaph—si historiam requiris, circumspice.

BIBLIOGRAPHY.—See Ch. V. Langlois, Manuel de bibliographie historique (2 vols., 1904). This forms the logical bibliography of this article. It is a general survey of the whole apparatus of historiography and is invaluable. The guide is most useful for bibliographies covering sections of history are noted with the articles where they properly belong, e.g. in English medieval history the manual of Chas. Gross, Sources and Literature of English History;

HIT, a town of Asiatic Turkey, in the vilayet of Bagdad, on the Gulf of the Bosphorus, N.W. of Bagdad, lat. 35° 58′ 8″ N., 45° 42′ 15″ E. It is picturesquely situated on a line of hills, partly natural, but in large part certainly artificial, the accumulation of centuries of former habitations, from 30 to 100 ft. in height, bordering the river. The houses are built of field stones and mud. A striking feature of the town is a lofty and well-proportioned minaret, which leans quite perceptibly. Behind and around Hit is an extensive but utterly barren plain, through which flow several streams of bitter water, coming from mineral springs. Directly behind the town are two bitumen springs, one cold and one hot, within 30 ft. of one another. The gypseous cliffs on the edge of the plain, and the rocks which crop out here and there in the plain, are full of seams of bitumen, and the whole place is redolent of sulphured hydrogten. Across the river there are naphtha springs. Indeed, the entire region is one possessing great potential wealth in mineral oils and the like. Hit, with its fringe of palms, is like an oasis in the desert occasioned by the outcrop of these deposits. From time immemorial it has been the chief source of supply of bitumen for Babylonia, the prosperity of the town depending always upon its bitumen springs, which are still the property of the government, but are rented out to any one who wishes to use them. There is also a shipyard at Hit, where the characteristic Babylonian boats are still made, smeared within and without with bitumen. Hit is the head of navigation on the Euphrates. It is also the point from which the camel-post starts across the desert to Damascus. About 8 m. inland from Hit, on a bitter stream, lies the small town of Kubeitha. Hit is mentioned, under the name of Isha, in the Kannik inscription as paying tribute to Tethmosis (Thothmes) III. In the Bible (Ex. vii. 1) it is called Ahava; the original Babylonian name seems to have been Iša, which becomes in the Talmud Ilhadira, in Potlemy Ḳaba, and in Zosimus and Ammianus Δάκρα and Διάκρινα.

See Geo. Rawlinson's Herodota, i. 179, and note by H. C. Rawlinson; J. P. Peers, Nippur (1897); H. V. Geere, Hit (1910); (J. P. Pict.)

HITA, GINÉS PEREZ DE (1544?-1605?), Spanish novelist and poet, was born at Mula (Murcia) about the middle of the 16th century. He served in the campaign of 1569-1571 against the Moriscos, and in 1572 wrote a rhymed history of the city of Lorca which remained unpublished till 1888. He owes his wide celebrity to the Historia de los bandos de Zegres y Abencerages (1595-1604), better known as the Guerras civiles de Granada, which purports to be a chronicle based on an Arabic original ascribed to a certain Aben-Hamin. Aben-Hamin is a fictitious personage, and the Guerras de Granada is in reality a historical novel, perhaps the earliest example of its kind, and certainly the first historical novel that attained popularity. In the first part the events which led to the downfall of Granada are related with uncommon brilliancy, and Hita's sympathetic transcription of life at the Emir's court has clearly suggested the conventional presentation of the picturesque, chivalrous Moor in the pages of Mme de Scudéry, Mme de Lafayette, Chateaubriand and Washington Irving. The second part is concerned with the author's personal experiences, and the treatment is effective; yet, though Calderón's play, Amar después de la muerte, is derived from it, the second part has never enjoyed the vogue or influence of the first. The exact date of Hita's death is unknown. His blank verse rendering of the Crónica Troyana, written in 1596, exists in manuscript.

HITCHCOCK, EDWARD (1793-1864), American geologist, was born of poor parents at Deerfield, Massachusetts, on the 24th of May 1793. He owed his education chiefly to his own exertions, and was preparing himself to enter Harvard College when he was compelled to interrupt his studies from a weakness in his eyesight. In 1815 he became principal of the academy of his native town; but he resigned this office in 1818 in order to study for the ministry. Having been ordained in 1821 pastor of the Congregational church of Conway, Mass., he employed his leisure in making a scientific survey of the western counties of the state. From 1825 to 1845 he was professor of chemistry and natural history, from 1845 to 1854 was professor of natural theology and geology at Amherst College, and from 1845 to 1854 was president; the college owed its early success largely to his energetic efforts, especially during the period of his presidency. In 1850 he was made professor of geology in the state of Massachusetts, and in 1856 was made geologist of the first district of the state of New York. In 1860 he received the degree of LL.D. from Harvard, and in 1864 that of D.D. from Middlebury College, Vermont. Besides his constant labours in geology, zoology and botany, Hitchcock took an active interest in agriculture, and in 1850 he was sent by the Massachusetts legislature to examine into the methods of the agricultural schools of Europe. In geology he made a detailed examination and exposition of the footprints from the Triassic sandstones of the Connecticut valley. His collection is preserved in the Hitchcock Ichnological Museum of Amherst College, and a description of it was published in 1858 in his report to the Massachusetts legislature on the ichnology of New England. The footprints were regarded as those of reptiles, amphibia and birds (?). In 1857 he undertook, with the aid of his two sons, the geological survey of Vermont, which was completed in 1861. As a writer on geological science, Hitchcock was largely concerned in determining the connexion between it and religion, and employing its results to explain and support what he regarded as the truths of revelation. He died at Amherst, on the 27th of February 1864.

His son, CHARLES HENRY HITCHCOCK (1836- ), did good service in geology, in Vermont, New Hampshire (1868-1878), and other parts of America, and became professor of geology at Dartmouth in 1868.

The following are Edward Hitchcock's principal works: Geology of the Connecticut Valley (1821); Catalogue of Plants growing without cultivation in the vicinity of Amherst (1829); Reports on the Geology of Massachusetts (1833-1841); Elementary Geology (1840; ed. 2, 1841; and later ed. with C. H. Hitchcock, 1862); Fossil Footprints in the United States (1848); Outline of the Geology of the Globe and of the United States in particular (1852); Illustrations of Surface Geology (1856); Ichnology of New England (1858); The Religion of Geologists and its Connection with the Teachings of the Church (1851); Reminiscences of Amherst College (1865); and various papers in the American Journal of Science, and other periodicals.

HITCHCOCK, GEORGE (1839- ), American artist, was born at Providence, Rhode Island, in 1856. He graduated from Brown University in 1872 and from the law school of Harvard University in 1874; then turned his attention to art and became a pupil of Boulanger and Lefebvre in Paris. He attracted notice in the Salon of 1885 with his "Tulip Growing," a Dutch garden which he painted in Holland. He had for years a studio at Egmond, in the Netherlands. He became a Chevalier of the Legion of Honour, France; a member of the Vienna Academy of Arts, the Munich Secession Society, and other art bodies; and is represented in the Dresden gallery; the imperial collection, the Embden, the Chicago Art Institute, and the Detroit Museum of Fine Art.

HITCHCOCK, ROSWELL DWIGHT (1817-1887), American divine, was born at East Machias, Maine, on the 15th of August 1817, graduated at Amherst College in 1836, and later studied at Andover Theological Seminary, Mass. After a visit to Germany he was a tutor at Amherst in 1839-1842, and was minister of the First (Congregational) Church, Exeter, New Hampshire, in 1845-1852. He became professor of natural and revealed religion in Bowdoin College, Brunswick, Maine, in 1852, and in 1855 professor of church history in the Union Theological Seminary in New York, of which he was president in 1880-1887. He died at Somerset, Mass., on the 16th of June 1887.

Among his works are: Life of Edward Robinson (1863); Socialism (1879); Carmina Sanctorum (with Z. Eddy and L. W. Mudge, 1885); and Eternal Atonement (1888).
HITCHIN—HITTITES

HITCHIN, a market town in the Hitchin parliamentary division of Hertfordshire, England, on the small river Hiz, 32 m. N. from London by the Great Northern railway. Pop. of urban district (1901) 10,972. It is the junction of the main line with the Cambridge branch, and with a branch of the Midland railway to Bedford. The church of St Mary is Perpendicular, with a fine porch, a paviered N. aisle, and many ancient Rubens, a small crypt said to have been used by Cromwell as a prison for the Royalists, and many interesting monuments. Hitchin Priory is a mansion on the site of a Carmelite foundation of the early 14th century. A Gilbertine nunnery, founded later in the same century, stood adjacent to the church, and portions of the buildings appear in an existing block of almshouses. The grammar school (1632) was reconstituted in 1889 for boys and girls. Straw-plaiting, malting, brewing, and the cultivation and distillation of lavender and peppermint are carried on.

HITTITES, an ancient people, alluded to frequently in the earlier records of Israel, and also, under slightly variant names, in Egyptian records of the XVIIIth, XIXth and XXth Dynasties, and in Assyrian from about 1100 to 700 B.C. They appear also in the Vannic cuneiform texts, and are believed to be the authors of a class of monuments bearing inscriptions in a peculiar pictographic character, and widely distributed over Asia Minor and N. Syria, around which much controversy has raged during the past thirty years.

1. The Bible.—In the Old Testament the name of the race is written Heth (with initial aspirate), members of it being Hittis, Hittites, the Septuagint renders χέτ, χεττάσω, χεττίν or χέττιν, keeping, it will be noted, in the stem throughout. The race appears in two connexions. (a) In pre-Israelite Palestine, it is resident about Hebron (Gen. xxiii. 3), and in the central uplands (Num. xiii. 20). To Joshua (i. 4) is promised "from the wilderness and this Lebanon even unto the great river, the river Euphrates, all the land of the Hittites." The term "wilderness" here is of geographical ambiguity; but the promise is usually taken to mean that Palestine itself was part of the Hittite land before the coming of Israel; and an apostrophe of Ezekiel (xvi. 3) to Jerusalem, "thy mother (was) an Hittite," is quoted in confirmation. Under the monarchy we hear frequently of Hittites within the borders of Israel, but either as a small subject people, coupled with other petty tribes, or as individuals in the Jewish script (e.g. Unah, in the time of David). At this epoch, therefore, that there survived in Palestine at late times a detached Hittite population, with which Hebrews sometimes intermarried (Judges iii. 6; Gen. xxvi. 34) and lived in relations now amicable, now tyrannical (e.g. Hittites were made tributary bondsmen by Solomon, i Kings ix. 20, 21; 2 Chron. viii. 7, 8). (b) An independent and powerful Hittite people was domiciled N. of Palestine proper, organized rather as a confederacy of tribes than a single monarchy (1 Kings x. 28; 2 Kings vii. 6). Presumably it was a daughter of these Hittites that Solomon took to wife. If the enumeration of 2 Sam. xxiv. 64, "Talhith-hodshi," based on the Septuagint version χεττίν, Xeitli, Xeitili, or χέττελα, keeping, is correct, it may well be inferred that these were not the Hittites that lived in the land of Canaan (Gen. xiv. 7) but a separate people of the later period. It appears, therefore, that there survived in Palestine in late times a detached Hittite population, with which Hebrews sometimes intermarried (Judges iii. 6; Gen. xvii. 34) and lived in relations now amicable, now tyrannical (e.g. Hittites were made tributary bondsmen by Solomon, i Kings ix. 20, 21; 2 Chron. viii. 7, 8).

2. Egyptian Records.—The decipherment of the inscriptions of the XVIIIth Theban Dynasty led, before the middle of the 19th century, to the discovery of the important part played in the Syrian campaigns of Tethomos (Thothmes) III. by the H-tes (vulgarily transliterated Kheta, though the vocalization is uncertain). The coincidence of this name, beginning with an aspirate, led H. K. Brugsch to identify the Kheta with Heth. That identification stands, and no earlier Egyptian mention of the race is known. Although Tethomos III. found the Kheta ("Great" and "Little") in N. Syria, not apparently at Kadesh, but at Carchemish, though they had not been in possession of the latter place long (not in the epoch of Tethomos I.'s Syrian campaign). They were a power strong enough to give the Pharaoh cause to vaunt his success (see also EGYPT: ANCIENT HISTORY, § "The New Empire"). Though he says he levied tribute upon them, his successors in the dynasty nearly all record fresh wars with the Kheta who appear as the northernmost of Pharaoh's enemies, and Amenophis or Amenhotep III. saw fit to take to wife Gilukhipa, a Syrian princess, who may or may not have been an Hittite. This queen is by some supposed to have introduced into Egypt certain exotic ideas which blossomed in the reign of Amenophis IV. The first Pharaoh of the succeeding dynasty, Rameses I., came to terms with a Kheta king called Sapiel or Saparuta; but Seti I. again attacked the Kheta (1366 B.C.), who had apparently pushed southwards. Forced back by Seti, the Kheta returned and were found holding Kades by Rameses II., who, in his fifth year, there fought against them and a large body of allies, drawn probably in part from beyond Taurus, the battle which occasioned the monumental poem of Pentaur. After long struggles, a treaty was concluded in Rameses's twenty-first year, between Pharaoh and "Khetasar" (i.e. Kheta-king), of which we possess an Egyptian copy. The discovery of a cuneiform tablet containing a copy of this same treaty, in the Babylonian language, was reported from Boghaz Keui in Cappadocia by H. Winckler in 1907. It argues the Kheta a people of considerable civilization. The Kheta king subsequently visited Pharaoh and gave him his daughter to wife. Rameses's successor, Mineptah, remained on terms with the Kheta folk; but in the reign of Rameses III. (Dyn. XX.) the latter seem to have joined in the great raid of northern tribes on Egypt which was checked by the battle of Pelusium. From this point (c. 1150 B.C.)—the point at which (roughly) the monarchic history of Israel in Palestine opens—Egyptian records cease to mention Kheta; and as we know from other sources, the latter continued powerful in Carchemish for some centuries to come, we must presume that the rise of the Israelite state imposed an effective political barrier.

3. Assyrian Records.—In an inscription of Tiglath Pileser I. (about 1100 B.C.), first deciphered in 1857, a people called Khati is mentioned as powerful in Girgimash on Euphrates (i.e. Carchemish); and in other records of the same monarch, subsequently read, much mention is made of this and of other N. Syrian names. These Khatti appear again in the inscriptions of Assur-nazir-pal (early 9th century B.C.), in whose time Carchemish was very wealthy, and the Khatti power extended far over N. Syria and even into Mesopotamia. Shalmaneser II. (d. 825 B.C.) raided the Khatti and their allies year after year; and at last Sargon III., in 717 B.C., relates that he captured Carchemish and its king, Pissir, and put an end to its independence. We hear no more of it thenceforward. These Khatti, there is no reasonable doubt, are identical with Kheta. (For the chronology see further under BABYLONIA and ASSYRIA.)

4. Other Cuneiform Records.—The name of the race appears in certain of the Tel-el-Amarna letters, tablets written in Babylonian script to Amenophis (Amenhotep) IV. and found in 1922 on the site of his capital. Some of his governors in Syrian districts (e.g. one Aziru of Phonicia) report movements of the Khittites, who were then pursuing an aggressive policy (about 1400 B.C.). There are also other letters from rulers of principalities in N. Syria (Mitanni) and E. Asia Minor (Arzawa), who write in non-Semitic tongues and are supposed to have been Hittites.

Certain Khaedor Khaiti are mentioned in the Vannic inscriptions (deciphered partially by A. H. Sayce and others) as attacked by
The Hittites

The "Hittite" Monuments.—It remains to consider in the light of the foregoing evidence a class of monuments to which attention began to be called about 1870. In that year two Americans, C. H. Davis and W. H. Wright, began excavations at Hamah (Hamath) on Orontes, five basaltic blocks bearing pictographic inscriptions in relief, one of which had been reported by J. L. Burckhardt in 1812. In spite of their efforts and subsequent attempts made by Tyrwhitt Drake and Richard Burton, when consul at Damascus, proper copies could not be obtained; and it was not till the end of 1872 that, thanks to W. Wright of Beirut, casts were taken and the stones themselves sent to Constantinople by Subh Pasha of Damascus. As unusually happens when a new class of antiquities is announced, it was soon found that the "Hamathite" inscriptions did not stand alone. A manuscript in the same script had been seen in Aleppo by Tyrwhitt Drake and George Smith in 1872. It still exists, built into a mosque on the western wall of the city. Certain clay sealings, eight of which bore pictographic signs, found by A. H. Layard in the palace of Assur-bani-pal at Kuyunjik (Nineveh), as long ago as 1850 and noticed then as in a "doubtful character," were compared by Hayes Ward and found to be of the Hamathite class. A new copy of the long-known rock-sculpture at Ivriz in S. W. Cappadocia was published by E. J. Davis in 1878, and clearly showed Hamathite characters accompanying the figures. Davis also reported, but did not see, a similar inscription at Bulgar Maden, not far away. Sculptures seen by W. Skene and George Smith at Jerablus, on the middle Euphrates, led to excavations being undertaken there, in 1878, by the British Museum, and to the discovery of certain Hamathite inscriptions accompanying sculptures, a few of which were brought to London. The conduct of these excavations, owing to the death of George Smith, devolved on Consul Henderson of Aleppo, and was not carried on by the Museum. Meanwhile Wright, Ward and Sayce had all suggested "Hittite" as a substitute for "Hamathite," because no other N. Syrian people loomed so large in ancient records as did the Hittites, and the suggestion began to find acceptance. Jerablus was confidently identified with Carcomish (but without positive proof to this day), and the occurrence of Hamathite monuments there was held to confirm the Hittite theory.

In 1876 Sayce pointed out the resemblance between certain Hittite signs and characters in the lately deciphered Cypriote syllabary, and suggested that the comparison might lead to a beginning of decipherment; but the hope has proved vain. To this scholar, however, is owed the next great step ahead. In 1879 it first occurred to him to compare the rock-monuments at Boghaz Keui (see Pteria) and Euyuk in N. Cappadocia, discovered by Texier and Hamilton in 1835 and subsequently explored by G. Perrot and E. Guillaume. These, he now saw, bore Hittite pictographs. Other rock-sculptures at Giur Kaleesi, in Galatia, and in the Karabel pass near Smyrna, he suspected of belonging to the same class; and visiting the last-named locality in the autumn, he found Hittite pictographs accompanying one of the two figures. He announced his discoveries in 1880, and proclaimed the fact that a great Hittite empire, extending from Kadesh to Smyrna, had risen from the dead. A month later he had the good fortune to recover copies of a silver boss, or hilt-top, offered to various museums about 1850, but rejected by them as a meaningless forgery and for a long time lost again to sight. Round the rim was a cuneiform legend, and in the field a Hittite figure with six Hittite symbols engraved twice over on either hand of it. Reading the cuneiform as Torqu-dimme sar not Erme (i.e. "T. king of the country E.")), Sayce distributed phonetic values, corresponding to the syllables of the two proper names, among four of the Hittite characters, reserving two as "ideograms" of "king" and "country," and launched into the field of decipherment. But he subsequently recognized that this was a false start, and began afresh from another basis. Since then a number of other monuments have been found, some on new sites, others on sites already known to be Hittite, the distribution of signs often being shown by reference to the accompanying map. It will be observed that, so far as at present known, they cluster most closely in Commagene, Cappadocia and S. Phrygia.

The following notes supplement the map:—

A. West Asia Minor.—1) Niobe (Sarula Tush) and Karabel (two) rock-cut figures with much defaced hieroglyphics in relief. Remains of buildings, not yet explored, lie near the "Niobe" figure. Nothing purely Hittite has been found at Sardis or in any W. Asian excavation; but small Hittite objects have been sold in Smyrna 1888.

B. Phrygia.—Giur-Kalesi; rock-cut figures and remains of a stronghold, but no inscriptions. Daghbasiule and Bethekeiu in the Phrygian rock-monument country; at the first is a sculptured rock-panel with a few pictographs in relief; at the latter a fragment of an inscription in relief was deciphered from a mound. Kolotolu Yalta, near Higlin; block inscribed in relief, deciphered from mounds apparently marking a camp or palace-square. Efstanun Bunar (=Plato's Spring), W. of Konia; megalithic building with rude and greatly defaced reliefs, not certainly Hittite; no inscription. Panorathyia of Konia; stela, or altar, above ground, with figures on animals, not certainly Hittite; no inscription. Konia; relief of warrior, drawn by Texier in 1835 and since lost; of very doubtful Hittite character. A gold inscribed Hittite ring, (in the Museum), was found in a tomb at Gera (Tiglat-pileser); Etruscan inscriptions in relief (two on altars) and large mounds. Evidently an important Hittite site. Kara-Dagh; hill-sanctuary with incised carvings. The "pseudo-Sesostres" inscriptions, found by Miss G. L. Bell and Sir W. M. Ramsay in 1907 (see their Thousand and One Churches, 1909).

C. North Cappadocia.—Boghaz Keui (see Pteria); largeness with palace, citadel, walls, &c. Long rock-cut inscriptions on a series of inscriptions on a line of relief, two short relief inscriptions cut on blocks, and also cuneiform tablets in Babylonian and also in a native language, first found in situ in 1893, and showing the site to be the capital of Araawa, whence came two of theTell el-Amarna letters. Near the site are the rock-reliefs of Yasiti Kuyu in two hypaethral galleries, showing, in the one, two processions composed of over sixty figures moving at the head of the gallery; in the other, isolated groups of figures, fifteen in number (see for detailed description Murray's Guide to Asia Minor, 1895, pp. 23 fl.). Pictographs accompany most of the figures. The complex site of Hittite remains yet known. Boghaz Keui was never thoroughly explored until 1907, the survey of Perrot and Guillaume having been superficial only and the excavations of E. Chantre (1894) very slight. In 1885 a German expedition under Professor Stählin undertook the work, and great numbers of cuneiform tablets were found. These refer to the reigns of at least four kings from Subbluluiama (Sapullu, above) in the 13th, 12th, 11th and 10th centuries. The latter was an ally of Kashtamunamu of Babylon, the "Niobe" statue near Manisa was not definitely known for "Hittite" till 1882, when G. Dennis detected it in the "Laocoon." Herodotus had already demonstrated non-Egyptian by Rosellini. The second figure was unknown, till found by Dr Boedoe in 1896.

1 First described by the Turk, Haji Khalifa, in the 17th century; first seen by the Swedish traveller Otter in 1736, and first published in 1830 in Ritter's Erdkunde, iii., after a drawing by Major Fischer, made in 1837.
and powerful enough to write to the Babylonian court as a sovereign of equal standing. His letter shows that he considered the rise of Assyria a menace to himself. Winckler claims to read Hatti as the name of the possessors of Boghaz Keui, and to find in this name the proof of the Hittite character of Syro-Cappadocian power and of the imperial predominance of the city. But it remains to be proved whether these tablets were written there, and not rather, being in a foreign script, abroad, like most of the Tell el-Amarna archives. D. Puchstein has cleared and studied important architectural remains. Euyuk; large mound with remains of palace entered between sphinxes. Sculptured wall-dados, but no Hittite inscriptions. Cuneiform tablets; some Babylonian, others in a native language. Also inscriptions in early Phrygian character and language, found in 1894. The most famous of Hittite reliefs is here—a double-headed eagle "displayed" on the flank of one of the gateway structures. It is supposed to have suggested to the Seljuks of Konia their heraldic device adopted in the 13th century, which, brought to Europe by the Crusaders, became the emblem of Teutonic empire in 1345. This derivation must be taken, however, cum grano, proof of its successive steps being wanting. Kara-Euyuk; a mound near Dedik, partially excavated by E. Chantre in 1894. Cuneiform tablets and small objects possibly, but not certainly, Hittite. A colossal eagle was found on a desert site near Yamulki on the middle Haly, in 1907 by W. Attelemore Robinson.

D. SOUTH CAPPADOCIA.—Karaburna; long, incised rock-inscription. Boghaz Keui, on the side of Mt. Argaeus; incised rock-inscription. Eskid; a fragmentary inscription in relief and an incised inscription on a stela of very late appearance. Fraktin or Farkadin (probably anc. Das-tarkum); sculptured rock-panel showing two groups of figures in act of cult, with hieroglyphs in relief. Arslan Tash, near Comana (Cappadocia), on the Soghan Dagh; two colossal lions, one with incised inscription. Tashkii in the Zamanti valley; rock-relief with rudely incised inscription. Amidani and Bor; inscriptions incised on sculptured stelae of Kings (?), probably from Tyana (Eksi Hissar). All are now in Constantinople.

A silver seal with hieroglyphs, now at Oxford, came also from E. Wight; a basalt drum oraltar with incised inscription. Invii; rock-sculpture of king adoring god, with three inscriptions in relief. A second sculpture, similar in subject but smaller and much defaced, was found hard by in 1906. Bulgar Modern; long incised rock-inscription, near silver-ore. Gorun (Sivas); rock-inscriptions in relief, much damaged. Arslan Teppe, near Ordau (two hours from Malatia); large mound whence two sculptured stelae or wall-blocks with inscriptions in relief have been unearthed (now in Constantinople and the Louvre). Four other reliefs, reported found near Malatia and published by J. Garstang in Annals Arch. and Anthrop., 1908, probably came also from Arslan Teppe. Palanga; lower aniconic hall of draped statue with incised inscription, now in Constantinople. Also a small basalt lion, Arslan Tash, near Palanga; two rude gateway lions, uninscribed. Yevalık; defaced inscription, reported by J. S. Sterrett but never copied. Işnin; obelisk with long inscription in relief on all four faces, now in Constantinople. These last four places seem to lie on a main road leading from Cappadocia to Marash and the Syrian sites. The expedition sent out by Cornell University in 1907 found several Hittite inscriptions on rocks near Darende in the valley of the Tophama Su.

E. NORTH SYRIA.—Marash; several monuments (stelae, wall-blocks and two lions) with inscriptions, both in relief and incised (parts are now at Constantinople, part in Berlin and America); evidently one of the most important of Hittite sites. Karahurika, Arshak, Gerchin, Sinjerli; mounds about the head-waters of the Kara Su. The last-named mound, brought to O. Puchstein's notice in 1882 by the chance discovery of sculptured wall-dados, now in Constantinople, was the scene of extensive German excavations in 1893-1894, directed by F. v. Luschak and K. Koldevecy, and was found to cover a walled town with central fortified palace. Hittite, cuneiform and old Aramaic monuments were found with many small objects, most of which have been taken to Berlin; but no Hittite inscriptions came to light. Sakechegezu (Sakkechgen); a site with several mounds between Sinjarli and Antak; series of reliefs, once wall-dados, now in Berlin and Constantinople. This site is in process of excavation by Professor J. Garstang of the University of Liverpool. A sculptured portico has come to light in the smallest of the five mounds, and much pottery, with incised and painted decoration, has been recovered. Antak; fragment of relief inscription. Samsat (Samsata); sculptured stela with incised inscription much defaced. Jerabius; see above. Several Hittite objects sent from Birijik and Antak to Europe probably came from Jerabius, others from Tell Bashar on the Saour. Kelbeki, near Jerabius; two stelae, one with relief inscription. Iskanderun (Alexandretta); source of a long inscription cut on both sides of a spherical object of unknown origin. Kerekcu, a site on the Afrin, whence a fragmentary draped statue with incised inscription was sent to Berlin. Alepol; inscription in relief (see above). Tell Ahamar (on left bank of Euphrates); large stela with sculpture and inscription, found in 1908 with several sculptured slabs and two gateway lions, inscribed in cuneiform. Two hours south, a lion and a fragment of a relief inscription were found in 1909 by Mr. G. L. Bell. Tell Halaf in Mid-Mesopotamia, near Ras el-Ain; sculptures on portico of a temple or palace; cuneiform inscriptions.

**HITTITES**

Scale, 1:2,9,300,000

Sites where Hittite remains have been discovered are shown thus — Boghaz Keui

2 after a name implies doubt as to real provenance of the remnant or their Hittite character.

3 before a name implies doubt as to the exact situation of the site.
HITTITES

and large mounds, explored in 1902 by Oppenheim. *Hamah*; five tablets inscribed in relief (see above).

F. Olm, *Evrycte–Erzerum*: source of an incised inscription, perhaps not originally found there. *Kedabeg*: metal boss or hilt-top with pictographs, found in a tomb and stated by F. Hommel to be Hittite, but doubtful. *Tyrbak Kaleh*: bronze fragments with two pictographs; doubtful if Hittite. *Nineveh*: seals, see above. *Babylonia*: a bowl and a stela of storm-god, both with incised inscriptions; doubtful if Hittite. *Sinjerli*: the bowl is inscribed round the outside; the stela on the back.

A detailed description of the subjects of the reliefs, &c., is found, with the necessary illustrations, see the works indicated in the bibliography.

Structures.—The structural remains found as yet on Hittite sites are few, scanty and far better preserved. They consist of: (a) the standing pictographic doorway again the artistic Sculplured Bor, with detailed standing Hittite. Cappadocian These, at (c) Marash, (e.g. Doghanludere), Marash) a mounds, of Marash, (e.g. Jerablus, (Tepe, Arslan Tepe, &c.; the columns, probably of wood, rested on bases carved as winged lions. (c) Gate with sculptured approach at Euyuk. The ground plan of the gate is practically the same in idea as that at Sinjerli. Structures were found at Jerablus, but never properly uncovered or planned. (d) Sculptured pictorius of temples or palaces uncovered at Saskahez and Tell Halaf (see above). On other sites, e.g. Arslan Tepe (Ordasu), Arbistan, Marash (above the modern town and near the springs), Belkeu, mounds, doubtless covering structures; may be seen, and (6) sculpture and slabs have been recovered. The mounds, probably Hittite, in N. Syria alone are to be counted by hundreds. No tombs certainly Hittite have been found,1 though it is possible that some of the reliefs (e.g. at Fraktin) are funerary character.

Scultures and Other Objects of Art.—The sculptures hitherto found consist of reliefs on rocks and on stelae, either ornamental or funerary; reliefs on blocks forming parts of wall-dados, and a few figures more or less in the round, though most of these (e.g. the sphinxes of Euyuk and the lions of Arslan Tash and Marash) are not completely diseengaged from the block. The most considerable sculptured rock-panels are at Boghaz Keui (see Pteria); the others (Ivriz, Fraktin, Karabel, Glaur Kaleesi, Doghanludere), should be observed, all lie N. of Taurus—a fact of some bearing on the problem of the origin and local domicile of the art, since rock-reliefs, at any rate, cannot be otherwise than in situ. Sculptured stelae, ornionic or funerary, all with pyramidal or slightly rounded upper ends, and showing a single regal or divine figure or two figures, have come to light at Bor, Marash, Sinjerli, Jerablus, Bakery, &c. These, like most of the rock-panels, are all marked as Hittite by accompanying pictographic inscriptions. The wall-blocks are seldom inscribed, the exceptions (e.g. the Arslan Tepe lion-hunt and certain blocks from Marash and Jerablus) being not more certainly wall-dados than stelae. The only fairly complete anthropoid statue known is the much-defaced "Niobe" at Suratlu Tash, engaged in the rock behind. The aniconic lower part of an inscribed statue wholly in the round was found at Falanga, and parts of others at Kirchoglu and Marash. Despite considerable differences in execution and details, all these sculptures show one general type of art, a type which recalls now Babylonian, now Assyrian, now Egyptianian, now archaic Ionian, style, but is always individual and easily distinguishable from the actual prototypes of those peoples. The figures, whether of men or beasts, are of a squat, heavy-boned type (in some sculptures, such as graves, muscles, &c.) shown as if external, as in some Mesopotamian sculptures. The human type is always very brachycephalic, with brow receding sharply and long nose making almost one line with the sloping forehead. In the sculptures of the Commagene and the Tyana districts, the nose has a long curving tip, of very Jewish appearance, but not unlike the outline given to Kheta warriors in Egyptianian scenes. The lips are full and the chin short and shaven. The whole physiognomy is fleshly and markedly distinct from that of the Syr instant, made at that Boghaz Keui, Euyuk and Jerablus, the facial type is very markedly non-Semitic. But not much stress can be laid on these differences owing to (1) great variety of execution in different sculptures, which argues artists of very unequal capacity; (2) doubt whether individual portraits are intended in some cases and not in others. The hair of males is sometimes, but not always, worn in pigtail. The fashions of head-covering and clothes are very various, but several of them—e.g. the horned cap of the Ivriz god; the broad-brimmed hat at Boghaz Keui, Fraktin, and not least of all, the "jockey-cap" on the Tarkudimme boss; the broad-bordered over-robe, and the upturned shoes—are not found on other Asiatic monuments, except where Hittites are portrayed. Animals in profile are represented more naturalistically than human beings, e.g. at Yasi1 Kaya, and especially in some pictographic symbols in relief (e.g. at Hamah). This, however, is a feature common to Mesopotamian and Egyptianian, and perhaps to all primitive art.

The subjects depicted are processes of human, human and divine (Yasi1 Kaya, Euyuk, Glaur Kaleesi); scenes of sacrifice or adoration, or other human scenes (Yasi1 Kaya, Euyuk, Fraktin, Ivriz, and perhaps the figures seated beside tables at Marash Saskahez and Sinjerli, &c.); of the chase (Arslan Tepe, Saskahez); but not, as known at present, of battle. Both at Euyuk and Yasi1 Kaya reliefs in one and the same series are widely separated in artistic conception and execution, some showing the utmost natt, others expressing both outline and motion with fair success. The fact warns us against drawing hasty inferences as to relative dates from style and execution.

Beckford in his sculptures has still assured, Hittite and products include a very few small objects in metal (e.g. heavy, inscribed golden ring bought by Sir W. M. Ramsay at Konia; base silver seal, supported on three lions' claws, bought by D. G. Hogarth at Bor; inscribed silver boss of "Tarkudimme," mentioned above, &c., &c.); many intaglios in various stones (chiefly in steatite), mostly either spheroidal or gable-shaped, but a few scarabaeoiid, conical or cylindrical, bearing sometimes pictographic symbols, sometimes divine, human or animal figures. The best collection is at Oxford. The majority are of very rude workmanship, bodies and limbs being represented by mere skeleton lines or unfilled outlines; a few vessels (e.g. inscribed basilisk bowl found at Babylon) and fragments of ware painted with dark ornament on light body-clay, or in polychrome on a cream-white slip, or black burnished, found on N. Cappadocian sites, &c. The bronzes hitherto claimed as Hittite have been bought on the Syrian coast or come from not certainly Hittite sites in Cappa- docia (see E. Chantre, *Mission en Cappadoce*). A great many small objects were found in the excavations at Sinjerli, including carved ivories, seals, toilet-instruments, implements, &c., but these have not been published. Nor, except provisionally, has the pottery, found at Saskahez.

Inscriptions.—These, now almost sixty in number (excluding seals), are all in a pictographic character which employed symbols somewhat elaborately depicted in relief, but reduced to conventional and "shorthand" representations in the incised texts. So far, the majority of our Hittite inscriptions, like those first found at Hamah, are in relief (cameol); but the incised character, first observed in the Tyana district, has since been shown, by discoveries at Marash, Babylon, &c., to have had a

1 Five intramural graves were explored at Sinjerli, but whether of the Hittite or of the Assyrian occupation is doubtful.
As to the actual decipherment of the tablets, we encounter serious difficulties, involving the constant uncertainty of the form of the signs and the inscriptions. The method of decipherment is, however, based on a general theory of interpretation, and it is possible to make some progress in the reading of the Hittite tablets.

The Hittite language is a Semitic language, and the tablets are written in cuneiform script. The tablets are divided into two categories: the royal tablets and the official tablets. The royal tablets are generally written in a cursive script, while the official tablets are written in a more formal script.

In the case of the royal tablets, the decipherment is based on the Royal Tombs at Alaca Höyük. The inscriptions on these tablets provide valuable information about the Hittite kingdom and its history. The official tablets, on the other hand, are written in a more formal script and provide information about the administrative and legal aspects of the kingdom.

The Hittite language is a difficult language to decipher, and the process of decipherment is still ongoing. The decipherment of the tablets is a complex process that involves the use of various methods, including the study of ancient languages, the analysis of ancient texts, and the use of modern technology.

The decipherment of the Hittite tablets has been an ongoing process for many years, and it is still an active area of research. The decipherment of the tablets is important for understanding the history and culture of the Hittite kingdom.
HITTITES

Whether the Mitanni had shared in that civilization while independent, and whether they were racially kin to the Hatti, cannot be determined at present. Winckler has adduced evidence from names of local gods to show that there was an Indo-European racial element in Mitanni; but none of a similar element in the Hatti, whose chief god was Teshub. The majority of scholars has always regarded the Hittites proper as, at any rate, non-Semitic, and some leading authorities have called them proto-Armenian, and believed that they have modern descendants in the Caucasus. This racial question can hardly be determined till those Hatti records, whether in cuneiform or pictographic script, which are couched in a native tongue, not in Babylonian, are read. In the meantime we have proper to us the fragments of inscriptions, mostly of the late second millennium, on which a Hittite power was subject to or federated with the Hatti. Through Phrygia and Lydia (q.v.) influences of this same Cappadocian civilization passed towards the west; and indeed, before the Greek colonization of Asia Minor, a loosely knit Hatti empire may have stretched even to the Aegean. The Nymphi (Kara Bel) and Niobe sculptures near Smyrna are probably memorials of that extension. Certainly some inland Anatolian power seems to have kept Aegean settlers and culture away from the Ionian coast during the Bronze Age, and that power was in all likelihood a Hatti kingdom of Cappadocia. Owing perhaps to Assyrian aggression, this power seems to have begun to suffer decay about 1000 B.C. and thereafter to have shrunken inwards, leaving the coasts open. The powers of Phrygia and Lydia rose successively out of its ruins, and continued to offer westward passage to influences of Mesopotamian culture till well into historic times. The Greeks came too late to Asia to have had any contact with Hatti power obscured from their view by the intermediate and secondary state of Phrygia. Their earliest writers regarded the latter as the seat of the oldest and most godlike of mankind. Only one Greek author, Herodotus, alludes to the prehistoric Cappadocian power and only at the latest moment of its long decline. At the same time, some of the Greek legends seem to show that peoples, with whom the Greeks came into early contact, had vivid memories of the Hatti. Such are the Amazon stories, whose local range was very extensive, and the myths of Memnon and Polops. The real reference of these stories, however, was forgotten, and it has been reserved to our own generation to rediscover the records of a power and a civilization which once dominated Asia Minor and north Syria and occupied all the continental roads of communication between the East and the West of the ancient world. The credit of having been the first to divine this importance of the Hittites should always be ascribed to Sayce.

The history of the Hatti and their civilization, then, would appear to have been very briefly, this. They belonged to an ethnic scattered widely over Eastern Asia Minor and Syria at an early period (Khatti invaded Akkad about 1900 B.C. in the reign of Samsudinata); but they first formed a strong state in Cappadocia late in the 16th century B.C. Subbulilliuma became their first great king, though he had at least one dynastic predecessor of the name of Hattusil. The Hatti now pushed southwards in force, overcame the kingdom of Mitanni and proceeded partly to occupy and partly to make tributary both north Syria and western Mesopotamia where some of their congener were already settled. They came early into collision with Egypt, in which, however, as the base of their power under Hattusil II. fought the battle of Kadesh with Rameses II., on at least equal terms. Both now and previously the diplomatic correspondence of the Hatti monarchs shows that they treated on terms of practical equality with both the Babylonian and the Egyptian courts; and that they waged constant wars in Syria, mainly with the Amorite tribes. At this time the Hatti empire or confederation probably included, on the north, Hittites of Lydia. The Boghaz Keui correspondence ceases to be important with the generation following Hattusil II., and in the Assyrian records, which begin about a couple of centuries later, we find Carchemish the chief Hatti city and N. Syria called the Hatti-land. It is possible therefore that a change of imperial centre took place after the Hatti had ceased to fear Egypt in north Syria. If so, the continuation of Hittite history will have to be sought among the remains at Jeraubus and other middle eastern sites, after their enumeration in these pages, and is an important factor in the establishment of the Hatti at Carchemish not only made them a commercial people and probably sapped their highland vigour, but also brought them into closer proximity to the rising North Semitic power of Assyria, whose advent had been regarded with apprehension by Hattusil II. (see above). One of his successors, Arnaunta (late 13th century?), was already feeling the effect of Assyrian pressure, and with the accession of Tiglat Pileser I., about a century later, a long but often interrupted series of Assyrian efforts to break up the Hatti power began. With the overthrow of the Bosporan Hittite monarchy on the south-east Asia Minor, and gradually reduced the Hatti. But the resistance of the latter was sturdy and prolonged. They remained the strongest power in Syria and eastern Asia Minor till well into the first millennium B.C. and their Syrian seat was not lost till finally after the great extension of Assyrian power which took place in the latter part of the 9th century. What had been happening to their Cappadocian province meanwhile we do not yet know; but the presence of Phrygian inscriptions at Euyuk and Tyana, ancient seats of their power, suggests that the client monarchy in the Sangarius valley shook itself free during the early part of the Hittite struggle with Assyria, and in the day of Hatti weakness extended its clomination over the home territory of its former suzerain. "White Syrians," however, were still in Cappadocia even after the Cimmerians had destroyed the Phrygian monarchy, allowing Lydia to become independent under the Mermaid dynasty. Croesus found them centred at Ptera in the 6th century and dealt them a final blow. But much of their secular or religious custom lived on and was observed, and acknowledged by modern scholars as typically "Anatolian."

Hittorff was born in Cologne on the 28th of August 1829. After serving an apprenticeship to a mason in his native town, he went in 1830 to Paris, and studied for some years at the Academy of Fine Arts, where he was a favourite pupil of Bélanger, the government architect, who in 1814 appointed him his principal inspector. Succeeding Bélanger as government architect in 1818, he designed many important public and private buildings in Paris and also in the south of France. From 1819 to 1830 in collaboration with le Coët he directed the royal fêtes and ceremonials. After making architectural tours in Germany, England, Italy and Sicily, he published the result of his observations in the latter country in the work *Architecture antique de la Sicile* (3 vols., 1826-1830; new edition, 1865-1867), and also in *Architectura moderne de la Sicile* (1826-1832). One of his important discoveries was that colour had been made use of in ancient Greek architecture, a subject which he especially discussed in *Architectura polychrome des Grecs* (1830) and in *Restitution du temple d'Emphéloé à Sélinonte* (1831); and in accordance with the doctrines enunciated in these works he was in the habit of making colour an important feature in most of his architectural designs. His principal building is the church of St Vincent de Paul in the basilica style, which was constructed between 1830 and 1844. He also designed the two fountains in the Place de la Concorde, the Circus of the Empress, the Rotunda of the panamas, many cafés and restaurants of the Champs Elysées, the houses forming the circle round the Arc de Triomphe de l'Étoile, besides many embellishments of the Bois de Boulogne and other places. In 1833 he was elected a member of the Academy of Fine Arts. He died in Paris on the 25th of March 1867.

Hitzacker, a town of Germany, in the Prussian province of Hannon, at the influx of the Jette into the Elbe, 33 m. N.E. of Lüneburg by the railway to Wittenberge. Pop. (1905) 1106. It has an Evangelical church and an old castle and numerous medieval remains. There are chalybeate springs and a hydro-pathic establishment in the town. The famous library now in Wolfenbüttel was originally founded here by Augustus, duke of Brunswick (d. 1666) and was removed to its present habitation in 1643.

Hitzig, Ferdinand (1807-1875), German biblical critic, was born at Hauben, Baden, where his father was a pastor, on the 23rd of June 1807. He studied theology at Heidelberg under H. E. G. Paulus, at Halle under Wilhelm Gesenius and at Göttingen under Ewald. Returning to Heidelberg he became Privatdozent in theology in 1829, and in 1831 published his *Begriff der Kritik am Alten Testamente praktisch erörtert*, a study of Old Testament criticism in which he explained the critical principles of the grammatico-historical school, and his *Das Propheten Jonas Orakel über Moab*, an exposition of the 15th and 16th chapters of the book of Isaiah attributed by him to the prophet Jonah mentioned in 2 Kings xiv. 25. In 1833 he was called to the university of Zürich as professor ordinarius of theology. His next work was a commentary on Isaiah with a translation (*Übersetzung u. Auslegung des Propheten Jesaja*), which he dedicated to Heinrich Ewald, and which Hermann Hupfeld (1796-1869), well known as a commentator on the Psalms (1853-1861), pronounced to be his best exegetical work. At Zürich he laboured for a period of twenty-eight years, during which, besides commentaries on *The Psalms* (1835-1850; 2nd ed., 1865-1866), *The Minor Prophets* (1838; 3rd ed., 1863), *Jeremiah* (1841; 2nd ed., 1866), *Ezekiel* (1847), *Daniel* (1850), *Ecclesiastes* (1847), *Canticles* (1853), and *Proverbs* (1858), he published a monograph, *Über Johannes Markus u. seine Schriften* (1843), in which he maintained the chronological priority of the second gospel, and sought to prove that the Apocalypse was written by the same author. He also published various treatises of archaeological interest, of which the most important are *Die Erfindung des Alphabetes* (1840), *Urgeschichte u. Mythologie der Phylister* (1845), and *Die Grabsschrift des Eschmunazar* (1855). After the death of Friedrich Umbreit (1795-1860), one of the founders of the well-known *Studien und Kritiken*, he was called in 1861 to succeed him as professor of theology at Heidelberg. Here he wrote *His Geschicte des Volkes Israel* (1860-1870), in two volumes, extending respectively to the end of the Persian and to the fall of Masada, A.D. 72, as well as work on the Pauline epistles, *Zur Kritik Paulinischer Briefe* (1870), on the Moabite Stone, *Die Inschrift des Mescha* (1870), and on Assyrian, *Sprache u. Sprachen Assyriens* (1871), besides revising the commentary on Job by Ludwig Hitzel (1801-1841), which was first published in 1839. He was also a contributor to the *Monatsschrift des wissenschaftlichen Vereins in Zürich*, the *Zeitschrift der deutschen morgenländischen Gesellschaft*, the *Theologische Studien u. Kritiken*, Eduard Zeller's *Theologische Jahrbücher*, and Adolf Hilgenfeld's *Zeitschrift für wissenschaftliche Theologie*. Hitzig died at Heidelberg on the 22nd of January 1875. As a Hebrew philologist he holds very high rank; and as a constructive critic he is remarkable for acuteness and sagacity. As a historian, however, some of his speculations have been considered fanciful. "He places the cradle of the Israelites in the south of Arabia, and, like many other critics, makes the historical times begin only with Moses" (F. Lichtenberger, *History of German Theology*, p. 156).

His lectures on biblical theology (Vorlesungen über biblische Theologie u. mesopotamische Zeitersagen) were published in 1860 after his death, along with a portrait and biographical sketch by his pupil, J. J. Kneucker (b. 1804), professor of theology at Heidelberg. See Heinrich Steiner, *Ferdinand Hitzig* (1882); and Adolf Kahleman's article "Ferdinand Hitzig" in the *Encyclopædia Britannica*.

Hiung-nu, Hiung-ne, Heung-ne, &c., a people who about the end of the 3rd century B.C. formed, according to Chinese records, a powerful empire from the Great Wall of China to the Caspian. Their ethnical affinities have been much discussed; but it is most probable that they were of the Turki stock, as were the Huns, their later western representatives. They are the first Turkish people mentioned by the Chinese. A theory which seems plausible is that which assumes them to have been a heterogenous collection of Mongol, Tungus, Turki and perhaps even Finnish hordes under a Mongol military caste, though the Mongolo-Tungus element probably predominated. Towards the close of the 1st century of the Christian era the Hiung-nu empire broke up. Their suzerain was Hiung-nu. They seem to have gone westward and settled on the Ural river. These, de Guiges suggests, were the ancestors of the Huns, and many ethnologists hold that the Hiung-nu were the ancestors of the modern Turks.

Hivites, an ancient tribe of Palestine driven out by the invading Israelites. In Jos. ix. 7, 19 they are connected with Gibbon. The meaning of the name is uncertain; Wellhausen derives it from סָפָע "Eve," or "serpent," in which case the Hivites were originally the snake clan; others explain it from the Arabic hany, "family," as meaning "dwellers in (Bedouin) encampments." (See Palestine; Jews.)

Hjørring, an ancient town of Denmark, capital of the Om (county) of its name, in the northern insular part of the peninsula of Jutland. Pop. (1901) 901. It lies 7 m. inland from the shore of Jammer Bay, a stretch of coast notoriously dangerous to ships. On the north side is a large lagoon, Lolland-faxo, a favoured seaside resort. In this neighbourhood as well as to the south-east of Hjørring, slight elevations are seen, deserving the name of hills in this low-lying district. Hjørring is on the northern railway of Jutland, which here turns eastward to the Cattegat part of Frederikshavn (23 m.), a harbour of refuge.

Hkamti Long (called Kanigutiy by the Burmes, and Bor Hkampti by the peoples of the Assam side), a collection of seven
HLOTHHERE—HOACTZIN

Shan states subordinate to Burma, but at present beyond the administrative border. Estimated area, 900 sq. m.; estimated pop. 11,000. It lies between 27° and 38° N. and 97° and 98° E., and is bordered by the Mishmi country on the N., by the Patkai range on the W., by the Hukawng valley on the S. and E., and indeed all round by various Chinpgaw or Kachin communities. The country is little known. It was visited by T. T. Cooper, the Chinese traveller and political agent at Bhamo, where he was murdered; by General Woodthorpe and Colonel Macgregor in 1834, by Mr Errol Grey in the following year, and by Prince Henry of Orleans in 1895. All of these, however, limited their explorations to the vicinity of the Malai-hla, the western branch of the Irrawaddy river. Kamiti has shrunk very much from its old size. It was no doubt the northernmost province of the Shan kingdom, founded at Mogaueng by Sam Long-hpa, the brother of the ruler of Kambawa, when that empire had reached its greatest extension. The irruption of Kachins or Chinpgaw from the north has now completely hemmed the state in. Prince Henry of Orleans described it as "a splendid territory, fertile in soil and abundant in water, where tropical and temperate culture flourish side by side, and the inhabitants are protected on three fronts by mountains." Referring to him as King, the people emigrated to the hills between the Irrawaddy and the Salween, and became part of the kingdom of Moam.

HLOTHHERE, king of Kent, succeeded his brother Ecgbert in 673, and appears for a time to have reigned jointly with his nephew Eadric, son of Ecgbert, as a code of laws still extant was issued under both names. Neither is mentioned in the account of the invasion of Æthelred in 676. In 685 Eadric, who seems to have quarrelled with Hlothhere, went into exile and led the South Saxons against him. Hlothhere was defeated and died of his wounds.

See Bede, Hist. eccl. (Plummer), iv. 5, 17, 26, v. 24; Saxon Chronicle (Earle and Plummer), s.a. 685; Schmidt, Gesetze, pp. 10 sqq.; Thorpe, Ancient Laws, i. 26 sqq.

HOACTZIN, or Hoactzin, a bird of tropical South America, thought by Buffon to be that indicated by Hernandez or Fernandez under these names, the Opisthocomus hoazin or O. cristatus of modern ornithologists—a very curious and remarkable form, which has long exercised the ingenuity of classifiers. Placed by Buffon among his "Hoccos" (Curassows), and then by P. L. S. Müller and J. F. Gmelin in the Linnaean genus Phasianus, its many peculiarities were recognized by J. K. W. Illiger in 1811 as sufficient to establish it as a distinct genus, Opisthocomus; but various opinions were subsequently expressed by systematic authors. L’Héritier was the first to give any account of its anatomy (Comptes rendus, 1837, v. 433), and from his time our knowledge of it has been successively increased by Johannes Müller (Ber. Akad. Wissensch. Berlin, 1841, p. 177), Deville (Rev. et mag. de zoologie, 1852, p. 217), Gervais (Castelnaud, Espèces Américaine du Sud, zoologie, anatome, p. 66), Huxley (Proc. Zool. Society, 1868, p. 304), Perrin (Trans. Zool. Society, ix. p. 353), and A. H. Garrod (Proc. Zool. Society, 1879, p. 106). After a minute description of the skeleton of Opisthocomus, with the especial object of determining its affinities, Huxley declared that it "resembles the ordinary gallinaceous birds and pigeons more than it does any others, and that when it diverges from them it is either sui generis or approaches the Musophagidae." He accordingly regarded it as the type and sole member of a group, named by him Heteroninae, which sprang from the great Carinate stem later than the Tinamorninae, Turricorninae, or Charadriorninae, but before the Peristerorninae, Pierocorninae or Alectororninae. This conclusion is substantially the same as that reached by H. W. Bates, and which A. H. Garrod subsequently arrived at after closely examining and dissecting specimens preserved in spirit; but the latter has gone further and endeavoured to trace more particularly the descent of this peculiar form and some others, remarking that the ancestor of Opisthocomus must have left the parent stem very shortly before the true Gallinae first appeared, and at about the same time as the independent pedigree of the Cuculidae and Musophagidae commenced—these two groups being, he believed, very closely related, and Opisthocomus serving to fill the gap between them.

The first thing that strikes the observer of its skeleton is the extraordinary structure of the sternal apparatus, which is wholly unlike that of any other bird known. The keel is only developed on the posterior part of the sternum—the fore part being, as it were, cut away, while the short furcula at its symphysis meets the manubrium, with which it is firmly consolidated by means of a prolonged and straight hypocleidium, and anteriorly ossifies with the coracoids. This unique arrangement seems to be correlated with the enormously capacious crop, which rests upon the furcula and fore part of the sternum, and is also received in a cavity formed on the surface of each of the great pectoral muscles. Furthermore this crop is extremely muscular, so as more to resemble a gizzard, and consists of two portions divided by a partial constriction, after a fashion of which no other example is known among birds. The true gizzard is greatly reduced.

The hoactzin appears to be about the size of a small pheasant, but is really a much smaller bird. The beak is strong, curiously denticulated along the margin of the maxilla near the base, and is beset by diverging bristles. The eyes, placed in the middle of a patch of bare skin, are furnished with briskly lashes, resembling those of horn-bills and some few other birds. The head bears a long pendant crest of loose yellowish feathers. The body is olive-coloured, varied with white above, and beneath is of a dull bay. The wings are short and rounded. The tail is long and tipped with yellow. The legs are rather short, the feet stout, the tarsi reticulated, and the toes scutellated; the claws long and slightly curved. According to all who have observed the habits of this bird, it lives in bands on the lower trees and bushes bordering the streams and lagoons, feeding on leaves and various wild fruits, especially, says H. W. Bates (Naturalist on the River Amazons, i. 120), those of a species of Psidium, and it is also credited with eating those of an arum (Caladium arborescens), which grows plentifully in its haunts. "Its voice is a harsh, grating hiss," continues the same traveller, and "it makes the noise when alarmed, all the individuals sibilating as they fly heavily away from tree to tree, when disturbed by passing canoes." It exhales a very strong odour—wherefore it is known in British Guiana as the "stink-bird"—compared by Bates to "musk combined with wet hides," and by Deville to that of a cow-house. The species is said to be polygamous; the nest is built on trees, of sticks placed above one another, and softer materials atop. Therein the hen lays her eggs to the number of three or four, of a dull-yellowish white, somewhat profusely marked with reddish blotches and spots, so as to resemble those of some of the Railidae (Proc. Zool. Society, 1867, pl. xv. fig. 7, p. 164). The young are covered only with very scanty hair, like down, and have well-developed claws on the first and second fingers of the wing, which they use
in clambering about the twigs in a quadrupedal manner; if placed in the water they swim and dive well, although the adults seem to be not at all aquatic.

(A. N.)

HOADLY, BENJAMIN (1676-1761), English divine, was born at Westerham, Kent, on the 14th of November 1766. In 1691 he entered Catharine Hall, Cambridge, where he graduated M.A. and was for two years tutor, after which he held from 1701 to 1711 the lectureship of St Mildred in the Poultry, and along with it from 1704 the rectory of St Peter-le-Poer, London. His first important appearance as a controversialist was against Edmund Calamy's "the younger" in reference to conformity (1703-1707), and after this he came into conflict with Francis Atterbury, first on the interpretation of certain texts and then on the whole Anglican doctrine of non-resistance. His principal treatises on this subject were the Measures of Submission to the Civil Magistrate and The Origin and Institution of Civil Government discussed; and his part in the discussion was so much appreciated by the Commons that in 1709 they presented an address to the queen praying her to "bestow some dignity in the church on Mr Hoadly for his eminent services both to church and state." The queen returned a favourable answer, but the dignity was not conferred. In 1710 he was presented by a private patron to a seventy-four years later he was made an elector of the university. In 1715 he was appointed chaplain to the king, and the same year he obtained the rectory of Bangor. He held the see for six years, but never visited the diocese. In 1716, in reply to George Hicks (q.v.), he published a Preparation against the Principles and Practices of Nonjurors in Church and State, and in the following year preached before the king his famous sermon on the Kingdom of Christ, which was immediately published by royal command. These works were attacks on the divine authority of kings and of the clergy, but as the sermon dealt more specifically and distinctly with the power of the church, its publication caused an ecclesiastical ferment which in certain aspects has no parallel in religious history. It was at once resolved to proceed against him in convention, but this was prevented by the king prossing the assembly, a step which had consequences of vital bearing on the history of the Church of England, since from that period the great Anglican council ceased to transact business of a more than formal nature. The restrained sentiments of the council in regard to Hoadly found expression in a war of pamphlets known as the Bangorian Controversy, which, partly from a want of clearness in the statements of Hoadly, partly from the disingenuousness of his opponents and the confusion resulting from exasperated feelings, developed into an intricate and bewildering maze of side discussions in which the main issue of the dispute were concealed almost beyond the possibility of discovery. But however vague and uncertain might be the meaning of Hoadly in regard to several of the important bearings of the questions around which he aroused discussion, he was explicit in denying the power of the Church over the conscience, and its right to determine the condition of men in relation to the favour of God. The most able of his opponents was William Law; others were Andrew Snape, provost of Eton, and Thomas Sherlock, dean of Chichester. So exercised was the mind of the religious world over the dispute that in July 1717 as many as sixty pamphlets were made their appearance; and at one period the crisis became so serious that the business of London was for some days virtually at a stand-still. Hoadly, being not unskilled in the art of flattery, was translated in 1721 to the see of Hereford, in 1723 to Salisbury and in 1734 to Winchester. He died at his palace at Chelsea on the 17th of April 1761. His controversial writings are vigorous if prolific and his theological essays have little merit. He must have been a much hated man, for his latitudinarianism offended the high church party and his rationalism the other sections. He was an intimate friend of Dr Samuel Clarke, of whom he wrote a Life. Hoadly's brother, JOHN HODALY (1675-1746), was archbishop of Dublin from 1730 to 1742 and archbishop of Armagh from the latter date until his death on the 19th of July 1746. In early life the archbishop was very intimate with Gilbert Burnet, then bishop of Salisbury, and in later life he was a prominent figure in Irish politics.

The works of Benjamin Hoadly were collected and published by his son John in 3 vols. (1773). To the first volume was prefixed the article "Hoadly" from the supplement to the Biographia Britannica. See also L. Stephen, English Thought in the 18th Century.

HOAR, SAMUEL (1778-1856), American lawyer, was born in Lincoln, Massachusetts, on the 8th of May 1778. He was the son of Samuel Hoar, an officer in the American army during the War of Independence, for many years a member of the Massachusetts General Court, and a member in 1826-1833 of the state Constitutional Convention. The son graduated at Harvard in 1802, was admitted to the Massachusetts bar in 1805 and began practice at Concord. His success in his profession was immediate, and for a half-century he was one of the leading lawyers of Massachusetts. He was in early life a Federalist and was later an ardent Whig in politics. He was a member of the state senate in 1829, 1832 and 1833, and of the national house of representatives in 1835-1837, during which time he made a notable speech in favour of the constitutional right of congress to abolish slavery in the District of Columbia. In November 1844, having retired for a short time from legal practice some years before, he went to Charleston, S.C., at the instance of Governor George Nixon Briggs (1796-1861), to test in the courts of South Carolina the constitutionality of the state law which provided that "it shall not be lawful for any free negro, or person of color, to come into this state on board any vessel, as a cook, steward or mariner, or in any other employment," and that such free negroes should be seized and locked up until the vessels on which they had come were ready for sea, when they should be returned to such vessels. His visit aroused great excitement, he was threatened with personal injury, the state legislature passed resolutions calling for his expulsion, and he was compelled to leave early in December. In 1848 he was prominent in the Free Soil movement in Massachusetts, and subsequently assisted in the organization of the Republican Party. In 1850 he served in the Massachusetts house of representatives. He married a daughter of Roger Sherman of Connecticut. He died at Concord, Massachusetts, on the 2nd of November 1856. See a memoir by his son G. F. Hoar in Memorial Biographies of the New England Historic Genealogical Society, vol. iii. (Boston, 1883); the estimate by R. W. Emerson in Lectures and Biographical Sketches (Boston, 1863); and "Samuel Hoar's Expulsion from Charleston," Old South Leaflets, vol. vii. No. 140.

His son, Ebenezer Rockwood Hoar (1816-1895), was born at Concord, Massachusetts, on the 21st of February 1816. He graduated at Harvard in 1835 and at the Harvard Law School in 1839, and was admitted to the Massachusetts bar in 1840. From 1849 to 1855 he was a judge of the Massachusetts court of common pleas, from 1850 to 1869 a judge of the state supreme court, and in 1869-1870 attorney-general of the United States in the cabinet of President Grant, and in that position fought unmerited "machine" appointments to offices in the civil service until at the pressure of the "machine" Grant asked for his resignation from the cabinet. The Senate had already shown its disapproval of Hoar's policy of civil service reform by its failure in 1870 to confirm the President's nomination of Hoar as associate-justice of the supreme court. In 1871 he was a member of the Joint High Commission which drew up the Treaty of Washington. In 1872 he was a presidential elector on the Republican ticket, and in 1873-1875 was a representative in Congress. He was a member of the Board of Overseers of Harvard University from 1868 to 1880 and from 1881 to 1887, and was president of the Board in 1878-1880 and in 1881-1887. He was also prominent in the affairs of the Unitarian church. He was a man of high character and brilliant wit. He died at Concord on the 31st of January 1895. Another son, George Freake Hoar (1826-1904), was born in Concord, Massachusetts, on the 20th of August 1826. He graduated at Harvard in 1849, and was admitted to the Massachusetts bar in 1849. He settled in the practice of law in Worcester, Massachusetts, where in 1852 he became a partner of Emory Washburn (1800-1877). In 1852 he was elected as a Free-Soiler to the
HOARE—HOBART PASHA

Massachusetts House of Representatives, and during his single term of service became the leader of his party in that body. He was active in the organization of the Republican party in Massachusetts, and in 1837 was elected to the State senate, but declined a re-election. During 1856-1857 he was active in behalf of the Free-State cause in Kansas. He was a member of the National House of Representatives from 1869 until 1877, and in this body took high rank as a ready debater and a conscientious committee worker. He was prominent as a defender and supporter of the Freedman’s Bureau, took a leading part in the later reconstruction legislation and in the investigation of the Crédit Mobilier scandal, and in 1875 was one of the House managers of the impeachment of General W. W. Belknap, Grant’s secretary of war. In 1877 he was a member of the Electoral Commission which settled the disputed Hayes-Tilden election. From 1877 until his death he was a member of the United States senate. In the senate almost from the start he took rank as the most influential leaders of the Republican party; he was a member from 1882 until his death of the important Judiciary Committee, of which he was chairman in 1891-1893 and in 1893-1904. His most important piece of legislation was the Presidential Succession Act of 1886. He was a delegate to every Republican National Convention from 1876 to 1904, and presided over that at Chicago in 1880. He was a conservative by birth and training, and although he did not leave his party he disagreed with its policy in regard to the Philippines, and spoke and voted against the ratification of the Spanish Treaty. He was regent of the Smithsonian Institution in 1880-1881, and long served as an overseer of Harvard University (1896-1904) and as president of its alumni association. He was also president of the American Historical Association (1884-1885) and of the American Antiquarian Society (1884-1887). Like his brother, he was a leading Unitarian, and was president of its National Conference from 1894 to 1902. He died at Worcester, Massachusetts, on the 30th of September 1904. A memorial statue has been erected there.

See his Recollections of Seventy Years (New York, 1903).

HOARE, SIR RICHARD COLT. BART. (1758-1838). English antiquary, was the eldest son of Richard Hoare, who created a baronet in 1756, and was born on the 9th of December 1758. He was descended from Sir Richard Hoare (1648-1718), lord mayor of London, the founder of the family banking business. An ample allowance from his grandfather, Henry Hoare, enabled him to pursue the archaeological studies for which he had already shown an inclination. In 1783 he married Hester, daughter of William Henry, Lord Lyttelton, and after her death in 1785 he paid a prolonged visit to France, Italy and Switzerland. He succeeded to the baronetcy in 1787, and in 1788 made a second continental visit, the result of which was his book called A Classical Tour through Italy and Sicily. A journey through Wales was followed by a translation of the Itinerarium Cambium and of the Descriptio Cambriae of Giraldus Cambrensis, Hoare adding notes and a life of Giraldus to the translation. This was first published in 1804, and has been revised by T. Wright (London, 1863). Sir Richard died at Stourhead, Wilts, on the 10th of May 1838, being succeeded in the baronetcy by his half-brother, Henry Hugh Hoare. Hoare’s most important work was his Ancient History of North and South Wales (1812-1819); he also did some work on the large History of Modern Wiltsire (1822-1844). For notices of him and a list of his works, many of which were printed privately, see the Gentleman’s Magazine for July 1838, and the Dict. Nat. Biog. vol. xxvii. (1891). See also E. Hoare, History of the Hoare Family (1883).

HOBART, GARRET AUGUSTUS (1844-1890), Vice-President of the United States 1879-1890, was born at Long Branch, N.J., on the 3rd of June 1844. He graduated at Rutgers College in 1863, was admitted to the bar in 1869, practised law at Paterson, N.J., and rose to prominence in the State. He was long conspicuous in the State Republican organization, was Chairman of the New Jersey State Republican Committee from 1886 to 1890, became a member in 1884 of the Republican National Committee, and was the delegate-at-large from New Jersey to five successive Republican national nominating conventions. He served in the New Jersey Assembly in 1873-1874, and in the New Jersey Senate in 1877-1882, and was speaker of the Assembly in 1874 and president of the Senate in 1883 and 1882. He was also prominent and successful in business and accumulated a large fortune. He accepted the nomination as Vice-President in 1890, on the ticket with President McKinley, and was elected; but while still in office he died at Paterson, N.J., on the 21st of November 1890.

See the Life (New York, 1910) by David Magie.

HOBART, JOHN HENRY (1775-1839), American Protestant Episcopal bishop, was born in Philadelphia, Pennsylvania, on the 14th of September 1775, being fifth in direct descent from Edmund Hoare, a founder of Hingham, Massachusetts. He was educated at the Philadelphia Latin School, the College of Philadelphia (now the University of Pennsylvania), and Princeton, where he graduated in 1793. After studying theology under Bishop William White at Philadelphia, he was ordained deacon in 1798, and priest two years later. He was elected assistant bishop of New York, with the right of succession, in 1811, and was acting diocesan from that date because of the ill-health of Bishop Benjamin Moore, whom he formally succeeded on the latter’s death in 1816. He was one of the founders of the General Theological Seminary, became its professor of pastoral theology in 1821, and as bishop was its governor. In his zeal for the historic episcopacy he published in 1809 An Apology for Apostolic Order and its Advocates, a series of letters to Rev. John M. Mason, who, in The Christian’s Magazine, of which he was editor, had attacked the Episcopacy in general and in particular Hobart’s Collection of Essays on the Subject of Episcopacy (1806). Hobart’s zeal for the General Seminary and the General Convention led him to oppose the plan of Philander Chase, bishop of Ohio, for an Episcopalian seminary in that diocese; but the Ohio seminary was made directly responsible to the House of Bishops, and Hobart approved the plan. His strong opposition to “dissenting churches” was nowhere so clearly shown as in a pamphlet published in 1819 to dissuade all Episcopalians from joining the American Bible Society, which he thought the Protestant Episcopal Church had not the numerical or the financial strength to control. In 1818, to counterbalance the influence of the Bible Society and especially of Scott’s Commentaries, he began to edit with selected notes the Family Bible of the Society for Promoting Christian Knowledge. He delivered episcopal charges to the clergy of Connecticut and New York entitled The Churchman (1810) and The High Churchman Vindicated (1826), in which he accepted the name “high churchman,” and stated and explained his principles “in distinction from the corruptions of the Church of Rome and from the Errors of Certain Protestant Sects.” He exerted himself greatly in building up his diocese, attempting to make an annual visit to every parish. His failing health led him to visit Europe in 1823-1825. Upon his return he preached a characteristic sermon entitled The United States of America compared with some European Countries, particularly England (published 1826), in which, although there was some praise for the English church, he so boldly criticized the establishment, state patronage, cabinet appointment of bishops, lax discipline, and the low requirements of theological education, as to rouse much hostility in England, where he had been highly praised for two volumes of Sermons on the Principal Events and Truths of Redemption (1824). He died at Auburn, New York, on the 12th of September 1830. He was able, impetuous, frank, perfectly fearless in controversy, a speaker and preacher of much eloquence, a supporter of missions to the Oneida Indians in his diocese, and the compiler of the following devotional works: A Companion for the Altar (1804), Festivals and Fasts (1804), A Companion to the Book of Common Prayer (1803), and A Clergyman’s Companion (1805).

See Memorial of Bishop Hobart, containing a Memoir (New York, 1869), published by the Bishop’s Successor, the Bishop of Hobart (New York, 1834), and The Closing Years of Bishop Hobart (New York, 1836).

HOBART PASCHA, AUGUSTUS CHARLES HOBART-HAMPDEN (1822-1886), English naval captain and Turkish admiral, was
HOBART—HOBBEMA

born in Leicestershire on the 1st of April 1822, being the third son of the 6th Earl of Buckinghamshire. In 1845 he entered the Royal Navy and served as a midshipman on the coast of Brazil in the suppression of the slave trade, displaying much gallantry in the operations. In 1855 he took part, as captain of the “Driver,” in the Baltic Expedition, and was actively engaged at Bomarsund and Abo. In 1852 he retired from the navy with the rank of post-captain; but his love of adventure led him, during the American Civil War, to take the command of a blockade-runner. He had the good fortune to run the blockade eighteen times, conveying war material to Charleston and returning with a cargo of cotton. In 1867 Hobart entered the Turkish service, and was immediately nominated to the command of that fleet, with the rank of “Bahrie Limassi” (rear-admiral). In this capacity he performed splendid service in helping to suppress the insurrection in Crete, and was rewarded by the Sultan with the title of Pasha (1866). In 1874 Hobart, whose name had, on representations made by Greece, been removed from the British Navy List, was reinstated; his restoration did not, however, last long, for on the outbreak of the Russo-Turkish war he again entered Turkish service. In command of the Turkish squadron he completely dominated the Black Sea, blockading the ports of South Russia and the mouths of the Danube, and preventing the passage of the enemy’s fleet. On the conclusion of peace Hobart still remained in the Turkish service, and in 1881 was appointed Mushir, or marshal, being the first Christian to hold that high office. His achievements as a blockade-runner, his blockade of Crete, and his handling of the Turkish fleet against the torpedo-lined coasts of Russia, showed him to be a daring, resourceful, and skilful commander, worthy to be ranked among the illustrious names of British naval heroes. He died at Milan on the 10th of June 1886.

See his Sketches of My Life (1886), which must, however, be used with caution, since it contains many proved inaccuracies.

HOBART, the capital of Tasmania, in the county of Buckingham, on the southern coast of the island. It occupies a site of great beauty, standing on a series of low hills at the foot of Mount Wellington, a lofty peak (4166 ft.) which is snow-clad for many months in the year. The town fronts Sullivan’s Cove, a picturesque bay opening into the estuary of the river Derwent, and is nearly square in form, laid out with wide streets intersecting at right angles, the chief of which are served by electric tramways. It is the seat of the Anglican bishop of Tasmania, and of the Roman Catholic archbishop of Hobart. The Anglican cathedral of St David dates from 1873, though its foundations were laid as early as 1845. St Mary’s, the Catholic cathedral, is a beautiful building; but perhaps the most magnificent example of architecture in Hobart is the great Baptist tabernacle in Upper Elizabeth Street. The most prominent public buildings are the Houses of Parliament, to which an excellent library is attached; the town hall, a beautiful building of brown and white Tasmania freestone in Italian style; the museum and national art gallery, and the general post office (1904) with its lofty clock-tower. Government House, the residence of the governor of Tasmania, a handsome castellated building, stands in its domain on the banks of the Derwent, to the north of the town. The botanical gardens adjoining it, the parks and public gardens, the most extensive is the Queen’s Domain, covering an area of about 700 acres, while the most central is Franklin Square, adorned with a statue of Sir John Franklin, the famous Arctic explorer, who was governor of Tasmania from 1837 to 1843. The university of Tasmania, established in 1890, and opened in 1893, has its headquarters at Hobart. The town is celebrated for its invigorating climate, and its annual regatta on the Derwent attracts numerous visitors. The harbour is easy of access, well sheltered and deep, with wharf accommodation for vessels of the largest tonnage. It is a regular port of call for several intercolonial lines from Sydney and Melbourne, and for lines from London to New Zealand. The exports, of an average value of £850,000 annually, consist mainly of fruit, hops, grain, timber and wool. The industries comprise brewing, saw-milling, iron-founding, flour-milling, tanning, and the manufacture of pottery and woollen goods. Hobart is the centre of a large fruit-growing district, the produce of which, for the most part, is exported to London and Sydney. The city was founded in 1804 and takes its name from Lord Hobart (see BUCKINGHAMSHIRE, EARLS OF), then secretary of state for the colonies. It was created a municipality in 1853, and a city in 1877; and in 1881 its name was changed from Hobart Town to the present form. The chief suburbs are Newton, Sandy Bay, Wellington, Risdol, Glenorchy, Bellerive and Belgota. The population of the city proper in 1901 was 24,652, or including suburbs, 34,182.

HOBBEMA, MEYNDERT (c. 1638-1709), the greatest landscape painter of the Dutch school after Ruysdael, lived at Utrecht in the second half of the 17th century. The facts of his life are somewhat obscure. Nothing is more disappointing than to find that in Hobbe"
mastered as he did the still life of woods and hedges, or masts and pools. Nor can we believe that he obtained this mastery otherwise than by constantly dwelling in the same neighbourhood, say in Guelders or on the Dutch Westphalian border, where day after day he might study the branching and foliage of trees and underwood embowering cottages and mills, under every variety of light, in every shade of transparency, in all changes produced by the seasons. Though his landscapes are severely and moderately toned, generally in an olive key, and often attuned to a puritanical grey or russet, they surprise us, not only by the variety of their leafage, but by the finish of their detail as well as the boldness of their touch. With astonishing subtlety light and shade are thrown off species of themselves for perception, and as moved by sympathies and antipathies, with much else of a like sort, all beyond his comprehension; and how he therefore turned to his old books again, fed his mind on maps and charts of earth and sky, traced the sun in his path, followed Drake and Cavendish round the main, and paced with delight upon picotage, made the intimate and physical knowledge of men and wonders of unknown lands. Very characteristic is the interest in men and things, and the disposition to cut through questions in the schools after a trenchant fashion of his own. He was little attracted by the scholastic learning, though it would be wrong to take his words as evidence of a precocious insight into its weakness. The truth probably is that he took no interest in studies which there was no risk in neglecting, and thought as little of rejecting as of accepting the traditional doctrines. He adds that he took his degree at the proper time; and in fact, upon any subject, he was not slow to come, sometimes transiently, sometimes steadily, different portions of the ground, shining through leaves upon other leaves, and multiplying in an endless way the transparency of the picture. If the chance be given he mirrors all these things in the still pool near a cottage, the reaches of a sluggish river, or the swirl of the stream that feeds a busy mill. The same spot will furnish him with several pictures. One mill gives him repeated opportunities of charming our eye; and this wonderful artist, who is only second to Ruysdael because he had not Ruysdael's fertility, and did not extend his study equally to downs and rocky emergences, or torrents and estuaries—this is the man who lived penuriously, died poor, and left no trace in the artistic annals of his country! It has been said that Hobbes did not paint his own figures, but transferred that duty to Adrian van de Velde, Lingelbach, Barendt Gaal, and Abraham Storck. As to this much is conjecture.

The best of Hobbes's dated pictures are those of the years 1663 to 1667. Of the former, several in the galleries of Brussels and St. Petersburg, and one in the Holford collection, are celebrated. Of 1665 fine specimens are at Groovven House and the Wallace collection. Of seven pieces in the National Gallery, including the "Avenue at Middelharnis," which some assign to 1669, and the "Ruins of Breberode Castle," two are dated 1667. A sample of the last of these years is also in the Fitzwilliam Museum at Cambridge. Another piece in the National Gallery in England, which he once noticed two landscapes in Buckingham Palace, two at Bridgewater House, and one belonging to Mr Walter of Bearwood. On the continent are a "Wooded Landscape" in the Berlin gallery; "Forest "belonging to the duchess of Sagan in Paris, and a "Glede" in the Louvre. There are other fine Hobbesian in the Antwerp Museum, the Arenberg gallery at Brussels, and the Belvedere (J. A. C.

HOBBES, THOMAS (1588-1679), English philosopher, second son of Thomas Hobbes, was born at Westport (now part of Malmsbury, Wilts.) on the 4th of April 1588. His father, vicar of Charlton and Westport, an illiterate and choleric man, quarrelled, it is said, with a brother clergyman at the church door, and was forced to decamp, leaving his three children to the care of an elder brother Francis, a flourishing grocer at Malmsbury. Thomas Hobbes was put to school at Westport church at the age of four, passed to the Malmsbury school at eight, and was taught again in Westport later at a private school kept by a young man named Robert Latimer, fresh from Oxford and "a good Grecian." He had begun Latin and Greek early, and under Latimer made such progress as to be able to translate the Medea of Euripides into Latin iambic verse before he was fourteen. About the age of fifteen he was sent to Oxford and entered at Magdalen Hall. During his residence, the first principal of Magdalen Hall, John Husse, was succeeded by John Wilkinson, who ruled in the interest of the Calvinistic party in the university. Thus early was he brought into contact with the aggressive Puritan spirit. Apart from this, Hobbes owed little to his university training, which was based on the scholastic logic then prevalent. We have from himself a lively record of his student life (Vit. carm. exp. p. lxxxv), which, though penned in extreme old age, may be taken as trustworthy. He tells how, when he had slowly taken in the doctrine of logical figures and moods, he put it aside and would prove things only in his own way; how he then turned, not hurriedly as commonly supposed, to physics, throwing off species of themselves for perception, and as moved by sympathies and antipathies, with much else of a like sort, all beyond his comprehension; and how he therefore turned to his works again, fed his mind on maps and charts of earth and sky, traced the sun in his path, followed Drake and Cavendish round the main, and paced with delight upon picotage.

HOBBES, Thomas (1588-1679), English philosopher, second son of Thomas Hobbes, was born at Westport (now part of Malmsbury, Wilts.) on the 4th of April 1588. His father, vicar of Charlton and Westport, an illiterate and choleric man, quarrelled, it is said, with a brother clergyman at the church door, and was forced to decamp, leaving his three children to the care of an elder brother Francis, a flourishing grocer at Malmsbury. 1 The translation, under the title Eight Books of the Peloponnesian War, written by Thucydides the son of Olerus, was published with faith and diligence immediately out of the Greek by Thomas Hobbes, secretary to the late Earl of Devonshire, in 1662 (or 1660), after the death of the earl, to whom touching reference is made in the dedication. It reappeared in 1644, with the date of the dedication altered, as if then newly written. Though Hobbes claims to have performed his work "with much more diligence than elegance," his version is remarkable as a piece of English writing, but is too mechanical to be read. It is included in his Collected Works (11 vols., including index vol.) of Hobbes's English Works (London, Bohn, 1839-1845). The volumes of this collection will here be cited as E.W. M. refers to the edition of 1641. The Latin edition, voc. sophica (5 vols., 1839-1845) will be cited as L.W. The five hundred and odd Latin hexameters under the title De mirabilibus Petci (L.W. v. 323-340), giving an account of a short excursion from Chios to the shores of Thrace, were written before 1628 (in 1626 or 1627), though not published till 1636. It was a New Year's present to his patron, who gave him f5 in return. A later edition, in 1678, included an English version by another hand.
before 1628, except that through his connexion with young Cavendish he had relations with literary men of note like Ben Jonson, and also with Bacon and Lord Herbert of Cherbury. If he intended any in his own right, he intimated in a few principles in philosophy, he was no less eager, as he afterwards showed, to Herbert to rationalize in matters of religious doctrine, so that he may be called the second of the English deists, as Herbert has been called the first. With Bacon he was so intimate (Aubrey’s *Lives*, pp. 222, 602) that some writers have described him as a disciple. The facts that he used to walk at Bacon at Gorham- bury, and would jot down with exceptional intelligence the eager thinker’s sudden “notions,” and that he was employed to make the Latin version of some of the *Essays*, prove nothing when weighed against his own disregard of all Bacon’s principles, and the other evidence that the impulse to independent thinking came to him from Bacon, and not till some time after Bacon’s death in 1626.1

So far as we have any positive evidence, it was not before the year 1629 that Hobbes entered on philosophical inquiry. Meanwhile a great change had been wrought in his circumstances. His friend and master, after about two years’ tenure of the earldom of Devonshire, died of the plague in June 1628, and the affairs of the family were so disordered financially that the widowed countess was left with the task of righting them in the boyhood of the third earl. Hobbes went on for a time living in the household; but his services were no longer wanted and, now bereaved of the personal counsel he had been accustomed to in his boyhood, he sought distraction, in 1629, in another engagement which took him abroad as tutor to the son of Sir Gervase Clifton, of an old Nottinghamshire family. This, his second, sojourn abroad appears to have been spent chiefly in Paris, and the one important fact recorded of it is that he then first began to look into Euclid. The engagement came to an end in 1631, when he was recalled to train the young earl of Devonshire, now thirteen years old, son of his previous pupil. In the course of the next seven years in Derbyshire and abroad, Hobbes took his pupil over rhetoric,2 logic, astronomy, and the principles of law, with other subjects. His mind was now full of the thought of motion in nature, and on the continent he sought out the philosophical speculators or scientific workers. In Florence in 1636 he saw Galileo, for whom he ever retained the warmest admiration, and spent eight months in daily converse with the members of a scientific circle in Paris, held together by Marin Mersenne (q.v.). From that time (the winter of 1636–1637) he too, as he tells us, was numbered among philosophers.

His introduction to Euclid took place accidentally in 1629 (Aubrey’s *Lives*, p. 604), for Hobbes’s manner of proof was his model for his own way of thinking upon all subjects. It is less easy to determine when he awoke to an interest in the physical doctrine of motion. The story told by himself (*V. I., p. xx.*) is that, hearing that a question asked “What is sense?” he fell to thinking often on the subject, till it suddenly occurred to him that if bodies and their internal parts were at rest, or were always in the same state of motion, there could be no distinction of anything, and consequently no sense; the cause of all things must therefore be sought in diversity of movements. Starting from this principle he was driven to geometry for insight into the ground and modes of motion. The biographies we possess do not tell us where or when this great change of interest occurred. Nothing is said, however, which contradicts a statement that on his third journey in Europe he began to study the doctrine of motion more seriously, because he was inspired thereby; and that he claimed more than once (L.W. v. 303; E.W. vii. 468) to have explained light and sound by mechanical hypothesis as far back as 1630, the inspiration may be attributed to the third of the second journey. But it was not till the third journey that the new interest became an overpowering passion, and the “philosopher” was on his way home before he had advanced so far as to conceive the scheme of a system of thought to the elaboration of which his life should henceforth be devoted. Hobbes was able to carry out his plan in some twenty years or more from the time of its conception, but the execution was so slow that it was only upon his death by natural causes, associated with other labours, that its stages can hardly be followed without some understanding of the relations of the parts of the scheme, as there is reason to believe they were sketched out from the beginning. Hobbes’s system, as first put forward in 1651, was a systematic doctrine of Body, showing how physical phenomena were universally explicable in terms of motion, or mechanical action was then (through Galileo and others) understood—the theory of motion being the key to the basic mechanism of nature and its productions and, for that matter, the subject-matter of mathematics, had been duly considered in its place among the fundamental conceptions of philosophy, and a clear indication had been given, at first starting, of the logical ground and method of all philosophical inquiry. He would then single out Man from the realm of nature, and, in a treatise *De homine*, show what specific bodily motions were involved in the production of the peculiar phenomena of sensation and knowledge, as also of the affections and passions thence resulting, whereby man came into relation with man. Finally he would consider, in a crowning treatise *De civile, how men, being naturally and universally disposed to strife, are fitted two by two into into groups, and demonstrate how this great product of human will must be regulated if men were not to fall back into brutishness and misery. Thus he proposed to unite in one coherent whole the separate phenomena of Body, Man and the State.

Hobbes came home, in 1637, to a country seething with discontent. The reign of “Thorough” was collapsing, and the forces pent up since 1629 were soon to rend the fabric of the state. By these events Hobbes was distracted from the ponderous execution of his philosophic plan. The Short Parliament, as he tells us at a later time (L.W. iv. 414), was not dissolved before he had ready “a little treatise in English,” in which he sought to prove that the points of the royal prerogative which the members were determined to dispute before granting supplies “were inseparably annexed to the sovereignty which they did not then deny to be in the king.” Now it can be proved that at this time he had written not only his *Human Nature* but also his *De corpore politico*, the two treatises (though published separately ten years later) having been composed as parts of one work; and there cannot be the least question that together they make “the little treatise” just mentioned. We are therefore to understand, first, that he wrote the earliest draft of his political theory some years before the outbreak of the Civil War, and, secondly, that this earliest draft was not written till, in accordance with his philosophical conception, he had established the grounds of polity in human nature. The first point is to be noted, because it has often been supposed that Hobbes’s political doctrine took its peculiar complexion from his revulsion against the state of anarchy before his eyes, as he wrote during the progress of the Civil War. The second point must be maintained against his own implied, if not express, statement some years later, when publishing his De *cive* (L.W. ii. 151), that he wrote this third part of his system before he had been able to set down any finished representation of the fundamental doctrines which it presupposed. In the beginning of 1640, therefore, he had written out his doctrine of Man at least, with almost as much elaboration as it ever received from him.

In November 1640 the Long Parliament succeeded to the Short, and sent Laud and Strafford to the Tower, and Hobbes, who had become, or thought he had become, a marked man by the circulation of his treatise (of which, though not printed, many gentlemen had copies3), hastened to escape, and was in the first month of the fourth and last year abroad, and did not return for eleven years. Apparently he remained the greater part of the time in or about Paris.

1 Hobbes, in minor works dealing with physical questions (L.W. iv. 316; E.W. vii. 112), makes two incidental references to Bacon’s writings, and never mentions Bacon as he mentions Galileo, Kepler, Huygens, and others (*De corpore, section 185*, in the second edition of the *De corpore*, 1663; *De cive*, 423-510), corresponds with a Latin version dictated to his young pupil. Among Hobbes’s papers preserved at Hardwick, where he died, there remains the boy’s dictation-book, interspersed with headings, examples, &c. in Hobbes’s hand.

2 The free English abstract of Aristotle’s *Rhetoric*, published in 1651, during Hobbes’s life, was, as the *Whole Art of Rhetoric*, as quoted by the dedication to the earl of Newcastle, written in Hobbes’s own hand, and dated May 9, 1640. This dedication was prefixed to the first thirteen chapters of the work when printed by themselves, under the title *Human Nature* in 1660.
HOBES

Paris. He was welcomed back into the scientific coterie about
Mersenne, and forthwith he had the task assigned him of criticising the Meditationes of Descartes, which had been sent from Holland, before publication, to Mersenne with the author's request for criticism from the most different points of view. Hobbes was soon ready with the remarks that were printed as "Third" among a variety of posthumous set of replies, appended, with "Replies" from Descartes, to the Meditationes, when published shortly afterwards in 1641 (reprinted in L.W. v. 249-274). About the same time also Mersenne sent to Descartes, as if they came from a friend in England, another set of objections which Hobbes had to offer on various points in the scientific treatises, especially the Dioptrics, appended by Descartes to his Discourse on Method in 1637; to which Descartes replied without suspecting the common authorship of the two sets. The result was to keep the two thinkers apart rather than bring them together. Hobbes was more eager to bring forward his own philosophical and physical ideas than careful to enter into the full meaning of another's thought; and Descartes was too jealous, and too confident in his conclusions to bear with this kind of criticism. He was very curt in his replies to Hobbes's philosophical objections, and broke off all correspondence on the physical questions, writing privately to Mersenne that he had grave doubts of the Englishman's good faith in drawing him into controversy (L.W. v. 277-307).

Meanwhile Hobbes had published his own treatise, too full of the political theory of the last years that ripened within him to settle, even in Paris, to the orderly composition of his works. Though connected in his own mind with his view of human nature and of nature generally, the political theory, as he always declared, could stand by itself. Also, while he may have hoped at this time to be able to add much (though he never did) to the sketch of his doctrine of Man contained in the unpublished "little treatise," he might extend, but could hardly otherwise modify, the sketch he had there given of his carefully articulated theory of Body Politic. Possibly, indeed, before that sketch was written early in 1640, he may, under pressure of the political excitement, have advanced no small way in the actual composition of the treatise De Cive, the third section of his projected system. In any case, it was upon this section, before the others, that he set to work in Paris; and before the end of 1641 the book, as we know from the date of the dedication (November 1), was finished. Though it was forthwith printed in the course of the year 1642, he was content to circulate a little of one of the presses, and, after a few weeks, he found his work received with applause (it was praised even by Descartes), he seems to have taken this recognition of his philosophical achievement as an additional reason for deferring publication till the earlier works of the system were completed.

Accordingly, for the next three or four years, he remained steadily at work, and nothing appeared from him in public except a short treatise on optics (Tractatus opticus, L.W. v. 217-248) included in the collection of scientific tracts published by Mersenne under the title Cogitata physicæ-mathematica in 1644, and a highly compressed statement of his psychological application of the doctrine of motion (L.W. v. 309-318), incorporated with Mersenne's Ballistica, published in the same year. Thus or otherwise he had become sufficiently known by 1645 to be chosen as a referee, with Descartes, Roberval and others, in the famous controversy between John Pell (p.v.) and the Dane Longomontanus (p.v.) over that part of the squaring of the circle which had been seen later on to have such a fatal charm for himself. But though about this time he had got ready all or most of the materials for his fundamental work, the Leviathan, now even was he able to make way with its composition, and when he returned to it after a number of years, he returned a different man.

The Civil War had broken out in 1642, and the royalist cause began to decline from the time of the defeat at Marston Moor, in the middle of 1644. Then commenced an exodus of the king's friends. Newcastle himself, who was a cousin of the late patron, Spinoza's friend, who published the "little treatise" of 1640, found his way to Paris, and was followed by a stream of fugitives, many of whom were known to Hobbes. The sight of these exiles made the political interest once more predominant in Hobbes, and before long the revived feeling issued in the formation of a new and important design. It first showed itself in the publication of the De cive, of which the fame, but only the fame, had extended beyond the inner circle of friends and critics who had copied of the original impression. Hobbes now entrusted it, early in 1646, to his admirer, the Frenchman Samuel de Sorbière, by whom it was seen through the Elzevir press at Amsterdam in 1647—having previously inserted a number of notes in reply to objections, and also a striking preface, in the course of which he explained its relation to the other parts of the system not yet forthcoming, and the (political) occasion of its having been composed and being now published before them. So hopeless, meanwhile, was his growing of being able to return home that, later on in the year, he was on the point of leaving Paris to take up his abode in the south (L.W. v. 313-314), to be a French friend, when he was engaged "by the month" as mathematical instructor to the young prince of Orange, who had come over from Jersey about the month of July. This engagement lasted nominally from 1646 to 1648 when Charles went to Holland. Thus thrown more than ever into the company of the exiled royalists, it was then, if not earlier, that he conceived his new design of bringing all his powers of thought and expression to bear upon the production of an English book that should set forth his whole theory of civil government in relation to the political crisis resulting from the war. The De cive, presently to be published, was written in Latin for the learned, and gave the political theory without its foundation in human nature. The unpublished treatise of 1640 contained all or nearly all that he had to tell concerning human nature, but was written before the terrible events of the last years had disclosed how men might still be urged by their anti-social passions back into the abyss of anarchy. There was need of an exposition at once comprehensive, incisive and popular. The State, it now seemed to Hobbes, might be regarded as a great artificial machine, the Leviathan, composed of men, with a life that might be traced from its generation through human reason under pressure of human needs to its dissolution through civil strife proceeding from human passions. This, we may suppose, was the presiding conception from the first, but the design may have been variously modified in the three or four years of its execution. Before the end, in 1650-1651, it is plain that he wrote in direct reference to the greatly changed aspect of affairs in England. The king being dead, and the royalist cause appearing to be hopelessly lost, he did not scruple, in closing the work with a general "Review and Conclusion," to raise the question of the subject's right to change allegiance when a former sovereign's power to protect was irrecoverably gone. Also he took advantage of the rule of the Commonwealth to indulge much more freely than he might have otherwise dared in rationalistic criticism of religious doctrines; while, amid the turmoil of sects, he could the more forcibly urge that the preservation of social order, when again firmly restored, must depend on the assumption by the civil power of the right to take "the terror" of the populace (L.W. v. 333-334). This right was changed to Elementum philosophiae de cive, the references in the text to the previous sections being omitted. The date of the dedication to the young earl of Devonshire was altered from 1641 to 1646.

1 The book, of which the copies are rare (one in Dr Williams's library in London and one in the Bodleian), was printed in quarto size (Paris, 1642), with a pictorial title-page (not afterwards reproduced) of scenes and figures illustrating its three divisions, "Libertas," "Imperium," "Religio." The title Elementorum philosophiae secio tertia, De cive, expresses its relation to the unwritten sections, which also comes out in one or two back-references in the text.

2 Described as "nobilis Languedocius" in Vit; doubtless the same with the "Dominus Verduisius, nobilis Aquisitanus," to whom the dedication to the Elementa philosophiae de cive, iv. 421, in De Verduis was one of Hobbes's profoundest admirers and most frequent correspondents in later years; there are many of his letters among Hobbes's papers at Hardwick.
to wield all sanctions, supernatural as well as natural, against the pretensions of any clergy, Catholic, Anglican or Presbyterian, to the exercise of an imperium in imperio.

We know the Leviathan only as it finally emerged from Hobbes's pen. During the years of its composition he remained in or near Paris, at first in attendance on his royal pupil, with whom he became intimate. In 1648 his health was overtaken by a serious illness which disabled him for six months. Meanwhile, he begged him not to die outside the Roman Catholic Church, but Hobbes said that he had already considered the matter sufficiently and afterwards took the sacrament according to the rites of the Church of England. On recovering from this illness, which nearly proved fatal, he resumed his literary task, and carried it steadily forward to completion by the year 1650, having also within the same time translated into English, with characteristic force of expression, his Latin treatise. Otherwise the only thing known (from one or two letters) of his life in those years is that from the year 1648 he had begun to think of returning home; he was then sixty, and might well be weary of exile. When 1650 came, as if to prepare the way for the reception of his magnum opus, he allowed the publication of his earliest treatise, divided into two separate small volumes (Human Nature, or the Fundamental Elements of Policy, E.W. iv. 1-76, and De Cive, or the Elements of Law, Moral and Political, pp. 77-228). In 1651 he published his translation of the De Cive under the title of Philosophical Rudiments Concerning Government and Society (E.W. ii.). Meanwhile the printing of the greater work was proceeding, and finally it appeared about the middle of the same year, 1651, under the title of Leviathan, or the Matter, Form and Power of a Commonwealth, Ecclesiastical and Civil (E.W. ii.), with a quaint frontispiece in which, from behind hills overlooking a fair landscape of town and country, there towered the body (above the waist) of a crowned giant, made up of tiny figures of human beings and bearing sword and crozier in the two hands. It appeared, and soon its author was more lauded and detested than any other thinker of his time; but the first effect of its publication was to sever his connexion with the exiled royalist party, and to throw him for protection on the revolutionary Government. No sooner did copies of the book reach Paris than he found himself shunned by his former associates, and though he was himself so little conscious of disloyalty as to be forward to present a manuscript copy, "engrossed in vellum in a marvellous fair hand" to the young king of the Scots (who, after the defeat at Worcester, escaped to Paris about the end of October), he was denied the royal presence when he sought it shortly afterwards. Straightway, then, he saw himself exposed to a double peril. The exiles had among them desperadoes who could slay; and, besides exciting the enmity of the Anglican clergy about the king, who bitterly resented the secularist spirit of his book, he had compromised himself with the French authorities by his elaborate attack on the papal system. In the circumstances, no resource was left him but secret flight. Travelling with what speed he could in the depths of a severe winter and under the effects of a recent (second) illness, he managed to reach London, where, sending in his submission to the council of state, he was allowed to subside into private life.

Though Hobbes came back, after his eleven years' absence, without having as yet publicly proved his title to rank with the natural philosophers of the age, he was sufficiently conscious of what he had been able to achieve in Leviathan; and it was in no humble mood that he now, at the age of sixty-four, turned to complete the fundamental treatise of his philosophical system. Neither those whom his masterpiece soon roused to enthusiasm, nor those whom it moved to indignation, were likely to be indifferent to anything he should now write, whether it lay near to or far from the region of practice. Taking up his abode in Fetter Lane, he seemed fully justified in proceeding to reside there for the sake of his health and the cultivation of the society of intellectual men, even after renewing his old ties with the earl of Devonshire, who lived in the country till the Restoration, he worked so steadily as to be printing the De corpore in the year 1654. Circumstances of which more presently), however, kept the book back till the following year, and meanwhile the readers of Leviathan had a different excitement. In 1654 a small treatise, "Of Liberty and Necessity" (E.W. iv. 220-278), issued from the press, claiming to be an answer to a discourse on the same subject by Bishop Bramhall of Londonerry (afterwards archbishop of Armagh, d. 1663), addressed by the marquis of Newcastle. It had grown out of an oral discussion between Hobbes and Bramhall in the marquis's presence at Paris in 1646. Bramhall, a strong Arminian, had afterwards written down his views and sent them to Newcastle to be answered in this form by Hobbes. Hobbes duly replied, but not for publication, because he thought the subject a delicate one. But it happened that Hobbes had allowed a French acquaintance to have a private translation of his reply made by a young Englishman, who secretly took a copy of the original for himself; and now it was this unnamed publisher who, in 1654, when Hobbes had become famous and feared, gave it to the world of his own motion, with an extravagantly laudatory epistle to the reader in its front. Upon Hobbes himself the publication came as a surprise, but, after his plain speaking in Leviathan, there was nothing in the piece that he need scruple to have made known, and he seems to have condoned the act. On the other hand, Bramhall, supposing Hobbes privy to the publication, resented the manner of it, especially as no mention was made of his rejoinder. According, in 1655, he printed everything that had passed between them (under the title of A Defence of the True Liberty of Human Actions from Antecedent or Extrinsic Necessity), with loud complaint against the treatment he had received, and the promise of other books. The marquis of Newcastle had expressed a wish to expose the deadly principles of Leviathan. About this time Hobbes had begun to be hard pressed by other foes, and, being never more sure of himself than upon the question of the will, he appears to have welcomed the opportunity thus given him of showing his strength. By 1656 he was ready with his Questions concerning Liberty, Necessity and Chance (E.W. v.), in which he replied with astonishing force to the bishop's rejoinder point by point, besides explaining the occasion and circumstances of the whole debate, and reproducing (as Bramhall had done) all the pieces from the beginning. As perhaps the first clear exposition and defence of the psychological doctrine of determinism, Hobbes's own (two pieces must ever retain a classical importance in the history of the free-will controversy; while Bramhall's are still worthy study as specimens of scholastic fence. The bishop, it should be added, returned to the charge in 1658 with ponderous Castigations of Mr Hobbes's Animadversions, and also made good his previous threat in a bulky

---

1 The Human Nature corresponds with cc. i-xiii. of the first part of the original treatise. The remaining six chapters of the part stand now as Part I. of the De corpore politico. Part II. of the D.C.P. corresponds with the original second part of the whole work.

2 At the beginning of this year he wrote and published in Paris a letter on the nature and conditions of poetry, chiefly epic, in answer to a apparent misjudgment made in the preface of Samuel Davenant's heroic poem, Londiserti (E.W. iv. 441-458). The letter is dated Jan. 10, 1650 (1650/1).

3 This presentation copy, as described by Chalmers (Survey of the Leviathan, 1760, p. 8), is doubtless the beautifully written and finely bound MS. now to be found in the British Museum (Egerton MSS. 1910).

---

4 During all the time he was abroad he had continued to receive from his patron a certain allowance of 500 l. a year, in steady correspondence. The earl, having sided with the king in 1642, was declared unfit to sit in the House of Peers, and though, by submission to Parliament, he recovered his estates when they were sequestered later on, he did not sit again till 1660. Among Hobbes's friends at this time are specially mentioned John Selden and William Harvey, who left him a legacy of £10. According to Aubrey, Selden left him an annuity for life but this seems to be a mistake. Harvey (not Bacon) is the only Englishman he mentions in the dedicatory epistle prefixed to the De corpore, among the founders, before himself, of the new natural philosophy.

5 The treatise bore the date, "Rouen, Aug. 20, 1652," but it should have been 1646, as afterwards explained by Hobbes himself (E.W. v. 25).
appendix entitled *The Catching of Leviathan the Great Whale*. Hobbes never took any notice of the *Castigations*, but ten years later replied to the charges contained in them, in *De corpore* (E.W. i.) of 1668, the Savilian professor of astronomy, replying in his *Vindiciae academiae* to some other assaults (especially against John Webster's *Examen of Academicians*) on the academic system, retorted upon Hobbes that, so far from the universities being now what he had known them in his youth, he would find his geometrical pieces, when they appeared, better understood than he should like. This was said in reference to *De corpore*. He himself had been freely indulging of having squared the circle and accomplished other such feats; and, when a year later the *De corpore* (L.W. i.) finally appeared, it was seen how the thrust had gone home— how its biting and trenchantness was the famous problem whose solution he thought he had found, there were left expressions against Vindix (Ward) at a time when the solutions still seemed to him good, but the solutions themselves, as being now just as likely to be all in different ways halting, as he naively confessed he had discovered only when he had been driven by the insults of malevolent men to examine them more closely with that ardent structure into which he had, by a path not less strange, as now to be disclosed by a relentless hand. Ward's colleague, the more famous John Wallis (q.v.), Savilian professor of geometry from 1646, had been privy to the challenge thrown out in 1654, and it was arranged that they should critically dispose of the *De corpore* between them. Ward was to occupy himself with the philosophical and physical sections, which he did in a manner which Wallis had expected to out hold him for the year (In Th. Hobbei philosophiam exercitatio epistola). Wallis was to confine himself to the mathematical chapters, and set to work at once with characteristic energy. Obtaining an unbound copy of the *De corpore*, he saw by the mutilated pages of the sheets that Hobbes had repeatedly altered his demonstrations before he issued them at last in their actual form, grotesque as it was, rather than delay the book longer. Obtaining also a copy of the work as it had been printed before Hobbes had any doubt of the validity of his solutions, Wallis was able to track his whole course from the time of Ward's provocation—his passage from exultation to reflection, from triumph to confession of his errors, from abandoning the old assumption of confident strength; and all his turnings and windings were now laid bare in one of the most trenchant pieces of reasoning and criticism as the *Problemata geometrica Hobbiacea*, published in 1655 about three months after the *De corpore*, contained also an elaborate criticism of Hobbes's whole attempt to relay the foundations of mathematical science in that of geometry. This general baleful criticism of which, if it failed to allow for the merit of the conception, exposed only too effectually the utter inadequacy of the result. Taking to mathematics when not only his mind was already formed but his thoughts were crystallizing into a philosophical system, Hobbes had, in fact, never put himself to school and sought to work up gradually to the best knowledge of the time, but had been more anxious from the first to become himself an innovator in an unsound and insufficient means. The consequence was that, when not spending himself in vain attempts to solve the impossible problems that have always waylaid the spirit of self-criticism, he turned his ingenuity in the elements of geometry, and never had any notion of the full scope of mathematical science, undertaking as it then was (and not least at the hands of Wallis) the extraordinary development of that noble art in the seventeenth century instrument of physical discovery which it became in the hands of Newton. He was even unable, in dealing with the elementary conceptions of geometry, to work out with any consistency or coherency rough and easy spots of Wallis. At his advanced age, however, and with the sense he had of his powers, he was not likely to be brought to a better mind by so indolent an approach. He did indeed, before allowing an acceptance of the translation of the *De corpore* (E.W. i.) to appear in 1665, take care to remove some of the worst mistakes exposed by Wallis, and, while leaving out all the references to Vindix, now professed to make, in altered form, a series of mere "attacks or windings" from yielding the best to the worst. With the translation, in the spring of 1656, he had ready Six Lessons to the Professors of Mathematics, one of Geometry, the other of Astronomy, both being the Harleian Society, in E.W. vi., 1656, 1657. He had this, reasserting his view of the principles of geometry in opposition to Euclid's, he proceeded to repel Wallis's objections with no lack of dialectical skill, and with an unreserved equal to Wallis's in the parts of the commonest positions that he had resigned in the translation, and he was not afraid to assume the offensive by a counter criticism of three of Wallis's arguments, of which he made use in his "Paralogisms" of his more formidable antagonist in the first five lessons, he ended with a lesson on "Manners" to the two professors together, and set himself gravely at the close to show that he too could be civil. In this particular part of his task, it must be allowed, he succeeded very well; his criticism of Wallis's works, especially the great treatise *Arithmetica infinitorum* (1655), only showed how little able he was to enter into the meaning of the modern analysis. Wallis, on his side, was not less ready to keep up the game in English than he had been to begin it in Latin. Swift as before to strike, in three months' time he had deftly turned his controversy against the English and published *A New Due Correction for Mr Hobbes, or School Discipline for not saying his Lessons right*, in a piece that differed from the *Elenchus* only in having been printed. Hobbes, in defending himself against Wallis's trivial criticism, he seized the opportunity given him by the English translation of the *De corpore* to track Hobbes again step by step over the whole course, and now to expose his book with equal accuracy, and every new utterance. But it was no longer a fight over mathematical questions only. Wallis having been betrayed originally by his own profession into the better carpenter art, he had not only corrected in kind, and then it became a high duty in the other to defend his Latin with great parade of learning and give fresh provocation. One of Wallis's rough salts in this kind suggested to Hobbes the title of the next rejoinder with which, in 1657, he sought to close the unseemly wrangle. Arguing in the *Lessons* that a mathematical point must have quantity, though this were not so among the Greeks, he had explicitly said the contrary, which, to a mean mark made with a hot iron; whereupon he was charged by Wallis with gross ignorance for confusing *ôxygón* and *ôxynma*. Hence the title of his new piece: *Elencho exegesiwn, kyvadies, árrhata, árrhata, árrhata, or Marks of the Absurd Geometry, Rural Language, Scottish Church Politics, and Barbarisms of John Wallis;* Professor of Geometry and Doctor of Divinity (E.W. vii. 357-400). He now attacked more in detail but not more happily than before Wallis's great work, while hardly attempting any further defence of his own positions; also he rebelled with some force and dignity the insults that had been heaped upon him, and fought for the holy leave the world in peace. In his political insinuations against his adversary, quite irrelevant in themselves and only noteworthy as evidence of his own resignation to *Liberty* and its rule, all the world turned. Wallis in a reply (*Hobbiame puncti disputatio, 1657*) occupied mainly with the verbal questions. Irritating as it was, it did not take to shake Hobbes's determination to remain silent; and thus at last the controversy ended.

Before the strike flamed up again, Hobbes had published, in 1658, the outstanding section of his philosophical system, and thus completed, after a fashion, the scheme he had planned more than twenty years before. So far as the treatise *De homine* (L.W. ii. 11-32) was concerned, the completion was more in name than in fact. It consisted for the most part of an elaborate theory of vision which, though very creditable to Hobbes's scientific insight, was not of the first importance. He was not kept by his whole system to the idea that *Nature* and the *Leviathan*, has all the appearance of having been tagged in haste to the optical chapters (composed years before) 2 as

---

1 The *Vitautus* refers to 1657, a 'Letter to William duke of Newcastle on the Controversy about Hobbes's more compact held with Benjamin Laney, bishop of Ely.' In that year there did appear a (confused) little tract written by Laney against Hobbes's concluding statements of his own. Opinion 1 in the *Essay and Meditations of 1654* (1640), but I can find no trace of any further writing by Hobbes on the subject " (G. Croom Robertson, *Hobbes*, p. 202).

2 This translation, Concerning Body, though not made by Hobbes, was revised by him; but it is far from accurate, and not seldom, at critical places (e.g. c. vi. § 2), quite incorrect. From the *Dioptrica, clava* of 1661, the Latin has always been made in the original Latin. Molesworth reprints the Latin, not from the first edition of 1655, but from the modified edition of 1668—modified, in the mathematical chapters, in the Latin of the English edition of 1656. The Vindiep episode, referred to in the *Six Lessons*, becomes intelligible only by going beyond Molesworth to the original Latin edition of 1655.
a match for the proper transition required in the system from questions of Body Natural to questions of Body Politic. Hobbes had in fact spent himself in his earlier constructive efforts, and at the age of seventy, having nothing to add to his doctrine of Man as it was already in one form or another before the world, was content with anything consistent for the benefit of his country. 

But he had still in him more than twenty years of vigorous vitality, and, not conscious to himself of any shortcoming, looked forward to, and had expected, his last long life. Rather than remain quiet, on finding no notice taken of his latest production, he would himself force on a new conflict with the enemy. 

Wallis having meanwhile published other works and especially a comprehensive edition of Leibniz's man's life, 1667, of his works, for the benefit of the public. 

In 1661, Wallis published his Dialogus physicus, De natura aethris (L.W. iv. 233-296), fulminated in 1661 against Boyle and other friends of Wallis who, as he fancied, under the influence of that master, and following in the footsteps of his earlier contemporary, were bringing themselves into a society (incorporated as the Royal Society in 1662) for experimental research, to the exclusion of himself personally, and in direct contravention of the method of physical inquiry enunciated in the discourse. 

In the case of this diatribe as concerned himself Boyle quickly replied with force and dignity, but it was from Hobbes's old enemy that retribution came, in the scathing satire Hobbes beauton-limornos (1662). Wallis, who had deftly steered his course amid all the political changes of the previous years, managing ever to be on the side of the ruling power, was now apparently stirred to fury by a wanton allusion in Hobbes's latest dialogue to a passage of his former life (his deciphering for the parliament the king's papers taken at Newcastle, and thereupon imprisoned after the restoration of the king, could not speak or hear too little. The revenge he took was crushing. Professing to be roused by the attack on his friend Boyle, when he had scoured to lift a finger in defence of himself against the earlier diatribe, he loaded his adversary with a shower of invectives, most of which his opponent had never before attempted. 

Wallis's last great achievement in his life was the publication of his great work De principiis et rationatione geometricarum (L.W. iv. 385-484), as the sub-title declared, to lower the pride of geometrical professors by showing that there was more than one way to skin a cat, and to vindicate those of physical or ethical writers. Wallis replied shortly in the Philosophical Transactions (August 1666). 

Three years later he brought his three great achievements together in a compendious form, Quadratura circuli, Cubatio spherae, Duplicatio cubi, and as soon as they were once more refuted by Wallis, reprinted them with an answer to the objections, in compliment to the grand-duke of Tuscany, who, having given an audience to him in his last year, Wallis, who had promised to leave him alone henceforward, refuted him again before the year was out. In 1671 he worked up his propositions once more in Rosatum geometricum (L.W. v. 1-50), as a (1671) Diatribe, referring to the latest publication (Censura brevis, pp. 50-88) on the first part of Wallis's treatise De spatii, published in 1669; also he sent Three Papers to the Royal Society, which saw them very briefly, and when Wallis, still not weary of confuting, shortly replying, was dealt with by the body at once with triumphant Considerations on Dr Wallis's Answer to them (E.W. vii. 429-445). Next year (1672), having now, as he believed, established himself with the Royal Society in the discomfiture of Wallis by a public address to the Society on all the points at issue between them from the beginning, Luz Mathematica excusa collisionibus Johannis Wallisii et Thomae Hobbesii (L.W. vi. 89-150) the light, as the author, R. Lio (Roosiot Imperator, added, being here "increased by many very brilliant rays." Wallis replied in the Transactions, and then finally held his hand. Hobbes's energy was not yet exhausted. In 1674, at the age of eighty-six, he published his last work, Principiis aliorum geometricarum, and descripta mine breviier explicata et demonstrata (L.W. v. 195-214), containing in the chapters dealing with questions of principle not a few "replies to observations" not to be overlooked in the study of his philosophy. His last piece of all, Decameron physiologicum (E.W. vii. 60-180), in 1678, was a new set of dialogues on physical questions, most of which he had treated in a similar fashion before; but now, in dealing with gravitation, he was able to paint a fuller part of Wallis's picture; and one more demonstration of the equality of a straight line to the arc of a circle, thrown in at the end, appropriately closed the strangest warfare in which pervader thinker ever engaged.

We must now turn back to trace the fortunes of Hobbes and his other doings in the last twenty years of his life. All these controversial writings on mathematics and physics represent but one half of his activity after the age of seventy; though, as regards the other half, it is not possible, for a reason that will be seen, to say as definitely in what order the works belonging to the period were produced. From the time of the Restoration he acquired a new prominence in the public eye. No year had passed since the appearance of Leviathan without some indications of protest against the work which its trenchant doctrine was calculated to produce upon minds longing above everything for civil repose; but after the Restoration "Hobism" became a fashionable creed, which it was the duty of every lover of true morality and religion to denounce. Two or three days after Charles's arrival in London, Hobbes drew in the street the notice of his former pupil, and was at once received into favour. The young king, if he had ever himself resented the apparent disloyalty of the "Conclusion" of Leviathan, had not retained the feeling long, and could appreciate the principles of the great book when the application of them happened, as now, in the conditions of his own days. His mind, he had, but not his body, for Hobbes's wit (as he used to say, "Here comes the bear to be baited ") and did not like the old man the less because his presence at court scandalized the bishops or the prim virtue of Chancellor Hyde. He even went the length of bestowing on Hobbes (but not always paying) a pension of £100, and had his portrait hung up in the royal halls.

Hobbes's pieces were excluded from the collected edition of his works (1693-1697), and have become extremely rare.
dsset. These marks of favour, naturally, did not lessen Hobbes's self-esteem, and perhaps they explain, in his later writings, a certain slavishness toward the regal authority, which is wholly absent from the strong demonstration of absolutism in his earlier works. At all events Hobbes was satisfied with the rule of a king who had appreciated the author of Leviathan, and protected him when, after a time, protection in a very real sense became necessary. His eagerness to defend himself against Wallis's imputation of disloyalty, and his apologetic dedication of the Problemati physica to the king, are evidence of the hostility with which he was being pressed as early as 1662; but it was not till 1666 that he felt himself seriously in danger. In that year the Great Fire of London, following on the Great Plague, roused the superstitious fears of the people, and the House of Commons embodied the general feeling in a bill against atheism and profaneness. On the 17th of October it was ordered that the committee to which the bill was referred "should be empowered to receive information touching such books as tend to atheism, blasphemy and profaneness, or against the essence and attributes of God, and in particular the book published in the name of one White,\(^1\) and the book of Mr Hobbes called the Leviathan, and to report the matter with their opinion to the House." The former was then very vigorously dealt with at the prospect of being treated as a heretic, and proceeded to burn such of his papers as he thought might compromise him. At the same time he set himself, with a very characteristic determination, to inquire into the actual state of the law of heresy. The results of his investigation were first announced in three short Dialogues added (in place of the old "Review and Conclusion," for which the day had passed) as an Appendix to his Latin translation of Leviathan (L.W. iii.), included with the general collection of his works published at Amsterdam in 1668. In this Appendix, as also in the posthumous tract, published in 1680, An Historical Narration concerning Heresy and the Punishment thereof (E.W. iv. 385-408), he aimed at showing that, since the High Court of Commission had been put down, there remained no court of heresy at all to which he was amenable, and that even when it stood nothing was to be declared heresy but what was at variance with the Nicene Creed, as he maintained the doctrine of Leviathan was not.

The only consequence that came of the parliamentary scare was that Hobbes could never afterwards get permission to print anything on subjects relating to human conduct. The collected edition of his Latin works (in two quarto volumes) appeared at Amsterdam in 1668, because he could not obtain the censor's licence for its publication at London, Oxford or Cambridge. Other writings which he had finished, or on which he must have been engaged about this time, were not made public till after his death—the king apparently having made it the price of his protection that no fresh provocation should be offered to the popular sentiment. The most important of the works composed towards 1670, and thus kept back, is the extremely spirited dialogue to which he gave the title Behemoth: the History of the Causes of the Civil Wars of England and of the Counsels and Artifices by which they were carried on from the year 1640 to the year 1660.\(^2\) To the same period probably belongs the unfinished Dialogue between a Philosopher and a Student of the Common Laws of England (E.W. vi. 1-160), a trenchant criticism of the constitutional theory of English government as upheld by Coke. Aubrey takes credit for having tried to induce Hobbes to write upon the subject in 1664 by presenting him with a copy of Bacon's Elements of the Laws of England, and though the attempt was then unsuccessful, Hobbes later on took to studying the statute-book, with Coke upon Littleton. One other posthumous production also (besides the tract on Heresy before mentioned) may be referred to, if not, as Aubrey suggests, an earlier time—the two thousand and odd elegiac verses in which he gave his view of ecclesiastical encroachment on the civil power; the quaint verses, disposed in his now favourite dialogue-form, were first published, nine years after his death, under the title Historia ecclesiastica (L.W. v. 341-408), with a preface by Thomas Raynesford.

For some time Hobbes was not even allowed to utter a word of protest, whatever might be the occasion that his enemies took to triumph over him. In 1669 an unworthy follower—Daniel Sarcil by name, a fellow of Corpus Christi College, Cambridge—had to recant publicly and confess that his evil life had been the result of Hobbesian doctrines. In 1674 John Fell, the dean of Christ Church, who bore the charges of the Latin translation of Anthony Wood's History and Antiquities of the University of Oxford (1695), struck all the complimentary epitaphs in the account of his life, and suffered worse hardship when by some misadventure at the same time the king did suffer him to defend himself by publishing a dignified letter (Vit. Auct. pp. xvii.-l.), to which Fell replied by adding to the translation when it appeared a note full of the grossest insults. And, amid all his troubles, Hobbes was not without his consolations. No Englishman of that day stood in the same repute abroad, and foreigners, noble or learned, who came to England, never forgot to pay their respects to the old man, whose vigour and freshness of intellect no progress of the years could make him lose. The most notable of these was the grand- duke of Tuscany (Ferdinand II.), who took away some works and a portrait to adorn the Medicean library.

His pastimes in the latest years were as singular as his labours. The autobiography in Latin verse, with its playful humour, occasional pathos and sublime self-complacency, was thrown off at the age of eighty-four. At eighty-five, in the year 1675, he sent forth a translation of four books of the Odyssey (ix.-xii.) in rugged but not seldom happily turned English rhymes; and, when he found this Voyage of Ulysses eagerly received, he had ready by 1675 a complete translation of both Iliad and Odyssey (E.W. x.), prefaced by a lively dissertation "Concerning the Virtues of an Heroic Poem," showing his unabated interest in questions of literary style. After 1675, he passed his time at his patron's seat in Derbyshire, occupied to the last with intellectual work in the early morning and in the afternoon hours, which it had long been his habit to devote to thinking and to writing. Even as late as August 1679 he was promising his publisher "somewhat to print in English." The end came very soon afterwards. A tumour found and urine in October, in spite of which he insisted upon being conveyed with the family from Chatsworth to Hardwick Hall towards the end of November, was followed by a paralytic stroke, under which he sank on the 4th of December, in his ninety-second year. He lies buried in the neighbouring church of Ault Hucknall. He was tall and erect in figure, and lived on the whole a temperate life, though he used to say that he had been drunk about a hundred times. His favourite exercise was tennis, which he played regularly even after the age of seventy. Socially he was genial and courteous, though in argument he occasionally lost his temper. As a friend he was generous and loyal. Intellectually bold in the extreme, he was curiously timid in ordinary life, and is said to have had a horror of ghosts. He read little, and often boasted that he would have known as little as other men if he had read as much. He appears to have had an illegitimate daughter for whom he made generous provision. In the National Portrait Gallery there is a portrait of him by J. M. Wright, and two others are in the possession of the Royal Society.

As already suggested, it cannot be allowed that Hobbes falls into any regular succession from Bacon; neither can it be said that he handed on the torch to Locke. He was the one English thinker of the first rank in the long period of two generations separating Locke from Bacon, but, save in the chronological sense, there is no true relation of succession among the three. It would be difficult even to perceive any ground of affinity among them beyond a disposition to take sense as a prime factor in the account of subjective experience: their common interest in physical science was shared.
equally by rationalist thinkers of the Cartesian school, and was indeed bequeathed of the time. Backwards, Hobbes’s relations are rather with Galileo and the other inquirers who, from the beginning of the 17th century, occupied themselves with the physical world in the manner that has come later to be distinguished by the name of science in opposition to philosophy. But even more than in external nature, Hobbes was interested in the phenomena of social life, presenting themselves so impressively in an age of political revolution. So it came to pass that while he was unable, by reason of imperfect training and too tardy development, with all his pains, to make any contribution to physical science or to mathematics as instrumental in physical reasoning, he attempted a task which no other of the new “mechanical philosophy” conceived—nothing less than that such a universal construction of human knowledge as would bring Society and Man (at once the matter and maker of Society) within the same principles of scientific explanation as were found applicable to the world of Nature. The construction was, of course, utterly premature, even supposing it were inherently possible; but it is Hobbes’s distinction, in his century, to have conceived it, and he is thereby lifted from among the scientific workers with whom he associated to the rank of those philosophical thinkers who have sought to order the whole domain of human knowledge. The effects of his philosophical and of his political philosophy are not known to history. Upon every subject that came within the sweep of his system, except mathematics and physics, his thoughts have been productive of thought. When the first storm of opposition from smaller men had begun to die down, thinkers of real weight, beginning with Cumberland and Cudworth, were moved by their aversion to his analysis of the moral nature of man to probe anew the question of the natural springs and the rational grounds of human action; and thus it may be said that Hobbes gave the first impulse to that movement of ethical speculation that, in modern times, has been carried on with such remarkable continuity in England. In politics the revision from his particular conclusions prevented the more clear-sighted of his opponents from recognizing the force of his supreme demonstration of the practical irresistibility of the sovereign power, wherever seated, in the state; and, when in a later age the foundations of a positive theory of legislation were laid in England, the school of Bentham—James Mill, Grote, Molesworth—brought again into general notice the writings of the great publicist of the 17th century, who, however he might, by the force of temperment, himself prefer the rule of one, based his whole political system upon a rational regard to the common weal. Finally, the psychology of Hobbes, though too undeveloped to guide the thoughts or even perhaps arrest the attention of Locke, who, in his subsequent scientific knowledge, came to course of time (chiefly through James Mill) to be connected with the theory of associationism developed from within the school of Locke, in different ways, by Hartley and Hume; nor is it surprising that the later associationists, finding their principle more distinctly formulated in the earlier thinker, should sometimes have been betrayed into affiliating themselves to Hobbes rather than to Locke. For his ethical theories see ETHICS.

Sufficient information is given in the Vitae Hobbianae auctarium (L. W. I. de, 1869, 2 vols., dealing successively about the frequent early editions of Hobbes’s separate works, and also concerning the works of those who wrote upon him, to the end of the 17th century. In the 18th century, in Clarke’s Boyle Lectures of 1704–1705, the opposition was less express; in 1750 The Moral and Political Works were collected, with life, &c., by Dr. Campbell, in a folio edition, including in order, Human Nature, De corpore politico, Leviathan, Answer to Bramhall’s Catching of the Leviathan, Navigation concerning Heresy, Of Liberty and Necessity, Behemoth, Dialogue of the Common Laws, The Introduction to the Thucydides, Letter to Davenant and two others, The Preface to the Homer, De mirabilibus Pecil (with English translation), Considerations on the Revelation, etc., of 1641, in 1812 the Human Nature and the Liberty and Necessity (with supplementary extracts from the Questions of 1656) were reprinted in a small edition of 250 copies, with a meritorious notice (based on Campbell) and dedication to Sir William Maitland of Tullibardine (with English translation) in 1818. The English of Hobbes’s Le Livres et De la nature humaine, by d’Holbach, in 1787, under the general title Les Oeuvres philosophiques et politiques de Thomas Hobbes; a translation of the first section, "Comparativo sive procoptico," was added to De ciborii politici, et philosophici, Ed. d’Iole (1804); a translation of Leviathan into Dutch in 1678, and another (anonymous) into German—Des Engländer Thomas Hobbes Leviathan oder der kirchliche und burgerliche Staat (Halle, 1794, 2 vols.); a translation of the De cive by J. H. v. Kirchmann—Hobbes: Abhandlung über den Bürger, etc. (Leipzig, 1873). Important later editions are those of Ferdinand Tonnies, Beethoven (1870), which see also Hobbes’s Philosophical Remains (1894), 341 Elements of Law (1896). Biographical and Critical Works.—There are three accounts of Hobbes’s life, first published together in 1681, two years after his death, by R. E. (Richard) Blackwood, a friend of Hobbes’s admirers (John Aubrey), and reprinted, with complimentary verses by Cowley and others, at the beginning of Sir W. Molesworth’s collection of the Latin Works: (1) T. H. Malmeius, v. 111. (pp. xxi. –xxii.), written by E. Aubrey; (2) H. H. H., of the English Men of Letters series, written by John Aubrey, and reprinted, 1845, with additions, J. Tonnies, Hobbes Leben und Lehre (1896), Hobbes-Analekten (1904 foll.); G. Zart, Einfluss der englischen Philosophie sehon Bacon auf die deutsche Philosophie des 16ten Jahrh., (Berlin, 1881); G. Brandt, Grundlinien der Theorie seiner Philosophie (1889); G. Lyon, Le Philos. de Hobbes (1893); J. M. Robertson, Pioneer Humanists (1907); J. Rickaby, Free Will and Four English Philosophers (1906), pp. 1–72; Watson, Hobbes’s Theory of Man (1869); Croom, Political Philosophy from Hobbes to Maine (1899); W. J. H. Campon, Outlines of Lectures on Political Science (1895). (G. C. R.; X.)

HOBBY, a small horse, probably from early quotations, of Irish breed, trained to an easy gait so that riding was not fatiguing. The common use of the word is for a favourite pursuit or occupation, with the idea either of excessive devotion or of absence of ulterior motive or of profit, &c., outside the occupation itself. This use is probably not derived from the easy ambling gait of the Irish “hobby,” but from the “hobby-horse,” the mock horse of the old morris-dances, made of a painted wooden horse’s head and tail, with a framework casing for an actor’s body, his legs being covered by a cloth mantle to represent any “housings” of the medieval tilting-horse. A hobby or hobby-horse is thus a toy, a diversion. The O. F. fr. hobin, or hobbi, Mod. awbin, and Ital. ubina are probably adaptations of the English, according to the New English Dictionary. The O. F. fr. hoibe, to move, which is often taken to be the origin of all these words, is the source of a use of “hobby” for a small kind of falcon, falco subbuto, used in hawking.

HOBBHOUSE, ARTHUR HOBHOUSE, 1ST BARON (1819–1904), English judge, fourth son of Henry Hobhouse, permanent under-secretary of state in the Home Office, was born at Hadsben, Northumberland, on the 10th of November 1819. Educated at Eton and Balliol, he was called to the bar at Lincoln’s Inn in 1843, and rapidly acquired a large practice as a conveyancer and equity draftsman; he became Q.C. in 1862, and practised in the Rolls Court, retiring in 1866. He was an active member of the charity commission and urged the appropriation of pious bequests to educational and other purposes. In 1872 he began a five years’ term of service as legal member of the council of the governor-general of India, his services being acknowledged by a K.C.S.I.; and in 1881 he was appointed a member of the judicial committee of the privy council, on which he served for twenty years. He was a peer in 1885, and consistently supported the Liberal party. He died on the 20th of December 1904, leaving no heir to the barony.

His papers read before the Social Science Association on the subject of property were collected in 1880 under the title of The Dead Hand.

HOBBOKEN, a small village of Belgium, on the right bank of the Scheldt about 4 m. above Antwerp. It is only important as an account of the ship-building yard which the Cockrell firm of Seraing has established at Hoboken. Many wealthy Antwerp
merchants have visas here, and it is the headquarters of several of the leading rowing clubs on the Schelde. Pop. (1904) 12,816.

HOBOKEN, a city of Hudson county, New Jersey, U.S.A., on the Hudson river, adjoining Jersey City on the S. and W. and opposite New York city, with which it is connected by ferries and by two subway lines through tunnel under the river. Pop. (1890) 43,648; (1900) 50,364, of whom 21,380 were foreign-born, 10,843 being natives of Germany; (1910 census) 70,324. Of the total population in 1900, 48,349 had either one or both parents foreign-born, German being the principal racial element.

The city is served by the West Shore, and the Delaware, Lackawanna & Western railways, being the eastern terminus of the latter, and is connected by electric railway with the neighbouring cities of north-eastern New Jersey. In Hoboken are the piers of the North German Lloyd, the Hamburg American, the Netherlands American, the Scandinavian and the Phoenix steamship lines. Hoboken occupies a little more than 1 sq. m. and lies near the foot of the New Jersey Palisades, which rise both on the W. and N. to a height of nearly 200 ft. Much of its surface has had to be filled in to raise it above high tide, but Castle Point, in the N.E., rises from the generally low level about 100 ft. On this Point are the residence and private estate of the founder of the city, John Stevens (1749-1838), Hudson Park, and facing it the Stevens Institute of Technology, an excellent school of mechanical engineering endowed by Edwin A. Stevens (1795-1868), son of John Stevens, opened in 1871, and having in 1900-1910 32 instructors and 390 students. The institute owes much to its first president, Henry Morton (1836-1902), a distinguished scientist, whose aim was "to offer a course of instruction in which theory and practice were carefully balanced and thoroughly combined," and who gave to the institute sums aggregating $175,000 (see Morton Memorial, History of Stevens Institute, ed. by Furman, 1905). In connexion with the institute there is a preparatory school, the Stevens School (1870). The city maintains a teachers' training school. Among the city's prominent buildings are the Delaware, Lackawanna & Western station, the Hoboken Academy (1860), founded by German Americans, and the public library. The city has an extensive coal trade and numerous manufactures, among which are lead pencils, leather goods, silk goods, wall-paper and caskets. The value of the manufactured product increased from $7,151,391 in 1890 to $12,092,872 in 1900, or 69.1%. The factory product in 1905 valuated at $14,077,305, an increase of 34.3% over that for 1900. The sum of $1,500 charged for the "hacking," or the use of the tobacco pipe) was occupied about 1660 as a Dutch farm, but in 1643 the stock and all the buildings except a brewhouse were destroyed by the Indians. In 1711 title to the place was acquired by Samuel Bayard, a New York merchant, who built on Castle Point his summer residence. During the War of Independence his descendant, William Bayard, was a loyalist, and his home was burned and his estate confiscated. In 1784 the property was purchased by John Stevens, the inventor, who in 1804 laid it out as a town. For the next thirty-five years its "Elysian Fields" was a famous pleasure resort of New York City. Hoboken was incorporated as a town in 1829 and as a city in 1855. On the 30th of June 1800 the wharves of the North German Lloyd Steamship Company and three of its ocean liners were almost completely destroyed by a fire, which caused a loss of more than 200 lives and over $5,000,000.

HOBY, SIR THOMAS (1530-1566), English diplomatist and translator, son of William Hoby of Leominster, was born in 1530. He entered St John's College, Cambridge, in 1545, but in 1547 he went to Strasbourg, where he was the guest of Martin Bucer, whose Gratulation ... unto the Church of Englande for the restitution of Chrestes Religion he translated into English. He then proceeded to Italy, visiting Padua and Venice, Florence and Siena, and in May 1550 he had settled at Rome, when he was summoned by his half-brother, Sir Philip Hoby (1505-1558), then ambassador at the emperor's court, to Augsburg. The brothers returned to England at the end of the year, and Thomas attached himself to the service of the marquis of Northumberland, whom he accompanied to France on an embassy to arrange a marriage between Edward VI. and the princess Elizabeth. Shortly after he returned to England he started once more for Paris, and in 1552 he was engaged on his translation of The Courtier of Count Baldessar Castilio. His work was probably completed in 1554, and the freedom of the allusions to the Roman church probably accounts for the fact that it was withheld from publication until 1561. The Cortegiano of Baldassare Castiglione, which Dr Johnson called "the best book that ever was written upon good breeding," is a book as entirely typical of the Italian Renaissance as Machiaveli's Prince in another direction. It exercised an immense influence on the standards of chivalry throughout Europe, and was long the recognized authority for the education of a nobleman. The accession of Mary made it desirable for the Hobys to remain abroad, and they were in Italy until the end of 1555. Thomas Hoby married in 1558 Elizabeth, the learned daughter of Sir Anthony Cook, who wrote a Latin epitaph on her husband. He was knighted in 1566 by Elizabeth, and was sent to France as English ambassador. He died on the 13th of July in the same year in Paris, and was buried in Bisham Church.

His son, SIR EDWARD HOBY (1560-1617), enjoyed Elizabeth's favour, and he was employed on various confidential missions. He was constable of Queenborough Castle, Kent, where he died on the 1st of March 1617. He took part in the religious controversies of the time, publishing many pamphlets against Theophilus Higgons and John Fludd or Floyd. He translated, from the French of Mathieu Coignet, Politique Discours on Truth and Lying (1586).

The authority for Thomas Hoby's biography is a MS. "Booke of the Travalle and liffe of me Thomas Hoby, with diverse things worth the noting." This was edited for the Royal Historical Society by Edgar Powell in 1902. Hoby's translation of The Courtier was edited (1900) by Professor Walter Raleigh for the "Tudor Translations" series.

HOCE, LAZARE (1768-1797), French general, was born of poor parents near Versailles on the 24th of June 1768. At the age of 12 he joined the French army as a volunteer. He was naturalized as a private soldier in the Gardes françaises. He spent his entire leisure in the study of civil work, his object being to provide himself with books, and this love of study, which was combined with a strong sense of duty and personal courage, soon led to his promotion. When the Gardes françaises were broken up in 1780 he was a corporal, and thereafter he served in various line regiments up to the time of his receiving a commission in 1792. In the defence of Thionville in that year Hoce earned further promotion, and he served with credit in the operations of 1792-1793 on the northern frontier of France. At the battle of Neerwinden he was aide-de-camp to General le Vener, and when Dumouriez deserted to the Austrians, Hoce, along with le Vener and others, fell under suspicion of treason; but after being kept under arrest and unemployed for some months he took part in the defence of Dunkirk, and in the same year (1793) he was promoted successively chef de brigade, general of brigade, and general of division. In October 1793 he was provisionally appointed to command the Army of the Moselle, and within a few weeks he was in the field at the head of his army in Lorraine. His first battle was that of Kaiserslautern (28th-30th of November) against Prussians. The French were defeated, but even in the midst of the Terror the Committee of Public Safety continued Hoce in his command. Fortinicity and fiery energy in their eyes outweighed everything else, and Hoce soon showed that he possessed these qualities. On the 22nd of December he stormed the lines of Prischweiler, and the representatives of the Convention with his army at once added the Army of the Rhine to his sphere of command. On the 26th of December the French
carried by assault the famous lines of Weissenburg, and Hoche pursued his success, sweeping the enemy before him to the middle Rhine in four days. He then put his troops into winter quarters. Before the following campaign opened, he married Anne Adelinda Dechaux at Thionville (March 11th, 1794). But ten days later he was suddenly arrested, charges of treason having been preferred by Pichegru, the displaced commander of the Army of the Rhine, and by his friends. Hoche escaped execution, however, though imprisoned in Paris until the fall of Robespierre. Shortly after his release he was appointed to command against the Vendéens (21st of August 1794). He completed the work of his predecessors in a few months by the peace of Jaudray (15th of February 1795), but soon afterwards the war was renewed by the Royalists. Hoche showed himself equal to the crisis and inflicted a crushing blow on the Royalist cause by defeating and capturing de Sombreuil's expedition at Quiberon and Penthièvre (16th–21st of July 1795). Thereafter, by means of mobile columns (which he kept under good discipline) he succeeded before the summer of 1796 in pacifying the whole of the west, which had for more than three years been the scene of a pitiless civil war. After this he was appointed to organize and command the troops destined for the invasion of Ireland, and he started on this enterprise in December 1796. A tempestuous sea, however, compelled Hoche to return to France, where he was joined by his wife and children. In August 1797 the French fleet defeated the British off Brest without having effected its purpose. Hoche was at once transferred to the Rhine frontier, where he defeated the Austrians at Neuwied (April), though operations were soon afterwards brought to an end by the Preliminaries of Leoben. Later in 1797 he was minister of war for a short period, but in this position he was surrounded by obscure political intrigues, and, finding himself the dupe of Barras and technically guilty of violating the constitution, he quickly laid down his office, returning to command on the Rhine frontier. But his health grew rapidly worse, and he died at Wettolsheim on the 4th of September 1797 at the age of 70. It is said that he had been widely spread that he had been poisoned, but the suspicion seems to have been without foundation. He was buried by the side of his friend Marceau in a fort on the Rhine, amidst the mourning not only of his army but of all France.

Chuecat, Hoche et la lutte pour l'Alsace (a volume of this author's series on the campaigns of the Revolution, 1893); E. Chavaveny, Le Général Hoche (1893); A. Dirick, Hoche et Marceau (1895).
with numerous players on each side. The rules were simple and the play very rough.

Modern Hockey, properly so called, is played during the cold season on the hard turf, and owes its recent vogue to the formation of "The Men's Hockey Association" in England in 1873. The rules drawn up by the Wimbeldon Club in 1883 still obtain in all essentials. Since 1893 international " matches at hockey have been played annually between England, Scotland, or Ireland, and Wales; and in 1907 a match was played between England and France, won by England by 14 goals to nil. In 1890 Divisional Association matches (North, South, West, Midlands) and inter-university matches (Oxford and Cambridge) were inaugurated, and have since been played annually. County matches are also now regularly played in England, twenty-six counties competing in 1907. Of other hockey clubs playing regular matches in 1907, there were eighty-one in the London district, and fifty-nine in the provinces.

The game is played by teams of eleven players on a ground 100 yds. long and 50 to 60 yds. wide. The goals are in the centre of each end-line, and consist of two uprights 7 ft. high surmounted by a horizontal bar, enclosing a space 12 ft. wide. In front of each goal is a space enclosed within a curved line, its greatest diameter from the goal-line being 15 ft., called the striking-circle. The positions of the players on each side may be seen on the accompanying diagram. Two umpires, one on each side of the centre-line, are in charge.

The ball is an ordinary cricket-ball painted white. The stick has a hard-wood curved head, and a handle of cork or wrapped cane. It must not exceed 2 in. in diameter nor 28 oz. in weight. At the start of the game, which consists of two or thirty-five minute periods, the two centre-forwards of each team stand with the ball in the middle of the field. In "bullying off" each player must strike the ball with his own side of the ball three times with his stick and strike his opponent's stick three times alternately; after which either may strike the ball. Each player then endeavours, by means of striking, passing and dribbling, to drive the ball into its opponents' goal. A player is "off side" if he is nearer the enemy's goal than one of his own players who strikes the ball, and he may not strike the ball himself until it has been touched by one of the opposing side. The ball may be caught (but not held) or stopped by any part of the body, but may not be picked up, carried, kicked, thrown or knocked except with the stick. An opponent's stick may be hooked, but not an opponent's person, which may not be obstructed in any way. No left-handed play is allowed. Penalties for infringing rules consist of two classes: "free hits" and "penalty ballyes," to be taken where the foul occurred. For flagrant fouls penalty goals may also be awarded. A "corner" occurs when the ball goes behind the goal-line, not on goal. If it is hit by the attacking side intentionally by the defenders, it must be brought out 25 yds., in a direction at right angles to the goal-line from the point where it crossed the line, and there "bulled." But if the ball is driven from within the 25-yd. line unintentionally behind the goal-line by the defenders, a member of the attacking side is given a free hit from a point within 3 yds. of a corner flag, the members of the defending side remaining behind their goal-line. If the ball is struck intentionally behind the goal-line by the attacking side, the free hit is taken from the point where the ball went over. No goal can be scored from a free hit directly.

Ice Hockey (or Bandy, to give it its original name) is far more popular than ordinary Hockey in countries where there is much ice; in fact in America "Hockey" means Ice Hockey, while the land game is called Field Hockey. Ice Hockey in its simplest form is of driving a ball across a given limit with a stick or club has been played for centuries in northern Europe, attaining its greatest popularity in the Low Countries, and there are many 17th- and 18th-century paintings extant which represent games of Bandy. The players using an implement formed much like a golf club.

In England Bandy is controlled by the "National Bandy Association." A team consists of eleven players, wearing skates, and the proper space for play is 200 yds. by 100 yds. in extent. The ball is of solid rubber, and is 6 ft. in circumference, between 24 and 26 in. thick. The straight lines are 2 in. in diameter and about 4 ft. long. The goals, placed in the centre of each goal-line, consist of two upright posts 7 ft. high and 12 ft. connected by a horizontal bar. A match is begun by the referee throwing up the ball in the centre of the field, after which it must not be touched other than with the bandy until a goal is scored or the ball passes the boundaries of the course, in which case it is hit into the field in any direction excepting forward from the point where it went out by the player who touched it last. If the ball is hit across the goal-line but not into a goal, it is hit out by one of the defenders from the point where it went over, the opponents not being allowed to approach nearer than 25 yds. from the goal-line while the hit is made.

In America the development of the modern game is due to the Victoria Hockey Club and McGill University (Montreal). About 1881 the secretary of the former club made the first efforts towards drawing up a recognized code of laws, and for some time afterwards playing rules were agreed upon from time to time whenever an occasional match was played. In 1884 the "Amateur Hockey Association of Canada" was formed, and a definite code of rules drawn up. Soon afterwards, in consequence of exhibitions given by the best Canadian teams in some of the larger cities of the United States, the new game was taken up by American schools, colleges and athletic clubs, and became nearly as popular in the northern states as in the Dominion. The rules differ widely from those of English Bandy. The rink must be at least 112 ft. in length and 75 ft. in width. The goals are 6 ft. wide and 4 ft. high and are provided with goal-nets. Instead of the English painted cricket-ball a puck is used, made of vulcanized rubber in the form of a drafted-stone, 1 in. thick. The sticks are made of one piece of hard wood, and may not be more than 3 in. wide at any part. The game is played for two half-hour or twenty-minute periods with an intermission of ten minutes. At the beginning of a match, and also whenever a goal has been made, the puck is "faced," i.e., it is placed in the middle of the rink between the sticks of the two left-centres, and the referee calls "play." Whichever side then secures the ball by endeavours of means of passing and dribbling to get the puck into a position from which a goal may be shot. The puck may be stopped by any part of the person but not carried or knocked except with the stick. No stick may be raised above the shoulder except when deliberately striking the puck. When the puck is driven off the rink or behind the goal, or a foul has been made behind the goal, it is faced 5 yds. inside the rink. The goal-keeper must maintain a standing position.

There are a number of Hockey organizations in America, all under the jurisdiction of the "American Amateur Hockey League" in the United States and the "Canadian Amateur Athletic League" in Canada.

Ice Polo, a water sport similar to Ice Hockey, is almost exclusively played in the New England states. A rubber-covered ball is used and the stick is heavier than that used in Ice Hockey. The radical difference is that, in Ice Hockey, a player, in striking the puck, must be of the off-side rule, so that passes and shots at goal may come from any and often the most unexpected direction. Five men constitute a team: a goal-tend, a half-back, a centre and two rushers. The rusher must be a flat skater, adept in dribbling and passing and good goal shots. The centre supports the rushers, passing the ball to them or trying for goal himself. The half-back is the first defence and the goal-tend the last. The rink is 150 ft. long.

Ring Hockey may be played on the floor of any gymnasium or large room by teams of six, comprising a goal-keeper, a quarter, three
HOCK-TIDE, HODGE

The garden is a centre of two uprights 3 ft. high and 4 ft. apart. The ring, which takes the place of the ball or puck, is made of flexible fiber, and is 5 in. in diameter with a 3-1/2 in. hole through the centre. It weighs between 12 and 16 oz. The stick is a wand of light but tough wood, between 36 and 40 in. long, about 1 in. in diameter, provided with a 5-in. guard 20 in. from the lower end. The method of shooting is to insert the end of the stick in the hole of the ring and drive it towards the goal. A goal shot from the field counts one point, a goal from a foul 3 points. When a foul is called, the referee at the upper end of the field is allowed a free shot for goal from any point on the quarter line.

Roller Polo, played extensively during the winter months in the United States, is practically Ice Polo adapted to the floors of gymnasiums. The players, five on a side, wearing roller-skates. The first professional league was organized in 1883.

HOCK-TIDE, an ancient general holiday in England, celebrated on the second Monday and Tuesday after Easter Sunday. Hock-Tuesday was an important term day, rents being then payable, for with Michaelmas it divided the rural year into its winter and summer halves. The derivation of the word is disputed: any analogy with Ger. hoch, "high," being generally denied. No trace of the word is found in Old English, and "hock-day," its earliest use in composition, appears first in the 13th century. The characteristic pastime of hock-tide was called binding. On Monday the women, on Tuesday the men, stopped all passers of the opposite sex and bound them with ropes till they bought their release with a small payment, or a rope was stretched across the highroads, and the passers were obliged to pay toll. The money thus collected seems to have gone towards parish expenses. Many entries are found in parish registers under "Hocktyde money." The hocktide celebration became obsolete in the beginning of the 18th century. At Coventry there was a play called "The Old Coventry Play of Hock Tuesday." This, suppressed at the Reformation owing to the incidental disorder, and revived as part of the festivities on Queen Elizabeth's visit to Kenilworth in July 1575, depicted the struggle between Saxons and Danes, and has given colour to the suggestion that hock-tide was originally a commemoration of the massacre of the Danes on St Brice's Day, the 13th of November A.D. 1002, or of the rejoicings at the death of Hardicanute on the 8th of June 1042 and the expulsion of the Danes. But the dates of these anniversaries do not bear this out.

HOCUS, a shortened form of "hocus pocus," used in the 17th century in the sense of "to play a trick on any one," to "hoax," which is generally taken to be a derivative. "Hocus pocus" appears to have been a mock Latin expression first used as the name of a juggler or conjurer. Thus in Ady's Candles in the Dark (1655), quoted in the New English Dictionary, "I will speak of one man ... that went about in King James his time ... who called himself, The Kings Majesties most excellent Hocus Pocus, and so was called, because that at the playing of every Trick, he used to say, Hocus pocus, tontus tolontus, vade celeriter jubeo, a dark composure of words, to blinde the eyes of the beholders, to make his Trick pass the more currantly without discovery." Tillotsen's guess (Sermon, xxvi.) that the phrase was a corruption of hoc est corpus and alluded to the words of the Eucharist, "in ridiculous imitation of the priests of the Church of Rome in their trick of Transubstantiation," has frequently been accepted as a serious derivation, but has no foundation. A connexion with a supposed demon of Scandinavian mythology, called "Ochus Bochus," is equally unwarranted. "Hocus" is used as a verb, meaning to drug, stupefy with opium, &c., for a criminal purpose. This use dates from the beginning of the 19th century.

HODDEN (a word of unknown origin), a coarse kind of cloth made of undyed wool, formerly much worn by the peasantry of Scotland. It was usually made on small hand-loom by the peasants themselves. Grey hodden was made by mixing black and white fleeces together, the proportion of one to twelve when weaving.

HODDESDON, an urban district in the Hertford parliamentary division of Hertfordshire, England, near the river Lea, 17 m. N. from London by the Great Eastern railway (Broxbourne and Hoddesdon station on the Cambridge line). Pop. (1901), 4711. This is the northernmost of a series of populous townships extending from the suburbs of London along the Lea valley as far as its junction with the Stort, which is close to Hoddesdon. They are in the main residential. Hoddesdon was a famous coaching station on the Old North Road; and the Bull posting-house is mentioned in Matthew Prior's "Down Hall." The Lea has been a favourite resort of anglers (mainly for coarse fish in this part) from the time of Isaac Walton, in whose book Hoddesdon is specifically named. The church of St Augustine, Broxbourne, is a fine example of Perpendicular work, and contains interesting monuments, including an altar tomb with enamelled brasses of 1473. Hoddesdon probably covers the site of a Roman-British village.

HODEDA (Hodeida, Hodeda), a town in Arabia situated on the Red Sea coast 14° 48′ N. and 49° 57′ E. It lies on a beach of muddy sand exposed to the southerly and westerly winds. Steamers anchor more than a mile from shore, and merchandise has to be transshipped by means of sambubs or native boats. But Hodeida has become the chief centre of the maritime trade of Turkish Yemen, and has superseded Mokha as the great port of export of South Arabian coffee. The town is composed of stone-built houses of several storeys, and is surrounded, except on the sea face, by a fortified enceinte. The population is estimated at 33,000, and contains, besides the Arab inhabitants and the Turkish officials and garrison, a considerable foreign element, Greeks, Indians and African traders from the opposite coast. There are consulates of Great Britain, United States, France, Germany, Italy and Greece. The steam tonnage entering and clearing the port in 1904 amounted to 78,700 tons, the highest hitherto recorded. Regular services are maintained with Aden, and with Suez, Massowa and the other Red Sea ports. Large cargoes bring dates from the Persian Gulf, and occasional steamers from Bombay call on their way to Jidda with cargoes of grain. The imports for 1904 amounted in value to £67,000, the chief items being piece goods, food grains and sugar; the exports amounted to £251,000, including coffee valued at £29,000.

HODENING, an ancient Christmas custom still surviving in Wales, Kent, Lancashire and elsewhere. A horse's skull or a wooden imitatio on a pole is carried round by a party of youths, one of whom conceals himself under a white cloth to simulate the horse's body, holding a lighted candle in the skull. They make a house-to-house visitation, begging gratuities. The "Penitential" of Archbishop Theodore (d. 690) speaks of "any who, on the kalanda of January, clothe themselves with the skins of cattle and carry heads of animals." This, coupled with the fact that among the primitive Scandinavians the horse was often the sacrifice made at the winter solstice to Odin for success in battle, has been thought to justify the theory that hodening is a corruption of Oldning.

HODGE, CHARLES (1797–1878), American theologian, was born in Philadelphia, Pennsylvania, on the 28th of December 1797. He graduated at the College of New Jersey (now Princeton) in 1815, and in 1819 at the Princeton Theological seminary, where he became an instructor in 1829, and the first professor of Oriental and Biblical literature in 1822. Meanwhile, in 1821, he had been ordained as a Presbyterian minister. From 1826 to 1828 he studied under Dr Sacy in Paris, under Gesenius and Tholuck in Halle, and under Hengstenberg, Neander and Humboldt in Berlin. In 1840 he was transferred to the chair of exegetical and didactic theology, to which subjects that of polemic theology was added in 1854, and this office he held until his death. In 1825 he established the quarterly Biblical Repository, the title of which was changed to Biblical Repository and Theological Review in 1830 and to Biblical Repository and Princeton Review in 1837. With it, in 1840, was merged the Literary and Philosophical Repository, founded 1820, and hence the Presbyterian Review of New York, the title becoming Presbyterian Quarterly and Princeton Review in 1872 and Princeton Review in 1877. He secured for it the position of theological organ of the Old School division of the Presbyterian church, and continued its principal editor and contributor until 1888, when the Rev. Lyman H. Atwater became its colleague. His more important essays were republished under the titles Essays and Reviews.
HODGKIN—HÓDMEZO-VÁSÁRHELY

(1857), Princeton Theological Essays, and Discussions in Church Polity (1858). He was moderator of the General Assembly (O.S.) in 1846, a member of the committee to revise the Book of Discipline of the Presbyterian church in 1858, and president of the Presbyterian Board of Foreign Missions in 1866-1870. The 24th of April 1872, the fiftieth anniversary of his election to his professorship, was observed in Princeton as his jubilee by between 400 and 500 representatives of his 2700 pupils, and $40,000 worth of important series of experiments on cast iron, and his help was sought by Robert Stephenson in regard to the forms and dimensions of the tubes for the Britannia bridge. A paper which he communicated to the Royal Society on "Experimental Researches on the Strength of Pillars of Cast Iron and other Materials," in 1840 gained him a Royal medal in 1841, and he was also elected a fellow. In 1842 he was appointed professor of the mechanical principles of engineering in University College, London, and at the same time he was employed as a member of the Royal Commission appointed to inquire into the application of iron to railway structures. In 1848 he was chosen president of the Manchester Philosophical Society, of which he had been a member since 1826, and to which, both previously and subsequently, he contributed many of the important results of his discoveries. For several years he took an active part in the discussions of the Institution of Civil Engineers, of which he was elected an honorary member in 1851. He died at Eaglesfield House, near Manchester, on the 18th of June 1861.

HODGSON, BRIAN HUGHTON (1800-1804), English administrator, ethnologist and naturalist, was born at Lower Beech, Prestbury, Cheshire, on the 1st of February 1800. His father, Brian Hodgson, came of a family of country gentlemen, and his mother was a daughter of William Houghton of Manchester. In 1816 he obtained an East Indian writtership. After passing through the usual course at Haileybury, he went out to India in 1818, and after a brief service at Kurnoor as assistant-commissioner was in 1820 appointed assistant to the Resident at Katmandu, the capital of Nepal. In 1823 he obtained an undersecretaryship in the foreign department at Calcutta, but his health failed, and in 1824 he returned to Nepal, to which he should have been made a fellow of his company; his health distinctly eager, but he was also in 1826 1877 pastor of the North Church (Presbyterian). In 1878 he succeeded his father as professor of didactic theology at the Princeton seminary. He died on the 11th of November 1886. Besides writing the biography of his father, he was the author of Outlines of Theology (1860, new ed. 1875; enlarged, 1879); The Atomen (1867); Exposition of the Confession of Faith (1869); and Popular Lectures on Theological Themes (1889). See C. A. Salmon's Charles and A. A. Hodge (New York, 1888).

HODGKIN, THOMAS (1831- ), British historian, son of John Hodgkin (1800-1875), barrister, was born in London on the 20th of July 1831. Having been educated as a member of the Society of Friends and taken the degree of B.A. at London University, he became a partner in the banking house of Hodgkin, Barnett & Co., Newcastle-on-Tyne, a firm afterwards amalgamated with Lloyds' Bank. While continuing in business as a banker he spent a good deal of time to historical study, and soon became a leading authority on the history of the early middle ages, his books being indispensable to all students of this period. His chief works are, Italy and her Invaders (8 vols., Oxford, 1880-1890); The Dynasty of theodocus (Oxford, 1889); Theodoric the Great (London, 1891); and an introduction to the Letters of Cassiodorus (London, 1886). He also wrote a Life of Charles the Great (London, 1897); Life of George Fox (Boston, 1876); and the opening volume of Longman's Political History of England (London, 1896).

HODKINSON, EATON (1789-1861), English engineer, the son of a farmer, was born at Anderton near Northwich, Cheshire, on the 26th of February 1789. After attending school at Northwich, he began to help his widowed mother on the farm, but to escape from that unhappy occupation he persuaded her in 1811 to remove to Manchester and start a pawnbroking business. There he made the acquaintance of John Dalton, and began to see into the strength of materials which formed the work of his life. He was associated with Sir William Fairbairn in an important series of experiments on cast iron, and his help was sought by Robert Stephenson in regard to the forms and dimensions of the tubes for the Britannia bridge. A paper which he communicated to the Royal Society on "Experimental Researches on the Strength of Pillars of Cast Iron and other Materials," in 1840 gained him a Royal medal in 1841, and he was also elected a fellow. In 1847 he was appointed professor of the mechanical
red grapes, skirt the town, and the horned cattle and horses of Hódmező-Vásárhely have a good reputation; sheep and pigs are also extensively reared. The commune is protected from inundations of the Tisza by an enormous dike, but the town, nevertheless, sometimes suffers considerable damage during the spring floods.

HODOGRAPH (Gr. δογγραφης, to write), a curve of which the radius vector is proportional to the velocity of a moving particle. It appears to have been used by James Bradley, but for its practical development we are mainly indebted to Sir William Rowan Hamilton, who published an account of it in the Proceedings of the Royal Irish Academy, 1846. If a point be in motion in any orbit and with any velocity, and if, at each instant, a line be drawn from a fixed point parallel and equal to the velocity of the moving point at that instant, the extremities of these lines will lie on a curve called the hodograph. Let PP₁P₂ be the path of the moving point, and let OT, OT₁, OT₂, be drawn from the fixed point O parallel and equal to the velocities at P, P₁, P₂ respectively, then the locus of T is the hodograph of the orbits described by P (see figure). From this definition we have the following important fundamental property which belongs to all hodographs, viz. that at any point the tangent to the hodograph is parallel to the direction, and the velocity in the hodograph equal to the magnitude of the resultant acceleration at the corresponding point of the orbit. This will be evident if we consider that, since radii vectors of the hodograph represent velocities in the orbit, the elementary arc between two consecutive radii vectors of the hodograph represents the velocity which must be compounded with the velocity of the moving point at the beginning of any short interval of time to get the velocity at the end of that interval, that is to say, represents the change of velocity for that interval. Hence the elementary arc divided by the element of time is the rate of change of velocity of the moving-point, or in other words, the velocity in the hodograph is the acceleration in the orbit.

Analytically thus (Thomson and Tait, Nat. Phil.)—Let x, y, z be the coordinates of P in the orbit, \( \xi, \eta, \zeta \) those of the corresponding point T in the hodograph, then

\[
\xi = \frac{dx}{dt}, \quad \eta = \frac{dy}{dt}, \quad \zeta = \frac{dz}{dt};
\]

therefore

\[
\frac{d\xi}{dt} = \frac{d^2x}{dt^2} \quad \frac{d\eta}{dt} = \frac{d^2y}{dt^2} \quad \frac{d\zeta}{dt} = \frac{d^2z}{dt^2}.
\]

Also, if \( t \) be the arc of the hodograph,

\[
\frac{d\xi}{dt} = \sqrt{\left(\frac{d^2x}{dt^2}\right)^2 + \left(\frac{d^2y}{dt^2}\right)^2 + \left(\frac{d^2z}{dt^2}\right)^2}.
\]

Equation (1) shows that the tangent to the hodograph is parallel to the line of resultant acceleration, and (2) that the velocity in the hodograph is equal to the acceleration.

Every orbit must clearly have a hodograph, and, conversely, every hodograph a corresponding orbit; and, theoretically speaking, it is possible to deduce the one from the other, having given the other circumstances.

For applications of the hodograph to the solution of kinematical problems see Mechanics.

HODSON, WILLIAM STEPHEN RAIKES (1821-1858), known as "Hodson of Hodson's Horse," British leader of light cavalry during the Indian Mutiny, third son of the Rev. George Hodson, afterwards archdeacon of Stafford and canon of Lichfield, was born on the 19th of March 1821 at Maisemore Court, near Gloucester. He was educated at Rugby and Cambridge, and accepted a cadetship in the Indian army at the advanced age for those days of twenty-three. Joining the 2nd Bengal Grenadiers he went through the first Sikh War, and was present at the battles of Moodkee, Ferozeshah and Sobraon. In one of his letters home at this period he calls the campaign a "tissue of mismanagement, blunders, errors, ignorance and arrogance"; and outspoken criticism such as this brought him many bitter enemies throughout his career, who made the most of undeniable faults of character. In 1847, through the influence of Sir Henry Lawrence, he was appointed adjutant of the 3rd Madras native cavalry, and in 1852 was promoted to the command of the Guides with the civil charge of Yusafzai. But his brusque and haughty demeanour to his equals made him many enemies. In 1855 two separate charges were brought against him. The first was that he had arbitrarily imprisoned a Pathan chief named Khadar Khan, on suspicion of being concerned in the murder of Colonel Mackeson. The man was acquitted, and Lord Dalhousie removed Hodson from his civil functions and remanded him to his regiment on account of his lack of judgment. The second charge was more serious, amounting to an accusation of malversation in the funds of his regiment. Hodson was tried by a court of inquiry, who found that his conduct to natives had been "unjustifiable and oppressive," that he had used abusive language to his native officers and personal violence to his men, and that his system of accounts was "calculated to screen peculation and fraud." Subsequently another inquiry was carried out by Major Reynell Taylor, which dealt simply with Hodson's accounts and found them to be "an honest and correct record ... irregularly kept." At this time the Guides were split up into numerous detachments, and there was a system of advances which made the accounts very complicated. The verdicts of the two inquiries may be set against each other, and this particular charge declared "not proven." It is possible that Hodson was careless and extravagant in money matters rather than actually dishonest; but there were several similar charges against him. During a tour through Kashmir with Sir Henry Lawrence he kept the purse and Sir Henry could never obtain an account from him; subsequently Sir George Lawrence accused him of embezzling the funds of the Lawrence Asylum at Kasauli; while Sir Neville Chamberlain in a published letter says of the third brother, Lord Lawrence, "I am bound to say that Lord Lawrence had no opinion of Hodson's integrity in money matters. Hodson never discussed Hodson's character, with me, and it was to him a regret that a man possessing so many fine gifts should have been wanting in a moral quality which made him untrustworthy." Finally, on one occasion Hodson spent £500 of the pay due to Lieutenant Godby, and under threat of exposure was obliged to borrow the money from a native banker through one of his officers named Bisharat Ali.

It was just at the time when Hodson's career seemed ruined that the Indian Mutiny broke out, and he obtained the opportunity of rehabilitating himself. At the very outset of the campaign he made his name by riding with despatches from General Anson at Karnal to Meerut and back again, a distance of 152 m. in all, in seventy-two hours, through a country swarming with the rebel cavalry. This feat so pleased the commander-in-chief that he empowered him to raise a regiment of 2000 irregular horse, which became known to fame as Hodson's Horse, and placed him at the head of the Intelligence Department. In his double rôle of cavalry leader and intelligence officer, Hodson played a large part in the reduction of Delhi and consequently in saving India for the British empire. He was the finest swordsman in the army, and possessed that rare combination of reckless courage and coolness that marks the leadership of most Asiaties. In explanation of the fact that he never received the Victoria Cross it was said of him that it was because he earned it every day of his life. But he also had the defects of his qualities, and could display on occasion a certain cruelty and callousness of disposition. Reference has already been made to Bisharat Ali, who had lent Hodson money. During the siege of Delhi another native, said to be an enemy of Bisharat Ali's, informed Hodson that he had turned rebel
and had just reached Khurbhouda, a village near Delhi. Hodson thereupon took out a body of his squaters, attacked the village, and shot Birdhat Ali and several of his relatives. General Crawford Chamberlain states that this was Hodson's way of wiping out the debt. Again, after the fall of Delhi, Hodson obtained from General Wilson permission to ride out with fifty horsemen to Humayun's tomb, 6 m. out of Delhi, and bring in Babadur Shah, the last of the Moguls. This he did with safety in the face of a large and threatening crowd, and thus dealt the mutinies a heavy blow. On the following day with 100 horsemen he went out to the same tomb and obtained the unconditional surrender of the three princes, who had been left behind on the previous occasion. A crowd of 6000 persons gathered, and Hodson with marvellous coolness ordered them to disarm, which they proceeded to do. He sent the princes on with an escort of ten men, while with the remaining ninety he collected the arms of the crowd. On galloping after the princes he found the crowd once more pressing on the escort and threatening an attack; and fearing that he would be unable to bring his prisoners into Delhi he shot them with his own hand. This is the most bitterly criticized action in his career, but no one but the man on the spot can judge how it is necessary to handle a crowd; and in addition one of the princes, Abu Bukt, heir-apparent to the throne, had made himself notorious for cutting off the arms and legs of English children and pouring the blood into their mothers' mouths. Considering the circumstances of the moment, Hodson's act at the worst was one of irregular justice. A more unpleasant side to the question is that he gave the king a safe conduct, which was afterwards seen by Sir Donald Stewart, before he left the palace, and presumably for a bribe; and he took an armlet and rings from the bodies of the princes. He was freely accused of looting at the time, and though this charge, like that of peculation, is matter for controversy, it is very strongly supported. General Pelham Burn said that he saw loot in Hodson's boxes when he accompanied him from Fatchgar to take part in the siege of Lucknow, and Sir Henry Daly said that he found "loads of loot" in Hodson's boxes after his death, and also a file of documents relating to the Guides case, which had been stolen from him and of which Hodson denied all knowledge. On the other hand the Rev. G. Hodson states in his book that he obtained the inventory of his brother's possessions made by the Committee of Adjustment and it contained no articles of loot, and Sir Charles Gough, president of the committee, confirmed this evidence. This statement is totally incompatible with Sir Henry Daly's and is only one of many contradictions in the case. Sir Henry Norman stated that to his personal knowledge Hodson had collected several thousand pounds to Cabutta which could only have been obtained by looting. On the other hand, again Hodson died a poor man, his effects were sold for £170, his widow was dependent on charity for her passage home, was given appointments at the queen at Hampton Court, and left only £100 at her death.

Hodson was killed on the 11th of March 1838 in the attack on the Begum Kotee at Lucknow. He had just arrived on the spot and met a man going to fetch powder to blow in a door; instead Hodson, with his usual recklessness, rushed into the doorway and was shot. On the whole, it can hardly be doubted that he was somewhat unscrupulous in his private character, but he was a splendid soldier, and rendered inestimable services to the empire.

HODY, HUMPHREY (1659-1707), English divine, was born at Odcombe in Somersetshire in 1659. In 1676 he entered Wadham College, Oxford, of which he became fellow in 1685. In 1684 he published Contra historiam Aristaeus de LXX. interpretarios dissertation, in which he showed that the so-called letter of Aristaeus, containing an account of the production of the Septuagint, was the late forgery of a Hellenist Jew originally circulated to lend authority to that version. The dissertation was generally regarded as conclusive, although Isaac Vossius published an angry and scurrilous reply to it in the appendix to his edition of Pompomus Mela. In 1689 Hody wrote the Prologomena to the Greek chronicle of John Malalas, published at Oxford in 1691. The following year he became chaplain to Edward Stillingfleet, bishop of Worcester, and for his support of the ruling party in a controversy with Henry Dodwell regarding the non-juring bishops he was appointed chaplain to Archbishop Tillotson, an office which he continued to hold under Tenison. In 1698 he was appointed regius professor of Greek at Oxford, and in 1704 was made archdeacon of Oxford. In 1701 he published A History of English Councils and Convocations, and in 1703 in four volumes De Bibliorum textis originalibus, in which he included a revision of his work on the Septuagint, and published a reply to Vossius. He died on the 26th of January 1707.

A work, De Graecis Illustribus, which he left in manuscript, was published in 1742 by Samuel Jebb, who prefixed to it a Latin life of the author.

HOE, RICHARD MARCH (1812-1886), American inventor, was born in New York City on the 13th of September 1812. He was the son of Robert Hoe (1784-1833), an English-born American mechanic, who with his brothers-in-law, Peter and Matthew Smith, established in New York City a manufactory of printing presses, and used steam to run his machinery. Richard entered his father's manufactory at the age of fifteen and became head of the firm (Robert Hoe & Company) on his father's death. He had considerable inventive genius and set himself to secure greater speed for printing presses. He discarded the old flat-bed model and placed the type on a revolving cylinder, a model later developed into the well-known Hoe rotary or "lightning" press, patented in 1846, and further improved under the name of the Hoe web perfecting press (see PRINTING). He died in Florence, Italy, on the 7th of June 1886.

See A Short History of the Printing Press (New York, 1902) by his nephew Robert Hoe (1839-1909), who was responsible for further improvements in printing, and was an indefatigable worker in support of the New York Metropolitan Museum.

HOE (through Fr. houe from O.H.G. hawod, mod. Ger. Haue); the root is seen in "hew," to cut, cleave; the word must be distinguished from "hoe," promontory, tongue of land, seen in place names, e.g. Morthoe, Luton Hoo, the Hoe at Plymouth, &c.; this is the same as Northern English "heugh" and is connected with "hang"), an agricultural and gardener's implement used for extirpating weeds, for stirring the surface-soil in order to break the capillary channels and so prevent the evaporation of moisture, for singling out turnips and other root-crops and similar purposes. Among common forms of hoe are the ordinary

- garden-hoe (numbered 1 in fig. 1), which consists of a flat blade set transversely in a long wooden handle; the Dutch or thrust-hoe (2), which has the blade set into the handle after the fashion of a spade; and the swan-neck hoe (3), the best manual hoe for agricultural purposes, which has a long curved neck to attach the blade to the handle; the soil falls back over this, blocking it thus avoiding slods, a longer stroke obtained. Several types of horse-drawn hoe capable of working one or more rows at once are used among root and grain crops. The illustrations show two forms of the implement, the blades of which differ in shape from those of the garden-hoe. Fig. 2 is in ordinary use for hoeing between two lines of beans or turnips or other "roots." Fig. 3
is adapted for the narrow rows of grain crops and is also convertible into a root-hoe. In the lever-hoe, which is largely used in grain crops, the blades may be raised and lowered by means of a lever. The horse-drawn hoe is steered by means of handles in the rear, but its successful working depends on accurate drilling of the seed, because unless the rows are parallel the roots of the plants are liable to be cut and the foliage injured. Thus Jethro Tull (17th century), with whose name the beginning of the practice of horse-hoeing is principally connected, used the drill which he invented as an essential adjunct in the so-called "Horse-hoe Husbandry" (see Agriculture).

**HOEFNAGEL, JORIS** (1545-1601), Dutch painter and engraver, the son of a diamond merchant, was born at Antwerp. He travelled abroad, making drawings from archaeological subjects, and was a pupil of Jan Bol at Mechlin. He was afterwards patronized by the elector of Bavaria at Munich, where he stayed eight years, and by the Emperor Rudolph at Prague. He died at Vienna in 1601. He is famous for his miniature work, especially on a missal in the imperial library at Vienna; he painted animals and plants to illustrate works on natural history; and his engravings (especially for Braun's *Civitates orbis terrarum*, 1572, and Ortelius's *Theatrum orbis terrarum*, 1570) give him an interesting place among early topographical draughtsmen.

**HOF, a town of Germany, in the Bavarian province of Upper Franconia, beautifully situated on the Saale, on the north-eastern spurs of the Fichtelgebirge, 103 m. S.W. of Leipzig on the main line of railway to Regensburg and Munich. Pop. (1885) 24,257; (1905) 36,348. It has one Roman Catholic and three Protestant churches (among the latter that of St Michael, which was restored in 1884), a town hall of 1563, a gymnasium and an extensive library, a commercial school and a hospital founded in 1262. It is the seat of various flourishing industries, notably woollen, cotton and jute spinning, jute weaving, and the manufacture of cotton and half-woollen fabrics. It has also dye-works, flour-mills, saw-mills, breweries, iron-works, and manufactures of machinery, iron and tin wares, chemicals and sugar. In the neighbourhood there are large marble quarries and extensive iron mines. Hof, originally called Regnitzhof, was built about 1060. It was held for some time by the dukes of Meran, and was sold in 1373 to the burgraves of Nuremberg. The cloth manufacture introduced into it in the 15th century, and the manufacture of veils began in the 16th century, greatly promoted its prosperity, but it suffered severely in the Albertine and Hussite wars as well as in the Thirty Years' War. In 1792 it came into the possession of Prussia; in 1806 it fell to France; and in 1810 it was incorporated with Bavaria. In 1823 the greater part of the town was destroyed by fire.

See Ernst, Geschichte und Beschreibung des Bezirks und der Stadt Hof (1866); Tillmann, *Die Stadt Hof und ihre Umgebung* (Hof, 1899), and C. Meyer, Quellen zur Geschichte der Stadt Hof (1894-1896).

**HOFER, ANDREAS** (1767-1810), Tirolese patriot, was born on the 22d of November 1767 at St Leonhard, in the Passeier valley. There his father kept an inn known as "am Sand," which Hofer inherited, and on that account he was popularly known as the "Sandwirth." In addition to this he carried on a trade in wine and horses with the north of Italy, acquiring a high reputation for intelligence and honesty. In the wars against the French from 1796 to 1805 he took part, first as a sharp-shooter and afterwards as a captain of militia. By the treaty of Pressburg (1805) Tirol was transferred from Austria to Bavaria, and Hofer, who was almost fanatically devoted to the Austrian house, became conspicuous as a leader of the agitation against Bavarian rule. In 1808 he formed one of a deputation who went to Vienna, at the invitation of the archduke John, to concert a rising; and when in April 1809 the Tirolese rose in arms, Hofer was chosen commander of the contingent from his native valley, and inflicted an overwhelming defeat on the Bavarians at Sterzing (April 11). This victory, which resulted in the temporary reoccupation of Innsbruck by the Austrians, made Hofer the most conspicuous of the insurgent leaders. The rapid advance of Napoleon, indeed, and the defeat of the main Austrian army under the archduke Charles, once more exposed Tirol to the French and Bavarian troops who reoccupied Innsbruck. The withdrawal of the bulk of the troops, however, gave the Tirolese their chance again; after two battles fought on the Iselberg (May 25 and 29) the Bavarians were again forced to evacuate the country, and Hofer entered Innsbruck in triumph. An autograph letter of the emperor Francis (May 29) assured him that no peace would be concluded by which Tirol would again be separated from the Austrian monarchy, and Hofer, believing his work accomplished, returned to his home. Then came the news of the armistice of Znaim (July 12), by which Tirol and Vorarlberg were surrendered by Austria unconditionally and given up to the general government of the French. The country was again invaded by 70,000 French and Bavarian troops, and Innsbruck fell; but the Tirolese once more organized resistance to the French "atheists and freemasons," and, after a temporary hesitation, Hofer—on whose head a price had been placed—threw himself into the movement. On the 13th of August, in another battle on the Iselberg, the French under Marshal Lefebvre were routed by the Tirolese peasants, and Hofer once more entered Innsbruck, which he had some difficulty in saving from sack. Hofer was now elected Oberkommandant of Tirol, took up his quarters in the Hofburg at Innsbruck and for two months ruled the country in the emperor's name. He preserved the habits of a simple peasant, and his administration was characterized in part by the peasant's shrewd common sense, but yet more by a pious solicitude for the minutest details of faith and morals. On the 29th of September Hofer received from the emperor a chain and medal of honour, which encouraged him in the belief that Austria did not intend again to desert him; the news of the conclusion of the treaty of Schönbrunn (October 14), by which Tirol was again ceded to Bavaria, came upon him as an overwhelming surprise. The French in overpowering force at once pushed into the country, and, an amnesty having been stipulated in the treaty, Hofer and his companions, after some hesitation, gave in their submission. On the 12th of November, however,
HÖFFDING—HOFFMANN, E. T. W.

501

urged on by the hotter heads among the peasant leaders and deceived by false reports of Austrian victories, Hofert again issued his clarion call. The goading was a temptation to arms. The summons met with little response; the enemy advanced in irresistible force, and Hofert, a price once more set on his head, had to take refuge in the mountains. His hiding-place was betrayed by one of his neighbours, named Josef Raffl, and on the 27th of January 1810 he was captured by Italian troops and sent in chains to Mantua. There he was tried by court-martial, and on the 30th of February was shot, twenty-four hours after his condemnation. This crime, which was believed to be due to Napoleon's orders, created a sensation throughout Germany and did much to inflame popular sentiment against the French. At the court of Austria, too, which was accused of having cynically sacrificed the hero, it produced a painful impression, and Metternich, when he visited Paris on the occasion of the marriage of the archduchess Marie Louise to Napoleon, was charged to remonstrate with the emperor. Napoleon expressed his regret, stating that the execution had been carried out against his wishes, having been hurried on by the zeal of his generals. In 1813 Hofert's remains were removed from Mantua to Innsbruck, where they were interred in the Franciscan church, and in 1834 a marble statue was erected over his tomb. In 1893 a bronze statue of him was also set up on the Iselberg. At Meran his patriotic deeds of heroism are the subject of a festival play celebrated annually in the open air. In 1818 the patent of nobility bestowed upon him by the Austrian emperor in 1809 was conferred upon his family.

Schiller and Lessing of the Palestinian Tyrolean Insurgent-Chef Andr. Hofert (Berlin, 1810); Andr. Hofert and die Tyroler Insurrection im Jahre 1809 (Munich, 1811); Hornay, Geschichte Andr. Hofers (Leipzig, 1845); B. Weber, Das Thal, Passyey und seine Bewohner mit besonderer Rücksicht auf Andreas Hofers und das Jahr 1809 (Innsbruck, 1841); Rapp, Tirol im Jahr 1809 (Innsbruck, 1852); Weidinger, Andreas Hofers und seine Kampfgenossen (3rd ed., Leipzig, 1861); Andreas Hofers (Munich, 1874); Stampfer, Sandwirt Andreas Hofers (Freiburg, 1874); Schmüll, Andreas Hofers und seine Kampfgenossen (Innsbruck, 1900). His history has supplied the materials for tragedies to B. Auerbach and Immermann, and for numerous ballads, of which some remain very popular in Germany (see Franke, Andreas Hofers im Liede, Innsbruck, 1884).

HÖFFDING, HARALD (1843— ), Danish philosopher, was born and educated in Copenhagen. He became a schoolmaster, and ultimately in 1883 professor in the university of Copenhagen. He was much influenced by Sören Kierkegaard in the early development of his thought, but later became a positivist, retaining, however, and combining with it the spirit and method of practical psychology and the critical school. His best-known work is perhaps his Den nye Filosofs Historie (1854), translated into English from the German edition (1852) by B. E. Meyer as History of Modern Philosophy (2 vols., 1900), a work intended by him to supplement and correct that of Hans Brüchner, to whom it is dedicated. His Psychology, the Problems of Philosophy (1905) and Philosophy of Religion (1906) also have appeared in English.

Among Höffding's other writings, practically all of which have been translated into German, are: Den engelske Filosopher I vor Tid (1852); Einige Ueberlegungen und Omriters (1863); Geschichte der Erlebnng (ed. 1862); Psychologische Untersucher (1862); Charles Darwin (1869); Kontinuitaet i Kants filosofiske Udviklingsgang (1893); Der psychologischen Grundbegriffe in deutscher Sprache (1899); Rousseau und seine Philosophie (1901); Mindre Arbejder (1899).

HOFFMANN, AUGUST HENRICH (1758—1784), known as Hoffmann von Fallersleben, German poet, philologist and historian of literature, was born at Fallersleben in the duchy of Lüneburg, Hanover, on the 2nd of April 1758, the son of the mayor of the town. He was educated at the classical schools of Helmstedt and Brunswick, and afterwards at the universities of Göttingen and Bonn. His original intention was to study theology, but he soon gave expression to a purely literary bent. In 1783 he was appointed custodian of the university library at Breslau, a post which he held till 1838. He was also made extraordinary professor of the German language and literature at that university in 1830, and ordinary professor in 1835, but he was deprived of his chair in 1842 in consequence of his Ungpolitische Lieder (1840—1841), which gave much offence to the authorities in Prussia, and then given a post in the German consulates in Switzerland, Germany, and Italy, and lived for two or three years in Mecklenburg, of which he became a naturalized citizen. After the revolution of 1848 he was enabled to return to Prussia, where he was restored to his rights, and received the Wartegeld—the salary attached to a promised office not yet vacant. He married in 1849, and during the next ten years lived first in Bingenbrück, afterwards in Neuwied, and then in Weimar, where together with Oskar Schade (1826—1906) he edited the Weimarer Allgemeine Zeitung (1854—1857). He was buried in the lake of bis residence, the Duke of Ratibor at the monasterial castle of Corvey near Höxter on the Weser, where he died on the 19th of January 1874. Fallersleben was one of the best popular poets of modern Germany. In politics he ardently sympathized with the progressive tendencies of his time, and he was among the earliest and most effective of the political poets who prepared the way for the outbreak of 1848. As a poet, however, he acquired distinction chiefly by the ease, simplicity and grace with which he expressed the passions and aspirations of the time. Although he had not been scientifically trained in music, he composed melodies for many of his songs, and a considerable number of them are sung by all classes in every part of Germany. Among the best known is the patriotic Deutschland, Deutschland über Alles, composed in 1841 on the island of Heligoland, where a monument was erected in 1892 to his memory (subsequently destroyed).

The best of his poetical writings is his Geschild (1879; 9th ed., Berlin, 1899), but there is great merit also in his Almanachtische Lieder (1826; 5th ed., 1834), Soldatenlieder (1851), Soldatenlieder (1852), Rheinlieder (1866), and in his Fünfzig Kinderlieder, Fünfzig neue Kinderlieder, and Alte und neue Kinderlieder. His Ungpolitische Lieder, Deutsche Lieder aus der Schweiz and Streiflichter are not without poetical value, but they are mainly interesting in relation to the movements of the age in which they were written. As a student of the German language he published Teutonic literature. Hoffmann was one of the most persevering and cultivated of German scholars, among the chief results of his labours being embodied in his Horae Belgicae, Fundgruben für Geschichte deutscher Sprache und Literatur (1815—1838, 1876—1879), and his Gesammelte Werke (ed. by H. Gerstenberg in 8 vols., 1891; B. Neuhäusel and J. H. Bennewitz, 3 vols., 1891—1894). See also Briefe von Hoffmann von Fallersleben und Moritz Haupt an Ferdinand Wolf (1874); J. M. Wagner, Hoffmann von Fallersleben, 1818—1888 (1880—1897), and R. von Gottschall, Porträts und Studien (vol. v., 1876).

HÖFFDING, ERNST THEODOR WILHELM (1776—1822), German romance-writer, was born at Königsberg on the 24th of January 1776. For the name Wilhelm he himself substituted Amadeus in homage to Mozart. His parents lived unhappily together, and when the child was only three they separated. Falling up was at Königsberg, where he did not find either sympathy or patronage for his dreamy and wayward temperament. Hoffding showed more talent for music and drawing than for books. In 1792, when little over sixteen years old, he entered the university of Königsberg, with a view to preparing himself for a legal career. The chief features of interest in his student years were an intimate friendship for Theodor Gottlieb von Hippel (1775—1843), a nephew of the novelist Hippel, and an unhappy passion for a lady to whom he gave music lessons; the latter found its outlet, not merely in music, but also in two novels, neither of which he was able to have published. In the summer of 1795 he began his practical career as a jurist in Königsberg, but his mother's death and the complications in which his love-affair threatened to involve him made him decide to leave his native town and continue his legal apprenticeship
in Glogau. In the autumn of 1798 he was transferred to Berlin, where the beginnings of the new Romantic movement were in the air. Music, however, had still the first place in his heart, and the Berlin opera house was the chief centre of his interests.

In 1800 further promotion brought him to Posen, where he gave himself up entirely to the pleasures of the hour. Unfortunately, however, his brilliant powers of caricature brought him into ill odour, and instead of receiving the hoped-for preferment in Posen itself, he found himself virtually banished to the little town of Plozk on the Vistula. Before leaving Posen he married, and his domestic happiness was on the same extent with monotony of the two years' exile. His leisure was spent in literary studies and musical composition. In 1804 he was transferred to Warsaw, where, through J. E. Hitzig (1780–1849), he introduced to Zacharias Werner, and began to take an interest in the later Romantic literature; now, for the first time, he discovered how writers like Novalis, Tieck, and especially Wackenroder, had spoken out of his own heart. But in spite of this literary stimulus, his leisure in Warsaw was mainly occupied by composition; he wrote music to Brentano's Lustige Musikanten and Werner's Kreuze an der Oissee, and also an opera Lieben und Eifersucht, based on Calderon's La Banda de la Flor.

The arrival of the French in Warsaw and the consequent political changes put an end to Hoffmann's congenial life there, and a time of tribulation followed. A position which he obtained in 1808 as musical director of a new theatre in Bamberg availed him little, as within a very short time the theatre was bankrupt and Hoffmann again reduced to destitution. But these misfortunes induced him to turn to literature in order to eke out the miserable livelihood he earned by composing and giving music lessons. The editor of the Allgemeine musikalische Zeitung expressed his willingness to accept contributions from Hoffmann, and here appeared for the first time some of the musical sketches which ultimately passed over into the Phantastische in Callots Manier. This work appeared in four volumes in 1814 and laid the foundation of his fame as a writer. Meanwhile, Hoffmann had again been for some time attached, in the capacity of musical director, to a theatrical company, whose headquarters were at Dresden. In 1814 he gladly embraced the opportunity that was offered him of resuming his legal profession in Berlin, and two years later he was appointed councillor of the Court of Appeal (Kammergericht). Hoffmann had the reputation of being an excellent jurist and a conscientious official; he had leisure for literary pursuits and was on the best of terms with the circle of Romantic poets and novelists who gathered round Fouqué, Chamisso and his old friend Hitzig. Unfortunately, however, the habits of intemperance which, in earlier years, had thrown a shadow over his life, grew upon him, and his health was speedily undermined by the nights he spent in the wine-house, in company unworthy of him. He was struck down by locomotor ataxia, and died on the 24th of July 1822.

The Phantastischke, which had been published with a commendatory preface by Jean Paul, were followed in 1816 by the gruesome novel—to some extent inspired by Lewis's Fortunatus, and here appeared for the first time some of the gruesome and grotesque stories which make up the Nachtschöcke (1817, 2 vols.). The full range of Hoffmann's powers is first clearly displayed in the collection of stories (4 vols., 1819–1821) Die Serapionsbrüder, this being the name of a small club of Hoffmann's more intimate literary friends. Die Serapionsbrüder includes not merely stories in which Hoffmann's love for the mysterious and the supernatural is to be seen, but novels in which he draws on his own early reminiscences (Rot Kreisped, Pernoot), finely outlined pictures of old German life (Der Artushof, Meister Martin der Käufer und seine Gesellen), and vivid and picturesque incidents from Italian and French history (Doge und Dogadessa, the story of Marino Faliero, and Das Frübein von Scuderi). The last-mentioned story is usually regarded as Hoffmann's masterpiece. Two longer works also belong to Hoffmann's later years and display to advantage his powers as a humorist; these are Klein Zoches, genannt Zimmber (1819), and Lebensansichten des Katers Murr, nebst fragmentarischer Biographie des Kapellmeisters Johannes Kreisler (1821–1822).

Hoffmann is one of the master novelists of the Romantic movement in Germany. He combined with a humour that reminds us of Jean Paul the warm sympathy for the artist's standpoint towards life, which was enunciated by early Romantic leaders like Tieck and Wackenroder; but he was superior to all in the almostclairvoyant powers of his imagination. His works abound in grotesque and gruesome scenes—in this respect they mark a descent from the high ideals of the Romantic school; but the commonplace is on the other side for Hoffmann's genius, and even here the secret of his power lay not in his choice of subjects, but in the wonderfully vivid and realistic presentation of them. Every line he wrote leaves the impression behind it that it expresses something felt or experienced; every scene, vision or character he described seems to have been real and living to him. It is this realism, in the best sense of the word, that made him the great artist he was, and gave him so extraordinary a power over his contemporaries.

The first collected edition of Hoffmann's works appeared in ten volumes (Auszugwähle Schriften, 1827–1828); to these his widow added five volumes in 1839 (including the 3rd edition of J. E. Hitzig's Aus Hoffmanns Leben und Nachlass, 1839). Other editions include the 4th, 5th and 6th, again between 1845; the 7th and 8th, and most complete of all, Sämtliche Werke, edited by F. Grisebach, in 15 vols. (1906). There are many editions of selections, as well as cheap reprints of the more popular stories. All Hoffmann's important works have been translated into English; The Devil's Elixir (1824), The Golden Pot by Carlyle (in German Romance, 1827), The Serapion Brethren by A. Ewing (1892), &c. France Hoffmann was even more popular than in England. C. G. Thoma, Hoffmanns Erzählungen in Frankreich (1896). An edition of his Oeuvres complètes appeared in 12 vols. in Paris in 1893. The best monograph on Hoffmann is by G. Ellinger, C. T. A. Hoffmann (1894); see also O. Klimke, Hoffmanns Leben und Werke vom Standpunkte eines Irrenarztes (1903); and the exhaustive bibliography in Goedel's Grundzüge zur Geschichte der deutschen Dichtung, 2nd ed., vol. vii. pp. 456 ff. (1905).

Hoffmann, François Benoît (1770–1828). French diplomat and critic, was born at Nancy on the 11th of July 1760. He studied law at the university of Strassburg, but a slight hesitation in his speech precluded success at the bar, and he entered a regiment on service in Corsica. He served, however, for a very short time, and, returning to Nancy, he wrote some poems which brought him into notice at the little court of Lunéville over which the marquis de Boufflers then presided. In 1784 he went to Paris, and two years later produced the opera Phédre. His opera Adrien (1792) was objected to by the government on political grounds, and Hoffmann, who refused to make the changes proposed to him, ran considerable risk under the Directory. In the wake of his first success, however, numerous, were produced at the Opéra Comique. In 1807 he was invited by Étienne to contribute to the Journal de l'Empire (afterwards the Journal des débats). Hoffmann's wide reading qualified him to write on all sorts of subjects, and he turned, apparently with no difficulty, from reviewing books on medicine to violent attacks on the Jesuits. His severe criticism of Chateaubriand's Martyrs led the author to make some changes in a later edition. He had the reputation of being an absolutely conscientious and incorruptible critic and thus exercised wide influence. Hoffmann died in Paris on the 25th of April 1828. Among his numerous plays should be mentioned an excellent one-act comedy, Le Roman d'une heure (1805), and an amusing one-act opera Les Rendez-vous bourgeois.

See Sainte-Beuve, "M. de Feletz et la critique littéraire sous l'Empire" in Causeries du lundi, i.

Hoffmann, Friedrich (1860–1742), German physician, a member of a family that had been connected with medicine for 200 years before him, was born at Hale on the 19th of February 1660. At the gymnasium of his native town he acquired the taste for medicine, which he attributed much of his after success. At the age of eighteen he went to study medicine at Jena, whence in 1680 he passed to Erfurt, in order to attend Kaspar Cramer's lectures on chemistry. Next year, returning to Jena, he received his doctor's diploma, and, after publishing a thesis, was permitted to
teach. Constant study then began to tell on his health, and in 1682, leaving his already numerous pupils, he proceeded to Minden in Westphalia to recruit himself, at the request of a relative who held a high position in that town. After practising at Minden for two years, Hoffmann made a journey to Holland and England, where he formed the acquaintance of many illustrious chemists and physicians. Towards the end of 1684 he returned to Minden, and during the next three years he received many flattering appointments. In 1688 he removed to the more promising sphere of Halberstadt, with the title of physician to the principality of Halberstadt; and on the founding of Halle university in 1693, his reputation, which had been steadily increasing, procured for him the primus chair of medicine, while at the same time he was charged with the responsible duty of framing the statutes for the new medical faculty. He filled also the chair of natural philosophy. With the exception of four years (1708-1712), which he passed at Berlin in the capacity of royal physician, Hoffmann spent the rest of his life at Halberstadt, and he appears, in April and July of each year, suddenly interrupted now and again by visits to different courts of Germany, where his services procured him honours and rewards. His fame became European. He was enrolled a member of many learned societies in different foreign countries, while in his own he became privy councillor. He died at Halle on the 12th of November 1742.

Of his numerous writings a catalogue is to be found in Haller's Beyträge zur analytischen Chemie. The chief is Medicinae rationis systematica, undertaken at the age of sixty, and published in 1739. It was translated into French in 1739, under the title of Methode analytique, medicale. A volume of Hoffmann's works, with a life of the author, was published at Geneva in 1740, to which supplements were added in 1753 and 1760. Editions appeared also at Venice in 1745 and at Naples in 1753 and 1793. (See also Medicine.)

Hoffmann, Johann Joseph (1805-1878), German scholar, was born at Würzburg on the 16th of February 1805. After studying at Würzburg he went on the stage in 1825, but owing to an accidental meeting with the German traveller, Dr Philipp von Siebold (1796-1866), in July 1830, his interest was diverted to Oriental philology. From Siebold he acquired the rudiments of Japanese, and in order to take advantage of the instructions of Ko-ching-chan, a Chinese teacher whom Siebold had brought home with him, he made himself acquainted with Malay, the only language except Chinese which the Chinaman could understand. In a few years he was able to supply the translations for Siebold's Nippon; and the high character of his work soon attracted the attention of older scholars. Stanislas Julien invited him to Paris; and he would probably have accepted the invitation, as a disagreement had broken out between him and Siebold, had not M. Baud, the Dutch colonial minister, appointed him Japanese translator with a salary of 1800 florins (£50). The Dutch authorities were slow in giving him further recognition; and he was too modest a man successfully to urge his claims. It was not till after he had received the offer of the professorship of Chinese in King's College, London, that the authorities made him professor at Leiden and the king allowed him a yearly pension. In 1875 he was decorated with the order of the Netherlands Lion, and in 1877 he was elected corresponding member of the Berlin Academy. He died at the Hague on the 3rd of January 1878.

Hoffmann's chief work was his unfinished Japanese Dictionary, begun in 1839 and afterwards continued by L. Serrurier. Unable at first to procure the necessary type, he set himself to the cutting of plates, and though the proper founts were obtained he had to act as his own compositor as far as Chinese and Japanese were concerned. His Japanese grammar (Japanische Sprechlehre) was published in English in 1857, and in English and German in 1876. Of his miscellaneous productions it is enough to mention "Japans Bezüge mit der korielsen Halbinsel und mit Schina" in Nippon, vii.; Yo-san-Joh, L'Art d'éléver les vers à soie au Japon; von der Ausbildung der Japanischen Philosophie (Paris), and Hochkunde in Japan in Mittheil. d. deutsch. Gesellsch. für Naturl. und Volkerk. Ost-Asiens (1873-1874); and Japanische Studien (1878).

Hoffmann, August Wilhelm von (1818-1892), German chemist, was born at Giessen on the 8th of April 1818. Not intending originally to devote himself to physical science, he first took up the study of law and philosophy at Göttingen, and the general culture he thus gained stood him in good stead when he turned to chemistry, the study of which he began under Liebig. When, in 1845, a school of practical chemistry was started in London, under the style of the Royal College of Chemistry, Hoffmann, largely through the influence of the Prince Consort, was appointed its first director. It was with some natural hesitation that he, then a Privatdozent at Bonn, accepted the position, which may well have seemed rather a precarious one; but the difficulty was removed by his appointment as extraordinary professor at Bonn, with leave of absence for two years, so that he could resume his career in Germany if his English one proved unsatisfactory. Fortunately the college was more or less successful, owing largely to his enthusiasm and energy, and many of the men who were trained there subsequently made their mark in chemical history. But in 1864 he returned to Bonn, and in the succeeding year he was selected to succeed E. Mitscherlich as professor of chemistry and director of the laboratory in Berlin University. In leaving England, of which he used to speak as his adopted country, Hoffmann was probably influenced by a combination of causes. The public support extended to the college of chemistry had been dwindling for some years, and before he left it had ceased to have an independent existence and had been absorbed into the School of Mines. This event he must have looked upon as a curtailment of its possibilities of usefulness. But, in addition, there is only too good a reason to suppose that he was dissatisfied at the general apathy with which his science was regarded in England.

No man ever realized more fully than he how entirely dependent on the advance of scientific knowledge is the continuation of a country's material prosperity, and no single chemist ever exercised a greater or more direct influence upon industrial development. In England, however, people cared for none of these things, and were blind to the commercial potentialities of scientific research. The college to which Hoffmann devoted nearly twenty of the best years of his life was starved; the coal-tar industry, which was really brought into existence by his work and that of his pupils under his direction at that college, and which with a little intelligent forethought might have been retained in England, was allowed to slip into the hands of Germany, where it is now worth millions of pounds annually; and Hoffmann himself was compelled to return to his native land to find due appreciation as one of the foremost chemists of his time. The rest of his life was spent in Berlin, and there he died on the 8th of May 1892. That city possesses a permanent monument to his name in the Sohn von Hoffmann House, the house in which the first meetings of the German Chemical Society (of which he was the founder), which was formally opened in 1900, appropriately enough with an account of that great triumph of German chemical enterprise, the industrial manufacture of synthetical indigo.

Hoffmann's work covered a wide range of organic chemistry, though with inorganic bodies he did but little. His first research, carried out in Liebig's laboratory at Giessen, was on coal-tar, and his investigation of the organic bases in coal-gas naphtha established the nature of aniline. This aniline is Hoffmann to refer to as his first love, and it was a love to which he remained faithful throughout his life. His perception of the analogy between it and ammonia led to his famous work on the amines and ammonium bases and the allied organic phosphorus compounds, while his researches on rosaniline, which he first prepared in 1858, formed the first of a series of investigations on colouring matters which only ended with quinoline red in 1887. But in addition to these and numberless other investigations for which he was responsible the influence he exercised through his pupils must be taken into account. As a teacher, besides the power of accurately gauging the character and capabilities of those who studied under him, he had the faculty of infecting them with his own enthusiasm, and thus of stimulating them to put forward their best efforts. In the lecture-room he laid great stress on the importance of experimental demonstrations, paying particular attention to their selection and arrangement, though, since he
himself was a somewhat clumsy manipulator, their actual exhibition was generally entrusted to his assistants. He was the possessor of a clear and graceful, if somewhat florid, style, which showed to special advantage in his numerous obituary notices or encomiums (collected and published in three volumes Zur Erinnerung an vorangegangene Freunde, 1888). He also excelled as a speaker, particularly at gatherings of an international character, for in addition to his native German he could speak English, French and Italian with fluency.

See Memorial Lectures delivered before the Chemical Society, 1893–1900 (London, 1901).

HOFMANN, JOHANN CHRISTIAN KONRAD VON (1810–1877), Lutheran theologian and historian, was born on the 21st of December 1810 at Nuremberg, and studied theology and history at the university of Erlangen. In 1839 he went to Berlin, where Schleiermacher, Hengstenberg, Neander, Rank and Raumer were among his teachers. In 1843 he received an appointment to teach Hebrew and history in the gymnasmium of Erlangen. In 1835 he became Repetent, in 1838 Privatdozent and in 1841 professor extraordinarius in the theological faculty at Erlangen. In 1842 he became professor ordinarius at Rostock, but in 1845 returned once more to Erlangen as the successor of Gottlieb Christolf Adolf von Haslau (1806–1870), founder of the Zeitschrift für Protestantismus und Kirchengeschichte, of which Hofmann became the editor in 1845. In 1846 he was called to Flensburg (1846–1852) and Gottfried Thomasius (1802–1875) being his collaborators. He was a conservative in theology, but an enthusiastic adherent of the progressive party in politics, and sat as member for Erlangen and Fürth in the Bavarian second chamber from 1863 to 1868. He died on the 20th of December 1877.

He wrote Die siebzig Jahre des Jeremia u. die siebzig Jahrwochen des Daniel (1836); Geschichte des Aufsurfs in den Cevennen (1837); Lehrbuch der Weltgeschichte für Gymnasien (1839), which became a textbook in the Protestant gymnasium of Bavaria; Weissagung u. Erzählung im alten u. neuen Testament (1841–1844; 2nd ed. 1856–1858); Der Schriftenbau (1852–1856; 2nd ed. 1875–1880); Die heilige Schrift des neuen Testaments zusammenhängend untersucht (1862–1875); Schuttschriften (1865–1869), in which he defends himself against the charge of denying the Atonement; and Theologische Ethik (1878). His most important works are the five last named. In theology, as in ecclesiastical polity, Hofmann was a Lutheran of an extreme type, although the strongly marked individuality of some of his opinions laid him open to repeated accusations of heterodoxy. He was the head of what has been called the Erlangen School, and "in his day he was unquestionably the chief glory of the University of Erlangen" (Lichtenberger).

He wrote articles about the zur Hauck’s Realencyklopädie and the Allgemeine deutsche Biographie; and of F. Lichtenberger, History of German Theology in the Nineteenth Century (1886) pp. 446–458.

HOFMANN, MELCHIOR (c. 1468–1544), anabaptist, was born at Hall, in Swabia, before 1500 (Zur Linde suggests 1498). His biographers usually give his surname as above; in his printed works it is Hoffman, in his manuscripts Hofmann. He was without scholarly training, and first appears as a furrier at Livland. Attracted by Luther’s doctrine, he came forward as a lay preacher, combining business travels with a religious mission. Accompanied by Melchior Rinck, also a Skinner or furrier, and a religious enthusiast, he made his way to Sweden. Joined by Bernard Knipperdolling, the party reached Stockholm in the autumn of 1524. Their fervid attacks on image worship led to their expulsion. By way of Livonia, Hofmann arrived at Dorpat in November 1524, but was driven thence in the following January. Making his way to Riga, and thence to Wittenberg, he found favour with Luther; his letter of the 22nd of June 1525 appears in a tract by Luther of that year. He was again at Dorpat in May 1526; later at Magdeburg. Returning to Wittenberg, he was coldly received; he wrote there his exposition of Daniel xii. (1527). Repairing to Holstein, he got into the good graces of Frederick I. of Denmark, and was appointed by royal ordinance to preach the Gospel at Kiel. He was extravagant in denunciation, and developed a Zwinglian view of the Eucharist. Luther was alarmed. At a colloquy of preachers in Flensburg (28th April 1529) Hofmann, John Campanus and others were put on their defence. Hofmann maintained (against the "magic" of the Lutherans) that the function of the Eucharist, like that of preaching, is an appeal for spiritual union with Christ. Refusing to retract, he was banished. At Strassburg where he now turned, he was well received (1539) till his anabaptist development became apparent. He was in relations with Schwenkfeld and with Carlstadt, but assumed a prophetic rôle of his own. Journeying to East Friesland, (1530) he founded a community at Emden (1532), securing a large following of artisans. Despite the warning of John Trypmaker, who prophesied for him "six months" in prison, he returned in the spring of 1533 to Strassburg, where we hear of his wife and child. He gathered from the Apocalypse a vision of "resurrections" of apostolic Christianity, first under John Hus, and now under himself. The year 1533 was to inaugurate the new era; Strassburg was to be the seat of the New Jerusalem. In May 1533 he and others were arrested. Under examination, he denied that he had made common cause with the anabaptists and claimed to be no prophet, a mere witness of the Most High, but refused the articles of faith proposed to him by the provincial synod. Hofmann and Claus Frey, an anabaptist, were detained in prison, a measure due to the terror excited by the Münster episode of 1533–1534. The synod, in 1539, made further effort to reclaim him. The last notice of his imprisonment is on the 19th of November 1545; he probably died soon after.

His publications, with similar titles, in 1530, are noteworthy as having influenced Menno Simons and David Joris (Weissagung van heiliger göttlicher geschript and Prophecy or Weissagung van warer heiliger göttlicher schrift). Bock treats him as an antitrinitarian, on grounds which Wallace rightly deems inconclusive. With better reason Trechsel includes him among pioneers of some of the positions of Servetus. His Christology was Valentinian. While all are elected to salvation, only the regenerate may receive baptism, and those who sin after regeneration sin against the Holy Ghost, and cannot be saved. His followers were known as Hofmannites or Melchiorites.

See G. Herrmann, Essai sur la vie et les écrits de M. Hofmann (1852); F. O. zur Linden, M. Hofmann, ein Prophet der Wiederstätter (1885); H. Holtzmann, in Allgemeine deutsche Biographie (1856); Hegler in Hauck’s Realencyklopädie (1900); Bock, Hist. Antitrinir. (1778), ii. i., Wallace, Antitrinitir. (1845) iii., app. iii.; Hist. Rel. Societies. Antitrinitir. History of Religious Society, 5th ed. (1867); Life of Rel. Societies (1876). An alleged portrait, from an engraving of 1608, is reproduced in the appendix to A. Ross, Parsebeia (1665).

(HOFMEISTER, WILHELM FRITZCH BENEDICT (1824–1877), German botanist, was born at Leipzig on the 18th of May 1824. He came of a family engaged in trade, and after being educated at the gymnasium of Leipzig he entered business as a music-dealer. Much of his botanical work was done while he was so employed, till in 1863 he was nominated, without intermediate academic steps, to the chair in Hildelberg; thence he was transferred in 1872 to Tübingen, in succession to H. von Mohl. His first work was on the distribution of the Coniferae in the Himalaya, but his attention was very soon devoted to studying the sexuality and origin of the embryo of Phanerogams. His contributions on this subject extended from 1847 till 1860, and they finally settled the question of the origin of the embryo from an ovum, as against the prevalent pollen-tube theory of M. J. Schiedel, for he showed that the pollen-tube does not produce the embryo, but only stimulates the ovum already present in the ovule. He soon turned his attention to the embryology of Bryophytes and Pteridophytes, and gave continuous accounts of the germination of the spores and fertilization in Pteridium, Selaginella, Selaginella. Some of the main facts of the life of ferns and mosses were already known; these, together with his own wider observations, were worked into that great general pronouncement published in 1851 under the title, Vergleichende Untersuchungen der Keimung, Entfaltung und Fruchtbildung höherer Kryptogamen und der Samenbildung der Coniferen.

(A. G.O.)
This work will always stand in the first rank of botanical books. It antedated the Origin of Species by eight years, but contained facts and comparisons which could only become intelligible on some theory of descent. The plan of life-story common to them all, involving two alternating generations, was demonstrated for Liverworts, Mosses, Ferns, Equiseta, Rhizocarps, Lycopodiaceae, and even Gymnosperms, with a completeness and certainty which must still surprise those who know the botanical literature of the author's time. The conclusions of Hofmeister remain in their broad outlines unshaken, but rather strengthened by later- acquired details. In the light of the theory of descent the common plan of life-history in plants apparently so diverse as those named acquires a special significance; but it is one of the remarkable features of this great work that the writer himself does not theorize—with an unerring insight he points out his comparisons and states his homologies, but does not indulge in explanatory surmises. It is the typical work of an heroic age of plant-morphology. From 1857 till 1882 Hofmeister wrote occasionally on physiological subjects, such as the ascent of sap, and curvatures of growing parts, but it was in morphology that he found his natural sphere. In 1861, in conjunction with other botanists, a plan was drawn up of a handbook of physiological botany, of which Hofmeister was to be editor. Though the original scheme was never completed, the editor himself contributed two notable parts, Die Lehre von der Pflanzenzelle (1867) and Allgemeine Morphologie der Gewächse (1868). The former gives an excellent summary of the structure and relations of the plant, while the latter knowledge did not greatly differ from the occasional views. The latter was notable for its refutation of the spiral theory of leaf arrangement in plants, founded by C. F. Schimper and A. Braun. Hofmeister transferred the discussion from the mere study of mature form to the observation of the development of the parts, and substituted for the "spiral tendency" a mechanical theory based upon the observed fact that new branchings appear over the widest gaps which exist between the next older branchings of like nature. With this important work Hofmeister's period of active production closed; he fell into ill-health, and retired from his academic duties some time before his death at Lindenau, near Leipzig, on the 12th of January 1877. (F. O. B.)

HOFMEYR, JAN HENDRIK (1845-1909), South African politician, was born at Cape Town on the 4th of July 1845. He was educated at the South African College, and at an early age turned his attention to politics, first as a journalist. He was editor of the Zuid Afrikaan till its incorporation with Ons Land, and of the Zuid Afrikaansche Tijdschrift. He is fond of learning, education and sympathies a typical Dutch Afrikaner, he set himself to organize the political power of his fellow-countrymen. This he did very effectively, and when in 1879 he entered the Cape parliament as member for Stellenbosch, he became the real leader of the Dutch party. Yet he only held office for six months—as minister without portfolio in the Scalen ministry from May to November 1881. He held no subsequent official post in the colony, though he shared with Sir Thomas Upton and Sir Charles Mills the honour of representing the Cape at the intercolonial conference of 1887. Here he supported the proposal for entrusting the defence of Simon's Town to Cape Colony, leaving only the armament to be provided by the imperial government, opposed trans-oceanic penny postage, and moved a resolution in favour of an imperial customs union. At the colonial conference of 1894 at Ottawa he was again one of the Cape representatives. In 1888 and in 1889 he was a member of the South African customs conference. His chief importance as a public man was, however, derived from the fact that he was one of the Dutch leaders in controlling the Union of the Afrikaner Bond. In 1878 he had himself founded the "Farmers' Association," and as the Cape farmers were almost entirely Dutch the Association became a centre of Dutch influence. When the Bond was formed in 1882, with purely political aims, Hofmeyr made haste to obtain control of it, and in 1883 amalgamated the Farmers' Association with it. Under his direction the constitution of the Bond was modified by the elimination of the provisions inconsistent with loyalty to the British crown. But it remained an organization for obtaining the political supremacy of the Cape Dutch. (See Cape Colony: History.) His control over the Bond enabled him for many years, while free from the responsibilities of office, to make and unmake ministers at his will, and earned for him the name of "Cabinet-maker of South Africa." Although officially the term "Afrikaner" was explained by Hofmeyr to include white men of whatever race, yet in practice the influence of the Bond was always exerted in favour of the Dutch, and its power was drawn from the Dutch districts of Cape Colony. The sympathies of the Bond were thus always strongly with the Transvaal, as the chief centre of Dutch influence in South Africa; and Hofmeyr's position might in many respects be compared with that of Parnell at the head of the Irish Nationalist party in Great Britain. In the Bechuanaland difficulty of 1884 Hofmeyr threw all the influence of the Bond into the scale in favour of the Transvaal. But in the course of the next few years he began to drift away from President Kruger. He resented the reckless disregard of Cape interests involved in Kruger's fiscal policy; he feared that the Transvaal, after its sudden leap into prosperity upon the gold discoveries of 1886, might overshadow all other Dutch influences in South Africa; above all he was convinced, as he showed by his action at the London conference, that the protection of the British navy was indispensable to South Africa, and he set his face against Kruger's intrigues with Germany, and his avowed intention of acquiring armament as a present to the sea in order to get into touch with foreign powers.

In 1890 Hofmeyr joined forces with Cecil Rhodes, who became premier of Cape Colony with the support of the Bond. Hofmeyr's influence was a powerful factor in the conclusion of the Swaziland convention of 1890, as well as in stopping the "trek" to Banyaland (Rhodesia) in 1891—a notable reversal of the policy he had pursued seven years before. But the reactionary elements in the Bond grew alarmed at Rhodes's imperialism, and in 1895 Hofmeyr resigned his seat in parliament and the presidency of the Bond. Then came the Jameson Raid, and in its wake there rolled over South Africa a wave of Dutch and anti-British feeling such as had not been known since the days of Majuba. (The proclamation issued by Sir Hercules Robinson disavowing Jameson was suggested by Hofmeyr, who helped to draw up its terms.) Once more Hofmeyr became premier of the Bond. By an alteration of the provincial constitution, all power in the Cape branch of the Bond was vested in the hands of a vigilance committee of three, of whom Hofmeyr and his brother were two. As the recognized leader of the Cape Dutch he protested against such abuses as the dynamite monopoly in the Transvaal, and urged Kruger even at the eleventh hour to grant reasonable concessions rather than plunge into a war that might involve Cape Afrikanerdem and the Transvaal in a common ruin. In July 1890 he journeyed to Pretoria, and vainly supported the proposal of a satisfactory franchise law, combined with a limited representation of the Uitlanders in the Volksraad, and in September urged the Transvaal to accede to the proposed joint inquiry. During the negotiations of 1899, and after the outbreak of war, the official organ of the Bond, Ons Land, was conspicuous for its anti-British attitude, and its violence forced Lord Roberts to suppress it in the Cape Colony district under martial law. Hofmeyr never associated himself publicly with the opinions expressed by Ons Land, but neither did he repudiate them. The tide of race sympathy among his Dutch supporters made his position one of great difficulty, and shortly after the outbreak of war he withdrew to Europe, and refused to act as a delegate to the Cape Bond on Kruger's return. Hofmeyr came to England in 1901 in the interests of the Boer republics.

Towards the close of the war Hofmeyr returned to South Africa and organized the Bond forces for the general election held in Cape Colony at the beginning of 1904, which resulted in the defeat of the Bond party. Hofmeyr retained his ascendency over the Cape Dutch, but now began to find himself somewhat out of sympathy with the larger outlook on South African
affairs taken by the younger leaders of the Boers in the Transvaal. During 1896 he gave offence to the extreme section of the Bond by some criticisms of the taal and his use of English in public speeches. At the general election in 1908 the Bond, still largely under his direction, gained a victory at the polls, but Hofmeyr himself was not a candidate. In the renewed movement for the closer union of the South African states he advocated federation as opposed to unification. When, however, the unification proposals were ratified by the Cape parliament, Hofmeyr procured his nomination as one of the Cape delegates to England in the summer of 1909 to submit the draft act of union to the imperial government. He attended the conferences with the officials of the Colonial Office for the preparation of the draft act, and after the bill had become law went to Germany for a "cure." He returned to London in October 1909, where he died on the 16th of that month. His body was taken to Cape Town for burial.

HOFSTEDE DE GROOT, PETRUS (1802-1866), Dutch theologian, was born at Leer in East Friesland, Prussia, on the 8th of October 1802, and was educated at the Gymnasium and University of Gröningen. For three years (1826-1829) he was pastor of the Reformed Church at Ulrum, and then entered upon his lifelong duties as professor of theology at Gröningen. With his colleagues J. C. Pareau, J. F. van Vordt, and W. Muruing he edited from 1837 to 1872 the "Woahred in Liece." In this review and in his numerous books he vigorously upheld the orthodox faith against the Dutch "modern theology" movement. Many of his works were written in Latin, including: "Disputatio, qua ep. ad Hbros cum Paulinam, epistolam comparationem (1826), Institutiones historicae ecclesiasticae (1835), Institutio theologiae naturalis (1842). Excepllepaedia theologii christianii (1844). Others, in Dutch, were: "The Divine Education of Humanity up to the Coming of Jesus Christ" (3 vols., 1846), The Nature of the Gospel Ministry (1858), The "Modern Theology" of the Netherlands (1869), The Old Catholic Movement (1877). He became professor emeritus in 1872, and died at Gröningen on the 5th of December 1886.

HOGARTH, WILLIAM (1697-1764), the great English painter and pictorial satirist, was born at Bartholomew Close in London on the 10th of November 1697, and baptized on the 24th in the church of St Bartholomew the Great. He had two younger sisters, Mary, born in 1699, and Ann, born in 1701. His father, Richard Hogarth, who died in 1718, was a schoolmaster and literary hack, who had come to the metropolis to seek that fortune which had been denied to him in his native Westmorland. The son seems to have been early distinguished by a talent for drawing and an active perceptive faculty rather than by any close attention to the learning which he was soon shrewd enough to see had not made his parent prosperous. "Shows of all sorts gave me uncommon pleasure when an infant," he says, "and mimicry, common to all children, was remarkable in me..." Mr. Horace Walpole, when at school were more remarkable for the ornaments which adorned them than for the exercise itself."

This being the case, it is no wonder that, by his own desire, he was apprenticed to a silver-plate engraver, Mr Ellis Gamble, at the sign of the "Golden Angel" in Cranbourne Street or Alley, Leicester Fields. For this master he engraved a shop-card which is still extant. When his apprenticeship began is not recorded; but it must have been concluded before the beginning of 1720, for in April of that year he appears to have set up as engraver on his own account. His desires, however, were not limited to silver-plate engraving. Engraving on copper was, at twenty-two years of age, more common and required more skill. For this art he had the needful draughtsmanship, and his account of the means which he took to supply this want, without too much interfering with his pleasure, is thoroughly characteristic, though it can scarcely be recommended as an example. "Laying it down," he says, "first as an axiom, that he who could by any means acquire and retain in his memory, perfect ideas of the subjects he meant to draw, would have as clear a knowledge of the figure as a man who can write freely hath of the twenty-four letters of the alphabet and their infinite combinations (each of these being composed of lines), and would consequently be an accurate designer,... I therefore endeavoured to habituate myself to the exercise of a sort of technical memory, and by repeating in my own mind, the parts of which objects were composed, I could by degrees combine and put them down with my pencil." This account, it is possible, has something of the implausibility of the old age in which it was written; but there is little doubt that his marvellous skill was largely owing to seizing expression owed less to patient academical study than to his unexampled eye-memory and tenacity of minor detail. But he was not entirely without technical training, since, by his own showing, he occasionally "took the life" to correct his memories, and is known to have studied at Sir James Thornhill's then recently opened art school.

His first employment (i.e. after he set up for himself) "seems," says John Nichols, in his "Anecdotes," "to have been the engraving of arms and shop bills. After this he was employed in designing "plates for booksellers." Of these early and mostly insignificant works we may pass over. "The Lottery," an Emblematic Print on the South Sea Scheme," and some book illustrations, to pause at "Masquerades and Operas" (1724), the first plate he published on his own account. This is a clever little satire on contemporary follies, such as the masque-rades of the Swiss adventurer Heidegger, the popular Italian opera-singers, Rich's pantomimes at Lincoln's Inn Fields, and last, but by no means least, the exaggerated popularity of Lord Burlington's protégé, the architect painter William Kent, who is here represented on the summit of Burlington Gate, with Raphael and Michelangelo for supporters. This worthy, Hogarth had doubtless not learned to despise lest in the school of his rival Sir James Thornhill. Indeed almost the next of Hogarth's important prints was aimed at Kent alone, being that memorable burlesque of the unfortunate altarpiece designed by the latter for St Clement Danes, which, in deference to the ridicule of the parishioners, Bishop Gibson took down in 1725. Hogarth's squib, which appeared subsequently, exhibits it as a very masterpiece of confusion and bad drawing. In 1726 he prepared twelve large engravings for Butler's Hudibras. These he himself valued highly, and they are the best of his book illustrations. But he was far too individual to be the patient interpreter of other men's thoughts, and it is not in this direction that his successes are to be sought.

To 1727-1728 belongs one of those rare occurrences which have survived as contributions to his biography. He was engaged by Joshua Morris, a tapestry worker, to prepare a design for the "Element of Earth." Morris, however, having heard that he was "an engraver, and no painter," declined the work when completed, and Hogarth accordingly sued him for the money in the Westminster Court, where, on the 28th of May 1728, the case was decided in his (Hogarth's) favour. It may have been the asperity thus early cast on his skill as a painter (coupled perhaps with the unsatisfactory state of print-selling, owing to the uncontrolled circulation of piratical copies) that induced him about this time to turn his attention to the production of "small conversation pieces" (i.e. groups in oil of full-length portraits from 12 to 15 in. high), many of which are still preserved in different collections. "This," he says, "having novelty, succeeded for a few years." Among his other efforts in oil between 1728 and 1732 were "The Wanstead Conversation," "The House of Commons examining Bambridge," an infamous warden of the Fleet, and several pictures of the chief actors in Gay's popular Beggar's Opera.

Then came the series in which Hogarth was the great designer of the old Peel or old Paddington church to Jane Thornhill, the only daughter of Kent's rival above mentioned. The match was a clandestine one, although Lady Thornhill appears to have favoured it. We next hear of him in "lodgings at South Lambeth," where he rendered some assistance to the then well-known Jonathan Tyers, who opened Vauxhall in 1732 with an entertainment styled a ridotto al fresco. For these gardens Hogarth painted a poor picture of Henry VIII, and Anne Boleyn, and he also permitted Hayman to make copies of the later series of the "Four Times of the Day."
In return, the grateful Tyers presented him with a gold pass ticket. "In perpetuum Beneficii Memoriam." It was long thought that Hogarth designed this himself. "A Warwick Whore" (Numismatic Chronicle, vol. vii.) doubts this, although he thinks it probable that Hogarth designed some of the silver Vauxhall passes which are figured in Wilkinson's Londino Illustrato. The only engravings between 1726 and 1732 which need be referred to are the "Large Masquerade Ticket" (1727), another satire on masquerades, and the print of "Burlington Gate" (1731), evoked by Pope's Epistle to Lord Burlington, and defending Lord Chandos, who is therein satirized. This print gave great offence, and was, it is said, suppressed.

Hogarth had also painted the earliest of the series of moral works which first gave him his position as a great and original genius. This was "A Harlot's Progress," the paintings for which, if we may trust the date in the last of the pictures, were finished in that year. Almost immediately afterwards he must have begun to engrave them—a task he had at first intended to leave to others. From an advertisement in the Country Journal; or, the Craftsman, 29th of January 1732, the pictures were then being engraved, and from later announcements it seems clear that they were delivered to the subscribers early in the following April, on the 21st of which month an unauthorized prose description of them was published. We have no record of the particular train of thought which prompted these story-pictures; but it may perhaps be fairly assumed that the necessity for creating some link of interest between the personages of the little "conversation pieces" above referred to, led to the further idea of connecting several groups or scenes so as to form a sequential narrative. I wished," says Hogarth, "to compose pictures on canvas, similar to representations on the stage." "I have endeavoured," he says again, "to treat my subject as a dramatic writer; my picture is my stage, and men and women my players, who by means of certain actions and gestures are to exhibit a dumb show." There was never a more eloquent dumb show than this of the "Harlot's Progress." In six scenes the miserable career of a woman of the town is traced out remorselessly from its first facile beginning to its shameful and degraded end. Nothing of the detail is softened or abated; the whole is acted out coram populo, with the hard, uncompassionate morality of the age the painter lived in, while the introduction here and there of one or two well-known characters such as Colonel Charteris and Justice Gonson give a vivid reality to the satire. It had an immediate success. To say nothing of the fact that the talent of the paintings completely reconciled Sir James Thornhill to the son-in-law he had hitherto refused to acknowledge, more than twelve hundred names of subscribers to the engravings were entered in the artist's book. On the appearance of plate ii. the lords of the treasury trooped to the print shop for Sir John Gonson's portrait which it contained. The story was made into a pantomime by Theophilus Cibber, and by some one else into a ballad opera; and it gave rise to numerous pamphlets and poems. It was painted on fan-mounts and transferred to cups and saucers. Lastly, it was freely pirated. There could be no surer testimony to its popularity.

From the MSS. of George Vertue in the British Museum (Add. MSS. 32069-98) it seems that during the progress of the plates, Hogarth was domiciled with his father-in-law, Sir James Thornhill, in the Middle Piazza, Covent Garden (the "second house eastward from James Street"), and it must have been thence that set out the historical expedition from London to Sheerness of which the original record still exists at the British Museum. This is an oblong MS. volume entitled An Account of what seem'd most Remarkable in the Five Days' Peregination of the Five Following Persons, viz., Messieurs Tothall, Scott, Hogarth, Thornhill and Forrest. Begun on Saturday May 27th 1732 and Finish'd on the 31st of the same Month. Abi tu et fac similiter. Inscription at Dulwich College Porch. The journal, written in a small, neat and legible hand, by Theodosius Forrest, gives a good idea of what a "frisk"—as Johnson called it—was in those days, while the illustrations were by Hogarth and Samuel Scott the landscape painter. John Thornhill, Sir James's son, made the map. This version (in prose) was subsequently run into rhyme by one of Hogarth's friends, the Rev. Wm. Gosling of Catterbury, and after the artist's death both versions were published. In the absence of other biographical detail, they are of considerable interest to the student of Hogarth. In 1733 Hogarth moved into the "Golden Head" in Leicester Fields, which, with occasional absences at Chiswick, he continued to occupy until his death. By December of this year he was already engaged upon the engravings of a second Progress, that of a Rake. It was not as successful as its predecessor. It was in eight plates in lieu of six. The story is unequal; but there is nothing finer than the figure of the desperate hero, the "Country Rake," or the admirable scenes in the Fleet prison and Bedlam, where at last his headlong career comes to its tragic termination. The plates abound with allusive suggestion and covert humour; but it is impossible to attempt any detailed description of them here.

"A Rake's Progress" was dated June 25, 1735, and the engravings bear the words "according to Act of Parliament." This was an act (S Geo. II. cap. 13) which Hogarth had been instrumental in obtaining from the legislature, aiming chiefly thereto by the shameless piracies of rival print-sellers. Although loosely drawn, it served its purpose; and the painter comically morated his success by a long inscription on the plate entitled "Crowns, Mitres, &c.," afterwards used as a subscription ticket to the Election series. These subscription tickets to his engravings, let us add, are among the brightest and most vivacious of the artist's productions. That to the "Harlot's Progress" was entitled "Boys peeping at Nature," while the Rake's Progress was heralded by the delightful etching known as "A Pleased Audience at a Play, or, The Laughing Audience."

"We must pass more briefly over the prints which followed the two Progresses, noting first a "A Modern Midnight Conversation," an admirable drinking scene which comes between them in 1733, and the bright little plate of "Southwark Fair," which, although dated 1733, was published with "A Rake's Progress" in 1735. Between these and "Marriage à la mode," upon the pictures of which the painter must have been not long after at work, come the small prints of the "Consultation of Physicians" and "Sleeping Congregation" (1736), the "Scholars at a Lecture" (1737), the "Four Times of the Day" (1738), a series of pictures of 18th century life, the earlier designs for which have been already referred to; the "Strolling Actresses dressing in a Barn" (1738), which Walpole held to be, "for wit and imagination, without any other end, the best of all the painter's works;" and finally the admirable plates of the Distrest Poet painfully composing a poem on "Riches" in a garret, and the Enraged Musician culminating from his parlour window upon a discordant orchestra of knife-grinders, milk-girls, ballad-singers and the rest upon the pavement outside. These are dated respectively 1736 and 1741. To this period also (i.e. the period preceding the production of the plates of "Marriage à la mode") belong two of those history pictures to which, in emulation of the Haymans and Thornhills, the artist was continually attracted. "The Pool of Bethesda" and the "Good Samaritan," "with figures seven feet high," were painted circa 1736, and presented by the artist to St Bartholomew's Hospital, where they remain. They were not masterpieces; and it is pleasanter to think of his connexion with Captain Coram's recently established Foundling Hospital (1739), which he aided with his money, his graver and his brush, and for which he painted that admirable portrait of the good old philanthropist which is still, and deservedly, one of its chief ornaments.

In "A Harlot's Progress" Hogarth had not strayed much beyond the lower walks of society, and although, in "A Rake's Progress," his hero was taken from the middle classes, he can scarcely be said to have quitted those fields of observation which were his especial province. It is remarkable, looking to his education and antecedents, that his masterpiece, "Marriage à la mode," should successfully depict, as the advertisement has it, "a variety of modern occurrences in high life."
Yet, as an accurate delineation of upper class 18th century society, his “Marriage à la mode” has never, we believe, been seriously assailed. The counteresateroom’s, the earl’s apartment with its lavish coroets. and old masters, the grand salon with its marble pillars and grotesque ornaments, are fully as true to nature as the frowsey chamber in the “Turk’s Head Bagnio,” the quack-doctor’s museum in St Martin’s Lane, or the mean opulence of the merchant’s house in the city. And what story could be more vividly, more perspicuously, more powerfully told than this godless alliance of sots et parcheurnians—this miserable tragedy of an ill-assorted marriage? There is no defect of invention, no superfluity of detail, no purposeless stroke. It has the power of a whole of a great master of fiction, replete with the considerational advantages which result from the pictorial fashion of the narrative; and it is matter for congratulation that it is still to be seen by all the world in the National Gallery in London, where it can tell its own tale better than pages of commentary. The engravings of “Marriage à la mode” were dated April 1745. Although by this time the painter found a ready market for his engravings, he does not appear to have been equally successful in selling his pictures. The people bought his prints; but the richer and no more numerous connoisseurs who purchased pictures were wholly in the hands of the importers and manufacturers of old masters.” In February 1745 the original oil paintings of the two Progresses, “the Four Times of the Day” and the “Strolling Actresses” were still unsold. On the last day of that month Hogarth disposed of them by an ill-adeised kind of auction, the details of which may be read in Nichols’s Anecoces, for the palty sum of £27.7s. No better fate attended “Marriage à la mode,” which six years later became the property of Mr. Lane of Hillington for 120 guineas, being then in Carlo Maratti frames which had cost the artist four guineas a piece. Something of this was no doubt due to Hogarth’s impracticable arrangements, but the fact shows conclusively how completely blind his contemporaries were to the merits of an artist, and how he was in bondage to the all-powerful picture-dealers. Of these latter the painter himself gave a graphic picture in a letter addressed by him under the pseudonym of “Britophil” to the St James’s Evening Post, in June 1737. But if Hogarth was not successful with his dramas on canvas, he occasionally shared with his contemporaries in the popularity of portrait painting. For a picture, executed in 1746, of Garrick as Richard III, he was paid £200, “which was more,” says he, “than any English artist ever received for a single portrait.” In the same year a sketch of Simon Fraser, Lord Lovat, afterwards beheaded on Tower Hill, had an exceptional success.

We must content ourselves with a brief enumeration of the most important of his remaining works. These are “The Stage Coach or Country Inn Yard” (1747); the series of twelve plates entitled “Industry and Idleness” (1747), depicting the career of two London apprentices; the “Gate of Calais” (1749), which had its origin in a rather unfortunate visit paid to France by the painter after the peace of Aix-la-Chapelle; the “March to Finchley” (1750); “Beer Street,” “Gin Lane” and the “Four Stages of Cruelty” (1751); the admirable representations of election scenes in the days of Sir Robert Walpole, entitled “Four Prints of a Election” (1751-1753), and the plate of “Credulity, Superstition and Fanaticism. a Medley” (1752), adapted from an earlier unpublished design called “Enthusiasm Delineated.” Besides these must be chronicled three more essays in the “great style of history painting,” viz. “Paul before Felix,” “Moses brought to Pharaoh’s Daughter” and the Altarpiece for St Mary Redcliffe at Bristol. The first two were engraved in 1751-1752, the last in 1794. A subscription ticket to the earlier pictures, entitled “Paul before Felix Burlesque,” had a popularity far greater than that of the prints themselves. In 1745 Hogarth painted that admirable portrait of himself with his dog Trump, which is now in the National Gallery. In a canvas of the same period a sheet drawn on vellum of a serpentine curve with the words “The Line of Beauty.” Much inquiry ensued as to the meaning of this hieroglyphic; and in an unpropitious hour the painter resolved to explain himself in writing. The result was the well-known Analysis of Beauty (1753), a treatise to fix “the fluctuating ideas of Taste,” otherwise a desculatory essay having for pretext the precept attributed to Michelangelo that a figure should be always “Pyramidal, Serpent-like and multiplied by one two and three.” The fate of the book was what might have been expected. By the painter’s adherents it was praised as a final deliverance upon aesthetics; by his enemies and professional rivals, its obscurities, and the minor errors which, notwithstanding the benevolent efforts of literary friends, the work had not escaped, were made the subject of endless ridicule and caricature. It added little to its author’s fame, and it is perhaps to be regretted that he ever undertook it. In the latter part of 1753, however, there were further humiliations in store for him. In 1759 the success of a little picture called “The Lady’s Last Stake,” painted for Lord Charlemont, procured him a commission from Sir Richard Grosvenor to paint another picture “upon the same terms.” Unhappily on this occasion he deserted his own field of genre and social satire, to select the story from Boccaccio (or rather Dryden) of Sigismunda weeping over the heart of her murdered lover Guiscard, being the subject of a picture in Sir Luke Schaub’s collection by Furtini which had recently been sold for £400. The picture, over which he spent much time and patience, was not regarded as a success; and Sir Richard rather meanly shuffled out of his bargain upon the plea that “the constantly having it before one’s eyes, would be too often occasioning melancholy ideas to arise in one’s mind.” Sigismunda, therefore, much to the artist’s mortification, and the delight of the malicious, remained upon his hands. As, by her husband’s desire, his widow valued it at £500, it found no purchaser until after her death, when the Boydells bought it for 56 guineas. It was exhibited, with others of Hogarth’s pictures, at the Spring Gardens exhibition of 1761, for the catalogue of which Hogarth engraved a Head-piece and a Tail-piece which are still the delight of collectors; and finally, by the bequest of Mr. J. H. Anderson, its present home in the National Gallery, where, in spite of theatrical treatment and a repulsive theme, it still commands admiration for its colour, drawing and expression.

In 1761 Hogarth was sixty-five years of age, and he had but three years more to live. These three years were embittered by an unhappy quarrel with his quondam friends, John Wilkes and Churchill the poet, over which most of his biographers are contented to pass rapidly. Having succeeded John Thornhill in 1757 as serjeant painter (to which post he was reappointed at the accession of George III), an evil genius prompted him in 1762 to do some “timed” thing in the ministerial interest, and he accordingly published the indifferent satire of “The Times, plate 1.” This at once brought him into collision with Wilkes and Churchill, and the immediate result was a violent attack upon him, both as a man and an artist, in the opposition North Briton, No. 17. The alleged decay of his powers, the miscarriage of Sigismunda, the cobbled composition of the Analysis, were all discussed with scurrilous malignity by those who had known his domestic life and learned his weaknesses. The old artist was deeply wounded, and his health was failing. Early in the next year, however, he replied by that portrait of Wilkes which will forever carry his squinting features to posterity. Churchill retaliated in July by a savage Epistle to William Hoggart, to which the artist rejoined by a print of Churchill as a bear, in torn bands and ruffles, not the most successful of his works. “The pleasure, and pecuniary advantage,” writes Hogarth manfully, “which I derived from these two engravings” (of Wilkes and Churchill), “together with occasionally riding on horseback, restored me to as much health as can be expected at my time of life.” He produced but one more print, that of “Fins, or The Bathos,” March 1764, a strange jumble of “fag ends,” intended as a tail-piece to his collected prints; and on the 26th October of the same year he died of aneurism at his house in Leicester Square. His wife, to whom he left his plates as a chief source of income, survived him until 1789. He was buried in Chiswick churchyard, where a tomb was erected to him by his friends in 1771, with an epitaph by Garrick. Not far off, on the road
to Chiswick Gardens, still stands the little red-brick Georgian villa in which from September 1749 until his death he spent the summer seasons. After many vicissitudes and changes of ownership it was purchased in 1902 by Lieut.-Colonel Shipway of Chiswick, who turned it into a Hogarth museum and preserved it to the nation.

From such records of his as survive, Hogarth appears to have been much what from his portrait one might suppose him to have been—a blue-eyed, honest, combative little man, thoroughly insular in his prejudices and antipathies, fond of flattery, sensitive like most artists, a good friend, an instructive enemy, ambitious, as he somewhere says, in all things to be singular, and not always accurately estimating the extent of his powers. With the art connoisseurship of his day he was wholly at war, because, as he believed, it favoured foreign mediocrity at the expense of native talent; and in the heat of argument he would probably, as he admits, often come to utter blasphemous expressions against the divinity even of Raphael Urbino, Correggio and Michelangelo. But it was rather against the third-rate copies of third-rate artists—the “ship-loads of dead Christ, Holy Families and Madonnas”—that his indignation was directed; and in speaking of his attitude with regard to the great masters of art, it is well to remember his words to Mrs Piozzi:—“The connoisseurs and I are at war, you know; and because I hate them, they think I hate Titian—and let them!”

But no doubt it was in a measure owing to this hostile attitude of his towards the all-powerful picture-brokers that his contemporaries failed to recognize adequately his merits as a painter, and persisted in regarding him as an ingenious humorist alone. Time has reversed that unjust sentence. He is now held to have been a splendid painter, pure and harmonious in his colouring, wonderfully dexterous and direct in his handling, and in his composition leaving little or nothing to be desired. As an engraver his work is more conspicuous for its vigour, spirit and intelligibility than for finish and beauty of line. He desired that it should tell its own tale plainly, and bear the distinct impress of his individuality, and in this he thoroughly succeeded. As a draughtsman his skill has sometimes been debated, and his work at times undoubtedly bears marks of haste, and even carelessness. If, however, he is judged by his best instead of his worst, he will not be found wanting in this respect. But it is not after all as a draughtsman, an engraver or a painter that he claims his unique position among English artists—it is as a humorist and a satirist upon the canvas. Regarded in this light he has never been equalled, whether for his vigour of realism and dramatic power, his fancy and invention in the decoration of his story, or his merciless anatomy and exposure of folly and wickedness. If we regard him—as he loved to regard himself—as “a writer rather than an artist,” his place is with the great masters of literature,—with the Thackerays and Fielings, the Cervantes and Molières.

**Authorities.—** The main body of Hogarth literature is to be found in the autobiographical *Memoranda* published by John Ireland in 1798, and in the successive *Anecdotes of the antiquary John Nichols*. Much minute information has also been collected in F. C. Pringle’s *Catalogue of the Satirical Prints and Drawings in the British Museum*. But a copious bibliography of books, pamphlets, &c., relating to Hogarth and his collection of his paintings and prints will be found in the *Memoir of Hogarth* by Austin Dobson. First issued in 1879, this was reprinted and expanded in 1891, 1897, 1902 and finally in 1907. Pictures by Hogarth from private collections are constantly to be found at the annual exhibition of the Royal Academy, and at the annual exhibitions of Prints and Drawings at the National Portrait Gallery. At the Print Room in the British Museum there is also a very interesting set of sixteen designs for the series called *Industrious and Idle Hours,* the majority of which formerly belonged to Horace Walpole.

**HOGG, JAMES** (1770-1833). Scottish poet, known as the “Etrick Shepherd,” was baptized at Etrick in Selkirkshire on the 9th of December 1770. His ancestors had been shepherds for centuries. He received hardly any school training, and seems to have had difficulty in getting books to read. After spending his early years herding sheep for different masters, he was engaged as shepherd by Mr Laird, tenant of Blackhouse, in the parish of Yarrow, from 1790 till 1799. He was treated with great kindness, and had access to a large collection of books. When this was exhausted he subscribed to a circulating library in Peebles. While attending to his flock, he spent a great deal of time in reading. He profited by the company of his master’s son, of whom William Laird is known as the friend of Scott and the author of Lucy’s Flittin’. Hogg’s first printed piece was “The Mistakes of a Night” in the *Scots Magazine* for October 1794, and in 1801 he published his *Scottish Pastoral*. In 1802 Hogg became acquainted with Sir Walter Scott, who was then collecting materials for his *Border Minstrelsy*. On Scott’s recommendation Constable published Hogg’s miscellaneous poems (The Mountain Bard) in 1807. By this work, and by *The Shepherd’s Guide, being a Practical Treatise on the Diseases of Sheep*, Hogg realized about £300. With this money he unfortunately embarked in farming in Dumfrieshire, and in three years was utterly ruined, having to abandon all his effects to his creditors. He returned to Etrick, only to find that he could not even obtain employment as a shepherd; so he set off in February 1810 to push his fortune in Edinburgh as a literary adventurer. In the same year he published a collection of songs, *The Forest Minstrel*, to which he was the largest contributor. This book, being dedicated to the courtiers of Dalcith (afterwards duchess of Buccleuch, and recommended to her notice by Scott, was rewarded with a present of 100 guineas. He then began a weekly periodical, *The Spy*, which he continued from September 1810 till August 1811. The appearance of *The Queen’s Wake* in 1813 established Hoggs’s reputation as a poet; Byron recommended it to John Murray, who brought out an English edition. The scene of the poem is laid in 1561; the queen is Mary Stuart; and the “wake” provides a simple framework for seventeen poems sung by rival bards. It was followed by the *Pilgrims of the Sun* (1819), and *Moor of the Moor* (1816). The duchess of Buccleuch, on her death-bed (1814), had asked her husband to do something for the Etrick bard; and the duke gave him a lease for life of the farm of Altrive in Yarrow, consisting of about 70 acres of moorland, on which the poet built a house and spent the last years of his life. In order to obtain money to stock his farm Hogg asked various poets to contribute to a volume of verse which should be a kind of poetic “benefit” for himself. Failing in his applications he wrote a volume of parodies, published in 1816, as *The Poetic Mirror, or the Living Bards of Great Britain*. He took possession of his farm in 1817; but his literary exertions were never relaxed. Before 1820 he had written the prose tales of *The Brownie of Bodzech* (1818) and two volumes of *Winter Evening Tales* (1820), besides collecting, editing and writing part of two volumes of *The Jacobite Relics of Scotland* (1810–1821), and contributing largely to *Blackwood’s Magazine*. “The Chaldee MS.,” which appeared in *Blackwood’s Magazine* (October 1817), and gave such offence that it was immediately withdrawn, was largely Hogg’s work.

In 1820 he married Margaret Phillips, a lady of a good Annandale family, and found himself possessed of about £1000, a good house and a well-stocked farm. Hogg’s connexion with *Blackwood’s Magazine* kept him continually before the public; his contributions, which include the best of his prose works, were collected in the *Shepherd’s Calendar* (1829). The wit and mischief of some of his literary friends made free with his name as the “Shepherd” of the *Nobis Amorosam*, and represented him in ludicrous and grotesque aspects; but the effect of the whole was favourable to his popularity. Whatever may be the merits of the picture of the shepherd [in the *Nobis Amorosam*] and no one will denounce his poems, as noted by Professor Velich—“it is true, all the same, that this Shepherd was not the Shepherd of Etrick or the man James Hogg. He was neither a Socrates nor a Falstaff, neither to be credited..."
with the wisdom and lofty idealizations of the one, nor with the characteristic humour and coarseness of the other." The Three Perils of Woman (1820), and The Three Perils of Man (1822), were followed in 1825 by an epic poem, Queen Hynde, which was unfavourably received. He visited London in 1832, and was much lionized. On his return a public dinner was given to him in Peebles,—Professor Wilson in the chair,—and he acknowledged that he had at last "found fame." His health, however, was seriously impaired. With his pen in his hand to the last, Hogg in 1834 published a volume of Lay Sermons, and The Domestic Manners and Private Life of Walter Scott, in which Lockhart regarded as an infringement on his rights. In 1835 appeared three volumes of Tales of the Wars of Montrose.

Hogg died on the 21st of November 1835, and was buried in the churchyard of his native parish Ettrick. His fame had seemed to fill the whole district, and was brightest at its close; his presence was associated with all the border sports and festivities; and as a man James Hogg was ever frank, joyous and charitable. It is mainly as a great peasant poet that he lives in literature. Some of his lyrics and minor poems—his "Skylark," "When the Kye comes Harne," his verses on the "Comet," "Evening Star," and his "Address to Lady Ann Scott"—are exquisite. The Queen's Wake unites his characteristic excellences—his command of the old romantic ballad style, his graceful fairy mythology and his aerial flights of imagination. In the fairy story of Kilmenary in this work Hogg seems completely transformed; he is absorbed in the ideal and supernatural, and writes under direct and immediate inspiration.

See Hogg's "Memoir of the Author's Life, written by himself," prefixed to the 3rd edition (1821) of The Mountain Bard, also Memorials of James Hogg, the Ettrick Shepherd, edited by his daughter, Mrs M. G. Garden (enlarged edition with preface by Professor Veitch, 1893), and Sir G. B. S. Douglas, James Hogg (1889) in the "Famous Scots" series; Also The Memoirs of James Hogg, edited by William Wallace (1933). John Wilson ("Christopher North") had a real affection for Hogg, but for some reason or other made no use of the materials placed in his hands for a biography of the poet. The memoir mentioned on the title-page of the Works (1838-1840) never appeared, and the memoir prefixed to the edition of Hogg's works published by Blackie & Co. (1865) was written by the Rev. Thomas Thompson. See also Wilson's Notes Ambrosiastica; Mr Oliphant's Annals of a Publishing House, vol. 1. chap. vii.; Gilliman's First Gallery of Literary Portraits; Cunningham's Blog, and Crit. Hist. of Lit.; and the general index to Blackwood's Magazine. A collected edition of Hogg's Tales and Poems, issued in 10 vols., was published in 1841; his Poetical Works were published in 1822, 1838-1840 and 1865-1866. For an admirable account of the social entertainments Hogg used to give in Edinburgh, see Memoir of Robert Chambers (1874), by his wife, and The Chambers, (1876).

THOMAS JEFFERSON (1749-1826), English man of letters, was born at Norton, Durham, on the 24th of May 1792. He was educated at Durham grammar school and at University College, Oxford. Here he became the intimate friend of the poet Shelley, with whom in 1811 he was expelled from the university for refusing to disclaim connexion with the authorship of the pamphlet The Necessity for Atheism. He was then sent to study law at York, where he remained for six months. Hogg's behaviour to Harriet Shelley interrupted his relations with her husband for some time, but in 1813 the friendship was renewed in London. In 1817 Hogg was called to the bar, and became later a revising barrister. In 1844 he inherited £2000 under Shelley's will, and in 1855, in accordance with the wishes of the poet's family, began to write Shelley's biography. The first two volumes of it were published in 1858, but they proved to be far more an autobiography than a biography, and Shelley's representatives refused Hogg further access to the materials necessary for its completion. Hogg died on the 27th of August 1862.

HOGMANY, the name in Scotland and some parts of the north of England for New Year's Eve, as also for the cake then given to the children. On the morning of the 31st of December the children in small bands go from door to door singing:

"Hogmany Trolool,
Gie's o' your white bread and none o' your grey";

and begging for small gifts or alms. These usually take the form of an oat cake. The derivation of the term has been much disputed. Cotgrave (1611) says: "It is the voice of the country folks begging small presents or New Year's gifts ... an ancient term of rejoicing derived from the Druids, who were wont the first of each January to go into the woods, where, having sacrificed and banqueted together, they gathered mistletoe, esteem[ing] it excellent to make beasts fruitful and most soveraine against all poysyon." And he connects the word, through such Norman French forms as hognianu, with the old French aigulanneuf, which he explains as au gui-l'an-neuf, "to the mistletoe the New Year!"—this being (on his interpretation) the Druidical salutation to the coming year as the revellers issued from the woods armed with boughs of mistletoe. But though this explanation may be accepted as containing the truth in referring the word to a French original, Cotgrave's detailed etymology is now repudiated by scientific philologists, and the identical French aigulanneuf remains, like it, in obscurity.

HOGHEAD, a cask for holding liquor or other commodities, such as tobacco, sugar, molasses, &c.; also a liquid measure of wine, spirits, &c., equal to 115 gallons, or 183 firkins, of cider, &c., it equals 54 gallons. A statute of Richard III. (1483) fixed the hoghead of wine at 63 wine-gallons, i.e. 52 imperial gallons. The etymology of the word has been much discussed. According to Skeat, the origin is to be found in the name for a cask or liquid measure appearing in various forms in several Teutonic languages, in Dutch oksvoet (modern oksvoord), Dan. oxove, O. Swed. oxvyft, &c. The word should therefore be "oxhead," and "hoghead" is a mere corruption. It has been suggested that the name arose from the branding of such a measure with the head of an ox (see Notes and Queries, series iv. 2, 46, note by H. Tiedeman). The New English Dictionary does not contain any explanation of the term, and takes "hoghead" as the original form, from which the forms in other languages have been corrupted. The earlier Dutch forms hukeshovet and hoekshooft are nearer to the English form, and, further, the Dutch for "ox" is os.

HOHENASPERG, an ancient fortress of Germany, in the kingdom of Württemberg, 10 m. N. of Stuttgart, is situated on a conical hill, 1100 ft. high, overlooking the town of Asperg. It was formerly strongly fortified and was long the state prison of the kingdom of Württemberg. Among the many who have been interned here may be mentioned the notorious Jew financier, French aigulanneuf, which he explains as au gui-l'an-neuf, "to the mistletoe the New Year!"—this being (on his interpretation) the Druidical salutation to the coming year as the revellers issued from the woods armed with boughs of mistletoe. But though this explanation may be accepted as containing the truth in referring the word to a French original, Cotgrave's detailed etymology is now repudiated by scientific philologists, and the identical French aigulanneuf remains, like it, in obscurity.

HOGHEFREDERG, or Hohenfriedberg, a village of Silesia, about 5 m. from the small town of Striegau. It gives its name to a battle (also called the battle of Striegau) in the War of the Austrian Succession, fought on the 3rd of June 1745 between the Prussians under Frederick the Great and the Austrians and Saxons commanded by Prince Charles of Lorraine. In May the king, whose army had occupied extended winter quarters in Silesia, had drawn it together into a position about Neisse whence he could manoeuvre against the Austrians, whether they invaded Silesia by Troppau or Glatz, or joined their allies (who, under the duke of Weisenfeld, were on the upper Elbe), and made their advance on Schweidnitz, Breslau or Liegnitz. On the Austrians concentrating towards the Elbe, Frederick at once ordered his army to march along the edge of the mountain country until on the 1st of June it was near Schweidnitz. At that date the Austro-Saxons were advancing (very slowly owing to the poormess of the roads and the dilatoriness of the Saxon artillery train) from Waldenburg
Hohenfriedberg

and Landshut through the mountains, heading for Striegau. After a few minor skirmishes at the end of May, Frederick had made up his mind to offer no opposition to the passage of the Allies, but to fall upon them as they emerged, and the Prussian army was therefore kept concentrated out of sight, while only selected officers and patrols watched the debouches of the mountains. On the other hand the Allies had no intention of delivering battle, but meant only, on emerging from the mountains, to take up a suitable camping position and thence to interpose between Breslau and the king, believing that "the king was at his wits' end, and, once the army really began its retreat on Breslau, there would be frightful consternation in its ranks." But in fact, as even the coolest observers noticed, the Prussian army was in excellent spirits and eager for the "decisive affair" promised by the king. On the 3rd of June, watched by the invisible patrols, the Austrians and Saxons emerged from the hills at Hohenfriedberg with bands playing and colours flying. Their advanced guard of infantry and cavalry spread out into the plain, making for a line of hills spreading north-west from Striegau, where the army was to encamp. But the main body moved slowly, and at last Prince Charles and Weissenfels decided to put off the occupation of the line of hills till the morrow. The army bivouacked therefore in two separate wings, the Saxons (with a few Austrian regiments) between Güntersdorf and Pilgrasmühle, the Austrians near Hausdorff. They were about 70,000 strong, Frederick 65,000.

The king had made his arrangements in good time, aided by the enemy's slowness, and in the evening he issued simple orders to move. About 9 p.m. the Prussians marched off from Alt-Jauerick towards Striegau, the guns on the road, the infantry and cavalry, in long open columns of companies and squadrons, over the fields on either side—a night march well remembered by contrast with others as having been executed in perfect order. Meanwhile General Dumoulin, who commanded an advanced detachment between Striegau and Stanowitz, broke camp silently and moved into position below the hill north-west of Striegau, which was found to be occupied by Saxon light infantry outposts. The king's orders were for Dumoulin and the right wing of the main army to deploy and advance towards Halsicht against the Saxons, and for the left wing infantry to prolong the line from the marsh to Güntersdorf, covered by the left-wing cavalry on the plain near Thomaswaldau. On the side of the Austrians, the outlying hussars are said to have noticed and reported the king's movement, for the night was clear and starlit, but their report, if made, was ignored.

At 4 a.m. Dumoulin advanced on Pilgrasmühle, neglecting the fire of the Saxon outpost on the Spitzberg, whereupon this promptly retired in order to avoid being surrounded. Dumoulin then posted artillery on the slope of the hill and deployed his six grenadier battalions facing the village. The leading cavalry of the main army came up and deployed on Dumoulin's left front in open rolling ground. Meantime the duke's and Weissenfels' improvised line of defence, protected his infantry in the marshy ground and about Pilgrasmühle, and his cavalry, partly in front of Pilgrasmühle and partly on the intervening space, opposite that of the Prussians. But before the marshy ground was effectively occupied by the duke's infantry, his cavalry had been first shaken by the fire of Dumoulin's guns on the Spitzberg and a heavy battery that was brought up to the Graben Fuchseberg, and then charged by the Prussian right-wing cavalry, and in the mêlée the Allies were gradually driven in confusion off the battlefield. The cavalry battle was ended by 6.30 a.m., by which time Dumoulin's grenadiers, stiffened by the line regiment Anhalt (the "Old Dessauer's" own), were vigorously attacking the garden hedges and walls of Pilgrasmühle, and the Saxon and Austrian infantry in the marsh was being attacked by Prince Dietrich of Dessau with the right wing of the king's infantry. The line infantry of those days, however, did not work easily in bad ground, and the Saxons were steady and well drilled. After an hour's fight, well supported by the guns and continually reinforced as the rest of the army closed up, the prince expelled the enemy from the marsh, while Dumoulin drove the light troops out of Pilgrasmühle. By 7 a.m. the Saxons, forming the left wing of the allied army, were in full retreat.

While his allies were being defeated, Prince Charles of Lorraine had done nothing, believing that the cannonade was merely an outpost affair for the possession of the Spitzberg. His generals indeed had drawn out their respective commands in order of battle, the infantry south of Güntersdorf, the cavalry near Thomaswaldau, but they had no authority to advance without orders, and stood inactive, while, 1 m. away, the Prussian columns were defiling over the Striegau Water. This phase of the king's advance was the most delicate of all, and the moment that he heard from Prince Dietrich that the march was captured he stopped the northward flow of his battalions and swung them westward, the left wing cavalry having to cover their deployment. But this cavalry only had crossed at Teichau the bridge broke. For a time the advanced squadrons were in great danger. But they charged boldly, and a disjointed cavalry battle began, during which (Zieten's hussars having discovered a ford) the rest of the left-wing cavalry was able to cross. At last 25 intact squadrons under Lieut.-General von Nassau charged and drove the Austrians in disorder towards Hohenfriedberg. This action was the more creditable to the victors in that 45 squadrons in 3 separate fractions defeated a mass of 60 squadrons that stood already deployed to meet them.

Meanwhile the Prussian infantry columns of the centre and left had crossed Striegau Water and deployed to their left, and by 8.30 they were advancing on Güntersdorf and the Austrian infantry south of that place. Frederick's purpose was to roll up the enemy from their inner flank, and while Prince Dietrich, with most of the troops that had forced the Saxons out of the marsh, pursued Weissenfels, two regiments of his and one of Dumoulin's were brought over to the left wing and sent against the north side of Güntersdorf. In the course of the general forward movement, which was made in what was for those days a very irregular line, a wide gap opened up between the centre and left, behind which 10 squadrons of the Bayruth dragon regiment, with Lieut.-General von Gessler, took up their position. Thus the line advanced. The grenadiers on the extreme left cleared Thomaswaldau, and their fire gallied the Austrian squadrons engaged in the cavalry battle to the south. Then Güntersdorf, attacked on three sides, was also evacuated by the enemy. But although Frederick rode back from the front saying "the battle is won," the Prussian infantry, in spite
of its superior fire discipline, failed for some time to master the
defence, and suffered heavily from the eight close-range volleys
they received, one or two regiments losing 40 and 50 % of their
strength. The Austrians, however, suffered still more; feeling
themselves isolated in the midst of the victorious enemy, they
began to surrender, and at the palace of the Beyersnach, the
Bayreuth dragoons charged into their ranks and "broke the
equilibrium." These 1500 sabres scattered twenty battalions
of the enemy and brought in 2500 prisoners and 66 Austrian
colours, and in this astounding charge they themselves lost no
more than 94 men. By nine o'clock the battle was over, and
the wrecks of the Austro-Saxon army were retreating to the
mountains. The Prussians, who had been marching all night,
were too far spent to pursue.

The loss of the allies was in all 15,224, 7985 killed and wounded,
and 7239 prisoners, as well as 72 guns and 83 standards and colours.
The Prussians lost 4666 killed and wounded, 71 missing.

HOHENHEIM, a village of Germany, in the kingdom of
Württemberg, 7 m. S. of Stuttgart by rail. Pop. 300. It came
in 1768 from the counties of Hohenheim to the dukes of Württem-
berg, and in 1785 Duke Karl Eugen built a country house here.
This house with grounds is now the seat of the most important
agricultural college in Germany; it was founded in 1817, was
raised to the position of a high school in 1865, and now ranks
as a technical high school with university status.

See Förlich, Das Schloss und die Akademie Hohenheim (Stuttgart,
1870).

HOHENLIMBURG, a town of Germany, on the Lenne, in
the Prussian prov. of Westphalia, 30 m. by rail S.E. of Dortmum.
Pop. (1895) 11,790. It has 2 Evangelical churches, a Roman
Catholic church and a synagogue. The town is the seat of various
iron and metal industries, while dyeing, cloth-making and linen-
weaving are also carried on here. It is the chief town of the
county of Limburg, and formerly belonged to the counts of Limburg, a family which became extinct in 1508. Later it
passed to the counts of Bentheim-Tecklenburg. The castle of
Hohenlimburg, which overlooks the town, is now the residence
of Prince Adolf of Bentheim-Tecklenburg.

HOHENLOHE, a German princely family which took its name
from the district of Hohenlohe in Franconia. At first a count-
ship, its two branches were raised to the rank of principalities
of the Empire in 1744 and 1764 respectively; in 1806 they
lost their independence and their lands now form part of the
kingdoms of Bavaria and of Württemberg. At the time of the
mediatisation the area of Hohenlohe was 680 sq. m. and its
estimated population was 108,000. The family is first mentioned
in the 12th century as possessing the castle of Hohenloch, or
Hohenlohe, near Uffenheim, and its influence was soon perceptible
in several of the Franconian valleys, including those of the
Kocher, the Jagst and the Tauber. Henry I. (d. 1183) was the
first to take the title of count of Hohenlohe, and in 1250 his
grandsons, Gottfried and Conrad, supporters of the emperor
Frederick II., founded the lines of Hohenlohe-Hohenlohe and
Hohenlohe-Brauneck, names taken from their respective castles.
The latter became extinct in 1590, its lands passing later to
Brandenburg, while the former was divided into several branches,
only two of which, however, Hohenlohe-Weikersheim and
Hohenlohe-Uffenheim-Speckfeld, need be mentioned here.
Hohenlohe-Weikersheim, descended from Count Kraft I.
(d. 1313), also underwent several divisions, that which took
place after the deaths of Counts Albert and George in 1551
being specially important. At this time the lines of Hohenlohe-
Neuenstein and Hohenlohe-Waldenburg were founded by the
son of Count George. Meanwhile, in 1412, the family of
Hohenlohe-Uffenheim-Speckfeld had become extinct, and its
lands had passed through the marriages of its heiresses into
other families.

The existing branches of the Hohenlohe family are descended
from the lines of Hohenlohe-Neuenstein and Hohenlohe-Walden-
burg, established in 1551. The former of these became Pro-
testant, while the latter remained Catholic. Of the family
of Hohenlohe-Neuenstein, which underwent several partitions
and inherited Gleichen in 1631, the senior line became extinct
in 1805, while in 1701 the junior line divided itself into three
branches, those of Langenburg, Ingelfingen and Kirchberg.
Kirchberg died out in 1867, but members of the families of
Hohenlohe-Langenburg and Hohenlohe-Ingelfingen are still
alive, the latter being represented by the branches of Hohenlohe-
Ingelfingen and Hohenlohe-Ingelfingen-Neurenberg. The Roman
Catholic family of Hohenlohe-Waldenburg was soon divided into
three branches, but two of these had died out by 1729. The surviving
branch, that of Schillingsfürst, was divided into the lines of
Hohenlohe-Schillingsfürst and Hohenlohe-Bartenstein; other
divisions followed, and the four existing lines of this branch of
the family are those of Waldenburg, Schillingsfürst, Jagstberg
and Bartenstein. The family of Hohenlohe-Schillingsfürst
possesses the duchies of Rattibor and of Corbie inherited in 1824.
The principal members of the family are dealt with below.

I. FRIEDRICH LUDWIG, prince of Hohenlohe-Ingelfingen
(1797-1858), Prussia's eldest son of Prince
Johann Friedrich (d. 1796) of Hohenlohe-Ingelfingen, and began
his military career as a boy, serving against the Prussians in the
last years of the Seven Years' War. Entering the Prussian army
after the peace (1768), he was on account of his rank at once
made major, and in 1775 he became lieutenant-colonel; in 1778
he took part in the War of the Bavarian Succession and about
the same time was made a colonel. Shortly before the death
of Frederick the Great he was promoted to the rank of major-
general and appointed chief of a regiment. For some years the
prince did garrison duty at Breslau, until in 1791 he was made
governor of Berlin. In 1794 he commanded a corps in the
Prussian army on the Rhine and distinguished himself greatly
in many engagements, particularly in the battle of Kaisers-
lautern on the 20th of September. He was at this time the
most popular soldier in the Prussian army. Bücher wrote of
him that "he was a leader of whom the Prussian army might
well be proud." He succeeded his father in the principality,
and acquired additional lands by his marriage with a daughter
of Count von Hoym. In 1806 Hohenlohe, now a general of
infantry, was appointed to command the left-wing army of the
Prussian forces opposing Napoleon, having under him Prince
Louis Ferdinand of Prussia; but, feeling that his career had
been that of a prince and not that of a scientific soldier, he
allowed his quartermaster-general Massenbach to influence
him unduly. Disputes soon broke out between Hohenlohe and
the commander-in-chief, the duke of Brunswick, the armies
marched hither and thither without effective results, and finally
Hohenlohe's army was almost destroyed by Napoleon at Jena
(see NAPOLEONIC CAMPAIGNS). The prince displayed his usual
personal bravery in the battle, and managed to rally a portion
of his corps near Erfurt, whence he retired into Prussia. But
the pursuers followed him up closely, and, still acting under
Massenbach's advice, he surrendered the remnant of his army
at Prenzlau on the 28th of October, a fortnight after Jena and
three weeks after the beginning of hostilities. Hohenlohe's
former popularity and influence in the army had now the worst
possible effect, for the commandants of garrisons everywhere
lost heart and followed his example. After two years spent as
a prisoner of war in France Hohenlohe retired to his estates,
living in self-imposed obscurity until his death on the 15th
of February 1818. He had, in August 1806, just before the out-
brake of the French War, resigned the principality to his eldest
son, not being willing to become a "mediatized" ruler under
Württemberg suzerainty.

II. LUWIG ADOLF, prince of Hohenlohe-Waldenburg-
Eckingen (1765-1839), marshal and peer of France, was born
on the 18th of August 1765. In 1784 he entered the service of
the Palatinate, which he quitted in 1792 in order to take the
command of a regiment raised by his father for the service
of the emigrant princes of France. He greatly distinguished
himself under Condé in the campaigns of 1792-1793, especially
at the storming of the lines of Weissenburg. Subsequently he
took the service of Holland, and, when almost surrounded
by the army of General Pichegru, conducted a masterly retreat
from the island of Bommel. From 1794 to 1799 he served as
colonel in the Austrian campaigns; in 1799 he was named major-general by the archduke Charles; and after obtaining the rank of lieutenant-general he was appointed by the emperor governor of the two Galicias. Napoleon offered to restore to him his principality on condition that he adhered to the
federation of the Rhine, but he turned it down and joined the
Württemberg. After Napoleon's fall in 1814 he joined the
French service, and in 1815 he held the command of a regiment
raised by himself, with which he took part in the Spanish
campaign of 1823. In 1827 he was created marshal and peer of
France. He died at Lunéville on the 30th of May 1829.

III. ALEXANDER LEOPOLD FRANZ EMMicHER, prince of
Hohenlohe-Waldenburg-Schillingsfürst (1794-1849), priest
and reputed miracle-worker, was born at Kuppelzern,
Waldenburg, on the 17th of August 1794. By his mother, the
daughter of an Hungarian nobleman, he was from infancy
destined for the church; and she entrusted his early education
to the ex-Jesuit Riel. In 1804 he entered the “Theresianum”
at Vienna, in 1808 the academy at Bern, in 1810 the arch-
episcopal seminary at Vienna, and afterwards he studied at
Tyrnau and Ellwangen. He was ordained priest in 1815,
and in the following year he went to Rome, where he entered
the society of the “Fathers of the Sacred Heart.” Subsequently,
at Munich and Bamberg, he was blamed for Jesuit and ob-
serverist tendencies, but obtained considerable reputation
as a preacher. His first co-called miraculous cure was effected
in conjunction with a peasant, Martin Michel, on a princess
of Schwarzenberg who had been for some years paralytic.
Immediately he acquired such fame as a performer of miraculous
cures that multitudes from various countries flocked to partake
of the beneficial influence of his supposed supernatural gifts.
Ultimately, on account of the interference of the authorities
with his operations, he went in 1821 to Vienna and then to
Hungary, where he became canon at Grosswardein and in 1824
situated bishop. He bettered a Viennese of the Hohenlohe
on the 17th of November 1845. He was the author of a number
of ascetic and controversial writings, which were collected
and published in one edition by S. Brunner in 1851.

IV. KRAFT, prince of Hohenlohe-Ingelfingen (1827-1892),
soldier and military writer, son of Prince Adolf of Hohenlohe-
Ingelfingen (1797-1873), was born at Koschten in Upper
Silesia. He was a nephew of the Prince Hohenlohe noticed
above, who commanded the Prussians at Jena. Educated with
great rigour, owing to the impoverishment of the family
estates during the Napoleonic wars, he was sent into the Prussian
army, and commissioned to the artillery at the least expensive
arm of the service. He joined the Prussian Guard artillery in
1845, and it was soon discovered that he had unusual aptitudes
as an artillery officer. For a time his brother officers resented
the presence of a prince, until it was found that he made no
attempt to use his social position to secure advancement. After
serving as a military attaché in Vienna and on the Transylvanian
frontier during the Crimean War, he was made a captain on the
general staff, and in 1856 personal aide-de-camp to the king,
remaining, however, in close touch with the artillery. In 1864,
having become in the meanwhile successively major and lieut-
colonel, he resigned the staff appointments to become commander
of the new Guard Field Artillery regiment and in the following
year he became colonel. In 1866 he saw his first real active
service. In the bold advance of the Guard corps on the Austrian
right wing at Königgrätz (see Seven Weeks’ War), he led the
Guard reserve artillery with the greatest dash and success, and
after the short war ended he turned his energies, now fortified
by the training of his years, in the higher work of developing
the Prussian army artillery. In 1868 he was made a major-general and assigned
to command the Guard artillery brigade. In this capacity he gained great distinction during the Franco-German war and especially at Gravelotte and Sedan; he was in control of the artillery attack on the fortifications of Paris. In 1873 he was placed in command of an infantry division, and three years later was promoted lieutenant-general. He retired in 1879,
was made general of infantry in 1883 and general of artillery
in 1889. His military writings were numerous, and amongst
them several have become classics. These are Briefe über Artillerie (Eng. trans. Letters on Artillery, 1887); Briefe über Strategie (1877; Eng. trans. Letters on Strategy, 1898); and Gespräche über Reformen (1887; Eng. trans. Conversations on Reforms). The Briefe über Infanterie und Briefe über Kavallerie (translated into English, Letters on Infantry and Letters on Cavalry, 1889) are of less importance, though interesting as a reflection of prevailing German ideas. His memoirs (Aus meinem Leben) were prepared in retirement near Dresden, and the first volume (1897) created such a sensation that eight years were allowed
to elapse before the publication was continued. Prince Kraft
died near Dresden on the 16th of January 1892. (C. F. A.)

V. CILIOwIC KART VICTOR, prince of Hohenlohe-Schillings-
fürst (1859-1901), statesman, was born on the 31st of March
1859 at Schillingsfürst in Bavaria. His father, Prince Franz
Joseph (1787-1841), was a Catholic, his mother, Princess
Konstanze of Hohenlohe-Langenburg, a Protestant. In accord-
ance with the compromise customary at the time, Prince Chlodwig
and his brothers were brought up in the religion of their father,
while his sisters followed that of their mother. In spite of
the difference of creed the family was very united, and it was
to the spirit that rendered this possible that the prince owed
his liberal and tolerant point of view, which was to exercise
an important influence on his political activity. As the younger
son of a cadet line of his house it was necessary for Prince
Chlodwig to follow a profession. For a while he thought
of obtaining a commission in the British army through the in-
fluence of his aunt, Princess Feodora of Hohenlohe-Langenburg
(née princess of Leiningen), Queen Victoria's half-sister. He
decided, however, to enter the Prussian diplomatic service.
His application to be excused the preliminary steps, which
involved several years' work in subordinate positions in the
Prussian civil service, was refused by Frederick William IV.,
his great grandfather, who, in good sense, decided to sacrifice
his pride of rank and to accept the king's conditions. As auscultat
in the courts at Coblenz he acquired a taste for jurisprudence,
became a Referendar in September 1843, and after some months
of travel in France, Switzerland and Italy went to Potsdam
as a civil servant (May 13, 1844). These early years were
invaluable, not only as giving him experience of practical affairs
but as affording him an insight into the strength and weakness
of the Prussian system. The immediate result was to confirm
his Liberalism. The Prussian principle of propagating en-
lightenment with a stick "did not appeal to him; he recognized
the confusion and want of clear ideas in the highest circles,"
the tendency to make agreement with the views of the govern-
ment the test of loyalty to the state; and he noted in his
journal (June 25, 1844) four years before the revolution of
1848, "a slight cause and we shall have a rising." "The free press,"
his notes on another occasion, "is a necessity, progress the
condition of the existence of a state." If he was an ardent
advocate of German unity, and saw in Prussia the instrument
for its attainment, he was throughout opposed to the "Prussifica-
tion," as Germany, and ultimately it was he who made the
unification of Germany possible by insisting at once on the
principle of union with the North German states and at the
same time on the preservation of the individuality of the states
of the South.

On the 11th of November 1834 the landgrave Viktor Amadeus
of Hesse-Rotenburg died, leaving to his nephews, the princes
Viktor and Chlodwig Hohenlohe, his allodial estates: the duchy
of Ratibor in Silesia, the principality of Corvey in Westphalia,
the bishopric of Ardres in the Duchy of Lorraine, and the
district of Erfurt. On the death of Prince Franz Joseph on the
14th of January 1841 it was decided that the principality of
Schillingsfürst should pass to the third brother, Philipp Ernst,
as the two elder sons, Viktor and Chlodwig, were provided
for already under their uncle's will, the one with the duchy
of Ratibor, the other with Corvey and Treffurt. The youngest
son, Gustav (b. February 28, 1834), the future cardinal, was
designed for the Church. On the death of Prince Philipp Ernst
Hohenlohe

(May 3, 1845) a new arrangement was made: Prince Chlodwig became prince of Schillingsfürst, while Corvey was assigned to the duke of Ratibor; Treffurt was subsequently sold by Prince Chlodwig, who purchased with the price large estates in Posen. This involved a complete change in Prince Chlodwig's career. His new position as a "reigning" prince and hereditary member of the Bavarian Upper House was incompatible with that of a Prussian official. On the 18th of April 1846 he took his seat as a member of the Bavarian Reichsrath, and on the 26th of June received his formal discharge from the Prussian service.

Save for the interlude of 1848 the political life of Prince Hohenlohe was for the next eighteen years not eventful. During the revolutionary years his sympathies were with the Liberal idea of a united Germany, and he compromised his chances of favour from the king of Bavaria by accepting the task (November 1, 1848) of announcing to the courts of Rome, Florence and Athens the accession to office of the Archduke John of Austria as regent of Germany. But he was too shrewd an observer to hope much from a national parliament which "wasted time in idle babble," or from a democratic victory which had stunned but not destroyed the German military powers. On the 16th of Febr. 1849 he married Princess Maria of the House of Hohenlohe-Wittenstein-Berleburg, the heiress to vast estates in Russia.

This led to a prolonged visit to Werki in Lithuania (1851-1853) in connexion with the property of a visit repeated in 1860. In general this period of Hohenlohe's life was occupied in the management of his estates, in the sessions of the Bavarian Reichsrath and in travels. In 1856 he visited Rome, during which he noted the baneful influence of the Jesuits. In 1859 he was studying the political situation at Berlin, and in the same year he paid a visit to England. The marriage of his brother Konstantin in 1859 to another princess of Sayn-Wittenstein-Berleburg led also to frequent visits to Vienna. Thus Prince Hohenlohe was brought into close touch with all the most notable people in Europe. At the same time, during this period (1850-1866) he was endeavouring to get into relations with the Bavarian government, with a view to taking a more active part in affairs. Towards the German question his attitude at this time was tentative. He had little hope of a practical realization of a united Germany, and inclined towards the tripartite divisions under Austria, Prussia and Bavaria—the so-called "Trias." He attended the Fürsten-tag at Frankfort in 1863, and in the Schleswig-Holstein question was a supporter of the prince of Augustenburg. It was at this time that, at the request of Queen Victoria, he began to send her reports touching on the political condition of Germany.

Prince Hohenlohe's importance in history, however, begins with the year 1866. In his opinion the war was a blessing. It had demonstrated the insignificance of the small and middle states, "a misfortune for the dynasties"—with whose feelings a mediatized prince could scarcely be expected to be sympathetic—but the best possible good fortune for the German nation. In the Bavarian Reichsrath Hohenlohe now began to make his voice heard in favour of a closer union with Prussia; clearly, if such a union were desirable, he was the man in every way best fitted to prepare the way for it. Only of the main obstacles in the way was the temperament of King Louis II. of Bavaria, whose ideas of kingship were very remote from those of the Hohenzollerns, whose pride revolted from any concession to Prussian superiority, and who—even during the crisis of 1866—was more absorbed in operas than in affairs of state. Fortunately Richard Wagner was a politician as well as a composer, and equally fortunately Hohenlohe was a man of culture capable of appreciating "the master's" genius. It was Wagner, apparently, who persuaded the king to place Hohenlohe at the head of his government (Denkwürdigkeiten, i. 178, 211), and on the 31st of December 1866 the prince was duly appointed minister of the royal house and of foreign affairs and president of the council of ministers.

As head of the Bavarian government Hohenlohe's principal task was to discover some basis for an effective union of the South German states with the North German Confederation, and during the three critical years of his tenure of office he was, next to Bismarck, the most important statesman in Germany. He carried out the reorganization of the Bavarian army on the Prussian model, brought about the military union of the southern states, and took a leading share in the creation of the customs parliament (Zollparlament), of which on the 28th of April 1868 he was elected a viceregal representative. Dealing with the agitation that arose in connexion with the summoning of the Vatican council Hohenlohe took up an attitude of strong opposition to the ultramontane position. In common with his brothers, the duke of Ratibor and the cardinal, he believed that the policy of Pius IX.—inspired by the Jesuits (that "devil's society," as he once called it)—of setting the Church in opposition to the modern State would prove ruinous to both, and that the definition of the dogma of papal infallibility, by raising the pronouncements of the Syllabus of 1864 into articles of faith, would soon prove a separation of the Church to this policy irrevocably. This view he embodied in a circular letter to the Catholic press (April 9, 1869), drawn up by Döllinger, inviting them to exercise the right of sending ambassadors to the council and to combine to prevent the definition of the dogma. The greater powers, however, were for one reason or another unwilling to intervene, and the only practical outcome of Hohenlohe's action was that in Bavaria the powerful ultramontane party combined against him with the Bavarian "patriots" who accused him of bartering away Bavarian independence to Prussia. The combination was too strong for him; a bill which he brought in for curbing the influence of the Church over education was defeated, the elections of 1869 went against him, and in spite of the continued support of the king he was forced to resign (March 7, 1870).

Though out of office, his personal influence continued very great both at Munich and Berlin and had not a little to do with favourable terms of the treaty of the North German Confederation with Bavaria, which embodied his views, and with its acceptance by the Bavarian parliament. Elected a member of the German Reichstag, he was on the 23rd of March 1871 chosen one of its vice-presidents, and was instrumental in founding the new groups which took the name of the Liberal Imperial party (Liberale Reichspartei), the objects of which were to support the emperor, to secure its internal development on Liberal lines, and to oppose clericalism as advocated by the Catholic Centre. Like the duke of Ratibor, Hohenlohe was from the first a strenuous supporter of Bismarck's anti-papal policy, the main lines of which (prohibition of the Society of Jesus, &c.) he himself suggested. Though sympathizing with the motives of the Old Catholics, however, he realized that they were doomed to sink into a powerless sect, and did not join them, believing that the only hope for a reform of the Church lay in those who desired it remaining in her communion. In 1872 Bismarck proposed to appoint Cardinal Hohenlohe Prussian envoy at the Vatican, but his views were too much in harmony with those of his family, and the pope refused to receive him in this capacity.

In 1873 Bismarck chose Prince Hohenlohe to succeed Count Harry Arnim as ambassador in Paris, where he remained for seven years. In 1878 he attended the congress of Berlin as third German representative, and in 1880, on the death of Bernhard Ernst von Bülow (October 20), secretary of state for foreign affairs, he was called to Berlin as temporary head of the Foreign Office and representative of Bismarck during his

1 Through her mother, née Princess Stephanie Radziwill (d. 1832). Before Prince Wittgenstein's death (1889) a new law had forbidden foreigners to hold land in Russia. Prince Hohenlohe appears, however, to have sold one of his wife's estates and to have secured certain privileges from the Russian court for the rest.

2 Speech of December 30, 1870, in the Reichsrath. Denkwürdigkeiten, ii. 36.

3 He wished to leave the Church because of all the scandalous occurrences in the Catholic Church, I should have had to secede while studying Church history; op. cit. ii. 92.

4 Prof. Johann Friedrich (q.v.), afterwards one of the Old Catholic leaders, was his secretary at the time of the Vatican council, and supplied historical and theological material to the opposition bishops.
HOHENSTAUFEN—HOHENZOLLERN

absence through illness. In 1885 he was chosen to succeed Manteuffel as governor of Alsace-Lorraine. In this capacity he had to carry out the coercive measures introduced by the chancellor in 1887-1888, though he largely disapproved of them; his conciliatory disposition, however, did much to reconcile the Alsace-Lorrainers to German rule. He remained at Strassburg till October 1894, when, at the urgent request of the emperor, he consented, in spite of his advanced years, to accept the chancellorship in succession to Caprivi. The events of his chancellorship belong to the general history of Germany (q.v.); as regards the inner history of this time the editor of his memoirs has properly suppressed the greater part of the detailed comments which the prince left behind him. In general, during his term of office, the personality of the chancellor was less conspicuous in public affairs than in the case of either of his predecessors. His appearances in the Prussian and German parliaments were rare, and great independence was left to the secretaries of state. What influence the tact and experience of Hohenlohe exercised behind the scenes on the masterful will and impulsive character of the emperor cannot as yet be generally known.

Prince Hohenlohe resigned the chancellorship on the 17th of October 1900, and died at Ragaz on the 6th of July 1901. On the 16th of February 1897 he had celebrated his golden wedding; on the 21st of December of the same year the princess died. There were six children of the marriage: Elizabeth (b. 1847); Stephanie (b. 1851); Philipp Ernst, reigning prince of Hohenlohe-Schillingsfürst (b. 1853), who married Princess Charlotta Ypsilanti; Albert (1857-1960); Moritz and Alexander, twins (b. 1862).

All other authorities for the life of Prince Hohenlohe have been superseded by the _Denkwürdigkeiten_ (2 vols., Stuttgart and Leipzig, 1906). With the exception noted above these are singularly full and spoken, the latter quality causing no little scandal in Germany; and bringing down on Prince Alexander, who was responsible for their publication, the disfavour of the emperor. They form not only the record of a singularly full and varied life, but are invaluable to the historian for the wealth of material they contain and for appreciations of men and events by an observer who had the best opportunities for forming a judgment. The prince himself they reveal not only as a man of affairs, though falling short of greatness, but as a personality of singular charm, tenacious of his principles, tolerant, a broad-minded, and possessed of a large measure of the saving grace of humour.

Charles Albert, A. F. Fischer, _Geschichte des Hauses Hohenlohe_ (1866-1871); K. Weller, _Hohenloheholisches Urkundenbuch_, 1553-1559 (Stuttgart, 1890-1901); and _Geschichte des Hauses Hohenlohe_ (Stuttgart, 1904). (W. A. F.; C. F. A.)

HOHENSTAUFEN, the name of a village and ruined castle near Lorsch in Swabia, which belonged to the kingdom of Württemberg, which in 1248 received the name to a celebrated Swabian family of which were emperors or German kings from 1138 to 1208, and again from 1214 to 1254. The earliest known ancestor was Frederick, count of Büren (d. 1094), whose son Frederick built a castle at Staufen, or Hohenstaufen, and called himself by this name. He was a firm supporter of the emperor Henry IV., who rewarded his fidelity by granting him the dukedom of Swabia in 1179, and giving him his daughter Agnes in marriage. In 1181 he remained in Germany as Henry's representative, and possessed a considerable part of the electorate lasting twenty years. In 1105 Frederick was succeeded by his son Frederick II., called the One-eyed, who, together with his brother Conrad, afterwards the German king Conrad III., held south-west Germany for their uncle the emperor Henry V. Frederick inherited the estates of Henry V. in 1125, but failed to secure the throne, and took up an attitude of hostility towards the new emperor, Lothair the Saxon, who claimed some of the estates of the late emperor as crown property. A war broke out and ended in the complete submission of Frederick at Bamberg. He retained, however, his secular and estates. In 1258 Conrad of Hohenstaufen was elected German king, and was succeeded in 1259, not by his but by his nephew Frederick Barbarossa, son of his brother Frederick (d. 1147). Conrad's son Frederick inherited the duchy of Franconia which his father had received in 1115, and this was retained by the Hohenstaufen until the death of Duke Conrad II. in 1196. In 1152 Frederick received the duchy of Swabia from his cousin the German king Frederick I., and on his death in 1167 it passed successively to Frederick's three sons Frederick, Conrad and Philip. The second Hohenstaufen emperor was Frederick Barbarossa, son of Henry VI., after whose death a struggle for the throne took place between Henry's brother Philip, duke of Swabia, and Otto of Brunswick, afterwards the emperor Otto IV. Regained for the Hohenstaufen by Henry's son, Frederick II., in 1214, the German kingdom passed to his son, Conrad IV., and when Conrad's son Conradin was beheaded in Italy in 1268, the male line of the Hohenstaufen became extinct. Daughters of Philip of Swabia married Ferdinand III., king of Castle and Leon, and Henry II., duke of Brabant, and a daughter of Conrad, brother of the emperor Frederick I., married into the family of Guelph. The castle of Hohenstaufen was destroyed in the 16th century during the Peasants' War, and only a few fragments now remain.

HOHENSTEIN, Hohenstein-Ernstthal, a town of Germany, in the kingdom of Saxony, on the slopes of the Erzgebirge, and on the railway Reichenbach-Chemnitz, 12 m. N.E. of Zwicker, Pop. (1905) 13,901. Hohenstein possesses two fine Evangelical churches, a town hall, restored in 1876, and several monuments to famous men. The principal industries are the spinning and weaving of cotton, the manufacture of machines, stockings, gloves and woolen and silk fabrics, cotton printing and dyeing. Many of the inhabitants are also employed in the neighbouring copper and arsenic mines. Not far from Hohenstein there is a mineral spring, connected with which there are various kinds of baths. Hohenstein is the birthplace of the physicist G. H. von Schubert and of C. G. Schröter (1699-1783), one of the inventors of the pianoforte. Hohenstein consists of two towns, Hohenstein and Ernstthal, which were united in 1868.

Another place of the same name is a town in East Prussia. Pop. (1900) 2467. This Hohenstein, which was founded by the Teutonic Order in 1359, has a Roman Catholic and an Evangelical church, a synagogue and several educational establishments.

HOHENZOLLERN, the name of a castle which stood on the hill of Zollern about 5 miles N.W. of Hechingen, and gave its name to the family to which the present German emperor belongs. A vague tradition connects the house with the Colonna family of Rome, or the Colalto family of Lombardy; but one more definite unites the Hohenzollerns with the Burkhardings, who were counts in Racia during the early part of the 10th century, and two of whom became dukes of Swabia. Tassilo, a member of this family, is said to have built a castle at Zollern early in the 9th century; but the first historical mention of the name is in the _Chronicon_ of a certain Berthold, who refers to Burkhard and Wezil, or Wezel, and Zollern, or Zolrin. These men appear to have been counts of Zollern, and to have met their death in 1061. The family of Wezil died out in 1104, and the existing branches of the Hohenzollerns are descended from Burkhard and his son Frederick, whose eldest son, Frederick II., was in great favour with the German kings, Lothair the Saxon and Conrad III. Frederick II. died about 1145, and his son and successor, Frederick III., was a constant supporter of the Hohenstaufen. This count married Sophia, daughter and heiress of Conrad, burgrave of Nuremberg, and about 1192 he succeeded his father-in-law as burgrave, obtaining also some lands in Austria and Franconia. He died about 1200, and his sons, Conrad and Frederick, ruled their lands in common until 1227, when an important division took place. Conrad became burgrave of Nuremberg, and, receiving the lands which
had come into the family through his mother, founded the Franconian branch of the family, which became the more important of the two; while Frederick, receiving the county of Zollern and the older possessions of the family, was the ancestor of the Swabian branch.

Early in the 14th century Burkhart, a younger son of Frederick I., secured the county of Hohenberg, and this district remained in the possession of the Hohenzollerns until the death of Count Sigismund in 1386. Its rulers, however, with the exception of Count Albert II. (d. 1398), played an unimportant part in German history. Albert, who was a Minnesinger, was loyal to the declining fortunes of the Hohenstaufen, and afterwards supported his brother-in-law, Rudolph of Habsburg, in his efforts to obtain the German throne. He shared in the campaigns of Rudolph and fell in battle in 1298, during the struggle between Adolph of Nassau and Albert of Habsburg (afterwards King Albert I.). When this family became extinct in 1486 Hohenberg passed to the Habsburgs.

The Franconian branch of the Hohenzollerns was represented in 1227 by Conrad, burggrave of Nuremberg, whom the emperor Frederick II. appointed guardian of his son Henry, and administrator of Austria. After a short apostasy, during which he supported Henry Raspe, landgrave of Thuringia, Conrad returned to the side of the Hohenstaufen and aided Conrad IV. He died in 1261, when his son and successor, the burggrave Frederick III., had already obtained Bayreuth through his marriage with Elizabeth, daughter of Otto of Meran (d. 1254). Frederick took a leading part in German affairs, and it is interesting to note that he had a considerable share in securing the election of his uncle, Rudolph of Habsburg, as German king in 1273. He died in 1297 and was succeeded by his son, Frederick IV. This burggrave fought for King Albert I. in Thuringia, and supported Henry VII. in his efforts to secure Bohemia for his son John; but in 1314, forsaking his father's policy, he favoured Louis, afterwards the emperor Louis IV., in his struggle with Frederick, duke of Austria, and by his conduct at the battle of Mühlklopf in 1322 and elsewhere earned the designation of "saviour of the empire." Frederick, however, did not neglect his hereditary lands. He did something for the maintenance of peace and the security of traders, gave corporate privileges to villages, and took the Jews under his protection. His services to Louis were rewarded in various ways, and, using part of his wealth to increase the area of his possessions, he bought the town and district of Ansbach in 1331. Dying in 1332, Frederick was succeeded by his son, John II., who, after one of his brothers had died and two others had entered the church, ruled his lands in common with his brother Albert. About 1338 John bought Culmbach and Plassenburg, and on the strength of a privilege granted to him in 1347 he seized many robber-fortresses and held the surrounding lands as imperial fiefs. In general he continued his father's policy, and when he died in 1357 was succeeded by his son, Frederick V., who, after the death of his uncle Albert in 1361, became sole ruler of Nuremberg, Ansbach and Bayreuth. Frederick lived in close friendship with the emperor Charles IV., who formally invested him with Ansbach and Bayreuth and made him a prince of the empire in 1363. In spite of the troubled times in which he lived, Frederick was a successful ruler, and introduced a regular system of public finance into his lands. In 1397 he divided his territories between his sons John and Frederick, and died in the following year. His elder son, John III., who had married Margaret, a daughter of the emperor Charles IV., was frequently in the company of his brothers-in-law, the German kings Wenceslaus and Casimir. He died without sons in 1420.

Since 1397 the office of burggrave of Nuremberg had been held by John's brother, Frederick, who in 1415 received Brandenburg from King Sigismund, and became marquess of Brandenburg as Frederick I. (q.v.). On his brother's death in 1420 he reunited the lands of his branch of the family, but in 1427 he sold his rights as burggrave to the town of Nuremberg. The subsequent history of this branch of the Hohenzollerns is identified with that of Brandenburg from 1415 to 1701, and with that of Prussia since the latter date, as in this year the elector Frederick III. became king of Prussia. In 1871 William, the seventh king, took the title of German emperor. While the electorate of Brandenburg passed according to the rule of primogeniture, the Franconian possessions of the Hohenzollerns, Ansbach and Bayreuth, were given as appanages to younger sons, an arrangement which was confirmed by the dispositio Aquilina.

These principalities were ruled by the sons and descendants of the elector Albert Achilles from 1486 to 1633; and, after reverting to the elector of Brandenburg, by the descendants of the elector John George from 1633 to 1791. In 1791 Prince Charles Alexander (d. 1806), who had inherited both districts, sold his lands to Prussia.

The influence of the Swabian branch of the Hohenzollerns was weakened by several partitions of its lands; but early in the 16th century it rose to some eminence through Count Eitel Frederick II. (d. 1512), a friend and adviser of the emperor Maximilian I. Eitel received from this emperor the districts of Haimburg and Lengersheim, and in 1534 his grandson Charles (d. 1576) was granted the counties of Sigmaringen and Vohringen by the emperor Charles V. In 1576 the sons of Charles divided their lands, and founded three branches of the family, one of which is still flourishing. Eitel Frederick IV. took Hohenzollern with the title of Hohenzollern-Hechingen; Charles II. Sigmaringen and Vohringen and the title of Hohenzollern-Sigmaringen; and Christopher took Haigerloch. Christopher's family died out in 1634, but the remaining lines are of some importance. Count John George of Hohenzollern-Hechingen was made a peer of the Holy Roman Empire in 1622, and was given the title of Count of Hohenzollern-Hechingen. In 1695 his grandson John George (d. 1707) was created a Prince of Hohenzollern. In 1706 Charles of Haimburg and Vohringen was made a Prince of Hohenzollern. These and the other princely titles were confirmed by the Electors of Brandenburg and the Lords of the Holy Roman Empire. In 1709 Prince Charles Alexander (d. 1806), who had inherited both districts, sold his lands to Prussia.

The influence of the Swabian branch of the family entered conjointly into an agreement with Brandenburg, which provided that, in case of the extinction of either of the Swabian branches, the remaining branch should inherit its lands; and if both branches became extinct the principalities should revert to Brandenburg. During the 17th and 18th centuries and during the period of the Napoleonic wars the history of these lands was very similar to that of the other small estates of Germany. In consequence of the political troubles of 1848 Princes Frederick William of Hohenzollern-Hechingen and Charles Anton of Hohenzollern-Sigmaringen resigned their principalities, and accordingly these titles fell to the king of Prussia, who took possession on the 12th of March 1850. By a royal decree of the 20th of May following the title of "highness," with the prerogatives of younger sons of the royal house, was conferred on the two princes. The proposal to raise Prince Leopold of Hohenzollern-Sigmaringen (1835-1903) to the Spanish throne in 1870 was the immediate cause of the war between France and Germany. In 1908 the head of this branch of the Hohenzollerns, the only one existing besides the imperial house, was Leopold's son William (b. 1864), who, owing to the extinction of the family of Hohenzollern-Hechingen in 1869, was called simply prince of Hohenzollern. In 1866 Prince Charles of Hohenzollern-Sigmaringen was chosen prince of Rumania, becoming king in 1881.

The modern Prussian province of Hohenzollern is a long, narrow strip of territory bounded on the S.W. by Baden and in other directions by Württemberg. It was divided into two principalities, Hohenzollern-Sigmaringen and Hohenzollern-Hechingen, until 1850, when these were united. They now form the government of Sigmaringen (q.v.).

The castle of Hohenzollern was destroyed in 1423, but it has been restored several times. Some remains of the old building may still be seen adjoining the present castle, which was built by King Frederick William IV.

HOKKAIDO—HOLBEIN

HOKKAIDO, the native name for the northern division of the empire (Hoku = north; kai = sea; and do = road), including Yezo, the Kuriles and their adjacent islands.

HOKUSA (1760–1849), the greatest of all the Japanese painters of the Popular School (Ukiyo-ye), was born at Yedo (Tokyo) in the 4th month of the 10th year of the period Horeki, i.e. October-November 1760. He came of an artisan family, his father having been a mirror-maker, Nakajima Issai. After some practice as a wood-engraver in 1776, at the age of eighteen, entered the studio of Katsugawa Shûshû, a painter and designer of colour-prints of considerable importance. His disregard for the artistic principles of his master caused his expulsion in 1785; and thereafter—although from time to time Hokusai studied various styles, including especially that of Shiba Gokan, from whom he gained some fragmentary knowledge of European methods—he kept his personal independence. For a time he lived in extreme poverty, and, although he must have gained sums for his work which might have secured him comfort, he humbly and modestly described himself as a peasant. He illustrated large numbers of books, of which the world-famous Mangue, a pictorial encyclopaedia of Japanese life, appeared, in fifteen volumes from 1812 to 1875. Of his colour-prints the “Thirty-six Views of Mount Fuji” (the whole set consisting of forty-six prints) were made between 1823 and 1830; “Views of Famous Bridges” (11), “Waterfalls” (6), and “Views of the Lu-chu Islands” (8), are the best known of those issued in series; but Hokusai also designed some superb broadsheets published separately, and his varimento (small prints made for special occasions and ceremonies) are unequalled for delicacy and beauty. The “Hundred Views of Mount Fuji” (1834–1835), 3 vols., in monochrome, are of extraordinary originality and variety. As a painter and draughtsman Hokusai is not held by Japanese critics to be of the first rank, but this verdict has never been accepted by Europeans, who place him among the greatest artists of the world. He possessed great powers of observation and characterization, a singular technical skill, an unfailing gift of humour, and unerring industry. He was an eager student to the end of his long life, and on his death-bed said, “If Heaven had lent me but five years more, I should have become a great painter.” He died on the 20th of May 1849.

HOLBEIN, PAUL HEINRICH DIETRICH, BARON d' (1723–1759), French philosopher and man of letters, of German origin, was born at Heidelberg in the Palatinat in 1723. Of his family little is known; according to J. J. Rousseau his father was a rich parvenu, who brought his son at an early age to Paris, where the latter spent most of his life. Much of Holbach's fame is due to his intimate connexion with the brilliant coterie of bold thinkers and polished wits whose creed, the new philosophy, is concentrated in the famous Encyclopédie. Possessed of easy manners and being of hospitable disposition, he kept open house for Helvétius, D'Alambert, Diderot, Condillac, Turgot, Buffon, Grimm, Hume, Garrick, Wilkes, Sterne, and for a time J. J. Rousseau, guests who, while enjoying the intellectual pleasure of their host's conversation, were not insensible to his excellent cuisine and costly wines. For the Encyclopédie he compiled and translated a large number of articles on chemistry and mineralogy, chiefly from German sources. He attracted more attention, however, in the department of philosophy. In 1797 Christianisme révélé appeared in which he attacked Christianity and religion as the source of all human evils. This was followed by a series of works, and in 1797 by a still more open attack in his most famous book, Le Système de la nature, in which it is probable he was assisted by Diderot. Denying the existence of a deity, and refusing to admit as evidence all a priori arguments, Holbach saw in the universe nothing save matter in spontaneous movement. What men call their souls become extinct when the body dies. Happiness is the end of mankind. "It would be useless and almost unjust to insist upon a man's being virtuous if he cannot be so without being unhappy. So long as vice renders him happy, he should love vice." The constraints of religion were to be replaced by an education developing an enlightened self-interest. The study of science was to bring human self-interest into line with their natural surroundings. Not less direct and trenchant are his attacks on political government, which is attacked by the light of after events, sound like the first distant murmurings of revolution. Holbach exposed the logical consequences of the theories of the Encyclopaedists. Voltaire hastily seized his pen to refute the philosophy of the Système in the article "Dieu" in his Dictionnaire philosophique, while Frederick the Great also drew up an answer to it. Though vigorous in thought and in some passages clear and eloquent, the style of the Système is diffuse and declamatory, and asserts rather than proves its statements. Its principles are summed up in a more popular form in Bon Sens, ou idées naturelles reformées aux idées anciennes et modernes (1780). In the Système social (1773), the Politique naturelle (1772–1774), and the Morale universelle (1776) Holbach attempts to rear a system of morality in place of the one he had so fiercely attacked, but these later writings had not a tithe of the popularity and influence of his earlier work. He published his books either anonymously or under borrowed names, and was forced to have them printed out of France. The uprightness and sincerity of his character won the friendship of many to whom his philosophy was repugnant. J. J. Rousseau is supposed to have drawn his portrait in the virtuous atheist Wolff, of the Nouvelle Héloïse. He died on the 21st of January 1789.

Holbach is also the author of the following and other works: Esprit du clergé (1767); De l'imposture sacerdotale (1767); Prêtres démasqués (1768); Examen critique de la vie et des ouvrages de St Paul (1770); Histoire critique de Jésus-Christ (1770), and Etho- cratie (1776). For further particulars as to his life and doctrines see Grimm's Correspondance littéraire, &c. (1813); Rousseau's Confessions; Morellet's Mémôtres (1821); Madame de Genlis, Les Dîners du Baron Holbach; Madame d'Épinay's Mémôtres; Averic-Lavigne, Diderot et la société du Baron d'Holbach (1875), and Morley's Diderot (1878).

HOLBEACH, a market town in the Holland or Spalding parliamentary division of Lincolnshire, England, on the Midland and Great Northern joint railway, 23½ m. N.E. of Peterborough. Pop. of urban district (1901), 4755. All Saints' Church, with a lofty spire, is a fine specimen of late Decorated work. The grammar school, founded in 1666, occupies a building erected in 1877. Other public buildings are the assembly rooms and a market house. Roman and Saxon remains have been found, and the market dates from the 13th century.

HOLBEIN, HANS, the elder (c. 1460–1524), belonged to a celebrated family of painters in practice at Augsburg and Basel from the close of the 15th to the middle of the 16th century. Though closely connected with Venice by her commercial relations, and geographically nearer to Italy than to Flanders, Augsburg at the time of Maximilian cultivated art after the fashion of the Flemings, and felt the influence of the schools of Bruges and Brussels, which had branches at Cologne and in many cities about the headwaters of the Rhine. It was not till after the opening of the 16th century, and between that and the era of the Reformation, that Italian example mitigated to some extent the asperity of South German painting. Flemish and German art was first tempered with Italian elements at Augsburg by Hans Holbein the elder. Hans first appears at Augsburg as partner to his brother Sigismund, who survived him and died in 1540 at Berne. Sigismund is described as a painter, but his works have not come down to us. Hans had the lead of the painting at Augsburg, and signed all the pictures which it produced. In common with Heren, Schongauer, and other masters of South Germany, he first cultivated a style...
akin to that of Memlinc and other followers of the schools of Brussels and Bruges, but he probably modified the systems of those schools by studying the works of the masters of Cologne. As these early impressions waned, they were replaced by others less favourable to the expansion of the master's fame; and as his custom increased between 1490 and 1506, we find him relying less upon the teaching of the schools than upon a mere observation and reproduction of the quaintnesses of local passion plays. Most of his early works indeed are taken from the Passion, and in these he obviously marshall'd his figures with the shallow stage effect of the plays, copying their artificial system of grouping careless to some extent of proportion in the human, by the want of any but the coarser forms of expression, and technically satisfied with the simplest methods of execution. If in any branch of his art he can be said to have had a conscience at this period, we should say that he showed it in his portrait drawings. It is seldom that we find a painter likeness worthy of the name. The drawings of which numbers are still preserved in the galleries of Basel, Berlin and Copenhagen show extraordinary quickness and delicacy of hand, and a wonderful facility for seizing character; and this happily is one of the features which Holbein bequeathed to his more famous son, Hans the younger. It is between 1512 and 1513 that Holbein the elder, the German quality of his style with some North Italian elements. A pure taste and more pleasing realism mark his work, which in drapery, dress and tone is as much more agreeable to the eye as in respect of modelling and finish it is smoother and more carefully rounded. Costume, architecture, ornament and colour are applied with some knowledge of the higher canons of art. Here, too, advantage accrued to Hans the younger, whose independent career about this time began.

The date of the elder Holbein's birth is unknown. But his name appears in the books of the tax-gatherers of Augsburg in 1494, suggesting that of Michael Holbein, who is supposed to have been his father. Previous to that date, and as early as 1493, he was a painter of name, and he executed in that year, it is said, for the abbey at Weingarten, the wings of an altarpiece representing Joachim's Offering, the Nativity of the Virgin, Mary's Presentation in the Temple, and the Presentation of Christ, which now hang in separate panels in the cathedral of Augsburg. In these pieces and others of the same period, for instance in two Madonnas in the Moritz chapel and castle of Nuremberg, we mark the clear impress of the schools of Van der Weyden and Memlinc; whilst in later works, such as the Basilica of St Paul (1504) in the gallery of Augsburg, the wane of Flemish influence is apparent. But this altarpiece, with its quaint illustrations of St Paul's life and martyrdom, is not alone of interest because its execution is characteristic of old Holbein. It is equally so because it contains portraits of the master himself, accompanied by his two sons, the painters Ambroise (c. 1494–c. 1519) and Hans the younger. Former pictures, such as the Passion series in the Fürstenberg gallery at Donaueschingen, or the Martyrdom of St Sebastian in the Munich Pinakothek, contain similar portraits, the original drawings of which are found in old Holbein's sketch-book at Berlin, or in stray leaves like those possessed by the duke of Aumale in Paris. Not one of those tells us anything about the character, or a reflex of the features, of the members of this celebrated family. Old Holbein seems to ape Leonardo, allowing his hair and beard to grow wildly, except on the upper lip. Hans the younger is a plain-looking boy. But his father points to him with his finger, and hints that though but a child he is clearly a prodigy.

After 1516 Hans Holbein the elder appears as a default in the registers of the tax-gatherers at Augsburg; but he willingly accepts commissions abroad. At Issenheim in Alsace, where Grünewald was employed in 1516, old Holbein also finds patrons, and contracts to complete an altarpiece. But misfortune or a hellish pursuit of him; and he had assembled and bequeathed the fortune and tools. According to Sandrart, he wanders to Basel and takes the freedom of its gild. His brother Sigismund and others are found suing him for debt before the courts of Augsburg. Where he lived when he executed the altarpiece, of which two wings with the date of 1522 are in the gallery of Carlsruhe, is uncertain; where he died two years later is unknown. He slinks, from ken at the close of a long life, and disappears at last heeded by none but his own son, who claims his brushes and paints from the monks of Einsenheim without much chance of obtaining them. His name is struck off the books of the Augsburg guild in 1524.

The elder Holbein was a prolific artist, who left many pictures behind him. Earlier than the Basilica of St Paul, already mentioned, is the Basilica of St Mary Magdalen, and a Passion in eleven pieces, in the Augsburg gallery, both executed in 1499. Another Passion, with the root of Jesse and a tree of the Dominicans, is that preserved in the church of St Paul at Saalfeld, a very fine work, painted in Frankfurt. It was executed in 1501. The Passion of Donaueschingen was finished about 1502, in which year was completed the Passion of Kaisheim, a conglomerate of twenty-seven panels, now divided amongst the galleries of Munich, Nuremberg, Augsburg and Schleissheim. An altarpiece of the same class, commissioned for the monastery of St Moritz at Augsburg in 1504–1508, has been dispersed and lost. 1512 is the date of a Conception in the Augsburg gallery, long assigned, in consequence of a forged inscription, to Hans Holbein the younger. A diptych, with a Virgin and Child, and a portrait of an old man, dated 1513, came in separate parts into the collections of Mr Posony and Count Lancekoronski at Vienna. The sketch-books of Hans Holbein, the elder, in the Augsburg gallery, are of the finest forms and dress of Augsburg residents at the beginning of the 16th century. They comprise portraits of the emperor Maximilian, the futurities of Emil V. K., Augustus I. and Maximilian, the Fuggers, friars, merchants, and at rare intervals ladies.

See also the biography by Stödtner (Berlin, 1896).

**HOLBEIN, HANS, the younger (1497–1543), German painter, favourite son of Hans Holbein the elder, was probably born at Augsburg about the year 1497. Though Sandrart and Van Mander declare that they do not know who gave him the first lessons, he doubtless received an artist's education from his father. About 1515 he left Augsburg with Ambroise, his elder brother, to seek employment as an illustrator of books at Basel. His first patron is said to have been Erasmus, for whom, shortly after his arrival, he illustrated with pen-and-ink sketches an edition of the *Encomium Moriae*, now in the museum of Basel. But his chief occupation was that of drawing title-page-blocks and initials for new editions of the Bible and classics issued from the presses of Froben and other publishers. His leisure hours, it is supposed, were devoted to the production of rough painter's work, a schoolmaster's sign in the Basel collection, a table with pictures of St Nobody in the library of the university at Zurich. In contrast with these coarse productions, the portraits of Jacob Meyer, the wife of the Basel goldsmith, and portraits of young monks to have been finished in 1516, are miracles of workmanship. It has always seemed difficult indeed to ascribe such excellent creations to Holbein's nineteenth year; and it is hardly credible that he should have been asked to do things of this kind so early, especially when it is remembered that neither he nor his brother Ambroise were then allowed to matriculate in the guild of Basel. Not till 1517 did Ambroise, whose life otherwise remains obscure, join that corporation; Hans, not overburdened with practice, wandered into Switzerland, where (1517) he was employed to paint in the house of Jacob Hertenstein at Lucerne. In 1518 Holbein reappeared in Switzerland, where the matriculation of his name does not lead us to think he was married. Whether, previous to this time, he took advantage of his vicinity to the Italian border to cross the Alps is uncertain. Van Mander says that he never was in Italy; yet the large wall-paintings which he executed after 1540 at Basel, and the series of his sketches and pictures which is still extant, might lead to the belief that Van Mander was misinformed. The spirit of Holbein's compositions for the Basel town hall, the scenery and architecture of his numerous drawings, and the cast of form in some of his imaginative portraits, make it more likely that he should have felt the direct influence of North Germans and of Rubens. He has taken Italian elements from imported works or prints. The Swiss at this period wandered in thousands to swell the ranks of the French or imperial armies fighting on Italian soil, and the road they took may have been followed by Hans on a more peaceful mission. He shows himself at all events familiar with Italian examples.
HOLBEIN

at various periods of his career; and if we accept as early works the "Flagellation," and the "Last Supper" at Basel, coarsely as they are, they show some acquaintance with Lombard methods of painting, whilst in other pieces, such as the series of the Passion in oil in the same collection, the modes of Hans Holbein the elder are agreeably combined with them. A more modern, it may be said Italian, polish. Again, looking at the "Virgin" and "Man of Sorrow" in the Basel museum, we shall be struck by a searching metallic style akin to that of the Ferrarese; and the "Lais" or the "Venus and Amor" of the same collection reminds us of the Leonardesque of the school of Milan. When Holbein settled down to an extensive practice at Basel in 1510, he decorated the walls of the house "Zum Tanz" with simulated architectural features of a florid character after the fashion of the Venetian. Among his wall paintings in the town-hall, if we can truly judge of them by copies, reveal an artist not unfamiliar with North Italian composition, distribution, action, gesture and expression. In his drawings too, particularly in a set representing the Passion at Basel, the arrangement, and also the perspective, form and decorative ornament, are in the spirit of the school of Mantegna. Contemporary with these, however, and almost inexplicably in contrast with them as regards handling, are portrait-drawings such as the likenesses of Jacob Meyer, and his wife, which are found with uniformity, and with a power and an accuracy of hand seldom rivaled in any school. Curiously enough, the same contrast may be observed between painted compositions and painted portraits. The "Bonifacius Aemacher" of 1510 at Basel is acknowledged to be one of the most complete examples of smooth and transparent handling that Holbein ever executed. His versatility at this period is shown by a dead Christ (1521), a corpse in profile on a dissecting table, and a set of figures in couples; the "Madonna and St. Fantulus," and "Kaiser Henry with the Empress Kunigunde" (1521), originally composed for the organ loft of the Basel cathedral, now in the Basel museum. Equally remarkable, but more attractive, though injured, is the "Virgin and Child between St. Ursus and St. Nicholas" (not St. Martin) giving alms to a beggar, in the gallery of Solothurn. This remarkable picture is dated 1522, and seems to have been ordered for an altar in the minister of St. Ursus of Solothurn by Nicholas Conrad, a captain and statesman of the 16th century, whose family allowed the precious heirloom to fall into decay in a chapel of the neighboring village of Grenchen. Numerous drawings, some of them receiving his personal signature in this period in his career, may have led Holbein's contemporaries to believe that he would make his mark in the annals of Basel as a model for painters of altarpieces as well as a model for pictorial composition and portrait. The promise which he gave at this time was immense. He was gaining a freedom in draughtsmanship that gave him facility to deal with any subject. Though a realist, he was sensible of the dignity and severity of religious painting. His colour had almost all the richness and sweetness of the Venetians. But he had fallen on evil times, as the next few years undoubtedly showed. Amongst the portraits which he executed in these years are those of Froben, the publisher, known only by copies at Basel and Hampton Court, and Erasmus, who sat in 1523, as he likewise did in 1530, in various positions, showing his face threequarters as at Longford, Basel, Turin, Parma, the Hague and Vienna, and in profile as in the Louvre or at Hampton Court. Besides these, Holbein made designs for glass windows, and for woodcuts, including subjects of every sort, from the Virgin and Child with saints of the old time to the Dance of Death, from gospel incidents extracted from Luther's Bible to satirical pieces illustrating the sale of indulgences and other abuses denounced by Reformers. Holbein, in this way, was carried irresistibly with the stream of the Reformation, in which, it must now be admitted, the old traditions of religious painting were wrenched, leaving nothing behind but pictorial elements which Cranach and his school vainerly used for pictorial purposes. 

Notably, after 1526, and after he had produced the "Lais" and "Venus and Amor," did Holbein with impartial spirit give his services and pencil to the Roman Catholic cause. The burgo-

master Meyer, whose patronage he had already enjoyed, now asked him to represent himself and his wives and children in prayer before the Virgin; and Holbein produced the celebrated altarpiece now in the palace of Prince William of Hesse at Darmstadt, the shape and composition of which are known to all the world by its copy in the Dresden museum. The drawings for this masterpiece are amongst the most precious relics in the museum of Basel. The time now came when art began to suffer from unavoidable depression in all countries north of the Alps. Holbein, at Basel, was reduced to accept the smallest commissions—ever for scutcheons. Then he saw that his chances were dwindling to nothing, and taking a bold resolution, armed with letters of introduction from Erasmus to More, he crossed the Channel to England, where in the one-sided branch of portrait painting he found a ready and generous patron, the family of the gallery of Basel, and numerous copies of a picture from it prove how popular the lost original must once have been. At the same period were executed the portraits of Warham (Lambeth and Louvre), Wyatt (Louvre), Sir Henry Guildford and his wife (Windsor), all finished in 1527, the astronomer Nicholas Kratzer (Louvre), Thomas Gadsalve (Dresden), and Sir Bryan Tuke (Munich) in 1528. In this year, 1528, Holbein returned to Basel, taking to Erasmus the sketch of More's family. With money which he brought from London he purchased a house at Basel wherein to lodge his wife and family, whose portraits he now painted with all the care of a husband and father (1528). He then witnessed the flight of Erasmus and the fury of the iconoclasts, who destroyed in one day almost all the religious pictures at Basel. The municipality, unwilling that he should suffer again from the depression caused by evil times, asked him to finish the frescoes of the town-hall, and the sketches from these lost pictures are still before us to show that he had not lost the spirit of his earlier days, and was still capable as a compositor. His portrait of Cromwell, whom he had met in London for the first time, and again on the move, and he landed in England for the second time with the prospect of bettering his fortunes. Here indeed political changes had robbed him of his earlier patrons. The circle of More and Warham was gone. But that of the merchants of the Steelyard took its place, for whom Holbein executed the long and important series of portraits that scattered throughout the galleries and collections of England and the Continent, and bear date after 1532. Then came again the chance of practice in more fashionable circles. In 1533 the "Ambassadors" (National Gallery), and the "Triumphs of Wealth and Poverty" were executed, then the portraits of Leland and Wyatt (Longford), and (1534) the portrait of Thomas Cromwell. Through Cromwell Holbein probably became attached to the court, in the pay of which he appears permanently after 1537. From that time onwards he was connected with all that was highest in the society of London. Henry VIII. invited him to make a family picture of himself, his father and family, which obtained a post of honour at Whitehall. The beautiful cartoon of a part of this fine piece at Hardwicke Hall enables us to gauge its beauty before the fire which destroyed it in the 17th century. Then Holbein painted Jane Seymour in state (Vienna), employing
some English hand perhaps to make the portraits at the Hague, Sion House and Woburn; he finished the Southwell of the Uffizi (copy at the Louvre), the Jeweller Morett at Dresden, and last, not least, Christine of Denmark, who gave sitting at Brussels in 1538. During the journey which this work involved Holbein took the opportunity of revisiting Basel, where he made his appearance in silk and satin, and pro forma only accepted the office of town painter. He had been living long and continuously away from home, not indeed observing due fidelity to his wife, who still resided at Basel, but fairly performing the duties of keeping her in comfort. His return to London in autumn enabled him to do homage to the king in the way familiar to artists. He presented to Henry at Christmas a portrait of Prince Edward. Again abroad in the summer of 1539, he painted with great fidelity the princess Anne of Cleves, at Düren near Cologne, whose form we still see depicted in the great picture of the Louvre. That he could render the features of his sitter without flattery is plain from this one example. Indeed, habitual flattery was contrary to his habits. His portraits up to this time all display that uncommon facility for seizing character which his father enjoyed before him, and which he had inherited in an expanded form. No amount of labour, no labouriousness of finish—and of both he was ever prodigal—betrayed him into loss of resemblance or expression. No painter was ever quicker at noting peculiarities of physiognomy, and it may be observed that in none of his faces, and indeed in none of the faces one sees in nature, are the two sides alike. Yet he was not a child of the 16th century, as the Venetians were, in substituting touch for line. We must not look in his works for modulations of surface or subtle contrasts of colour in juxtaposition. His method was to the very last delicate, finished and smooth, as became a painter of the old school.

Amongst the more important creations of Holbein's later time we should note his "Duke of Norfolk" at Windsor, the hands of which are so perfectly preserved as to compensate for the shrivelled that now disfigures the head. Two other portraits of 1541 (Berlin and Vienna), a Falconer at the Hague, and John Chambers at Vienna (1542), are noble specimens of portrait art; most interesting and of the same year are the likenesses of Holbein himself, of which several examples are extant—one particularly good at Fåhna, the seat of the Stackelberg family near Riga, and another at the Uffizi in Florence. Here Holbein appears to us as a man of regular features, with hair just turning grey, but healthy in colour and shape, and evidently well to do in the world. Yet a few months only separated him then from his death-bed. He was busy painting a picture of Henry the VIII., confirming the Privileges of the Barber Surgeons (Lincoln's Inn Fields), when he sickened of the plague and died after making a will about November 1543. His loss must have been seriously felt in England. Had he lived his last years in Germany, he would not have changed the current which decided the fate of painting in that country; he would but have shared the fate of Dürer and others who merely prolonged the agony of art amidst the troubles of the Reformation.

The early authorities are Karel Van Mander's Het Schilder Boek (16th century), J. G. H. Horne, Accademia dei Lincei (16th century), R. N. Wornum, Life and Work of Holbein (1867); H. Knackfuss, Holbein (1899); G. S. Davies, Holbein (1903); A. F. G. A. Woltmann, Holbein und seine Zeit (1876).

HOLBERG, LUDVIG HOLBERG, BARON (1684-1754), the great Scandinavian writer, was born at Bergen, in Norway, on the 3rd of December 1684. Both Holberg's parents died in his childhood, his father first, leaving a considerable property; and in his eleventh year he lost his mother also. Before the latter event, however, the family had been seriously impoverished by a great fire, which destroyed several valuable buildings, but notwithstanding this, the mother left to each of her six children some little fortune. In 1695 the boy Holberg was taken into the house of his uncle, Peder Lom, who sent him to the Latin school, and prepared him for the profession of a soldier; but soon after this he was adopted by his cousin Otto Munthe, and went to him up in the mountains. His great desire for instruction, however, at last induced his family to send him back to Bergen, to his uncle, and there he remained, eagerly studying, until the destruction of that city by fire in 1702, when he was sent to the university of Copenhagen. But he soon exhausted his resources, and, having nothing to live upon, was glad to hurry back to Norway, where he accepted the position of tutor in the house of a rural dean at Voss. He soon returned to Copenhagen, where in 1704 he took his degree, and worked hard at French, English and Italian. But he had to gain his living, and accordingly he accepted the post of tutor once more, this time in the house of Dr Smith, vice-bishop of Bergen. The good doctor had travelled much, and the reading of his itineraries and note-books awakened such a longing for travel in the young Holberg that at last, at the close of 1704, and having shewn that he was not unprepared to face the hardships of a life of itinerancy, he was circumvented and seduced to return to London. He proceeded as far as Aix-la-Chapelle, where he felt sick of a fever, and suffered so much from weakness and poverty, that he made his way on foot to Amsterdam, and came back to Norway. Ashamed to be seen so soon in Bergen, he stopped at Christiansand, where he lived through the winter, supporting himself by giving lessons in French. In the spring of 1706 he travelled, in company with a student named Brix, through London to Oxford, where he studied for two years, gaining his livelihood by giving lessons on the violin and the flute. He mentions, with gratitude, the valuable libraries of Oxford, and is of the opinion that he was there that it first occurred to him, as he says, "how splendid and glorious a thing it would be to take a place among the authors." Through London and Elsinore he reached Copenhagen a third time, and began to lecture at the university; his lectures were attended, but he got no money. He was asked in 1709 to conduct a rich young gentleman to Dresden, and on his return journey he lectured at Leipzig, Halle and Hamburg. Once more in Copenhagen, he undertook to teach the children of Admiral Gedde. Weary with this work, he took a post at Borch College in 1710, where he wrote, and printed in 1711, his first work, An Introduction to the History of the Nations of Europe, and was permitted to present to King Frederick IV. two manuscript essays on Christian IV. and Frederick III. The king soon after presented him with the title of Professor, and with the Rosenkranz grant of 100 dollars for four years, the holder of which was expected to travel. Holberg accordingly started in 1714, and visited, chiefly on foot, a great portion of Europe. From Amsterdam he walked through Rotterdam to Antwerp, took a boat to Brussels, and on foot again reached Paris. Walking and skating, he proceeded in the depth of winter to Marseilles, and on by sea to Genoa. On the last-mentioned voyage he caught a fever, and nearly died in that city. On his recovery he pushed on to Civita Vecchia, to Bologna, then to the springodore, a little being still vexed at a thing he was ashamed to be taken. The author of a great and in feeble health, he started homewards on foot by Florence, across the Apennines, through Bologna, Parma, Placenza, Turin, over the Alps, through Savoy and Dauphiné to Lyons, and finally to Paris, where he arrived in excellent health. After spending a month in Paris, he walked on to Amsterdam, took sail to Hamburg, and so went back to Denmark in 1716. He spent the next two years in extreme poverty, and published his Introduction to Natural and Popular Law. But at last, in 1718, his talents were recognized by his appointment as professor of metaphysics at the university of Copenhagen; and in 1720 he was presented to the lucrative chair of public eloquence, which gave him a seat in the consistory. His pecuniary troubles were now at an end. Hitherto he had written only on law, history and philology, although in a Latin controversy with the jurist Andreas Hojer of Flensborg his satirical genius had flashed out. But now, and until 1728, he created an entirely new class of humorous literature under the pseudonym of Hans Mikkelsen. The scrico-comic epic of Peder Paars, the earliest of the great classics of the Danish language, appeared in 1719. This poem was a brilliant satire on contemporary manners, and enjoyed an extraordinary success. But the author had offended in it several powerful persons who threatened his life, and if Count Danneskjold had not personally interested the king in
HOLBORN

him, Holberg's career might have had an untimely close. During the next two years he published five shorter satires, all of which were well received by the public. The great event of 1721 was the erection of the first Danish theatre in Grönnegade, Copenhagen; Holberg took the direction of this house, in which he was played, in September 1722, a Danish translation of L'Avere. Until the end of life he had been, in particular, a writer of French and German, but Holberg now determined to use his talent in the construction of Danish comedy. The first of his original pieces performed was Den politiske Kandestöber (The Pewterer turned Politician); he wrote other comedies with miraculous rapidity, and before 1722 was closed, there had been performed in succession, and with immense success, Den Vægt-sinde (The Waferer), Jean de France, Jeppe paa Bjerget, and Gert the Westphalian. Of these five plays, four at least are masterpieces; and they were almost immediately followed by others. Holberg took no rest, and before the end of 1723 the comedies of Barselstuen (The Lying-in Room), The Eleventh of July, Jakob von Thyboe, Den Bundesløse (The Fidget), Erasmus Montanus, Don Ransuno, Ulysse of Ithaca, Without Head or Tail, Witchcraft and Melompe had all been written, and some of them acted. In 1724 the most famous comedy that Holberg produced was Henrik and Pernille. But in spite of this unprecedented blaze of dramatic genius the theatre fell into pecuniary difficulties, and had to be closed, Holberg composing for the last night's performance, in February 1727, a Funeral of Danish Comedy. All this excessive labour for the stage had undermined the great poet's health, and in 1725 he had determined to take the baths at Aix-la-Chapelle; but instead of going thither he wandered through Belgium to Paris, and spent the winter there. In the spring he returned to Copenhagen with recovered health and spirits, and worked quietly at his protracted literary labours until the great fire of 1728. In the period of national poverty and depression that followed this event, a puritanical spirit came into vogue which was little in sympathy with Holberg's dramatic or satiric genius. He therefore closed his career as a dramatic poet by publishing in 1731 his acted comedies, with the addition of five which he had no opportunity of putting on the stage. With characteristic versatility, he adopted the serious tone of the new age, and busied himself for the next twenty years with historical, philosophical and statistical writings. During this period he published his poetical satire called Metamorphosis (1726), his Epistola ad virum perillustrem (1727), his Description of Denmark and Norway (1729), History of Denmark, Universal Chrestomathy, History of Friesland, Description of Bergen (1737), A History of the Jews, and other learned and laborious compilations. The only poem he published at this time was the famous Nicolai Klimis iæluberraneum (1741), afterwards translated into Danish by Baggesen. When Christian VI. died in 1747, pietism lost its sway; the theatre was reopened and Holberg was appointed director, but he soon resigned this arduous post. The six comedies he wrote in his old age did not add to his reputation. His last published work was his Epitelles, in 5 vols. the last of them posthumous (1754). In 1747 he was created by the new king Baron of Holberg. In August 1753 he took to his bed, and he died at Copenhagen on the 28th of January 1754, in the seventieth year of his age. He was buried at Sorø, in Zealand. He had never married, and he bequeathed all his property, which was considerable, to Sorø College.

Holberg was not only the founder of Danish literature and the greatest of Danish authors, but he was, with the exception of Voltaire, the first writer in Europe during his own generation. Neither Pope nor Swift, nor, perhaps, Sir Christian Møller, whom he considerably surpassed in the branches of literary production, approached him in range of genius, or in encyclopaedic versatility. Holberg found Denmark provided with no books, and he wrote a library for her. When he arrived in the country, the Danish language was never heard in a gentleman's house. Polite Danes were wont to say that a man wrote Latin to his friends, talked French to the ladies, called his dogs in German, and only used Danish to swear at his servants. The single genius of Holberg revolutionized this system. He wrote poems of all kinds in a language hitherto employed only for ballads and hymns; he instituted a theatre, and composed a rich collection of comedies for it; he filled the shelves of the citizens with works in their own tongue on history, law, politics, science, philology and philosophy, all written in a true and manly style, and representing the extreme attainment of European culture at the moment. Perhaps no author who ever lived has had so vast an influence over his countrymen, an influence that is still at work after 200 years.

The editions of Holberg's works are legion. Complete editions of the Comedies are too numerous to be quoted; the best is that brought out by F. L. Lichtenberg, in 1780. Of Peder Paar there exist at least twenty-three editions, besides translations in Dutch, German and Swedish. The Iter subterraneum has been several times translated into Danish, ten times into German, thrice into Swedish, thrice into Dutch, thrice into English, twice into Spanish, twice into Russian and once into Hungarian. The life of Holberg was written by Welhaven in 1858 and by Georg Brandes in 1884. Among works on his genius by foreigners may be mentioned an exhaustive study by Robert Prutz (1857), and Holberg considere comme imitateur de Molière, by A. Legrelle (Paris, 1864). (E. G.)

The name of Holborn was formerly derived from Old Bourne, a tributary of the Fleet, the valley of which is clearly seen where Holborn Viaduct crosses Farringdon Street. Of the existence of this tributary, however, there is no evidence, and the origin of the name is found in Hole-bourne, the stream in the hollow, in allusion to the Fleet itself. The fall and rise of the road across the valley before the construction of the viaduct (1860) was abrupt and inconvenient. In earlier times a bridge here crossed the stream, and the first quarter of a mile west of the viaduct is the site of Holborn Bars, at the entrance to the City, where tolls were levied. The better residential district of Holborn, which extends northward to Euston Road in the borough of St Pancras, is mainly within the parish of St George, Bloomsbury. The name of Bloomsbury is commonly derived from William Blemund, a lord of the manor in the 15th century. A dyke called Blemund's Ditch, of unknown origin, bounded it on the south, where the land was marshy. During the 18th century Bloomsbury was a fashionable and wealthy residential quarter. The repation of the district immediately to the south, embraced in the parish of St Giles in the Fields, was far different. From the 17th century until modern times this was notorious as a home of crime and poverty. Here occurred some of the earliest cases of the plague which spread over London in 1664-1665. The opening of the thoroughfares of New Oxford Street (1830) and Shaftesbury Avenue (1835) by no means wholly destroyed the character of the district. The circus of Seven Dials, east of Shaftesbury Avenue, affords a typical name in connexion with the lowest aspect of life in London. A similar notoriety attached to Saffron Hill on the eastern confines of the borough. By a singular contrast, the neighbouring thoroughfare of Hatton Garden, leading north from Holborn Circus, is a centre of the diamond trade. Of the ecclesiastical buildings of Holborn that of first interest is the chapel of St Etheldreda in Ely Place, opening from Holborn Circus. Ely Place takes its name from a palace of the bishops of Ely, who held land here as early as the 13th century. Here died John of Gaunt in 1399. The property was taken by Hatton, Lord Chamberlain, and given to Queen Elizabeth, after whom Hatton Garden is named; though the bishopric kept some hold upon it until the 18th century. The chapel, the only remnant of the palace, is a beautiful Decorated structure with a vaulted crypt, itself above ground-level. Both are used for worship by Roman Catholics, by whom the chapel was acquired in 1874 and opened five years later after careful restoration. The present parish church of St Giles in the Fields, between Shaftesbury Avenue and New
HOLCROFT—HOLDEN, SIR I.

Oxford Street, dates from 1734, but here was situated a leper’s hospital founded by Matilda, wife of Henry I., in 1101. Its chapel became the parish church on the suppression of the monasteries. The church of St Andrew, the parish of which extends into the City, stands near Holborn Viaduct. It is by Wren, but there are traces of the previous Gothic edifice in the tower. Sacheverell was among its rector’s (1713-1724), and Thomas Chatterton (1779) was interred in the adjacent burial ground, no longer extant, of Shoe Lane Workhouse; the register recording his Christian name as William. Close to this church is the City Temple (Congregational).

Two of the four Inns of Court, Lincoln’s Inn and Gray’s Inn, stand within the borough. Of the first the Tudor gateway opens upon Chancery Lane. The chapel, hall and residential buildings surrounding the squares within, are picturesque, but of later date. To the west lie the fine square, with public gardens, still called, from its original character, Lincoln’s Inn Fields. Gray’s Inn, between High Holborn and Theobald’s Road, and west of Gray’s Inn Road, is of similar arrangement. The fabric of the small chapel is apparently of the 14th century, and may have been attached to the manor house of Portpool, held at that period by the Lords Grey of Wilton. Of the former Inns of Chancery attached to these Inns of Court the most noteworthy buildings remaining are those of Staple Inn, of which the timbered and gabled Elizabethan front upon High Holborn is a unique survival of its character in a London thoroughfare; and of Barnard’s Inn, occupied by the Mercer’s School. Both these were attached to Gray’s Inn. Of Furnival’s and Thavies Inns, attached to Lincoln’s Inn, only the names remain. The site of the first is covered by the fine red brick buildings of the Prudential Assurance Company, Holborn Viaduct. Among other institutions in Holborn, the British Museum, north of New Oxford Street, is pre-eminent. The varied collections of Sir John Soane, accumulated at his house in Lincoln’s Inn Fields, are open to view as the Soane Museum. There may also be mentioned the Royal College of Surgeons, Lincoln’s Inn Fields, with museum; the Royal Colleges of Organists, and of Veterinary Surgeons, the College of Preceptors, the Jews’ College, and the Metropolitan School of shorthand. Among hospitals are the Italian, the Homoeopathic, the National for the paralysed and epileptic, the Alexandra for children with hip disease, and the Hospital for sick children. The Foundling Hospital, Guilford Street, was founded by Thomas Coram in 1739.

HOLCROFT, THOMAS (1745-1809), English dramatist and miscellaneous writer, was born on the 10th of December 1745 (old style) in Orange Court, Leadenhall Street, London. His father was a horse-dealer and a contractor in horses for hire; but having fallen into difficulties was reduced ultimately to the necessity of hawking pedlary. The son accompanied his parents in their tramps, and succeeded in procuring the situation of a stable boy at Newmarket, where he spent his evenings chiefly in miscellaneous reading and the study of music. Gradually he obtained a knowledge of French, German and Italian. At the end of his term of engagement as stable boy he returned to assist his father, who had again resumed his trade of shoemaker in London; but after marrying in 1765, he became a teacher in a small school in Liverpool. He failed in an attempt to set up a private school, and became prompter in a Dublin theatre. He acted in various touring companies until 1778, when he produced The Crisis; or, Love and Famine, at Drury Lane. Duplicity followed in 1781. Two years later he went to Paris as correspondent of the Morning Herald. Here he attended the performances of Beaumarchais’s Mariage de Figaro until he had memorized the whole. The translation of it, with the title The Follies of the Day, was produced at Drury Lane in 1784. The Road to Ruin, his most successful melodrama, was produced in 1792. A revival in 1873 ran for 118 nights. Holcroft died on the 23rd of March 1809. He was a member of the Society for Constitutional Information, and on that account was, in 1794, indicted of high treason, but was discharged without a trial. Among his novels may be mentioned Albyn (1780), an account, largely autobiographical, of a strolling comedian, and Hugh Trevis (1794-1797). He also was the author of Travels from Hamburg through Westphalia, Holland, and to the Netherlands to Paris, of some volumes of verse and of translations from the French and German.

His Memoirs written by Himself and continued down to the Time of his Death, from his Diary, Notes and other Papers, by William Hazlitt, appeared in 1816, and was reprinted, in a slightly abridged form, in 1852.

HOLDEN, HUBERT ASHTON (1822-1896), English classical scholar, came of an old Staffordshire family. He was educated at King Edward’s school, Birmingham, and Trinity College, Cambridge (senior classics 1845; fellows, 1847). He was vice-principal of Cheltenham College (1854-1897) and headmaster of Queen Elizabeth’s school, Ipswich (1858-1893). He was born in London on the 1st of December 1896. In addition to several school editions of portions of Ciceron, Thucydives, Xenophon and Plutarch, he published an expurgated text of Aristophanes with a useful onomasticon (re-issued separately, 1902) and larger editions of Ciceron’s De officis (revised ed., 1898) and of the Octavius of Minucius Felix (1853). His chief works, however, were his Pol Courium silvius (1852), a collection of English extracts for translation into Greek and Latin verse; Folia silvulae (translations of the same); and Pol Courium centuriae, a companion volume to the preceding. In addition to translations, in English schools these books have been widely used for the teaching of Latin and Greek composition.

HOLDEN, SIR ISAAC, BART. (1807-1897), English inventor and manufacturer, was the son of Isaac Holden, a native of Cumberland, and was born at Hurlet, a village between Paisley and Glasgow, on the 7th of May 1807. His early life was passed in very straitened circumstances, but his father spared no pains to give him as much elementary education as possible. At the age of ten he began to work as a weaver’s draw-boy, and afterwards was employed in a cotton mill. Meanwhile his education was continued at the night schools, and from time to time, as funds allowed, he was taken from work and sent to the grammar-school, to which he at last went regularly for a year or two until he was fifteen, when his father removed to Paisley and apprenticed him to an uncle, a shawl-weaver there. This proving too much for his strength, in 1823 he became assistant teacher in a school at Paisley, and in 1828 he was appointed mathematical teacher in the Queen’s Square Academy, Leeds. At the end of six months he was transferred to Lingard’s grammar school, near Huddersfield, and shortly afterwards became classical master at Castle Street Academy, Reading. It was here that in 1829 he invented a lucifer match by adopting sulphur from the dressing of the wood, but he refused to patent the invention. In 1830 his health again failed, and he returned to Scotland, where a Glasgow friend set up a school for him. After six months, however, he was recommended for the post of bookkeeper to Messrs. Townend Brothers, worsted manufacturers, of Cullingworth, where his interest in machinery soon led to his transfer from the counting-house to the mill. There his experiments led him to the invention of his square motion wool-comber and of a process for making genappe yarns, a patent for which was taken out by him in conjunction with S. C. Lister (Lord Masham) in 1847. The firm of Lister & Holden, which established a factory near Paris in 1848, carried on a successful business, and in 1850, when Lister retired, was succeeded by Isaac Holden and Sons, which became the largest wool-combing business in the world, employing upwards of 4000 workpeople. In 1865 Holden’s medical advisers insisted on complete change of occupation, and he entered parliament as Liberal member for Knaresborough. From 1868 to 1882 he was without a seat, but in the latter year he was elected for the northern division of the West Riding, and in 1885 for Keighley. He was created a baronet in 1883, and died suddenly at Oakworth House, near Keighley, on the 13th of August 1893. His son and heir, Sir Angus Holden, was in 1908 created a peer with the title of Baron Holden of Alston.
HÖLDERLIN—HOLGUÍN

HÖLDERLIN, JOHANN CHRISTIAN FRIEDRICH (1770-1843), German poet, was born on the 20th of March 1770, at Lauffen on the Neckar. His mother removing, after a second marriage, to Nürtingen, he began his education at the classical school there. He was introduced by his relations for the church, and with this view was later admitted to the seminaries at Denkendorf and Maulbronn. At the age of eighteen he entered as a student of theology the university of Tübingen, where he remained till 1793. He was already the writer of occasional verses, and had begun to sketch his novel Hyperion, when he was introduced in this year to Schiller, and obtained through him the post of tutor to the young son of Charlotte von Kalb. A year later he left this situation to attend Fichte's lectures, and to be near Schiller in Jena. The latter recognized in the young poet something of his own genius, and encouraged him by publishing some of his early writings in his periodicals Die neue Thalia and Die Horen. In 1796 Hölderlin obtained the post of tutor in the family of the banker J. F. Gontard in Frankfort-on-Main. For Gontard's beautiful and gifted wife, Susette, the "Diotima" of his Hyperion, he conceived a violent passion; and she became at once his inspiration and his ruin. At the end of two years, during which time the first volume of Hyperion was written (1797), a crisis appears to have occurred in his relations, for the young poet suddenly left Frankfort. In spite of ill-health, he now completed Hyperion, the second volume of which appeared in 1799, and began a tragedy, Der Tod des Empedokles, a fragment of which is published among his works. His friends became alarmed at the alternate depression and nervous irritability from which he suffered, and he was induced to go to Switzerland, as tutor in a family at Hauptwill. There his health improved; and several of his poems, among which are Der blinde Sänger, An die Hoffnung und Dichtermut, were written at this time. In 1801 he returned home to Munich for the publication of a volume of his poems; but, on the failure of this enterprise, he was obliged to accept a tutorship at Bordeaux. "Diotima" died a year later, in June 1802, and the news is supposed to have reached Hölderlin shortly afterwards, for in the following month he suddenly left Bordeaux, and travelled homewards on foot through France, arriving at Nürtingen destitute and insane. Kind treatment gradually alleviated his condition, and in lucid intervals he occupied himself by writing verses and translating Greek plays. Two of these translations—the Antigone and Oedipus rex of Sophocles—appeared in 1804, and several of his short poems were published by Franz K. L. von Seckendorff in his Musenalmanach, 1807 and 1808. In 1804 Hölderlin obtained the sincere post of librarian to the landgrave Frederick V. of Hesse-Homburg, and went to live in Homburg under the supervision of friends; but two years later becoming irretrievably but harmlessly insane, he was taken in the summer of 1807 to Tübingen, where he remained till his death on the 7th of June 1843.

Hölderlin's writings are the production of a beautiful and sensitive mind; but they are intensely, almost morbidity, subjective, and they lack real human strength. Perhaps his strongest characteristic was his passion for Greece, the result of which was that he almost entirely discarded rhyme in favour of the ancient verse measures. His poems are all short pieces; of his tragedy only a fragment was written. Hyperion, oder der Eremis in Griechenland (1797-1799), is a romance in letters, in which the stormy fervour of the "Sturm und Drang" is combined with a romantic enthusiasm for Greek antiquity. The interest centres not in the story, for the novel has little or none—Hyperion is a young Greek who takes part in the rising of his people against the Turks in 1770—but in its lyric subjectivity and the dithyrambic beauty of its language.

Hölderlin's lyrics, Lyrische Gedichte, were edited by L. Uhland and G. Schwind in 1841; a complete edition of his works, Sämtliche Werke, with a biography by C. T. Schwab, appeared in 1846; also Dichtungen by K. Köstlin (Tübingen, 1884), and (the best edition) Gesammelte Dichtungen by B. Litzmann (2 vols., Stuttgart, 1887). For a life of Hölderlin, see C. P. Winter, Heldentum, Leben (Berlin, 1890), A. Willibrand, Hölderlin (2nd ed., Berlin, 1891), and C. Müller, Friedrich Hölderlin, sein Leben und sein Dichten (Bremen, 1894).

HOLDERNESSE, EARL OF, an English title borne by Sir John Ramsay and later by the family of Darcy. John Ramsay (c. 1580-1626), a member of the Scottish family of Ramsay of Holderness, was knighted for his share in rescuing James VI. from the hands of John Ruthven, earl of Gowrie, in 1605; and in 1606. In 1606 the king created him Viscount Haddington and Lord Ramsay of Barns, and in 1621 made him an English peer as earl of Holderness. Ramsay died without surviving issue in February 1626, when his titles became extinct. In 1644 Charles I. created his nephew, Prince Rupert, earl of Holderness, but when the prince died unmarried in November 1682 the earldom again became extinct. Conyers Darcy (1569-1689), who was made earl of Holderness in 1682 only a few days after the death of Rupert, was the son and heir of Conyers Darcy, Lord Darcy and Conyers (c. 1571-1654), and succeeded his father in these baronies in March 1654. He was succeeded as 2nd earl by his only son Conyers (c. 1620-1692), who was member of parliament for Yorkshire during the reign of Charles II. In his turn he was succeeded by his grandson Robert (1681-1722). Robert's only son, Robert Darcy, 4th earl of Holderness (1718-1759), was a diplomatist and a politician. From 1744 to 1746 he was ambassador at Venice and from 1749 to 1751 he represented Great Britain at the Hague. In 1751 he became one of the secretaries of state, and he remained in office until March 1761, when he was dismissed by George III. From 1771 to 1776 he acted as governor to two of the king's sons, a "solemn phantom" as Horace Walpole calls him. He left no sons, and all his titles became extinct except the barony of Conyers, which had been created by writ in 1590 in favour of his ancestor Sir William Conyers (d. 1525). This descended to his only daughter Amelia (1734-1784), the wife of Francis Osborne, afterwards 5th duke of Leeds, and when the 7th duke of Leeds died in 1859 it passed to his nephew, George Lane-Fox, 9th earl of Leeds, and falling into abeyance on his death. Hornby castle in Yorkshire, now the principal seat of the dukes of Leeds, came to them through marriage of the 5th Duke with the heiress of the families of Conyers and of Darcy.

HOLDEIM, SAMUEL (1806-1866), Jewish rabbi, a leader of reform in the German Synagogue, was born in Posen in 1806 and died in Berlin in 1860. In 1836 he was appointed rabbi at Frankfort-on-the-Oder, in 1840 he was transferred to the rabbinical college at Mecklenburg, and in 1848 he was appointed to the chair of Oriental languages at the University of Berlin, and became not only the greatest rabbinical scholar of his day, but also an advocate on the one hand of religious freedom (much trammelled at the time by Prussian state laws) and on the other of reform within the Jewish community. Various rabbinical conferences were held, at Brunswick (1844), Frankfort-on-the-Main (1845) and Breslau (1846). At all of these Holdeim was a strong supporter of the policy of modifying ritual (especially with regard to Sabbath observance, marriage laws and liturgical customs). In 1846 he was chosen Rabbi of the new Berlin congregation and there exercised considerable influence on the course of Jewish reform.

See I. H. Ritter in the Jewish Quarterly Review, i. 202. The same authority has written the life of Holdeim in vol. iii. of his Geschichte der jüdischen Reformation (Berlin, 1865). Graetz in his History passes an unfavourable judgment on Holdeim, and there were admittedly grounds for opposition to Holdeim's attitude. A moderate criticism is contained in Dr D. Philipson's History of the Reform Movement in Judaism (London, 1896).

HOLGUÍN, a town of the high plateau country in the interior of Oriente province, Cuba, about 65 m. N.W. of Santiago de Cuba. Pop. (1907) 7592. The town is near the Marañon and Jigue rivers, on a plain from which hills rise on all sides except E., on which side lies one of the ends of the great Holguín road. Holguín was long the principal acclimatization station for Spanish troops. The oldest public buildings are two churches built in 1800 and 1809 respectively. Holguín has trade in cabinet woods, tobacco, Indian corn and cattle products, which it exports through its port Gibara, about 25 m. N.N.E., with which it is connected by railway. Holguín was settled about 1720 and became a ciudad (city) in 1731. In the Ten Years' War of 1868-78 and in the revolution of 1895-98 Holguín was an insurgent centre.
HOLIDAY, originally the "holy day," a festival set apart for religious observances as a memorial of some sacred event or sacred person; hence a day on which the ordinary work or business ceases. For the religious sense see FEASTS and FESTIVALS, and SUNDAY. Apart from the use of the term for a single day of rest or enjoyment, it is commonly used in the plural for a recognized and regular period (as at schools, &c.) of absence from work. It is unnecessary here to deal with what may be regarded as private holidays, which are matters of agreement between employer and employed or between the authorities of this or that institution and those who attend it. In recent years there has been a notable tendency in most occupations to shorten the hours of labour, and make holidays more regular. It will suffice here to mention, without entering into additional detail, recognized as general holidays, such as Empire Day (May 24th), Arbor Day, &c. In the British colonies there is no uniform practice. In Canada eight days are generally observed as public holidays: New Year's Day, Good Friday, Easter Monday, Christmas Day, the birthday of the sovereign, Victoria Day, Dominion Day and Labour Day. Some of the provinces have followed the American example by adding an Arbor Day. Alberta and Saskatchewan observe Ash Wednesday. In Quebec, where the majority of the population is Roman Catholic, the holy days are also holidays, namely, the Festival of the Epiphany, Ash Wednesday, Good Friday, Easter Monday, the Ascension, All Saint's Day, Conception Day, Christmas Day. In 1897 Labour Day was added. In New South Wales, the 1st of January, Good Friday, Easter Eve, Easter Monday, the birthday of the sovereign, the 1st of August, the birthday of the prince of Wales, Christmas Day and the 26th of December, are observed as holidays. In Victoria there are thirteen public holidays during the year, and in Queensland fourteen. In New Zealand the public holidays are confined to four, Christmas Day, New Year's Day, Good Friday and Labour Day. In most of the other British colonies the usual number of public holidays is from six to eight.

In the United States there is no legal holiday in the sense of the English bank holidays. A legal holiday is dependent upon state and territorial legislation. It is usual for the president to proclaim the last Thursday in November as a day of thanksgiving; this makes it only a legal holiday in the District of Columbia, and in the territories, but most states make it a general holiday. Independence Day (July 4th) and Labour Day (first Monday in September) are legal holidays in most states. There are other days which, in connexion with particular events or in remembrance of particular persons, have been made legal holidays by particular states. For example, Lincoln's birthday, Washington's birthday, Memorial Day (May 30th), Patriots' Day (April 19th, Maine and Mass.), R. E. Lee's birthday (Jan. 19th, Ala., Fla., Ga., &c.), Pioneers' Day (July 24th, Utah), Colorado Day (Aug. 1st), Battle of New Orleans (Jan. 8th, La.), Bennington Battle Day (Aug. 16th, Vt.), Defenders' Day (Sept. 12th, Md.), Arbor Day (April 22nd, Nebraska; second Friday in May R.I., &c.), Admission Day (September 9th, Cal.; Oct. 31st, Nev.), Confederate Memorial Day (April 26th, Ala., Fla., Ga., Miss., May 10th, N. & S. Car., June 3rd, La., Miss., Texas, &c.).

See M'Curdy, _Bibliography of Articles relating to Holidays_ (Boston, 1903).

HOLKAR (or HOLLINGSHEAD), RAPHAEL (d. c. 1586), English chronicler, belonged probably to a Cheshire family, and according to Anthony Wood was educated at one of the English universities, afterwards becoming a "minister of God's Word." The authenticity of these facts is doubtful, although it is possible that Raphael was the Hollinshed who matriculated from Christ's College, Cambridge, in 1544. About 1560 he came to London and was employed as a translator by Reginald or Keyner Wolfe, to whom he says he was "singularly beholden." Wolfe was already engaged in the preparation of a universal history, and Holinshed worked for some years on this undertaking; but after Wolfe's death in 1573 the scope of the work was abridged, and it appeared in 1578 as the _Chronicles of England, Scotland, and Ireland_. The work was in two volumes, which were illustrated, and although Holinshed did a great deal of the work he received valuable assistance from William Harrison (1534-1593). The work now known as "Holinshed's History of England" is only a translation of Hector Boece's _Scotorum historiae_. Afterwards, as is shown by his will, Holinshed served as steward to Thomas Burdet of Bramcott, Warwickshire, and died about 1580.

A second edition of the _Chronicles_, enlarged and improved but without illustrations, which appeared in 1587, contained statements which were offensive to Queen Elizabeth and her advisers, and immediately after publication some of the pages were excised by order of the privy council. These excisions were published separately in 1724. An edition of the _Chronicles_, in accordance with the original text, was published in two volumes in 1868. The work contains a vast amount of information, and in its treatment of the field of great industry; but its chief interest lies in the fact that it was largely used by Shakespeare and other Elizabethan dramatists; and the thought and style of a later period. The work has served as the _Chronicles_ material for most of his historical plays, and also for _Macbeth_, _King Lear_ and part of _Cymbeline_. A single manuscript by Holinshed is known to be extant. This is a translation of _Florence and Rome_ (1571), and is in the British Museum. See W. G. Bowell-Stone, _Shakspeare's Holinshed_. _The Chronicle _ and the historical plays compared (London, 1896).

HOLKAR, the family name of the Maharatta ruler of Indore (q.v.), which has been adopted as a dynastic title. The termination -kar implies that the founder of the family came from the village of Hol near Poona.

HOLL, FRANK (1845-1888), English painter, was born in London on the 4th of July 1818. He was educated chiefly at University College School. He was a grandson of William Holl, an engraver on steel, and the son of Francis Holl, A.R.A., another engraver, whose profession he originally intended to follow. Entering the Royal Academy schools as a probationer in painting in 1860, he rapidly progressed, winning silver and gold medals, and making his début as an exhibitor in 1864 with "A Portrait," and "Turned out of Church," a subject picture. "A Fern Gatherer" (1865); "The Ordeal" (1866); "Convalescent" (the somewhat grim pathos of which attracted much attention), and "Faces in the Fire" (1867), succeeded. Holl gained the travelling studentship in 1868; the successful work was characteristic of the young painter's mood; among the Lord gave, and the Lord hath taken away." His insatiable zeal for work of all kinds began early to undermine the artist's health, but his position was assured by the studentship picture, which created a sort of _furore_, although, as with most of his works, the blackness of its coloration, probably due to his training as an engraver, was even more decidedly against it than the sadness of its theme. Otherwise, this painting exhibited nearly all the best technical qualities to which he ever attained, except high finish and clearness, and a very sincere vehemence of pathos. Holl was much below Millais in portraiture, and far inferior in all the higher ways of design; in technical resources, relatively speaking, he was but scantily provided. The range of his studies and the manner of his painting were narrower than those of Josef Israels, with whom, except as a portrait-painter, he may better be compared than with Millais. In 1870 he painted "Better is a Dinner of Herbs where Love is, than a Stalled Ox and Hatred therewith; ""No Tidings from the Sea," a scene in a fisherman's cottage, in 1871—a story told with breath-catching pathos and power; "I am the Resurrection and the Life" (1872); "Leaving Home" (1873), "Deserted" (1874), both of which had great success; "Her First-born," girls carrying a baby to the grave. (1876); and "Going Home" (1877). In 1877 he painted the two pictures "Hush" and...
HOLLAND, C.—HOLLAND, 1ST BARON

"Hushed." "Newgate, Committed for Trial," a very sad and telling piece, first attested the breaking down of the painter's health in 1787. In this year he was elected A.R.A., and exhibited "The Gifts of the Fairies," "The Daughter of the House," "Absconded," and a very fine portrait of Samuel Cousins, the mezzotint engraver. This last canvas is a masterpiece, and deserved the success which attended the print engraved from it. Holl was overwhelmed with commissions, which he would not decline. The consequences of this strain upon a constitution which was not strong were more or less, though unequally, manifest in "Ordered to March," a soldier's departure (1886); "Home Again," its sequel, in 1883 (after which he was made R.A.). In 1886 he produced a portrait of Millais as his diploma work, but his health rapidly declined and he died at Hampstead, on the 31st of July 1888. Holl's better portraits, being of men of rare importance, attest the commanding position he occupied in the branch of art he so unfailingly followed. They include likenesses of Lord Roberts, painted for queen Victoria (1882); the prince of Wales, Lord Dufferin, the duke of Cleveland (1883); Lord Overstone, Mr Bright, Mr Gladstone, Mr Chamberlain, Sir J. Tenniel, Earl Spencer, Viscount Cranbrook, and a score of other important subjects.

HOLLAND, CHARLES (1733-1769), English actor, was born in Chiswick, the son of a haker. He made his first appearance on the stage in the title rôle of Oronoko at Drury Lane in 1755, John Palmer, Richard Yates and Mrs Cibber being in the cast. He played under Garrick, and was the original Florizel in the latter's adaptation of Shakespeare's Winter's Tale. Garrick thought highly of him, and wrote a eulogistic epitaph for his monument in Chiswick church. His nephew, Charles Holland (1768-1849) was also an actor, who played with Mrs Siddons and Kean.

HOLLAND, SIR HENRY, BART. (1788-1873), English physician and author, was born at Knutsford, Cheshire, on the 27th of October 1788. His maternal grandmother was the sister of Josiah Wedgwood, whose grandson was Charles Darwin; and his paternal aunt was the mother of Mrs Gaskell. After spending some years at a private school at Knutsford, he was sent to a school at Newcastle-on-Tyne, whence after four years he was transferred to Dr J. P. Estlin's school near Bristol. There he at once took the position of head boy, in succession to John Cam Hobhouse, afterwards Lord Broughton, an honour which required to be maintained by physical prowess. On leaving school he became articled clerk to a mercantile firm in Liverpool, but, as the privilege was reserved to him of passing two sessions at Glasgow university, he at the close of his second session sought relief from his articles, and in 1806, began the study of medicine in the university of Edinburgh, where he graduated in 1811. After several years spent in foreign travel, he began practice in 1816 as a physician in London—according to his own statement, "with a fair augury of success speedily and completely fulfilled." This "success," he adds, "was materially aided by visits for four successive years to Spa, at the close of that which is called the London season." It must also, however, be in a great degree attributed to his happy temperament and his gifts as a conversationalist—qualities the influence of which, in the majority of cases belonging to his class of practice, is often of more importance than direct medical treatment. In 1816 he was elected F.R.S., and in 1828 F.R.C.S. He became physician in ordinary to Prince Albert in 1840, and was appointed in 1852 physician in ordinary to the queen. In April 1853 he was created a baronet. He was also a D.C.L. of Oxford and a member of the principal learned societies of Europe. He was twice married, his second wife being a daughter of Sydney Smith, a lady of considerable literary talent, who published Cleveland, a biography on which he had spent his heart. On July 17th, 1873, he left this world in his 86th year, at his residence, the House, Kensington, on the 1st of July 1774, a sorely disappointed man, with a reputation for cunning and unscrupulosity which cannot easily be matched, and with an unpopularity which justifies the conclusion that he was the most thoroughly hated statesman of his day. Lord Holland married in 1744
Lady Georgiana Caroline Lennox, daughter of the duke of Richmond, who was created Baroness Holland, of Holland, Lincolnshire, in 1762. There were four sons of the marriage: Stephen, 2nd Lord Holland (d. 1774); Henry (d. an infant); Charles James (the celebrated statesman); and Henry Edward (1755-1811), soldier and diplomatist.

See Walpole’s and other memoirs of the time, also the article Fox, CHARLES JAMES.

HOLLAND, HENRY RICH, 1st EARL OF (1590-1649), 2nd son of Robert, 1st earl of Warwick, and of Penelope, Sir Philip Sidney’s “Stella,” daughter of Walter Devereux, 1st earl of Essex, was baptized on the 19th of August 1590, educated at Emmanuel College, Cambridge, knighted on the 3rd of June 1610, and returned to parliament for Leicester in 1610 and 1614. In 1619 he was present at the siege of Juliers. Favourites were showered upon him by James I. He was made gentleman of the bedchamber to Charles, prince of Wales, and captain of the yeomen of the guard; and on the 8th of March 1623 he was raised to the peerage as Baron Kensington. In 1624 he was sent to Paris to negotiate the marriage treaty between Charles and Henrietta Maria. On the 17th of September he was created earl of Holland, and in 1625 was sent on two further missions, first to Paris to arrange a treaty between Louis XIII. and the Huguenots, and later to the Netherlands in company with Buckingham. In October 1627 he was given command of the troops sent to reinforce Buckingham at Rhe, but through delay in starting only the defeated troops on their return. He succeeded Buckingham as chancellor of Cambridge University; was master of the horse in 1628, and was appointed constable of Windsor and high steward to the queen in 1629. He interested himself, like his elder brother, Lord Warwick, in the plantations; and was the first governor of the Providence company in 1630, and one of the proprietors of Newfoundland in 1637. In 1631 he was made chief-justice-in-eyre south of the Trent, and in this capacity was responsible for the unpopular revival of the obsolete forest laws. He intrigued at court against Portland and against Strafford, who expressed for him the greatest contempt. In 1636 he was disappointed at not obtaining the great office of lord high admiral, but was made instead groom of the stole. In 1639 he was appointed general of the horse, and drew ridicule upon himself by the fiasco at Keso. In the second war against the Scots he was superseded in favour of Conway. He opposed the dissolution of the Short Parliament, joined the peers who supported the parliamentary cause, and gave evidence against Strafford. He was, however, won back to the king’s side by the queen, and on the 16th of April 1641 made captain general north of the Trent. Dissatisfied, however, with Charles’s refusal to grant him the nomination of a new baron, he again abandoned him, refused the summons to York, and was deprived of his office as groom of the stole at the instance of the queen, who greatly resented his ingratitude. He was chosen by the parliament in March and July 1642 to communicate its votes to Charles, who received him, much to his indignation, with studied coldness. He was appointed one of the committee of safety in July; made zealous speeches on behalf of the parliamentary cause to the London citizens; and joined Essex’s army at Twickenham, where, it is said, he persuaded him to avoid a battle. In 1643 he appeared as a peacemaker, and after failing to bring over Essex, he returned to the king. His reception, however, was not a cordial one, and he was not reinstated in his office of groom of the stole. After, therefore, accompanying the king to Gloucester and taking part in the first battle of Newbury, he once more returned to the parliament, declaring that the court was too much bent on continuing hostilities, and the influence of the “papists” too strong for his patriotism.

He was restored to his estates, but the Commons obliged the Lords to exclude him from the upper house, and his petition was refused in 1645 for compensation for his losses and for a pension. He refused. His hopes being in this quarter also disappointed, he once again renewed his allegiance to the king’s cause; and after endeavouring to promote the negotiations for peace in 1645 and 1647 he took up arms in the second Civil War, received a commission as general, and put himself at the head of 600 men at Kingston. He was defeated on the 7th of July 1647, captured at St Neots shortly afterwards, and imprisoned at Warwick Castle. He was tried before a “high court of justice” on the 3rd of February 1649, and in spite of his plea that he had received quarter was sentenced to death. He was executed together with Hamilton and Capel on the 9th of March. Clarendon styles him “a very well-bred man and a fine gentleman in good times.”

He was evidently a man of shallow character, devoid of ability, raised far above his merits and hopelessly unfit for the great times in which he lived. Lord Holland married Elizabeth, daughter and heiress of Sir Walter Cope of Kensington, and, besides several daughters, had four sons, of whom the eldest, Robert, succeeded him as 2nd earl of Holland, and inherited the estates of Warwick in 1657.

HOLLAND, HENRY RICHARD VASSALL FOX, 3rd BARON (1732-1840), was the son of Stephen Fox, 2nd Baron Holland, his mother, Lady Mary Fitzpatrick, being the daughter of the earl of Upper Ossory. He was born at Winterslow House in Wiltshire, on the 21st of November 1773, and his father died in the following year. He was educated at Eton and at Christ Church, Oxford, where he became the friend of Canning, of Hookham Frere, and of other wits of the time. Lord Holland did not take the same political side as his friends in the conflicts of the revolutionary epoch. He was from his boyhood deeply attached to his uncle, C. J. Fox, and remained steadily loyal to the Whig party. In 1791 he visited Paris and became acquainted with Lafayette and Talleyrand, and in 1793 he again went abroad to travel in France and Italy. At Florence he met with Lady Webster, wife of Sir Godfrey Webster, Bart., who left her husband for him. She was by birth Elizabeth Vassall (1770-1843), daughter of Richard Vassall, a planter in Jamaica. A son was born of their irregular union, a Charles Richard Fox (1796-1873), who after some service in the navy entered the Grenadiers, and was known in later life as a collector of Greek coins. His collection was bought for the royal museum of Berlin when he died in 1873. He married Lady Mary Fitzclarence, a daughter of William IV. by Mrs Jordan. Sir Godfrey Webster having obtained a divorce, Lord Holland was enabled to marry on the 6th of July 1797. He had taken his seat in the House of Lords on the 5th of October 1796. During several years he may be said almost to have constituted the Whig party in the Upper House. His protests against the measures of the Tory ministers were collected and published, as the Opinions of Lord Holland (1841), by Dr Moylan of Lincoln’s Inn. In 1800 he was authorized to take the name of Vassall, and after 1807 he signed himself Vassall Holland, though the name was no part of his title. In 1800 Lord and Lady Holland went abroad and remained in France and Spain till 1805, visiting Paris during the Peace of Amiens, and being well received by Napoleon. Lady Holland always professed a profound admiration of Napoleon, of which she made a theatrical display after his fall, and he left her a gold snuff-box by his will. In public life Lord Holland took a share proportionate to his birth and opportunities. He was appointed to negotiate with the American envoys, Monroe and W. Pinkey, was admitted to the privy council on the 27th of August 1806, and on the 15th of October entered the cabinet “of all the talents” as lord privy seal, retiring with the rest of his colleagues in March 1807. He led the opposition to the Regency bill in 1811, and he attacked the “orders in council” and other strong measures of the government taken to counteract Napoleon’s Berlin decrees. He was in fact in politics a consistent Whig, and in that character he denounced the treaty of 1813 with Sweden which bound England to consent to the forcible union of Norway, and he resisted the bill of 1816 for confining Napoleon in St Helena. His loyalty as a Whig secured recognition when his party triumphed in the struggle for parliamentary reform, by his appointment as chancellor of the duchy of Lancaster in the cabinet of Lord Grey and Lord Melbourne, and he was still in office when he died on the 22nd of October 1840. Lord Holland is notable, not for his somewhat Hist. of the Rebellion, xi. 265.
insignificant political career, but as a patron of literature, as a writer on his own account, and because his house was the centre and the headquarters of the Whig political and literary world of the time; and Lady Holland (who died on the 16th of November 1845) succeeded in taking the sort of place in London which had been filled in Paris during the 18th century by the society ladies who kept "salons." Lord Holland's "Political Reminiscences" (1820) contain much amusing gossip from the Revolutionary and Napoleonic era. His Memoirs of the Whig Party (1852) is an important contemporary authority. His small work on Lope de Vega (1860) is still of some value. Holland had two legitimate sons, Stephen, who died in 1800, and Henry Edward, who became 4th Lord Holland. When this peer died in December 1859 the title became extinct.

See The Journal of Elizabeth, Lady Holland, edited by the earl of Ilchester (1908); and Lloyd Sanders, The Holland House Circle (1908).

HOLLAND, JOSIAH GILBERT (1819-1881), American editor and author, was born in Belchertown, Massachusetts, on the 24th of July 1819. He graduated in 1843 at the Berkshire Medical College (no longer in existence) at Pittsfield, Mass., and after practising medicine in 1844-1847, and making an unsuccessful attempt, with Charles Robinson (1818-1884), later first governor of the state of Kansas, to establish a hospital for women, he taught for a brief period in Richmond, Virginia, and in 1848 was superintendent of schools in Vicksburg, Mississippi. In 1849 he became assistant editor under Samuel Bowles, and three years later one of the owners, of the Springfield (Massachusetts) Republican, with which he retained his connexion until 1867. He then travelled for some time in Europe, and in 1870 removed to New York, where he helped to establish and became editor and one-third owner of Scribner's Monthly (the title of which was changed in 1881 to The Century), which absorbed the periodicals Hours at Home, Painam's Magazine and the Riverside Magazine. He remained editor of this magazine until his death. Dr Holland's books long enjoyed a wide popularity. The earlier titles were published under the pseudonym "Timothy Titcomb." His writings fall into four classes: history and biography, represented by a History of Western Massachusetts (1855), and a Life of Abraham Lincoln (1865); fiction, of which Miss Gilbert's Career (1880) and The Story of Sevenoaks (1875) remain faithful pictures of village life in eastern United States; poetry, of which Bilsr-Sweet (1858) and Katherina, Her Life and Mine (1867) were widely read; and a series of homely essays on the art of living, of which the most characteristic were Letters to Young People, Single and Married (1838), Gold Feil, hammered from Popular Proverbs (1859), Letters to the Joneses (1863), and Every-Day Topics (2 series, 1876 and 1882). While a resident of New York, where he died on the 14th of October 1881, he identified himself with measures for good government and school reform, and in 1872 became a member and for a short time in 1873 was president of the Board of Education.

See Mrs H. M. Plunkett's Josiah Gilbert Holland (New York, 1894).

HOLLAND, PHILEMON (1552-1637), English scholar, "the translator-general in his age," was born at Chelmsford in Essex. He was the son of a clergyman, John Holland, who had been obliged to take refuge in Germany and Denmark with Miles Coverdale during the Marian persecution. Having become a fellow of Trinity College, Cambridge, and taken the degree of M.A., he was incorporated at Oxford (July 11th, 1585). Having subsequently studied medicine, about 1595 he settled as a doctor in Coventry, but chiefly occupied himself with translations. In 1605 he was appointed headmaster of the free school, but, owing probably to advancing age, he held office for only eleven months. His latter days were oppressed by poverty, partly relieved by the generosity of the common council of Coventry, which in 1632 assigned him £3 6s. 8d. for three years, "if he should live so long." He died on the 9th of February, 1636-1637. His fame is due solely to his translations, which included Livy, Pliny's Natural History, Plutarch's Morals, Suetonius, Ammianus Marcellinus and Xenophon's Cyropaedia. He published also an English version, with additions, of Camden's Britannia. His Latin translation of Brice Bauderon's Pharmaco- poeia and his Regimen sanitis. Salerni were published after his death by his son, Henry Holland (1583-1650), who became a London bookseller, and is known to bibliographers for his Basiliadicon; a Booke of Kings, being the true and litle Eggies of all our English Kings from the Conquest (1618), and his Heroeologia Anglica (1620).

HOLLAND, RICHARD, or RICHARD DE HOLLANDE (fl. 1450), Scottish writer, author of the Book of the Hotelat, was secretary or chaplain to the earl of Moray (1450) and rector of Halkirk, near Thurso. He was afterwards rector of Abridge, Loch Ness, and later held a chantry in the cathedral of Norway. He was an ardent partisan of the Douglas, and on their overthrow retired to Orkney and later to Shetland. He was employed by Edward IV. in his attempt to rouse the Western Isles through Douglas agency, and in 1452 was excluded from the general pardon granted by James III. to those who would renounce their fealty to the Douglases.

The poem, entitled the Book of the Hotelat, written about 1450, shows his devotion to the house of Douglas:—

"On ilk bough till embrace
Writtin in a bill was
O Douglass, O Douglass,
Tender and trewe!"

and is dedicated to the wife of a Douglas—

"Thus for ane Dow of Dunbar drew I this Dyre.
Dowit with ane Douglass, and both war they dowis."

but all theories of its being a political allegory in favour of that house may be discarded. Sir Walter Scott's argument that the Book is "a poetical apologue . . . without any view whatever to local or natural politics" is certainly the most reasonable. The poem, which extends to 1001 lines written in the irregular alliterative rhymed stanza, is a bird-allegory, of the type familiar in the Parlement of Foules. It has the incidental interest of showing (especially in stanzas 62 and 63) the antipathy of the "Inglis-speaking Scot" to the "Scots-speaking Gael" of the west, as is also shown in Dunbar's Flying with Kennedy.

The text of the poem is preserved in the Asloan and Banntayne MSS. Fragments of an early 16th century black-letter edition, discovered by D. Laing, are reproduced in the Adversaria of the Banntayne Club. The poem has been frequently reprinted, by Pinkerton, in his Scottish Antiquities (1792); by D. Laing (Banntayne Club 1821; reprinted in "New Club" series, Paisley, 1882); by the Hunterian Club in their edition of the Banntayne MS., and by A. Diebler (Chenmitz, 1893). The latest edition is that by F. J. Amours in Scottish Alliterative Poems (Scottish Text Society, 1897), pp. 47-81. (See also Introduction pp. xx-xxxiv.)

HOLLAND, officially the kingdom of the Netherlands (Koningrijk der Nederlanden), a maritime country in the north-west of Europe. The name Holland is that of the former countship, which forms part of the political, as well as the geographical centre of the kingdom (see the next article).

Topography.—Holland is bounded on the E. by Germany, on the S. by Belgium, on the W. and N. by the North Sea, and at the N.E. corner by the Dollart. From Stevensweert southward to the extreme corner of Limburg the boundary line is formed by the river Maas or Meuse. On the east a natural geographical boundary was formed by the long line of marshy fens extending along the borders of Overijssel, Drente and Groningen. The kingdom extends from 53° 32' 21" (Groningen Cape on Rottum Island) to 50° 45' 49" N. (Mesch in the province of Limburg), and from 3° 25' 27" (Sluis in the province of Zeeland) to 7° 12' 20" E. (Langakkerschaars in the province of Groningen). The greatest length from north to south, viz. that from Rottum Island to Eisdon near Maastricht is 164 m., and the greatest breadth from south-west to north-east, or from Zwin near Sluis to Losser in Overijssel, 144 m. The area is subject

1 At Maastricht, however, a portion lies on the left bank of the river, measured, according to the treaty with Belgium, 19th of April 1839, art. 4, by an average radius of 1200 Dutch fathoms (7874 ft.) from the outer glacis of the fortress.
to perpetual variation owing, on the one hand, to the erosion of the coasts, and, on the other, to reclamation of land by means of embanking and drainage operations. In 1880 the total area was calculated at 12,558 sq. m., and, including the Zuider Zee and the Wadden (2050 sq. m.) and the Dutch portion of the Wadden (23 sq. m.), 14,613 sq. m. In no country in Europe has the character of the territory exercised so great an influence on the inhabitants as in the Netherlands; and, on the other hand, no people has so extensively modified the condition of its territory as the Dutch. The greatest importance attaches therefore to the physical conformation of the country.

The coast-line extends in a double curve from south-west to north-east, and is formed by a row of sand dunes, 171 m. in length, fringed by a broad sandy beach descending very gradually to the sea. In the north and south, however, this line is broken by the inlets of the sea which form the Frisian and the South Holland and Zelandic islands respectively; but the dunes themselves are found continued along the seaward side of the islands, thus indicating the original continuity of the coast-line. The breadth of the dunes naturally varies greatly, the maximum width of about 4375 yds. being found at Schoorl, north-west of Alkmaar. The average width is about 750 yds., with local intervals which at times attain a width of 19 ft. (at the High Blinkert, near Haarlem). The steepness of the dunes on the side towards the sea is caused by the continual emigration of sand from the sea, and is the result of the ebb and flow of the tides, which (at mean tide has a velocity of 14 or 15 in. per second), and to the strong west or north-west winds which carry off large quantities of material. This alteration of coast-line appears at some places, as at Katwijk, more marked. The slope of the dunes behind the dunes now crops out on the shore amid the sand, being pressed to the compactness of lime by the weight of the sand drifted over it. Again, the remains of the Roman camp Bitterbuiten on the North Sea coast of the province of South Holland was found covered by sand. The original extent of the dunes was, however, considerably greater, as the sand has, at some places, been removed by man. The tendency of the dunes to drift off on the landward side is prevented by the planting of bent-grass (Arundo arenaria), whose roots serve to bind the sand, and the further protection afforded by the cliffs. The ebb and flow of the tides is also modified by the dunes on account of the rapidity with which they are formed, their firmness, their steepness, and their saltiness. The numerous springs at the base of the dunes are of the utmost value to the great cities situated on the marly soil inland, the example set by Amsterdam in 1653 in supplying itself with this water having been followed by the other towns of the province of South Holland.

As already remarked, the coast-line of Holland breaks up into a series of islands at its northern and southern extremities. The principal of these islands is North and South Beemster, the latter of which leads past the chain of the Frisian Islands into the large inland sea or gulf called the Zuider Zee, and the Wadden or "shallows," which extend along the shores of Friesland and Groningen. The Wadden and Zuider Zee, as the Dutch call the whole of this tract, consist of an accumulation of sand covering the tidal flats of the Zuider Zee, which are, in common with the adjacent districts, periodically flooded by the sea. The Zuider Zee is thus the largest lake in the Netherlands, containing 1,881,000 acres, while the extent of the Wadden passes is about 280,000 acres. The principal mouths of the Zuider Zee are the Zuider Zee and the Vlie, which extend far up towards the cities of Rotterdam and Delft. The Zuider Zee is remarkably picturesque; it is remarkable for the abundance of its fish and their beauty of situation, on which last account the Udderdemeer in Gelderland is also celebrated. The Rockanje Lake near Brielle is remarkable for the strong salty solution which covers even the growing reeds with a

1 The datum plane, or basis of the measurement of heights, is throughout Holland, and also in some of the border districts of Germany, the Amsterdam Peil (A.P.), or Amsterdam water-level, and presents the average level of the Vissersvaart at Amsterdam at the time when it was still open to the Zuider Zee. Local and provincial "peils" are, however, also in use on some waterways.

HOLLAND

589

Grasses begin to grow. Upon these clay-lands (bouwders) horses, cattle and sheep are at last able to pastur at low tide, and in course of time they are brought to market.

River dikes are as necessary as sea dikes, elevated banks being found only in a few places, as on the Lower Rhine. Owing to the unsuitability of the foundations, Dutch dikes are usually marked by a great width, which at the crown varies between 13 and 26 ft. The height of the dike ranges from 40 in. above high water-level. Between the dikes and the stream lie "forelands" (interwaarden), which are usually submerged in winter, and frequently lie 1 or 2 yds., higher than the country without dikes. These forelands also offer in course of time an opportunity for the growth of dunes. Hence the towns of Rotterdam, Schiedam, Vlaardingen and Maasluis have all gradually extended over the Maas dike in order to keep in touch with the river, and the small town of Delftshaven is built altogether on the outer side of the same dike.

Impoldering.—The first step in the reclamation of land is to "impolder it", or convert it into a "polder" (i.e. a section of artificially drained land), by surrounding it with dikes or quays for the twofold purpose of protecting it from all further inundation from outside and of controlling the amount of water inside. Impoldering for its own sake is not always necessary, for where the ground-water was wasted and it was found that the outer layer of ground-water, which was not carried on an unnecessary menace to the neighbouring lands, and also that a more enduring source of profit lay in the bed of the fertile soil underneath the peat. It became usual, therefore, to make a step towards subsequent drainage by enclosing a considerable area of land by a dike or dike-wall, or sometimes several dike-walls, and carrying the peat from it, this condition being established by declaration in 1595.

Drainage.—It has been shown that the western provinces of Holland may be broadly defined as lying below sea-level. In fact the surface of the sea-clay in these provinces is from 11\(\text{f}^\text{f}\) to 16\(\text{f}^\text{f}\) below the Amsterdam zero. The ground-water is, therefore, relatively very high and the capacity of the soil for further absorption is naturally very low. But the removal of the surface clay and the presence of the reservoir capacity of the polder, as well as to conduct the water to the windmills or engines, it is intersected by a network of ditches cut at right angles to each other, and these of ditches usually one-third of the area to be drained. In modern times pumping engines have replaced windmills, and the typical old Dutch landscape with its countless hooded dikes and swinging arms has been greatly transformed by the advent of the chimney stacks of the pumping-stations. The power of the pumping-engines is taken on the basis of 12 h.p. per 1000 hectares for every metre that the water has to be raised, or 4 h.p. per another form, the engine being capable of raising nearly 9 ft of water through 1 yd. per acre minute. The main canals, or canals, afterwards also serve as a means of navigation. The level at which it is desired to keep the water in these ditches constitutes the "land-water-level" for the polder, which, in the case of a polder's "sommer peil" (Z.P.) or summer-water-level. In pasture-polders (bouwpolders) Z.P. is 1 to 1\(\frac{1}{2}\) ft. below the level of the polder, and in agricultural polders 2 to 3\(\frac{1}{2}\) ft. below. Owing to the shrinkage of the ground-water it is often necessary to regrade the land after a few or other reclamation, the sides of the polder are often higher than the middle, and it is necessary by means of small dikes or sluices to make separate water-tight compartments (afpolderingen), each having its own unit of measurement. Some polders also have a winter peil as a precaution against the increased fall of water in that season. The summer-water-level of the pasture-polder is usually 1 ft. above the Amsterdam zero, but in the Noorderkwartier to the north, it reaches 10\(\frac{1}{4}\) ft. below A.P. in the Beschotl polder, and in reclamed lands (droogmakijken) may be lowered, thus in the Reeuwijck polder north of Couda it is 2\(\frac{1}{2}\) ft. below.

The drainage of the country is effected by natural or artificial means, according to the slope of the ground. Nearly all the polders of Zeeland and South Holland are able to discharge naturally into the sea at average low water, self-regulating sluices being used. But in North Holland and Utrecht on the contrary the polder water has generally to be removed by engines. In some of the marshlands where the water cannot be brought to the required height at once, windmills are found at two or even three different levels. The final removal of polder water, however, is only truly effected by an interchange of old and new water. If the new water is high, as is the case in South Holland, to the level of the large rivers freely communicating with it; and this happens with but a small proportion of Dutch polders, such as those of Zeeland, the water is allowed to fall into the sea in the process of impoldering extended, the small sluggish rivers were gradually cut off by dikes from the marshy lands through which they flowed, and by sluices from the waters with which they communicated. Their level ranges from about 1\(\frac{1}{2}\) to 6 ft. above that of the pasture polders. In addition, various kinds of canals

DIKES: DRAINAGE
and endikied or embanked lakes had come into existence, forming altogether a vast network of more or less stagnant waters. These waters are utilized as the temporary reservoirs of the superfuous water which falls in summer and autumn. In the winter season, the waters of the North Sea or the Zuider Zee are discharged by one or more sluices, and the resulting waters are utilized to fill the canals and the ditches. This is the usual case where there is a great difference in height between the surface of the boezem and the outer waters, and may be illustrated by the Afsluiswaard and the Rotte boezem in the province of Zuid-Holland. The sluice-gates in the Haringvliet barrier, on the other hand, are ordered to be opened as the necessity arises. In the latter case, the water in the canals and boezemen is allowed to run back into the polders, and so serve a double purpose as water-reservoirs. Boezemen, like ditches and canals, are certain water-lake basins which have been formed for the convenience of labour and self-sacrifice involved in the making of this complete and harmonious system of combined defence and reclamation. Boezemen are better imagined than described, and even at the present day there are still many parts of the country where they are almost unknown.

Geology.—Except in Limburg, where, in the neighbourhood of Maastricht, the upper layers of the chalk are exposed and followed by Oligocene and Miocene beds, the whole of Holland is covered by a considerable thickness, beneath which deep borings have revealed the existence of Pliocene beds similar to the "Crag" of East Anglia. They are divided into the Diestien, corresponding in part with the English Coraline Crag, the Scaldstein and the Holocene, or Holocene Crag. The lower group is the Amstelien corresponding with the Red Crag of Suffolk.

In the south of Holland the total thickness of the Pliocene series is only about 30 ft. In the provinces of Utrecht and Gelderland, it is more, and increases as we go northwards. This is not due to the fact that the bed of the Pliocene was not reached by the borings, but that the lower sands are more easily detachable. The thickness of the upper group of the Quaternary series is also greater in the north, probably because the Pleistocene sea gradually retreated towards the North Sea. The borings in the province of West Friesland have not penetrated this sea. The sands and gravels, which are composed of the same kind of material as the higher beds, are more sandy, and do not contain the large pebbles of which the sands of the lower beds are composed. The sands are more nearly of the same depth as the gravel beds. As a rule, the deposits of the Pleistocene period are in the neighborhood of the ancient sea, whereas those of the Pliocene are in the neighborhood of the ancient river-bed.

Climate.—Situated in the temperate zone between 50° and 53° N., the climate of Holland shows a difference in the lengths of day and night extending in the north to nine hours, and there is a correspondingly wide range of temperature: it also belongs to the region of variable winds. On an average of fifty years the mean annual temperature was 49° Fahr.; the maximum, 93° Fahr.; the minimum, 9° Fahr. The mean annual pressure is 29.93 in.; the mean annual moisture, 81%; the mean annual rainfall, 29.97 in. The mean annual number of days with rain is 204, with snow 19, and with thunder-storms 38. The increased rainfall nearly the whole province. It sometimes happens that a polder is not in direct contact with the boezem to which it belongs, but first drains into an adjacent polder, from which the water is afterwards removed. In the same way, some boezemen discharge first into a neighboring lake, and then into the sea. It is, however, the usual case where there is a great difference in height between the surface of the boezem and the outer waters, and may be illustrated by the Afsluiswaard and the Rotte boezem in the province of Zuid-Holland.

Fauna.—In the densely populated Netherlands, with no extensive forests, the fauna does not present any unusual varieties. The otter, martin, and badger may be mentioned among the rarer wild animals, although near the accessibility of the farmer, or in confined localities, cannot but exercise an influence on the character and temperament of the inhabitants. Only of certain districts, e.g., Friesland, can it be said that they are specially worthy of this category because some parts of the Holland provinces, Zeeland, and Friesland, where the inhabitants are exposed to the exhalations from the marshy ground, and the atmosphere is often burdened with pestilence.

Flora.—The flora may be most conveniently dealt with in the four physiological divisions to which it belongs. These are, namely, the dry-land, or sand-winnowed, dunes; the dune-forests, or mixed woods; the coastal marshes, or marsh-grasses; and the low or grassy land. The dunes are divided, and as in the polder this level may vary in the different parts of an extended boezem. The height of the boezem peil ranges between 1 ft. above to 1 ft. below the Amsterdam zero, though the average is about 1 ft. below. Some boezemen, again, which are less easily controlled, have a "danger water-level" at which they refuse to receive any more water from the surrounding polders. The Schie or Dillersboezem of South Holland is of this kind, as also is the Schelde boezem, which is not accompanied by any corresponding water-level. The different parts of these boezemen are characterized by a great variety of low shrubs and grasses, which are very important in the irrigation works, and which are divided into Koppelaarsen and Boshoenders. The first have a yellow blossom, resembling the "yellow legs" of the dunes, and the latter, which have a green blossom, are found chiefly around the canals and in the salt marshes.

The climate in the province of Zuid-Holland is very similar to that of the other parts of the Netherlands, as the country is almost entirely low lying. The difference of temperature is very small, and the climate is characterized by a great prevalence of rain during the summer months. The summers are comparatively cool, and the winters are generally mild. The rainfall is also much greater than in any other part of the country, and the winters are much colder than in the southern provinces. The province of Zuid-Holland is very fertile, and is divided into a number of districts, each of which has its own peculiarities. The western part of the province is the most fertile, and is the most densely populated, while the eastern part is less fertile and more thinly populated. The province of Zuid-Holland is also very rich in waterfalls and rivers, and is the scene of much water-power.
The extremes of density of population are found in the provinces of North Holland and South Holland on the one hand, and Drente on the other. This divergence is partly explained by the difference of soil—which in Drente comprises the maximum of waste lands, and in South Holland the minimum—and partly also by the greater facilities which the seaward provinces enjoy of internal communications, and the greater variety of their industries. The largest towns are Amsterdam, Rotterdam, The Hague, Utrecht, Groningen, Haarlem, Arnheim, Leiden, Nijmegen, Tilburg. Other considerable towns are Dordrecht, Maastricht, Leeuwarden, Zwolle, Delft, 's-Hertogenbosch, Schiedam, Deventer, Breda, Apeldoorn, Helder, Enschedé, Gouda, Zaandam, Kampen, Hilversum, Flushing, Amersfoort, Middelburg, Zutphen and Alkmaar. Many of the smaller towns, such as Assen, Enschedé, Helmond, Hengelo, Tiel, Venlo, Vaarderingen, Zaandam, Yerseke, show a great development, and it is a noteworthy fact that, in the smaller municipalities, the control of the waterways and canals, on account of the diminution in the number of the inhabitants, has been more often attained than in the larger towns.

The canal system of Holland is peculiarly complete and extends into every part of the country, giving to many inland towns almost maritime appearance. The united length of the canals and waterways exceeds 5,000 m. As a matter of course the smaller streams have been largely utilized in their formation, while the necessity for a comprehensive drainage system has also contributed in no small degree. During the years 1815-1830 a large part of the extension in Holland was carried out by King William I, who, in 1821, commissioned a canal to be carried out, the following canals, among others, coming into existence in that period: the North Holland ship canal (4 miles) from Amsterdam to the Amstel, the Grift canal between Apeldoorn and Harderwijk, the Kollumvaart connecting Zwolle with the Ysel, (the Kuyd Willemaarsvaart, or South William's canal (6 ft), from 's-Hertogenbosch to Maarsch, and the Terneuzen-Ghent ship canal. After 1839 the canal programme was again taken up by the state, which alone or in conjunction with the provincial authorities constructed the Apeldoorn-Dieren canal (1859-1869), the drainage canals of the "Feel" marsh in North Brabant, and of the eastern provinces. The Schelde (1850) and the Rhine (1853-1858) were drained. The IJssel, the Emel, the Heereweg, the Alme (1851-1858) and Oversijl (1848-1848) canals from Zwolle, Deventer and Alme to Koervorden, and the Stich Rijn and Emmel (1869, 1870 and 1881-1889) canals in Drente, the Nijmegen (1859) and the Groningen-Ems (1866-1876) ship canal from the Nijmegen to Delfzyl, and the New Merwed, and enlarged the canal from Haringvliet to the Ems at Zuid Zee. The Groningen-Rotterdam and Amsterdam, called the New Waterway and the North Sea canal respectively, were constructed in 1856-1872 and cost £5,000,000, and 3 million pounds sterling, the former by widening the channel of the Schier north of Rosendaal, and cutting across the Hook of Holland, the latter by utilizing the bed of the Y and cutting through the dunes at Ymuiden. In 1876 an agreement was arrived at with Germany for connecting the important drainage canals in Oversijl, Drente and Groningen with the Ems canal system, as a result of which the Almelo-Noordoostpolder (1862-1867) and the Haren-Mattenspolder (1868) came into existence.

The canals differ in character in the different provinces. In Zeeland they connect the towns of the interior with the sea or the river mouths; for example, the one from Middelburg to Veere and Flushing (1866-1876), from Goes to the East Scheldt, and Zierikzee also to the East Scheldt. The South Beveland (1862-1866) canal connects the East and West Scheldt; similarly in South Holland, the canal unites the Haringvliet with the New Maas, which does not allow large vessels to sail. In addition, the Zuiderzee is still navigable, while owing to the banks and shallows in front of Hellevoetsluis the New Waterway was cut to Rotterdam. Of another character is the construction of the transcontinental railway lines from Amsterdam, the Lek, at Vianen by means of the Linge with the Merwede at Gorkum. Amsterdam is connected with the Lek and the Zederik canal, and the Vecht and the Vaart Rhine (1881-1883; depth 2-3 ft). Again, a railway runs parallel below the canals in North Brabant, and the east and north-east of Holland where, in the absence of great rivers, they form the only waterways which render possible the drainage of the fields and the export of peat; and unite the lesser streams with each other. Thus in Overijssel, in addition to the canals already mentioned, the Dedemsvaart connects the Vecht with the Zwaarte Water near Hasselt; in Limburg the Sint Jansklooster, the Smidenvijver, and the Meppel and the Linge with Meppel, and receives on the eastern side the drainage canals of the Drente fens, namely, the Orange canal and the Hoogeveen (1857-1862); 1858 it communicates with the Lauwers Zee by the Reitdiep (1875-1876), while the Waddenzee-Eecke channel connects the Stadskaanaal, or State canal (1875-1880), bring it in connexion with the flourishing ten colonies in the east of the country as well as those situated in Drente. From Harlingen to the Lauwers Zee there are canals from Leeuwarden to the Lemmer, whence there is a busy traffic with Amsterdam, the Cas, the Nolens, and Kolosels Diep, and the Hoendiep connect it with Groningen.

The construction of railways was long deferred and slowly accomplished. The first line was that between Amsterdam and Haarlem, opened in 1846 by the Holland and Zeeland company. In 1852 the state undertook to develop the railway system, and a company of private individuals was formed to administer it under the title of the Maatschappij tot Exploitatie van Staatsspoorwegen. In 1860, however, the total length of railways was only 208 m., and in that year a parliamentary bill embodying a comprehensive scheme of construction was adopted. By 1872 this programme was nearly completed, and 542 m. of new railway had been added. In 1873 and 1875 a second and a third bill provided for the extension of the railways; at the cost of the state, and, in 1876, 1878 and 1890 laws were introduced to extend the railways and establish a state company, some of which were transferred to the Holland railway. The state railway system was completed in 1892, and since that time the whole of the state railways has been under the control of the state company. These include various local lines such as the line Alkmar-Hoorn (1889), Ede-Bornevedel-Nykerk, Enschedé-Ahaus in Germany (1904), Leeuwarden to Franeker, Harlingen and Dokkum, and the Zwolle-Almelo (junction at Marienberg), Koervorden-Stadskanaal, Veendam-Delfzyl, connecting all the canals in the eastern borders. The electric railway Amsterdam-Zandvoort was opened in 1894. The frame upon which the whole net of national railways may be said to depend is formed of two main lines from north and south and four transverse lines from west to east. They are the longitudinal lines are the railway the Heiderl from Haarlem (1862-1867), Rotterdam (1859-1857), and Zwolle (1869-1877) to Antwerp (1852-1855), belonging to the Holland railway company, and the State railway from Leeuwarden and Groningen (1870) to Meppel (1867) Zwolle (1860)-Arnhem (1865)-Nijmegen (1879)-Venlo (1883)-Maarsch (1865). The four transverse lines belong to the State and Holland railways alternately and are, beginning with the State railway: (1) the line from Haarlem (1872)-Rozendaal (1860)-Tilburg (1866)-Bokstel (whence there is a branch line belonging to the North Brabant and Germany railway company via Vecheel to Goeh in Germany, opened in 1864); (2) the line from Arnhem (1872) to Rotterdam (1865), and Amsterdam (1877) to Eindhoven (1877), (3) the line from Rotterdam-Utrecht (1866-1869) and Amsterdam (1873-1874) to Emmen (1870), a line which was formerly belonging to the Netherlands-Rhine company, but was bought by the state in 1890; and finally (4) the line from Amsterdam-Hilversum-Veenendaal (1873), which is here (4) continued by Deventer, Alme and Hengelo (1886); (5) the line from Utrecht to Venlo (1865-1867), and the Zuid Zee Railway (1873), which is here (4) continued by Veenendaal and Elizabeth to Groland, Germany (1865); (6) via Zutphen, Hengelo (1865), Enschedé (1866) to Groningen, Germany; (c) via Zutphen (1876) and Ruurlo to Winterswyk (1867). Each of these (1) and (2) form the main transcontinental routes in connection with the steamboat service to England (ports of Queenborough and Harwich respectively). Two other lines of these latter belonging to the state, also traverse the country west to east, namely, the line Roden-Groningen (1880); and the line Roden-Nijmegen, and in the extreme north, the line from Harlingen through Leeuwarden (1865) and Groningen (1866) to the border at Denmark. The railways (1865), and the Amsterd-Zaandam (1878) is connected with the ferry across the Zuider Zee to Stavoren, from where the railway line to Leeuwarden (1885); the Netherlands Central railway, Utrecht-Amersfoort-Zwolle-Kampen (1863); and the line Utrecht-'s-Hertogenbosch-Zwolle (1865), which are the principal south-eastern lines bought in 1898 from the Grand Central Belge railway, namely, via Tilburg to Turnhout (1867), and via Eindhoven (1866) to Hasselt. Since 1877 railway communication has been largely supplemented by the tramways, which have been constructed in connection with the railways across the country on special embankments, while one of them is

1The dates indicate the period of construction of the different sections.
carried across the river Yssel at Doesburg on a pontoon bridge. The state first began to encourage the construction of these local light fathoms in the seventeenth century. The most prominent lines have come into existence, such as Pernemerd—Alkmaar (1898), Zutphen—Emmerich (1902), along the Oudeemsy in Overijssel (1902), from Ede to Twente, and via Breda to the Scheld and the Maas. Brouwershaven and Schiedam (1900). An electric tramway connects Haarlem and Zandvoort. The number of passengers carried by the steam-tramways is relatively higher than that of the railways. The value of the goods traffic is not so high, owing, principally, to the want of intercommunication between the various lines on account of differences in the width of the gauge.

Agriculture.—Waste lands are chiefly composed of the barren stretches of heaths found in Drente, Overijssel, Gelderland and North Brabant. They formerly served to support large flocks of sheep and some cattle, but are gradually transformed by the planting of woods, as well as by strenuous efforts at cultivation. Zeeland and Groningen are the two principal agricultural provinces, and after them follow Limburg, North Brabant, Gelderland and South Holland. The chief products of cultivation on the heavy clay soil are oats, barley and wheat, and on the sand-grounds rye, buckwheat and potatoes. Flax and beetroot are also cultivated on the clay lands. Tobacco, hemp, hops, colza and chicory form special cultures. With the possible exception of oats, the cereals do not suffice for home consumption, and maize is imported in large quantities for cattle-feeding, and barley for the distilleries and breweries. Horticulture and market-gardening are of a high order, and flourish especially on the low fen soil and geest grounds along the coast of the West Frisian in the provinces of North and South Holland. The principal market products are cauliflower, cabbage, onions, asparagus, gherkins, cucumbers, beans, peas, &c. The principal flowers are hyacinths, tulips, crocuses, narcissus and other bulbous plants, the total export of which is estimated at over £200,000. Fruit is everywhere grown, and there is a special cultivation of grapes and figs in the Westland of South Holland. The woods, or rather the plantations, covering 6% consist of (1) the so-called forest timber (opgoandhout; Fr. arbres de haute forêt), including the beech, oak, elm, poplar, birch, ash, willow and coniferous trees; and (2) the coarse wood (akkermaal or hakimaal), embracing the elder, willow, beech, oak, &c. This forms no unimportant branch of the national economy.

With nearly 35% of the total surface of the country under permanent pasture, cattle-breeding forms one of the most characteristic industries of the country. The provinces of Friesland, North and South Holland, and Utrecht take the leading place, and the chief breeds both in Friesland and in the other provinces are the hardier kind of cattle and large numbers of sheep are kept upon the heath-lands in the eastern provinces, which also favour the rearing of pigs and bee-culture. Horse-breeding is most important in Friesland, which produces the well-known black breed of horse, commonly used in funeral processions. Goats are most numerous in Gelderland and North Brabant. Poultry, especially fowls, are generally kept. Stock-breeding, like agriculture, has considerable importance to the state, and is a province (formed on the state and provincial), which grants subsidies for breeding, irrigation of pasture-lands, the importation of finer breeds of cattle and horses, the erection of factories, for dairy products, schools, &c., and gives a considerable impetus to the growth of the industries. The chief manufacturing districts are Amsterdam, Eindhoven, Rotterdam, and Veere. On the canals and rivers are a great number of large warehouses, which give a market to nearly all the produce of the country; and on the canals, and from the quantity of produce brought to the public market. In connexion with this traffic there is a large fleet of tug boats; but steam- or petroleum-propelled barges are becoming more common. Some of the lighters used in the Rhine transport trade have a capacity of 3000 tons. A great part of the commercial business at Rotterdam belongs to the commission and transit trade. The other principal ports are Flushing, Terneuzen (for Belgium), Harlingen, Delfzyl, Ter Apel, and Brouwershaven in Zeeland, Groning, den Helder, Middelburg, Vlaardingen. Among the national mail steamship services are the lines to the East and West Indies, Africa and the United States. An examination of its list of goods and industrial imports shows how Germany, via its colonies its spiceries, coffee, sugar, tobacco, indigo, cinamon; from England and Belgium its manufactures and coal; petroleum, raw cotton and cereals from the United States; grain from the Baltic provinces, Archangel, and the ports of the Black Sea; timber from Norway and the basin of the Rhine, yarn from England, wine from France, hops from Bavaria and Alsace; iron-ore from Sweden; and its commercial intercourse with Russia, Germany, its agricultural produce to the London market, its fish to Belgium and Germany, and its cheese to France, Belgium and Hamburg, as well as England. The bulk of trade is carried on with the United States, Russia, England, France, and other countries of the United States, &c. In the last half of the 19th century the total value of the foreign commerce was more than trebled.

Fishing.——The fishing industry of the Netherlands may be said to have been in existence already in the 13th century, and in the following century received a considerable impetus from the discovery how to cure herring by William Beukelaer, a Zeeland fisherman. It steadily declined during the 17th and 18th centuries, but again began to revive in the last half of the 19th century. The fisheries are commonly divided into four particular fishing areas, namely, the Zuiderzee, the Waddensy, the South Holland and Zeeland waters. The deep-sea fisheries may be further divided into the so-called "green" or "salt-herring" fisheries during the summer and autumn, and the "fresh-herring" fishery, chiefly pursued at Scheveningen, Katwijk and Noordwijk. The value of the herring fisheries to the state is considerable, as considerable are the exports of salted fish being considerable. In the winter the largest boats are laid up and the remainder take to line-fishing.

Middelharnis, Pernis and Zwartewaard are the centres of this branch of fishery, which yields haddock, cod, ling and haddock. The trawl fisheries on the coast yield sole, plaice, turbot, brill, skate, &c., of which large quantities are also caught. The Zee small herring, flat fish, anchovies and shrimps are caught, the chief fishing centres being the islands of Texel, Urk and Wieringen. There are also important fisheries for salmon, perch and pike are caught in the Maas, the Lek and the New Merwede. The oyster-beds and salmon fisheries are largely in the hands of the state, which lets them to the highest bidder. Large quantities of herrings are caught in the Wadden sea. The fisheries not only supply the great local demand, but allow of large exports.

Manufacturing Industries.——The mineral resources of Holland give no encouragement to industrial activity, with the exception of the coal-mining in Limburg, the smelting of iron ore in a few furnaces in Overijssel and Gelderland, the use of stone and gravel in the making of dikes and roads, and of clay in brickworks and potteries, the quarrying of stone at St Petersberg, &c. Nevertheless, the industry of the country has developed in a remarkable manner since the separation from Belgium. The greatest activity is shown in the cotton industry. This flourishing especially in the Twente district of Overijssel, where jute is also worked into sacks. In the manufacture of woollen and linen goods Tilburg ranks first, followed by Leiden, Utrecht and Eindhoven; that of half-woollens is best developed at Roermond and Helmond. Other branches of industry include carpet-weaving at Deventer, the distillation of brandy, gin and liqueurs at Schiedam, Rotterdam and Amsterdam, and beer-brewing in most of the principal towns; shoe-making and leather-tanning in the Langstraat district of North Brabant; and knitting at Apeldoorn and in Utrecht; and in Limburg; the manufacture of earthenware and faience at Maasbracht, the Hague and Delft, as well as at Utrecht, Pernemerd and Makkum; clay pipes and stearine candles at Gouda; margarine at Osch; chocolate at Weesp and on the Zaan; mat-plaiting and broom-making at Genemuiden and Blokzuy; diamond-cutting and the manufacture of quinine at Amsterdam; and the making of cigars and snuff at Eindhoven, Amsterdam, Utrecht, Kampen, &c. Shipbuilding is of no small importance in Holland, not only in the greater, but also in the smaller towns along the rivers and canals. The principal shipbuilding yards are at Amsterdam, Kinderdijk, Rotterdam and Flushing, where is a permanent dockyard for building warships.

Trade and Shipping.——To obtain a correct idea of the trade of Holland, greater attention should be paid to the traffic of other countries must be paid to the inland traffic. It is impossible to state the value of this in definite figures, but an estimate may be possible of the whole of the large and small goods the traffic on the canals, and from the quantity of produce brought to the public market. In connexion with this traffic there is a large fleet of tug boats; but steam- or petroleum-propelled barges are becoming more common. Some of the lighters used in the Rhine transport trade have a capacity of 3000 tons. A great part of the commercial business at Rotterdam belongs to the commission and transit trade. The other principal ports are Flushing, Terneuzen (for Belgium), Harlingen, Delfzyl, Ter Apel, and Brouwershaven; Amsterdam, Groningen, den Helder, Middelburg, Vlaardingen. Among the national mail steamship services are the lines to the East and West Indies, Africa and the United States. An examination of its list of goods and industrial imports shows how Germany, via its colonies its spiceries, coffee, sugar, tobacco, indigo, cinnamon, from England and Belgium its manufactures and coal; petroleum, raw cotton and cereals from the United States; grain from the Baltic provinces, Archangel, and the ports of the Black Sea; timber from Norway and the basin of the Rhine, yarn from England, wine from France, hops from Bavaria and Alsace; iron-ore from Sweden; and its commercial intercourse with Russia, Germany, its agricultural produce to the London market, its fish to Belgium and Germany, and its cheese to France, Belgium and Hamburg, as well as England. The bulk of trade is carried on with the United States, Russia, England, France, and other countries of the United States, &c. In the last half of the 19th century the total value of the foreign commerce was more than trebled.

Constitution and Government.——The government of the Netherlands is regulated by the constitution of 1815, revised in 1848 and 1887; under which the sovereign's person is inviolable and
the ministers are responsible. The age of majority of the sovereign is eighteen. The crown is hereditary in both the male and the female line according to primogeniture; but it is only in default of male heirs that females can come to the throne. The crown prince or heir apparent is the first subject of the sovereign, and bears the title of the prince of Orange. The sovereign alone has executive authority. To him belong the ultimate direction of foreign affairs, the power to make treaties and alliances, and to dissolve one or both chambers of parliament, the supreme command of the army and navy, the supreme administration of the state finances and of the colonies and other possessions of the kingdom, and the prerogative of mercy. By the provisions of the same constitution he establishes the ministerial departments, and shares the legislative power with the first and second chambers of parliament, which constitute the states-general and sit at the Hague. The heads of the departments to whom the especial executive functions are entrusted are eight in number—ministers respectively of the interior, of "water-stat," trade and industry (that is, of public works, including railways, post-office, &c.), of justice, of finance, of war, of marine, of the colonies and of foreign affairs. There is a department of agriculture, but without a minister at its head. The heads of departments are appointed and dismissed at the pleasure of the sovereign, usually determined, however, as in all constitutional states, by the will of the nation as indicated by its representatives.

The number of members in the first chamber is 50, South Holland and the town of Amsterdam are each entitled to 12, Brabant and Gelderland each 6, Friesland 4, Overijssel, Limburg and Groningen each 3, Zeeland, Utrecht and Drente each 2. According to the fundamental law (Grondwet) of 1887, they are chosen by the provincial states, not only from amongst those who bear the greatest burden of direct taxation in each province, but also from amongst great functionaries and persons of high rank.

Those deputies who are not resident in the Hague are entitled to receive 166. 8d. a day during the session. The duration of parliament is nine years, a third of the members retiring every three years. The retiring members are eligible for re-election. The members of the second chamber are chosen in the electoral districts by all capable male citizens not under 23 years of age, who pay one or more direct taxes, ranging from a minimum of one guilder (18. 8d.) towards the income tax. The number of members is 100, Amsterdam returning 9, Rotterdam 5, the Hague 3, Groningen and Utrecht 2 members each. Members must be at least thirty years old, and receive an annual allowance of 1,666, besides travelling expenses. They only, and the governor, may initiate all laws, and make amendments. Their term is four years, but they are re-eligible. All communications from the sovereign to the states-general and from the states to the sovereign, as well as all measures relating to internal administration or to foreign possessions, are first submitted to the consideration of the council of state, which consists of 14 members appointed by the sovereign, who is the president. The state council also has the right of making suggestions to the sovereign in regard to subjects of legislation and administration.

The provincial administration is entrusted to the provincial states, which are returned by direct election by the same electors as vote for the second chamber. The term is for six years, but one-half of the members retire every three years subject to re-election or renewal. The president of the assembly is the royal commissioner for the province. As the provincial states only meet a few times in the year, they name a committee of deputy-states which manages current general business, and at the same time exercises the right of control over the affairs of the communes. At the head of every commune stands a communal council, whose members must be not under 25 years of age, and who are chosen for four years (the council retiring every two years) by the same voters as for the provincial states. Communal franchise is further restricted, however, to those electors who pay a certain sum to the communal rates. The number of councillors varies according to the population between 7 and 45. One of the special duties of the council is the supervision of education. The president of the communal council is the burgomaster, elected by the council (one for each six years, and receives a salary varying from 400 to over 1,600. Provision is made for paying the councillors a certain fee—called "presence-money"—when required. The burgomaster has the power to suspend any of the council's decrees for 30 days. The municipality power is vested in a board of two counselors and two or four magistrates (wethouders) to be chosen by and from the members of the council. The provinces are eleven in number.

Constitutional Defence.—The home defence system of Holland is a militia with strong cadres based on universal service. Service in the "militia" or 1st line force is for 8 years, in the 2nd line for 7. The 1st line force is made up of long or short period cadres. The man strength under arms in the summer is about 35,000, of whom half are permanent cadres and half militia. In 1908 12,300 of the permanent cadres were aged 18–26, and of the militia men aged 17–25, 5,200 for four months. The war strength of the militia is 105,000, that of the second line or reserve 70,000. The defence of the country is based on the historic principle of concentrating the people and their resources in the coastal and port districts of the country and the coast belt. The chosen line of defence is marked by a series of forts which control the sluices, extending from Amsterdam, through Muiden, thence along the Veerl and through Utrecht to Ginneken (Gorkum) on the Waal. The line continues thence by the Hollandse Diep and Volkerak to the sea, and the coast also is fortified. The army in the colonies numbers in all about 26,000, all permanent troops and for the most part voluntarily enlisted European regulars. The military expenditure in 1908 was 2,331,255. The Dutch navy at home and in Indian waters consists (1909) of eight ships of the line, and 31 cruisers and destroyers, besides about 8,600 officers and men of the navy and about 2,250 marines. Recruitment is by voluntary enlistment, with contingent powers of conscription amongst the maritime population.

The administration is entrusted (1) to the high council (hooge raad) at the Hague, the supreme court of the whole kingdom, and the tribunal for all high government officials of the province (2) to the provincial council, and town and city (3) to the council of justice established at Amsterdam, the Hague, Arnhem, Leeuwarden and 's Hertogenbosch; (4) to tribunals established in each arrondissement; (4) to cantonal judges appointed over a group of communes, whose jurisdiction is restricted to claims of small amount (under 200 gilders), and to breaches of police regulations, and who at the same time look after the interest of minors. The high council is composed of 12 to 14 councilors, who perform general administrative, advocates-general. Criminal and correctional procedure were formerly divided between the courts of justice and the arrondissements tribunals; but this distinction was suppressed by the penal code of 1866, thereby increasing the importance of the arrondissements courts, which also act as court of appeal of the cantonal courts.

Besides the prisons, which include one built on the cellular principle at Breda, the state supports three penal workhouses for drunkards and beggars. There are also the penal colonies at Veendam in Drenthe, which were brought from the Society of Charity (Maatschappij het nut van't algemeen, 1785), whose efforts have been mainly in the direction of the improvement of the colony system for the various branches of agriculture, as well as various industries for supplying all the requirements of the colony. The objection raised against these institutions is that they do not free the vagoon-bondage of the country, but a class of more or less voluntary inmates. Children under 16 years of age are placed in the three state reformatories, and there is an institution for vagabond women at Rotterdam.

Charitable and other Institutions.—Private charities have always occupied a distinguished position in the Netherlands, and the principle of the law of 1854 concerning the relief of the poor is, that the state shall only interfere when private charity fails. All private and religious institutions have to be inscribed before they can collect public funds. In some cases these institutions are organized and administered conjointly with the civil authorities. At the head of the charitable institutions stand the agricultural colonies belonging to the Society of Charity (see DRENTE). Of the numerous institutions for the encouragement of the sciences and the arts, the following are of the most important: the Institute of Sciences (1858), the Royal Netherlands Meteorological Institute (1854), the National Academy of the Plastic Arts, the Royal School of Art in the National Archives, the Historical Society, the Institute for Artworks, the Geological Society, the Nautical Society, the Meteorological Society, the Statistical Society, the Colonial Society, the Institute for the Encouragement of Music at Amsterdam, &c.

Religion.—Religion is one of the most characteristic traits of the Dutch people, and finds expression in a large number of independent religious congregations. The bond between church
and state which had been established by the synod of Dort (1618) and the organization of the Low-Dutch Reformed Church (Nederlands gereformeerde kerk), as the national church. The latter gradually came to an end in the revolution of 1795, and in the revision of the Constitution in 1814 the complete religious liberty and equality accorded by the constitution of 1813 was the recognition of the present organization of the Reformed Church dates from 1852. It is governed by a general assembly or "synod" of deputies from the principal judicatories, sitting once a year. The provinces are subdivided into "circuits," which have again into congregations (kerken), each comprising from 5 to 25 congregations, and each congregation being governed by a "church council" or session. The provincial synods are composed of ministers and elders deputed by the classes; and these synods, composed of the ministers belonging to the latter body and an equal number of elders appointed by the local sessions. The meetings of the circles have no administrative character, but are mere brotherly conferences. The financial management in each congregation is placed in the hands of a special committee, composed of "notables" and "churchwardens." In every province there is besides, in the case of the Reformed Church, a provincial committee and a religious administrative. For the whole kingdom this supervision is entrusted to a common "collegium" or committee of supervision, which meets at the Hague and consists of 11 members named by the provincial committee and 3 chosen by the synod. Some congregations have withdrawn from provincial supervision, and have thus free control of their own financial affairs.

The oldest secession from the orthodox Church is that of the Remonstrants, who still represent the most liberal theological views, and have a considerable following in the Netherlands, especially in Leiden. Towards 1840 a new congregation calling itself the Christian Reformed Church (Christelijke Gereformeerde Kerk) arose as a protest against the government and the modern tendencies of the Reformed Church, their father church, and some time later the Free University of Amsterdam (1880) formed themselves in 1886 into an independent body called the Nederlandsche Gereformeerde Kerk en Evangelisch-Lutherische Bond der Nederlanden (Netherlands Reformed Churches (Gereformeerde Kerken) with the doctrine and discipline of Dort. They have a theological seminary at Kampen. Other Protestant bodies are the Walloons, who, though possessing an independent government, are attached to the Low Dutch Reformed Church; the Lutherans, divided into the main body of Evangelical Lutherans and a smaller division calling themselves the Re-established or Old Lutherans (Herschelde Lutherschen) who separate themselves from the synod; the Mennonites (Mennonieten or confession; the Mennonites founded by Menno Simons of Friesland about the beginning of the 16th century; the Baptists, whose only central authority is the General Baptist Society founded at Am-

sterdam in 1811: the Evangelical Brotherhood of Herrnhutters or Moravians, who have churches and schools at Zeist and Haarlem; and a Catholic Apostolic Church (1867) at the Hague. There are congregations of English Episcopalians at the Hague, Amsterdam and Rotterdam, and German Evangelicals at the Hague (1857) and Rotterdam (1861). In 1853 the Roman Catholic Church, which before had been a mission in the island of papal legation and in the mission-minded province of the Netherlands, added a papal province with five dioceses, namely, the archbishopric of Utrecht and the suffragan bishopric of Haarlem, Breda, 's Hertogenbosch and Roermond, each with its own seminary. Side by side with the Roman Catholic Church there is the Catholic Apostolic or Oud Bischoppelijke Chersche and the Jansenists (see Jansenism). The Old Catholics, with whom the Jansenists are frequently confounded, have their own synod, and are organized at Utrecht, the Old Catholics have bishops at Deventer and Haarlem, and a training college at Amersfoort. They numbered in 1905 about 9000 (see UTRECHT). The large Jewish population in Holland had its origin in the wholesale influx of Portuguese Jews at the end of the 16th, and of German Jews in the beginning of the 17th century. In 1780 they were reorganized under the central authority of the Netherlands Dispotic Church, and, under the heading of "Jewish and "Reformed" congregations, each circi churches. The Roman Catholic element preponderates in the southern provinces of Limburg, and North Brabant, but in Fries-land, Groningen and Drente the Baptists and Christian Reformed are more numerous.

Education.—Every grade of education in the Netherlands is under the control and supervision of the state, being administered by a special department of education, which has under its control the state recognized private denominational schools, and in 1900 passed a law of compulsory attendance. Infant schools, which are generally in the hands of private societies or the municipal authorities, and are subsidized by the state, have been adopted by the Synod of 1889. Primary education is carried on in the ordinary and in continuation schools for boys and girls (co-education having been long in vogue). These schools are established in every commune, the state paying one half of the expense and the other half, which is not in all cases sufficient for the satisfaction of the teachers, being given by the parents. The age of admission is six; and the course is for six years, 7-13 being the legal age limits; the fee, from which poverty exemptions, is almost nominal. Nature-study, as an essential part in the curriculum of these schools, and elementary general history, English, French and German are among the optional subjects. While the boys are instructed in woodwork, needlwork is taught to the girls, its introduction in 1889 having become a national necessity with the growth of the female proletariat. The continuation schools (herholingschoolen) must be organized wherever required, and are generally open for six months in winter, pupils attending for one or four years. Secondary schools were established by the law of 1862, and numerous, the commune of 10,000 inhabitants; they comprise the Burger-Day- and Evening schools and the Higher-Burgher schools. The first named are held in the evening, while the latter belong to the more industrial or agricultural pursuits, the day classes gradually fell into disuse. The length of the course as prescribed by law is two years, but it is usually extended to three or four years, and the instruction, theoretical and practical, is divided into the clerical, commercial, and technical. The municipal authorities have no control over the fees, if any, may not exceed one pound sterling per annum. Special mention must be made in this connexion, of the school of engineering in Amsterdam (1879) and the Academy of Plastic Arts in Rotterdam (1886). The secular or public schools, especially the higher-burgher schools. Among the schools which give specialized instruction, mention must be made of the admirable trade schools (handels- en arbeiders-openbare school) under thedirection of the Hollandische geregereerde Kerk); the trade schools for girls; the fishery schools and schools of navigation; the many private schools of domestic science, and of commerce and industry, among which the municipal school at Amsterdam has the most extended course of instruction and the highest repute. The "Dutch Huis," at Amsterdam (1900). For the education of medical practitioners, civil and military, the more important institutions are the National Obstetrical College at Amsterdam, the Public Military Seminary and the Military Police Academy at The Hague, and the Central Military Institute at Rotterdam, the latter having the character of a military seminary and an intermediate stage between the former two. The Royal Military Physicians at Amsterdam the establishment at Utrecht for the training of military apothecaries for the East and West Indies, the Royal Veterinary College at Utrecht, the Catholic College of the Missions at Utrecht, and the Catholic College of the Missions at Utrecht. There are three state universities in Holland, namely, Leiden (1575), Groningen (1856) and Utrecht (1634). The ancient atheistic Reformed Church, which had been converted from the Roman Catholic religion in 1592, still exists under the name of Utrecht, but that of Amsterdam was converted into a municipal university in 1877. In each of these universities there are five faculties, namely, law, theology, medicine, science and mathematics, and literature and philosophy, the courses for which range from respectively four, five, eight, and six or seven years for the two last named. The fees amount to 200 florins (f16, 13s. 4d.) per annum and are payable for four years. Two kinds of degrees are conferred: namely, the "theological" (theologische) and the "doctor," degrees. Pupils from the higher-burgher schools are only eligible for the first. There is also a free (Calvinistic) university at Amsterdam, founded in 1867, and enjoying, since 1895, the right of con-fering degrees. It has, however, no faculties of law, or science. The state polytechnic school at Delft (1864) for the study of engineering in all its branches, architecture and naval construction, and a number of the courses of the interior training of the "mechanical engi-ner." The fees are the same as those of the universities, and as at the universities there are bursaries. A national institution at Leiden for the study of languages, geography and ethnology of the Indies, which has been recognized as an independent faculty by the state in 1874, and which is known as the "Museum of the Indies and as Delft and at Leiden, founded in 1864 and 1877. The centre of Dutch university life, which is non-residential, is the students' "corps," at the head of which is a "senate," elected annually by the whole student body. This body acts as the "government" of the corps and is gained after a somewhat trying novitiate, but is the only passport to the various social and sports societies. The study of religion for their profession by examination. Under the act of 1898 they are trained either in the state training-colleges, or in state-aided municipal, and private
denominational colleges; or else by means of state-aided courses of instruction. The age of admission to this class of training is from 14 to 18, and the course is for four years. In the last practice year in teaching is obtained at the primary "practice" school attached to each college, and students are also taught to make models explanatory of the various subjects of instruction after the manner of the Swedish Sloyd (Slojd) system. Assistant-teachers wishing to qualify as head-teachers must have had two years' practical experience. Pupil-teachers can only give instruction under the supervision of a certificated teacher. The minimum salary of teachers is determined by law. The teaching, which follows the so-called "Heuristic" method, and the equipment of schools of every description, are admirable.

**Finance.**—The following statement shows the revenue and expenditure of the kingdom for the years 1889, 1900-1901 and 1905:

The total debt in 1905 amounted to £96,764,266, the annual interest amounted to £3,396,550. During the years 1883-1905, £27,416,651 has been devoted to the redemption of the public debt. The total wealth of the kingdom is estimated at 900 million sterlings. The various provinces and communes have separate budgets. The following table gives a statement of the provincial and communal finances:

1 Including various miscellaneous items not specified in detail.
2 Including, besides the ordinary budget, the outlays in payment of annuities, in funding and discharging debt, in railway extension, &c.

**Colleges.**—The Dutch colonies in the Malay Archipelago have an area of 600,000 sq. m., with a population of 23,000, among which are 35,000 Europeans, 319,000 Chinese, 15,000 Arabs, and 19,000 other immigrant Asians. The West Indian possessions of Holland include Dutch Guiana or the government of Surinam, and the Dutch Antilles or the government of Curazao and Aruba. The Kingdom of New Netherlands (St. Eustatius, Sint Eustatius, St. Martin, Curacao, Bonaire, and Aruba), a total area of 60,000 sq. m., with 90,000 inhabitants, of whom a small portion are Europeans, and the rest negroes and other people of colour, and Chinese.

**Bibliography.**—The chief place is due to the following geographical publications: Dr. H. Blink, Nederland en zijne Bevolkers (Amsterdam, 1888-1892), containing a copious bibliography of the "Tegenvoorwoord tot de Nederlandsche kolonieeraar", or "Hollandsch Nieuwe Geschiedenis der Nederlanden", published by the Netherland Geography Society (Amsterdam, 1885, &c.), contains a historical geography of the Netherlands, the "Boek van den Boerestaat en den landbouw in Nederland, H. Blink (Groningen, 1902), and the report on agriculture, published at the Hague by the Royal Commission appointed in 1896, furnish special information in connection with this subject. Of more general interest is the "Hoofdevente", 1858-1898, edited by Dr. H. Ritter (Amsterdam, 1898), containing a series of articles on all subjects connected with the kingdom during the second half of the 19th century, written by specialists; and Les Pays Bas (Leiden, 1869), and La Hollande géographique, ethnologique, politique, &c. (Paris, 1900), both works of the same class as the preceding.

Books of travel include some of considerable topographical as well as literary interest, from Lodovicucciardi (1657) down to Edmondo de Amicis (Holland, translated from the Italian, London, 1882); H. H. Harms, Dead Cities of the Zuider Zee (translated from the French, London, 1876), and D. S. Meldrum, Holland and the Netherlands (London, 1899) in the 19th century. Mention may also be made of Old Dutch Towns and Villages of the Zuider Zee, by W. J. Twyn (translated from the Dutch, London, 1901), Nieuwe Wendingen door Nederland, by J. Craenlaick and P. A. Schippers (Haarlem, 1888); Friesland Meren and through the Netherlands, by T. Middendorp (translated from the Dutch, London, 1899), 1872, the last three books being of considerable value for their line illustrations. Works of historical and antiquarian interest of a high order are Merkwaardige Kastelen in Nederland, by J. van Lennep and W. J. Hofdyk (Leiden, 1881-1884); Noord-Hollandsche Oudheden, by G. van Arkend and A. W. Weisman, published by the Royal Antiquarian Society (Amsterdam, 1891); and Oud Holland, edited by A. A. de Vrie and N. de Roever (Amsterdam, 1883-1886), containing miscellaneous contributions to the history of ancient Dutch art, crafts and letters. The history is covered by various periodical publications of the Royal Zoological Society "Natura Artis Magistra" at Amsterdam, and the "Natuurlijke Historie van Nederland" (Haarlem, 1866-1863) written by specialists, and including ethnology and flora. Military and naval defence may be studied in De vesting Holland, by A. L. W. Schiﬀardt (Utrecht, 1887), and the Handbook of the Dutch Army, by Major W. L. White, R.A. (London, 1896); ecclesiastical history in The Church in the Netherlands, by P. H. Ditchﬁeld (London, 1893); and education in vol. viii. of the Special Reports on Educational Subjects prepared by the Royal Committee of Education, London, 1893-1893, and furnished by the annual publication of the Society for Statistics in the Netherlands, Amsterdam.

**History from 1579 to Modern Times**

The political compact known as the Union of Utrecht differed from its immediate predecessors, the Pacification of Ghent, the Union of Brussels and the Perpetual Edict, in its permanence. The confederacy of the northern provinces of the Netherlands which was effected (20th of January 1579) by the exertions of John of Nassau, was destined to be the beginning of a new national life. The foundation of the Republic of the Netherlands. The history of the Netherlands previous to the confederacy of the northern provinces in 1579 see Netherlands.
Holland

United Netherlands was to be raised. Its immediate results were far from promising. The falling away of the Walloon provinces and the Catholic nobles from the patriot cause threatened it with ruin. Nothing but the strong personal influence and indefatigable labours of the prince of Orange stood in the way of a more general defection. Everywhere, save in Zeeland and steadfast Holland and Zeeland, a feeling of wavering and hesitation was spreading through the land. In Holland and Zeeland William was supreme, but elsewhere his aims and his principles were misrepresented and misunderstood. He saw that unaided the patriotic party could not hope to resist the power of Philip II., and he therefore resolved to gain the support of France by the offer of the sovereignty of the Netherlands to the duke of Anjou. But Anjou was a Catholic, and this fact aroused among the Protestants a feeling that they were being betrayed. But the prince persisted in the policy he felt to be a necessity, and (23rd of Jan. 1581) a treaty was concluded with the duke, by which he, under certain conditions, agreed to accept the sovereignty of the Netherland provinces, except Holland and Zeeland. These two provinces were unwilling to have any sovereign but William himself, and after considerable hesitation he agreed to become their Count (24th of July 1581). He felt that he was justified in taking this step because of the Ban which Philip had published on the 15th of March 1581, in which Orange had been proclaimed a traitor and miscreant, and a reward offered to any one who would take his life. His practical answer to the king was the act of Abjuration, by which at his persuasion the representatives of the provinces of Brabant, Flanders, Holland, Zeeland, Gelderland and Utrecht, assembled at the Hague, declared that Philip had forfeited his sovereignty over them, and that they held themselves henceforth absolved from their allegiance to him. In a written defence, the famous Apology, published later in the year, William replied at great length to the charges that had been brought against him, and carrying the war into the enemy's camp, endeavoured to prove that the course he had pursued was justified by the crimes and tyranny of the king.

The duke of Anjou was solemnly inaugurated as duke of Brabant (February 1582), and shortly afterwards as duke of Gelderland, count of Flanders and lord of Friesland. William had taken up his residence at Antwerp in order to give the French prince his strongest personal support, and while there a serious attempt was made upon his life (March 18th) by a youth named Jean Jaureguy. He fired a pistol at the prince close to his head, and the ball passed under the right ear and out at the left jaw. It was a terrible wound, but fortunately not fatal. Meanwhile Anjou soon grew tired of his dependent position and of the limitations placed upon his sovereignty. He resolved by a secret and sudden attack (17th of January 1583) to make himself master of Antwerp and of the person of Orange. The assault was made, but it proved an utter failure. The citizens resisted stoutly behind barricades, and the French were routed with heavy loss. The "French Fury" as it was called, rendered the position of Anjou in the Netherlands impossible, and made William himself unpopular in Brabant. He accordingly withdrew to Delft. In the midst of his faithful Hollanders he felt that he could still organize resistance, and stem the progress made by Spanish arms and Spanish influence under the able leadership of Alexander of Parma. Antwerp, with St. Aldegonde as its burgomaster, was still in the hands of the patriots and William Parma withdrew, and covered Zeeland from invasion. Never for one moment did William lose heart or relax his efforts and vigilance; he felt that with the two maritime provinces secure the national cause need not be despaired of. But his own days had now drawn to their end. The failure of Jaureguy did not deter a young Catholic zealot, by name Balthasar Gérard, from attempting to assassinate the man whom he looked upon as the arch-enemy of God and the king. Under the pretext of seeking a passport, Gérard penetrated into the Prinsenhof at Delft, and firing point blank at William as he left the dining hall, mortally wounded him (10th of July 1584). Amidst general lamentations "the Father of his Country," as he was called, was buried with great state in the Nieuwe Kerk at Delft at the public charge.

But though the great leader was dead, he had not striven or worked in vain. The situation was critical, but there was no panic. Throughout the revolted provinces there was a general determination to continue the struggle to the bitter end. To make head, however, against the victorious advance of Parma, before whose arms all the chief towns of Brabant and Flanders, Bruges, Ghent, Brussels and lastly—avaliant defence—Antwerp itself had fallen, it was necessary to look for the protection of a foreign ruler. The government, now that the commanding personal influence of William was no more, was without any central authority which could claim obedience. The States-General were but the delegates of a number of sovereign provinces, and amongst these Holland by its size and wealth (after the occupation by the Spaniards of Brabant and Flanders) was predominant. Maurice of Nassau, William's second son, had indeed on his father's death been appointed captain and admiral-general of the Union, president of the Council of State, and stadtholder of Holland and Zeeland, but he was as yet too young, only seventeen, to take a leading part in affairs. Count Hohenlooh took the command of the troops with the title of lieutenant-general. Two devoted adherents of William of Orange, Paul Buys, advocate of Holland, and Johan van Oldenbarneveldt, pensionary of Rotterdam, were the statesmen who at this difficult juncture took the foremost part in directing the policy of the confederacy. They turned first to France. The sovereignty of the provinces was offered to Henry III., but the king, harassed by civil discords in his own country, declined the dangerous honour (1585). Repelled in this direction, the States-General next turned themselves to England. Elizabeth was alarmed by the successes of the Spanish arms, and especially by the fall of Antwerp; and, though refusing the sovereignty, she agreed to send a force of 5000 foot and 2000 horse to the aid of the Provinces under the command of the earl of Leicester, her expenses being guaranteed by the handing over to her the towns of Flushing, Brill and Rammekens as pledges (10th of August 1585). Leicester, on landing in Holland, was in the presence of the States-General and of Maurice of Nassau invested with the title of governor-general and practically sovereign powers (February 1586).

The new governor had great difficulties to contend with. He knew nothing of the language or the character of the people he was called upon to govern; his own abilities both as general and statesman were mediocre; and he was hampered constantly in his efforts by the negligence and changing whims of his royal mistress. In trying to consolidate the forces of the Provinces for united action and to centralize its government, he undoubtedly did his best, according to his lights, for the national cause. But he was too hasty and overbearing. His edict prohibiting all commercial intercourse with the enemy at once aroused against him the bitter hostility of the merchants of Holland and Zeeland, who thrived by such traffic. His attempts to pack the council of State, on which already two Englishmen had seats, with personal adherents and to override the opposition of the provincial states of Holland to his arbitrary acts, at last made his position untenable. The members of the council of Deventer and Zutphen by their English governors, Stanley and York, both Catholics, rendered all Englishmen suspect. The States of Holland under the leadership of Johan van Oldenbarneveldt, took up an attitude of resolute hostility to him, and the States of Holland dominated the States-General. In the midst of these divided councils the important seaport of Sluis was taken by Parma. Utterly discredited, Leicester (6th of August 1587) abandoned the task,
in which he had met with nothing but failure, and returned to England.

Nothing could have been worse than the position of the States at the beginning of 1588. Had Parma had a free hand, in all probability he would have crushed out the revolt and recovered the northern provinces. The attention of the Spanish king was at this time concentrated upon the success of the Invincible Armada.

The army of Parma was held in readiness for the invasion of England, and the United Provinces had a respite. They were fortunately able to avail themselves of it. The commanding abilities of Oldenbarneveldt, now advocate of Holland, gradually gathered into his hands the entire administration of the Republic. He became indispensable and, as his influence grew, more and more did the policy of the provinces acquire unity and consistence of purpose. At the same time Maurice of Nassau, now grown to man's estate, began to display those military talents which were to gain for him the fame of being the first general of his time. But Maurice was no politician. He had implicit trust in the advocate, his father's faithful friend and counsellor, and for many years to come the statesman and the soldier worked in harmony together for the best interests of their country (see Oldenbarneveldt and Maurice, prince of Orange). At the side of Maurice, as a wise adviser, stood his cousin William Louis, stadholder of Friesland, a trained soldier and good commander in the field.

After the destruction of the Armada, Parma had been occupied with campaigns on the southern frontier against the French, and the Netherlanders had been content to stand on guard against attack. The surprise of Breda by a stratagem (8th of March 1590) was the only military event of importance up to 1591. But the two stadholders had not wasted the time. The States' forces had been reorganized and brought to a high state of military discipline and training. In 1591 the States-General, after considerable hesitation, were persuaded by Maurice to sanction an offensive campaign. It was attended by marvellous success. Zutphen was captured on the 20th of May, Deventer on the 20th of June. Parma, who was besieging the fort of Knodsenburg, was forced to retire with loss. Huist fell after a three days' investment, and finally Nijmegen was taken on the 21st of October. The fame of Maurice, a consummate general at the early age of twenty-four, was on Parma's lips. The following campaign was signalized by the capture of Steenwyck and Koeorden. On the 8th of December 1592 Parma died, and the States were delivered from their most reducible adversary.

In 1593 the legator of Geertruidenberg put the seal on Maurice's reputation as an invincible besieger. The town fell after an investment of three months. Groningen was the chief fruit of the campaign of 1594. With its dependent district it was formed into a new province under the name of Stad en Landen. William Louis became the stadholder (see Groningen). The soil of the northern Netherlands was at last practically free from the presence of Spanish garrisons.

The growing importance of the new state was signalized by the conclusion, in 1596, of a triple alliance between England, France and the United Provinces. It was of short duration and purchased by hard conditions, but it implied the recognition by Henry IV, and Elizabeth of the States-General, as a sovereign power, with whom treaties could be concluded. Such a recognition was justified by the brilliant success of the campaign of 1597. It began with the complete rout of a Spanish force of 4500 men at Turnhout in January, with scarcely any loss to the victors. Then in a succession of sieges Rheineburg, Meurs, Groenlo, Bredevoort, Enschede, Ootmarsum, Oldenzaal and Lingen fell into the hands of Maurice.

The relations of the Netherlands to Spain were in 1598 completely changed. Philip II. feeling death approaching, resolved to marry his elder daughter, the Infanta Isabel Clara Eugenia, to her cousin, the Cardinal Archduke Albert of Austria, who had been governor-general of the Netherlands since 1596, and to erect the Provinces into an independent sovereignty under their joint rule. The instrument was executed in May; Philip died in September; the marriage took place in November. The clergy of the United Provinces felt that marriage should have no issue, the sovereignty of the Netherlands was to revert to the king of Spain. The archdukes (such was their official title) did not make their joyeuse entrée into Brussels until the close of 1599. The step was taken too late to effect a reconciliation with the rebel provinces. Peace overtures were made, but the conditions were unacceptable. The States-General never seriously considered the question of giving in their submission to the new sovereigns. The traders of Holland and Zeeland had thriven mightily by the war. Their ships had penetrated to the East and West Indies, and were to be found in every sea. The year 1600 saw the foundation of the Chartered East India Company (see Dutch East India Company). The question of freedom of trade with the Indies had become no less vital to the Dutch people than freedom of religious worship. To both these concessions Spanish policy was irreconcilably opposed.

Dunkirk, as a nest of freebooters who preyed upon Dutch commerce, was made the objective of a daring offensive campaign in 1600 by the orders of the States-General under the influence of Oldenbarneveldt in the teeth of the opposition of the stadholders Maurice and William Louis.

By a bold march across Flanders, Maurice reached Nieuport on the 1st of July, and proceeded to invest it. The archduke Albert, however, followed hard on his steps with an army of seasoned troops, and Maurice, with his communications cut, was forced to fight for his existence. A desperate combat took place on the dunes between forces of equal strength and valour. Only by calling up his last reserves did victory declare for Maurice. The archduke had to fly for his life. Five thousand Spaniards were killed; seven hundred taken, and one hundred and five standards. To have thus worsted the dreaded Spanish infantry in open fight was a great triumph for the States troops and their general, but it was barren of results. Maurice refused to run further risks and led back his army to Holland. For the following three years all the energies alike of the archdukes and the States-General were concentrated on the siege of Ostend (15th of July 1601-20th of Sept. 1604), the last and most important of the Dutch wars. The heroic obstinacy of the defence was equalled by the perseverance of the attack, and there was a vast expenditure, especially on the side of the Spaniards, of blood and treasure. At last when reduced to a heap of ruins, Ostend fell before the resolution of Ambrosio de Spinola, a Genoese banker, to whom the command of the besiegers had been entrusted (see Spinola). A month before the surrender, however, another and more commodious seaport, Sluis, had fallen into the possession of the States army under Maurice, and thus the loss of Ostend was discounted.

Spinola proved himself to be a general of a high order, and the campaigns of 1606 and 1607 resolved themselves into a duel of skill between him and Maurice without much advantage accruing to either side. But the archdukes' treasury was now empty, and their credit exhausted; both sides were weary of fighting, and serious negotiations for peace were set on foot. The dispositions of the Spaniards to make concessions was further quickened by the destruction of their fleet at Gibraltar by the Dutch admiral Heemskerck (April 1607). But there were many difficulties in the way. For peace in the United Provinces heads by Oldenbarneveldt was opposed by the stadholders Maurice and William Louis, the great majority of the military and naval officers, the Calvinist preachers and many leading merchants. The Spaniards on their side were obdurate on the subjects of freedom of trade in the Indies and of freedom of religious worship. At last, after the negotiations had been repeatedly on the point of breaking off, a compromise was effected by the mediation of the envoys of France and England. On the 9th of April 1609
A truce for twelve years was agreed upon. On all points the Dutch demands were granted. The treaty was concluded with the Provinces, "in the quality of free States over whom the archdukes made no pretensions." The uti possidetis as regards territorial possession was recognized. Neither the granting of freedom of worship to Roman Catholics nor the word "Indies" was mentioned, but in a secret treaty King Philip undertook to place no hindrance in the way of Dutch trade, wherever carried on.

One of the immediate results of this triumph of his policy was the increase of Oldenbarneveldt's influence and authority in the government of the Republic. But though Maurice and his other opponents had reluctantly yielded to the advocate's skilful diplomacy and persuasive arguments, a soreness remained between the statesman and the stadtholder which was destined never to be healed. The country was no sooner relieved from the pressure of external war than it was torn by internal discord. After a brief interlude in the affairs of Germany, where the intricate question of the Cleves-Jülich succession was already preparing the way for the Thirty Years' War, the United Provinces became immersed in a hot and absorbing theological struggle with which were mixed up important political issues. The province of Holland was the arena in which it was fought out.

Two professors of theology at Leiden, Jacobus Arminius (see Arminius) and Franciscus Gomarus, became the leaders of two parties, who differed from one another under certain tenets of the abstruse doctrine of predestination. Gomarus supported the orthodox Calvinist view; Arminius assailed it. The Arminians appealed to the States of Holland (1610) in a Remonstrance in which their theological position was defined. They were henceforth known as "Remonstrants"; their opponents were styled "Contra-Remonstrants." The advocate and the States of Holland took sides with the Remonstrants, Maurice and the majority of the States-General (four provinces out of seven) supported the Contra-Remonstrants. It became a question of the extent of the rights of sovereign princes under the Union. The States-General wished to summon a national synod, the States of Holland refused their assent, and made levies of local militia (waard-gelders) for the maintenance of order. The States-General (9th of July 1615) took up the challenge, and the prince of Orange, as captain-general, was placed at the head of a commission to go in the first place to Utrecht, which supported Oldenbarneveldt, and then to the various cities of Holland to insist on the disbanding of the waard-gelders. On the side of Maurice, whom the army obeyed, was the power of the sword. The opposition collapsed; the recalcitrant provincial states were purged; and the leaders of the party of state rights—the advocate himself, Hugo de Groot (see Groots), pensionary of Rotterdam, and Hoogerbeets, pensionary of Leiden, were arrested and thrown into prison. The whole proceedings were illegal, and the illegality was consummated by the prisoners being brought before a special tribunal of 24 judges, nearly all of whom were personal enemies of the accused. The trial was merely a preliminary to condemnation. The advocate was sentenced to death, and executed (13th of May 1619) in the Binnenhof at the Hague. The sentences of Groots and Hoogerbeets were commuted to perpetual imprisonment.

Meanwhile the National Synod had been summoned and had met at Dort on the 13th of November 1618. One hundred members, many of them foreign divines, composed this great assembly, who after 1545 sittings gave their seal to the doctrines of the Netherlands Confession and the Heidelberg Catechism. The Arminians were condemned, their preachers deprived, and the Remonstrant party placed under a ban (6th of May 1619).

In 1621 the Twelve Years' Truce came to an end, and war broke out once more with Spain. Maurice, after the death of Oldenbarneveldt, was supreme in the land, but he missed sorely the wise counsels of the old statesman whose tragic end he had been so largely instrumental in bringing about. He and Spinola found themselves once more at the head of the armies in the field, but the health of the stadtholder was undermined, and his military genius was under a cloud. Deeply mortified by his failure to relieve Breda, which was blockaded by Spinola, Maurice fell seriously ill, and died on the 23rd of April 1625. He was succeeded in his dignities by his younger brother Frederick Henry (see Frederick Henry, prince of Orange), who was appointed stadtholder of Holland, Zeeland, Utrecht, Overysell and Gelderland, captain and adjutant-general of the Union and head of the Council of State. Frederick Henry was as a general scarcely inferior to Maurice, and a far more able statesman. The moderation of his views and his conciliatory temper did much to heal the wounds left by civil and religious strife, and during his time the power and influence of the stadtholderate attained their highest point. Such was his popularity and the confidence he inspired that in 1631 his great offices of state were declared hereditary, in favour of his five-year-old son, by the Acte de Successie. He did much to justify the trust placed in him, for the period of Frederick Henry is the most brilliant in the history of the Dutch Republic.

DURING the reign of Frederick Henry the East India Company, which had founded the town of Batavia in Java as their administrative and trading centre, was enlarged and made many conquests and established a network of factories and trade posts stretching from the Cape of Good Hope to Japan (see Dutch East India Company). The West India Company, erected in 1621, though framed on the same model, aimed rather at waging war on the enemies' commerce than in developing their own. Their fleets for some years brought vast booty into the company's coffers. The Mexican treasure ships fell into the hands of Piet Heyn, the boldest of their admirals, in 1628; and they were able to send armies across the ocean, conquer a large part of Brazil, and set up a flourishing Dutch dominion in South America (see Dutch West India Company). The operations of these two great chartered companies occupy a place among memorable events of Frederick Henry's stadtholderate; they are therefore mentioned here, but for further details the special articles must be consulted.

When Frederick Henry stepped into his brother's place, he found the United Provinces in a position of great danger and of critical importance. The Protestants of Germany were on the point of being crushed by the forces of the Austrian Habsburgs and the Catholic League. It lay with the Netherlands to create a diversion in the favour of their co-religionists by keeping the forces of the Spanish Habsburgs fully occupied. But to do so with their flank exposed to imperialist attack from the east, was a task involving grave risks and possible disaster. In these circumstances, Frederick Henry saw the necessity of securing French aid. It was secured by the skilful diplomacy of Francis van Aarsens (q.v.) but on hard conditions. Richelieu required the assistance of the Dutch fleet to enable him to overcome the resistance of the Hugenot stronghold of La Rochelle. The far-sighted stadtholder, despite popular opposition, by his powerful personal influence induced the States-General to grant the naval aid, and thus obtain the French alliance on which the safety of the republic depended.

THE first great military success of Frederick Henry was in 1629. His capture of Hertogenbosch (Bois-le-Duc), hitherto supposed to be impregnable, after a siege of five months was a triumph of engineering skill, Wesel also was taken by a similar trick the same year. In 1631 a large Spanish fleet, carrying a picked force of 6000 soldiers, for the invasion of Zeeland, was completely destroyed by the Dutch in the Slack and the troops made prisoners. The campaign of the following year was made memorable by the siege of Maestricht. This important frontier town lying on both sides of the river Meuse was taken by the prince of Orange in the teeth of two relieving armies, Spanish
and Imperialist, whose united forces were far larger than his own. This brilliant feat of arms was the prelude to peace negotiations, which led to a lengthy exchange of diplomatic notes. No agreement, however, was reached. The death of the Infanta Isabel in November 1633, and the reversion of the Netherlands to the sovereignty of the king of Spain, rendered all efforts to end the war, for the time being, fruitless.

At this juncture a strengthening of the French alliance seemed to the prince not merely expedient, but necessary. He had to contend against a strong peace party in Holland headed by the pensionary Pauw, but with the aid of the diplomatic skill of Aarsens, all opposition was overcome. Pauw was replaced as pensionary by Jacob Cats, and the objections of Richelieu were met and satisfied. A defensive and offensive alliance with France was concluded early in 1635 against the king of Spain, and each party bound itself not to make a peace or truce without the assent of the other. A large French force was sent into the Netherlands and placed under the command of the prince of Orange. The military results of the alliance were during the first two campaigns inconsiderable. The Cardinal Infant Ferdinand had been appointed governor of the Netherlands, and he proved himself an excellent general, and there were dissensions in the councils of the allies. In 1637 the stadholder was able to add to his fame as an invincible besiegler of cities. His failure to relieve Breda had hastened the death of Maurice.

It fell in 1625 into the hands of Spinola after a blockade of eleven months; it was now retaken by Frederick Henry after a siege of eleven weeks, in the face of immense difficulties. The reluctance of the States of Holland, and of Amsterdam in particular, to grant adequate supplies caused the campaigns of 1638 and 1639 to be in the main defensive and dilatory. An attempted attack on Antwerp was foiled by the vigilance of the Cardinal Infant. A body of 6000 men under Count William of Nassau were surprised and utterly cut to pieces. The year 1639, which had begun with abortive negotiations, and in which the activity of the stadholder had been much hampered by ill-health, was not to end, however, without a signal triumph of the Dutch arms, but it was to be on sea and not on land. A magnificent Spanish armada consisting of 77 vessels, manned by 24,000 soldiers and sailors under the command of Admiral Oquendo, were sent to the Channel in September with orders to drive the Dutch from the narrow seas and land a large body of troops at Dunkirk. Attacked by a large Dutch fleet under Admiral Marten de Ruijter, the Spaniards sheltered themselves under the English Downs by the side of an English squadron.

Tromp kept watch over them until he had received large reinforcements, and then (21st of October) boldly attacked them as they lay in English waters. Oquendo himself with seven vessels escaped under cover of a fog; all the rest of the fleet was destroyed. This crushing victory assured to the Dutch the command of the sea during the rest of the war. The naval power of Spain never in fact recovered from the blow.

The triumph of Tromp had, however, a bad effect on public feeling in England. The circumstances under which the battle of the Downs was won were galling to the pride of the English people, and intensified the growing unfriendliness between two nations, one of whom possessed and the other claimed supremacy upon the seas. The prosperity of the world-wide Dutch commerce was looked upon with eyes of jealousy across the Channel. Disputes had been constantly recurring between Dutch and English traders in these seas and the seeds were already sown of that stern rivalry which was to issue in a series of fiercely contested wars. But in 1639-1640 civil discord in England stood in the way of a strong foreign policy, and the adroit Aarsens was able so to "sweeten the bitterness of the pill" as to bring King Charles not merely to "overlook the scandal of the Downs," but to consent to the marriage of the princess royal with William, the only son of the stadholder. The wedding of the youthful couple (aged respectively 14 and 10 years) took place on the 12th of May 1641 (see William II., prince of Orange). This royal alliance gave added influence and position to the house of Orange-Nassau.

About this time various causes brought about a change in the feelings which had hitherto prevented any possibility of alliances between Spain and the United Netherlands.

The revolt of Portugal (December 1640) weakened the Spanish power, and involved the loss to Spain of the Portuguese colonies. But it was in the Portuguese colonies that the conquests of the Dutch East and West India Companies had been made, and the question of the Indies as between Netherland and Spaniard assumed henceforth quite a different complexion. Aarsens, the strongest advocate of the French alliance, passed away in 1641, and his death was quickly followed by those of Richelieu and Louis XIII. The victory of Condé at Rocroy opened the eyes of Frederick Henry to the danger of a French conquest of the Belgian provinces; and, feeling his health growing efeebled, the prince became anxious before his death to obtain peace and security for his country by means of an accommodation with Spain. In 1643 negotiations were opened which, after many delays and in the face of countless difficulties, were at length, four years later, to terminate successfully.

The course of the powers would doubtless have run more smoothly but for the infirm health and finally the death of the prince of Orange himself. Frederick Henry expired on the 14th of March 1647, and was buried by the side of his father and brother in Delft. In his last campaigns he had completed with signal success the task which, as a military commander, he had set himself,—of giving to the United Provinces a thoroughly defensible frontier of barrier fortresses. In 1644 he captured Sas de Ghent; in 1645 Hulst. That portion of Flanders which skirts the south bank of the Scheldt thus passed into the possession of the States, and with it the complete control of all the waterways to the sea.

The death of the great stadholder did not, however, long delay the carrying out of the policy on which he had set his heart, of concluding a separate peace with Spain behind the back of France, notwithstanding the compact of 1635 with that power. A provisional draft of a treaty had already been drawn up before the demise of Frederick Henry, and afterwards, despite the strenuous opposition of the new prince of Orange (who, under the Act of Settlement, had inherited all his father's offices and dignities) and of two of the provinces, Zeeland and Utrecht, the negotiations were by the powerful support of the States of Holland and of the majority of the States-General, quickly brought to a successful issue. The treaty was signed at Münster on the 30th of January 1648. It was a peace practically dictated by the Dutch, and involved a complete surrender of everything for which Spain had so long fought. The United Provinces were recognized as free and independent, and Spain dropped all her claims; the ultimatum has was adopted in respect to all conquests; the Scheldt was declared entirely closed—a clause which meant the ruin of Antwerp for the profit of Amsterdam; the right to trade in the East and West Indies was granted, and all the conquests made by the Dutch from the Portuguese were ceded to them; the two contracting parties agreed to respect and keep clear of each other's trading grounds; each was to pay in the ports of the other only such tolls as natives paid. Thus, triumphantly for the revolted provinces, the eighty years' war was ended. At this moment the republic of the United Netherlands touched, perhaps, the topmost point of its prosperity and greatness.

No sooner was peace concluded than bitter disputes arose between the provincial States of Holland and the prince of Orange, supported by the other six provinces, upon the question of the disbanding of the military forces. William was a young man (he was twenty-one at the time of his father's death) of

the highest abilities and of soaring ambition. He was totally opposed to the peace with Spain, and wished to bring about a speedy resumption of the war. With this view he entered into secret negotiations for a French alliance which, as far as can be gathered from extant records, had for its objects the conquest and partition by the allies of the Belgian provinces, and joint action in England on behalf of Charles II. As a preliminary step William aimed at a centralization of the powers of government in the United Provinces in his own person. He saw clearly the inherent defects of the existing federation, and he wished to remedy a system which was so complicated as to be at times almost unworkable. The States-General were but the delegates, the stadholders the servants, of a number of sovereign provinces, each of which had different historical traditions and a different form of government, and one of which—Holland—in wealth and importance outweighed the other six taken together. Between the States of Holland and the States-General there was constant jealousy and friction. And yet strangely enough the States of Holland themselves were not really representative of the people of that province, but only of the limited, self-coopting burgh aristocracies of certain towns, each of which with its rights and liberties had a quasi-independence of its own. Foremost among these was the great commercial capital, Amsterdam, whose rich burgher patriciate did not scruple on occasion to defy the authority of the States-General, the stadholder and even of the States of Holland themselves.

The States of Holland had, in the years that followed the truce of 1660, measured their strength with that of the States-General, but the issue had been decided conclusively in favour of the federal authority by the sword of Maurice. The party and the principles of Oldenbarneweldt, however, though crushed, were not extinguished, and though Frederick Henry by his personal influence and prudent statesmanship had been able to surmount the difficulties placed in his way, he had had to encounter at times strong opposition, and had been much hampered in the conduct both of his campaigns and of his policy. With the conclusion of the peace of Munster and the death of the veteran stadholder the struggle for predominance in the Union between the Orange-federalist and the Hollander States-rights parties was certain to be renewed. There was every reason to believe that the overthrow of the centralizing tendency of the federalists and the assertion of provincial sovereignty because of the youth and inexperience of the new prince of Orange. But William II., though little more than a boy, was endowed with singular capacity and great strength of will, and he was intent upon ambitious projects, the scope of which has been already indicated. The collision came, which was perhaps inevitable. The States-General in the disbanding of the forces wished to retain the cadres of the regiments complete in case of a renewal of the war. The States of Holland objected, and, although the army was a federal force, gave orders for the general disbanding of the troops in the pay of the province. The officers refused to obey any orders but those of the council of State of the Union. The provincial states, on their part, threatened them with loss of pay. At this juncture the States-General, as in 1618, appointed a commission headed by the prince of Orange to visit the towns of Holland, and provide for the maintenance of order and the upholstery of the Union. Both parties put themselves in the wrong, the province by refusing its quota to the federal war-sheet, the generality by dealing with individual towns instead of with the states of the province. The visitation was a failure. The town councils, though most of them willing to receive William in his capacity as stadholder, declined to give a hearing to the commission. Amsterdam refused absolutely to admit either stadholder or commission. In these circumstances William resolved upon strong measures. Six leading members of the States of Holland were seized (30th of July 1650) and imprisoned in Loevenstein Castle, and troops under the command of William Frederick, stadholder of Friesland, were sent to surprise Amsterdam. But the town council had been warned, and the gates were shut and guarded. The coup d'état nevertheless was completely successful. The anti-Orange party, remembering the fate of Oldenbarneweldt, were stricken with panic at the imprisonment of their leaders. The States of Holland and the town council of Amsterdam gave in their submission. The prisoners were released, and public thanks were rendered to the prince by the various provincial states for "his great trouble, care and prudence." William appeared to be master of the situation but his plans for future action were never to be carried into effect. Busily engaged in secret negotiations with France, he had retired to his hunting seat at Dieren, when he fell ill with smallpox on the 27th of October. A few days later he expired at the Hague (6th of November), aged but twenty-four years. A week after his death, his widow, the princess Mary of England, gave birth to a son who, as William III., was to give added lustre to the house of Orange.

The anti-Orange particularist party, which had just suffered decisive defeat, now lifted up its head again. At the instance of Holland a Grand Assembly was summoned, consisting of delegates from all the provinces, to consider the state of the Union, the army and religion. It met at the Hague on the 18th of January 1651. The conclusions arrived at were that all sovereign powers resided in the provinces, and that to them severally, each within its own borders, belonged the control of the military forces and of religion. There was to be no captain-general of the Union. All the provinces, except Friesland and Groningen, which remained true to William Frederick of Nassau-Dietz, agreed to leave the office of stadholder vacant. The practical result was the establishment of the hegemony of Holland in the Union, and the handing over of the control of its policy to the patrician oligarchies who formed the town councils of that province. Such a system would have been unworkable but for the fact that with the revival of the political principles of Oldenbarneweldt, there was found a statesman of commanding ability to fill the office in which the famous advocate of Holland had for so many years been "minister of all affairs" in the forming state. The title of advocate had indeed been replaced by that of grand pensionary (Road pensionaria), but the duties assigned to the office remained the same. The holder of the office was at first chosen by the provincial councils, but in 1656 the king of France, who wished to provide a life grand pensionary for life, the grand pensionary for a term of five years. The grand pensionary was nominally the paid servant of the States of Holland, but his functions were such as to permit a man of talent and industry in the stadholderless republic to exercise control in all departments of policy and of government. All correspondence passed through his hands, he wrote all despatches, conducted the debates over which he presided, kept the minutes, drafted the resolutions, and was ex officio the leader and spokesman of the delegates who represented the Province of Holland in the States-General. Such was the position to which Joannes van der Stad, a young man of twenty-eight years of age, belonging to one of the most influential patrician families of Dortrecht (his father, Jacob de Witt, was one of the prisoners of Loevenstein) was appointed in 1653. From that date until 1672 it was his brain and his will that guided the affairs of the United Netherlands. He was supreme in the States of Holland, and Holland was dominant in the States-General (see JOHN DE WITT).

The death of William II. had left the Dutch republic at the very highest point of commercial prosperity, based upon an almost universal carrying trade, and the strictest system of monopoly. Friction and disputes had frequently arisen between the Dutch and the English traders in different parts of the world, and especially in the East Indies, culminating in the so-called "Massacre of Amboyna"; and the strained relations between the two nations would, but for the civil discords in England, have probably led to active hostilities during the reign of Charles I. With the accession of Cromwell to power the breach
was widened. A strong party in the Provinces were unfriendly to the Commonwealth, and insults were offered in the Hague to the English envoys. The parliament replied by passing the memorable Navigation Act (Oct. 1651), which struck a deadly blow at the Dutch carrying trade. It was the beginning of that struggle for three wars between the states which was to continue for three great wars, in the defeat of the weaker country.

The French invasion.

The first English war lasted from May 1652 to April 1654, and within fifteen months twelve sea-fights took place, which were desperately contested with varying success. The leaders on both sides—the Netherlands' Tromp (killed in action on the 10th of August 1653) and de Ruyter, the Englishmen Blake and Monk—covered themselves with equal glory. But the losses to Dutch trade were so serious that negotiations for peace were set on foot by the burgher party of Holland, and Cromwell being not unwilling, an agreement was reached in the Treaty of Westminster, signed on the 5th of April 1654. The Dutch conceded the striking of the flag and compensation for English claims against the Dutch in the East Indies and elsewhere. The act of Seclusion, which barred the young prince of Orange from holding the office of stadtholder and of captain-general, had been one of the conditions on which Cromwell had insisted. The proposition of the States-General was refused, but a secret treaty Holland, under the influence of de Witt, accepted it in its own name as a sovereign province. The popular feeling throughout the United Provinces was strongly antagonistic to the act of Seclusion, by which at the dictation of a foreign power a ban of exclusion was pronounced against the house of Orange-Nassau, to which the republic owed its independence.

In 1658, the States-General interfered to save the Danes from Charles Gustavus of Sweden. In 1659 a treaty of peace was concluded between England, and the United Provinces with a view to the settlement of the Danish-Swedish question, which ended in securing a northern peace in 1660, and in keeping the Baltic open for Dutch trade. The foreign affairs of the republic were throughout these years ably conducted by de Witt, and the position of Dutch colonial expansion in the Eastern seas made secure and firm. An advantageous peace with Portugal was made in 1662. Meanwhile the Commonwealth in England had been followed in 1660 by the restoration of the monarchy. To confirm the new king the act of Seclusion was repealed, and the education of the young prince of Orange was undertaken by the States of Holland under the superintendence of de Witt. But Charles owed a grudge against Holland, and he was determined to gratify it. The Navigation Act was re-enacted, old grievances revived, and finally the Dutch colony of New Netherland was seized in time of peace (1664) and its capital, New Amsterdam, renamed New York. War broke out in 1665, and was marked by a series of terrific battles. On the 13th of June 1665 the Dutch admiral Obdam was completely defeated by the English under the duke of York. The four days' fight (11th-14th of June 1666) ended in a hard-won victory by de Ruyter over Monk, but later in this year (August 3rd) de Ruyter was beaten by Ayscue and forced to take refuge in the Dutch harbours. He had his revenge, for on the 22nd of June 1667 the Dutch fleet under de Ruyter and Cornelius de Witt made their way up the Medway as far as Chatham and burnt the English fleet as it lay at anchor. Negotiations between the two countries were already in progress and this event hastened a settlement. The peace of Breda was signed (31st of July 1667) on terms on the whole favourable to the Dutch. New Netherland was retained by England in exchange for Suriname. In the following year by the efforts of Sir William Temple the much vaunted Triple Alliance was concluded between Great Britain, the United Provinces and Sweden to check the designs of Louis XIV. The instability of Charles II., who sold out to Louis by the treaty of Dover (1670), speedily rendered it of no effect, and left the United Provinces to face unaided the vengeance of the French king.

From 1668 to 1672 Louis made ready to destroy the Dutch, and so well had his diplomacy served him that they were left without a friend in Europe. In 1672 the storm broke: the French invasion was to be made speedily, to intercept the Dutch Mediterranean fleet; and the French at the same time set forth in apparently irresistible strength to overcome the despised traders of Holland. The States were ill-prepared on land though their fleet was strong and ready; party spirit had become intensely bitter as the prince of Orange (see William III.) grew to man's estate, and the ruling burgher party, knowing how great was the popularity of William, especially in the army, had purposely neglected their land forces. Town after town fell before the French armies, and to de Witt and his supporters there seemed to be nothing left but to make submission and accept the best terms that Louis XIV. would grant. The young prince alone rose to the height of the occasion, and set his face against such cowardly counsels, and he had the enthusiastic support of the great majority of the people. Amidst general acclamation William was elected stadtholder, first of Zeeland, then of Holland, and was appointed captain-general of the United Provinces (6th June). Meanwhile the fleet under de Ruyter had encountered a combined English and French force in Solebay (7th of June), and after a desperate fight, in which the French had but slackly supported their allies, had more then held its own. William, in his turn, with an army wholly insufficient to meet the French in the open field, was able to persuade his countrymen to open the dikes and by flooding the land to prevent its occupation by the enemy. The courage and resourcefulness of their young leader inspired the people to make heroic sacrifices for their independence, but unfortunately such was the revulsion of feeling against the grand pensionary, that he himself and his brother Cornelius were torn in pieces by an infuriated mob at the Hague (20th of August).

William, now supreme in the States, while on land struggling with chequered success against the superior forces of the French, strove by his diplomacy, and not in vain, to gain allies for the republic. The growing power of France caused alarm to her neighbours, and Sweden, Denmark, Spain and the emperor lent a willing ear to the persuasions of the stadtholder and were ready to aid his efforts to curb the ambition of Louis. On sea in 1673 de Ruyter, in a series of fiercely contested battles, successfully maintained his strenuous and dogged conflict against the united English and French fleets. In England the war was exceedingly unpopular, and public opinion forced Charles II. to conclude peace. The treaty of Westminster, which provided that all conquests should be restored, was signed on the 14th of February 1674. The French now found themselves threatened on many sides, and were reduced to the defensive. The prince, however, suffered a defeat at Seneff, and was in 1674 prevented from invading France. The war, nevertheless, during the following years was on the whole advantageous to the Dutch. In 1676 a Dutch squadron fought two hard but indecisive battles with a superior French force, off Stromboli (8th of January) and off Messina (22nd of April). In the last-named fight Admiral de Ruyter was badly wounded and died (30th of April). In 1677 negotiations for peace went on, and were forwarded by the marriage, at the close of the year, of William of Orange with his cousin the princess Mary, daughter of the duke of York. At last (August 1678) a peace was concluded at Nymegen by which the Dutch secured the integrity and independence of their country. All the conquests made by the French were given up.

The aggressive policy of Louis XIV. in the years that followed the peace of Nymegen enabled William to lay the foundations of the famous confederacy which changed the whole aspect
of European politics. The league of Augsburg (1686), which followed the revocation of the edict of Nantes, placed Orange at the head of the resistance to French domination. The league was formed by the emperor, Spain, Sweden, the United Provinces and by several German states. In England William and Mary were looked upon as the natural successors to the throne on the death of James II., and William set up close relations with the manutenents in Church and State, who disliked the arbitrary and papistical policy of his father-in-law. But with the birth of a prince of Wales the situation was changed, and William determined to intervene actively in English affairs. His opportunity came when Louis XIV., having declared war against the Empire, had invaded the Palatinate. The opposition of Amsterdam to an English expedition, in the absence of danger from the side of France, was overcome. The Revolution of 1688 ensued, and England became, under William’s strong rule, the chief member of the Great Coalition against French aggression. In the Grand Alliance of 1689–1690 he was accused of sacrificing Dutch to English interests, but there can be no doubt that William loved his native country better than his adopted one, and was a true patriot. If the United Provinces suffered in prosperity through their close relations with and subordination to Great Britain during a long series of years, it was due not to the policy of William, but to the fact that the territory of the republic was small, open to attack by great military powers, and devoid of natural resources. The stadholder’s authority and popularity continued unimpaired, despite of his frequent absences in England. He had to contend, like his predecessors, with the perennial hostility of the burgher aristocracy of Amsterdam, and at times with other refractory town councils, but his power in the States during his life was almost autocratic. His task was rendered lighter by the influence and ability of Heinsius, the grand pensionary of Holland, a wise and prudent statesman, whose tact and moderation in dealing with the details and difficulties of internal administration were conspicuous. The stadholder gave to Heinsius his fullest confidence, and the pensionary on his part loyally supported William’s policy and placed his services ungrudgingly at his disposal (see Heinsius).

The conduct of the war by the allies was far from successful.

In 1690 (July 1st) Waldeck was defeated by Luxemburg at Fleurs; and the Anglo-Dutch fleet was so severely handled by Tourville (10th July) off Beachy Head that for two years the command of the sea remained in the possession of the French. A striking victory off Cape la Hogue (29th of May 1692) restored, however, supremacy to the allies. On land the combined armies fared ill. In 1691 the French took Mons, and in 1692 Namur, in which year after a hard-fought battle William was defeated at Steenkirk and in 1693 at Neerwinden. But William’s military genius never shone so brightly as in the hour of defeat; he never knew what it was to be beaten, and in 1695 his recapture of Namur was a real triumph of skill and resolution. At last, after long negotiations, exhaustion compelled the French king to sign the peace of Ryswick in 1697, in which William was recognized by France as king of England, the Dutch obtaining a favourable commercial treaty, and the right to garrison the Netherland barrier towns. This peace, however, did no more than afford a breathing space during which Louis XIV. prepared for a renewal of the struggle. The great question of the Spanish succession was looming in all men’s eyes, and though partition treaties between the interested powers were concluded in 1688 and 1700, it is practically certain that the French king held himself little bound by them. In 1701 he relieved the Dutch troops out of the barrier towns; he delivered England by recognizing James III. on the death of his father; and it was clear that another war was imminent when William III. died in 1702.

In 1672 the stadholdership in five provinces had been made hereditary in the family of the prince of Orange, but William died childless, and the republican burgher party was strong enough to prevent the posts being filled up. William had wished that his cousin, Count John William Friso of Nassau, stadholder of Friesland and Groningen, should succeed him, but his extreme youth and the jealousy of Holland against a “Frisian” stood in the way. The result was a want of united counsel and action among the provinces, Friesland and Groningen standing aloof from the other five, while Holland and Zeeland had to pay for their predominance in the Union by being left to bear the bulk of the charges. Fortunately there was no break of continuity in the policy of the States, the chief conduct of affairs remaining, until his death in 1720, in the capable and tried hands of the grand pensionary Heinsius, who had at his side a number of exceptionally experienced and wise counsellors—among these Simon van Slingeland, for forty-five years (1680–1725) secretary of the council of state, and afterwards grand pensionary of Holland (1727–1736), and Francis Fagel, who succeeded his father in 1699 as recorder (Griffier) of the States-General, and held that important office for fifty years. The tradition of William III. was thus preserved, but with the loss of the firm hand and strong personality of that great ruler the United Provinces were relegated to a subordinate place in the councils of the nations, and with the gradual decadence of its navy the Dutch republic ceased to rank as a power to be reckoned with.

In the War of the Spanish Succession, which broke out in 1702, Dutch troops took part in the campaigns of Marlborough and Eugene, and had their share in winning the great victories of Blenheim (1704), Ramillies (1706), Oudenarde (1708) and Malplaquet (1709). At the peace of Utrecht, concluded in 1713, the interests of the Netherlands were but half-heartedly supported by the English plenipotentiaries, and the French were able to obtain far more favourable terms than they had the power to exact. But they were compelled to abandon all claim to the Spanish Netherlands, which were formally handed over to the United Provinces, as trustees, to be by them, after the conclusion of a satisfactory barrier treaty, given up to the emperor, and be known henceforth as the Austrian Netherlands. The peace of Utrecht taught the Dutch that the great powers around them, while ready to use their resources for war, would not scruple to abandon them when they wanted peace; they, therefore, determined henceforth to stand clear of all foreign complications. With 1713 the influence of the United Netherlands upon European politics comes almost to an end.

The ruling party in the States took an active part in securing George I. on the throne of England; and they succeeded in coming to an agreement both with France and with Austria over the difficulties connected with the barrier towns, and were thus able in tranquility to concentrate their energies upon furthering the interests of their trade. Under the close oligarchical rule of the patrician families, who filled all offices in the town councils, the States of Holland, in which the influence of Amsterdam was dominant, and which in their turn exercised predominance in the States-General, became more and more an assembly of “shopkeepers” whose policy was to maintain peace for the sake of the commerce on which they thrived. For thirty years after the peace of Utrecht the Provinces kept themselves free from entanglement in the quarrels of their neighbours. The foundation of the Ostend East India Company (see East India Company), however, the emperor Joseph II. in 1772, at once aroused the strong opposition of the Amsterdam merchants, who looked upon this invasion of their monopoly with alarm, and declared that the Ostend Company had been set up in contravention to the terms of Article V. of the treaty of Munster. In maintaining this position the States had the support of England, but it was not until 1731 that they succeeded in obtaining the suppression of the company by consenting to
guarantee the Pragmatic Sanction of Charles VI. This step led in 1743 to their being involved in the War of the Austrian Succession, and thus being drawn into hostilities with France, which invaded the barrier country. In 1744 the United Provinces were joined by Britain, Austria and Saxony, a Quadruple Alliance, and put a contingent of troops in the field. The Dutch took an active part in the campaign of 1745 and suffered heavily at Fontenoy, after which battle Marshal Saxe overran the Austrian Netherlands. The French captured all the barrier towns, and in 1747 entered Dutch Flanders and made an easy conquest. The United Provinces, as in 1762, seemed to lie at the mercy of their enemies, and as in that eventful year, popular feeling broke down, and Orange, and turned to William IV., prince of Orange, as the saviour of the state. John William Friso had died young in 1711, leaving a posthumous son, William Henry Friso, who was duly elected stadtholder by the two provinces, Friesland and Groningen, which were always faithful to his family, and in 1722 he became also, though with very limited powers, stadtholder of Gelderland. The other provinces, however, under pressure from Holland, bound themselves not to elect stadholders, and they had never before elected a stadholder of the Union. By the conquest of Dutch Flanders Zeeland was threatened, and the states of that province, in which there were always many Orange partisans, elected (April 1747) William stadtholder, captain-general and admiral of Zeeland. The example once given was infectious, and was followed in rapid succession by Holland, Utrecht and Overyssel. Finally the States-General (May 4) appointed the prince, who was the first member of his family to be stadholder of all the seven provinces, captain and admiral-general of the Union, and a little later these offices were declared hereditary in both the male and female lines.

William IV., though not a man of great ability, was sincerely anxious to do his utmost for securing the maintenance of peace, and the development of the resources and commercial prosperity of the country, and his powerful dynastic connexions (he had married Anne, eldest daughter of George II.) gave him weight in the councils of Europe. The peace of Aix-la-Chapelle, in 1748, in which the influence of Great Britain was exerted on behalf of the States, though it nominally restored the old condition of things left the Provinces crippled by debt, and fallen low from their old position among the nations. At first the stadholder's efforts to promote the trade and welfare of the country were hampered by the distrust and opposition of Amsterdam, and other strongholds of anti-Orange feeling, and just as his good intentions were becoming more generally recognized, William unfortunately died, on the 22nd of October 1751, aged forty years, leaving his three-year-old son, William V., heir to his dignities. The princess Anne of England became regent, but she had a difficult part to play, and on the outbreak of the Seven Years' War in which the Provinces were determined to maintain neutrality, her English leanings brought much unpopularity upon her. She died in 1759, and for the next seven years the regency passed into the hands of the States, and the government was practically stadholderless.

In 1766 William V. was declared to be of age; and his accession to power was generally welcomed. He was, however, a weak prince, and, without energy or resolution, and he allowed himself to be entirely led by his old guardian the duke of Brunswick, and by his wife Frederica Wilhelmina of Prussia, a woman of marked ability, to whom he entirely deferred. In the American War of Independence William's sympathies were strongly on the English side, while those of the majority of the Dutch people were with the revolted colonies. It is, however, certain that nothing would have driven the Provinces to take part in the war but for the overbearing attitude of the British government with regard to the right of neutral shipping upon the seas, and the heavy losses sustained by Dutch commerce at the hands of British privateers. The famous agreement, known as the "Armed Neutrality," with which in 1780 the States of the continent at the instigation of Catherine II. of Russia replied to British claims put forward by Great Britain drew the Provinces once more into the arena of European politics.

Every effort was made by the English to prevent the Dutch from joining the league, and in this they were assisted by the stadholder, but at last the States-General, though only by the bare majority of four provinces against three, determined to throw in their lot with the opponents of England.

Nothing could have been more unfortunate, for the country was not ready for war, and party spirit was too strong for united action to be taken, nor for preparations to be made. When war broke out Dutch commerce was destroyed, and the Dutch colonies were at the mercy of the English fleet without the possibility of a blow being struck in their defence. An indecisive, but bravely fought action with Admiral Parker at the Dogger Bank showed, however, that the Dutch seamen had lost none of their old dogged courage, and did much to soothe the national sense of humiliation. In the negotiations of the Treaty of Paris (1783) the Dutch found their allies abandoned, and compelled to accept the disadvantageous but not ungenerous terms accorded to them by Great Britain. They had to sacrifice some of their East Indian possessions and to concede to the English freedom of trade in the Eastern seas.

One result of this humiliating and disastrous war was the strengthening of the hands of the anti-Orange burgher-regents, who had now arrogated to themselves the name of "patriots." It was they, and not the stadholder, who had been mainly responsible for the Provinces joining the "Armed Neutrality," but the consequences of the war, in which this act had involved them, was largely visited upon the prince of Orange. The "patriot" party did their utmost tocurtail his prerogatives, and harass him with petty insults, and at last the Prussian king was obliged to intervene to save his niece, who was even more unpopular than her weak husband, from being driven from the country. In 1784 the emperor Joseph II. took advantage of the discontents in the Provinces to raise the question of the opening of the Scheldt. He himself was, however, no more prepared for attack than the Republic for defence, but the Dutch had already sunk so low, that they agreed to pay a heavy indemnity to induce the Austrians to drop a demand they were unable to enforce. To hold the mouth of the Scheldt and prevent at all costs a revival of Antwerp as a commercial port had been for two centuries a cardinal point of Dutch policy. This difficulty removed, the agitation of the "patriots" against the stadholderate form of government increased in violence, and William speedily found his position untenable. An insult offered to the prince of Orange in 1787 led to an invasion of the country by a Prussian army. Amsterdam capitulated, the country was occupied, and the patriot leaders declared incapable of holding any office. The Orange party was completely triumphant, and William V., under the protection of Prussia and England, with which states the United Provinces were compelled to ally themselves, was restored to power. It was, however, impossible to make the complicated and creaking machinery of the constitution of the worn-out republic of the United Netherlands work smoothly, and in all probability it would have been within a very short time replaced by an hereditary monarchy, had not the cataclysm of the French Revolution swept it away from its path, never to be revived.

When war broke out between the French revolutionary government and the coalition of kings, the Provinces remained neutral as long as they could. It was not till the Dumouriez had overrun the Austrian Netherlands in 1792 and had thrown open the passage of the Scheldt, that they were drawn into the war. The patriot party sided with
the French, but for various reasons the conquest of the country was delayed until 1795. In the closing months of 1794 Pichegru, at the head of a large and victorious army, invaded the Provinces. The very severe frost of that winter gave his troops an easy passage over all the rivers and low-lying lands; town after town fell before him; he occupied Amsterdam, and crossing the ice with his cavalry took the Dutch fleet as it was frosted for Texel. The stadtholder and his family fled to England, and the disorganized remnants of the allied forces under the duke of York retreated into Germany. The "patriots," as the anti-Orange republicans still styled themselves, received the French with open arms and public rejoicings, and the government was reorganized so as to bring it into close harmony with that of Paris. The stadtholder, the officers of captain and admiral-general, and all the ancient organization of the United Netherlands were abolished, and were transformed into the Batavian Republic, in close alliance with France. But the Dutch had soon cause to regret their revolutionary ardour. French alliance meant French domination, and participation in the wars of the Revolution. Its consequences were the total ruin of Dutch commerce, and the seizure of all the Dutch colonies by the English. Internally one change of government succeeded another; after the States-General came a national convention; then in 1798 a constituent assembly with an executive directory; then chambers of representatives; then a return to the earlier systems under the names of the eight provincial and one central Commission (1801). These changes were the outcome of a gradual reaction in a conservative direction.

The peace of Amiens gave the country a little rest, and the Dutch got back the Cape of Good Hope and their West Indian colonies; it was, however, but the brief and deceptive interlude between two storms; when war began again England once more took possession of all she had restored. In 1803 the autocratic will of Napoleon Bonaparte imposed upon them a new constitution, and Rutger Jan Schimmelpenninck (1765-1832) was made, under the ancient title of grand pensionary, head of the government. In the next year the French emperor added Holland, as the United Provinces were now named, to the ring of dependent sovereignties, by means of which he sought to build up a universal empire, and he forced his brother Louis to be the unwilling king of an unwilling people. The new king was a man of excellent intentions and did his best to promote the interest of his subjects, but finding himself unable to protect them from the despotic overlordship of his brother, after a four years' reign, Louis abdicated. In 1810 the Northern Netherlands by decree of Napoleon were incorporated in the French empire, and had to bear the burdens of conscription and of a crushing weight of taxation. The defeat of Leipzig in 1813 was the signal for a general revolt in the Netherlands; the prince of Orange (son of William V.) was recalled, and amongst general rejoicing accepted at Amsterdam the offer of the sovereignty under a free constitution (Dec. 1, 1813), with the title of sovereign prince. On the downfall of Napoleon the great powers determined to create in the Low Countries a powerful state, and by the treaty of London (June 14, 1814) the Belgians were united with the Dutch provinces to form the kingdom of the Netherlands, which was also to include the bishopric of Liège and the duchy of Bouillon, and the prince of Orange was placed on the throne of the 15th of March 1815 as William I., king of the Netherlands (see William I., king of the Netherlands). The ancestral possessions of the House of Nassau were exchanged for Luxemburg, of which territory King William in his personal capacity became grand duke. The carrying out of the treaty was delayed by the Hundred Days' campaign, which for a short time threatened its very existence. The daring invasion of Napoleon, however, afforded the Dutch and Belgian contingents of the allied army the opportunity to fight side by side under the command of William, prince of Orange, eldest son of the new king, who highly distinguished himself by his gallantry at Quatre Bras, and afterwards at Waterloo where he was wounded (see William II., king of the Netherlands). The Congress of Vienna confirmed the arrangements made by the first London, and on the 27th of September 1815, William I. was crowned king of the Netherlands at Brussels. Under the constitution the king, as hereditary sovereign, possessed full executive powers, and the initiative in proposing laws. He had the power of appointing his own council of state. The legislative body bore the time-honoured title of States-General, and was divided into an Upper Chamber nominated by the king, and a Lower Chamber elected by the people. Freedom of worship, freedom of the press, and political equality were principles of the constitution, guaranteed to all.

The union of the Dutch and Belgian provinces, like so many of the territorial arrangements of the Congress of Vienna, was an attempt to create a strong state out of diverse and jarring elements. It was an artificial union, which nothing but consummate tact and statesman-like ability could have rendered permanent and solid. North and south were divided from one another by religious belief, by laws and usages, by material interests, and by two centuries and a half of widely separated national life. The Belgians were strict Catholics, the Dutch Calvinistic Protestants. The Dutch were chiefly a commercial and seafaring people, with interests in distant lands and colonial possessions; the Belgians were agriculturists, except where their abundance of minerals made them manufacturers. The national traits of the Dutch were a blend of German and English, the national leaning of the Belgians was towards France and French ideals. Nevertheless the materials were there out of which a really broad-minded and conciliatory handling of religion and racial difficulties might have gradually built up a Netherlands nation able to hold from its population and resources a considerable place among European powers. For it must not be forgotten that some two-thirds of the Belgian people are by origin and language of the same race as the Dutch. But when difficulties and differences arose between North and South, as they were sure to arise, they were not dealt with wisely. The king had good intentions, but his mind was warped by Dutch prejudices, and he was ill-advised and acted unadvisedly. The consequences were the Belgian Revolution of 1830, which ended in the intervention of the great powers, and the setting up, in 1831, of Belgium as an independent kingdom. The final settlement of outstanding questions between the two countries was not reached till 1839 (for an account of the Belgian Revolution, see Belgium). King William I., who reigned in the following year, having become unpopular through his resistance to reform, resigned his crown to his son William II., who reigned in peace till his death in 1849, when he was succeeded by his eldest son William III. (see William III., king of the Netherlands). His accession marked the beginning of constitutional government in the Netherlands. William I. had been to a large extent a personal ruler, but William II., though for a time following in his father's steps, had been moved by the revolutionary outbreaks of 1848 to concede a revision of the constitution. The fundamental law of 1848 ensured in the first place that the States-General should be elected by the Provincial Estates instead of being appointed by the king, and that the second chamber should be elected directly by all persons paying a certain amount in taxation. Ministers were declared responsible to the States-General, and a liberal measure of self-government was also granted. During the long reign of William III. (1849-1890) the chief struggles of parties in the Netherlands centred round religious education. On

The long-continued and costly wars with the sultan of Achin have during a series of years been a source of trouble to Dutch

Military service.

the one side are the liberals, divided into moderates and progressives, the representatives to a large extent of the commercial towns. Opposed to them is the coalition of

the orthodox Protestant conservatives, styled anti-revolutionaries, supported by the Calvinistic peasantry. But the liberal ascendancy closed the ranks of the Catholic-Calvinist coalition, and united them against the neutral schools, and in 1874 they were able to pass a law enabling not only the unsectarian public schools, but all private schools organized by societies and bodies recognized by the law to receive subventions from the state. In 1890 there were 3000 public schools with 450,000 scholars and 1300 private schools with 195,000 scholars.

The subject of the extension of the franchise has also been the cause of violent party strife and controversy. It was taken in hand as early as 1872, but as a revision of the constitution was necessary, no change was actually carried out till 1877. The law of that year lowered the qualification of the payer of a direct tax to 10 fl. Votes were given to all householders paying a certain minimum house duty, and to all lodgers who had for a given time paid a minimum of rent, also to all who possessed certain educational and social qualifications, whose definition was left to be specified by a later law. The passing of such a law was deferred by the coalition (Catholic-Orthodox) ministry of 1887. The liberal ministry of 1891 attempted to deal with the question, and a proposal was made by the minister T. van Poortvliet, which almost amounted to universal suffrage. The educational qualification was to be able to write, the social that of not receiving charitable relief. This proposal caused a cleavage right through all parties. It was supported by the radical left, by a large portion of the Orthodox-Calvinists under Dr. Kuyper, and by some Catholics; it had against it the moderate liberals, the aristocratic section of the Orthodox-Calvinists, the bulk of the Catholics, and a few radicals under an influential leader van Houten. After a fierce electoral fight the Takkians were vicors at the first polls, but were beaten at the second ballots. Of the 46 Takkians, 35 were liberals; of the 54 anti-Takkians, 24 were Catholics. A moderate liberal ministry was formed (1894) and in 1896 carried into law what was known as the van Houten project. It gave the right of voting to all Dutchmen over twenty-five years of age, who paid a fl. in direct taxation, were householders or lodgers as defined in 1877, or tenants of a vessel of, at least, 24 tons; were the recipients of certain salaries or had certain deposits in the public funds or savings banks. By this reform the number of electors, which had been raised in 1887 from 140,000 to 300,000, was augmented to 700,000. The question of universal military service has also divided parties. The principle of personal service has been strongly opposed by the Catholics and conservatives, but became the law in 1898, though exemptions were conceded in favour of ecclesiastics and certain classes of students.

HOLLAND, COUNTY AND PROVINCE OF.—The first mention of Holland in any document is found in an imperial gift brief dated May 2nd, 1064. In this they say "omnis comitatus in Hollandia" occurs, but without any further description of the locality indicated. A comparison with other documentary evidence, however, leads to the identification of Holland with the forestum Merweda, or the bush-grown fenland lying between the Waal, the old Meuse and the Merwede. It is the district surrounding the town of Dordrecht. A portion of the original Holland was submerged by a great inundation in 1615, which modern appellation of "bushland" (reed-forest) is descriptive of what must have been the condition of the entire district in early times. The word Holland is indeed by many authorities thought to be a corruption of Holt-land (it was sometimes so spelt by 13th-century writers) and to signify wood-land. The earliest spelling is, however, Holland, and it is more probable that it means low-lying land (hol = hollow), a derivation which is equally applicable to the district in Lincolnshire which bears the same name.

The title count of Holland appears to have been first borne by the Frisian count Dirk III., who founded Dordrecht (about 1015) and made it the seat of government (see below). It was not, however, till late in the 11th century that his successors adopted the style "Hollandensis comes" as their territorial designation (it is found for the first time on a seal of Dirk V. 1083), and that the name Holland became gradually extended northwards to connote all the land subject to the rule of the counts between Texel and the Maas.

The beginnings of the history of this feudal state (the later Holland) centre round the abbey of Egmont in whose archives its records have been preserved. In 922 Charles the Simple gave in full possession to a count in Frisia, Dirk by name (a shortened form of Diederik, Latin Theodoricus), "the church of Egmont with all that belonged to it from Swithardeshage to Kinhem." This man, usually known as Dirk I., died about 939 and was succeeded by his son of the same name. Among the records of the abbey of Egmont is a document by which the emperor Arnulf gave to a certain count Gerolf the same land "between Swithardeshage and Kinhem," afterwards held by Dirk I. It is generally assumed that this Gerolf was his father, otherwise their deed of gift would not have been preserved among the family papers. Dirk II. was the founder of the abbey of Egmont. His younger son Egbert married Liutgardis, daughter of Siegfried of Luxemburg and sister-in-law of the emperor Henry II. He obtained from the emperor Otto III., with whom he was in great favour in 983, a considerable extension of territory, that now covered by the Zuider Zee and southward down to Nijmegen. In the deed of gift it is spoken of as holding the three counties of Maasland, Kinhem or Kenemerland and Texla or Texel; in other words his rule extended over the whole country from the right bank of the Maas or Meuse to the Vlie. He appears also to have exercised authority at Ghent. He died in 988. Arnulf was count till 993, when he was slain in battle against the west Frisians, and was succeeded by his twelve-year-old son Dirk III. During the guardianship of his mother, Liutgardis, the boy was despoiled of almost all his possessions, except Kenemerland and Maasland.

Dirk III. had no sooner was he arrived at man's estate than Dirk turned upon his enemies with courage and vigour. He waged war successfully with Adelhold, the powerful bishop of Utrecht, and made himself master not only of his ancestral possessions, but of the district on the Meuse known as the Bushland of Merweda (forestum Merweda), hitherto subject to the see of Utrecht. In the midst of this marshy tract, at a point commanding the courses of the Meuse and the Waal, he built a castle (about 1015) and began to levy tolls. Around this castle sprang up the town of Thurendrecht or Dordrecht. The possession of this stronghold was so injurious to the commerce of Tiel, Cologne and the Rhenish towns with England that complaints were made by the bishop of Utrecht and the archbishop of Cologne to the emperor. Henry II. took the part of the complainants and commissioned Duke Godfrey of Lorraine to chastise the young Frisian count. Duke Godfrey invaded Dirk's lands with a large army, but they were impeded by the swampy nature of the country and totally defeated with heavy loss (July 29, 1018). The duke was himself taken prisoner. The result was that Dirk was not merely confirmed in his possession of Dordrecht and the Merweda lands, but was invested with the title of earl (the land now belongs to the earls of the land of Utrecht see, Dirk Bayo by name, which he conquered. This victory of 1018 is often regarded as the true starting-point of the history of the county of Holland. Having thus established his rule in the south, Dirk next proceeded to bring into subjection the Frisians in the north. He appointed his brother Siegfried or Sikka as governor over them. In his later days Dirk went upon a pilgrimage to the Holy Land from which he returned in 1034; and ruled in peace until his death in 1039.

Dirk IV., his son, was one of the most enterprising of his race. He extended his rule southwards and took the counties of Flanders, as to the lordship over Walcheren and other islands of Zeeland; the quarrel was important, as dealing with the borderland between French and German overlordship. This strife, which lasted 400 years, did not at first break out into actual warfare, because both Dirk and Baldwin V. of Flanders had a common danger in the emperor Henry III., who in 1046 occupied the lands in dispute. Dirk allied himself with Godfrey the Bearded of Lorraine, who was at war with the emperor, and his territory was invaded by a powerful imperial fleet and army (1047). But Dirk entrenched himself in his stronghold at Vlaardingen, and when winter came on he surrounded and cut off with his light boats a number of the enemy's ships, and destroyed a large part of their army as they made their way amidst the marches, which impeded their retreat. He was able to recover what he had lost and to make peace on his own terms. Two years later he was again assailed by a coalition headed by the archbishop of Cologne and the bishop of Utrecht. They availed themselves of a very hard winter to penetrate into the land over the frozen water. Dirk offered a stout resistance, but, according to the most trustworthy account, was enticed into an ambuscade and was killed in the fight (1049). He died unmarried and was succeeded by his brother Floris I.

Floris, like his predecessors, was hard-fighting and tenacious. He gradually recovered possession of his ancestral lands. He found a formidable adversary in the able and warlike William, who, becoming bishop of Utrecht in 1054, was determined to recover the lost possessions of his see; and in 1058, in alliance with Hanno, archbishop of Cologne, Egbert, margrave of Brandenburg, the bishop of Liége and others, invaded the Frisian territory. At first success attended the invaders and many places fell into their hands, but finally they were surprised and defeated near Dordrecht. The counties of Guelders and Louvain were among the prisoners that fell into the hands of Floris. The attack was renewed in 1059. In a battle at Nederhemert Floris met with his death in the hour of victory. He is said to have been killed as, wearied with pursuing, he lay asleep under a tree. He was succeeded by his son, Dirk V., a child, under the guardianship of his mother, Gertrude of Saxony. Bishop William seems now to have seized his opportunity and occupied all the territory that he claimed. In this he was confirmed by two charters of the emperor Henry IV. (April 30 and May 2, 1064).

Among the possessions thus assigned to him is found comitatus omnis
in Holland cum omnibus ad bovnum regalem pertinientibus. An examination of these documents shows the possessions of Dirk as in Westflinge et circa oras Rheni, i.e. west of the Rijn and around the mouths of the Rine. Gertrude and her son appear to have withdrawn to the islands of Frisland, and had to pay tribute to the Frisians under the badfellowdom of William, in an undisturbed occupation of the disputed lands. In 1063 Gertrude contracted a marriage with Robert, the second son of Baldwin V. of Flanders, a man famous for his adventurous career (see FLANDERS). On his marriage his father invested him with Imperial Flanders, as an apanage including the islands of Frisia (Zeeland) west of the Scheldt. He now became guardian to his stepson, in whose inheritance lay the islands east of the Scheldt. Robert settled on his own island of Frisland (later of all Frisia (Zeeland)), and thus became known among his Flemish countrymen as Robert the Frisian. The death of his brother Baldwin VI. in 1070 led to civil war in Flanders, the claim of Robert to the guardianship of his nephew Arnulf being disputed by Richilde, the widow of Baldwin. The issue was decided by the decisive victory of Robert at Cassel (February 1071) when Arnulf was killed and Richilde taken prisoner (see FLANDERS). While Robert was thus engaged in Flanders, an effort was made to reconquer "the Count of Holland"—a title now held by William of Utrecht. The people rose in revolt, but by command of the emperor Henry IV. were speedily brought back under episcopal rule by an army under the command of Godfrey the Hunchback, duke of Lower Lorraine. Again in 1076, at the request of the bishop, Duke Godfrey visited his domains in the Frisian borderland. At Delft, of which town tradition makes Godfrey the founder, the duke was treacherously murdered (February 26, 1076). William of Utrecht died on the 17th of the following April. Now grown to man's estate, was not slow to take advantage of the favourable juncture. With the help of Robert (his stepfather) he raised an army, besieged Conrad, the successor of William, in the castle of Ysselmonde and took him prisoner. The bishop purchased his liberty by surrendering all claim to the disputed lands. Henceforth the Frisian counts became definitely known as counts of Holland. Dirk V. died in 1091 and was succeeded by his son Floris II, the Fat. This count had a peaceful and prosperous reign of thirty-one years. After his death (1122) his widow, Petronilla of Saxony, governed in the name of Dirk VI., who was a minor. The accession of her half-brother, Lothaire of Saxony, to the imperial throne on the death of Henry V. greatly strengthened her position. The East Frisian districts, Oostergo and Westergo, were by Lothaire transferred from the rule of the bishops of Utrecht to that of the counts of Holland (1125). These Frisians proved very troublesome subjects to Dirk VI. In 1132 they rose in insurrection under the leadership of Dirk's own brother, Floris the Black. The emperor Conrad III. (1138), who was of the rival house of Hohenstaufen, gave back these Frisian districts to the bishop; it was in truth somewhat of an empty gift. The Frisian peasants and fisher folk loved their independence, and were equally refractory to the rule of any distant overlord, whether count or bishop. Dirk VI. was succeeded in 1157 by Floris III.

Floris III. reversed the traditional policy of his house by aligning himself with the Hohenstaufens. He became a devoted adherent and friend of Frederick Barbarossa. He had troubles with West Frisia and Groningen, and with a war with the count of Flanders concerning their respective rights in West Zeeland, in which he was beaten. In 1170 a great flood caused immense devastation in the north and helped to form the Zuider Zee. In 1180 Floris accompanied Frederick Barbarossa upon the third Crusade, of which he was the vanguard. At Liman he was declared ruler of the Frisian coast. His son, Dirk VII., had a stormy, but on the whole successful reign. Contests with the Flemings in West Zeeland and with the West Frisians, stirred up to revolt by his brother William, ended in his favour. The brothers were reconciled and William was made count of East Friesland. In 1202, however, Dirk was defeated and taken prisoner by the Duke of Brabant, and had to pay tribute to the imperial court, which had in the meantime expanded so as to include the Frisians. He only survived his defeat a short time and died early in 1204, leaving as his only issue a daughter, Ada, 17 years of age. The question of female succession thus raised was not likely to be accepted without a challenge by William. It had been the intention of Dirk VII. to secure the recognition of his daughter's rights by appointing his brother her guardian. His widow Alida, however, an ambitious woman of strong character, as soon as her husband was dead, hurried on a marriage between Ada and Count Louis of Holland and attempted with the nobles of Holland, who now for the first time make their appearance as a power in the country, to oppose the claim which William had made to the countship as heir in the male line. A struggle ensued. William was supported by the Zeelanders and Ada was forced to fly to England. William, by a treaty concluded with Louis of Loon in 1206, became undisputed count. He took an active part in the events of his time. He fought by the side of the emperor Otto IV. in the great battle of Bouvines in 1214 (see PUTTIAC AUGUSTUS), and taken prisoner. Two years later he accompanied Louis, the eldest son of Philip Augustus, in his expedition against King John of England. William is perhaps best known in history by his taking part in the fourth Crusade. He distinguished himself greatly at the capture of Damietta (1219). He did not long survive his return home, dying in 1222. The earliest charters conveying civic privileges in the county of Holland date from his reign—those of Geertruidenberg (1219) and of Dordrecht (1220). His son Floris IV., being a minor, succeeded him under the guardianship of his maternal uncle, Gerhard III. of Gelderland. He maintained in later life close relations of friendship with Gerard, and supported him in his quarrel with the bishop of Utrecht (1224-1226). Floris was murdered in 1235 at a tournament at Corbie in Picardy by the count of Clermont. Another long minority followed his death, during which his brother Otto, bishop of Utrecht, acted as guardian to his nephew William II.

William II. became a man of mark. Pope Innocent IV., having deposed the emperor Frederick II., after several princes had refused to allow themselves to be nominated in the place of the Hohenstaufen, caused the young count of Holland to be elected king of the Romans (1247) by an assembly composed chiefly of German ecclesiastics. William took Aachen in 1248 and was there crowned king; and after Frederick's death in 1250, he had a considerable party in Germany. He brought a war with Margaret of Flanders (Black Margaret) to a successful conclusion (1255). He was on the point of proceeding to Rome to be crowned emperor, when in an expedition against the West Frisians he perished, going down, horse and armour, through the ice (1256). Like so many of his predecessors he left his inheritance to a child. Floris V. was but two years old on his father's death; and he was destined during a reign of forty years to leave a deeper impress upon the history of Holland than any other of its counts. Floris was a man of chivalrous character and high capacity, and throughout his reign he proved himself an able and beneficent ruler. Alike in his troubles with his turbulent subjects and in the perennial disputes with his neighbours he pursued a strong, far-sighted and successful policy. But his active interest in affairs was not limited to the Netherlands. He allied himself closely with Edward I. of England in his strife with France, and secured from the English king great trading advantages for his people; the staple of wool was placed at Dort (Dordrecht) and the Hollanders and Zeelanders got fishing rights on the English coast. But his relations with the nobles were at times difficult. Floris sent his son John to be educated at the court of Edward with a view to his marriage with an English princess. To
balance the power of the nobles he granted charters to many of the towns. Floris made himself master of Amstelanda and Goolland; and Amsterdam, destined to become the chief commercial town of Holland, counts him the founder of its greatness. Its earliest extant charter dates from 1275. In 1296 Floris forsook the alliance of Edward I. for that of Philip IV. of France, probably because Edward had given support to Guy, count of Flanders, in his dynastic dispute with John of Avesnes, count of Hainaut, Floris’s nephew (see FLANDERS). The real motives of his policy will, however, never be known, for shortly afterwards a conspiracy of disaffected nobles, headed by Gijsbrecht van Amstel, Gerard van Velzen and Wolpert van Borsele, was formed against him. He was by them basely murdered in the castle of Muider (June 27, 1296). The tragic event has been immortalized in ballads from the pen of Holland’s most famous writers (see VONDEL, HOORT). The burghers and people, who knew him to be their best friend, took such vengeance on his slayers as permanently to reduce the power of the nobles.

John I., his son, was in England when his father was murdered; he was but 15 years of age, feeble in body and mind. He was married to Eleanor, daughter of Edward I. His reign was a struggle between John of Avesnes, the young count’s guardian and next heir, and Wolpert van Borsele, who had a strong following in Zeeland. In 1299 van Borsele was killed, and a few months later John I. died. John of Avesnes was at once recognized as his successor by the Hollanders. Thus with John I. ended the first line of counts, after a rule of nearly 400 years. Europe has perhaps never seen an ablebsser series of princes than these fourteen lineal descendants of Dirk I. Excepting the last there is not a weak man among them. Physically handsome and strong, model knights of the days of chivalry, hard fighters, wise statesmen, they were born leaders of men; always ready to advance the commerce of the country, they were the supporters of the growing towns, and likewise the pioneers in the task of converting a land of marshes and swamps into a fertile agricultural territory rich in flocks and herds. As individuals they had their failings, but one and all were worthy members of a high-souled race.

John of Avesnes, who took the title of John II., was the son of John of Avesnes, count of Hainaut, and Alida, sister of William II. of Holland. On his succession to the countship the Hollanders were willing to receive him, but the Zeelanders were hostile; and a long struggle ensued before his authority was generally recognized. In 1301 Bishop William of Utrecht invaded Amstelanda, but was killed in the castle of Muider by one of his victims. The election of his brother Guy as bishop in his place. A war with the Flemings followed, in which the Flemings were at first victorious, but after a struggle of many vicissitudes they were at length driven out of Holland and Zeeland in 1304. John II. died in that year and was succeeded by his son William III., surnamed the Good (1304–1337). In his reign the long-standing quarrel with Flanders, which had during a century and a half caused so many wars, was finally settled by the treaty of 1295, by which the full possession of West Zeeland was granted to William, who on his part renounced all claim in Imperial Flanders. The Amstelanda with its capital, Amsterdam, which had hitherto been held as a fief of Utrecht, was by William, on the death of his uncle Bishop Guy, finally annexed to Holland. This count did much to encourage civic life and to develop the resources of the country. He had close relations through marriage with the three principal European dynasties of his time. His wife was Jeanne of Valois, niece of the French king; in 1233 the emperor Louis the Bavarian wedded his daughter Margaret; and in 1228 his third daughter, Philippa of Hainaut, was married to Edward III. of England. By their alliance William III. occupied a position of much dignity and influence, which he used to further the interests and increase the welfare of his hereditary lands. He was in all respects a great prince and a wise and prudent statesman. He was succeeded by his son, William IV., who was the ally of his brother-in-law, Edward III., in his French wars. He was fond of adventure, and in 1343 made a journey to the Holy Land in disguise, and on his way took part in an expedition of the knights of the Teutonic Order against the infidel Wends and Lithuanians. He was killed in battle against the Frisians in 1345. He left no children, and the question as to the succession now brought on Holland a period of violent civil commotions. His inheritance was claimed by his eldest sister, the empress Margaret, as well as by Philippa of Hainaut, or in other words, by Edward III. of England. Margaret came in person and was duly recognized as countess in Holland, Zeeland and Hainaut; but returned to her husband after appointing her second son (the eldest, Louis, renounced his rights) Duke William of Bavaria, as stadholder in her place. William was but sixteen, and disorder and confusion soon reigned in the land. The sudden death of the emperor in 1347 added to the difficulties of his position. In 1349 Margaret was induced to resign her sovereignty, and the stadholder became count under the title of William V. This was the time of the formation of the famous parties in Holland, known as Kabbeljauws (Cods) and Hoeks (Hooks); the former, the burgher party, who were the supporters of William (possibly his name was derived from the light blue, sky-looking Bavarian coat of arms), the latter the party of the disaffected nobles, who wanted to catch and devour the fat burgher fish. In 1350 such was the disorder in the land that Margaret, at the request of the nobles, came to Holland to take into her own hands the reins of government. The struggle between the nobles and the cities broke out into civil war. Edward III. came to Margaret’s aid, winning a sea-fight off Veere in 1351; a few weeks later the Hooks and their English allies were defeated by William and the Gods at Vaardingen—an overthrow which ruined Margaret’s cause. Edward III. shortly afterwards changed sides, and the empress saw herself compelled (1354) to come to an understanding with her son, he being recognized as count of Holland and Zeeland, she of Hainaut. Margaret died two years later, leaving William, who had married Matilda of Lancaster, in possession of the entire Holland-Hainaut inheritance (July 1356). His tenure of power was, however, very brief. Before the close of 1357 he showed such marked signs of insanity that his wife, with his own consent and the support of both parties, invited Duke Albert of Bavaria, younger brother of William V., to be regent, with the title of Rule (1358).

William lived in confinement for 31 years. Albert died in 1404, having ruled the land well and wisely for 46 years, and the regency was only temporary. From time to time the Hook and Cod troubles, he was able to make his authority respected, and to help forward in many ways the social progress of the country. The influence of the towns was steadily on the increase, and their government began to fall into the hands of the burgher patrician class, who formed the Cod party. Opposed to them were the nobility and the lower classes, forming the Hook party. In Albert’s latter years a fresh outbreak of civil war (1392–1395) was caused by the count’s espousing the side of the Cod, while the Hooks had the support of his eldest son, William. Albert was afterwards reconciled to his son, who succeeded him as William VI. in 1404. On his accession to power William upheld the Hooks, and secured their ascendancy. His reign was much troubled with civil discord, but he was a brave soldier, and was generally successful in his enterprises. He died in 1417, leaving an only child, a daughter, Jacqueline or Jacoba, who had in her early youth been married to John, heir to the throne of France. At a gathering held at the Hague (August 15, 1416) the nobles and representatives of the cities of Holland and Zeeland had promised at William’s request to support his daughter’s claims to the succession. But John of France died (April 1417), and William VI.
HOLLAND, COUNTY OF

about a month later, leaving the widowed Jacqueline at 17 years of age face to face with a difficult situation. She was at first welcomed in Holland and Zeeland, but found her claims opposed by her uncle, John of Bavaria, supported by the Cod party. Every one from whom she might have expected help betrayed her in turn, her second husband John IV. of Brabant, her third husband Humphrey of Gloucester, her cousin Philip the Good of Burgundy, all behaved shamefully to her. Her romantic and sad life has rendered the courageous and accomplished Jacqueline the most picturesque figure in the whole history of Holland. She struggled long against her powerful kinsfolk, nor did she know happiness till near the end of her life, when she abandoned the unequal strife, and found repose with Francis of Borsele, Ruward of Holland, her fourth husband. Him Philip the Good, duke of Burgundy, craftily seized; and thereby in 1433 the Duchess Jacqueline was compelled to cede her rights over the counties of Holland and Hainaut. Consequently at her death in 1436, as she left no children, Philip succeeded to the full and undisputed possession of her lands. He had already acquired by inheritance, purchase or force almost all the other Netherlands states; and now, with the extinction of the Bavarian line of counts, Holland ceased to have an independent existence and became an outlying province of the growing Burgundian power (see Burgundy). During the years that followed the accession to the sovereignty of Duke Philip, Holland plays but an insignificant part. It was governed by a stadholder, and small respect was shown for it. March 1452, 1477, 1482.

The quarrels between the Hook and Cod factions still continued, but the outbreaks of civil strife were quickly repressed by the strong hand of Philip. Holland during this time contented herself with growing material prosperity. Her herring fishery, rendered more valuable by the currying process discovered or introduced by Benkelszoon, brought her increasing wealth, and her fishermen were already laying the foundations of her future maritime greatness. It was in the days of Duke Philip that Lorenz Koster of Haarlem contributed his share to the discovery of printing. During the reign of Charles the Bold (1467-1477) the Hollanders, like the other subjects of that warlike prince, suffered much from the burden of taxation. An outbreak at Hoorn was by Charles sternly repressed. The Hollanders were much aggrieved by the establishment of a high court of justice for the entire Netherlands at Mechlin. (1474). This was regarded as a serious breach of their privileges.

The success of Mary of Burgundy led to the granting to Holland of a vote to the other provinces of the Netherlands. The Great Estates of Zeeland, and afterwards of the other provinces, restored the most important of their ancient rights and liberties (see Netherlands). A high court of justice was established for Holland, Zeeland and Friesland, and the use of the native language was made official. The Hook and Cod troubles again disturbed the country. Hook uprisings took place at Leiden and Dordrecht and had to be repressed by armed force.

By the sudden death of the Duchess Mary in 1482 her possessios, including the county of Holland, passed to her infant son, Philip, under the guardianship of his father the Archduke Maximilian of Austria. Thus the Burgundian dynasty was succeeded by that of the Habsburgs. During the regency of Maximilian the turbulence of the Hook caused much strife and unrest in Holland. Their leaders, Francis of Brederode and John of Naaldwijk, seized Rotterdam and other places. Their overthrow finally ended the strife between Hook and Cod. The "Bread and Cheese" was an uprising of the peasants in North Holland caused by famine, is a proof of the misery caused by civil disorders and oppressive taxation. In 1491, Maximilian having been elected emperor, Philip was declared of age. His assumption of the government was greeted with joy in Holland, and in his reign the province enjoyed rest and its fisheries benefited from the commercial treaty concluded with England. The story of Holland during the long reign of his son and successor Charles III. (1506-1553), better known as the emperor Charles V., belongs to the general history of the Netherlands (see Netherlands). On the abdication of Charles, his son Philip II. of Spain became Philip III., count of Holland, the ruler whose arbitrary rule in church and state brought about the revolt of the Netherlands. His appointment of William, prince of Orange, as stadholder of Holland and Zeeland, was destined to have momentous results to the future of those provinces (see William the Silent).

The capture of Brill and of-Flushing in 1572 by the Sea-Beggars led to the submission of the greater part of Holland and Zeeland to the authority of the prince of Orange, who, as stadholder, summoned the states of Holland to meet at Dordrecht. This act was the beginning of Dutch independence. From this time forward William made Holland his home. It became the bulwark of the Protestant faith in the Netherlands, the focus of the resistance to Spanish tyranny. The sieges of Haarlem, Alkmaar and Leiden saved Holland from being overwhelmed by the armies of Alva and Requesens and stemmed the tide of Spanish victory. The act of federation between Holland and Zeeland brought about by the influence of William was the germ of the larger union of Utrecht between the seven northern provinces in 1579. But within the larger union the inner and closer union between Holland and Zeeland was never relinquished. In 1580, when the sovereignty of the Netherlands was offered to the duke of Anjou, the two maritime provinces refused to acquiesce, and forced William to accept the title of count of Holland and Zeeland. In the following year William in the name of the two provinces solemnly abjured the sovereignty of the Spanish king (July 24). After the assassination of William (1584) the title of count of Holland was never revived.

In the long struggle of the united provinces with Spain, which followed the death of Orange, the brunt of the conflict fell upon Holland. More than half the burden of the charges of the war fell upon this one province; and with Zeeland it furnished the fleets which formed the chief defence of the country. Hence the importance attached to the vote of Holland in the assembly of the States-General. That vote was given by deputies at the head of whom was the advocate (in later times called the grand pensionary) of Holland, and who were responsible to, and the spokesmen of, the provincial states. These states, which met at the same building as the States-General, had their representatives (regents) of the principal towns, together with representatives of the nobles, who possessed one vote only. The advocate was the paid minister of the states. He presided over their meetings, kept their minutes and conducted all correspondence, and, as stated above, was their spokesman in the States-General. The advocate (or grand pensionary) of Holland therefore, if an able man, had opportunities for exercising a very considerable influence, becoming in fact a kind of minister of all affairs. It was this influence as exerted by the successive advocates of Holland, Paul Buys and Johan van Oldenbarneveldt, which rendered abortive the well-meaning efforts of the earl of Leicester to centralize the government of the United Provinces. After his departure (1687) the advocate of Holland, Oldenbarneveldt, became the indispensable statesman of the struggling republic. The multiplicity of his functions gave to the advocate an almost unlimited authority in the details of administration, and for thirty years the conduct of affairs remained in his hands (see Oldenbarneveldt). This meant the undisputed hegemony of Holland in the federation, in other words of the burger oligarchies who controlled the town corporations of the province, and especially of Amsterdam. This authority of Holland was, however, more than counterbalanced...
by the extensive powers with which the stadholder princes of Orange were invested; and the chief crises in the internal history of the Dutch republic are to be found in the struggles for supremacy between two, in reality, different principles of government. On the one side the principle of provincial sovereignty which gave to the voice of Holland a preponderating weight that was decisive; on the other side the principle of national sovereignty personified in the princes of Orange, to whom the States-General and the provincial states delegated executive powers that were little less than monarchical.

The conclusion of the twelve years' truce in 1690 was a triumph for Oldenbarneveldt and the province of Holland over the opposition of Maurice, prince of Orange. The outbreak of the religious dispute between the Remonstrant and Contra-remonstrant parties brought on a life and death struggle between the sovereign province of Holland and the States-General of the union. The sword of Maurice decided the issue in favour of the States-General. The claims of Holland were overthrown and the head of Oldenbarneveldt fell upon the scaffold (1619).

The stadholder, Frederick Henry of Orange, ruled with well-nigh monarchical authority (1625-1647), but even he at the height of his power and popularity had always to reckon with the opposition of the states of Holland, and of Amsterdam, and many of his plans of campaign were thwarted by the refusal of the Hollanders to furnish supplies. His son William II. was but 21 years of age on succeeding to the stadholdership, and the states of Holland were sufficiently powerful to carry through the negotiations for the peace of Münster (1648) in spite of his opposition. A life and death conflict again ensued, and once more in 1650 the prince of Orange by armed force crushed the opposition of the Hollanders. The sudden death of William in the hour of his triumph caused a complete revolution in the government of the Dutch republic. Frederick Henry, the infant, and the party of the burgher regents of Holland was once more in the ascendant. The office of stadholder was abolished, and John de Witt, the grand pensionary (Raad-Pensionaris) of Holland, for two decades held in his hands all the threads of administration, and occupied the same position of undisputed authority in the councils of the land as Oldenbarneveldt had done at the beginning of the century. Amsterdam during this period was the centre and head of the United Provinces. The principle of provincial sovereignty was carried to its extreme point in the separate treaty concluded with Cromwell in 1655, in which the province of Holland agreed to exclude for ever the prince of Orange from the office of stadholder of Holland or captain-general of the union. In 1672 another revolution took place. John de Witt was murdered, and William III. was called to fill the office of dignity and authority which had been held by his ancestors of the house of Orange, and the stadholdership was declared to be hereditary in his family. But William died without issue (see William III.) and a stadholderless period, during which the province of Holland was in the supremacy, followed till 1737. This change was effected smoothly, for though William had many differences with Amsterdam, he had in Anthony Heinsius (van der Helm), who was grand pensionary of Holland from 1690 to his death in 1720, a statesman whom he thoroughly trusted, who worked with him in the furtherance of his policy during life and who continued to carry out that policy after his death. In 1737 there was once more a revolution to the stadholdership in the person of William IV., whose powers were strengthened and declared hereditary both in the male and female line in 1747. But until the final destruction of the federal republic by the French armies, the perennial struggle went on between the Holland or federal party (Staatssgezinden) centred at Amsterdam—out of which grew the patriot party under William V.—and the Orange or unionist party (Oranjegesinden), which was strong in the smaller provinces and had much popular support among the lower classes. The French conquest swept away the old condition of things never to reappear; hence allegiance to the Orange dynasty survived, and in 1813 became the rallying point of a united Dutch people. At the same time the leading part played by the province of Holland in the history of the republic has not been unrecognized, for the country ruled over by the sovereigns of the house of Orange is always popularly, and often officially, known as Holland.

The full title of the states of Holland in the 17th and 18th centuries was: de Eedele Groote Moge ende Heeren Staten van Holland en Westfriesland. After 1668 this assembly consisted of nineteen members, one representing the municipality (ridderschap), the other eight, the towns. The member for the nobles had preceded in this function. The interests of the country districts (het platte land) were the peculiar charges of the member for the nobles. The nobles also retained the right of appointing representatives to the seats in the College of Deputed Councillors, in certain colleges of the admiralty, and upon the board of directors of the East India Company, and to various public offices. The following eighteen towns sent representatives: South Quarter—(1) Dordrecht, (2) Haarlem, (3) Delft, (4) Leiden, (5) Amsterdam, (6) Gouda, (7) Rotterdam, (8) Gorinchem, (9) Schiedam, (10) Vlaardingen, (11) Veere, (12) Alkmaar, (13) Hoorn, (14) Enkhuizen, (15) Edam, (16) Monnikendam, (17) Medemblik, (18) Purmerend. Each town (as did also the nobles) sent as many representatives as they pleased, but the nineteen members had only one vote each. Each town's depu- tation was headed by its pensionary, who was the spokesman on behalf of the representatives. Certain questions such as peace and war, voting of subsidies, imposition of taxation, changes in the mode of government, &c., required unanimity of votes. The grand pensionary (Raad-Pensionaris) was at once the president and chief administrative officer of the states. He presided over all meetings, and had the power of keeping the business of the states charged with the maintenance of the rights of the states, with the execution of their resolutions and with the entire correspondence. Nor were his functions only provincial. He was the head and the spokesman of the deputation of the states to the States-General of the union; and in the stadholderless period the influence of such grand pensionaries of Holland as John de Witt and Anthony Heinsius enabled the complicated and intricate machinery of government in a confederacy of many sovereign and semi-sovereign authorities without any recognized head of the state, to work with comparative smoothness and a remark- able unity of policy. This was secured by the indispensible the policy of the states of Holland swayed the policy of the generality, and historical circumstances decreed that the policy of the states of Holland during long and critical periods should be controlled by a succession of remarkable men filling the office of grand pensionary. The states of Holland sat at the Hague in the months of March, July, September and November. During the periods of prorogation the continuous oversight of the business and interests of the province was, however, never neglected. This duty was confided to a body called the College of Deputed Councillors (het Kollegied der Gekommergeide Ridders, which was itself divided into two sections, one for the south quarter, another for the north quarter. The more important—that for the south quarter—consisted of ten members, (1) the senior member of the nobility, who sat for life, (2) representatives (for periods of three years) of the eight towns: Dordrecht, Haarlem, Delft, Leiden, Amsterdam, Gouda, Rotterdam and Gorinchem, with a tenth member (usually elected biennially) for the towns of Schiedam, Schoonhoven and Brill conjointly. The grand pensionary presided over the meetings of the college, which had the general charge of the whole provincial administration, especially of finance, the carrying out of the resolutions of the states, the maintenance of defences, and the upholding of the privileges and liberties of the land. With particular regard to this last-
Holland—Holles

named duty the college deputed two of its members to attend all meetings of the states-general, to watch the proceedings and report any unwarranted proposals which might be held to the interests or to infringe upon the rights of the province of Holland. The institution of the College of Deputed Councillors might thus be described as a vigilance committee of the states in perpetual session. The existence of the college, with its many weighty and important functions, must never be lost sight of by students who desire to have a clear understanding of the remarkable part played by the province of Holland in the history of the United Netherlands.

HOLLAND, a city of Ottawa county, Michigan, U.S.A., on Michigan lake (known as Black Lake), near Lake Michigan, and 25 m. W.S.W. of Grand Rapids. Pop. (1890) 3043; (1900) 7790, of whom a large portion were of Dutch descent; (1904) 8666; (1910) 10,490. It is served by the Pere Marquette Railroad, by steamboat lines to Chicago and other lake ports, and by electric lines connecting with Grand Rapids, Saugatuck, and the neighbouring summer resorts. On Macatawa Bay are Ottawa Beach, Macatawa Park, Jenison Park, Central Park, Castle Park and Waukeezoo. In the city itself are Hope College (co-educational; founded in 1855 and incorporated as a college in 1866), an institution of the (Dutch) Reformed Church in America; and the Western Theological Seminary (1869; suspended 1877–1884) of the same denomination. Holland is a grain and fruit shipping centre, and among its manufactures are furniture, leather, grain mill products, iron, beer, pickles, shoes, bent sugar, gelatine, biscuit (Holland rusk), electric and steam launches, and pianos. In 1908 seven weekly, one daily, and two monthly papers (four denominational) were published at Holland, five of them in Dutch. The municipality owns its water-works and electric-lighting plant. Holland was founded in 1847 by Dutch settlers, under the leadership of the Rev. A. C. Van Raalte, and was chartered as a city in 1867. In 1871 much of it was destroyed by a forest fire.

Holland, a cloth so called from the country where it was first made. It was originally a fine plain linen fabric of a brownish colour—unbleached flax. Several varieties are now made: hollasses, pale hollasses and fine hollasses. They are used for aprons, blinds, shirts, blouses and dresses.

Hollar, Wenzel or Wenceslaus [VACLAV HOLAR] (1607–1677), Bohemian etcher, was born at Prague on the 13th of July 1607, and died in London, being buried at St Margaret's church, Westminster, on the 28th of March 1677. His family was ruined by the capture of Prague in the Thirty Years' War, and young Hollar, who had been destined for the law, determined to become an artist. The earliest of his works that have come down to us are dated 1625 and 1626; they are small plates, and one of them is a copy of a Virgil and Child by Dürer, whose influence upon Hollar's work was always great. In 1637 he was at Frankfort, working under Matthew Merian, an etcher and engraver; hence he passed to Strassburg, and thence, in 1633, to Cologne. It was there that he attracted the notice of the famous amateur Thomas, earl of Arundel, then on an embassy to the imperial court; and with him Hollar travelled to Vienna and Prague, and finally came in 1637 to England, destined to be his home for many years. Though he lived in the household of Lord Arundel, he seems to have worked not exclusively for him, but to have begun that slavery to the publishers which was afterwards the normal condition of his life. In his first year in England he made for Stent, the printseller, the magnificent View of Greenwich, nearly a yard long, and received thirty shillings for the plate,—perhaps a twentieth part of what would now be paid for a single good impression. Afterwards we hear of his fixing the price of his work at fourpence an hour, and measuring his time by a sandglass. The Civil War had its effect on his fortunes, but none on his industry. Lord Arundel left England in 1642, and Hollar passed into the service of the duke of Buckingham, who thereupon engaged him as engraver to his two children. With other royalist artists, notably Inigo Jones and Faithorne, he stood the long and eventful siege of Basing House; and as we have some hundred plates from his hand dated during the years 1643 and 1644 he must have turned his enforced leisure to good purpose. Taken prisoner, he escaped or was released, and joined some letter of Trelawny at Antwerp, and there he remained eight years, the prime of his work, when he produced his plates of every kind, his noblest views, his miraculous "muffs" and "shells," and the superb portrait of the duke of York. In 1652 he returned to London, and lived for a time with Faithorne the engraver near Temple Bar. During the following years were published many books which he illustrated:—Ogilby's Virgil and Homer, Stapylton's Juvenal, and Dugdale's Warwicke's, St Paul's and Monasticon (part i.). The booksellers continued to impose on the simple-minded foreigner, pretending to decline him the "Mighty," until further reduce the wretched price he charged them. Nor did the Restoration improve his position. The court did nothing for him, and in the great plague he lost his young son, who, we are told, might have rivelled his father as an artist. After the great fire he produced some of his famous "Views of London"; and it may have been the success of these plates which induced the king to send him, in 1668, to Tangier, to draw the town and forts. During his return to England occurred the desperate and successful engagement fought by his ship the "Mary-Duke," against Captain Kemphorne, against seven Algerine men-of-war,—a brilliant duel, in which he was etched for Ogilby's Africa. He lived eight years after his return, still working for the booksellers, and retaining to the end his wonderful powers; witness the large plate of Edinburgh (dated 1670), one of the greatest of his works. He died in extreme poverty, his last recorded words being a request to the bailiffs that they would not carry away the bed on which he was dying.

Hollar's variety was boundless; his plates number some 2749, and include views, portraits, ships, religious subjects, heraldic subjects, landscapes, and still life in a hundred different forms. No one that ever lived has been able to represent fur, or shells, or a butterfly's wing as he has done. His architectural drawings, such as those of Antwerp and Strassbourg cathedrals, and his views of towns, are mathematically exact, but they are pictures as well. He could reproduce the decorative works of other artists quite faultlessly, as in the famous chalice after Mantegna's drawing. His Theatrum mulierum and similar collections reproduce for us with literal truth the outward aspects of the people of his day; and his portraits, a branch of art in which he has been unfairly disregarded, are of extraordinary refinement and power.

Almost complete collections of Hollar's works exist in the British Museum and in the library at Windsor Castle. Two admirable sets are his plates of his own household, one drawn by George Vertue, and one in 1853 by Parthey. The latter, published at Berlin, is a model of German thoroughness and accuracy.

Holles, Denzil Holles, Baron (1599–1680), English statesman and writer, second son of John Holles, 1st earl of Clare (c. 1564–1637), by Anne, daughter of Sir Thomas Stanhope, was born on the 31st of October 1599. The favourite son of his father and endowed with great natural abilities, Denzil Holles grew up under advantageous circumstances. Destined to become later one of the most formidable antagonists of King Charles's arbitrary government, he was in early youth that prince's playmate and intimate companion. The earl of Clare was, however, no friend to the Stuart administration, being especially hostile to the duke of Buckingham; and on the accession of Charles to the throne the king's offers of favour were rejected. In 1640 Holles was returned to parliament for Mitchel in Cornwall, and in 1628 for Dorchester. He had from the first a keen sense of the humiliations which attended the foreign policy of the Stuart kings. Writing to Strafford, his brother-in-law, on the 29th of November 1627, he severely censures Buckingham's conduct of the expedition to the Isle of Râ; "since England was England," he declared, "it received not so dishonourable a blow"; and he joined in the demand for Buckingham's impeachment in 1648. To these charges the king's friends were quick to respond, and Holles was himself impeached by the king's arbitrary administration. On the 2nd of March 1649, when Sir John Finch, the speaker, refused to put Sir John Eliot's Protestsations and was about to adjourn the House by the king's
command, Holles with another member thrust him back into the chair and swore "he should sit still till it pleased them to rise." Meanwhile Eliot, on the refusal of the speaker to read the Protestations, had himself thrown them into the fire; the usher of the black rod was knocking at the door for admittance, and the king had sent for the guard. But Holles, declaring that he could not render the king or his country better service, put the Protestations to the House from memory, all the members rising to their feet and applauding. In consequence a warrant was issued for his arrest with others on the following day. They were prosecuted first in the Star Chamber and subsequently in the King's Bench. When brought upon his habeas before the latter court Holles offered with the rest to give bail, but refused sureties for good behaviour, and argued that the court had no jurisdiction over offences supposed to have been committed in parliament. On his refusal to plead he was sentenced to a fine of 1000 marks and to imprisonment during the king's pleasure. Holles had at first been committed and remained for some time a close prisoner in the Tower of London. The "close" confinement, however, was soon changed to a "safe" one, the prisoner then having leave to take the air and even go with a walking-stick in his hand. According to Clarendon, on the 29th of October Holles, with Eliot and Valentine, was transferred to the Marshalsea. His resistance to the king's tyranny did not prove so stout as that of some of his comrades in misfortune. Among the papers of the secretary Sir John Coke is a petition of Holles, couched in humble and submissive terms, to be restored to the king's favour; but having given the security demanded for his good behaviour, he was liberated early in 1630, and on the 30th of October was allowed bail. Being still banished from London he retired to the country, paying his fine in 1637 or 1638. The fine was repaid by the parliament in July 1644, and the judgment was revised on a writ of error in 1648. In 1648 we find him, notwithstanding his recent experiences, one of the chief leaders in his county of the resistance to ship money, though it would appear that he subsequently made submission.

Holles was a member of the Short and Long Parliaments assembled in 1640. According to Laud he was now "one of the great leading men in the House of Commons," and in Clarendon's opinion he was "a man of more accomplished parts than any of his party" and of most authority. He was not, however, in the confidence of the republican party. Though he was at first named one of the managers for the impeachment of Strafford, Holles had little share in his prosecution. According to Laud, he held out to Strafford hopes of saving his life if he would use his influence with the king to abolish episcopacy, but the earl refused, and Holles advised Charles that Strafford should demand a short respite, of which he would take advantage to procure a commutation of the death sentence. In the debate on the attainder he spoke on behalf of Strafford's family, and later obtained some favours from the parliament for his eldest son. In all other matters in parliament Holles took a principal part. He was one of the chief movers of the Protestation of the 3rd of May 1641, which he carried up to the Lords, urging them to give it their approval. Although, himself at his own command, he did not wish to change the government of the church, he showed himself at this time decidedly hostile to the bishops. He took up the impeachment of Laud to the House of Peers, supported the Londoners' petition for the abolition of episcopacy and the Root and Branch Bill, and afterwards urged that the bishops impeached for their conduct in the affair of the late canons should be accused of treason. He showed equal energy in the affairs of Ireland at the outbreak of the rebellion, supported strongly the independence and purity of the judicial bench, and opposed toleration of the Roman Catholics. On the 9th of July 1641 he addressed the Lords on behalf of the queen of blood, reproving their conduct: foremost to the king and royal family and urging the necessity of supporting the Protestant religion everywhere. Together with Pym, Holles drew up the Grand Remonstrance, and made a vigorous speech in its support on

1 Hist. MSS. Comm., MSS. of Earl Cowper, i, 222.

the 22nd of November 1641, in which he argued for the right of one House to make a declaration, and asserted: "If kings are misled by their counsellors we may, we must tell them of it." On the 15th of December he was a teller in the division in favour of printing it. On the great subject of the militia he also showed activity. He supported Hesilrige's Militia Bill of the 7th of December 1641, and on the 31st of December he took up to the king the Commons' demand for a guard under the command of Essex. "Holles's force and reputation," said Sir Ralph Verney, "are the two things that give the success to our actions." After the failure of the attempt by the court to gain over Holles and others by offering them posts in the administration, he was one of the "five members" impeached by the king. Holles at once grasped the full significance of the king's action, and after the triumphant return to the House of the five members, on the 11th of January, threw himself into still more pronounced opposition to the arbitrary policy of the crown. He demanded that before anything further was done the members should be cleared of their impeachment; was himself leader in the impeachment of the duke of Richmond; and on the 31st of January, when taking up the militia petition in the House of Commons, declared that the act of Parliament was an act of submission, at the same time presenting a petition of some thousands of starved starving artificers of London, congregated round the House. On the 15th of June he carried up the impeachment of the nine Lords who had deserted the parliament; and he was one of the committee of safety appointed on the 4th of July.

On the outbreak of the Civil War (see GREAT REBELLION) Holles, who had been made lieutenant of Bristol, was sent with Bedford to the west against the marquess of Hertford, and took part in the unsuccessful siege of the latter at Sherborne Castle. He was present at Edgehill, where his regiment of Furrata's recruited in London was one of the few which stood firm and saved the day for the parliament. On the 13th of November his men were surprised at Brentford during his absence, and routed after a stout resistance. In December he was proposed for the command of the forces in the west, an appointment which he appears to have refused. Notwithstanding his activity in the field for the cause of the parliament, the appeal to arms had been distasteful to Holles from the start. As early as September he surprised the House by the marked abatement of his former "violent and fiery spirit," and his changed attitude did not escape the taunts of his enemies, who attributed it scornfully to his disaster at Brentford and to his new wife. He probably foresaw that, to whichever side victory fell, the struggle could only terminate in the suppression of the constitution and of the moderate party on which all his hopes were based. His feelings and political opinions, too, were essentially aristocratic, and he regarded with horror the transference of the government of the state from the king and the ruling families to the parliamentary leaders. He now advocated peace and a settlement of the disputes by concessions on both sides; a proposal full of danger because impracticable, and one therefore which could only weaken the parliamentary resistance and prolong the struggle. He warmly supported the peace negotiations on the 23rd of November and the 9th of December, and his attitude led to a breach with Pym and the more determined party. In June 1643 he was accused of complicity in Waller's plot, but swore to his innocency; and his arrest with others of the peace party was even proposed in August, when Holles applied for a pass to leave the country. The king's successes, however, for the moment put a stop to all hopes of peace; and in April 1644 Holles addressed the citizens of London at the Guildhall, calling upon them "to join with their purses, their persons, and their prayers together" to support the army of Essex. In November Holles and White- locke headed the commission appointed to treat with the king at Oxford. He endeavoured to convince the royalists of the necessity of yielding in time, before the "new party of hot men" should gain the upper hand. Holles and White Locke had a

2 The speech of January 5 attributed to him and printed in Thomson Tracts, E 199 (55), is a forgery.
private meeting with the king, when at Charles's request they drew up the answer which they advised him to return to the parliament. This interview was not communicated to the other commissioners or to parliament, and though doubtless their motives were to further patriotic, their action was scarcely compatible with their position as trustees of the parliamentary cause. Holles was also appointed a commissioner at Uxbridge in January 1645 and endeavoured to overcome the crucial difficulty of the militia by postponing its discussion altogether. As leader of the moderate (or Presbyteran) party Holles now came into violent antagonism with Cromwell and the army faction. "They hated one another equally"; and Holles would not allow any merit in Cromwell, accusing him of cowardice and attributing his successes to chance and good fortune. With the support of Essex and the Scottish commissioners Holles endeavoured in December 1644 to procure Cromwell's impeachment as an incendiary between the two nations, and "passionately" opposed the self-denying ordinance. In return Holles was charged with having held secret communications with the king at Oxford and with a correspondence with Lord Digby; but after a long examination by the House he was pronounced innocent on the 19th of July 1645. Determined on Cromwell's destruction, he refused to listen to the prudent counsels of Sir Anthony Ashley Cooper, who urged that Cromwell was too strong to be resisted or provoked; and on the 29th of March 1645 drew up in parliament a hasty proclamation declaring the promoters of the army petition enemies to the state; in April challenging Irelon to a duel.

The army party was now thoroughly exasperated against Holles. "They were resolved one way or other to be rid of him," says Clarendon. On the 16th of June 1647 eleven members including Holles were charged by the army with various offences against the state, followed on the 23rd by fresh demands for their impeachment and for their suspension, which was refused. On the 26th, however, the eleven members, to avoid violence, asked leave to withdraw. Their reply to the charges against them was handed into the House on the 19th of July, and on the 20th Holles took leave of the House in a grave and learned speech. After the riot of the apprentices on the 26th, for which Holles disclaimed any responsibility, the eleven members were again (30th of July) recalled to their seats, and Holles was one of the committee of safety appointed. On the flight of the speaker, however, and part of the parliament to the north, the advance of the latter to London, Holles, whose party and policy were now entirely defeated, left England on the 22nd of August for Sainte-Mère Eglise in Normandy. On the 26th of January 1648 the eleven members, who had not appeared when summoned to answer the charges against them, were expelled. Not long afterwards, however, on the 3rd of June, these proceedings were annulled; and Holles, who had then returned and was a prisoner in the Tower with the rest of the eleven members, was discharged. He returned to his seat on the 14th of August.

Holles was one of the commissioners appointed to treat with the king at Newport on the 18th of September 1648. Aware of the plans of the extreme party, Holles threw himself at the king's feet and implored him not to waste time in useless negotiations, and he was one of those who stayed behind the rest in order to urge Charles to compliance. On the 1st of December he received the thanks of the House. On the occasion of Pride's Purge on the 6th of December Holles absented himself and escaped again to France. From his retirement there he wrote to Charles II. in 1657, advising him to come to terms with the Scots as the only means of effecting a restoration; but after the alliance he refused Charles's offer of the secretaryship of state. In March 1654 Cromwell, who in alarm at the plots being formed against him was attempting to reconcile some of his opponents to his government, sent Holles a pass "with notable circumstances of kindness and esteem." His subsequent movements and the date of his return to England are uncertain, but in 1656 Cromwell's resentment was again excited against him as the supposed author of a tract, really written by Clarendon.

He appears to have been imprisoned, for his release was ordered by the council on the 2nd of September 1659.

Holles took part in the conference with Monk at Northumberland House, when the Restoration was directly proposed, and when the Parliament was to take his seat again in parliament on the 21st of February 1666. On the 23rd of February he was chosen one of the council to carry on the government during the interregnum; on the 2nd of March the votes passed against him and the sequestration of his estates were repealed, and on the 7th he was made custos rotulorum for Dorsetshire. He took a leading part in bringing about the Restoration, was chairman of the committee of seven appointed to prepare an answer to the king's letter, and as one of the deputed Lords and Commons he delivered at the Hague the invitation to Charles to return. He preceded Charles to England to prepare for his reception, and was sworn of the privy council on the 5th of June. He was one of the thirty-four commissioners appointed to try the regicides in September and October. On the 20th of April 1661 he was created Baron Holles of Ifield in Sussex, and became henceforth one of the leading members of the Upper House.

Holles, who was a good French scholar, was sent as ambassador to France on the 7th of July 1663. He was ostentatiously English, and a zealous upholder of the national honour and interests; but his position was rendered difficult by the absence of home support. On the 27th of January 1666 war was declared, but Holles was not recalled till May. Pepys remarks on the 14th of November: "Sir G. Cartaret tells me that just now my Lord Holles had been with him and wept to think in what a condition we are fallen." Soon afterwards he was employed on another disagreeable mission in which the national honour was again at stake, being sent to Breda to make a peace with Holland in May 1667. He accomplished his task successfully, the articles being signed on the 21st of June.

On the 12th of December he protested against Lord Clarendon's banishment and was nearly put out of the council in consequence. In 1668 he was manager for the Lords in the celebrated Skinner's case, in which his knowledge of precedents was of great service, and on which occasion he published the tract The Grand Question concerning the Judicature of the House of Peers (1669). Holles, who was honourably distinguished by Charles as a "stiff and sullen man," and as one who would not yield to solicitation, now became with Halifax and Shaftesbury a leader in the closet for the domestic and foreign policy of the court. Together with Halifax he supported both the Parliamentary Conventicle Act of 1670 and the Test Oath of 1675, his objection to the latter being chiefly founded on the invasion of the privileges of the peers which it involved; and he defended with vigour the right of the Peers to record their protests. On the 7th of January 1676 Holles with Halifax was summarily dismissed from the council. On the occasion of the Commons petitioning the king in favour of an alliance with the Dutch, Holles addressed a Letter to Van Beuninghen at Amsterdam on "Love to our Country and Hatred of a Common Enemy," enlarging upon the necessity of uniting in a common defence against French aggression and in support of the Protestant religion. "The People are strong but the Government is weak," he declares; and he attributes the cause of weakness to the transference of power from the nobility to the people, and to a succession of three weak princes. "Save what (the Parliament) did, we have not taken one true step nor struck one true stroke since Queen Elizabeth." He endeavoured to embarrass the government this year in his tract on Some Considerations upon the Question whether the parliament is dissolved by its prorogation for 15 months. It was held by the Lords to be seditious and scandalous; while for publishing another pamphlet written by Holles entitled The Grand Question concerning the Prorogation of this Parliament (otherwise The Long Parliament dissolved) the corrector of the proof sheets was committed to the Tower and fined £1000. In order to bring about the downfall of Danby (afterwards duke of Leeds) and the disbanding of the army, which he believed to be intended for the suppression of the national liberties, Holles at this time (1677–1679) engaged, as did many others, in a

HOLLOWAY, THOMAS (1800-1883), English patent-medicine vendor and philanthropist, was born at Devonport, on the 22nd of September 1800, of humble parents. Until his twenty-eight \nyear he lived at Penzance, where he assisted his mother and brother in the baker’s shop which his father, who was a warrant officer in a militia regiment, had left them at his death. On \ncoming to London he became the acquaintance of Felix Albinò, an Italian, from whom he obtained the idea for the ointment \nwhich was to carry his name all over the world. The secret of \nhis enormous success in business was due almost entirely to \nadvertisement, in the efficacy of which he had great faith. He \nsoon added the sale of pills to that of the ointment, and began to \ndevote the larger part of his profits to advertising. Holloway’s \nfirst newspaper announcement appeared on the 15th of October \n1837, and in 1842 his yearly expenses for publicity had reached \nthe sum of £5000; this expenditure went on steadily increasing \nas his sales increased, until it had reached the figure of £50,000 \nper annum at the time of his death. It is, however, chiefly \nby the two princely foundations—the Sanatorium and the \nCollege for Women at Egham (q.v.), endowed by Holloway \ntowards the close of his life—that his name will be perpetuated, \nmore than a million sterling having been set apart by him for the \nerection and permanent endowment of these institutions. In \nthe deed of gift of the college the founder credited his wife, who \ndied in 1875, with the advice and counsel that led him to provide \nwhat he hoped might ultimately become the nucleus of a uni- \nversity for women. The philanthropic and somewhat eccentric \ndonor (he had an unconcealed prejudice against doctors, lawyers \nand persons) died of congestion of the lungs at Sunninghill on \nthe 26th of December 1883.

HOLLY (Ilex Aquifolium), the European representative of \na large genus of trees and shrubs of the natural order Ilicineae, \ncontaining about 170 species. The genus finds its chief de- \ndevelopment in Central and South America; it is well developed in Asia, especially the Chinese-Japanese area, and has but few species in Europe, Africa and Australia. In Europe, where I. Aquifolium \nis the sole surviving species, the genus was richly represented \nduring the Miocene period by forms at first South American and \nA'alatic, and later North American in type. The genus I. \nAquifolium was described by Linnaeus in 1753. The leaves are \ngenerally leathery and evergreen, and are alternate and stalked; \nthe flowers are \ncomonly dioecious, are in \naxillary cymes, fascicles or umbellules, \nand have a persistent four- to five-lobed calyx, a white, rotate \nfour- or rarely five- or six-cleft corolla, with the four or five \nstamens adherent to its base in the male, sometimes hypogynous \nin the female flowers, and a two- to twelve-celled ovary; the \nfruit is a globose, very seldom ovoid, and usually drupe, \ncontaining two to sixteen one-seeded stones.

The common holly, or Huver (apparently the \n踏实 of Theophrastus); 2 Ang.-Sax. holen or \nholsig; Mid. Eng. holm or \nholl, whence holl and holtre. 3 Welsh \nhol, (celyn, Ger. Steck- \nholz, Hulse; Ho. Fr. houx; and Fr. houle); 4 I. Aquifolium, \nis an evergreen shrub or low tree, having smooth, ash-coloured \nbark, and wavy, pointed, smooth and glossy leaves, 2 to 3 in. \nlong, with a spinous margin, raised and cartilaginous below, or, \nas commonly on the upper branches of the older trees, entire.

1 Hist. Plant. i. 9, 3. iii. 3. 1 and 4. 6. et passim. On the aqui- \nofolium or aquifolia of Latin authors, commonly regarded as the \nt同, see A. de Grandis, Hist. Nat. de Plante, b. xvi. “Notes,” \npp. 199, 206. \n
2 The name “holm,” as indicative of a prevalence of holly, is \nsted to have entered into the names of several places in Britain. \nFrom its superficial resemblance to the holly, the tree Quercus \nBux, the euryale, has often been called “holm oak.” 3 Welsh \npeps, and Grimm (Deut. Wörterb. Bd. ii. 110) suggests that the term \nHulse, as the O.H.G. Hults, applied to \nthe butcher’s brome, or knee-holly, in the earliest times used for \nhedges, may have reference to the holly as a protecting (bühlsen-) plant.
—a peculiarity alluded to by Southey in his poem *The Holly Tree*. The flowers, which appear in May, are ordinarily dioecious, as in all the best of the cultivated varieties in nurseries (Gard. Chron., 1877, i. 149). Darwin (Diff. Forms of Flow., 1877, p. 297) says of the holly: "During several years I have examined many plants, but have never found one that was really hermaphrodite." Shirley Hibberd, however (Gard. Chron., 1877, ii. 777), mentions the occurrence of "flowers bearing globular anthers well furnished with pollen, and also perfect ovaries." In his opinion, *I. Aquifolium* changes its sex from male to female with age. In the female flowers the stamens are destitute of pollen, though but slightly or not at all shorter than in the male flowers; the latter are more numerous than the female, and have a smaller ovary and a larger corolla, to which the filaments adhere for a greater length. The corolla in male plants falls off entirely, whereas in fruit-bearers it is broken into separate segments by the swelling of the young ovary. The holly occurs in Britain, north-east Scotland excepted, and in western and southern Europe, from as high as 62° N. lat. in Norway to Turkey and the Caucasus and in western Asia. It is found generally in forest glades or in hedges, and does not flourish under the shade of other trees. In England it is usually small, probably on account of its destruction for timber, but it may attain to 60 or 70 ft. in height, and Loudon mentions one tree at Claremont, in Surrey, of 80 ft. Some of the trees on Bleak Hill, Shropshire, are asserted to be 14 ft. in girth at some distance from the ground (N. and Q., 5th ser., xii. 508). The holly is abundant in France, especially in Brittany. It will grow in almost any soil not absolutely wet, but flourishes best in rather dry than moist sandy loam. Beckmann (Hist. of Invent., 1846, i. 193) says that the plant which first induced J. d. Castro to search for alum in Italy was the holly, which is there still considered to indicate that its habitat is aluminiferous. The holly is propagated by means of the seeds, which do not normally germinate until their second year, by whip-grafting and budding, and by cuttings of the matured summer shoots, which, placed in sandy soil and kept under cover of a hand-glass in sheltered situations, generally strike root in spring. Transplantation should be performed in damp weather in September and October, or, according to some writers, in spring or on mild days in winter, and care should be taken that the roots are not dried by exposure to the air. It is rarely injured by frosts in Britain, where its foliage and bright red berries in winter render it a valuable ornamental tree. The yield of berries has been noticed to be less when a warm spring, following on a wet winter season, has promoted excess of growth. There are numerous varieties of the holly. Some trees have yellow, and others white or even black fruit. In the fruitless variety *laurifolia*, "the most floriferous of all hollies" (Hibberd), the flowers are highly fragrant; the form known as *femina* is, on the other hand, remarkable for the number of its berries. The leaves in the unarmed varieties *uro-cro-margined* and *ala-margined* are of great beauty, and in *ferox* they are studded with sharp prickles. The holly is of importance as a hedge-plant, and is patient of clipping, which is best: performed by the knife. Evelyn's holly hedge at Say's Court, Deptford, was 400 ft. long, 9 ft. high and 5 ft. in breadth. To form fences, for which Evelyn recommends the employment of seedlings from woods, the plants should be 9 to 12 ft. in height, with plenty of small fibrous roots, and require to be set 1 to 1½ ft. apart, in well-manured and weeded ground and thoroughly watered.

The wood of the holly is even-grained and hard, especially when it was obtained from the heartwood of large trees, and almost as white as ivory, except near the centre of old trunks, where it is brownish. It is employed in inlaying and turning, and, since it stains well, in the place of ebony, as for teapot handles. For engraving it is inferior to box. When dry it weighs about 4½ lb. per cubic ft. From the bark of the holly bird-like is manufactured. From the leaves an acid, *Utic acid*, and a bitter principle, *Utic acid*, which has been variously described by different analytical chemists. They are eaten by sheep and deer, and in parts of France serve as a winter fodder for cattle. The berries provoke in man violent vomiting and purging, but are eaten with immunity by thrushes and other birds. The larvae of the moths *Sphinx ligustri* and *Phloxoterza naevana* have been met with on holly. The leaves are minced by the larva of a fly, *Phylomyza ictis*, and both on them and the tops of the young twigs occurs the plant-louse *Phytoptus* (Kaltenbach, Pflanzenfeinde, 1874, p. 427). The custom of employing holly and other plants for decorative purposes at Christmas is one of considerable antiquity, and has been regarded as a survival of the usages of the Roman Saturnalia, or of an old Teutonic practice of hanging the interior of dwellings with evergreens as a refuge for sylvan spirits from the inclemency of winter. A Border proverb defines an habitual story-teller as one that "lees never but when the hollen is green." Several superstitions exist with respect to holly. In the north of Rutland it is deemed unlucky to introduce it into a house before Christmas Eve. In some English rural districts the prickly and non-prickly kinds are distinguished as 'he' and 'she' holly; and in Derbyshire the tradition obtains that according as the holly brought at Christmas into a house is smooth or rough, the wife or the husband will be master. Holly that has adorned churches at that season is in Worcestershire and Herefordshire much esteemed and cherished, the possession of a small branch with berries being supposed to bring a lucky year; and Lonicerus mentions a notion in his time vulgarly prevalent in Germany that consecrated twigs of the plant hung over a door are a protection against thunder.

Among the North American species of *Ilex* are *I. opaca*, which resembles the European tree, the Inkberry, *I. (Prinos) glabra*, and the American Black Alder, or Winterberry, *I. (Prinos) verticillata*. Hooker (Fl. of Brit. Indio, i. 508, 606) mentions twenty-four Indian species of *Ilex*. The Japanese *I. crenata*, and *I. totofilia*, a remarkably hardy plant, and the North American *I. Cassine*, are among the species cultivated in Britain. The leaves of several species of *Ilex* are used by dyers. An herb of the genus *Ilex* most important economically is *I. paraguariensis*, the prepared leaves of which constitute Paraguay tea, or *Mate* (q.v.). Knee holly is *Ruscus aculeatus*, and the broom *Erythemum virginicum*; sea holly, *Erythemum maritimum*, an unbelliferous plant; and the mountain holly of America, *Nemophantes camadenesi*, also a member of the order Icicleae.

Besides the works above mentioned, see Loudon, Arboratum, ii. 504 (1844).

**HOLLYHOCK** (from M.E. holli—doubtless because brought from the Holy Land, where it is indigenous (Wedg.))—and A.S.
hew, a mallow), Althaea rosea, a perennial plant of the natural order Malvaceae, a native of the East, which has been cultivated in Great Britain for about three centuries. The single-blossomed, cuttings from Scotland. The flowered hollyhock is single-blossomed, but the florists' varieties have all double flowers, of white, yellow, rose, violet and other tints, some being almost black. The plant is in its prime about August, but by careful management examples may be obtained in blossom from July to as late as November. Hollyhocks are propagated from seed, or by division of the root, or by planting out in rich sandy soil, in a close frame, with a gentle bottom heat, single eyes from woodshoots, or cuttings from outgrowths of the old stock or of the lateral offsets of the spike. The seed may be sown in October under cover, the plants obtained being set in November, and left under glass till the following April, or, if it be late-gathered, in May or June, in the open ground, whence, if required, the plants are best removed in October or April. In many gardens, when the plants are not disturbed, self-sown seedlings come up in abundance about April and May. Seedlings may also be raised in February or March, by the aid of a gentle heat, in a light and rich moist soil; they should not be watered till they have made their second leaves, and when large enough for handling should be pricked off in a cold frame; they are subsequently transferred to the flower-bed. Hollyhocks thrive best in a well-trenched and manured sandy loam. The spikes as they are budded or staked; and water and, for the finest blossoms, liquid manure should be liberally supplied to the roots. Plants for exhibition require the side growths to be pinched out; and it is recommended, in cold, bleak or northerly localities, when the flowering is over, and the stalks have been cut off to 6 in. above the soil, to earth up the crowns with sand. Some of the finest double-flowered kinds of hollyhock do not bloom well in Scotland. The plant is susceptible of great modification under cultivation. The forms now grown are due to the careful selection and crossing of varieties. It is found that the most diverse varieties may be crossed and obtained from plants grown from pure lines. The young shoots of the hollyhock are very liable to the attacks of slugs, and to a disease occasioned by a fungus, Puccinia malvacearum, which is a native of Chile, attained notoriety in the Australian colonies, and finally, reaching Europe in 1869, threatened the extermination of the hollyhock, the soft parts of the leaves of which it destroys, leaving the venation only remaining. It has been found especially hurtful to the plant in dry seasons. It is also parasitic on the wild mallows. The disease appears on the leaves as minute hard pale-brown pustules, filled with spores which germinate without a resting-period, but when produced late in the season may last for seasons. The spores are transmitted by rain and dew. The Bordeaux mixture is an effective preventive, but the best means of treatment is to destroy all leaves as soon as they show signs of being attacked, and to prevent the growth of other host-plants such as mallows, in the neighbourhood. In hot dry seasons, red-spider injures the foliage very much, but may be kept at bay by syringing the plants frequently with plenty of clean water.

HOLLY SPRINGS, a city and the county-seat of Marshall county, Mississippi, U.S.A., in the N. part of the state, 45 m. S.E. of Memphis. Pop. (1890) 2246; (1900) 3815 (1559 negroes); (1910) 2192. Holly Springs is served by the Illinois Central and the Kansas City, Memphis & Birmingham (Prisco) system railways. The city has broad and well-shaded streets, and a fine court-house and court-house square. It is the seat of Rust University (opened in 1867), a Methodist Episcopal institution for negroes; of the Mississippi Synodical College (1905; Presbyterian), for white girls; and of the North Mississippi Agricultural Experiment Station. The principal industries are the ginning, compressing and shipping of cotton, and the manufacture of cotton-seed oil, but the city also manufactures pottery and brick from clay obtained in the vicinity, and has an ice factory, bottling works and marble quarry. The municipal government is by a mayor and city council. The city has schools and electric lighting plant. Holly Springs was founded in 1837 and was charted as a city in 1896. Early in December 1862 General Grant established here a large depot of supplies designed for the use of the Federal army while on its march toward Vicksburg, but General Earl Van Dorn, with a brigade of cavalry, and riding the post at daylight on the 20th of this month, burned the supplies and took 1500 prisoners. Holly Springs was the home and is the burial-place of Edward Cary Walthall (1831-1880), a Democratic member of the United States Senate in 1883-1894 and in 1895-1898.

HOLMAN, JAMES (1786-1857), known as the "Blind Traveller," was born at Exeter on the 15th of October 1786. He entered the British navy in 1798 as first-class volunteer, and was appointed lieutenant in April 1807. In 1810 he was invalidated by an illness which resulted in total loss of sight. In consideration of his helpless circumstances he was in 1812 appointed one of the royal knights of Windsor, but the quietness of such a life harmonized so ill with his active habits and keen interests that he requested leave of absence to go abroad, and in 1819, 1820 and 1821 journeyed through France, Italy, Switzerland, the parts of Germany bordering on the Rhine, Belgium and the Netherlands. On his return he published The Narrative of a Journey through France, &c. (London, 1822). He again set out in 1822 with the design of making the circuit of the world, but after traveling through Russia into Siberia, he was suspected of being a spy, was arrested when he had managed to penetrate 2000 m. beyond Smolensk, and after being conducted to the frontiers of Poland, returned home by Austria, Saxony, Prussia and Hanover. He now issued Travels through Russia, Siberia, &c. (London, 1825). Shortly afterwards he again set out to accomplish by a somewhat different method the design which had been frustrated by the Russian authorities; and an account of his remarkable achievement was published in four volumes in 1834-1835, under the title of A Voyage round the World, including Travels in Africa, Asia, Australasia, America, &c., from 1827 to 1832. His last journeys were through Spain, Portugal, Moldavia, Montenegro, Syria and Turkey; and he died at Wiesbaden near Dorn, in the province of Hesse, on the 29th of July 1837.

HOLMES, OLIVER WENDELL (1809-1894), American writer and physician, was born on the 29th of August 1809 at Cambridge, Mass. His father, Abiel Holmes (1763-1837), was a Calvinist clergyman, the writer of a useful history, Annals of America, and of much very dull poetry. His mother (the second wife of Abiel) was Sarah Wendell, of a distinguished New York family. Through her Dr Holmes was descended from Governors Thomas Dudley and Simon Bradstreet of Massachusetts, and from her he derived his cheerfulness and vivacity, his sympathetic humour and wit. From Phillips (Andover) Academy he entered Harvard in the "famous class of '59," made further illustrous by the charming lyrics which he wrote for the anniversary dinners from 1851 to 1889, closing with the touching "After the Curfew." After graduation he studied law perfunctorily for a year and dabbled in literature, winning the public ear by a spirited lyric called forth by the order to destroy the old frigate Constitution. These verses were sung all over the land, and induced the Navy Department to revoke its order and save the old ship. Turning next to medicine, and convinced by a brief experience in Boston that he liked it, he went to Paris in March 1833. He studied industriously under Louis and other famous physicians and surgeons in France, and in his vacations visited the Low Countries, England, Scotland and Italy. Returning to Boston at the close of 1835, filled with a high professional ambition, he sought practice, but achieved only moderate success. Social, brilliant in conversation, and a writer of gay little poems, he seemed to the grave Bostonians not sufficiently serious. He won prizes, however, for professional papers, and lectured on anatomy at Dartmouth College. He wrote two papers on homoeopathy, which he attacked with trenchant wit; also a valuable paper on the malarial fevers of New England. In 1843 he published his essay on the Contiguous Fever, which gained him wide repute, and brought upon him bitter personal abuse; but he maintained his position with dignity, temper and judgment; and in time he was rewarded...
the discoverer of a beneficent truth. The volume of his medical essays holds some of his most sparkling wit, his shrewdest observation, his kindliest humanity. In 1840 he married Amelia Lee Jackson, daughter of the Hon. Charles Jackson (1775-1855), formerly associate justice of the State supreme judicial court, a lady of rare charm alike of mind and character. She died in the winter of 1887-1888. Their first-born child, Oliver Wendell Holmes, Jr., became chief justice of that same bench on which his grandfather sat. In 1847 Dr Holmes was appointed professor of anatomy and physiology in the Medical School of Harvard University, the duties involving the giving of instruction also in kindred departments, so that, as he said, he occupied "not a chair, but a settee in the school." He delivered the anatomical lectures until November 1882, and in later years these were his only link with the medical profession. They were fresh, witty and lively; and the students were sent to him at the end of the day, when they were fagged, because he alone could keep them awake. In later years he made few finished contributions to medical knowledge; his eager and impetuous temperament caused him to leave more patient investigators to push to ultimate results the suggestions thrown out by his fertile and imaginative mind.

In 1836, being in that year the Phi Beta Kappa poet at Harvard University, he published his first volume of Poems, which afterwards reached a second edition. Among these earlier lyrics was "The Last Leaf," one of the most delicate combinations of pathos and humour in literature. His collected poetry fills three volumes. In 1856-1857 a Boston publishing house (Phillips, Sampson, and Co.) invited James Russell Lowell to edit a new magazine, which he agreed to do on condition that he could secure the assistance of Dr Holmes. By this urgent invitation the Doctor was equally surprised and flattered, for heretofore he had stood rather outside the literary coterie of Cambridge and Boston. He accepted with pleasure, and at once threw himself into the enterprise with zeal. He christened it The Atlantic Monthly; and, as Mr Howells afterwards said, he "not only named but made" it. For in each number of its first volume there appeared one of the papers of the Autocrat of the Breakfast Table. The opening of the Autocrat—"I was just going to say when I was interrupted"—is explained by the fact that in the old New England Magazine (1831 to 1833) the Doctor had published two Autocrat papers, which, by his wish, have never been reprinted. In the commercial panic of 1857 the new magazine would inevitably have failed had it not been for these fascinating essays. Their originality of conception, their wit and scope, their power of expression, their sagacity in what they saw and their expression of New Englandism, all combined to make them so popular that the most harassed merchant in that gloomy winter purchased them as a dose of cheering medicine. Thus Dr Holmes made The Atlantic Monthly, which in return made him. A success so immediate and so splendid settled the rest of his career; he ceased to be a physician and became an author. These twelve papers were immediately (1858) published as a volume. No sooner was the Autocrat silent than the Professor (1859) succeeded him at the breakfast table. The Professor was preferred by more thoughtful readers, though it has hardly been so widely popular as the Autocrat. Its theology, which seemed in those days audacious, frightened many of the strict and old-fashioned religious leaders of New England, though to-day it seems mild enough. Twelve years later, in 1871, the Landlady had another boarder, who took the vacant chair—the Poet (published 1872). But here Holmes told a little short. In these three books, especially in the Autocrat and the Professor, the Doctor wrote as he talked at many a dinner table in Boston, but this style and the general English of the table talk of the Saturday Club are among Boston's proudest traditions, as they were the chief pleasure of Dr Holmes's life. There he met Emerson, Longfellow, Whittier, Lowell, Sumner, Agassiz, Motley, and many other charming talkers, and among them all he was admitted to be the best.

There were characters and incidents, but hardly a story, in the Autocrat and the Professor. Holmes had an ambition for more sustained work, and in 1861 his novel, Elsie Venner, at first called The Professor's Story, was published. The book was illuminated throughout by admirable pictures of character and society in the typical New England town. But the rattle-snake element was unduly extravagant, and in other respects the book was open to criticism as a work of art. It was written with the same purpose which informed the greatest part of the Doctor's literary work, which had already been severely and nervously condemned by the religious world. By heretofore the Doctor was a theologian; no other topic enchained him more than did the stern and merciless dogmas of his Calvinist forefathers. His humanity revolted against them, his reason condemned them, and he set himself to their destruction as his task in literature. The religious world of his time was still so largely under the control of old ideas that he was assailed as a freethinker and a subverter of Christianity; though before his death opinions had so changed that the bitterness of the attacks upon him seemed incredible, even to some of those who had most vehemently made them. None the less, undaunted and profoundly earnest, he returned, six years later, to the same line of thought in his second novel, The Guardian Angel (published 1867). This, though less well known than Elsie Venner, is in many respects better. No more lifelike and charming picture of the society of the New England country-town of the middle third of the 19th century has ever been drawn, and every page sparkles with wit and humour. In 1884 and 1885 it was followed, still in the same line, by A Mortal Antipathy, a production inferior to its predecessors.

Holmes generally held himself aloof from politics, and from those "causes" of temperance, abolition and woman's rights which enthralled most of his contemporaries in New England. The Civil War, however, aroused him for the time; finding him first a strenuous Unionist, it quickly converted him into an ardent advocate of emancipation. His interest was enhanced by the career of his elder son Oliver (see below), who was three times severely wounded, and finally rose to the rank of brevet colonel in the Northern army. He wrote some ringing war lyrics, and in 1863 delivered the Fourth of July oration in Boston, which showed a masterly appreciation of the stirring public questions of the day. In 1878 Dr Holmes wrote a memoir of the historian John Lothrop Motley, an affectionate tribute to one who had been his dear friend. In 1884 he contributed the life of Emerson to the American "Men of Letters" series. He admired the "Sage of Concord," but was not quite in intellectual sympathy with him. Both were Liberals in thought, but in politics Dr Holmes was a Republican.

But in spite of this handicap the volume proved very popular. In 1888 he began the papers which he happily christened Over the Tea Cups. As a tour de force on the part of a man of nearly fourscore years they are very remarkable. After his return from Paris in 1853 Dr Holmes lived in Boston, with summer sojourns at Pittsfield and Beverly Farms, and occasional trips to neighbouring cities, until 1886. He then undertook a four months' journey in Europe, and in England had a sort of triumphal progress. On his return he wrote Our Hundred Days in Europe (1887), a courteous recognition of the hospitality and praise which had been accorded to him. During this visit Cambridge University made him Doctor of Letters, Edinburgh University made him Doctor of Laws, and Oxford University made him Doctor of Civil Law. Already, in 1880, Harvard University had made him Doctor of Laws. He died on the 7th of October 1884, and was buried from King's Chapel, Boston, in the cemetery of Mount Auburn.

His eldest son Oliver Wendell (b. 1841), who graduated from Harvard in 1861 and fought in the Civil War, retiring from the navy after the war, lived a simple life, fought literature, wrote legal articles on many points of law and was admitted to the bar in Boston in 1886. He was for some years editor of the American Law Review, and after being professor in the Harvard Law School in 1882 was appointed in the same year a judge of the Massachusetts supreme court, rising to be chief justice in 1890. In 1902 he was made a judge of the United States Supreme Court. His work on The Common Law (1881) and his edition (1872) of Kent's Commentaries

HOLMES, O. W.
are his principal publications; and he became widely recognized as one of the great jurists of his day.

BIBLIOGRAPHY.—Holmes’s Complete Works, in 13 volumes, were published at Boston in 1891. See J. T. Morse, Life and Letters of Oliver Wendell Holmes (London, 1896); G. B. Ives, Bibliography (Boston, 1907); and the bibliography in F. K. Foyle’s American Authors (Boston, 1897). An essay by Sir Leslie Stephen is prefixed to the “Golden Treasury” edition (1903) of The Autocrat of the Breakfast Table. See also monographs by William Sloane Kennedy (Boston, 1882); Emma E. Brown (Boston, 1884). (J. T. MO.)

HOLMFIRTH, an urban district in the Holmfirth parliamentary division of the West Riding of Yorkshire, England, on and Holme and the Ribble, 6 m. S. of Huddersfield, and on the Lancashire and Yorkshire railway. Pop. (1901) 8077. The valley of the Holme, is the cow-calf country. In 1532 great destruction was wrought in the town by the bursting of a reservoir in the vicinity. The large industrial population is employed in woolen manufactories, and in the neighbouring stone quarries.

HOLOCAUST (Gr. ἄθλος, whole, κατον, wholly burnt), strictly a sacrifice wholly destroyed by fire, such as the sacrifices of the Jews, described in the Pentateuch as “whole burnt offerings” (see SACRIFICE). The term is now often applied to a catastrophe on a large scale, whether by fire or not, or to a massacre or slaughter.

HOLOCENE (from Gr. ὁλοκ, whole, καιν, recent), in geology, the modern division which embraces the youngest of all the formations; it is equivalent to the “Recent” of some authors. The name was proposed in 1860 by P. Gervais. The oldest deposits that may be included are those containing neolithic implements; deposits of historic times should also be grouped here; presumably the youngest are those to be chronicled by the last man. The Holocene formations obviously include all the varieties of deposits which are accumulating at the present day: the gravels and alluvia of rivers; boulder clays, marlines and fluvo-glacial deposits; estuarine, coastal and abyssal deposits of the seas, and their equivalents in lakes; screes, taluses, wind-borne dust, and other accumulations at any elevation; and such deposits as are laid down in lakes, saline waters; peat, diatomite, marls, foraminiferal and other oozes, coral, algal and shell banks, and other organic deposits; mud, lava and dust deposits of volcanic origin and extrusions of asphalt and pitch; to all these must be added the works of man.

HOLROYD, SIR CHARLES (1861– ), British artist, was born in Leeds on the 9th of April 1861. He received his art education under Professor Legros at the Slade School, University College, London, where he had a distinguished career. After passing six months at Newlyn, where he painted his first picture exhibited in the Royal Academy, “Fishermen Mending a Sail” (1885), he obtained a travelling scholarship and studied for two years in Italy. He settled in London in 1887 and in 1889 he married his wife. At his return, on the invitation of Legros, he became for two years assistant-master at the Slade School, and there devoted himself to painting and etching. Among his pictures may be mentioned “The Death of Torrigiano” (1886), “The Satyr King” (1889), “The Supper at Emmaus,” and, perhaps his best picture, “Pan and Peasants” (1893). For the church of Aveley, Essex, he painted a triptych altarpiece, “The Adoration of the Shepherds,” with wings representing “St Michael” and “St Gabriel,” and designed as well the window, “The Resurrection.” His portraits, such as that of “G. F. Watts, R.A.,” in the Legros manner, show much dignity and distinction. Sir Charles Holroyd has made his chief reputation as an etcher of exceptional ability, combining strength with delicacy, and a profound technical knowledge of the art. Among the best known are the “Monte Olivo” series, the “Icarus” series, the “Monte Subasio” series, and the “Eye” series, together with the plates, “The Flight into Egypt,” “The Prodigal Son,” “A Barn on Tadworth Common” (etched in the open air), and “The Storm.” His etched heads of “Professor Legros,” “Lord Coutts” and “Night,” are admirable alike in knowledge and in likeness. His principal dry-point is “The Bather.” In all his work Holroyd displays an eye, walled by bold hills, is very picturesque. In 1872 great destruction was wrought in the town by the bursting of a reservoir in the vicinity. The large industrial population is employed in woolen manufactories, and in the neighbouring stone quarries.

HOLSTEIN, FRIEDRICH VON (1837-1900), German statesman, for more than thirty years head of the political department of the German Foreign Office. Holstein’s importance began with the dismissal of Bismarck in 1890. The new chancellor, Caprivi, was ignorant of foreign affairs; and Holstein, as the repository of the Bismarckian tradition, became indispensable. This reluctance to emerge into publicity has been ascribed to the part he had played under Bismarck in the Armin affair, which had made him powerful enemies; it was, however, possibly due to a shrinking from the responsibility of office. Yet the weakness of his position lay just in the fact that he was not ultimately responsible. He protested against the despatch of the “Kruger telegram,” but protested in vain. On the other hand, where his ideas were acceptable, he was generally able to realize them. Thus it was almost entirely due to him that Germany acquired Kiaochau and asserted her interests in China, and the acquisition of Samoa was largely his work. If the skill and pertinacity with which Holstein carried through his plans in these matters was learned in the school of Bismarck, he had not acquired Bismarck’s faculty for foreseeing their ultimate consequences. This was shown in his continued support of his master’s policy in Morocco. The emperor William II.’s journey to Tangier was undertaken on his advice, as a protest against the supposed attempt at the isolation of Germany; but of the later developments of German policy in the Morocco question he did not approve, on the ground that the result would merely be to strengthen the Anglo-French entente; and from the 12th of March 1906 onwards he took no active part in the matter. To the last he believed that the position of Germany would remain unsafe until an understanding had been arrived at with Great Britain, and it was this belief that determined his attitude towards the “sea-power question.” Yet he was to contribute the “answer” to the “sea-power of Germany is relatively increased if for every new German ship Great Britain built two? Herr von Holstein retired on the resignation of Prince Bismarck, and died on the 8th of May 1900.

HOLSTEIN, formerly a duchy of Germany. Until about 1110 the county of Holstein formed part of the duchy of Saxony, and it was made a duchy in 1472. From 1460 to 1864 it was ruled by members of the house of Oldenburg, some of whom were also kings of Denmark. It is now the southern part of the Prussian province of Schleswig-Holstein. (See SCHLESWIG-HOLSTEIN, and for history SCHLESWIG-HOLSTEIN QUESTION.

HOLSTEIN, KARL CHRISTIAN JOHANN (1825-1897), German theologian, was born at Güstrow, Mecklenburg, on the 1st of March 1825, and educated at Leipzig, Berlin and Rostock, where in 1852 he became a teacher of religion. He went to Breslau as a professor of New Testament studies, passing thence in 1876 to Heidelberg, where he remained until his death on the 26th of January 1897. Holsten was an adherent of the Tübinger school, and held to Baur’s views on the alleged antagonism between Petrinism and Paulinism. Among his writings are Zum Evangelium d. Paulus und d. Petrus (1867); Das Evangelium des Paulus dargestellt (1880); Die sym-

Tate Gallery), and on the retirement of Sir Edward Poynter in 1896 he received the directorship of the National Gallery. He was knighted in 1903. His Michael Angelo Buonarroti (London, Duckworth, 1903) is a scholarly work of real value.

Petrus (1867); Das Evangelium des Paulus dargestellt (1880); Die sym-

Tate Gallery), and on the retirement of Sir Edward Poynter in 1896 he received the directorship of the National Gallery. He was knighted in 1903. His Michael Angelo Buonarroti (London, Duckworth, 1903) is a scholarly work of real value.
HOLSTENIUS, LUCAS, the Latinized name of Luc Holste (1599–1611), German humanist, geographer and theological writer, was born at Hamburg. He went to Italy, where he became intimate with the most famous scholars of the age—J. Meursius, D. Heinsius and P. Cluverius, whom he accompanied on his travels in Italy and Sicily. Disappointed at his failure to obtain a post in the gymnasium of his native town, he left Germany for good. Having spent two years in Oxford and London, he went to Paris. Here he obtained the patronage of N. de Peiresc, who recommended him to Cardinal Francesco Barberini, papal nuncio and the possessor of the most important private library in Rome. On the cardinal's return in 1627 he took Holstenius to live with him in his palace and made him his librarian. Although converted to Roman Catholicism in 1625, Holstenius showed his liberal-mindedness by strenuously opposing the strict censorship exercised by the Congregation of the Index. He was appointed librarian of the Vatican by Innocent X., and was sent to Innsbruck by Alexander VII. to receive Queen Christina's abjuration of Protestantism. He died in Rome on the 2nd of February 1661. Holstenius was a man of unwaried industry and immense learning, but he lacked the persistency to carry out the vast literary schemes he had planned. He was the author of notes on Clavier's Italia antiqua (1624); an edition of portions of Porphyrius (1630), with a dissertation on his life and writings, described as a model of its kind; notes on Eusebius Against Hierocles (1628), on the Sayings of the later Pythagoreans (1638), and the De diis et mundo of the neo-Platonist Sallustius (1638); Note et castigationes in Stephani Byzantini ethnica (first published in 1684); and Codex regulorum, Collection of the Early Rules of the Monastic Orders (1661). His correspondence (Epistolae ad diversos, ed. J. F. Boissennade, 1872) is a valuable source of information on the literary history of his time.

See N. Wilckens, Leben des gelehrten Luciae Holstini (Hamburg, 1723); Johann Moller, Cimbria literata, iii. (1744).

HOLSTER, a leather case to hold a pistol, used by a horseman and properly fastened to the saddle-bow, but sometimes worn in the belt. The same word appears in Dutch, from which the English word probably directly derives. The root is hel- or hul- to cover, and is seen in the O. Eng. heolster, a place of shelter or concealment, and in "hull" a sheath or covering. The German word for the same object, holster, is, according to the New English Dictionary, from a different root.

HOLT, SIR JOHN (1624–1710), lord chief justice of England, was born at Thame, Oxfordshire, on the 30th of December 1624. His father, Sir Thomas Holt, possessed a small patrimonial estate, but in order to supplement his income had adopted the profession of law, in which he was not very successful, although he was sergeant in 1677, and afterwards for his political services to the king was rewarded with a knighthood. After attending for some years the free school of the town of Abingdon, of which his father was recorder, young Holt in his sixteenth year entered Oriel College, Oxford. He is said to have spent a very dissipated youth, and even to have been in the habit of taking purses on the highway, but after entering Gray's Inn about 1660 he applied himself with exemplary diligence to the study of law. He was called to the bar in 1663. An ardent supporter of civil and religious liberty, he distinguished himself in the state trials which were then so common by the able and courageous manner in which he supported the pleas of the defendants. In 1685–1686 he was appointed recorder of London, and about the same time he was made king's sergeant and received the honour of knighthood. His giving a decision adverse to the pretensions of the king to exercise martial law in time of peace led to his dismissal from the office of recorder, but he was continued in the office of king's sergeant in order to prevent him from becoming counsel for accused persons. Having been one of the judges who acted as assessors for the peers in the impeachment of the Earl of Clarendon, and taking a leading part in arranging the constitutional change by which William III. was called to the throne, and after his accession he was appointed lord chief justice of the King's Bench. His merits as a judge are the more apparent and the more remarkable when contrasted with the qualities displayed by his predecessors in office. In judicial fairness, legal knowledge and ability, clearness of expression, and impartiality, he was equal to any superiors on the English bench. Over the civil rights of his countrymen he exercised a jealous watchfulness, more especially when presiding at the trial of state prosecutions, and he was especially careful that all accused persons should be treated with fairness and respect. He is, however, best known for the firmness with which he upheld his own prerogatives in opposition to the authority of the Houses of Parliament. On several occasions his physical as well as his moral courage was tried by extreme peril, and he was requested to supply a number of police to help the soldiers to quell a riot, in which he assured the messenger that if any of the people were shot he would have the soldiers hanged, and proceeding himself to the scene of riot he was successful in preventing bloodshed. While steadfast in his sympathies with the Whig party, Holt maintained on the bench entire political impartiality, and always held himself aloof from political intrigue. On the retirement of Somers from the chancellorship in 1700 he was offered the great seal, but declined it. His death took place in London on the 5th of March 1710. He was buried in the chancel of Redgrave church.

HOLTEI, KARL EDUARD VON (1798–1880), German poet and actor, was born at Breslau on the 24th of January 1798, the son of an officer of Hussars. Having served in the Prussian army as a volunteer in 1815, he shortly afterwards entered the university of Breslau as a student of law; but, attracted by the stage, he soon forsook academic life and made his début in the Breslau theatre as Mortimer in Schiller's Maria Stuart. He led a wandering life for the next two years, appearing less on the stage as an actor than as a reciter of his own poems. In 1821 he married the actress Louise Rogée (1800–1822), and was appointed theatre-poet to the Breslau stage. He next removed to Berlin, where his wife fulfilled an engagement at the Court theatre. During his sojourn here he produced the vaudeville Die Wiener in Berlin (1824), and Die Berliner in Wien (1825), pieces which enjoyed at the time great popular favour. In 1825 his wife died; but soon after her death he accepted an engagement at the Königstädtler theatre in Berlin, when he wrote a number of plays, notably Lenore (1829) and Der alte Feldherr (1839). In 1830 he married Julie Holzecker (1805–1839), an actress engaged at the same theatre, and with her he went to Darmstadt. Returning to Berlin in 1831 he wrote for the composer Franz Glisler (1798–1871), the text of his opera Des Adler Horst (1835), and for Ludwig Devrient the drama, Der dumme Peter (1837). In 1833 Holtei again went on the stage and toured with his wife to various important cities, Hamburg, Leipzig, Dresden, Munich and Vienna. In the last of his declamatory powers as a reciter, particularly of Shakespeare's plays, made a furor, and the poet-actor was given the appointment of manager of the Josefstadler theatre in the last-named city. Though proud of his successes both as actor and reciter, Holtei left Vienna in 1836, and from 1837 to 1850 conducted the theatre in Riga. Here his second wife died, and after wandering through Germany reciting and accepting a short engagement at Breslau, he settled in 1847 at Graz, where he devoted himself to a literary life and produced the novels Die Vagabunden (1851), Christian Lammfell (1853) and Der letzte Komödiant (1863). The last years of his life were spent at Breslau, where being in poor circumstances he found a home in the Kloster der borromäischen Brüder, and here he died on the 12th of February 1880. He was a very singular figure, and in a speech at the opening of Holtei's Getem Theater introduced the "vaudeville" into Germany; as an actor, although miserable behind the greater artists of his time, he contrived to fascinate his audience by the dramatic force of his exposition of character; as a reciter, especially of Shakespeare, he knew no rival. August
Lewald said of Holtei that by the energy of his poetic conception and plastic force he brought his audience round to his own ideas; and he added, "an eloquence such as his I have never met with in any other German."

Holtei was not only a stage-poet but a lyric-writer of great charm. Notable among his many prominent collections are: Schlesische Gedichte (1840), Gedichte (5th ed., 1861; 2nd ed., 1895), Gedichte des Waldes (2nd ed., 1854). Mention ought also to be made of Holtei's interesting autobiography, Vierzig Jahre (8 vols., 1843-1850; 3rd ed., 1862) with the supplementary volume Noch ein Jahr in Schlesien (1864).

Holtei's Theater appeared in 6 vols. (1867); his Erzählende Schriften, 39 vols. (1865-1866). See. M. Kurnick, Karl von Holtei, ein Lebensbild (1885); F. Wehl, Zeit und Menschen (1886); O. Storch, K. von Holtei (1898).

HÖLTY, LUDWIG HEINRICH CHRISTOPH (1749-1876), German poet, was born on the 21st of December 1749 at the village of Mariensee in Hanover, where his father was pastor. In 1769 he went to study theology at Göttingen. Here he formed a close friendship with J. M. Miller, J. H. Voss, H. Boie, the brothers Stolberg and others, and became one of the founders of the famous society of young poets known as the Göttinger Dichter. He had already in the university days abandoned all intention of becoming a clergyman; but he was not destined to enter any other profession. He died of consumption on the 1st of September 1776 at Hanover. Holty was the most gifted lyric poet of the Göttingen circle. He was influenced both by Us und Klopstock, and his love for the Volkslied and his delight in nature preserved him from the artificiality of the one poet and the unworldliness of the other. A strain of melancholy runs through all his lyrics. His ballads are the pioneers of the rich ballad literature on English models, which sprang up in Germany during the next few years. Among his most familiar poems was the Una, der Tod und die Welt (1820), which was translated into English by W. Wordsworth in 1822.

Höltzsche Gedichte were published by his friends Count Friedrich Leopold zu Stolberg and J. H. Voss (Hamburg, 1783); a new edition, enlarged by Voss, with a biography (1804); a more complete but still imperfect edition by P. Voigt (Hanover, 1857). The first complete edition was that of Karl Halm (Leipzig, 1870), who had access to MSS, but hitherto unknown. See H. Rüeter, Höltzsche Leben und Dichten (Guben, 1883), and A. Sauer, Der Göttinger Dichterbund, vol. ii. (Stuttgart, 1894), where an excellent selection of Höltzsche poetry would be found.

HOLTZENDORFF, JOACHIM WILHELM FRANZ PHILIPP VON (1829-1889), German jurist, born at Viemansdorf, in the Mark of Brandenburg, on the 14th of October 1829, was descended from a family of the old nobility. He was educated at Berlin and at Plotta, afterwards studying law at the universities of Bonn, Heidelberg and Berlin. The struggles of 1848 inspired him with youthful enthusiasm, and he remained for the rest of his life a strong advocate of political liberty. In 1842 he graduated LL.D. at Berlin; in 1857 he became a Privatdocent, and in 1860 he was nominated a professor extra-ordinary. The predominant party in Prussia regarded his political opinions with mistrust, and he was not offered an ordinary professorship until February 1873, after he had decided to accept a chair at the university of Munich. At Munich he passed the last nineteen years of his life. During the thirty years that he was professor he successively taught several branches of jurisprudence, but he was chiefly distinguished as an authority on criminal and international law. He was especially well fitted for organizing collective work, and he has appeared as an editor with a series of publications of the first value. While acting as editor he often reserved for himself, among the independent monographs of which the work was composed, only those on subjects distasteful to his collaborators on account of their obscurity or lack of importance. Among the compilations which he superintended may be mentioned his Encyclopädie der Rechtswissenschaft (Leipzig, 1870-1871, 2 vols.; his Handbuch des deutschen Strafrechts (Berlin, 1871-1877, 4 vols.), and his Handbuch des Völkerrechts auf Grundlage europäischer Staatspraxis (Berlin, 1885-1890, 4 vols.). Among his many independent works may be mentioned: Das irische Gesetzesystem (Leipzig, 1859), Französische Rechtssysteme (Leipzig, 1859), Die Deportation als Strafmittel (Leipzig, 1859), Die Konfiskationsfäähigkeit der Freiheitsstrafen (Leipzig, 1861), Die Reform der Staatsanwaltschaft in Deutschland (Berlin, 1864), Die Umstellung der Staatsanwaltschaft (Berlin, 1863), Die Lehre von den Verbrechen des Mordes und der Todesstrafe (Berlin, 1875), Rumung des Urgesetzes an der Donau (Leipzig, 1883; French edition, 1884). He also edited or assisted in editing a number of periodical publications on legal subjects. From 1866 to the time of his death he was associated with Rudolf Ludwig Carl Vichrov in editing Sammlung gemeinschaftlicher wissenschaftlicher Vorträge (Berlin). Von Holtzendorf died at Munich on the 4th of February 1889.

HOLTZMANN, HEINRICH JULIUS (1832—), German Protestant theologian, son of Karl Julius Holtmann (1804—1877), was born on the 17th of May 1832 at Karlsruhe, where his father ultimately became prelate and counsellor to the supreme consistory. He studied at Berlin, and eventually (1857) was appointed professor ordinarius at Strassburg. A moderately liberal theologian, he became best known as a New Testament critic and exegete, being the author of the Commentary on the Synoptics (1889; 3rd ed., 1907), the Johannine books (1890; 2nd ed., 1893), and the Acts of the Apostles (1901), in the series Handkommentar zum Neuen Testament. On the question of the relationship of the Synoptic Gospels, Holtzmann in his early work, Die synoptischen Evangelien, ihr Ursprung und geschichtlicher Charakter (1863), presents a view which has been modified, mainly in the work, Der Matthäus (1867), deriving from the logical order and from his earlier "collection of Sayings," the Logia of Papias, and Luke from Matthew and Mark in the form in which we have them. Other noteworthy works are the Lehrbuch der histor.-kritischen Einleitung in das Neue Testament (1855, 3rd ed., 1892), and the Geschichtslehre der neu testamentlichen Theologie (2 vols., 1896-1897). He also collaborated with R. Zöppel in the preparation of a small Lexikon für Theologie und Kirchengeschichte (1882; 3rd ed. 1895), and in 1893 became editor of the Theol. Jahresberichte.

HOLUB, EMIL (1847—1902), Bohemian traveller in south-central Africa, was born at Hölitz, eastern Bohemia, on the 7th of October 1847. He was educated at Prague University, where he graduated M.D. In 1872 he went to the Kimberley diamond-fields, and with the money earned by his practice as a surgeon undertook expeditions into the northern Transvaal, Mashonaland and through Bechuanaland to the Victoria Falls, making extensive natural history collections, which he brought to Europe in 1879 and distributed among over a hundred museums and schools. In 1883 he went back to South Africa with his wife, intending to cross the continent to Egypt. In June 1886 the party crossed the Zambezi west of the Victoria Falls, and explored the then almost unknown region between that river and its tributary the Kafue. When beyond the Kafue the camp was attacked by the Mashukulumbwe and Holub was obliged to retrace his steps. He returned to Austria in 1887 with a collection of great scientific interest, of over 13,000 objects, now in various museums. Holub died at Vienna on the 21st of February 1902.

His principal works are: Eine Culturskizze des Maruste-Mombundereiches (Vienna, 1879); Siedlungs-und Säuber-acts, &c. (2 vols., 1881); Geschichte des Komorischen (1884; English translation published: Die Colonisation Afrikas (Vienna, 1882); Von der Kapstadt ins Land der Maschukulumbwe (2 vols., Vienna, 1886-1889).

HÖLY, sacred, devoted or set apart for religious worship or observance; a term characteristic of the attributes of perfection and sinlessness of the Persons of the Trinity, as the objects of human worship and reverence, and hence transferred to those human persons who, either by their devotion to a spiritual ascetic life or by their approximation to moral perfection, are considered worthy of reverence. The word in Old English was hālig, and is common to other Teutonic languages; cf. Ger. and Dutch heilig, Swed. helig, Dan. hellig. It is derived from hāl, hale, whole, and cognate with "health." The New English Dictionary suggests that the sense-developement may be from "whole," i.e. inviolate, from "health,"
HOLY ALLIANCE—HOLYHEAD

621

well-being," or from "good-omen," "augury." It is impossible to get behind the Christian uses, in which from the earliest times it was employed as the equivalent of the Latin sacer and saeculog, the famous treaty, or declaration, known by this name was signed in the first instance by Alexander I., emperor of Russia, Francis I., emperor of Austria, and Frederick William III., king of Prussia, on the 26th of September 1815. It was promulgated by the emperor Alexander the same day at a great review of the allied troops held on the Champ des Vertus near Paris. The English version of the text is as follows:—

In the name of the Most Holy and Indivisible Trinity.

Holy Alliance of Sovereigns of Austria, Prussia and Russia. Their Majesties the Emperor of Austria, the King of Prussia, and the Emperor of Russia, having, in consequence of the great events which have marked the course of the three last years in Europe, and especially of the blessings which it has pleased Divine Providence to shower down upon those States which place their confidence and their hope on it alone, acquired the intimate conviction of the necessity of settling the steps to be observed by the Powers, in their reciprocal relations, upon the sublime truths which the Holy Religion of our Saviour teaches.

Government and Political Relations.

They solemnly declare that the present Act has no other object than to publish, in the face of the whole world, their fixed resolution, both in the administration of their respective States, and in their political intercourse with each other, to be guided by the sublime truths which the Holy Religion of our Saviour teaches, and by the only means of consolidating human institutions and remedying their imperfections. In consequence, their Majesties have agreed on the following Articles:

Principles of the Christian Religion.

Art. I. Concerning the words of the Holy Scriptures which command all men to consider each other as brethren, the Three contracting Monarchs will remain united by the bonds of a true and indissoluble fraternity, and, considering each other as fellow countrymen, will enter into mutual consultations and assistance; and, regarding themselves towards their subjects and armies as fathers of families, they will lead them, in the same spirit of fraternity with which they are animated, to protect Religion, Peace and Justice.

Fraternity and Affection.

Art. II. In consequence, the sole principle of force, whether between the said Governments or between their Subjects, shall be that of doing each other reciprocal service, and of realizing the unalterable good which will be mutual affection with which they ought to be animated, to consider themselves all as members of one and the same Christian nation; the three allied Princes looking on themselves as merely delegated by Providence to govern three branches of the One family, namely, Austria, Prussia and Russia, thus confessing that the Christian world, of which they and their people form a part, has in reality no interest but His alone who rules over all creation and belongs, because in Him alone are found all the treasures of love, science and infinite wisdom, that is to say, God, our Divine Saviour, the Word of the Most High, the Word of Life. Their Majesties consequently recommend to their people, with the most tender solicitude, as the sole means of enjoying that Peace which arises from a good conscience, and which alone is durable, to strengthen themselves every day more and more in the principles and exercise of the duties which the Divine Saviour has taught to mankind.

Accession of Foreign Powers.

Art. III. All the Powers who shall choose solemnly to avow the sacred principles which have dictated the present Act, and shall acknowledge how important it is for the happiness of nations, too long agitated, that these truths should henceforth exercise over the destinies of mankind all the influence which belongs to them, will be received with equal ardour and affection into this Holy Alliance.

The credit for inspiring this singular document was claimed by the Baroness von Kriidener (q.v.); in any case it was the outcome of the same evangelical exaltation, and was in its inception perfectly sincere. Neither Frederick's Whim nor Francis signed willingly, the latter remarking that "if it was a question of politics, he must refer it to his chancellor, if of religion, to his confessor." Metternich called it a "loud-sounding nothing," Castlereagh, "a piece of sublime mysticism and nonsense." None the less, in accordance with its last article, the signature of all the European sovereigns were invited to the instrument, the pope and the Ottoman sultan alone being excepted. The prince regent courteously declined to sign, on the constitutional ground that all acts of the British crown required the counter-signature of a minister, but he sent a letter expressing his "entire concurrence with the principles laid down by the 'august sovereigns' and stating that it would always be his endeavour to regulate his conduct by their 'sacred maxims.'"

In popular parlance, which has found its way into the language of serious historians, the "Holy Alliance" soon became synonymous with the combination of the great powers by whom Europe was ruled in concert during the period of the congresses, and associated with the policy of reaction which gradually dominated their counsels. For the understanding of the inner history of the diplomacy of this period, however, a clear distinction must be drawn between the Holy Alliance and the Grand, or Quadruple (Quintuple) Alliance. The Grand Alliance was established on definite treaties concluded for definite purposes, of which the chief was the preservation of peace on the basis of the territorial settlement of 1815. The Holy Alliance was a general treaty—hardly indeed a treaty at all—which bound its signatories to act on certain vague principles for no well-defined end; and in its essence it was so far from necessarily reactionary that the emperor Alexander at one time declared that it involved the grant of liberal constitutions by princes to their subjects. The Holy Alliance's significance was due to the persistent efforts of the tsar to make it the basis of the "universal union," or general confederation of Europe, which he wished to substitute for the actual committee of the great powers, efforts which were frustrated by the vigorous diplomacy of Castlereagh, acting as the mouthpiece of the British government (see EUROPE: HISTORY; ALEXANDER I. OF RUSSIA; LONDONDERRY, ROBERT STEWART, 2ND MARQUIS OF).

As a diplomatic instrument the Holy Alliance never, as a matter of fact, became effective. None the less, its principles and the fact of its signature powerfully affected the course of European diplomacy during the 19th century. It strongly influenced the emperor Nicholas I. of Russia, to whom the brotherhood of sovereigns by divine right was an article of faith, inspiring the principles of the convention of Berlin (between Russia, Austria and Prussia) in 1833, and the tsar's intervention in 1849 to crush the Hungarian insurrection on behalf of his brother of Austria. That it had become synonymous with a conspiracy against popular liberties was, however, a mere accident of the point of view of those who interpreted its principles. It was capable of other and more noble interpretations, and it was avowedly the inspiration of the famous rescript of the emperor Nicholas II., embodied in the circular of Count Muraviev to the European courts (August 4th, 1898), which issued in the first international peace conference at the Hague in 1899.

(W. A. P.)

HOLYHEAD (Caergybi, the fort of Cybi, the saint mentioned by Matthew Arnold as meeting St Sisiril of Penbryn, Anglesey), a seaport and market-town of Anglesey, N. Wales, situated on the small Holy Island, at the western end of the county, Pop. of urban district (1901) 19,799. Here the London and North-Western railway has a terminus, 263 m. from London by rail. Holy Island is connected with Anglesey by an embankment, 2 m. long, over which pass the railway and main road, the tide flowing fast under the central pier. Once a small fishing village, the town has since William IV.'s reign acquired importance as the Dublin mail steam station. Its magnificent harbour of refuge was begun in 1837 and opened in September 1837. The east breakwater scheme, which would have covered the Platter's Field, was thrown up in 1858 to meet the growing demand for buoys which mark the spots. The north breakwater is 2860 ft. long (instead of 5360, as originally planned). The roadway (400 acres) and enclosed area (267 acres) together make a magnificent shelter for shipping. The rubble mound of the breakwater was very costly to the railway company, as time after time it was swept away by storms. On it is a central
HOLY ISLAND—HOLYOKE

wall of some 38 ft. above low water, and on the wall a promenade sheltered by a parapet. The lighthouse is at the end of the breakwater, of which the whole cost was nearly 1½ million sterling. Additional works, begun in 1879 by the company, to extend the old harbour and lengthen the quay by 4000 ft., were opened by Edward VII. (as Prince of Wales) in 1882. These cost another half million. George IV. passed through Holyhead in 1821 on his way to Ireland, and there is a commemorative tablet on the old harbour pier. The church is said to occupy the site of the old monastery (6th or early 7th century) of St Cýbi, of whom there is a rude figure in the porch. The churchyard wall, 6 ft. thick, is possibly partly Roman. On the south of the harbour is an obelisk in memory of Captain Skinner, of the steam packets, washed overboard in 1833. Pen Caergybi rises perpendicularly from the sea to the height of 710 ft., at some 2 m. from the town; it is a mass of serpentine rocks, off which, in the 15th century, a fortification was built leading to the island. There is a station on the North-Eastern railway at Beal, 9 m. S.E. of Berwick, opposite the island, but 1½ m. inland. The island measures 3 m. from E. to W. and 1½ N. to S., extreme distances. Its total area is 1051 acres. On the N. it is sandy and barren, but on the S. very fertile and under cultivation. Large numbers of rabbits have their warrens among the sands, and, with fish, oysters and agricultural produce, are exported. There are several fresh springs on the island, and in the northeast is a lake of 6 acres. At the south-west angle is the little fishing village (formerly much larger) which is now a favourite summer watering-place. Here is the harbour, offering good shelter to small vessels. Holy Island derives its name from a monastery founded on it by St Aidan, and restored in 682 as a cell of the Benedictine monastery at Durham. Its ruins, still extensive and carefully preserved, justify Scott's description of it as a "solemn, huge and dark-red pile." An islet, lying off the S.W. angle, has traces of a chapel upon it, and is believed to have offered a retreat to St Cuthbert and his successors. The castle, situated east of the village, on a basaltic rock about 90 ft. high, dates from c. 1300.

When St Aidan came at the request of King Oswald to preach to the Northumbrians he chose the island of Lindisfarne as the site of his church and monastery, and made it the head of the diocese which he founded in 635. For some years the see continued in peace, numbering among its bishops St Cuthbert, but in 703 the Danes landed on the island and burnt the settlement, killing many of the monks. The survivors, however, rebuilt the church and continued to live there until 883, when, through fear of a second invasion of the Danes, they fled inland, taking with them the body of St Cuthbert and other holy relics. The church and monastery were again destroyed and the bishop and monks, on account of the exposed situation of the island, determined not to return to it, and settled first at Chester-le-Street and finally at Durham. With the fall of the monastery, the island appears to have become again untenanted, and probably continued so until the prior and convent of Durham established there a cell of monks from their own house. The inhabitants of Holy Island were governed by two bailiffs at least as early as the 14th century, and, according to J. Raine in his History of North Durham (1852), are called "burgesses or freemen" in a private paper dated 1728. In 1533 the bailiffs and community of Holy Island were commanded to cause all ships of the burthen of thirty tons or over to go to Ereswell with their ships provisioned for a month at least and under double manning to be ready to set out on the king's service. Towards the end of the 15th century the fort on Holy Island was garrisoned for fear of foreign invasion by Sir William Read, who found it very much in need of repair, the guns being so decayed that the gunners "dare not give fire but by trayment," and the mast of the gun was "miseryfully slain" in discharging one of them. During the Civil Wars the castle was held for the king until 1646, when it was taken and garrisoned by the parliamentarians. The only other historical event connected with the island is the attempt made by two Jacobites in 1715 to hold it for the Pretender.

HOLYOKE, GEORGE JACOB (1817-1906), English secularist and co-operator, was born at St John's, Holyoke, in the 13th of April 1817. At an early age he became an Owenite lecturer, and in 1841 was the last person convicted for blasphemy in a public lecture, though this had no theological character and the inquest on the body only declared the cause of death to be "overwork." He never pledged himself to theism, and put on his address a short statement denying the existence of God. He was also the last person indicted for publishing an un stamped newspaper, but the prosecution dropped upon the repeal of the tax. His later years were chiefly devoted to the promotion of the cooperative movement among the working classes. He wrote the history of the Rochdale Pioneers (1857), The History of Co-operation in England (1857; revised ed., 1906), and The Co-operative Movement of To-day (1867). He also published (1892) his autobiography, under the title of Sixty Years of an Agitator's Life, and in 1905 two volumes of reminiscences, Bygones worth Remembering. He died at Brighton on the 22nd of January 1906.

See J. McCabe, Life and Letters of G. J. Holyoke (2 vols., 1908); C. W. F. Goss, Descriptive Bibliography of the Writings of G. J. Holyoke (1908).

HOLYOKE, a city of Hampden county, Massachusetts, U.S.A., in a bend of the Connecticut river, about 8 m. N. of Springfield. Pop. (1880) 21,915; (1890) 35,637; (1900) 45,712; (1910 census) 57,730. Of the total population in 1900, 18,021 were foreign-born, including 6001 French-Canadians, 550 Irish, 1602 Germans and 1118 English; and 33,626 were of foreign parentage (both parents foreign-born), including 12,370 of Irish and 11,050 of French-Canadian parentage. The city's area is about 17 sq. m. The city is served by the Boston & Maine, and the New York, New Haven & Hartford railways, and by an interurban line. Holyoke is characteristically an industrial and mercantile city; it has some handsome public buildings (the city hall and the public library, founded in 1879, being especially noteworthy) and attractive environs. Holyoke is the railway station for Mt Holyoke College, in South Hadley, about 16 m. N. by E. of Holyoke; the city is connected with South Hadley by an electric line. Just above Holyoke the Connecticut leaves the rugged highlands through a rift between Mt Tom (1214 ft.; ascended by a mountain-railway from Holyoke) and Mt Holyoke (954 ft.), and begins a meandering valley course, falling (in the Hadley Falls) in great volume some 66 ft. in about 1½ m. The water-power was unutilized until 1849, when a great dam (1017 ft. long) was completed, which enabled vast power to be developed along a series of canals laid out from the river. This was, in its day, a colossal undertaking; and its success transformed Holyoke from a farming village into a great manufacturing centre—in 1900 and 1905 the ninth largest of the commonwealth. In 1900 a stone dam (1200 ft.), said to be the second largest in New England, was completed at a cost of about $750,000. Cotton manufactures first, and later paper products were chief in importance, and Holyoke now leads all the cities in the United States in the manufacture of fine paper. In 1905 the total value of all factory products was $30,731,332, of which $16,620,253 (or 34-6% of the total) represented paper and wood pulp; $3,019,817, cotton goods; $1,318,409, woolen goods; $5,756,473, book binding and blank books, and $2,027,750, foundry and machine-shop
products. Silk and worsted goods are other important manufactures. Opposite Holyoke, in Hampshire county, is South Hadley Falls. The municipality owns and operates the gas and electric-lighting plants and the water works (the watersupply being derived from natural ponds, some of which are outside the city limits), and owns and leases (to the New York, New Haven & Hartford railroad) a railway extending (10.6 m.) to Westfield, Mass. Holyoke was originally a part of Springfield, and after 1754 of West Springfield. In 1850 it was incorporated as a township, and in 1873 was chartered as a city.

HOLYSTONE, a soft kind of sandstone used by sailors for scrubbing and cleaning the decks of ships. The origin of the word is doubtful. Some authorities hold that it arose from the general practice of scrubbing the decks for Sunday service; while others think the name arises from the fact that the stone so employed is naturally porous and full of holes. A small flint or stone having a natural hole in it, and worn as a charm, is also called a holystone.

HOLY WATER, technically the water with which Christian believers sign the cross on their foreheads on entering or leaving church. The edict of Gratian lays down that it should be exorcized and blessed by the priest and sprinkled with exorcized salt. This rite is found in the Gelasian, Gregorian and other sacramentaries. In the East the water was blessed once a month, in the Latin Church it is now blessed every Sunday. In the 4th century in the East it was usual to wash the hands on entering the church (see AnLittonus).

In the early church water was not expressly consecrated for baptisms and other lustrations. "Water," says Tertullian in his tract on baptism, "was the abode at the first of the divine Spirit, being more acceptable then (to God) than the other elements." He pictures the world in the beginning: "total darkness, formless as yet, without tending of stars, the melancholy abyss, the earth unprepared, the heaven undevelop. The liquid alone an ever perfect material, smiling, simple, pure in its own right, as a worthy vehicle underlay the God." Water was similarly pure in itself in the old Persian religion.

The Caena of Hippolytus, or Egyptian church order, of about A.D. 250, gives no prayer for consecration of fonts, but enacts that "at cock crow the baptismal party shall take their stand near waving water, pure, prepared, sacred, of the sea." The Teaching of the Apostles, c. 100, merely insists on "living," that is, clear and running water. The ancient feeling, especially Jewish, was that in lustrations the same water must not pass twice over the body. A stagnant pool was useless. Bubbling was too seemed to have a spirit in them.

Either because running water was a always at hand, or as part of the growing tendency of the church to multiply ceremonies, rituals arose late in the 3rd century for consecrating water. The sacramentary of Scrapiion, c. 350, provides a prayer asking that the divine Word may descend into the water and hallow it, as of old it hallowed the Jordan. In the Roman order of baptism the priest prays that "the font may receive the grace of the only begotten Son from the holy Spirit, and that the latter may impregnate with hidden adixture of His light this water prepared for the regeneration of mankind, to the end that man through a sanctification conceived from the immaculate womb of the divine font, may emerge a heavenly offspring reborn as a new creature." The water is then exorcized and evil spirits warned off, and lastly blessed. During the prayer the priest twice signs the water with the cross, and once blows upon it.

The first mention of a special consecration of water for other ends than baptism is in the Acts of Thomas (? A.D. 200); it is for the purgation of a youth already baptized who had killed his mother by beating her, a crime which would not live chastely with him. The apostle prays: "Fountain sent unto us from Resi, Power of Salvation from that Power proceeding which overcomes and subjects all to its own will, come and dwell within these waters, that the Charisma (gift) of the holy Spirit may be fully perfected through them." The youth then washes his hands, which on touching the sacrament had withered up, and is healed.

The church shared the universal belief that holiness or the holy Spirit is quasi-material and capable of being held in suspense in water, just as sin is a half material infection, absorbed and carried away by it. So Tertullian writes: "The water which carried the Spirit of God (probably regarded as a shadow or reflection-soul) borrowed holiness from that which was carried upon it; for every underlying matter must needs absorb and take up the quality of that matter which overhangs it; especially does a corporeal so absorb a spiritual, as this can easily penetrate and settle into it owing to the sublety of its substance.

"Water," he continues, "was generally hallowed by the Spirit of God brooding over it at creation, and therefore all special waters are holy, and at once obtain the sacrament of sanctification when God is invoked (over them.) For the Spirit from heaven instantly supervenes and is upon the waters, hallowing them out of itself, and being so hallowed they drink up a power of hallowing."

What is done in material semblance, he then argues, is repeated in the unseen medium of the Spirit. The stains of idolatry, vice and fraud are not visible on the flesh, yet they resemble real dirt. "The waters are medicated in a manner through the intervention of the angel, and the Spirit is corporeally washed in the water and the flesh is spiritually purified in the same."

Tertullian believed that an angel was sent down, when God was invoked, like that which stirred the pool of Bethesda. As regards rival Isiac and Mithraic baptisms, he asserts that their waters are destitute of divine power; nay, are rather tenanted by the devil who in this matter sets himself to rival God. Without any pious use at all, he urges, "unchaste spirits brood upon waters, aspiring to repeat that primordial gestation of the divine Spirit." And he instances the "darkling springs and lonely rivers which are said to snatch, to wit by force of a harmful spirit." In the sequel he defines the ōrole of the angel of baptism who does not infuse himself in waters, already holy from the first; but merely presides over the washing of the faithful, and ensures their being made pure for the reception of the holy Spirit in the rite of confirmation which immediately follows. "The devil would till now ruled over us, we leave behind overwhelmed in the water."

From all this we conclude that what is poetry to us—anakin to the folk-lore of water-sprites, naiads, kelpies, river-gods and water-worship in general—was to Tertullian and to the generations of believers who fashioned the baptismal rites, ablations and beliefs of the church, nothing less than grim reality and unquestionable fact.

See John, marquess of Bute, and E. A. Wallis Budge, The Blessing of the Waters (London, 1901); E. B. Tylor, Primitive Religion (London, 1872); F. C. C.)

HOLY WEEK (ἐβδομάδα μεγάλη, ἀγία ἡ τῶν ἁγίων, ἐρημοφαίνω, ἀπρόκτος, also ἤμαιρα παθήματων, ἤμαιρα σταυρώσεως: hodeinns [or septimana] major, sancta, authentica [i.e. canonica, du Cange], ultima, poenosa, luxiosa, nigra, inofficiosa, muta, crucis, lamentationum, indulgentiae, in the Christian ecclesiastical year the week immediately preceding Easter. The earliest allusion to the custom of marking this week as a whole with special observances is to be found in the Apostolical Constitutions (v. 18, 19), dating from the latter half of the 3rd century A.D. Abstinence from wine and flesh is there commanded for all the days, while for the Friday and Saturday an absolute fast is enjoined. Dionysius Alexandrinus also, in his canonical epistle (260 A.D.), refers to the six fasting days (ἐξ τῶν προτέρων ἤμαιρα) in a manner which implies that the observance of them had already become an established usage in his time. There is some doubt about the genuineness of an ordinance attributed to Constantine, in which abstinence from public business was enforced for the seven days immediately preceding Easter Sunday, and also for the seven which followed it; the Canon Theodosianus, however, is explicit in orders that all actions at law should cease, and the doors of all courts of law be closed during those fifteen days (I. ii. tit. viii.). Of the particular days of the "great week" the earliest to emerge into special prominence was naturally Good Friday. Next came the Sabbatum Magnum (Holy Saturday or Easter Eve) with its vigil, which
in the early church was associated with an expectation that the second advent would occur on an Easter Sunday.

For details of the ceremonial observed in the Roman Catholic Church, and reference must be made to the Missal and Breviary. In the Eastern Church the week is marked by similar practices, but with less elaboration and differentiation of rite. See also Easter, Good Friday, Maundy Thursday, Palm Sunday and Holy Week.

HOLYWELL (Treffynnon, well-town), a market town and contributory parliamentary borough of Flintshire, N. Wales, situated on a height near the left bank of the Dee estuary, 156 m. from London by the London & North-Western railway (the station being 2 m. distant). Pop. of urban district (1901) 6252.

The parish church (1760) has some columns of an earlier building, interesting brasses and strong embattled tower. The remains of Basingwerk Abbey (Maes glas, green field), partly Saxon and partly Early English, are near the station. It is of uncertain origin but was used as a monastery before 1119. In 1131 Ranulph, 2nd earl of Chester, introduced the Cistercians. In 1555, when its revenues were £50, 7s. 3d., it was dissolved, but revived under Mary I. and used as a Roman Catholic burial place in 1647. Scarcely any traces remain of Basingwerk castle, an old fort. Small up to the beginning of the 19th century, Holywell has increasingly prospered, thanks to lime quarries, lead, copper and zinc mines, smelting works, a shot factory, copper, brass, iron and zinc works; brewing, tanning and mineral water, flannel and cement works. St Winifred's holy well, one of the wonders of Wales, sends up water at the rate of 21 tons a minute, of an almost unvarying temperature, higher than that of ordinary spring water. To its curative powers many crutches and ex votos objects, hung round the well, as in the Lourdes Grot, bear ample witness. The stones at the bottom are slightly reddish, owing to vegetable substances. The well itself is covered by a fine Gothic building, said to have been erected by Margaret, countess of Richmond and mother of Henry VII., with some portions of earlier date. The chapel (restored) is used for public service. Catholics and others visit the site in great numbers. There are swimming baths for general use. In 1870 a hospital for poorer pilgrims was erected. Other public buildings are St Winifred's (Catholic) church and a convent, a town hall and a market-hall. The export trade is expedited by wharves on the Dee.

HOLYWOD, a seaport of county Down, Ireland, on the east shore of Belfast Lough, 43 m. N.E. from Belfast by the Belfast & County Down railway. Its pleasant situation renders it a favourite residential locality of the wealthier classes in Belfast. There was a religious settlement here from the 7th century, which subsequently became a Franciscan monastery. The old church dating from the late 12th or early 13th century marks its site. A Solemn League and Covenant was signed here in 1644 for the defence of the kingdom, and the document is preserved at the Belfast.

HOLZMINDEN, a town of Germany, in the duchy of Brunswick, on the right bank of the Weser, at the foot of the Sollinger Mountains, at the junction of the railways Scherfede-Holzminden and Soest-Bössum, 56 m. S.W. of Brunswick Pop. (1905) 9938. It has an Evangelical and a Roman Catholic church, a gymnasion, an architectural school and a school of engineering. The prosperity of the town depends chiefly on agriculture and the manufacture of iron and steel wares, and of chemicals, but weaving and the making of pottery are also carried on, and there are baryta mills and polishing-mills for sandstone. By means of the Weser it carries on a lively trade. Holzminden obtained municipal rights from Count Otto of Eberstein in 1245, and in 1410 it came into the possession of Brunswick.

HOLZTROMPETE (Wooden Trumpet), an instrument somewhat resembling the Alpenhorn (q.v.) in tone-quality, designed by Richard Wagner for representing the natural pipe of the peasant in Tristan and Isolde. This instrument is not unlike the cor anglais in rough outline, being a conical tube of approximately the same length, terminating in a small globular bell, but having neither holes nor keys; it is blown through a cup-shaped mouthpiece made of horn. The Holz trompete is in the key of C; the scale is produced by overblowing, whereby the upper partials from the 2nd to the 6th are produced. A single piston placed at a third of the distance from the mouth-piece to the bell gives the notes D and F. Wagner inserted a note in the score concerning the cor anglais for which the part was originally scored, and advised the use of the oboe as an alternative. To reinforce the latter, the effect intended being that of a powerful natural instrument, unless a wooden instrument with a natural scale be specially made for the part, which would be preferable.

The Holz trompete was used at Munich for the first performance of Tristan and Isolde, and was still in use there in 1897. At Bayreuth it was also used for the Tristan performances at the festivals of 1886 and 1889, but in 1891 W. Heckel's clarina, an instrument partaking of the nature of both oboe and clarinet, was substituted for the Holz trompete and has been retained ever since, having been found more effective.

(K.S.)

HOMAGE (from homo, through the Low Lat. hominaticum, which occurs in a document of 1305), one of the ceremonies used in the granting of a fief, and indicating the submission of a vassal to his lord. It could be received only by the suzerain in person. With head uncovered the vassal humbly requested to be allowed to enter into the feudal relation; he then laid aside his sword and spurs, ungirt his belt, and kneeling before his lord, and holding his hands extended and joined between the hands of his lord, uttered words to this effect: “I become your man from this day forth, of life and limb, and will hold faith to you for the lands I claim to hold of you.” The oath of fealty, which could be received by proxy, followed the act of homage; then came the ceremony of investiture, either directly on the ground or by the delivery of a turf, a handful of earth, a stone, or some other symbolical object. Homage was done not only by the vassal to whom feudal lands were first granted but by every one in turn by whom they were inherited, since they were not granted absolutely but only on condition of military and other service. An infant might do homage, but he did not thus enter into full possession of his lands. The ceremony was of a preliminary nature, securing that the fief would not be alienated; but the vassal had to take the oath of fealty, and to be formally invested, when he reached his majority. The obligations involved in the act of homage were more general than those associated with the oath of fealty, but they had a strong moral sanction for more specific engagements. They essentially resembled the obligations undertaken towards a Teutonic chief by the members of his “comitatus” or “gefolge,” one of the institutions from which feudalism directly sprang. Besides homagium ligeum, there was a kind of homage which imposed no feudal duty; this was homagium per paragium, such as the dukes of Normandy rendered to the kings of France, and as the dukes of Normandy received from the dukes of Brittany. The act of liege homage to a particular lord did not involve with the vassal’s allegiance as a subject to his sovereign, or with his duty to any other suzerain of whom he might hold lands.

The word is also used of the body of tenants attending a manorial court, or of the court in a court baron (consisting of the tenants that do homage and make inquiries and presentments, termed a homage jury).

HOMBERG, WILHELM (1652-1715), Dutch natural philosopher, was the son of an officer of the Dutch East India Company, and was born at Batavia (Java) on the 8th of January 1652. Coming to Europe with his family in 1670, he studied law at Leiden, and in 1674 became an advocate at Magdeburg. In that town he made a acquaintance of Otto von Guericke, and under his influence determined to devote himself to natural science. He, therefore, travelled in various parts of Europe for study, and after graduating in medicine at Wittenberg, settled in Paris in 1682. From 1685 to 1690 he practised as a physician at Rome; then returning to Paris in 1691, he was elected a member of the Academy of Sciences and appointed director of

Communique by Madame Wagner, December 28th, 1897.
HOMBURG-VOR-DER-HÖHE—HOME, D. D.

its chemical laboratory. Subsequently he became teacher of physics and chemistry (1792), and private physician (1795) to the duke of Orleans. His death occurred at Paris on the 24th of September 1715. Homburg was not free from alchemistical tendencies, but he made many solid contributions to chemical and physical knowledge, recording observations on the preparation of Kunkel's phosphorus, on the green colour produced in flames by copper, on the crystallization of common salt, on the salts of plants, on the saturation of bases by acids, on the freezing of water and its evaporation in vacuo, etc. Much of his work was published in the Recueil de l'Academie des Sciences from 1692 to 1714. The Sal Sedativum Homberti is boric acid, which he discovered in 1702, and "Homberti's phosphorus" is prepared by fusing sal-ammoniac with quick lime.

HOMBURG-VOR-DER-HÖHE, a town and watering-place of Germany, in the Prussian province of Hesse-Nassau, prettily situated at the south-east foot of the Taunus Mountains, 12 m. N. of Frankfort-on-Main, with which it is connected by rail. Pop. (1905) 15,749. Homburg consists of an old and a new town, the latter, founded by the landgrave of Hesse-Homburg Frederick II. (d. 1706), being regular and well-built. Besides the palatial edifices erected in connexion with the mineral water-cure, there are churches of various denominations, Lutheran, Roman Catholic, Russian-Greek and Anglican, schools and benevolent institutions. On a neighbouring hill stands the palace of the former landgraves, built in 1808 and subsequently enlarged and improved. The White Tower, 183 ft. in height, is said to date from Roman times, and certainly existed under the lords of Eppstein, who held the district in the 11th century. The palace is surrounded by extensive grounds, laid out in the manner of an English park. The eight mineral springs which form the attraction of the town to strangers belong to the class of saline acidulous chalybeates and contain a considerable proportion of carbonate of lime. Their use is beneficial for diseases of the stomach and intestines, and, externally, for diseases of the skin and rheumatism. The establishments connected with the springs are arranged on a scale of great magnificence, and include the Kurhaus (built 1841-1843), with a theatre, the Kaiser Wilhelmshof and the Kurhausbad. They lie grouped round a pretty park which also furnishes the visitors with facilities for various recreations, such as lawn tennis, croquet, polo and other games. The industries of Homburg embrace iron founding and the manufacture of leather and hats, but they are comparatively unimportant, the prosperity of the town being almost entirely due to the annual influx of visitors, which during the season from May to October inclusive averages 12,000. In the beautiful neighbourhood lies the ancient Roman castle of Saalburg, which in 1871 was discovered as an early chruch and villa. Homburg first came into repute as a watering-place in 1834, and owing to its gaming-tables, which were set up soon after, it rapidly became one of the favourite and most fashionable health-resorts of Europe. In 1840 the town was occupied by Austrian troops for the purpose of enforcing the imperial decree against gambling establishments, but immediately on their withdrawal the bank was again opened, and play continued unchecked until 1852, when the Prussian government refused to renew the licence for gambling purposes, which then expired. As the capital of the former landgrave of Hesse-Homburg, the town shared the vicissitudes of that state.

Homburg is also the name of a town in Bavaria. Pop. (1900) 4,785. It has a Roman Catholic and an Evangelical church, and manufactures of iron goods. In the neighbourhood are the ruins of the castles of Karlshof and of Hohenburg. The family of the counts of Homburg became extinct in the 13th century. The town came into the possession of Zweibrücken in 1755 and later into that of Bavaria.

E. Vorko-Davies, Homburg and its Waters (London, 1897).

HOME, EARLS OF. Alexander Home or Home, 1st earl of Home (c. 1566-1616), was the son of Alexander, 5th Lord Home (d. 1575), who fought against Mary, queen of Scots, at Carberry Hill and at Langside, but was afterwards one of her most stalwart supporters, being taken prisoner when defending Edinburgh castle in her interests in 1573 and probably dying in captivity. He belonged to an old and famous border family, an early member of which, Sir Alexander Home, was killed at the battle of Verneuil in 1424. This Sir Alexander was the father of Sir Alexander Home (d. 1456), warden of the marches and the founder of the family fortunes, whose son, another Sir Alexander (d. 1491), was created a lord of parliament as Lord Home in 1473, being one of the band of nobles who defeated the forces of King James III. at the battle of Sauchieburn in 1488. Other distinguished members of the family were: the first lord's grandson and successor, Alexander, 2nd Lord Home (d. 1506), chamberlain of Scotland; and the latter's son, Alexander, 3rd Lord Home (d. 1516), a person of great importance during the reign of James IV., whom he served as chamberlain. He fought at Flodden, but before the death of the king he had led his men away to plunder. During the minority of the new king, James V., he was engaged in quarrelling with the regent, John Stewart, duke of Albany, and in intriguing with England. In September 1516 he was seized, was charged with treachery and beheaded, his title and estates being restored to his brother George in 1522. George, who was killed in September 1547 during a skirmish just before the battle of Pinkie, was the father of Alexander, the 5th lord.

Alexander Home became 6th Lord Home on his father's death in August 1575, and took part in many of the turbulent incidents which marked the reign of James VI. He was warden of the east marches, and was often at variance with the Hepburns, a rival border family whose head was the earl of Bothwell; the feud between the Homes and the Hepburns was an old one, and it was probably the main reason why Home's father, the 5th lord, sided with the enemies of Mary during the period of her intimacy with Bothwell. Home accompanied James to England in 1603 and was created earl of Home in 1605; he died in April 1610.

His son James, the 2nd earl, died childless in 1633 when his titles passed to a distant kinsman, Sir James Home of Coldknows (d. 1666), a descendant of the 1st Lord Home. This earl was in the Scottish ranks at the battle of Preston and lost his estates under the Commonwealth, but these were restored to him in 1661. His descendant, William, the 8th earl (d. 1761) fought on the English side at Prestonpans, and from his brother Alexander, the 9th earl (d. 1786), the present earl of Home is descended. In 1875 Cospatrick Alexander, the 12th earl (d. 1890), an elder son of the 11th earl, was created Baron Douglas, and his son Charles Alexander, the 12th earl (b. 1834), took the additional name of Douglas. The principal strongholds of the Homes were Douglas castle in Haddington and Home castle in Berwickshire.

See H. Drummond, Histories of Noble British Families (1846).

HOME, DANIEL DUNGLAS (1833-1886), Scottish spiritualist, was born near Edinburgh on the 20th of March 1833, his father being said to be a natural son of the 10th earl of Home, and his mother a Swiss woman. He was an eccentric and a family credited with second sight. He went with his mother to America, and on her death was adopted by an aunt. In the United States he came out as a spiritualistic medium, though, it should be noted, he never sought to make money out of his exhibitions. In 1855 he came to England and gave numerous séances, which were attended by many well-known people. Robert Browning, the poet, went to one of these, but without altering his contempt for spiritualism, and he subsequently gave his impression of Home in the unfinished poem of "Sludge the Medium" (1864); Home, nevertheless, had many disciples, and gave séances at several European courts. He became a Roman Catholic, but was expelled from Rome as a sorcerer. In 1866 Mrs Lyon, a wealthy widow, adopted him as her son, and settled 600,000 upon him. Repenting, however, of her action, she brought a suit for the return of her money,
HOME, J.—HOMER

on the ground that it had been obtained by "spiritual" influence. It was held that the burden of establishing the validity of the gift lay on Home, and as he failed to do so the case was decided against him. He continued, however, to give sances, mostly on the Continent, and in 1871 appeared before the tsar of Russia and two Russian scientists, who attested the phenomena as genuine. Returning to England he submitted to a series of experiments designed to test his pretensions before Professor (subsequently Sir William) Crookes, which the latter declared to be thoroughly genuine; and Professor von Boutlerow, of the Russian Academy of Science, after witnessing a similar series of experiments, expressed the same opinion. Home published two volumes of Incidents of My Life and Lights and Shadows of Spiritualism. He married successively two well-connected Russian ladies. He died at Autecuil, France, on the 21st of June 1856.

HOME, JOHN (1722-1808), Scottish dramatic poet, was born on the 22nd of September 1722 at Leith, where his father, Alexander Home, who was distantly related to the earls of Home, held the office of town-clerk. He was educated at the grammar school of his native town, and at the university of Edinburgh, where he graduated M.A. in 1742. Though he showed a fondness for the profession of arms, he studied divinity, and was licensed by the presbytery of Edinburgh in 1745. In the same year he joined as a volunteer against the Pretender, and was taken prisoner at the battle of Falkirk (1746). With many others he was carried to the castle of Doune in Perthshire, but soon escaped his effect. In July 1746 Home was presented to the parish of Athelstaneford, Haddingtonshire, vacant by the death of Robert Blair (the author of Gravemosyne). With his leisure to visit his friends and became especially intimate with David Hume who belonged to the same family as himself. His first play, Agis: a tragedy, founded on Plutarch's narrative, was finished in 1747. He took it to London and submitted it to Garrick for representation at Drury Lane, but it was rejected as unsuitable for the stage. The tragedy of Douglas was suggested to him by hearing a lady sing the ballad of Gil Morrice or Child Maurice (F. J. Child, Popular Ballads, ii. 263). The ballad supplied him with the outline of a simple and striking plot. After five years' labour he completed his play, which he took to London for Garrick's opinion. It was also rejected, but on his return to Edinburgh his friends resolved that it should be brought out in that city. It was produced on the 14th of December 1756 with overwhelming success, in spite of the opposition of the presbytery, who summoned Alexander Carlyle to answer for having attended its representation. Home wisely resigned his charge in 1757, after a visit to London, where Douglas was brought out at Covent Garden on the 14th of March. Peg Woffington played Lady Randolph, a part which found a later exponent in Mrs Siddons. David Hume summed up his admiration for Douglas by saying that his friend possessed "the true theatric genius of Shakespeare and Otway, refined from the unhappy barbarism of the one and licentiousness of the other." Gray, writing to Horace Walpole (August, 1757), said that the author "seemed to have retrieved the true language of the stage, which has been lost for these hundred years," but Samuel Johnson held aloof from the general enthusiasm, and averred that there were not ten good lines in the whole play (Boswell, Life, ed. Croker, 1848, p. 390). In 1758 Home became private secretary to Lord Bute, then secretary of state, and was appointed tutor to the prince of Wales; and in 1760 his patron's influence procured him a pension of £300 per annum and in 1765 a sinecure worth another £500. Garrick produced Agis at Drury Lane on the 21st of February 1758. By dint of good assigned no official support, according to Genest (Short Account &c., iv. 513 seq.), the piece kept the stage for eleven days, but it was lamentably inferior to Douglas. In 1760 his tragedy, The Siege of Aquileia, was put on the stage, Garrick taking the part of Aemilius. In 1760 his tragedy of The Fatal Discovery had a run of nine nights; Almoe also (1773) had fair success in the representation; but his last tragedy, Alfred (1778), was so coolly received that he gave up writing for the stage. In 1778 he joined a regiment formed by the duke of Buccleuch. He sustained severe injuries in a fall from horseback which permanently affected his brain, and was persuaded by his friends to retire. From 1767 he resided either at Edinburgh or at a villa which he built at Kilduff near his former parish. It was at this time that he wrote his History of the Rebellion of 1745, which appeared in 1802. Home died at Merchiston Bank, near Edinburgh, on the 5th of September 1808, in his eighty-sixth year.

The Works of John Home were collected and published by Henry Mackenzie in 1822 with "An Account of the Life and Writings of Mr John Home," which also appeared as The Life and Works of John Home, in the Quarterly Review (June, 1827). Douglas is included in numerous collections of British drama. Voltaire published his Le Café, ou l'Écosaisse (1756), Londres (really Geneva), as a translation from the work of Mr Hume, described as pasteur de l'église d'Edimbourg, but Home seems to have taken no notice of the mystification.

HOMEL or GOMEL, a town of Russia, in the government of Mogilev, and 132 m. by rail S.S.E. of the town of Mogilev, on the Sozh, a tributary of the Dnieper. Pop. (1900) 45,081, nearly half of whom are Jews. It is an important junction of the railways from Vilna to Odessa and from Orel to Poland, and is in steamier communication with Kiev and Mogilev. In front of Prince Paskevich's castle stands an equestrian statue of the Polish general Joseph Poniatowski, and in the cathedral is the tomb of the chancellor Nikolai Petrovich Rumantsve, by Canova. The town carries on a brisk trade in hops, corn and timber; there are also paper-pulp mills and oil factories. Home was founded in the 14th century, and after changing hands several times between Poles and Russians was annexed to Russia in 1772. In 1648 it suffered at the hands of the Cossack chieftain Bogdan Chmielnicki.

HOME OFFICE, a principal government department in the United Kingdom, the creation of which dates from 1782, when the conduct of foreign affairs, which had previously been divided between the northern and southern secretaries, was handed over to the northern department (see FOREIGN OFFICE). The home department retained control of Irish and colonial affairs, and of war business until 1794, when an additional secretary of state was re-appointed. In 1801 the colonial business was formed into the home department, which now attends only to domestic affairs. The head of the department, the principal secretary of state for home affairs, or home secretary, is a member of the government for the time being, and of the cabinet, receiving a salary of £500 a year. He is the proper medium of communication between the sovereign and the subject, and receives petitions addressed to the crown. He is responsible for the maintenance of the king's peace and attends to the administration of criminal justice, police and prisons, and through him the sovereign exercises his prerogative of mercy. Within his department is the supervision of lunatic asylums, reformatories and industrial schools, and it is his duty to see that the internal well-being of the country, to enforce the rules made for the health or safety of the community generally, and especially of those classes employed in special trades or dangerous occupations. He is assisted by a permanent under-secretary, a parliamentary secretary and several assistant under-secretaries.

See Anson, Law and Custom of the Constitution (1907).

HOMER1 ("Ouypsos"), the great epic poet of Greece. Many of the works once attributed to him are lost; those which remain are the two great epics, the Iliad and the Odyssey; the lesser poem, the Three Hymns, a mock epic; the Battle of the Doves; the Iliad and Mute), and several pieces of a few lines each (the so-called Epigrams).

Ancient Accounts of Homer.—Of the date of Homer probably record, real or pretended, ever existed. Herodotus (ii. 53) maintains that Hesiod and Homer lived not more than 400 years

1This article was thoroughly revised by Dr D. B. Monro before his death in 1905; a few points have since been added by Mr. T. W. Allen.
before his own time, consequently not much before 850 B.C.

From the controversial tone in which he expresses himself it is evident that others had made Homer more ancient; and accordingly the dates given by later authorities, though very various, generally fall within the 10th and 11th centuries B.C. But none of these statements has any claim to the character of external evidence.

The extant living of Homer (edited in Westermann's *Vitrum Scripturae Graecae minores*) are eight in number, including the piece called the *Contest of Hesiod and Homer*. The longest is written in the Ionic dialect, and bears the name of Herodotus, but is certainly spurious. In all probability it belongs to the time which was fruitful beyond all others in literary forgeries, viz. the 2nd century of our era.\(^1\) The other lives are certainly no more ancient. Their chief value consists in the curious short poems or fragments of verse which they have preserved—the so-called *Epigrams*, which were used to be printed at the end of editions of Homer. These are easily recognized as "Popular Rhymes," a form of folk-lore to be met with in most countries, treasured by the people as a kind of proverb.\(^2\) In the Homeric *epigrams* the interest turns sometimes on the characteristics of particular localities—Smyrna and Cyme (*Epigr. iv.*), Erythrae (*Epigr. vii.*, *viii.*), Mt Ida (*Epigr. x.*), Neon Teichos (*Epigr. i.*); others relate to certain trades or occupations—potters (*Epigr. xiv.*), sailors, fishermen, goat herds, &c. Some may be fragments of longer poems, but evidently they are not the work of any one poet. The fact that they were all ascribed to Homer merely means that they belong to a period in the history of the Ionian and Aeolian colonies when "Homer" was a name which drew to itself all ancient and popular verse.

Again, comparing the "epigrams" with the legends and anecdotes told in the Lives of Homer, we can hardly doubt that they were the chief source from which these Lives were derived. Thus in *Epigr. iv.* we find a blind poet, a native of Aeolian Smyrna, through which flows the water of the sacred Meles. Here is doubtless the source of the chief incident of the Herodotean *Life*:—the birth of Homer "Son of the Meles." The epithet Aeolian implies high antiquity, inasmuch as according to Herodotus Smyrna became Ionian about 688 B.C. Naturally the Ionians had their own version of the story—a version which made Homer come out with the first Athenian colonists.

The same line of argument may be extended to the *Hymns*, and even to some of the lost works of the post-Homeric or so-called "Cyclic" poets. Thus:

1. The hymn to the Delian Apollo ends with an address of the poet to his audience. When any stranger comes and asks who is the sweetest singer, he is to answer with one voice, the "blind man that dwells in rocky Chios; his songs deserve the prize for all time to come." Thucydides, who describes this passage to show the ancient character of the Delian festival, seems to have no doubt of the Homeric authorship of the hymn. Hence we may most naturally account for the belief that Homer was a Chian.

2. The *Margies*—a humorous poem which kept its ground as the reputed work of Homer down to the time of Aristotlene—began with the words: "There came to Colophon an old man, a divine singer, servant of the Muses and Apollo." Hence doubtless the claim of Colophon to be the native city of Homer—a claim supported in the early times of Homeric learning by the Colophonian poet and grammarian Antimachus.

3. The poem called the *Cypria* was said to have been given by Homer to Stasinus of Cyprus as a daughter's dowry. The connexion with Cyprus appears further in the predominance given in the poem to Aphrodite.

4. The *Phocids*, according to the Herodotean life, were composed by Homer when he lived at Phocaea with a certain Thestorides, who carried them off to Chios and there gained fame by reciting them as his own. The name Thestorides occurs in *Epigr. v.*

5. A similar story was told about the poem called the *Taking of Oechalia* (*Oxybais "I a w e w i s*), the subject of which was one of the exploits of Heracles. It passed under the name of Creophylus, a friend or (as some said) a son-in-law of Homer; but it was generally believed to have been in fact the work of the poet himself.

6. Finally the *Thebaid* always counted as the work of Homer. As to the *Epigoni*, which carried on the Theban story, some doubt seems to have been felt.

These indications render it probable that the stories connecting Homer with different cities and islands grew up after his poems had become known and famous, especially in the new and flourishing colonies of Aeolis and Ionia. The contention for Homer, in short, began at a time when his real history was lost, and he had become a sort of mythical figure, an "eponymous hero," or personification of a great school of poetry.

An interesting confirmation of this view from the negative side is furnished by the city which ranked as chief among the Asiatic colonies of Greece, viz. Miletus. No legend claims for Miletus even a visit from Homer, or a share in the authorship of any Homeric poem. Yet Arctinus of Miletus was said to have been a "disciple of Homer," and was certainly one of the earliest and most considerable of the "Cyclic" poets. His *Aethiopis* was composed as a sequel to the *Iliad*; and the structure and general character of his poems show that he took the *Iliad* as his model. Yet in his case we find no trace of the disputed authorship which is so common with other "Cyclic" poems. However this come about? Why have the works of Arctinus escaped the attraction which drew to the name of Homer such epics as the *Cypria*, the *Little Iliad*, the *Thebaid*, the *Epigoni*, the *Taking of Oechalia* and the *Phocis*. The most obvious account of the matter is that Arctinus was never so far forgotten that his poems became the subject of dispute. We seem through him to obtain a glimpse of an early post-Homeric age in Ionia, when the immediate disciples and successors of Homer were distinct figures in a trustworthy tradition—when they had not yet merged their individuality in the legendary "Homer" of the Epic Cycle.

Recitation of the Poems.—The recitation of epic poetry was called in historical times "rhapsody" (*βαφόφως*). The word *βαφόφως* is post-Homeric, but was known to Pindar, who gives two different explanations of it—"singer of stitched verse" (*βαφωφώς κώτων σωμάτων*), and "singer with the wand" (*βαφωβός*). Of these the first is etymologically correct (except that it should rather be "stitcher of verse"); the second was suggested by the idea for which the early evidence that the reciter was accustomed to hold a wand in his hand—perhaps, like the sceptre in the Homeric assembly, as a symbol of the right to a hearing.\(^3\)

The first notice of rhapsody meets us at Sicyon, in the reign of Cleisthenes (600–560 B.C.), who "put down the rhapsodists on account of the poems of Homer, because they are all about Argos and the Argives" (Hdt. vi. 67). This description applies very well to the *Iliad*, in which Argos and Argives occur on almost every page. It may have suited the *Thebaid* still better, but there is no need to understand in any of that poem, as Grote does. The incident shows that the poems of the Ionic Homer had gained in the 6th century B.C., and in the Doric parts of the Peloponnese, the ascendency, the national importance and the almost canonical character which they ever afterwards retained.

At Athens there was a law that the Homeric poems should be recited (βαφοφοθέα) on every occasion of the Panathenaea. This law is appealed to as an especial glory of Athens by the orator Lycurgus (Lecor. 102). Perhaps therefore the custom yet more recent was exceptional,\(^4\) and unfortunately we do not know when or by whom it was introduced. The Platonic dialogue *Hipparchus* attributes it to Hipparcatus, son of Pelsistratus. This, however, is part of the historical romance of

---

\(^1\) See a paper in the *Diss. Philol. Helvenses*, ii. 97-219.

\(^2\) Compare the *Popular Rhymes of Scotland*, published by Robert Chambers.

\(^3\) Compare the branch of myrtle at an Athenian feast (Aristoph. *Nikul*, 1364).

\(^4\) The *Iliad* was also recited at the festival of the Brauronia, at Brauron in Attica (Hesych. s.v. βαφοφοθέα)
which the dialogue mainly consists. The author makes (perhaps willfully) all the mistakes about the family of Peisistratus which Thucydides' knowledge in this period (p. 54) is not. In one point, however, the writer's testimony is valuable. He tells us that the law required the rhapsodists to recite "taking each other up in order (ἐξ ἑαυτῶν ἐκεῖνος, as they still do)."

This recurs in a different form in the statement of Diogenes Laertius (i. 2. 57) that Solon made a law that the poems should be recited "with prompting" (ἐξ ἑαυτοῦν). The question as between Solon and Hipparchus cannot be settled; but it is at least clear that a due order of recitation was secured by the presence of a person charged to give the rhapsodists their cue (ὑποδαίλεσ). It was necessary, of course, to divide the poem to be recited into parts, and to compel each contending rhapsodist to take the part assigned to him. Otherwise they would have chosen favourite or show passages.

The practice of poets or rhapsodists contending for the prize at the great religious festivals is of considerable antiquity, though apparently post-Homeric. It is brought vividly before us in the Hymn to Apollo (see the passage mentioned above), and in two Hymns to Aphrodite (v. and ix.). The latter of these may evidently be taken to belong to Salamis in Cyprus and the festival of the Cyprian Aphrodite, in the same way that the Hymn to Apollo belongs to Delos and the Delian gathering.

The earliest trace of such contests is to be found in the story of the Pythian Games, the Thracian singer, who boasted that he could conquer even the Muses in song (II. ii. 594 ff.).

Much has been made in this part of the subject of a family or clan (γεροδ) of Homeridae in the island of Chios. On the one hand, it seemed to follow from the existence of such a family that Homer was a mere "eponymous," or mythical ancestor; on the other hand, it became easy to imagine the Homeric poems handed down orally in a family whose hereditary occupation it was to recite them, possibly to add new episodes from time to time, or to combine their materials in new ways, as their poetical gifts permitted. But, although there is no reason to doubt the existence of a family of "Homeridae," it is far from certain that they had anything to do with Homeric poetry. The word occurs first in Pindar (Nem. 2. 2), who applies it to the rhapsodists (Ὀμέριδας ἐπαυτὸς ἐκεῖνος δοῦλο). On this a scholar says that the name "Homeridae" denoted originally descendants of Homer, who sang his poems in succession, but afterwards was applied to rhapsodists who did not claim descent from him. He adds that there was a famous rhapsodist, Cynaethus of Chios, who was said to be the author of the Hymn to Apollo, and to have first recited Homer at Syracuse about the 69th Olympiad. Nothing here connects the Homeridae with Chios. The statement of the scholar is evidently a mere inference from the paenymic form of the word. If it proves anything, it proves that Cynaethus, who was a Chian and a rhapsodist, made no claim to Homeric descent. On the other hand our knowledge of Chian Homeridae comes chiefly from the lexicon of Harpocration, where we are told that Acusilaus and Hellanicus said that they were so called from the poet; whereas Seleucus pronounced this to be an error. Strabo also says that the Chians put forward the Homeridae as an argument in support of their claim to Homer. These Homeridae, then, belonged to Chios, but there is no indication of their being rhapsodists. On the contrary, Plato and other Attic writers use the word to include interpreters and adorers—in short, the whole "spiritual kindred"—of Homer. And although we hear of "descendants of Creophylus" as in possession of the Homeric poems, there is no similar story about descendants of Homer himself. Such is the evidence on which so many inferences are based.

The result of the notices now collected is to show that the early history of epic recitation consists of (1) passages in the Homeric hymns showing that poets contended for the prize at the great festivals, (2) the passing mention in Herodotus of rhapsodists at Sicyon, and (3) a law at Athens, of unknown date, regulating the recitation at the Panathenaea. Let us now compare these data with the account given in the Homeric poems.

The word "rhapsode" does not yet exist; we hear only of the "singer" (δοῦλος), who does not carry a wand or laurel-branch, but the lyre (φοίνικας), with which he accompanies his "song."

The Odyssey even the "epic singer" is not met with. It is Achilles himself who sings the stories of heroes (εἰκώνες) in his tent, and Patroclus is waiting ([responde parato) to take up the song in his turn (II. ix. 191). Again we do not hear of poetical contests (except in the story of Thamyris already mentioned) or of recitation of epic poetry at festivals. The Odyssey gives us pictures of two great houses, and each has its singer. The song is on a subject taken from the Trojan war, at some point chosen by the singer himself, or by his hearers. Phemius pleases the suitors by singing of the calamitous return of the Greeks; Demodocus sings of a quarrel between Ulysses and Achilles, and afterwards of the wooden horse and the capture of Troy.

It may be granted that the author of the Odyssey can hardly have been just such a singer as he himself describes. The songs of Phemius and Demodocus are too short, and have too much the character of improvisations. Nor is it necessary to suppose that epic poetry, at the time to which the picture in the Odyssey belongs, was confined to the one type represented. Yet in several respects the conditions under which the singer finds himself in the house of a chieftain like Odysseus or Alcinoos are more in harmony with the character of Homeric poetry than those of the latter rhapsodic contests. The subdivision of a poem like the Iliad or Odyssey among different and necessarily unequal performers must have been injurious to the effect. The highly theatrical manner of recitation which was fostered by the spirit of competition, and by the example of the stage, cannot have done justice to the even movement of the epic style. It is not certain indeed that the practice of reciting a long poem by the agency of several competitors was ancient, or that it prevailed elsewhere than at Athens; but as rhapsodists were numerous, and popular favour throughout Greece became more and more confined to one or two great works, it must have become almost a necessity. That it was the mode of recitation contemplated by Homer in the Iliad or Odyssey it is impossible to believe.

The difference made by substituting the wand or branch of laurel for the lyre of the Homeric singer is a smaller one, though not without significance. The recitation of the Hesiodic poems was from the first unaccompanied by the lyre, i.e. they were confessedly said, not sung; and it was natural that the example should be extended to Homer. For it is difficult to believe that the Homeric poems were ever "sung" in the strict sense of the word. We can only suppose that the lyre in the hands of the epic poet or reciter was in reality a piece of convention, a "survival" from the stage in which narrative poetry had a lyrical character. Probably the poets of the Homeric school—that is, which dealt with war and adventure—were the genuine descendants of minstrels whose "lays" or "ballads" were the amusement of the feasts in an earlier heroic age; whereas the Hesiodic compositions were non-lyrical from the first, and were only in verse because that was the universal form of literature.

It seems, then, that if we imagine Homer as a singer in a royal house of the Homeric age, but with more freedom regarding the limits of his subject, and a more tranquil audience than is allowed him in the rapid movement of the Odyssey, we shall probably not be far from the truth.

Time and Place of Homer.—The oldest direct references to the Iliad and Odyssey are in Herodotus, who quotes from both poems (ii. 53). The quotation from the Iliad is of interest because it is made in order to show that Homer supported the story of the travels of Paris to Egypt and Sidon (whereas the Cyclic poem called the Cypria ignored them), and also because the part of the Iliad from which it comes is cited as the "Aristea of Diomed." This was therefore a recognized part of the poem.

The earliest mention of the name of Homer is found in a fragment of the philosopher Xenophanes of the 6th century B.C., or possibly earlier, who complains of the false notions implanted through the teaching of Homer. The passage shows, not merely that Homer was well known at Colophon in the time of Xenophanes, but also that the great advance in moral and
religious ideas which forced Plato to banish Homer from his republic had made itself felt in the days of the early Ionic philosophers.

Failing external testimony, the time and place of the Homeric poems can only be determined (if at all) by internal evidence. This is of two main kinds: (a) evidence of history, consisting in a comparison of the political and social condition, the geography, the institutions, the manners, arts and ideas of Homer with those of other times; (b) evidence of language, consisting in a comparison with later dialects, in respect of grammar and vocabulary. To these may be added, as occasion- ally of value, (c) much evidence of the direct influence of Homer upon the subsequent course of literature and art.

(a) The political condition of Greece in the earliest times known to history is separated from the Greece of Homer by an interval which can hardly be overestimated. The great national names are different: instead of Achaean, Argive, Danai, we find Hellenes, subdivided into Dorians, Ionians, Aeolians—names either unknown to Homer, or mentioned in terms more significant than silence. At the dawn of Greek history Mycenae is no longer the seat of empire; new empires, politics and civilizations have grown up—Sparta with its military discipline, Delphi with its religious supremacy, Miletus with its commerce and numberless colonies, Aeolis and Ionia, Sidly and Magna Graecia.

While the political centre of Homeric Greece is at Mycenae, the real centre is rather to be found in Boeotia. The Catalogue of the Ships begins with Boeotia; the list of Boeotian towns is much the longest; and they sail, not from the bay of Argos, but from the Boeotian harbour of Aulis. This position is not due to its chiefs, who are all of inferior rank. The importance of Boeotia for Greek civilization is further shown by the ancient worship of the Muses on Mount Helicon, and the fact that the oldest poet whose birthplace was known was the Boeotian Hesiod. Next to Boeotia and the neighbouring countries, it appears that the Peloponnesus, Crete and Thessaly were the most important seats of Greek population.

In the Peloponnesus the face of things was completely altered by the Dorian conquest, no trace of which is found in Homer. The only Dorians known in Homer are those that the Odyssey (xix. 177) places in Crete. It is difficult to connect them with the Dorians of history.

The eastern shores of the Aegean, which the earliest historical records represent to us as the seat of a brilliant civilization, giving way before the advance of the great military empires (Lydia and afterwards Persia), are almost a blank in Homer's map. The list of settlements can be traced in the Catalogue from Crete to Rhodes, and embraces the neighbouring islands of Cos and Calymnos. The colonization of Rhodes by Thlepomenus is related (II. ii. 661 ff.), and seems to mark the farthest point reached in the Homeric age. Between Rhodes and the Troad Homer knows of but one city, Miletus—which is a Carian ally of Troy—and the mouth of one river, the Cayster. Even the Cyclades—Naxos, Paros, Melos—are unknown to the Homeric world. The disposition of the Greeks to look to the west for the centres of religious feeling appears in the mention of Dodona and the Dodonian Zeus, put in the mouth of the Thessalian Achilles.

To the north we find the Thracians, known from the stories of Thamyris the singer (II. ii. 593), and Lycurgus, the enemy of the young god Dionysus (II. vi. 130). Here the Trojan empire begins. It does not appear, however, that the Trojans are thought of as people of a different language. So as is expressly said of the Carians, and of the Trojan allies who were "summoned from afar," the contrary rather is implied regarding Troy itself.

The mixed type of government described by Homer—consisting in the Dorian of a council of elders, and bringing all important resolutions before the assembled folk of the fighting men—does not seem to have been universal in Indo-European communities, but to have grown up in many different parts of the world under the stress of similar conditions. The king is the commander in war, and the office probably owed its existence to military necessities. It is not surrounded with any special sacredness. There were ruling families, laying claim to divine descent, from whom the king was naturally chosen, but his own fitness is the essence of his title. The aged Laertes is set aside; the young Telemachus does not succeed as a matter of course. Nor are any very definite rights attached to the office. Each tribe in the army before Troy was commanded by its own king (or kings); but Agamemnon was supreme, and was "more a king" (besvart, saep) than any other. The assembly is summoned to all critical occasions, and its approval is the divine sanction. A king therefore stands in almost as much need of oratory as of warlike skill and prowess. Even the division of the spoil is not made in the Iliad by Agamemnon, but by "the Achaeans" (II. i. 162, 638). The taking of Briseis from Achilles was an arbitrary act, and against all rule and custom. The council is more difficult to understand. The "elders" (ygrwv) of the Iliad are the same as the subordinate "kings"; they are summoned by Agamemnon to his tent, and form a small council of nine or ten persons. In Troy we hear of elders of the people (xevqevwv) who are with Priam, and are men past the military age. So in Ithaca there are elders who have not gone to Troy with the army. It would seem therefore that the meeting in Agamemnon's tent was only a copy or adaptation of the true constitutional "council of elders," which indeed was essentially unfitted for the purposes of military service. The king's palace, if we may judge from Tiryns and Mycenae, was usually in a strong position on an "acropolis." In the later times of democracy the acropolis was reserved for the temples of the principal gods.

Priesthood in Homer is found in the case of particular temples, where an officer is naturally wanted to take charge of the sacred inclosure and the sacrifices offered within it. It is perhaps an accident that we do not hear of priests in Ithaca. Agamemnon performs sacrifice himself, not because a priestly character was attached to the kingly office, but simply because he was "master in his own house."

The conception of "law" is foreign to Homer. The later words for it (qynv, phryv) are unknown, and the terms which Homer knows (lkv and thvnt) mean merely "custom." Judicial functions are in the hands of the elders, who "have to do with suits" (huvnvdv) and "uphold judgments" (thvnt evvrop). On such matters as the compensation in cases of homicide, it is evident that there were no rules, but merely a feeling, created by usage and wont, that the relatives of the slain man should be willing to accept payment. The sense of anger which follows a violation of custom has the name of "Nemesis"—righteous displeasure.

As there is no law in Homer, so there is no morality. That is to say, there are no general principles of action, and no words which indicate that acts have been classified as good or bad, right or wrong. Moral "feeling," indeed, existed and was denoted by "Aides"; but the numerous meanings of this word—shame, veneration, pity—show how rudimentary the idea was. And when we look to practice we find that cruel and even treacherous deeds are spoken of without the least sense that they deserve censure. The heroes of Homer are hardly more moral agents than the giants and enchanters of a fairy tale.

The religious ideas of Homer differ in some important points from those of later Greece. The Apollo of the Iliad has the character of a local Asiatic deity—"ruled by Chryse and goodly Cilla and Tenedos." He may be compared with the Clarion and the Lycian god, but he is unlike the Apollo of Dorian times, the "deliverer" and giver of oracles. Again, the worship of Dionysus, and of Demeter and Persephone, is mainly or wholly post-Homeric. The greatest difference, however, lies in the absence of hero-worship from the Homeric order of things. Castor and Polydeuces, for instance, are simply brothers of Achilles who died before the expedition to Troy (II. iii. 413).

The military tactics of Homer belong to the age when the chariot was the principal engine of warfare. Cavalry is unknown, and the battles are mainly decided by the prowess of the chiefs. The use of the trumpet is also later. It has been supposed indeed that the art of riding was known in Homer's own time, because it occurs in comparisons. But the riding which

HOMER

629
describes (II, xv. 679) is a mere exhibition of skill, such as we may see in a modern circus. And though he mentions the trumpet (II, xviii. 219), there is nothing to show that it was used, as in historical times, to give the signal for the charge.

The chief industries of Homeric times are those of the carpenter (κτέων), the worker in leather (σκευοράμος), the smith or worker in metal (χάλκον) whose implements are the hammer and pincers—and the potter (κέραμες); also spinning and weaving, which were carried on by the women. The fine arts are represented by sculpture in relief, carving in wood and ivory, embroidery. Statuary is later; it appears to have come into existence in the 7th century, about the time when casting in metal was invented by Rhoeacus of Samos. In general, as was well shown by A. S. Murray, Homeric art does not rise above the stage of decoration, applied to objects in common use; while in point of style it is characterized by a richness and variety of ornament which is in the strongest contrast to the simplicity of the best periods. It is the work, in short, not of artists but of skilled workmen; the ideal artist is "Daedalus," a name which implies mechanical skill and intricate workmanship, not beauty of design.

One art of the highest importance remains. The question whether writing was known in the time of Homer was raised in antiquity, and has been debated with especial eagerness ever since the appearance of Wolf's Prolegomena. In this case we have to consider not merely the indications of the poems, but also the external evidence which we possess regarding the use of writing in Greece. This latter kind of evidence is much more considerable now than it was in Wolf's time. (See Warrin elsewhere in these volumes.)

The oldest known stage of the Greek alphabet appears to be represented by inscriptions of the islands of Thera, Melos and Crete, which are referred to the 40th Olympiad (620 B.C.). The oldest specimen of a distinctively Ionian alphabet is the famous inscription of the mercenaries of Psammetichus, in Upper Egypt, as to which the only doubt is whether the Psammetichus in question is the first or the second, and consequently whether the inscription is to be dated Ol. 40 or Ol. 47. Considering that the divergence of two alphabets (like the difference of two dialects) requires both time and familiar use, we may gather from these facts that writing was well known in Greece early in the 7th century B.C.

The rise of prose composition in the 6th century B.C. has been thought to mark the time when memory was practically superseded by writing as a means of preserving literature—the earlier use of letters being confined to short documents, such as lists of names, treaties, laws, &c. This conclusion, however, is by no means necessary. It may be that down to comparatively late times poetry was not commonly read, but was recited from memory. But the question is—From what time are we to suppose that the preservation of long poems was generally secured by the existence of written copies? Now, without counting the Homeric poems—which doubtless had exceptional advantages in their fame and popularity—we find a body of literature dating from the 8th century B.C. to which the theory of oral transmission is surely inapplicable. In the Trojan cycle alone we know of the two epics of Arctinus, the Little Iliad of Lesches, the Cypria, the Nestoi. The Theban cycle is represented by the Thebaid (which Callinus, who was of the 7th century, ascribed to Homer) and the Epigoni. Other ancient epics—ancient enough to have passed under the name of Homer—are the Taking of Ochotia, and the Phocids. Again, there are the numerous works attributed to Hesiod and other poets of the didactic, mythological and quasi-historical schools—Eumelus of Corinth, Cinaedon of Sparta, Agias of Trozezen, and many more. The preservation of this vast mass can only be attributed to writing, which must therefore have been in use for two centuries or more before there was any considerable prose literature. Nor is this in itself improbable.

The further question, whether the Iliad and Odyssey were originally written, is much more difficult. External evidence does not reach back so far, and the internal evidence is curiously indefinite. The only passage which can be interpreted as a reference to writing occurs in the story of Bellerophon, told by Glaucus in the sixth book of the Iliad. Proetus, king of Corinth, sent Bellerophon to his father-in-law the king of Lycia, and gave him "baneful tokens" (σημαρα Λιμηρά, i.e. tokens which were messages of death), "scratching on a folded tablet many spirit-destroying things, and bade him show this to his father-in-law, that he might perish." The king of Lycia asked duly (on the tenth day from the guest's coming) for a token (γραφη ήσαβα), and then knew what Proetus wished to be done. In this account there is nothing to show exactly how the message of Proetus was expressed. The use of writing for the purpose of the token between "guest-friends" (tessera hospitalis) is certainly very ancient. Mommsen (Röm. Forsch. i. 338 ff.) aptly compares the use in treaties, which are the oldest species of public documents. But we may suppose that tokens of some kind—like the marks which the Greek chiefs made on the lots (II. vii. 175 ff.)—were in use before writing was known. In any system of signs there were doubtless means of recommending a friend, and warning of the presence of enemies. But there is the difficulty, therefore, in understanding the message of Proetus without alphabetical writing. But, on the other hand, there is no reason for so understanding it.

If the language of Homer is so ambiguous where the use of writing would naturally be mentioned, we cannot expect to find more decisive references elsewhere. Arguments have been founded upon the descriptions of the blind singers in the Odyssey, with their songs inspired directly by the Muse; upon the appeals of the poet to the Muses, especially in such a place as the opening of the Catalogue; upon the Catalogue itself, which is a kind of historical document put into verse to help the memory; upon the shi noneer of Proetes in the Odyssey, who has "a good memory for his cargo," &c. It may be answered, however, that much of this is traditional, handed down from the time when all poetry was unwritten. Moreover it is one thing to recognize that a literature is essentially oral in its form, characteristic of an age which was one of hearing rather than of reading, and quite another to hold that the same literature was preserved entirely by oral transmission.

The result of these various considerations seems to be that the age which we may call the Homeric—the age which is brought before us in vivid outlines in the Iliad and Odyssey—lies beyond the earliest point at which history, enables us to penetrate. And so far as we can draw any conclusion as to the author (or authors) of the two poems, it is that the whole debate between the cities of Aeolis and Ionia was wide of the mark. The author of the Iliad, at least, was evidently a European Greek who lived before the colonization of Asia Minor; and the claims of the Asiatic cities mean no more than that in the days of their prosperity these were the chief seats of the name of Homer.

This is perhaps the case to consider whether the poems are to be regarded as possessing in themselves the same external record. The question is one which in the absence of satisfactory criteria will generally be decided by taste and predilection. A few suggestions, however, may be made.

1. The contents of the Iliad take place in a real locality, the general features of which are kept steadily in view. There is no doubt about Siegeum and Rhoeutem, or the river Scamander, or the islands Imbrros, Lemnos and Tenedos. It is at least remarkable that a legend so remote as that of the "tale of Troy," should be so distinctly localized, and that in a district which was never famous as a seat of Greek population. It may be urged, too, that the story of the Iliad is singularly free from the exaggerations and moralizations which are a feature of legendary traditions. The apple of discord, the arrows of Philoctetes, the invulnerability of Achilles, and similar fancies, are the additions of later poets. This
sobriety, however, belongs not to the whole Iliad, but to the events and the persons. Such figures as the Helenophobe Hector of the Erinyes, and others must have been written at one time Fānsk, Fānto, Fīpion, Fīrōs. This letter, however, died out earlier in Ionic than in most dialects, and there is no proof that the Homeric poems were ever written with it.

These are not, speaking generally, the differences that are produced by the gradual divergence of dialects in a language. They are rather to be classed with those which we find between the earlier and the later stages of every language which has had a long history. The Homeric dialect has passed into New Ionic and Attic by gradual but ceaseless development of the same kind as that which brought about the change from Vedic to classical Sanskrit, or from old high German to the present dialect of German.

The points that have been mentioned, to which many others might be added, make it clear that the Homeric and Attic dialects are separated by differences which affect the whole structure of the language, and require a considerable time for their development. At the same time there is hardly one of these differences which cannot be accounted for by the natural growth of the language. It has been thought indeed that the Homeric dialect was a mixed one, mainly Ionic, but containing Aeolic and even Doric forms; this, however, is a mistaken view of the processes of language change. There were doubtless many Homeric forms which were unknown to the later Ionic and Attic, and which are found in Aeolic or other dialects. In general, however, these are older forms, which must have existed in Ionic at one time, and may very well have belonged to the Ionic of Homer's time. So too the digamma is called "Aeolic" by grammarians, and is found on Aeolic and Doric inscriptions. But the letter was one of the original alphabet, and was retained universally as a numeral. It can only have fallen into disuse by degrees, as the sound it denoted ceased to be pronounced. The fact that there are so many traces of it in Homer is a strong proof of the antiquity of the poems, but no proof of admixture with Aeolic.

There is one sense, however, in which an admixture of dialects may be recognized. It is clear that the variety of forms in Homer is too great for any actual spoken dialect. To take a single instance: it is impossible that the genitives in οο and in -οο should both have been in everyday use together. The form in -οο must have been poetical or literary, like the old English forms that survive in the language of the Bible. The origin of such double forms is not far to seek. The effect of dialect on style was always recognized in Greece, and the dialect which had once been adopted by a particular kind of poetry was ever afterwards adhered to. The Epic of Homer was doubtless formed from a spoken variety of Greek, but became literary and conventional with time. It is Homer himself who tells us, in a striking passage (II. iv. 437) that all the Greeks spoke the same language—that is to say, that they understood one another, in spite of the inevitable local differences. Experience shows how some one dialect in a country gains a literary supremacy to which the whole nation yields. So Tuscan became the type of Italian, and Anglian of English. But as soon as the dialect is adopted, it begins to diverge from the colloquial form. Just as modern poetical Italian uses many older grammatical forms peculiar to itself, so the language of poetry, even in Homeric times, had formed a deposit (so to speak) of archaic grammar. There were doubtless poets before Homer, as well as brave men before Agamemnon; and indeed the formation of a poetical dialect such as the Homeric must have been the work of several generations. The use of that dialect (instead of Aeolic) by the Boeotian poet Hesiod, in a kind of poetry which was not of the Homeric type, tends to the conclusion that the literary ascendency of the epic dialect was anterior to the Iliad and Odyssey, and independent of the influence exercised by these poems.

What then was the original language of Homer? Where and when was it spoken? [The answer given to this question by Aug. Fick (in 1883) and still held, with modifications, by some European scholars can no longer be maintained. Fick's original statement was made in or about the 6th century B.C.].
the poems, which had originally worn an Aeolic dress, were transposed into Ionic. To this it is easily answered that such an event is not only unique in history, but contrary to all that we know of the Greek genius. At the period in question an Aeolic literature, the lyrics of Sappho and Alcaeus, were in existence. If it was found necessary to transpose the Aeolic Homer, why did the Aeolic lyric verse escape? If, however, as is the view of some of Fick’s followers, the transposition took place several centuries earlier, before species of literature had appropriated particular dialects, then the linguistic facts upon which Fick relied to distinguish the “Aeolic” and “Ionic” elements in Homer disappear. We have no means of knowing what the Aeolic and Ionic of say the 9th century were, or if there were such dialects at all. Certain prominent historical differences between Aeolic and Ionic (the digamma and á) are known to be unoriginal. The view that Homer underwent at any time a passage from one dialect to another may be dismissed. The tendency of modern dialectologists is to divide the Greek dialects into Dorian and non-Dorian. The non-Dorian dialects, Ionic, Attic and the various forms of Aeolic, are regarded as relatively closely akin, and go by the common name “Achaean.” They formed the common language of Greece before the Doric invasion. As the scene which Homer depicts is pre-Dorian, it is reasonable to call his language Achaean. The historical divergences of Achaean into Aeolian and Ionic were later than the Migration, and were due to the well-known effects of change of soil and air.

To what local variety of Achaean Homeric Greek belonged it is idle to ask. Thessaly, Boeotia and Mysenae have equal claims. It seems clearer that when once this local variety of Achaean had been used by poets of eminence as their vehicle for national history, it established its right to be considered as the one poetical language of Hellas. As the dialect of the Arno in Italy, of Castille in Spain, by the virtue of the genius of the singers who used them, became literary “Italian” and “Spanish,” so this variety of Achaean elevated itself to the position of the vulgare illustre of Greece.

(c) The influence of Homer upon the subsequent course of Greek literature is a large subject, even if we restrict it to the centuries which immediately followed the Homeric age. It will be enough to observe that in the earliest elegiac poets, such as Archilochus, Tyrtaeus and Theognis, reminiscences of Homeric language and thought meet us on every page. If the same cannot be said of the ancient epic poems, that is because of the extreme scantiness of the existing fragments. Much, however, is to be gathered from the arguments of the Trojan part of the Epic Cycle (preserved in the Codex Venetus of the IIiad, a full discussion of which will be found in the Journal of Hellenic Studies, 1884, pp. 1-40). An examination of these arguments throws light on two chief aspects of the relation between Homer and his “cyclic” successors.

1. The later poets sought to complete the story of the Trojan war by supplying the parts which did not fall within the IIiad and Odyssey—the so-called ante-homeric and post-homeric. They did so largely from hints and passing references in Homer. Thus the successive episodes of the siege related at length in the Little IIiad, and ending with the story of the Wooden Horse, are nearly all taken from passages in the Odyssey. Much the same may be said of the Nasti.

2. With this process of expansion and development (so to speak) of Homeric themes is combined the addition of new characters. Such, in the Little IIiad (e.g.), are the story of the Palladium and of the treachery of Sinon. Such, too, in the Cyropa are the new legendary figures—Palamedes, Iphigenia, Telephus, Laococon.

These new elements in the narrative are evidently due not only to the natural growth of legend in a people highly endowed with imagination, but in a large proportion also to the new races and countries with which the Greeks came into contact, as well as to their own rapid advance in wealth and civilization. It will be observed that the two poems of Arctinus are remarkable for the proportion of new matter of the latter kind. The Achæiopis shows us the allies of Troy reinforced by two peoples that are evidently creations of oriental fancy, the Amazons and Memnon with his Aethiopians. The IIii Persis, again, was the oldest authority for the story of Laococon and of the consequent escape of Aeneas—a story which connected a surviving branch of the house of Priam with the later inhabitants of the Troad. On the other hand the fate of Creusa (sed me magna deum generis hic detexit oris) is a link with the worship of Cybele. The poems of Callimachus, Colophon and Cebes, found in the early IIiad, is another instance of the kind. These facts point to a familiarity with the Greek colonies in Asia which contrasts strongly with the silence of the Iliad and Odyssey.

Study of Homer. The Homeric Question.—The critical study of Hesiod began in Greece almost with the beginning of printing. The first name is that of Theagenes of Rhegium, contemporary of Cambyses (525 B.C.), who is said to have founded the “new grammar” (the older “grammar” being the art of reading and criticism) to have invented the Homeric interpretation of the IIiad and Odyssey. His so-called “small verses” (a) of which seems to have been a great storehouse of mythological learning rather than a poem of the Homeric school.

The judgments of the pre-Socratic and Socratic times are mentioned by Xenophon, Plato and Aristotle. These were the “ancient Homeric” (αἱ ἁμέρικα ὁμολογία), who busied themselves much with the hidden meanings of Homer; of whom Aristotle says, with his profound insight, that they “saw the same likeness and overlock the great ones (Metaph. xxii.)

The text of Homer must have attracted some attention when Antimachus came to be known as the “corrector” (kérateuths) of a “recension for the use of Alexander the Great. This is unlikely. His remarks on Homer (in the Poetics and elsewhere) show that he had made a careful study of the structure and leading ideas of the poems, but do not throw much light on the text. The real work of criticism became possible only when great collections of manuscripts began to be made by the princes of the genera-
tion of Alexander. It is from these that we have been able to reconstruct the text of the IIiad and Odyssey, and to arrange these treasures. In this way the great Alexandria school of Homeric criticism began with Zenodotus, the first chief of the museum, and was continued by Aristophanes and Aristarchus. This last edition of our ancient manuscripts is apparently quoted in the MSS. of the classical text of the IIiad, and is used by Homer himself in Socrates. All earlier learning either passed into his writings, or was lost; all subsequent research turned upon his critical and grammatical work.

The means of forming a judgment of the Alexandrine criticism are scanty. The literary form which preserved the works of the great historians was unfortunately wanting, or was not sufficiently valued, in the case of the grammarians. Abridgments and new treatises soon drove out the writings of Aristarchus and other founders of the school. Moreover, a recension could not be reproduced without new errors soon creeping in. Thus we find that the literary form of some MSS. is(Agamon–redesigned to suit these purposes, the readings of Aristarchus as we should quote a lexus receptus. Indeed, the object of his work seems to have been to determine those readings were. Enough, however, remains to show that Aristarchus and his successors (the last of whom is Stesimbrotus) were the editors of the text, and especially that the MSS. of the IIiad were on the readings of Homer and those given by later poets, and made many comparisons between Homeric and later manners, arts and institutions. Again, he was sensible of the paramount value of these MSS. as authorities, and made it his business to have them collated from mere conjecture. The frequent mention in the Scholia of the “better” and “inferior” texts may indicate a classification made by him or by the general opinion of critics. His use of the “obolus” to distinguish spurious verses, which made so large a part of his fame

in antiquity, has rather told against him with modern scholars. It is chiefly interesting as a proof of the confusion in which the text must have been before the Alexandrian times; for it is impossible to understand the readiness of Aristarchus to suspect the genuineness of verses unless the state of the copies had pointed to the existence of numerous interpolations. On this matter, however, we are left to conjecture.

Our knowledge of Alexandrian criticism is derived almost wholly from a single document, the famous IIiad of the library of St Mark in Venice (Codex Venetus 453, or Ven. 1), first published by the French scholar, Dr Batiffol, in 1785 (sive demonstratio invenire quidquid in IIiadem eisdem scripsit). This manuscript, written in the 10th century, contains (1) the best text of the IIiad, (2) the critical marks of Aristarchus and (3) Scholia, consisting mainly of extracts from later manuscripts. This manuscript probably contains the lineations of the scholiastic Aristarchus, Aristonichus (fl. 24 n.c.) on the critical marks of Aristarchus, Herodotan (fl. a.d. 160) on the accentuation, and Nicander (fl. a.d. 260) on the ortography of the text. These extracts present themselves in two distinct forms. One series of scholia is written in the usual way, on a margin reserved for the purpose. The other consists of brief scholia, written in small characters (but of the same period) on the narrow space left vacant round the text. Occasionally a scholion of this kind gives the substance of one of the longer extracts; but as a rule they are distinct. It would seem, therefore, that after the manuscript was finished the "marginal scholia" were discovered to be extremely defective, and a new series of extracts was added in a form which interfered as little as possible with the appearance of the book.

The occurrence of this manuscript is of considerable interest to the Homer controversy; for the immortal Prolegomena of F. A. Wolf appeared a few years after Villiobon's publication, and was founded in great part on the fresh and important materials which it furnished. Not that the "Wolfian theory" of the Homeric poems is directly supported by anything in the Scholia; the immediate object of the Prolegomena was not to put forward that theory, but to show that there was no evidence from the manuscripts under which the text of Homer had to be set. As is the discovery of an apparatus criticus of the 2nd century n.c. The questions regarding the original structure and early history of the poems were raised (for once upon it may be said) by the critical problem; but they were really originated by facts and ideas of a wholly different order.

The 18th century, in which the spirit of classical correctness had the advantage, and in which an interest in the Homeric poems excited a reaction set in, which affected not only literature but also speculation and politics. In this movement the leading ideas were concentrated on the state of the natural culture of society, natural law, natural religion, the poetry of nature, gained a singular hold, first on the English philosophers from Hume onwards, and then (through Rousseau chiefly) on the general drift of thought and action in Europe. In literature the effect of these ideas was to set up a false opposition between nature and art. As political writers imagined a patriarchal innocence prior to codes of law, so men of letters sought in popular unwritten poetry the freshness and simplicity which were supposed to be lost in the artificial poetry of the old society. The Homeric poems, however, were the most perfect work of the noble savage. The supposed discovery of the poems of Ossian fell in with this train of sentiment, and created an enthusiasm for the study of the Homeric poems as an authentic poetry. Homer was regarded as a dean of the school of inquiry. Blackwell (Professor of Greek at Aberdeen) had insisted, in a book published in 1735, on the "naturalness" of Homer; and Wood (Essay on the Original Genius of Homer, London, 1769) was the first to point out that Homer was a poet of great genius, and supported his thesis by ancient authority, and also by the parallel of Ossian. Both these books were translated into German, and their ideas passed into the popular philosophy of the day. Everything in short was ripe for the reception of a book that brought together, with masterly ease and vigour, the old and the new Homeric learning, and drew from it the historical proof that Homer was no single poet, writing according to art and rule, but a name which stood for a golden age of the true spontaneous poetry of genius and nature.

Ie see the chapter in Cobet's Miscellenia critica, pp. 225-239. The existence of two groups of the Venetian Scholia was first noted by Dr Wolf (Homerische Forschungen, iii. 278, and the edition of W. Dindorf (Oxford, 1875). There is also a group of Schol, chiefly exegetical, a collection of which was published by Villiobon from a MS. Ven. 453 (s. x.), in his edition of 1788, and has been re-edited by Dindorf (1877). One important collection of this group is contained in the Codex Toulensianus (Burney 86 s. x.) of the British Museum, edited by L. Maas, (Vulgaris Formae, p. 1602). It is a fair facsimile of the text of the 12th century marks a third stage in the progress of ancient Homeric learning.

In Prolegomena ad Homerum, sine de operum Homericius præcis et gentium formae varietate mutuihitatem et probabilis ratione emendandi, scriptum Fri. Aug. Wolfius, volumen i. (1795).
Homer probably left Persia, and thus, he was persuaded. Regarding this evidence, many of the testimonies of grammarians. And it is hard to believe that their accent is identical. Homer and Thucydides seem to tell us all that they know of Peisistratus. The orators Lycurgus and Isocrates make a great deal of the recitation of Homer at the Panathenaeum, but know nothing of the poems having been collected and arranged at Athens, a fact which would have redounded still more to the honor of the city. Finally, the Scholia of the Iliad. A contains no reference or allusion to the story of Peisistratus. As these Scholia are derived in substance from the writings of Aristarchus, it seems impossible to believe that they derive from the poem either in its present form or from the time before Peisistratus, for that should be attributed with more or less confidence to Solon or Peisistratus or Hipparchus. The choice was determined in great measure by political feeling. It is probably not an accident that Homer’s name is given so often in the Iliad and at the time that the Peisistratian, which seems more necessary than that Peisistratus did what other authorities ascribe to Solon and Hipparchus, viz. regulated the recitation.

Against the theory which sees in Peisistratus the author of the first version of the Iliad, we have the testimony of several of the historians, Herodotus, Thucydides, the orators and the Alexandrian grammarians. And it can hardly be thought that their silence is accidental. Herodotus and Thucydides seem to tell us all that they know of Peisistratus. The orators Lycurgus and Isocrates make a great deal of the recitation of Homer at the Panathenaea, but know nothing of the poems having been collected and arranged at Athens, a fact which would have redounded still more to the honor of the city. Finally, the Scholia of the Iliad. A contains no reference or allusion to the story of Peisistratus. As these Scholia are derived in substance from the writings of Aristarchus, it seems impossible to believe that they derive from the poem either in its present form or from the time before Peisistratus, for that should be attributed with more or less confidence to Solon or Peisistratus or Hipparchus. The choice was determined in great measure by political feeling. It is probably not an accident that Homer’s name is given so often in the Iliad and at the time that the Peisistratian, which seems more necessary than that Peisistratus did what other authorities ascribe to Solon and Hipparchus, viz. regulated the recitation.

The conjectures of Lassen, in which the Wolfian theory found a modified and tentative application, were presently thrown into the shade by the more trenchant method of Lachmann, who (in two papers read to the Berlin Academy in 1837 and 1841) sought to demonstrate that the Iliad was the work of a subsequent poet, who adopted the name of Homer, and who, if not actually the author, certainly drew on Homer for his material. Lachmann was followed by Deleiters, who (in his De intercalationibus Homerum, Leipzig, 1852, and De isertis Homeris, Leipzig, 1840, called forth by the writings of Nitzsch. As the word “interpolation” implies, Hermann did not maintain the hypothesis of a congeries of independent “lays.” He felt the difficulty of supposing that all the ancient minstrels sang of the “wrath of Achilles” or the “return of Ulysses” (leaving out even the capture of Troy itself), he was led to assume that two poems of no great compass dealing with these two themes became so famous at an early period as to throw other parts of the Trojan story into the background, and were then enlarged by successive generations of imitators. Some parts of the Iliad, moreover, seemed to him to be of a date later than the second part of the Odyssey. Accordingly, he maintained that the “wrath of Achilles” and “post-Homeric” matter distinguished a “pre-Homeric” element.

Structure of the Iliad. —The subject of the Iliad, as the first line proclaims, is the “anger of Achilles.” The manner in which it is treated is thus thrown into the following summary of Homer, in which we distinguish (1) the plot, i.e. the story of the quarrel, the Homeric poems had influenced both the form and the substance of epic poetry.

In this way there arose a conservative school who admitted more or less freely the absorption of pre-existing lays in the formation of the Iliad and Odyssey, and also the existence of considerable interpolations. But assigned only to the genius of a great poet. Whether the two epics were by the same author remained an open question; the tendency of modern scholars, however, is to regard the two epics as independent: Regarding the use of writing, too, they were not unanimous. K. O. Müller, for instance, maintained the view of Wolf on this point, while he strenuously combated the inference which Wolf drew from it. The Pre-Iliad (348-459), on the other hand, is ascribed to a poet who lived before the age of the Peisistratian, and whose works are called “pre-Iliad.” But the second volume ever appeared, nor was any attempt made by Wolf himself to carry his theory further. The first important steps in that direction were taken by Gottfried Hermann, chiefly in two works: "De intercalationibus Homerum" (Leipzig, 1832), and "De isertis Homeris" (Leipzig, 1840), called forth by the writings of Nitzsch. As the word “interpolation” implies, Hermann did not maintain the hypothesis of a congeries of independent “lays.” He felt the difficulty of supposing that all the ancient minstrels sang of the “wrath of Achilles” or the “return of Ulysses” (leaving out even the capture of Troy itself), he was led to assume that two poems of no great compass dealing with these two themes became so famous at an early period as to throw other parts of the Trojan story into the background, and were then enlarged by successive generations of imitators. Some parts of the Iliad, moreover, seemed to him to be of a date later than the second part of the Odyssey. Accordingly, he maintained that the “wrath of Achilles” and “post-Homeric” matter distinguished a “pre-Homeric” element.

The effect of Wolf’s Prolegomena was so overwhelming that, although a few protests were made at the time, the true Homeric controversy did not begin until 1842. The controversies were, however, harmonious in nature, and his historical arguments, especially his long series of testimonies to the work of Peisistratus, were vehemently attacked. The most considerable and influential book was that of W. Nitzsch, whose writings cover the years 1828-1862, and deal with every side of the controversy. In the earlier part of his Meletemata (1830) he took up the question of written or unwritten literature, of the succession of Peisistratus; the Iliad and the Odyssey, his volumes (written with great care and understanding) of writing must be anterior to Peisistratus. In the later part of the same series of discussions (1837), and in his chief work (Die Sagenpoesie der Griechen, 1852), he investigated the structure of the Homeric poems, and the relationship of the Trojan cycle. These epics had meanwhile been made the subject of a work which for exhaustive learning and delicacy of artistic perception is unequalled in the field of philological criticism. It is the work of F. G. Welcker. The confusion which previous scholars had made between the ancient post-Homeric poets (Arctinus, Lesches, &c.) and the learned mythological writers (such as the “scrip tor cyclicus” of Homer), first cleared up by Diodor. If the cyclic writers had known the Iliad and Odyssey which we possess, they would have imitated the unity of structure which distinguishes these two poems. The result of Welcker’s labours was to show that the Homeric poems had influenced both the form and the substance of epic poetry.

The result of Welcker’s labours was to show that
IX. Agamemnon sends an embassy by night, offering Achilles restoration and full amends—Achilles refuses.

X. Donoeele—Night expedition of Odysseus and Diomedes (in all probability added later).

XI. Aristotle of Agamemnon—he is wounded—Wounding of Diomedes and Odysseus.

Achilles is persuaded to allow Patroclus to take the field. Patroclus drives back the Trojans—kills Sarpedon—is himself killed by Hector.

XII. Battle for the body of Patroclus—Aristeia of Menelaus.

XIII. News of the death of Patroclus brought to Achilles—Thetis comes with the Nereids—promises to obtain new armour for him from Hephaestus. The shield of Achilles described.

XIV. Reconciliation of Achilles—His grief and desire to avenge Patroclus.

XV. The gods come down to the plain—Combat of Achilles with Aeneas and Hector, who escape.

XVI. The Scamander is choked with slates—Rises against Achilles, who is saved by Hephaestus.

XVII. Hector alone stands against Achilles—His flight from the walls—he is shot and falls.

XVIII. Burial of Patroclus—Funeral games.

XIX. Priam ransom the body of Hector—His burial.

Such is the "action" (πάρατρις) which in Aristotle's opinion showed the superiority of Homer to all later epic poets. But the proof that his scheme was the work of a great poet does not depend merely upon the artistic unity which excited the wonder of Aristotle. A number of separate "lays" might conceivably be arranged and connected by a man of poetical taste in a manner that would satisfy all requirements. In such a case, however, the connecting passages would be slight and weak. Now, in the Iliad these passages are the finest and most characteristic. The element of connexion and unity is the story of the "wrath of Achilles"; and we have only to look at the books which give the story of the wrath to see how essential they are. Even if the ninth book is rejected (as Grote proposed), there remain the speeches of the first, sixteenth and nineteenth books. These speeches form the cardinal points in the action of the Iliad—the framework into which everything else is set; and they have also the best title to the name of Homer.

The further question, however, remains,—What shorter narrative piece fulfilling the conditions of an independent poem has Lachmann succeeded in disengaging from the existing Iliad? It must be admitted that when tried by this test his "lays" generally fail. The "quarrel of the chiefs," the "muster of the army," the "departure of Paris," are excellent beginnings, but have no satisfying conclusion. And the reason is not far to seek. The Iliad is not a history, nor is it a series of incidents in the history, of the siege. It turns entirely upon a single incident, occupying a few days only. The several episodes of the poem are not so many distinct stories, each with an interest of its own. They are only parts of a single main event. Consequently the type of epic poem which would be produced by an aggregation of shorter lays is not the type which we have in the Iliad. Rather the Iliad is itself a single lay which has grown with the growth of poetical art to the dimensions of an epic.

But the original nucleus and parts of the incidents may be the work of a single great poet, and yet other episodes may be of different authorship, wrought into the structure of the poem in later times. Various theories have been based on this supposition. Grote in particular held that the original poem, which he called the Achilleis, did not include books ii.-vii., ix., x., xxii., xxiv. Such a view may be defended somewhat as follows. Of the books which relate the events during the absence of Achilles from the Greek ranks (ii.-xxv.), the last five are directly related to the main action. They describe the successive steps by which the Greeks are driven back, first from the plain to the rampart, then to their ships. Moreover, three of the chief heroes, Agamemnon, Diomedes and Ulysses, are wounded, and this circumstance, as Lachmann himself admitted, is steadily kept in mind throughout. It is otherwise with the earlier books (especially ii.-vii.). The chief incidents in that part of the poem—the panic rush to the ships, the duels of Paris and Menelaus, and of Hector and Ajax, the Aristeia of Diomedes—stand in no relation to the mainspring of the poem, the promise made by Zeus to Thetis. It is true that in the thirteenth and fourteenth books the purpose of Zeus is thwarted for a time by other gods; but in books ix.-xvii. it is not so much thwarted as ignored. Further, the events follow without sufficient connexion. The truce of the third book is broken by Pandarus; and Agamemnon passes along the Greek ranks with words of encouragement, but without a hint of the treachery just committed. The Aristeia of Diomedes ends in the middle of the sixth book; he is uppermost in all thoughts down to ver. 311, but from this point, in the meetings of Hector with Helen and Andromache, and again in the seventh book when Hector challenges the Greek chiefs, his prowess is forgotten. Once more, some of the incidents seem to belong properly to the beginning of the war. The joy of Menelaus on seeing Paris, Priam's ignorance of the Greek leaders, the speeches of Agamemnon in his review of the ranks (in book iv.), the building of the wall—all these are in place after the Greek landing, but hardly in the ninth year of the siege.

On the other hand, it may be said, the second book opens with a direct reference to the events of the first, and the mention of Achilles in the speech of Thersites (ii. 239 sqq.) is sufficient to keep the main course of events in view. The Catalogue is connected with its place in the poem by the lines about Achilles (686-694). When Diomedes is at the height of his Aristeia Helen says (ii. 99), "We did not so fear even Achilles." And when in the third book Priam asks Helen about the Greek captains, or when in the seventh book nine champions come forward to contend with Hector, the want of the greatest hero of all is sufficiently felt. If these passages do not belong to the period of the wrath of Achilles, how are we to account for his conspicuous absence?

Further, the want of smoothness and unity which is visible in this part of the Iliad may be due to other causes than difference of date or authorship. A national poet such as the author of the Iliad cannot always choose or arrange his matter at his own will. He is bound by the traditions of his art, and by the feelings and expectations of his hearers. The poet who brought the exploits of Diomedes into the Iliad doubtless had his reasons for doing so, which were equally strong whether he was the poet of the Achilleis or a later Homeric or rhapsodist. And if some of the incidents (those of the third book in particular) seem to belong to the beginning of the war, it must be considered that poetically, historically, the place of these events is the first part of the poem, and the incidents are of the kind that is required in such a place. The truce makes a pause which heightens the interest of the impending battle; the duel and the scene on the walls are effective in bringing some of the leading characters on the stage, and in making us acquainted with the previous history. The story of Paris and Helen especially, and the general position of affairs in Troy, is put before us in a singularly vivid manner. The book in short forms so good a prologue to the action of the poem that we can hardly be wrong in attributing it to the genius which devised the rest of the Iliad.

The case against the remaining books is of a different kind. The ninth and tenth seem like two independent pictures of the night before the great battle of xii.-xvii. Either is enough to fill the space in Homer's canvas; and the suspicion arises (as when two Platonic dialogues bear the same name) that if either had been genuine, the other would not have come into existence. If one of the two is to be rejected it must be the tenth, which is certainly the less Homeric. It relates a picturesque adventure, conceived in a vein more approaching that of comedy than any other part of the Iliad. Moreover, the language in several places exhibits traces of post-Homeric date. The ninth book, on the other hand, was rejected by Grote, chiefly on the grounds that the embassy to Achilles ought to have put an end to the quarrel, and that it is ignored in later passages, especially in the speeches
of Achilles (xi. 600; xvi. 72, 85). His argument, however, rests on an assumption which we are apt to bring with us to the reading of the Iliad, but which is not borne out by its language, viz. that there was some definite atonement demanded by Achilles, or due to him according to the custom and sentiment of time. But in the Iliad the whole stress is laid on Greek of Achilles, which can only be satisfied by the defeat and extreme peril of the Greeks. He is influenced by his own feeling, and by nothing else. Accordingly, in the ninth book, when they are still protected by the rampart (see 348 sqq.), he rejects gifts and fair words alike; in the sixteenth he is moved by the tears and entreaties of Patroclus, and the sight of the Greek ships on fire; in the nineteenth his anger is quenched in grief. But he makes no conditions, either in rejecting the offers of the embassy or in returning to the Greek army. And this conduct is the result, not only of his fierce and inexorable character, but also (as the silence of Homer shows) of the want of any general rules or principles, any code of morality or of honour, which would have required him to act in a different way.

Finally, Grote objected to the two last books that they prolong the action of the Iliad beyond the exigencies of a coherent scheme. Of the two, the twenty-third could more easily be spared. In language, and perhaps in style and manner, it is akin to the tenth; while the twenty-fourth is in the pathetic vein of the ninth, and like it serves to bring out new aspects of the character of Achilles.

Dr E. Kammer has given some strong reasons for doubting the genealogy of the whole story (in book xiii) describing the duel between Achilles and Aeneas (79-352). The incident is certainly very much out of keeping with the vehement action of that part of the poem, and especially with the moment when Achilles returns to Ithaca, eager to meet Hector and avenge the death of his friend. The interpolation (if it is one) is probably due to local interests. It contains the well-known prophecy that the descendants of Aeneas are to be greater in war than those of the Trojans (in the ancient sense of influence exerted in the seat of power). So, too, the legend of Anchises in the Hymn to Aphrodite is evidently local; and Aeneas becomes more prominent in the later epic, especially the Cypria and the Tyro of Anchises.

Structure of the Odyssey.—In the Odyssey, as in the Iliad, the events related fall within a short space of time. The difficulty of adapting the long wanderings of Ulysses to a plan of this type is got over by the device—first met with in the Odyssey—of making the hero tell the story of his own adventures. In this way the action is made to begin almost immediately after the actual return of Ulysses. Up to the time when he reaches Ithaca it moves on three distinct scenes: we follow the fortunes of Ulysses, of Telemachus on his voyage in the Peloponnese, and of Penelope with the suitors. The art with which these threads are woven together was recognized by Wolf himself, who admitted the difficulty of applying his theory to the "admirabilis summa et copiae" of the poem. Of the comparatively few attempts which have been made to dissect the Odyssey, the most moderate and attractive is that of Professor A. Kirchoff of Berlin. According to Kirchoff, the Odyssey as we have it is the result of additions made to an original nucleus. There was first of all a "Return of Odysseus," relating chiefly the adventures with the Cyclopes, Calypso and the Phaeacians; then a continuation, the scene of which lay in Ithaca, embracing the bulk of books xii.-xxii. The poem so formed was enlarged at some time between book xii. and xvi. (OL), by the story of Telemachus (xxiii. Circe, the Sirens, Scylla, &c.), and the adventures of Telemachus. Lastly, a few passages were interpolated in the time of Peisistratus.

The proof that the scenes in Ithaca are by a later hand than the ancient "Return" is found chiefly in a contradiction discussed by Kirchoff in his sixth dissertation (pp. 135 sqq., ed. 1869). Sometimes Ulysses is represented as aged and worn by toil, so that Penelope, for example, in seeing him for the first time after twenty years, is the prime of heroic vigour, and his appearing as a beggarly old man is the work of Athena's wand. The first of these representations is evidently natural, considering the twenty eventful years that have passed; but the second, Kirchoff holds, is the Ulysses of Calypso's island and the Phaeacian court. He concludes that the aged Ulysses must have been "continually used by the character wrought by Athena's wand being a device to reconcile the two views," and hence that the continuation is the work of a different author.

Ingenious as this is, there is really very slender ground for Kirchoff's thesis. The evidence is not from the Iliad, but from other works in which the appearance of Ulysses do not give two well-marked representations of him. Sometimes Athena disguises him as a decrepit beggar, but otherwise leaves him supernatural in aspect and vigour. It must be admitted that this is a very exact and coldly long how in each case the effect of these changes lasted. But neither answers to his natural appearance, or to the appearance with which he was imagined to go to the end of the world; and the circumstances of Alcinous, for instance, it is noticed that he is vigorous but "marred by many ills" (Od. viii. 137); and this agrees with the scenes of recognition in the latter part of the poem.

The continuations by which Kirchoff seeks to prove that the stories of books x.-xii. are much later than those of book ix. are not more convincing. He points out some resemblances between these three books and the Argonautic fables, among them the circumstance that a fountain Artasia occurs in both. In the Argonautic story the fountain is placed in the neighbourhood of Cyzicus, and answers to an actual fountain known in historical times. Kirchoff argues that the origin of the Argonautic story must have been taken from the real Artasia, and the Artasia of the Odyssey again from that of the Argonautic story. And as Cyzicus was settled from Miletus, he infers that both sets of stories must be comparatively late. It is less clear why, surely, the name Artasia occurred independently (as most geographical names are found to occur) in more than one place. Or it may be that the Artasia of the Odyssey suggested the name to the colossus of Cyzicus, whence it was adopted into the geography of the Argonautic story. Further the Argonautic story shows that the Nostoi recognized a son of Calypso by Ulysses but no son of Circe, consequently that Circe was unknown to the poet of the Nostoi (in the latest form of the converse). Lastly, the geographical alteration of a passage in Eustathius, and, moreover, has all the weakness of an argument from silence, in addition to the uncertainty arising from our very slight knowledge of the author whose silence is in question. Finally, when Kirchoff finds traces in books x.-xii. of their having been originally told by the poet himself instead of being put in the mouth of his hero, we feel that inaccuracies of this kind are apt to creep in wherever a fictitious story is thrown into the form of an autobiography.

Inquiries conducted with the refinement which characterizes those of Kirchoff are always instructive, and his book contains very many just observations; but it is impossible to admit his main conclusions. And perhaps we may infer that no other system can be more successful. It does not indeed follow that the Odyssey is free from interpolations. The Nekta of book xi. may be later (as Lauer maintained), or it may contain additions, which could easily be inserted in a description of the kind. And the last book is probably by a different hand, as the ancient critics believed. But the unity of the Odyssey as a whole is apparently beyond the reach of the existing weapons of criticism.

Chorizontes.—When we are satisfied that each of the great Homeric poems is either wholly or mainly the work of a single poet, a question remains which has been matter of controversy in ancient as well as modern times.—Are they the work of the same poet? Two answers to this question have been proposed. The first was known as the "separators" (of xapidiores); and Aristarchus seems to have written a treatise against their heresy. In modern times some of the greatest names have been on the side of the "Chorizontes."

If, as has been maintained in the preceding pages, the external evidence regarding Homer is of no value, the problem now before us may be stated in this form: Given two poems of which nothing is known except that they are of the same school of poetry, is the probability that they are by the same author? We may find a fair parallel by imagining two plays drawn at hazard from the works of the great tragic writers.

It is evident that the burden of proof would rest with those who held them to be by the same hand.

The arguments used in this discussion have been of very various calibre. The ancient Chorizontes observed that the messenger of Zeus is Iris in the Iliad, but Hermes in the Odyssey; that the wife of Hephaestus is one of the Charites in the Iliad, but Aphrodite in the Odyssey; in the Iliad the Naiads do not eat fish; that Crete has a hundred cities according to the Iliad, and only ninety according to the Odyssey; that ναυπάκτω is used in the Iliad of place, in the Odyssey of time, &c. Modern scholars have added to the list, especially by making careful comparisons of the two poems in respect of vocabulary and
grammatical forms. Nothing is more difficult than to assign the degree of weight to be given to such facts. The difference of subject between the two poems is so great that it leads to the most striking differences of detail, especially in the vocabulary. For instance, the word φάσσα, which in Homer means "flight in battle" (not "fear"), occurs thirty-nine times in the Iliad, and only once in the Odyssey; but then there are no battles in the Odyssey. Again, the verb ἕρρησαι, "to break," occurs forty-eight times in the Iliad, and once in the Odyssey—the reason being that it is constantly used of breaking the armour of an enemy, the gate of a city, the hostile ranks, &c. Once more, the word σκότος, "darkness," occurs fourteen times in the Iliad, once in the Odyssey. But in every one of the fourteen places it is used of "darkness" coming over the sight of a fallen warrior. On the other side, if words such as ἀδαμπήσας, "a bath," χερωπή, "a basin for the hands," θαλάττης, "a place to meet and talk," &c., are peculiar to the Odyssey, we have only to remember that the scene in the Iliad is hardly ever laid within any walls except those of a tent. These examples will show that mere statistics of the occurrence of words prove little, and that we must begin by looking to the subject and character of each poem. When we do so, we at once find ourselves in the presence of differences of the broadest kind. The Iliad is much more historical in tone and character. The scene of the poem is a real place, and the poet sings (as Ulysses says of Demodocus) as though he had been present himself, or had heard from one who had been. The supernatural element is confined to an interference of the gods, which to the common eye hardly disturbs the natural current of affairs. The Odyssey, on the contrary, is full of the magical and romantic—"speciosa miracula," as Horace called them. Moreover, these marvels—which in their original form are doubtless as old as anything in the Iliad, since in fact they are part of the vast stock of popular tales (Märchen) diffused all over the world—are mixed up in the Odyssey with the heroes of the Trojan war. This has been especially noticed in the case of the story of Polyphemus, one that is found in many countries, and in versions which cannot all be derived from Homer. W. Grimm has pointed out that the behaviour of Ulysses in that story is senseless and foolhardy, utterly beneath the wise and much-enduring Ulysses of the Trojan war. The reason is simple; he is not the Ulysses of the Trojan war, but a being of the same world as Polyphemus himself—the world of giants and ogres. The question then is—

How long must the name of Ulysses have been familiar in the legend (Sage) of Troy before it made its way into the tales of giants and ogres (Märchen), where the poet of the Odyssey found it?

The Trojan legend has itself received some extension between the time of the Iliad and that of the Odyssey. The story of the Wooden Horse is not only unknown to the Iliad, but is of a kind which we can hardly imagine the poet of the Iliad admitting. The part taken by Neoptolemus seems also to be a later addition. The tendency to amplify and complete the story shows itself still more in the Cyclic poets. Between the Iliad and these poets the Odyssey often occupies an intermediate position.

This great and significant change in the treatment of the heroic legends is accompanied by numerous minor differences (such as the ancients remarked) in belief, in manners and institutions, and in language. These differences bear out the inference that the Odyssey is of a later age. The progress of reflection is especially shown in the higher ideas entertained regarding the gods. The turbulent Olympian court has almost disappeared. Zeus has acquired the character of a supreme moral ruler; and although Athena and Poseidon are adverse influences in the poem, the notion of a direct contest between them is scrupulously avoided. The advance of morality is shown in the more frequent use of terms such as "just" (δίκαιος), "piety" (δέοι), "insolence" (ἐβεβρής), "god-fearing" (θεομόρφος), "pure" (ἀγνός); and also in the plot of the story, which is distinctly a contest between right and wrong. In matters bearing upon the arts of life it is unsafe to press the silence of the Iliad. We may note, however, the difference between the house of Priam, surrounded by distinct dwellings for his many sons and daughters, and the houses of Ulysses and Alcinous, with many chambers under a single roof. The singer, too, who is so prominent a figure in the Iliad can hardly be thought to be absent from the Odyssey merely because the scene is laid in a camp.

**Style of Homer.**—A few words remain to be said on the style and general character of the Homeric poems, and on the comparisons which may be made between Homer and analogous poetry in other countries.

The cardinal qualities of the style of Homer have been pointed out once for all by Matthew Arnold. "The translator of Homer," he says, "should above all be penetrated by a sense of four qualities of his author—that he is eminently rapid; that he is eminently plain and direct, both in the evolution of his thought and in the expression of it, that is, both in his syntax and in his words; that he is eminently plain and direct in the substance of his thought, that is, in his matter and ideas; and, finally, that he is eminently noble." (On Translating Homer, p. 9).

The peculiar rapidity of Homer is due in great measure to his use of the hexameter verse. It is characteristic of early literature that the evolution of the thought—that is, the grammatical form of the sentence—is guided by the structure of the verse; and the correspondence which consequently obtains between the rhythm and the grammar—the thought being given out in lengths, as it were, and these again divided by tolerably uniform pauses—produces a swift flowing movement, such as is rarely found when the periods have been constructed without direct reference to metre. The Homer poetizes this rapidity without falling into the corresponding faults—that is, without becoming either "jerky" or monotonous—is perhaps the best proof of his unequalled poetical skill. The plainness and directness, both of thought and of expression, which characterize Homer were doubtless qualities of his age; but the author of the Iliad (like Voltaire, to whom Arnold happily compares him) must have possessed the natural gift in a surpassing degree. The Odyssey is in this respect perceptibly below the level of the Iliad.

Rapidity or ease of movement, plainness of expression and plainness of thought, are not the distinguishing qualities of the great epic poets—Virgil, Dante, Milton. On the contrary, they belong rather to the humbler epic-lyrical school for which Homer has been so often claimed. The proof that Homer does not belong to that school—that his poetry is not in any true sense "ballad-poetry"—is furnished by the higher artistic structure of his poems (already discussed), and as regards style by the fourth of the qualities distinguished by Arnold—the quality of nobleness. It is his noble and powerful style, sustained through every change of idea and subject, that finally separates Homer from all former "ballad-poetry" and "popular epic."

But while we are on our guard against a once common error, we may recognize the historical connexion between the Iliad and Odyssey and the "ballad" literature which undoubtedly preceded them in Greece. It may even be admitted that the swift-flowing movement, and the simplicity of thought and style, which we admire in the Iliad are an inheritance from the earlier "lays"—the ἄλοιχοι ἀρχάριοι such as Achilles and Patroclus sang to the lyre in their tent. Even the metre—the hexameter verse—may be assigned to them. But beyond these lays and Homers we must place the cultivation of epic poetry as an art.2

The pre-Homeric lays doubtless furnished the elements of such a poetry—the alphabet, so to speak, of the art; but they must have been refined and transmuted before they formed poems like the Iliad and Odyssey.

A single example will illustrate this. In the scene on the walls of Troy, in the third book of the Iliad, after Helen has pointed out Agamemnon, Ulysses and Ajax in answer to Priam's question about his (Priam's) prisoners, Homer's poetical grace and beauty show itself in a line where he describes the Homeric style as "epizeuxis," while in the Iliad, for instance, the lines:

1. As a poet Homer must be acknowledged to excel Shakespeare in the truth, the harmony, the sustained grandeur, the satisfying completeness of his images" (Shelley, Essays, i. 51, ed. 1852).
2. The old English balladist may stir Sir Philip Sidney's heart like a trumpet, and this is much; but Homer, but the few artists in the grand style, can do more—they can refine the raw natural man, they can transmute him" (On Translating Homer, p. 61).
questions, she goes on unasked to name Idomeneus. Lachmann, whose mind is full of the ballad manner, fastens upon this as an irregularity. "The unskilled transition from Ajax to Idomeneus, about whom no question has been asked," he cannot attribute to the original poet of the lay (Betrachtungen, p. 15, ed. 1849). But, as was pointed out by A. Römer 1 this is exactly the variation which a poet would introduce to relieve the primitive ballad-like sameness of question and answer; and moreover it forms the transition to the lines about the Dioscuri by which the scene is so touchingly brought to a close.

Analogies.—The development of epic poetry (properly so called) out of the oral songs or ballads of a country is a process which in the nature of things can seldom be observed. It seems clear, however, that the hypothesis of epics such as the Iliad and Odyssey having been formed by putting together or even by weaving together fragments of oral poetry intermediate between contemporary poetry and the epic. The true epics are those of India, Persia, Greece, Germany, Britain and France. Most of these, however, fail to afford any useful points of comparison, either from their utter unlikeness to Homer, or because there is no evidence of the existence of anterior popular song-forms of any peculiar character. An exception to this rule is to be found in the French "chansons de geste," of which the Chanson de Roland is the earliest and best example. These poems are traced back with much probability to the 10th century. They are epic in character, and were recited by professional jongleurs (who may be compared to the dodoi of Homer). But as early as the 7th century we come upon traces of short lays (the so-called cantilènes) which were in the mouths of all and were sung in chorus. It has been held that the chansons de geste were formed by joining together "bunches" of these earlier cantilènes, and this was the view taken by Léon Gautier in the first edition of Les Épopées françaises (1865). In the second edition, of which the first volume appeared in 1878, he abandoned this theory. He believes that the epics were generally composed under the influence of earlier songs. "Our first epic poets," he says, "did not actually and materially patch together pre-existing cantilènes. They were only inspired by these popular songs; they only borrowed from them the traditional and legendary elements. In short, they took nothing from them but the ideas, the spirit, the life; they "found" (ils ont trouvé) all the rest "(p. 86). But he admits that "some of the old poems may have been borrowed from tradition, without any intermediary (ibid.); and when it is considered that the traces of the "cantilènes" are slight, and that it is probable in which they inspired the later poetry must be a matter of impression rather than of proof, it does not surprise us to find other scholars (notably Paul Meyer) attaching less importance to them, or even doubting their existence. 2

When Léon Gautier shows how history passes into legends, and legend again into romance, we are reminded of the difference noticed above between the Iliad and the Odyssey, and between Homer and the early Cyclic poems. And the peculiar degradation of Homeric characters which appears in some poems (especially the Iliad, xii, 219-257) is not without influence upon the literature of the Middle Ages. The comparison of Homer with the great literary epics calls for more discursive treatment than would be in place here. Some external differences have been already indicated. Like the French epics, Homeric poetry is indigenous, and is distinguished by this fact, and by the ease of movement and the simplicity which result from it, from poets such as Virgil, Dante and Milton. It is also distinguished from them by the comparative absence of underlying motives or sentiment. In Virgil's poetry a sense of the greatness of Rome and Italy is the leading motive of a passionate rhetoric, partly veiled by the chosen grace of his language; but the Homeric epics are more faithful exponents of the religion and politics of their time. Even the French epics are pervaded by the sentiment of fear and hatred of the Saracens. But in Homer the interest is purely dramatic. There is no strong antipathy of race or religion; the war turns on no political event; the capture of Troy lies outside the range of the Iliad. Even the heroes are not the chief national heroes of Greece. The interest lies wholly (so far as we can see) in the picture of human action and feeling.

BIBLIOGRAPHY.—A complete bibliography of Homer would fill volumes. The following are intended to include those books which only are of first-rate importance.

The edito princeps of Homer, published at Florence in 1488, by Demetrios Chakoudyanis, and the Aldine editions of 1504 and 1517, have the same value. Of the modern critical editions are those of Wolf (Halle, 1795-1795; Leipzig, 1806-1807) and Scholz (Würzburg, 1821; Leipzig, 1844). The best critical editions are those of Wolf (Halle, 1794-1795; Leipzig, 1806-1807). Scholz (Würzburg, 1821). Scholz is particularly superceded; but Heyne's Iliad (Leipzig, 1802) and Nietzsche's commentary on the Odyssey (books i.-xii.) (Hannover, 1826-1846) are still useful. The most recent edition of the Iliad is that of W. R. Lachmann, published by the Oxford Press. The Odyssey has been edited by the same scholar (Halle, 1795). Scholz was the first to make the Iliad and Odyssey together (Leipzig, 1821). Some other MSS. by Beker (next Homeris Iliadem, Berlin, 1825-1826). Another new edition has been published by the Oxford Press (Scholia Graeca in Homeri Iliadem, ed. G. Dindorf and others). Six volumes have appeared (1877-1878) of a complete edition of both Iliad and Odyssey, by A. L. W. Maass. The vast commentary of Eustathius was first printed at Rome in 1542; the last edition is that of Staball (Leipzig, 1827). The Scholia on the Odyssey were published by Buttmann (Berlin, 1829-1839); he has been succeeded by C. F. Dindorf (Oxford, 1853). Although Wolf at once perceived the value of the Venetian Scholia on the Iliad, the first scholar who thoroughly explored them was C. Less (De Aristarchi studiis Homericis, Kölnberg, 1833; 2nd ed., Leipzig, 1865). Of the studies in the same field which have appeared since, the most important are: Aug. Nauck, Aristophani Byzantini fragmenta (Halle, 1848); L. Friedlander, Aristonici et asterisciOdysseis relicturae (Göttingen, 1852); M. Schmidt, Didymi Chalcenteri fragmenta (Leipzig, 1854); L. Friedlander, Nicatoris et aulicea Tyrannis relicturae (Berlin, 1857); Aug. Lestze, Herodiani Technici relicturae (Leipzig, 1867); and J. La Roche, Homeris testimonia homeri editionem alteram (Leipzig, 1886); Homerische Untersuchungen (Leipzig, 1886); Ad. Römer, Die Werke der Aristarchos im Cod. Venet. A. (Munich, 1875); A. Ludwich, Aristarch's Homerische Textkritik (2 vols. Leipzig, 1884-1885); and Die Scholia Homerica a C. Less v B. Wolf (Leipzig, 1886). The literature of the "Homerian Question" begins practically with Wolf's Prolegomena (Halle, 1795). Of the earlier books Wood's Essentials of the Original Genius and the Works of Homer (Cölln, 1840); and Monro's Homerische Studien (Leipzig, 1818); and the better edition of the Iliad was brought out by H. C. L. Maass, together by C. Less (2nd ed., Berlin, 1865). Besides the somewhat voluminous writings of Nietzsche, and the discussions contained in the histories of the literature of Homer by Monro, H. W. Wolf, C. Less, and C. B. Pfeiffer, and in Grote's Homer, see Welcker, Der epische

2 The word "Homerian Question" is now practically a synonym for the Iliad and Odyssey. Wolf's view was that the Homeric poems were composed by a single author, and that the "Iliad" and "Odyssey" were the work of the one poet. This view was generally accepted by the 19th century scholars, and was opposed by the 20th century scholars, who held that the poems were composed by a group of poets, or by a single poet who wrote the poems in a later period.
Cyclus oder die homerischen Dichter (Bonn, 1835-1849); on Proclus and the Cycle reference may also be made to Wilamowitz-Möllendorf p. 328 seq.; E. Bethe, Rhein. Mus. (1891), xxvi, p. 593 seq.; O. Immerwahr, Homer (Cöln, 1849); F. m. v. Lauer, Geschichte der homerischen Poete (Berlin, 1851); Sengelbusch, two dissertations prefixed to the two volumes of W. Dilordt's Homer in the Teubner series (Leipzig, 1860); W. Dilordt, Die Kahni (Köln, 1885); Natzhorn, Die Entstehungsweise der homerischen Gedichte, with Vorwort von J. N. Madvig (Leipzig, 1869); E. Kammer, Zu homerischen Fragen (Königsberg, 1870); and Die Entstehung der Odyssee (Leipzig, 1873); A. Kirschhoell, Die Composition der Odyssee (Berlin, 1869); Vollmann, Geschichte und Kritik der Wöhl'schen Prologena (Leipzig, 1874); K. Sitt, Die Wiederholungen in der Odyssee (Münch., 1891); U. v. Westphalen, Mundarten und homerische Untersuchungen (Berlin, 1884); O. Seeck, Die Quellen der Odyssee (Berlin, 1887); F. Blass, Die Interpolationen in der Odyssee (Leipzig, 1905). The interest taken in the question by English scholars is clearly shown by most of them, and by Gladstone, F. A. Paley, Henry Hayman (In the Introduction to his Odyssee), P. Geddes, R. C. Jebb and A. Lang (see especially the latter's Homer and his Age, 1907).

The homeric dialect must be studied in the books (such as those of G. Curtius) that deal with Greek on the comparative method. The best special work is the brief Griechische Formenlehre of H. L. Ahrens (Göttingen, 1882). Other important works are those of Aug. Fick: Die Homeriche odyssee in der ursprünglichen Sprachform wiederhergestellt (Göttingen, 1886); Die homerische Illas (ibid., 1886); W. Schulze, Questions époques (Götterdöse, 1892). On Homer's life the best book is Helbig's Syntactische Forschungen (Halle, 1871-1879), especially vols. i. and iv. on metre., Hartel's Homerische Studien (i.-iii., Vienna); Knös. De digammon Heraclis (ibid., 1879); M. W. L., Die homerischen homerischen Studien (Göttingen, 1888). Hay's Geschichte des griech. Digamma, Indogermanische Forschungen (1898), ix. 294 seq. The papers reprinted in Becker's Homerische Blätter (Bonn, 1865-1872) and Cobert's Miscellanea Critica (Leiden, 1876) are of permanent value and are usually of interest. In the first edition, 1894, and the 2nd edition, 1894-1898, there is a useful collection of facts, Buttmann's Lexogos, as an example of method, is still worth study.

The antiquity of Homer—the word in a wide sense—may be studied in the following books: Völker, Über homerische Geographie und Weltkunde (Hanover, 1830); Nägelsbach's Homerische Theologie (2nd ed., Nuremberg, 1861); H. Brunn, Die Kunst bei Homer (Berlin, 1862); W. W. L., Die homerische Weltkunde (Berlin, 1871); W. L. and W. J., Die Ilias (London, 1873); W. L. and W. J., Die Ilias (Berlin, 1875); W. L. and W. J., Die Ilias (Berlin, 1875); W. L. and W. J., Die Ilias (Berlin, 1875). The Iliad of Homer, with an introduction by D. Comaretti. (D. B. M.)

HOMER, WINSLOW (1836–1910), American painter, was born in Boston, U.S.A., on the 24th of February 1836. At the age of nineteen he was apprenticed to a lithographer. Two years later he opened a studio in Boston, and devoted much of his time to making drawings for wood-engravers. In 1850 he removed to New York, where he studied in the night-school of the National Academy of Design. During the American Civil War he was a correspondent and artist at the front, and contributed sketches to Harper's Weekly. The War also afforded him the subjects for the first two pictures which he exhibited (1863), one of which was "Home, Sweet Home." His "Prisoners from the Front"—perhaps his most generally popular picture—was exhibited in New York in 1865, and also in Paris in 1867, where he was spending the year in study. Among his other paintings in oil are "Snap the Whip" (which was exhibited at the Philadelphia Centennial Exposition of 1876, and, in company with "The Country Schoolroom," at the Paris Salon the following year), "The Old Mistress' Visit" (the famous picture of the Old Mistress, Sunday Morning"), "The Life-Line" and "The Coming of the Gale." His genius, however, has perhaps shown better in his works in water-colour, among which are his marine studies painted at Gloucester, Mass., and his "Inside the Bar," "The Voice from the Cliffs" (pictures of English fisherwomen), "Tynemouth," "Wrecking of a Vessel" and "Lost on the Grand Banks." His work, which principally consists of genre pictures, is characterized by strength, rugged directness and unmistakable freshness and originality, rather than by technical excellence, grace of line or beauty of colour. He was little affected by European influences. His types and scenes, apart from his few English pictures, are distinctly American—soldiers in blue, New England children, negroes in the land of cotton, Gloucester fishermen and stormy Atlantic seas. Besides being a member of the Society of Painters in Water-color, New York, he was elected in 1864 an associate and the following year a member of the National Academy of Design.

HOMESTEAD, a borough of Allegheny county, Pennsylvania, U.S.A., on the Monongahela river, 8 m. S.E. of Pittsburg. Pop. (1890) 7971; (1900) 12,554, of whom 3604 were foreign-born and 640 were negroes; (U.S. census, 1910) 18,713. It is served by the Pennsylvania and the Pittsburg & Lake Erie railways, and by the short Union Railroad, which connects with the Beaver & Lake Erie and the Wabash railways. The borough has a Carnegie library and the C.M. Schwab Manual Training School. Partly in Homestead but chiefly in the adjoining borough of Munhall (and therefore not reported as in Homestead by the U.S. Census) is one of the largest plants in the United States for the manufacture of steel used in the construction of bridges and steel-frame buildings and of steel armour-plate, and this is its chief industry; among Homestead's other manufactures are glass and fire-bricks. The water-works are owned and operated by the municipality. Homestead was first settled in 1871, and incorporated as a borough in 1880. In 1882, the Homestead Strike lasted 143 days and one of the most serious in the history of the United States was carried on here by the National Amalgamated Association of Iron and Steel Workers of the United States against the Carnegie Steel Company. The arrival (on the 6th of July) of a force of about 200 Pinkerton detectives from New York and Chicago resulted in a fight in which about 10 men were killed, and to restore order two brigades of the state militia were called out. See STRIKES AND LOCKOUTS.

HOMESTEAD AND EXEMPTION LAWS, laws (principally in the United States) designed primarily either to aid the head of a family to acquire title to a place of residence or to protect the owner against loss of that title through seizure for debt. These laws have all been enacted in America since about the middle of the 19th century, and owe their origin to the demand for a population of the right sort in a new country, to the conviction that the freeholder rather than the tenant is the natural supplier of popular support, to the effort to prevent insolvent debtors from becoming useless members of society, and to the belief that such support would encourage the stability of the family. By the cessions of several of the older states, and by various treaties with foreign countries, public lands have been acquired for the United States in every state and territory of the Union except the original thirteen, and Maine, Vermont, Kentucky, Tennessee and Texas. For a time they were regarded chiefly as a source of revenue, but about 1826, as the need of revenue for the payment of the national debt decreased and the inhabitants of an increasing number of new states became eager to have the vacant lands within their bounds occupied, the demand that the public lands should be disposed of more in the interest of the settler became increasingly strong, and the homestead idea originated. Until the advent of railways, however, the older states of the North were opposed to promoting the development of the West in this manner, and soon afterwards the Southern representatives in Congress opposed the general homestead bills in the interests of slavery, so that except in isolated cases where settlers were desired to protect some frontier, as in Florida and Oregon, and to a limited extent in the case of the Mexican Cession Act of 1853, the homestead principle was not applied by the national government until the Civil War had begun. A general homestead bill was passed by Congress in 1860, but this was vetoed by President James Buchanan; two years later, however, a similar bill became a law. The act of 1862 originally provided that any citizen of the United States, or applicant for citizenship, who was the head of a family,
HOMESTEAD AND EXEMPTION LAWS

twenty-one years of age, or, if younger, had served not less than fourteen days in the army or navy of the United States during an actual war, who is entitled to 160 acres of unappropriated public lands, and might acquire title to this amount of land by residing upon and cultivating it for five years immediately following, and paying such fees as were necessary to cover the cost of administration; a homestead acquired in this manner was exempted from seizure for any debt contracted prior to the date of issuing the patent. A commutation clause of this act permitted title to be acquired after only six months of residence by paying $1.25 per acre, as provided in the Pre-emption Act of 1841. Act of 1872, amended in 1901, allows any soldier or seaman, who has served at least ninety days in the army or navy of the United States during the Civil War or in the suppression of the insurrection in the Philippines, and was honourably discharged, to apply for a homestead, and permits the deduction of the time of such service, or, if discharged on account of wounds or other disability incurred in the line of duty, the full term of his enlistment, from the five years otherwise required for perfecting title, except that in any case he shall have resided upon and cultivated the land at least one year before the passing of title. Since 1866 mineral lands have been for the most part excluded from entry as homesteads.

In accordance with the provisions of the homestead law, 718,930 homesteads were claimed under the Act of 1862, 96,405,448 acres were established in forty-two years, and besides this principal act, Congress has passed several minor ones of a like nature, that is, acts designed to benefit the actual settler who improves the land. Thus the Pre-emption Act of 1841 gave to any head of a family or any single person over twenty-one years of age, who was a citizen of the United States or had declared his intention to become one, the right to purchase not to exceed 160 acres of public lands after he had resided upon and improved the same for six months; the Timber-Culture Act of 1873 allowed title to 160 acres of public pasture-land to be given to any one who should plant upon it 40 acres of timber, and keep the same in good growing condition for ten years; and the Desert-Land Act of 1877 gave to any citizen of the United States, or to any person who had declared his intention to become one, the privilege of acquiring title to 640 acres of such public land as was not included in mining or timber lands, and would not without irrigation produce an agricultural crop, by paying twenty-five cents an acre and creating for the tract an artificial water-supply. These several land acts, however, invited fraud to such an extent that in time they promoted the establishment of large land holdings by ranchmen and others quite as much as they encouraged settlement and cultivation, and so great was this evil that in 1891 the Timber-Culture acts and the Desert-Land Act were repealed, the total amount of land that could be acquired by any one person under the several land laws was limited to 320 acres, the Desert-Land Act was so amended as to require an expenditure of at least three dollars an acre for irrigation, and the original Homestead Act was so amended as to disqualify any person who was already proprietor of more than 160 acres in any state or Territory of the Union for acquiring any more land under its provisions; and in 1896 a residence of fourteen months was required before permitting commutation or the purchase of title. But even these measures were inadequate to prevent fraud. In 1894 Congress enacted what is known as the Carey Act, donated to California, Oregon, Nevada, Washington, Idaho, Montana, Utah, Wyoming, Arizona, New Mexico and the Dakotas so much of 1,000,000 acres each of desert-lands as each state should cause to be irrigated, reclaimed and occupied within ten years,1 not less than 20 acres of each 160 acres to be cultivated by actual settlers; and in several of these states and territories irrigating companies have been formed and land offered to settlers in amounts not exceeding 160 acres to each, on terms requiring the settler to purchase ample and perpetual water-rights. In 1902, Congress appropriated the proceeds of the sales of public lands in these states and territories to form a reclamation fund to be used for the construction and maintenance of irrigation works, and lands reclaimed by this means are open to homestead entries, the entrant being required to pay for the work of reclamation in ten equal annual installments without interest. When Texas was admitted to the Union the disposal of its public lands was reserved to the state, and under its laws every person who is the head of a family and without a homestead may acquire title to 160 acres of land by residing upon and improving it for three years; every unmarried man eighteen years of age or over may acquire title to 80 acres in the same way.

A short time before the National Homestead Act for aiding citizens to acquire homesteads went into operation, some of the state legislatures had passed homestead and exemption laws designed to protect homesteads or a certain amount of property against loss to the owners in case they should become insolvent debtors, and by the close of the century the legislature of nearly every state in the Union had passed a law of this nature. These laws vary greatly. In most states the exemption of a homestead or other property from liability for debts can be claimed only by the head of a family, but in Georgia it may be claimed by any aged or infirm person, by any trustee of a family of minor children, or by any person on whom any woman or girl is dependent for support; and in California, although the head of a family may claim exemption for a homestead valued at $500, all other persons may claim exemption of up to 180 acres of land valued at $1000. In some states exemptions may be claimed either for a farm limited to 40, 80, 160 or 200 acres, or for a house and one or more lots, usually limited in size, in a town, village or city; in other states the homestead for which exemption may be claimed is limited in value, and this value varies from $500 to $5000. With the homestead are usually included the appurtenances thereto, and the courts invariably interpret the law liberally; but many states also exempt a specified amount of personal property, including wearing apparel, furniture, provisions, tools, libraries and in some cases domestic animals and livestock. A few states exempt homesites, and in Maryland, for example, exempts only $100 worth of property besides money payable in the nature of insurance, or for relief, in the event of sickness, injury or death. To some debts the exemption does not usually apply; the most common of these are taxes, purchase money, a debt secured by mortgage on the homestead and debts contracted in making improvements upon it; in Maryland the only exception is a judgment for breach of promise to marry or in case of seduction. If the homestead belongs to a married person, the consent of both husband and wife is usually required to mortgage it. Finally, some states require the homestead to be actually occupied and that it shall be previously entered upon record, others require only occupancy, and still others permit the homestead to be designated whenever a claim is presented.

Following the example of either the United States Congress or the state legislatures, the governments of several British colonial states and provinces have passed homestead laws. In Quebec every settler on public lands is allowed, after receiving a patent, an exemption of not to exceed 200 acres from that of his widow, of his, her or their children and descendants in the direct line. In Ontario an applicant for a homestead may have to not exceed 200 acres of unimproved unwatered land for farming purposes by building a house thereon, occupying it for five years, and bringing at least fifteen acres under cultivation; the exemption of such a homestead from liability to seizure for debts is, however, limited to twenty years from the date of application for the land, and does not extend during that period to rates or taxes. Manitoba, British Columbia, Queensland, New South Wales, South Australia, West Australia and New Zealand also have liberal homestead and exemption laws.

HOMICIDE (Lat. homicidium), the general and neutral term for the killing of one human being by another. The nature of the responsibility of the slayer to the state and to the relatives of the slain has been one of the chief concerns of all systems of law from the earliest times, and it has been variously considered from the points of view of the sanctity of human life, the interests of the sovereign, the injury to the family of the slain and the moral guilt, i.e., the motives and intentions, of the slayer.

The earliest recorded laws (those of Khammurabi) do not contain any sweeping general provision as to the punishment of homicide. The death penalty is freely imposed but not for homicide. If a man strike a gentleman's daughter that she dies, her own daughter is to be put to death, if a poor man's the slayer pays 4 mina. In the Mosiac law the general command "Thou shalt not kill" of the Decalogue is in terms absolute. In primitive law homicide, however innocent, subjected the slayer to the lawful vengeance of the kindred of the slain, unless he could make some composition with him. This lex talionis (a life for a life) resulted: (1) in a course of private justice which still survives in the vendetta of Corsica and Albania, and the blood feuds arising out of "difficulties" in the southern and western parts of the United States; (2) in the recognition of sanctuaries and cities of refuge within which the avenger of blood might not penetrate to kill an innocent manslaughter; and (3) in the system of withe, bote and wer, by which the life of every man had its assessed price payable to his chief and his next of kin.

It took long to induce the relatives of the slain to appreciate anything beyond the fact of the death of their kinman or to discriminate between intentional and accidental homicide. By the laws of Khammurabi (206, 208) striking a man in a quarrel without deadly intent but with fatal effect was treated as a matter for compensation according to the rank of the slain. The Pentateuch discriminates between the man "who lieth in wait for" or "cometh presumptuously" on "his neighbour to slay him with guile" (Exodus xxii. 13, 14), and the man "who killeth his neighbour ignorantly whom he hated not in time past" (Deut. xix. 4). But even killing by misadventure exposed the slayer to the avenger of blood. As a man goeth by the way to his home where he befouls a stroke with the axe to cut down a tree and the head slips off, and the man who was his neighbour beheld the man die: he shall flee into one of these cities (of refuge) and live" (Deut. xix. 5).

Under the early laws of Teutonic and Celtic communities the inconveniences of the blood feud were gradually mitigated (see Criminal Law) by the system of withe and wer (or eric), but the blood feud continued long in Friesland and Lower Saxony, and in parts of Switzerland until the 16th century. In England under the Norman system homicide became a plea of the crown, and the rights of the kindred to private vengeance and to compensation were gradually superseded in favour of the right of the king to forfeitures where the homicide amounted to "murdrum" (felony), and the common law.

Though homicide was thus made a public offence and not a matter for private vengeance, it took long to discriminate between those forms of homicide which should and those which should not be punished.

The terms of act in English law used to describe criminal homicide are murder (mord, murstre, murdrum), manslaughter and fleo de xe (or suicide by a person of sound mind).

The original meaning of the word "murder" seems to have been secret homicide,—"Murdrum proprii dicitior moris alicuius occulatius cujus interfector ignoratur" (Dialogus de Scaccario i. 2); and Glanville says: Duo sunt genera homicidii. unus est quod dicitur murdrum quod nullo vidente nullo sciente clam poteratrum, ita quod non assignatur clamor popularis (hue and cry). est et alius homicidium quod dicier simplex homicidium. After the Conquest, and for the protection of the ruling race, a fine (also called murdrum) was levied for the king on the hundred or other district in which a stranger was found dead, if the slayer was not brought to justice and the blood kin of the slain did not present Englishry, there being a presumption (in favour of the Exchequer) that the deceased was a Frenchman. After the assize of Clarendon (1856) the distinction between the killing of Normans and Englishmen gradually evaporated and the term murder came to acquire its present meaning of deliberate as distinct from secret homicide. In 1850 it was provided that the murder fine should not be levied in cases of death by "misadventure" (per infortunium). But at that date and for long afterwards homicide in self-defence or by misadventure or even while of unsound mind involved at the least a forfeiture of goods, and required a pardon, and restitution of the goods, became a matter of course, and the judges appear at a later date to have been in the habit of directing an acquittal in such cases. But it was not until 1828 that the innocence of excusable homicide was expressly declared. The rule is now expressed in s. 7 of the Offences against the Person Act 1861: "No punishment or forfeiture shall be incurred by any person who shall kill another by misfortune, or in his own defence, or in any other manner without felony."

The further differentiation between different degrees of criminal homicide was marked by legislation of Henry VIII. (1531) taking away benefit of clergy in the case of "wilful murder with malice prepenset" (aforethought), and that phrase is still the essential element in the definition of "wilful murder," which is committed "when a person of sound memory and discretion unlawfully killeth any reasonable creature or being and under the king's peace with malice aforethought either expressly or implied" (3 Co. Inst. 47). The whole development of the substantive law as to murder rests on judicial rulings as to the meaning of malice prepenset coupled with the extrajudicial commentaries of Coke, Hale and Foster; for parliament, though often tempted by bills and codes, has never ventured on a legislative definition. Much discussion has ranged round the phrase "malice aforethought," and it has undoubtedly been expanded by judicial decision so as to create what is described as "constructive" murder. According to the view of the criminal code commissioners of 1879 (Parl. Pap., 1879, c. 23, p. 33) the term "malice aforethought" is now a common name for all the following states of mind:

1. A man, by premeditation, to kill or do grievous bodily harm to the person or to any other person:

2. Knowledge that the act done is likely to produce such consequences, whether coupled with an intention to produce them or not:

3. An intent to commit any felony: or

4. An intent to resist an officer of police in the execution of his duty.

HOMEYER—HOMICIDE 641

XIII. 21
HOMICIDE

The third form of malice aforethought has been much controverted. When it was first recognized as creating a liability for wilful murder almost all felonies were capital offences: but even at the end of the 17th century Lord Holt expressed a view that it should be limited to felonies involving violence or danger to life, e.g. assault with intent to rob, or setting fire to a dwelling-house. And Sir James Stephen's opinion is that, to justify conviction of murder by an act done with intent to commit a felony, the act done must be one dangerous to life or known to be likely to cause death.

Starting with the definition given above, English law still retains so much of its medieval character as to presume all homicide to be malicious, and therefore murder, unless it is either justified by the command or permission of the law, executed on the ground of accidental or self-preservation, or alleviated into manslaughter by being the involuntary consequence of some act not strictly lawful or occasioned by some sudden and sufficiently violent provocation.” The truth of the facts alleged in justification, excuse or alleviation, is for the jury to determine: the question whether if true they support the plea for which they are put forward is for the court.

In the administration of the English criminal law as to homicide the consequences of too strict an adherence to the technical definition of the offences are avoided (a) by the exercise of the jury over their powers to convict of manslaughter only even in cases where they are directed that the offence is murder or nothing; (b) by the report of the judge as to the particular circumstances of each case in which a conviction of murder has been followed by the statutory sentence of death; (c) by the examination of all the evidence in the case by the Home Office in order to enable the secretary of state to determine whether the prerogative of mercy should be exercised.

Homicide is justifiable and not criminal when the killing is done in the execution of the law. The most important case of justifiable homicide is the execution of a criminal in due course of public justice. This condition is most strictly observed where the crime is against the person of the judge himself, as in the case of carrying out his duty, as such, is also justifiable; e.g. where a felon resists a legal arrest and is killed in the effort to arrest him (see 2 Pollock and Maitland, 476); or where officers in dispersing a riotous assemblage kill any of the mob, &c. (see R101). In these cases the homicide must be shown to have been absolutely necessary.

Again, homicide is justifiable if committed in the defence of person or property against forcible and heinous crime, such as murder, violent robbery, rape or burglary. In this connection there has been much discussion as to whether the person attacked is under a duty to retreat: and in substance the justification depends on the continuous necessity of attack or defence in order to prevent the commission by the deceased of the crime threatened.

Homicide is excusable and not criminal at all when committed either by misadventure or in self-defence. In the former case the homicide is excused; where a man in the course of doing some lawful work, accidentally and without intention kills another, e.g. shooting at a mark and undesignedly hitting and killing a man. The act must be strictly lawful, and death by misadventure in unlawful sports is not a case of excusable homicide. Homicide in self-defence is excusable when the slayer is himself in immediate danger of death, and has done all he could to avoid the assault. Accordingly, if he strikes and kills his assailant after the assault is over, this is not excusable homicide. But if the assault has been premeditated, as in the case of a duel, the death of either antagonist has under English law always been held to be murder and not excusable homicide. The excuse of self-defence covers the case in which a person in defence of others whom it is his duty to protect—children, wife, master, &c.—kills an assailant. It has been considered doubtful whether the plea of self-defence is available to one who has himself provoked a fray, in the course of which he is so pressed by his antagonist that his only resource is to kill him.

In English law the term “manslaughter” is applied to those forms of homicide which though neither justifiable nor excusable are attended by alleviating circumstances which bring them short of wilful murder. The offence is not defined by statute, but only by judicial rulings. Its punishment is as a maximum of seven years imprisonment for life, and as a minimum a fine or recognizances to be of good behaviour. The quantum of punishment between the limits above stated is in the discretion of the court, and not, as under continental codes, with fixed minima; and the offence includes acts and omissions of very varying gravity, from acts which only by the charitable appreciation of a jury fall short of wilful murder, to acts or omissions which can only technically be described as criminal, e.g. where one of two persons engaged in poaching, by pure accident gets caught in a hedge so that his gun goes off and kills his fellow-poacher. This may be described as an extreme instance of “constructive crime.”

There are two main forms of “manslaughter”:

1. “Voluntary” homicide under grave and sudden provocation or on a sudden quarrel in the heat of passion, without the slayer taking undue advantage or acting in an unusual manner. The substance of the alleviation of guilt lies in the absence of time for cool reflection or the formation of a premeditated design to kill. Under English law the provocation must be by acts and not by words or gestures, and must be serious and not trivial, and the killing must be immediately after provocation and while the slayer has lost his self-control in consequence of the provocation. The provocation need not be by assault or violence, and perhaps best represented example in the slayer's husband of a man found committing adultery with the slayer's wife. In the case of a sudden quarrel it does not matter who began or provoked the quarrel. This used to be called “chance medley.”

2. “Involuntary” homicide as a result of great rashness or gross negligence in respect of matters involving danger to human life, e.g. in driving trains or vehicles, or in dealing with dangerous weapons, or in performing surgical operations, or in taking care of the helpless.

The innumerable modes in which criminal liability for killing others has been adjudged under the English definitions of murder and manslaughter cannot be here stated, and can only be studied by reference to the judicial decisions collected and discussed in Russell on Crimes and other English text-books; and in the valuable work by Mr. J. D. Mayne on the criminal law of India, in which the English common law rulings are stated side by side with the terms and interpretations of the Indian penal code. Much labour has been expended by many jurists in efforts to create a scientific and acceptable classification of the various forms of unlawful homicide which shall properly define the cases which should be punishable by law and the appropriate punishment. Their efforts have resulted in the establishment in almost every state except the United Kingdom of statutory definitions of the crime, beginning with the French penal code and going down to the criminal code of Japan. In the case of England, as a result of the labours of Sir James Stephen, a code bill was submitted to parliament in 1878. In 1879 a draft code was prepared by Blackburn, Lush and Barry, and was presented to parliament. It was founded on and prepared with Sir J. Stephen, and is a revision of his digest of the criminal law.

After defining homicide and culpable homicide, the draft code (cl. 174) declares culpable homicide to be murder in the following cases: (a) if the offender means to cause the death of the person killed; (b) if the offender means to cause to the person killed any bodily injury which is known to the offender to be likely to cause death, and if the offender, whether he does
or does not mean to cause death, is reckless whether death ensues or not; (c) if the offender means to cause death or such bodily injury as aforesaid to one person, that so that if that person be killed the offender would be guilty of murder, and by accident or mistake the offender kills another person though he does not mean to hurt the person killed; (d) if the offender for any unlawful object does an act which he knows or ought to have known to be likely to cause death, and thereby kills any person, though he may have desired that his object should be effected without hurting any one.

Further (cl. 175), it is murder (whether the offender means or not to cause death, or knows or not that death is likely to ensue) in the following cases:— (a) if he means to inflict grievous bodily injury for the purpose of facilitating the commission of any of the offences hereinafter mentioned, or the flight of the offender upon the commission or attempted commission thereof, and death ensues from his violence; (b) if he administers any stupefying thing for either of the purposes aforesaid and death ensues from the effects thereof; (c) if he by any means wilfully stops the breath of any person for either of the purposes aforesaid and death ensues from such stopping of the breath.” The following are the offences referred to:—

“high treason and other offences against the king’s authority, piracy and offences deemed to be piracy, escape or rescue from prison or lawful custody, resisting lawful apprehension, murder, rape, forcible abduction, robbery, burglary, arson.” Cl. 176 reduces culpable homicide to manslaughter if the person who caused death by the homicide was driven by sudden provocation; and “any wrongful act or insult of such a nature as to be sufficient to deprive any ordinary person of the power of self-control may be provocation if the offender acts upon it on the sudden, and before there has been time for his passion to cool. Whether any particular wrongful act or insult amounts to provocation and whether the offender was deprived of self-control shall be questions of fact; but no one shall be deemed to give provocation by doing that which he had a legal right to do, or which the offender invited him to do in order to provide an excuse for killing him or doing grievous bodily harm to any person.” Further, “an arrest shall not necessarily reduce the offence from murder to manslaughter because an arrest was illegal, but if the illegality was known to the offender it may be evidence of provocation”; (cl. 177) “culpable homicide not amounting to murder is manslaughter.”

The definitions embodied in these clauses though not yet accepted by the British legislature, have in substance been embodied in the criminal codes of Canada (1892 ss. 227-230), New Zealand (1893, ss. 163-166), Queensland (1899, ss. 356-363), and Western Australia (1901, ss. 275-280).

From the point of view of civil as distinct from criminal responsibility homicide does not by the common law give any cause of action against the person causing the death of another in favour of the wife or blood relations of the deceased. In early law this was otherwise; and the writ or eric of the deceased came historically before the right of chief or state. But under English law the rights of relations, except by way of appeal for felony, were swept aside in favour of the crown, on the principle that every homicide is presumed felonious (murder) unless the contrary is proved, and that in all cases of homicide not justifiable by law a forfeiture was incurred. The rights of the relatives were also defeated by application of the maxim “actus personalis moriturcum personam” (“a personal action dies with the person”) to all proceedings for injury to the person or to reputation. In Scotland the old theory was preserved in the law as to assuagement.

Until 1857 the law was altered at the instance of Lord Campbell in 1846 (9 & 10 V. c. 93) so as to give a right of a claim by the husband, wife, parent or child of a person killed by a wrongful (or even criminal) act, neglect or default by another which would have given the deceased if he had sur-

The Italian code punishes as homicide those who with intention to kill cause the death of another (364). The death penalty is not imposed, but scales of punishment are provided to deal with aggravated forms of the offence. Thus ergastole (penal servitude for life) is the punishment in the case of homicide of ascendants and descendants, or with premeditation, or under the sole impulse of brutal ferocity or with gross cruelty (gravis servicie), or by means of arson, inundation, drowning and certain other crimes, or to secure the gains or conceal the commission, or to secure immunity from the consequences, of another crime (366). Personal violence resulting in death inflicted without intention to kill is punishable minore poena (368), and it is crime to cause the death of another by imprudence, negligence or want of skill in an art or profession (imperitia nella propria arte o professione), or by non-observance of regulations, orders or instructions.

The Spanish code has like those of Italy and France special punishments for parricide (417) and for assassination, in which are included killing for reward or promise of reward or by inundation (418), and for aiding another to commit suicide (421). Both the Italian and the Spanish codes afford a special mitigation.
to infanticide committed to avoid dishonour to the mother of the infant or her family.

The most notable difference between England and the United States in regard to the law on this subject is the recognition by state legislation of degrees in murder. English law treats all unlawful killing not reducible to manslaughter as of the same degree of guilt in law. American statutes seek to discriminate for purposes of punishment between the graver and the less culpable forms of murder. Thus an act of the legislature of Pennsylvania (22d of April 1794) declares "all murder which shall be perpetrated by means of poison or by lying in wait or by any other kind of wilful, deliberate and premeditated killing, or which shall be committed in the perpetration of or attempt to perpetrate any arson, rape, robbery or burglary or murder by asphyxiation or by drowning or by hanging, or any other kind of murder shall be deemed murder of the second degree." This legislation has been copied or adopted in many if not most of the other states. There are also statutory degrees of manslaughter in the legislation of some of the states.

The differences of legislation, coupled with the power of the jury in some states to determine the sentence, and the limitations on the right of the judges to comment on the testimony adduced, lead to very great differences between the administration of the law as to homicide in the two countries.

HOMILETICS (Gr. ὑμηλητικός, from ὑμηλητήν, to assemble together), in theology the application of the general principles of rhetoric to the specific department of public preaching. It may be further defined as the science that treats of the analysis, classification, preparation, composition and delivery of sermons. The formation during recent years of such lectureships as the "Lyman Beecher" course at Yale University has resulted in increased attention being given to homiletics, and the published volumes of this series are the best contribution to the subject.

The older literature is cited exhaustively in W. G. Blakie, For the Work of the Ministry (1872); and D. F. Kidder, Treatise on Homiletics (1884).

HOMILY, a simple religious address, less elaborate than a sermon, and confining itself to the practical exposition of some ethical topic or some passage of Scripture. The word ὑμηλία from ὑμηλητήν (ἡμιλητός, εἶλος), meaning communion, intercourse, and especially interchange of thought and feeling by means of words (conversation), was early employed in classical Greek to denote the instruction which a philosopher gave to his pupils in familiar talk (Xenophon, Memorabilia, I. ii. 6. 15). This use of the word was long preserved (Aelian, Hist. Natur. ii. 19); and the ὑμηλητικά of Acts xx. 11 may safely be assigned to, not only a free and informal but also a didactic character to the apostles Paul's discourse in the upper chamber of Troas, when "he talked a long while, even till break of day." That the "talk" on that occasion partook of the nature of the "exposition" (παράστασις) of Scripture, which, undertaken by a priest, elder or other competent person, had become a regular part of the service of the Jewish synagogue,5 may also with much probability be assumed. The custom of delivering expositions or comments more or less extemporaneous on the lessons of the day at all events passed over soon and readily into the Christian Church, as may be gathered from the first Apology (c. 67) of Justin Martyr, where we read that, in connexion with the practice of reading portions from the collected writings of the prophets and from the memoirs of the apostles, it had by that time become usual for the presiding minister to deliver a discourse in which "he admonishes the people, stirring them up to an imitation of the good works which have been brought before their notice." This discourse, from its explanatory character, and from the easy conversational manner of its delivery, was for a long time called ὑμηλία rather than λέγον: it was regarded as part of the regular duty of the bishop, but he could devolve it, if he thought fit, on a presbyter or deacon, or even on a layman. An early and well-known instance of such delegation is that mentioned by Eusebius (Hist. Eccl. vii. 13) in the case of Origen (216 A.D.).2 In course of time the exposition of the lesson for the day came more frequently to assume a more elaborate character, and to pass into the category of a λέγον of even φιλοσοφία or φιλοσοφικόμα: but when it did so the fact was as far as possible denoted by a change of name, the word ὑμηλία being reserved for the expository or exegetical lecture as distinguished from the pulpitis oration or sermon.3 While the church of the 3rd and 4th centuries could point to a brilliant succession of great preachers, whose discourses were wont to be taken down in shorthand and circulated among the Christian public as an exposition of the meaning of the homilies, a supply of ordinary homiletical talent kept pace with the rapidity of church expansion throughout the Roman empire. In the smaller and remoter communities it not uncommonly happened that the minister was totally unqualified to undertake the work of preaching; and though, as is curiously shown by the case of Rome (Sozomen, Hist. Eccl. vii. 19), the regular exposition of the appointed lessons was by no means regarded as part of the necessary business of a church, it was generally felt to be advisable that some provision should be made for the public instruction of congregations. Even in Jerome's time (De Vir. Ill. c. 113), accordingly, it had become usual to hold, in the regular meetings of the churches which were not so fortunate as to possess a competent presbyter or deacon, the written discourses of celebrated fathers; and at a considerably later period we have on record the canon of at least one provincial council (that of Vaux, probably the third, held in 529 A.D.), positively enjoining that if the presbyter through any infirmity is unable himself to preach, "homilies of the holy fathers" (homilae sanctorum patrum) are to be read by the deacons. Thus the finally fixed meaning of the word homily as an ecclesiastical term came to be a written discourse (generally possessing the sanction of some great name) read in church by or for the officiating clergyman when from any cause he was unable to deliver a sermon of his own. As the standard of clerical education sank during the dark ages, the habit of using the sermons of others became almost universal. Among the authors whose works were found specially serviceable in this way may be mentioned the Venerable Bede, who is credited with no fewer than 140 homilies in the Basil and Cologne editions of his works, and who certainly was the author of many Homiliae de Tempore which were much in vogue during the 8th and following centuries. Prior to Charlemagne it is probable that several other collections of homilies had obtained considerable popularity, but in the time of that emperor these had suffered so much in their purity and fidelity that an authorial revision was felt to be imperatively necessary. The result was the well-known Homiliarium, prepared by Paul Warnefrid, otherwise known as Paulus Diaconus (p.n.).4 It consisted of

5 Sizomen (Hist. Eccl. vii. 19) mentions that in Alexandria in his day the bishop alone was in the custom of preaching; but he, this implies, was a very exceptional state of matters, dating only from the time of Arius.

6 To the more strictly exegetical lectures the names λεγον or παραστασις were sometimes applied. But no popular discourse delivered from the pulpiti could ever be explicit exposition and as on the other hand every sermon professing to be based on Scripture required to be more or less "explanatory," and "textual," it would obviously be sometimes very hard to draw the line of distinction between ὑμηλία and λέγον. It would be difficult to define very precisely the difference in French between a "conférence" and a "préche," as difficult distinction was always expressed in Greek by Photius, who says of the eloquent pulpiti orations of Chrysostom, that they were διαλογία rather than λέγον. Manuscript copies are preserved at Heidelberg, Darmstadt, Freiburg, Ratisbon, Göttingen, and other places. They were first printed at Spire in 1482. In the Cologne edition of 1530 the title runs—Hoeiliae seu matris sermones sive conciones ad populum, praestantisarious demonstrationis, Augustini, Ambrictii, Gregorii, Origenti, Chrysostomi, Bedae, et al. in libros de Pater et Alchaimnium lectam, &que injiciens ac Cardo R. Rom.: Imp., cui a secretis fuimus. Though it, thus attributed here to Alcuin, who is known to have revised the Lectionary or Comes Hieronymi, the compilation
HOMOEOPATHY

645

176 homilies arranged in order for all the Sundays and festivals of the ecclesiastical year; and probably was completed before the year 780. Though written in Latin, its discourses were doubtless intended to be delivered in the vulgar tongue; the clauses are often too long and involved for homilies, although by more than one provincial council they were enjoined to exert themselves so that they might be able to do so. Hence an important form of literary activity came to be the translation of the homilies approved by the church into the vernacular. Thus we find Alfred the Great translating the homilies of Bede; and in a similar manner arose Alfric’s Anglo-Saxon Homilies and the German Homiliarium of Ottfried of Weissenburg. Such Homiliaria as were in use in England down to the end of the 9th century, at the time of the Reformation, are sought for and destroyed, so that they are now extremely rare, and the few copies which have been preserved are generally in a mutilated or imperfect form.

The Books of Homilies referred to in the 35th article of the Church of England originated at a convocation in 1542, at which it was agreed “to make certain homilies for stay of such errors as were then by ignorant preachers sparkled among the people.” Certain homilies, accordingly, composed by dignitaries of the lower house, were in the following year produced by Cranmer and his followers; and in some short while a volume was published in 1547 entitled Certain sermons or homilies appointed by the King’s Majesty to be declared and read by all persons, vicars, or curates every Sunday in their churches where they have cure. In 1553 a second Book of Homilies was submitted along with the 30 Articles to convocation; it was issued the same year under the title The second Tome of Homilies of such matters as were promised and instituted in the former part of Homilies, set out by the authority of the Queen’s Majesty, and to be read in every Parish Church agreeably. Of the twelve homilies contained in the first book, four (the 1st, 2nd, 3rd and 4th) are probably to be attributed to Cranmer, and one (the 12th) possibly to Latimer; one (the 6th) is by Bonner; another (the 5th) is by John Harpsfield, archdeacon of London, and another (the 11th) by Thomas Becon, one of Cranmer’s chaplains. The authorship of the others is unknown. The second book consists of twenty-one homilies, of which the 1st, 2nd, 3rd, 7th, 8th, 9th, 10th and 17th have been assigned to Jewell, the 4th to Grindal, the 5th and 6th to Flikington and the 18th to Parker. See the critical edition by Forster, Oxford, 1869. Original editions are now not read publicly, though they are sometimes appealed to in controversies affecting the doctrines of the Anglican Church.

HOMOEOPATHY (from the Greek ὑομε-, like, and πάθος, feeling). The distinctive system of therapeutics which bears the name of homoeopathy is based upon the law similia similibus curantur, 1 the originator of which was S. C. F. Hahemann, a native of Meissen in Germany, who discovered his new principle while he was experimenting with cinchona bark in 1790, and announced it in 1796.2 The essential tenets of homoeopathy— with which is contrasted the “allopathy” (i.e., other) of the “orthodox” therapeutics—are that the cure of disease is effected by drugs that are capable of producing in a healthy individual symptoms similar to those of the disease to be treated, and that to ascertain the curative virtues of any drug it must be “proved” upon healthy persons—that is, taken by individuals of both sexes in a state of health in gradually increasing doses. The manifestations of drug action thus produced are carefully recorded, and this record of “drug-diseases,” after being verified by repetition on many “provers,” constitutes the distinguishing feature of the homoeopathic materia medica. Thus, homoeopathy embraces the sources, preparation and uses of drugs as known to the orthodox pharmacopoeia, contains, in addition, the various “proving” obtained in the manner above described.

Besides the promulgation of the doctrine of similars, Hahemann also enunciated a theory to account for the origin of all chronic diseases, which he asserted were derived either directly or remotely from psora (the itch), syphilis (venereal disease) or sykrosis (sick-wart disease). This doctrine, although at first adopted by some of the enthusiastic followers of Hahemann, was afterwards discredited by his pupils, who preserved a firm belief in his law of cure. In the light of advancing science such theories are entirely untenable, and it was unfortunate for the system of medicine which he founded that Hahemann should have promulgated such an hypothesis. It served as a target for the shafts of ridicule showered upon the system by those who were its opponents, and even at the present time there still exists in the minds of many misinformed persons the conviction that homoeopathy is a system of medicine that bases the origin of all chronic disease on the itch or on syphilis or on sykritas.

Another peculiar feature of homoeopathy is its posology or theory of dose. It may be asserted that homoeopathic posology has nothing more to do with the original law of cure than the psora (itch) theory has, and that it was one of the later creations of Hahemann’s mind. Most homoeopathists believe more or less in the action of minute doses of medicine, but it must not be considered as an integral part of the system. The dose is the corollary, not the principle. Yet in the minds of many, homoeopathic doses of medicine stand for homoeopathy itself, and the real law of cure being completely put into the background. The question of dose has also divided the members of the homoeopathic school into bitter factions, and is therefore a matter for careful consideration. Many employ low potencies, 3 i.e. mother

1 Some points of Hahemann’s system were borrowed from previous writers—as he himself, though imperfectly, admits. Not to mention others, he was anticipated by Hippocrates, and especially by Paracelsus (1495-1541). The identical words similia similibus curantur occur in the Geneva edition (1668) of the works of Paracelsus, as a marginal heading of one of the paragraphs; and in the “Fragmenta Medica,” Op. Omnia, i. 168, 169, occurs the following passage:

Simile simili cura; non contrarium.

“Quiquis enim cum haude Medicum volet, is haudus longe valere jubet. Nec enim ullos unquam morbos curavit per frigidum sanatibus uii, nec frigidus per calidâ. Simile autem sumpsum simile ferventior curavit, et salutarem curavit. Et quidem medicus non centum esse uidentur in universa medicina, quibus cuncti homoeo-”

2 It is very remarkable that in Hahemann’s enumeration of authors who anticipated him in regard to the doctrine of Similia, he makes no mention of Eberhard of Sebaldus, though a monument erected to the memory of Hahemann and unveiled in Washington, D.C., on the 23rd of June 1900, and also those carved upon the tomb of Hahemann in Père-la-Chaise, Paris.

3 Two methods of preparing medicines are recognized, one on the decimal, the other on the centesimal scale. The pure tinctures are designated “mother tinctures,” and represented by the Greek φ. To
tinctures, first, second, sixth dilutions, &c., while others use hundred-thousandths and mill billions.

Some homoeopathists of the present day still believe with Hahnemann that, even after the material medicinal particles of a drug have been subdivided to the fullest extent, the continuation of the dynamization or trituration or succussion develops a spiritual active agent, and that the higher the power the more subtle and more powerful is the curative action. Hahnemann says (Organon, 3rd American edition, p. 101), "It is only by means of the spiritual influence of a morific agent that our spiritual vital power can be diseased, and in like manner only by the spiritual operation of medicine can health be restored." This is absolutely denied by others. Thus there exist two schools among the adherents of homoeopathy. On the one hand there are the Hahnemannians, the "Purists" or "High Potency" men, who still profess to regard the Organon as their Bible, who believe in all the teachings of Hahnemann, who adhere in their prescriptions to the single dose, the single medicine, and of the highest possible potency, and regard the doctrine of the spiritual dynamization acquired by trituration and succussion as indubitable. On the other side there are the "Rational" or "Low Potency" men, who believe in the universality of the law of cure, but think that it cannot always be applied, on account of an imperfect materia medica and a lack of knowledge on the part of the physician. They believe that in many cases of severe and acute pain palliatives are required, and that they are free to use all the adjuvants at present known to science for the relief of suffering humanity—massage, balneology, electricity, hygiea, &c. The American Institute of Homoeopathy, the national body of the United States, has adopted the following resolution and ordered it to be published conspicuously in each number of the Transactions of the society: "A homoeopathic physician is one who adds to his knowledge of medicine a special knowledge of homoeopathic therapeutics. All that pertains to the great field of medical learning is his by tradition, by inheritance, by right."

It is claimed that the effect produced upon both the laity and the general profession of medicine by the introduction of homoeopathy was salutary in many ways. It diminished the quantity of medicine that was formerly considered necessary for the eradication of disease, and thus revealed the fact that the is medicatrix nature is often sufficient, with occasional and gentle assistance, to cure many diseases, especially those fevers that run a definite and regular course. Corroboration of the law similia similibus curentur is seen, according to homoeopathists, in the adoption of the serum therapy, which consists in the treatment of the most malignant diseases (diphtheria, lock-jaw, typhoid fever, tuberculosis, bubonic plague) by introducing into the system a modified form (similar) of those poisons that produce them in the healthy individual. Hahnemann undoubtedly deserves the credit of being the first to break decidedly with the old school of medical practice, in which, forgetful of the teachings of Hippocrates, nature was either overlooked or rudely opposed by wrong and ungentle methods. We can scarcely now estimate the force of character and of courage which was implied in his abandoning the common lines of medicine. More than this, he and his followers showed results in the treatment of disease which compared very favourably with the results of contemporary orthodox practice.

make a first decimal dilution or first decimal trituration, 10 drops of the mother tincture, or 10 grains of a crude substance, are mixed with 90 drops of alcohol, or 90 grains of saccharum lactis (sugar of milk) respectively. The liquid is thoroughly shaken, or the gr. 90 is fully triturated. The bottles containing them marked 1X, meaning first decimal dilution or trituration. To make the 2X potency, 10 drops or 10 grains of this first dilution or trituration are mixed with 90 drops of pure alcohol, or 90 grains of milk sugar and was triturated as above described, and marked 2X dilution or trituration. This subdivision of particles may be continued to an indefinite degree. On the Hahnemannian or centesimal scale the medicines are prepared in the same manner, the difference being that 1 drop or grain is mixed with 90 drops or grains, to make the first centesimal, which is marked 1 c or it simply, and so on for the second and higher dilutions.

Homoeopathy has given prominence to the therapeutical side of medicine, and has done much to stimulate the study of the physiological action of drugs. It has done service in directing more special attention to various powerful drugs, such as aconite, nux vomica, belladonna, and to the advantage of giving them in simpler forms than were common before the time of Hahnemann. Homoeopathy nevertheless remains under the stigma of being a dissenting sect. It has been publicly announced that if the homoeopathists would abolish the name "homoeopathy," and remove it from their periodicals, colleges, hospitals, dispensaries and asylums, they would be received within the fold of the regular profession. These conditions have been accepted by a few homoeopathists who have become members of the most prominent medical association in the United States.

Homoeopathy as it exists to-day can, in the opinion of its adherents, stand by itself, and its progress for a century in fact of prolonged and determined opposition appears to its upholders to be evidence of its truth. There are still, indeed, in both schools of medical thought, men who stand fast by their old principles. There are homoeopathists who can see nothing but evil in the practice of their brothers of the orthodox school, as there are allopaths who still regard homoeopathy as a humbug and a sham. There are, however, liberal-minded men in both schools, who look upon the adoption of any safe and efficient method of curing disease as the birthright of the true physician, and who allow every man to prescribe for his patients as his conscience may dictate, and, provided he be educated in the art of medicine, or at least the medical schools are ready to exchange views for the good of suffering humanity.

Great Britain.—Homoeopathy is not rapidly extending in Great Britain, and its recognition has been slow. The first notice taken of the new system of therapeutics was by the Medical Society of London, when in 1820 Dr. B. W. Lewis published an abstract of the works of Hahnemann, from which the word homoeopathy derives.
HOMOEOPATHY

Reports, the Journal of the British Homoeopathic Society, and the British Medical Journal, the latter from its inception in 1821, have carried the journal of the Homoeopathic Association, which was founded in 1902 for the purpose of developing and extending homoeopathy in Great Britain. The British Journal of Homoeopathy was first published in 1843, and was edited by John Hahnemann himself for the rest of his life. In 1847, the Association was incorporated and became the foremost homoeopathic journal in the world. Its motto was In curis unitas, in dubbis libertas, in omnibus caritatis. One reason why homoeopathy has been so successful is that the disease of the body is regarded in America as is the discrimination exercised against it by the General Medical Council, and another is want of cohesion amongst the homoeopathy themselves.

In 1842 Homeopathy was introduced into the United States by Dr Hans Birch Gram, who was born in Boston. His father being Danish, Gram in his eighteenth year went to Copenhagen, where he graduated in medicine in 1816, and brought a knowledge of it to America in 1825 when he settled in New York. The first homoeopathic association was formed in 1833 in Philadelphia, the second in New York, 1837, and homoeopathy became known in the United States that homoeopathy principally flourishes. There are at present thirty-five homoeopathic colleges and hospitals, with an enrolment of several millions. It may be noted that departments of homoeopathy are connected with the universities of Chicago, Indiana, Michigan, Iowa, Missouri, Kansas and Tennessee.

Canada.—The early history of homoeopathy can be traced back nearly to 1820 in the province of Quebec. In the Dominion of Canada the various provinces control the licensing of physicians, excepting in Quebec, which is the only province having a separate homoeopathic board of examiners. This is under the control of the Provincial homoeopathic Association, and is known as the College of Homoeopathic Physicians and Surgeons of Quebec. There are two such boards of examiners annually appointed by the association. Successful candidates receive the diploma of the college, and are entitled to add to their degree the letters M.C.H.P.S. A certificate of successful examination is forwarded to the lieutenant-governor at Quebec, who, "if satisfied of the loyalty, integrity and good morals of the applicant, may grant him a license to practise surgery, medicine and midwifery, or either of them, in the province of Quebec." The word "loyalty" has been decided by the provincial secretary to mean a British subject. This is the only national medical license now issued in the British empire, the others being by provincial boards or colleges of physicians and surgeons. The homoeopathic medical institution in the province; at present the Montreal Homoeopathic Hospital is in active operation. Two homoeopathic papers are published monthly—the Montreal Medical and Homoeopathic Journal, and the Canadian Journal of Medicine and Homoeopathy in Toronto. In 1879, in the province of Ontario, the three schools, allopathic, homoeopathic and eclectic, united for examining purposes into one board called the medical council, seventeen members representing the three schools being appointed. The homoeopathic and eclectic schools were merged in the old school, the board appointing five of Hahnemann's followers for examining purposes. Grace Hospital at Toronto (erected 1822) was begun as a dispensary in 1887, and in 1888 it was bought by the city, and is now called the Union Homoeopathic Dispensary, which was the starting-point of homoeopathy in Germany. In 1811 an endeavour was made to found an institution in Leipzig in which practitioners might learn the new method of treatment theoretically and practically, but it was not a success, as the entire tide of public opinion was against the system. In 1829, at the celebration of the fiftieth anniversary of Hahnemann's doctorate, the German Homoeopathic Society was organized, having its first meeting in 1830. In the university hospital of Munich some experiments were made to test the efficacy of homoeopathic medicines, but there was nothing like the success of the two world's wars, in England. In 1837 the first attempt was made to establish homoeopaths from dispensing their own medicines; this was a severe blow to the system. In 1834 there was a division among the homoeopathicists themselves, which much retarded the progress of the system in Germany. There is the first drive on homoeopathy in this time (January 1833) in Leipzig, but there was such constant wrangling among the physicians connected with it that its sphere of usefulness never increased. The school was founded in 1830 at Leipzig. The Baden Homoeopathic Society was established in 1834. The homoeopathic hospital in Munich was established in 1836, but suffered a similar fate to that of Leipzig, and was converted into a district hospital by the Bavarian Government. For many years Saxony and Bavaria was in direct contrast to the fate of two newly established hospitals in Austria, one in Vienna and the other in Linc, which had the support of many physicians and laymen. During the political confusion of 1846 and 1849 there was complete stagnation of everything medical in Germany. But during all these years, though the public institutions were few, the literature on homoeopathic subjects became very extensive, and increased so rapidly that at the end of the 19th century the homoeopathic literature was being published in all parts of the world. Hahnemann died in 1843, and on the 10th of August 1851 a bronze monument to him was unveiled at Leipzig. The Leipzig dispensary lived thirty-three years. From 1842 to 1874 there were four years' intervals between the new dispensaries. In 1845 homoeopathic physicians in Germany; they appeared to be strongest at Berlin, in the province of Brandenburg, in Pomerania and Silesia, Saxony, Stettin, Magdeburg, Frankfort, and Wurzburg.

Austria-Hungary.—Homeopathy was introduced into Austria about 1817, and in 1819 its practice was forbidden by law. Shortly afterwards the physician attending the archduke John became a homoeopathic physician. In 1841 Dr Feodorovna, the Imperial Empress of Russia, having a severe attack of dysentery, sent the homoeopathic physician in Vienna. The empress was cured. To test the efficacy of the system Francis I. ordered that experiments be made with homoeopathic medicines, and for this purpose a ward at St Elizabeth Hospital was set apart. The results were satisfactory to the new system, and it made great progress. During the cholera epidemic of 1836 an increased impetus was given to the new school by the reported brilliant successes of the treatment. The entire French army was homoeopathic in the Crimean War. In 1850 a third hospital was opened, and clinical lectures upon the system were delivered. In 1873 the Society of Homoeopathic Physicians was formed. Between the years 1873 and 1893 homoeopathy declined. In 1901, in thirty-seven cities and towns there were to be found about fifty physicians and two hospitals, and it was estimated that about seventy-five more were practising in the German universities. There are only one or two homoeopathic physicians in the United States, which is the only province of the United States where homoeopathy is practised, and has penetrated to the remotest parts of the country. In 1836 the civil engineers proposed to commemorate the virtues of the emperor Alexander II. by the erection of a hospital; a committee for collecting funds was created, and 58,064 roubles were handed to the Charity Society of the followers of homoeopathy at St Petersburg for the erection and founding of a homoeopathic hospital. The foundation stone of the edifice was laid on 19th June 1853, the emperor Alexander III, giving 5000 roubles. The inauguration of a new dispensary and a pharmacy took place on the 19th of April 1898, and the hospital itself, intended originally for fifty beds, was opened on the 1st of November 1899. There are sixty-six beds, there of thirty beds in the 2nd hospital. The hospital was founded in the name of the emperor Nicholas, the empress Maria Fedorovna, and the emperor Alexander III. On the 28th of January 1890 an imperial edict was issued granting the rights of public service to the hospital, and the establishment of the Russian Charity Society, thus placing them on an equality with the doctors of the prevailing medical school.

Homoeopathy was first introduced into France in 1830 by Count de Guidi, doctor of medicine, doctor of science, and inspector of the university, who practised in Lyons. About the same year Dr Antoine Petroz, widely known by his Grand dictionnaire des sciences medicales, began his practise in Paris, and his establishment became the headquarters of the new system there. In 1835 Hahnemann himself came to the capital. In 1832 the homoeopathic method of treating disease was introduced into the Hospice de Choisy, and in 1842 into the hospital of Carentan. Tessier practised the new doctrine in his wards in the hospital St Marguerite, and in the Children's Hospital up to the year 1862, when he was removed to the hospital of the Invalides. The first scientific journal in Paris was founded by Dr Petroz, who in 1835 opened the Paris Medical and Homoeopathic Review, an organ which appeared until 1836. The Institut National de la Santé et de la Recherché, L'Art medical, La Revue homoeopathique belge, Journal belge d'homoepathie, Le Thérapeutique Intégrale, La Revue homoeopathique française. In 1900 the International Congress of Homoeopathic Physicians, the 30th of that month, with appropriate ceremonies, the remains of Hahnemann were removed from the cemetery of Montmartre and deposited in the Pantheon. A monument was raised in his honor, and an inscription was erected to the memory of the founder of homoeopathy.

Italy.—The Austrians when they entered Naples in 1821 brought homoeopathy into Italy, the general in command of the army being
a devoted friend of Hahnemann. In 1828 Dr Count Sebastian de Guidi came from Naples and assisted in spreading the doctrine. During the period from 1830 to 1860 many physicians practised homeopathy, and the literature on the subject became extensive. A homeopathic hospital was established in Trinità Hospital at Naples, and a homeopathic physician was appointed to the count of Syracuse. During the severe cholera epidemics of 1854, 1855, 1860, a case of treatment of that disease was so marked under the care of Dr Rubini that the cholera of the authorities was directed to the system. In 1860 the homeoopathic practice was introduced into the Specola della Cesarina, and subsequently it was gathered with great favour in most of the cities. The Italian Homeopathic Institute is recognized by royal warrant as an established institution, and its regulations are approved by the government. In Turin the legal seat of the Homeopathic Institution is in the Hospital for the management of the State Association. The homeopathic medical press consists of the Rivista Omiopatica, established in 1855, and L'Omiopatca in Italy, the organ of the Italian Homeopathic Institute, which first appeared in 1884.

Spain.—Homeopathy was introduced into Spain in 1829 by a physician to the Royal Commission sent by the king of Naples to attend the marriage of Maria Christina with Don Ferdinand VII. Shortly after this, a merchant of Cadiz visited Hahnemann in Cothen, and was cured of a serious disorder; he returned to Spain with a supply of homeopathic literature, and immediately sent a merchant with it to some large cities. In the province of Seville, many cases of cholera were treated homeoopathically in Madrid. The civil war, which did not terminate until 1840, arrested all medical investigation in Spain, but in 1843 there still existed in Madrid a number of homeopathic physicians. About this time Dr Tosi Nanzeri returned from an investigation of the new system with Hahnemann, and owing to his success in the treatment of disease was created one of the physicians of the best classes in the kingdom. He soon arranged to be recognized with the title of marquis, with the grand crosses of the Charles III., and of the Civil Order of Beneficence. This recognition by high authority gave an impetus to homoeopathy which has continued ever since.

Denmark.—Homeopathy was unknown in Denmark until the year 1821, when Hans Christian Lund, a medical practitioner, adopted it. Hahnemann, however, had been both before and after that time consulted by Danes, and consequently homoeopathic therapeutics was recognized in different parts of the country. Lund translated many of Hahnemann's works into Danish, as well as those of other eminent members of the new school. (W. T. H.)

HOMONYM (Gr. ὑμώνυμος, having the same name, from ὑμω, same, alike, and ὑμωνα, name), a term in philology for those words which differ in sense but are alike in sound or spelling or both. Words alike only in spelling but not in sound, e.g. "bow," are sometimes called homographs; and words alike only in sound but not in spelling, e.g. "meat," "meet," "homeo- phones. Skene (Eymol. Dict.) gives a list of English homonyms.

HOMS, or Homs (anc. Emesa or Emessa, near the Hittite Kadesh), a town of Syria, on the right bank of the Orontes, and 35 miles to the W. of Tripoli. It is bounded by the S. (Damascus-Beirut) line. Pop. 30,000 (20,000 Moslem, 10,000 Christian). The importance of the place arises from its command of the great north road from Egypt, Palestine and Damascus by the Orontes valley. Invading armies from the south have often been opposed near Homs, from the time of Rameses II., who had to fight the battle of Kadesh, to that of Ibrahim Pasha, who broke the first line of Ottoman defence in 1831 by his victory there. Ancient Emesa, in the district of Apamea, was a very old Syrian city, devoted to the worship of Baal, the sun god, of whose great temple the emperor Heligabalus was originally a priest (a.d. 211). Apamea was a city of great influence in the Seleucid foundation of Apamea; but it opposed the Roman advance. There Aurelian crushed, in a.d. 272, the Syrian national movement led by Zenobia. Caracalla made it a Roman colony, and later it became the capital of a small province, Phoenicia Libanena or ad Libanum. About 630 it was captured by the Moslem leader, Khalid ibn Walid, who is buried there. It now became the capital of a jund, or military district, which under the Omeyyad Caliphs extended from Palmyra to the sea. Under the Arabs it was one of the largest cities in Syria, with walls and a strong citadel, which stood on a hill, occupying part of the site of the great and magnificent castles of the Roman times. The town, blown up by Ibrahim Pasha, are still the most conspicuous feature of Homs, and contain many remains of ancient buildings. Its men were noted for their courage in war, and its women for their beauty. The climate was extolled for its excellence, and the land for its fertility. A succession of gardens bordered the Orontes, and the vineyards were remarkable for their abundant yield of grapes. When the place capitulated the great church of St John was divided between the Christians and Moslems, an arrangement which apparently lasted until the arrival of the Turks. At the end of the 11th century it fell into crusading hands, but was recovered by the Moslems under Saladin in 1187. Its decay probably dates from the invasion of the Mongols (1260), who fought two important battles with the Egyptians (1281 and 1290) in its vicinity. The construction of a carriage road to Tripoli led to a partial revival of prosperity and to the export of cereals and fruit, and this growth has, in turn, been accentuated by the railway, which now connects it with Aleppo and the Damascus-Beirut line.

In the district is well planted with mulberries and produces much silk, most of which is worked up on the spot. (D. G. H.)

HO-NAN, a central province of China, bounded N. and E. by the Hwang-ho (which it crosses to the west of Ho-nan Fu), forming an arm northwards between the provinces of Shan-si and Chih-lü, on the W. by Shen-si, on the S. by Hu-p'ei, and on the E. by Ngan-hui. It occupies an area of 81,000 sq. m., with a population of about 21,100,000, and contains nine prefectoral counties. Its capital is K'ai-f'eng Fu. The prefecture of Hu-k'ang, south of the Hwang-ho, consists of a broad plain, "rendered park-like by numerous plantations of trees and shrubs, among which thick bosquets of bamboo contrast with the gloomy groves of cypress." All kinds of cereals grow luxuriantly, and the general productivity of the district is indicated by the extreme denseness of the population. The most noticeable feature in that portion of the province which is properly called Ho-nan is the Fu-niu Shan range, which runs east and west across this part of the province. Coal is found on the south of the Hwang-ho in the districts of Ho-nan Fu, the ancient capital, Lushan and Ju Chow. The chief products of the province are agricultural, especially in the valley of the Sang-ho and Pai-ho, which is an extensive and densely populated plain running north and south from the Fu-niu Shan. Cotton is also grown extensively and forms the principal article of export, and a considerable quantity of wild silk is produced from the Fu-niu Shan. Three roads from the east and south unite at Ho-nan Fu, and one from the west. The southern road leads to Ju Chow, where it forks, one branch going to Shi-chi-ch'ên, connecting the trade from Fan-ch'eng, Han-kow, and the Han river generally, and the other to Chow-kia-ch'ow near the city of Ch'ien-chow Fu, at the confluence of the three rivers which unite to form the Sha-ho; the second road runs parallel with the Hwang-ho to K'ai-f'eng Fu; the third crosses the Hwang-ho at Mêngching Hien, and passes thence in a north-easterly direction to Hwa-k'ing Fu, Sew-wu Hien and Wei-hui Fu, at which place it joins the high road from Peking to Fan-ch'eng; and the western road follows the southern bank of the Hwang-ho for 250 m. to its great bend at the fortified pass known as the Tung-kwan, where it joins the great wagon road leading through Shan-si from Peking to Si-gan Fu. Ho-nan is now traversed north to south by the Peking-Hankow railway (completed 1905). The line crosses the Hwang-ho by Yung-t'ie and runs east of the Fu-niu Shan. Branch lines serve Ho-nan Fu and K'ai-f'eng Fu.

HONAVAR, or ONOWRE, a seaport of British India, in the North Kanara district of Bombay. Pop. (1901) 6290. It is mentioned as a place of trade as early as the 16th century, and is associated with two interesting incidents in Anglo-Indian history. In 1670, the English factors here had a bull-dog which unfortunately killed a sacred bull, in revenge for which they were all murdered, to the number of eighteen persons, by an enraged mob. In 1784 it was bravely defended for three months by Captain Torrano and a detachment of sepoys against the army of Tippoo Sultan.

HONDA, or SÁN BARTOLOMEO DE HONDA, a town of the department of Tolima, Colombia, on the W. bank of the Magdalena river, 580 m. above its mouth. In 1906 Mr F. Loreine Petre
estimated the population at 7000. It is about 659 ft. above sea-level and stands at the entrance to a narrow valley formed by spurs of the Central Cordillera, through which a picturesque little stream, called the Guali, flows into the Magdalena. The town overlooks the rapids of the Magdalena, and is shut in closely by spurs of the Eastern and Central Cordilleras. The climate is hot and damp and the temperature frequently rises to 105° F. In the shade, Honda dates back to the beginning of the 17th century, and has been one of the important centres of traffic in South America for three hundred years. Within the city there is a Wira bridge across the Guali, and there is a suspension bridge across the Magdalena at the head of the rapids. A railway 18 m. long connects with the landing place of La Dorada, or Las Vegas, where the steamers of the lower Magdalena discharge and receive their cargoes (the old landing at Caroacali nearer the rapids having been abandoned), and with Arrancaplumas, 14 m. above, where navigation of the upper river begins. Up to 1908 the greater part of the traffic for Bogotá crossed the river at this point, and was carried on mule-back over the old camino real, which was at best only a rough bridle-path over which transportation to Bogotá (67 m. distant) was laborious and highly expensive; now the transshipment is made to smaller steamboats on the upper river for carriage to Girardot, 93 m. distant, from which place a railway runs to the Bogotá plateau. Honda was nearly destroyed by an earthquake in 1868.

HONDECOETER, MELCHIOR D' (c. 1636-1693), Dutch painter, was born at Utrecht, it is said, about 1636, and died at Amsterdam on the 3rd of April 1693. Old historians say that, being the grandson of Gillis and son of Gisbert d' Hondecoeter, as well as nephew of J. B. Weenix, he was brought up by the last two to the profession of painting. Of Weenix we know that he married one Josina d'Hondecoeter in 1658. Melchior was, therefore, related to Weenix, who certainly influenced his style. As to Gillis and Gisbert some points still remain obscure, and it is difficult to accept the statement that they stood towards each other in the relation of father and son, since both were registered as painters at Utrecht in 1637. Both it appears had practised art before coming to Utrecht, but where they resided or what they painted is uncertain. Unhappy pictures scarcely help us to clear up the mystery. In the Fürstenberg collection at Donaueschingen there is a "Concert of Birds" dated 1630, and signed with the monogram G. D. H.; and we may presume that G. D. H. is the man whose "Hen and Chickens in a Landscape" in the gallery of Rotterdam is inscribed G. D. H. "Hondecoeter, 1652"; but is the first letter of the monogram to stand for Gillis or Gisbert? In the museums of Dresden and Cassel landscapes with sportsmen are catalogued under the name of Gabriel de Weenix (q.v.), one of them dated 1629, and certified with the monogram G. D. H., challenging attention by resemblance to a canvas of the same class inscribed G. D. Hond. in the Berlin Museum. The question here is also whether G. means Gillis or Gisbert. Obviously there are two artists to consider, one of whom paints birds, the other landscapes and sportsmen. Perhaps the first is Gisbert, whose son Melchior also chose birds as his peculiar subject. Weenix too would naturally teach his nephew to study the feathered tribe. Melchior, however, began his career with a different specialty from that by which he is usually known. Mr de Stuers affirms that he produced sea-pieces. One of his earliest works is a "Tub with Fish," dated 1655, in the gallery of Brunswick. But Melchior soon abandoned fish or fowl. He acquired celebrity as a painter of birds only, which he represented not exclusively, like Fyt, as the gamekeeper's perquisite after a day's shooting, or stock of a poulterer's shop, but as living beings with passions, joys, fears and quarrels, to which naturalists will tell us that birds are subject. With the brilliance and high finish of Fyt, his Dutch rival's birds are full of action; and, as Bürger truly says, Hondecoeter displays the maternity of the hen with as much tenderness and feeling as Raphael the maternity of Madonnas. But Fyt was at home in depicting the coat of deer and dogs as well as plumage. Hondecoeter cultivates a narrower field, and seldom goes beyond a cock-fight or a display of mere bird life. Very few of his pictures are dated, though more are signed. Amongst the former we should note the "Jack-daw deprived of his Borrowed Plumage" (1671), at the Hague, of which Carl Cadogan has a variety; or "Game and Poultry" and "A Spanish hunting a Partridge" (1672), in the gallery of Brussels; or "A Park with Poultry" (1686) at the Hermitage of St Petersburg. Hondecoeter, in great favour with the magnates of the Netherlands, became a member of the painters' academy at the Hague in 1659. William III. employed him to paint his canvases in 1670, and the picture, now at the Hague museum, shows that he could at a pinch overcome the difficulty of representing India's cattle, elephants and gazelles. But he is better in homelier works, with which he adorned the royal chateaux of Bensberg and Oranienstein at different periods of his life (Hague and Amsterdam). In 1688 Hondecoeter took the freedom of the city of Amsterdam, where he resided till his death. His earliest works are more conscientious, lighter and more transparent than his later ones. At all times he is bold of touch and sure of eye, giving the motion of birds with great spirit and accuracy. His masterpieces are at the Hague and Amsterdam. But there are fine examples in private collections in England, and in the public galleries of Berlin, Caen, Carlsruhe, Cassel, Cologne, Copenhagen, Dresden, Dublin, Florence, Glasgow, Hanover, London, Lyons, Montpellier, Munich, Paris, Rotterdam, Rouen, St Petersburg, Stuttgart and Vienna.

HONDURAS, a republic of Central America, bounded on the N. by the Caribbean Sea, F. by Nicaragua, S. by Nicaragua, the Pacific Ocean and Salvador, and W. by Guatemala. (For map see CENTRAL AMERICA.) Pop. (1905) 600,136; area, about 46,500 sq. m. Honduras is said to owe its name, meaning in Spanish "depths," to the difficulty experienced by its original Spanish explorers in finding anchorage off its shores; Cape Gracias à Dios (Cape "Thanks to God") is the name bestowed, for analogous reasons, on its easternmost headland, which shelters a small harbour, now included in Nicaragua. Modern navigators are not confronted by the same difficulty; for, although the north coast is unbroken by any remarkable inlet except the Carataaska Lagoon, a land-locked lake on the east, with a narrow entrance from the sea, there are many small bays and estuaries, such as those of Puerto Cortes, Omoa, Ulua, La Ceiba and Trujillo, which serve as harbours. The broad basin of the Caribbean Sea, bounded by Honduras, Guatemala and British Honduras, is known as the bay or gulf of Honduras. Several islets and the important group of the Bay Islands (q.v.) belong to the republic. On the Pacific the Hondurian littoral is short but of great commercial value; for it consists of a frontage of some 60 m. on the Bay of Fonseca (q.v.), one of the principal harbours of the whole Anglo-American section. It includes, Sacate Grande and Guenguessi, in the bay, belong to Honduras.

The frontier which separates the republic from Nicaragua extends across the continent from E.N.E. to W.S.W. It is defined by the river Segovia, Wanks or Coco, for about one-third of the distance; it then deflects across the watershed on the east and south of the river Choluteca, crosses the main Nicaraguan Cordillera (mountain chain) and follows the river Negro to the Bay of Fonseca. The line of separation from Malvadita is marked by the first inlets of that stream on both sides, the one on a westerly direction; beginning at the mouth of the river Goascoran, in the Bay of Fonseca, it ends 12 m. W. of San Francisco city. At this point begins the Guatemalan frontier, the largest section of which is delimited along the crest of the Sierra de Merendon. On the Caribbean seaboard the estuary of the Motagua forms the boundary between Honduras and Guatemala.

Physical Features.—The general aspect of the country is mountainous; its southern half is traversed by a continuation of the main Nicaraguan Cordillera. The chain does not, in this approach within 50 or 60 m. of the Pacific; nor does it throughout maintain its general character of an unbroken range, but sometimes turns back upon itself, forming interior basins or valleys, within which are collected the headwaters of the streams that traverse the country in the direction of the Atlantic Ocean. Nevertheless, viewed from the
HONDURAS

Pacific, it presents the appearance of a great natural wall, with many volcanic peaks towering above it and with a lower range of mountains interlacing. It is true that the former probably is not always what it appears at one time the Pacific broke at the foot of the great mountain and that the subordinate coast range was subsequently thrust up by volcanic forces. At one point the main range is interrupted by a great transverse valley, or plain known as the plain of Comayagua; this has an extreme length of about 40 m., with a width of from 5 to 15 m. From this plain the valley of the river Humuya extends north to the Atlantic, and the valley of the Goascoran extends south to the Bay of Fonseca. Farther south, the river Jiquilisco rises in a great transverse valley reaching from sea to sea, which was pointed out soon after the conquest as an appropriate course for inter-oceanic communication. The mountains of the northern half of Honduras are not volcanic in character, and the interior valleys are those of the south, which sometimes exceed 10,000 ft. The relief of all the highlands of the Atlantic watershed is extremely varied; its culminating points are probably in the mountain mass about the sources of the Choluteca, Sulaco and Roman, and in the Sierra de Piza, near the coast. Further eastward the different ranges are less clearly marked and the surface of the country resembles a plateau intersected by numerous watercourses.

The rivers of the Atlantic slope of Honduras are numerous and some of them of large size and navigable. The largest is the Uluca, with its tributary the Humuya. It rises in the plain of Comayagua and flows north to the Atlantic, while its eastern tributary, the Comala, rising near 60 m. of the Junco river, ascending by boats of light draft for 80 m. Rio Tinto, Negro or Black River, called also Poyer or Peys, is a considerable stream, navigable by small vessels for about 60 m. Some English settlements were established near the mouth of this river. The Rio Pico rises near the frontier of Nicaragua, and enters the Atlantic east of the Brus or Brewer lagoon. The Segovia is the longest river in Central America, rising within 90 m. of the Bay of Fonseca, and flowing into the Caribbean sea at Cape Gracias a Dios (see Nicaragua). Three considerable rivers flow into the Pacific—the Goascoran, Nacoame and Choluteca, the last named having a length of near 200 m. The great rivers of the Atlantic slope of Honduras, the Humuya, in the plain of Comayagua, has a length of about 80 m. The lake of Yojoua or Taulebe is the only large inland lake in Honduras, and is about 25 m. in length, by 6 to 8 in breadth. Its surface is 200 ft. above the sea. It has two outlets on the south, the rivers Jaiatique and Carapaca, which unite about 15 m. from the lake; and it is drained on the north by the Rio Blanco, a narrow, deep stream falling into the Uluca. It also has a feeder on the north, in the form of a river near the Atlantic coast, which, after a series of falls, comes to the surface. The Caratasca or Caratasca lagoon is a shallow salt-water lake connected by a narrow channel with the Atlantic. It forms the mouth of the Segovia. It contains several large sandy islands.

Honduras resembles the neighbouring countries in the general character of its geological formations, fauna and flora. Here, as in other parts of Central America, there are extensive tracts of rain forest, from May to November, and the dry, from November to May. On the moist lowlands of the Atlantic coast the climate is oppressive, but on the highlands of the interior it is delightful. At Tegucigalpa, on the uplands, a year's observations showed the mean temperature to be 90° F. in May, and the minimum to be 50° F. in December, the range of variation during the whole year being within 40° F. See also CEntral America: Geology, Fauna, Flora, Climate.

Inhabitants.—The inhabitants of Honduras are in many cases of the Indian or aboriginal type, and the European element is very small, although it shares in the social, political and economic preponderance of the Spanish-speaking half-castes (Ladinos or Mestizos), who are the most numerous section of the population. Throughout the country there are many interesting relics of the native civilization which was destroyed by the Spanish invaders in the 16th century. In the eastern part of the states, the coast south of Cape Gracias a Dios, and the Segovia river, the country is almost wholly occupied by native Indian tribes, known under the general names of Xicas and Poyas. In many districts the Indians are known as Lencas, a generic name which includes several tribes akin to the Mayans of Guatemala. Portions of all of these tribes have accepted the Roman Catholic religion, and live in peaceful neighbourhood and good understanding with the white inhabitants. There are, however, considerable numbers, probably about 90,000 in all, who live among the mountains, and still conform closely to the aboriginal modes of life. They all cultivate the soil, and are good and industrious labourers. A small portion of the coast, above Cape Gracias, is occupied by the Sambos, a mixed race of Indians and negroes, which, however, is fast disappearing. Spreading along the entire north coast are the Caribs, a vigorous race, descendants of the Caribs of St Vincent, one of the Windward Islands. These, to the number of 5000, were deported in 1796 by the English and landed on the island of Roatan. They still retain their national language, although it tends to disappear and be replaced by Spanish and a back dialect English; they are active, industrious and provident, forming the chief body of the mahogany cutters on the coast. A portion of them, who have a mixture of negro blood, are called the Black Caribs. They profess the Roman Catholic religion, but retain many of their native rites and superstitions. In the departments of Gracias, Comayagua and Choluteca are many purely Indian towns.

The aggregate population, according to an official estimate made in 1905, is 500,159, but a complete and satisfactory census cannot be taken throughout the country, since the census of the people, and especially the Indians, avoid a census as in so many other parts of the world, as a means of voluntary taxation or exaction. The bulk of the Spanish population is found on the Pacific slope of the continent, while on the Atlantic the country is uninhabited or but sparsely occupied by Indian tribes, of which the number is wholly unknown. In 1905 there were fewer than 17 inhabitants per sq. m., but all the available data tend to show that the population increases rapidly, owing to the continuous excess of births over deaths. The first census, taken in 1791, gave the total population as only 95,500. There is little emigration or immigration.

The capital is Tegucigalpa (pop. 1905, about 35,000); other important towns are Jutiguala (18,000), Comayagua (8000), and the seaports of Amatigual and Tlapana (1000), and Puerto Cortes (2500). These are described in separate articles. The towns of Nacaome, La Esperanza, Choluteca and Santa Rosa have upwards of 10,000 inhabitants.

Communications.—Means of communication are very defective. In 1905 the only railway in the country was that from Puerto Cortes to La Pimienta, a distance of 57 m. This is a section of the proposed inter-oceanic railway for which the external debt of the republic was incurred. For the completion of the line concessions were granted, one after another, were granted, and expired or were revoked. Other railways are projected, including one along the Atlantic coast, an extension of the Guatemala-Costa Rica line, and a line from Gracias a Dios to Tegucigalpa, and to the port of San Lorenzo. The capital is connected with other towns by fairly well made roads, which, however, are not kept in good repair. In the interior generally, all travelling and transport are by mules and ox-carts over two and three days' journey. In 1880, Honduras joined the Postal Union in 1879. The telegraph service is conducted by the government and is inefficient. Telegraphs are obtained by the Spanish from mines near important towns.

Commerce and Industry.—Although grants of land for mining and agricultural purposes are readily made by the state to companies and individual capitalists, the economic development of Honduras has been a very slow process, impeded as it has been by political disturbances and in modern times by national bankruptcy, heavy import and export duties, and the scarcity of both labour and capital. The natural wealth of the country is great and consists especially in its veins of gold, silver, antimony, and copper. A large part of Honduras are unassumed, but the destruction of these and of other valuable cabinet-woods and dye-woods has much reduced the supply available for export. With the growth of the modern industry, has proved successful, and tends to supplement the almost exhausted stock of wild rubber. Of still greater importance are the plantations of bananas, especially in the northern maritime provinces. The production of coffee, tobacco, sugar, oranges, lemons, maize and beans are produced in all parts, rice, cocoa, indigo and wheat over more limited areas. Cattle and pigs are bred extensively; cattle are exported to Cuba, and dairy-farming is carried on with success. Sheep-farming is almost an unknown industry. Turtle and fish are obtained in large quantities off the Atlantic seaboard. In its mineral resources Honduras ranks first in the state of Central America. Silver is worked by a British company, gold by a French company. The mining was practised in a primitive manner even before the Spanish conquest, and in the 18th century immense quantities of gold and silver were obtained by the Spanish from mines near Tegucigalpa. Orpals, platinum, copper, lead, zinc, nickel, antimony, iron, coal have been found, but the causes already enumerated have
prevented the exploitation of any of these minerals on a large scale, and the total value of the ores exported was only £174,800 in 1904 and £239,426 in 1905. The total value of the exports in a normal year is £1,000,000 or more, and that of timber, hides, and furs is £650,000 to £500,000. Apart from minerals the most valuable commodity exported is bananas (209,263 in 1905): cacao-nuts, timber, hides, deer-skins, feathers, coffee, sarsaparilla and rubber are also exported. Nearly all the exportable products are shipped to the United States, which also send to Honduras more than half of its imports. These chiefly consist of cotton goods, hardware and provisions. The manufacturing industries of Honduras include the plaiting of straw hats, cigar-making, brick-making and the distillation of spirits.

Finance.—Owing to the greater variety of its products and the greater purchasing power of its public currency, Honduras is less affected by fluctuations of exchange than the neighbouring republics, in which little except paper money circulates. The monetary unit is the silver peso, and the strength of its silver currency is worth about 1s. 8d.; the gold dollar is worth about 48s.

The principal coins in circulation are the 1-cent copper piece, 5, 10, 20, 25 and 50 centavos, and 1 peso silver pieces, and 1, 5, 10 and 20 dollar gold pieces. The metric system of weights and measures, adopted officially on the 1st of April 1897, has not supplanted the older Spanish standards in general use. There is only one bank in the republic, the Banco de Honduras, with its head office at Tegucigalpa. Its bills are legal tender for all debts due to the state.

In July 1899 the foreign debt of Honduras, with arrears of interest, amounted to £2,470,510, of which more than £1,000,000 were for advances to the railways. The principal debt dates between 1870 and 1879, chiefly for railway construction; but it was mainly devoted to other purposes and no interest has been paid since 1872. The country is nearly bankrupt, its revenue, derived chiefly from customs and from the spirit, gunpowder and tobacco monopolies, reached an average of £265,000 during the five years 1901-1905; the expenditure in normal years is about £250,000. The prosecution of wars and departments are those of war, finance, public works and education.

Constitution and Government.—The constitution of Honduras, promulgated in 1839 and frequently amended, was to a great extent rescinded in 1886. It was again remodelled in 1894, when a new charter was proclaimed. This instrument gives the legislative power to a congress of deputies elected for four years by popular vote, in the ratio of one member for every 10,000 inhabitants. The congress meets on the 1st of January and sits for sixty consecutive days. The executive is entrusted to the president, who is nominated and elected for four years by popular vote, and is re-eligible for a second but not for a third consecutive term. He is assisted by a council of ministers representing the departments of the interior, war, finance, public works, education and justice. For purposes of local administration the republic is divided into sixteen departments. The highest judicial power is vested in the Supreme Court, which consists of five popularly elected judges; there are also four Courts of Appeals, and lower courts of justice and district tribunals. The active army consists of about 500 regular soldiers and 20,000 militia, recruited by conscription from all able-bodied males between the ages of twenty and thirty. Service in the reserve is obligatory for a further period of ten years.

Religion and Education.—Roman Catholicism is the creed of a very large majority of the population; but the constitution grants complete liberty to all religious communities, and no Church is supported by public funds or receives any other public privilege. Education is free, secular and compulsory for children between the ages of seven and fifteen. The government is responsible for the conversion of the school system, but the percentage of illiterates is high, especially among the Indians. The state maintains a central institute and a university at Tegucigalpa, a school of jurisprudence at Comayagua, and colleges for secondary education, with special schools for teachers, in each department. The annual cost of primary education is about £11,000.

History.—It was at Cape Honduras that Columbus first landed on the American continent in 1502, and took possession of the country on behalf of Spain. The first settlement was made in 1524 by order of Hernando Cortes, who had heard rumours of rich and populous empires in this region, and sent his lieutenant Christoval de Olid to found a Spanish colony. Owing to the resistance of the Guatemalan and the warlike nature of the Indians, the settlement was abandoned in 1526. In 1565 the Spaniards were enabled to undertake the long and arduous march across the mountains of southern Mexico and Guatemala. In the spring of 1525 he reached the colony and founded the city which is now Puerto Cortes. He entrusted the administration to a new governor, whose successors were to be nominated by the king, and returned to Mexico in 1536. By 1559, when Honduras was incorporated in the captaincy-general of Guatemala, the mines of the province had proved to be the richest as yet discovered in the New World and several large cities had come into existence. The system under which Honduras was administered from 1559 to 1821, when it repudiated the authority of the Spanish crown, the effects of that system, the part subsequently played by Honduras in the protracted struggle for Central American unity, and the invasion by William Walker and his followers (1855-1860), are fully described under CENTRAL AMERICA.

War and revolution had stunted the economic growth of the country and retarded every attempt at social or political reform; its future was mortgaged by the assumption of an enormous burden of debt in 1869 and 1870. A renewal of war with Guatemala in 1871, and a revolution three years later in the interests of the ex-president Medina, brought about the intervention of the neighbouring states and the provisional appointment to the presidency of Mariano Aurelio Soto, a nominee of Guatemala. This appointment proved successful and was confirmed by popular vote in 1877 and 1880, when a new constitution was issued and the seat of government fixed at Tegucigalpa. Fresh outbreaks of civil war occurred frequently between 1883 and 1903; the republic was bankrupt and progress again at a standstill. In 1903 Manuel Bonilla, an able, popular and experienced general, gained the presidency and seemed likely to repeat the success of Soto in maintaining order. As his term of office drew to a close, and his re-election appeared certain, the leaders of rival candidates and some of his own political adherents intrigued to secure the co-operation of Nicaragua for his overthrow. Bonilla welcomed the opportunity of consolidating his own position which a successful war would offer; José Santos Zelaya, the president of Nicaragua, was equally ambitious; and several alleged violations of territory had embittered popular feeling on both sides. The United States and Mexican governments endeavoured to secure a peaceful settlement without intervention, but failed. At the outbreak of hostilities in February 1902 the Honduran forces were commanded by Bonilla in person and by General Sotero Barahona his minister of war. One of their chief subordinates was Lee Christmas, an adventurer from Memphis, Tennessee, who had previously been a locomotive-driver. Honduras received active support from his ally, Salvador, and was favoured by public opinion throughout Central America. But from the outset the Nicaraguans proved victorious, largely owing to their remarkable mobility. Their superior naval force enabled them to capture Puerto Cortes and La Ceiba, and to threaten Tegucigalpa, prolonging hostilities on land they were eventually evacuated by a body of Nicaraguan rebels, who also established a provisional government. Zelaya captured Tegucigalpa after severe fighting, and besieged Bonilla in Ampala. Lee Christmas was killed. The surrender of Amapala on the 11th of April practically ended the war. Bonilla took refuge on board the United States cruiser "Chicago." A noteworthy feature of the war was the attitude of the American naval officers, who landed marines, armed the surrender, and arrested Bonilla, and who threatened to deport to the United States any deserting officers; on land they were compelled to evacuate by the Nicaraguans, and her provisional government was recognized by Zelaya. Miguel R. Davila was president in 1908 and 1909.

Bibliography.—Official documents such as the annual presidential message and the reports of the ministries are published in the local newspapers. Tegucigalpa: El Liberal, Tegucigalpa: El Diario, and El Curioso are publications which throw much light on the movement of trade and politics are the British Foreign Office reports (London, annual), United States consular reports (Washington, monthly), bulletins of Nicaragua (Washington), and reports of the Council of the Corporation of Foreign Bondholders (London, annual). For a more comprehensive account of the country and its history, the works of K. Burkett, E. G. Squier, A. H. Kroeber, and others, cited under CENTRAL AMERICA, are important. See also E. Pelletier, Honduras et ses ports: documents officiels sur le chemin-de-fer interocéanique (Paris, 1865); E. G. Squier, "Honduras," in "Honduras, its History, Geography and Statistics" (London, 1880); C. Charles, Honduras (Chicago, 1890); and Handbook of Honduras, published by the Bureau of American
Hone, N.—Hone

Republiques (1892); T. R. Lombard, The New Honduras (New York, 1887); H. Laliberté, La République de Honduras (Antwerp, 1898); Perry, Directorio nacional de Honduras (New York, 1899); H. G. Bourgeois, Breve noticia sobre Honduras (Tegucigalpa, 1900).

HONE, NATHANIEL (1718–1784), British painter, was the son of a merchant in Dublin, and without any regular training acquired in his youth much skill as a portrait-painter. Early in his career he left Dublin for England and worked first in various provincial towns, but ultimately settled in London, where he soon made a considerable reputation. His oil-paintings were decidedly popular, but he gained his chief success by his miniatures and enamels, which he executed with marvellous capacity. He became a member of the Incorporated Society of Artists and afterwards a foundation member of the Royal Academy; but he had several disagreements with his fellow-members of that institution, and on one occasion they rejected two of his pictures, one of which was regarded as a satire on Reynolds and the other on Angelica Kaufman. Most of his contributions to the Academy exhibitions were portraits. The quality of his work varied greatly, but the merit of his miniatures and enamels entitles him to a place among the ablest artists of the British school. He executed also a few mezzo-tint plates of reasonable importance, and some etchings. His portrait, painted by himself two years before his death, is in the possession of the Royal Academy.

HONE, WILLIAM (1780–1842), English writer and bookseller, was born at Bath on the 3rd of June 1780. His father brought up his children with the sectarian narrowness that so frequently produces reaction. Hone received no systematic education, and was taught to read from the Bible only. His father having removed to London in 1783, he was in 1790 placed in an attorney's office. After two and a half years spent in the office of a solicitor at Chatham he returned to London to become clerk to a solicitor in Gray's Inn. But he disliked the law, and had already acquired a taste for free-thought and political agitation. He married in 1800, and started a book and print shop with a circulating library in Lambeth Walk. He soon removed to St Martin's Churchyard, where he brought out his first publication, Shaw's Gardener (1806). It was at this time that he and his friend, John Bone, tried to realize a plan for the establishment of popular savings banks, and even had an interview on the subject with the president of the Board of Trade. This scheme, however, failed. Bone joined him next in a bookseller's business; but Hone's habits were not those of a tradesman, and bankruptcy was the result. He was in 1811 chosen by the booksellers as auctioneer to the trade, and had an office in Ivy Lane. Independent investigations carried on by him into the condition of lunatic asylums led again to business difficulties and failure, but he took a small lodging in the Old Bailey, keeping himself and his now large family by contributions to magazines and reviews. He hired a small shop, or rather box, in Fleet Street but this was on two separate nights broken into, and valuable books lent for show were stolen. In 1815 he started the Traveller newspaper, and endeavoured vainly to exculpate Eliza Fenning, a poor girl, apparently quite guiltless, who was executed on a charge of murder. But he failed in this, and early in 1816 he established the Reformer's Register, writing in it as the serious critic of the state abuses, which he soon after attacked in the famous political squibs and parodies, illustrated by George Cruikshank. In April 1817 three ex-officio informations were filed against him by the attorney-general, Sir William Garrow. Three separate trials took place in the Guildhall before special juries on the 18th, 19th and 20th of December 1817. The first, for publishing Wilkes's Catechism of a Ministerial Member (1817), was before Mr Justice Abbot (afterwards Lord Tenterden); the second, for parodying the litany and libelling the prince regent, and the third, for publishing the Seditious Creed (1817)'s parody on the Athanasian creed; were before Lord Ellenborough (q.v.). The prosecution took the ground that the prints were calculated to injure public morals, and to bring the prayer-book and even religion itself into contempt. But there can be no doubt that the real motives of the prosecution were political; Hone had ridiculed the habits and exposed the corruption of the prince regent and of other persons in power. He went to the root of the matter when he wished the jury "to understand that, had he been a publisher of ministerial parodies, he would not then have been defending himself on the floor of that court." In spite of illness and exhaustion Hone displayed great courage and ability, speaking on each of the three days for about seven hours. Although his judges were biased against him he was acquitted on each count, and the result was received with enthusiastic cheers by immense crowds within and without the court. Soon after the trials a subscription was begun which enabled him to get over the difficulties caused by his prosecution. Among Hone's most successful political parodies were the Enamelled House that Jack Built (1819), The Queen's Matrimonial Ladder (1820), in favour of Queen Caroline, The Man in the Moon (1820), The Political Showman (1821), all illustrated by Cruikshank. Many of his squibs are directed against a certain "Dr Slop," a nickname given by him to Dr (afterwards Sir John) Stoddart, of The Times. In researches for his defence he had come upon some curious and at that time little trodden literary ground, and the results were shown by his publication in 1820 of his Apocryphal New Testament. And in 1823 of his Ancient Mysteries Explained. In 1826 he published the Enamelled Book, in 1827–1828 the Table-Book, and in 1829 the Year-Book; all three were collections of curious information on manners, antiquities and various other subjects. These are the works by which Hone is best remembered. In preparing them he had the approval of Southey and the assistance of Charles Lamb, but peculiarly they were not successful, and Hone was lodged in King's Bench prison for debt. Friends, however, again came to his assistance, and he was established in a coffee-house in Gracechurch Street; but this, like most of his enterprises, ended in failure. Hone's attitude of mind had gradually changed to that of a free-thinker, and during the latter years of his life he frequently preached in Leigh House Chapel, Eastcheap. In 1830 he edited Strutt's Sports and Pastimes, and he contributed to the first number of the Penny Magazine. He was also for some years sub-editor of the Patriot. He died at Tottenham on the 6th of November 1842.

Hone (in O. Eng. hôn, cognate with Swed. hon; the root appears in Skt. āhā, āha to sharpen), a variety of finely siliceous stone employed for whetting or sharpening edge tools, and for abrading steel and other hard surfaces. Synonyms are hone, whetstone, oillstone and sharpening stone. Hones are generally prepared in the form of flat slabs or small pencils or rods, but some are made with the outline of the special instrument they are designed to sharpen. Their abrading action is due to the quartz or silica which is always present in predominating proportion, some kinds consisting of almost pure quartz, while in others the siliceous element is very intimately mixed with aluminous or calcareous matter, forming a uniform compact stone, the extremely fine siliceous particles of which impart a remarkably keen edge to the instruments for the sharpening of which they are applied. In some cases the presence of minute garnets or magnetite assists in the cutting action. Hones of the coarsest grades are useful only for turning or rough grinding, the object to be sharpened is drawn with hand pressure backward and forward across the surface of the hone; but sometimes the stone is moved over the cutting edge.

The coarsest type of stone which can be included among hones is the bat or scythe stone, a porous fine-grained sandstone used for sharpening scythes and cutters of mowing machines, and for other like purposes. Next come the ragstones, which consist of quartzite mica-schist, and give a finer edge than any sandstone. Under the head of oillstones or hones proper the most famous and best-known qualities are the German razor hone, the Turkey oillstone, and the Arkansas stone. The German razor hone, used, as its name implies, chiefly for razors, is obtained from the slate mountains near Ratisbon, where it forms a yellow vein of from 1 to 1½ in. in the blue slate. It is sawn into thin slabs, and these are cemented to slabs of slate which serve as a support. Turkey oillstone is a close-grained bluish stone
HONEY

containing from 70 to 75% of silica in a state of very fine division, intimately blended with about 20 to 25% of calcite. It is obtained only in small pieces, frequently flamed and not tough, so that the slabs must have a backing of slate or wood. It is one of the most valuable of all whetstones, abrading the hardest steel, and possessing sufficient compactness to resist the pressure required for sharpening gravers. The stone comes from the interior of Asia Minor, whence it is carried to Smyrna. Of Arkansas stones there are two varieties, both found in the same district, Garland and Saline counties, Arkansas, United States. The finer kind, known as Arkansas hone, is obtained in small pieces at the Hot Springs, and the second quality, distinguished as Washita stone, comes from Washita or Ouachita river. The hone yields on analysis 98% of silica, with small proportions of alumina, potash and soda, and mere traces of iron, lime, magnesia and fluorine. They are white in colour, extremely hard and keen in grit, and not easily worn down or broken. Geologically the materials are called novaculites, and are supposed to be metamorphosed sandstone silt, chalk or limestone resulting from the permeation through the mass of heated alkaline siliceous waters. The finer kind is employed for fine cutting instruments, and also for polishing steel pivots of watch-wheels and similar minute work, the second and coarser quality being used for common tools. Both varieties are largely exported from the United States in the form of blocks, slips, pencils, rods and wheels. Other honestones are obtained in the state of New York, the northern and central counties, Ohio (Deerlick stone) and Indiana (Hindostan or Orange stone). Among hone of less importance in general use may be noted the Charley Forest stone—or Whittle Hill honestone—a good substitute for Turkey oilstone; Water of Ayr stone, Scotch stone, or snake stone, a pale grey carboniferous shale hardened by igneous action, used for tools and for polishing marble and copper-plates; Idwall or Welsh oilstone, used for small articles; and cutlers' greenstone from Snowden, very hard and close in texture, used for giving a fine edge to knives.

HONEY (Chin. mē; Sansk. madhu, mead, honey; cf. A.S. medo, medu, mead; Gr. μέλι, in which θ or ό is changed into η; Lat. mel; Fr. miel; A.S. hunig; Ger. Honig), a sweet viscid liquid, obtained by bees (see BEE, Bee-keeping) chiefly from the nectaries of flowers, i.e. those parts of flowers specially constructed for the elaboration of honey, and, after transportation to the hive in the proventriculus or crop of the insects, discharged by them into the cells prepared for its reception. Whether the nectar undergoes any alteration within the crop of the bee is a point on which authors have differed. Some wags, e.g. Myraptora scutellaris and the genus Nectaria, collect honey. A honey-like fluid, which consists of a nearly pure solution of uncrystallizable sugar having the formula C12H22O11 after drying in vacuo, and which is used by the Mexicans in the preparation of a beverage, is yielded by certain inactive individuals of Myrmecocystus mexicanus, Wesmael, the honey-ants or pouched ants (hormigas mieleras or mochileras) of Mexico.4 The abdomen in these insects, owing to the distensibility of the membrane connecting its segments, becomes converted into a globular thin-walled sac by the accumulation within it of the nectar supplied to them by their working comrades (Wesmael, Bull. de l'Acad. Roy. de Brux., v. 766, 1838). By the Rev. H. C. Mc'Cook, who discovered the insect in the Garden of the Gods, Colorado, the honey-beaters were found hanging by their feet, in groups of about thirty, to the roofs of special chambers in their underground nests, their large globular abdomens causing them to resemble "bunches of small Delaware grapes" (Proc. Acad. Nat. Sci. Philad., 1859, p. 107). A bladder-shaped sac on the metathorax of another ant, Campogastra inflata (F. Smith, Cat. of Hymenoptera, pt. vi, pp. 136 and 200, pl. ix fig. 1),

1 The term honey in its various forms is peculiar to the Teutonic group of languages, and in the Gothic New Testament is wanting, the Greek word being there translated melith.
3 Wetherill (Chem. Gaz. xi. 72, 1853) calculates that the average weight of the honey is 8-2 times that of the body of the ant, or 0-3942 grammes.

which has a small circular orifice at each lateral angular part, appears to possess a function similar to that of the abdomen in the honey-ant.

It is a popular saying that where is the best honey there also is the best wool; and a pastoral district, since it affords a greater profusion of flowers, is superior for the production of honey to one under tilage.4 Dry warm weather is most favourable to the secretion of nectar by flowers. It protects them from rain by various internal structures, such as papilae, cushions of hairs and spurs, or by virtue of their position (in the raspberry, drooping), or the arrangement of their constituent parts. Dr A. W. Bennett (How Flowers are Fertilized, p. 31, 1873) has remarked that the perfume of flowers is generally derived from their nectar; the blossoms of some plants, however, as ivory and holly, though almost scentless, are highly nectariferous. The exudation of a honey-like or saccharine fluid, as honey, from the nectar glands of the flowers in all plants. A sweet material, the manna of pharmacy, e.g. is produced by the leaves and stems of a species of ash, Fraxinus Ormus; and honey-secreting glands are to be met with on the leaves, petioles, phyllodes, stipules (as in Vicia sativa), or bracteae (as in the Margaritacea) of a considerable number of different vegetable forms. The origin of the honey-yielding properties manifested specially by flowers among the several parts of plants has been carefully considered by Darwin, who regards the saccharine matter in nectar as a waste product of the flowers. Inasmuch as the sugar is derived by the plants, it is excreted within the envelopes of flowers, was utilized for the important object of cross-fertilization, and subsequently was much increased in quantity, and stored in various ways (see Cross and Self Fertilization of Plants, pp. 402 sq., 1876). It has been noted with respect to the nectar of the fuchsia that it is most abundant when the anthers are about to dehisce, and absent in the unexpanded flower.

Pettigrew is of opinion that few bees go more than 2 m. from home in search of honey. The number of blossoms visited in order to meet the requirements of a single hive of bees must be very great; for it has been found by A. S. Wilson (" On the Nectar of Flowers," Brit. Assoc. Rep., 1878, p. 507) that 125,000 of common red clover, which is a plant comparatively abundant in nectar, yield but one gramme (15432 grains) of sugar; and as each head contains about 60 flowers, 7,500,000 distinct flower-tubes must on this estimate be exhausted for each kilogramme (2-204 lb) of sugar collected. Among the richer sources of honey are reckoned the apple, asparagus, asters, barberry, basswood (Tilia americana), and the European lime or linden (Tilia europea), butcher's broom (Ruscus aculeatus), buckwheat, catnip, or catmint (Nepeta Cataria), cherry, cleome, clover, cotton, crocus, currant, dandelion, eucalyptus, figwort (Scrophularia), fir, golden-rink (Solidago), gooseberry, hawkthorn, heater, hepatia, horehound, hyacinth, lucerne, maple, mignonette, mint, motherwort (Leonurus), mustard, onion, peach, pear, poplins, rape, raspberry, sage, silver maple, snapdragon, sour-wood (Oxydendrum arboreum), stonecrop, viburnum, vitis vinifera, tulip-tree (more especially rich in pollen), turnip, violet and willows, and the "honey-dew" of the leaves of the whitethorn (Bonner), oak, maple, aspen, and other trees.

Honey contains dextroglucose and levoglucose (the former practically insoluble, the latter soluble in 1 pt. of cold strong alcohol), cane-sugar (according to some), mucilage, water, wax, essential oil, colouring bodies, a minute quantity of mineral matter and pollen. By a species of fermentation, the cane-sugar is said to be gradually transformed into inverted sugar (lavęoglucose with dextroglucose). The pollen, as a source of nitrogen, is of importance to the bees feeding on the honey. It may be obtained for examination as a sediment from a mixture of the honey and water, and when it has been discovered in honey is mannnite (Guibourt), a free acid which precipitates the salts of silver and of lead, and is soluble in water and alcohol (Calloux), and an uncrystallizable sugar, nearly related to inverted sugar (Soubeiran, Compt. Rend., xxviii. 774-775, 1849). Byttiny honey contains conwain, a ferment which determines its active decomposition (Wurtz, Dict. de Chem. ii. 430). In the honey of Polybia apicennis, a wasp

4 Compare Isi. vii. 15, 22, where curdled milk (A.V. "butter") and honey are mentioned as exclusive articles of diet indicative of foreign invasion, which turns rich agricultural districts into pasture lands or uncultivated wastes.
HONEY of tropical America, cane-sugar occurs in crystals of large size (Karsten, Pogg. Ann., C. 550). Dr J. Campbell Brown ("On the Composition of Honey," Analyt. iii. 267, 1878) is doubtful as to the presence of cane-sugar in any one of nine samples, from various sources, examined by him. The following average percentage numbers are afforded by his analyses: luctose, 39-45; dextrose, 36-57; mineral matter, -15; water expelled at 100° C., 18-8; and at a much higher temperature, with loss, 7-51: the wax, pollen and insoluble matter vary from a trace to 1-15%. The specific gravity of honey is about 1-47. The rotation of a polarized ray by a solution of 176 grams of crude honey in 100 c.c. of water is generally from -3-2° to -5° at 60° F.; in the case of Greek honey it is nearly -5°-5. The term "virgin-honey" (c.S., kviskteen) is applied to the honey of young bees which have never swarmed, or to that which flows spontaneously from honeycomb with or without the application of heat. The honey obtained from old hives, considered inferior to it in quality, is ordinarily darker, thicker and less pleasant in taste and odour. The yield of honey is less in proportion to weight in old than in young or virgin combs. The far-famed honey of Narbonne is white, very granular and highly aromatic; and still finer honey is that procured from the Corbières Mountains, 6 to 9 m. to the south-west. The honey of Càtinas is usually white, and is less odorous and granularly less readily than that of Narbonne. Honey from white clover has a greenish-white, and that from heather a rich golden-yellow hue. What is made from honey-dew is dark in colour, and disagreeable to the palate, and does not candy like good honey. "We have seen aphide honey from sycamores," says F. Cheshire (Pract. Bee-keeping, p. 74), "as deep in tone as walnut liquor, and where much of it is stored the value of the whole crop is practically nil." The honey of the stingless bees (Melipona and Trigona) of Brazil varies greatly in quality according to the species of flowers from which it is collected, some kinds being black and sour, and others excellent (F. Smith, Transact. Brit. hist. Soc., viii. 1891, p. 379). That of Apis Peromel of India and Timor, is yellow, and of very agreeable flavour and is more liquid than the British sorts. A. unicolor, a bee indigenous to Madagascar, and naturalised in Mauritius and the island of Réunion, furnishes a thick and syrupy, peculiarly scented green honey, highly esteemed in Western India. A rose-coloured honey is stated (Gard. Chron., 1870, p. 1698) to have been procured by artificial feeding. The fine aroma of Maltese honey is due to its collection from orange blossoms. Narbonne honey being harvested chiefly from Labiate plants, as rosemary, an imitation of it is sometimes prepared by flavouring ordinary honey with the infusion of rosemary leaves. Alterations of honey are starch, detectable by the microscope, and by its blue reaction with iodine, also wheaten flour, gelatin, chalk, gypsum, pipe-clay, added water, cane-sugar and common syrup, and the different varieties of manufactured glucose. Honey, sweetened with glucose containing copperas as an impurity is turned of an inky colour by liquids containing tannin, as tea. Elm leaves have been used in America for the flavouring of imitation honey. Stone jars should be employed in preference to common earthenware for the storage of honey, which acts upon the lead glaze of the latter.

Honey is mildly laxative in properties. Some few kinds are poisonous, as frequently the reddish honey stored by the Brazilian wasp Nectarina (Polistes, Latr.) Lecheugara, Shuck., the effects of which have been vividly described by Aug. de Saint-Hilaire, the spring honey of the wild bees of East Nepal, said to be rendered noxious by collection from rhododendron

1 Mémoires du Muséum, xl. 313 (1824).
2 Hist. xiii. 319 (1825).
3 The honey, according to Lassaigne (ib. ix. 319), is almost entirely soluble in alcohol.

For a list of fifteen treatises concerning honey, dating from 1625 to 1688, see Waring, Bibli. Therap. ii. 559, New Syd. Soc. (1879). On sundry ancient uses for honey, see Beckmann, Hist. of Invent. i. 287 (1846).
HONEYCOMB—HONEY-EATER 655

and other articles of food, it is largely consumed. Grains, seeds and birds’ eggs, for transmission to great distances, are sometimes packed in honey. In India a mixture of honey and milk, or of equal parts of curds, honey and clarified butter (Sansk., madhu-parka), is a respectful offering to a guest, or to a bridegroom on his arrival at the door of the bride’s father; and one of the purificatory ceremonies of the Hindus (Sansk., madhu-prasana) is the placing of a little honey in the mouth of a newborn male infant. Honey is frequently alluded to by the writers of antiquity as food for children; it is not to this, however, as already mentioned, that Turks, Persians, or fresh butter together with honey, and with or without bread, is a favourite dish with the Arabs.

Among the observances at the Fandrôana or New Year’s Festival, in Madagascar, is the eating of mingled rice and honey by the queen and her guests; in the same country honey is placed in the sacred water of sprinkling used at the blessing of the children previous to circumciscion (Sibere, The Great African Is., pp. 219, 314, 1880). Honey was frequently employed in the ancient religious ceremonies of the heathen, but was forbidden as a sacrifice in the Jewish ritual (Lev. xii. 18). With milk or water it was presented by the Greeks as a libation to the dead (Odys. xi. 27; Eurip. Orest. 115). A honey-cake was the monthly food of the fabled serpent-guardian of the Acropolis (Herod. viii. 41). By the aborigines of Peru honey was offered to the sun.

The Sanskrit word translates "honey," in the authorized version of the English Bible and the French, and practically synonymous with which are ja'ar or ja'ar-th had-debash (1 Sam. xix. 25-27; cf. Cant. v. 1) and nopheth (I. xix. 10, &c.), rendered "honeycomb." Debash denotes bee-honey (as in Deut. xxvi. 13 and Jud. xiv. 8); the massa of trees, by some writers is considered to have been the "wild" honey eaten by John the Baptist (Matt. iii. 4); the syrup of dates or the fruits themselves; and probably in some passages (as Gen. xxxii. 11 and 17), the honey of the Ampy boars, the name of the grape-raisins or thin molasses, in use in Palestine, especially at Hebron, under the name of dibs (see Kittto, Cyclop., and E. Robinson, Bibl. Res. ii. 81). Josue’s army, after the capture of Jericho, consisting of the expressed juice of the fruit of palm trees, and Herodotus (iv. 194) mentions a similar preparation made by the Gyanitanis in North Africa, where it is still in use. The honey most esteemed was that of the ancients of Greece, and of Mount Hymettus in Attica (iii. 59). Mahaffy (Rambles in Greece, p. 145, 2nd ed., 1878) describes the honey of Hymettus as by no means so good as the honey of other parts of Greece—not to say of the heather hills of Scotland and Ireland. That of Thrace, and more especially that of Corinth, which is made in the thyme hills towards Cleonae, he found much better (cf. xi. 88). Honey and pollen, together (vi. 440), he mentions as the chief productions of the island. In England, in the 13th and 14th centuries, honey sold at about 7s. to 1s. 2d. a pound, and in the 18th century by the swarm or hive, or huruaka (Rogers, Hist. of Agric. and Priests in Eng., iii. 6). Wrexham, Denbigh, Wales, two honey fairs are annually held, one on the Thursday next after the 1st of September, and the other—the many recorded in the following year or by far the larger—on the Thursday following the first Wednesday in October. In Hungary the amounts of honey and of wax are in favourable years respectively about 190,000 and 12,000 cwt., and in unfavourable years, as, e.g. 1874, about 12,000 and 3000 cwt. The hives there in 1870 numbered 617,407 (or 40 per 1000 of the population, against 45 in Austria). Of these 305,711 were in Hungary Proper, and 91,348 (79 per 1000 of the population) in Transylvania (Übersicht Ungarns, 1871; Schwickher, Statistik d. K. Ungarn, 1877). In Poland the system of bee-keeping introduced by Doliowski has been found to be the best. An amount of 40 lb of honey and wax and two new swarms per hive, the consequent increase of honey, with two swarms only 3 lb of honey and wax. In forests and places remote from villages in Podolia and parts of Volhynia, as many as 1000 hives may be seen in one apiary. In the district of Ostrolenka, in the government of Plock, and in the woody region of Polisia, in Lithuania, a method is practised of rearing bees in excavated trunks of trees (Strelecki, "The Treatment of Bees in Poland," Technologia, vi. 45, 1866). When the trees are planted in banks of belles or flowering trees, the bees in their wooden hives are means of spring-carts transported at night to lower regions, where they obtain forage and produce honey in the inferior honey which serves them for winter consumption (ib. p. 38).

In Palestine, "the land flowing with milk and honey" (Ex. iii. 17; Numb. xiii. 27), wild bees are very numerous, especially in the

1 In Sanskrit, madhu-kuṣya, a stream of honey, is sometimes used to express an overflowing abundance of good things (Monier Williams, Sansk.-Eng. Dict., p. 730, 1872).
protrusible tongue with a brush-like tip, differing, it is believed, in structure from that found in any other bird—Promerops perhaps excepted—and capable of being formed into a saccular tube, by means of which honey is absorbed from the necary of flowers, though it would seem that insects attracted by the honey furnish the chief nourishment of many species, while others undoubtedly feed to a greater or less extent on fruits. The Meliphagidae, as now considered, are for the most part small birds, never exceeding the size of a missel thrush; and they have been divided into more than 20 genera, containing above 200 species, of which only a few can here be particularized. Most of these species have a very confined range, being found perhaps only on a single island or group of islands in the region, but the species of Bouraia and Cerneis of one of the most curious forms is Prosthemadera—the tui or parson-bird of New Zealand, so called from the two tufts of white feathers which hang beneath its chin in great contrast to its dark silky plumage, and suggest a likeness to the bands worn by ministers of several religious denominations when officiating. The bell-bird of the same island, Anthornis melanura—whose melody excited the admiration of Cook the morning after he had anchored in Queen Charlotte's Sound—is another member of this family, and unfortunately seems to be fast becoming extinct. But it would be impossible here to enter much further into detail, though the wattle-birds, Anthochaera, of Australia have at least to be named. Mention, however, must be made of the friar-birds, Tropidorkynchus, of which nearly a score of species, five of them belonging to Australia, have been described. With their stout bills, mostly surmounted by an excrescence, they seem to be the most abnormal forms of the family, and most of them are besides remarkable for the baldness of some part at least of their head. They assemble in troops, sitting on dead trees, with a loud call, and are very pugnacious, frequently driving away hawks and crows.

A. R. Wallace (Malay Archipelago, ii. 150-153) discovered the curious fact that two species of this genus—T. bourensis and T. subcornutus—respectively inhabiting two islands from 7.5 to 140 ft. in diameter, and having their "mimicry" on the part of two species of oriole of the genus Mimeta, M. bourenensis and M. forsteni, inhabiting the same islands, so as to be on a superficial examination identical in appearance—the honey-eater and the oriole of each island presenting exactly the same tints—the black patch of bare skin round the eyes of the former, for instance, being copied in the latter by a patch of black feathers, and even the protuberance on the beak of the Tropidorkynchus being imitated by a similar enlargement of the beak of the Mimeta. The very reasonable explanation which Wallace offers is that the pugnacity of the

former has led the smaller birds of prey to respect it, and it is therefore an advantage for the latter, being weaker and less courageous, to be mistaken for it.

**HONEY-GUIDE,** a bird so called from its habit of pointing out to man and to the rate (Mellivora capensis) the nests of bees. Stories to this effect have been often told, and may be found in the narratives of many African travellers, from Bruce to Livingstone. But Layard says (B. South Africa, p. 242) that the birds will not infrequently lead any one to a leopard or a snake, and will follow a dog with vociferations, though its noisy cry and antics unquestionably have in many cases the effect signified by its English name. If not its first discoverer, Sparman, in 1777, was the first who described and figured this bird, which he met with in the Cape Colony (Phil. Trans. 1816. 42-47, pl. i.), giving it the name of Calicus indicator, its zygodactylous feet with the toes placed in pairs—two before and two behind—inducing the belief that it must be referred to that genus. Viciliot in 1836 elevated it to the rank of a genus, Indicator; but it was still considered to belong to the family Cuculidae (its asserted parasitical habits lending force to that belief) by all systematists except Blyth and Jerdon, until it was shown by Blanford (Ozs. Geol. and Zool. Abyssinia, pp. 308, 309) and Sclater (Ibis, 1879, pp. 176-180) that it was more allied to the barbets, Capitonidae, and, in consequence, was then transferred to that family. Indicatella. In the meantime, while other species had been discovered, some of them differing sufficiently to warrant Sundevall's foundation of a second genus, Protodiscus, of the group. The honey-guides are small birds, the largest hardly exceeding a lark in size, and of plain plumage, with what appears to be a very sparrow-like bill. Bowdler Sharpe, in a revision of the family published in 1876 (Orn. Miscellany, i. 192-200), recognizes ten species of the genus Indicator, to which another was added by Dr Reichenow (Journ. für Ornithologie, 1877, p. 110), and two of Protodiscus. Four species of the former, including I. sparrmani, which was the subject of the present paper, I. indicata, the male from South Africa, and one of the latter. The rest inhabit other parts of the same continents, except I. archipelagicus, which seems to be peculiar to Borneo, and I. xanthonotus, which occurs on the Himalayas from the borders of Afghanistan to Bhutan. The interrupted geographical distribution of this genus is a very curious fact, no species having been found in the Indian or Malayan peninsula to connect the outlying forms with those of Africa, which must be regarded as their metropolis. (A. N.)

**HONEY LOCUST,** the popular name of a tree, *Gleditsia triacanthos,* a member of the natural order Leguminosae, and a native of the more eastern United States of North America. It reaches here (it is said) a height of 60 ft., and is often troubled with much thorn. The flowers, which are of two kinds, are borne in racemes in the leaf-axils; the staminate flowers in larger numbers. The brown pods are often 12 to 18 in. long, have thin, tough walls, and contain a quantity of pulp between the seeds; they contract spirally when drying. The tree was first cultivated in Europe towards the end of the 17th century by Bishop Compton in his garden at Fulham, near London, and is now extensively planted as an ornamental tree.

**HONEYMOON,** the first month after marriage. Lord Avelbury in his *Origin of Civilization* suggests that the word is associated with this period in the Cape Colony by capture, and answers to the period during which the husband kept his wife in retirement, to prevent her from appealing to her relatives...
HONEY-SUCKLE—HONG-KONG 657

for release. Others suggest that as the moon comes to
wané as soon as it is at its full, so does the mutual affec-
tion of the wedded pair, the “honeymoon” (with this deriva-
tion) not necessarily referring to any definite period of time.

HONEY-SUCKLE (Mid. Eng., honesuckle, i.e. any plant from
which honey may be sucked,—cf. A-S. huni-suge, privet; Ger.
Geißblatt; Fr. chêne-feuille), botanical name Lonicera, a genus
of climbing, erect or prostrate shrubs, of the natural order
caprifoliaceae, so named after the 17th-century German botanist
Adam Lonicer. The British species is L. Periclymenum, the
woodbine; L. Caprifolium and L. Xylosteum are naturalized
in a few counties in the south and east of England. Some of
the garden varieties of the woodbine are very beautiful, and
are held in high esteem for their delicious fragrance, even
the wild plant, with its pale flowers, compensating for its sickly
looks “with never-cloying odours.” The North American sub-
evergreen L. sempervirens, with its fine heads of blossoms,
commonly called the trumpet honeysuckle, the most handsome of
all the cultivated honeysuckles, is a distinct and
beautiful species producing both scarlet and
yellow flowered varieties, and the Japanese
L. fenzoua var. aure-
reticulata is esteemed for its charming varie-
gated leaves netted with
yellow golden. The fly
honeysuckle, L. Xylo-
teuim, a hardy shrub of
dwarfish, erect habit, and
L. tatarica, of similar habit, both
European, are amongst
the oldest English gar-
den shrubs, and bear
axillary flowers of
various colours, occur-
ing two on a peduncle.
(b) flower, nat. size; (c) fruit, slightly
reduced.

Honeysuckle.—(a) Flowering branch; (b) flower, nat. size; (c) fruit, slightly reduced. There are numerous
other species, many of
them introduced to our gardens, and well worth cultivating in
shrubberies or as climbers on walls and bowers, either for their
beauty or the fragrance of their blossoms.

In the western counties of England, and generally by agriculturists, the name honeysuckle is applied to the meadow clover,
Trifolium pratense. Another plant of the same family (Legu-
nosae) Hedysarum coronarium, a very handsome hardy
biennial often seen in old-fashioned collections of garden plants,
is commonly called the French honeysuckle. The name is
moreover applied with various affixes to several other totally
different plants. Thus white honeysuckle and false honeysuckle
are names for the North American Asclea viscosa; Australian
or heath honeysuckle is the Australian Banksia serrata, Jamaica
honeysuckle, Passiflora laurifolia, dwarf honeysuckle the widely
spread Cornus suecica, Virgin Mary’s honeysuckle the European
Pulmonaria officinalis, while West Indian honeysuckle is Tecoma
capensis, and is also a name applied to Desmodium.

The wood of the fly honeysuckle is extremely hard, and
the clear portions between the joints of the stema, when their
pith has been removed, were stated by Linnaeus to be utilized
in Sweden for making tobacco-pipes. The wood is also employed
to make teeth for rakes; and, like that of L. tatarica, it is a
favourite material for walking-sticks.

Honeysuckles (Lonicera) flourish in any ordinary garden soil,
but are usually sadly neglected in regard to pruning. This
should be done about March, cutting out some of the old wood,
and shortening back some of the younger growths of the
preceding year.

HONFLEUR, a seaport of north-western France, in the
department of Calvados, 57 m. N.E. of Caen by rail. Pop. (1906)
8735. The town is situated at the foot of a semicircle of hills,
on the south shore of the Seine estuary, opposite Havre, with
which it communicates by steamboat. Honfleur, with its dark
narrow lanes and old houses, has the typical aspect of an old-
-fashioned seaport. The most noteworthy of its buildings is the
church of St Catherine, constructed entirely of timber work,
with the exception of the façade added in the 18th century,
and consisting of two parallel naves, of which the more ancient
is supposed to date from the end of the 13th century. Within
the church are several antique statues and a painting by J.
Jordens—“Jesús in the Garden of Gethsemane.” The church
tower stands on the other side of a street. St Leonard’s dates
from the 17th century, with the exception of its fine ogival
portal and rose-window belonging to the 16th, and its octagonal
tower erected in the 18th. The ruins of a 16th-century castle
known as the Lieutenence and several houses of the same period
are also of antiquarian interest. The hôtel de ville contains
a library and a museum. On the rising ground above the town
is the chapel de Nôtre-Dame-de-Grâce, a shrine much resorted to
by pilgrims, which is said to have been founded in 1034
by Robert the Magnificent of Normandy and rebuilt in 1606.
The town has a tribunal and a chamber of commerce and a
communal college. The port, which is protected from the
west winds by the height known as the Côte de Grâce, consists
of the tidal harbour and four floating basins—The West basin,
dating from the 17th century, and the Centre, East and Carnot
basins. A reservoir affords the means of sluicing the channel
and supplying the basins. The surface available for vessels is about 27
acres. Numerous fishing and coasting vessels frequent the
harbour. In 1907 there entered 375 vessels, of 133,872 tons,
more than half this tonnage being British. The exports go mainly
to England and include poultry, butter, eggs, cheese, chocolate,
vegetables, fruit, seeds and purple ore. There is regular com-
unication by steamer with Southampton. Timber from
Scandinavia, English coal and artificial manures form the
bulk of the imports. There are important saw-mills, as well
as shipbuilding yards, manufactories of chemical manures and
iron foundries.

Honfleur dates from the 11th century and is thus four or
five hundred years older than its rival Havre, by which it was
supplanted during the 18th century. During the Hundred
Years’ War it was frequently taken and re-taken, the last occupa-
tion by the English ending in 1440. In 1562 the Protestant
forces got possession of it only after a regular siege of the suburb
of St Léonard; and though Henry IV, effected its capture in
1594, and again in 1600, it was finally in 1628 that
Normandy had submitted to his arms. In the earlier years of
the 17th century Honfleur colonists founded Quebec, and Hon-
fleur traders established factories in Java and Sumatra and a
fishing establishment in Newfoundland.

HONG-KONG (properly Hang-Kiang, the place of “sweet
lagoons”), an important British island-possessión, situated
off the south-east coast of China, opposite the province of
Kwang-tung, on the east side of the estuary of the Si-Kiang,
38 m. E. of Macao and 75 S.E. of Canton, between 22° 30’
N. and 114° 35’ 1’’ and 11° 18’ 2” E. It is one of a small
class named by the Portuguese “ladrões” or Thieves, on account
of the notorious habits of their old inhabitants. Extremely
irregular in outline, it has an area of 29 sq. m., measuring 105
m. in extreme length from N.E. to S.W., and varying in breadth
from 2 to 5 m. A good military road about 22 m. long encircles
the island. From the mainland it is separated by a narrow
channel, which at Hong-Kong roads, between Victoria, the island
capital, and Kowloon Point, is about 1 m. broad, and which
is supposed to be at Lytton-mun Pass to little over a 2 m.
The southern coast in particular is deeply indented; and there
are two bold peninsulas, extending for several miles into the sea,
form two capacious natural harbours, namely, Deep Water
Bay, with the village of Stanley to the east, and Tytam Bay,
which has a safe, well-protected entrance showing a depth of
HONG-KONG

10 to 16 fathoms. An inshore island on the west coast, called Aberdeen, or Taplishan, affords protection to the Shekpywan of Aberdeen harbor, an inlet provided with a granite graving dock, the caisson gate of which is 60 ft. wide, and the Hong dock, opened in 1807, with a length of 425 ft. and a depth of 24 ft. Opposite the same part of the coast, but nearly 2 m. distant, rises the largest of the surrounding islands, Lamma, whose conspicuous peak, Mount Stenhouse, attains a height of 1140 ft. and is a landmark for local navigation. On the northern shore of Hong-kong there is a patent slip at East or Matheson Point, which is serviceable during the north-east monsoon, when sailing vessels frequently approach Victoria through the Ly-ce-mun Pass. The ordinary course for such vessels is from the westward, on which side they are sheltered by Green Island and Keologi. There is, however, an entirely separate entrance throughout the entire channel separating the island from the mainland, except in the Ly-ce-mun Pass, where the water is deep; the best anchorage is in Hong-kong roads, in front of Victoria, where, over good holding ground, the depth is 5 to 9 fathoms. The inner anchorage of Victoria Bay, about 3/4 m. off shore and out of the strength of the tide, is 6 to 7 fathoms. Victoria, the seat of government and of trade, is the chief centre of population, but a tract on the mainland is covered with public buildings and villa residences. Practically an outlying suburb of Victoria, Kowloon or (Nine Dragons) is free from the extreme heat of the capital, being exposed to the south-west monsoon.

Numerous villas have also been erected along the beautiful western coast of the island, while Stanley, in the south, is favoured as a watering-place.

The island is mountainous throughout, the low granite ridges, parting by bleak, tortuous valleys, leaving in some places a narrow strip of level coast-land, and in others overlapping the sea in lofty precipices. From the sea, and especially from the magnificent harbour which faces the capital, the general aspect of Hong-Kong is one of singular beauty. Inland the prospect is wild, dreary and monotonous. The hills have a painfully bare appearance from the want of trees. The thumbs, which are plentiful, are traced through the uplands and gorges by a line of straggling bushwood and rank herbage. Nowhere is the eye relieved by the evidences of cultivation or fertility. The hills, which are mainly composed of granite, serpentinite and syenite, rise in irregular masses to considerable heights, the loftiest point, Victoria Peak, reaching an altitude of 1825 ft. The Peak lies immediately to the south-west of the capital, in the extreme north-west corner of the island, and is used as a station for signalling the approach of vessels. Patches of land, chiefly around the coast, have been laid under rice, sweet potatoes and yams, but the island is hardly able to raise a home-supply of vegetables. The mango, litchen, pomegranate and the orange are indigenous, and several fruits and esculents have been introduced. One of the chief products is building-stone, which is quarried by the Chinese. The animals are few, comprising a land tortoise, the armadillo, a species of boa, several poisonous snakes and some woodcock. The public works suffer from the ravages of white ants. Water everywhere abounds, and is supplied to the shipping by means of tanks.

Under the Peking Treaty of 1860 the peninsula of Kowloon (about 5 m. in area) was added to Hong-Kong. The population is about 27,000. There are several docks and warehouses, and there are being developed. Granite is quarried in the peninsula. An agreement was entered into in 1868 whereby China leased to Great Britain for ninety-nine years the territory behind Kowloon peninsula up to a line drawn from Mirs Bay to Deep Bay and the adjoining islands, including Lantao. The new district, which extends to 376 sq. m. in area, is mountainous, with extensive cultivated valleys of great fertility, and the coastline is deeply indented by bays. The alluvial soil of the valleys yields two crops of rice in the year. Sugar-cane, indigo, hemp, peanuts, potatoes of different varieties, yam, taro, beans, sesame, pumpkins and vegetables of all kinds are also grown. The mineral resources are as yet unknown. The population is estimated at about 100,000. It consists of Puntis (or Cantonese), Hakkas ("strangers") and Tankas. The Puntis are agricultural and inhabit the valleys, and they make excellent traders. The Hakkas are a hardy and frugal race, being mainly to the hill districts. The Tankas are the boat people or floating population. In the government of the new territory the existing organization is as far as possible utilized.

Hong-kong or Victoria harbour constantly presents an animated appearance, as many as 240 guns having been fired as salutes in a single day. Its approaches are strongly fortified. The steaming distance from Singapore is 1320 m. Victoria, the capital, often spoken of as Hong-kong (population over 166,000, of whom about 6000 are European or American), stretches for about 4 m. along the north coast. Its breadth varies from 2 m. in the northeastern portion to 200 or 300 yds. in the eastern and western portions. The town is built in three layers. The "Praya" or esplanade, 50 ft. wide, is given up to shipping. The Praya reclamation scheme provided for the extension of the land frontage of 250 ft. and a depth of 260 ft. at all states of the tide. A further extension of the naval dockyard was begun in 1902, and a new commercial pier was opened in 1900. The main commercial street runs inland parallel with the Praya. Beyond the commercial portion, on each side, lie the Chinese quarters, wherein there is a closely packed population. In 1888, 1600 people were living in the space of 390 ft. and over 100,000 began to lie living within an area not exceeding 1/2 m.; and the overcrowding does not tend to diminish, for in one district, in 1900, it was estimated that there were at the rate of 642,000 persons on the sq. m. The average, however, for the whole of the city is 126 per acre, or 80,640 per sq. m. The second stratum of the town lies ten minutes' climb up the side of the island. Government house and other public buildings are in this quarter. There abound "beautifully laid out gardens, public and private, and solidly constructed roads, some of them bordered with bamboos and other delicately-fronded trees, and embowered with the luxuriant growth of semi-tropical vegetation." Finally, the third layer, known as "the Peak," is reached by a cable tramway, is dotted over with private houses and bungalows, the summer health resort of those who can afford them; here a new residence for the governor was begun in 1900.

Excellent water is supplied to the town from the Pokfulom and Tytam reservoirs, the former containing 68 million gallons, the latter 350 millions.

Climate.—The temperature has a yearly range of from 45° to 98° but it occasionally falls below 40°, and ice occurs on the Peak. In five months, during which ice was not seen between January and May, after showers in March and April, and continues until the beginning of August. During this period rain falls almost without intermission. The rainfall varies greatly, but the mean is about 90 in. In 1898 only 57-025 in. fell, while in 1897 there were 199-933 in.; in 1899, 72-7 in, and in 1900, 73-7 in. The damp is extremely penetrating. During the dry season the climate is healthy, but dysentery and intermittent fever are not uncommon. Bilious remittent fever occurs in the summer months, and smallpox prevails from November to March. The annual death-rate per 1000 for the whole population in 1902 was 21-70.

Population, &c.—The following table shows the increase of population:

Education is provided by a few government schools and by a large number receiving grants-in-aid. The foundation-stone of Hong-Kong University was laid in March 1910, the buildings being the gift of Sir Hormusjee Mody, a colonial broker. The Queen's College provides secondary education for boys. There are several hospitals, one of which is a government institution. The Hong-Kong savings bank has deposits amounting to about $1,100,000. There is a police force composed of Europeans, Indian Sikhs and Chinese; and a strong military garrison.
The main sources of revenue are licences, rent of government property, the post-office and land sales. The light duties were reduced in 1896 from 2½ cents to 1 cent per ton. There is a public debt of about £40,000, borrowed for public works, which is being paid off by a sinking fund. The only legal tender is the Mexican dollar, and the British and Hong Kong dollar, or other silver dollars of equivalent value duly authorized by the governor. There are small silver and copper coins, which are legal tenders for amounts not exceeding two dollars and one dollar respectively. There is also a large paper currency in the form of notes issued by the Chartered Bank of India, Australia and China, the Hong Kong and Shanghai Banking Corporation, and the National Bank of China, Limited. The foundation of new law courts was laid in 1900.

Administration.—Formerly an integral part of China, the island of Hong Kong was first ceded to Great Britain in 1841, and thecession was confirmed by the treaty of Nanking in 1842, the charter bearing the date 5th of April 1843. The colony is administered by a governor, executive council and legislative council. The executive council consists of the holders of certain offices and of such other members as the crown may nominate. In 1890 there were nine members. The legislative council consists of the same officials and of six unofficial members. Of these, three are appointed by the governor (of whom one must be, and two at present are, members of the Chinese community); one is elected from the chamber of commerce, and one from the justices of the peace.

HONITON—HONOLULU

Marwood, who attained the age of 105. Allhallows Grammar School, founded in 1614, was enlarged in 1893; St Margaret's hospital, founded as a lazarette in the 18th century, is converted into almshouses. Honiton is famous for its lace industry, established by refugees from Flanders under Queen Elizabeth. The delicate fabric made by hand on the pillow was long in demand; its sale was, however, greatly diminished by the competition of cheaper machine-made goods, and a school of lace-making was opened to promote its recovery. The town possesses breweries, tanneries, malthouses, flour-mills, saw-mills, brick and tile works, potteries and an iron foundry; its trade in butter is considerable. It is governed by a mayor, 6 aldermen and 18 councillors. Area, 1,124 acres. Honiton (Honetona, Haneton) is situated on the British Icknield Street, and was probably the site of an early settlement, but it does not appear in history before the Domesday Survey, when it was a considerable manor, held by Drew (Drogo) under the count of Mortain, who had succeeded Elmer the Saxon, with a subject population of 33, a flock of 80 sheep, a mill and 2 salt-workers. The borough was founded before 1217 by William de Lacy, earl of Devon, whose ancestor Richard de Redvers had resigned the manor from Henry I. In the 14th century it passed to the Courtenays, and in 1606 Sir William Courtenay was confirmed in the right of holding court leet, view of frankpledge and the nomination of a portreeve, these privileges having been surrendered to James II. The borough was represented by two members in parliament in 1500 and 1311, and then not again till 1640, from which date it returned two members until disfranchised by the act of 1858, the returning officer being the portreeve, who was also the chief magistrate of the borough until its incorporation by charter of 1846. In 1211 Falke de Breaute, then custodian of the borough, rendered a palfrey for holding a three days' fayre at the feast of All Saints, transferred in 1247 to the feast of St Margaret, and still held under that grant. A great market for corn and other produce is still held on Saturday by prescription. The wool manufacture flourished at Honiton in the reign of Henry VII, and it is said to have been the first town at which serges were made, but the industry entirely declined during the 14th century. The lace manufacture was introduced by Flemish refugees, and was flourishing in the reign of Charles I. See Victoria County History, Devonshire; A. Farquharson, History of Honiton (Exeter, 1868).

HONNAP, a town and climatic health resort of Germany, beautifully situated on the right bank of the Rhine, at the foot of the Siebengebirge, 8 m. above Bonn by the railway Cologne-Königswinter-Horsholm (Pop. (1905) 6183. It has an Evangelical and a Roman Catholic church, a sanatorium for consumptives, and does a considerable trade in wine. The town is surrounded by vineyards and orchards, and has annually a large number of visitors. A mineral spring called the Drachenquelle is used both for drinking and bathing.

HONOLULU, a city, port of entry, and the capital of Hawaii, situated in the "city and county of Honolulu," on the S. coast of the island of Oahu, at the mouth of Nuuanu Valley, 2100 m. S.W. of San Francisco. Pop. (1890) 22,607; (1900) 39,306, of whom 24,476 were males, 14,860 were females; about 10,000 were Hawaiians, 15,000 Asians, and 5000 Portuguese; (1910) 52,183. Honolulu is served by the Oahu railway, by electric lines to the principal suburbs, and by steamship lines to San Francisco, Seattle, Vancouver, Manila, Salina Cruz (Mexico), Victoria, Sydney, and Chinese and Japanese ports. The business section and the older residence quarters occupy low ground, but many of the newer residences are built on the sides of neighbouring hills and mountains, of which there are several from 500 to 2000 ft. in height. The Punch Bowl (behind the city), a hill rising about 500 ft. above the sea, Diamond Head, a crater about 750 ft. in height, 4 m. to the S.E., and the Nuuanu Pali, a picturesque precipice 6 m. up the valley, are especially known for their commanding views. In front of the city is the small harbour, well protected from all winds except those from the S.; in and after 1892 the Hawaiian government
HONORIUS deepened its entrance from 21 ft. to 30 ft. Six miles to the W. is the much more spacious Pearl Harbor (a U.S. Naval Station), the bar at the entrance of which was removed (1905) by the U.S. government. Pearl Harbor and the harbour of Honolulu are the only safe ports in the archipelago. The streets of Honolulu are wide, and are macadamized with crushed or broken lava. The buildings are of brick or stone and from two to six storeys in height. About most of the residences there are many tropical trees, flowering shrubs and plants. Wood is the most common material of which the residences are built; a large portion of these residences are one-storey cottages; broad verandahs are common; and of the more pretentious residences the lanai, a semi-outdoor drawing-room with conservatories adjoining, is a notable feature. Throughout the city there is a marked absence of poverty and squalor. There are good hotels in the city and its suburbs. The government buildings are extensive and have a pleasing appearance; that of the executive, in a beautiful park, was formerly the royal palace and still contains many relics of royalty. Facing the judiciary building is an heroic statue in bronze of Kamehameha the Great. About 2 m. W. of the business centre of the city is the Bernice Pauahi Bishop Museum, a fine stone building on a commanding site, and containing a large collection of Hawaiian and Polynesian relics and curios, especially Hawaiian feather-work, and notable collections of fish and of Hawaiian land shells and birds. Four miles S.E. of the business centre, at the foot of Diamond Head, is Waikiki sea-beach, noted for its surf-riding, boating and bathing, and Kapilolani Park, a pleasure resort, near which is a famous aquarium of tropical fishes. Honolulu has other parks, a fine Botanical Garden, created by the Bureau of Agriculture, several public squares, several hospitals, a maternity home, the Lunahilo Home for aged Hawaiians, an asylum for the insane, several schools of high rank both public and private—notably Oahu College on the E. edge of the city, first founded as a school for the children of missionaries in 1841; the Honolulu High School, founded in 1833 as the Oahu Charity School, to teach English to the half whites; the Royal School, which was founded in 1840 for the sons of chiefs; and the Normal School, housed in what was in 1906 the most expensive building on the island of Oahu—a library containing about 14,000 volumes and the collections of the Hawaiian Historical Society, a number of benevolent, literary, social and political societies, an art and music league, and is the see of both an Anglican and a Roman Catholic bishop. In 1907 the Pacific Scientific Institution for the advancement of scientific knowledge of the Pacific, its islands and their people, was established here. Among the clubs of the city are the Pacific Club, founded in 1853 as the British Club; the Scottish Thistle Club (1851), of which Robert Lewis Stevenson was a member; the Hawaii Yacht Club, and the Polo, Country and University Clubs. There are various journals and periodicals, five languages being represented. The chief industries are the manufacture of machinery (especially machinery for sugar-refineries) and carriages, rice-milling and ship-building. Honolulu's total exports for the fiscal year 1908 were valued at $4,228,455, and its imports at $10,083,724. There is a privately owned electric street car service in the city. The water-works and electric-lighting plant are owned and operated by the Territorial government, and to the plentiful water-supply is partly due the luxuriant vegetation of the city. Honolulu's safe harbour, discovered in 1794, made it a place of resort for vessels (especially whalers) and traders from the beginning of the 19th century. Kamehameha I. (the Great) lived here from 1803 until 1811. In 1816 was built a fort which stood until 1857. In 1820 the city became the principal residence of the sovereigns of Hawaii, and after the departure of the Hawaiian government, and thus practically the seat of government. In 1907 an act was passed by which the former county of Oahu, including the island of Oahu and the small islands adjacent, was made a municipal corporation under the name of the "city and county of Honolulu"; this act came into effect on the 1st of January 1909.

HONORIUS, the name of four popes and one antipope (Honorius II.; i.e. 2 below).

1. HONORIUS I., pope from 625 to 638, was of a noble Roman family, his father Petronius having been consul. He was very active in carrying on the work of Gregory the Great, especially in England; Bede (Hist. Eccl. ii. 17) gives a letter of his to King Edwin of Northumbria, in which he admonishes him diligently to study Gregory's writings; and it was at Edwin's request that Honorius II. conferred the pallium on the bishops of Canterbury and York (ib. ii. 18). He also admonished the Irish for not following the custom of the Catholic Church in the celebration of Easter (ib. ii. 10), and commissioned Birinus to preach Christianity in Wessex (ib. iii. 7). It is, however, in connexion with the Monothelite heresy that Honorius is most remembered, his attitude in this matter having acquired fresh importance during the controversy raised by the promulgation of the dogma of papal infallibility in 1870. In his efforts to consolidate the papal power in Italy, Honorius had been hampered by the schism of the "three chapters" in Istria and Venetia, a schism that was ended by the deposition in 685 of the schismatic patriarch Fortunatus of Aquileia-Grado and the elevation of a Roman sub-deacon to the patriarchate. It is suggested that help rendered to him in this matter by the emperor Heraclius, or by the Greek exarch, may have inclined the pope to take the emperor's side in the Monothelite controversy, which broke out shortly afterwards in consequence of the formula proposed by the emperor with a view to reconciling the Monophysites and the Catholics. However that may be, he joined the patriarchs of Constantinople and Alexandria in supporting the doctrine of "one will " in Christ, and expounded this view forcibly, if somewhat obscurely, in two letters to the patriarch Sergius (Epist. 4 and 5 in Migne, Patrologia. Ser. Lat. ixxx. 470, 474). For this he was, more than forty years after his death (October 638), anathematized by name along with the Monothelite heretics by the council of Constantineople (First Trullan) in 681; and this condemnation was subsequently confirmed by more than one pope, particularly by Leo II. See Hefele, Die Irrlehre des Honorius u. die vatticanische Lehre der Unfehlbarkeit (1871), who, however, modified his view in his Conciliengeschichte (1877). Honorius I. was succeeded by Severinus.

2. HONORIUS II. (c. 1072), antipope, was the name taken by Peter Cadalus, who was born at Verona and became bishop of Parma in 1046. After the death of Pope Nicholas II. in July 1061 he was chosen pope by some German and Lombard bishops at Basel in opposition to Alexander II., who had been elected by the party led by Hildebrand, afterwards Pope Gregory VII. Taking the name of Honorius II., Cadalus was thus the representative of those who were opposed to reforms in the Church. Early in 1062 he advanced towards Rome, and though his supporters defeated the forces of his rival outside the city, he was driven back to Parma to await the decision of the advisers of the young German king, Henry IV., whose mother Agnes had supported his election. About this time, however, Agnes was deprived of her power, and the chief authority in Germany passed to Anno, archbishop of Cologne, who was hostile to Cadalus. Under these circumstances the antipope again marched towards Rome in 1063 and entered the city, but was soon forced to take refuge in the castle of St. Angelo. The ensuing war between the rival popes lasted for about a year, and then Cadalus left Rome as a fugitive. Refusing to attend a council held at Mantua in May 1064, he was deposed, and he died in 1072, at Verona, without having abandoned his claim to the papal throne. See the article on Honorius II. in Hauck's Realencyclopädie, Band viii. (Leipzig, 1900).

3. HONORIUS II. (Lamberto Scannabecchi), pope from the 15th of December 1124 to the 13th of February 1130, a native of Fagnano near Imola, of considerable learning and great religious zeal, successively archdeacon at Bologna, cardinal-priest of Sta Prassede under Urban II., cardinal-bishop of Ostia and Velletri under Paschal II., shared the exile of Gelasius II.
in France, and helped Calixtus II. to conclude the Concordat of Worms (1122), which settled the investiture contest. He owed his election in large measure to force employed by the French, who were reconciled with general consent on the 21st of December 1124. By the terms of a close alliance with that powerful family, he was enabled to maintain peace at Rome, and the death of Emperor Henry V. (1125) further strengthened the papal position. He recognized the Saxon Lothair III. as king of the Romans and later as emperor, and excommunicated his rival, Conrad of Hohenstaufen. He sanctioned the Praemonstratensian order and that of the Knights Templars. He excommunicated Count William of Normandy for marriage in professed degree; brought to an end, through the influence of Bernard of Clairvaux, the struggle with Louis VII. of France; and arranged with Henry I. for the reception of papal legates in England. He laid claim as feudal lord to the Norman possessions in southern Italy (July 1127), and excommunicated the claimant, Duke Roger of Sicily, but was unable to prevent the foundation of the Neapolitan monarchy, for Duke Roger defeated the papal army and forced recognition in August 1128. Honorius appealed to Lothair for assistance, but died before it arrived. His successor was Innocent II.

HONORIUS III. (Cencio Savelli), pope from the 18th of July 1216 to the 18th of March 1227, a highly-educated and pious Roman, successively canon of Sta Maria Maggiore, cardinal-deacon of Sta Lucia in Silice, vice-chancellor, chamberlain and cardinal-priest of St Giovanni e Paolo, was the successor of Innocent III. He made peace with Frederick II., in accordance with which the emperor was crowned with his wife Constance in St. Peter's on the 22nd of November 1220, and swore to accede fully to the decrees of the Lateran Council and to undertake a crusade. Honorius was eager to carry out the decrees of the Lateran Council against the Albigenses and to further the crusade proclaimed by his predecessor. He crowned Peter of Courtenay emperor of Byzantium in April 1217; espoused the cause of the young Henry III. of England against the barons; accepted the Isle of Man as a perpetual fief; arbitrated differences between Philip II. of France and James of Aragon; and made special ecclesiastical regulations for the Scandinavian countries. He sanctioned the Dominican order (22nd of November 1216), making St. Dominic papal major-domo in 1218; approved the Franciscan order by bull of the 29th of November 1223; and authorized many of the tertiary orders. He maintained, on the whole, a tranquil rule at Rome; but Frederick II.'s refusal to interrupt his reforms in Sicily in order to go on the crusade gave the pope much trouble. Honorius died in 1227, before the emperor had fulfilled his oath, and was succeeded by Gregory IX.

Honorius III. left many writings which have been collected and published by Abbé Honore in the Medii aevi biblicorum scriptoribus, vols. i.-ii. (Paris, 1879-1883). Among them are five books of decreals, compiled about 1226; a continuation of the Liber Pontificalis from Gregory VII., a coronation form; and a large number of sermons. His most important work is the Liber censuum Romanae ecclesiae, written in 1192 and containing a record of the income of the Roman Church and of its relations with secular authorities. This has been admirably edited by P. Fabre in Bibliotheque des ecles es fran ques d'Athines et de Rome (Paris, 1892). The letters of Honorius are in F. Liverani, Scriptaeg Liberalium (1851). There are good Regesta in Latin and Italian, edited by P. Pressuitti (Rome, 1885, &c.).
report of the invasion of Italy, fled to Ravenna, where he resided till his death on the 27th of August 423.

See Gibbon, Decline and Fall, chs. 28-33; J. B. Bury, Later Roman Empire, i. chs. 1-5, ii. chs. 4, 6; E. A. Freeman, "Tyrians of Britain, Gaul and Spain" in Eng. Histor. Rev. i. (January 1904); T. Hodgkin, Italy and her Invaders (Oxford, 1892), l. chs. 13, 15-18.

HONOUR (Lat. honors or honor, honoris; in English the word was spelled with or without the u indifferently until the 17th century, but during the 18th century it became fashionable to spell the word "honour"; Johnson's and Webster's Dictionaries stereotyped the English and American spellings respectively), a term which may be defined as respect, esteem or deference paid to, or received by, a person in consideration of his character, worth or position; also the state or condition of the person exciting the feeling or expression of such esteem; particularly a high or exalted rank, or the class of persons, of which the deceased had been a member, or which he or she belonged to. Further, the word is commonly used of the dignities, distinctions or titles, granted as a mark of such esteem or as a reward for services or merit, and quite generally of the credit or renown conferred by a person or thing on the country, town or particular society to which he or it belongs. The standard of conduct may be laid down not only by a scrupulous sense of what is due to lofty personal character but also by the conventional usages of society, hence it is that debts which cannot be legally enforced, such as gambling debts, are called "debts of honour." Similarly in the middle ages and later, courts, known as "courts of honour," sat to decide questions such as precedence, disputes as to coat-armour &c. (see CHIVALRY); such courts, chiefly military, are found in countries where duelling has not fallen into desuetude (see DUEL). In the British House of Lords, when the peers sit to try another peer on a criminal charge or at an impeachment, on the question being put whether the accused be guilty or not, each peer, rising in his place in turn, lays his right hand on his breast and returns his verdict " upon my honour." As a title of address, "his honour" or "your honour" is applied in the United States of America to all judges, in the United Kingdom only to county court judges. In university or other examinations, those who have won particular distinction, or have undergone with success an examination of a standard higher than that required for a "pass" degree, are said to have passed "with honours," or an "honours" examination or to have taken an "honours degree." In many games of cards the ace, king, queen and knave of trumps are the "honours."

Funeral or military honors are paid to a dead officer or soldier. The usual features of such a burial are as follows: the coffin is carried on a gun-carriage and attended by troops; it is covered by the national flag, on which rests the soldier's head-dress, and sometimes a time of firing by a mounted soldier, his charger follows with the boots reversed in the stirrups; three volleys are fired over the grave after committal, and "last post" or another call is sounded on the bugles or a roll on the drums is given.

Military force is said to be accorded "the honours of war" when, after a specially honourable defence, it has surrendered its post, and is permitted by the terms of capitulation to march out with colours flying, bands playing, bayonets fixed, &c. and retaining possession of the field artillery, horses, arms and baggage. The force remains free to act as combatants for the remainder of the war, without waiting for exchange or being considered as prisoners. Usually some point is named to which the surrendering troops must be conveyed before recommencing hostilities; thus, during the Peninsula War, at the Convention of Cintra 1808, the French army under Junot was conveyed to France by British transports before being free to rejoin the combatant troops in the Peninsula. By far the most usual case of the granting of the "honours of war" is in connexion with the surrender of a fortress. Of historic examples may be mentioned the surrender of Lille by Marshal Boufflers to Prince Eugène in 1708, that of Hunningen by General Joseph Barbanègre (1772-1836) to the Austrians in 1815, and that of Belfort by Colonel P. Denfert Rochereau to the Germans in 1871.

In English law the term "honour" is used of a seigniory of several manors held under one baron or lord paramount. The tenure by the followers of such baronies dates back to the Anglo-Saxon period, when jurisdiction of sac and soc was frequently given in the case of a group of estates lying close together. The system was encouraged by the Norman lords, as tending to strengthen the principles of feudal law, but the legislation of Henry II., which increased the power of the central administration, undoubtedly tended to discourage the creation of new honours. Frequently, they eschewed to the crown, retaining their corporate existence and their jurisdictions; they then either remained in the possession of the king or were regranted, diminished in extent. Although an honour contained all the manors, of which it was the owner, for all, but the various manors retained their separate organizations, having their " quasi several and distinct courts."

HONOURABLE (Fr. honorable, from Lat. honorabilis, worthy of honour), a style or title of honour common to the United Kingdom, the British colonies and the United States of America. The terms honorabilis and honorabilitas were in use in the middle ages rather as a form of politeness than as a stereotyped style; and though Gibbon assimilates the late Roman title of clarissimus to "honourable," as applied to the lowest of the three grades of rank in the imperial hierarchy, the analogy was good even in his day only in so far as both styles were applicable to those who belonged to the less exalted ranks of the titled classes, for the title "honourable" was not definitely confined to certain classes until later. As a formal address it is found frequently in the Paston Letters (15th century), but used loosely and interchangeable with other styles; thus John, Viscount Beaumont, is addressed alternately as "my worshipful and reverent Lord" (i. 88, ed. 1904) and as "my right honorabl Lord" (i. 118), while John Paston, a plain esquire, is "my right honourably malster." More than two centuries later Selden, in his Titles of Honor (1672), does not include "honourable" among the courtesy titles given to the children of the peers. The style was, in fact, used extremely loosely till well on into the 18th century. Thus we find in the registers of Westminster Abbey records of the burial (in 1710) of "The Hon. George Churchill, Esq.," who was only a son of Sir Winston Churchill, and of "The Hon. Sir William Godolphin," who had only been created a baronet; in 1717 was buried "The Hon. Colonel Henry Cornwall," who was only an esquire and the son of one; in 1743 a rear-admiral was buried as "The Hon. Sir John Jennings, Kt."; in 1746 "The Hon. Major-General Lowther," whose father was only a Dublin merchant; and finally, in 1747, "The Hon. Lieutenant-General Guest," who is said to have begun life as a hostler. From this time onwards the style of "honourable" tended to become more narrowly applied; but the whole matter is full of obscurity and contradictions. The baronets, for instance, allege that they were usually styled "the honourable" until the end of the 18th century, and in 1835 they petitioned for the style as a prefix to their names. The Herald's Office officially reported on the petition (21st of October 1835) that the evidence did not prove the right of baronets to the style, and that its use "has been no more warranted by authority than when the same style has been applied to Field Officers in the Army and others." They added that "the style of the Honourable is given to the Judges and to the Barons of the Exchequer with others because by the Decree of 10 James I, for settling the place and precedence of the Barons, the Judges and Barons of the Exchequer were declared to have place and precedence before the younger sons of Viscounts and Barons." This seems to make the style a consequence of the precedence; yet from the examples given it is clear that it was applied, e.g. in the case of field officers, where no question of precedence arose. It is not, indeed, until 1874 that we have any evidence of an authoritative limitation of the title. In this year the wives of lords of appeal, life peers, were granted style and precedence as baronesses; but it was provided that their children were not "to assume or use..."
HONTHEIM—HONTHORST 663

the prefix of Honourable, or to be entitled to the style, rank or precedence of the children of a Baron." In 1806, however, this was revoked, and it was ordained "that such children shall have and enjoy on all occasions the style and title enjoyed by the children of hereditary Barons together with the rank and precedence, &c." By these acts of the Crown the prefix of "honourable" would seem to have been restricted and stereotyped as a definite title of honour; yet in legal documents the sons of peers are still styled merely "esquire," with the addition of "of commonly called, &c." This latter fact points to the time when the prefix "honourable" was a mark of deference paid by others rather than a style assumed by right, and relics of this doubtless survive in the United Kingdom in the conventions by which an "honourable" does not use the title on his visiting card and is not announced as such.

As to the actual use and social significance of the style, the practice in the United Kingdom differs considerably from that in the colonies or in the United States. In the United Kingdom marquesses are "most honourable"; earls, viscounts and barons "right honourable," a style also borne by all-pvry councilors, including the lord mayor of London and lord provost of Edinburgh during office. The title of "honourable" is in the United Kingdom, except by special licence of the Crown (e.g. in the case of retired colonial or Indian officials), mainly confined to the sons and daughters of peers, and is the common style of the younger sons of earls and of the children of viscounts, barons and legal life peers. The eldest sons of dukes, marquesses and earls bear by courtesy" their father's second title, the younger sons of dukes and marquesses having the courtesy title Lord prefixed to their Christian name, while the daughters of dukes, marquesses and earls are styled Lady. The title of "honourable" is also given to all present or past maims of honour, and to the judges of the high court being lords justices or lords of appeal (who are "right honourable"). A county court judge is, however, his honour." The epithet is also applied to the House of Commons as a body and to individual members during debate ("the honourable member for X."). Certain other corporate bodies have, by tradition or grant, the right to bear the style; e.g. the Honourable Irish Society, the Inns of Court (Honourable Society of the Inner Temple, &c.) and the Honourable Artillery Company; the East India Company also had the prefix "honourable." The style may not be assumed by corporate bodies at will, as was proved in the case of the Society of Barones, whose original style of "Honourable" Society was dropped by command.

In the British colonies the title "honourable" is given to members of the executive and legislative bodies, to judges, &c., during their term of service. It is sometimes retained by royal licence after a certain number of years' service.

In the United States of America the title is very widespread, being commonly given to any one who holds or has held any office of importance in state or nation, more particularly to members of Congress or of the state legislatures, judges, justices, and certain other judicial and executive officials. Popular animosity even sometimes extends the title to holders of quite humble government appointments, and consoles with it the defeated candidates for a post. See also the article PRECEDENCE.

HONTHEIM, JOHANN (1671-1750), German historian and theologian, was born on the 27th of January 1701 at Trier. He belonged to a noble family which had been for many generations connected with the court and diocese of the archbishop-electors, his father, Kaspar von Hontheim, being receiver-general of the archdiocese. At the age of twelve young Hontheim was given by his maternal uncle, Hugo Friedrich von Anethan, canon of the collegiate church of St Simeon (which at that time still occupied the Roman Porta Nigra at Trier), a prebend in his church, and on the 13th of May 1724 he received the tunsure. He was educated by the Jesuits at Trier and at the universities of Trier, Louvain and Leiden, taking his degree of doctor of laws at Trier in 1724. During the following years he travelled in various European countries, spending some time at the German College in Rome; in 1728 he was ordained priest and, formally admitted to the chapter of St Simeon in 1732, he became a professor at the university of Trier.

In 1738 he went to Coblenz as official to the archbishop-elector. In this capacity he had plentiful opportunity of studying the effect of the interference of the Roman Curia in the internal affairs of the Empire, notably in the negotiations that preceded the elections of the emperors Charles VII. and Francis I, in which Hontheim took part as assistant to the electoral ambassador. It appears that it was the extreme claims of the papal nuncio on the side of the imperial pretensions and his interference in the affairs of the electoral college that first suggested to Hontheim that critical examination of the basis of the papal pretensions, the results of which he afterwards published to the world under the pseudonym of "Febronius." In 1747, broken down by overwork, he resigned his position as official and retired to St Simeon's, of which he was elected dean in the following year. In May 1748 he was appointed by the archbishop-elector Francis George (von Schönborn) as his suffragan, being consecrated at Mainz, in February 1749, under the title of bishop of Myriophiri in paribus. The archbishop of Trier was practically a great secular prince, and upon Hontheim as suffragan and vicar-general fell the whole spiritual administration of the diocese; this work, in addition to that of pro-chancellor of the university, he carried on single-handed until 1778, when Jean Marie Coutrot d'Herbain was appointed his coadjutor. On the 21st of April 1779 he resigned the deanery of St Simeon's on the ground of old age. He died on the 2nd of September 1790 at his château at Montquentin near Orval, an estate which he had purchased. He was buried at first in St Simeon's, but the church was ruined by the French during the revolutionary wars and never restored, and in 1863 the body of Hontheim was transferred to that of St Gervaisus.

As a historian Hontheim's reputation rests on his contributions to the history of Trier. He had, during the period of his activity as official at Coblenz, found time to collect a vast mass of printed and MS. material which he afterwards embodied in three works on the history of Trier. Of these the Historia Trewrensis diplomatica et pragmatica was published in 3 vols. folio in 1750, the Prodomus historiae Trewrensiae in 2 vols. in 1757. They give, besides a history of Trier and its constitution, a large number of documents and references to published authorities. A third work, the Historiae scriptorum et monumentarium Trewrensium amplissima collectio, remains in MS. at the city library of Trier. These books, the result of an enormous labour in collation and selection in very unfavourable circumstances, entitle Hontheim to the fame of a pioneer in modern historical methods. It is, however, as "Febronius" that Hontheim is best remembered. The character and effect of his book on "the state of the Church and the lawful power of the Roman pontiff" is described elsewhere (see FEBRONIANISM). The author of the book was known to be at Rome almost as soon as it was published; but it was not till some years afterwards (1778) that he was called on to retract. The terror of the spiritual power were reinforced by a threat of the archbishop-elect to deprive not only him but all his relations of their offices, and Hontheim, after much wavering and correspondence, signed a submission which was accepted at Rome as satisfactory, though he still refused to admit, as demanded, ut provido merito monarchicum ecclesiae regimen a caroliciadii doctoribus unius universi praebantur (1780). This is divided into six books, the first two of which were published at Frankfort when Hontheim published at Frankfort what purported to be a proof that his submission had been made of his own free will (Justini Febronii acti commentarius in suam retractationem, &c.). This book, however, which carefully avoided all the most burning questions, rather tended to show—as indeed his correspondence proves—that Hontheim had not essentially shifted his standpoint. But Rome left him thenceforth in peace.

See Otto Mejer, Febronius, Weihbischof Johann Nikolaus von Hontheim und sein Widerfuhr (Trier, 1803), and various letters. Of later date is the biography by F. X. Kraus in the Allgemeine deutsche Biographie (1881), which gives numerous references.

HONTHORST, GERARD VAN (1590-1656), Dutch painter of Utrecht, was brought up at the school of Bloemaert, who
HOOCH, P. DE

exchanged the style of the Frankcens for that of the pseudo-Italians at the beginning of the 16th century. Infected thus early with a mania which came to be very general in Holland, Honthorst went to Italy, where he copied the naturalism and eccentricities of Michelangelo da Caravaggio. Home again about 1614, after acquiring a considerable practice in Rome, he set up a studio, left Utrecht, returned to Haarlem, and he soon became so fashionable that Sir Dudley Carleton, then English envoy at the Hague, recommended his works to the earl of Arundel and Lord Dorchester. At the same time the queen of Bohemia, sister of Charles I. and electress palatine, being an exile in Holland, gave him her countenance and asked him to teach her children drawing; and Honthorst, thus approved and courted, became known to Charles I., who invited him to England. There he painted several portraits, and a vast allegory, now at Hampton Court, of Charles and his queen as Diana and Apollo in the clouds receiving the duke of Buckingham as Mercury and guardian of the king of Bohemia's children. Charles I., whose taste was flattered alike by the energy of Rubens and the elegance of Van Dyck, was thus first captivated by the fanciful mediocrity of Honthorst, whom a poor executant had luckily for himself caught, as Lord Arundel said, "much of the manner of Caravaggio's colouring, then so much esteemed at Rome." It was his habit to transmute every subject into a night scene, from the Nativity, for which there was warrant in the example of Correggio, to the penitence of the Magdalene, for which there was no warrant at all. But unhappily this caprice, though "sublime in Allegri and Rembrandt," was but a phantasm in the hands of Honthorst, whose prosaic pencil was not capable of more than vulgar utterances, and art gained little from the repetition of these quaint vagaries. Sandrart gave the measure of Honthorst's popularity at this period when he says that he had as many as twenty apprentices at one time, each of whom paid him a fee of one florins a year. In 1623 he was president of his guild at Utrecht. After that he went to England, returning to settle anew at Utrecht, where he married. His position amongst artists was acknowledged to be important, and in 1626 he received a visit from Rubens, whom he painted as the honest man sought for and found by Diogenes Honthorst. In his home at Utrecht Honthorst succeeded in preserving the support of the English monarch, for whom he finished in 1633 a large picture of the king and queen of Bohemia "and all their children." For Lord Dorchester about the same period he completed some illustrations of the Odyssey; for the king of Denmark he composed incidents of Danish history, of which one example remains in the gallery of Copenhagen. In the course of a large practice he had painted many likenesses--Charles I. and his queen, the duke of Buckingham, and the king and queen of Bohemia. He now became court painter to the princess of Orange, settled (1637) at the Hague, and painted in succession at the Castle of Ryswick and the House in the Wood. The time not consumed in producing pictures was devoted to portraits. Even now his works are very numerous, and amply represented in English and Continental galleries. His most attractive pieces are those in which he cultivates the style of Caravaggio, those, namely, which represent taverns, with players, singers and eaters. He shows great skill in reproducing scenes illuminated by a single candle. But he seems to have studied too much in dark rooms, where the subtleties of flesh colour are lost in the dusky smoothness and uniform redness of tints procurable from farthing dips. Of great interest still, though rather sharp in outline and hard in modelling, are his portraits of Hans and Anna, and their children, the König and Queen of Bohemia (Hanover and Combe Abbey), Mary de Medici (Amsterdam town-hall), 1628, the Stadtholders and their Wives (Amsterdam and Hague), Charles Louis and Rupert, Charles I.'s nephews (Louvre, St Petersburg, Combe Abbey and Willin), and Lord Craven (National Portrait Gallery). His early form may be judged by a Lute-player (1614) at the Louvre, the Martyrdom of St John in S. M. della Scala at Rome, or the Liberation of Peter in the Berlin Museum; his latest style is that of the House in the Wood (1648), where he appears to disadvantage by the side of Jordaeus and others.

Honthorst was succeeded by his brother William, born at Utrecht in 1604, who died, it is said, in 1666. He lived chiefly in his native place, temporarily at Berlin. But he has left little behind except a portrait at Amsterdam, and portraits in the Berlin Museum of William and Mary of England.

HOOCH, PIETER DE (1629-?1678), Dutch painter, was born in 1629, and died in Amsterdam probably shortly after 1677. He was a native of Rotterdam, and wandered early to Haarlem and the Hague. In 1654 we find him again at Rotterdam, where in that year he married a girl of Delft, Janne of der Burch. From 1655 to 1657 he was a member of the painter's guild of Delft, but after that date we have no traces of his doings until about 1668, when his presence is recorded in Amsterdam. His dated pictures prove that he was still alive in 1677, but his death followed probably soon after this year. De Hooch is one of the kindliest and most charming painters of homely subjects that Holland has produced. He seems to have been born at the same time and taught in the same school as van der Meer and Maes. All three are disciples of the school of Rembrandt. Houbraen mentions Nicolas Berchem as De Hooch's teacher. De Hooch only once painted a canvas of large size, and that unfortunately perished in a fire at Rotterdam in 1684. But his small pieces display perfect finish and dexterity of hand, combined with great power of discrimination. Though he sometimes paints open-air scenes, he is chiefly noted for his "studies," or subjects depicted at home in interiors illuminated by different lights, with the radiance of the day, in different intensities, seen through doors and windows. He thus brings together the most delicate varieties of tone, and produces chords that vibrate with harmony. The themes which he illustrates are thoroughly suited to his purpose. Sometimes he chooses the drawing-room where dames and cavaliers dance, or dine, or sing; sometimes--mostly indeed--he prefers cottages or court-yards, where the housewives tend their children or superintend the labours of the cook. Satin and gold are as familiar to him as camlet and fur; and there is no article of furniture in a Dutch house of the middle class that he does not paint with pleasure. What distinguishes him most besides subtle suggestiveness is the serenity of his pictures. One of his most charming was the canvas formerly in the Ashburnham collection, now burnt, where an old lady with a dish of apples walks with a child along a street bounded by a high wall, above which gables and a church steeple are seen, while the sun radiates joyfully over the whole. Fine in another way is the "Mug of Beer" in the Amsterdam Museum, an interior with a woman coming out of a pantry and giving a measure of beer to a little girl. The light flows in here from a small closed window; but through the door to the right we look into a drawing-room, and through the open sash of that room we see the open air. The three lights are managed with supreme cunning. Beautiful for its illumination again is the "Music Party," with its contending indoor and outdoor lights, a gem in the late A. Thieme collection at Leipzig. More subtly suggestive, in the museum of Berlin, is the "Mother seated near a Cradle." "A Card Party," dated 1658, at Buckingham Palace, is a good example of De Hooch's drawing-room scenes, counterpart as to date and value of a "Woman and Child" in the National Gallery, and the "Smoking Party," formerly in Lord Enfield's collection. Another very fine example is the "Interior," with figures represented, by Sir Francis Hely Wrigglesworth, presumably done later in the master's career are the "Lady and Child in a Courtyard," of 1665, in the National Gallery, and the "Lady receiving a Letter," of 1670, in the Amsterdam Museum (Van der Hoop collection).

It is possible to bring together over 250 examples of De Hooch. There are three at St Petersburg, three in Buckingham Palace, three in the National Gallery, two in the Wallace Collection, six in the Amsterdam Museum, some in the Louvre and at Munich and Darmstadt; many others are in private galleries in England. For England was the first country to recognize the merit of De Hooch, who only
HOOD, J. B.—HOOD, VISCOUNT 665

began to be valued in Holland in the middle of the 18th century. A celebrated picture at Amsterdam, sold for 450 florins in 1765, fetched 4000 in 1717, and in 1756 the Berlin Museum gave £540 for a De Fosse portrait of the admiral and his son. A life-drawing-room was worked up from the picture. See Hofstede de Groot's Catalogue raisonné, vol. i., London, 1907.

HOOD, JOHN BELL (1831-1879), American soldier, lieut.-general, was born at Owingsville, Kentucky, in 1831, and graduated from West Point military academy in 1853. As an officer of the 2nd U.S. cavalry (Colonel Sidney Johnston) he saw service against Indians, and later he was cavalry instructor at West Point. He resigned from the U.S. service in 1861, and became a colonel in the Confederate army. He was soon promoted brigadier-general, and at the battle of Gaines's Mill, where he was wounded, won the brevet of major-general for his gallant conduct. With the famous "Texas brigade" of the Army of Northern Virginia he served throughout the campaign of 1862. At Gettysburg he commanded one of the divisions of Longstreet's corps, receiving a wound which disabled his arm. With Longstreet he was transferred in the autumn of 1863 to the Army of Tennessee. At the battle of Chickamauga (September 19th, 20th) Hood was severely wounded again and his leg was amputated, but after six months he returned to duty undaunted. He remained with the Army of Tennessee as a corps commander, and when the general dissatisfaction with the Fabian policy of General J. E. Johnston brought about the removal of that officer, Hood was put in his place with the temporary rank of general. He had won a great reputation as a fighting general, and it was with the distinct understanding that battles were to be fought that he was placed at the head of the Army of Tennessee. But in spite of skill and courage he was uniformly unsuccessful in the battles around Atlanta. In the end he had to abandon the place, but he forthwith sought to attack Sherman in another direction, and finally invaded Tennessee. His march was pushed with the greatest energy, but he failed to draw the main body of the enemy after him, and, while Sherman with a picked force made his "March to the Sea," Thomas collected an army to oppose Hood. A severe battle was fought at Franklin on the 30th of November, and finally Hood was defeated and his army almost annihilated in the battle of Nashville. He was then relieved at his own request (January 23rd, 1863). After the war he was engaged in business in New Orleans, where he died of yellow fever on the 30th of August 1879. His experiences in the Civil War are narrated in his Advance and Retreat (New Orleans, 1880). Hood's reputation as a bold and energetic leader was well deserved, though his reckless vigour proved but a poor substitute for Johnston's careful husbanding of his strength at this declining stage of the Confederacy.

HOOD, VISCOUNT (1722-1788), British admiral, was the son of Samuel Hood, vicar of Butleigh in Somerset, and prebendary of Wells. He was born on the 12th of December 1724, and entered the navy on the 6th of May 1741. He served part of his time as midshipman with Rodney in the "Ludlow," and became lieutenant in 1746. He was fortunate in serving under active officers, and had opportunities of seeing service in the North Sea. In 1753 he was made commander of the Jamaica "sloop," and served in her on the North American station. In 1756 he was still on that station, and in 1757, when he sailed for the American station, he attained to post rank. In 1757, while in temporary command of the "Antelope" (50), he drove a French ship ashore in Audierne Bay, and captured two privateers. His zeal attracted the favourable notice of the Admiralty and he was appointed to a ship of his own. In 1759, when captain of the "Vestal" (32), he captured the French "Bellona" (32) after a sharp action. During the war his services were wholly in the Channel, and he was engaged under Rodney in 1759 in the second Scheldt expedition. In 1777 he accepted a command which in the ordinary course would have terminated his active career. He became commissioner of the dockyard at Portsmouth and governor of the Naval Academy. These posts were generally given to officers who were retiring from the sea. In 1780, on the occasion of the king's visit to Portsmouth, he was made a baronet. The circumstances of the time were not ordinary. Many admirals declined to serve under Lord Sandwich, and Rodney, who then commanded in the West Indies, had complained of want of proper support from his subordinate, whom he accused of disaffection. The Admiralty was naturally anxious to secure the services of trustworthy flag officers, and having confidence in Hood promoted him rear-admiral out of the usual course on the 26th of December 1786, and sent him to the West Indies to act as second in command under Rodney, whom he had long known. He joined Rodney in January 1781, and remained in the West Indies or on the coast of North America till the close of the War of American Independence. The calculation that he would work harmoniously with Rodney was not altogether justified by the results. The correspondence of the two shows that they were far from being on cordial personal terms with one another, but Hood always discharged his duty punctually, and his capacity was so great, and so signally proved, that no question of removing him from the station ever arose. The unfortunate turn taken by the campaign of 1782 was largely due to Rodney's neglect of his advice. If he had been allowed to choose his own position there can be no doubt that he could have prevented the comte de Grasse (1772-1788) from reaching Fort Royal with the reinforcements from France in April (see Rodney, LORD). When the fleet went on to the coast of North America during the hurricane months of 1781 he was sent to serve with Admiral Graves (1725-1782) in the unsuccessful effort to relieve the army at Yorktown. But his subordinate rank gave him no chance to impart a greater measure of energy to the naval operations. When, however, he returned to the West Indies he was for a time in independent command owing to Rodney's absence in England for the sake of his health. The French admiral, the comte de Grasse, attacked the British islands of St Kitts and Nevis with a much superior force to the squadron under Hood's command. The attempt Hood made in January 1782 to save them from capture, with 22 ships to 29, was not successful, but the series of bold movements by which he first turned the French out of their anchorage at the Basse Terre of St Kitts, and then beat off the attacks of the enemy, were the most brilliant things done by any British admiral during the war. He was made an Irish peer for his share in the defeat of the comte de Grasse on the 9th and 12th of April near Dominica. During the peace he entered parliament as member for Westminister in the fiercely contested election of 1784, was promoted vice-admiral in 1787, and in July of 1788 was appointed to the Board of Admiralty under the second earl of Chatham. On the outbreak of the revolutionary war he was sent to the Mediterranean, where he was employed in the cruise which lasted from May 1793 to October 1794, was very busy. In August he occupied Toulon on the invitation of the French royalists, and in co-operation with the Spaniards. In December of the same year the allies, who did not work harmoniously together, were driven out, mainly by the generalship of Napoleon. Hood now turned to the occupation of Corsica, which he had been invited to take in the name of the king of England by Paoli. The island was for a short time added to the dominions of Napoleon III., but the occupation, which was under his co-operation of Paoli. While the occupation of Corsica was being effected, the French at Toulon had so far recovered that they were able to send a fleet to sea. In June Hood sailed in the hope of bringing it to action. The plan which he laid to attack it in the Golfe Jouan in June may possibly have served to some extent as an inspiration, if not as a model, to Nelson for the battle of the Nile, but the wind was unfavourable, and the attack could not be carried out. In October he was recalled to England in consequence of some misunderstanding with the admiralty, or the ministry, which has never been explained. He had attained the rank of full admiral in April of 1794. He held no further command at sea, but in 1796 he was named governor of Greenwich Hospital, a post which he held till his death on the 27th of January 1816. A peerage of Great Britain was conferred on his wife as Baroness Hood of Catherington in
HOOD, SIR S.—HOOD, THOMAS

1705, and he was himself created Viscount Hood of Whitley in 1746. The titles descended to his son, Henry (1733–1830), the ancestor of the present Viscount Hood. There are several portraits of Lord Hood by Allan Ramsay, G. H. Kneller and in the National Portrait Gallery. He was also painted by Reynolds and Gainsborough.

There is no good life of Lord Hood, but a biographical notice of him by M’Arthur, his secretary during the Mediterranean command, is in the Naval Chronicle, vol. ii. Charnock’s Biog. Nar. vii. Ralf, Nut. Bio. vol. i., is largely a repetition of his, and his biographer, by his own confession, was in no way concerned during his command in America has been published by the Navy Record Society. The history of his campaigns will be found in the historians of the wars in which he served: for the earlier years, Beaton’s Naval and Military Memoirs; for the later, James’s Naval History, vol. i., for the English side, and for the French, Trouties, Batallons navaux de la France, ii. and iii.; and Chevalier’s Histoire de la marine française pendant la guerre de l’Indépendance américaine and mano la République. (D. H.)

HOOD, SIR SAMUEL (1762–1814), British vice-admiral, cousin of Lord Hood and of Lord Bridport, entered the Royal Navy in 1776. His first engagement was the battle off Ushant in 1778, and, soon afterwards transferred to the West Indies, he was present, under the command of his cousin Sir Samuel Hood, at all the actions which culminated in Rodney’s victory of April 12th, 1782. After the peace, like many other British naval officers, he spent some time in France, and on his return to England was given the command of a sloop, from which he proceeded in succession to various frigates. In the "Jum," his gallant rescue of some ships which were about to be captured by a vote of thanks and a sword of honour from the Jamaicæ assembly. Early in 1793 the "Juno" went to the Mediterranean under Lord Hood, and her captain distinguished himself by an audacious feat of coolness and seamanship in extricating his vessel from the harbour of Toulon, which he had entered in ignorance of Lord Hood’s withdrawal. Soon afterwards he was put in command of a frigate squadron for the protection of Levantine commerce, and in 1797 he was given the "Zealous" (74). In which he was present at Nelson’s unsuccessful attack on Santa Cruz. It was Captain Hood who conducted the negotiations which relieved the squadron from the consequences of its failure. The part played by the "Zealous" at the battle of the Nile was brilliant. Her first opponent she put out of action in twelve minutes, and, passing on, Hood immediately engaged other ships, the "Guerrier" being left powerless to fire a shot. When Nelson left the coast of Egypt, Hood commanded the blockading force off Alexandria and Rosetta. Later he rejoined Nelson on the coast of the two Sicilies, receiving for his services the order of St Ferdinand.

In the "Venerable" Hood was present at the action of Algeciras and the battle in the Straits of Gibraltar (1801). In the latter action Hood’s ship suffered heavily, losing 110 officers and men. A year later Captain Hood was employed in Trinidad as a commissioner, and, upon the death of the flag officer commanding the Leeward station, he succeeded him as Commodore. Island after island fell to him, and soon, outside Martinique, the French had scarcely a foothold in the West Indies. Amongst other measures taken by Hood may be mentioned the garrisoning of Diamond Rock, which he commissioned as a slope-of-war to blockade the approaches of Martinique (see James, Naval History, iii. 245). For these successes he received, amongst other rewards, the K.B. In command next of the squadron blockading Rochfort, Sir Samuel Hood had a sharp fight, on 23rd September 1805, with a small French squadron which was trying to escape. Amongst the few casualties on this occasion was the Commodore, who lost an arm. Promoted rear-admiral a few days after this action, Hood was in 1807 entrusted with the operations against Madeira, which he brought to a successful conclusion, and a year later went to the Baltic, with his flag in the "Centaur," to take part in the war between Russia and Sweden. In one of the actions of this war the "Centaur" and "Impalable," unsupported by the Swedish ships (which lay to leeward), cut out the Russian 80-gun ship "Sevolod," from the enemy’s line and, after a desperate fight, forced her to strike. The King of Sweden rewarded the admiral with the Grand Cross of the Order of the Sword. Present in the roads of Corunna at the re-embarkation of the army of Sir John Moore, Hood thence returned to the Mediterranean, where for two years he commanded a division of the British fleet. In 1811 he became vice-admiral. In his last command, that of the East Indias station, he carried out many salutary reforms, especially in matters of discipline and victualling. He died at Madras, 24th December 1814. A lofty column was raised to his memory on a hill near Butleigh, Somersetshire, and in Butleigh Church is another memorial, with an inscription written by Southey.

See Naval Chronicle, vii. The material was furnished by Hood himself, and he does not seem to have had much. His elder brother, Captain Alexander Hood (1758–1798), entered the Royal Navy in 1767, and accompanied Captain Cook in his second voyage round the world. Under Howe and Rodney he distinguished himself in the West Indies, and at the victory of April 12th, 1782, he was in command of one of Rodney’s frigates. Under Sir Samuel Hood he then proceeded to the Mona passage, where he captured the French corvette "Cérès." With the commander of his prize, the Baron de Peroy, Hood became very intimate, and during the peace he paid a long visit to France as his guest. In this he was not a little influenced by the Revolutionary war, ill health kept him at home, and it was not until 1797 that he went afloat again. His first experience was bitter; his ship, the "Mars," was uneventfully prominent in the mutiny at Spithead. On April 21st, 1798, occurred the famous duel of the "Mars" with the "Hercule," fought in the dusk near the Bec du Raz. The two ships were of equal force, but the "Hercule" was newly commissioned, and after an hour’s fighting at close quarters she struck her flag, having lost over three hundred men. The captain of the "Mars" was mortally wounded early in the fight, and died as the sword of the French captain was being put in his hand. The latter, L’Heritier, also died of his wounds.

See Naval Chronicle, vi. 175; Ralf, Naval Biographies, iv. 48; James, Naval History, and Chevalier, Hist. de la marine française sous la première république.

HOOD, THOMAS (1790–1843), British humorist and poet, the son of Thomas Hood, bookseller, was born in London on the 23rd of May 1790. "Next to being a citizen of the world," writes Thomas Hood in his Literary Reminiscences, "it must be the best thing to be born a citizen of the world’s greatest city." On the death of his husband in 1811 Mrs Hood removed to Islington, where Thomas Hood had a schoolmaster who appreciated his talents, and, as he says, "made him feel it impossible not to take an interest in learning while he seemed so interested in teaching." Under the care of this "decayed dominie," whom he has so affectionately recorded, he earned a few guineas as a schoolmaster—his first literary fee—by revising the new edition of Paul and Virginia. Admitted soon after into the counting-house of a friend of his family, he "turned his stool into a Pegasus on three legs, every foot, of course, being a dactyl or a spondee;" but the uncongenial profession affected his health, which was never strong, and he was transferred to the care of his father’s relations at Dunce. There he led a healthy outdoor life, and also became a large and indiscriminate reader, and before long contributed humorous and poetical articles to the provincial newspapers and magazines. As a proof of the seriousness with which he regarded the literary vocation, it may be mentioned that he used to write out his poems in printed characters, believing that that process best enabled him to understand his own peculiarities and faults, and probably unconscious that Coleridge had recommended some such method of criticism when he said he thought "print settles it." On his return to London in 1818 he applied himself assiduously to the art of engraving, in which he acquired a skill that in after years became a most valuable assistant to his literary labours, and enabled him to illustrate his various humours and fancies by a profusion of quaint devices, which not only repeated to the eye the impressions of the text, but, by suggesting amusing analogies and contrasts, added considerably to the sense and effect of the work.
In 1821 Mr John Scott, the editor of the London Magazine, was killed in a duel, and that periodical passed into 'the hands of some friends of Hood, who proposed to make him sub-editor. His installation into this congenial post at once introduced him to the best literary society of the time; and in becoming the associate of Charles Lamb, Cary, de Quincey, Allan Cunningham, Proctor, Talfourd, Hartley Coleridge, the peasant-poet Clare and other contributors to the magazine, he gradually developed his own intellectual powers, and experience became more simple, and intercourse with superior minds for which his cordial and genial character was so well adapted, and which he has described in his best manner in several chapters of Hood's Own. He had married in 1825, and Odes and Addresses—his first work—was written in conjunction with his brother-in-law Mr J. H. Reynolds, the friend of Keats. S. T. Coleridge wrote to Charles Lamb averring that the book must be his work. The Plea of the Midsummer Fairies (1827) and a dramatic romance, Lamia, published later, belong to this time. The Plea of the Midsummer Fairies was a volume of serious verse, in which Hood showed himself a by no means despicable follower of Keats. But he was known as a humorist, and the public, which had learned to expect jokes from him, rejected this little book almost entirely. There was much true poetry in the verse, and much sound sense and keen observation in the prose of these works; but the poetical feeling and lyrical faculty of the one, and the more solid qualities of the other, seemed best employed when they were subservient to his rapid wit, and to the ingenious coruscations of his fancy. This impression was confirmed by the series of the Comic Annual, dating from 1826, a kind of publication at that time popular, which Hood undertook and continued, almost unassisted, for several years. Under that somewhat frivolous title he treated all the leading events of the day in a fine spirit of caricature, entirely free from grossness and vulgarity, without a trace of personal malice, and with an under-current of true sympathy and honest purpose that will preserve these papers, like the sketches of Hogarth, long after the events and manners they illustrate have passed from the minds of men. But just as the agreeable jester rose into the earnest satirist, one of the most striking peculiarities of his style became a more manifest defect. The attention of the reader was distracted, and his good taste annoyed, by the incessant use of puns, of which Hood had written in his own vindication:—

"However critics may take offence,
A double meaning has double sense."

Now it is true that the critic must be unconscious of some of the subtlest charms and nicest delicacies of language who would exclude from humorous writing all those impressions and surprises which depend on the use of the diverse sense of words. The history, indeed, of many a word lies hid in its equivocal uses; and it in no way derogates from the dignity of the highest poetry to gain strength and variety from the ingenious application of the same sounds to different senses, any more than from the contrivances of rhythm or the accompaniment of imitative sounds. But when this habit becomes the characteristic of any wit, it is impossible to prevent it from degenerating into occasional buffoonery, and from supplying a clanger, and source, which a true wit becomes thin or rare. Artists have been known to use the left hand in the hope of checking the fatal facility which practice had conferred on the right; and if Hood had been able to place under some restraint the curious and complex machinery of words and syllables which his fancy was incessantly producing, his style would have been a great gainer, and much real earnestness of object, which now lies confused by the brilliant kaleidoscope of language, would have remained definite and clear. He was probably not unconscious of this danger; for, as his own experience as a writer, his diction became more simple, and his ludicrous illustrations less frequent. In another annual called the Gem appeared the poem on the story of "Eugene Aram," which first manifested the full extent of that poetical vigour which seemed to advance just in proportion as his physical health declined. He started a magazine in his own name, for which he secured the assistance of many literary men of reputation and authority, but which was mainly sustained by his own intellectual activity. From a sick-bed, from which he never rose, he conducted this work with surprising energy, and there composed those poems, too few in number, but immortal in the English language, such as the "Song of the Shirt," (which appeared anonymously in the Christmas number of Punch, 1843), the "Bridge of Sighs" and the "Song of the Laborer," which reveal such profound interests of the time, and transported them from the ground of social poverty into the loftier domain of the imagination. They are no clannish expressions of anger at the discrepancies and contrasts of humanity, but plain, solemn pictures of conditions of life, which neither the politician nor the moralist can deny to exist, and which they are imperatively called upon to remedy. Woman, in her wasted life, in her hurried death, here stands appealing to the society that degrades her, with a combination of eloquence and poetry, of forms of art at once instantaneous and permanent, and with great metrical energy and variety.

Hood was associated with the Athenaeum, started in 1828 by J. Silk Buckingham, and he was a regular contributor for the rest of his life. Prolonged illness brought on straitened circumstances; and application was made to Sir Robert Peel to place Hood's name on the pension list with which the British state so moderately rewards the national services of literary men. This was done without delay, and the pension was continued to his wife and family after his death, which occurred on the 3rd of May 1834. Nine years after a monument, raised by subscription, was placed in the porch of the church of St. Michael, and the name of J. G. Wilkes, the editor of the London Magazine, was struck off. But the most lasting monument to Hood has been the force of his words and life and art, and the sense of humour which is the just balance of all the faculties of man, the best security against the pride of knowledge and the conceits of the imagination, the strongest inducement to submit with a wise and pious patience to the vicissitudes of human existence. This was the lesson that Thomas Hood left behind him.

BIBLIOGRAPHY.—The list of Hood’s separately published works is as follows: Odes and Addresses to Great People (1825); Whims and Oddities (two series, 1826 and 1827); The Plea of the Midsummer Fairies, Hero and Leander, Lyceus the Centaur and other Poems (1827), his only collection of serious verse; The Dream of Eugene Aram, the Murderer (1831); Tynehy Hail, a novel (5 vols., 1834); The Comic Annual (1830–1842); Hood’s Own: or, Laughter from Year to Year (1838, second series, 1861); Up the Rhine (1840); Hood’s Magazine and Comic Miscellany (1844–1849); National Tales (2 vols., 1857), a collection of short novellettes; Whimsicalities (1844), with illustrations from Leech’s designs; and many contributions to contemporary periodicals.

The chief sources of his biography are: Memoirs of Thomas Hood, collected, arranged and edited by his daughter (1860); his "Literary Reminiscences" in Hood’s Own; Alexander Elliot, Hood in Scotland (1886). See also the memoir of Hood’s friend C. W. Dilke, by his grandson Sir Charles Dilke, prefixed to Papers of a Critic; and M. H. Spielmann’s History of Punch. There is an excellent edition of the Poems of Thomas Hood (2 vols., 1897), with a biographical introduction of great interest by Canon Alfred Ainger.

HOOD, TOM (1835–1874), English humorist, son of the poet Thomas Hood, was born at Lake House, Wanstead, Essex, on the 19th of January 1835. After attending the Jamaica College and the Lancashire Louth Grammar School he entered Pembroke College, Oxford, in 1853, where he passed all the examinations for the degree of B.A., but did not graduate. At Oxford he wrote his Farewell to the Swallows (1853) and Pen and Pencil Pictures (1857). He began to write for the Lizzieard Gazette in 1856, and edited that paper in 1858–1859. He then obtained a position in the War Office, which he filled for five years, leaving in 1865.
to become editor of Fun, the comic paper, which became very popular under his direction. In 1867 he first issued Tom Hood's Comic Annual. In 1861 had appeared The Daughters of King Daker, and other Poems, after which he published in conjunction with his sister, Frances Freeling Broderip, a number of amusing books for children. His serious novels, of which Captain Masters' Children (1865) is the best, were not so successful. Hood drew with considerable facility, among his illustrations being those of several of his father's comic verses. In private life his geniality and sincere friendliness secured him the affection and esteem of a wide circle of acquaintance. He died on the 20th of November 1874.

A memoir by his sister, F. F. Broderip, is prefixed to the edition of his poems published in 1877.

The term “hood” and “hat” are distantly related; they may be connected with the feminine hood or Hut, meaning charge, care, Eng. “head.” Some form of hood as a loose covering easily drawn on or off the head has formed a natural part of outdoor costume both for men and women at all times and in all quarters of the globe where climatic conditions called for it. In the middle ages and later both men and women are found wearing it, but with men it tended to be superseded by the hat before it became merely an occasional and additional head-covering in time of bad weather or in particularly rigorous climates. For illustrations and examples of the hood worn by men and women in medieval and later times see the article COSTUME; for the hood or cowl as part of the dress of a religious see COWL, and as forming a distinctive mark of degree in academic costume see ROSES. The word is applied to many objects resembling a hood in function or shape, such as a folding cover for a carriage to protect the occupants from rain or wind, the belled covering for the head of a hawk trained for falconry, the endmost planks in a ship's bottom at bow or stern, and, in botany and zoology, certain parts of a flower or of the neck of an animal which are surrounded and supported or from which are derived.

In architecture a “hood-mould” is a projecting mould carried outside the arch of a door or window; it is weathered underneath, and when continued horizontally is better known as a dripstone. The ends of the hood-mould are generally stopped on a corbel, plain or carved with heads in European churches, but in those of central Syria terminating in scrolls. Although in its origin the object of the projecting and weathered hood-mould was to protect the face of the wall below from rain, it gives more importance to, and emphasizes, the arch-moulds, so that it is often employed decoratively inside churches.

The suffix “-hood,” like the cognate “-head,” was originally a substantive meaning rank, status or quality, and was constantly used in combination with other substantives; cf. in O. Eng. eald-hed, child-hood, the latter of which it ceased to be used separately and became a mere suffix denoting condition added to adjectives; cf. false-hood, as well as to substantives. Hooft, Pieter Cornelissen (1581–1647), Dutch poet and historian, was born at Amsterdam on the 16th of March 1581. His father was one of the leading citizens of Holland, both in politics and in the patronage of letters, and for some time burgomaster of Amsterdam. As early as 1598 the young man was made a member of the chamber of rhetoric In Liefde bloeiend, and produced before that body his tragedy of Achilles and Polyxena, not printed until 1624. In June 1608 he left Holland and proceeded to Paris, where on the 10th of April 1609 he saw the body of Gabrielle d'Estrees lying in state. He went a few months later to Venice, Florence and Rome, and in 1609 to Naples. During his Italian sojourn he made a deep and fruitful study of the best literature of Italy. In July 1609 he sent home to the In Liefde bloeiende a very fine letter in verse, expressing his aspirations for the development of Dutch poetry. He returned through Germany, and after an absence of three years and a half found himself in Amsterdam again on the 8th of May 1613. He brought out his second tragedy, Thersites of Troy, not printed until 1614. In 1615 he completed his beautiful pastoral drama Granida, not published until 1615. He studied law and history at Leiden from 1606 to 1609, and in June of the latter year received from Prince Maurice of Orange the appointment of steward of Muiden, bailiff of Goooland, and lord of Weesp, a joint office of great emolument. He occupied himself with repairing and adornning the decayed castle of Muiden, which was his residence during the remainder of his life. There he entertained the poet Vondel, the scholar Barlaeus, 1 Constantin Huygens, Vossius, Laurens Reael and others. Hooft had been a suitor for the hand of Anna Roemer Visscher, and after the death of Roemer Visscher he left both the sisters visited Muiden. Anna's sympathies were in time diverted to the school of Jacob Cats, but Marie TesselSchelde maintained close ties with Hooft, who revised her translation of Tasso. In August 1610 he married Christina van Erp, an

1 Kaspar van Baerle (1584–1648); professor of rhetoric at Amsterdam, and famous as a Latin poet.
accomplished lady who died in 1629, and four years later he married Eleonora Hellemans. In 1612 Hooft produced his narrative poem, "Adenege" (Leiden, 1629), a story of the reign of Count Floris V. In 1614 was performed at Coster's academy Hooft's comedy of "Ware-nar," an adaptation of the Aulularia of Plautus, first printed in 1617. In 1616 he wrote another tragedy, Bacula, or the Origin of the Dutch, not printed until 1626. It was in 1618 that he abandoned poetry for history, and in 1626 he published the first of his great prose works, the History of Henry the Great (Henry IV. of France). His next production was his Miseries of the Princes of the House of Medici (Amsterdam, 1638). In 1642 he published a volume at Amsterdam a folio comprising the first twenty books of his Dutch History, embracing the period from 1555 to 1585, a magnificent performance, to the perfections of which he had given fifteen years of labour. The seven concluding books were published posthumously in 1645. His idea of history was gained from Tacitus, whose works he translated. Hooft died on a visit to the Hague, whither he had gone to attend the funeral of Prince Frederick Henry, on the 21st of May 1647, and was buried in the New Church at Amsterdam.

Hooft was one of the most brilliant figures that adorn Dutch literature at its best period. He was the first writer to introduce a modern and European tone into belles lettres, and the first to refresh the sources of native thought from the springs of antique and Renaissance poetry. His lyrics and his pastoral of Granida are strongly marked by the influence of Tasso and Sannazzaro; his later tragedies belong more exactly to the familiar tone of his native country. But high as Hooft stands among the Dutch poets, he stands higher—he holds perhaps the highest place—among writers of Dutch prose. His historical style has won the warmest eulogy from so temperate a critic as Motley, and his letters are the most charming ever published in the Dutch language. After Vondel, he may on the whole be considered the most considerable author that Holland has produced.

Hooft's poetical and dramatic works were collected in two volumes (1671, 1675) by F. Leendertz. His letters were edited by B. Heydcoaper (Leiden, 1738) and by van Vloten (Leiden, 4 vols., 1845). The best original account of Hooft is given by G. Brindt in his Leven Van C. G. Hooft (1677), and his funeral address (1647), edited together by J. C. Mathies (Groeningen, 1874). There is an account of the Museum circle in Edward Gooch's Literatures of Northern Europe. Many editions exist of his prose works.

HOOGSTRATEN, SAMUEL DIRKZAN VAN, Dutch painter, was born, it is said, in 1627 at Haarlem, and died at Dort on the 19th of October 1678. This artist, who was first a pupil of his father, lived at the Hague and at Dort till about 1649, when on the death of Dirk Hoogstraten he changed his residence to Amsterdam and entered the school of Rembrandt. A short time afterwards he started as a master and painter of portraits, set out on a round of travels which took him (1651) to Vienna, Rome and London, and finally retired to Dort, where he married in 1656, and held an appointment as "provost of the mint." Hoogstraten's works are scarce; but a sufficient number of them has been preserved to show that he strove to imitate different styles at different times. In a portrait dated 1645 in the Lichtenstein collection at Vienna he imitates Rembrandt; and he continues in this vein as late as 1653, when he produced that wonderful figure of a Jew looking out of a casement, which is the best example of his characteristic style. One of his masterpieces is that of his own portrait at the Belvedere at Vienna. A view of the Vienna Hofburg, dated 1652, in the same gallery displays his skill as a painter of architecture, whilst in a piece at the Hague representing a Lady Reading a Letter as she crosses a Courtyard, or a Lady Consulting a Doctor, in the Van der Hoop Museum at Amsterdam, he imitates de Hooch. One of his latest works is a portrait of Mathys van den Brouck, dated 1670, in the gallery of Amsterdam. The scarcity of Hoogstraten's pictures is probably due to his verbosity, and to his habit of directing a mint, he devoted himself with a fondness to literary labours, wrote a book on the theory of painting (1658) and composed sonnets and a tragedy. We are indebted to him for some of the familiar sayings of Rembrandt. He was an etcher too, and some of his plates are still preserved. His portrait, engraved by himself at the age of fifty, still exists.

HOOKE, JAMES CLARKE (1819-1907), English painter, was born in London on the 21st of November 1819. His father, James Hook, a Northumbrian by descent, Judge Arbitrator of Sierra Leone, married the second daughter of Dr Adam Clarke, the commentator on the Bible, who gave to the painter his second name. Young Hook's first taste of the sea was on board the Berwick smacks which took him on his way to Wooler. He drew with rare facility, and determined to become an artist; and accordingly, without any supervision, he set to work for more than a year in the sculpture galleries of the British Museum. In 1836 he was admitted a student of the Royal Academy, where he worked for three years, and elsewhere learned a good deal of the scientific technique of painting from a nephew of Opie. His first picture, called "The Hard Task," was exhibited in 1837, and represented a girl helping her sister with a lesson. Unusual facility in portraiture and a desire to earn his own living took the student into Ireland to paint likenesses of the country family and others; here he produced landscapes of the Vale of Avoca, and much developed his taste for pastoral art; later, he was similarly engaged in Kent and Somersetshire. In 1842 his second exhibited work was a portrait of "Master J. Finch Smith": in this year he gained silver medals at the Royal Academy, and in 1843 he was one of the competitors in the exhibition of cartoons in Westminster Hall, with a 10 by 7 ft. design of "Satan in Paradise." In 1844 the Academy contained a picture of a kind with which his name was long associated, an illustration of the Decameron, called "Pamphilius relating his Story," a meadow scene in bright light, with sumptuous ladies, richly clad, reclining on the grass. The British Institution, 1844 and 1845, set forth two of Hook's idylls, subjects taken from Shakespeare and Burns, which, with the above, showed him to be cultivating those veins of romantic sentiment and the picturesque which were then in vogue, but in a characteristically fresh and vigorous manner. "The Song of Old Times" (Royal Academy, 1845) marked the artist's future path distinctly in most technical respects. It was in this year Hook won the Academy gold medal for an oil picture of "The Finding of the Body of Harold." The travelling studentship in painting was awarded to him for "Razap watching the Dead Sons of Saul" in 1846; and he went for three years to Italy, having married Miss Rosalie Burton before he left England. Hook passed through Paris, worked diligently for some time in the Louvre, traversed Switzerland, and, though he stayed only part of three years in Italy, gained much from studies of Titian, Tintoret, Carpaccio, Mansueti and other Venetians. Their influence thenceforth dominated the coloring of his pictures, and enabled him to apply the principles to which they had attained to the representation (as Bovington before him had done) of romantic subjects and to those English themes of the land and sea with which the name of the artist is inseparably associated. "A Dream of Ancient Venice" (R.A., 1848)—the first fruit of these Italian studies—"Bayard of Brescia" (R.A., 1849), "Venice" (B.I., 1849) and other works assured for Hook the Associateship of the Royal Academy in 1851. Soon afterwards an incomparable series of English subjects was begun, in many pastorals and fine idylls of the sea and rocks. "A Rest by the Wayside" and "A Few Minutes to Wait before Twelve o'clock" proved his title to appear, in 1854, as a new and original painter. After these came "A Signal on the Horizon" (1857), "A Widow's Son going to Sea," "The Ship-boy's Letter," "Children's Children are the Crown of Old Men," "A Coast-boy gathering Eggs," a scene at Lundy; the perfect "Luff, Boy!" (1859), about which Ruskin broke into a dithyrambic chant, "The Brook," "Stand Clear!" "O Well for the Fisherman's Boy!" (1866), "Leaving Cornwall for the Whitby Fishing," "The Boys on the Rock," and a score more as fine as these. The artist was elected a full Academician on the 6th of March 1860, in the place of James Ward. He died on the 14th of April 1907.
HOOK, T. E.—HOOK

 Portfolio (1888); F. G. Stephens, "J. C. Hook, Royal Academician: His Life and Work,
 Art Annual (London, 1888); P. G. Hamerton, Etching and Etchers
 (London, 1877).

HOOK, THEODORE EDWARD (1738-1841), English author,
 was born in London on the 22nd of September 1758. He spent a
 year at Haw, and subsequently matriculated at Oxford,
 but he never actually resided at the University. His father,
 James Hook (1746-1827), the composer of numerous popular
 songs, took great delight in exhibiting the boy's extraordinary
 musical and metrical gifts, and the precocious Theodore became
 "the little pet lion of the green room." At the age of sixteen,
 in conjunction with his father, he scored a dramatic success
 with The Soldier's Return, a comic opera, and this he rapidly
 followed up with a series of over a dozen sparkling ventures,
 the instant popularity of which was hardly dependent on the
 infallible acting of John Liston and Charles Mathewes. But Hook
 gave himself up to some ten of the best years of his life to the
 pleasures of the town, winning a foremost place in the world of
 fashion by his matchless powers of improvisation and mimicry,
 and startling the public by the audacity of his practical jokes.
 His unique gift of improvising the words and the music of songs
 eventually charmed the prince Regent into a declaration that
 "something must be done for Hook." The prince was as good
 as his word, and Hook, in spite of a total ignorance of accounts,
 was appointed accountant-general and treasurer of the Mauritius
 with a salary of £2000 a year. For five delightful years he
 was the life and soul of the island, but in 1817, a serious deficiency
 having been discovered in the treasury accounts, he was arrested
 and brought to England on a criminal charge. A sum of about
 £12,000 had been abstracted by a deputy official, and for this
 amount Hook was held responsible.

During the tardy scrutiny of the audit board he lived obscurely
 and maintained himself by writing for magazines and newspapers.
 In 1820 he launched the newspaper John Bull, the champion of
 high Toryism and the virulent detractor of Queen Caroline.
 Witty, incisive criticism and pitiless invective secured it a large
 circulation, and from this source alone Hook derived, for the
 first year at least, an income of £2000. He was, however,
 arrested for the second time on account of his debt to the state,
 which he made no effort to defray. In a sponging-house, where
 he was confined for two years, he wrote the nine volumes of stories
 afterwards collected under the title of Sayings and Doings
 (1826-1829). In the remaining twenty-three years of his life
 he poured forth no fewer than thirty-eight volumes, besides
 numberless articles, squibs and sketches. His novels are not
 works of enduring interest, but they are saved from mediocrity
 by frequent passages of racy narrative and vivid portraiture.
 The best are Maxwell (1830), Love and Pride (1833), the autobiog-
 graphic Gilchrist (1836), Jock Bragg (1837), Sayings and Doings
 (1859), and Perseine Bunce (1842). Incessant work had already
 led to the decline of his health, when Hook returned to his old social
 habits, and a prolonged attempt to combine industry and dissipa-
 tion resulted in the confession that he was "done up in public,
 in mind and in body too at last." He died on the 24th of August
 1841. His writings in great part are of a purely ephemeral
 character; and the greatest triumphs of the improvisatore
 may be said to have been writ in wine. Putting aside, however,
 his claim to literary greatness, Hook will be remembered as one
 of the most brilliant, genial and original figures of Georgian
 times.

See the Rev. R. H. D. Barham's Life and Remains of Hook (3rd ed.,
 1877); and an article by J. G. Lockhart in the Quarterly Review
 (May 1843).

HOOK, WALTER FARQUHAR (1708-1875), English divine,
 nephew of the witty Theodore, was born in London on the 13th of
 March 1708. Educated at Tiverton and Winchester, he
 graduated at Oxford (Christ Church) in 1821, and after holding
 an incumbency in Coventry, 1829-1837, and in Leeds, 1857-
 1859, was nominated dean of Chichester by Lord Derby.
 He received the degree of D.D. in 1837. His friendship towards
 the Tractarians exposed him to considerable persecution, but
 his simple manly character and zealous devotion to parochial
 work gained him the support of widely divergent classes. His
 stay in Leeds was marked by vigorous and far-reaching church
 extension, and his views on education were far in advance of
 his time. Among his many writings are An Ecclesiastical
 Biography, containing the Lives of Ancient Fathers and Modern
 Divines (8 vols., 1852), A Church Dictionary, The Means
 of Rendering more Effectual the Education of the People,
 The Cross of Christ (1873), The Church and its Ordinances
 (sermons, 4 vols., 1876), and Lives of the Archbishops of Canter-
bury (12 vols., 1860-1870). He died on the 20th of October
 1875.

See Life and Letters of Dean Hook, by his son-in-law, W. R. W.
 Stephens (2 vols., 1878).

HOOKAH (the English spelling of the Persian and Hindustani
 huggle, an adaptation of the Arabic hukkah, a vase or casket
 through which one could indulge in a kind of smoking, probably
 derived from the Arabic hukk, a large pipe, a pipe with a long
 stem, or a smoking pipe), was a pipe with a long flexible
 tube attached to a large bowl containing water, often scented,
 and resting upon a tripod or stand. The smoke of the tobacco
 is made to pass through the water in the bowl, and is thus cooled
 before reaching the smoker. The narghile of India is principle-
 ly the same as that of the hookah; the word is derived from nargil,
 an Indian name for the coconut-nut tree, as when the narghile
 was first made the water was placed in a coconut. This re-
ceptacle is now often made of porcelain, glass or metal. In the
 hubble-bubble the pipe is so contrived that the water in
 the bowl makes a bubbling noise while the pipe is being
 smoked. This pipe is common in India, Egypt and the East
 generally.

HOOKE, ROBERT (1655-1703), English experimental
 philosopher, was born on the 28th of July 1655 at Freshwater,
 in the Isle of Wight, where his father, John Hooke, was minister
 of the parish. After working for a short time with Sir Peter
 Lely, he went to Westminster school; and in 1663 he entered
 Christ Church, Oxford, as a servant. After 1653 he was employed
 and patronized by the Hon. Robert Boyle, who turned his skill
 to account in the construction of his air-pump. On the 12th
 of November 1662 he was appointed curator of experiments
 to the Royal Society, of which he was elected a fellow in 1663,
 and filled the office during the remainder of his life. In 1664
 Sir John Cutler instituted for his benefit a mechanical lectrucship
 of £50 a year, and in the following year he was appointed
 professor of geometry in Gresham College, where he subsequently
 resided. After the Great Fire of 1666 he constructed a model
 for the rebuilding of the city, which was highly approved, although
 the design of Sir C. Wren was preferred. During the progress
 of the works, however, he acted as surveyor, and accumulated
 in that lucrative employment a sum of several thousand pounds,
 discovered after his death in an old iron chest, which had
 evidently lain unclosed for above thirty years. He fulfilled
 the duties of secretary to the Royal Society during five years
 after the death of Henry Oldenburg in 1677, publishing in 1681-
 1682 the papers read before that body under the title of Philo-
sophical Collections. A protracted controversy with Johann
 Hevelius, in which Hooke urged the advantages of telescopic
 over plain sights, brought him little but discredit. His reasons
 were good; but his offensive style of argument rendered them
 unpalatable and himself unpopular. Many circumstances
 concurred to embitter the latter years of his life. The death,
 in 1687, of his niece, Mrs Grace Hooke, who had lived with him
 for many years, caused him deep affliction; a law-suit with Sir
 John Cutler about his salary (decided, however, in his favour
 in 1696) occasioned him prolonged anxiety; and the repeated
 anticipation of his discoveries inspired him with a morbid
 jealousy. Marks of public respect were not indeed wanting to
 him. A degree of M.D. was conferred on him at Doctors'
 Commons in 1691, and the Royal Society made him, in 1696,
 a grant to enable him to complete his philosophical inventions.
 While engaged on this task he died, worn out with disease,
 on the 3rd of March 1703 in London, and was buried in St
 Helen's Church, Bishopsgate Street.

In personal appearance Hooke made but a sorry show. His
HOOKER, J.—HOOKER, SIR J. D. 671

figure was crooked, his limbs shrunken; his hair hung in dishevelled locks over his haggard countenance. His temper was irritable, his habits penurious and solitary. He was, however, blameless in morals and reverent in religion. His scientific achievements would probably have been more striking if they had been less variegated. He originated much, but perfected little. His optical investigations led him to adopt in an imperfect form, and put it in a new light, to anticipate the doctrine of interference, and to observe, independently of the work of F. M. Grimaldi (1618–1663), the phenomenon of diffraction. He was the first to state clearly that the motions of the heavenly bodies must be regarded as a mechanical problem, and he approached in a remarkable manner the discovery of universal gravitation. He invented the wheel barometer, discussed the application of barometrical indications to meteorological forecasting, suggested a system of optical telegraphy, anticipated E. F. Chladni's experiment of sounding a vibrating bell with flour, investigated the nature of sound and the function of the air in respiration and combustion, and originated the idea of using the pendulum as a measure of gravity. He is credited with the invention of the anchor escapement for clocks, and also with the application of spiral springs to the balances of watches, together with the explanation of their action by the principle "Un tensio sic vis" (1766).

His principal writings are Micrographia (1664); "Lectiones Cullerianae" (1675–1679); and "Posthumous Works", containing a sketch of his "Philosophical Algebra," published by R. Waller in 1705.

HOOKER, JOSEPH (1814–1879), American general, was born in Hadley, Massachusetts, on the 13th of November 1814. He was educated at the military academy at West Point (1833–1837), and on graduating entered the 1st U.S. Artillery. In the war with Mexico (1846–48) he served as a staff officer, and rose by successive brevets for meritorious services to the rank of lieutenant-colonel. In 1853 he left the service and bought a large farm near Sonoma, Cal., which he managed successfully till 1856, when he was made superintendent of military affairs in Oregon. Upon the opening of hostilities in the Civil War of 1861–65, he sacrificed his fine estate and offered his sword to the Federal Government. He was commissioned brigadier-general of volunteers on the 17th of May 1861 and major-general on the 5th of May 1862. The engagement of Williamsburg (May 5th) brought him and his subordinate Hancock into prominence, and Hooker received the sobriquet of "Fighting Joe." He was engaged at the battle of Fair Oaks, and did splendid service to the Union army during the Seven Days." In the fight between Chancellorsville, near Fredericksburg, (April 25, 1863), he led his division with fiery energy at Briscoe Station, Manassas and Chantilly. In the Maryland campaign (September) he was at the head of the I. corps, Army of the Potomac, forced the defile of South Mountain and opened the way for the advance of the army. The I. corps opened the great battle of Antietam, and sustained a sanguinary fight with the Confederates under Stonewall Jackson. Hooker himself was severely wounded. He was commissioned brigadier-general in the United States army on the 20th of September 1863, and in the battle of Fredericksburg, (May 19), under General Pope, commanded the centre grand division (III. and V. corps). He had protested against the useless slaughter of his men on that disastrous field, and when Burnside resigned the command Hooker succeeded him. The new leader effected a much-needed reorganization in the army, which had fought many battles without success. In this task, as in subordinate commands in battle, Hooker was excelled by few. But his grave defects as a commander-in-chief were soon to be obvious. By a well-planned withdrawal on the night of June 28, he saved himself and left the enemy's flank, but at the decisive moment he checked the advance of his troops. Lee turned upon him, Jackson surprised and destroyed a whole army corps, and the battle of Chancellorsville (see Wilderness), in which Hooker was himself disabled, ended in a retreat to the old position. Yet Hooker had not entirely forfeited the confidence of his men, to whom he was still "Fighting Joe." The second advance of Lee into Union territory, which led to the battle of Gettysburg, was strenuously resisted by Hooker, who would have inflicted a heavy blow on Lee's scattered forces had he not been condemned to inaction by orders from Washington. Even then Hooker followed the Confederates a day only behind them, until, finding himself discouraged and forbidden to control the movements of troops within the sphere of operations, he resigned the command on the eve of the battle of Antietam (September 17). He was a man of great energy, and an excessive sense of responsibility made his continued occupation of the command impossible, but when after a signal defeat Rosecrans was besieged in Chattanooga, and Grant with all the forces of the West was hurried to the rescue, two corps of the Army of the Potomac were sent over by rail, and Hooker, who was at least one of the finest fighting generals of the service, went with them in command. He fought and won the "Battle above the Clouds" on Lookout Mountain which cleared the way for the crowning victory of the army of the Cumberland on Missionary Ridge (see CHATTANOOGA), and in command of the same corps (consolidated as the XX. corps) he took part in all the battles and combats of the Atlanta campaign of 1864. When General McPherson was killed before Atlanta, the command of Grant's old Army of the Tennessee fell vacant. Hooker, who, though only a corps commander, was senior to the other army commanders, Thomas and Schofield, was normally entitled to receive it, but General Sherman feared to commit a whole army to the guidance of a man of Hooker's peculiar temperament, and the place was given to Howard. Hooker thereupon left the army. He was commissioned brevet-major-general in the United States army on the 13th of March 1865, and retired from active service with the full rank of major-general on the 15th of October 1868, in consequence of a paralytic seizure. The last years of his life were passed in the neighbourhood of New York. He died at Garden City, Long Island, on the 31st of October 1879.

HOOKER, SIR JOSEPH DALTON (1817–1892), English botanist and traveller, son of the famous botanist Sir W. J. Hooker, was born on the 26th June 1817, at Halesworth, Suffolk. He was educated at Glasgow University, and almost immediately after taking his M.D. degree there in 1839 joined Sir James Ross's Antarctic expedition, receiving a commission as assistant-surgeon on the "Erebus." The botanical fruits of the three years he thus spent in the Southern Seas were the *Flora Antarctica, Flora Novae Zelandiae* and *Flora Tasmanica*, which he published on his return. His next expedition was to the northern frontiers of India (1847–51), and the expenses in this case also were partly defrayed by the government, the party had its full share of adventure. Hooker and his friend Dr Campbell were detained in prison for some time by the rajah of Sikkim, but nevertheless they were able to bring back important results, both geographical and botanical. Their survey of hitherto unexplored regions was published by the Calcutta Trigonometrical Survey Office, and their botanical observations formed the basis of elaborate works on the rhododendrons of the Sikkim Himalaya and on the flora of India. Among other journeys undertaken by Hooker may be mentioned those to Palestine (1866), Morocco (1871), and the United States (1877), all yielding valuable scientific information. In the midst of all this travelling in foreign countries he quickly built up for himself a high scientific reputation at home. In 1853 he was appointed assistant-director of Kew Gardens, and in 1865 he succeeded his father as full director, holding the post for twenty years. At the early age of thirty he was elected a fellow of the Royal Society, and in 1853 he was chosen its president; he received three of its medals—a Royal in 1854, the Copley in 1867 and the Darwin in 1872. He was president of the British Association at its Norwich meeting of 1868, when his address was remarkable for its championship of Darwinian theories. Of Darwin, indeed, he was an early friend and supporter: it was he who, with Lyell, first induced Darwin to make his views public, and the author of *The Origin of Species* has recorded his indebtedness to Hooker's wide knowledge and balanced judgment. Sir Joseph Hooker is the author of numerous
scientific papers and monographs, and his larger books include, in addition to those already mentioned, a standard Student's Flora of the British Isles and a monumental work, the Genera plantarum, based on the collections at Kew, in which he had the assistance of Bentham. On the publication of the last part of his Flora of British India in 1897 he was created G.C.S.I., of which order he had been made a knight commander twenty years before; and twenty years later, on attaining the age of ninety, he was awarded the Order of Merit.

HOOKER, RICHARD (1553–1600), English writer, author of the Laws of Ecclesiastical Polity, son of Richard Vowell or Hooker, was born at Heatree, near the city of Exeter, about the end of 1553 or beginning of 1554. Vowell was the original name of his family, but was gradually dropped, and in the 15th century its members were known as Vowell alias Hooker. At school, not only his facility in mastering his tasks, but his intellectual inquisitiveness and his fine moral qualities, attracted the special notice of his teacher, who strongly recommended his parents to educate him for the church. Though well connected, they were, however, somewhat straitened in their worldly circumstances, and Hooker was indebted for admission to the university to his uncle, John Hooker alias Vowell, chamberlain of Exeter, and draughtsman of some of the early coins, who induced Bishop Jewell to become his patron and to bestow on him a clerk's place in Corpus Christi College, Oxford. To this Hooker was admitted in 1568. Bishop Jewell died in September 1571, but Dr William Cole, president of the college, from the strong interest he felt in the young man, on account at once of his character and his abilities, spontaneously offered to take the bishop's place as his patron; and shortly afterwards Hooker, by his own labours as a tutor, became independent of gratuitous aid. Two of his pupils, and these his favourite ones, were Edwin Sandys, afterwards author of Europae speculum, and George Cranmer, grand-nephew of the archbishop. Hooker's reputation as a preacher of some renown, was very high by the end of the five years at the university to such good purpose as not only to have acquired great proficiency in the learned languages, but to have joined to this a wide and varied culture which had delivered him from the bondage of learned pedantry; in addition to which he is said to have possessed a remarkable talent for communicating knowledge in a clear and interesting manner, and to have exercised a special influence over his pupils' intellectual and moral tendencies. In December 1573 he was elected scholar of his college; in July 1577 he proceeded to M.A., and in September of the same year he was admitted a fellow. In 1578 he was appointed by the chancellor of the university to read the public Hebrew lecture, a duty which he continued to discharge till he left Oxford. Not long after his admission into holy orders, about 1581, he was appointed to preach at St Paul's Cross; and, according to Walton, he was so kindly entertained by Mrs Churchman, who kept the Shunamite's house where the preachers were boarded, that he permitted her to choose him a wife, "promising upon a fair summons to return to London and accept of her choice." The lady selected by her was his daughter Joan, who, says the same authority, "found him neither beauty nor portion; and for her conditions they were too like 'that of a man which is by Solomon, compared to a drouching house.'" It is probable that Walston has exaggerated the simplicity and passiveness of Hooker in the matter, but though, as Keble observes with justice, his writings betray uncommon shrewdness and quickness of observation, as well as a vein of keener humour, it would appear that either gratitude or some other impulse had on this occasion led his judgment astray. After his marriage he was, about the end of 1584, presented to the living of Drayton Beauchamp in Buckinghamshire. In the following year he received a visit from his two pupils, Edwin Sandys and George Cranmer, who found him with the Odes of Horace in his hand, tending the sheep while the servant was at dinner. On one occasion, when the servant accompanied him to his house, "Richard was called to rock the cradle." Finding him so engrossed by worldly and domestic cares, "they stayed but till the morning." and, greatly grieved at his narrow circumstances and unhappy domestic condition, "left him to the company of his wife Joan.

The visit had, however, results of the highest moment, not only in regard to the career of Hooker, but in regard to English literature and English philosophical thought. Sandys prevailed on his father, the archbishop of York, to recommend Hooker for presentation to the mastership of the Temple, and Hooker, though his "wish was rather to gain a better country living," having agreed after some hesitation to become a candidate, the patent conferring upon him the mastership was granted on the 17th of March 1584/5. The rival candidate was Walter Travers, a preacher and evening lecturer in the same church. Being continued in the lectureship after the appointment of Hooker, Travers was in the habit of attempting a refutation in the evening of what Hooker had spoken in the morning, Hooker again replying on the following Sunday; so it was said "the forenoon sermon spake Canterbury, the afternoon Geneva." On account of the keen feeling displayed by the partisans of both, Archbishop Whitgift deemed it prudent to prohibit the preaching of Travers, whereupon he presented a petition to the council to have the prohibition recalled. Hooker published an Answer to the Petition of Mr Travers, and also printed several sermons bearing on special points, and placed strongly the unsatisfactory nature of such an isolated and fragmentary discussion of separate points, he resolved to compose an elaborate and exhaustive treatise, exhibiting the fundamental principles by which the question in dispute must be decided. It is probable that the work was begun in the latter half of 1586, and he had made considerable progress with it before, with a view to its completion, he petitioned Whitgift to be removed to a country parsonage, in order that, as he said, "I may keep myself in peace and privacy, and behold God's blessing spring out of my mother earth, and eat my own bread without oppositions." His desire was granted in 1591 by a presentation to the rectory of Boscombe, near Bournemouth. He had completed the work when he published the first four of the proposed Eight Books of the Laws of Ecclesiastical Polity. It was entered at Stationers' Hall on the 9th of March 1592, but was not published till 1593 or 1594. In July 1595 he was promoted by the crown to the rectory of Bishopsbourne near Canterbury, where he lived to see the completion of the fifth book in 1597. In the passage from London to Gravesend some time in 1600 he caught a severe cold from which he never recovered; but notwithstanding great weakness and constant suffering, he "was solicitous in his study," his one desire being "to live to finish the three remaining books of Polity." His death took place on the 3d of November of the same year. A volume professing to contain the sixth and eighth books of the Polity was published at London in 1628, but the bulk of the sixth book, as has been shown by Keble, is an entire deviation from the subject on which Hooker proposed to treat, and doubtless the genuine copy, known to have been completed, has been lost. The seventh book, which was published in a new edition of the work by Gauden in 1662, and the eighth book, may be regarded as in substance the composition of Hooker; but, as, in addition to wanting his final revision, they have been very unskilfully edited, if they have not been manipulated for theological purposes, their value is in regard to doubtful and uncertain points, it is to be hoped, if properly edited, they will be refutation.
Hooker, R.

673

The discovery of the intellectual atmosphere of his age was different from that which surrounded the writers who had acted under the same impulse and more of his energies were put to urging the youth to imbibe more thoroughly the spirit of Greek thought which was the source of their inspiration, and thus to reach a higher and freer standard than scholars, and, if possible, to exceed them in the philosophy in England. It may be admitted that his principles are only partially and in some degree capriciously wrought out—but if he were left under the dominion of intellectual tendencies leading to opposite results there is no reason why the genius of his character should not in his principles what seem sometimes to be groping after a meaning which he cannot fully grasp: but he is often charged with obscurity simply because his manner of expressing himself blurs in his principles what seem the outline and justification of their own cases, are disappointed when they find that these outlines instead of acquiring as they narrowly examine them the full and definite form of those, which are vital to a region, that is, to his region, and his sympathy, and therefore from their point of view enveloped in mist and shade. It is the exposition of philosophical principles in the first among books and sermons, of the divine order, of the relations of the remaining books that gives the work its standard place in English literature. It was intended to be an answer to the attacks of the Presbyterians upon the Westminster polity and customs, but no attempt is made directly to assault Presbyterianism from the place it then held in the Church of England. The work must rather be regarded as a remonstrance against the narrow ground chosen by the Presbyterians for their attack, and his exact position being that "a necessity of polity and regiment may be held in all churches without holding any form to be necessary."

The general purpose of his reasoning is to vindicate Episcopacy from the principle which has other and wider consequences than this. The fundamental principle on which he bases his reasoning is the unity and all-embracing character of the Church. The absolute and beautiful saying, "the bosom of God, whose voice the harmony of the Church, is the same as operative in nature, as regulating each man’s individual character and actions, as seen in the formations of societies and governments—is equally a manifestation and development of the divine order according to which God Himself acts, is the expression in various forms of the divine reason. He makes a distinction between natural and legal laws, the one being eternal and immutable, the other varying according to external circumstances; and gives the latter on every variety of knowledge, discipline and experience. The leading feature in his system is the high place assigned to reason, for, though affirming that certain truths necessary to salvation could be made known only by special divine revelation, he yet elevates reason into the criterion by which these truths are to be judged, and the standard to determine what in revelation is temporal and what eternal. "It is not the word of God itself," he says, "which doth or possibly can assure us that we do well to think it His word." At the same time he saves himself from the dangers of abstract and rash theorizing by a deep and absolute regard for facts, the diligent and accurate study of the facts, the painstaking effort to deduce conclusions from these facts, and the depression of the most faith on this natural knowledge. The general and personal voice of men is," he says, "the sentence of God Himself. For that which all men have at all times had sense by their persons, is the same as is the author of nature, her voice is but His instrument." Applying his principles to man individually, the foundation of morality is, according to Hooker, immutable, and rests on that law which God from the beginning hath set Himself to do all things by; this law is to be discovered by reason; and the perfection which reason teaches us to strive after is stated, with characteristic breadth of conception and regard to the facts of human nature, to be a "triple perfection: first a sensual, consisting in those things which very life itself requireth, either as necessary supplements, or as beauties or ornaments thereof; then an intellectual, consisting in those things which none one man is either capable of or acquired with; lastly a spiritual or divine, consisting in those things whereunto extend by supernatural means here, but cannot here attain unto them." His politics, as a means of government, assigns practically the same origin and sanctions to ecclesiastical as to civil government. His theory of government forms the basis of the Treatise on Civil Government by Locke, although Locke developed the theory on a larger scale. No where after than in Hooker, is the force and justification of government derived from public approbation, either given directly by the parties immediately concerned or indirectly by the consent of the ancestors. "Sith men," he says, "naturally have all full and perfect power to command whole politic multitudes of men, therefore utterly without our consent we could in such sort be in no man’s commandment. By no region do we consent to be commanded but whereof we are part hath at any time before consented, without revoking the same after, by the like universal agreement." His position is that stated it is, does not affect the applications liable to objection; but taken as a whole it is the first political, natural statement of the principles which, though disregarded in the succeeding age, have since regulated political progress in England.
and gradually modified its constitution. One of the corollaries of his principles is his theory of the relation of church and state, according to which, with the qualifications implied in his theory of government, he asserts the royal supremacy in matters of religion, and identifies the church and commonwealth as different aspects of the same government.

One of the chief life of Hooker by Dr Gauden was published in his edition of Hooker’s works (London, 1662). To correct the statements about Hooker in this life Walton wrote another, which was published in the 2nd edition of Hooker’s works in 1666. The standard modern edition of Hooker’s works is that of William Kelk, which first appeared in 1836, and has since been several times reprinted (1888 edition, revised by Dean Church and Bishop Paget). The first book of the Laws of Ecclesiastical Polity was edited for the Clarendon Press by Dean R. W. Church (1688-1876).

HOOKER, THOMAS (1586-1647), New England theologian, was born, probably on the 7th of July 1586, at Martha’s Vineyard. His father, William Hooker, a member of the parish of Tilton, County of Leicester, England. He graduated B.A. in 1608 and M.A. in 1611 at Emmanuel College, Cambridge, the intellectual centre of Puritanism, remained there as a fellow for several years, and then preached in the parish of Esher in Surrey. About 1626 he became lecturer to the church of St Mary at Chelmsford, Essex, delivering on market days and Sunday afternoons evangelical addresses which were notable for their moral fervour. In 1629 Archbishop Laud took measures to suppress church lectureships, which were an innovation of Puritanism. Hooker was placed under bond and retired to Little Baddow, near Chelmsford, from where he was called to appear before the Court of High Commission, but he forfeited his bond and fled to Holland, whence in 1633 he emigrated to the Colony of Massachusetts Bay in America, and became pastor at Newtowne (now Cambridge), Mass., of a company of Puritans who had arrived from England in the previous year and in expectation of his joining them were called “Mr Hooker’s Company.” Hooker seems to have been a leader in the formation of that sentiment of discontent with the Massachusetts government which resulted in the founding of Connecticut. He publicly criticized the limitation of suffrage to church members, and, according to an account by William Hubbard (General History of New England), “after Mr Hooker’s coming over it was observed that many of the freemen grew to be very jealous of their liberties.” He was a leader of the emigrants who in 1636 founded Hartford, Connecticut. In a sermon before the Connecticut General Court of 1638, he declared that “the choice of public magistrates belongs unto the people by God’s own allowance” and that “they who have the power to appoint officers and magistrates, it is in their power, also, to set the bounds and limitations of the power and place unto which they call them.” Though this theory was in advance of the age, Hooker held the idea of the separation of church and state—“the privilege of election, which belongs to the people in the earth, must be exercised” according to the blessed will and law of God.” He also defended the right of magistrates to convene synods, and in the Fundamental Orders of Connecticut (1639), which he probably framed, the union of church and state is presupposed.

Hooker was pastor of the Hartford church until his death on the 7th of July 1647. He was active in the negotiations which preceded the formation of the New England Confederation in 1643. In the same year he attended the meeting of Puritan ministers at Boston, whose object was to defend Congregationalism, and he wrote a Survey of the Summe of Church Discipline (1648) in justification of the New England church system. His other works deal chiefly with the experimental phases of religion, especially the experience precedent to conversion. In The Soul’s Humiliation (1637), he assigns as a test of conversion a willingness of the convert to be damned if that be God’s will, thus anticipating the doctrine of Samuel Hopkins in the following century.

See George L. Walker’s Thomas Hooker (New York, 1891); the appendix of which contains a bibliography of Hooker’s published works.

HOOKER, SIR WILLIAM JACKSON (1785-1865), English botanist, was born at Norwich on the 6th of July 1785. His father, Joseph Hooker of Exeter, a member of the same family as the celebrated Richard Hooker, devoted much of his time to the study of German literature and the cultivation of curious plants. The son was educated at the high school of Norwich, on leaving which his independent means enabled him to travel and to take up as a recreation the study of natural history, especially ornithology and entomology. He subsequently confined his attention to botany, on the recommendation of Sir James E. Smith, whom he had consulted respecting a rare moss. His first botanical expedition was made in Iceland, in the summer of 1809, at the suggestion of Sir Joseph Banks; but the natural history specimens which he collected, with his notes and drawings, were lost on the homeward voyage through the burning of the ship, and the young botanist himself narrowly escaped from his life. A good memory, however, aided him to publish an account of the island, and of its inhabitants and flora (Four in Iceland, 1809), privately circulated in 1811, and reprinted in 1813. In 1810-1811 he made extensive preparations, and sacrifices which proved financially serious, with a view to accompany Sir R. Brownrigg to Ceylon, but the disturbed state of the island led to the abandonment of the projected expedition. In 1814 he spent nine months in botanizing excursions in France, Switzerland and northern Italy, and in the following year he married the eldest daughter of Mr Dawson Turner, banker, of Yarmouth. Settling at Halesworth, Suffolk, he devoted himself to the formation of his herbarium, which became of world-wide interest, and which he projected new work, which was succeeded by a new edition of William Curtis’s Flora Londinensis, for which he wrote the descriptions (1817-1828); by a description of the Plantae cryptogamicae of A. von Humboldt and A. Bonpland; by the Muscoleia Britannica, a very complete account of the mosses of Great Britain and Ireland, prepared in conjunction with Dr T. Taylor (1818); and by his Musci exotici (2 vols., 1818-1820), devoted to new foreign mosses and other cryptogamic plants. In 1820 he accepted the regius professorship of botany in Glasgow University and at the same time he set about the preparation of his style being both clear and ready. The following year he brought out a book, Flora Scotia, in which the natural method of arrangement of British plants was given with the artificial. Subsequently he prepared or edited many works, the more important being the following:—

Botanical Illustrations (1822); Exotic Flora, indicating such of the specimens as are deserving cultivation (3 vols., 1822-1827); A Catalogue of Arctic Plants (1824); Catalogue of Plants in the Glasshouse in the Botanic Garden (1826); The Willoughby’s Botanical Magazine (38 vols., 1827-1865); Icones Filicum, in conjunction with Dr R. K. Greville (2 vols., 1829-1831); British Flora, or Descriptions of several new species of herbs appeared, undertaken by Dr G. W. Arnott, &c. (1830); British Flora Cryptogamica (1833); Characters of Genera from the British Flora (1839); Flora Boreali-Americana (2 vols., 1840), being the botany of British North America collected in Sir J. Franklin’s voyages; The Journal of Botany (4 vols., 1830-1835), and The Companion to the Botanical Magazine (2 vols., 1835-1836); Icones plantarum (10 vols., 1837-1844); The Botany of Beechey’s Voyage to the Pacific and Behring’s Straits (with Dr Arnott, 1841); the Genera Filicum (1842), from the original coloured drawings of F. Bauer, with additions and descriptive letterpress; The London Journal of Botany (7 vols., 1842-1848); Notes on the Botany of the Antarctic Voyage of the Erebus and Terror (1843); Species filicum (5 vols., 1846-1864), the standard work on the subject; A Catalogue of the British Flora and Kew Garden Miscellaneous (9 vols., 1849-1857); British Flora (1849); Victoria Regia (1851); Museums of Economic Botany at Kew (1858); Picea excelsa (1857-1859); The British Ferns (1861-1862); A Century of Ferns (1854); A Second Century of Ferns (1860-1861).

It was mainly by Hooker’s exertions that botanists were appointed to the government expeditions. While his works were in progress his herbarium received large and valuable additions from all parts of the globe, and his position as a botanist was thus vastly improved. He was made a knight of Hanover in 1836 and in 1841 he was appointed director of the Royal Botanical Gardens at Kew, on the resignation of W. T. Aiton. Under his direction the gardens expanded from 11 to 75 acres, with a five-acre botanic flower garden, and a more extensive greenhouse, was erected, and a museum of economic botany was established. He was engaged on the Synopsis filicum with J. G. Baker
when he was attacked by a throat disease then epidemic at Kent, where he died on the 21st of August 1685.

HOOLE, JOHN (1727–1803), English translator and dramatist, son of a watchmaker and machinist, Samuel Hoole, was born at Moorfields, London, in December 1727. He was educated at a private school at Hoddesdon, Hertfordshire, kept by James Bennet, who edited Ascham's English works. At the age of seventeen he became a clerk in the accountants' department of the East India House, and before 1767 became one of the auditors of Indian accounts. His leisure hours he devoted to the study of Latin and especially Italian, and began writing translations of the chief works of the Italian poets. He published translations of the Jerusalem Delivered of Tasso in 1763, the Orlando Furioso of Ariosto in 1773–1783, the Dramas of Metastasio in 1767, and Rinaldo, an early work of Tasso, in 1792. Among his plays are: Cyrus (1768), Timanthes (1770) and Cleonice, Princess of Bithynia (1775), none of which achieved success. The verses of Hoole were praised by Johnson, with whom he was on terms of intimacy, but, though correct, smooth and flowing, they cannot be commended for any other merit. His translation from D'Arbeau's Poél which was superseded by the versions of 1823–1831 of W. S. Rose. Hoole was also the friend of the Quaker poet John Scott of Amwell (1750–1783), whose life he wrote; it was prefixed to Scott's Critical Essays (1785).

In 1773 he was promoted to be chief auditor of Indian accounts, an office which he resigned in 1785. In 1786 he retired to the parishonage of Abinger, Surrey; and afterwards lived at Tenterden, Kent, dying at Dorking on the 2nd of April 1803.

See Anecdotes of the Life of the late Mr John Hoole, by his surviving brother, Samuel Hoole (London, 1903). Some of his plays are reprinted in J. Bell's British Theatre (1797).

HOLLIGAN, the generally accepted modern term for a young street ruffian or rowdy. It seems to have been first applied to the young street ruffians of the South-East of London about 1890, but though popular in the district, did not attract general attention till later, when authentic information of its origin was lost, but it appears that the most probable source was a comic song which was popular in the lower-class music-hall in the late 'eighties or early 'nineties, which described the doings of a rowdy family named Hooligan (i.e. Irish Hoolihan). A comic character with the same name also appears to have been the central figure in a series of adventures running through an obscure English comic paper of about the same date, and also in a similar New York paper, where his confrère in the adventures is a German named Schneider (see Notes and Queries, 9th series, vol. ii. pp. 227 and 316, 1898, and 10th series, vol. vii. p. 115, 1901). In other countries the "hooligan" finds his counterpart. The Parisian Apache, so self-styled after the North American Indian tribe, is a much more dangerous character; mere rowdism, the characteristic of the English "hooligan," is replaced by murder, robbery and outrage. An equally dangerous class of young street ruffian is the "hoodlum" of the United States of America; this term arose in San Francisco in 1870, and thence spread. Many fanciful origins of the name have been given, for some of which see Manchester (N.H.) Notes and Queries, September 1883 (cited in the New English Dictionary). The "plug-ugly" of Baltimore is another name for the same class. More familiar is the Australian "larrakien," which apparently came into use about 1870 in Melbourne. The story that the word represents an Irish policeman's pronunciation of "larking" is a mere invention. It is probably only an adaptation of the Irish "larry," short for Lawrence. Others suggest that it is a corruption of the slang Leary Kinchen, i.e. knowing, wide-awake child.

HOOPER, JOHN (d. 1555), bishop of Gloucester and Worcester and martyr, was born in Somerset about the end of the 15th century and graduated B.A. at Oxford in 1539. He is said to have then entered the Cistercian monastery at Gloucester; but there is no certain proof of his admission there, but Hooper in the passage above mentioned speaks of his having been "bred in the very principles and the revival of the heresy." Acts in December 1554 was swiftly followed by execution. On the 29th of January 1555, Hooper, Rogers, Rowland Taylor and others were condemned by Gardiner and
degraded by Bonner. Hooper was sent down to suffer at Gloucester, where he was burnt on the 9th of February, meeting his fate with steadfast courage and unshaken conviction.

Hooper was the first of the bishops to suffer because his Zwinglian views placed him further beyond the pale than Cranmer, Ridley and Latimer. He represented the extreme reforming party in England. While he expressed dissatisfaction with some of Calvin's earlier writings, he approved of the Consensus Tigrinensis negotiated in 1540 between the Zwinglians and Calvinists of Switzerland; and it was this form of religion that he laboured to spread in England against the wishes of Cranmer, Ridley, Bucer, Peter Martyr and other more conservative theologians. He would have reduced episcopacy to narrow limits; and his views had considerable influence on the Puritans of Elizabeth's reign, when many editions of Hooper's various works were published.

Two volumes of Hooper's writings are included in the Parker Society's publications and another edition appeared at Oxford in 1885. See also Gough's General Index to Parker Soc. Publ.; Strype's Works (General Index); Foxe's Acts and Monuments, ed. Townsend; Acts of the Privy Council; Cal. State Papers, Home; Series; Nichols's Lit. Remains of Edward VI.; Burnet, Collier, Dixon, Froude and Gairdner's histories; Pollard's Cranmer; Diet. Nat. Biog. (A. F. P.)

HOOPOE (Fr. Hoopoe, Lat. Upupa, Gr. ὑπόπη—all names bestowed apparently from its cry), a bird long celebrated in literature, and conspicuous by its variegated plumage and its large erectile crest, the Upupa epeps of naturalists, which is the type of the very peculiar family Upupidae, placed by Huxley in his group Coccygomorphae, but considered by Dr Murie (Ibis, 1873, p. 208) to deserve separate rank as Epopomorphae. This species has an exceedingly wide range in the Old World, being a regular summer-visitor to the whole of Europe, in some parts of which it is abundant, as well as to Siberia, mostly retiring southwards in autumn to winter in equatorial Africa and India, though it would seem to be resident throughout the year in north-eastern Africa and in China. Its power of wing ordinarily seems to be feeble; but it is capable of very extended flight, as is testified by its wandering habits (for it occasionally makes its appearance in places very far removed from its usual haunts), and also by the fact that when pursued by a falcon it will rapidly mount to an extreme height and frequently effect its escape from the enemy. About the size of a thrush, with a long, pointed and slightly arched bill, its head and neck are of a golden-buff—the former adorned by the crest already mentioned, which begins to rise from the forehead and consists of broad feathers, gradually increasing in length, tipped with black and having a subterminal bar of yellowish-white. The upper part of the back is of a vinous-gray, and the scapulars and flight-feathers are black, broadly barred with white tinged in the former with buff. The tail is black with a white chevron, marking off about the distal third part of its length. The legs and feet are as well adapted for running or walking as for perching, and the scutellations are arranged around the whole of the tarsi. (See Fig. 19.) A full account of this character, which is also possessed by the larks, Sundevall (Tentamen, pp. 43-55) united the Upupidae and Alaudidae in the same "cohors" Holaspidae. Comparative anatomy, however, forbids its being taken to signify any real affinity between these groups, and the resemblance on this point, which is by no means so striking as that displayed by the form of the bill and the colouration in certain larks (of the genus Certhialauda, for instance), must be ascribed to analogy merely.

Pleasing as is the appearance of the hoopoe as it fearlessly parades its showy plumage, some of its habits are much the reverse. All observers agree that it is skilful at eluding its enemies. Being assiduously fed by the cock as she sits; and when the young are hatched, their faces are not removed by their parents, as is the case with most birds, but are discharged in the immediate neighbourhood of the nest, the unsanitary condition of which can readily be imagined. Worms, grubs, and insects generally form the food of the hoopoe (Epopomorpha), and it is long mourned by the inhabitants of certain countries of southern Europe, and especially by the Christian population of Constantinople. Not a year passes but the hoopoe makes its appearance in some part or other of the British Islands, most often in spring, and if unmolested would doubtless stop to breed in them, and a few instances are known in which it has done so. But its remarkable plumage always attracts attention, and it is generally shot down soon as it is seen, and before it has time to begin a nest. Eight or nine so-called species of the genus have been described, but of them the existence of five only has been recognized by Sharpe and Dresser (Birds of Europe, pt. viii.). Besides the Upupa epeps above treated, these are U. indica, resident in India and Ceylon; U. longirostris, which seems to be the form of the Indo-Chinese countries; U. margarita, peculiar to Madagascar; and U. africana or U. minor of some writers, which inhabits South Africa to the Zambesi on the east and Benguela on the west coast. In habits and appearance they all resemble the best-known and most widely-spread species. (A. N.)

HOORN, a seaport in the province of North Holland, Holland, on a bay of the Zuider Zee called the Hoornherp, and a junction station 233 m. by rail N. by E. of Amsterdam, on the railway to Amsterdam, with which it is connected by steam tramway. Pop. (1900) 10,647. Hoorn is distinguished by its old-world air and the beauty and interest of its numerous gabled houses of the 16th and 17th centuries. Many of these are decorated with inscriptions and bas-reliefs, some of which commemorate the battle on the Zuider Zee in 1573, in which the Beggars defeated the Spaniards under Count Bossa. Walks and gardens now surround the town in the place of the old city walls, but a few towers and gateways adorned with various old coats of arms are still standing. The fine Gothic bastion tower overlooking the harbour was built in 1532; the East gate not later than 1578. Among the public buildings of special interest are the picturesque St John's hospital (1563), now used for military purposes.

1 This indeed is denied by Naumann, but by him alone; and the statement in the text is confirmed by many eye-witnesses.

2 Under the name of Dubiapath, in the authorized version of the Bible transliterated "lapwing" (Gen. vi. 22), the bird was accounted unclean by the Jewish law. Arabs have a great reverence for the bird, imparting to it marvellous medicinal and other qualities, and making use of its head in all their charms (cf. Tristram, Nat. Hist. of the Bible, pp. 208, 209.)

3 The genera Rhinopomastus and Irrisor are generally placed in the family Upupidae, but Dr Murie, after an exhaustive examination of their osteology, regards them as forming a group of equal value.
HOOSICK FALLS—HOP

purposes; the old mint; the hospital for aged men and women (beginning of 17th century); the weigh-house (1669); the town hall, in which the states of West Friesland formerly met; and the old court-house, which dates from the beginning of the 17th century, though parts of it are older, containing a modern museum and some early portraits. There are also various charitable and educational institutions, Protestant and Roman Catholic churches and a synagogue. The extensive foreign commerce which Hoorn carried on in the 16th and 17th centuries has almost entirely vanished, but there is still a considerable trade with other parts of the Netherlands, especially in cheese and cattle. The chief industries include wool and silver work, and there are also tobacco factories, saw-mills and some small boat-building yards, a considerable number of vessels being engaged in the Zuider Zee fisheries.

Hoorn, latinized as Horsa or Hornum, has existed at least from the first part of the 14th century, as it is mentioned in a document of the year 1311, five years earlier than the date usually assigned for its foundation. In 1395 it received municipal privileges from Count William V. of Holland, and in 1420 it was surrounded with walls. It was at Hoorn in 1416 that the first great net was made for the herring fishery, an industry which long proved an abundant source of wealth to the town. During the 15th century Hoorn shared in the troubles occasioned by the different contending factions; in 1569 the Spanish forces entered the town; but in 1572 it cast in its lot with the states of the Netherlands. In the 16th century it was a commercial centre, important for its trade, fisheries and breweries. A company of commerce and navigation was formed at Hoorn in 1750, and the admiralty offices and storehouses remained here until their removal to Medemblik in 1795. The English under Sir Ralph Abercromby took possession of the town in 1799, and in 1811 it suffered severely from the French. Among the celebrities of Hoorn are William Schouten, who discovered in 1616 the passage round Cape Horn, or Hoorn, as he named it in honour of his birthplace; Abel Janszoon Tasman, whose fame is associated with Tasmania; and Jan Pietersz Coen, governor-general of the Dutch East Indies.

HOOSICK FALLS, a village of Rensselaer county, New York, U.S.A., in the township of Hoosick, 27 m. N.E. of Troy, on the Hoosick river. Pop. of the village (1890) 7014; (1900) 5971, of whom 1092 were foreign-born; (1900) 5231; (1910) 5532; of the township (1900) 8631; (1910) 8315. Hoosick Falls is served by the Boston & Maine Railroad, and is connected by electric railway with Bennington, Vermont, about 8 m. E. The falls of the Hoosick river furnish water-power for the manufacture of agricultural machinery by the Walter A. Wood Mowing and Reaping Machine Co., which dates from 1866, the business having been started in 1852 by Walter Abbott Wood (1831–1892), who was a Republican representative in Congress in 1879–1885. Other manufactures are knit goods, shirts and collars and paper-making machinery. Hoosick Falls was settled about 1688 by Dutch settlers—settlers from Connecticut and Massachusetts came after 1763—and it was first incorporated in 1827. Three miles N.E. of the village, at Walloomsac, in the township of Hoosick, the battle of Bennington was fought, on the 16th of August 1777.

HOP (Ger. Hopfen, Fr. houblon), Humulus Lupulus, L., an herbaceous twining plant, belonging to the natural order Cananabineae, which is by some botanists included in the larger group called Urticaceae by Endlicher. It is of common occurrence in hedges and thickets in the southern counties of England, but is believed not to be native in Scotland. On the European continent it is distributed from Greece to Scandinavia, and extends through the Caucasus and Central Asia to the Altai Mountains. It is common, but doubtfully indigenous, in the northern and western states of North America, and has been introduced into New South Wales and the Himalayas. It is a perennial plant, producing annually several long twining roughish striated stems, which twist from left to right, are often 15 to 20 ft. long and climb freely over hedges and bushes. The roughness of stem and leaves is due to lines of strong hooked hairs, which help the plant to cling to its support. The leaves are stalked, opposite, 3–5 lobed, and coarsely serrate, and bear a general resemblance to those of the vine, but are, as well as the whole plant, rough to the touch; the upper leaves are sometimes scarcely divided, or quite entire. The stipules are between the leaf-stalks, each consisting of two lateral ones united, or rarely with the tips free. The male and female flowers are produced on distinct plants. The male inflorescence (fig. 1, A) forms a panicle; the flowers consist of a small greenish five-parted perianth (a) enclosing five stamens, whose anthers (b) open by terminal slits. The female inflorescence (fig. 1, B) is less conspicuous in the young state. The catkin or strobile consists of a number of small acute bracts, with two sessile ovaries at their base, each subtended by a rounded bractlet (c). Both the bracts and bractlets enlarge greatly during the development of the ovary, and form, when fully grown, the membranous scales of the strobile (fig. 2, a); they are known as "petals" by hop-growers. The bracts can then only be distinguished from the bractlets by being rather more acute and more strongly veined. The

Fig. 1.—Male (A) and Female (B) Inflorescence of the Hop.

perianth (fig. 1, d) is short, cup-shaped, undivided and closely applied to the ovary, which it ultimately encloses. In the young strobile the two purple hairy styles (e) of each ovary project beyond the bracts. The ovary contains a single ovule (fig. 1, f) which becomes in the fruit an exalbuminuous seed, containing a spirally-coiled embryo (fig. 2, b). The light dusty pollen is carried by the wind from the male to the female flowers.

The ovary and the base of the bracts are covered with a yellowish powder, consisting of minute sessile grains, called lupulin or lupulinic glands. These glands (fig. 2, c) are from $\ell_2$ to $\ell_2$ in. in diameter, like flattened subovate little saucers in shape, and attached to a short pedicel. The upper or hemispherical portion bears a delicate continuous membrane, the cuticle, which becomes raised by the secretion beneath it of the yellowish lupulin. The stalk is not perceptible in the gland as found in commerce. When fresh the gland is seen to be filled with a yellowish or dark brown liquid; this on drying contracts in bulk and forms a central mass. It is to these lupulinic glands that the medicinal properties of the hop are chiefly due. By careful sifting about 1 oz. may be obtained from 1 lb of hops, but the East Kent variety is said to yield more than the Sussex hops.
In hop gardens a few male plants, usually three or four to an acre, are sometimes planted, that number being deemed sufficient to fertilize the female flowers. The blossoms are produced in August, and the strobiles are fit for gathering from the beginning of September to the middle of October, according to the weather. The cultivation of hops for use in the manufacture of beer dates from an early period. In the 8th and 9th centuries hop gardens, called "humularia" or "humuleta," existed in France and Germany. Until the 16th century, however, hops appear to have been grown in a very fitful manner, and to a limited extent, generally only for private consumption; but after the beginning of the 17th century the cultivation increased rapidly. The plant was introduced into England from Flanders in 1525; and in America its cultivation was encouraged by legislative enactments in 1657. Formerly several plants were used as well as hops to season ale, hence the name "alehoof" for Nepeta Glechoma, and "alecote" for Balsamita vulgaris. The sweet gale, Myrica Gale, and the sage, Salvia officinalis, were also similarly employed. Various hop substitutes, in the form of powder, have been offered in commerce of late years, most of which appear to have quassia as a chief ingredient. The young tender tops of the hop are in Belgium cut off in spring and eaten like asparagus, and are forced from December to February.

Medical Use.—The principal constituents of the strobiles are lupulin, one of the few liquid alkaloids: lupulinic acid, a bitter crystalline body, soluble in ether, which is without any other pharmacological action than that common to bitter substances; Valerol, a volatile oil which in old hops undergoes a change to the malodorous body valerianic acid; resin; trimethylamine; a peculiar modification of tannin known as humulotannic acid; and a sesqui-terpene. The British pharmacopoeia contains two preparations of the strobiles,—an infusion (dose, 1-2 oz.) and a tincture (dose, ½ drachm). The glands obtained from the strobiles are known in pharmacy as lupulin, a name which tends to confusion with that of the alkaloid. They occur in commerce as a bright yellow-brown powder, seen under a lens to consist of minute glandular particles. The dose of this so-called lupulin is 2-5 grains. From it there is prepared the Tinctura Lupulinae of the United States pharmacopoeia, which is given in doses of 10-60 minims. Furthermore, there are prepared hop pillows, designed to procure sleep; but these act, when at all, mainly by suggestion. The pharmacological action of hops is determined first by the volatile oil they contain, which has the actions of its class. Similarly the lupulinic acid may act as a bitter tonic. The preparations of hops, when taken internally, are frequently hypnotic, though unfortunately different specimens vary considerably in composition, none of the preparations being standardized. It is by no means certain whether the hypnotic action of hops is due to the alkaloid lupulin or possibly to the volatile oil which they contain. Medical practice, however, is acquainted with many more trustworthy and easily safe hypnotics. The bitter acid of hops may endow beer containing it with a certain value in cases of impaired gastric digestion, and to the hypnotic principle of hops may partly be ascribed—as well as to the alcohol—the soporific action of beer in the case of some individuals.

**HOP PRODUCTION IN ENGLAND**

The cultivation of hops in the British Isles is restricted to England, where it is practically confined to half-a-dozen counties—four in the south-eastern and two in the west-midland districts. In 1901 the English crop was reported by the Board of Agriculture to occupy 51,127 acres. The official returns as to acreage do not extend back beyond 1865, in which year the total area was reported to be 64,688 acres. The largest area recorded since then was 71,789 acres in 1878; the smallest was 44,938 acres in 1907. The extent to which the areas of hops in the chief hop-growing counties vary from year to year is sufficiently indicated in Table I., which shows the annual acreages over a period of thirteen years, 1895 to 1907. The proportions in which the acres of hops are distributed amongst the counties concerned vary but little year by year, and as a rule over 60% belongs to Kent.

Less than 200 acres in all are annually grown in the other hop-growing counties of England, these being Shropshire, Gloucestershire and Suffolk.

The average yield per acre in cwt. in the six counties during the decade 1897 to 1906 was as follows:

The wide fluctuations in the home production of hops are worthy of note, as they exercise a powerful influence upon market prices. The largest crop between 1885, the first year in which figures relating to production were collected, and 1907 was 1 See Report from the Select Committee on the Hop Industry (London, 1908).
that of 776,144 cwt. in 1886, and the smallest that of 281,291 cwt. in 1888, the former being more than 2½ times the size of the latter. The crop of 1890, estimated at 661,373 cwt., was so large that prices receded to an extent such as to leave no margin of profit to the great body of growers, whilst some planters were able to market the crop only at a loss. The calculated annual average yields per acre over the years 1885 to 1907 ranged between 12.76 cwt. in 1899 and 4.81 cwt. in 1888. No other staple crop of British agriculture undergoes such wide fluctuations in yield as are here indicated, the size of the crop produced bearing no relation to the acreage under cultivation. For example, the 71,327 acres in 1885 produced only 561,170 cwt., whereas the 51,843 acres in 1890 produced 661,373 cwt.—19,484 acres less under crop yielded 152,203 cwt. more produce.

Comparing the quantities of home-grown hops with those of imported hops, of the total available for consumption about 70% on the average is home produce and about 30% is imported produce. The imports, however, do not vary so much as the home produce. Table IV. shows the average quantity of imports to and exports (home-grown) from Great Britain during the decades 1877-1886, 1887-1896 and 1897-1906.

The highest and lowest imports were 266,952 cwt. in 1885 and 145,122 cwt. in 1887, the latter in the year following the biggest home-grown crop on record. On a series of years the largest proportion of imports is from the United States.

During the twenty-five years 1884-1909 the annual values of the hops imported into England fluctuated between the wide limits of £2,902,651 in 1882 and £427,753 in 1887. In five other years besides 1882 the value exceeded a million sterling. The annual average value over the whole period was £623,100, whilst the annual average import was 194,000 cwt., consequently the average value per cwt. was nearly £4.15s., which is approximately the same as that of the exported product. The quantities and values of the imported hops that are again exported are almost insignificant.

HOP PRODUCTION IN THE UNITED STATES

The distribution of the area of hop-cultivation in the United States showed great changes during the last decades of the 19th and the first decade of the 20th century. During the earlier portion of that period New York was the chief hop-growing state of the Union, but toward the end of it a great extension of hop-growing took place on the Pacific coast (in the states of Oregon, California and Washington), where the richness of the soil and mildness of the climate are favourable to the vines.

The average annual produce of hops in the United States from 1900 to 1896 was 423,471 cwt.; of this quantity 86% was raised in the three states of the Pacific coast, where the yield per acre is much larger than in New York. In the latter state the yield does not appear to exceed 5 or 6 cwt. per acre, whereas in Oregon it is 9 or 10 cwt., and in Washington and California from 12 to 14 cwt. The average annual export (chiefly to Great Britain) in the years from 1890 to 1905 was 108,400 cwt.; the average import (chiefly from Germany) is about 50,000 cwt.

HOP CULTIVATION

As the county of Kent has always taken the lead in hop-growing in England, and as it includes about two-thirds of the hop acreage of the British Isles, the recent developments in hop cultivation cannot be better studied than in that county. They were well summarized by Mr Charles Whitehead in his sketch of the agriculture of Kent,1 wherein he states that the hop grounds—or hop gardens, as they are called in Kent—of

1 Jour. Roy. Agric. Soc. 1899.

poor character and least suitable for hop production have been gradually grubbed since 1894, on account of large crops, the importation of hops and low prices. At the beginning of the 19th century there were 290 parishes in Kent in which hops were cultivated. A century later, out of the 413 parishes in the county, as many as 331 included hop plantations. The hops grown in Kent are classified in the markets as “East Kents,” “Bastard East Kents,” “Mid Kents” and “Wealds,” according to the district of the county in which they are produced. The relative values of these four divisions follow in the same order, “East Kents” making the highest and Wealds the lowest rates. These divisions agree in the main with those defined by geological formations. Thus, “East Kents” are grown upon the Chalk, and especially on the outcrop of the soils of the London Tertiaries upon the Chalk. “Bastard East Kents” are produced on alluvial soil and soils formed by admixtures of loam, clay-loams, chalk, marl and clay from the Gault, Greensand and Chalk formations. “Mid Kents” are derived principally from the Greensand soils and outcrops of the London Tertiaries in the upper part of the district. “Wealds” come from soils on the Weald Clay, Hastings Sand and Tunbridge Wells Sand. As each “pocket” of hops must be marked with the owner’s name and the parish in which they were grown, buyers of hops can, without much trouble, ascertain from which of the four divisions hops come, especially if they have the map of the hop-growing parishes of England, which gives the name of each parish. There has been a considerable rearrangement of the hop plantations in Kent within recent years. Common varieties as Colegate’s, Jones’s, Grapes and Prolifics have been grubbed, and Goldings, Bramlings and other choice kinds planted in their places. The variety known as Fuggle’s, a heavy-cropping though slightly coarse hop, has been much planted in the Weald of Kent, and in parts of Mid Kent where the soil is suitable. In very old hop gardens, where there has been no change of plant for fifty or even one hundred years in some instances, except from the gradual process of filling up the places of plants that have died, there has been replanting with better varieties and varieties ripening in more convenient succession; and generally speaking, the plantations have been levelled up in this respect to suit the demand for bright hops of fine quality. A recent classification of the varieties of English hops arranges them in three groups: (1) early varieties (e.g. Prolific, Bramling, Amos’s Early Bird); (2) mid-season or main-crop varieties (e.g. Farnham Whitehine, Fuggle’s, Old Jones’s, Golding); (3) late varieties (e.g. Grapes, Colegate’s).

The cost of cultivating and preparing the produce of an acre of hop land tends to increase, on account of the advancing rates of wages, the intense cultivation more and more essential, and the necessity of freeing the plants from the persistent attacks of insects and fungi. In 1893 Mr Whitehead estimated the average annual cost of an acre of hop land to be £35, 10s., the following being the items—

Total £35 10 0

Seven years later the average cost per acre in Kent had risen to quite £37.

The hops in Kent are usually planted in October or November, the plants being 6 ft. apart each way, thus giving 1210 hills or plant-centres per acre. Some planters still grow potatoes or mangels between the rows the first year, as the plants do not bear much until the second year; but this is considered to be a mistake, as it encourages wire-worm and exhausts the ground. Many planters pole hop plants the first year with a single short pole, and stretch coco-nut-fibre string from pole to pole, and grow many hops in the first season. Much of the hop land is ploughed between the rows, as labour is scarce, and the spaces between are dug afterwards. It is far better to dig hop land if possible, the tool used being the Kent spud. The cost of digging an acre ranges from 18s. to 21s.

The hops in Kent are usually planted in October or November, the plants being 6 ft. apart each way, thus giving 1210 hills or plant-centres per acre. Some planters still grow potatoes or mangels between the rows the first year, as the plants do not bear much until the second year; but this is considered to be a mistake, as it encourages wire-worm and exhausts the ground. Many planters pole hop plants the first year with a single short pole, and stretch coco-nut-fibre string from pole to pole, and grow many hops in the first season. Much of the hop land is ploughed between the rows, as labour is scarce, and the spaces between are dug afterwards. It is far better to dig hop land if possible, the tool used being the Kent spud. The cost of digging an acre ranges from 18s. to 21s.

In only one year did the very large dressing of 10 cwt. of nitrate of soda per acre afford any better result than was produced by the less heavy dressing of 8 cwt. per acre, and this was in 1899, a season of such abundance and such low prices that it may be regarded as an abnormal season. If the effect of the dressing of 10 cwt. per acre shall be eliminated, the best results, as regards quantity, were obtained on plot E, receiving 8 cwt. of nitrate of soda per acre. But plot C, with 4 cwt. of nitrate of soda, has been on the average not more than 3 cwt. per acre behind plot E.

Valuations of the hops made by merchants and factors show that, on the whole, the market quality of the produce is very little affected by manuring with nitrate of soda. Moreover, experimental investigation of the hops appears to indicate that the brewing quality is not in any constant or definite way influenced by the manuring, except where the quantity of nitrate of soda has amounted to the large dressing of 8 cwt. or more per acre, a quantity which in some seasons would seem to have been prejudicial, although in one season it happened that the highest brewing value appertained to a sample grown with as much as 10 cwt. per acre.

The results of modern investigation show that it is very largely to the presence and proportion of short resin that hops owe their preservative value, although the quality of hops is by no means wholly dependent on that one feature. The resin percentages on the samples grown on the several plots in 1898, 1899 and 1900 were the following:

</table>

The general results seem to show that the purchase of town dung for hops is not economical, unless under specially favourable terms as to cost of conveyance, and that it should certainly not be relied upon as a sufficient manure. Home-made dung is in quite a different position, as not only is it richer, but it costs nothing for railway carriage. As a source of nitrogenous manure, purchased dung is on the whole too expensive. There is a large variety of other nitrogenous manures in the market besides nitrate of soda, such, for instance as Peruvian and Guiana guano, sulphate of ammonia, fish guano, dried blood, rape dust, furriers' refuse, horn shavings, hoof parings, wool dust, shoddy, &c. All of these may in turn be used for helping to maintain a stock of nitrogen in the soil; and the degree to which manures of this kind have been recently applied in any hop garden will influence the grower in deciding as to the quantity of nitrate of soda he should use in conjunction with them, and also to some extent in fixing the date of its application.

Dressings of 8 or 10 cwt. of nitrate of soda per acre, such as are approved annually to plots E and F, would be larger than would put on the land which has been already dressed with dung or with other nitrogenous manures; and even, in the circumstances under notice, although these plots have on the average beaten the others in weight, they then some seasons have been distinctly poorer than those more moderately manured—though in the dry season of 1899 the most heavily dressed plot gave actually the best quality as well as the greatest quantity of produce.

With regard to the application of nitrate of soda in case the season should turn out to be wet, present experience indicates that, on a soil otherwise liberally manured, 4 cwt. of nitrate of soda per acre...
applied not too late, would be a thoroughly safe dressing. In the case of neither dung nor any other nitrogenous fertilizers recently applied, there seems no reason for supposing that, even in a wet season, 6 cwt. of nitrate of soda per acre applied early would be otherwise than a safe dressing, considering both quantity and quality of the manures. On this principle it would be easy to lay down the following rules:—

As to the date of application, April or May is the last that would be recommended, in most circumstances, be applied, and probably April is preferable to May. The quantity used should be applied in separate dressings of not more than 2 cwt. per acre each, perhaps once a week for a month. Where the quantity of nitrate of soda used is large, and constitutes the whole of the nitrogenous manure employed, the first dressing may, on fairly deep and retentive soils, be given as early as January; or, if the quantity used is smaller, say in the case of a secondary will, probably be early enough, for the first dressing in the case of lighter soils. The condition of the soil and the degree and distribution of rainfall during both the previous and the present growing period, as far as the nature and abundance of the nitrogenous manures, used, the nitrification which has been taking place before the products of that nitrification become abundant. This would especially be so in a season immediately following a wet autumn and winter, when, if washing should continue into the dressing, the residues not utilized by the previous crop.

The necessity, whether dung is used or not, and whatever form of nitrogenous manure is employed, of also supplying the hops with an abundance of phosphates, cannot be too strongly urged. The use of phosphates for hops was long neglected by hop-planters, and even now there are many growers who do not realize the full importance of heavy phosphatic manuring. On soils containing an abundance of lime, a smaller phosphatic manure can be used than is required on ordinary superphosphate, of which as much as 10 cwt. per acre may be applied without the slightest fear of harm. But if the soil is not decidedly calcareous—that is to say, if it does not effervesce when it is stirred up with some diluted hydrochloric (muriatic) acid—bone dust, phosphatic guano or basic slag should be used as a source of phosphates, at the rate of not less than 10 cwt. per acre. On medium soils, which, without being distinctly calcareous, nevertheless contain a just appreciable quantity of carbonate of lime, it is probably a good plan to use the latter class of manures, alternately with superphosphate, year and year about; but it is wise policy to use phosphates in some form or other every year in every hop garden. They are inexpensive, and without them neither dung, nitrate of soda, ammonia salts or organic manures can be expected to produce both a large and a continuous crop of hops, and a valuable harvest. The method I have adopted is to discard the roots of hops and strings, and put on those of the top wire with a machine called a stringer. There are several methods of training hops with posts or stout poles, wire and string, whose first cost varies from £2 to £6 per acre. The system is cheaper in the long run than that of taking down the poles every year, and the wind does not blow down the poles or injure the hops by banging the poles together. In another method, extensively made use of in Kent and Sussex, stout posts are placed at the ends of each row of plants, and, at intervals where requisite, wires are fastened from top to top only of these posts, whilst coco-nut-fibre strings are fixed by pegs to the ground, close to each hop-stock, whence they radiate upwards for attachment to the wires stretching between the tops of the posts. This method is more simple and less expensive than the system first described, its cost being from £2 to £8 per acre. In this case the plants require to be well "lewed," or sheltered, as the strings being so light are blown about by the wind. These methods are being largely adopted, and, together with the practice of putting coco-nut-fibre strings from pole to pole in grounds poled in the old-fashioned manner, are important improvements in hop culture which have tended to increase the production of hops. Where the old system of poleing with two or three poles is still adhered to they are always crooseted, most growers having tanks for the purpose; and, in the new methods of poleing, the posts and poles are croosoted, dipped or kyanized.

At Wye College, Kent, different systems of planting and training have been tried, the alloys varying in width from 10 ft. down to 5 ft., and the distance between the hills varying quite as widely; so that the number of hills to the acre has ranged from 1210 down to 600. The biggest crop was secured on the plot where hills were 8 ft. apart each way. As a rule, indeed, a wide alley and abundant space between the plants, thus allowing the hops plenty of air and light, produced the best results, besides effecting some saving in the cost of cultivation, as there were only 660 or 680 hills per acre. Of the various methods of training, the umbrella system gave the biggest crop in each of the three years, 1899, 1900, 1901; and it seemed to be the best method, except in seasons when washing was required early, in which case the plants were not so readily clear of vermin. A great attention is required to keep the blues out in their places on the poles, strings or wire, during the summer. This gives employment to many women, for whose service in this and fruit-picking there is considerable demand, and a woman has no trouble in earning from 15 to 17s. per day from April till September at pleasant and not very arduous labour. The hop-picking follows, and at this women sometimes get 4s. and even 5s. per day. This is the real Kent harvest, which formerly lasted a month or five weeks. Now it rarely extends beyond eighteen days, as it is important to secure the hops before the weather and the aphides, which almost invariably swarm within the bracts of the cones, discolour them and spoil their sale, as brewers insist upon having bright, "coloury" hops. Picking is better done than was formerly the case. The hops are picked more singly, and with comparatively few leaves, and the pickers are of a somewhat better type than the rough hordes who formerly went into Kent for "hopping." Kent planters engage their pickers beforehand, and write to them, arranging the numbers required and the date of picking. Many farmers pole their hops, and put on those of the top wire and remain unimproved for hop-picking. Without this great immigration of persons, variously estimated at between 45,000 and 65,000, the crops of hops could not be picked; and fruit-farmers also would be unable to get their soft fruit gathered in time without the help of immigrant hands. The fruit-growers and hop-planters of Kent have greatly improved the accommodation for these immigrants.

Concerning the general question as to the advisibility or otherwise of cutting the hop vine at the time of picking, A.D.
HOPE, ANTHONY

Hall has ascertained experimentally that if the bine is cut close to the ground at a time when the whole plant is unripe there are the bine and leaves considerable quantities of nitrogen, potash and phosphoric acid which would have returned to the roots if the bine had not been cut until ripe. The plant, therefore, would retain a substantial store of these constituents for the following year's growth if the bine were left. Chemical analyses have shown that about 30 lb of nitrogen per acre may be saved by allowing the bines to remain uncut, this representing practically one-third of the total amount of nitrogen in the bine, leaf and bine together. There are also from 25 lb to 30 lb of potash in the growth, of which nine-tenths would return to the roots, with about half the phosphoric acid and two-fifths of the nitrogen of the bine. In ordinary culture, the succession crop is lessened to the extent of about one-tenth. As to stripping off the leaves and lower branches of the plant, it was found that this operation once reduced the crop 10% and once 20% but that in the year 1890 it did not affect the crop at all. The inference appears to be that when there is a good crop it is not reduced by stripping, but that when there is less vigour in the plant it suffers the more. Hence, it would seem advisable to study the plant itself in connexion with this matter, and to strip a little later, or somewhat less, than usual when the bine is not healthy.

The hop bines are therefore taken in pokes—long sacks holding ten bushes—to the oasts to be dried. The oasts are circular or square kilns, or groups of kilns, wherein the green hops are laid upon floors covered with horsehair, under which are enclosed or open stoves or furnaces. The heat from these is evenly distributed among the hops above by draughts below and round them. This is the usual simple arrangement, but patent processes are adopted here and there, though by no means general. The hops are from nine to ten hours drying, after which they are taken off the kiln and allowed to cool somewhat, and are then packed tightly into "pockets" 6 ft. long and 2 ft. wide, weighing 1½ cwt., by means of a hop-pressing machine, which has cogs and wheels worked by hand. Of late years more care has been bestowed by some of the leading growers upon the drying of hops, so as to preserve their qualities and volatile essences, and to meet the altered requirements of brewers, who must have bright, well-managed hops for the production of light clear beers for quick draught. The use, for example, of exhaust fans, recently introduced, greatly facilitates drying by drawing a large volume of air through the hops; and as the temperature may at the same time be kept low, the risk of getting over-fired samples is considerably reduced, though not entirely obviated. The introduction of the rolling hop is another great advance in the process of hop-drying, for this, used in conjunction with a raised platform for the men to stand on when turning, prevents any damage from the feet of the workmen, and reduces the loss of resin to a minimum. The best results are obtained when exhaust fans and the roller floor are associated together. In such cases the roller floor, which empties its load automatically, pours the hop cones into the receiving sheets in usually as whole and unbroken a condition as that in which they went on to the kiln.

Post of the Hop Crop.—In recent years the difficulties attendant upon hop cultivation have been aggravated, and the expenses increased, by regularly recurring attacks of aphid blight—due to the insect Aphis (Phorodon) humuli—which render it necessary to spray or spray every hop plant, every branch and leaf, with insecticidal solvents three or four times, and sometimes more often, in each season. Quassia and soft-soap solutions are usually employed; they contain from 4 lb to 8 lb of soft soap, and the extract of from 8 to 16 lb of Quassia chips to 100 gallons of water. The soft soap serves as a vehicle to retard the leaves, and the Quassia poisons the bines and leaves, making them repulsive to the aphides, which are thus starved out. Another pest, the red spider, Tetranychus telarius, which attacks the young leaves and buds, is very injurious in very hot summers. Congregating on the undersurfaces of the leaves, the red spiders exhaust the sap and cause the leaves to fall, producing the effect known in Germany as "fire-blast." The hop-wash of soft soap and quassia, so effective against aphid attack, is of little avail in the case of red spider. Some success, however, has attended the use of a solution containing 8 lb to 16 lb of red soap and 1 gal of water, with three pints of paraffin added. It is necessary to apply the washes with great force, in order to break through the webs with which the spiders protect their young. Hop-washing is done by means of large garden engines worked by hand, but mostly with horse engines. Resort is sometimes had to steam engines, which force the spraying solution along pipes laid between the rows of hops.

Mould or mildew is frequently the source of much loss to hop-planters. It is due to the action of the fungus Podosphaera castanea, and the mischief is more especially that done to the cones. The only remedy is sulphur, employed usually in the form of flowers of sulphur, from 40 lb to 60 lb per acre being applied at each sulphuring. The powder is distributed by means of a machine drawn by a horse between the rows. The sulphur is fed from a hopper and as it is dropped from a blast pipe, it is blown upon the leafy cones, and falls as a dense, wide-spreading cloud upon the hop-bines. The first sulphuring takes place when the plants are fairly up the poles, and is repeated three or four weeks later; and even again if indications of mildew are present. It may be added that sulphur is also successfully employed in the form of an alkaline sulphide, such as solution of "liver of sulphur," a variety of potassium sulphide.

HOPE, ANTHONY, the pen-name of ANTHONY HOPE HAWKINS (1863— ), British novelist, who was born on the 9th of February 1863, the second son of the Rev. E. C. Hawkins, Vicar of St. Bride's, Fleet Street, London. He was educated at Charterhouse and Magdalen College, Oxford, where he was president of the University Society, and graduated with a diploma in Mathematics and Final Schools. He was called to the bar at the Middle Temple in 1877. He soon began contributing stories and sketches to the St James's Gazette, and in 1890 published his first novel, A Man of Mark. This was followed by Father Stafford (1891), Mr Witt's Widow (1892), Change of Air and Sport Royal and Other Stories (1893). By this time he had attracted by his vivacious talent the attention of editors and readers; but it was not till the following year that he attained a great popular success with the publication (May 1894) of The Prisoner of Zenda. This was followed a few weeks later by The Dolly Diaries, which met with extraordinary success (subsequently separate instalments in the Westminster Gazette). Both books became the parents of a numerous progeny. The Prisoner of Zenda, owing something to the Prince Otto of R. L. Stevenson, established a fashion for what was christened, after its fictitious locality, "Ruritanian romance"; while the Dolly Dialogues, inspired possibly by "Gyp" and other French dialogue writers, was the forerunner of a whole school of epigrammatic drawing-room comedy. The Prisoner of Zenda, with Mr Alexander as "Rupert Rassendyll," enjoyed a further success in a dramatized form at the St James's Theatre, which did still more to popularize the author's fame. In 1894 also appeared The God in the Car, a novel suggested by the influence of the Explanations of Science of Professor J. A. H. Tyndall, and Half a Hero, a complementary study of Australian politics. The same year saw further the publication of The Indiscretion of the Duchess, in the style of the Dolly Dialogues, and of another collection of stories named (after the first) The Secret of Woldare Court. In 1895 Mr Hawkins published Count Antonio, and contributed to Dialogues of the Day, edited by Mr Oswald Crawford. Comedies of Courtship and The Heart of the Princess Osra followed in 1896; Phreno in 1897; Simon Dale and Rupert of Hentia (sequel of the Prisoner of Zenda) 1898; and The King's Mirror, a Ruritanian romance with an infusion of serious psychological interest, 1899. The author was advancing from his light comedy and gallant romantic inventions to the gravier kind of fiction of which The God in the Car had been an earlier essay. Quisane, published in 1900, was a study of English society face to face with a political genius of an alien type. Tristram of Blent (1901) embodied an ethical study of family pride. The Intrusions of Peggy reflected the effects on society of modern financial fashions. In 1904 he published Double Harness, and in 1905 A Servant of the Public, two novels of modern society, containing somewhat cynical pictures of the condition of marriage. With increasing gravity the novelist sacrificed some of the charm of his earlier irresponsible gaiety and buoyancy; but his art retained its wit and urbanity while
it gained in grip of the social conditions of contemporary life. He wrote two plays, The Adventure of Lady Ursula (1808) and Pilkerton's Peerring (1902), and his later novels include The Great Miss Driver (1908) and Second String (1909). Mr Hawkins's attractive and cultured style and command of plot give him a high place among the modern writers of English fiction. In 1903 he married Miss Elizabeth Somerville Sheldon of N. W., English art-collector, and author of Anaslasius, born in London about 1770, was the eldest son of John Hope of Amsterdam, and was descended from a branch of an old Scottish family who for several generations were extensive merchants in London and Amsterdam. About the age of eighteen he started on a tour through various parts of Europe, Asia and Africa, where he interested himself especially in architecture and sculpture, making a large collection of the principal objects which attracted his attention. On his return to London about 1806 he purchased a house in Duchess Street, Cavendish Square, which he fitted up in a very elaborate style, from drawings made by himself. In 1809 he published sketches of his furniture, accompanied by letterpress, in a folio volume, entitled Household Furniture and Interior Decoration, which had considerable influence in effecting a change in the upholster and interior decoration of houses, notwithstanding that Byron had referred scornfully to him as "House-furnisher withal, one Thomas Bright." Hope's furniture designs were in that pseudo-classical manner which is generally called "English Empire." It was sometimes extravagant, and often heavy, but was much more restrained than the wilder and later flights of Sheraton in this style. At the best, however, it was a not very inspiring mixture of Egyptian and Roman motives. In 1809 he published the Costumes of the Ancients, and in 1812 Designs of Modern Costumes, works which display a large amount of antiquarian research. He was also, as his father had been, the elder Hope's country house near Haarlem was crowded with fine pictures—"a magnificent patron of the highest forms of art, and both at his London house and in his extensive library near Dorking he formed large collections of paintings, sculpture and antiques. Deepdene in his day became a famous resort of men of letters as well as of people of fashion, and among the luxuries suggested by his fine taste was a miniature library in several languages in each bedroom. Thorvaldsen, the Danish sculptor, was indebted to him for the early recognition of his talents, and he also gave frequent employment to Chantrey and Flaxman—it was to his order that the latter illustrated Dante. In 1819 he published anonymously his novel Anastasius, or Memoirs of a Modern Greek, written at the close of the 18th century, a work which, chiefly on account of the novel character of its subject, caused a great sensation. It was at first generally attributed to Lord Byron, who told Lady Blessington that he had pretty quickly on reading it because he had not written it and Hope had. But, though remarkable for the acquaintance it displays with Eastern life, and distinguished by considerable imaginative vigour and much graphic and picturesque description, its paradoxes are not so striking as those of Lord Byron; and, notwithstanding some eloquent and forcible passages, the only reason which warranted its ascription to him was the general type of character to which it served. Hope died on the 3rd of January 1831. He was the author of two works published posthumously—"the Origin and Prospects of Man" (1831), in which his speculations diverged widely from the usual orthodox opinions, and an Historical Essay on Architecture (1835), an elaborate description of the architecture of the middle ages, illustrated by drawings made by himself in Italy and Germany. He is commonly known in literature as "Anastasius." He married his niece, Dorcas, daughter of Lord Decies, archbishop of Tuam.

HOPEDALE, a township of Worcester county, Massachusetts, U.S.A.; pop. (1905; state census) 2498; (1910) 2188. It is served by the Milford & Uxbridge (electric) street railway, and (for freight) by the Grafton & Upton railway. The town lies in the "dalen" between Milford and Mendon, and is cut from N.W. to S.E. by the Mill river, which furnishes good water power at its falls. The principal manufactures are textiles, boots and shoes, and, of most importance, cotton machinery. The great cotton machinery factories here are owned by the Draper Company. Hopedale has a public park on the site of the Ballou homestead, with a bronze statute of Adin Ballou; a memorial church erected by George A. and Eben S. Draper; the Bancroft Memorial Library, given by Joseph D. Bancroft in memory of his wife, a large and beautiful fountain with statuary by Waldo Story, the gift of Susan Preston Draper, General W. F. Draper's wife. The village is remarkable for the comfortable cottages of the workers.

The history of Hopedale centres round the Rev. Adin Ballou (1803-1899), a distant relative of Hosea Ballou; he left, in succession, the ministry of the Christian Connexion (1833) and that of the Universalist Church (1831), because of his restorationist views. In 1831 he became pastor of an independent church in Mendon. An ardent exponent of temperance, the anti-slavery movement, woman's rights, the peace cause and Christian non-resistance (even through the Civil War), and of "Practical Christian Socialism," it was in the interests of the last cause that he founded Hopedale, or "Fraternal Community No. 1," in Milford, in April 1842, the first compact of the community having been drawn up in January 1841. Thirty persons joined with him, and lived in a single house on a poor farm of 258 acres, purchased in June 1841. Ballou was for several years the president of the community, which was run on the plan that all should take an equal share in the handling of property, in spite of the fact that there was individual holding of property. The community, however, owned the instruments of production, with the single exception of the important patent rights held by Ebenezer D. Draper. The result was bickerings between those who were joint stockholders and those whose only profit came from their manual labour. In a short time the control of the community came into the hands of its richest members, E. D. Draper and his brother, George Draper (1817-1887), who owned the family farm. In the year 1856 there was a total deficit of about $12,000. The Draper brothers bought up the joint stock of the community at par and paid its debts, and the community soon ceased to exist save as a religious society. After George Draper's death the control of the mills passed to his sons. These included General William Franklin Draper (1842-1910), a Republican representative in Congress in 1892-1897 and U.S. ambassador to Italy in 1897-1900, and Eben Sumner Draper (b. 1858), lieutenant-governor of Massachusetts in 1900-1908 and governor in 1909-1911. In 1867 the community was merged with Hopedale parish, a Unitarian organization. Hopedale was separated from Milford and incorporated as a township in 1856.

See Adin Ballou's History of Milford (Boston, 1882), his History of the Hopedale Community, edited by William S. Heywood (Lowell, 1897), his Biography by the same editor (Lowell, 1896) and his Practical and Christian Socialism (Hopedale, 1844); George L. Cottrell, "Adin Ballou and the Hopedale Community" (in the New World, vol. vii., 1898); Lewis G. Wilson, "Hopedale and Its Founder" (in The New England Magazine, vol. x., 1891); and William F. Draper, Recollections of a Varied Career (Boston, 1908).

HOPE-SCOTT, JAMES ROBERT (1812-1872), English barrister and Tractarian, was born on the 15th of July 1812, at Great Marlow, Berkshire, the third son of Sir Alexander Hope, and grandson of the second earl of Hopetoun. He was educated at Eton and Oxford, where he was a contemporary and friend of Gladstone and H. H. Newman, and in 1838 was called to the bar. Between 1840 and 1843 he helped to found Trinity College, Glemalmond. He was one of the leaders of the Tractarian movement and entirely in Newman's confidence. In 1853 he was received with Manning into the Roman Catholic church. At first he was a member of the Liverpool Dankinses, but he was removed from the Parliamentary bar. He only commenced serious practice in this branch of his profession in 1843, but by the end of 1845 he stood at the head of it and in 1849 was made a Queen's Counsel. In 1847 he married Miss Lockhart, granddaughter of Sir Walter Scott, and on her coming into possession of Abbotsford six years later, 1 Adin Ballou wrote An Elaborate History and Genealogy of the Ballous in America (Providence, R.I., 1888).
assumed the surname of Hope-Scott. He retired from the bar in 1870 and died on the 20th of April 1873.

HOPFEN, HANS VON (1835-1904), German poet and novelist, was born on the 3rd of January 1835, at Munich. He studied law, and in 1858, having shown marked poetical promise, he was received into the circle of young poets whom King Maximilian II. had gathered round him, and thereafter devoted himself to literature. In 1862 he made his debut as an author, with Liedern und Balladen, which were published in the Münchener Dichterbuch, edited by E. Geibel. After travelling in Italy (1862), France (1863) and Austria (1864), he was appointed, in 1865, general secretary of the "Schillerstiftung," and in this capacity settled at Vienna. The following year, however, he removed to Berlin, in a suburb of which, Lichterfelde, he died on the 19th of November 1904. Of Hopfen's lyric poems, Gedichte (4th ed., Berlin, 1883), many are of considerable talent and originality; but it is as a novelist that he is best known. The novels Peregrina (1864); Verderben zu Paris (1868, new ed. 1892); Arge Sielen (1886); Der graue Freund (1874, 2nd ed., 1876); and Verfehlte Liebe (1876, 2nd ed., 1879) are attractive, while of his shorter stories Tierdr Geschichten (1884-1885) command much interest and favour.

An autobiographical sketch of Hopfen is contained in K. E. Franzos, Geschichte des Erzstifterverbes (1904).

HOPI, or Moki (Moquis), a tribe of North American Indians of Shoshonean stock. They are Pueblo or town-building Indians and occupy seven villages on three lofty plateaus of northern Arizona. The first accounts of them date from the expedition of Francisco Vasquez de Coronado in 1540. With the town-building Indians of New Mexico they were then subdued. They shared in the successful revolt of 1542, but again suffered defeat in 1586. In 1680, however, they made a successful revolt against the Spaniards. They weave very fine blankets, make baskets and are expert potters and wood-carvers. Their houses are built of stone set in mortar. Their ceremonies are of an elaborate nature, and in the famous "snake-dance" the performers carry live rattlesnakes in their mouths. They number some 1600. (See also PUEBLO INDIANS.)

HÖPPKEN, ANDERS JOHAN, COUNT VON (1712-1789), Swedish statesman, was the son of Daniel Niklas Höppken, one of Arvid Horn's most determined opponents and a founder of the Hat party. When in 1738 the Hats came into power the younger Höppken obtained a seat in the secret committee of the diet, and during the Finnish war of 1741-42 was one of the two commissioners appointed to negotiate with Russia. During the diet of 1745-1747 Höppken's influence was of the greatest importance. It was chiefly through his efforts that the estates issued a "national declaration" protesting against the arrogant attitude of the Russian ambassador, who attempted to dominate the crown prince Adolphus Frederick and the government. This spirited policy restored the waning prestige of the Hat party and firmly established their anti-Muscovite system. In 1746 Höppken was created a senator. In 1751 he succeeded Gustaf Tessin as prime minister, and controlled the foreign policy of Sweden for the next nine years. On the outbreak of the Seven Years' War, Austria, after negotiating an armed neutrality treaty with Denmark (1756); but in the following year acceded to the league against Frederick II. of Prussia. During the crisis of 1760-1762, when the Hats were at last compelled to give an account of their stewardship, Höppken was sacrificed to party exigencies and retired from the senate as well as from the premiership. On the 22nd of June 1762, however, he was created a count. After the revolution of 1772 he re-entered the senate at the particular request of Gustavus III., but no longer exercised any political influence. His caustic criticism of many of the royal measures, moreover, gave great offence, and in 1780 he retired into private life. Höppken was a distinguished author. The noble tale of his biographies and orations has earned for him the title of the Swedish Tacitus. He helped to found the Vetenskaps Akademii, and when Gustavus III. in 1786 established the Swedish Academy, he gave Höppken the first place in it.

HOPKINS, EDWARD WASHBURN (1857-1895), American Sanskrit scholar, was born in Northampton, Massachusetts, on the 8th of September 1857. He graduated at Columbia University in 1878, studied at Leipzig, where he received the degree of Ph.D. in 1881, was an instructor at Columbia in 1881-1885, and professor at Bryn Mawr in 1885-1895, and became professor of Sanskrit and comparative philology in Yale University in 1895. He became secretary of the American Oriental Society and editor of its Journal, to which he contributed many valuable papers, especially on numerical and temporal categories in early Sanskrit literature. He wrote Caste in Ancient India (1881); Manu's Lawbook (1884); Religions of India (1895); The Great Epic of India (1901), and India Old and New (1901).

HOPKINS, ESEK (1718-1802), the first admiral of the United States navy, was born at Scituate, Rhode Island, in 1718. He belonged to one of the most prominent Puritan families of his day, and was named after England's greatest naval hero, Lord Nelson, ten miles at sea, and rapidly came to the front as a good sailor and skilful trader. Marrying, three years later, into a prosperous family of Newport, and thus increasing his influence in Rhode Island, he became commodore of a fleet of seventeen merchantmen, the movements of which he directed with skill and energy. In war as well as peace, Hopkins was establishing his reputation as one of the leading colonial seamen, for as captain of a privateer he made more than one brilliant and successful venture during the Seven Years' War. In the interval between voyages, moreover, he was engaged in Rhode Island politics, and rendered efficient support to his brother Stephen against the Ward faction. At the outbreak of the War of Independence Hopkins was appointed brigadier-general by Rhode Island, was commissioned, December 1775, by the Continental Congress, commander-in-chief of the navy, and in January 1776 hoisted his flag as admiral of the eight converted merchantmen which then constituted the navy of the United States. His first cruise resulted in a great acquisition of material of war and an indecisive fight with H.M.S. "Glasgow." At this first created great enthusiasm, but criticism soon made itself heard. Hopkins and two of his captains were tried for breach of orders, and, though ably defended by John Adams, were censured by Congress. The commands, nevertheless, were not interdicted, and a prize was soon afterwards named after the admiral by their orders. But the difficulties and mutual distrust continually increased, and in 1777 Congress summarily dismissed Hopkins from his command, on the complaint of some of his officers. Before the order arrived, the admiral had detected the conspiracy against him, and had had the ringleaders tried and degraded by court-martial. But the Congress followed up its order by dismissing him from the navy. For the rest of his life he lived in Rhode Island, playing a prominent part in state politics, and he died at Providence in 1802.

See Edward Field, Life of Esek Hopkins (Providence, 1898); also an article by R. Grieve in the New England Magazine of November 1897.

HOPKINS, MARK (1824-1887), American educator, great-nephew of the theologian Samuel Hopkins, was born in Stockbridge, Massachusetts, on the 4th of February 1824. He graduated in 1824 at Williams College, where he was a tutor in 1825-1827, and where in 1830, after having graduated in the previous year at the Berkshire Medical College at Pittsfield, he became professor of Moral Philosophy and Rhetoric. In 1833 he was licensed to preach in Congregational churches. He was president of Williams College from 1836 until 1872. He was one of the ablest and most successful of the old type of college presidents. The book of his Essays and Lectures of Christianity (1846) was long a favourite text-book. Of his other writings, the chief were Lectures on Moral Science (1862), The Law of Love and Love as a Law (1869), An Outline Study of Man.
HOPKINS, S.—HOPKINSON, F. 685

(1873). The Scriptural Idea of Man (1883), and Teachings and Counsels (1884). Dr Hopkins took a lifelong interest in Christian missions, and from 1837 until his death was president of the American Board of Commissioners for Foreign Missions (the American Congregational Mission Board). He died at Williamsburg in June 1887. His son, Henry Hopkins (1837-1908), was also from 1905 till his death president of Williams College.

Mark Hopkins’s brother, Albert Hopkins (1807-1872), was long associated with him at Williams College, where he graduated in 1826 and was successively a tutor (1827-1829), professor of mathematics and natural philosophy (1829-1838), professor of natural philosophy and astronomy (1838-1868) and professor of astronomy (1868-1872). In 1835 he organized and conducted a Natural History Expedition to Nova Scotia, said to have been the first expedition of the kind sent out from any American college, and in 1837, at his suggestion and under his direction, was built at Williams College an astronomical observatory, said to have been the first in the United States built at an educational institution for the exclusive purposes of instruction. He died at Williams-town on the 24th of May 1872.

See Albert C. Sewall’s Life of Professor Albert Hopkins (1879).

HOPKINS, SAMUEL (1721-1803), American theologian, from whom the Hopkinsian theology takes its name, was born at Waterbury, Connecticut, on the 17th of September 1721. He graduated at Yale College in 1741; studied divinity at Northampton, Massachusetts, with Jonathan Edwards; was licensed to preach in 1744, and in December 1745 was ordained pastor of the church in the North Parish of Sheffield, or Hannah, (now Great Barrington), Massachusetts, at that time a small settlement of only thirty years and a half—preaching, studying and writing—until 1750, for part of the time (1751-1758) in intimate association with his old teacher, Edwards, whose call to Stockbridge he had been instrumental in procuring. His theological views having met with much opposition, however, he was finally dismissed from the pastorate on the pretext of want of funds for his support. From April 1770 until his death on the 20th of December 1803, he was the pastor of the First Church in Newport, Rhode Island, though during 1776-1780, while Newport was occupied by the British, he preached at Newburyport, Mass., and at Canterbury and Stamford, Conn. In 1799 he had an attack of paralysis, from which he never wholly recovered. Hopkins’s theological views have had a powerful influence in America. Personally he was remarkable for force and energy of character, and for the utter fearlessness with which he followed premises to their conclusions. In vigour of intellect and in strength and purity of moral tone he was hardly inferior to Edwards himself. Though he was originally a slave-holder, to him belongs the honour of having been the first among the Congregational ministers of New England to denounce slavery both by voice and pen; and to his persistent though bitterly opposed efforts are probably chiefly to be attributed the law of 1774, which forbade the importation of negro slaves into Rhode Island, as also that of 1784, which declared that all children of slaves born in Rhode Island after the following March should be free. His training school for negro missionaries to Africa was broken up by the confusion of the American War of Independence. Among his publications are a valuable Life and Character of Jonathan Edwards (1790), and numerous pamphlets in defence of the various Tenets, Principles, and Doctrines to which he was most intimate, viz., A Dialogue concerning the Slavery of the Africans, showing it to be the Duty and Interest of the American States to emancipate all their African Slaves (1778), and A Discourse upon the Slave Trade and the History of the Africans (1793). His distinctive theological tenets are to be found in his important work, A System of Doctrines Contained in Divine Revelation, Explained and Defended (1793), which has had an influence hardly inferior to that exercised by the writings of Edwards himself. They may be summed up as follows: God so rules the universe as to produce its highest happiness, considered as a whole. Since God’s sovereignty is absolute, sin must be, by divine permission, a means by which this happiness of the whole is secured, though that this is its consequence, renders it not an inconsistency in the Divine nature. Virtuous conduct is in preference for the good of the whole to any private advantage; hence the really virtuous man must willingly accept any disposition of himself that God may deem wise—a doctrine often called “willingness to be damned.” All have natural power to choose the right, and are therefore responsible for their acts; but all men lack inclination to choose the right unless the existing “bias” of their wills is transformed by the power of God from self-seeking into an effective inclination towards virtue. Hence preaching should demand instant submission to God and disinterested goodwill, and should teach the worthlessness of all religious acts or dispositions which are less than these, while recognizing that God can grant or withhold the regenerative change at his pleasure.

The best edition of Hopkins’s Works is that published in three volumes at Boston in 1852, containing an excellent biographical sketch by Professor Edwards A. Park. In 1854 was published separately Hopkins’s Treatise on the Millennium, which originally appeared in his Spiritual Journal and in letters which are contained in the prophecies in Daniel and Revelation that the millennium would come “not far from the end of the twentieth century.” See also Stephen Wood’s Slaves of the Life of the Late Reverend Samuel Hopkins (Hartford, Conn., 1805), Franklin B. Dexter’s Biographical Sketches of the Graduates of Yale College and Williston Walker’s Ten New England Leaders (New York, 1901).

HOPKINS, WILLIAM (1703-1868), English mathematician and geologist, was born at Kingston-on-Soar, in Nottinghamshire, on the 2nd of February 1703. In his youth he learned practical agriculture in Norfolk and afterwards took an extensive farm in Suffolk. In this he was unsuccessful. At the age of thirty he entered St Peter’s College, Cambridge, taking his degrees of Bachelor of Arts in 1733 and Master of Arts in 1739. In 1753 he published Elements of Trigonometry. He was distinguished for his mathematical knowledge, and became eminently successful as a private tutor, many of his pupils attaining high distinction. About 1833, through meeting Sedgwick at Barmouth and joining him in several excursions, he became intensely interested in geology. Thereafter, in papers published by the Cambridge Philosophical Society and the Geological Society of London, he entered largely into mathematical inquiries connected with geology, dealing with the effects which an elevatory force acting from below would produce on a portion of the earth’s crust, in fissures, faults, &c. In this way he discussed the elevation and denudation of the Lake district, the Wealden area, and the Bas Boulonnais. He wrote also on the motion of glaciers and the transport of erratic blocks. So ably had he grappled with many difficult problems that in 1850 the Wollaston medal was awarded to him by the Geological Society of London; and in the following year he was elected president. In his second address (1853) he criticized Élie de Beaumont’s theory of the elevation of mountain-chains and showed the imperfect evidence on which it rested. He brought before the Geological Society in 1851 an important paper On the Causes which may have produced changes in the Earth’s superficial Temperature. He was president of the British Association for 1853. His later researches included observations on the conductivity of various substances for heat, and on the effect of pressure on the temperature of fusion of different bodies. He died at Cambridge on the 14th of October 1866.

HOPKINSON, FRANCIS (1737-1791), American author and statesman, one of the signers of the Declaration of Independence, was born in Philadelphia, Pennsylvania, on the 2nd of October 1737. He was a son of Thomas Hopkinson (1700-1751), a prominent lawyer of Philadelphia, one of the first trustees of the College of Philadelphia, now the University of Pennsylvania, and first president of the American Philosophical Society. Francis was the first student to enter the College of Philadelphia.
from which he received his bachelor's degree in 1755 and his master's degree in 1760. He then studied law in the office in Philadelphia of Benjamin Chew, and was admitted to the bar in 1761. Removing after 1768 to Bordentown, New Jersey, he became a member of the council of that colony in 1774. On the approach of the War of Independence he identified himself with the patriot or whig element in the colony, and in 1776 and 1777 he was a delegate to the Continental Congress. He served on the committee appointed to frame the Articles of Confederation, executed, with John Nixon (1733-1808) and John Wharton, the "business of the navy" under the direction of the marine committee, and acted for a time as treasurer of the Continental loan office. From 1779 to 1789 he was judge of the court of admiralty in Pennsylvania, and from 1790 until his death was United States district judge for that state. He was famous for his versatility, and besides being a distinguished lawyer, jurist and political leader, was "a mathematician, a chemist, a physician, an inventor, a musician and a composer of music, a man of literary knowledge and practice, a writer of airy and dainty songs, a clever artist with pencil and brush and a humorist of unmistakable power." (Tyler, Literary History of the American Revolution). It is as a writer, however, that he will be remembered. He ranks as one of the three leading satirists on the patriot side during the War of Independence. His ballad, The Battle of the Kegs (1778), was long exceedingly popular. To alarm the British force at Philadelphia the Americans floated kegs charged with gunpowder down the Delaware river towards that city, and the British, alarmed for the safety of their shipping, fired with cannon and small arms at everything they saw floating in the river. Hopkinson's ballad is an imaginative expansion of the actual facts. To the cause of the revolution this ballad, says Professor Tyler, "was perhaps worth as much just then as the wounding of a comet or the battle." Hopkinson's principal writings are The Pretty Story (1774), A Prophecy (1776) and The Political Catechism (1777). Among his songs may be mentioned The Treaty and The New Roof, a Song for Federal Mechanics; and the best known of his satirical pieces are Typographical Method of conducting a Quarrel, Essay on White Washing and Modern Learning. His Miscellaneous Essays and Occasional Writings were published at Philadelphia in 3 vols., 1792.

His son, JOSPEH HOPKINSON (1770-1842), graduated at the University of Pennsylvania in 1786, studied law, and was a Federalist member of the national House of Representatives in 1807-1810. He was long judge of the county court of Philadelphia, from 1828 until his death, and a member of the state constitutional convention of 1837. He is better known, however, as the author of the patriotic anthem "Hail Columbia" (1798).

HOPKINSON, JOHN (1849-1868), English engineer and physician, was born in Manchester on the 27th of July 1849. Before he was sixteen he attended lectures at Owens College, and at eighteen he gained a mathematical scholarship at Trinity College, Cambridge, where he graduated in 1871 as senior wrangler and first Smith's prizeman, having previously taken the degree of D.Sc. at London University and won a Whitworth scholarship. Although elected a fellow and tutor of his college, he stayed up for a year as a demonstrator, and then entered the practical engineering as a pupil in the works in which his father was a partner. But there his stay was equally short, for in 1872 he undertook the duties of engineering manager in the glass manufactories of Messrs Chance Brothers and Company at Birmingham. Six years later he removed to London, and while continuing to act as scientific adviser to Messrs Chance, established a most successful practice as a consulting engineer. His work was mainly, though not exclusively, electrical, and his services were in great demand as an expert witness in patent cases. In 1890 he was appointed director of the Siemens laboratory at King's College, London, with the election of the death of her father prematurely on the 27th of August 1898, when he was killed, together with one son and two daughters, by an accident the nature of which was never precisely ascertained, while climbing the Petite Dent de Veisivi, above Evolena. Dr Hopkinson presented a rare combination of practical with theoretical ability, and his achievements in pure scientific research are not less intrinsically notable than the skill with which he applied their results to the solution of concrete engineering problems. His original work is contained in more than sixty papers, all written with a complete mastery both of style and of subject-matter. His name is best known in connexion with electricity and magnetism. On the one hand he worked out the general theory of the magnetic circuit in the dynamo (in conjunction with his brother Edward), and on the other the theory of alternating currents, and conducted a long series of observations on the phenomena attending magnetization in iron, nickel and the curious alloys of the two which can exist both in a magnetic and non-magnetic state at the same temperature. On the other hand, by the application of the principles he thus elucidated he furthered to an immense extent the employment of electricity for the purposes of daily life. As regards the generation of electric energy, by pointing out defects of design in the dynamo as it existed about 1878, and showing how important improvements were to be effected in its construction, he was largely instrumental in converting it from a clumsy and wasteful appliance into one of the most efficient known to the engineer. Again, as regards the distribution of the current, he took a leading part in the development of the three-wire system and the closed-circuit transformer, while electric traction had to thank him for the series-parallel method of working motors. During his residence in Birmingham, Messers Chance being makers of glass for use in lighthouse lamps, his attention was naturally turned to problems of lighthouse illumination, and he was able to devise improvements in both the catoptric and dioptric methods for concentrating and directing the beam. He was a strong advocate of the group-foreshining system as a means of differentiating lights, and invented an arrangement for carrying it into effect optically, his plan being first adopted for the catoptric light of the Royal Sovereign lighthouse, in the English Channel off Beachy Head. Moreover, his association with glass manufacture led him to study the refractive indices of different kinds of glass; he further undertook abstruse researches on electrostatic capacity, the phenomena of the residual charge, and other problems arising out of Clerk Maxwell's electro-magnetic theory.

His original papers were collected and published, with a memoir by his brother, in 1901.

HOPKINSVILLE, a city and the county-seat of Christian county, Kentucky, U.S.A., about 150 m. S.W. of Louisville. Pop. (1890) 5833; (1900) 7280 (3243 negroes); (1910) 9410. The city is served by the Illinois Central and the Louisville & Nashville railways. It is the seat of Bethel Female College (Baptist, founded 1854), of South Kentucky College (Christian; co-educational; chartered 1849) and of the Western Kentucky Asylum for the Insane. The city's chief interest is in the tobacco industry; it has also considerable trade in other agricultural products and in coal; and its manufactures include carriages and wagons, bricks, lime, flour and dressed lumber. When Christian county was formed from Logan county in 1799, Hopkinsville, formerly called Elizabethtown, became the county seat. John Hopkins (c. 1732-1810), an officer of the Continental Army in the War of Independence, a pioneer settler in Kentucky, and a representative in Congress from Kentucky in 1813-1815. In 1798 Hopkinsville was incorporated.

HOPPNER, JOHN (1758-1810), English portrait-painter, was born, it is said, on the 4th of April 1758 at Whitechapel. His father was of German extraction, and his mother was one of the German attendants at the royal palace. Hoppner was consequently brought early under the notice and received the patronage of George III., whose regard for him gave rise to unseemly scandal. As a boy he was a chorister at the royal chapel, but showing strong inclination for art, he in 1775 entered as a student at the Royal Academy. In 1778 he took a silver medal for drawing from the life, and in 1782 the Academy's highest award, the gold medal for historical painting, his subject
being King Lear. He first exhibited at the Royal Academy in 1780. His earliest love was for landscape, but necessity obliged him to turn to the more lucrative business of portrait-painting. At once successful, he had, throughout life, the most fashionable and wealthy sitters, and was the greatest rival of the growing attraction of Lawrence. Ideal subjects were very rarely attempted by Hoppner, though a "Sleeping Venus," "Belisarius," "Jupiter and Io," "Bacchante" and "Cupid and Psyche" are mentioned among his works. The prince of Wales especially patronized him, and many of his best portraits are in the state apartments at St James's Palace, the best perhaps being those of the prince, the duke and duchess of York, of Lord Rodney and of Lord Nelson. Among his other sitters were Sir Walter Scott, Wellington, Frere and Sir George Beaumont. Competent judges have deemed his most successful works to be his portraits of women and children. *A Series of Portraits of Ladies* was published by him in 1803, and a volume of translations of Eastern tales into English verse in 1805. The verse is of but mediocre quality. In his later years Hoppner suffered from a chronic disease of the liver; he died on the 23rd of January 1810. He was confessedly an imitator of Reynolds. When first painted, his works were much admired for the brilliancy and harmony of their colouring, but the injury due to destructive mediums and lapse of time which many of them suffered caused a great depreciation in his reputation. The appearance, however, of some of his pictures in good condition has shown that his fame as a brilliant colourist was well founded. His drawing is faulty, but his touch has qualities of breadth and freedom that give to his works a characteristic and division of the number of Reynolds. Hoppner was a man of great social power, and had the knowledge and accomplishments of a man of the world.

The best account of Hopper's life and paintings is the exhaustive work by William McKay and W. Roberts (1906).

**HOP-SCHOTCH** ("scotch," to score), an old English children's game in which a small object, like a flat stone, is kicked by the player, while hopping, from one division to another of an oblong space marked upon the ground. A stone is divided into the number of divisions, usually 10 or 12. These divisions are numbered, and the stone must rest successively in each. Should it rest upon a line or go out of the division aimed for, the player loses. In order to win a player must drive the stone into each division and back to the starting-point.

**HOPTON, RALPH HOPTON, BARON (1598-1652), Royalist commander in the English Civil War, was the son of Robert Hopton of Witham, Somerset.** He appears to have been educated at Lincoln College, Oxford, and to have served in the army of the Elector Palatine in the early campaigns of the Thirty Years' War, and in 1643 he was lieutenant-colonel of a regiment raised in England to serve in Mansfield's army. Charles I., at his coronation, made Hopton a Knight of the Bath. In the political troubles which preceded the outbreak of the Civil War, Hopton, as member of parliament successively for Bath, Somerset and Wells, at first opposed the royal policy, but after Strafford's attainder (for which he voted) he gradually became an ardent supporter of Charles, and at the beginning of the Great Rebellion he was made lieutenant-general under the marquess of Hertford in the west. His first achievement was the rallying of Cornwall to the royal cause, his next to carry the war from that county into Devonshire. In May 1643 he won the brilliant victory of Stratton, in June he overran Devonshire, and on the 5th of July he inflicted a severe defeat on Sir William Waller at Lansdown. In the last action he was severely wounded by the explosion of a powder-wagon and he was soon after shut up in Devizes by Waller, where he defended himself until relieved by the victory of Roundway Down on the 13th of July. He was soon afterwards created Baron Hopton of Stratton. But his successes in the west were cut short by the defeat of Cheltenham or Alrested in March 1644. After this he served in the western campaign under Charles's own command, and towards the end of the war, after Lord Goring had left England, he succumbed to the command of the royal army, which his predecessor had allowed to waste away in indiscipline.

It was no longer possible to stem the tide of the parliament's victory, and Hopton, defeated in his last stand at Torrington on the 10th of February 1646, surrendered to Fairfax. Subsequently he accompanied the prince of Wales in his attempts to prolong the war in the Scilly and Channel Islands. But his downright loyalty was incompatible with the spirit of concession and compromise which prevailed in the prince's council in 1649-1650, and he withdrew from active participation in the cause of royalism. He died, still in exile, at Bruges in September 1652. The peerage became extinct at his death. The king, Prince Charles and the governing circle appreciated the merits of their faithful lieutenant less than did his enemies; Waller and Fairfax, the former of whom wrote, "hostility itself cannot violate my friendship to your person," while the latter spoke of him as "one whom we honour and esteem above any other of your party.

**HOR, MOUNT (wv), the scene in the Bible of Aaron's death, situated "in the edge of the land of Edom" (Num. xxxiii. 37).

Since the time of Josephus it has been identified with the Jebel Nebi Harun ("Mountain of the Prophet Aaron"), a twin-peaked mountain 4780 ft. above the sea-level (6072 ft. above the Dead Sea) in the Edomite Mountains on the east side of the Jordan-Arabah valley. On the summit is a shrine said to cover the grave of Aaron. Some modern investigators dissent from this identification: H. Clay Trumbull prefers the Jebel Madâra, a peak north-west of 'Ain Kadi. Another Mount Hor is mentioned in Num. xxxiv. 7, 8, as on the northern boundary of the wilderness of Zin in the Old Testament period. It is perhaps to be identified with Hermon. It has been doubtfully suggested that for Hor we should here read *Hadrach*, the name of a northern country near Damascus, mentioned only once in the Bible (Zech. ix. 1).

**HORACE [QUINTUS HORATIUS FLACCUS] (65-8 B.C.), the famous Roman poet, was born on the 8th of December 65 B.C. at Venusia, on the borders of Lucania and Apulia (Sat. ii. 1. 34).

The town, originally a colony of veterans, appears to have long maintained its military traditions, and Horace was early imbued with a profound respect for the indomitable valour and industry of the Italian soldier. It would seem, however, that the poet was not brought up in the town itself, at least he did not attend the town school (Sat. i. 6. 72) and was much in the neighbouring country of, though he was but a child when he left it, he retained always a vivid and affective memory. The mountains near and far, the little villages on the hillsides, the woods, the roaring Aufidus, the mossy spring of Bandusia, after which he named another spring on his Sabine farm—these scenes, so always lying near and are frequently mentioned in his poetry (e.g. *Carm.* iii. 4 and 30, iv. 9). We may thus trace some of the germs of his poetical inspiration, as well as of his moral sympathies, to the early years which he spent near Venusia. But the most important moral influence of his youth was the training and example of his father, of whose worth, affectionate solicitude and homely wisdom Horace has given a most pleasing and life-like picture (Sat. i. 6. 70, &c.). He was a freedman by position; and it is supposed that he had been originally a slave of the town of Venusia, and on his emancipation had been received as a gentleman by the senate of the Horatian tribe in which the inhabitants of Venusia were enrolled. After his emancipation he acquired by the occupation of "coactor" (a collector of the payments made at public auctions, or, according to another interpretation, a collector of taxes) sufficient means to enable him to buy a small farm, to make sufficient provision for the future of his son (Sat. i. 4. 108), and to take him to Rome to give him the advantage of the best education there. To his care Horace attributes, not only the intellectual training which enabled him in later life to take his place among the Augustan school of Rome, but also his immunity from the baser forms of moral evil (Sat. i. 6. 68, &c.). To his practical teaching he attributes also his tendency to moralize and to observe character (Sat. i. 4. 105, &c.)—the tendency which enabled him to become the most truthful painter of social life and manners which the ancient world produced.
In one of his latest writings (Epist. ii. 2. 42. &c.) Horace gives a further account of his education; but we hear no more of his father, nor is there any allusion in his writings to the existence of any other member of his family or any other relative. After the ordinary grammatical and literary training at Rome, he went (45 B.C.) to Athens, the most famous school of philosophy, as Rhodes was of oratory; and he describes himself while there as "searching after truth among the groves of Academus" as well as advancing in literary accomplishment. His pleasant residence there was interrupted by the breaking out of the civil war. Following the example of his young associates, he attached himself to the cause of Brutus, whom he seems to have accompanied to Asia, probably as a member of his staff; and he served at the battle of Philippi in the post of military tribune. He shared in the rout which followed the battle, and henceforth, though he was not less firm in his conviction that some causes were worth fighting for and dying for, he had but a poor opinion of his own soldierly qualities.

He returned to Rome shortly after the battle, stripped of his property, which formed part of the land confiscated for the benefit of the soldiers of Octavianus and Antony. It may have been at this time that he encountered the danger of shipwreck, which he mentions among the perils from which his life had been protected by supernatural aid (Carm. iii. 4. 28). He procured in some way the post of a clerkship in the quasator's office, and about three years after the battle of Philippi, he was introduced by Virgil and Varus to Maecenas. This was the turning-point of his life; for he formed a friendship with the greatest of literary patrons to his personal merits rather than to his poetic fame; for he was on intimate terms with Maecenas before the first book of the Satires (his first published work) appeared. He tells us in one of his Satires (i. 10. 31) that his earliest ambition was to write Greek verses. In giving this direction to his ambition, he was probably influenced by his admiration of the old Iambic and lyrical poets whom he has made the models of his own Epodes and Odes. His common sense as well as his national feeling fortunately saved him from becoming a second-rate Greek versifier in an age when poetic inspiration had passed from Greece to Italy, and the living language of Rome was a more fitting vehicle for the new feelings and interests of men than the echoes of the old Ionian or Acolian melodies. His earliest Latin compositions were, as he tells us, written under the instigation of poverty; and they alone betray any trace of the bitterness of spirit which the defeat of his hopes and the hardships which he had to encounter on his first return to Rome may have temporarily produced on him. Some of the Epodes, of the nature of personal and licentious lampoons, and the second Satire of book 1., in which there is some trace of an angry republican feeling, belong to these early compositions. But by the time the first book of Satires was completed and published (35 B.C.) his temper had recovered its natural serenity, and, though he had not yet attained to the height of his fortunes, his personal position was one of comfort and security, and his intimate relation with the leading men in literature and social rank was firmly established.

About a year after the publication of this first book of Satires Maecenas presented him with a farm among the Sabine hills, near the modern Tivoli. This secured him pecuniary independence; it satisfied the love of nature which had been implanted in him during the early years spent on the Venusian farm; and it afforded him a welcome escape from the distractions of city life and the dangers of a Roman autumn. Many passages in the Satires, Odes and Epistles express the brightness and pride with which the thought of his own valley filled him, and the interest which he took in the simple and homely ways of his country neighbours. The inspiration of the Satires came from the heart of Rome; the feeling of many of the Odes comes direct from the Sabine hills; and even the meditative spirit of the later Epistles tells of the leisure and peace of quiet days spent among books, or in the open air, at a distance from "the smoke, wealth and tumult" of the great metropolis.

The second book of Satires was published in 29 B.C.; the Epodes (spoken of by himself as iambic) apparently about a year earlier, though many of them are, as regards the date of their composition, to be ranked among the earliest extant writings of Horace. In one of his Epistles (i. 19. 25) he rest his first originality on his having introduced into Latin the metres and spirit of Archilochus of Paros. He may have naturalized some special form of metre employed by that poet, and it may be (as Th. Pliiss has suggested) that we should see in the Epodes a tone of mockery and parody. But his personal lampoons are the least successful of his works; while those Epodes which treat of other subjects in a poetical spirit are inferior in metrical effect, and in truth and freshness of feeling, both to the lighter lyrics of Catullus and to his own later and more carefully meditated Odes. The Epodes, if they are serious at all, are chiefly interesting as a record of the personal feelings of Horace during and that immediately followed his return to Rome, and philosophy a prelude to the higher art and inspiration of the first three books of the Odes, which were published together about the end of 24 or the beginning of 23 B.C.

The composition of these Odes extended over several years, but all the most important among them belong to the years between the battle of Actium and 24 B.C. His lyrical poetry is thus, not, like that of Catullus, the ardent utterance of his youth, but the mature and finished workmanship of his manhood. The state of public affairs was more favourable than it had been since the outbreak of the civil war between Caesar and Pompey for the appearance of lyrical poetry. Peace, order and national unity had been secured by the triumphs of Augustus; the enthusiasm in favour of the new government had not yet been chilled by experience of its repressing influence. The poet's circumstances were, at the same time, most favourable for the exercise of his lyrical gift during these years. He lived partly at Rome, partly at his Sabine farm, varying his residence occasionally by visits to Tibur, Praeneste or Baiae. His intimacy with Maecenas was strengthened and he had become the familiar friend of the great minister. He was treated with distinction by Augustus, and by the foremost men in Roman society. He complains occasionally that the pleasures of his youth are passing from him, but he does so in the spirit of a temperate Epicurean, who found new enjoyments in life as the zest for the old enjoyments decayed, and who considered the wisdom and meditative spirit—"the philosophic mind that years had brought"—an ample compensation for the extinct fires of his youth.

About four years after the publication of the three books of Odes, the first book of the Epistles appeared, introduced, as his Epodes, Satires and Odes had been, by a special address to Maecenas. From these Epistles, as compared with the Satires, we gather that he had gradually adopted a more retired and meditative life, and had become fonder of the country and of study, and that which immediately followed his return to Rome, and philosophy, he was framing for himself a scheme of life, was endeavouring to conform to it, and was bent on inculcating it on others. He maintained his old friendships, and continued to form new intimacies, especially with younger men engaged in public affairs or animated by literary ambition. After the death of Virgil he was recognized as pre-eminent the greatest living poet, and was accordingly called upon by Augustus to compose the sacred hymn for the celebration of the secular games in 17 B.C. About four years later he published the fourth book of Odes (about 13 B.C.) having been called upon to do so by the emperor, in order that the victories of his stepsons Drusus and Tiberius over the Rhetai and Vindelici might be worthily celebrated. He lived about five years longer, and during these years published the second book of Epistles, and the Epistle to the Pisids, more generally known as the "Ars poetica." These later Epistles are mainly devoted to literary criticism, with the especial object of vindicating the poetic claims of his own age over those of the age of Ennius and the other early

1 The date is determined by the poem on the death of Quintilius Varus (who died 24 B.C.), and by the reference in Ode i. 12 to the young Marcellus (died in autumn 23 B.C.) as still alive. Cf. Wickham's Introduction to the Odes.
The proposals for Horace. He might have been expected, as a great critic and lawyer on literature, to have exercised a beneficial influence on the future poetry of his country, and to have applied as much wisdom to the theory of his own art as to that of a right life. But his critical Epistles are chiefly devoted to a controversial attack on the older writers and to the exposition of the laws of dramatic poetry, on which his own powers had never been exercised, and for which either the genius or circumstances of the Romans were unsuited. The same subordination of imagination and enthusiasm to good sense and sober judgment characterizes his opinions on poetry as on morals.

He died somewhat suddenly on the 7th of November of the year 8 B.C. He left Augustus to see after his affairs, and was buried on the Esquiline Hill, near Maecenas.

Horace is one of the few writers, ancient or modern, who have written a great deal about themselves without laying themselves open to the charge of weakness or egotism. His chief claim to literary originality is not that on which he himself rested his hopes of immortality—that of being the first to adapt certain lyrical metres to the Latin tongue—but rather that of being the first of those whose works have reached us who establishes a personal relation with his reader, speaks to him as a familiar friend, gives him good advice, tells him the story of his life, and shares with him his private tastes and pleasures—and all this without any loss of self-respect, any want of modesty or breach of good manners, and in a style so lively and natural that each new generation of readers might fancy that he was addressing them personally and speaking to them on subjects of every day modern interest. But on this point pertinacity, far from wishing to make himself out better or greater than he was, he seems to write under the influence of an irreligious restraint which checks him in the utterance of his highest moral teaching and of his poetical enthusiasm. He affords us some indications of his personal appearance, as where he speaks of the "nigros angusta fronte capillos" of his youth, and describes himself after he had completed his forty-fourth December as of small stature, prematurely grey and fond of hazing in the sun (Epist. i. 20. 24).

In his later years his health became weaker or more uncertain, and this caused a considerable change in his habits, tastes and places of residence. It inclined him more to a life of retirement and simplicity, and also it stimulated his tendency to self-introspection and self-culture. In his more vigorous years, when he lived much in Roman society, he claims to have acted in all his relations to others in accordance with the standard recognized among men of honour in every age, to have been charitably indulgent to the weakness of his friends, and to have been exempt from petty jealousies and the spirit of detection. If ever he deviates from his ordinary self-portraiture, far from wishing to make himself out better or greater than he was, it is to avoid self-pride or self-glory in earnest indignation, it is in denouncing conduct involving treachery or malice in the relations of friends (Sat. i. 4. 81, &c.).

He claims to be and evidently aims at being independent of fortune, superior to luxury, exempt both from the sordid cares of avarice and the coarser forms of profligacy. At the same time he makes a frank confession of indolence and of occasional failure in the pursuit of his ideal self-mastery. He admits that he has lost his love of pleasure, his sensitivity to opinion, and some touch of vanity or at least of gratified ambition arising out of the favour which through all his life he had enjoyed from those much above him in social station (Epist. i. 20. 23). Yet there appears no trace of any unworthy deference in Horace's feelings towards the great. Even towards Augustus he maintained his attitude of independence, by declining the office of private secretary which the emperor wished to force upon him; and he did so with such tact as neither to give offence nor to forfeit the regard of his superior. His feeling towards Maecenas is more like that of Pope towards Bolingbroke than that which a client in ancient or modern times entertains towards his patron. He felt pride in his protection and in the intellectual sympathy which united him with one whose personal qualities had enabled him to play so prominent and beneficent a part in public affairs. Their friendship was slowly formed, but when once established continued unshaken through their lives.

There is indeed nothing more remarkable in Horace than the independence, or rather the self-dependence, of his character. The enjoyment which he drew from his Sabine farm consisted partly in the refreshment to his spirit from the familiar beauty of the place, partly in the "otia liberima" from the claims of business and society which it afforded him. His love poems, when compared with those of Catullus, Tibullus and Propertius, show that he never, in his mature years at least, allowed his peace of mind to be at the mercy of any one. They are the expressions of a fine and subtle and often a humorous observation rather than of ardent feeling. There is perhaps a touch of pathos in his reference in the Odes to the early death of Cinara, but the epithet he applies to her in the Epistles, "Quem scis immunem Cinarae placuere rapaci," shows that the pain of thinking of her could not have been very heartfelt. Even when the Odes addressed to real or imaginary beauties are most genuine in feeling, they are more the artistic rekindling of extinct fires than the utterance of recent passion. In his friendships he had not the self-forgetful devotion which is the most attractive side of the character of Catullus; but he studied how to gain and keep the regard of those whose society he valued, and he repaid this regard by a fine courtesy and by a delicate appreciation of their higher gifts and qualities, whether proved in literature, or war, or affairs of state or the ordinary dealings of men. He enjoyed the great world, and it treated him well; but he readily maintained his personal independence and the equipoise of his feelings and judgment. If it is thought that in attributing a divine function to Augustus he has gone beyond the bounds of a sincere and temperate admiration, a comparison of the Odes in which this occurs with the first Epistle of the second book shows that he certainly recognized in the emperor a great and successful administrator and that his language is to be regarded rather as the artistic expression of the prevailing national sentiment than as the tribute of an insincere adulation.

The aim of Horace's philosophy was to "be master of oneself," to retain the "mens aqua" in all circumstances, to use the gifts of fortune while they remained, and to be prepared to part with them with equanimity; to make the most of life, and to contemplate its inevitable end without anxiety. Self-reliance and resignation are the lessons which he constantly inculcates. His philosophy is thus a mode of practical Epicureanism combined with other elements which have more affinity with Stoicism. In his early life he professed his adherence to the former system, and several expressions in his first published work show the influence of the study of Lucretius. At the time when the first book of the Epistles was published he professes to assume the position of an eclectic rather than that of an adherent of either school (Epist. i. 1. 13-19). We note in the passage here referred to, as in other passages, that he mentions Aristippus of Cyrene, rather than Epicurus himself, as the master under whose influence he from time to time insensibly lapsed. Yet the dominant tone of his teaching is that of a refined Epicureanism, not so elevated or purely contemplative as that preached by Lucretius, but yet more unbroken, the reach of a society which, though luxurious and pleasure-loving, had not yet become thoroughly frivolous and enervated. His advice is to subdue all violent emotion of fear or desire; to estimate all things calmly—"nil admirari"; to choose the mean between a high and low estate; and to find one's happiness in plain living rather than in luxurious indulgence. Still there was in Horace a robust fibre, inherited from the old Italian race, which moved him to value the dignity and nobleness of life more highly than its ease and enjoyment. In some of the stronger utterances of his Odes, where he expresses sympathy with the manlier qualities of character, we recognize the tenacious and Stoical view of life so combined as to be more worthy of human dignity than...
HORACE

The genial worldly wisdom of the former school, more in harmony with human experience than the formal precepts of the latter.

It is interesting to trace the growth of Horace in elevation of sentiment and serious conviction from his first ridicule of the paradoxes of Stoicism in the two books of the Satires to the application of the principles of Epicureanism to the things of the world, to the strongest Roman instincts of fortitude and self-sacrifice. A similar modification of his religious and political attitude may be noticed between his early declaration of Epicurean unbelief and the sympathy which he shows with the religious reaction fostered by Augustus; and again between the Epicurean indifference to national affairs and the strong support which he gives to the national policy of the emperor in the first six Odes of the third book, and in the fifth and fifteenth of the fourth book. In his whole religious attitude he seems to stand midway between the consistent denial of Lucretius and Virgil's pious endeavour to reconcile ancient faith with the conclusions of philosophy. His introduction into some of his Odes of the gods of mythology must be regarded as merely artistic or symbolical. Yet in some cases we recognize the expression of a natural piety, thankful for the blessing bestowed on purity and simplicity of life, and acknowledging a higher and more majestic law governing nations through their voluntary obedience. On the other hand, his allusions to a future life, as in the "domus exilis Plutonia," and the "furvae regna Proserpineae," are shadowy and artificial. The image of death is constantly obtruded in his poems to enhance the sense of present enjoyment. In the true spirit of paganism he associates all thoughts of love and wine, of the meeting of the months and the occupations of the seasons with the recollection of the transitoriness of our pleasures—

"Nos, ubi declinavimus
Quo pius Aeneas, quo dives Tullius et Ancus,
Pulvis et umbra sumus."

Horace is so much of a moralist in all his writings that, in order to enjoy the intrinsic charms of his familiarities of his lyrical talents, it is essential to realize what were his views of life and the influences under which they were formed. He is, though, in a different sense from Lucretius, eminently a philosophical and reflective poet. He is also, like all the other poets of the Augustan age, a poet whose composition culture and criticism were as conscious elements as spontaneous inspiration. In the judgment he passes on the older poetry of Rome and on that of his contemporaries, he seems to attach more importance to the critical and aesthetic than to the creative and inventive functions of genius. It is on the labour and judgment with which he has cultivated his gift that he rests his hopes of future progress. The whole poetry of the Augustan age was based on the works of older poets, Roman as well as Greek. Its aim was to perfect the more immature workmanship of the former, and to adapt the forms, manners and metres of the latter to subjects of immediate and practical interest. Virgil and Horace were of the same office which Ennius performed for an older generation, so Horace in his Satires, and to a more limited extent in his Epistles, brought to perfection for the amusement and instruction of his circle the "colloquial" and the rude but genuine graces of Lucilius.

It was the example of Lucilius which induced Horace to commit all his private thoughts, feelings and experience "to his books as to trusty companions," and also to comment freely on the characters and lives of other men. Many of the subjects of particular satires of Horace were immediately suggested by those of Lucilius. Thus the "Journey to Brundusium" (Sat. i. 5) reproduced the old song of the travel and the" Banquet of Nasidienus" (Sat. ii. 8) may have been suggested by the description of the older poet, who lived in the time of Augustus. The topography of the third book of the Satires is copied from the same kind of office which Ennius performed for an older generation, so Horace in his Satires, and to a more limited extent in his Epistles, brought to perfection for the amusement and instruction of his circle the "colloquial" and the rude but genuine graces of Lucilius.

He was the example of Lucilius which induced Horace to commit all his private thoughts, feelings and experience "to his books as to trusty companions," and also to comment freely on the characters and lives of other men. But for both of these works he himself disclaims the title of poetry. He rests his claims as a poet on his Odes. They reveal an entirely different aspect of his genius, his spirit and his culture. He is one of the greatest and most perfect epic poets of modern times, and his excellence in two widely separated provinces of literature. Through all his life he was probably conscious of the "ingenii benigna venia," which in his youth made him the sympathetic student and imitator of the old poets, and in his old age enabled him to write poetry with a profound poetic criticism. But it was in the years that intervened between the publication of his Satires and Epistles that his lyrical genius asserted itself as his masterpiece. The idea of Horatian pleasures and risen above the harrowing cares of his earlier career; a fresh source of happiness and inspiration had opened up to him in his beautiful Sabine retreat; he had a new view of the elevated and refined character of Horatian pleasures and risen above the harrowing cares of his earlier career; a fresh source of happiness and inspiration had opened up to him in his beautiful Sabine retreat; he had a new view of the elevated and refined character of Horatian pleasures and risen above the harrowing cares of his earlier career; a fresh source of happiness and inspiration had opened up to him in his beautiful Sabine retreat; he had a new view of the elevated and refined character of Horatian pleasures and risen above the harrowing cares of his earlier career; a fresh source of happiness and inspiration had opened up to him in his beautiful Sabine retreat; he had a new view of the elevated and refined character of Horatian pleasures. He was the only Roman who seems to have been convinced and, so far as his temperament admitted to enthusiasm, an enthusiastic believer in its beneficence. But it was only after much labour that his original vein of genius obtained a free and ready expression. He reached it after a "premeditated art," with which other great lyrical poets of ancient...
and modern times has charmed the world. His first efforts were apparently imitative, and were directed to the attainment of perfect mastery over form, metre and rhythm. The first nine Odes of the first volume are written in different metres. They and all the other metres employed by him are based on those employed by the older poets of Greece—Alcaeus, Sappho, Archilochus, Alcman, &c. He has built the structure of his lighter Odes also on the model, which he found in the metres of the three preceding centuries, that in which he calls Calliope "to dictate a long continuous strain," he has endeavoured to reproduce something of the intricate metres of the later antiquity, and especially that variety and reflection, which characterize the art of Pindar. He frequently reproduces the language and some of the thoughts of his masters, but he gives them new application, or stamps them with the impress of his own experience. He has enriched the metres which he has adopted to such perfection that the art perished with him. A great proof of his mastery over the art is the skill with which he has varied his manner according to the wishes of the reader.

Thus his great metre, the Alcaic, has a character of stateliness and majesty in addition to the energy and impetuosity originally imparted to it by Alcaeus. The Sapphic metre he employs with a peculiar lightness and vivacity which harmonize admirably with his gay moods.

Again in regard to his diction, if Horace has learned his subtlety and moderation from his Greek masters, he has tempered those qualities with the masculine characteristics of his race. No writer is more Roman in the stateliness and dignity, the terseness, occasionally even in the sobriety and l bare literalness, of his diction. While it is difficult to define the precise phrase which Horace gave to form, rhythm and diction that his own prophecy.

"Usque ego poster\a

Crescam laude recens

has been so amply fulfilled, yet no greater injustice could be done to him than to regard him as a mere poet, though those who have disdained everything in literature. With Horace the mastery over the vehicle of expression was merely an essential preliminary to making a worthy and serious use of that vehicle. The poet from the polemic point of view, was intended not merely to give refined pleasure to a few, but above all things, to "utilis urbi." Yet he is saved, in his practice, from the abuse of this theory by his admirable sense, his ironical humour, his intolerance of conventional opinions. Opinions will differ as to whether he or Catullus is to be regarded as the greater lyrical poet. Those who assign the palm to Horace will do so, certainly not because they recognize in him richer or equally rich a delicious taste of the most polished expression, but because he is the subject to which his art has been devoted a fuller, more varied, more mature and permanent interest for the world.

Authority,—For the life of Horace the chief authorities are his own works and a short ancient biography which is attributed to Suetonius. The apparatus criticus is most fully described in O. Keller's preface to vol. i. of the 2nd ed. (1899) of Keller and Holder's recent recension. This recension gives his works with a collection of variants and emendations to the text of the testimonia of ancient writers.

What might have proved the most important manuscript of Horace, the so-called Rusticosius Blandiumus, is now lost, and we know it only from the account of J. Cruquius who saw it at 1565. The relations of the extant MSS. to each other and the presumed ancient authoritative MSS. problem; and Keller's solution has not proved generally accepted. See a résumé of the controversy Horakritik seit 1880 by J. Rick (Leipzig, 1906) and F. Vollmer in Palæograph. Supp. x. 2, pp. 261-322. Many MSS. of Horace contain ancient scholia which are copied or taken with abridgment from the commentaries of Porphyrio. Horace, who lived about a.d. 200, and Helenius.Acr. a still earlier grammarian. These scholia also have been collected and edited—the Porphyrio scholia by A. Holder (1902), and the "Acronian" (or pseudo-Acronian) by O. Keller (1902-1904). R. Bentley's epoch-making edition (1711) has been reprinted with an index by Zangemeister (1866). Of the modern commentaries the most complete, and the most extensive are those of C. O. Holder (1902), G. Klindt (1902-1904), and A. C. Kiesling (1902). Revised editions by F. Rickert and F. de Wicke (1907), and E. C. Weiss (1906). The existing editions with English notes are those of T. E. Page (Odes, 1883), A. Palmer (Sapphics, 1883), A. S. Willis (Epistles, 1885), J. Gow (Odes and Epodes, 1896, revised 1900), W. H. Paton (Odes) (1897), and L. Müller's elaborate edition of the Odes and Epodes was published posthumously (1900). Of the critical editions Keller and Holder's still holds the field: to this Keller's Epistologras zu Horaz (1873) is referred (1907). But there were two attempts to give a new and late edition. The first was the attempt of E. C. Weiss with Latin text from the recension in Postgate's new Corpus poetarum. For further information see Teufel's Geschichte der römischen Litteratur (Eng. trans. by G. C. Watt), §§314-320, and M. Scharn's excellent account in his Geschichte der römischen Litteratur, vol. ii. §§251-266. (W. Y. S.; J. G.)

HORAE (Lat. hora, hour), the Hours, in Greek mythology Ποιοί, originally the personification of a series of natural phenomena. In the Iliad (v. 749) they are the custodians of the gates of Olympus, which they open or shut by scattering or condensing the clouds; that is, they are weather goddesses, who send down or withhold the fertilizing dews and rain. In the Odyssey, where they are represented as bringing round the seasons in regular order, they are an abstraction rather than a concrete personification. The brief notice in Herodotus (Theog. 901), where they are called the children of Zeus and Tethys, who superintend the operations of agriculture, indicates by the names assigned to them (Eunomia, Diikê, Eireňê, i.e. Good Order, Justice, Peace) the extension of their functions as goddesses of order from nature to the events of human life, and at the same time invests them with moral attributes. Like the Moeræ (Fates), they regulate the destinies of man, watch over the newly born, secure good laws and the administration of justice. The selection of three as their number has been supposed to refer to the most ancient division of the year into spring, summer and winter, but it is probably only another instance of the Greek liking for that particular number or its multiples in such connexions (three Moeræ, Charites, Gorgons, nine Muses). Order and regularity being indispensable conditions of beauty, it was easy to conceive of the Horae as the goddesses of youthful bloom and grace, inseparably associated with the idea of spring-time. As such they are companions of the Nymphs and Graces, with whom they are often confounded, and of other superior deities connected with the spring growth of vegetation (Demeter, Dionysus). At Athens, these two (or three) in number, Thallo and Carpo, the goddesses of the flowers of spring and of the fruits of summer, to whom Auzo, the goddess of the growth of plants, may be added, although some authorities make her only one of the Graces. In honour of the Horae a yearly festival (Hornaca) was celebrated, at which protection was sought against the scorching heat and drought, and offerings were made of boiled meat as less insipid and more nutritious than roast. In later mythology, under Alexandrian influence, the Horae become the four seasons, daughters of Helios and Selene, each represented with the conventional attributes. Subsequently, when the day was divided into twelve equal parts, each of them took the name of Hora. Ovid (Metam. ii. 26) describes them as placed at equal intervals on the throne of Phoebus, with whom are also associated the four seasons. Nonnus (5th cent. A.D.) in the Dionysiaca also unites the twelve Horae as representing the day and the four Horae as the seasons in the palace of Helios.

See C. Lehrs, Populare Aufsätze (1856); J. H. Krause, Die Musen, Gräfinnen und Mysterien (1893); J. C. O. Holder's Zwischenfragen in Darmen's and Nagels' Dictionnaire des antiquités, J. A. Hild; and in Roscher's Lexikon der Mythologie, W. Rupp. HORAPOLLON, of Phineythis in the name of Panopolis in Egypt, Greek grammarian, flourished in the 4th century A.D. during the reign of Theodosius I. According to Suidas, he wrote commentaries on Sophocles, Alcaeus and Homer, and a work (Tευρωκ) on places consecrated to the gods. Photios (Cor. 270) who calls him a dramatist as well as a grammarian, ascribes to him a history of the foundation and antiquities of Alexandria (unless this is by an Egyptian of the same name, who lived in the reign of Zenon, 474-490). Under the name of Horapollon two books on Hieroglyphics are extant, which profess to be a translation from an Egyptian original into Greek by a certain Philippus, of whom nothing is known. The Inferior Greek of the translation, and the character of the additions in the second book point to its being of late date; some have assigned it to Photius. It is claimed that a large proportion of the statements seem absurd and cannot be accounted for by anything known in the latest and most fanciful usage, yet there is ample evidence in both the books, in individual cases, that the tradition of the values of the hieroglyphic signs was not yet extinct in the days of their author.

Bibliography.—Editions by C. Leemans (1835) and A. T. Cory (1840) with English translation and notes; see also G. Rathgeber in Erich and Gruber's Allgemeine Encyclopädie; H. Schröder, Zeitschrift für ägyptische Sprache (1905), p. 72.
HORATII and CURIATII, in Roman legend, two sets of three brothers born at one birth on the same day—the former Roman, the latter Alban—the mothers being twin sisters. During the war between Rome and Alba Longa it was agreed that the issue should depend on a combat between the two families. Two of the Horatii were soon slain; the third brother fled. Horatius, when the Curiatii, who were all wounded, pursued him without concert he slew them one by one. When he entered Rome in triumph, his sister recognized a cloak which he was wearing as a trophy as one she had herself made for her lover, one of the Curiatii. She thereupon invoked a curse upon her brother, who slew her on the spot. Horatius was condemned to be scourged to death, but on his appealing to the people his life was spared (Livy i. 25, 26; Dion. Halic. iii. 13-22).

Monuments of the tragic story were shown by the Romans in the time of Livy (the altar of Janus Curiatius near the sororium tignum, the "sister's beam," or yoke under which Horatius had to pass; and the altar of Juno Sororia). The legend was probably invented to account for the origin of the provocatio (right of appeal to the people), while at the same time it points to the close connexion and final struggle for supremacy between the older city on the mountain and the younger city on the plain. Their relationship and origin from three tribes are symbolically represented by the twin sisters and the two sets of three brothers.

For a critical examination of the story, see Schwegler, Römische Geschichtskunde, vii. 11-14; Sir G. Cornewall Lewis, Credibility of Early Roman History, ch. xi. 15; W. Iahne, Hist. of Rome, i.; E. Pace, Storia di Roma, i. ch. 3 (1898), and Ancient Legends of Roman History (Eng. trans., 1906), where the story is connected with the ceremonies performed in honour of Jupiter Tique and Juno Sororia; C. Paccal, Fatti e leggende di Roma antica (Florence, 1903); O. Gilbert, Geschichte und Topographie der Stadt Rom im Altertum (1883-1885).

HORATII COCELIS, a legendary hero of ancient Rome. With two companions he defended the city bridge against Lars Porsena and the whole army of the Etruscans, while the Romans cut down the bridge behind. Then Horatius threw himself into the Tiber and swam against the current. A statue was erected in his honour in the temple of Vulcan, and he received as much land as he could plough round in a single day. According to another version, Horatius alone defended the bridge, and was drowned in the Tiber.

There is an obvious resemblance between the legend of Horatius Coecles and that of the Horatii and Curiatii. In both cases three Romans come forward as the champions of Rome at a critical moment of her fortunes, and only one successfully holds his ground. In the one case, the locality is the land frontier, in the other, the boundary stream of Roman territory. E. Pace finds the origin of the story in the worship of Vulcan, and identifies Coecles (the "one-eyed") with one of the Cyclopes, who in mythology were connected with Hephaestus, and later with Vulcan. He concludes that the supposed statue of Coecles was really that of Vulcan, who, as one of the most ancient Roman divinities and, in fact, the protecting deity of the state, would naturally be confounded with the hero who saved it by holding the bridge against the invaders. He suggests that the legend arose from some religious ceremony, possibly the practice of throwing the stuffed figures called Argel into the Tiber from the Pons Sublicius on the ide of May. The conspicuous part played in Roman history by members of the Horatian family, who were connected with the worship of Jupiter Vulcanus, will explain the attribution of the name Horatius to Vulcan-Cocles.

See Livy ii. 10; Dion. Halic. v. 23-25; Polybius vi. 55; Plutarch, Peptâcole, 16. For a critical examination of the legend, see Schwegler, Römische Geschichte, bk. xxi. 18; W. Iahne, History of Rome, i.; E. Pace, Storia di Roma, i. ch. 4 (1898), and Ancient Legends of Roman History (Eng. trans., 1906).

HORDE, a manufacturing town of Germany, in the Prussian province of Westphalia, is 2 m. S.E. from Dortmund on the railway to Soest. Pop. (1905) 26,401. It has a Roman Catholic and an Evangelical church, a synagogue and an old castle dating from about 1300. There are large smelting-works, foundries, puddling-works, rolling-mills and manufactures of iron and plated wares. In the neighbourhood there are large iron and coal mines. A tramway connects the town with Dortmund.

HOREB, the ancient seat of Yahweh, the tribal god of the Kenites, adopted by His covenant by Israel. This is the name prefixed by the Elohist writer (E) whose work is interwoven into the Old Testament narrative, and he is followed by the Deuteronomist school (D). The Yahwistic writer (J), on the other hand, prefers to call the mountain Sinai (q.v.), and so do the priestly writers (P). This latter form became the more usual. There is no ground for distinguishing between Horeb as the range and Sinai as the single mountain, or between Horeb and Sinai as respectively the N. and S. parts of the range.

HOREHOUND (O. Eng. hourehune, Ger. Andorn, Fr. marrubie). Common or white horehound, Marrubium vulgare, of the natural order Labiateae, is a perennial herb with a short stout rootstock, and thick stems, about 1 ft. in height, which, as well as their numerous branches, are coated with a white or hoary felt—whence the popular name of the plant. The leaves have long petioles, and are roundish or rhombic-ovate, with a bluntly toothed margin, much wrinkled, white and woolly below and pale green and downy above; the flowers are sessile, in dense whorls or clusters, small and dull-white, with a 10-toothed calyx and the upper lobe of the corolla long and bifid. The plant occurs in Europe, North Africa and West Asia to North-West India, and has been naturalized in parts of America. In Britain, where it is found generally on sandy or dry chalky ground, it is far from common. White horehound contains a volatile oil, resin, a crystallizable bitter principle termed marrubin and other substances, and has a net unpleasant aromatic odour, and a persistent bitter taste. Formerly it was official in British pharmacopoeias; and the infusion, syrup or confection of horehound has long been in popular repute for the treatment of a host of dissimilar affections. Black horehound, Ballota nigra, is a hairy perennial herb, belonging to the same order, of foetid odour, is 2 to 3 ft. in height, and has stalked, roundish-ovate, toothed leaves and numerous flowers, in dense axillary clusters, with a green or purplish calyx, and a pale red-purple corolla. It occurs in Europe, North Africa and West Asia, and in Britain south of the Forth and Clyde, and has been introduced into North America.

HÖRGEN, a small town in the Swiss canton of Zürich, situated on the left or west shore of the Lake of Zürich, and by rail 10½ m. S.E. of the town of Zürich. Pop. (1900) 6883, mostly German-speaking and Protestants. It possesses many industrial establishments of various kinds, and is a centre of the Zürich silk manufacture. It came in 1466 into the possession of Zürich, with which it communicates by means of steamers on the lake, as well as by rail.

HORIZON (Gr. ἡραξ, dividing), the apparent circle around which the sky and earth seem to meet. At sea this circle is well defined, the line being called the sea horizon, which divides the visible surface of the ocean from the sky. In astronomy the horizon is that great circle of the sphere the plane of which is at right angles to the direction of the plumb line. Sometimes a distinction is made between the rational and the apparent horizon, the former being the horizon as determined by a plane through the centre of the earth, parallel to that through the station of an observer. But on the celestial sphere the great circles of these two planes are coincident, so that this distinction is not necessary (see Astronomy: Spherical). The Dip of the horizon at sea is the angular depression of the apparent sea
HORMAYR—HORMIZD

HORMAYR, JOSEPH, Bavarian (1782-1848), German statesman and historian, was born at Innsbruck on the 20th of January 1782. After studying law at his native town, he attained the rank of captain in the Tirolean Landwehr, the young man, who had the advantage of being the grandson of Joseph von Hormayr (1705-1778), chancellor of Tirol, obtained a post in the foreign office at Vienna (1801), from which he rose in 1803 to be court secretary and, being a near friend of the Archduke John, director of the secret archives of the state and court for thirteen months. In 1803 he married Therese Anderler of Hohenwald. During the insurrection of 1809, by which the Tirolian nation sought to throw off Austrian supremacy and, confirmed by the treaty of Pressburg, Hormayr was the mainstay of the Austrian party, and assumed the administration of everything (especially the composition of proclamations and pamphlets); but, returning home without the prestige of success, he fell, in spite of the help of the Archduke John, into disfavour both with the emperor Francis I. and with Prince Metternich, and at length, when in 1813 he tried to stir up a new insurrection in Tirol, he was arrested and imprisoned at Munkatt. In 1816 some amends were made to him by his appointment as imperial historiographer; but so little was he satisfied with the general policy and conduct of the Austrian court that in 1828 he accepted an invitation of King Louis I. to the Bavarian capital, where he became ministerial councillor in the department of foreign affairs. In 1832 he was appointed Bavarian minister-resident at Hanover, and from 1837 to 1846 he held the same position at Bremen. Together with Count Johann Friedrich von der Decken (1796-1840) he founded the Historical Society of Lower Saxony (Historischer Verein für Niedersachsen). The last two years of his life were spent at Munich as superintendent of the national archives. He died on the 9th of October 1848.

Hormayr’s literary activity was closely conditioned by the circumstances of his political career and by the fact that Johannes von Müller (d. 1611) was his teacher: while his access to original documents gave value to his treatment of the past, his record or criticism of contemporary events received authority and interest from his personal experience. But his history of the Tirolean rebellion is far from being impartial; for he always liked to put himself into the first place, and the merits of Andreas Hofer and of other leaders are not sufficiently acknowledged. In his later writings he appears as a keen opponent of the policy of the court of Vienna.

The following are among Hormayr’s more important works: Geschichte des Grafen von Andechs (1796); Lexikon für Reisenden in Tirol (1796); Kritisich-diplomatisehe Beiträge zur Geschichte Tirols im Mittelalter (2 vols., Innsbruck, 1802-1803, new ed., 1853); Geschichte der gefährtest. Großfahrt Tirol (2 vols., Tübingen, 1806-1810); Österreichischer Plutarch, 20 vols., collection of portraits and biographies of the most celebrated administrators, commanders and statesmen of Austria (Vienna, 1807); an edition of Beuchamp’s Historie de la guerre en Vendée (1809); Geschichte Hofer’s (1817, 2nd ed., 2 vols., 1845) and other pamphlets; Archiv für Gesch., Stat., Lit. und Kunst, vol. 1 (1818); Allgemeine Geschichte der neuesten Zeit vom Tod Friedrichs des Großen bis zum zweiten Pariser Frieden (3 vols., Vienna, 1814-1819, 2nd ed., 1891); Wien, seine Gesch. und Denkmäler (5 vols., Vienna, 1823-1824); together with Friedrich Strieder, Im Sonnenschein Bayerns Welthandel, Lebensbilder aus dem Befreiungskriege (3 vols., Jena, 1841-1844, 2nd ed., 1845-1847); Die goldene Chronik von Hohenschwangau (Munich, 1842); Anekdoten über das Tagebuch eines alten Püllermanns (4 vols., Jena, 1845-1847). Together with Michael (1844), he composed Taschenbuch für die vaterland. Gesch. (Vienna, 1818-1848).

See T. H. Merdau, Biographische Züge aus dem Leben deutschen Ministerpräsidenten Gräfes, ein Verstorbener National-Encyklopädien, ii. (1835); Taschenbuch für vaterländische Geschicht (1836 and 1847); Neuer Nekrol Netz Deutschen (1848); Blätter für literarische Unterhaltung (1849); Wurzbach, Österreichisches biographisches Lexikon, ix. (1863); K. Th. von Heigel in the Allgemeine deutsche Biographie (1851) and F. X. Weges, Geschichte der deutschen Historiographie (Munich and Leipzig, 1883-1885). 1. Jur. HORMISDAS, pope from 514 to 523 in succession to Symmachus, was a native of Campania. He is known as having succeeded in obtaining the reunion of the Eastern and Western Churches, which had been separated since the excommunication of Acacius in 484. After two unsuccessful attempts under the emperor Anastasia I., Hormisdas had no difficulty in coming to an understanding in 518 with his successor Justin. Legates were dispatched to Constantinople; the memorial of the schismatic patriarchs was condemned; and union was resumed with the Holy See.

Details of this transaction have come down to us in the Collectio Avellana (Corpus script. eccl. Vindobon., vol. xxv., Nos. 105-203; cf. Andreas Thiel, Epp. Rom. Pont. i. 741 seq.).

HORMIZD, or HORMISDAS, the name of five kings of the Sassanid dynasty (see PERSIA: Ancient History). The name is another form of Ahuramazda or Ormuzd (Ormazd), which under the Sassanids became a common personal name and was borne not only by many generals and officials of their time (it therefore occurs very often on Persian seals), but even by the pope of Rome noticed above. It is strictly an abbreviation of Hormuzd-dad, “given by Ormuzd,” which form is preserved by Agathias iv. 24-25 as name of King Hormizd I. and II. (Q.33:95).

1. HORMIZD I. (272-273) was the son of Shapur I., under whom he was governor of Khorasan, and appears in his wars against Rome (Trebellius Pollio, Trig. Tyr. 2, where Nödeke has corrected the name Odomastes into Oromastes, i.e. Hormizd). In the Persian tradition of the history of Ardashir I., preserved in a Pahlavi text (Nödeke, Geschichte des Artachis I. Pâpekân), he is made the son of a daughter of Mithrak, a Persian dynasty, whose family Ardashir had extirpated because the magians had predicted that from his blood would come the restorer of the empire of Iran. Only this daughter is preserved by a peasant; Shapur sees her and makes her his wife, and her son Hormizd is afterwards recognized and acknowledged by Ardashir. In this legend, which has been partially preserved also in Tabari, the great conquests of Shapur are transferred to Hormizd. In reality he reigned only one year and ten days.

2. HORMIZD II., son of Narseh, reigned for seven years five months, 302-309. Of his reign nothing is known. After his death his son Adarnasir was killed by the grandees after a very short reign, as he showed a cruel disposition; another son, Hormizd, was kept a prisoner, and the throne reserved for the child with which a concubine of Hormizd II. was pregnant and which received the name Shapur II. Hormizd escaped from prison by the help of his wife in 323, and found refuge at the court of Constantine the Great (Zosim. ii. 27; John of Antioch, fr. 175; Zonar. 13:5). In 363 Hormizd served in the army of Julian against Persia; his son, with the same name, became consul in 366 (Ammian. Marc. 26. 8. 12).

3. HORMIZD III., son of Yazdegerd I., succeeded his father in 379. He had continued to fight with his brothers and with the Ephthalites in Bactria, and was killed by Peroz in 450.

4. HORMIZD IV., son of Chosroes I., reigned 578-590. He seems to have been imperious and violent, but not without some kindness of heart. Some very characteristic stories are told of him by Tabari (Nödeke, Geschichte d. Perser und Araber unter den Sassaniden, 264 f.). His father’s sympathies had been with the nobles and the priests. Hormizd protected the common people and introduced a severe discipline in his army and court. When the priests demanded a persecution of the Christians, he declined on the ground that the throne and the government could only be safe if it gained the goodwill of both concuring religions. The consequence was that he raised a strong opposition in the ruling classes, which led to many executions and confiscations. When he came to the throne he killed his brothers,
HORMUZ

according to the oriental fashion. From his father he inherited a war against the Byzantine empire and against the Turks in the east, and negotiations of peace had just begun with the emperor Tiberius, but Hormizd haughtily declined to cede anything of the conquests of his father. Therefore the accounts given of him by the Byzantine authors, Theophylact, Simocatta (iii. 16 fl.), Menander Protector and John of Ephesus (vi. 22), who give a full account of these negotiations, are far from favourable. In 588 his general, Bahram Chobin, defeated the Turks, but in the next year was beaten by the Romans; and when the king superseded him he rebelled with his army. This was the signal for a general insurrection. The magnates deposed and blinded Hormizd and proclaimed his son Chosroes II. king. In 590 Anahita, daughter of Bahram Chobin and Chosroes II. Hormizd was killed by some partisans of his son (590).

5. HORMIZD V. was one of the many pretenders who rose after the murder of Chosroes II. (628). He maintained himself about two years (631, 632) in the district of Nisibis. (Ed. M.)

HORMUZ (Hormus, Ormus, Ormuz), a famous city on the shores of the Persian Gulf, which occupied more than one position in the course of history, and has now long practically ceased to exist. The earliest mention of the name occurs in the voyage of Nearchus (325 B.C.). When that admirer beached his fleet at the mouth of the river Anamis on the shore of Hormozia, a coast district of Carmania, he found the country to be kindly, rich in every product except the olive. The Ananias appears to be the river now known as the Minab, discharging into the Persian Gulf near the entrance of the latter. The name Hormuz is derived from some of that of the Persian god Hormuzd (Ormazd), but it is more likely that the original etymology was connected with khorna, "a date"; for the meaning of Mohgistan the modern name of the territory Hormozia is "the region of date-palms." The foundation of the city of Hormuz in this territory is ascribed by one Persian writer to the Sassanian Ardashir Babegian (c. 230 A.D.). But it must have existed at an earlier date, for Ptolemy takes note of "Aegymia's ðôsèòs (vi. 8). Hormuz is mentioned by Idrisi, who wrote c. 1150, under the title of Hormuz-al-sāhilah, "Hormuz of the shore" (to distinguish it from inland cities of the same name then existing), as a large and well-built city, the chief mart of Kirman. Siraf and Kish (Kais), farther up the gulf, had preceded it as ports of trade with India, but in the 13th century Hormuz had become the chief seat of this traffic. It was at this time the seat also of a petty dynasty of kings, of which there is history by one of their number (Turan Shah); an abstract of it is given by the Jesuit Teixeira. According to this history the founder of the dynasty was Shah Mohammed Dhiram-Kub ("the Drachma- conquer"), an Arab chief who crossed the gulf and established himself here. The date is not given, but it must have been before 1100 A.D., as Rušsuddin Mahmûd, who succeeded in 1246, was the twelfth of the line. These princes appear to have been at times in dependence necessarily on the atabegs of Fars and on the princes of Kirman. About the year 1300 Hormuz was so severely and repeatedly harassed by raids of Tatar horsemen that the king and his people abandoned their city on the mainland and transferred themselves to the island of Jerun (Organa of Nearchus), about 12 m. westward and 4 m. from the nearest shore. The site of the continental or ancient Hormuz was first traced in modern times by Colonel (Sir Lewis) Pelly when resident at Bushire. It stands in the present district of Minab, several miles from the sea, and on a creek which communicates with the Minab river, but is partially silted up and not now accessible for vessels. There remain traces of a long wharf and extensive ruins. The new city occupied a triangular plain forming the northern part of the island, the southern wall, as its remains still show, being about 2 m. in extent from east to west. A suburb with a wharf or pier, called Turan Bagh (garden of Turan) after one of the kings, a name now corrupted to Trumpak, stood about 3 m. from the town to the south-east.

Odoric gives the earliest notice we have of the new city (c. 1320). He calls it Ormes, a city strongly fortified and abounding in costly wares, situated on an island 5 m. distant from the main, having no trees and no fresh water, unhealthy and (as all evidence confirms) incredibly hot. Some years later it was visited more than once by Ibn Batuta, who seems to speak of the old city as likewise still standing. The new Hormuz, called also Jerun (i.e. still retaining the original name of the island), was a great and fine city rising out of the sea, and serving as a mart for all the products of India, which were distributed hence over all Persia. The hills on the island were of rock-salt, from which vases and pedestals for lamps were carved. Near the gate of the chief mosque stood an enormous skull, apparently that of an aurochs. The king at this time was Kuthuddin Tahmantan, and the traveller gives a curious description of him, seated on the throne, in patched and dirty raiment, holding a rosary of enormous pearls, procured from the Bahrein fisheries, which at one time or another belonged, with other islands in the gulf and on the Oman shores from Ras-el-had (C. Rosalgat of the Portuguese) on the ocean round to Julfar on the gulf, to the princes of Hormuz. Abdurazzâk, the envoy of Shah Rukh on his way to the Hindu court of Vijayanagar, was in Hormuz in 1421, and speaks of it as a mart which had no equal, frequented by the merchants of all the countries of Asia, among which are mentioned China, Java, Bengal, Tenasserim, Shahr-i-nao (i.e. Siam) and the Maldives. Nikitla, the Russian C. (c. 1470), gives a similar account; he calls it "a vast emporium of the world."

In September 1507 the king of Hormuz, after some time hearing of the terrible foe who was carrying fire and sword along the shores of Arabia, saw the squadron of Alphonso d'Albuquerque appear before his city, an appearance speedily followed by extravagant demands, by refusal of these from the ministers of the young king, and by deeds of matchless daring and cruelty on the part of the Portuguese, which speedily broke down resistance. The King acknowledged himself tributary to Portugal, and gave leave to the Portuguese to build a castle, which was at once commenced on the northern part of the island, commanding the city and the anchorage on both sides. But the mutinous conduct and desertion of several of Albuquerque's captains compelled him suddenly to abandon the enterprise; and it was not till 1514, after the great leader had captured Goa and Malacca, and had for five years been viceroy, that he returned to Hormuz (or Ormuz, as the Portuguese called it), and without encountering resistance to a name now so terrible, laid his grasp again on the island and completed his castle. For more than a century Hormuz remained practically in the dominions of Portugal, though the hereditary prince, paying from his revenues a tribute to the emperor of the East (in lieu of which eventually the latter took the whole of the customs collections), continued to be the instrument of government. The position of things during the Portuguese rule may be understood from the description of Cesare de' Federici, a Venetian merchant who was at Hormuz about 1565. After speaking of the great trade in spices, drugs, silk and silk stuffs, and pearls of Bahrein, and in horses for export to India, he says the king was a Moor (i.e. Mahomedan), chosen by and subordinate to the Portuguese. "At the election of the king I was there and saw the ceremonies that they use ... The old king being dead, the captain of the Portugals chooseth another of the blood-royal, and makes this election in the castle with great ceremony. And when he is elected the captain sweareth him to be true ... to the K. of Portugal as his lord and governor, and then he giveth him the sceptre regal. After this ... with great pomp ... he is brought into the royal palace in the city. The king keeps a good train and hath sufficient revenues, ... because the captain of the castle doth maintain and defend his right ... he is honoured as a king, yet he cannot ride abroad with his train, without the consent of the captain first had" (in Hakluyt).1

1 In Barros, Dec. II, book x, c. 7, there is a curious detail of the revenue and expenditure of the kingdom of Ormuz, which would seem to exhibit the former as not more than £100,000.
The rise of the English trade and factories in the Indian seas in the beginning of the 17th century led to constant jealousies and broils with the Portuguese, and the successful efforts of the English company to open traffic with Persia especially embittered their rivals, to whom the possession of Hormuz had long given a monopoly of that trade. The officers of Shāh Abbās, who looked with a covetous and resentful eye on the Portuguese occupation of such a position, were strongly desirous of the aid of English ships in attacking Hormuz. During 1620 and 1621 the ships of Burgundy and of the English company had more than once come to action in the Indian seas, and in November of the latter year the council at Surat had resolved on what was practically maritime war with the Portuguese flag. There was hardly a step between this and the decision come to in the following month to join with the duke of Shiraz (Imām Kūf Khān, the governor of Fars) in the desired expedition against Hormuz. There was some pretext of being forced into the alliance by a Persian threat to lay embargo on the English goods at Jashk; but this seems to have been only brought forward by the English agents when, at a later date, their proceedings were called in question. The English crews were at first unwilling to take part in what they justly said was “no merchandizing business, nor were they engaged for the like,” but they were persuaded, and five English vessels aided, first, in the attack of Kishm, where (at the east end of the large island so called) the Portuguese had lately built a fort,1 and afterwards in that of Hormuz itself. The latter siege was opened on the 16th of February 1622, and continued to the 1st of May, when the Portuguese after a great defence of ten weeks, surrendered. It is to be recollected that Portugal was at this time subject to the crown of Spain, with which England was at peace; indeed, it was but a year later that the prince of Wales went on his woeing adventure to the Spanish court. The irritation there was naturally great, though it is surprising how little came of it. The company were supposed (apparently without foundation) to have profited largely by the Hormuz booty; and both the duke of Buckingham and the king claimed to be “sweetered,” as the record phrases it; from this supposed treasure. The former certainly received a large bribe (£10,000). The conclusion of the transaction with the king was formerly considered doubtful; but entries in the calendar of East India papers seem to show that James received an equal sum.2 Hormuz never recovered from this blow. The Persians transferred their establishments to Gomroon on the mainland, about 12 m. to the north-west, which the king had lately set up as a royal port under the name of Bander Abbāsī. The English stipulations for aid had embraced an equal division of the customs duties. This division was apparently recognized by the Persians at the time of the new treaty, and, though the trade with Persia was constantly decaying and precarious, the company held to their factory at Gomroon for the sake of this claim to revenue, which of course was most irregularly paid. In 1683-1684 the amount of debt due to the company in Persia, including their proportion of customs duties, was reckoned at a million sterling. As late as 1690-1691 their right seems to have been admitted, and a payment of 3495 sequins was received by them on this account. The factory at Gomroon lingered on till 1779, when the two French ships of war under Comte d'Estaing, it was re-established, but at the time of Niebuhr's visit to the gulf a few years later no European remained. Niebuhr mentions that in his time (c. 1765) Mulla 'All Shāh, formerly admiral of Nādir Shāh, was established on the island of Hormuz and part of Kishm as an independent chief.

HORN, A. B.

The island has a circumference of 16 m. and its longest axis measures 43 m. The village is in 25° 6' N., 56° 20' E. The Portuguese fort still stands, but is sadly out of repair and much of its western wall has been undermined and washed away by the action of the sea. It is a bastioned fort with orllons and loopholed casemates under the ramparts and was separated from the mainland by a moat now silted up, cut E.W. across the isthmus and crossed by a bridge. It has three cisterns for collecting rainwater; two are 17 ft. deep, have a capacity of about 60,000 gallons and are covered by arched roofs supported on six stone pillars. The third cistern is smaller and has no roof. Five rusty old iron guns are lying prone on the roof; six others on the strand before the village are used for fastening boats, another serves as a socket for a flagstaff before the representative of the government. The island is under the jurisdiction of the governor of the Persian Gulf ports who resides at Bushire. Of the old city hardly anything stands except a minaret, 70 ft. high, with a winding staircase inside and much worm away at the base, part of a former mosque used by the Portuguese as a lighthouse, but the traces of buildings, massive foundations constructed of stone quarried on the islands, of many cisterns (some say 300), &c., are numerous and extensive. The modern settlement, situated south of the fort on the eastern shore, has a population of about 1000 during the cool season, but less in the hot season, when many people go over to Minab on the mainland. In the early weeks of May, people live in huts constructed of the branches and leaves of the date palm. They own about sixty small sailing vessels trading to Muscat and other ports and also do some pearl-fishing. At Turan Bagh on the east coast 44° 3' E. the fort are some considerable ruins, irrigation canals, an extensive burial ground and some huts occupied by a few families who cultivate a small garden on a terrace supported by old retaining walls. On a hill near the shore 13° 3' S. E. of the fort is the ruin of a small chapel called "Santa Lucia" on an old map in Astley's Collection of Voyages, and on the summit of a salt hill 13 m. south of the fort are the remains of another chapel called "N.S. de la Pena" on the same map, and a "Monastery" in a sketch of Hormuz made by David Davies, a mate on board the East India Company's ship "Discovery" in 1627. With the exception of the northern part, where the old city stood, and the little patch at Turan Bagh, the island is covered with reddish brown hills with sharp serrated ridges composed of gypsum, rock-salt and clay. These hills, which do not exceed 300 ft. in height, are broken through in four places by conical, whithed peaks of volcanic rocks (green- sandstone), three of which are close but beneath it is not so high in altitude of 690 ft. is situated almost in the centre of the island.

The island has extensive beds of red ochre in which nodules of very pure haematite are often found. The ochre, here called gilek, has been an important article of export for centuries3 and great quantities of it are exported at the present time to England (in 1906-1907, 10,000 tons; local price 27s. the ton). The climate of Hormuz, although hot, is, according to medical experts, the best in the Persian Gulf. Rain falls in January, February and March, and the annual rainfall is said to be about the same as at Bushire, 12 to 15 in.

HORN, ARVID BERNHARD. Count (1664-1742), Swedish statesman, was born at Vuorentaka in Finland on the 6th of April 1664, of a noble but indigent family. After completing his studies at Åbo, he entered the army and served for several years in the Netherlands, in Hungary under Prince Eugen, and in Flanders under Waldeck (1690-1695). He stood high

---

1 The attack on Kishm was notable in that one of the two Englishmen killed there was the great navigator Baffin.

HORN, COUNT OF—HORN (KING)

in the favour of the young Charles XII. and was one of his foremost generals in the earlier part of the great Northern War. In 1704 he was entrusted with his first diplomatic mission, the deposition of Augustus II. of Poland and the election of Stanislaus I., a mission which he accomplished with distinguished ability but absolute unscrupulosity. Shortly afterwards he was besieged by Augustus in Warsaw and compelled to surrender. In 1705 he was made a senator, in 1706 a count and in 1707 governor of Charles XII.'s nephew, the young duke Charles Frederick of Holstein-Gottorp. In 1710 he succeeded Nils Gydenstolpe as prime minister. Transferred to the central point of the administration, he had ample opportunity of regarding with other eyes the situation of the kingdom, and in consequence of his remonstrances he fell rapidly in the favour of Charles XII. Both in 1710 and 1713 Horn was in favour of summoning the estates, but when in 1714 the diet adopted an anti-monarchical attitude, he gravely warned and ultimately dissolved it. In Charles XII.'s later years Horn had little to do with the administration. After the death of Charles XII. (1718) it was Horn who persuaded the princess Ulrica Leonora to relinquish her hereditary claims and submit to be elected queen of Sweden. He protested against the queen's autocratic behaviour, and resigned both the premiership and his senatorship. He was elected landstamshald at the diet of 1720, and contributed, on the resignation of Ulrica Leonora, to the election of Frederick of Hesse as king of Sweden, whose first act was to restore to him the office of prime minister. For the next eighteen years he so absolutely controlled both the foreign and the domestic affairs of Sweden that the period between 1720 and 1738 has well been called the Horn period. His services to his country were indeed inestimable. His strong hand kept the inevitable strife of the parliamentary factions within due limits, and it was entirely owing to his provident care that Sweden so rapidly recovered from the wretched condition in which the wars of Charles XII. had plunged her. In his foreign policy Horn was extremely wary and cautious, yet without compromising either the independence or the self-respect of his country. He was, however, the promoter of a new principle of administration which in later days proved very dangerous to Sweden under ministers less capable than he was. This was to increase the influence of the diet and its secret committees in the solution of purely diplomatic questions, which before had been left to the chance of any junto, whether among the central government and at the same time facilitating the interference of foreign Powers in Sweden's domestic affairs. Not till 1751 was there any appearance of opposition in the diet to Horn's "system"; but Horn, piqued by the growing coolness of the king, the same year offered his resignation, which was not accepted. In 1734, however, the opposition was bold enough to denote his neutrality on the occasion of the war of the Polish Succession, when Stanislaus I. again appeared upon the scene as a candidate for the Polish throne; but Horn was still strong enough to prevent a rupture with Russia. Henceforth he was bitterly but unjustly accused of want of patriotism, and in 1738 he was compelled at last to retire before the impetuous onsets of the triumphant young Hot party. For the rest of his life he lived in retirement at his estate at Ekebyholm, where he died on the 17th of April 1742. Horn in many respects greatly resembled his contemporary Walpole. The peculiar situation of Sweden, and the circumstances of his time, made his policy necessarily opportunist, but it was an opportunism based on excellent common sense.

See V. E. Svedelius, Avred Bernard Horn (Stockholm, 1879); R. N. Bain, Gustavus III., vol. i. (London, 1894); Charles XII. (Eng. trans. by J. W. Allen, 1852); Charles XII. (Stockholm, 1852). (R. N. B.)

HORN, PHILIP DE MONTMORENCY, COUNT OF (1518–1568), a man of illustrious descent and great possessions in the Netherlands, became in succession under Charles V. and Philip II. stadtholder of Gelderland, admirals of Flanders and knight of the Golden Fleece. In 1559 he commanded the stately fleet which conveyed Philip II. from the Netherlands to Spain, and he remained at the Spanish court till 1563. On his return he placed himself with the prince of Orange and Count Egmont at the head of the party which opposed the policy of Cardinal Granvelle. When Granvelle retired the three great nobles continued to resist the introduction of the Spanish Inquisition and of Spanish despotism into the Netherlands. But though Philip appeared for a time to give way, he had made up his mind to visit the opponents of his policy with ruthless punishment. The regent, Margaret, duchess of Parma, was replaced by the duke of Alva, who entered the Netherlands at the head of a veteran army and at once began to crush all opposition with a merciless hand. Orange fled from the country, but Egmont and Horn, despite his warning, decided to remain and face the storm. They were both seized, tried and condemned as traitors, and were executed on the 5th of June 1568 in the great square before the town hall at Brussels.

See biographical notices in A. J. van der Aa, Biographisch Woordenboek der Nederlanden (Haarlem, 1854–1873); J. Kok, Vaderlands Woordenboek (Amsterdam, 1785–1799); also bibliography to chapters vi. and xix. in Cambridge Modern History, vol. iii. pp. 798–809 (1904).

HORN, English hero of romance. King Horn is a heroic poem or gest of 1546 lines dating from the 13th century. Murry (or Alot), king of Sudene1 (Surrey and Sussex?) is slain by Saracen pirates who turn his son Horn adrift with twelve others in the boat now called the Westernesse (or Western Prize, Conf. iii.), where the children are received by King Aylmer (Athelmaer). Presently Horn is denounced by one of his companions as the lover of the king's daughter Rymenhild (Rimel) and is banished, taking with him a ring, the gift of his bride and a talisman against danger. In Ireland, under the name of Godmod, he serves for seven years, and slays in battle the Saracen who had killed his father. Learning that Rymenhild is to be married against his will to King Mody, he returns to Westernesse disguised as a palmer, and makes himself known to the bride by dropping the ring into the cup she offers him, with the words 2 "Drink to Horn, Horn." Then he reconquers his father's kingdom and marries Rymenhild.

The other versions of the story, which are founded on a common tradition, but are not immediately dependent on one another, are: (1) the longer French romance of Horn et Rymenhild by "mestre Thomas," describing more complex social conditions than those of the English poem; (2) a slightly shorter Middle English poem, Horn Childe and Maiden Rymmeld; (3) the Scottish ballad of "Hind Horn;" (4) a prose romance founded on the French Horn, entitled Pontus Sibideine (Lyons, 1480). Eng. trans. pr. by Wynkyn de Worde, 1511; German trans. Augsburg, 1485.

There is a marked resemblance between the story of Horn and the legend of Havelok the Dane, and it is interesting to note how closely Richard of Ely followed the Horn tradition in the 12th century De gestis Herewardi Saxonis. Hereward also loves an Irish princess, flees to Ireland, and returns in time for the bridal feast, where he is presented with a cup by the princess. The orphaned prince who recovers his father's kingdom and avenges his murder, and the maid or wife who waits years for an absent lover or husband, and is rescued on the eve of a forced marriage, are common characters in romance. The second of these motives, with almost identical incidents, occurs in the legend of Henry the Lion, duke of Brunswick; it is the subject of ballads in Swedish, Danish, German, Bohemian, &c., and of a Historia by Hans Sachs, though some magic elements are added; it also occurs in the ballad of Der edle Moringer (14th century), well known in Sir Walter Scott's translation; in the story of Torell in the Decameron of Boccaccio (10th day, 9th tale); and with some variation in the Russian tale of Dobrynja and Nasatya.

King Horn was re-edited for the Early English Text Soc. by G. H. McKnight in 1901; Horn et Rymenheid was edited with the English versions for the Browneanus by H. G. M. Park; Horn Childe and Maiden Rymmeld in J. Ritson's Metrical Romances, vol. iii.; and "Hind Horn" in F. J. Child's English and Scottish

1 There was a barrow in the Isle of Purbeck, Dorsetshire, called Hornsbeech; and there are other indications which point to a possible connexion between Horn and Dorset (see H. L. Ward, Cat. of Romances, i. 451).

2 Sudene and Westernesse are tentatively identified also with Isle of Man and Wirral (Cambridge Hist. of Eng Lit., i. 304).
HORN

(a) The body is the main tube, having a bore of the form known as trunco-conical, measuring approximately 7 ft. 4 in. in length, in which the bore at the diameter of the bore is very gradual in proportion to the length, the bore being considerably conical. In the valve horn the bore is only theoretically conical, the excess of lengths of tubing attached to the valves being practically cylindrical. The bore, however, is conical, and the transition from the former to the latter being from 11 to 12 in. in diameter having a parabolic curve, and at the other a conical ferrule into which fit the crooks.

(b) The crooks (Fr. corps ou tons de rechange; Ger. Krummhorne, Stimmhorn, Ersatzhörner; Eng. B cioales, etc.) are interconnecting, so that hard brass tubing varying in length from 16 in. for the Bb alto crook to 125 in. for the Bb bass crook in which crook the tubing varies spirally and the pitch which it produces on being added to the body. By lengthening the tube at will the crook lowers the pitch of the instrument, and consequently changes the key in which it stands. Although the harmonic series of the crooks forms the same as the body of the instrument sounds produced by overblowing are lower, the tube being longer, and they now belong to the key of the crook. The principle of the crook was known early in the 17th century; it had been applied to the trumpet, trombone and Jägertrummut before being adapted to the horn. Crooks are merely transposing agents; they are powerless to fill up the gaps in the scale of the horn in order to make it a chromatic or even a diatonic instrument, for they require time for adjustment. The principle of the crook doubtless suggested to Stölzel the system of valves, which is but an instantaneous application of the general principle. The crook is a combination of the individual notes, and is thereby lowered a semitone, a tone or a tone and a half, as long as the valve remains in operation. The body of the horn without crooks is of the length to produce 8 ft. C., and forms the standard, copyright &c., which are, as the author stated, in the key in which the pitch is pitched. The notes are sounded as written.

(c) The mouthpiece of the horn differs substantially from that of the trumpet. The mouthpiece is, strictly speaking, no cup, the inside of the mouthpiece being, like that of the crook, the bore of a truncated cone or funnel. Like the other parts of this difficult and complex instrument, the proportions of the mouthpiece must bear a certain undefined relation to the length and diameter of the column of air. The choice of a suitable mouthpiece is in fact a test of skill; the shape of the lip of the performer and the more special use he may wish to make of either the higher or the lower harmonics have to be taken into consideration. It naturally calls for the use of the higher harmonics, which are more easily obtained by means of a somewhat smaller and shallower mouthpiece than that at the present horn mouth, which is called upon to dwell more on the lower harmonics.

(d) The tuning slides (Fr. coulisses; Ger. Stimmhüllen) consist of a pair of sliding U-shaped pieces fitting tightly into each other, and which also act as compensators with the crooks. On these tuning slides, placed across the ring formed by the coils of the valve-horn, are fixed the pistons with their extra lengths of tubing; as the compensating principle the pistons are so situated that the slides, the value of the latter as compensators will be readily understood. Those accustomed to deal with instruments having fixed notepads may be surprised at the place in these horns of apparatus in the nature of which confront both maker and performer in intricate wind instruments such as the horn, on which no sounds can be produced without conscious adjustment of lips and breath, but few without the indispensable use of instruments, such as the crook, slide, piston or of the hand in the bell, in the case of the natural or hand horn.

The production of sound in wind instruments has a fourfold object: (1) pitch; (2) range or scale of available notes; (3) quality of tone or timbre; (4) dynamic variation, or crescendo and diminuendo. The pitch of the horn, as of other wind instruments, depends almost exclusively on the length of the air-column set in vibration, and remains un influenced by the bore or conical character of the case of conical tubes in which the difference in diameter at the two extremities, mouthpiece and bell, is very great, as in the horn, the pitch of the tube will be slightly higher than its theoretical length would warrant. When, for instance, three tubes of the same length are sounded—No. 1, conical diverging; No. 2, conical converging; No. 3, gradual—there is an error of nearly a tone.

1. See Michael Praetorius, Orgel und Orgelbearbeitungen (1618), tab. vili, where crooks for lowering the key by one tone on trumpet or horn are clearly shown. The key is then employed on one tone lower. See Victor Mahillon, Les Éléments d'accoustique musicale et instrumentale (Brussels, 1874), pp. 96, 97, &c.; Friedrich Zanner, Die Musik und die musikalischen Instrumente (Mannheim, 1858), p. 310, where diagrams of the mouthpieces are given.

2. See Joseph Frankh, Volkstümliche theoretisch-praktische Musikschule (Bonn, 1841), ii. 7, where diagrams of the two mouthpieces are given, and see the same author, Vorlesungen, ii. 7, where diagrams of the mouthpieces and crooks are shown.

4. See Michael Praetorius, Organographia (Wolfenbüttel, 1618), tab. vili, where crooks for lowering the key by one tone on trumpet or horn are clearly shown. The key is then employed on one tone lower.

5. See Victor Mahillon, Les Éléments d'accoustique musicale et instrumentale (Brussels, 1874), pp. 96, 97, &c.; Friedrich Zanner, Die Musik und die musikalischen Instrumente (Mannheim, 1858), p. 310, where diagrams of the mouthpieces are given.

The tube of the horn behaves as an open pipe. E. F. C. Chladni states that the mouthpiece end is to be considered as open in all wind instruments (excepting reed instruments), even when, as in horns and trumpets, it would seem to be closed by the lips. Victor Mahillon, although apparently holding the opposite view, and considering as closed the tubes of all instruments played by means of reeds, whether single or double, or by the lips acting as reeds, gives a new and practical explanation of the phenomenon. The result is the same in both cases, for the closed pipe of trunco-conical bore, whose diameter at the bell is at least four times greater than the diameter at the mouthpiece, behaves in the same manner, when set in vibration by a reed, as an open pipe, and gives the consequent scale of harmonics.

In order to produce sound from the horn, the performer, stretching his lips, blows into the funnel-shaped mouthpiece from rim to rim into the cavity. The lips, vibrating as the breath passes through the aperture between them, communicate pulsations or series of intermittent shocks to the thin stream of air, known as the exciting current, which, when transmitted through the long and thin tube, already in a state of stationary vibration. The effect of this series of shocks, without which there can be no sound, upon the column of air confined within the walls of the tube is to produce sound-waves, travelling longitudinally through the tube. Each sound-wave consists of two half-lengths, one in which the air has been compressed or condensed by the impulse or push, the second in which, the push being spent, the air again dilates or becomes rarefied. In an open pipe, the wave-length is theoretically equal to the length of the tube. The pitch of the note depends on the frequency per second with which each vibration or complete sound-wave reaches the drum of the ear. The longer the wave the lower the frequency. The velocity of the wave is independent of its length, being solely conditioned by the rate of vibration of the particles composing the conveying medium: while one individual particle performs one complete vibration, the wave advances one wavelength. The rate of particle vibration or frequency is therefore inversely proportional to the corresponding wave-length. Sound-waves therefore with the same exciting current travel with the same velocity whatever their length, the difference being the frequency number and therefore the pitch of the note. As long as the performer blows with normal force, the same length of tube produces the same notes whether the same frequency and pitch, blows "blowing with normal force" is understood the proper relative proportions to be maintained between the wind-pressure and the lip-tension—a ratio which is found instinctively by the performer but was only suspected by the older writers. If the shocks and vibrations initiated by the lips through the medium of the exciting current be sharper owing to the increased tension of the lips, and at the same time each succeed other with greater velocity, the wavelength breaks up, and two, three or more proportionally shorter complete waves form instead of one, and traverse the pipe within the same space of time, producing sounds proportionally higher by an octave, a twelfth, &c., according to the character of the initiating disturbance. We may therefore add this proposition: the rate of vibration of such columns of air—to which the vibrating column of air within it is divided—depends in each fundamental, the performer's lips must be loose and the wind-pressure gentle but steady, so that the exciting current may issue forth in a broad, slow stream, giving to the column of air some 16 or 17 ft. long a beat of extreme difficulty; this fact is quite exceptional to find a horn-player who can sound the fundamental on the low C or Bb basso horis. In the organ, where even a small change of the pressure of the wind downward, if not completely controlling the exciting current are mechanically regulated for each length of pipe—only one note being required from each. In order, therefore, to induce the column of air within the tube to break up into a broad, slow stream, the fundamental must be raised into an ever finer, tender and more incisive stream. There is in fact a certain minimum pressure for each degree of tension of the lips below which no harmonic can be produced.

It is often stated that the harmonics are obtained by increasing the tension of the lips and a crescendo by increasing the pressure of the breath. Victor Mahillon accounts for the harmonics by increased pressure only. It is evident that the greater the tension of the lips, the greater the force of wind required to set them vibrating: therefore the force and velocity of the air must vary with the tension of the lips in order to produce a steady or musical sound. D. J. Poynting considers that the exciting current or lip-opening controlling the exciting current are mechanically regulated for each length of pipe—only one note being required from each. In order, therefore, to induce the column of air within the tube to break up into a broad, slow stream, the fundamental must be raised into an ever finer, tender and more incisive stream. There is in fact a certain minimum pressure for each degree of tension of the lips below which no harmonic can be produced.
All the crooks, a list of the principal of which is appended, therefore necessarily give real sounds lower than the above series according to their individual length.

French horns are made with either two or three valves. To the first valve is attached sufficient length of tubing to lower the pitch of the instrument a tone, so that any note played upon the horn in F major is transposed to the second lower, and the third valve, which makes the instrument a semitone lower, will give the note in the fourth lower.

The practical aggregate compass of the natural horns from B♭ to B♭ basso at the service of composers therefore ranges (actual sounds) from $\text{C}$ to $\text{D}$, or with 3 valves from $\text{C}$ to $\text{E}$.

By means of hand-stopping, i.e. the practice of thrusting the hand into the bell in order to lower the sound by a tone or a semitone, or by the adaptation of valves to the horn, this compass may be rendered chromatic almost throughout the range.

The principle of the valve as applied to wind instruments differs entirely from that of keys. The latter necessitate lateral holes bored through the tube, and when the keys are raised the vibrating column of air within the tube and the ambient air without are set in communication, with the result that the vibrating column is shortened and the pitch of the note raised. The valve system consists of valves or plugs attached to additional lengths of tubing, the effect of which is invariably to lower the pitch, except in the case of valve systems specified as "ascending" tried by John Shaw and Adolph Sax. Insuperable practical difficulties led to the abandonment of these systems, which in any case were the exception and not the rule. The valves, placed upon the U-shaped slides in the centre of the horn, are worked by means of pistons or levers, opening or closing the windways at will, so that when they are in operation the vibrating column of air no longer takes its normal course along the main tube and directly through the slides, but makes a détour through the extra length of tubing before completing its course. Thus the valves, unlike the keys, do not open any communication with the ambient air. Even authoritative writers have confused the two principles, believing them to be one and the same.

The invention of the valve, although a substantial improvement, was, however, as Schilling discovered, in which, after referring to the Klappenwindhorn and Trompete (keyed horn and trumpet) made by Weidinger and played in public in 1802 and 1813 respectively, he goes on to state that Schilling in his Lexicon makes the comical mistake of looking upon the Klappen trompete (keyed horn) and Ventil trompete (valve trumpet) as different instruments. He accordingly sets matters right, as he thinks, by according to Weidinger the honour of the invention of valves, hitherto wrongly attributed to Stölzel; and in the Quellenrechen (1894) he leaves out Stölzel's name, and names Weidinger as the inventor of the Klappen or Ventil, referring readers for further particulars to his article, just quoted, in the Monatshefte.

The measurements are for the high phiharmonic pitch $a'=452\frac{4}{4}$. V. Mushlin, "Le Cor" (p. 32), gives a table of the lengths of crooks in metres.

1. The measurements are for the high phiharmonic pitch $a'=452\frac{4}{4}$. V. Mushlin, "Le Cor" (p. 32), gives a table of the lengths of crooks in metres.

2. Robert Eitner, editor of the Monatshefte für Musikwissenschaft, published therein an article in 1881, p. 41 seq.," Wer hat die Ventil trompete erfunden," in which, after referring to the Klappenwindhorn and Trompete (keyed horn and trumpet) made by Weidinger and played in public in 1802 and 1813 respectively, he goes on to state that Schilling in his Lexicon makes the comical mistake of looking upon the Klappen trompete (keyed horn) and Ventil trompete (valve trumpet) as different instruments. He accordingly sets matters right, as he thinks, by according to Weidinger the honour of the invention of valves, hitherto wrongly attributed to Stölzel; and in the Quellenrechen (1894) he leaves out Stölzel's name, and names Weidinger as the inventor of the Klappen or Ventil, referring readers for further particulars to his article, just quoted, in the Monatshefte.
was found to fall short of perfection in its operation on the tubes of which it is composed. The chief of these was a very long, thin tubing thrown into combination to produce six different positions or series of harmonics was realized, and for the following reason. In order to deepen the pitch one tone by means of valve 1, a length of tubing equal to the length of tubing in combination to produce the fundamental E₁ was thrown into communication with the latter. If, in addition to valve 1, valve 3 be depressed, a further drop in pitch of ½ tone should be effected; but as the length of tubing added by depressing valve 3 is equal to twice that to the length already been lengthened by depressing valve 1, therefore the additional length supplied by opening valve 3 is now too short to produce a drop of a minor third strictly in tune, and all notes played while valves 1 and 3 are depressed will be too sharp. Means of compensating slight errors in intonation are provided in the U-shaped slides mentioned above.

The sound of the natural horn is mellow, sonorous and rich in harmonics; it is quite distinctive and bears little resemblance to that of the other members of the brass wind. In listening to its sustained notes one receives the impression of the tone being breathed out as by a voice, whereas the trumpet and trombone produce the effect of a rapid series of concussions, and in the tuba and cornet the concussions, although still striking, are softened as by padding. The timbre of the hand-stopped notes is veiled and suggestive of mystery; so characteristic is the timbre that passages in the Rheingold heard when the magic power of the Tarnhelm reveals itself sound meaningless if the weird chords are played by means of the valves instead of by hand-stopping. The timbre of the piston note, produced by causing a spiral to vibrate, produces a little of the character of the trombone, which is probably due to the fact that the strictly conical bore of the natural horn has been replaced by a mixed cylindrical and conical as in trumpet and trombone.

The form of the mouthpiece (g.) at the point where it joins the main bore of the tube must also exercise of course an influence on the form of vibration which it helps to modify in conjunction with the conformation of each individual horn-player's lip. In the horn the cup of the mouthpiece is shaped like a funnel, the bore converging insensibly into the narrow end of the main conical bore without break or sharp edges as in the mouthpieces, more properly known as cup-shaped, of trumpet and bombardon.

The brilliant sonorosity and roundness of the timbre of the horn are due to the strength and predominance of the partial tones belonging to the second scale, ranging from the 10th to the 16th, in which the partial tones lie very close together, determines the harsh quality of the trumpet timbre, which may be easily understood on the basis of the sound production and using a trumpet mouthpiece, and by raising the bell, an effect which is indicated by composers by the words "Raise the Bells." 1

The origin of the horn must be sought in remote prehistoric times, when, by breaking off the tip of a short animal horn, one or at best two notes, powerful, rough, unsteady, only barely approximating to definite musical sounds, were obtained. This was undoubtedly the archetypal of the modern families of brass wind instruments, and from it evolved the trumpet, the bugle and the horn. The mouthpieces which link together these widely different modern families of instruments are: (1) the more or less pronounced conical bore, and (2) the property possessed in a greater or lesser degree of producing the natural sounds by what has been termed overblowing the harmonic overtones. If we follow the evolution of the animal horn throughout the centuries, the ultimate development leads us not to the French horn but to the bugle and tube.

Before civilization had dawned in classic Greece, Egypt, Assyria and the Semitic races were using wind instruments of wood and metal which are not unlike the modern brass instruments. From the northern Europe, during the Bronze age (c. 1000 B.C.), prehistoric man had evolved for himself the prototype of the Roman cornu, a bronze horn of wide conical bore, bent in the shape of a G. One of these instruments, known among the modern Scandinavian races as lur or lurs, found in the peat beds of Denmark and now preserved in the Museum of Northern Antiquities in Copenhagen, has a length of 1-91 m. (about 6 ft. 4 in.). The U-shape mouthpiece joint is nearly parallel to the main bore, and the position of the mouth is against the long of the red bronze ring; the bell, which must have rested on the shoulder, consists merely of a flat rim set round the end of the tube. There is also reported on the bell, by Victor Mahillon of Brussels, an exact facsimile of this prehistoric horn has been made by Victor Mahillon of Brussels, who finds that it was in the key of E and easily produces the first eight harmonics of that key. It stands, therefore, an octave higher than the modern horn in E (which measures some 13 ft.), but within the range of the fundamental E₁ can be reached owing to the wider calibre of the bore. 2

Among the Romans the wind instruments derived from the horn were well represented, and included well-developed types which do not differ materially from the modern cornet. The modern cornet was in fact an innovation of the 18th century, produced by a combination of the 20th-century horn, and includes through all the changes in form and locality to the one type, and still remains at the present day in the German Posse (trombone). There were four instruments known by the name of cornu mentioned in the Romans: (1) the short animal horn used by shepherds; (2) the longer, semicircular horn, used for signals; and (3) the still longer cornu, bent and carried like the buccina, which had the wide bore, and -cone, and was the chief Roman cornet. Modern harmonics were easily obtained on the cornu the natural scale consisted of the first eight harmonics only. The cornu, although shorter than the buccina, had a deeper pitch and more sonorous tone, for, owing to the wider calibre of the bore, the fundamental was easily reached. In the reliefs on Trajan's Column, where the two instruments may be compared, the wider curve of the buccina forms a ready means of identification. In addition to these was (4) the small single slide cornet, which figures as service badge in many British infantry regiments, such as the first battalion of the King's Own Light Infantry. A terra-cotta model, slightly broken, found at Pompeii (Fig. 7), represents a single spiral cornet with an oval cross-section, and is at present preserved in the department of Greek and Roman antiquities at the British Museum, having been acquired from the Countess of M. M. 3

The litus, or cavalry trumpet of the Romans, consisted of a cylindrical tube, to which was attached a bent horn or conical bell, the whole in the shape of a D. The long, straight Roman tuba was similar to the large, bent cornet, so far as bore and capabilities were concerned, but more unwieldy. All these wind instruments seem to have been used during the classic Greek and Roman periods merely to sound fanfares, and therefore, in spite of the high degree of perfection to which they attained as instruments, they scarcely possess any claim to be considered within the domain of music. They were signalling instruments, mainly used in war, in hunting, or in processions, so that they fall outside the ordinary sphere of musical interest, and are merely mentioned for the sake of completeness.

All three Roman instruments, the tuba, the buccina and the cornu, had well-formed mouthpieces, differing but little from the modern cup-shaped form in use on the trumpet, the trombone, the tuba, &c. 2 It would seem that even the short horn in the 4

century was provided with a mouthpiece; judging from a carved specimen on an ivory capsa or pyx dated from the period immediately preceding the fall of the Roman Empire, preserved among the precious relics at Xanten.

After the fall of the Roman Empire, when instrumental music had fallen into disrepute and had been placed under a ban by the church, hunting-horn models, were carved. The 14th-century hybrid instruments, indicated, were made in Leipzig, and described by Turbevile's Noble Arte of Venerie (1576), facsimile reprint, Oxford, 1908). The following is a measure of blowing according to the order which is observed in this country of England. They are given here for D. One of these, given in fig. 3, is the English 16th-century hunting call, corresponding to the 14th-century French Cornue de chasse de veue given above.

In the first poem is given a list of these signs with the names by which they were known in venery.

In the 16th century in England the hunting-horn sometimes had a spiral turn in the centre, half-way between mouthpiece and bell end, the extra length being apparently added solely in order to lower the pitch, the higher harmonics not being used for the hunting calls. It was characteristic of Turbevile's Noble Arte of Venerie (1576), facsimile reprint, Oxford, 1908). The following is a measure of blowing according to the order which is observed in this country of England.

4 Le Trésor de vénérier par Ihardouin, seigneur de Fontaines-Guitrin (edited by H. Michelant, Metz, 1866), the first part was edited by Jérome Fichon (Paris, 1855), with an historical introduction by J. M. de Toulmon.

HORN

arms of the city of Frankfort-on-Main. In the two opposite corners are two cherubs playing immense cornus. The bore of the instrument is not necessarily cylindrical and the accoutrement of the circle formed is of a diameter sufficiently large to accommodate the youthful performer in a sitting posture; the bell is the fore-runner of that of the modern saxophone, shaped like a globule; the coil or the winding of the tube, with the exception of the two examples is attempts to reproduce the classic instrument, but the figures of the musicians and the feeling of the whole scheme of ornamentation seem to render such an explanation improbable. Moreover, Sebastian Virdung, writing on musicum praecedentium, tells that in the beginning of the 16th century, there was a drawing of a cornet coiled round tightly, the tubing being probably soldered together at certain points. Virdung calls this instrument a Jägerhorn, and the short hunting-horn (Ackerhorn—Ackerhorn—the synonym of the modern Waldhorn). The scale of the former could have consisted of only the first eight harmonics, including the fundamental, which would be easily obtained on an instrument of such caliber. Memmense, a century and a quarter later, gives a drawing of the same kind of horn among his cors de chasse, but does not in his description display his customary intimate knowledge of his subject; it may be that he was dealing at this juncture with an instrument of which he had had little practical experience. Praetorius gives as Jägerhorn only the simple forms of crescent-shaped horns with a single spiral, the spirally-wound horn of Virdung is replaced by a new instrument—the Jägertrumpet (huntsman’s trumpet)—of the same form, but less cumbersome, of cylindrical bore excepting at the bell end and having a crook inserted between the mouthpiece and the main coils. The tube, which could not have been less than 8 ft. long, probably projected from the breast of the cavalier to the 3rd or 12th. The restrictions placed upon the use of the cavalry trumpet would have rendered it unavailable for use in the hunting-field, as it was a snake-shaped metal coiled into a spiral in accordance with the decided importance of the horn, although inferior in resonance to the cavalry model. Here then are the materials for the fusion of the trumpet and hunting-horn into the nature-or wind-horn of the 17th and 18th centuries. There is evidence, however, that a century earlier, i.e. at the end of the 15th century, the art of bending a brass tube of the delicate proportions of the French horn, which is still a test of fine workmanship, had been successfully practised. In an illustrated copy of Virgil’s works published in Strassburg in 1502 and emanating from Grünling’s office, Brant being responsible for the illustrations, the lines (Aen. viii. 1-2) ‘Ut beli signum Laurentius Turnus ab arce Euboeae in coro et destincto corpore cantare possit et item iussus est in ordinem of two soldiers, one with the sackbut (posamine, the descendant of the buccina), the other with a horn wound spirally round his body in three coils, which appear to have a conical bore from the funnel-shaped mouthpiece to the bell which extends at the back of the head horizontally over the left shoulder (fig. 6). There is ample room for the performer’s head and shoulders to pass through the circle; the length of the tube could not therefore have been much less than 16 ft. long, equivalent to the horn in C or Bb basso. In the first book (vol. i. of Virgil’s Works) drawn in the latter is a small (horns, smaller, differing slightly in the disposition of the coils and held like the modern horn in front. These horns were not used for hunting but for war in conjunction with the draw-trumpet. Brant could not have imagined these instruments, and must have seen the originals or at least drawings of them. He says that the Bursa horns were generally emanated from the famous workshops of Nuremberg, being intended mainly for use in Italy, and had not been generally adopted in France before his death in 1514. The significance of such a horn in a German work of the dawn of the 16th century will not be lost. It disposes once and for all of the oft-repeated fable that the hunting-horn first assumed its present form in France about 1600, a statement accepted without question by authorities of all countries, but without reference to any pièce justificative other than the story of the Bohemian Count Sóprüken first quoted by Gerber, and repeated in most musical works without the slightest attempt at verification. This statement had been published in 1782 in a book by Faustinus Prochaska: ‘Vix Parisius infasidau cornua venatoria ars quum delectatus aciamque in omnem conscientiam perennis obnoxiis id principium apud nos ari, qua hodie Boehmich excellent putantur.’ In a preceding passage after the count’s name, Franz Anton, Graf von Sóprüken, are the words: ‘anno sacculi superioris Parisii, et ab hac temporis praecepto &c.’ There is no reference here to the invention of the horn in Paris or to the folding of the tube spirally, but only to the manner of eliciting sound from the instrument. Count Sóprüken, accustomed to the medieval hunting fanfares in which the tone of the horn approximated to the brane of the trumpet, was merely struck by the musical quality of the true horn tone elicited in Paris, and gave France the cutting-horn. The writer considers this horn probably more proper to be so-called, than the horn on which he is writing. The account published by Prochaska a hundred years after, without reference to the source from which it was obtained, finds no corroboration from French sources. Had the French horn been in common use in the hunting-horn at the end of the 17th century, transforming it from the primitive instrument into an orchestral instrument, it would only be reasonable to expect to find some evidence of this, considering the importance attached to the art of music at the court of Louis XIV., whose musical establishments, the Chapelle Musicale, the Chapelle de la Chambre du Roi and the Musique de la Grande Ecurie, included the most brilliant French artists. One would expect to find horns of the same character during the last half of the 17th century in musical instruments in the museums of Europe. This does not seem to be the case. Moreover, in Diderot and d’Alembert’s Encyclopédie (1767) the entry on the horn given to the public in 1760 the cor de chasse grand et petit is very vague, and contains no hint of any special merit due to France for any improvement in construction. Among the plates (vol. v., pl. vii.) is given an illustration of a horn very similar to the instrument made in France in the year 1639, and with a funnel-shaped mouthpiece. Dr. Julius Rühlmann states that there are two horns by Raoux, bearing the date 1703 in the Bavarian National Museum in Munich, but although fine examples, one in silver, the other in brass (fig. 6) by Raoux, they turn out on inquiry to bear no date whatever, Rühlmann’s statement in the same article, that in the arms of the family of Wertenberg-Kolb (now extinct), which goes back to 1169, there is a hunting-horn, coiled round in a complete circle is also misleading.

5 See Communication from Dr. Georg Hagen, assistant director.
The horn (a post horn) did not appear in the arms of the family in question until 1699, when the first poet Casimir Johann Friedrich was created hereditary Post-Master. The following statements in the work of noted writers is far-reaching. Inquiries at the department of the French National Archives in Paris concerning Raoux, the founder of the after- wards famous firm of horn-makers whose concern with pistons is used in the British military bands and at Keilholz, the horn factory have improved fruitless. Féte states that he worked during the second half of the 18th century, Albert Chouquet states that he has seen a trumpet by Raoux, "seul ordinaire du Roy, Place du Louvre" dated 1695. The inscriptions on the horns in question are: For No. 105, a silver horn of the simplest form of construction in D, "Fait à Paris par Raoux" for No. 106, a brass horn engraved with a crown on an ermine mantle with the initials C. A. (Car. Albert). "Fait à Paris par Raoux, seul ordinaire du Roy, Place du Louvre." Both horns measure across the coils 29 cm and across the bell 27 cm. They are practically the same as the cors de chasse now in use in French and Belgian military bands, the large diameter of the coil enabling the performer to carry it over his shoulder. The orchestral horn was given a narrower diameter in order to facilitate its being held in front of the performer in a convenient position for stopping the bell with the right hand. No. 107 in the same collection, a horn of German construction, bears the inscription "Philipp Jacob Schmidt in Nürnberg" and the trademark " J. S. " with a bird. A horn in Ex of French make, having flour-de-lys stamped on the rim of the bell, and measuring only 15 in. across the exterior edge of the bell—therefore a very small horn—is preserved in the Grand Ducal Museum at Darmstadt. A horn in F (probably F in modern high pitch), having the rim ornamented as above and the inscription "Fait à Paris, Carlin, ordinaire du Roy," readily gives the harmonics from the 3rd to the 12th. The extreme width is 20 in. Carlin, who lived at rue Croix des Petits Champs, died about 1780. The earliest dated horn extant is believed to be the one preserved in the Hohenzollern Museum in Sigmaringen, "Maximilian Wilhelm Haas, Nürnberg, 1688." Another early German horn engraved "Machts Heinr. Rich. Pleiffer in Leipzig, 1697," formerly in the Paul der Welt museum in Leipzig and later transferred with the rest of the collection to Cologne, is of similar construction.

The horn must have been well known at this time in England, for there are 17th-century horns of English manufacture still extant, one, for instance, in the collection of Rev. F. W. Galpin by William Bull, dated 1699. In 1701 Clagett invented a contrivance by means of which two horns in different keys could be coupled and played by means of one mouthpiece, a valve or key opening the passage into the airways of one or the other of these horns at the will of the performer. Another horn of English manufacture about 1700 was exhibited at the South Kensington Museum in 1872, bearing No. 337 in the catalogue, in which unfortunately no details are given. Enough examples have been quoted to show that, judging from the specimens extant, Germany was not behind France, if not actually ahead, in the manufacture of French horns. Data are wanting concerning the instruments of Italy; they would probably prove to be the earliest of all, and as brass wind instruments are perishable are perhaps for that very reason unrepresented at the present time.

The horn at the present stage in its evolution was also well represented among the illustrations of the musical literature in print during the first half of the 18th century, and references to them are frequent.

The earliest orchestral music for the horn occurs in the operas of Cavalli and Cesti, leaders of the Venetian Opera in the 17th century. Among the first to mention the scoring in C clefs on the first, second, third and fourth lines shows, by the use of the note 5/4, the 5th harmonic of the series, that the fundamental could have been no other than the 16-ft. C; the highest note in the treble part is 3/8, the 12th harmonic of the 8-ft.

A horn in C now obsolete. It is clear therefore that horns with tubing respectively 8 ft. and 16 ft. long, which must have been disposed in coils as in the present day, were in use in Italy before the middle of the 17th century, fifty years before the date of their reputed invention in Paris.

In the same opera, act i, sc. 4, "Coro di Cavallieri" is a stirring call to arms in series of elements and at the same time, "All'armi, o la guerrieri corni e tamburi e trombe, ogni campo ogni canto, armi ribombe." There are above the voice parts four horns in treble and in the same key. The writer states that no instruments, indicated by the music written thereon, which alternates with the voices but does not accompany them, have been intended for no instruments but trumpets and horns, but carrying out the indications in the text. The horn is here once again put to the same use as the Roman cornu, and associated in like manner with the descendant of the buccina in a call to arms. It may be purely a coincidence that the early illustration of a horn with the tubing wound in coils round the body in the Strasbourg Virgil mentioned above was put to the same use and associated with the same instrument.

Cavalli likewise contain many passages evidently intended for the horn, although the instruments are not specified in the score, which was nothing unusual at the time. Lulli composed the incidental music for a ballet, La Princesse d'Elide, which formed part of Molière's divertissement, "Les plaisirs d'île enchantées," written for a great festival at Versailles on the 7th of May 1664. A copy of the music for this ballet, made about 1680, is preserved in the library of the Fitzwilliam Museum, Cambridge. The music contains a piece entitled "Les violons et les cors de chasse," written in the same style as Cavalli's scene; there are but two staves, and on both the music is characteristic of the horn, with which the violins would play in unison. The piece finishes on B♭ and to play this note as the second of the harmonic series, the fundamental not being obtainable, the tube of the horn must have been over 17 ft. long. Among Philidor's copies of Lulli's ballets preserved in the library of the Paris Conservatoire of Music (vol. 1700) is a music of Lulli's in C for a horn with an inscription number is "Air des valets de chiens et des chasseurs avec les cors de chasse," which is substantially the same as the one in the Fitzwilliam Museum, but set for five horns in B♭. Here again the use of D, the fifth note of the harmonic series, indicates that the fundamental was a tone lower than the C horn scored for by Cavalli, and known as B♭ basso. Victor Mahillon considers that the music reveals the fact that it was written for horns in B♭, 35 degrees (chromatic semitones) above 32 ft. C, or having a wave-length of 1,475 m. To this statement it is not possible to subscribe. The quintette required four horns in B♭ over 8 ft. long and one B♭ basso about 17 ft. long. It is obvious that the present custom of placing the bass notes of the horn on the
HORN

F clef an octave too low, as is now customary, had not yet been adopted, for in that case the bass horn would in several bars be placed too high above the treble. In 1647 Cardinal Mazarin, wishing to create in France a taste for Italian opera, had procured from Italy an orchestra, singers and mise-en-scène. That he was not entirely successful in making Paris appreciate Italian music is borne out by the fact that within a few years he became instead a demand for French opera, to which Lulli proved equal. The remarkable similarity in the style of the horn scène by Cavalli and Lulli may perhaps provide a clue to the mysterious and sudden aggrandizement of the instrument. In the last quarter of the 17th century it was known as a of the hybrid instrument thirty years before, when Mersenne wrote his careful treatise on musical instruments.

The orchestral horn had been introduced from Italy. It is not difficult to understand how the horns came to be called the French horn in England; the term only appears after Gerber and other writers had repeated the story of Count Spörklen introducing the musical instrument into the Hamburg opera in 1705, which was by the first horn-orchestra established in Paris a hundred years, had won for itself full recognition of its high standard of workmanship in the making of horns. This use of the horn by Lulli in the one scene seems to be an isolated instance; no other has yet been quoted. The introduction of the natural horn into the orchestra of the French opera did not occur until much later in 1735 in André Campra's Achille et Deidamie, and then only in a fanfare. In the meantime the horn had already won a place in most of the rising opera houses and duet orchestras of Germany, and had been introduced by Handel into the orchestra in London in his Water-music composed in honour of the Queen.

Although the Italians were undoubtedly the first to introduce the horn into the orchestra, it figured at first only as the characteristic instrument of the chase, suggesting and accompanying hunting scenes or dramatic episodes of the same kind. In the orchestra we must turn to Germany. Reinhard Keiser, the founder of German opera, at the end of the 17th century in Hamburg, introduced two horns in C into the opening chorus of his opera Oedipus in 1705, where the horns are added to the string quartet and the oboes; they play again in act i. sc. 3, and in act ii. sc. 6 and 9. The compass used by the composer for the horns in C alto is the following:

Wilhelm Kleefeld (Gerber's horn-player) attracts attention in the application, which differed in the three acts. In Henrico (1711), in Diemara (1712) and in L'Innangia Fodile (1714) F horns were used. This called forth from Mattheson his much-quoted eulogy, the earliest description of the orchestral horn. The lieblich pompeisen Waldhörner sind bei itziger Zeit sehr en vogue kommen, weil sie therls nicht so rude von Natur sind als die Trompeten, teils auch weil sie mit mehr Fäciit können trachtiret werden. Die brauchbarsten haben F und G, auf welchen dem der Ton so beherrschet und auch dicker und flüllen besser aus als die überentübende und schreyende Clarinen, weil sie um eine ganze quinte tieher stehen." Lotti in his Giro in Argo, given in Dresden, 1717, scored for two horns, which are there used in a more skillful manner (act ii. sc. 1). Examples of C. H. Graun's scoring for horns in F and G respectively in Polydorus (1728-1729) and in Iphigenia (1731) show the complete emancipation of the instrument from its original function and denote the extra-ordinary and expanded means to which it is brought by the composers to enrich the harmony and emphasize the rhythm. A comparison of the early scores of Cavalli and Lulli with those of Handel's Wasser-fahrtsmusik (1717) and of Radamisto, performed in London in 1720,

1 Mersenne's drawings of cors de chasse are very crude; they have no bell and are all of the large calibre suggestive of the primitive animal horn. He mentions nevertheless that they were not only used for signals and fanfares but also for little concerted pieces in parts for horns alone, or with oboes, at the conclusion of the hunt.

shows the rapid progress made by the horn, even at a time when its technique was still necessarily imperfect. Although the first horn of the prince of Anhalt-Cöthen's orchestra (1717-1723), it is probable that horns in several keys were used. In Dresden two Bohemian horn-players, Johann Adalbert Fischer and Franz Adam Samm, were added to the court orchestra in 1714. In Vienna the addition is stated to have taken place in 1712 at the opera. It is probable that as in Paris so in Vienna there were solitary instances in which the horn was heard in opera without attracting the attention of musicians long before Wimmer. In 1686, Poncet the court trumpeter of Dresden, in 1667 and 1668 and performed for the wedding ceremonies of Kaiser Leopold and Margareta, infanta of Spain. A horn in F (former F pitch) in the museum of the old conservatoire bears the inscription "Machts Michael Leichhardt, der Hornspieler zu Dresden, 1716". Fürstenau gives a further list of operas in Vienna during the first two decades of the 18th century.

In the 18th century, the stage in the evolution is approached to consider the compass of the natural horn. The pedal octave from the fundamental to the 2nd harmonic was altogether wanting; the next octave contained only the 2nd and 3rd harmonics or the octave and its fifth; in the third octave, the 5ve, its major 3rd, 5th and minor 7th; in the fourth octave, a diatonic scale with a few accidentals was possible. It will be seen that the compass was very limited on any individual horn, but by grouping horns in different keys, or by changing the crooks, command was gained by the composer over a larger number of open notes.

An important period in the development of the horn has now been reached. Anton Joseph Hampel came into the world with the innovation of adapting the crooks to the middle of the body of the horn instead of near the mouthpiece, which greatly improved the quality of the notes obtained by means of the crooks. The invention of this comma followed in the wake of the first harmonics which also is attributed to Haltenhof of Hanau. Others again mention Michael Wögel of Carlsruhe and Rastadt, probably confusing his adaptation of the Invention or Machine, as the slide contrivance was called in Germany, to the tromper in 1789. The Inventions-horn, although embodying an important principle which has also found its application in all brass wind instruments with valves as a means of correcting defective intonation, did not add to the compass of the horn. At this date Hampel is the only horn-player whose compass exceeds the compass of the natural horn.

By hand-stopping (Fr. sons bouchés, Ger. gestopfte Töne) is understood the practice of inserting the hand with palm outward and stretched out.

8 See Moritz Fürstenau, op. cit. ii. 58.

12 The Department of State Records for Saxony in Dresden possessed a document, the Invention in Alphabete von dem Horn, which indicates the compass of the horn-player, through the courtesy of the director, the following facts have been communicated. Two documents concerning Anton Joseph Hampel are extant: (1) An application by his son, Johann Michael Wimmer, a brass instrument-maker of Dresden, printed in Mitteilungen der Gesellschaft der Künste in Dresden, April 3, 1771, in which he prays that the post of his father as horn-player in the court orchestra—in which he had already served as deputy for his invalid father—may be awarded to him; (2) A petition from the widow, Aloisia Ludewica Hampelin, to the elector, bearing the same date (April 3, 1771), wherein she announces the death of her husband on the 30th of March 1771, who had been in service of the horn-player for twenty-four years as horn-player, and prays for the grant of a monthly pension for herself and her three delicate daughters, as she finds herself in the most unfortunate circumstances. There is no allusion in either letter to any member of the family of the horn-player.

13 There is an instrument of this early type, supposed to date from the middle of the 18th century, in Paul de Witte's fine collection of musical instruments formerly in Leipzig and now transferred to Cologne; see Catalog., No. 645, p. 141.

14 See Dictionnaire de l'acad. des beaux art (iv., (Paris), article "Cor.

15 See Dr Gustav Schilling, Universal Lexikon der Tonkunst (Stuttgart, 1840), Bd. vi., " Trompette;" also Capt. C. R. Day, pp. 139 and 151, where the term Invention is quite misunderstood and misapplied. See Gottfried Weber in Caecilia (Mainz, 1833), Bd. iv. p. 65.

16 Gerber in the first edition of his Lexikon does not mention Hampel or award him a separate biographical article; we may therefore conclude that he was not personally acquainted with him, although Hampel was the principal or the sole player of the cornet-horn in the orchestra in Dresden during Gerber's short career in Leipzig. In the edition of 1812 Gerber renders him full justice.
fingers drawn together, forming a long, shallow cup, into the bell of the horn; the effect is similar to that produced in wood wind instruments by a well-rounded, bell-shaped mouthpiece. A single note is produced by a closed, open, or partly open mouth, the open mouth giving the tone.

The complete school of horn-playing by the Kgl. Polnischen u. Kursächs. Cammermusik Antoan Joseph Hampel, a celebrated virtuoso, invented by himself in 1762.1 Judging from the standard of modern technique, there are many passages in the "Lectio" which could not be played without artificially humouring the production of harmonics with the lips, and it is an open question to which purpose this method was given. It is, however, certain that the pitch was practised in the 18th century. When, therefore, Franz Schubert states that the method was invented by Hampel, we may suppose it was indirectly through his pupil. Confirmation is obtained from the text of a work on the horn written by Heinrich Dommich in 1760, the son of a celebrated horn-player of Wurtzburg contemporary with Hampel. Dommich further explains that Hampel, who had practised the "bouché" notes in his youth, only made use of them in slow music, and that he applied them to the horn in a different manner. Due to his pupil Giovanni Punto (Joh. Stich) the celebrated horn virtuoso, who was a friend of Dommich's. It may be well to draw attention to the fact that hand-stopping was not accessible so long as the bell of horn was folded in a circle wide enough to be worn round the body. The reduction of the diameter of the orchestral horn in order to allow the performer to hold it in a convenient position, and making the bell of the instrument a fixed right arm in a convenient position for hand-stopping, must have preceded the discovery of hand-stopping. In the absence of contrary evidence we may suppose that the change was effected for the convenience of the performer and made by the horn-maker. Dommich's "Inventions." So radical a change in the compass of the horn could not occur and be adopted generally without leaving its mark on the horn of which the change does not occur, as far as we know, before the last decades of the 18th century. The rapid acceptance in other countries of Hampel's discovery of hand-stopping is evidenced by a passage from a little English work on music, published in London in 1772, but bearing at the end of the preface the date June 1766:2 "Some eminent Proficients have been so dexterous as very nearly to perform all the defective notes of the scale on the Horn by management of Breath and by a little stopping the bell with their fingers." Hampel's success gave a general impetus to the inventive faculty of musical instrument makers in Europe. At first the result was not uniform. Köböl, a Bohemian horn virtuoso at the imperial Russian court from 1754, spent many years in vain endeavours to improve his instrument. At last, in 1760, he applied keys to his horn or, better, substituted upon the slide of the bell of the horn, which is known in Germany as Signal or Buglehorn. Köböl's experiment did not become widely known or adopted during his lifetime, but Anton Weidlinger, court trumpeter at Vienna, made a key-trompet in 1801, which attracted attention in musical circles and gave a fresh impetus in experimenting with keys upon brass instruments. In 1813 Joseph Weidlinger, the twelve-year-old son of the above, gave a concert in Vienna on the Klangbochhorn 3 (or key trumpet with the slide), about which little seems to be known. Victor Mahillon 4 describes such an instrument, but ascribes the invention to Köböl; but it was not key-trompete, which on being opened had the effect of raising the pitch of the instrument a whole tone. By alternately using the harmonic open notes on the normal length of the tube, and then by the action of the key shortening the air passage, the following diatonic scale was obtained in the third octave:

XIII. 23
HORNBEEAM—HORNBILL

In 1812 Dikkhuth, 1 horn-player in the orchestra of the grand-duke of Baden at Mannheim, constructed a horn in which a slide on the principle of that of the trombone was intended, with hand-stopping and to lower the pitch at will a semitone. The most felicitous, far-reaching, and impressive effect was the invention of valves (q.v.), pistons or cylinders (the principle of which has already been explained), by Heinrich Stölzel, 2 who applied them first of all to the horn, the trumpet and the trombone, 3 thus endowing the brass wind with a chromatic compass obtained with such perfect ease throughout the compass. The inherent defect of valve instruments already explained, which causes faulty intonation needing correction when the pistons are used in combination, has now been practically overcome. The numerous

Fig. 8.—Modern Horn (Boosey & Co.) attempts to solve the difficulty, made with varying success by makers of brass instruments, are described under CORNET, BOMBARDON, and CORNET. 4

HORNBEEAM (Carpinus betulus), a member of a small genus of trees of the natural order Corylaceae. The Latin name Carpinus has been thought to be derived from the Celtic car, wood, and pin or pen, head, the wood of hornbeams having been used for yokes of cattle (see Loudon, Ency. of Pl. p. 792, new ed. 1835, and Littré, Dict. ii. 556). The common hornbeam, or yoke-elm, Carpinus betulus (Ger. Hornbaum and Hornbuche, Fr. charme), is indigenous in the temperate parts of western Asia and of Asia Minor, and in Europe, where it ranges as high as 55° and 56° N. lat. It is common in woods and hedges in the north of England and of the south of England. The trunk is usually flattened, and twisted as though composed of several stems united; the bark is smooth and light grey; and the leaves are in two rows, 2 to 3 in. long, elliptic-ovate, doubly toothed, pointed, numerous ribbed, hairy below and opaque, and not glossy as in the beech, have short stalks and when young are plaited. The stipules of the leaves act as protecting scale-leaves in the winter-bud and fall when the bud opens in spring. The flowers appear with the leaves in April and May. The male catkins are about 1.5 in. long, and have pale-yellow anthers, bearing tufts of hairs at the apex; the female attain a length in the fruiting stage of 2 in., with bracts 1 to 1.5 in. long, and of "nut" ripens in October; it is about 1/2 in. in length, is in shape like a small chestnut, and is enclosed in leafy, 3-lobed bracts. The hornbeam thrives well on stilly, clayey, moist soils, into which its roots penetrate deeply; on chalk or gravel it does not flourish. Raised from seed it may become a tree 40 to as much as 70 ft. in height, greatly resembling the beech, except

1 See the description of the instrument and of other attempts to obtain the same result by Gottfried Weber, "Wichtige Ver- besserung des Horns" in Allg. musik. Ztg., 1815, p. 735, &c.; also, 1815, pp. 637 and 638 (the regent or keyed bugle).

2 See Allg. musik. Ztg., 1815, May, p. 209, the first announcement of the invention in a paragraph by Captain G. B. Bierer, in ibid., 1817, p. 214, by F. Schneider, and Dec. 1558; 1816, p. 531. An announcement of the invention and of a patent granted for the same for ten years, in which Blimm is for the first time associated with Stölzel as co-inventor. See also Caecilia (Mainz, 1815), lbd. xlvi. 73 seq., with illustrations, an excellent article by Gottfried Weber on the valve horn and valve trumpet.

4 In its rounder and closer head. It is, however, rarely grown as a timber-tree, its chief employment being for hedges. "In the single row," says Evelyn (Sylva, p. 1694), "it makes the noblest and the stateliest hedges for long Walks in Gardens or Parks, of any Tree whatsoever whose leaves are deciduous." As it bears clipping well, it was formerly much used in geometric gardening. The branches should not be lopped in spring, on account of their tendency to bleed at that season. The wood of the hornbeam is white and close-grained, and polishes ill, is of considerable tenacity and little flexibility, and is extremely tough and hard to work—whence, according to Gerard, the name of the tree. It has been found to lose about 8% of its weight by drying. As a fuel it is excellent; and its charcoal is much esteemed for making gunpowder. The inner part of the bark of the hornbeam is stated by Linnaeus to afford a yellow dye. In France the leaves serve as fodder. The tree is a favourite with hares and rabbits, and the seedlings are apt to be destroyed by mice. Pliny (Nat. Hist. xxvi. 26), who describes its wood as red and easily split, classes the hornbeam with maples.

The American hornbeam, blue or water beech, is Carpinus americana (also known as C. caroliniana); the common hornbeam, a native of the south of Europe, is a member of a larger genus, Carpinus vulgaris, and C. virginiana, the allied American species, is also known as ironwood from its very hard, tight, close-grained wood.

HORNBILL, the English name long generally given to all the birds of the family Bucerotidae of modern ornithologists, from the extraordinary horn-like excrescence (epithema) developed on the bill of most of the species, though to which of them it was first applied seems doubtful. Among classical authors Pliny had heard of such animals, and mentions them (Hist. Nat. lib. x. cap. lxx.) under the name of Tragpeon; but he deemed their existence fabulous, comparing them with Pegasi and Gryphones—in the words of Holland, his translator (vol. i. p. 100)."I think the same of the tragopanes, which many men affirm to be greater than the Aigle; having crooked horns like a Ram on either side of the head, of the colour of yron, and the head only red." Yet this is but an exaggerated description of some of the species with which doubtless his informants had an imperfect acquaintance. Medieval writers found Pliny's bird to be no fable, for specimens of the beak of one species or another seem occasionally to have been brought to Europe, where they were preserved in the cabinets of the curious, and thus Aldrovandus was able to describe pretty fairly to and figure (Ornithologia, lib. zii. cap. xx. tab. x. fig. 7) one of them under the name of "Tragopan," though the rest of the bird was wholly unknown to him. When the discovery of the East Indies had extended farther, more examples reached Europe, and the "Corvus Indicus cornutus" of Bonnitsch became fully recognized by Willughby and Ray, under the title of the "Horned Indian Raven or Topau called the Rhinocerot Bird." Since the time of those excellent ornithologists our knowledge of the hornbills has been steadily increasing, but up to the third quarter of the 19th century there was a great lack of precise information, and the publication of D. G. Elliot's "Monograph of the Bucerotidae," then supplied a great want. He divides the family into two sections, the Bucerotinae and the Ceratopinae. The latter contains 20 (of which 14 are) genera, which are divided into many genera. Of these, the most remarkable is Rhinoceros, which seems properly to contain but one species, the Buceros virgili, B. scutatus or B. geleotus of authors, commonly known as the helmet-hornbill, a native of Sumatra and Borneo. This is easily distinguished by having the front of its nearly vertical and slightly convex epithema composed of a solid mass of horn 4 instead of a thin coating of the light

5 Apparently correlated with this structure is the curious thickening of the prosencephalic median septum 6 of the cranium as also of that which divides the prosencephalon 7 from the "mesencephalic chamber," noticed by Sir R. Owen (Cat. Osteol. Ser. Mus. Rey. Coll. Surg. England, i. 287); while the solid horny mass is further strengthened by a backing of bony props, directed forwards and meeting its base at right angles. This last singular arrangement is not perceived in the skull of any other species examined by the present writer.
and cellular structure found in the others. So dense and hard is this portion of the "helmet" that Chinese and Malay artists carve figures on its surface, or cut it transversely into plates, which from their agreeable colouring, bright yellow with a scarlet rim, are worn as brooches or other ornaments. This bird, which is larger than a raven, is also remarkable for its long graduated tail, having the middle two feathers nearly twice the length of the rest. Nothing is known of its habits. Its head was figured by George Edwards in the 18th century, but little else had been seen of it until 1801, when John Latham described the plumage from a specimen in the British Museum, and the first figure of the whole bird, from an example in the Museum at Calcutta, was published by General Hardwicke in 1823 (Trans. Linn. Society, xiv. pl. 23). Yet more than twenty years elapsed before French naturalists became acquainted with it.

In the Bucerotinae we have only the genus Bucorius, or Bucorax as some call it, confined to Africa, and containing at least two and perhaps more species, distinguishable by their longer legs and shorter toes, the ground-hornbills of English writers, in contrast to the Bucorinae which are chiefly arboreal in their habits, and when not flying move by short leaps or hops, while the members of this group walk and run with facility. From the days of James Bruce at least there are few African travellers who have not met with and in their narratives more or less fully described one or other of these birds, whose large size and fearless habits render them conspicuous objects.

As a whole the hornbills, of which more than 50 species have been described, form a very natural and in some respects an isolated group, being most closely related to the hoopoes (Upupidae), and this view is now generally accepted. Their supposed alliance to the toucans (Ramphastidae) rests only on the apparent similarity presented by the enormous beak, and is contradicted by important structural characters. In many of their habits, so far as these are known, all hornbills seem to be much alike, and though the modification in the form of the beak, and the presence or absence of the extraordinary excrescence, whence their name is derived, causes great diversity of aspect among them, the possession of prominent eyelashes (not a common feature in birds) produces a uniformity of expression which makes it impossible to mistake any member of the family. Hornbills are social birds, keeping in companies, not to say flocks, and living chiefly on fruits and seeds; but the bigger species also capture and devour a large number of snakes, while the smaller are great destroyers of insects. The older writers say that they eat carrion, but further evidence to that effect is required before the statement can be believed. Almost every morsel of food that is picked up is tossed into the air, and then caught in the bill before it is swallowed. They breed in holes of trees, laying large white eggs, and when the hen begins to sit the cock plasters up the entrance with mud or clay, leaving only a small window through which she receives the food he brings her during her incarceration.

This remarkable habit, almost simultaneously noticed by Dr Mason in Burma, S. R. Tickell in India, and Livingstone in Africa, and since confirmed by other observers, especially A. R. Wallace in the Malay Archipelago, has been connected with by A. D. Bartlett (Proc. Zool. Society, 1869, p. 142) with a peculiarity as remarkable, which he was the first to notice. This is the fact that hornbills at intervals of time, whether periodical or irregular is not yet known, cast the epithelial layer of their gizzard, that layer being formed by a secretion derived from the glands of the proventriculus or some other part of the alimentary canal. The epithelium is ejected in the form of a sack or bag, the mouth of which is closely folded, and is filled with the fruit that the bird has been eating. The announcement of a circumstance so extraordinary naturally caused some hesitation in its acceptance, but the essential truth of Bartlett's observations was abundantly confirmed by Sir W. H. Flower and especially by Dr J. Murie. These castings form the hen bird's food during her confinement.

Hornblende: an important member of the amphibole group of rock-forming minerals. The name is of German origin, and was used for any dark-coloured prismatic crystals from which metals could not be extracted. It is now applied to the dark-coloured aluminous members of the monoclinic amphiboles, occupying in this group the same position that augite occupies in the pyroxene group. The monoclinic crystals are prismatic in habit with a six-sided cross-section; the angle between the prism-faces (M), parallel to which there are perfect cleavages, is 55° 49'. The colour (green, brown or black) and the specific gravity (3.0-3.3) vary with the amount of iron present. The pleochroism is always strong, and the angle of optical extinction on the plane of symmetry (x in the figure) varies from 0° to 37°. The chemical composition is expressed by mixtures in varying proportions of the molecules Ca(Mg,Fe)2(SiO4)3, (Mg,Fe)(Al,Fe)2SiO4 and NaAl(SiO3). Numerous varieties have been distinguished by special names: edenite, from Edenville in New York, is a pale-coloured aluminous amphibole containing little iron; pargasite, from Pargas near Abo in Finland, a green or bluish-green variety; common hornblende includes the greenish-black and black kinds containing more iron. The dark-coloured pyroxphilitic crystals of basalts are known as basaltic hornblende.

Hornblende occurs as an essential constituent of many kinds of rocks, particularly ultrabasic and some basic igneous rocks, and in metamorphic rocks and coal measures. In metamorphic rocks, it is usually associated with other amphiboles, and is often found in schists and gneisses. In coal measures, it is often found in coal beds, and is a common constituent of some coals and coal seams. It is also found in some sedimentary rocks, such as sandstones and shales. In igneous rocks, it is often found in contact-metamorphosed areas, and is a common constituent of some granite and diorite.

1 Buffon, as was his manner, enlarges on the cruel injustice done to these birds by Newton, by referring them with this or that story, which he declares must hinder them from getting their food with ease. The only corroboration his purported view receives is afforded by the observed fact that hornbills, in captivity at any rate, never have any fat about them.

2 In The Malay Archipelago (i. 213), Wallace describes a nesting hornbill (B. bicorvis) which he obtained as "a most curious object, as large as a pigeon, but without a particle of plumage on any part of its body; one exceedingly pale and soft, and with a semi-transparent skin, so that it looked more like a bag of jelly, with head and feet stuck on, than like a real bird."
of igneous rocks, such as hornblende-granite, syenite, diorite, hornblende-andesite, basalt, &c.; and in many crystalline schists, for example, amphibolite and hornblende-schist which are composed almost entirely of this mineral. Well-crystallized specimens are met with at many localities, for example: brilliant black crystals (syntamatic) with augite and mica in the sanidine bombs of Monte Somma, Vesuvius; large crystals at Arendal in Norway, and at several places in the state of New York; isolated crystals from the basaltic of Bohemia.

(L. J. S.)

HORN-BOOK, a name originally applied to a sheet containing the letters of the alphabet, which formed a primer for the use of children. It was mounted on wood and protected with transparent horn. Sometimes the lead was simply pasted against the slice of horn. The wooden frame had a handle, and it was usually hung at the child's girdle. The sheet, which in ancient times was of vellum and latterly of paper, contained first a large cross—the criss-cross—from which the horn-book was called the Christ Cross Row, or criss-cross-row. The alphabet in large and small letters followed. The vowels then formed a line, and their combinations with the consonants were given in a tabular form. The usual exercise—" In the name of the Father and of the Son and of the Holy Ghost, Amen "—followed, then the Lord's Prayer, the whole concluding with the Roman numerals. The horn-book is mentioned in Shakespeare's "Love's Labour's Lost," Act v., where the a, e, i, o, u, and the horn, are alluded to. It is also described by Ben Jonson—"The letters may be read, through the horn, That make the story perfect."

HORNY, SIR GEOFFREY THOMAS PHIPPS (1825-1895), British admiral of the fleet, son of Admiral Sir Phipps Hornby, the first cousin and brother-in-law of the 13th earl of Derby, by a daughter of Lieut.-General Burgoyne, commonly distinguished as " Saratoga " Burgoyne, was born on the 20th of February 1825. At the age of twelve he was sent to sea in the flagship of Sir Robert Stopford, with whom he shared the capture of Acre in November 1840. He afterwards served in the flagship of Rear-Admiral Josceline Percy at the Cape of Good Hope, was flag-lieutenant to his father in the Pacific, and came home as a commander. When the Derby ministry fell in December 1852 young Hornby was promoted to be captain. Early in 1853 he married, and as the Derby connexion put him out of favour with the Aberdeen ministry, and especially with Sir James Graham, the first lord of the Admiralty, he settled down in Sussex as manager of his father's property. He had no appointment in the navy till 1858, when he was sent out to China to take command of the "Tribune" frigate and convey a body of British troops to Vancouver Island, where the dispute with the United States about the island of San Juan was threatening to become very bitter. As senior naval officer there Hornby's moderation, temper and tact did much to smooth over matters, and a temporary arrangement for joint occupation of the island was concluded. He afterwards commanded the "Neptune" in the Mediterranean under Sir William Fanshawe Martin, was flag-captain to Rear-Admiral Dacres in the Channel, was commodore of the squadron on the west coast of Africa, and, being promoted to rear-admiral in January 1869, commanded the training squadron for a couple of years. He then commanded the Channel Fleet, and was for two years a junior lord of the Admiralty. It was early in 1877 that he went out as commander-in-chief in the Mediterranean, where his skill in manoeuvring the fleet, his power as a disciplinarian, and the tact and determination with which he conducted the foreign relations at the time of the Russian advance on Constantinople, won for him the K.C.B. He returned home in 1880 with the character of being perhaps the most able commander on the active list of the navy. His later appointments were to the Royal Naval College as president, and afterwards to Portsmouth as commander-in-chief. On hanging down his flag he was appointed G.C.B., and in May 1888 was promoted to be admiral of the fleet. From 1886 he was principal naval aide-de-camp to Queen Victoria, and in that capacity, and as an admiral of the fleet, was appointed on the staff of the German emperor during his visits to England in 1889 and 1890. He died, after a short illness, on the 3rd of March 1895. By his first wife he had five sons, one of whom, a major in the artillery, won the Victoria Cross in South Africa in 1900.

HORNCastle, a market-town in the S. Lindsey or Horncastle parliamentary division of Lincolnshire, England, at the foot of a line of low hills called the Wolds, at the confluence of the Bain and Waring streams; the terminus of a branch line of the Great Northern railway, 130 m. N. from London. Pop. of urban district (1901) 4098. The church of St Mary is principally Decorated and Perpendicular, with some Early English remains and an embattled western tower. Queen Elizabeth's grammar school was founded in 1562. Other buildings are an exchange, a court-house and a dispensary founded in 1789. The prosperity of the town is chiefly dependent on agriculture and its well-known horse fairs. Brewing and malting are carried on, and there is some trade in coal and iron.

Remains have been found here which may indicate the existence of a Roman village. The manor of Horncastle (Hornecaster) belonged to Queen Edith in Saxon times and was royal demesne in 1086 and the head of a large soke. In the reign of Stephen it fell into the hands of the Norman de Camville, after the marriage of the empress Maud, and passing to the crown on her death was granted by Henry III. to Gerbald de Escald, from whom it descended to Ralph de Rhodes, who sold it to Walter Mauclere, bishop of Carlisle in 1230. The see of Carlisle retained it till the reign of Edward VI. when it was granted to Edward, Lord Clinton, but was recovered in the following reign. In 1230 Henry III. directed the men of Horncastle to render a reasonable aid to the bishop, who obtained the right to try felons, hold a court leet and have free warren. An inquisition of 1275 shows that the bishop had then, besides the return of writs, the assize of bread and ale and wafers and strays in the soke. Horncastle was a centre of the Lincolnshire rebellion of 1536. Royalist garrisons occupied the town in 1643, and were pursued through its streets after the battle fought at Winceby. It was never a municipal or parliamentary borough, but during the middle ages it was frequently the residence of the bishops of Carlisle. Its prosperity has always depended largely on its fairs, the great horse fair described by George Borrow in "Romany Rye" being granted to the bishop in 1230 for the octave of St Lawrence, together with the fair on the feast of St Barnabas. The three other fairs are apparently of later date.

George Weir, "Historical and Descriptive Sketches of the Town and Soke of Horncastle in the County of Lincoln and of Several Places adjacent" (London, 1820).

HORN DANCE, a medieval dance, still celebrated during the September "wakes" at Abbots Bromley, a village on the borders of Needwood Forest, Staffordshire. Six or seven men, each wearing a deer's skull with antlers, dance through the streets, pursued by a crowd who bes梯rides a mimic horse, and whips the dancers to keep them on the move. The horn-dance usually takes place on the Monday after Wakes Sunday, which is the Sunday next after the 4th of September. Originally the dance took place on Sunday.

HUGH GEORGE (1720-1792), English divine, was born on the 1st of November 1720, at Otham near Maidstone, and received his education at Maidstone school and University College, Oxford. In 1740 he became a fellow of Magdalen, of which college he was elected president in 1758. As a preacher he early attained great popularity, and was, albeit unjustly, accused of Methodism. His reputation was helped by several clever if somewhat wrong-headed publications, including a satirical pamphlet entitled "Theology and Philosophy of Cicero's Seminum Scipionis (1732), a defence of the Hutchinsonians in "A Fair, Candid and Impartial Case of the Settlement between Sir Isaac Newton and Mr Hallicinson (1733), and critiques upon William Law (1758) and Benjamin Kennicott (1760). In 1771 he published his well-known "Commentary on the Psalms,"

709

a series of expositions based on the Messianic idea. In 1776 he was chosen vice-chancellor of his university; in 1781 he was made dean of Canterbury, and in 1790 was raised to the see of Norwich. He died at Bath on the 17th of January 1792.

His collected Works were published with a Memoir by William Jones in 1799.

HORNE, RICHARD HENRY, or HENGIST (1803-1884), English poet and critic, was born in London on New Year's Day 1803. He was intended for the army, and entered at Sandhurst, but receiving no commission, he left his country and joined the Mexican navy. He served in the war against Spain, and underwent many adventures. Returning to England, he became a journalist, and in 1836-1837 edited The Monthly Repository. In 1837 he published two tragedies, Cosmo de Medicis and The Death of Marlowe, and in 1841 a History of Napoleon. The book, however, by which he lives is his epic of Orion, which appeared in 1843. It was published originally at a farthing, was widely read, and passed through many editions.

In the next year he set forth a volume of critical essays called A New Spirit of the Age, in which he was assisted by Elizabeth Barrett (Mrs Browning), with whom, from 1830 to her marriage in 1845, he conducted a voluminous correspondence. In 1852 he went to Australia in company with William Howitt, and did not return to England until 1856. He received a Civil List pension in 1874, and died at Margate on the 13th of March 1884. Horne possessed extraordinary versatility, but, except in the case of Orion, he never attained to the high ideal that three of distinction. That poem, indeed, has much of the quality of fine poetry; it is earnest, vivid and alive with spirit. But Horne early drove his talent too hard, and continued to write when he had little left to say. In criticism he had insight and quickness. He was one of the first to appreciate Keats and Tennyson, and he gave valuable encouragement to Mrs Browning when she was still Miss Elizabeth Barrett.

HORNE, THOMAS HARTWELL (1782-1865), English theologian and bibliographer, was born in London on the 20th of October 1782, and was educated at Christ's Hospital, with S. T. Coleridge as an elder contemporary. On leaving school he became clerk to a barrister, but showed a keen taste for authorship. As early as 1800 he published A Brief View of the Necessity and Truth of the Christian Revelation, which was followed by several minor works on very varied subjects. In 1814, having been appointed librarian of the Surrey Institution, he issued his Introduction to the Study of Bibliography. This was followed in 1818 by his long matured work, the Introduction to the Critical Study of the Holy Scriptures, which rapidly attained popularity, and secured for its author widespread fame and an honorary M.A. degree from Aberdeen. In 1819 he received ordination from William Howley, bishop of London, and after holding two smaller livings was appointed rector of the united parishes of St Edmund the King and Martyr, and St Nicolas Acons in London. On the breaking up of the Surrey Institution in 1823, he was appointed (1824) senior assistant librarian in the department of printed books in the British Museum. After the project of making a classified catalogue had been abandoned, he took part in the preparation of the alphabetical one, and his connexion with the museum continued until within a few months of his death on the 27th of January 1862.

Horne's works exceed forty in number. The Introduction, edited by John Ayre and S. F. Tregelles, reached a 12th edition in 1809; but, owing to subsequent advances in bibliographical scholarship, it fell into disuse.

HORNELL, a city of Steuben county, New York, U.S.A., on the Canisteo river, 90 m. S.E. of Buffalo. Pop. (1890) 10,966; (1900) 11,918, of whom 1250 were foreign-born; (1910 census) 15,617. Hornell is served by the Erie and the Pittsburg, Shawmut & North-West (the latter connects at Waterloo and 90 m. by rail) with the Delaware, Lackawanna & Western railroad. In the city are St Ann's Academy, the St James Mercy Hospital, the Steuben Sanitarium, a public library, and a county court-house—terms of the county court being held here as well as in Bath (pop. in 1905, 3659), the county-seat, and in Corning. Hornell has extensive car shops of the Erie railroad, and among its manufactures are silk goods (silk gloves being a specially important product), sash, doors and blinds, leather, furniture, shoes, white-goods, wire-fences, foundry and machine shop products, electric motors, and brick and tile. The value of the factory product in 1905 was $1,156,677, an increase of 30.7% since 1900. The first settlement here was made in 1790, within the district of Erwin (then in Ontario county); after 1796 it was a part of Canistieo township, and the settlement itself was known as Upper Canistieo until 1826, when a new township was formed and named Hornellsville in honour of Judge George Hornell (b. 1812). I do not possess in 1852, and in 1888 was chartered as a city; and by act of the state legislature the name was changed to Hornell in 1906.

See G. H. McMaster, History of the Settlement of Steuben County (Bath, New York, 1849).

HORNEMANN, FREDERICK (fl. 1746-1825), German traveller in Africa, was born at Hildesheim. He was a young man when, early in 1796, he offered his services to the African Association of London as an explorer in Africa. By the association he was sent to Göttingen University to study Arabic and otherwise prepare for an expedition into the unknown regions of North Africa from the east. In September 1797 he arrived in Egypt, where he continued his studies. On the invasion of the country by the French he was confined in the citadel of Cairo, to preserve him from the fanatics of the populace. Liberated by the French, he received the patronage of Bonaparte. On the 5th of July 1799, having informed himself of the ports from Mecca, attaching himself to a party of Fezzan merchants who accompanied the pilgrims. As an avowed Christian would not have been permitted to join the caravan Hornemann assumed the character of a young mameluke trading to Fezzan. He then spoke, but indifferently, both Arabic and Turkish, and he was accompanied as servant and interpreter by Joseph Frenenburg, a German convert to Islam, who had thrice made the pilgrimage to Mecca. Travelling by way of the oases of Siwa and Ajulja, a "black rocky desert" was traversed to Temissa in Fezzan. Murzuk was reached on the 17th of November 1798. Here Hornemann lived till June 1799, going thence to the city of Tripoli, whence in August of the same year he despatched his journals to London. He then returned to Murzuk. Nothing further is known with certitude concerning him or his companion. In Murzuk Hornemann had collected a great deal of trustworthy information concerning the peoples and countries of the western Sahara and central Sudan, and when he left Tripoli it was his intention to go direct to the Haura country, which region he had never to behold. "I trust," he wrote in his journal, "I hope in five years I shall be able to make the Society better acquainted with the people of whom I have given this short description." The British consul at Tripoli heard from a source believed to be trustworthy that about June 1803 Jusef (Hornemann's Mahometan name) was at Caša, i.e. Katsena, in Northern Nigeria, "in good health and highly respected as a marabout." A report reached Murzuk in 1819 that the traveller had gone to "Noofy" (Nuna), and had died there. Horne was the first European in modern times to traverse the northern part of the Sahara, and up to 1910 no other explorer had followed his route across the Jebel-es-Sudra from Ajulja to Temissa.

The original text of Hornemann's journal, which was written in German, was printed at Weimar in 1801; an English translation, Travels from Cairo to Meursouk, &c., with maps and dissertations by Major James Rennell, appeared in London in 1802. A French translation of the English work, made by order of the First Consul, was connected with the Egyptian oases by L. Langlès, was published in Paris in the following year. The French version is the most valuable of the three. Consult also the Proceedings of the African Association (1810), and the Geog. Jnl. Nov. 1906.

HORNER, FRANCIS (1775-1817), British economist, was born at Edinburgh on the 13th of August 1775. After passing through the usual courses at the high school and university of his native city, he devoted five years, the first two in England, to comprehensive but desultory study, and in 1800 was called to the Scottish bar. Desirous, however, of a wider sphere, Horner removed to London in 1802, and occupied the interval
that elapsed before his admission to the English bar in 1807 with researches in law, philosophy and political economy. In February 1866 he became one of the commissioners for adjusting the claims against the naval bar of Acre, and in November entered the House of Commons for St. Pancras, in succession for Wendover, and in 1872 for St. Mawes, in the patronage of the marquis of Buckingham. In 1872, when Lord Grenville was organizing a prospective ministry, Horner had the offer, which he refused, of a treasury secretariatship. He had resolved not to accept office till he could afford to live out of office; and his professional income, on which he depended, was at no time proportionate to his abilities. His labours at last began to tell upon a constitution never robust, and in October 1876 his physicians ordered him to Italy, where, however, he sank under his malady. He died at Pisa, on the 8th of February 1877. He was buried at Leghorn, and a marble statue by Chantray was erected to his memory in Westminster Abbey.

Without the advantages of rank, wealth, or even of genius, Francis Horner rose to a high position of public influence and private estate. His special field was political economy. Master of that subject, and exercising a sort of moral as well as intellectual influence over the House of Commons he, by his nervous and earnest rather than eloquent style of speaking, could fix his attention for hours on such dry topics as finance, and coinage, and currency. As chairman of the parliamentary committee for investigating the depreciation of bank-notes, for which he moved in 1810, he extended and confirmed his fame as a political economist by his share in the famous Bullion Report. It was chiefly through his efforts that the paper-issue of the English banks was checked, and gold and silver reinstated in their true position as circulating media; and his views on free trade and commerce have been generally accepted at their really high value. Horner was one of the promoters of the Edinburgh Review in 1802. His articles in the early numbers of that publication, chiefly on political economy, form his only literary legacy.

See Memoirs and Correspondence of Francis Horner, M.P., published by his brother (see below) in 1843. Also the Edinburgh and Quarterly Reviews for the same year; and Blackwood's Magazine, vol. i.

HORNER, LEONARD (1783–1864), Scottish geologist, brother of Francis Horner (above), was born in Edinburgh on the 17th of January 1783. His father, John Horner, was a linen merchant in Edinburgh, and Leonard, the third and youngest son, entered the university of Edinburgh in 1799. There in the course of the next four years he studied chemistry and mineralogy, and gained a love of geology from Playfair's Illustrations of the Huttonian Theory. At the age of nineteen he became a partner in a branch of his father's business, and went to London. In 1808 he joined the newly formed Geological Society and two years later was elected one of the secretaries. Throughout his long life he was ardently devoted to the welfare of the society; he was elected president in 1846 and again in 1860. In 1811 he read his first paper "On the Mineralogy of the Malvern Hills" (Trans. Geol. Soc. vol. i.) and subsequently communicated other papers on the "Brine-springs at Droitwich," and the "Geology of the S.W. part of Somersetshire." He was elected F.R.S., in 1813. In 1815 he returned to Edinburgh to take personal superintendence of his business, and while there (1821) he was instrumental in founding the Edinburgh School of Arts for the instruction of mechanics, and he was one of the founders of the Edinburgh Academy. In 1827 he was invited to London to become a warder of the London University, an office which he held six years; he then resided at Bath for two years, and pursued the study of minerals and rocks, communicating to the Geological Society he on his return a paper on the "Geology of the Environs of Bonn," and another "On the Quantity of Solid Matter suspended in the Water of the Rhine." In 1833 he was appointed one of the commissioners to inquire into the employment of children in the factories of Great Britain, and he was subsequently selected as one of the inspectors. In later years he devoted much attention to the geological history of the alluvial lands of Egypt; and in 1843 he published his Life of his brother Francis. He died in London on the 5th of March 1864.

See Memoir of Leonard Horner, by Katherine M. Lyell (1890) (privately printed).

HORNES, MORITZ (1815–1868), Austrian palaeontologist, was born in Vienna on the 14th of July 1815. He was educated in the university and graduated Ph.D. He then became assistant in the Vienna mineralogical museum. He was distinguished for his researches on the Tertiary mollusca of the Vienna Basin, and on the Triassic mollusca of Alpine regions. Most of his memoirs were published in the Jahrbuch der K. K. geol. Reichsanstalt. In 1864 he introduced the term Neogene to include Miocene and Pliocene, as these formations are not always to be clearly separated: the fauna of the lower division being subtropical and gradually giving place in the upper division to Mediterranean forms. He died in Vienna on the 4th of November 1868. His son Dr Rudolf Hornes (b. 1839), professor of geology and palaeontology in the university of Graz, has also carried on researches among the Tertiary mollusca, and is author of Elemente der Palaeontologie (1884).

HORNFELS (a German word meaning hornstone), the group designation for a series of rocks which have been baked and indurated by the heat of intrusive granitic masses and have been rendered massive, hard, splintery, and in some cases exceedingly tough and durable. Most hornfelses are fine-grained, and while the original rocks (such as sandstone, shale and slate, limestone and basalt) may have been more or less fissile owing to the presence of bedding or cleavage planes, this structure is effaced or rendered inopercative in the hornfels. Though they may show bedding, due to bedding, &c., they break across this as readily as along it; in fact they tend to separate into cubical fragments rather than into thin plates. The commonest hornfelses (the "biotite hornfelses") are dark-brown to black with a somewhat velvety lustre owing to the abundance of small crystals of shining black mica. The "lime hornfelses" are often white, yellow, pale-green, brown and other colours. Green and dark-green are the prevalent tints of the hornfelses produced by the alteration of igneous rocks. Although for the most part the constituent grains are too small to be determined by the unaided eye, there are often larger crystals of garnet or andalusite scattered through the fine matrix, and these may become very prominent on the weathered faces of the rock.

The structure of the hornfelses is very characteristic. Very rarely do any of the minerals show crystalline form, but the small grains fit closely together like the fragments of a mosaic; they are usually of nearly equal dimensions and from the resemblance to rough pavement work this has been called pflaster structure or pavement structure. Each mineral may also enclose particles of the others; in the quartz, for example, small crystals of graphite, biotite, iron oxides, siliimanite or felspar may appear in great numbers. Often the whole of the minerals are rendered semi-opaque in this way. The minutest crystals may show traces of crystalline outlines; undoubtedly they are of new formation and have originated in situ. This leads us to believe that the whole rock has been recrystallized at a high temperature and in the solid state, so that there was little freedom for the mineral molecules to build up well-individualized crystals. The regeneration of the rock has been sufficient to efface most of the original structures and to replace the former minerals more or less completely by new ones. But crystallization has been hampered by the solid condition of the mass and the new minerals are formless and have been unable to reach their maximum size for this reason.

Slates, shales and clays yield biotite hornfelses in which the most conspicuous mineral is black mica, in small scales which under the microscope are transparent and have a dark reddish-brown colour and strong dichroism. There is also quartz, and often a considerable amount of felspar, while graphite, tourmaline and iron oxides frequently occur in lesser quantity. In these diotite hornfelses the minerals, which consist of aluminium silicates, are commonly found; they are usually andalusite and
sillimanite, but kyanite appears also in hornfelses, especially in those which have a schistose character. The andalusite may be pink or blue is then the chief gneissic in this section, or it may be white with the cross-shaped dark enclosures of the matrix which are characteristic of chloritoid. Sillimanite usually forms exceedingly minute needles embedded in quartz. In the rocks of this group cordierite also occurs, not rarely, and may have the outlines of imperfect hexagonal prisms which are divided up into six sectors when seen in polarized light. In biotite hornfelses a faint striation may indicate the original bedding of the unaltered rock and corresponds to small changes in the nature of the sediment deposited. More commonly there is a distinct speckling, visible on the surface and palpably proclaiming the fact; hence the expression, "put to the horn." The subsequent process, the warrant directing a messenger-at-arms to charge the debtor to pay or perform in terms of the letters, was called "letters of horning." This system of execution was simplified by an act of 1837 (Personal Diligence Act), and execution is now usually by diligence (see Execution).

**Hornpipe** originally the name of an instrument no longer in existence, and now the name of an English national dance. Despite its name, hornpipe does not contain corn an horn, but rather "hornpipe, placed in a corner of the dance," is by no means the only form of the dance, for there is a prettier tune known as the "College Hornpipe," and other specimens of this kind might be cited. The composition of hornpipes flourished chiefly in the 18th century, and even Handel did not disdain to use the characteristic rhythm. The hornpipe may be written in 3/4 or in common time, and is always of a lively nature.

**Hornsey,** a municipal borough in the Hornsey parliamentary division of Middlesex, England, suburban to London, 6 m. N. of St. Paul's Cathedral, on the Great Northern railway. Pop. (1801) 44,523; (1901) 72,056. It is chiefly occupied by small residences of the working classes. The manor, called in the 13th century *Haringoe* (a name which survives as Harringay), belonged from an early date to the see of London, the bishops having a seat here. In 1387 the duke of Gloucester, uncle of Richard II., assembled in Hornsey Park the forces by the display of which he compelled the king to dismiss his minister de la Pole, earl of Suffolk; and in 1483 the park was the scene of the ceremonial reception of Edward V., under the charge of Richard, earl of Gloucester, by Edmund Shaw, lord mayor of London. The parish church of St. Mary, Hornsey, retains its Perpendicular tower (c. 1500) and a number of interesting monuments. Finsbury Park, of 120 acres, and other smaller public grounds, are within the borough. Hornsey was incorporated in 1903 under a mayor, 10 aldermen and 30 councillors. Area, 2875 acres.

**Horowitz, Isaiah** (c. 1555-c. 1630), Jewish rabbi and mystic, was born at Prague, and died at Safed, then the home of Jewish Kabala. His largest work is called *Shehol* (abbreviated from the initials of the full title *Shone luzah ha-baaret, "Two Tables of the Covenant"). This is a compilation of ritual, ethics and mysticism, and had a profound influence on Jewish life. It has been often reprinted, especially in an abbreviated form.

For an account of the Jewish mystics at Safed see S. Schechter, *Studies in Judaism*, series ii. (1906).

**Horreum,** the Latin word for a magazine or storehouse for the storage of grain and other produce of the earth, and occasionally for that of agricultural implements. The storehouses of Rome were of the most extensive character, there being no fewer than 290 public horrea at the time of Constantine. They were used for the storage of food and merchandise of all kinds, being part of the great Roman system of providing food for the population, and they were supplied constantly with corn and other provisions from Africa, Spain and elsewhere.

**Horrocks, Jeremiah** (1610-1641), English astronomer, was born in 1610 at Toxteth Park, near Liverpool. His family was poor, and the register of Emmanuel College, Cambridge, testifies to his entry as a sizar on the 18th of May 1621. Isolated in his scientific tastes, and painfully straitened in means, he
pursued amid innumerable difficulties his purpose of self-education. His university career lasted three years, and on its termination he became a tutor at Toxteth, devoting to astronomical observations his brief intervals of leisure. In 1636 he met with a congenial spirit in William Crabtree, a draper of Broughton, near Manchester; and encouraged by his advice he exchanged the guidance of Philipp von Lansberg, a pretentious but inaccurate Belgian astronomer, for that of Kepler. He now set himself to the revision of the Rudolphine Tables (published by Kepler in 1627), and in the progress of his task became convinced that a transit of Venus overlooked by Kepler would nevertheless occur on the 24th of November (O.S.) 1639. He was at this time curate of Hoole, near Preston, having recently taken orders in the Church of England; although, according to the received accounts, he had not attained the canonical age. The 24th of November falling on a Sunday, his clerical duties threatened fatally to clash with his astronomical observations; he was, however, released just in time to witness the punctual verification of his forecast, and carefully noted the progress of the phenomenon during half an hour before sunset (3:15 to 3:45). This transit of Venus is remarkable as the first ever observed, that of 1631 predicted by Kepler having been invisible in western Europe. Notwithstanding the rude character of the apparatus at his disposal, Horrocks was enabled by his observation of it to introduce some important corrections into the elements of the planet's orbit, and to reduce to its exact value the received estimate of its apparent diameter.

After a year spent at Hoole, he returned to Toxteth, and there, on the eve of the long-promised visit to his friend Crabtree, he died, on the 3rd of January 1641, when only in his twenty-second year. To the inventive activity of the discoverer he had already united the patient skill of the observer and the practical sagacity of the experimentalist. Before he was twenty he had afforded a specimen of his powers by an important contribution to the lunar theory. He first brought the revolutions of our satellite within the domain of Kepler's laws, pointing out that her apparent irregularities could be completely accounted for by supposing her to move in an ellipse with a variable eccentricity and directly rotatory major axis, of which the earth occupied one focus. These precise conditions were afterwards demonstrated by Newton to follow necessarily from the law of gravitation.

In his speculations as to the physical cause of the celestial motions, his mind, though not wholly emancipated from the tyranny of gratuitous assumptions, was working steadily towards the light. He clearly perceived the significant analogy between terrestrial gravity and the force exerted in the solar system, and by the ingenious device of a circular pendulum illustrated the composite character of the planetary movements. He also reduced the solar parallax to 14' (less than a quarter of Kepler's estimate), corrected the sun's semi-diameter to 15' 45'', recommended decimal notation, and was the first to make tidal observations.

Only a remnant of the papers left by Horrocks was preserved by the care of William Crabtree. After his death (which occurred soon after that of his friend) these were purchased by Dr Worthington of Cambridge; and from his hands the treatise Venus in sole visitate auscultavit... was published by him in 1662 with his own observations on a transit of Mercury. The remaining fragments were, under the directions of the Royal Society, reduced by Dr Wallis to a compact form, with the heading Astronomia geometrica de motu, and published with numerous extracts from the letters of Horrocks to Crabtree, and a sketch of the author's life, in a volume entitled Jeremias Horroccii opera posthuma (London, 1672). A memoir of his life by the Rev. Arundel Blount, presented to a translation of the Venus in sole visite, appeared at London in 1859.

For additional particulars, see J. E. Bailey's Palatine Note-Book, ii. 253, iii. 17; Bailey's Writings of Horrocks and Crabtree (from MS. of 1682); Dec. 2, 1682; Notes and Queries, 3rd series, vol. v., 5th series, vol. ii., iv.; Martin's Biographia philosophica, p. 271 (1764); R. Brinkel, Transits of Venus, 1638-1754, in Mémoires de l'Académie des Sciences, 1754, 293; Hevelius, Mercurius in sole visite, pp. 116-140; S. Rigaud's Correspondence de Scientific Men; Th. Birch, History of the Royal Society, i. 386, 395, 470; Sir E. Sherburne's Sphere of M. Manlius, p. 92 (1675);
Horse

Hebrides, &c., and the wild pony of Mongolia (E. c. przewalskii), with which the now extinct tarpan of the Russian steppes appears to have been identical. The prevalent colour is yellow- 
dun, with dark brown or black mane, tail and legs; in the wild forms the muzzle is often white and the root of the tail short-
haired; while the head is relatively large and heavy. No depression exists in the skull in front of the eye. Most of the 
ordinary horses of N.W. Europe are descended from the dun 
type, with more or less admixture of Barb blood. (2) The 
southern, or Barb type, represented by Barbès, Arabs, thorough-
bred, &c. (E. c. asiaticus or libycus), in which the typical colour 
is bay with black "points" and often a white star on the forehead, 
and the mane and tail are long and full. The skull generally 
shows a slight depression in front of the socket of the eye, which, 
although now serving as the attachment for the muscle running 
to the nostril, may represent the face-land of the extinct Hipparion. Many of the dark-coloured horses of Europe have 
Barb or Arab blood in their veins, this being markedly the 
case with the Old English black or Shire horse, the skull of which 
shows a distinct depression in front of the eye-socket. This 
depression is so marked in the extinct Indian E. sivalensis, which 
may have been the ancestor of the Arabian horse.

In Europe wild horses were abundant in the prehistoric 
Neolithic or polished-stone period. Judging from the quantity 
of their remains found associated with those of men of that 
time, the chase of these animals must have been among man's 
chief occupations, and horses must have furnished him with one of his most important food-supplies. The characters of the 
bones preserved, and certain rude but graphic representations 
carved on bones or reindeers' antlers, enable us to know that they were rather small in size and heavy in build, with large 
heads and rough shaggy manes and tails, much like, in fact, the 
recently extinct tarpan or wild horses of the steppes of the 
south of Russia, and the still-surviving Mongolian wild pony or "Przewalski's horse." These horses were domesticated by the inhabitants of Europe before the dawn of history. Horses are now diffused by the agency of man throughout almost the whole of the inhabited parts of the globe, and the great modifications they have undergone in consequence of domestication, crossing, and selective breeding are well exemplified by comparing such extreme forms as the Shetland pony, dwarfed by uncongenial climate, the thoroughbred racer, and the London dray-horse. In Australia, as in America, horses imported by European settlers have escaped into unreclaimed lands and multiplied to a prodigious extent, roaming in vast herds over the wide and uncultivated plains.

Ass, Zebra, Quagga.—The next group is formed by the Asiatic 
wild asses, or kiangs and onagers, as they might well be called, 
in order to distinguish them from the wild asses of Africa. These 
asses have moderate ears, the tail rather long, and the back-stripe 
dark brown and running from head to tail. On the neck and 
shoulder this stripe is formed by the mane. There are two 
species of Asiatic wild ass, with several varieties. The first and 
largest has two races, the chigetai (Equus hemionus) of Mongolia, 
and the kiang (E. h. kiang) of Tibet, which is a redder animal. 
The onager (E. onager), of which there are several races, is 
smaller, with a broader dorsal stripe, bordered with white; 
the colour varying from sandy to greyish. This species ranges 
from Baluchistan and N.W. India to Persia, Syria and Arabia. 
These asses inhabit desert plains or open table-land; the kiang 
dwelling at elevations of about 14,000 ft. They are generally 
found in herds of from twenty to forty, although occasionally 
in larger numbers. All are fleet, and traverse rough ground 
with speed. On the lowlands they feed on dry grasses, and in 
Tibet on small woody plants. In India and Persia they are 
difficult to approach, although this is not the case in Tibet. 
Their sandy or chestnut colouring assimilates them to the horse, 
and separates them widely from the African wild asses, which 
are generally black. The kiang has also larger and more horse-like 
hoofes, and the tail is hairied higher up, thus approximating to Equus 
caballus przewalskii.

Among the striped species, or zebras and quaggas of Africa, 
the large Grévy's zebra (Equus grevyi) of Somaliland and 
 Abyssinia stands apart from the rest by the number and narrow-
ness of its stripes, which have an altogether peculiar arrangement 
on the hind-quarters, the small size of the callosities on the 
fore-legs, the mane extending onto the withers and enormous 
rounded ears, thickly haired internally. The large size of the 
ears and the narrow stripes are in some degree at any rate 
adaptations to a life on scrub-clad plains.

Next comes the closely allied species with small pointed 
ears, of which the true quagga (E. quagga) of South Africa is now 
extinct. This animal has the dark stripes limited to the head, 
neck, and shoulders, upon a brown ground. In the typical 
form, now also extinct, of the bonte-quagga, dauw, or Burchell's 
zebra (E. burchelli), the ground-colour is white, and the stripes 
cover the body and upper part of the limbs. This was the 
commonest species in the great plains of South Africa, where 
it roamed in large herds, often in company with the quagga and numerous antelopes. The species ranges from the Orange river 
to the confines of Abyssinia, but its more northern representatives 
show a gradual increase in the striping of the legs, culminating 
in the striped, almost black, African Equus burchelli granti, in which the stripes extend to the hoofs. The remaining varieties are alternately black and white, and in place of brown and creamy, with intermediate "shadow stripes," as in the southern races.

Lastly, there is the true or mountain zebra (E. zebra), typically 
from the mountain ranges of Cape Colony, where it is now 
specially protected, but represented by E. zebra perrieci in 
south-west Africa. In its relatively long ears and general build 
it approaches the African wild asses, from which it chiefly 
differs by the striping (which is markedly different from that of the 
quagga-group) and the reversal of the direction of the hairs along 
the spine.

The African wild ass (E. asinus) is the parent of the domest-
cated breed, and is a long-cared grey animal, with no forelock, 
and either a shoulder-stripe or dark harring in on the legs. There 
are two races, of which the Nubian E. a. africanus is the smaller, 
and has a continuous dorsal stripe and a shoulder-stripe but no 
bars on the legs. The Somali race (E. a. somaliensis), on the other 
hand, is a larger and greyer animal, with an interrupted dorsal 
and no shoulder-stripe, but distinct leg-barring.

Hybrids.—There are thus eight modifications of the horse-type 
at present existing, sufficiently distinct to be reckoned as species 
by most zoologists, and easily recognizable by their external 
characters. They are, however, all so closely allied that each 
will, at least in a state of domestication or captivity, breed with 
any of the others. Cases of fertile union are recorded between 
the horse and the quagga, the horse and the bonte-quagga or 
Burchell's zebra, the horse and the onager and kiang or Asiatic 
wild asses, the common ass and the zebra, the ass and bonte-
quagga, the ass and the onager, the onager and the zebra, and 
the onager and the bonte-quagga. The two species which are 
farthest removed in structure, the horse and the ass, produce, as 
is well known, hybrids or mules, which in certain qualities useful 
to man excel both their progenitors, and in some countries and 
for certain kinds of work are in greater requisition than either. 
Although occasional more or less doubtful instances have been 
recorded of female mules breeding with the males of one or other 
of the pure species, it is more than doubtful if any case has 
occurred of their breeding inter se, although the opportunities 
of doing so must have been great, as mules have been reared in 
immense numbers for at least several thousands of years. We 
may therefore consider it settled that the different species of 
the group are now in that degree of physiological differentiation 
which enables them to produce offspring with each other, but 
does not permit of the progeny continuing the race, at all events 
unless reinforced by the aid of one of the pure forms.

The several members of the group show mental differences 
quite as striking as those exhibited by their external form, and 
more than perhaps might be expected from the similarity of 
their brains. In the patience of the ass, the high spirit of the horse, 
the obstinacy of the mule, have long been proverbial. It is very 
remarkable that, out of so many species, two only should have
shown any aptitude for domestication, and these should have been from time immemorial the universal and most useful companions and servants of man, while all the others remain in their native freedom to this day. It is, however, still a question whether this really arises from a different mental constitution causing a natural capacity for taming into relation with man, or whether it may not be owing to their having been brought gradually into this condition by long-continued and persevering efforts when the need of their services was felt. It is possible that one reason why most of the attempts to add new species to the list of our domestic animals in modern times have ended in failure is that it does not answer to do so in cases in which existing species supply all the principal purposes to which the new ones might be put. It can hardly be expected that zebras and bontequagga fresh from their native mountains and plains can be brought into competition as beasts of burden and draught with horses and asses, whose useful qualities have been augmented by the training of thousands of generations of progenitors.

Not infrequently instances occur of domestic horses being produced with a small additional toe with complete hoof, usually on the inside of the principal toe, and, though far more rarely, three or more toes may be present. These malformations are often cited as instances of reversion to the condition of some of the earlier forms of equine animals previously mentioned. In some instances, however, the feet of such polydactyle horses bear little resemblance to those of the extinct Hipparion or Anchitherium, but look rather as if due to that tendency to reduplication of parts which occurs so frequently as a monstrous condition, especially among domesticated animals, and which, whatever its origin, certainly cannot in many instances, as the cases of entire limbs superadded, or of six digits in man, be attributed to reversion.

ANATOMY

The anatomical structure of the horse has been described in detail in several works mentioned in the bibliography at the end of this section, though these have generally been written from the point of view of the veterinarian, rather than the comparative anatomist. The limits of the present article will only admit of the most salient points being indicated, particularly those in which the horse differs from other Ungulata. Unless otherwise specified, it must be understood that all that is stated here, although mostly derived from observation upon the horse, applies equally well to the other existing members of the group.

Skeleton.—The skull as a whole is greatly elongated, chiefly in consequence of the immense size of the face as compared with the smaller or true cranial portion. The basal line of the cranium from the lower border of the foramen magnum to the incisor border of the palate is nearly straight. The orbit, of nearly circular form, though somewhat flattened on the front and lower face, is, in proportion to the size of the cranium, distinctly marked, and being completely surrounded by a strong ring of bone with prominent edges. Behind it, and freely communicating with it beneath the occipital bridge (the post-orbital process of the frontal) forming the boundary between them, is the small temporal fossa occupying the whole of the side of the cranium proper, and in front is the great flattened expanse of the "cheek," formed chiefly by the maxilla, giving support to the long row of cheek-teeth, and having a prominent ridge running forward from below the orbit for the attachment of the masseter muscle. The lachrymal occupies a considerable space on the flat surface of the cheek in front of the orbit, and below it the jugal does not extend. The dentary sends in a very considerable process backwards below the orbit to join the under surface of the zygomatic process of the squamosal, which is remarkably large, and instead of ending as usual behind the orbit, runs forwards to join the greatly developed post-orbital process of the frontal, and even forms part of the posterior and inferior boundary of the orbit, an arrangement not met with in other mammals. The closure of the orbit behind distinguishes the skull of the horse from that of all its allies the rhinoceros, rhinoceros, and, also from all of the perissodactyles of the Eocene period. In front of the brain cavity, the great tubular nasal cavities are provided with well-developed turbinal bones, and are roofed over by large nasals, broad behind, and ending in front in a narrow curved point. The anterior nares is prolonged backwards on each side of the face between the nasals and the elongated slender premaxillae. The latter expand in front, and are curved downwards to form the semi-circular border, which supports the large incisor teeth. The palate is narrow in the interval between the incisor and molar teeth, in which are situated the large anterior palatine foramina. Between the molar teeth it is broader, and it ends posteriorly in a rounded excavated border opposite the hinder border of the palatines, and supported externally by, and generally welded with, the rough pterygoid plates of the alisphenoid, with no pterygoid fossa between. They slope obliquely forwards, and end in curved, compressed, hamular processes. There is a distinct alisphenoid canal for the passage of the internal maxillary artery.

The base of the cranium is long and narrow; the alisphenoid is very obliquely perforated by the foramen rotundum, but the foramen ovale is confluent with the large foramen lacerum medium behind. The glenoid surface for the articulation of the mandible is greatly extended transversely, concave from side to side, convex from before backwards in front, and hollow behind, and is bounded posteriorly at its inner part by a prominent post-glenoid process. The squamosal enters considerably into the formation of the temporal fossa, and, besides sending the zygomatic process forwards, it sends down behind the mentus auditorius a post-tympanic process which aids to hold in place the otherwise loose tympano-periodic bone. Behind this the exoccipital gives off a long paroccipital process.

**FIG. 1.**—Side view of Skull of Horse, with the bone removed so as to expose the whole of the teeth. 

PMX, Premaxilla. 
MX, Maxilla. 
Na, Nasal bone. 
Ma, Jugal or malar bone. 
L, Lacrymal bone. 
Fr, Frontal bone. 
Sm, Squamosal bone. 
pM1, pM2, and pM3. The three fully developed primate teeth. 
Pr, Parietal bone. 
oc, Occipital condyle. 
PP, Paroccipital process. 
m1, m2, and m3. The three true molar teeth.

The periosteum and tympanic are welded together, but not with the squamosal. The former has a wide but shallow fossa on its inner side, and sends backwards a considerable "pars mastoidea," which appears on the outer surface of the skull between the post-tympanic process of the squamosal and the exoccipital. The tympanic forms a tubular meatus auditorius externus directed outwards and slightly backwards. It is not dilated into a distinct bulb but ends in front in a pointed rod-like process. It completely embraces the truncated cylindrical tympanohyal, which is of great size, corresponding with the large development of the whole anterior arch of the brain. This consists mainly of a long and compressed stylohyal, expanded at the upper end, where it sends off a triangular posterior process. The basi-tymanal is remarkable for the long, median, pointed, compressed "glossohyal" process, which sends forward from its anterior border into the base of the tongue. A similar but less developed process is found in the rhinoceros and tapir. The lower jaw is large, especially the region of the angle, which is expanded and flattened, giving great surface for the attachment of the masseter muscle. The condyle is greatly elevated above the alveolar border; its articular surface is very wide transversely, and narrow and convex from before backwards. The coronoid process is slender, straight, and inclined backwards. The horizontal ramus, long, straight, and compressed, gradually narrows towards the symphysis, where it expands laterally to form with the ankyllosed opposite ramus the wide, semicircular, shallow alveolar border for the incisor teeth.

The vertebral column consists of seven cervical, eighteen dorsal, six lumbar, five sacral, and fifteen to eighteen caudal vertebrae.
There may be nineteen rib-bearing vertebrae, in which case five only will be reckoned as belonging to the lumbar series. The odontoid process of the axis is wide, flat, and hollowed above, as in the ruminants. The bodies of the cervical vertebrae are elongated, slender, and marked externally by spines or tubercles, and convex in front. The neural laminae are broad, the spinous processes almost obsolete, except in the seventh, and the transverse processes much elongated, as in the ruminants. In the horses, the transverse diameter of the centrum gradually diminishes. The spinous processes of the anterior thoracic region are high and compressed. To these is attached the powerful elastic ligament (ligamentum nuchae, or ligamentum nuchae accessorium) passing from the third cervical to the mental neck above the neural arches of the cervical vertebrae—towards which it is also connected—is attached to the occiput and supports the weight of the head. The scapula is stouter and rather short. The ulna is rudimentary, being represented by little more than the olecranon. The shaft gradually tapers below and is firmly wedged to the radius. The latter bone is of nearly equal width throughout. The three bones of the carpus are cuboid, ulna, and radius, and are subequal in size. The second row consists of a broad and flat magnum, supporting the great third metacarpal, having to its radial side a carpal joint, and to its ulnar side the facetal articulation, which are both small and articulate imperfectly with the rudimentary second and fourth metacarpals. The pisiform is large and prominent, flattened and curved; it articulates partly with the cuneiform and proximate through the shorter end of the radius. The largest is called in veterinary anatomy "cannon bone"; the small lateral metacarpals, which gradually taper towards their lower extremities, and lie in close contact with the large one, are called "split bones." The single digit consists of a moderate-sized proximal (os subfraginis, or large paster), a short middle (os corono, or small paster), and a wide, semi-lunar, ungual phalanx (os pedis, or coffin bone). There is a pair of large nodular sesamoids behind the metacarpal-phalangeal articulation, and a single large transversely-extended sesamoid behind the joint between the second and third phalanx, called the "navicular bone." The carpal joint, corresponding to the wrist of man, is commonly called the "knee" of the horse, the joint between the metacarpal and the first phalanx the "fetlock," that between the first and second metapodials the "pastern," and that between the second and third phalanges the "coffin joint." In the hinder limb the femur is marked, as in other perissodactyles, by the presence of a "third trochanter," a flattened process, curving forwards for the insertion of the bone, articulating behind the distance from the upper end. The fibula is reduced to a mere rod-like rudiment of the upper end. The lower part is absent or completely fused with the tibia. The calcaneum has a long and compressed calcaneal process. The astragalus has a large flat articular surface in front for the navicular, and a small one for the cuboid. The navicular and the external cuneiform bones are broad and flat, corresponding to the outer side of the bone, and the internal and middle cuboid bones are small and united together. The metapodals and phalanges resemble very closely those of the fore limb, but the principal metapodals are nearly correlative with the upper phalanges of the corresponding metacarpal. The joint between the femur and tibia, corresponding to the knee of man, is called the "stifle joint;" that between the tibia and tarsus, corresponding to the ankle of man, the "hock." In the metacarpo-phalangeal region the terms "metacarpal" and "phalanx" have the same names as in the fore limb. The horse is eminently "digitigrade," standing on the extremity of the single digit of each foot, which is kept habitually turned inwards approaching to vertical.

The muscles of the limbs are many, and derived from those of the ordinary mammalian type in accordance with the reduced condition of the bones and the simple requirements of flexion and extension of the joints. Many of the superficial muscles are ascribed to the function of digits, being possible or needed. The muscles therefore which perform these functions in other quadrupeds are absent or rudimentary.

Below the carpal and tarsal joints, the fore and hind limbs correspond in structure and form of muscle. The internal or extensor surface of the limb a powerful tendon (7 in fig. 2), that of the anterior extensor of the phalanges (corresponding to the extensor communs digitorum of the arm and extensor longus digitorum of the foot of man) passes down over the metacarpal bone and phalanges, to be inserted mainly into the upper edge of the anterior surface of the last phalanx or pedal bone. There is also a much smaller second extensor on the outer side of this in each limb, the lateral extensor of the phalanges. In the fore-leg the tendon of this muscle (which corresponds with the extensor minimitis digit of man) receives a slip from that of the principal extensor, and is inserted into the first phalanx. In the hind-leg (where it is the homologue apparently of the peroneus brevis of man) the tendon becomes blended with that of the large extensor.

A strong ligamentous band behind the metapodium, arising from near the upper extremity of its posterior surface, divides into two at its lower end, and each division, being first connected with one of the paired upper sesamoid bones, passes by the side of the first phalanx to join the extensor tendon of the phalanges. This is called in veterinary anatomy the "suspensory ligament of the seomaidors," or of the "fetlock" (10 in fig. 2); but its attachments and relations, as well as the occasional presence of muscular fibres in its substance, show that it is the homologue of the interosseous muscles of other mammals, modified in structure and function, to suit the requirements of the horse's foot. Behind or superficial to this are placed the two strong tendons of the flexor muscles, the most superficial, or flexor peroneus (8) dividing to allow the other to pass through, and then inserted into the middle phalanx. The flexor peronaeus (9) is as usual inserted into the terminal phalanx. In the fore-leg these muscles correspond with those similarly named in man. In the hind-leg, the perforated tendon is a continuation of that of the plantaris, passing pulley-wise over the tuberosity of the calcaneum. The perforating tendon is derived from the muscle corresponding with the long flexor of man, and the smaller tendon of the oblique flexor (tubialis posterior of man) is united with it. The hoof of the horse corresponds to the nail or claw of other mammals, but is so constructed as to form a complete and solid case to the expanded termination of the toe, giving a firm basis of support formed of a non-sensitive substance, which is continually renewed by the addition of material from within, as its surface wears away by friction. The terminal phalanx of the toe is greatly enlarged and modified in form to support this hook, and the size of the internal framework of the foot is increased by a pair of lateral fibro-cartilaginous masses attached on each side to the hinder edges of the bone, and by a bony circular capsule surrounding the cushion in the median plane. These structures are all enclosed in the middle fibro-cartilaginous connexus, a continuation of the ordinary skin of the limb, but extremely versatile, and having its superficial extent greatly increased by being developed in the line of the coronary.
HORSE dentition, not soft. The horny hoof is divided into a wall or crust consisting of the front and side of the foot (14), corresponding with the wall of the hoof, is covered with parallel, fine longitudinal lamiae, which fit into corresponding depressions on the distal surface of the foot. The horn or digital cushion is made up of pavement epithelial cells, mainly grouped in a concentric manner around the vascular papillae of the subcornaceous integument, so that a section near the base of the hoof, cut transversely to the long axis of these papillae, shows a series of secondary lamiae, with cells arranged concentrically round them. The nearer the surface of the hoof, or farther removed from the seat of growth, the more indistinct the structure becomes.

Small round or oval plates of horny epithelium called "chestnuts," callus growing like the hoof from enlarged papillae of the skin, are found on the inner face of the fore-arm, above the carpal joint in all species of horses, and in the horse it is of the external surface of the tooth (see fig. 3), by which should properly be the apex is carried deeply into the interior of the crown, forming a pit, the bottom of which becomes partially filled with cement.

As the tooth wears, the surface, besides the external enamel layer as in a simple tooth, shows in addition a second inner ring of the same hard substance surrounding the pit, which adds greatly to the efficiency of the tooth as an organ for biting tough, fibrous substances. This pit, generally filled with a dark or blackish incipient mamilla, is especially well developed in the living animal with particles of food, is conspicuous from its dark color, and the term "pulp cavity" is applied to it. This cavity constitutes the "mark" by which the age of the horse is judged, the circumference of which is much smaller than the circumference of the tooth as a whole.

The teeth, therefore, are not only strong but durable, and the large size of the horses and their food are in good part accounted for by this quality of their teeth. Their eruption commences a few days after birth, and is complete before the end of the first year, the upper teeth usually appearing somewhat earlier than the lower. The first tooth which appears are the incisors, usually called the "premolars," and the second, which are the "molars," are the last to appear, the permanent tooth the first molar appears a little after the end of the first year, first premolar at the end of the second year, and the second premolar replaces its predecessor. Between two and a half and three years the first and second premolars, and the third molar have appeared, at from three and a half to four years the second incisor, at four to five a half years the canine, and, finally, at five years, the third incisor, or "molar," appears. The primary or deciduous tooth, which is shed at from seven to ten days; this is followed by the second incisor (at one month), then the third molar, and finally the third premolar, or "molar," as the horse is called.

The milk-dentition consists of i, c, p, m, l = 24,—the incisors and first or rudimentary premolars having apparently no predecessors. In form and structure the milk-teeth much resemble the permanent teeth, except in size and strength. They erupt about the middle of the third month, and are succeeded by the permanent teeth at the end of the first year, the last premolar appearing between the age of two and a half years.

There are frequently two deciduous premolars, and the third molars have appeared, at from three and a half to four years the second incisor, at four to five a half years the canine, and, finally, at five years, the third incisor, or "molar," appears. The primary or deciduous tooth, which is shed at from seven to ten days; this is followed by the second incisor (at one month), then the third molar, and finally the third premolar, or "molar," as the horse is called.

The uterus is bicorneate. The vagina is often partially divided by a membranous septum or hymen. The teats are two, inguinally placed. The surface of the chorion is covered evenly with minute villi, which persist throughout the non-desidiatum placenta. The period of gestation is eleven months.

AUTHORITIES.—R. J. Pocock, "The Species and Subspecies of Zoology." New, rev. ed. 2 vol., 1870. He did not visit the areas marked. The interior is divided by the character of the lining membrane into two distinct portions, right and left. Over the latter the dense white epithelial lining of the osophagus is continuous, and abruptly becomes a transverse fold; over the right part the mucous membrane has a greasy-red colour and a velvety appearance, and contains numerous peptic glands, which are situated on the anterior orifice. The orifice, which is small, is guarded by a strong crescentic or horsehoe-like band of muscular fibres, supposed to be the cause of the difficulty of vomiting in the horse. The small intestine is of great length (80 to 90 feet) and continues the membranous bronchus into the lung villi. The caecum is of conical form, about 2 ft. long and nearly a foot in diameter; its walls are succulent, especially near the base, having four longitudinal muscular bands; and its capacity is about twice that of the stomach. It lies with its base near the lower part of the abdomen, and its apex directed towards the thorax. The colon is about one-third the length of the small intestine, and very capacious in the greater part of its course. As usual it may be divided into an ascending, transverse, and descending portion; but the middle or transverse portion is folded into a great loop, which descends into the cæcum. The cæcum has two orifices, the four folds, generally parallel to the long axis of the body. The descending colon is much narrower than the rest, and not succulated, and, being considerably longer than the distance it has to traverse, is sinuated into three folds.

The liver is tolerably symmetrical in general arrangement, being divided nearly equally into segments by a well-marked umbilical fissure. This fissure is again divided into lateral portions, which do not extend quite to the posterior border of the organ; of the central lobes thus cut off, the right is rather the larger, and has two fissures in its free border dividing it into lobules. The extent of these variations, however, is different in individuals. The two lateral lobes are subtriangular in form. The Spigelian lobe is represented by a flat surface between the postoral fissure and the posterior border, not distinctly marked off from the left lateral of the ductus deferens, and the right lobe is buried deep in the hepatic substance, but the caudate lobe is distinct and tongue-shaped, its free apex reaching nearly to the border of the right lateral lobe. There is no gall-bladder, and the biliary duct enters the duodenum about six in. from the pylorus. The pancreas has two lobes or branches, a long one passing to the left and reaching the spleen, and a shorter right lobe. The principal duct enters the duodenum with the bile-duct, and there is often a second small duct opening separately.

Circulatory and Respiratory Organs.—The heart has the form of a rather elongated and pointed cone. There is one anterior vena cava, which, after communicating with the two jugular veins, the aorta gives off a large branch (the anterior aorta) very near its origin, from which arise, first, the left axillary, and afterwards the right axillary and the two carotid arteries. The passage of the blood through the capillary vessels is free and open. The heart itself is dilatable, being bordered by cartilages upon which several muscles act. Immediately within the opening of the nostril, the respiratory canal sends off on its upper and outer side a blind pouch ("false nostril") of conical form, and curved, 2 to 3 in. in depth, lying in the notch formed between the nasal and premaxillary bones. It is lined by mucous membrane continuous with that of the nasal passages. Its use is not apparent. It is longer in the ass than in the horse. Here may be mentioned the guttural pouches, large air-sacs from the Eustachian tubes, and lying behind the upper part of the pharynx, the function of which is also not understood. The lungs are large. The bronchial walls are thick, and only where the bronchi are dilated are the lungs divided into regions by laminae of connective tissue. The trachea divides into two bronchi.

Terminology.—The brain differs little, except in details of arrangement of convolutions, from that of other ungulates. The hemispheres are rather elongated and subcylindrical, the olfactory lobes are large and project freely in front of the hemispheres, and the cerebral convolutions of the front are well developed with a niictitating membrane or third eyelid, at the base of which open the ducts of the Harderian gland.

The testicles are situated in a distinct sessile or slightly pedunculated scrotum, which they descend from the sixth to the tenth month after birth. The accessory generative glands are the two vesiculae seminales, with the median vesicle, the bulbocavernosus, lying beneath the scrotum, and the paired prostates, with a pair of globular Cowper's glands. The penis is very large, cylindrical, with a truncated, expanded, flattened termination. When the horse ejaculates, a rosette of thick, copious, mucous matter, issuing from the sacrum, within the prepuce, a catouse fold attached below the symphysis pubis.

The evidence from the philology it appears that the horse was already known to the Aryans before the period of their dispersion. The first mention of the British horse occurs in the well-known passage of the Caedaic (in the Cæsarean, "B.C. 1869; Das Aszva, (1824), and Hand, of the vergleich. Anat. der Haussäugthiere (2 vols., 1822; Huet, "Croissement des diverses espèces du genre cheval," Nouv. Arch. du Muséum, 2nd ser., tom. ii. p. 46, 1879; Leisering, Atlas der Anatomie des Pferdes (Leipzig, 1861); O. C. Marsh, "Notice of New Equine Mammals from the Tertiary Forma-

HISTORY

Horse

fate, and exposed to the rigour of the seasons, he was probably the little hardy thing we yet see him; but in the marshes of the Nen and the Witham, and on the borders of the Tees and the Clyde, there would be as much proportionate development of frame and strength as we find at the present day." After the occupation of the country by the Romans, it appears that the horses of their cavalry were crossed with the native mares, and thus there was infused into the breed new blood, consisting probably of strains from very quarter from which Roman remounts were procured. As to the effect of this cross we are not, however, in a position to judge. We are also quite uncertain as to the extent to which the Jutes and Saxons may in their turn have again introduced a new breed of horses into England; and even to the close of the Anglo-Saxon period of English history about the tenth century horse breeding was in a state of ignorance which we know, however, was from an early period a high court official; and from such a law as that of Athelstan prohibiting the exportation of horses except as presents, it may be inferred that the English breed was not only much valued at home but also in great request abroad.1

The period of the Norman Conquest marks an important stage in the history of the British horse. William the Conqueror's own horse was of the Spanish breed, and others of the same kind were introduced by the barons on their estates. But the Norman horses included many varieties, and there is no doubt that to the Conquest the inhabitants of Britain were indebted for a decided improvement in the native horse, as well as for the introduction of several varieties previously unknown. According to Giraldus Cambrensis, Roger de Bellesme, a follower of William I., afterwards created earl of Shrewsbury, imported some stallions from Spain into England; their produce was celebrated by Drayton the poet. It is curious to notice that agriculture seems to be the last use to which the horse has been put. The earliest suggestion that horses were used in agriculture is derived from a piece of the Bayeux tapestry, where a horse is represented as drawing a harrow. This, however, must have been an exceptional case, for we know that oxen were used until a comparatively late time, and that in Wales a law existed forbidding horses to be used for ploughing.

In 1182 two Eastern horses are said to have been imported— one of them remaining in England, and the other being sent as a present by King Alexander I. to the church of St Andrews, in Scotland. It has been alleged that these horses were Barbos from Morocco, but a still more likely theory is that they existed only in name, and never reached either England or Scotland. The crusades were probably the means of introducing fresh strains of blood into England, and of giving opportunity for fresh crossings. The Spanish jennet was brought over about 1182. King John gave great encouragement to horse-breeding: one of his earliest efforts was to import a hundred Flemish stallions, and, having thus paved the way for improving the breed of agricultural horses, he set about acquiring a valuable stud for his own use.

Edward III. was likewise an admirer of the horse; he procured fifty Spanish horses, probably Jennets. At this time there was evidently a tendency to breed a somewhat lighter and speedier horse; but, while the introduction of a more active animal would soon have led to the displacement of the ponderous but powerful cavalry horse then in use, the substituted variety would have been unable to carry the weight of armour with which horse and rider were alike protected; and so in the end the old breed was kept up for a time. With the object of preserving to England whatever advantages might accrue from her care and skill in breeding an improved stamp of horses, Edward III. forbade their exportation; they consequently improved so rapidly in value that Richard II. compelled dealers to limit their prices to a fixed maximum. In the ninth year of his reign, Edward received from the king of Navarre a present of two running horses, supposed to have been valuable. The wars of 1346 checked the improvement of horses, and undid much of what had been previously accomplished, for we read that the cavalry taken into France by Edward III. were but indifferent mounted, and that in consequence he had to purchase large numbers of foreign horses from Hainault and elsewhere for remounts. The reign of Richard III. does not seem to have been remarkable for the furtherance of horse-breeding; but it was then that post-horses and stages were introduced.

Our information on the whole subject is but scanty down to the reign of Henry VII., who continued the enactment against the exportation of stallions, but relaxed it in the case of mares above two years old. His object was to retain the best horses in the country, and to keep the price of them down by limiting supply and encouraging the supply. In his reign gelding is believed to have had a further account of numerous breeds of horses belonging to different proprietors grazing together, especially in time of harvest. Henry VIII. was particularly careful that horse-breeding should be conducted on right principles, and his enactments, if somewhat arbitrary, were singularly to the point. In the thirty-second year of this reign, the "bill for the breed of horses" was passed, the preamble of which runs thus:—"Forasmuch as the generation and breed of good and strong horses within this realm extendeth not only to a great help and defence of the same, but also is a great commodity and profit to the inhabitants thereof, which is now much decayed and diminished, by reason that, in forests, chases, moors and waste grounds within this realm, little stoned horses and nags of small stature and of little value be not only suffered to pasture thereupon, but also to cover mares feeding there, whereof cometh in manner no profit or commodity." Section 2 of the act provides that no entire horse being above the age of two years, and not being of the height of 15 "handfuls," shall be put to graze on any common or waste land in certain counties; any one was to be at liberty to seize a horse of unlawful height, and those whose duty it was to measure horses, but who refused to do so, were to be fined 40s. By section 6 all forests, chases, commons, &c., were to be "driven" within fifteen days of Michaelmas day, and all horses, mares and colts not giving promise of growing into serviceable animals, or of producing them, were to be killed. The aim of the act was to prevent breeding from animals not calculated to produce the class of horse suited to the needs of the country. By another act (27 Henry VIII. chapter 6), after stating that the "breed of good strong horses" was likely to diminish, it was ordered that the owners of all parks and enclosed grounds of the extent of one mile should keep two mares 13 hands high for breeding purposes, or, if the extent of the ground was 4 m., four mares. The statute was not to extend to the counties of Westmorland, Cumberland, Northumb., or the bishopric of Durham. Henry took great pains to improve the royal stud; according to Sir Thomas Chaloner—a writer in the reign of Elizabeth—he imported horses from Turkey, Naples and Spain.

Queen Elizabeth is reputed to have been an accomplished horsewoman, and to have indulged in riding late in life. In the first year of her reign she revived an act passed by Henry VIII. making it felony "to sell, exchange or deliver within Scotland, or to the use of any Scottishman, any horse"; this, however, was very naturally repealed by James I. Carriages were soon after introduced, and the use of them speedily became so fashionable that a bill was brought in; "to restrain the excessive and superfluous use of coaches." Prior to the introduction of carriages horseback was the means of locomotion, and Queen Elizabeth rode in state to St Paul's on a pillion; but even after carriages were used, horseback was held to be more dignified, for James I. and his judges rode on horseback to Westminster Hall. One advantage of the introduction of carriages was that it created a demand for a lighter and quicker sort of horse, instead of the ponderous animal which, despite all attempts to diminish him, was still the horse of England—the age of chivalry having been the first epoch of the British horse.

Gunpowder, too, was invented; and now that the weight

1 Some fragments of legislation relating to the horse about this period may be gleaned from Ancient Laws and Institutes of England (fol., London, 1840), and Ancient Laws and Institutes of Wales (fol., London, 1841).
of the cavalry soldier was diminished by the substitution of lighter armour, a quicker and better bred horse was thought desirable for military service. The introduction of carriages and the invention of gunpowder thus opened up a new industry in breeding; and a decided change was gradually creeping on by the time that James I. came to the throne (1603), which commences the second epoch. James was a thorough sportsman, and his taste for racing, in which he freely indulged, caused him to think but little of the speed of even the best English horses. With the laudable motive, therefore, of effecting improvement in horses, he gave the then large sum of 500 guineas for an Arab stallion which had been procured from Constantinoipole by a Mr Markham, since known as the "Markham Arabian." This is the first authentic account we have of the importation of Arab blood, and the Stud-Book says he was the first of that breed ever seen in England. The people having to do with horses at that time were as conservative in their notions as most of the grooms are now, and the "Markham Arabian" was not at all approved of. The duke of Newcastle, in his treatise on horsemanship, said that he had seen the above Arab, and described him as a small bay horse and not of very excellent shape. In this instance, however, prejudice (and it is difficult to believe that it was anything else) was right, for King James's first venture does not appear to have been a success either as a race-horse or as a sire, and thus Arabian blood was brought into disrepute. The king, however, resolved to give Eastern blood another trial, and bought a horse known as Place's White Turk from a Mr Place, who subsequently held some office in connection with the stable under Cromwell. Charles I. followed in the footsteps of James, and sent sucharge to the breeding of a better kind of horse that a memorial was presented to him, asking that some measures might be taken to prevent the old stamp of horse "fit for the defence of the country" from dying out.

We now come to a very important period in the history of the British horse, for Charles II. warmly espoused the introduction of Eastern blood into England. He sent his master of the horse abroad to purchase a number of foreign horses and mares for breeding, and the mares brought over by him (as also many of their produce) were called "royal mares"; they form a conspicuous feature in the annals of breeding. The Stud-Book shows what breed the royal mares really were: one of them, the dam of Dodsworth (who, though foaled in England, was a natural Barb), was a Barb mare; she was sold by the stud-master, after Charles II.'s death, for forty guineas, at twenty years old, when in foal by the Helmstey Turk.

James II. was a good horseman, and had circumstances been more propitious he might have left his mark in the sporting annals of the country. In his reign, according to the Stud-Book, the Stradling or Lister Turk was brought into England by the duke of Berwick from the siege of Buda.

The reign of William III. is noteworthy as the era in which, among other importations, there appeared the first of three Eastern horses to which the modern thoroughbred race-horse traces back as the founders of his lineage. This was the Byerly Turk, of whom nothing more is known than that—to use the words of the first volume of the Stud-Book—he was Captain Byerly's charger in Ireland in King William's wars. The second of the three horses above alluded to was the Darley Arabian, who was a genuine Arab, and was imported from Aleppo by a brother of Mr Darley of Aldby Park, Yorkshire, about the end of the reign of William III. or the beginning of that of Anne. The third horse of the famous trio, the Godolphin Arabian or Barb, brought to England about five-and-twenty years after the Darley Arabian, will be more particularly referred to further on. All the horses now on the turf or at the stud trace their ancestry in the direct male line to one of other of these three—the Byerly Turk, the Darley Arabian, and the Godolphin Arabian or Barb. In the female line their pedigrees can be traced to other sources, but for all practical purposes it suffices to regard one or other of these three animals as the ultima Thule of racing pedigree. Of course there is a large interfusion of the blood of each of the trio through the dams of horses of the present day; indeed, it is impossible to find an English race-horse which does not combine the blood of all three.

The Race-horse.—The third and last epoch of the British horse, viz. that of the thoroughbred racer, may be taken to date from the beginning of the 18th century. By thoroughbred is meant a horse or mare whose pedigree is registered in the Stud-Book kept by Messrs Weatherby, the official agents of the Jockey Club—originally termed the keepers of the match-book—thus well as publishers of the Racing Calendar. The first attempt to evolve order out of the chaos which had long reigned supreme was made in 1791, for we find in the preface of the first volume of the Stud-Book, published in 1808, that "with a view to correct the then increasing evil of false and inaccurate pedigrees, the author was in the year 1791 prevailed upon to publish an Introduction to a General Stud-Book, consisting of a small collection of pedigrees which he had extracted from racing calendars and sale papers and arranged on a new plan." It will be seen that the compiler of the volume on which so much depended had to go back fully a century, with little else to guide him but odds and ends in the way of publications and tradition. Mistakes under such circumstances are pardonable. The Stud-Book then (vol. i.), which is the oldest authority we have, contains the names and in most cases the pedigrees, obscure though they may be, of a very large number of horses and mares of note from the earliest accounts, but with two exceptions no dates prior to the 18th century are specified in it. These exceptions are the Byerly Turk, who was "Capt. Byerly's charger in Ireland in King William's wars (1688, &c.)," and a horse called Counsellor, bred by Mr Egerton in 1694, by Lord D'Arcy's Counsellor by Lord Lonsdale's Counsellor by the Shaftesbury Turk out of sister to Spanker—all the dams in Counsellor's pedigree tracing back to Eastern mares. There is not the least doubt that many of the animals named in the Stud-Book were foaled much earlier than the above dates, but we have no particulars as to time; and after all it is not of much consequence.

The Stud-Book goes on to say of the Byerly Turk that he did not cover many bred mares, but was the sire of the duke of Devonshire's Basto, Halloway's Jigg, and others. Jigg, or Jig, is a very important factor, as will be seen hereafter. The Stud-Book, although silent as to the date of his birth, says he was a common country stallion in Lincolnshire until Partner was six years old—and we know from the same authority that Partner was foaled in 1718; we may therefore conclude that Jigg was a later foal than Basto, who, according to Whyte's History of the Turf, was a brown horse foaled in 1703.

The reign of Queen Anne, however (1702-1714), is that which will ever be inseparably connected with the thoroughbred race-horse on account of the fame during that period. The Darley Arabian, a bay stallion, from whom our very best horses are descended. According to the Stud-Book, "Darley's Arabian was brought over by a brother of Mr Darley of Yorkshire, who, being an agent in merchandise abroad, became member of a hunting club, by which means he acquired interest to procure this horse." The Stud-Book is silent, and other authorities differ, as to the date of the importation of this celebrated Arab, some saying he came over in the year 1700, others that he arrived somewhat later; but we know from the Stud-Book that Manica (foaled in 1707), Aleppo (1711), Almanzar (1713), and Flying Childers (1713) were got by him, as also was Bartlett's Childers, a younger brother of Flying Childers. It is generally believed that he was imported in Anne's reign, but the exact date is immaterial, for, assuming that he was brought over as early as 1700 from Aleppo, he could scarcely have had a foal living before 1701, the first year of the 18th century. The Darley Arabian did much to remove the prejudice against Eastern blood which had been instilled into the public mind by the duke of Newcastle's description of the people of the Arabian. Prince George of Denmark, consort of Queen Anne, was himself a large horse-owner; and it was in a great measure owing to his intervention that so many valuable stallions were imported during her reign.
This article opens with a list of pedigrees of men and horses.

"HORSE

... and was purchased when young by the duke of Devonshire. He was got by the Darley Arabian from Betty Lamb, one of the mares from sister to Leedes, by Leedes's Arabian from a mare by Spanker out of a Barb mare, who was Spanker's own mother. Spanker himself was got by the Darley Arabian from a daughter of the Morocco Barb and Old Bald Peg, by a mare. The horse's dam was by Spanker from a Barb mare, so that Childers's dam was closely inbred to Spanker. Flying Childers—the wonder of his time— was the desert, the peak of English horsebreeding in the 17th century, aged twenty-six years. He was the sire of, among other horses, Wire (1753) and Snip (1776). Snip too had a celebrated son called Snap (1730), and it is chiefly in the female line through the dam of Snap, from whom there are remarkably good Steeds-Book, that the blood of Flying Childers is handed down to us.

The other representative line of the Darley Arabian is through Bartlett's Childers, also bred by Mr. Leonard Childers, and sold to the incomparable Lord Lovat, of Murrage, in 1776. This horse, who was called Young Childers,—it being generally supposed that he was a younger brother of his Flying namesake, but his date of birth is not recorded,—has from time to time been considered by many as the line through which the Darley Arabian's blood is handed down to us. His sire was a grandson of the Arabian, Blaze (1753) and Snip (1776), with a celebrated son called Snap (1730), and it is chiefly in the female line through the dam of Snap, from whom there are remarkably good Steeds-Book, that the blood of Flying Childers is handed down to us.

In regard to the mares already alluded to, and likewise of three Turk mares brought over from the siege of Vienna in 1664, as well as of other importations; but it is unquestionable that there was a very large number of native mares in England, improved probably from time to time by racing, however much they may have been crossed at various periods with foreign horses, and that from this original stock were to some extent derived the size and stride which characterized the English race-horse, while his powers of endurance and elegant shape were no doubt inherited from the Eastern horses, most of which were of a low stature, 14 hands or thereabouts. It is only necessary to trace carefully back the pedigree of most of the famous horses of early times to discover faults on the side of the dam—that is to say, the expression "dam's pedigrees unknown," which evidently means of original stock. With the introduction of foreign blood, in the latter half of the 18th century, the beginning of the 19th century, a complete wave swept over the British Isles, some credit is unquestionable due to the native mares (which Blaine says were mostly Cleveland bays) upon which the Arabian, Barb, or Turk blood was grafted, and which laid the foundation of the modern thoroughbred. Other nations may have furnished the blood, but England has made the race-horse.

Without prosecuting this subject further, it may be enough here to follow out the lines of the Darley Arabian, the Byerly Turk, and the Godolphin Arabian or Barb, the main ancestors of the British thoroughbred of the 18th and 19th centuries, through several famous race-horses, each and all brilliant winners,—Flying Childers, Eclipse, Herod and Matchen,—to whom it is considered sufficient to look as the progenitors of the race-horse of to-day.

1. The Darley Arabian's line is represented in a twofold degree, first, through his son, Flying Childers, by grandsire Blaze and Snip, and his great-grandson Snap, and, secondly, through his other son Bartlett's Childers and his great-great-grandson Eclipse. Flying or Devonshire Childers, so called to distinguish him from other horses of the same name, was a bay horse of entirely Eastern blood, with a blaze in his face and four white feet, foaled in 1715. He was bred by Mr. Leonard Childers of Carr House near Doncaster.
Blue Gown (1862). Mercury was sire of Gohanna (1790), who was foaled in the same year as Waxy, and the two, who were both grandsons of Eclipse and both out of Herod mares, had several close races. In consequence, his colts and descendants come down through Golumbus (1802), Catton (1809), Mulatto (1823), Royal Oak (1823), and Slane (1833).

2. The Byerly Turk’s line is represented by Herod, the Turk being the sire of Mary (1768), whose daughter, Fanny (1795), the Byerly Highflyer (1797), was by Graham’s Champion by a daughter of the Darley Arabian and a mare who claims Merlin for her sire, but whose mother’s pedigree is unknown. In Herod’s pedigree there are two horses whose pedigrees are unknown; one was a bay horse about 15 hands 3 inches high, possessed of both substance and length, those grand requisites in a racehorse, combined with uncommon power and stamina, and such qualities as bred by a stallion, Duke of Cumberland, uncle of King George III. He commenced his racing career in 1763, when he was five years old, and ended it on the 16th of May 1797. He ran ten times, winning six and losing four races. He died in 1780, and among other progeny left two famous sons, Woodpecker (1773), whose dam was Miss Ramsden (1760) by Carle, son of the Godolphin Barb, but descended also on the dam’s side from the Darley Arabian and the Turk; and Herod Highflyer (1774), whose dam was Rachel (1763) by Blank, son of the Godolphin Barb from a daughter of Regulus, also son of the Godolphin. These two horses have transmitted the Turk’s blood down to the present day in the male line, although in the female line he is represented through some of his other sons and his daughters as well. Woodpecker was the sire of Buzzard (1787), who in his turn became the father of three celebrated sons, viz., Sylvanus (1809), Sir Bey (1810), and Sir Charles (1813), and all three chestnuts, and all out of an Arabian mare (1790), who thereby became famous. This mare was by Eclipse’s son Alexander (1781) and out of a Darley Arabian (Highflyer) of Herod) out of a daughter of Alfred, by Matchem out of a daughter of Snap. Bustard (1813), whose dam was a daughter of Shuttle, and his son Heron (1833), Sultan (1816) and his sons Glencoe (1831) and Bay Middleton (1833) and Middleton’s sons Cow (1842) and the Flying Dutchman (1847), Pantaloon (1850), and his son Windhound (1847), Langar (1847), and his son Euphras (1854) and grandson Pyrrhus the First (1843), are all Martials.

Highflyer is represented through his great-esteen son Sir Peter Teaze, commonly called Sir Peter (1784), whose dam was Papillon by Snap. Sir Peter had five sons at the stud, Walton (1790), Stamford (1794), and Sir Paul (1802) being the chief. Paulowitz (1813), Cain (1822), Ion (1835), Wild Dayrell (1832), and his son Buccaneer (1837) bring down Sir Paul’s blood; whilst Walton is represented through Phantom (1806), Partisan (1811) and his sons Glaurus (1829) and Venison (1833) and Gladiator (1833), Venison’s sons Alarm (1842) and Kingston (1846), Gladiator’s son Sweetmeat (1842), Sweetmeat’s sons Macaroni (1860) and Farmesan (1864), and Farmesan’s sons Favonian (1879), and Cymon (1889), and Cymon’s offspring. It may be added that in the first volume of the Stud-Book there are nearly a hundred Herod and Highflyer mares registered.

3. The Godolphin Barb is represented by Matchem as the former was the sire of Sir Peter Teaze and Cain, both Matchems, who was foaled in 1748. He was thus ten years the senior of Herod, representing the Byerly Turk, and sixteen years before Eclipse, though long speaking of as a Darley Arabian (Highflyer), and the Turk’s representation in Arabia. Matchem was a brown bay horse with some white on his off hind heel, about 15 hands high, bred by Sir John Holme of Carlisle, and sold to Mr W. Fenwick of Heywell, Northumberland. His dam was Miss Partner (1732) by Partner out of Brown Farewell by Makeless (son of the Ogilthorpe Arabian) from a dam of Brimmer out of Trumpet’s dam, by Place’s White Turk from a daughter of the Barb Dodoworth and a Layton Barb horse of near the same blood as the Godolphin down to modern times. Sorcerer was the sire of Soothsayer (1806), Comus (1809), and Smolensko (1810). Comus was the sire of Humphrey Clinker (1822), who was son of Melbourne (1819), and Melbourne was the sire of the Darley Arabian (1816), including Canezou (1845) and Blink Bonny (1854), dam of Blair Athol. Paynator was the sire of Dr Syntax (1811), who had a colt called David and a daughter called Beeswing (1833), dam of Newminster by Touchstone.

The gnomes of the three lines may be briefly enumerated thus: (1) of the Darley Arabian’s line—Snap, Shatta, Waxy, and Orville—the last the sire of the Byerly Turk; Buzzard and Sir Peter—speedy blood, the latter the stouter of the two; (2) of the Godolphin Barb’s line—Sorcerer—often producing larger-sized animals, but showing a tendency to die out, and becoming rare.

On the principle that as a rule begetts like, it has been the practice to select as sires the best public performers on the turf, and of two horses of like blood it is sound sense to choose the better as against the inferior public performer. But there can be little doubt that the mating of mares with horses has been often pursued on a haphazard plan, or on no system at all; to this the Stud-Book testifies too plainly. In the article Horse-Racing mention is made of some of the great horses of recent years; but the following list of the principal sires of earlier days indicates also how their progeny found a place among the winners of the three great races, the Derby (D), Oaks (O), and St Leger (L):—

**Eclipse:** Young Eclipse (D), Saltram (D), Sergeant (D), Annette (O).

**Herod:** Bridget (O), Faith (O), Maid of the Oaks (O), Phenomenon (L).

**Matchem:** Teetotum (O), Hollandaise (L), Florizel (son of Herod) diomed (D), Eager (D), Tartar (L), Ninety-third (O).

**Highflyer:** Noble (D), Sir Peter Teaze (D), Skyscraper (O), Violante (O), Omphale (O), Cowslip (L), Spadille (L), Young Flora (L).

**Peter:** Waxy (D), Champion (D, L), Tyrant (D), Nightshade (O).

**Sir Peter:** Sir Harry (D), Lady Bank (D), Dino (O), Paris (O), Hermione (O), Parasite (O), Ambrosio (D), Fyldeiner (L), Paulina (L), Petronius (L).

**Winston:** Paynator (D), Paget (D), Bucanneer (D), Blucher (D), Whisker (D), Music (O), Minuet (O), Cortine (O).

**Whalo** (D): Moses (D), Lapdog (D), Spanish (D), Caroline (O).

**Woful** (D): Augusta (O), Zin (O), Theodore (L).

**Whisker** (D): Mortimer (D), Canezou (D).

**Phantom:** Ceric (D), Middleton (D), Cobweb (O).

**Oriole** (D): Octavius (D), Enidius (D), Ebor (L).

**Trumper** (L): St Giles (D), Dangerous (D), Barfoot (O).

**Emilus** (D): Friam (D), Plenipotentiary (D), Oxygen (O), Mangle (D).

**Pram** (D): Miss Seltz (O), Industry (O), Crucifix (O).

**Sir Hercules** (D): Coronation (D), Faugh-a-Ballag (L), Birdcatcher (L).

**Touchstone** (L): Cotherstone (D), Orlando (D), Surplice (D, L), Mendicant (O), Blue Bonnet (L), Newminster (L).

**Birdcatcher** (D): Raleigh (D), Morning (D), Lord (D), Dennis (D), Conception (O), Knight of St George (L), Warlock (L), The Baron (L), Stockwell (L).

**Melbourne** (D): West Australian (D, L), Blink Bonny (O, D), Sir Tatton Sykes (L).

**Newminster** (L): Musjid (D), Hermit (D), Lord Clifton (L).

**Sweetmeat** (D): Macaroni (D), Mincemeat (O), Mincepie (O).

**Stockwell** (L): Blair Athol (D, L), Lord Lyon (D, L), Doncaster (D), Regalia (O), St Albans (L), Caller Ou (L), The Marquis (L), Achievement (L).

**King Tom** (D): Kingscraft (D), Tormentor (O), Hippia (O), Hannah (O).

**Rataplan** (son of the Baron): Kettledrum (D).

**Monarque** (D): Gladiateur (L, D).

**Parmesan** (son of Sweetmeat): Favonian (D), Cromorne (D).

**Buccaster** (O, L), Brigantine (O).

**Lord Clifton** (L): Jannette (O, L), Hawthorned (L), Wenlock (L), Petrach (L).

**Adventure** (D): Pretender (O, L), Apology (L, O), Wheel of Fortune (O).

**Blair Athol** (D, L): Silvio (D, L), Craig Millar (L).

In regard to mares it has very frequently turned out that animals which were brilliant public performers have been far less successful as dams than others which were comparatively valueless as runners. Beeswing, a brilliant public performer, gave birth to a good horse in Newminster; the same may be said of Alice Hawthorn, dam of Thormanby, of Canezou, dam of Fazzolatto, of Crucifix, dam of Surplice, and of Blink Bonny, dam of Blair Athol; but many of the greatest winners have dropped nothing worth training. On the other hand, there are mares of little or no value as racers who have become the mothers of some of the most celebrated horses on the turf; among them we may cite Queen Mary, Pocahontas and Paradigm. Queen Mary, who was by Gladiateur out of a daughter of Plenipotentiary and Myrrha by Whalebone, when mated with Melbourne produced Blink Bonny (winner of the Derby and Oaks); when mated with Mango and Lanercost she produced Haricot, dam of Caller Ou (winner of the St Leger). Pocahontas, perhaps, the most remarkable mare in the Stud-Book, never won a race on the turf, but threw Stockwell and Rataplan to the Baron, son of Birdcatcher, King Tom to Harkaway, Knight of St Patrick to Knight of St George, and Knight of Kars to Nutwith—all these horses being 16 hands high and upwards, while Pocahontas was
HORSE

722

a long low mares of about 15 hands or a trifle more. She also
gave birth to Ayacanora by Birdcatcher, and to Araucaria by
Ambrose, both very valuable brood mares, Araucaria being the
dam of Chamant by Mortemer, and of Rayon d'Or by Flagolet,
son of Phutus by Touchstone. Paradigm again produced, among
several winners of more or less celebrity, Lord Lyon (winner of
the Two Thousand Guineas, Derby and St Leger) and Achievement
(winner of the St Leger), both being by Stockwell. Another
famous mare was Manganese (1853) by Birdcatcher from Moon-
beam by Tomboy from Lunatic by the Prime Minister from
Manicue by Shuttle. Manganese when mated with Rataplan
threw Mandragara, dam of Apology, winner of the Oaks and St
Leger, whose sire was Adventurer, son of Newman. She
also threw Mineral, who, when mated with Lord Clifden, pro-
duced Wenlock, winner of the St Leger, and after being sold to
12,000 guineas, to go to Hungary, was there mated with Buccaneer, the produce
being Kibser, winner of the Derby.

We append the pedigree of Blair Athol, winner of the Derby
and St Leger in 1864, who, when subsequently sold by auction,
fetched the then unprecedented sum of 12,000 guineas, as it
contains, not only Stockwell (the emperor of stallions, as he
has been termed), but Blink Bonny and Eleanor—in which latter
animal are combined the blood of Eclipse, Herod, Matchem and
Snap,—the mares that won the Derby in 1801 and 1857 respec-
tively, as well as those queens of the stud, Eleanor's great-
granddaughter Pocahontas and Blink Bonny's dam Queen Mary.
Both Eleanor and Blink Bonny won the Oaks as well as the Derby.

The shape of a race-horse is of considerable importance,
though it is said with some degree of truth that they win in
all shapes. There are the neat and elegant animals, like the
descendants of Saunterer and Sweetmeat; the large-framed,
plain-looking, and heavy-headed Melbourne, often with long
ears; the descendants of Birdcatcher, full of quality, and of
more than average stature, though sometimes disfigured with
curvy hocks; and the medium-sized but withal speedy descend-
ants of Touchstone, though in some cases characterized by
somewhat loaded shoulders. In height it will be found that the
most successful races average from 15 to 16 hands; the neck
being considered somewhat small, while the latter is unquestion-
ably very large; the mean may be taken as between 15½ and 16
hands (the hand = 4 in.). The head should be light and lean,
and well set on; the ears small and pricked, but not too short;
the eyes full; the forehead broad and flat; the nostrils large and
dilating; the muzzle fine; the neck moderate in length, wide,
muscular, and yet light; the throat clean; the windpipe
spacious and loosely attached to the neck; the crest thin, not
course and arched. The withers may be moderately high and
thin; the chest well developed, but not too wide or deep; the
shoulder should lie well on the chest, and be oblique and well
covered with muscle, so as to reduce concussion in galloping;
the upper and lower arms should be long and muscular; the
knees broad and strong; legs short, flat and broad; fetlock
joints large; pasterns strong and of moderate length; the feet
should be moderately large, with the heels open and frogs sound
—with no signs of contraction. The body or barrel should be
moderately deep, long and straight, the length being really in
the shoulders and in the quarters; the back should be strong
and muscular, with the shoulders and loins running well in
at each end; the loins themselves should have great height and
substance, this being a vital necessity for weight-carrying and
propelling power uphill. The hips should be long and wide,
and of a firm, necky, and thigh strong, long and propor-
tionately developed, and the hind quarters well let down. The
hock should have plenty of bone, and be strongly affixed to the
leg, and show no signs of curf; the bones below the hock
should be flat, and free from adhe-
sions; the ligaments and tendons
well developed, and standing out from
the bone; the joints well formed and
wide, yet without undue enlarge-
ment; the pasterns and feet similar
to those of the forehand. The tail
should be high set on, the croup being continued in a
straight line to the tail, and not falling away and drooping.

to a low-set tail. Fine action is the best criterion of everything fitting properly, and all a horse's points ought to harmonize or be in proportion to one another, no one point being more prominent than another, such as good shoulders, fine, loins or excellent quarters. If the observer is struck with the remarkable prominence of any one feature, it is probable that the remaining parts are defective. A well-made horse wants dissecting in detail, and then if a good judge can discover, not only the finer parts, set on free from overheating, and the whole to harmonize without defect, deformity or deficiency, he has before him a well-shaped horse; and of two equally well-made and equitably proportioned horses the best bred one will be the best. As regards hue, the favourite colour of the ancients, according to Xenophon, was bay, and for a long time it was the fashionable colour in England; but for some time chestnut thoroughbreds have been the most conspicuous figure on English race-courses, so far as the more important events are concerned. Eclipse was a chestnut; Castrel, Selim and Rubens were chestnuts; so also were Gleneoe and Pantaloone, of whom the latter had black spots on his hind quarters like Eclipse; and also Stockwell and Doncaster. Birdcatcher was a chestnut, so also were Stockwell and his brother Rataplan, Manganese, Mandragora, Thornamby, Kettledrum, St Albans, Blair Athol, Regalia, Formosa, Hermit, Marie Stuart, Doncaster, George Frederick, Apology, Craig Millar, Prince Charlie, Rayon d'Or and Bend Or. The dark browns or black browns, such as the Sweetmeat tribe, are not so common as the bays, and black or grey horses are almost as unusual as roans. The skin and hair of the thoroughbred are finer, and the veins which underlie the skin are larger and more prominent than in other horses. The mane and tail should be silky and devoid of curl, which is a sign of impurity.

Whether the race-horse of to-day is as good as the stock to which he traces back has often been disputed, chiefly no doubt because he is brought to more early maturity, commencing to win races at two years instead of at five years of age, as in the days of Childers and Eclipse; but the highest authorities, and none more emphatically than the late Admiral Rous, have insisted that he can not only stay quite as long as his ancestors, but also go a good deal faster. In size and shape the modern race-horse is unquestionably superior, being on an average fully a hand higher than the Eastern horses from which he is descended; and in elegance of shape and beauty of outline he has certainly never been surpassed. That experiments, founded on the study of his nature and properties, which have from time to time been made to improve the breed, and bring the different varieties to the perfection in which we now find them, have succeeded, is absolutely confirmed by the high estimation in which the horses of Great Britain are held in all parts of the civilized world; and it is not too much to assert that, although the cold, humid and variable nature of their climate is by no means favourable to the production of these animals in their very best form, Englishmen have by great care, and by sedulous attention to breeding, high feeding and good grooming, with consequent development of muscle, brought them to the highest state of perfection of which their nature is capable. (E. D. B.)

Breeds of Horses

The British breeds of light horses include the Thoroughbred, the Yorkshire Coach-horse, the Cleveland Bay, the Hackney and the Pony; of heavy horses, the Shire, the Clydesdale and the Suffolk.

The Thoroughbred is probably the oldest of the breeds, and it is known as the "blood-horse" on account of the length of time through which its purity of descent can be traced. The frame is light, slender and graceful. The points of chief importance are a fine, clean, lean head, set on free from collar heaviness; a long and strongly muscular neck, shoulders oblique and covered with muscle; high, long withers, chest of good depth and narrow but not extremely so; body round in type; back rib well down; depth at withers a little under half the height; length equal to the height at withers and croup; loins level and muscular; croup long, rather level; tail set on high and carried gracefully; the hind quarters long, strongly developed, and full of muscle and driving power; the limbs clean-cut and sinewy, possessing abundance of good bone, especially desired in the cannons, which are short, broad and flat; comparatively little space between the fore legs; pastern joints smooth and true; pasterns strong, clean and springy, sloping when at rest at an angle of 45°; feet medium size, wide and high at the heels, concave below and somewhat overlapping; the action in trotting is generally low, but the bending of the knee and the flexing of the hock is smooth, free and true. The thoroughbred is apt to be nervous and excitable, and impatient of common work, but its speed, resolution and endurance, as tested on the race-course, are beyond praise.

Many of the best hunters in the United Kingdom are thoroughbreds, but of the substantial weight-carrying type. The Hunters Improvement Society, established in 1885, did not restrict entries to the Hunters' Stud-Book to entirely clean-bred animals, but admitted those with breeding enough to pass strict inspection. This society acts in consort with two other powerful organizations (the Royal Commission on Horse-breeding, which began its work in 1888, and the Brood Mare Society, established in 1903), with the desirable object of improving the standard of light horse breeding. The initial efforts began by securing the services of thoroughbred stallions for specified districts, by offering a limited number of "Queen's Premiums," of $300 each, to selected animals of four years old and upwards. Since the formation of the Brood Mare Society mares have come within the sphere of influence of the three Societies, and well-conceived inducements are offered to breeders to retain their young mares at home. The efforts have met with gratifying success, and they were much needed, for while in 1904 the Dutch government took away 350 of the best young Irish mares, Great Britain was paying the foreigner over £2,000,000 a year for horses which the old system of management did not supply at home. The Royal Dublin Society also keeps a Register of Thoroughbred Stallions under the horse-breeding scheme of 1892, which, like the British efforts, is now bearing fruit.

The Yorkshire Coach-horse is extensively bred in the North and East Ridings of Yorkshire, and the thoroughbred has taken a share in its development. The colour is usually bay, with black or brown points. A fine head, sloping shoulders, strong loins, lengthy quarters, high-stepping action, flat bone and sound feet are characteristic. The height varies from 16 hands to 16 hands 2 in.

The Cleveland Bay is an ancestor of the Yorkshire Coach-horse and is bred in parts of Yorkshire, Durham and Northumberland. He is adapted alike for the plough, for heavy draught, and for slow saddle work. Some specimens make imposing-looking carriage horses, but they have low action and are lacking in quality. The colour is light or dark bay, with black legs. Though rather coarse-headed, the Cleveland Bay has a well-set shoulder and neck, a deep chest and round barrel. The height is from 16 to 17 hands.

The Hackney has come prominently to the front in recent years. The term Nag, applied to the active riding or trotting horse, is derived from the A.S. knegon, to neigh. The Normandy brought with them their own word cheval haquinete, a French derivative from the Latin equus, a horse, whence the name hackney. Both nag and hackney continue to be used as synonymous terms. Frequent mention is made of hackneys and trotters in old farm accounts of the 14th century. The first noteworthy trotting hackney stallion, of the modern type, was a horse foaled about 1755, and known as the Schales, Shields or Shales horse, and most of the recognized hackneys of to-day trace back to him. The breeding of hackneys is extensively pursued in the counties of Norfolk, Cambridge, Huntingdon, Lincoln and York, and in the showyard competitions a keen but friendly rivalry is usually to be noticed between the hackney-breeding farmers of Norfolk and Yorkshire. The high hackney action is uncomfortable in a riding horse. Excellent results have sometimes followed the use of hackney sires upon half-bred mares, i.e. by thoroughbred stallions and trotting..
mares, but it is not always so. As regards the movement, or
“action,” of the hackney, he should go light in hand, and the
knee should be well elevated and advanced during the trot, and,
before the foot is put down, the leg should be well extended.
The hackney should also possess good hock action, as distin-
guished from mere fetlock action, the propelling power
depending upon the efficiency of the former. The hackney
type of the day is “a powerfully built, short-legged, big horse,
with an intelligent head, neat neck, strong, level back, powerful
loins, and as perfect shoulders as can be obtained, good feet,
flat-boned legs, and a height of from 15 hands 2 in. to 15 hands
3 ft. Carriage-horses hackney-bred have been produced over
17 hands high.

The Pony differs essentially from the hackney in height, the
former not exceeding 14 hands. There is one exception, which
is made clear in the following extract from Sir Walter Gilbey’s
Ponies Past and Present (1900):

Before the establishment of the Hackney Horse Society in 1863
the dividing line between the horse and the pony in England
was vague and undefined. It was then found necessary to distinguish
clearly between horses and ponies, and, accordingly, all animals
measuring 14 hands or under were designated “ponies,” and reg-
istered in a separate part of the (Hackney) Stud-Book. This record
of horses had other particulars as to breeding, &c., serves to direct
breeders in their choice of sires and dams. The standard of height
established by the Hackney Horse Society was accepted and officially
recognized by the Royal Agricultural Society in 1889, when the ponies
for the Windsor show contained pony classes for animals
not exceeding 14 hands. The altered polo-rule, which fixes the
limit of height at 14 hands 2 in., may be productive of some little
collateral advantage, for it is well known that the pony is the
maximum height of a pony. Prior to 1883 small horses were called
indifferently Galloways, hobbes, cobs or ponies, irrespective of
their height.

Native ponies include those variously known as Welsh, New
Forest, Exmoor, Dartmoor, Cumberland and Westmorland,
Fell, Highland, Highland Garron, Celtic, Shetland and Cone-
mara. Ponies range in height from 14 hands down to 8 hands.
Shetland ponies eligible for the Stud-Book not exceeding the
latter. As in the case of the hackney, so with the pony,
thoroughbred blood has been used, and with good results,
except in the case of those animals which have to remain to breed
in their native haunts on the hills and moorlands. There the
only possible way of improvement is by selecting the best native
specimens, especially the sires, to breed from. The thin-skinned
progeny of thoroughbred or Arab stock is too delicate to live
unless when hand-fed—and hand-feeding is not according to
custom. Excellent polo ponies are bred as first or second crosses
by thoroughbred stallions on the mares of nearly all the varieties of
ponies. The height is less uniform than in the hackney, the
perpendicular shoulder and the drooping hind quarters, are
modified; but neither the latter, nor bent hocks, which place
the hind legs under the body as in the zebra, are objected to,
as the conformation is favourable to rapid turning. One object
of the pony breeder, while maintaining hardiness of constitu-
tion, is to control size—to compress the most valuable qualities
into small compass. He endeavours to breed an animal
possessing a small head, good shoulders, true action and
perfect manners. A combination of the best points of the hunter with
the style and finish of the hackney produces a class of weight-
carrying pony which is always saleable.
The Shire horse owes its happily-chosen name to Arthur
Young’s remarks, in the description of his agricultural tours
during the closing years of the 18th century, concerning the
large Old English Black Horse, “the produce principally of the
Shire counties in the heart of England.” Long previous to this,
however, the word Shire, in connexion with horses, was used in the
statutes of Henry VIII. Under the various names of the War
Horse, the Great Horse, the Old English Black Horse and the
Shire Horse, the breed has for centuries been cultivated in the
rich fen-lands of Lincolnshire and Cambridgeshire, and in many
counties to the west. The Shire is the largest of draught horses,
the stallion commonly attains a maximum height of 17 to 17-3 hands.
Though the black colour is still frequently met with, bay and
brown are more usually seen. With their immense size and
HORSE [MANAGEMENT]

weight—1800 lb to 2200 lb—the Shires combine great strength,
and they are withal docile and intelligent. They stand on short
stout legs, with a plentiful covering—sometimes too abundant—
of long hair extending chiefly down the back but also round the
front of the limbs from knees and hocks, and when in full feather
obscuring nearly the whole of the hoofs. The head is a good
size, and broad between the eyes; the neck fairly long, with the
crest well arched on to the shoulders, which are deep and strong,
and moderately oblique. The chest is wide, full and deep, the
back short and straight, the ribs are round and deep, the hind
quarters long, level and well let down into the muscular thighs.
The cannon-bones should be flat, heavy and clean, and the feet
wide, tough, and prominent at the heels. A good type of Shire
horse combines symmetrical outlines and bold, free action.
There is a good and remunerative demand for Shire geldings
for use as draught horses in towns.
The Clydesdale, the Scottish breed named from the valley of
the Clyde, is not so quite so large as the Shire, the average height
of stallions being about 16 hands 2 in. The upper part is
bay, particularly if of a dark shade, or dappled. Black is not
uncommon, but grey is not encouraged. White markings on
one or more of the legs, with a white star or stripe on the face,
should be avoided. Long hair on the legs is rather the rule
as in the Shires, and it is permissible in texture. It is regarded as
an indication of good bone. The bones of the legs should be short,
flat, clean and hard; the feet large, with hoofs deep and concave
below. With its symmetry, activity, strength and endurance
the Clydesdale is easily broken to harness, and makes an excellent
draught horse. This breed is growing rapidly in favour in
Canada, but in the United States the Percheron, with its round
head and short pasterns, holds the field. A blend of the Shire
and Clydesdale strains of the British rough-legged draught horse
(virtually sections of the same breed) is a better animal than
either of the parents. It is an improvement upon the Shire due
to the quality contributed by the Clydesdale, and it surpasses
the Clydesdale in strength and substance, as a result of the Shire
connexion. To secure success the two Stud-Books will require
to be opened to animals eligible to be entered in either record.
The blend is being established in U.S.A. as a National breed.
The Suffolk is a horse quite distinct from the Shire and the
Clydesdale. Its body looks too heavy for its limbs, which are
free from the “feather” so much admired in the two other
heavy breeds; it possesses a characteristic chestnut colour.
How long the Suffolks have been associated with the county
after which they are named is unknown, but they are mentioned
in 1256 in Camden’s Britannia. With an average height of about
14-2 hands they often have big, heavy heads, short necks, which
this may explain the appearance which has given rise to the name
of the Suffolk Punch, by which the breed is known. The Suffolk
is a resolute and unwearying worker, and is richly endowed
with many of the best qualities of a horse. The Suffolk
Stud-Book and History of the Breed, published in 1888, is the most exhaustive
record of its kind in England.

MANAGEMENT

Breeding—Animals to breed from should be of good blood,
sound and compactly built, with good pluck and free from
ill-health, and with a tendency to quiet and docility. A mare used to
be put to the horse at three years old, but latterly two has become
the common age. Young sires begin to serve in moderation at
two. May is considered the best month for a mare to foal, as
there is abundance of natural food and the weather is mild enough
for the mare to lie out. Show specimens generally profit by
being born earlier. The period of gestation in the mare is about
eleven months. No nursing mare should go to work, if this can
possibly be avoided. A brood mare requires plenty of exercise
at a slow pace and may work, except between shafts or on a road,
till the day of foaling.

To avoid colic an animal has to be gradually prepared by
giving small quantities of well food for a few days before going
to grass. Shelter against severe storms is needed. Succulent
food encourages the flow of milk, and the success of the foal
greatly depends on its milk supply. Mares most readily conceive when served at the "foal heat" eleven days after foaling. A mature stallion can serve from eighty to one hundred mares per annum.

Foals are weaned when five or six months old, often in October, and require to be housed to save the foal-flesh, and liberally but not overfed; but from the time they are a month old they require to be "gentled" by handling and kindly treatment, and the elementary training of leading from time to time by a halter adjusted permanently to the head. When they are hand-reared on cow's milk foals require firm treatment and must have no fooling to teach them tricks. Young horses that are too highly fed are apt to become weak-limbed and top-heavy.

Breaking.—Systematic breaking begins at about the age of two years, and the method of subduing a colt by "galvanising" is as good as any. It is a more humane system than "rareying," which overcame by exhaustion under circumstances which were not fruitful of permanent results. Galvanising is accomplished by bending the horse's neck round at an angle of thirty-five to forty degrees and tying the halter to the tail, so that when he attempts to walk forward he holds himself and turns "round and round, almost upon his own ground." The more strenuous his resistance the sooner he yields to the inevitable force applied by himself. A wooden pole, the "third hand," is then gently applied to all parts of the body until kicking or any form of resistance ceases. "Biting" or "mouthing," or the familiarising of an animal to the bit in his mouth, and to answer to the rein without bending his neck, is still a necessity with the galvanising method of breaking. Experiences can only be gained by a horse continuing during a considerable time to practise what he has been taught.

Three main characteristics of a successful horse-breaker are firmness, good temper, and incessant vigilance. Carelessness in trusting too much to a young colt that begins its training by being docile is a fruitful source of untrustworthy habits which need never have developed. Driving with long reins in the field should precede the fastening of ropes to the collar, as it accustoms the animal to the pressure on the shoulders of the draught, later to be experienced in the yoke. If a young horse be well handled and accustomed to the dummy jockey, mounting it is not attended with much risk of resistance, although this should invariably be anticipated. An animal ought to be in good condition when being broken in, else it is liable to break out in unpleasant ways when it becomes high-spirited as a result of improved condition. It should be well but not overfed, and while young not overworked, as an overfed animal is liable to refuse to pull, and thus contract a bad habit. Most bad habits and stable tricks are the result of defective management and avoidable accidents.

Feeding.—Horses have small stomachs relatively to ruminating animals, and require small quantities of food frequently. While grazing they feed almost continually, preferring short pasture. No stable food for quick work surpasses a superior sample of fine-hulled whole oats like "Garton's Abundance" (120 lb per week), and Timothy hay harvested in dry weather. The unbruised oats develop a spirit and courage in either a saddle or harness horse that no other food can. A double handful of clean grass, or of bran mixed with the oats in the manger, prevents a greedy horse from swallowing a considerable proportion whole.

Unched oats pass out in the faaces uninjured, so that they are capable of germination, and are of less than no value to a horse. Horses doing slow or other than "upper ton" work may have oats crushed, not ground, and a variety of additions made to the oats which are usually the basis of the feed—for example, a few old crushed beans, a little linseed meal, ground linseed cake or about a wine-glassful of unboiled linseed oil. Indeed, all these are to be avoided on account of the danger of Lathyrus poisoning. A seasoning of ground fennelseed or spice is sometimes given to shy feeders to encourage them to eat. A little sugar or molasses added to the food will sometimes serve the same purpose. Newly crushed barley or cracked maize, even in considerable proportion to the rest of the food, gives good results with draught, coach, 'bus and light harness horses generally. Boiled food of any kind is unnatural to a horse, and is risky to give, being liable to produce colic, especially if the animal bolts its food when hungry, although it generally produces a glossy coat. Too much linseed, often used in preparing horses for market, gives a similar appearance, but is liable to induce fatty degeneration of the liver; given in moderation it regulates the bowels and stimulates the more perfect digestion of other foods. In an England red-clover hay, or, better still, crimson-clover or lucerne hay, these advantages are to be had with about 10 lb per day of oats, while they usually run in open yards with shelter sheds. Bean straw is sometimes given as part of the roughage in Scotland, but not in England. In England hunters and carriage horses are generally fed on natural hay, in Scotland on Timothy, largely imported from Canada, or ryegrass hay that has not been grown with nitrate of soda. Heavily nitrated hay is reputed to produce excessive urination and irritation of the bladder. Pease straw, if not sandy, and good bright oat straw are good fodder for horses; but with barley and wheat straw, in the case of a horse, more energy is consumed during its passage through the alimentary canal than the digested straw yields. Three or four Swedish turnips or an equivalent of carrots is an excellent cooling food for a horse at hard work.

The greater number of horses in the country should have green forage given them during summer, when the work they do will permit of it, as it is their natural food, and they thrive better on it than on any dry food.

When a horse has been overstrained by work the best remedy is to rest at pasture, and if it be lame or weak in the limbs, the winter season is most conducive to recovery. A horse becomes low in condition and moves about quietly, and the frost tends to brace up the limbs. In autumn all horses that have been grazing should be dosed with some vermifuge to destroy the worms that are invariably present, and thus prevent colic or an unthrifty or anaemic state. On a long journey a horse should have occasional short drinks, and near the end a long drink with a slower rate of progression with the object of cooling off. In the stable a horse should always be provided with rock salt, and water to drink at will by means of some such stall fixture as the Mundt hygienic water-supply fittings. Overhead hay-racks are unnatural and are liable to drop seeds into a horse's eye.

Literature.—For riding, &c. see Riding, Driving, Horsemanship, and Horse-Racing. For diseases of the horse see Veterinary Surgery. The literature is voluminous, and collected up to 1887 in Huth's Works on Horses, &c., a bibliographical record of hippology. See also, besides the already mentioned horse-books by Capt. M. B. Hayes, Points of the Horse (1893, 2nd ed., 1897); Stable Management and Exercise (1900); Illustrated Horse-breaking (1889, 2nd ed., 1896); and The Horsewoman (1893) (with Mrs Hayes); E. L. Anderson, Modern Horsemanship (1884); W. Day, The Horse: How to Breed and Rear Him (1888); W. Ridgway, Origin and Influence of the Thoroughbred Horse (1905); Major-General Tweddle, The Arab Horse (1894); J. Wortlev Axe, The Horse, its Treatises on Health and Disease (1906); R. Wallace, Farm Line Stock of Great Britain (1885; 4th ed., 1907); Sydney Galwayne, The Twentieth Century Book of the Horse (1905); C. Bruce Low, Breeding Racehorses by the Figure System (1915); J. H. Weinreich, The History of the American horse in his Derivation, &c. (1897); Weatherly's Celebrated Racehorses (1887); Ruff's Guide to the Turf; T. A. Cook, History of the English Turf (1905); The General Stud-Book (issued quinquennially, and the Stud-Books of the various breed societies. (R. W.)

HORSE LATITUDES—HORSE-MACKEREL, the belts of calms and variable breezes at the polar edge of the N.E. and S.E. trades. According to the New English Dictionary two explanations have been given of the origin of the name: one that the calm kills horses on a sailing ship, the other that the name signifies the unruly and boisterous nature of these winds compared with the pleasant trades. The name is commonly applied to the permanent belt of high atmospheric pressure which encircles the globe in 30° to 35° from the equator.

Horse-Mackerel, the name applied to a genus of fishes (Caranx) found in abundance in almost all temperate and especially in tropical seas. The designation "cavall," given to them by the early Portuguese navigators, and often met with
in the accounts of the adventures of the buccaneers, is still in frequent use among the sailors of all nations. Some ninety different kinds are known—the majority being wholesome food, and some of the species attaining a length of 3 ft. and more. The fish to which the name horse-mackerel is applied in Great Britain is *Caranx trachurus*, distinguished by having the lateral line in its whole length armed with large but narrow bony plates. Horse-mackerel are found singly on the coast all the year round, but sometimes they congregate in shoals of thousands. Although well-flavoured, they are much more frequently used for bait than for food. This species has a very extraordinary range, being found almost everywhere within the temperate and tropical zones of the northern and southern hemispheres.

**HORSEMANSHIP**, the art of managing the horse from his back and controlling his paces and the direction and speed of his movement. The ordinary procedure is dealt with in the articles on Riding and cognate subjects (see also Horse: section Management). A special kind of skill is, however, needed in breaking, training, bitting and schooling horses for a game like polo, or for the evolutions of what is known as the haute école. It is with the latter, or "school" riding, that we deal here. The mid-Victorian system almost entirely developed into a scientific system, and horsemanship into a form of knightly prowess. The Renaissance introduced the cultivation of horsemanship as an art, with regular conditions and rules, instead of merely its skilful practice for utility and exercise. In Italy in the 16th century schools of horsemanship were established at Naples, Rome and other chief cities; thither flocked the nobility of France, Spain and Germany; and Henry VIII. of England and other monarchs of his time had Italians for their masters of the horse. The academy of Pignatelli at Naples was the most famous of the schools in the middle of the 16th century, but a score of other less renowned masters devoted themselves to teaching the riders and training the horses. Trappings of all sorts multiplied; the prescribed tricks, feats and postures involved considerable dexterity; they were fatigueing to both man and beast, and were really useless except for show. This elaborate art, enthusiastically followed among the Romance nations, was the parent of later developments of the haute école, and of the circus-performances of modern days. In England, however, the continental style did not find favour for long. The duke of Newcastle's *Méthode nouvelle de dresser les chevaux* (1648) was the leading text-book of the day, and in 1761 the earl of Pembroke published his *Manual of Cavalry Horsemanship*. In France, a simplification of technical teaching was introduced by the 18th century by La Guériére (École de cavalerie) and others. The French military school thus became the model for Europe, though the English style remained in opposition, forming a sort of compromise with the ordinary method of riding across country. In more modern times France again came to the front in regard to the haute école, through the innovations of the vicomte d'Aure (1798-1863) and François Baucher (1796-1973). Baucher was a circus-rider who became the greatest master of his art, and who had an elaborate theory of the principles involved in training a horse. His system was carried on, with modifications, by masters and trainers developed under his influence. In more recent times the style of the haute école has also been cultivated by various masters in the United States, such as H. L. de Bussigny at Boston.

**HORSES**, a market town of Denmark, at the head of Horsens Fjord, on the east side of Jutland, 32 m. by rail S.W. of Aarhus, in the amt (county) of that name. Pop. (1901) 22,243. It is the junction of branch railways to Bryrup and to Tørring inland, and to Juelsminde on the coast. The exports are chiefly bacon and butter; the imports, iron, yarn, coal and timber. The town is ancient; there is a Norway church, with towers of the 17th century, and the Vor-Freisers-Kirke has a carved pulpit of the same period. Horsens is the birthplace of the navigator Vitus Bering or Behring (1680), the Arctic explorer. To the north lies the picturesque lake district between Skanderborg and Silkeborg (see Aarhus).

**HORSE-POWER**. The device, frequently seen in farmyards, by which the power of a horse is utilized to drive threshing or other machinery, is sometimes described as a "horse-power," but this term usually denotes the unit in which the performance of steam and other engines is expressed, and which is defined as the rate at which work is done when 33,000 lb are raised one foot in one minute. This value was adopted by James Watt as the result of experiments with strong draught-horses, but, as he was aware, it is in excess of what can be done by an average horse over a full day's work. It is equal to 7.46 watts. On the metric system it is reckoned as 4500 kilogram-metres a minute, and the French cheval-vapeur is thus equal to 32,540 foot-pounds a minute, or 0.9863 of an English horse-power, or 736 watts. The "nominal horse-power" of engines is sometimes rated at an arbitrary and obsolete term of indefinite significance. An ordinary formula for obtaining it is \(17.7D^2\) for high-pressure engines, and \(17.7D^2\) \(S\) for condensing engines, where \(D\) is the diameter of the piston in inches and \(S\) the length of the stroke in inches. The horse-power is thus applied to the reciprocating engine. The "indicated horse-power" of a reciprocating engine is given by \(ASP\left(\frac{736}{3300}\right)\), where \(A\) is the area of the piston in square inches, \(S\) the length of the stroke in feet, \(P\) the mean pressure on the piston in lb per sq. in., and \(N\) the number of effective strokes per minute, namely, one for each revolution of the crank shaft if the engine is single-acting, but twice as many if it is double-acting. The mean pressure of the engine is ascertained from the diagram or "card" given by an indicator (see Steam-Engine). In turbine engines this method is inapplicable. A statement of indicated horse-power supplies a measure of the force acting in the cylinder of an engine, but the power available for doing external work on the crank-shaft is less than this by the amount absorbed in driving the engine itself. The useful residue, known as the "actual," "effective" or "brake" horse-power, can be directly measured by a dynamometer (q.v.); it amounts to about 80% of the indicated horse-power for good condensing engines and about 85% for non-condensing engines, or perhaps a little more when the engines are of the largest sizes. When turbines, as often happens in land practice, are directly coupled to electrical generators, their horse-power can be deduced from the electrical output. When they are used for the propulsion of ships recourse is had to "torton meters" which merely give an indication of the propulsive power of the propeller shafts while transmitting power. Two points are selected on the surface of the shaft at different positions along it, and the relative displacement which occurs between them round the shaft when power is being transmitted is determined either by electrical means, as in the Denny-Johnson torsion-meter, or optically, as in the Hopkinson-Thring and Bevis-Gibson instruments. The twist or surface-shear being proportional to the torque, the horse-power can be calculated if the modulus of rigidity of the steel employed is known or if the amount of twist corresponding to a given power has previously been ascertained by direct experiment. The word "horse" was originally applied to the part of the mowing-engine which twisted the grass while transmitting power.

**HORSE-RACING**. Probably the earliest instance of the use of horses in racing recorded in literature occurs in II. xxiii. 212-650, where the various incidents of the chariot-race at the funeral games held in honour of Patroclus are detailed with much vividness. According to the ancient authorities the four-horse chariot-race was introduced into the Olympic games as early as the 23rd Olympiad; to this the race with mounted horses was added in the 33rd; while other variations (such as two-horse chariot-races, mule races, loose-horse races, special races for under-aged horses) were admitted at a still later period. Of the training and management of the Olympic race-horse we are left in ignorance; but it is known that the equestrian candidates were required to enter their names and send their horses to Elis at least thirty days before the celebration of the games commenced, and that the charioteers and riders, whether owners or proxies, went through a prescribed course of exercise.
HORSE-RACING during the intervening month. At all the other national games of Greece (Pythian, Isthmian, Nemean), as well as at many of the local festivals (the Athenian Olympia and Panathenaea), similar contests had a prominent place. Some indication of the extent to which the passion for horse-racing was indulged in at Athens, for example, about the time of Aristophanes may be obtained from the scene with which *The Clouds* opens; while it is a significant fact that the Bocotians termed one of the months of their year, corresponding to the Athenian Hemitimaeon, Hippodromius ("Horse-race month"); see Plutarch, *Cam. 15*). For the chariot-races and horse-races of the Greeks and Romans, see Circus and Games.

**Great Britain**

There is no direct historical evidence to show that the ancient Britons addicted themselves to any form of this amusement; but there are indications that among some at least of the Germanic tribes, from a very early period, horse-racing was an accomplishment of their religious cultus. There can be no doubt that the Romans encouraged the pursuit in Britain, if they did not introduce it; traces of race-courses belonging to the period of their occupation have been frequently discovered. The influence of the Christian Church was everywhere at first strongly against the practice. The opinion of Augustine and other fathers of the church with regard to attendance at the spectacles, whether of theatre or of circus, is well known; those who performed in them were rigidly excluded from church fellowship, and sometimes even those who merely frequented them. Thus the first council of Arles, in its fourth canons, declared that those members of the church who drove chariots at the public games should, so long as they continued in that employment, be denounced communion. (Compare the rule in the *Ap. Const.* viii. 32; *Ap. Bingham, Ant. Chr. Church*, xvi. 4, 10.) In many cases, however, the weight of ecclesiastical authority proved insufficient to cope with the force of old custom, or with the fascination of a sport the unchristian character of which was not very easily demonstrable; and ultimately in Germany and elsewhere the old local races appear to have been admitted to a recognized place among the ceremonies peculiar to certain Christian festivals.

The first distinct indication which contemporary history affords of horse-racing as a sport occurs in the *Description of the City of London* of William Fitzstephen (c. 1174). He says that in a certain "plane field without one of the gates (quidam planus campus re et nomine—Smithfield, quasi Smoothfield) every Friday, unless it be one of the more solemn festivals, is a noted show of well-bred (nobilium) horses exposed for sale. The earls, barons and knights who are resident in the city, as well as a multitude of citizens, flock thither either to look on or buy." After describing the various types of horses brought into the market, especially the more valuable chargers (dextrarios preciosos), he says: "When a race is to be run by such horses as these, and perhaps by others which, in like manner, according to their breed are strong for carriage and vigorous for the course, the people raise a shout and order the common horses to be withdrawn to another part of the field. The jockeys, who are boys expert in the management of horses, which they regulate by means of curb bridles, sometimes by threes and sometimes by twos, as the manner is made, perform several courses for the contest. Their chief aim is to prevent a competitor from getting before them. The horses too, after their manner, are eager for the race; their limbs tremble, and impatient of delay they cannot stand still; upon the signal being given they stretch out their limbs, hurry on the course, and are borne along with unremitting speed. The riders, inspired with the love of praise and the hope of victory, clasp spurs to their flying horses, lashing them with whips, and inciting them by their shouts" (see Stow's Translation). In the reign of Richard I. knights rode at Whitsuntide on steeds and palfreys over a three-mile course for "forty pounds of ready gold," according to the old romance of Sir Bevys of Hampton. The fents of the tilt-yard, however, seem to have surpassed horse-racing in popular estimation at the period of the crusades. That the sport was to some extent indulged in by King John is quite possible, as running horses are frequently mentioned in the register of royal expenditure; and we know that Edward III. had a number of running horses, but it is probable they were chiefly used for field sports.

An example of the growing favour in which horse-racing was held as a popular amusement is furnished by the fact that public races were established at Chester in 1312. Randle Holme of that city tells us that towards the latter part of Henry VIII.'s reign, on Shrove Tuesday, the company of saddlers of Chester presented to "the drapers a wooden ball embellished with flowers, and placed upon the point of a lance. This ceremony was performed in the presence of the mayor at the cross of the Roody or Rooede, an open place near the city; but this year (1540) the ball was changed into a silver ball, valued at three shillings and sixpence or more, to be given to him who shall run best and furthest on horseback before them on the same day, Shrove Tuesday; these balls were denominated St George's bells." In the reign of Elizabeth there is evidence from the poems of Bishop Hall (1597) that racing was in vogue, though apparently not patronized by the queen, or it would no doubt have formed part of the pastimes at Kenilworth; indeed, it seems then to have gone much out of fashion.

The accession of the Stuarts opened up an era of prosperity for the sport, for James I., who, according to Youatt, had encouraged if not established horse-racing in Scotland, greatly patronized it in England when he came to the throne. Not only did he run races at Croydon and Enfield, but he endeavoured to improve the breed of horses by the purchase for a high figure of the Arab stallion known as Markham's Arabian, which little horse, however, was beaten in every race he ran.

In 1607, according to Camden's *Britannia*, races were run near York, the prize being a little golden bell. Camden also mentions as the prize for running horses in Gistrator Forest a little golden ball, which was apparently anterior to the bell. In 1609 Mr Robert Ambryte, sometime sheriff of the city of Chester, caused three silver balls to be made of good value, which balls he appointed to be run for with horses on St George's day upon the Rooede, the first horse to have the best bell and the money put in by the horses that ran—in other words, a sweepstake—the bells to be returned that day twelvemonth as challenge cups are now; towards the expenses he had an allowance from the city. In 1613 subscription purses are first mentioned. Nicholls, in his *Progress of James I.*, makes mention of racing in the years 1617 and 1619. Challenge bells appear to have continued to be the prizes at Chester, according to Randle Holme the younger, and Ormerod's *History of Chester*, until 1623 or 1624, when Mr John Brennan, mayor of Chester, altered the course and caused the horses to run five times round the Rooede, the bell to be of good value, £8 or £10, and to be a free bell to be held for ever—in other words, a presentation and not a challenge prize.

During James's reign public race meetings were established at Gistrator or Garderley, near Richmond in Yorkshire, at Croydon in Surrey, and at Enfield Chase, the last two being patronized by the king, who not only had races at Epsom during his residence at Nonsuch, but also built a house at Newmarket for the purpose of enjoying hunting, and no doubt racing too, as we find a note of public races at this place as early as 1605. Races are also recorded as having taken place at Linton near Cambridge, but they were probably merely casual meetings. The prizes were for the most part silver or gold bells, whence the phrase "bearing away the bell." The turf indeed appears to have attracted a great deal of notice, and the systematic preparation of running horses was studied, attention being paid to their feeding and training, to the instruction of jockeys—although private matches between gentlemen who rode their own horses were very common—and to the training of weights, which were usually about 10 stone. The sport also seems to have taken firm hold of the people, and to have become very popular.

The reign of Charles I., which commenced in 1625, saw still more marked strides made, for the king not only patronized the
Horse-racing at Newmarket, which we know was current in 1640, but thoroughly established it there, and built a stand house in 1667, since which year the races have been annual. Mention is likewise made in the comedy of the Merry Beggars, played in 1641, of races, both horse and foot, in Hyde Park, which were patronized by Charles I., who gave a silver cup, value 100 guineas, to be run for instead of bells. Butcher, in his survey of the town of Stamford (1640), also says that a race was annually run in that town for a silver and gilt cup and cover, of the value of £7 or £8, provided by the care of the aldermen for the time being out of the interest of a stock formerly made by the nobility and gentry of the neighbourhood.

In 1648 Clarendon tells us that a meeting of Royalists was held at several match-day in 1668 and 1670, as Epsom Downs were then called, "under the pretence of a horse-race," so that horse-racing at Epsom was not unknown early in the 17th century; Pepys, too, in his Diary of 1663, mentions his having intended to go to Banstead Downs to see a famous horse-race. Cromwell is said to have kept running horses in the year 1653, but in 1654 he appears to have gone so far as to forbid racing for six and eight months respectively. After the Reformation in 1660, a new impetus was given to horse-racing, which had languished during the civil wars, and the races at Newmarket, which had been suspended, were restored and attended by the king; and as an additional encouragement, and as a suit to government, royal plates were given at each of the principal courses, and royal mares, as they were called, were imported from abroad. Charles II. rebuilt the house originally erected at Newmarket by James I., which had fallen into decay. The Round course was made in 1666, and racing at the headquarters of the turf was regulated in the most systematic way, as to the course, weights and other conditions. Charles II. was the first monarch who entered and ran horses in his own name; and, besides being a frequent visitor at the races on Newmarket Heath, and on Burford Downs, near Stockbridge, where the Bibury Club meeting was held, he established races at Datchet. In the reign of James II. nothing specially noteworthy occurred, but William III. continued former crown donations and even added to them.

Anne was much devoted to horse-racing, and not only gave royal plates to be competed for, but ran horses for them in her own name. In 1703 Doncaster races were established, when 4 guineas a year were voted by the corporation towards a plate, and in 1716 the Town Plate was established by the same authority to be run on Doncaster Moor. Nearly a century, however, elapsed before the St Leger was instituted. Matches at Newmarket had become common, for we find that Bosto, one of the earliest race-horses of whom we have any authentic account, won at Banstead Downs, and that there were in 1708 and 1709. In the latter year, according to Camden, York races were established, the course at first being on Clifton Ings, but it was subsequently removed to Knavesmire, on which the races are now run. In 1710 the first gold cup said to have been given by the queen, of 60 guineas value, was run for by six-year-old horses carrying 12 stone each, the best of three 4-mile heats, and was won by Bay Bolton. In 1711 it was increased to 100 guineas. In 1712 Queen Anne's gelding Pepper ran for the Royal Cup of £500 at York, and her Mustard, a nutmeg-grey horse, ran for the same prize in 1713. Again in 1714 her Majesty's bay horse Star won a sweepstake of 10 guineas added to a plate of £40 at the same place, in four heats, carrying 11 stone. In 1716 the Ladies' Plate at York for five-year-olds was won by Aleppo, son of the Darley Arabian. Racing and match-making continued to be a regular sport at Newmarket, and at York and Hamilton, and we also find a record of a race at Lincoln in August 1719 for a silver tea-board, won by Brocklesby Betty, as was the Queen's Plate at Black Hamilton in the year before.

Between 1714 and 1720 there were races at Pontefract in Yorkshire for plates or money. The best of two out of three heats was to be the winner, provided the said horse was not distanced in the third heat—the distance post being 1 furlong from the winning post; and this appears to have been a usual condition. In or about the year 1721 Flying Childers is said to have run a trial against Almanzor and Brown Betty over the Round course at Newmarket (3 m. 4 f. 93 y.) in 6 m. 40 s., and another trial over the Beaufort course (a.m. f. 158 y.) in 7 m. 30 s.—which is fast even for a six-year-old; but it is just possible that in those days the art of time-taking was anything but perfect.

In 1721 George I. gave 100 guineas in specie in lieu of the gold cup at York presented by Anne, and the king's or queen's plates have been given in cash ever since. In 1725 a ladies' plate was run for on the 14th of September by female riders on Ripon Heath in Yorkshire. In 1727 Mr John Cheney established the Racing Calendar—an historical list of all the horse matches run, and of all plates and prizes run for in England and Wales of the value of £50 or upwards in 1727, &c. No systematic records had till then been preserved of the running of the race-horses of the day, and it is only through the Racing Calendar and the records of certain celebrated horses and mares that we have any information of what actually took place, and even that is more or less of a fragmentary kind. At this time racing was thoroughly established as a national and popular sport, for there were upwards of a hundred meetings in England and Wales; but the plates or sweepstakes run for were for the most part of small value, as £10, £20, £30, £40, and sometimes £50. In 1737, according to Whyte, there were only a dozen royal plates run for in England: one at Newmarket in April for six-year-old horses carrying 10 stone each, in heats over the Round course—first called the King's Plate course; one for five-year-old horses, carrying 12 stone each, in one heat, and another in October for six-year-old horses at 12 stone, in heats over the same course; one at York (which commenced in 1711) for six-year-old horses, 12 stone each, 4-m. heats; one at Blackhampton, Yorkshire (of which no regular account was kept until 1715), for five-year-old mares, 10 stone, 4 m.; one at each of the following places, Nottingham, Lincoln, Guildford, Winchester, Salisbury and Lewes, for six-year-old horses, 12 stone each, 4-m. heats; and one at Ipswich for five-year-old horses, 10 stone each. A royal plate was also run for at Edinburgh in 1728 or 1729, and one at the Curragh of Kildare in 1741.

In 1739 an act was passed to prevent racing by ponies and weak horses, 13 Geo. II. cap. 10, which also prohibited prizes or plates of less value than £50. At this period the best horses seldom ran more than five or six times, and some not so often, there being scarcely any plates of note except royal ones, and very few sweepstakes or matches of value except at Newmarket until after 1750; moreover, as the races were run in heats, best three out of four, over a course of several miles in length, the task set the horses before winning a plate was very severe, and by no means commensurate with the value of the prize. In 1755 the great subscription races commenced at York, the city aldermen having added £500 to every plate to be conducted. At Newmarket there were only two meetings, one in April and the other in October, but in 1753 a second spring meeting was established, and in that year the Jockey Club, which was founded in 1750, established the present racing ground. In 1762 a second October meeting was added, in 1765 the July meeting, in 1770 the Houghton meeting, and in 1771 the Craven meeting. In 1766 Tattersalls's was established at Hyde Park Corner by Richard Tattersall for the sale of horses; it remained the great emporium of horses, and the rendezvous for betting on horse races, until 1855, when, the lease of the premises at the Corner having run out, it was removed to Knightsbridge.

We now come to a very important period—that at which the great three-year-old races were instituted. The St Leger was established in 1776 by Colonel St Leger, who resided at Parkhill, near Doncaster. On the 24th of September, during the Doncaster races, which took place annually in the autumn, at his suggestion a sweepstake of 25 guineas each for three-year-old colts and fillies was run over a 2-m. course; there were six competitors, the property of as many subscribers,—a very small beginning, it must be owned. The race was won by a filly by Sampson, belonging to Lord Rockingham, which was afterwards named Allabaculla. In the following year the same stake had twelve
HORSE-RACING

Subscribers and ten starters, and was won by Mr Sotheron's Bourbon. It was not, however, until the succeeding year, 1728, that it was named the St Leger, in compliment to the founder, at the suggestion of the marquis of Rockingham. The stakes were increased in 1832 to 50 sovs. each, and the weights have been raised from time to time to keep pace with modern requirements. The Doncaster Cup, a weight for age race for three-year-olds and upwards, was established in 1801. The course is nearly flat, of an oval or kite shape, about 1 1/2 m. round the town-moor.

The Epsom Derby and Oaks were established in 1779 and 1780, the Oaks in the former and the Derby in the latter year. It is true that in 1730 Epsom races became annual, but the prizes were nothing more than the usual plates run for in heats, the money required being raised by voluntary subscriptions, as well as the owners of booths on the downs as by the parties more immediately interested, whence arose the custom of charges being made by the lord of the manor for permission to erect booths, &c. during the races. On the 14th of May 1779 the twelfth edition of Sir Charles Bunbury's Chestnut Colt Diable or Florizel, son of Herod, who beat eight opponents, including the duke of Bolton's Bay Bolton and Lord Grosvenor's Diadem. These two races have since been run for regularly every year, the Derby, which before 1839 was run on the Thursday, now taking place on the Wednesday, and the Oaks on the Friday, in the same week at the end of May.

Ascot races, which are held on Ascot Heath, were established by the Duke of Cumberland, uncle of George III., and are patronized by royalty in state or semi-state. They are mentioned in the first Racing Calendar, published in 1772, but the races were for the most part plates and other prizes of small importance, though a royal plate for hunters appears to have been given in 1785. The Gold Cup was first given in 1807, and has been regularly competed for ever since, though from 1845 to 1853 inclusive it was won by the defeated party of the Emperor of France, the prize being offered by the emperor of Russia. In 1854, during the Crimean War, the cup was again called the Ascot Gold Cup, and was given from the racing fund. The Queen's Vase was first given in 1828, and the Royal Hunt Cup in 1833, while in 1865 a new long-distance race for four-year-olds and upwards was established, and named the Alexandra Plate, after the Princess of Wales.

Goodwood races were established by the Duke of Richmond on the downs at the northern edge of Goodwood Park in 1802, upon the earl of Egremont discontinuing races in his park at Petworth. The races take place at the end of July, on the close of the London season. The Goodwood Cup, the chief prize of the meeting, was first given in 1812; but from 1836 to 1844 inclusive there was no race for it, with the single exception of 1816.

During the latter half of the 18th century horse-racing declined very much in England, and numbers of meetings were discontinued, the wars which took place necessarily causing the change. From the beginning of the 19th century, and especially after the conclusion of the French war in 1815, racing rapidly revived, and many new meetings were either founded or renewed after a period of suspension, and new races were from time to time established. Among others the Two Thousand and Four Thousand Guineas at Newmarket for three-year-old colts and fillies, and the One Thousand Guineas for fillies, were established in 1809 and 1814 respectively, the Goodwood Stakes in 1833, the Chester Cup and Brighton Stakes in 1824, the Liverpool Stud Cup in 1828, the Northumberland Plate in 1833, the Manchester Cup in 1834, the Ascot Stakes and the Cesarewitch and Cambridgeshire Handicaps at Newmarket in 1839, the Stewards' and Chesterfield Cups at Goodwood in 1840, the Great Ebor Handicap at York in 1843, and, to omit others, the City and Suburban Handicap at Epsom in 1851, and the Lincoln Handicap in 1853.

Two-year-old racing was established very shortly after the great three-year-old races, and on a similar footing, that is to say, the competitors carried the same weights, with the exception of a slight allowance for sex, the July Stakes at the Newmarket Midsummer Meeting having been founded as early as 1786. The Woodcote Stakes at Epsom succeeded in 1809, the Champagne Stakes at Doncaster in 1823, the Criterion Stakes at the Houghton Meeting in 1829, the Chesterfield Stakes at the Newmarket July meeting in 1834, the New Stakes at Ascot in 1843, the Middle Park Plate (or two-year-old Derby, as it is sometimes called) at the Newmarket Second October Meeting in 1866, the Dewhurst Plate at the Houghton Meeting in 1875, and the Richmond Stakes at Goodwood in 1877.

Present Conditions.—Horse-racing, usually described as "the national sport," has greatly advanced in general popularity in the British Isles. There is no doubt that the best specimens of the English thoroughbred horse are the finest animals of their kind in existence; the value of an infusion of the blood of chargers, hunters, hacks, and other varieties is scarcely to be overestimated; and the only way of ascertaining what animals may be most judiciously employed for breeding purposes is to submit them to the tests of preparation on the course and performance in the turf. Racing is therefore a practical necessity. On some accepted authority, the origin of which is not to be traced, five races run each season by three-year-olds are distinguished as "classic." Of these the chief, by universal consent, is the Derby, which takes place at Epsom during the week which includes the 31st May. The Epsom course, on which the Derby has been run since its origin in 1770, is by no means a good one, in consequence of the abrupt turn at Tattenham Corner; and the severe descent after this turn is made is also held to be a disadvantage, though a really good horse should be able to act on ascents, descents and level ground with equal relative facility. In many respects the St Leger, run at Doncaster about the middle of September, is a better test, as here colts and fillies meet when both are presumably able to themselves the fullest justice. September, indeed, has been called "the Mares' Month," for though fillies are eligible to run in the Derby, they are very frequently out of sorts and always more or less uncertain in their performances during the summer—only four have been successful in 129 contests for the stake—whereas in the autumn their numerous victories in the St Leger seem to be at their best. It was the recognition of this fact which induced an alteration of the weights in the year 1839, previously to which fillies had carried 5 lb less than colts; the weights, formerly 8 st. 10 lb and 8 st. 5 lb, are now 9 st. and 8 st. 11 lb. At the Doncaster course is superior for racing purposes to that at Epsom, where the Oaks, another of the "classic races," is run on the Friday following the Derby; the other two contests which come into this category being the Two Thousand Guineas for colts and fillies, and the One Thousand Guineas for fillies only. These races are usually run for at Doncaster during the first Spring Meeting, the former always on a Wednesday, the latter on Friday. The expression "a Derby horse" is common, but has no precise significance, as the three-year-olds vary much in capacity from year to year. It is generally understood, for instance, that Ormonde, who won the Derby in 1886, must have been at least 21 lb superior to Sir Visto or Jeddah, who were successful in 1895 and 1898. By their ability to carry weight the value of horses is estimated on the turf. Thus one horse who beats another by a length over a distance of a mile would be described as a 5 lb better animal.

The term "handicap horse" once had an adverse significance which it does not now possess. In handicaps horses carry weight according to their presumed capacity, as calculated by handicappers who are licensed by the Jockey Club and...
employed by the directors of different meetings. The idea of a handicap is to afford chances of success to animals who would have no prospect of winning if they met their rivals on equal terms; but of late years the value of handicaps has been so greatly increased that few owners resist the temptation of taking part in them. Horses nowadays who do not run in this kind of contest are very rare, though a few, such as Ormonde, Isinglass, and Persimmon, never condescended to this class of sport. The duke of Westminster did not hesitate to put his Derby winner Bend Or into some of the chief handicaps; and it is, of course, a great test of merit when horses carrying heavy weights show marked superiority in these contests to rivals of good reputation more lightly burdened. St Galen, who dead-heated with Harvester in the Derby of 1884, Robert the Devil, who won the St Leger in 1886 and on several occasions beat the Derby winner Bend Or; and La Flèche, who won the Oaks and the St Leger in 1892, added to the esteem in which they were held by their successes under heavy weights, the colts in the Cesarewitch, the filly in the Cambridgeshire. Of the chief handicaps of the year, special mention may be made of the City and Suburban, run at the Epsom Spring Meeting over 1½ m.; the Kempton Park Jubilee, over 1 m.; the Ascot Stakes, 2 m., and the Royal Hunt Cup, 1 m.; the Stewards' Cup at Goodwood, six furlongs; the Cesarewitch Stakes and the Cambridgeshire Stakes at Newmarket, the former 2½ m., the latter a mile and a furlong—till lately it was "a mile and a distance"—"a distance" on the Turf being a fixed limit of 240 yds. The cups at Manchester, Newbury, and Liverpool are also handicaps of some note, though it may be remarked that the expression "a cup horse" is understood to imply an animal capable of distinguishing himself over a long distance at even weights against the best opponents. There are many other valuable stakes of almost equal importance, diminishing to what are known as "selling handicaps," the winners of which are always put up for sale by auction immediately after the race, in the lowest class of them: the condition being that the winner is to be offered for £50. No stake of less than £100 can be run for under Jockey Club rules, which govern all reputable flat racing in England, nor is any horse ever entered to be sold for less than £50. As horses mature they are naturally able to carry heavier weights.

**Scale of Weight for Age.**

The following scale of weight for age is published under the sanction of the Stewards of the Jockey Club as a guide to managers of race meetings, but is not intended to be imperative, especially as regards the weights of two- and three-year-olds relatively to the old horses in selling races early in the year. It is founded on the scale published by Admiral Roux, and revised by him in 1873, but has been modified in accordance with suggestions from the principal trainers and practical authorities.

In the year 1884 the managers of Sandown Park formulated the scheme of a race for a prize of £10,000, to be called the Eclipse Stakes, and to be run over a distance of 1½ m. In order to secure a large entry, horses were to be nominated soon after their birth; owners who perceived the hopelessness of their nominations could withdraw at stated intervals by the payment of increasing forfeits; if their animals finally went to the post a stake amounting in all to £115 would have to be paid for them; and thus it will be seen that owners were willing to sacrifice the best they possessed, if there were an insufficient number of entries the club might be taxed to supply the deficiency. The scheme was found to be attractive, and the example was followed at Leicester and at Manchester, at both of which places, however, it lapsed. At Newmarket, under the immediate auspices of the Jockey Club, the £10,000 races succeeded, and there were two of them each year. The Princess of Wales's Stakes was run for the first time in 1894 at the First July Meeting, and the Jockey Club Stakes at the First October. The former has, however, now been reduced to £5000 added to a sweepstake of £50 each with a minor forfeit. In the year 1890 a fourth race of similar character, the Century Stakes, was originated at Sandown, but the experiment proved a failure, and the contest was discontinued.

The age of the thoroughbred horse is always dated from the 1st January. Foals are generally born in February, March or April, though not a few good horses have been born in May; they become yearlings, therefore, on the 1st January following, two-year-olds twelve months later, and many of them begin to race in the following March, for flat racing always starts during the week which contains the 25th, except when Easter falls unusually early. In France no two-year-olds run until the 1st August, and discussion is frequently raised as to the respective wisdom of the English and French systems. It happens, however, that some young horses "come to hand" soon, and deteriorate with equal rapidity. They are, in fact, able to win races at the beginning of the season, and fail to hold their own later in the year against bigger and more powerful animals of their own age who have taken longer to mature; so that there is some argument in favour of the earlier date. The first noteworthy two-year-old race is the Brocklesby Stakes, run at Lincoln during the first week of the season. Sometimes the winner of the Brocklesby is really a good animal, as was the case with The Bard in 1895 and Elephant in 1883, but as a general rule when the autumn comes he is found to be far inferior to the winners of subsequent two-year-old races of good class. It is seldom that a first-class two-year-old appears before the Ascot Meeting about the middle of June, though horses of character sometimes run for the Woodcote Stakes at Epsom and in other contests elsewhere. The names of many of the most famous horses on the turf are found in the list of winners of the New Stakes at Ascot, which was run in 1843 and maintains its character. In 1890 the Coventry Stakes was originated, and is regarded as a race of practically equal importance. The July Stakes at Newmarket is the oldest of existing two-year-old races, having been first run in 1756. The list of winners is a brilliant one. The Chesterfield Stakes ranks with it. The best two-year-olds are usually seen out at Goodwood, and as a general rule those that have chiefly distinguished themselves during the year, and are to make names for themselves later in life, are found contesting the Middle Park Plate at the Newmarket Second October Meeting and the Dewhurst Plate at the Newmarket Houghton. The Middle Park Plate is generally worth over £2000, the
other races named are between £1000 and £2000 in value; but these are not the richest two-year-old prizes of the year, the value of the National Breeders' Produce Stakes at Sandown, run on the day following the Eclipse, being between £4000 and £5000, and the Imperial Stakes at Kempton Park falling not very far short of £3000. As a rule, a colt who has been specially successful as a two-year-old maintains his capacity later in life, unless it be found that he cannot "stay"—that is to say, is unable to maintain his best speed over more than five or six furlongs; but it is frequently the case that fillies who have won good races as two-year-olds entirely lose their form and meet with little or no success afterwards.

Newmarket is called with reason "the headquarters of the Turf." There are about forty training establishments in the town, each trainer being in charge of an average of thirty to forty horses, irrespective of mares, foals and yearlings. During the year eight race meetings are held on the Heath: the Craven, the First and Second Spring; the First and Second October—the First October usually occurring at the end of September; and the Houghton. These are contested on "the Flat," the course which includes the Rowley Mile. It is said that the Rowley Mile is so called from the fact of its having been a favourite race-ground with Charles II. The First and Second July Meetings take place on another course, known as "Behind the Ditch," the Ditch being the huge embankment which runs through several counties and has existed from time immemorial. The Craven Stakes for three-year-olds is an event of some importance at the first meeting of the year. It used to finish on an ascent at what is called the "Top of the Town," a course over which the handicap for the Cambridgeshire was run. This course has now been abandoned and the stand pulled down. At the First Spring Meeting the Two Thousand Guineas and the One Thousand Guineas occur, as already stated, but the names do not represent the values of the stakes, which are, in fact, usually worth close on £5000 each. The July Stakes and the Princess of Wales' Stakes are run at the First July Meeting. The Jockey Club Stakes is the leading event of the First October; the Cesarewitch and the Middle Park Plates follow in the Second October; the Criterion Stakes, another of the few races that once finished at the "Top of the Town," the Cambridgeshire and the Dewhurst Plate take place at the Houghton Meeting. The majority of races finish at the Rowley Mile post; but there are three other winning-posts along the Rowley Mile. "Behind the Ditch " races finish at two different posts, one of which enables horses to avoid the necessity of galloping up the severe ascent of the "Runbury Mile." Although, as a rule, there is no better racing to be seen than the best events at Newmarket, the programmes are often spun out by selling plates and patrician handicaps, and a high level is nowhere so consistently maintained as at Ascot.

Ascot and other meetings.

The Ascot meeting is distinguished by the entire absence of selling plates, and much more "added money" is given than on any other course. Added money is the sum supplied by the directors of a race meeting, derived by them from the amounts paid for entrances to stands and enclosures; for in many races—the Ten Thousand prizes, for instance—owners are allowed to enter horses on the account of others, for which they are paid the fees provided. The Ascot Cup is generally spoken of as a race success in which sets the seal to the fame of a good horse. It is a prize of the highest distinction, and of late years has been of considerable value, the winner in 1900 having gained for his owner £3430. That the number of runners for this race should be invariably small—the average for many years past has been about six—is not a matter of surprise to those who are familiar with the Turf. There are very few horses possessing sufficient speed and staying power to make it worth while for their owners to submit them to the exceedingly severe test of a preparation for this race, which is run over 2½ m. of ground at a time of year when the turf is almost always extremely hard everywhere, and harder at Ascot than almost anywhere else. There is no course on which more good horses have hopelessly broken down. All the prizes are handsome, and success at Ascot confers much prestige, for the reason that the majority of horses that run are good ones; but annually there is a list of victims that never recover from the effects of galloping on this ground. Goodwood also attracts horses of high character, though some unimportant races fill out the programme. Formerly there were many meetings around London, which fell into disrepute in consequence of the manner in which they were conducted. These have been replaced by well-managed gatherings in enclosed parks, and here the value of the prizes is often so high that the best horses in training are attracted. These meetings include Sandown, Kempton, Gatwick, Lingfield, Newbury and Hurst Park. Liverpool, Manchester, Birmingham, Brighton, York and various other towns have race meetings twice or oftener in the course of each year. At the various fixtures over half a million of money is annually given in stakes. The largest sum ever won by a horse was the £57,185 gained by Islington in 1892–1893. Donovan follows with £54,935. In all probability these large totals would have been considerably exceeded had not Flying Fox—who had won in his first two seasons £40,000—been disqualified by the death of his owner, the duke of Westminster, as this colt was engaged in the four £10,000 races of 1900, in which to all appearance he could not have been beaten, so much was he superior to his contemporaries. The death of an owner of horses disqualifies the animals he has entered—a necessary regulation, as otherwise an heir might be burdened with a stable of horses the possession of which would entail heavy expense and serious responsibility on a person who perhaps had no knowledge of or taste for racing.

The value of an unquestionably good horse is enormous. It has been seen what handsome prizes are offered for competition, and when withdrawn from the Turf the horse may secure a large income to his owner at the stud. A stallion's fee of 600 guineas (as in the case of St Simon) should mean well over £20,000 a year; and fees of 100 guineas and more are common. Proved merit on the Turf is considered essential in a sire, though there have been instances of horses, unsuccessful during their racing career, who have distinguished themselves at the stud: Wisdom, sire of the Derby winner Sir Hugo, and several notable examples might be cited. Mares are much more uncertain in this respect. On the whole, the famous mares that have won the Oaks, the St Leger and other leading races, have been apt to fail in the paddocks; but there is always a hope of success with them, and the large sum of 12,600 guineas was paid for La Flèche when she had ceased from active service on the Turf. For None-the-Wiser 7200 guineas was given; and 4600 guineas for Wedlock when well advanced in years, for the sake of a female claim of a good horse called Best Man. Well-bred mares that have shown no capacity for racing are, however, frequently the dams of good winners. Breeding is a lottery. An Australian enthusiast some years since published a book the object of which was to enable breeders to produce good horses by a species of mathematical calculation; but the fallacy of the "Figure System" was at once proved by the simple circumstance that in very many cases the own brothers and sisters of good winners, whose breeding conformed entirely to the system, proved to be utterly unworthy for racing purposes. It is a fact difficult of explanation that the majority of famous winners have been privately bred by their owners. Many persons breed for sale, in some cases sparing no expense or trouble in the endeavour to secure good results, and yearlings sold by auction have fetched prices of from 10,000 guineas (paid for Spectre, a daughter of Persimmon and Ornament, in 1900) downwards; sums of over 1000 guineas being frequently given. That so large a proportion of high-priced yearlings should turn out failures is not at all a matter for surprise, considering the uncertainties of the Turf, but it is by no means follows that a high-priced yearling is necessarily an expensive animal; 500 guineas was, for instance, given for La Flèche, who won for her owner £34,935 in stakes, and, as already observed, was subsequently sold for 12,600 guineas. The principal yearling sales take place during the July meeting
at Newmarket and the Doncaster meeting in September. There are also sales at Ascot and elsewhere. The Royal Stud at Bushey Park, where Memoir, La Flèche, Best Man and other good animals were bred, has now been abandoned.

In many cases trainers have graduated from jockeys. The usual charge to an owner is 50s. a week per horse, but, as regards the cost of a horse in training, to this there are various additions irrespective of entrances to races, forfeits, travelling, jockey’s fees, &c. The recognized sum paid to a jockey is 3 guineas for a losing mount, 5 guineas for winning, plus a number of other special terms are made; the principal owners usually have a claim on a rider’s services, and for this call as much as £5000 per annum, exclusive of the usual riding fees, has been given.

From time immemorial until within a very recent period jockeys rode in much the same style, though, of course, with varying degrees of skill. Many hundreds of boys exercise daily at Newmarket and other training grounds, all of them necessarily having a firm seat in the saddle, for the thoroughbred horse is, as a rule, high-couraged and apt to play violent tricks; but though most of these lads find chances to distinguish themselves in trials and races for apprentices, probably not 5% grow into real jockeys. The increasing weight keeping many of the business, as a jockey has few chances unless he can ride well under 9 stone. Knowledge of pace is a rare gift or acquisition which is essential to successful jockeyship. The rider must also be quick to perceive how his own horse is going—what he has “left in him”; he must understand at a glance which of his rivals are beaten and which are still likely to be dangerous; must know when the moment comes for the supreme effort to be made, and how to balance and prepare the horse for that critical struggle. At the beginning of the race the jockey used to stand in his stirrups, with the idea of removing weight from the horse’s back and preserving perfect steadiness; towards the end of the race, if it were necessary to drive the animal home, he sat down “to finish.” This method used to be adopted in all countries, but recently a new system came into practice in America. Instead of putting the saddle in the middle of the horse’s back, where it had always been placed previously, it was shifted forward on to the animal’s withers. The jockey rode with very short stirrups, leaning forward over the neck and grasping the reins within a few inches of the horse’s mouth. The appearance of this was ungainly in the extreme and an entire departure from ancient ways (though Fordham and a few other riders of great reputation had always sat much more forward than their contemporaries, but it was found to be remarkably effective. From the position thus adopted there was less resistance to the wind, and though the saving in this respect was largely exaggerated, in racing, where success or failure is frequently a matter of a very few inches, every little that helps is to be considered. The value of the discovery lay almost entirely in the fact that the horse carries weight better—and is therefore able to stride out more freely—when it is placed well forward on his shoulders. With characteristic conservatism the English were slow to accept the new plan. Several American jockeys, however, came to England. In all the main attributes of horsemanship there was no reason to believe that they were in the least superior to English jockeys, but their constant successes required explanation, and the only way to account for them appeared to be that horses derived a marked advantage from the new system of saddling. A number of English riders followed the American lead, and those who did so met with an unusual degree of success. Race-riding, indeed, was in a very great measure revolutionized in the closing years of the 19th century.

Of late years American horses—bred, it must always be remembered, from stock imported from England—have won many races in England. Australian horses have also been sent to the mother country, with results remarkably favorable to their owners, and the intermingling of blood which will necessarily result should have beneficial consequences. French horses—i.e. horses bred in France from immediate or from more or less remote English parentage—have also on various occasions distinguished themselves on English racecourses. That coveted trophy, the Ascot Cup, was won by a French horse, Elf II., in 1858, it having fallen also to the French-bred Venneuil in 1878, to Boiard in 1874, to Henry in 1872 and to Mortemore in 1871. In the Cesarewicht Plaisanterie (3 yrs., 7st. 8 lb) and Ténèbreuse (4 yrs., 8 st. 12 lb) were successful in 1885 and 1888; and Plaisanterie also carried off the Cambridge Stakes as a three-year-old with the heavy weight of 8 st. 12 lb in a field of 27 runners. In most respects racing in France is conducted with praiseworthy discrimination. There are races for any of the five- and six-year-old stallions for horses over two years old which are such common features of English programmes.

That the horses who have covered various distances in the shortest times on record must have been exceptionally speedy animals is obvious. The times of races, however, frequently form a most deceptive basis in any attempt to gauge the relative capacity of horses. A good animal will often win a race in bad time, for the reason that his opponents are unable to make him exert himself to the utmost. Not seldom a race is described as having been won in a cantor,” and this may mean that the winner has been pressed so hard that he would have completed the course more quickly. The following figures show the shortest times that had been occupied in winning over various distances up to the spring of 1910:

<table>

It may be noted that, as compared with similar records in 1901, only three of these latter held good in 1910, i.e. the mile, the six furlongs and the three miles. The fastest times over a mile and a half (the Derby and Oaks distance) up to 1901 may be repeated here as of interest: Avidity, 2 min. 30 s; in September 1901 at Doncaster; Santoi, 2 min. 31 s., in May 1901 at Hurst Park; King’s Courier, 2 min. 31 s., in 1900 at Hurst Park; Landrail, 2 min. 34 s., in September 1899 at Doncaster; Carlston, 2 min. 37 s. in August 1885, in New York; Bend Or, 2 min. 39 s., in 1881 at Epsom (gold cup): Volodyovski won the Derby in 1901, and Memoir the Oaks in 1890, in 2 min. 40 s.

As regards time in famous races, Ormonde, perhaps the best horse of the 19th century—one, at any rate, that can scarcely have had a superior—occupied 2 minutes 43½ seconds in winning the Derby; and Lonely, one of the worst mares that have won the Oaks, galloped the same mile and a half in 2 seconds less. Ormonde’s St Leger time was 3 min. 21 s., and Sir Visto, one of the poorest specimens of a winner of the great Doncaster race, took 3 min. 18 s. The regulation of the weight to be carried serves to “ bring the horses together,” as the popular sporting phrase runs—that is to say, it equalizes their chances of winning; hence handicaps, the carrying of penalties by winners of previous races, and the granting of “maiden allowances.” A horse that has never won a race, and is therefore known as a “maiden,” often has an allowance of as much as 7 lb made in its favour.

Sport is carried on under the auspices of the Jockey Club, a self-elected body of the highest standing, whose powers are absolute and whose sway is judicious and beneficent. Three stewards, one of whom retires each year, when a successor is nominated, govern the active—and extremely arduous—work of the club. They grant licences to trainers and jockeys and all officials, and supervise the whole business of racing. The stewards of the Jockey Club are ex officio stewards of Ascot, Epsom, Goodwood and

Doncaster. All other meetings are controlled by stewards, usually well-known patrons of the Turf invited to act by the projectors of the fixture, who settle disputed points, hear and adjudicate on objections, &c., and, if special difficulties arise, report to the stewards of the Jockey Club, whose decision is final.

Steeplechasing has altered entirely since the first introduction of this essentially British sport. In early days men were accustomed to match their hunters against each other and ride across country to a fixed point near to some steeple which guided them on their way; and this is no doubt, in several respects, a class of sport superior to that now practised under the name of steeplechasing; for it tested the capacity of the horse to jump fences of all descriptions, and provided the rider with opportunities of showing his readiness and skill in picking the best line of country. But racing of this kind afforded spectators a very small chance of watching the struggle; and made-up steeplechase courses, the whole circuit of which could be viewed from the enclosures, came into existence. The steeplechase horse has also altered. The speed of the thoroughbred is so much greater than that of any other breeds that if one were in the field, if he only stood up and could jump a little, his success was certain; consequently, except in "point-to-point" races, organized by various hunts, where a qualification is that all starters must have been regularly ridden with hounds, few other than thoroughbred horses are nowadays ever found in races run under the rules of the National Hunt Committee, the body which governs the sport of steeplechasing. A considerable proportion of existing steeplechase horses have done duty on the flat. Members of certain equine families display a special aptitude for jumping; thus the descendants of Hermit, who won the Derby in 1867, are very frequently successful in steeplechases—Hermit's son Ascetic, the sire of Cloister, Hidden Mystery and other good winners, is a notable case in point. The sons and daughters of Timothy and of several other Hermit horses often jump well. When a flat-race horse appears to have comparatively poor prospects of winning under Jockey Club rules, he is frequently, if he "looks like jumping," schooled for steeplechasing, generally in the first place over hurdles, and subsequently over what is technically called "a country," beginning with small fences, over which he canter, led by some steady animal who is to be depended on to show the way. A great many steeplechase horses also come from Ireland. They are usually recognizable as thoroughbred, though it is possible that in some cases the name of an ancestor may be missing from the Stud Book. Irish horse-masters are for the most part particularly skilful in schooling jumpers, and the grass and climate of Ireland appear to have beneficial effects on young stock; but, as a rule, the imported Irish horse improves considerably in an English training-stable, where he is better fed and groomed than in most Irish establishments. All steeplechase courses must at the present time contain certain regulation jumps, the nature of which is specified in the National Hunt rules:

44. In all steeplechase courses there shall be at least twelve fences (exclusive of hurdles) in the first 2 m., and at least six fences in each succeeding m. There shall be a water jump at least 12 ft. wide or 2 m. long, with a 6 ft. wide and 3 ft. deep water jump, the run-off from the fence, and a 6 ft. wide and 2 ft. deep dash fence, if the ground is firm. There shall be a fence, at least 4 ft. wide and 6 ft. in height, and if of dead brushwood or goose, 2 ft. in width.

45. In all hurdle-race courses there shall be not less than eight flights of hurdles in the first 2 m., with an additional flight of hurdles for every quarter of a m. or odd fraction thereof that remains, the height of the hurdles being not less than 3 ft. 6 in. from the bottom bar to the top bar.

Natural fences would no doubt be desirable if they could be utilized; but it is obvious that fences must be made up, because when the same hedge is jumped frequently, and for the most part in the same place—as it is the object of riders to go the shortest way round—gaps would necessarily be made. The use of these made courses naturally renders the sport somewhat artificial, but under existing conditions this is unavoidable; and as a matter of fact, by reason of the conformation of the ground, the arrangement and make of the fences, courses do vary in no small degree. The steeplechase horse differs from the hunter in his method of jumping. In riding to hounds a man usually steadies his horse at a fence, and in almost every case the animal "delves" more or less after the leap. In a steeplechase, where it is everything, horses must be taught to dash resolutely at their jumps without hesitation, and to get away with no pause on the other side; as a rule, therefore, an old steeplechase horse who is employed as a hunter is rarely a pleasant mount for any but a bold rider. It has been remarked that steeplechase horses are usually in the first place schooled over hurdles, and many animals remain hurdle racers till the end. More speed is required for hurdles than for a steeplechase course, and there is more money to be won over hurdles than over "a country." No hurdle race is worth so much as the Grand National or the Lancashire Handicap Steeplechase, the two richest prizes now offered; but, with the exception of these, hurdle-race stakes are as a rule of greater value. Except as a spectacle, there is little to be said in defence of this mongrel business, which is neither one thing nor the other; but hurdle races are popular and are therefore likely to continue. A few years ago an attempt was made to discriminate between what were called "hunters" and handicap steeplechase horses, and certain races were only open to the former class. It proved, however, that there was a distinction without a difference; thoroughbred horses crept into the ranks of the so-called hunters, and when nominal hunters began to be entered for, and in some cases to win, the Grand National and other important steeplechases, for which they could be nominated by abandoning their qualification of hunter, the meaningless title was relinquished. Still more absurd were the hunters' flat races of a former day. In order to compete in these the rule was that an owner must produce a certificate from a master of hounds to the effect that his horse had been hunted. Thoroughbreds who lacked speed to win under Jockey Club rules used to be ridden to a meet, perhaps cantered across a field or two, and were then supposed to have become hunters. Animals who were genuinely and regularly utilized for the pursuit of foxes had of course no chance against these race-horses in shallow disguise. What are called National Hunt flat races still exist, the qualification being that a horse must have been placed first, second or third in a steeplechase in Great Britain or Ireland, after having jumped all the fences and completed the whole distance of the race to the satisfaction of at least two of the stewards, to whom previous notice must have been given in writing. There are no handicaps for such animals, and none is allowed to carry less than 11 stone. No race under National Hunt rules can be of a shorter distance than 2 m., except for three-year-olds, who sometimes run a mile and a half over hurdles; and the lowest weight carried can never be less than 10 stone except in a handicap steeplechase of 3½ m. or upwards, when it may be 9 st. 7½ lb.

Horses are ridden in these races either by gentlemen, or by professional riders or jockeys. The first of these classes comprises officials on full pay in the army or navy, persons holding commissions under the Crown, bearing titles either in their own right or by courtesy, or members of certain social and racing clubs. Qualified riders may be farmers holding at least a hundred acres of land, their sons if following the same occupation, and persons elected by members of the National Hunt Committee, a proviso being that they must never have ridden for hire; but it is feared that this rule is in not a few cases evaded. Professional Jockeys are paid £5 for each mount or £10 if they win. The sport is governed by the National Hunt Committee, a body which receives delegated powers from the Jockey Club, and six stewards are elected every year to supervise the business of the various meetings. Steeplechases and hurdle races are either handicaps or weight-for-age races according to the following scale:
HORSE-RACING

UNITED STATES

Horse-racing was indulged in to a limited extent in Maryland and Virginia as early as the middle of the 17th century, particularly in the latter colony. Most of the inhabitants of both were either from the British Isles or were descended from parents who had immigrated from them, and they inherited a taste for the sport. The animals used for this purpose, however, were not highly prized at the time, and the pedigrees of not even one of them has been preserved.

The first recorded importation of a thoroughbred horse into America. He was imported into Virginia in 1730. In 1723 the duke of Bolton bred a mare named Bonny Lass by his celebrated horse Bay Bolton out of a daughter of the Darley Arabian. She became celebrated in England as a brood mare, and was the first thoroughbred mare, according to the records, that was carried to America. This is supposed to have been in or after 1740, as the Stud-Book shows she produced in England after 1730 a filly by Lord Lonsdale's Arabian. She subsequently became familiar to the public as the granddam of Zamora. The imports increased very rapidly from this period, and many valuable shipments were made before the war which resulted in a separation of the colonies from the mother country. This acquisition of thoroughbred stock increased the number and value of racing prizes, and extended the area of operations into the Carolinas in the South, and New Jersey and New York in the North. The first race run in South Carolina was in February 1734 for £50. It took place over "the Green," on Charleston parade ground, and the earlier races in America were actually on the turf, as they had been years before in England. The next year a Jockey Club was organized at Charleston, and a course was prepared, such as those which came later into general use throughout the states, the turf being removed and the ground made as level as possible.

After 1776, when the United States declared their independence of Great Britain, the importation of thoroughbred horses from England became quite common, and selections were made from the best stocks in the United Kingdom. This continued and even increased as the country became developed, down to 1840. As the Stud-Book shows the earlier races in America were actually on the turf, as they had been years before in England. The next year a Jockey Club was organized at Charleston, and a course was prepared, such as those which came later into general use throughout the states, the turf being removed and the ground made as level as possible. After 1776, when the United States declared their independence of Great Britain, the importation of thoroughbred horses from England became quite common, and selections were made from the best stocks in the United Kingdom. This continued and even increased as the country became developed, down to 1840. As the Stud-Book shows the earlier races in America were actually on the turf, as they had been years before in England. The next year a Jockey Club was organized at Charleston (1745), and a course was prepared, such as those which came later into general use throughout the states, the turf being removed and the ground made as level as possible.

For Steeplechases of 3 miles and upwards.

From the 1st of January to the 30th of June, both inclusive:—

The grand National. 49 m., and includes thirty jumps, the fences being for the most part larger than are found elsewhere. The average time occupied is well under ten minutes. The stake has varied in value since the race was originated in 1839; it now amounts to close on £2500. Only a very small percentage of steeplechase horses possess the speed and staying power to give them a chance in this race, and the number of entries year by year falls considerably short of a hundred, the prospects of many of these usually appearing hopeless to all but unduly sanguine owners. The average number of starters during the period 1860-1901 was rather over twenty. As many as thirty-two competed in 1900, when the French-bred Latteur III. won; in 1885, when Zoesdine, ridden by her owner, Count Kinsky, was successful, only ten went to the post. Mistakes are almost invariably numerous; in most years about one-third completing the course. So severe is the task that for a long time most good judges of steeplechasing believed that no horse with more than 12 stone on his back could possibly win. In 1893, however, Cloister won in a canter by forty lengths carrying 11 st. 7 lb, and with the same weight Manifesto also won in 1899. The race which most nearly approaches the Grand National in importance is the Lancashire Handicap Steeplechase, run at Manchester over 3½ m. early in April. The stake is worth about £1750. An interesting steeplechase called the Grand Seaton takes place at Liverpool about the middle of November; the distance is 3 m. During the winter, and extending into the spring, steeplechasing and hurdle racing are carried on at Sandown, Kemptown, Gatwick, Lingfield, Newbury and Hurst Park; at Ludlow, Newmarket, Aldershot, Birmingham, Manchester, Windsor and other places. A race called the National Hunt Steeplechase, under the immediate patronage of the National Hunt Committee, is run annually over a 4-mile course, the stake being £1000. Managers of various courses bid for the privilege of having the race on their ground, and it is therefore found in different localities. A condition is that no horse that has ever won a race can compete; and, as few owners are willing to keep their animals with a view to success in this event, the field consists either of unknown horses or of those that have been beaten.

AUSTRIA

Racing in Australia has its headquarters at Sydney, under the government of the Australian Jockey Club, the principal course being at Randwick; and at Melbourne, where the Victoria Jockey Club is supreme, the principal course being at Flemington. In New Zealand sport is carried on under the authority of delegates from the chief racing clubs, who meet in conference. There is a Sydney Derby and a Victoria Derby, and a notable event at Flemington is the Champion Race, weight-for-age, for three-year-olds and upwards, which usually attracts the best horses in training, as the fee at which a sire stands depends in a great measure on his success in this contest.

The Melbourne Cup is regarded as one of the most important races on the state. This is a handicap, and in comparison with English races is perhaps ranked with the Cesarewitch. The birth of horses dates from the 1st of August, which corresponds as nearly as possible to the 1st of February in England, so that the Australian horses are about seven months younger than the English—a matter of some importance in the comparison of those sent to run in England. There are few races which close long before the date of decision, and practically all the good animals run in handicaps. The five- and six-furlong races for other than thoroughbreds, so common in Great Britain, are extremely rare; and it is asserted by colonial sportsmen that their horses stay better than those in England, a circumstance which is largely attributed to the fact that mares and colts have much more liberty and exercise than is the case in the mother country.
or to sustain extensive training stables. Then the civil war between the North and the South broke out, which raged for four years. Breeding establishments were broken up during that time; the horses were taken by the armies for cavalry purposes, for which service they were highly prized; and racing was completely paralyzed. It was some time before that same prosperity set in about 1870, and since then the progress in interest has been continuous.

In the United States interest in trotting races more than rivals that felt in the contests of thoroughbred horses. This interest dates back to the importation to Philadelphia from England, in 1788, of the thoroughbred horse Messenger, a grey stallion, by Mambrino, 1st dam by Turk, 2nd dam by Regulus, 3rd dam by Starling, 4th dam by Fox, 5th dam Gipsy, by Bay Bolton, 6th dam by duke of Newcastle's Turk, 7th dam by Byerly Turk, 8th dam by Taffelet Barb, 9th dam by Place's White Turk. He was eight years old when imported to the United States. He was at the stud for twenty years, in the vicinity of Philadelphia and New York, serving a number of thoroughbred mares, but a far greater number of cold-blooded mares, and in the progeny of the latter the trotting instinct was almost invariably developed, while his thoroughbred sons, who became scattered over the country, were also noted for transmitting the trotting instinct. The first public trotting race of which there is any account in the United States was in 1835, when the grey gelding Boston Blue was matched to trot a mile in 3 minutes, a feat deemed impossible; but he won, though the time of his performance has not been preserved. From about that date interest in this gait began to increase; breeders of trotters sprang up, and horses were trained for trotting contests. The problem of breeding trotters has been necessarily found to be a much more complex one than that of breeding the thoroughbred, as in the latter case pure blood lines of long recognized value could be relied upon, while in the former the best results were constantly being obtained by the closest union of varied sources. In 1844, when the leading families came to be the Hambletonian, of whom the modern head was Rysdyk's Hambletonian, a bay horse foaled in 1849, got by Abdallah (traced to imp. Messenger on the side of both sire and dam) out of the Charles Kent mare, by imp. (i.e. imported) Bellfountain, with two crosses to imp. Messenger on her dam's side; the Mambrinos, whose modern head was Mambrino Chief, foaled in 1844, by Mambrino Paymaster, a grandson of imp. Messenger; the Bashaws, founded by Young Bashaw, foaled in 1822, by Grand Bashaw, an Arabian horse, dam Pearl, by First Consul; the Clays, springing from Henry Clay, a grandson of Young Bashaw through Andrew Jackson; the Stars, springing from Stockholm's American Star, by Duroc, son of imp. Diomed; the Morgans, whose founder was Justin Morgan, foaled 1793, by a horse called True Briton, or Beautiful Bay, who was probably thoroughbred; the Black Hawks, a branch of the Morgan family; the Blue Bulls, descended from Doyle's Blue Bull, foaled in 1835, a pacer, sired by a pacer of the same name, dam by Blackrose, son of Medoc; the Canadians, whose best representatives were St Lawrence and pacing Pilot, horses of unknown pedigree; the Gold Dusts, another branch of the Morgan family; and the Royal Georges, springing from Tippoo, a horse who was probably by Ogden's Messenger, son of imp. Messenger. But trotters of great speed have been produced which do not trace to any of the sources mentioned. Very large prices are paid. Steinway, a three-year-old colt, was sold in 1879, to go to California, for $13,000; and in 1878 $21,000 was paid for the four-year-old filly Maud S., after she had trotted a mile in public in 2 minutes 17.5 seconds. Much larger sums have been paid, however, for trotters, such as Smuggler, $38,000 for Pocahontas, $35,000 for Dexter, $38,000 for Rarus, and long prices for many others; St Julien, the trotter with the fastest record at the close of 1879, was held at $50,000, while Rysdyk's Hambletonian, Messenger Duroc and Volunteer were valued, in their prime, at $100,000 each.

Compared with the early days of American trotting, the advance has been rapid and the changes marked. After the performance of Boston Blue, mentioned above, more attention was paid to the gait, but for a long time the races were generally under saddle, and at long distances, 3 miles being rather the favourite. The best of the old time trotters were Edwin Forrest, who trotted a mile in 2 minutes 31.2 seconds in 1834; Dutchman, who did 3 miles under saddle in 7 minutes 32.8 seconds; Ripton; Lady Suffolk, who trotted a mile in 2 minutes 26.8 seconds in 1843, and headed the list of bidders; and the Turbo. After this period came the era of the people settled upon the style of race called "mile heats, three out of five, in harness" as the favourite. By "in harness" is meant that the horse draws a sulky, a light two-wheeled vehicle in which the driver sits close to the horse, with his legs on each side of its flanks. These sulks often weigh less than 40 lb. The driver is required to weigh, with the blanket on which he sits, 150 lb, while for saddle races the regulation weight is 145 lb, or 10st. 5 lb. Each heat of a mile is a separate race; 20 minutes is allowed between heats; and the horse that first places three heats to his credit wins the race. There are various penalties imposed upon a horse that breaks into a run in a trotting race. The driver is required to pull him to a trot as quickly as possible; if the horse gains by running, the judges set him back at the finish twice the distance he has gained, in their estimation, by running; and for repeated "breaks" they can declare him distanced. The first-class tracks are of oval shape, with long stretches and easy curves, measuring 1 mile at 3 ft. distance from the "pole," as the inner railing of the track is called. The time in which the leading horse trots each heat is accurately kept, placed on a blackboard in front of the judges' stand for the information of the public, and also placed in the book of the course. The fastest time that any trotter has in thus entered as his "record." This is one of the distinctive features of trotting in America.

Prior to 1866 purses for trotters were small; match races were more in vogue, and the trotting turf was in bad odour. In that year an association was formed at Buffalo, N.Y., which inaugurated its efforts by offering the then unprecedented sum of $1,500 for a trotting contest of four days. The experiment was successful; other cities followed the example of Buffalo; larger and larger purses were given; and at Buffalo in 1872 the prizes amounted to $70,000. Since then the amount offered in the United States and Canada, during a single year, has reached $1,500,000. Individual trotters, in the course of a long turf career, earn enormous amounts. A remarkable instance of this was the mare Goldsmith Maid, by Alexander's Abdallah (a son of Rysdyk's Hambletonian), out of an Abdallah mare. She began trotting in 1866, and left the turf in 1878, when twenty-one years old, and her winnings amounted to over $200,000.

In 1869 the National Trotting Association was formed, under which an elaborate code of rules has been published.

In trotting races, it will be noted, the time test is supreme, differing from running races, in which time is of comparatively little consequence. The animal which has the fastest record for 1 mile is in harness, until deposed, the king or queen of the trotting turf. Lady Suffolk, with her record of 2 minutes 26.5 seconds, in 1843, held this honour until 1854, when Tacony trotted in 2 minutes 23.5 seconds; Flora Temple wrested it from him in 1856 by trotting in 2 minutes 24.3 seconds in harness. This latter mare, in 1859, trotted a mile in 2 minutes 10.5 seconds, a feat which the best horsemen thought would never be repeated, but since that time forty-two trotters have beaten 2 minutes 20 seconds. Dexter's record was 2 minutes 17.4 seconds in 1867, and Goldsmith Maid's in 1871 was 2 minutes 17 seconds, which she reduced, by successive efforts, to 2 minutes 16.8 seconds, 2 minutes 16 seconds, 2 minutes 15.5 seconds, and finally, in 1874, to 2 minutes 14 seconds. In 1876 Flora Tacony trotted a mile in 2 minutes 15 seconds; and in 1876 the bay gelding St. Julien, a son of Duroc, trotted in 2 minutes 18.5 seconds. St Julien, trotted a mile in 2 minutes 17.9 seconds; in 1878 he trotted a mile in 2 minutes 15.9 seconds; and in 1879 he trotted a mile in 2 minutes 15.9 seconds. In 1880 the bay gelding St. Julien, trotted a mile in 2 minutes 15.9 seconds.
instance, a horse never had water the night before a race, and the system generally appears to have overtaxed the animal's strength. A prominent consideration in trotting races is the adjustment of toe-weights, which are fastened on to the horses' feet to equalize their action, and it is found that horses improve their time to the extent of several seconds when properly shod.

Racing races are also frequent in the United States. In trotting the action may be described as diagonal; the pacer moves both legs on the same side at the same time, and both feet stride as one. A similar gait to employ the American term, was called in England several centuries ago an "amble." The pacer moves more easily and with apparently less exertion than the trotter, and the mile record (made by Prince Alert in 1903) stands at 1 m. 57 s.

Owing to the vast size of the country there are various centres of sport, which can be classified with reasonable accuracy as follows: the Eastern States, dominated by the Jockey Club, founded in New York in 1834, and recognized by a state law in 1835; the Middle Western States, under the control of the Western Jockey Club, whose headquarters are in Chicago; the Pacific Coast, with San Francisco for its centre; and the Southern States and the Southern Western States, with Saratoga Springs as the important centre. The passage of the racing law in New York State marked the opening of a new era. Supreme even over the Jockey Club is a State Racing Commission of five, appointed by the governor of the state. While the Jockey Club is only recognized by law in its native state, it has assumed and maintains control of all racing on the eastern seaboard, within certain limits of latitude and longitude, extending as far north as the Canadian border and south to Georgia. There is small question that other states, both east and west, will follow suit and enact similar laws. The Western Jockey Club, though not recognized by law, controls practically all the racing through the middle west, west and south; but the racing associations of the Pacific Coast have maintained a position of independence.

What New York is to the east, Chicago is to the middle west, and a very large proportion of American racing is conducted close to these centres. In New York State the Coney Island Jockey Club, at Sheepshead Bay; the Brooklyn Jockey Club, at Gravesend; the Westchester Racing Association, at Morris Park; the Brighton Beach Racing Association, at Brighton Beach; the Queen's County Jockey Club, at Aqueduct; and the Saratoga Racing Association, at Saratoga, are the leading organizations; and all these race-courses, with the exception of Saratoga, are within a radius of 20 miles of the city. The Empire City Jockey Club, near Yonkers, and another club with headquarters near Jamaica, Long Island, have also become prominent institutions. The Washington Park Club, at Chicago, is the leading Turf body of the west, and the only one on an equal footing with the prominent associations of New York State. With this single exception the most important and valuable stakes of the American Turf are given in the east; and so great has the prosperity of the Turf been since the Jockey Club came into existence that the list of rich prizes is growing at a surprising rate. In this respect the principal fault is the undue encouragement given to the racing of two-year-olds. At the winter meetings held at New Orleans and San Francisco, two-year-olds are raced from the very beginning of the year; and under the rules of the Jockey Club of New York they run as early as March. The Westchester Racing Association, with which are closely identified some of the principal members of the Jockey Club, gives valuable two-year-old stakes in May. The Futurity Stakes, the richest event of the year—on one occasion it reached a value of $85,000—are for two-year-olds, and is run at Sheepshead Bay in the autumn. The institution of races, either absolutely or practically at weight-for-age, and over long courses, has engaged much attention. The Coney Island Jockey Club, in the leading three-year-old stake in the Lawrence Reservation, over 1 mile 5 furlongs, with an average value of at least $20,000. The Westchester Racing Association's two principal three-year-old stakes, the Worthers, over a mile, run in May, and the Belmont, 1 mile and 3 furlongs, run later in the same month, are of less value, but are much older-established and have a species of "classic" prestige, dating from the old Jerome Park race-course in the 'sixties. The Coney Island Jockey Club's Century and the Annual Champion Stakes, both for three-year-olds and upwards, over a mile and a half and two miles and a quarter respectively, are fair specimens of the races the associations have founded. At Saratoga a stake of $30,000 for three-year-olds and upwards, distance a mile and a quarter, was opened, and run for first in 1904. The hope is to wean owners from the practice of overtaxing their two-year-olds, which has resulted practically in a positive dearth, almost a total absence, of good four-year-olds and upwards of late years. Handicaps play a more important part than in England. The principal events of this character, such as the Brooklyn Handicap at Gravesend and the Suburban at Sheepshead Bay, have for years drawn the largest attendances of the racing season.

Practically all flat racing in the United States is held on "dirt-tracks," i.e. courses with soil specially prepared for racing, instead of turf courses. At Sheepshead Bay there is a turf course, but it is only used for a minority of races. Dirt-tracks, with their vast areas in the sun, and the things American racing, a legacy from the once hugely popular barne racing, are conducive to great speed, but are costly in the extreme strain on horses' legs. Steeplechases are run on turf. This branch of the sport in the east is now flourishing under the administration of the National Steeplechase and Hunt Association, a sister body of the Jockey Club. Comparatively few races are, however, run under these rules, as the weather conditions render it impossible to have a separate season for cross-country sport and steeplechases, and hurdle races are incorporated in programmes of flat racing held through the spring, summer and autumn, though the ground is frequently so hard as to be unseemly. Since the National Steeplechase and Hunt Association assumed control, regulation courses, practically similar in every respect to those used in England, have been insisted upon in the east, the "open ditch" figuring under the name of the "Liverpool." In the west and south there is not the same uniformity, and so far the sport has not flourished.

France

Racing in France as conducted on modern lines may be said to date from the year 1833, when the French Stud-Book was originated, and a body formed, somewhat after the model of the English Jockey Club, under the title of the Société d'Encouragement pour l'Amélioration des Races de Chevaux en France. Races took place in the Champs de Mars, and an unsuccessful attempt was made in 1834 to arrange for a course, or "hippodrome," as it is termed in France, at Maisons Laffitte. Chantilly was, however, fixed upon as the principal racing centre; on the 22nd April 1836 the first meeting was held there, with five races on the card, the principal being the Prix d'Orlians, a stake of 3500 francs, named after the duc d'Orlans, one of the chief promoters of the fixture. Next day the first race for the Prix du Jockey Club was run, and won by Franck, the property of Lord Henry Seymour, who was at the time taking a very active part in French sport. The Prix du Jockey Club was then worth 5000 francs; the value has since increased to 200,000 francs. This race occupies in France the place of the English Derby, The Prix de Diane, which corresponds to the English Oaks, was first run in 1834. Chantilly still continues an important centre of the French Turf, and a great many horses are trained in the district. Attempts had been made to popularize racing at Longchamp prior to the year 1836, when the Société d'Encouragement obtained a lease, erected stands, laid out the course, and held their first meeting on the 27th August 1837. Next season two meetings were held, one of four days in the spring and another of three days in the autumn. The sport is vigorously carried on from March to the end of October, except during a summer recess. In 1837 meetings under the auspices of the Société d'Encouragement began to
take place at Amiens, Caen, Nantes, Versailles, Moulins and other towns; and there were stakes for two-year-olds in the spring, though of late years the appearance of the young horses has been confined to the last week in August. Progress was rapid, and in 1863 two important events were contested for the first time, the Prix du Prince Impérial, which was designed to balance the English St Leger, but for obvious reasons faded out of the programme, and the Grand Prix de Paris, an international race for three-year-olds, run at Longchamps over a distance of 1 mile 7 furlongs, and now the most valuable stake in Europe. In 1900 the prize was £14,071. The first Grand Prix fell to an English horse, Mr Savile's The Ranger; two years later it was won by Gladiateur, winner of the English Derby and the property of the comte de Lagrange, who raced equally in France and in England; the duke of Beaufort's Ceylon was successful in 1866, and the marquis of Hastings' Earl in 1868. Mr Savile's Cremonne followed up his Derby victory by a victory at Longchamps in 1872, as did Mr Baltazzi's Kisber four years later. English horses were also victorious in 1874 (Mr W. R. Marshall's Trent), in 1878 (Prince Soltykoff's Thuriro), in 1880 (Mr C. Brewer's Robert the Devil), in 1881 (Mr Keene's Foxhall, who, however, should rather rank as an American horse), in 1883 (Mr Cleaver's Don Boro), in 1884 (Mr Vyner's Minting); and in 1906 Joustace Loder's Derby winner Spearman. During the first 23 years of the Grand Prix (owing to the war the race did not take place in 1871) the stake fell to English horses—if Kisber and Foxhall be included—on twelve occasions, and generally to English jockeys. In recent years, however, French owners have held their own. In not a few respects racing is managed more judiciously than in England. The courses, for one thing, are better tended and maintained. The five- and six-furlong races for others than two-year-olds, which are so common at English meetings, are comparatively rare in France, and the value of the prizes in an average day's racing is considerably higher across the Channel than in England. A very large percentage of trainers and jockeys are English, and the former are, as a rule, quite as expert as at Newmarket and elsewhere. Transatlantic methods have been introduced by American jockeys since 1899. From the middle of February until the middle of December a race meeting within easy reach of Paris takes place almost every day, except during August, when the sport is carried on in the provinces, notably at Deauville. Near Paris, the chief centre after Longchamps is Maisons Laffitte. At Longchamps, early in October, a race called the Prix du Conseil Municipal, worth £4,000, for three-year-olds and upwards, over a mile and a half, was organized in 1863, and has usually attracted English horses, Mr Wallace Johnstone's Best Man having been successful in 1894, and Mr Sullivan's Winkfield's Pride the following year. Except when the Whip is challenged for and the challenge decided over the Beacon Course at Newmarket, no race is run in England over a longer distance than two miles and 6 furlongs; but in France the Prix Gladiateur, of £1,200 and a work of art value £100, 3 miles 7 furlongs, creates considerable interest at Longchamps in the autumn.

The first recognized steeplechase in France took place at Croix de Berny, and was won by the comte de Vaublan's May-ry, all the horses at that time being ridden by gentlemen. Sport does not seem to have been carried on with much spirit, for it is said that the death of an animal called Barchi, in 1839, nearly led to the abandonment of the meeting; and it was not till 1863, when the Société des Steeplechases de France was founded, that the business was resolutely taken in hand. Gravelle and Vincennes were the principal centres until 1873, when the Société obtained possession of the ground at Auteuil, where the excellent course now in use was laid out. In 1874 twelve days' racing took place here, the card each day including three steeplechases and a hurdle race, the 'hurdles,' however, being small fences, as they are at present. The Grand Steeplechase d'Auteuil was then for a stake of 30,000 francs, at the time the most valuable offered in any country; but, as in racing on the flat, the stakes have enormously increased in value, and in 1901 the Paris Grand Steeplechase, as the chief event is now termed, credited the winner with £95,000, the hurdle race being won for a consideration of more than half as much. The charming country is scarcely any steeplechasing between March and November, except at hunt meetings, but in Paris cross-country sport is pursued almost all through the year, the chief races at Auteuil taking place in June, about the time of the Grand Prix, which is usually run for between the English Epsom and Ascot meetings. The Auteuil course is laid out in the shape of the figure 8, with varied fences, several of which really test a horse's jumping capacity; and variety is further obtained by starting the fields in different places and traversing the course in different ways. St Ouen, meeting place of a little below the crown, is entirely devoted to steeplechasing; and jumping is also carried on at Vincennes, Colombes, Enghien, and elsewhere near Paris, as also at Nice in the winter, at Dieppe and other places in August. As a rule, the stakes run for, especially at Auteuil, are very much larger than in England. There are none of the clubs and special enclosures such as at Sandown, Keston, Hurst, Lingfield, Gatwick, &c., though portions of the stand are set apart for privileged persons. A fee of 20 francs is charged on the admission of French racing, and foreign is charged half as much for a lady's voucher, and the tickets give access everywhere but to the very few reserved portions. At Vincennes, St Cloud, and some other courses trotting races are also contested.

Other Countries.—Racing in Germany is mainly conducted under the authority of the Union Club of Berlin, the principal course being the Hoppegarten. Two-year-olds do not run until the 1st of June, except in Saxony, where they appear a month earlier. During the month of August there are several days' racing at Baden-Baden, steeplechases as well as flat races being run. Some of the more valuable stakes are usually contested by a proportion of horses from France and other countries, a few being occasionally sent from England. For years past blood-stock has been imported from England. In Austria the two centres of racing are Vienna and Budapest, and the former is the most important; it is essentially a cross-country course, and has steeplechasing in the German style. The headquarters of the Belgium Jockey Club are in the Bois de la Cambre at Boksen, and meetings are held at Oostend, Antwerp, Spa, Bruges and elsewhere. Steeplechases take place at Groenenveld and on other Belgian courses, but are not of high class. Racing has not reached a great degree of excellence in Italy, though attempts have been made to improve competitors by the purchase of Melton, who won the Derby of 1885, and of other notable animals. Meetings take place at Florence, Padua, Bologna and other places, but the stakes are usually small. (A. E. T. W.)

HORSERADISH (Ger. Meerrettich; Fr. raifort = racine forte, cron de Bretagne; Swed. Peppar-rot; Russ. chren), known botanically as Cochlearia Armoracia, a perennial plant of the natural order Cruciferae, having a stout cylindrical rootstock from the crown of which spring large radical leaves on long stalks, 4 to 6 in. broad, and about a foot in length with a deeply crenate margin, and coarsely veined; the stem-leaves are short-stalked or sessile, elongated and tapering to their attachment, the lower ones often deeply toothed. The flowers, which appear in May and June, are ½ in. in width, in flat-topped panicles, with purplish sepals and white petals; the fruit is a small silicula, which does not ripen in the climate of England. The horseradish is indigenous to eastern Europe. Into western Europe and Great Britain, where it is to be met with on waste ground, it was probably introduced. It was wild in various parts of England in Gerard's time.

The root, the armoraciae radix of pharmacy, is 4 to 10 in. or more in diameter, and commonly 1 ft., sometimes 3 ft. in length; the upper part is enlarged into a crown, which is annulated with the scars of fallen leaves; and from the numerous irregular lateral branches are produced vertical stolons, and also adventitious buds, which latter render the plant very difficult of extirpation. From the root of Aconite (g.v.), which has occasionally been mistaken for it, horseradish root differs in being more or less canescent, and also in its pale yellowish (or brownish) white hue externally, acid and penetrating odour when scraped or bruised, and...
HORSE-SHOES—HORSETAIL

pungent and either sweetish or bitter taste. Under the influence of a ferment which it contains, the fresh root yields on distillation with water about 0.5% of a volatile oil, butyl sulphocyanide, C₈H₅CN. After drying, the root has been found to afford 11-15% of ash. Horseradish root is an ingredient in the *spiritus armoricæ compositus* (dose 1-2 drachms) of the British Pharmacopoeia. It is an agreeable flavouring agent. In common with other species of *Coelocarpus*, the horseradish was formerly in high repute as an antiscorbutic. The root was, as well as the leaves, taken with food by the Germans in the middle ages, whence the old French name for it, *moutarde des Allemands*; and Coles, writing in 1657, mentions its use with meat in England, where it is still chiefly employed as a condiment with beef. For the successful cultivation of the horseradish, a light and friable damp soil is the most suitable; this having been trenched 3 ft. deep in autumn, and the surface turned down with a liberal supply of farm-yard manure, a second dressing of decomposed manure should in the ensuing spring be dug in 2 ft. deep, and pieces of the root 6 in. in length may then be planted a foot apart in narrow trenches. During summer the ground requires to be kept free of weeds; and the application of liquid manure twice or thrice in sufficient quantity to reach the lowest roots is an advantage. When dug the root may be long preserved in good condition by placing it in sand.

HORSE-SHOES. The horny casing of the foot of the horse and other Solidogulantes, while quite sufficient to protect the extremity of the limb under natural conditions, is found to wear away and break, especially in moist climates, when the animal is subjected to hard work of any kind. This, however, can be obviated by the simple device of attaching to the hoof a rim of iron, adjusted to the shape of the hoof. The animal itself has been in a very marked manner modified by shoeing, for without this we could have had neither the fleet racers nor the heavy and powerful cart-horses of the present day. Though the ancients were sufficiently impressed by the damage done to horses' hoofs to devise certain forms of covering for them (in the shape of socks or sandals), the practice of nailing iron plates or rim-shoes to the hoof does not appear to have been introduced earlier than the 2nd century B.C., and was not commonly known till the close of the 5th century A.D., or in regular use till the middle ages. The evidence for the earlier date depends on the doubtful interpretations of designs on coins, &c. As time went on, however, the profession of the farrier and the art of the shoesmith gradually grew in importance. It was only in the 19th century that horse-shoeing was introduced in Japan, where the former practice was to attach to the horse's feet slippers of straw, which were renewed when necessary, a custom which may indicate the usage of early peoples. In modern times much attention has been devoted to horse-shoeing by veterinary science, with the result of showing that methods formerly adopted caused cruel injury to horses and serious loss to their owners. The evils resulted from (1) paring the sole and frog; (2) applying shoes too heavy and of faulty shape; (3) employing too many and too large nails; (4) applying shoes too small and removing the wall of the hoof to make the feet fit the shoes, and (5) rasping the front of the hoof. In rural districts, where the art of the farrier is combined with general blacksmith work, too little attention is apt to be given to considerations which have an important bearing on the comfort, usefulness and life of the horse. According to modern principles (1) shoes should be as light as compatible with the wear demanded of them; (2) the ground face of the shoe should be concave, and the face applied to the foot plain; (3) heavy draught horses alone should have toe and heel calks on their shoes to increase foothold; (4) the excess growth of the wall or outer portion of horny matter should only be removed in re-shoeing, care being taken to keep both sides of the hoof of equal height; (5) the shoe should fit accurately to the circumference of the hoof, and project slightly beyond the heel; (6) the shoes should be fixed with as few nails as possible, six or seven in fore-shoes and eight in hind-shoes, and (7) the nails should take a short thick hold of the wall, so that old nail-holes may be removed with the natural growth and paring of the horny matter. Horse-shoes and nails are now made with great economy by machinery, and special forms of shoe or plate are made for race-horses and trotters, or to suit abnormalities of the hoof.

*HORSETAIL* (*Equisetum*), the sole genus of the botanical natural order Equisetaceae, consisting of a group of vascular cryptogamous plants (see *Pteridophyta*) remarkable for the vegetative structure which resembles in general appearance the genera of flowering plants *Casuarina* and *Ephedra*. They are herbaceous plants growing from an underground much-

From Strasburger’s *Lehrbuch der Botanik*, by permission of Gustav Fischer.

Equisetum arvense.

A, Fertile shoot, *springing* B, C, Sporophylls bearing sporangia, from the rhizome, which in *C* have opened. D, also bears tubers; the Spore showing the two spiral vegetative shoots have not yet unfolded. E, Dry spores showing the expanded spiral bands. (A, F, *sp. nat. size*. B, C, D, E, enlarged.)

branched rootstock from which spring slender aerial shoots which are green, ribbed, and bear at each node a whorl of leaves reduced to a toothed sheath. From the nodes spring whorls of similar but more slender branches. Some shoots are sterile while others are fertile, bearing at the apex the so-called fructification—a dense oval, oblong conical or cylindrical spike, consisting of a number of shortly-stalked peltate scales, each of which has attached to its under surface a circle of spore-cases (*sporangia*)
which open by a longitudinal slit on their inner side. The spores differ from those of ferns in their outer coat (exospore) being split up into four club-shaped hygroscopic threads (elaters) which are curled when moist, but become straightened when dry. In most species the fertile and sterile shoots are alike, both being green and leaf-bearing, but in a few species the fertile are more or less different, e.g. in _E. arvense_ the fertile shoots appear first, in the spring, and are unbranched and not green. Any portion of the underground rhizome when broken off is capable of producing a new plant; hence the difficulty of eradicating them when once established. There are 24 known species of the genus which is universally distributed.

The corn horsetail _E. arvense_, one of the commonest species, is a troublesome weed in clayey cornfields (see fig.). The fructification appears in March and April, terminating in short unbranched stems. It is said to produce diarrhea in such cattle as eat it. The bog horsetail, _E. palustre_, is said to possess similar properties. It grows in marshes, ditches, pools and drains in meadows, and sometimes obstructs the flow of water with its dense matted roots. The fructification in this species is cylindrical, and in that of _E. limosum_, which grows in similar situations, it is ovate in outline. The largest British species, _E. maximum_, grows in wet sandy declivities by railway embankments or streams, &c., and is remarkable for its beauty, due to the abundance of its elegant branches and the alternately green and white appearance of the stem. In this species the fructification is conical or lioleolate, and is found in April on short, stout, unbranched stems which have large loose sheaths. Horses appear to be fond of this species, and in Sweden it is stored for use as winter fodder. _E. hyemale_, commonly known as the Dutch rush, is much more abundant in Holland than in Britain; it is used for polishing purposes. _E. variegatum_ grows on wet sandy ground, and serves by means of its fibrous roots to bind the sand together. The horsetails are remarkable for the large quantity of silica they contain in the cuticle (hence their value in polishing), which often amounts to half the weight of the ash yielded by burning them; the roots contain a quantity of starch.

**HORSHAM**

a market town in the Horsham parliamentary division of Sussex, England, 38 m. S. by W. from London by the London, Brighton and South Coast railway. Pop. of urban district (1901) 9446. It is pleasantly situated in the midst of a fertile country near the source of the Arun. A picturesque avenue leads to the church of St Mary, principally Early English and Perpendicular, with remains of Norman work. In the churchyard is a lofty tower surmounted by a spire, and containing several fine monuments, tombs and brasses. Other buildings include the grammar school, founded in 1532 and rebuilt in 1893, a town hall and corn exchange, erected in 1866 in Italian style, with an assembly room. In the vicinity are several fine mansions. The buildings of Christ's Hospital (q.v.) at West Horsham were opened in 1902, the school being removed hither from London. The town has industries of tanning, founding, carriage-building and flour-milling.

Some neolithic remains have been found at Horsham. The town is not mentioned in Domesday Book, but the Rape of Bramber, in which it lies, belonged at that time to William de Braose. His descendants held the borough and the manor of Horsham, and through them they passed to the family of Mowbray, afterwards dukes of Norfolk. There are traces of burgage tenure at Horsham in 1210, and it was called a borough in 1236. It has no charter of incorporation. Horsham sent two representatives to parliament from 1295 until 1832, when the number was reduced to one. In 1855 it was disfranchised. In 1853 Henry III, granted William de Braose a yearly three-days’ fair at his manor of Horsham. In the reign of Edward I. William de Braose claimed to have a free market on Wednesdays and Saturdays. Fairs are held on the 5th of April, 18th of July, 17th of November and 27th of November. Market days are Monday and Wednesday. “Glovers” of Horsham are mentioned in a patent roll of 1485, and a brewery existed here in the time of Queen Anne.

**HORSLEY, JOHN** (c. 1685—1732), British archaeologist. John Hodgson (1770-1845), the historian of Northumberland, in a short memoir published in 1831, held that he was born in 1685, at Pinkie House, in the parish of Inveresk, Midlothian, and that his father was a Northumberland Nonconformist, who had migrated to Scotland, but returned to England soon after the Revolution of 1688. J. H. Hindle, in the _Archaeologia Adeliana_ (Feb. 1866), held that he was a native of Newcastle-on-Tyne, the son of Charles Horsley, a member of the Tailor’s Company of that town. He was educated at Newcastle, and at Edinburgh University, where he graduated M.A. on the 26th of April 1701. There is evidence that he “was settled in Morpeth as a Presbyterian minister as early as 1709.” Hodgson, however, thought that up to 1721, at which time he was residing at Widdrington, “he had not received ordination, but preached as a licentiate.” Even if he was ordained then, his stay at the latter place was probably prolonged beyond that date; for he communicated to the _Philosophical Transactions_ (xxxi. 328) notes on the rainfall there in the years 1722 and 1723. Hindle shows that during these years “he certainly followed a secular employment as agent to the York Buildings Company, who had contracted to purchase and were then in possession of the Widdrington estates.” At Morpeth Horsley opened a private school. Respect for his character and abilities attracted pupils irrespective of religious connection, among them Newton Ogle, afterwards dean of Westminster. He gave lectures on mechanics and hydrostatics in Morpeth, Alnwick and Newcastle, and was elected F.R.S. on the 23rd of April 1730. It is as an archaeologist that Horsley is now known. His great work, _Britannia Romana, or the Roman Antiquities of Britain_ (London, 1732), one of the rarest and most valuable of its class, contains the result of patient labour. There is in the British Museum a copy with notes by John Ward (c. 1679-1738), biographer of the Gresham professors. Horsley died of apoplexy on the 12th of January 1732, on the eve of the publication of the _Britannia Romana_. He also published two sermons and a handbook to lectures on mechanics, &c., and projected a history of Northumberland and Durham, collections for which were found among his papers.

J. P. Wood (d. 1838) (Parish of Cradon, 1794, and Anecdotes of _Borbur_, 1782, p. 371) says that his wife was a daughter of William Hamilton, D.D., minister of Cradon, afterwards professor of Divinity at the University of Edinburgh, and probably the Mr. Horsley in question was another, the father of Samuel Horsley (q.v.).

**HORSLEY, JOHN CALCOTT** (1817-1902), English painter, son of William Horsley, the musician, and grandson of Sir Augustus Calcott, was born in London, on the 29th of January 1817. He studied painting in the Academy schools, and in 1836 exhibited “The Pride of the Village” (Vernon Gallery) at the Royal Academy. This was followed by numerous genre pictures at subsequent exhibitions up to 1883, the best known of these being “Malvolio,” “L’Allegro and il Penseroso” (painted for the Prince Consort), “Le Jour des Morts,” “A Scene from Don Quixote,” &c. In 1843 his cartoon of “St Augustine Preaching” won a prize in the Westminster Hall competition, and in 1844 he was selected as one of the six painters commissioned to execute frescoes for the Houses of Parliament, his “Religion” (1845) being put in the House of Lords; he also painted the “Henry V. assuming the Crown” and “Satans surprised at the Ear of Eve.” In 1864 he became R.A., and in 1882 was elected treasurer, a post which he held till 1897, when he resigned and became a “retired Academician.” Mr Horsley had much to do with organizing the winter exhibitions of “Old Masters” at Brighton House after 1870. When, during the ’eighties, the example of the French Salon began to affect the Academy exhibitions, and paintings of the nude became the fashion, he protested against the innovation, and his attitude caused _Punch_ to give him the punning sobriquet of “Mr J. C. (lothes) Horsley.” He died on the 18th of October 1903. His son, Sir Victor Horsley (b. 1857), became famous as a surgeon and neuropathologist, and a prominent supporter of the cause of experimental research.
HORSLEY, SAMUEL (1733-1806), English divine, was born in London on the 15th of September 1733. Entering Trinity College, Cambridge, he became L.B. in 1758 without graduating in arts, and in the following year succeeded his father in the living of Belgrade Street, Chelsea. Horsley was a Fellow of the Royal Society in 1767, and secretary in 1773, but, in consequence of a difference with the president (Sir Joseph Banks) he withdrew in 1784. In 1768 he attended the eldest son of the 4th Earl of Aylesford to Oxford as private tutor; and, after receiving through the earl and Bishop Lowth various minor preferments, which by dispensations he combined with his first living, he was installed in 1781 as archdeacon of St Albans. Horsley now entered in earnest upon his famous controversy with Joseph Priestley, who denied that the early Christians held the doctrine of the Trinity. In this controversy, conducted on both sides in the fiercest polemical spirit, Horsley showed the superior learning and ability. His aim was to lessen the influence which the prestige of Priestley's name gave to his views, by indicating inaccuracies in his scholarship and undue haste in his conclusions. For the energy displayed in the contest Horsley was rewarded by Lord Chancellor Thurlow with a prebendal stall at Gloucester; and in 1788 the same patron procured his promotion to the see of St David's. As a bishop, Horsley was energetic both in his diocese, where he strove to better the position of his clergy, and in parliament. The efficient support which he afforded the government was acknowledged by his successive translations to Rochester in 1795, and to Southwell. With the bishopric of Rochester he held the deanery of Westminster. He died at Brighton on the 4th of October 1806.

Besides the controversial Tracts, which appeared in 1783-1784-1786, and were republished in 1789 and 1812, Horsley's more important works are:—Apoloignant Peregrination libri duo (1770); Remarks on the Observations ... for determining the acceleration of the Pendulum in Lat. 70° 51' (1774); Isaiah Newtoni Opera quae extant Omnia, with a commentary (5 vols. 4to, 1779-1785); On the Prosodies of the Greek and Latin Languages (1766); Disquisitions on Isaiah xxvii. (1796); Horsa, translated ... with Notes and historical Memoirs (1801); Euclidis elementorum libri priori XII. (1802); Euclidis datorum liber (1803); Virgil's Two Seasons of Honey, &c. (1805); and papers in the Philosophical Transactions from 1767 to 1776. After his death there appeared—Sermons (1810-1812); Speeches in Parliament (1813); Book of Psalms, translated with Notes (1815); Biblical Criticism (1820); Collected Theological Works (6 vols. 8vo, 1845).

HORSLEY, WILLIAM (1774-1838), English musician, was born on the 15th of November 1774. He became in 1790 the pupil of Theodore Smith, an indifferent musician of the time, who, however, taught him sufficient to obtain in 1794 the position of organist at Ely Chapel, Holborn. This post he resigned in 1796, to become organist at the Asylum for Female Orphans, as assistant to Dr Callcott, with whom he had long been on terms of personal and artistic intimacy, and who was his eldest daughter he married. In 1802 he became his friend's successor upon the latter's resignation. Besides holding this appointment he became in 1812 organist of Belgrave Chapel, Halkin Street, and in 1838 of the Charter House. He died on the 12th of June 1838. Horsley's compositions are numerous, and include amongst other instrumental pieces three symphonies for full orchestra. Infinitely more important are his glees, of which he published five books (1801-1807) besides contributing many detached glees and part songs to various collections. His glees, "By Celia's arbour," "O nightingale," "Now the storm begins to lower," and others, are amongst the finest specimens of the peculiarly English choral composition. Horsley's son Charles Edward (1782-1867), also enjoyed a certain reputation as a musician. He studied in Germany under Hauptmann and Mendelssohn, and on his return to England composed several oratorios and other pieces, none of which had permanent success. In 1868 he emigrated to Australia, and in 1872 went to America; he died at New York.

HORSMAN, EDWARD (1807-1876), English politician, was the son of a well-to-do gentleman of Stirling, and connected on the mother's side with the earls of Stair. He was educated at Rugby and Cambridge, and was called to the Scotch bar in 1834, but then took to politics. He was elected to parliament as a Liberal for Cockermouth in 1836, and represented that constituency till 1852, when he was defeated; in 1853 he was returned for Cumberland, and held the seat till 1868; and from 1869 to 1870 he was member for Liskeard. He was a junior lord of the treasury in Lord Melbourne's administration for a few months during 1841, and became prominent for attacking Lord John Russell's ecclesiastical policy in 1847 and subsequent years. In 1845, under Lord Palmerston, he was made chief secretary for Ireland, but resigned in 1857. He gradually took up a position as an independent Liberal, and was well known for his attacks on the Church, and his exposures of various "jobs." But his name is principally connected with his influence over Robert Lowe (Lord Sherbrooke) in 1866 at the time of Mr Gladstone's Reform Bill, to which he and Lowe were hostile; and it was in describing the Lowe-Horsman combination that John Bright spoke of the "Cave of Adullam." Horsman died at Berrington on the 30th of November 1876.

HORST, the term used in physical geography and geology for a block of the earth's crust that has remained stationary while the land has sunk on either side of it, or has been crushed in a mountain range against it. The Vosges and Black Forest are examples of the former, the Table, Jura and the Dôle of the latter result. The word is also applied to those larger areas, such as the Russian plain, Arabia, India and Central South Africa, where the continent remains stable, with horizontal land-surface stratification, in distinction to folded regions such as the Eurasian chains.

HORT, FENTON JOHN ANTHONY (1828-1892), English theologian, was born in Dublin on the 23rd of April 1828, the great-grandson of Josiah Hort, archbishop of Tuam in the 18th century. In 1846 he passed from Rugby to Trinity College, Cambridge, where he was the contemporary of E. W. Benson, B. F. Westcott and J. B. Lightfoot. The four men became lifelong friends and fellow-workers. In 1850 Hort took his degree, being third in the classical tripos, and in 1852 he became fellow of his college. In 1854, in conjunction with J. E. B. Mayor and Lightfoot, he established the Journal of Classical and Sacred Philology, and plunged eagerly into theological and patristic study. He had been brought up in the strictest principles of the Evangelical school, but at Rugby he fell under the influence of Arnold and Tait, and his acquaintance with Maurice and Kingsley finally gave his opinions a direction towards Liberalism. In 1857 he married, and accepted the college living of St Ippolyts, near Hitchin, in Hertfordshire, where he remained for fifteen years. During his residence there he took some part in the discussions on university reform, continued his studies, and wrote essays for various periodicals. In 1870 he was appointed a member of the committee for revising the translation of the New Testament, and in 1871 he delivered the Hulsean lectures before the university. Their title was The Way, the Truth, and the Life, but they were not prepared for publication until many years after their delivery. In 1872 he accepted a fellowship and lectureship at Emmanuel College; in 1878 he was made Hulsean professor of divinity, and in 1887 Lady Margaret reader in divinity. In the meantime he had published, with his friend Westcott, an edition of the text of the New Testament. The Revision Committee had very largely accepted this text, even before its publication, as a basis for their translation of the New Testament. The work on its appearance created an immense sensation among scholars, and was universally attacked in many quarters, but on the whole it was regarded as being much the nearest approach yet made to the original text of the New Testament (see BLINN: New Testament, "Critical Criticism"). The introduction was the work of Hort, and its depth and fulness convinced all who read it that they were under the guidance of a master. Hort died on the 30th of November 1892, worn out by intense mental labour. Next to his Greek Testament his best-known work is The Christian Ecclesia (1897). Other publications are: Judaistic Christianity (1894); Village Sermons (two series); Cambridge
HORTICULTURE

and other Sermons; Prolegomena to . . . Romans and Ephesians (1893); The Ante-Nicene Fathers (1893); and two Dissertations, on the reading wv φιλος in John i. 18, and on The Constantinopolitan and other Eastern Creeds in the Fourth Century. All are models of exact scholarship and skilful use of materials.

Life and Letters was edited by his son, Sir Arthur Hopt, Bart. (1896).

HORTA, the capital of an administrative district comprising the islands of Pico, Fayal, Flores and Corvo, in the Portuguese archipelago of the Azores. Pop. (1900) 6544. Horta is a seaport on the south-east coast of Fayal. It is defended by two castles and a wall, but these fortifications are obsolete. The harbour, a bay 2 m. long and nearly 1 m. broad, affords good anchorage in 5 to 20 fathoms of water, but is dangerous in south-westerly and south-easterly winds. It is the headquarters of profitable whale, tunny, bonito and mullet fisheries. Its exports include sperm-oil, fruit, wine and grain. Between 1897 and 1904 the port annually accommodated about 140 vessels of 220,000 tons, mostly of British or Portuguese nationality.

HORTEN, a seaport of Norway, in Jarlsberg-Laurvik amt (county), beautifully situated on the west bank of the Christiana Fjord, opposite Moss, 38 m. by water and 66 by rail S. of Christiania. Pop. (1900) 8466. It is practically united with Karl-Johansvaen, which is defended by strong fortifications, is the headquarters of the Norwegian fleet, and possesses an arsenal and shipbuilding yards. There are also an observatory and a nautical museum.

HORTENSUS, QUINTUS (114–50 B.C.), surnamed Hortalus, Roman orator and advocate. At the age of nineteen he made his first speech at the bar, and shortly afterwards successfully defended Nicomedes III. of Bithynia, one of Rome's dependants in the East, who had been deprived of his throne by his brother. From that time his reputation as an advocate was established. As the son-in-law of Lucretius Catulus he was attached to the aristocratic party. During Sulla's ascendancy the courts of law were under the control of the senate, the judges being themselves senators. To this circumstance perhaps, as well as to his own merits, Hortensius may have been indebted for much of his success. Many of his clients were the governors of provinces which they were accused of having plundered. Such men were sure to find themselves brought before a friendly, not to say a corrupt, tribunal, and Hortensius, according to Cicero (Div. in Caecil. 7), was not ashamed to avail himself of this advantage. Having served during two campaigns (60–67) in the Social War, he became quaestor in 81, aedile in 75, praetor in 72, and consul in 69. In the year before his consularship he came into collision with Cicero in the case of Verres, and from that time his supremacy at the bar was lost. After Cicero was himself drawn towards the party to which Hortensius belonged. Consequently, in political cases, the two men were often engaged on the same side (e.g. in defence of Rabirius, Murena, Publius Cornelius Sulla, and Milius). After Pompey's return from the East in 61, Hortensius withdrew from public life and devoted himself to his profession. In 50, the year of his death, he successfully defended Appius Claudius Pulcher when accused of treason and corrupt practices by P. Cornelius Dolabella, afterwards Cicero's son-in-law.

Hortensius's speeches are not extant. His oratory, according to Cicero, was of the Asiatic style, a florid rhetoric, better to hear than to read. He had a wonderfully tenacious memory (Cicero, Brutus, 88, 93), and could retain every single point in his opponent's argument. His action was highly artificial, and is described by his age as being his chief accomplishment. His decline began before the end of the day (Macrobius, Sat. iii. 13. 4). He also possessed a fine musical voice, which he could skilfully command. The vast wealth he had accumulated he spent on splendid villas, parks, fish-ponds and costly entertainments. He was the first to introduce peacocks as a table delicacy at Rome. He was a great buyer of wine, pictures and works of art. He wrote a treatise on general questions of oratory, erotic poems (Ovid, Tristia, ii. 441), and an Ars Satires, which gained him considerable reputation as an historian (Vell. Pat. ii. 16. 3).

His daughter Hortensia was also a successful orator. In 42 she spoke against the imposition of a special tax on wealthy Roman matrons with such success that part of it was remitted (Quint. Inst. i. 1. 6; Val. Max. viii. 3. 3).

To the 21st edition of Cicero, see Dio Cassius xxxviii. 16, xxxix. 37; Pliny, Nat. Hist. ix. 81, x. 23, xiv. 17, xxxv. 40; Varro, R. R. iii. 13. 17.

HORTENSIUS, QUINTUS, dictator of Rome 286 B.C. When the people, pressed by their patrician creditors, "seeded" to the Janiculum, he was commissioned to put an end to the strife. He passed a law whereby the resolutions of the multitude (plebiscita) were made binding on all the citizens, without the approval of the senate being necessary. This was not a mere re-enactment of previous laws. Another law, passed about the same time, which declared the nudines (market days) to be dies fasti (days on which legal business might be transacted), is also attributed to him. He is said to have died while still dictator.

Aulus Gellius xv. 27; Pliny, Nat. Hist. xvi. 15; Macrobius, Saturnalia i. 16; Livy, Epit. ii.

HORTICULTURE (Lat. hortus, a garden), the art and science of the cultivation of garden plants, whether for utilitarian or for decorative purposes. The subject naturally divides itself into two sections, which we here propose to treat separately, commencing with the science, and passing on to the practice of the cultivation of flowers, fruits and vegetables as applicable to the home garden. The point of view taken is necessarily, as a rule, that of a British gardener.

PART I.—PRINCIPLES OR SCIENCE OF HORTICULTURE

Horticulture, apart from the mechanical details connected with the maintenance of a garden and its appurtenances, may be considered as the application of the principles of plant physiology to the cultivation of plants from all parts of the globe, and from various altitudes, soils and situations. The lessons derived from the abstract principles enunciated by the physiologist, the chemist and the physicist require, however, to be modified to suit the special circumstances of plants under cultivation. The necessity for this modification arises from the fact that such plants are subjected to conditions more or less unnatural to them, and that they are grown for special purposes which are at variance, in degree at any rate, with their natural requirements.

The life of the plant (see PLANTS) makes itself manifest in the processes of growth, development and reproduction. By growth is here meant mere increase in bulk, and by development the series of gradual modifications by which a plant, originally simple in its structure and conformation, becomes eventually complicated, and endowed with distinct parts or organs. The reproduction of the higher plants takes place either asexually by the formation of buds or organs answering chereto, or sexually by the production of an embryo plant within the seed. The conditions requisite for the growth, development and reproduction of plants are, in general terms, exposure, at the proper time, to suitable amounts of light, heat and moisture, and a due supply of appropriate food. The various amounts of these needed in different cases have to be adjusted by the gardener, according to the nature of the plant, its "habit" or general mode of growth in its native country, and the influence to which it is there subjected, as also in accordance with the purposes for which it is to be cultivated, &c.

It is but rarely that direct information on all these points can be obtained; but inference from previous experience, especially with regard to allied forms, will go far to supply such deficiencies. Moreover, it must be remembered that the conditions most favourable to plants are not always those to which they are subjected in nature, for, owing to the competition of other forms in the struggle for existence, liability to injury from insects, and other adverse circumstances, plants may actually be excluded from the localities best suited for their development. The gardener therefore may, and does, by modifying, improve upon the conditions under which a plant naturally exists. Thus it frequently happens that in our gardens flowers have a beauty.
and a fragrance, and fruits a size and savour denied to them in their native haunts. It behoves the judicious gardener, then, not to be too slavish in his attempts to imitate natural conditions, and to bear in mind that such attempts sometimes end in failure. The most successful gardening is that which turns to the best account the plastic organization of the plant, and enables it to develop and multiply as perfectly as possible. Experience, much valued by the old-time horticulturist, as well as the more indirect teachings of tradition, are therefore of primary importance to the practical gardener.

We propose here to notice briefly the several parts of a flowering plant, and to point out the rationale of the cultural procedures connected with them (see the references to separate articles at the end of article on Botany).

The Root.—The root, though not precluded from access of air, is not directly dependent for its growth on the agency of light. The energy of drainage, digging, hoeing and like operations is accounted for by the manner in which they promote aeration of the soil, raise its temperature and remove its stagnant water. Owing to their growth in length at, or rather in the immediate vicinity of, their tips, they are liable to travel long distances by surmounting some obstacles, penetrating others, and insinuating themselves into narrow crevices. As they have no power of absorbing solid materials, their food must be of a liquid or gaseous character. It is the root which initiates the process of transpiration in the plant. It is the root which is usually supplied exclusively by the finest subdivisions of the fibris, and in many cases by the extremely delicate thread-like cells which project from them and which are known as root-hairs. The importance of the root-stock cannot be overestimated. Every good gardener must secure its development, and to prevent as far as possible any injury to them in digging, potting and transplanting operations being therefore least prejudicial at seasons when the plant is in a state of comparative rest.

Root-Pruning and Lifting.—In apparent disregard of the general rule just enunciated is the practice of root-pruning fruit trees, when, from the formation of wood being more intensive on the sides of the root, they bear badly. The contrariety is more apparent than real, as the operation consists in the removal of the coarser roots, a process which results in the development of a mass of fine feeding roots. It is in general the fine feeding roots which are the objects of the mode of growth and reproduction of the plant, and between the vegetative and reproductive processes, so that, other things being equal, anything that checks the one helps forward the other.

WATERING.—So far as practical gardening is concerned, feeding by the roots after they have been placed in suitable soil is confined principally to the administration of water and, under certain circumstances, of leafy or liquid manures; and, no operations demand more judicious management. The amount of water required, and the times when it should be applied, may be greatly according to the kind of plant and the object for which it is grown, the state of the weather, the condition of the soil, and the season. Conditions, the influence of which is to be learnt by experience only. The same may be said with respect to the application of manures. The watering of pot-plants requires special care. Water should as a rule be given to the plants when they are beginning to dry, and not too soon, for this serves to break the rooting threads and helps the plant to root itself. Injuries are thus prevented and the plants are kept in a warmer and more uniform medium than are the upper parts of the plant. Often the escape of heat from the soil is prevented by mulching, i.e. by depositing on it a layer of litter, straw, dead leaves and the like.

The Stem and its subdivisions or branches raise to the light and air the leaves and flowers, serve as channels for the passage to them of fluids from the roots, and act as reservoirs for nutritive substances. The growth of the internodes is a case in point. It is a case after the ripening of the seed, whilst in plants of longer duration layer after layer of strong woody tissue is formed, which enables them to bear the strains which the plant has to undergo. It is obvious to the gardener that during the period when the plant is young and robust, stout, short-jointed stems, instead of long lanky growths defective in woody tissue. To secure these conditions free exposure to light and air is necessary, but in the case of coppies and woods, or where long straight spars are needed by the forester, plants are allowed to grow thickly so as to ensure development in an upward rather than in a lateral direction. This and like matters will, however, not be finely considered in dealing hereafter with the buds and their treatment.

Leaves.—The work of the leaves may be briefly stated to consist of the processes of nutrition, respiration and transpiration. Nutrition (in digestion) by means of chlorophyll, the green or chlorophyll pigments, which is the interaction under the influence of light and in the presence of chlorophyll of the carbon dioxide of the air with the water received from the root, to form carbonaceous food. Respiration in plants, the combustion of the stored different kinds of oxygen, the liberation of energy in the form of heat, and the exhalation of carbon dioxide and water vapour. Transpiration is also a process by which moisture is removed from the minute pores or stomata on the leaves. In xerophytic plants (those of the cacti, euphorbias, &c.) from hot, dry and almost waterless regions where evaporation would be excessive, the leaf surface, and consequently the number of stomata, are reduced to a minimum, so that it would be fatal to such plants to exhale vapour as freely in those regions as the broad-leaved plants that grow in places where there is abundance of moisture. Although transpiration is a necessary accompanying of evaporation, it is not always excessive, especially where the plant cannot readily recoup itself. In these circumstances “syringing” and “damping down” are of value in cooling the temperature of the air in hot-houses and greenhouses and increasing its humidity, thereby checking excessive transpiration. Shading the greenhouse with canvas or washes during the summer months has the same object in view. Syringing is also beneficial in washing away dirt and dust and promoting a healthy atmosphere.

BUDS.—The recognition of the various forms of buds and their modes of disposition in different plants is a matter of the first consequence in the operations of pruning and training. Flower-buds usually consist of three scales, the upper one, like the flower, the middle one, like the leaves, and the lower one, like the flower-buds of the past year’s growth, or on a shoot of the present year. The peach, horse-chestnut, lilac, morello cherry, black currant, rhododendron and many other trees and shrubs develop flower-buds for the next season’s growth already in the spring; while in the case of the pepper-tree and the laurel, the buds of the upper year’s growth are substituted by flower-buds next season. The heartwood and the sapwood are not, as a rule, connected. The foliage leaves, or “leaves” in the broadest sense, consist of a sheath or petiole and a blade. The distinction between the vegetative and reproductive processes, so that, other things being equal, anything that checks the one helps forward the other.
severed. Many plants can be far more easily propagated thus than by cuttings.

*The graft* or *"working"* consists in the transfer of a branch, the "graft" or "scion," from one plant to another, which latter is termed the "stock." The operation must be so performed that the growing points of the two plants shall meet, and firm pressure should be made, corresponding to the corresponding layer of the stock. In *budding*, as with roses and peaches, a single bud only is implanted. *Inarching* is essentially the promotion of the union of a shoot of one plant to that of another of the same or different species. It is usually the outer bark of the scion being removed, the two shoots are kept in contact by ligature until union is established, when the scion is completely severed from its original attachments. This operation is difficult in detail; it is not to be propagated, but it is essential in all cases that the affinity between the two plants be near, that the union be neatly effected, and that the ratio as well as the season of growth of the scion is favorable.

The selection of suitable stocks is a matter still requiring much scientific experiment. The object of grafting is to expedite and increase the formation of flowers and fruit. Strong-growing pears, for instance, are grafted on the quince stock in order to restrict their tendency to form "gross" shoots and a superabundance of wood in place of flowers and fruit. Apples, for the same reason, are "worked" on the "paradise" or "doucin" stocks, which from their influence on the scion are known as dwarving stocks. Scions from a tree which is weakly, or liable to injury by frosts, are strengthened by grafting on robust stocks. Lindley has pointed out the different affinities of the various species of the peach, that best grafted on the peach, or on its wild type the almond, in England, where the summer temperature of the soil is much lower than that of many other parts of the British isles. In America it has been found to be most successful on stocks of the native plum.

The soil in which the stock grows is a point demanding attention. From a careful series of experiments made in the Horticultural Society's garden in Regent's Park, it was shown that when the soil was loamy, or light and slightly enriched with decayed vegetable matter, the apple succeeds best on the doucin stock, and the pear on the quince and apple. Hence it is to be desired that the soil shall be rich and friable to graft the stock on the crab, and the pear on the wild pear. For the plum on loamy soils the scions, and on chalky and light soils the almond, are the most desirable stocks, and for the cherry on loamy or light rich soils the wild pear is best. The soil in which they are grown, and the extent to which these affinities are observed, has proved, to be the most successful on stocks of the native plum.

The form and especially the quality of fruit is more or less affected by the stock upon which it is grown. The Stanwick nectarine, so apt to crack and not to ripen when worked in the ordinary way in said country, is cured of these propensities by being first budded close to the ground, on a very strong-growing Magnol. Bonum plum, worked on a Brussels stock, and then budding the nectarine on the Magnol. Bonum about a foot from the ground. The fruit of the pear is of a higher colour and smaller on the quince stock than on the wild pear; still more so on the medlar. On the mountain ash the pear becomes earlier.

Budding from stock on scion, and more particularly by scion on stock, are as a rule with difficulty acceptable. Nevertheless, in exceptional cases modified growths, termed graft-hybrids, have been developed which have not only obscured the conning of the characteristics of stock and scion (see HYBRIDISM). Of these the most remarkable example is *Cytisus Adami*, a tree which year after year produces some shoots, foliage and flowers like that of the *Cytisus*, and others like those of the plantain lily, but different looking dwarf shrub *C. purpureus*, and others again intermediate between these. We may hence infer that *C. purpureus* was grafted or budded on the common laburnum, and that the intermediate forms are the result of graft-hybridization. Numerous similar facts have been recorded. Among gardeners the general opinion is against the possibility of graft-hybridization. The wonder, however, seems to be that it does not occur more often. It was seen that fluids must pass from stock to scion, and matter elaborated in the leaves of the scion must certainly to some extent enter the stock. It does not, however, from examination of rules as a rule the wood of the stock and the wood of the scion, with their external characters year by year without change. Still, as in the laburnum just mentioned, in the variegated jasmine and in *Abutilon Darwinii*, in which the same differences in the growth, such as in the case of *C. purpureus*, it is frequently the case that the variegated scion has occasionally shown itself in the production from the stock of variegated shoots. At a meeting of the Scottish Horticultural Society (see Gard. Chron., Jan. 1, 1880, f. 12-14), species of *Gleditschia* were exhibited, which were peculiarly intermediate in size, form, colour, speckling of the stamens and other characteristics. Similar, though less marked, intermediate characters were obvious in the foliage and flowers.

Pruning.—By removal from one place to another the growth of every plant receives a check. How this check can be obviated or lessened, or at least the damage it is productive of; the condition and circumstances of the plant generally, is a matter to be considered by the practical gardener.

The idea of pruning is much respect to deciduous trees and shrubs that the earlier in autumn pruning is performed the better; although some extend it from the period when the leaves fall to the first part of spring, before the sap begins to move. If a stock be severely pruned during the winter, great care must be taken whilst the soil is still warm with the heat absorbed during summer. Attention to this rule is specially important in the case of rare and delicate plants. Before the advent of the season, hard parts of roots to be heaved over, and to form fibris, which will be ready in spring, when it is most required, to collect food for the plant. Planting late in spring should, as far as possible, be avoided, and if the plant has been transplanted then being heaved over before or soon after the planting, the better the roots become. It has been supposed that because the surface of the young leaves is small transpiration is correspondingly feeble; but it must be remembered, not only that their newly-formed tissue is unable without an abundant supply of sap from the roots to resist the excessive drying action of the atmosphere, but that, in spring, the lowness of the temperature at that season in Great Britain prevents the free circulation of the sap. The comparative dryness of the atmosphere in spring also causes a greater amount of transpiration than then in autumn and winter. Another fact in favour of autumn pruning is the production of roots in winter.

The best way of performing transplantation depends greatly on the size of the trees, the soil in which they grow, and the mechanical qualities of the soil. To judge whether a tree is not too small, the more the tree the more successively it can be removed. The more argillaceous and the less silicious the soil the more readily can balls of earth be retained about the roots. All planters lay great stress on the importance of the condition of the root to the transfer, and to what extent they can with safety be allowed to be cut off in transplanting. Trees and shrubs in thick plantations, or in some parts of the world, places ill suited for planting, become stunted and smaller. During their removal it is important that the roots be covered, if only to prevent desiccation by the air. Dam деньги therefore the best for the operation; the driest months are the most unfavourable. Though success in transplanting depends much on the soil, the humidity of the atmosphere, the most important requisite is warmth in the soil; humidity can be supplied artificially, but heat cannot.

Pruning, or the removal of superfluous growths, is practised in order to equalize the development of the different parts of trees, or to promote it in particular directions so as to secure a certain form, and, by checking undue luxuriance, to promote enhanced fertility. In the rose-bush, for instance, in which, as we have seen, the flower-buds are formed on the new wood of the year, pruning causes the old wood to "break," i.e. to put forth a number of new shoots, half of which will not flower, and the manner and time in which pruning should be accomplished, and its extent, vary with the plant, the objects of the operation, i.e. the purposes in view. In fruit trees it is necessary to attend, throughout the season, and under various circumstances. So much judgment and experience does the operation call for that it is a truism to say that bad pruning is worse than none. The removal of weakly, sickly, overcrowded shoots, and the judicious suppression of the growth of flowers, is a necessity, and it is difficult sometimes to avoid the great loss in yield which there can be few mistakes when once the habit of growth and the form and arrangement of the buds are known. Winter pruning is effected when the tree is comparatively at rest, and is therefore less liable to bleeding or outpouring of sap. Summer pruning or pinching off the tips of such of the younger shoots as are not required for the extension of the tree, when not carried to too great an extent, is preferable to the corser more reckless style of pruning. The injury inflicted is less and not so concentrated; the wounds are smaller, and have time to heal before winter sets in. The effects of badly-executed, or rather thorough, pruning are far more immediate, and the irritation which of often results in rotting, canker and other diseases. Judicious and timely thinning as so to allow the trees room to grow, and to give them sufficient space to be pruned, is the object of the pruning-saw, except to a relatively small extent.

Training is a proceedure adopted when it is required to grow plants in a limited area, or in a particular shape, as in the case of many flowers. The same training has a double object, viz., to secure the most vigorous growth, and to encourage the formation of flowers and fruit. Growth in length is mainly in a vertical direction, or at least at the ends of the branches. Flower-buds are produced from young twigs or even from a tree, or of a climbing plant which it is desired should cover a wall quickly; but where flowers or fruit are specially desired, then, when the wood required is formed, the lateral shoots may be cut back or left detached, and that pruning may be confined to the pot of training, as of pruning, may, however, be carried too far; and not unfrequently the symmetrically trained trees of the French excite admiration in every respect save fertility.

Spurs or Bud Variations.—Here we may conveniently mention certain variations from the normal condition in the size, form or
disposition of buds or shoots on a given plant. An inferior variety of plant, with suddenly appearing fruit of superior quality; a beech tree, without obvious cause, with finely divided foliage; or a camellia an unwatered fine flower. When removed from the plant and treated as cuttings or grafts, such newly induced fruitfulness has been stored in the tissues of the plant. The reproduction of flowers through the process of which the flower is the first stage being an exhaustive one, it is necessary that the plant, as gardeners, say, should get "established" before it flowers. Throughout the flower do indeed perform the same office as the leaves, the more highly coloured and more specialized portions, which are further removed from the typical leaf-form, do not carry on those processes for which the parts are specialized, will tend to throw a plant into a flowering condition. This is exemplified by the fact that the temperature of the climate of Great Britain is too low for the flowering, though sufficiently high for the growth of many plants. The natives of high altitudes, and some of them in countries of mild climate, are usually only flowers in exceptionally hot seasons.

Forcing.—The operation of forcing is based upon the facts just mentioned. By subjecting a plant to a gradually increasing temperature, and supply of water in proportion, the period of dormancy is accelerated; its season of development may be, as it were, anticipated; it is roused from a dormant to an active state. Forcing therefore demands an understanding, and careful adjustment of temperature and supplies of moisture and light.

Deficiency of light is less injurious than might at first be expected, because the plant to be forced has stored up in its tissues, and available for use, a reservoir of stock of material forms, through the agency of light in former seasons. The intensity of the colour of flowers and the richness of flavour of fruit are, however, deficient where there is feebleness of light. Recent experiments show that the chief things that give bright colours to flowers are sunlight, and that deficiencies of natural light may to some extent be made good by its use. The employment of that light for forcing purposes would seem to be in part a question of expense. The and sun-dried, or artificially elevated from its use has consisted in the rapidity with which flowers have been formed and fruits ripened under its influence, circumstances which go towards compensating for the extra cost of production.

Retention.—The art of retarding the period of flowering in certain plants consists, in principle, in the artificial application of cold temperature whereby the resting condition induced by low winter temperatures is prolonged. For commercial purposes, crops of lily of the valley, tulip and other bulbs, and such deciduous woody plants as lilac and deciduous species of rhododendron, while in a state of rest, are packed in wet moss and introduced into coldstorage chambers, where they may remain, in a sound and healthy condition, if desired, throughout the following summer. The temperature of the cold chamber is varied from the freezing-point of water, to a few degrees lower, according to the needs of the plants under treatment. When required for use they are removed to cool sheds to thaw, and are then gradually inured to higher temperatures. The chief advantages of retarded plants are:—(a) they may be flowered at will; (b) they are readily induced to flower at their times when required; (c) the large cold-storage chambers form a part of the equipment of most of the leading establishments where flowers are grown for market.

A peculiarity of some species of "double flowers" should be largely grown. Though in many instances, as in hycamint, they are less beautiful than single ones, they always present the advantage of being less evanescent. Under the vogue to-day of hybrid flowers, they differ from those of the same species, but are included. The flower of a double dahlia, e.g. offers a totally different condition of structure from that of a rose or a hycamint. The double poinsettia, again, owes its so-called double condition merely to the increased number of its accessory involucral leaves, which are more than the parts of the flower at all. It is reasonable, therefore, to infer that the causes leading to the production of double flowers are varied. A good deal of difference of opinion exists as to whether they are the result of a separate natural order of characters, or of the result of the crossing of two kinds of flowers, the nature of which is such that the result of the cross is a double flower. Double flowers, it is often maintained, are the result of a cross between two species, or between a species and its variety. Further, double flowers, although they may be produced, according to whether restricted food or abundant supplies of nourishment are the more necessary for their production. It must suffice here to note that double flowers are produced in a way commonly the result of the substitution of brightly-coloured petals for petals of the same or another colour, and that a perfectly double flower where all the stamens and pistils are thus metamorphosed is necessarily barren. Such a combination is frequently obtained by the treatment of a male flower with the female portion of the ordinary type, a "strain" or race of double flowers is gradually produced.

Fertilization.—In fertilization the influence in flowering plants of the male-cell in the pollen tube up the egg cell in the ovule (see BOTANY)—there are many circumstances of importance horticulturally, to which, therefore, brief reference must be made. Fertilization of the flower may be of two kinds, either self-fertilized, cross-fertilized or hybridized. Self-fertilization is usual when the pollen of a given flower acts on the ovule of its own flower. Cross-fertilization occurs when pollen from another flower or of another plant is used. Cross-fertilization is rendered possible, ripper berries, before unknown, became possible.

The conveyance of pollen from one flower to another in cross-fertilization is effected naturally by the wind, or by the agency of insects and other creatures. Flowers that require the aid of insects may have some attractions to plants, as scents, nectar, pollen or pollen with sugary matter, and colours, or sweet juices. The colour and markings of a flower often serve to guide the insects to the honey, in the obtaining of which they are compelled either to remove or to deposit pollen. Cross-fertilization by insects on flowers may be divided into two great groups, the one, which is the common and very ancient, is the result of the introduction of the male plant into another species, often through the introduction of the male plant from Japan, its fertilization was rendered possible, ripper berries, before unknown, became possible.

It is very probable that the same flower at certain times and seasons is self-fertilizing, and at others not so. The defects which occur in such flowers, and those which are self-fertilized, certain strawberries as "blind," may be due either to unsuitable conditions of external temperature, or to the non-accompanyment, from some cause or other, of cross-fertilization. In a very, tomato-though the degree of the pollination is practically the same, the pollen to tap the branches smartly with a stick so as to ensure the dispersal of the pollen. Sometimes more delicate and direct manipulation is required, and the gardener has himself to convey the pollen from one flower to another, for which purpose a camel's-hair pencil is generally suitable. The degree of fertility varies greatly according to external conditions, the structural and functional arrangements just alluded to, and other causes which may roughly be called constitutional. Thus, it often happens that an apparently very slight change in climate alters the degree of fertility. In a particular country or at certain seasons one flower will bear an abundance of fruit, and another of different kind, of the same species, and so on. It is evident that the gardener's greatest triumphs have been obtained by hybridization, i.e. the crossing of two individuals not of the same but of two distinct species of plants, as e.g. the rose and the hybrid rose, the rhododendron or two species of orchid (see HYBRIDISM). It is obvious that hybridization differs more in degree than in kind from cross-fertilization. The occurrence of hybrids in nature explains the difficulties experienced by botanists in delimiting the species, and the widely different hybridizations of the term adopted by different observers in the case of willows, roses, brambles, &c. The artificial method of hybridization is of course more direct, and usually requires more care. To prevent self-fertilization, or the access of insects, it is advisable to remove the stamens and even the corolla from the flower to be impregnated, as its own pollen may be sufficient to effect the fertilization of the flower, and that is "sterile," or "potent." There are, however, cases, e.g. some passion-flowers and rhododendrons, in which a flower is more or less sterile with its own, but fertile with foreign pollen, even when this is from a distinct species.
afford pollen perfectly potent on the stigma of another kind, by the pollen of which latter its own stigma is unaffected.

The object of the hybridizer is to obtain varieties exhibiting improvements in hardihood, vigour, size, shape, colour, form and texture, or resistance to disease, or other attributes. His success depends not alone on skill and judgment, for some seasons, or days even, are found more propitious than others. Although promiscuous and haphazard procedure do no damage with regard to measurement of soil-provision, the best results are those which are attained by systematic work with a definite aim.

Hybrids are sometimes more fertile than pure-bred species, and are frequently sterile. Some hybrids, however, are as fertile as pure-bred plants. Hybrid plants may be again crossed, or even re-hybridized, so as to produce a progeny of very mixed parentage. Greenhouses, glass-nets, dahlias, begonias, pelargoniums, and orchids and other long or widely cultivated garden plants.

Reversion.—In modified forms of plants there is frequently a tendency to revert to parental or ancestral characteristics. So markedly is this the case with hybrids that in a few generations all traces of a hybrid origin may disappear. The dissociation of the hybrid element in a plant must be obtained by careful selection. The researches of Gregor Johann Mendel (1822-1884), abbot of the Augustinian monastery, at Brünn, in connexion with peas and other plants, apparently indicate that there is a definite law by which the ratio of hybrid to pure-bred seed is always the same. He found that the progeny resulted in all yellow coloured seeds. These gave rise in due course to a generation in which there were twice as many yellows as one green. In the third generation the yellow seed from the second generation gave the proportion of one pure yellow, two impure yellows, and one green; while the green seed of the second generation throve into the fourth and fifth generations. The pure yellow in the third generation also threw pure yellows in the fourth and fifth and succeeding generations. The impure yellows, however, in the next generation gave rise to one pure yellow, one pure green, to two impure yellows, and again to generation from generation to generation. Accordingly as the green or the yellow predominated in the progeny it was termed "dominant," while the colour that disappeared was called "recessive." It happened, however, that a recessive colour in one generation becomes the dominant in a succeeding one.

Germination.—The length of the period during which seeds remain dormant after their formation is very variable. The conditions for germination are much the same as for growth in general. Access to light is not required, because the seed contains a sufficiency of stored-up food. The temperature necessary varies according to the nature and source of the seed. Some seeds require prolonged immersion in water to soften their shells; others are so delicate a texture that they would dry up and perish if not kept constantly in a moist atmosphere. Seeds buried too deeply receive a deficient supply of air. As a rule, seeds require to be sown more deeply in proportion to their size and the lightness of the soil.

The most favourable circumstances vary very greatly, even in the same species, and in seeds taken from one pod. Thus the seeds of Primula japonica, though sown under precisely similar conditions, yet come up at varying intervals of time, often to the wonder. There is a store of available food in the perispem, or in the endo-sperm, or in the embryo itself, than which is scanty or wanting. In the latter case the seedling has early to shift for itself, and to form roots and leaves for the supply of its needs.

Selection.—Supposing seedlings to have been developed, it is found that a large number of them present considerable variations, some being especially robust, others peculiar in size or form. Those most suitable for the purpose of the gardener are carefully selected for propagation, while others not so desirable are destroyed; and thus after a few generations a fixed variety, race or strain superior to the original form is obtained. Many garden plants have been improved solely by selection; and much has been done to improve our breeds of vegetables, flowers and fruit by systematic selection.

In fruit and vegetable seeds are always used for harvesting. The seeds should be kept in sacks or bags in a dry place, and if from plants which are rare, or liable to lose their vitality, they are advantageously packed for transmission to a distance in hermetically sealed bottles or jars filled with earth or moss, without the addition of moisture.

It will have been gathered from what has been said that seeds cannot always be depended on to reproduce exactly the characteristics of the plant which yielded them; for instance, seeds of the greenage plum or of the Ribston pippin will produce a plum or an apple, but not these particular varieties, to perpetuate which grafts or buds must be employed.

(M. T. M.; W. R. W.)

PART II.—THE PRACTICE OF HORTICULTURE

The details of horticultural practice naturally range under the three heads of flowers, fruits and vegetables (see also Fruit and Flower Farming). There are, however, certain general aspects of the subject which will be more conveniently noticed apart, since they apply alike to each department. We shall therefore first treat of these under four headings: formation and preparation of the garden, garden structures and edifices, garden materials and appliances, and garden operations.

I. Formation and Preparation of the Garden

Site.—The site chosen for the mansion will more or less determine that of the garden, the pleasure grounds and flower garden being placed so as to surround or lie contiguous to it, while the fruit and vegetable gardens, either together or separate, should be placed on one side or in the rear, according to fitness as regards the nature of the soil and subsoil, the slope of the surface or the general features of the park scenery. In the case of ville gardens there is usually little choice: the land to be occupied is cut up into plots, usually rectangular, and of greater or less breadth, and in laying out these plots there is generally a smaller space left in the front of the villa residence and a larger one behind, the front plot being usually devoted to approaches, shrubbery and plantations, flower beds being added if space permits, while the back or more private plot has a piece of lawn grass with flower beds near the house, and a space for vegetables and fruit trees at the far end, this latter being shut off from the lawn by an intervening screen of evergreens or other plants. Between these two classes of gardens there are many gradations, but our remarks will chiefly apply to those of larger extent.

The almost universal practice is to have the fruit and vegetable gardens combined; and the flower garden may sometimes be conveniently placed in juxtaposition with them. When the fruit and vegetable gardens are combined, the smaller and choicer fruit trees only should be admitted, such larger-growing hardy fruits as apples, pears, plums, cherries, &c., being relegated to the orchard.

Ground possessing a gentle inclination towards the south is desirable for a garden. On such a slope effectual draining is easily accomplished, and the greatest possible benefit is derived from the sun's rays. It is well also to have an open exposure towards the east and west, so that the garden may enjoy the full benefit of the morning and evening sun, especially the latter; but shelter is desirable on the north and north-east, or in any direction in which the particular locality may happen to be exposed. In some places the south-western gales are so severe that a belt of trees is useful as a break wind and shelter.

Soil and Subsoil.—A hazel-coloured loam, moderately light in texture, is well adapted for most garden crops, whether of fruits or vegetables, especially a good warm deep loam resting upon chalk; and if such a soil occurs naturally in the selected site, little will be required in the way of preparation. If the soil is not moderately good and of fair depth, it is not so favourable for gardening purposes. Wherever the soil is not quite suitable, but is capable of being made so, it is best to remedy the defect at the outset by trenching it all over to a depth of 2 or 3 ft., incorporating plenty of manure with it. A heavy soil, although at first requiring more labour, generally gives far better results when worked than a light soil. The latter is not sufficiently retentive of moisture and gets too hot in summer, and requires large quantities of organic manures to keep it in good condition. It is advantageous to possess a variety of soils; and if the garden be on a slope it will often be practicable to render the upper part light and dry, while the lower remains of a heavier and damper nature.

Natural soils consist of substances derived from the decomposition of various kinds of rocks, the bulk consisting of clay, silica and lime, in various proportions. As regards preparation, draining is of course of the utmost importance. The ground should also be trenched to the depth of 3 ft. at least, and the deeper the better so as to bring up the subsoil—whether it be clay, sand, gravel, marl, &c.—for exposure to the weather and thus convert it from a sterile mass into a living soil teeming with bacteria. In this operation all stones larger than a man's fist must be taken out, and all roots of trees and of
perennial weeds carefully cleared away. When the whole ground has been thus treated, a moderate liming will, in general, be useful, especially on heavy clay soils. After this, supposing the work to have occupied most of the summer, the whole may be laid up in ridges, to expose as great a surface as possible to the action of the winter's frost.

Argillaceous or clay soils are those which contain a large percentage (45-50) of clay, and a small percentage (5 or less) of lime. They are not unfitted for garden purposes until improved by draining, liming, trenching and the addition of porous materials, such as ashes, burnt ballast or sand, but when thoroughly improved they are very fertile and less liable to become exhausted than most other soils. Loamy soils contain a considerable quantity (50-45%) of clay, and smaller quantities of lime, humus and sand. Such soils properly drained and prepared are very suitable for orchards, and when the proportion of clay is smaller (20-30%) they form excellent garden soils, in which the better sort of fruit trees luxuriate. Marly soils are those which contain a considerable percentage (10-20) of lime, and are called clay marls, loamy marls and sandy marls, according as these several ingredients preponderate. The clay marls are, like clay soils, too stiff for garden purposes until well worked and heavily manured; but loamy marls are fertile and well suited to fruit trees, and sandy marls are adapted for producing early crops. Calcareous soils, which may also be heavy, intermediate or light, are those which contain more than 20% of lime, their fertility depending on the proportions of clay and sand which enter into their composition; they are generally cold and wet. Vehemently sandy soils contain a considerable percentage (more than 5%) of humus, and embrace both the rich productive garden moulds and those known as peaty soils.

The nature of the subsoil is of scarcely less importance than that of the surface soil. Many gardeners are still afraid to disturb an unsuitable subsoil, but experienced growers have proved that by bringing it up to the surface and placing plenty of manure in the bottoms of the various trenches, the very best results are attained in the course of a season or so. An uneven subsoil, especially if retentive, is most undesirable, as water is apt to collect in the hollows, and thus affect the upper soil. The sloping or uneven plane of its surface agrees with that of the ground. When there is a hard pan this should be broken up with the spade or the fork, and have plenty of manure mixed with it. When there is an injurious preponderance of metallic oxides or other deleterious substances, the roots of trees would be affected by them, and they must therefore be removed. When the subsoil is too compact to be pervious to water, effective drainage must be resorted to; when it is very loose, so that it drains away the fertile ingredients of the soil as well as those which are artificially supplied, the compactness of the stratum should be increased by the addition of clay, marl or loam. The better all subsoils is a dry bed of clay overlying sandstone.

Plan.—In laying out the garden, the plan should be prepared in minute detail before commencing operations. The form of the kitchen and fruit garden should be square or oblong, rather than curvilinear, since the working and cropping of the ground can thus be more easily carried out. The whole should be compactly arranged, so as to facilitate working, and to afford convenient access for the carting of the heavy materials. This access is especially desirable as regards the store-yards and framing ground, where fermenting manures and tree leaves for making up hot beds, coals or wood for fuel and ingredients for composts, together with flower-pots and the many necessaries of garden culture, have to be accommodated. In the case of villas or picturesque residences, gardens of irregular form may be permitted; when adapted to the conditions of the locality, they associate better with surrounding objects, but in such gardens wall space is usually limited.

The distribution of paths must be governed by circumstances. Generally speaking, the main paths for cartage should be 8 ft. wide, made up of 9 in. hard core covered by 4 in. of gravel or ash, with a gentle rise to centre to throw off surface water. The smaller paths, not intended for cartage, should be 4 ft. to 6 ft. wide, according to circumstances, made up of 6 in. hard core and 3 in. of gravel or ash, and should be slightly raised at centre. A considerable portion of the north wall is usually covered in front with the glazed structures called forcing-houses, and to these the houses for ornamental plants are sometimes attached; but a more appropriate site for the latter is the flower garden, when that forms a separate department. It is well to have that everything connected with the forcing of fruits or flowers should be concentrated in one place. The frame ground, including melon and pine pits, should occupy some well-sheltered spot in the slips, or on one side of the garden, and adjoining to this may be found a suitable site for the compost ground, in which the various kinds of soils are kept in store, and in which also composts may be prepared.

As walls afford valuable space for the growth of the choicer kinds of hardy fruits, the direction in which they are built is of considerable importance. In the warmer parts of the country the wall on the north side of the garden should be so placed as to face the sun at about an hour before noon, or a little to the east of south; in less favoured localities it should be made to face direct south, and in still more unfavourable districts it should face the sun an hour after noon, or a little west of south. The east and west walls should run parallel to each other, and at right angles to that on the north side, in all the most favoured localities; but in colder or later ones, though parallel, they should be so far removed from a right angle as to get the sun by eleven o'clock. On the whole, the form of a parallelogram with its longest sides in the proportion of about one to four of the shorter, and running east and west, may be considered the best form, since it affords a greater extent of south wall than any other.

Fig. 1 represents a garden of one acre and admits of nearly double the number of trees on the south aspect as compared with the east and west; it allows a greater number of espalier or pyramid trees to face the south; and it admits of being divided into equal principal compartments, each of which forms nearly a square. The size of course can be increased to any requisite extent. To this plan belong the royal gardens at Frogmore, 760 ft. east to west and 440 ft. from north to south, is nearly of the same proportions. The spaces between the walls and the outer fence are called "slips." A considerable extent of such slips is sometimes thus enclosed.

Shelter.—A screen of some kind to temper the fury of the blast is absolutely necessary. If the situation is not naturally well sheltered, the defect may be remedied by masses of forest trees disposed at a considerable distance so as not to shade the walls or fruit trees. They should not be nearer than, say, 50 yds., and may vary from that to 100 or 150 yds. distance according to circumstances, regard being had especially to peculiarities of situation, made by the configuration of the country, as for instance to aerial currents from adjacent eminences. Care should be taken, however, not to hem in the garden by crowded plantations, shelter from the prevailing strong winds being all that is required, while the more open it is in other directions the better. The trees employed for screens should include both those of deciduous and of evergreen habit, and should suit the peculiarities of local soil and climate. Of deciduous trees the sycamore, wych-elm, horse-chestnut, beech, lime, plane and poplar may be used,—the abele or white poplar, Populus alba, being one of the most rapid-growing of all trees, and, like other poplars, well suited for nursing other choicer subjects; while of evergreens, the holm oak, holly, laurel (both common and Portugal), and such conifers as the Scotch, Weymouth and Austrian pines, with spruce and...
silver firs and yews, are suitable. The conifers make the most effective screens.

Extensive gardens in exposed situations are often divided into compartments by hedges, so disposed as to break the force of high winds. Where these are required to be narrow as well as lofty, holly, yew or beech is to be preferred; but, if there is sufficient space, the beautiful laurel and the bay may be employed where they will thrive. Smaller hedges may be distributed in a more convenient way by the use of rough sandstone, or hard earth, thus forming a close, even surface, and such walks are kept clean by hoeing.

Grass walks were common in English gardens during the prevalence of the Dutch taste, but, owing to the frequent humidity of the climate, they have in a great measure been discarded. Grass walks are made in the same way as grass lawns. When the space to be thus occupied is prepared, a thin layer of sand or poor earth is laid upon the surface and over this a similar layer of good soil. This arrangement is adopted in order to prevent excessive luxuriance in the grass. In many modern gardens pathways made of old paving stones lead from the house to different parts. They give an old-fashioned and restful appearance to a garden, and in the interstices charming little plants like thyme, Tonopodium acaule, &c., are allowed to grow.

Edgings.—Walks are separated from the adjoining beds and borders in a variety of ways. If a living edging is adopted, by far the best is afforded by the dwarf box planted closely in line. It is of extremely neat growth, and when annually clipped will remain in good order for many years. Very good edgings, but of a less durable character, are formed by thrift (Armeria vulgaris), double daisy (Bellis perennis), gentianella (Gentiana acaulis) and London pride (Saxifraga umbrosa), Cerastium tomentosum, Stachys lavata and the beautiful evergreen Veronica rupestris with sheets of bright blue flowers close to the ground, or by some of the finer grasses very carefully selected, such as the sheep's fescue (Festuca ovina) or its glaucous-leaved variety. Indeed, any low-growing herbaceous plant, susceptible of minute division, is suitable for an edging. Amongst shrubby plants suitable for edgings are the evergreen candytuft (Iberis sempervirens), Eryngium radicans variegata, ivy, and Euknemium microphyllum—a charming little evergreen with small serrated leaves. Edgings may also be formed of narrow slips of sandstone flag, slate, tiles or bricks. One advantage of using edgings of this kind, especially in kitchen gardens, is that they do not harbour slugs and similar vermin, which all live edgings do, and often to a serious extent, if they are left to grow large. In shrubberies and large flower-plots, vortic of grass-turf, from 1 to 3 ft. in breadth, according to the size of the thriller and length of the walk, make a very handsome edging, but they should not be allowed to rise more than an inch and a half above the gravel, the grass being kept short by repeated mowings, and the edges kept trim and well-defined by frequently clipping with shears and cutting once or twice a year with an edging iron.

II. Garden Structures.

Walls.—The position to be given to the garden walls has been already referred to. The shelter afforded by a wall, and the increase of temperature by its inner surface, are particularly advantageous in the climate of Great Britain, for the production of all the finer kinds of outdoor fruits; and hence the inner side of a north wall, having a southern aspect, is appropriated to the more tender kinds. It is, indeed, estimated that such positions enjoy an increased temperature equal to 7° of latitude—that is to say, the mean temperature within a few inches of the wall is equal to the mean temperature of the open plain 7° farther south. The eastern and western aspects are set apart for fruits of a somewhat harder character.

Where the inclination of the ground is considerable, and the presence of high walls would be objectionable, the latter may be replaced by sunk walls. These should not rise more than 3 ft. above the level of the ground behind them. As dryness is favourable to an increase of heat, such walls should be either built hollow or packed behind to the thickness of 3 or 4 ft.
with rubble stones, flints, brickbats or similar material, thoroughly drained at bottom. For more purposes of shelter a height of 6 or 7 ft. will generally be sufficient for the walls of a garden, but for the training of fruit trees it is found that an average height of 12 ft. is more suitable. In gardens of large size the northern or principal wall may be 14 ft., and the side walls 12 ft. in height; while smaller areas of an acre or so should have the principal wall 12 ft. and the side walls 10 ft. in height. As brick is more easily built hollow than stone, it is to be preferred for garden walls. A 14-in. hollow wall will take in its construction 12,800 bricks, while a solid 9-in. one, with piers, will take 11,000; but the hollow wall, while thus only a little more costly, will be greatly superior, being drier and warmer, as well as more substantial. Bricks cannot be too well burnt for garden walls; the harder they are the less moisture will they absorb. Many excellent walls are built of stone. The best is dark-coloured whinstone, because it absorbs very little moisture, or in Scotland Caithness pavement 4 in. thick. The stones can be cut (in the quarries) to any required length, and built in regular courses. Stone walls should always be built with thin courses for convenience of training over their surface. Concrete walls, properly coped and provided with a trellis, may in some places be the cheapest, and they are very durable. Common rubble walls are the worst of all.

The coping of garden walls is important, both for the preservation of the walls and for throwing the rain-water off their surfaces. It should not project less than from 2 to 2½ in., but in wet districts may be extended to 6 in. Stone copings are best, but they are costly, and Portland cement is sometimes substituted. Temporary copings of wood, which may be fixed by means of permanent iron brackets just below the stone coping, are extremely useful in spring for the protection of the blossoms of fruit trees. They should be 9 in. or 1 ft. wide, and should be put on during spring before the blossom buds begin to expand; they should have attached to them scrim cloth (a sort of thin canvas), which admits light pretty freely, yet is sufficient to ward off ordinary frosts; this canvas is to be let down towards evening and drawn up again in the morning. These copings should be removed when they are of no further utility as protectors, so that the foliage may have the full benefit of rain and dew. Any contrivance that serves to interrupt radiation, though it may not keep the temperature much above freezing, will be found sufficient. Standard fruit trees must be left to take their chance; and, indeed from the lateness of their flowering, they are generally more injured by blight, and by drenching rains, which wash away the pollen of the flowers, than by the direct effects of cold.

Espailer Rails.—Subsidiary to walls as a means of training fruit trees, espailer rails were formerly much employed, and are still used in many gardens. In their simplest form, they are merely a row of slender stakes of larch or other wood driven into the ground, and connected by a slight rod or fillet at top. The use of iron rails has now been almost wholly discontinued on account of metallic substances acting as powerful conductors of both heat and cold in equal extremes. Standards from which galvanized wire is tightly strained from one end to the other are preferable and very convenient. Trees trained to them may easily get all the coolness the walls dispense, and the fruit, while freely exposed to sun and air, is tolerably secure against wind. They form, moreover, neat enclosures for the vegetable quarters, and, provided excess of growth from the centre is successfully grappled with, they are productive in soils and situations which are suitable.

Plant Houses.—These include all those structures which are more intimately associated with the growth of ornamental plants and flowers, and comprise conservatory, plant store, greenhouse and the subsidiary pits and frames. They should be so erected as to present the smallest extent of opaque surface consistent with stability. With this object in view, the early improvers of hot-house architecture substituted metal for wood in the construction of the roofs, and for the most part dispensed with back walls; but the conducting power of the metal caused a great irregularity of temperature, which it was found difficult to control; and, notwithstanding the elegance of metallic houses, this circumstance, together with their greater cost, has induced most recent authorities to give the preference to wood. The combination of the two, however, shows clearly that, without much variation of heat or loss of light, any extent of space may be covered, and houses of any altitude constructed.

The earliest notice we have of such structures is given in the Latin writers of the 1st century (Mart. Epigr. viii. 14 and 68); the 'Abandhos εἰδών, to which allusion is made by various Greek authors, have no claim to be mentioned in this connexion. Columella (xii. 3, 51, 22) and Pliny (H.N. xi. 23) both refer to their use in Italy for the cultivation of the rarer and more delicate sorts of plants and trees. Seneca has given us a description of the application of hot water for securing the necessary temperature. The botanist Jungermann had plant houses at Altdorf in Switzerland; those of Loader, a London merchant, and the conservatory in the Apothe- caries' Botanic Garden at Chelsea, were among the first structures of the kind erected in British gardens. These were, however, ill adapted for the growth of plants, as they consisted of little else than a huge chamber of masonry, having large windows in front, with the roof invariably opaque. The next step was taken when it became fashionable to have conservatories attached to mansions, instead of having them in the pleasure grounds. This arrangement brought them within the province of architects, and for nearly a century utility and fitness for the cultivation of plants were sacrificed, as still is often the case, to the unity of architectural expression between the conservatory and the dwelling.

Plant houses must be as far as possible impervious to wet and cold air from the exterior, provision at the same time being made for ventilation, while the escape of warm air from the interior must also be under control. The most important part of the enclosing material is necessarily glass. But as the rays of light, even in passing through transparent glass, lose much of their energy, which is further weakened in proportion to the distance it has to travel, the nearer the plant can be placed to the glass the more perfectly will its functions be performed; hence the importance of constructing the roofs at such an angle as will admit the most light, especially sunlight, at the time it is most required. Plants in glass houses require for their fullest development more solar light probably than even our best hot-houses transmit—certainly much more than is transmitted through the roofs of houses as generally constructed.

Plant houses constructed of the best Baltic pine timber are very durable, but the whole of the parts should be kept as light as possible. In many houses, especially those whose ornament is of no consequence, the rafters are now omitted, or only used at wide intervals, somewhat stouter sash-bars being adopted, and stout panes of glass (usually called 21-oz.) 12 to 18 in. wide, made use of. Such houses are very light; being also very close, they require careful ventilation. The glass roof is commonly designed so as to form a uniform plane or slope from back to front in lean-to houses (fig. 2), and from centre to sides in span-roofed houses. To secure the greatest possible influx of light, some horticulturists recommend curvilinear roofs; but the superiority of these is largely due to the absence of rafters, which may also be dispensed with in plain roofs. They are very expensive to build and maintain. Span-arched or narrow roofs, the forms now mostly preferred, are exceedingly well adapted for the admission of light, especially when they are glazed to within a few inches
of the ground. They can be made, too, to cover in any extent of area without sustaining walls. Indeed, it has been proposed to support such roofs to a great extent upon suspension principles, the internal columns of support being utilized for conducting the rain-water off the roof to underground drains or reservoirs. The lean-to is the least desirable form, since it scarcely admits of elegance of design, but it is necessarily adopted in many cases.

In glazing, the greater the surface of glass, and the less space occupied by rafters and astragals as well as overlaps, the greater will be the admission of light. Some prefer that the sash-bar should be grooved instead of rebated, and this plan exposes less putty to the action of the weather. The simple bedding of the glass, without the use of over-putty, seems to be widely approved; but the glass may be fixed in a variety of other ways, some of which are patented.

The Conservatory is often built in connexion with the mansion, so as to be entered from the drawing-room or boudoir. But when so situated it is apt to suffer from the shade of the building, and is objectionable on account of admitting damp to the drawing-room. Where circumstances will admit, it is better to place it at some distance from the house, and to form a connexion by means of a glass corridor. In order that the conservatory may be kept gay, the flowers and plants should be selected to receive the plants as they go out of bloom. The conservatory may also with great propriety be placed in the flower garden, where it may occupy an elevated terrace, and form the termination of one of the more important walks.

Great variety of design is admissible in the conservatory, but it ought always to be adapted to the style of the mansion of which it is a prominent appendage. Some very pleasing examples to this effect meet with which have the form of a parallelogram with a lightly rounded roof; others of appropriate character are square or nearly so, with a ridge-and-furrow roof. Whatever the form, there must be light in abundance; and the shade both of buildings and of trees must be avoided. A southern aspect, or one varying to south-east or south-west, is preferable; if these aspects cannot be secured, the plants selected must be adapted to the position. The central part of the house may be devoted to permanent plants; the side stages and open spaces in the permanent beds should be reserved for the temporary plants.

The Greenhouse is a structure designed for the growth of such exotic plants as require to be kept during winter in a temperature considerably above the freezing-point. The best form is the span-roofed, a single span being better even than a series of spans such as the ridge-and-furrow roof. For plant culture, houses at a comparatively low pitch are better than higher ones where the plants have to stand at a greater distance from the glass, and therefore in greater gloom. Fig. 3 represents a convenient form of greenhouse.

![Fig. 3.—Section of greenhouse.](image)

One of the latter could be converted into two of the former of opposite aspects by a divisional wall along the centre. Except where space does not permit a span-roofed building to be introduced, a lean-to is not to be recommended; but a house of this class may often be greatly improved by adopting a half-span or hipped roof—that is, one with a short slope behind and a longer in front.

Where the cultivation of large specimens of plants to be carried on, a span-roofed house of greater height and larger dimensions may sometimes prove useful; but space for this class of plants may generally be secured in a house of the smaller elevation, simply by lowering or removing altogether the staging or shelf intended for smaller plants, and allowing the larger ones to stand on or near the floor.

The Plant Stove differs in no respect from the greenhouse except in having a greater extent of hot-water pipes for the purpose of securing a greater degree of heat, although, as the plants in stove houses often attain a larger size, and many of them require a bed of coco-nut fibre, tan or leaf mould to supply them with bottom heat, a somewhat greater elevation may perhaps be occasionally required in some of the houses.

For the smaller plants, and for all choice subjects, the smaller size of house already recommended for greenhouses, namely 20 ft. wide and 12 ft. high, with a side-table of 4 ft. on each side, a pathway of 3 ft. and a central stage on two levels of 6 ft. wide, will be preferable, because more easily managed as to the supply of heat and moisture. It will be seen (fig. 4) that along the ridge of the roof a raised portion or lantern light, b, b is introduced, which permits of the fixing of two continuous ventilators, one along each side, for the egress of heated and foul air, openings a, a being also provided in the side walls opposite the hot-water pipes for the admission of pure cold air. This type of house is at all very suitable for greenhouse plants, but would not need so much a heating apparatus.

Three or four rows of flow and return pipes respectively will be required on each side, according to the best proposed to be maintained. In their interior fittings plant stores require more care than greenhouses, which are much drier, and in which consequently the staging does not so soon decay. In stoves the stages should be of slate or stone where practicable, and the supports of iron. These should be covered with a layer of 2 or 3 in. of some coarse gritty material, such as pounded spar, or the shell sand obtained on the sea-coast, on which the pots are to stand; its use is to absorb moisture and gradually give it out for the benefit of the plants. The pathways should be covered with pebble tiles, brick edgings, or made of concrete and cement, and the surface should be gently rounded so that the water required for evaporation may drain to the sides while the centre is sufficiently dried upon; they should also have brick or stone edgings to prevent the water so applied soaking away at the sides and thus being wasted.

**Fruit Houses.**—The principal of these are the vineyard, peach house, cucumber and melon house and orchard house. These, or a portion of them, especially the vineyards and peacheries, are frequently brought together into a range along the principal interior or south wall of the garden, where they are well exposed to sun and light, a ornamental plant house being some

Horticulture

Forcing

The Viney is a house devoted to the culture of the grape-vine, which is by far the most important exotic fruit cultivated in English gardens. When forming part of a range a viney would in most cases be a lean-to structure, with a sharp pitch (45°–50°) if intended for early forcing, and a flatter roof (40°) with longer rafters if designed for the main and late crops. (1) The lean-to (fig. 5) is the simplest form, often erected against some existing wall, and the best for early forcing, being warmer on account of the shelter afforded by the back wall. In this house the principal part of the roof is a fixture, ventilation being provided for by small lifting sashes against the back wall, and by the upright front sashes being hung on a pivot so as to swing outwards on the lower side. For necessary heat is provided by four 4-in. hot-water pipes, which would perhaps be best placed if all laid side by side, while the vines are planted in front and trained upwards under the roof. A second set of vines may be planted against the back wall, and will thrive there until the shade of the roof becomes too dense. (2) The hip-roofed or three-quarter span (fig. 6) is a combination of the lean-to and the span-roofed, uniting to a great degree the advantages of both, being warmer than the span and lighter than the lean-to. The heating and ventilating arrangements are much the same as in the lean-to, only the top sashes which open are on the back slope, and therefore do not interfere so much with the vines on the front slope. In both this and the lean-to the aspect should be as nearly due south as possible. Houses of this form are excellent for general purposes, and they are well adapted both for muscats, which require a high temperature, and for late-keeping grapes. (3) The span-roofed (fig. 7), the most elegant and ornamental form, is especially adapted for isolated positions; indeed, no other form affords so much roof space for the development of the vines. The amount of light admitted being very great, these houses answer well for general purposes and for the main crop. The large amount of glass or cooling surface, however, makes it more difficult to keep up a high and regular temperature in them, and from this cause they are not so well adapted for very early or very late crops. They are best, nevertheless, when grapes and ornamental plants are grown in the same house, except, indeed, in very wet and cold districts, where, in consequence of its greater warmth, the lean-to is to be preferred.

This type of house, cheaply constructed, is in general use for raising grapes for market.

The Peach House is a structure in which the ripening of the fruit is accelerated by the judicious employment of artificial heat. For early forcing, as in vineyards, the lean-to form is to be preferred, and the house may have a tolerably sharp pitch. A width of 7 or 8 ft., with the glass slope continued down to within a foot or two of the ground, and without any upright front sashes, will be suitable for such a house, which may also be conveniently divided into compartments of from 30 to 50 ft. in length according to the extent of the building, small houses being preferable to larger ones. As a very high temperature is not required, two or three pipes running the whole length of the house will suffice. The front wall should be built on piers and arches to allow the roots to pass outwards into a prepared border, the trees being planted just within the house. Abundant means of ventilation should be provided.

For more general purposes the house represented in fig. 8 will be found more useful. One set of trees is planted near the front, and trained to an arched trellis b. Another set is planted at the back, and trained on a trellis c, which is nearly upright, and leans against the back wall; or the back wall itself may be used for training. There are no upright front sashes, but to facilitate ventilation there are ventilators d in the front wall, and the upper roof sashes are made to move up and down for the same object. Two or three hot-water pipes are placed near the front wall. The back wall is usually planted with dwarf and standard trees alternately, the latter being temporary, and intended to furnish the upper part of the trellis, while the permanent dwarfs are gradually filling up the trellis from below. In any case the front trellis should stop conveniently short of the top of the sashes if there are trees against the back wall, in order to admit light to them. They would also be better carried up nearly parallel to the roof, and at about 1 ft. distant from it, supposing there were no trees at the back.

A span-roofed house, being lighter than a lean-to, would be so much the better for peach culture, especially for the crop grown just in anticipation of those from the open walls since a high temperature is not required. A low span, with dwarf side walls, and a lantern ventilator along the ridge, the height in the centre being 9 ft., would be very well adapted for the purpose. The trees should be planted inside and trained up towards the ridge on a trellis about a foot from the glass, the walls being arched to permit the egress of the roots. A trellis path should run along the centre, and movable pieces of trellis should be provided to prevent trampling on the soil while dressing and tying in the young wood.

The Forcing House.—Whenever continuous supplies of cucumbers, melons and tomatoes are required, it is most convenient to grow them in properly constructed forcing houses. Span-roofed houses (fig. 9) are probably the most useful for the purpose. They are usually

Fig. 6.—Hip-Roofed Viney.

Fig. 7.—Span-Roofed Viney.

Fig. 8.—Peach House.

Fig. 9.—Forcing House.
HORTICULTURE

12 to 14 ft. wide, by 10 to 12 ft. high, and of any convenient length. Heating is effected by means of hot-water pipes below the beds, and against the side ventilators. The walls bordering the central paths are arched or clotted to admit heat from the chambers below the beds. Side pipes are occasionally dispensed with, heat being obtained by means of slots at the back of the beds, communicating with the chambers. The beds are also used for plunging pot plants. Ventilation may be by side vents and top.

Pits and frames of various kinds are frequently used for the cultivation of cucumbers and melons, as well as hot beds covered by ordinary garden frames. In these cases the first supply of heat is derived from the hot bed made up within the pit. When the heat of the original bed subsides, linings of fermenting dung must be added, and these must be kept active by occasional turnings and the addition of fresh material as required. It is best, however, to effect both top and bottom heating by hot-water pipes.

Orchard Houses are span-roofed or lean-to structures, in which various fruits are cultivated without the aid of artificial heat. Peaches, nectarines, apricots, cherries and the more tender varieties of plums and pears succeed well in houses of this kind. The types of houses in general use are substantially as shown in fig. 7, for span-roofed, and as fig. 5, for lean-to; in each case without the heating apparatus. The orchard house is among the most generally useful of all garden structures. These houses require careful management in early summer so as to induce the more delicate varieties of peaches and nectarines to complete and ripen their growth before cold, unless weather sets in.

In commercial establishments where utility is of more importance than ornament, the glass houses and hot water apparatus are not so elaborate as indicated in the foregoing remarks, and in many cases excellent produce is grown in structures moire or less dilapidated. In some places movable greenhouses have been erected for market purposes so that the soil may be exposed to the sweetening effect of the weather, when the glass roof is moved to an adjoining patch.

Pits and Frames.—These are used both for the summer growth and winter protection of various kinds of ornamental plants, for the growth of such fruits as cucumbers, melons and strawberries, and for the forcing of vegetables. When heat is required, it is sometimes supplied by means of fermenting dung, or by ashes, or leaves, or tanner’s bark, but it is much more economically provided by hot-water pipes. Pits of many different forms have been designed, but it may be sufficient here to describe one or two which can be recommended for general purposes.

An excellent pit for wintering bedding-out plants or young greenhouse stock is shown at fig. 10. It is built upon the pigeon-hole principle as high as the ground level a, a, and above that in 9-in. brickwork. At a distance of 9 in. retaining walls b, b are built up to the ground level, and the spaces between the two are covered by thick boarding, which is to be shut as shown at c in cold weather to exclude frost, and opened as shown at d in mild weather to promote a free circulation of air through the pit. The height of the pit might be reduced according to the size of the plants; and, to secure the exclusion of frost, the end return hot-water pipe e should pass along beneath the staging, which should be a strong wooden trellis supported by projections in the brickwork. The water which drains from the plants or is split in watering would fall on the bottom, which should be made porous to carry it away. For many plants this under current of ventilation would be exceedingly beneficial, especially when cold winds prevented theashes from being opened. A piece of slat or tasset may be sunk into the ground deeper than is indicated in the figure if the subsoil is dry and gravelly, but in the case of a damp subsol it should rather be more elevated, as the soil could easily be stepped up to meet the retaining boarding as shown at e.

Frames.—Frames (fig. 11) should be made of the best red deal, 1 in. thick. A convenient size is 6 ft. wide, 24 in. high at the back and 15 in. front; and they are usually 12 ft. long, which makes three lights and sashes, though they may be made with two lights or one light for particular purposes. Indeed, a one-light frame is often found very convenient for many purposes. The lights should be 2 in. thick, and glazed with 21 oz. sheet glass, in broad panes four or five to the breadth of a light, and of a length which will work in conveniently and economically, very long panes being undesirable from the havoc caused by accidents, and very short ones being objectionable as multiplying the chances of drip, and the exclusion of light by the numerous lappings; panes about 12 in. long are of convenient size for garden lights of this character. In all gardens

![Fig. 11.—Hot-Bed Three-Light Frame.](image)

the frames and lights should be of one size so as to be interchangeable, and a good supply of extra lights (sashes) may always be turned to good account for various purposes.

Span-roof garden frame (fig. 12) may under some circumstances be useful as a substitute for the three-light frame. It is adapted for storing plants in winter, for nursing small plants in summer and for the culture of melons and other crops requiring glass shelter. These frames are made 11 in. high in front, 22 at the back and 32 at the

![Fig. 12.—Span-Roof Frame.](image)

ridge, with ends of 14-in. red deal; the sashes, which are 2 in. thick, and are supported by iron uprights b, b, each half having a front ledge of bricks set on edge in cement e, e. The slabs of slate forming the shelves should not be too closely fitted, as a small interval will prevent the accumulation of moisture at the bottom of the bed. They may be supported by iron standards or brick piers, back and front, bearing up a flat bar of iron on which the slates may rest; the use of the bar will give wider intervals between the supports, which will be found convenient for filling and emptying the beds. The roof may be tiled or slated; but, to prevent the injurious influence of hot sun, there should be an inner roof or ceiling d, the space between which and the outer roof e should be packed with sawdust. A hot-water pipe f should run along both sides of the pathway, close to the front ledge of the lowest beds. The different shelves may be planted in succession; and the lower ones, especially those on the floor level, as being most convenient, can be utilized for forcing sea-kale and rhubarb.

The Fruit Room.—This important store should be dark, moderately dry, with a steady, moderately cool atmosphere.

![Fig. 13.—Lean-to Mushroom House.](image)
and with the means of giving sufficient ventilation to keep the air sweet. It should also be sufficiently commodious to permit of the fruit being arranged in single layers on the shelves or trays. A type of building which is becoming increasingly popular for this purpose, and which is in many respects superior to the older, and often more costly, type, is the fruit-shed. It is built of brick foundations, and is thickly thatched with reeds or other non-conducting material externally—on walls and roof—where the interior is matchboarded. The ventilations are afforded at the ends, usually by tilting laths, operated by a cord. Two doors are provided at one end—an inner, and an outer—the inner being glazed at the top to admit light. They are generally span-roofed, about 6 ft. high at the eaves, and 8 or 10 ft. high at the ridge, according to width.

The breadth of these stores should be governed by the amount and character of the storage accommodation to be provided. If intended for storage only, a width of 9 ft. 6 in. would suffice, but if intended to combine display with storage, the interior diameter should be about 13 ft. In the former type, the walls are fitted with four rows of shelves, about 3 ft. wide, and about 1 ft. 6 in. apart. The shelves are of deal strips, 2 or 3 in. wide, laid about 1 in. apart for ventilation. These are being superseded, however, by sliding-out trays of convenient lengths and about 9 in. deep, working on friction guides. In this case, the volume is accurately doubled and the fruit is more easily manipulated. The central gangway is about 3 ft. 6 in. wide. In the latter a central exhibition bell is placed, and intermediate is provided for the display. The ventilation, especially in the presence of large quantities of newly-gathered fruit; in the prompt removal of all decaying fruit; and in the exclusion of vermin. It is also advisable to wash all woodwork and gangways annually with a weak solution of formalin, or other inodorous germicide.

**Heating Apparatus.**—Plant houses were formerly heated in a variety of ways—by fermenting organic matter, such as dung, by smoke flues, by steam, and by hot water circulating in iron pipes. The last-named method has proved so satisfactory in practice that it is now in general use for all ordinary purposes. The water is heated by a furnace, and is conveyed from the boiler into the houses by a main or "flow" pipe, connected by means of syphon branches with as many pipes as it is intended to serve. When cooled it is returned to the boiler by another main or "return" pipe. Heat is regulated in the structures by means of valves at the points where the pipes are conveyed to the different parts of the house. This arrangement is necessitated by the necessity of heating each part of the house to its highest point, to take the heated water as it ascends. The return pipe is connected with the boiler at or near its lowest point. The highest points of the pipes are fitted with small taps, for the removal of air, which would retard circulation if allowed to remain. Heating by hot water may be said to depend, in part, on the influence of gravity on water being to some extent overcome by heating in a boiler. It ascends the flow pipe by convection, where its onward journey would speedily end if it were not for the driving force of other molecules of water following, and the suction set up by the gravitation into the boiler of the cooled water by the return pipe. The power of water to conduct heat is very low. The conductive power of the iron in which it is conveyed is high. It is, however, probable that conduction is to some extent a factor in the process.

**Pipes.**—It is a mistake to stint the quantity of piping, since it is far more economical and better for the plants to have a larger surface heated moderately than a smaller surface heated excessively. In view of the fact that air expands, becomes lighter and rises, under the influence of heat, the pipes should be set near the floor. If intended to raise the temperature of the structure, they should be set on iron or brick supports just clear of walls, earth or other heat-absorbing bodies. Those intended to provide the upper surface of the bed, or (a) water tanks running under the beds, or (b) in enclosed dry chambers under the beds, or are (c) embedded in the soil or peat of a surface layer. The first-named method is distinctly superior to the others for the following reasons: it is cheaper, and the diameter of pipes used, the 4 in. being the most convenient for general purposes. The latter are packed or caulked with tow, smeared with a mixture of white and red lead. Flanged joints are made to bolt together on wooden or metal accessories.

**Boilers.**—There are numerous types of boilers in use, illustrative of efforts to secure as much exposure as possible to the action of the flames. The water-tube type, with multiple waterways, consists of a number of separate tubes joined together in various ways. Some of these are built in the form of a blunt cone, and are known as conical tubular boilers. Others are built with the tubes arranged horizontally, and are known as horizontal tubular boilers. The majority of the larger engines are of the cone-shaped or saddle type. The waterway are of three principal types, the Cornish, the saddle and the conical. The Cornish is cylindrical with the furnace occupying about half the length of the cylinder. The saddle is so named from its supposed resemblance to a saddle. It is set to span the furnace, additional exposure to heat being secured in a variety of ways by flues. Exposure in the conical boiler is direct on its inner surface, being made possible by the sliding-out trays. Tableau boilers, in which the horizontal types, are very powerful and economical. The Cornish type is a rather slow and steady boiler, and is much used for providing heat for large areas. The saddle boiler is very commonly employed in connection with steam plants, and is used for providing heat for moderately small spaces. Both are powerful and economical. Conical boilers are more expensive to set by reason of their shape, and are not so convenient to manipulate as the horizontal kind. All the conical types require setting in masonry. Portable boilers are convenient for heating small areas, and are less expensive to install than those described above. They are less economical, however, owing to loss of heat from their exterior surfaces. What are called hit-and-miss stokers are used where cooking is necessary. The Prince of Wales and the Continent are being introduced to British gardens. Portions can be added or taken away according to the amount of heating surface required.

**Stokehold.**—These have usually to be excavated to admit of the boilers being set below the level of the pipes they are intended to serve, and consequently the flask of the boiler and the pipes must extend to the level where the coal is in readiness. The Stokehold will present difficulties. Care should be taken to allow sufficient room to properly manipulate the fires and to store fuel. It is important that the ventilation should be as efficient as practicable, especially where coke fuel is to be used, since the supply must be of a fairly good height, according to circumstances, to secure a good draught.

**Solar Heat.**—The importance of sun heat to the general well-being of plants is so well known that it is not necessary to dwell on its influence on vegetable production. Solar heat produces the ripening of edible fruits, has long been appreciated in horticulture. The practice of "closing up" early in the afternoon, i.e., the closing of ventilators (accompanied by syringing and damping of surfaces to the greatest extent possible) has been adopted with great advantage for its object the conservation of as much solar heat as practicable.

**Ventilation.**—This consists in the admission of air for the purpose of preventing stagnation of the atmosphere and for general regulation of temperature. Mechanical ventilation by Fans or by dynamos are commonly used in all those houses should be provided in at least two places—as near the floor as practicable, and at the top. Mechanical contrivances whereby whole sets of ventilators may be raised and lowered at will, are much more convenient and economical than the older method of working each ventilator separately. Efficient ventilating can only be effected by the exercise of common sense and vigilance, and care must be taken to avoid cold draughts through the houses.

**III. Garden Materials and Appliances.**

**Soils and Composts.**—The principal soils used in gardens, either alone, or mixed to form what are called composts, are—loam, sand, peat, leaf-mould and various mixtures and combinations of these made up to suit the different subjects under cultivation.

A firm, stable soil for the gardener; it is not only used extensively in the pure and simple state, but enters into most of the composts prepared specially for his plants. For garden purposes loam should be rather unctuous or soapy to the touch when moderately dry, not too clingling nor adhesive, and should readily crumble when a compressed handful is thrown on the ground. If it clings together closely it is too heavy and requires amelioration by the admixture of gritty material; if it has little or no cohesion when squeezed tightly in the hand, it is
too light, and needs to be improved by the addition of heavier or clayey material. Sound friable loam cut one soil deep from the surface of a pasture, and stacked up for twelve months in a heap or ridge, is invaluable to the gardener. Where employed for making vine borders, loam of a somewhat heavier nature can be used with advantage, on account of the porous materials which should accompany it. For stone fruits a calcareous loam is best; indeed, for these subjects a rich calcareous loam used in a pure and simple state cannot be surpassed. Somewhat heavy loams are best for potting pine apples, for melons and strawberries, fruit trees in pots, &c., and may be used with the addition of manures only, but for ornamental plants a loam of a somewhat freer texture is preferable and more pleasant to work. Loam which contains much red matter (iron) should be avoided.

Sand is by itself of little value except for striking cuttings, for which purpose fine clean sharp silver sand is the best; and a somewhat coarser kind, if it is gritty, is to be preferred to the comminuted sands which contain a large proportion of earthy matter. River sand and the sharp grit washed up sometimes by the road side are excellent materials for laying around choice bulbs at planting time to prevent contact with earth which is perhaps manure-tainted. Sea sand, on the other hand, is excellent both for propagating purposes and for mixing in comports. For the growth of pot plants sand is an essential part of most comports, in order to give them the needful porosity to carry off all excess of moisture from the roots. If the finer earthy sands only are obtainable, they must be rendered sharper by washing away the earthy particles. Washed sand is best for all plants like heaths, which need a pure and lasting peaty compost.

Peat soil is largely employed for the culture of such plants as foxglove, dianthus, azaleas, heaths, &c., in districts where heather and gritty soil predominate. The peat soil is poor and unprofitable, but selections from both the heathy and the richer peat soils, collected with judgment, and stored in a dry part of the compost yard, are essential ingredients in the cultivation of many choice pot plants, such as the Cape heaths and many of the Australian plants. Many monocotyledons do well in peat, even if they do not absolutely require it.

Leaf-mould is eminently suited for the growth of many soft-wooded plants, especially when it has been mixed with stable manure and has been subjected to fermentation for the formation of hot beds. It may state most plants feed greedily upon it, and when pure or free from decaying wood or sticks it is a very safe ingredient in comports; but it is so liable to generate fungus, and the mycelium or spawn of certain fungi is so injurious to the roots of trees, attacking them if at all sickly or weakened by drought, that many cultivators prefer not to mix leaf-mould with the soil used for permanent plants, as peaches or choice ornamental trees. For quick growing plants, however, as for example most annuals cultivated in pots, such as balsams, cockscombs, globe-amaranthas and the like, for cucumbers, and for young soft-wooded plants generally, it is exceedingly useful, both by preventing the consolidation of the soil and as a manure. The accumulations of light earth formed on the surface in woods where the leaves fall and decay annually are leaf-mould of the finest quality. Leaves collected in the autumn and stored in pits or heaps, and covered with a layer of soil, make beautiful leaf-mould at the end of about twelve months, if frequently drenched with water or rain during this period.

Composts are mixtures of the foregoing ingredients in varying proportions, and in combination with manures if necessary, so as to suit particular plants or classes of plants. The chief point to be borne in mind in making these mixtures is not to combine in the same compost any bodies that are antagonistic in their nature, as for example lime and ammonia. In making up comports for pot plants, the fibrous portion should not be removed by siftting, except for small-sized pots, but the turfy portions should be broken up by hand and distributed in smaller or larger lumps throughout the mass. When sifting is had recourse to, the fibrous matter should be rubbed through the meshes of the sieve along with the earthy particles. Before being used the turfy ingredients of comports should lie together in a heap only long enough for the roots of the herbage to die, not to exceed one month.

**Manures (see Manure).**—These are of two classes, organic and inorganic—the former being of animal and vegetable, the latter of mineral origin. The following are organic manures:

- Farm-yard manure consists of the mixed dung of horses and cattle thrown together, and more or less soaked with liquid drainings of the stable or byre. It is no doubt the finest stimulant for the growth of plants, and that most adapted to restore the sterile elements which the leaves abstracted from exhausted soils. This manure is best fitted for garden use when in a moderately fermented state.

- Horse dung is generally the principal ingredient in all hot bed manure; and, in its partially decomposed state, as afforded by experience, is superior to horse and cow dungs. It, however, commands a higher price than the latter, and, unless beneficial on cold stiff soils. It should not be allowed to lie too long unmoved when fresh, as it will then heat violently, and the ammonia is thus driven off. To avoid this, it should be turned over two or three times if practicable, and well moistened—preferably with farm-yard drainings.

- Cow dung is less fertilizing than horse dung, but being slower in its action it is more durable; it is also cooler, and therefore better for hot dry sandy soils. Thoroughly decayed, it is one of the best of all manures for mixing in comports for florists' flowers and other choice plants.

- Pig dung is very powerful, containing more nitrogen than horse dung; it is therefore desirable that it should undergo moderate fermentation, which will be secured by mixing it with litter and hot compost in the proportion of three to one. When this occurs, the fermentation becomes specially desirable to kill their seeds.

- Night-soil is an excellent manure for all bulky crops, but requires to be broken up with earthy or coal-ash to prevent its being dried by the sun, and to ensure its being equally distributed. Quicklime should not be used, as it dispels the greater part of the ammonia. When prepared by drying and mixing with various substances, night-soil as desiccated night-soil or native guano, the value of which depends upon the materials used for admixture.

- Muriate of soda is an active manure frequently used as a top-dressing, especially for fruit trees in pots. It is rapid in its action, but its effects are not very permanent. Roapo and is somewhat similar in its character and action.

- Bones are employed as a manure with decided advantage both to vegetable crops and to fruit trees, as well as to flowers. For some purposes the bone manure is invaluable. The effects of bones are no doubt mainly due to the phosphates they contain, and they are most effectual on dry soils. They are most quickly available when dissolved in sulphuric acid.

- Guano is a valuable manure now much employed, and may be applied to almost every kind of crop with decided advantage. It should be mixed with at least six or eight times its weight of loam or ashes, and certain soils contain, and they are most effectual on dry soils. They are most quickly available when dissolved in sulphuric acid.

- Horn, hoof-parings, woolen rags, fish, blubber and blood, after treatment with sulphuric acid, are all good manures, and should be utilized if available.

- Liquid manures, consisting of the drainings of dung-heaps, stables, cowsheds, &c., or of urine collected from dwelling houses or other sources, is a most valuable and powerful stimulant, and can be applied freely. Manure applied in this way is often turned to the best advantage by laying it on the surface of the soil, and not allowed to putrefy, as in its decomposition a large amount of ammonia is formed, which should then be fixed by sulphuric acid or gypsum; or it may be applied to the growing crop in the evening, if it is being freely watered or absorbed in a compost heap. Liquid manures can be readily made from most of the solid manures when required, simply by admixture with water. When thus artificially compounded, unless made in the immediate use, they should be made strong for convenience of storage, and applied as required much diluted.

The following are inorganic manures:

- Ammonia is the most powerful and one of the most important of the elements of manure; so generally, since it is the chief source whence plants derive their nitrogen. It is largely supplied in all the most fertilizing of organic manures, but when required in the inorganic form, it must be obtained from some of the salts of ammonia, as the sulphate, the nitrate or the phosphate, all of which, being extremely energetic, require to be used with great caution. These salts of ammonia may be used at the rate of from 2 to 3 cwt. per acre as a top-dressing in moist weather. When dissolved in water they
Horticulture

FORM ACTIVE LIQUID MANURES. The most commonly used nitrogenous manures are nitrates of soda, nitro-magazine and sulphate of ammonia, the prices of which are constantly fluctuating.

Potash and soda are also valuable inorganic manures in the form of muriate of potash, sulphate of potash, and potash and phosphates, but the most valuable is the nitrate of potash. The nitrate of potash is very high that its use is practically nil, except in small doses as a liquid manure for choice pot plants. Cheaper substitutes, however, are not only found in the form of potash, and nitrate of potash and kainite.

The two last-named must not be applied direct to growing plants, but to the soil some weeks in advance of sowing or cropping. The manures of this class are of course of value only in cases where the soil is already depleted by them, and to them the plants must be adapted that are of less importance than those of potash. The value of wood ashes as a manure very much depends upon the carbonate and other salts contained in them.

Phosphoric acid, in the form of phosphates, is a most valuable plant food, and is absorbed by most plants in fairly large quantities from the soil. It produces the earlier production of flowers and fruits. In a natural state it is found in bones, guano and wood ashes; and in an artificial condition from basic slag or Thomas's phosphate, coprolites and superphosphate of lime.

Lime in the caustic state is beneficially applied to soils which are poor in lime, but only when so much of the latter is present as to neutralize the excess of hydrogen in the soil. It also improves the texture of clay soils.

Gypsum, or sulphate of lime, applied as a top-dressing at the rate of from 5 to 10 bushels an acre, has been found to yield good results, especially on light soils. It is also employed in the case of liquid manures to fix the ammonia.

Gas lime, after it has been exposed to the air for a few months as an amorphous sulphate of lime, is found in the state it is poisonous and fatal to vegetation, and is often used for the reason to dress land infested with wireworms, grubs, club-root fungus, &c.

Burnt clay has a very beneficial effect on clay land by improving its texture and rendering soluble the alkaloid substances it contains. The clay should be only slightly burnt, so as to make it easily go down readily; in fact, the fire should not be allowed to break through, but should be constantly reproved by the addition of more fuel. In this state it is poisonous and fatal to vegetation.

Vegetable refuse of all kinds, when smother-burned in a similar way, becomes a valuable mechanical improver of the soil; but the process of burning it in a heap with quicklime and layers of earth, converting it into lime and ashes, is attended with considerable loss of its value. The practice is not a sound one.

Common salt acts as a manure when used in moderate quantities, but in strong doses is injurious to vegetation. It suits many of the leguminous crops, beans, cabbages, carrots, beet-root, asparagus, &c.; the quantity required being from 5 to 10 bushels per acre. It is used as a dressing down the soil. Hyacinths and other bulbs derive benefit from slight doses, while to asparagus as much as 20 lb. to the rood has been used with beneficial effect. At the rate of from 6 to 10 bushels to the acre it may be used on garden lawns to prevent worm casts. For the destruction of weeds on gravel walks or in paved yards a strong dose of salt, applied every week or in a very strong solution, is found very effective in destroying weeds, and after a time much of it becomes washed down, and the residue acts as a manure; its continued application is undesirable, as gravel so treated becomes pasty.

Gardeners who have not used these are so well known that we shall not discuss them here. They are, moreover, illustrated and described in the catalogues of most nurserymen and dealers in horticultural sundries.

TALLIES OR LABELS.—The importance of properly labelling plants can hardly be over-estimated. For ordinary purposes labels of wood of various sizes (sold in bundles) are the most convenient. These should be wiped with a little white paint or linseed oil, and written with a soft lead pencil before the surface becomes dry.

Copying ink pencils should not be used, as water will wash away the writing. For permanent plants, as trees, roses, &c., metallic labels in a raised type are procurable from dealers, and are neat, durable and convenient. Permanent labels may also be made from sheet lead, the names being punched in by means of steel type. For stove and greenhouse plants, orchids, ferns, &c., labels made of xylolite, zinc and other materials are also used.

IV. Garden Operations.

Propagation.—The increase of plants, so far as the production of new individuals of particular kinds is concerned, is one of the most important and constantly recurring of gardening operations. In effecting this, various processes are adopted, which will now be described.

1. By Seeds.—This may be called the natural means of increasing the number of any particular kind of plant, but it is to be remembered that we cannot always rely upon exact reproduction of the parent, especially in the case of plants raised by hybridization and selection. We may get a progeny very closely resembling it, yet each plant possessing a distinct and individual character of its own; or we may get a progeny unlike the parent, or a mixed progeny showing various degrees of divergence. Many seeds will grow freely if sown in a partially shaded bed, but a general rule seeds have to be kept for some weeks or months in store, and hence they should be thoroughly ripened before being gathered. They should be sown in fine rich soil, and such as will not readily get consolidated. In the case of outdoor growths, the seeds should be sown at a depth of two or three times as much as the diameter of the seed, according to the size. Outdoor crops require to be sown, the smaller seeds 1 in., and the larger ones from 2 to 4 in. under the surface, the covering being kept off the soil by hoeing and fork, and open. Many seeds grow well when raked in; that is, the surface on which they are scattered is raked backwards and forwards over them, so as to work them into the soil. Whatever the seeds, the ground should be made tolerably firm before sowing, and may be done by treading in the case of most kitchen garden crops, which are also better sown in drills, this admitting the more readily the seeds getting off from the surface, and being covered by hoeing. All seeds should require a certain degree of heat to induce germination, but tropical plants the heat of a propagating house—75° to 80°, with a bottom heat of 60° to 90° is desirable, and in many cases absolutely necessary, for other plants a temperature of 60° to 70°, either from a hot bed or a temperate pit ranging from 60° to 70°, is convenient; while course all outdoor crops have to submit to the natural temperature of the state, it is very important that seeds should be sown when the ground is in a good working condition, and not clanny with moisture.

2. By Offsets.—This mode of increase applies specially to bulbs and tubers, such as the hyacinth, which produce little bulbs on the exterior round their bases, and in the cultivation of vegetables, a limited but variable extent; when more rapid increase is wanted the heart is destroyed, and this induces the formation of a larger number of bulbs, which are starchy in character to the offsets from the parent bulb. The same mode of increasing plants from the stem is the origin of the gladiolus and crocus, but their bulb-like permanent parts are called corms, not bulbs. After they have ripened in connexion with the bulb, they are pulled out, and separated into their appropriate places, and at the proper season planted out in nursery beds.

3. By Tubers.—The tuber is a fibrous underground stem, furnished with eyes which are either visible, as in the potato and in some ripened plants, or latent, as in the Chinese yam (Dioscorea Batatas). When used for propagation, the tubers are cut up into what are called "sets," every portion having an eye attached being capable of forming an independent plant. The cut portions of bulky sets should be suffered to lie a short time before being planted, in order to dry the surface and prevent rotting; this should not, however, be done with such tender varieties as caladiums, the tubers of which are often cut up into very small fragments for propagation, and of course require to be manipulated in a properly heated propagating pit. No eyes are visible in the Chinese yam, but slices of the long club-shaped tubers will push out young shoots and form independent plants, if planted with ordinary care.

4. By Division.—Division, or partition, is usually resorted to in the increase of clumps of rooted or forked plants, chiefly perennial herbs; they may be evergreen, like holly, dogrose or, or, when dormant may consist only of underground crowns, as larkspur or lily-of-the-valley; but in either case the old tufted plant being dug up may be separated into separate parts, each furnished with roots, and, when replanted, generally starting off on its own account at once. A good check. Sulfuricose plants and even small shrubs may be propagated in this way, by first planting them deeper than they are ordinarily planted, and then after they have taken firm root, get rooted, taking them up again and dividing them into parts or separate plants. Box-edges and southerwood are examples. The same ends may sometimes be effected by merely working fine

should be shortened, and some care in watering and mulching should be bestowed on the plant if it is of value.

6. By Runners.—The young string-like shoots produced by the strawberry are a well-known example of runners. The process of rooting these runners should be facilitated by fixing them close down to the soil, and by the use of small, pointed hooks or by stones; hair-pins, short lengths of bent wire, &c., may also be used. After the runners are formed, the shoots are cut through, and the runners become independent plants.

7. By Profliferous Buds.—Not unlike the runner, though growing in a very different way, are the bud-plants formed on the fronds of several kinds of ferns belonging to the genera Asplenium, Woodwardia, Polystichum, Lastrea, Adiantum, Cystopteris, &c. In some of these (Adiantum caudatum, Polystichum lepidocaulon) the rachis of the frond is lengthened out much like the string of the strawberry runner, and bears a plant at its apex. In others (Polystichum angulare profliferum) the stipes below and the rachis amongst the pinnae develop buds, which are often numerous and crowded. In others again (Woodwardia orientalis, Asplenium bulbiferum), buds are numerous and produced on the upper surface of the fronds. These will develop on the plant if allowed to remain. For propagation the bulbiferous portion is pegged down on the surface of a pot of suitable soil; if kept close in a moist atmosphere, the little buds will soon strike root and form independent plants. In Cystopteris the buds are deciduous, falling off as the fronds acquire maturity, but, if collected and pressed into the surface of a pot of soil and kept close, they will grow up into young plants the following season. In some genera of flowering plants, and notably in Bryophyllum, little plants form on various parts of the leaves. In some Monocotyledons, ordinarily in Chlorophyllum, and exceptionally in Phalaenopsis and others, new plants are often formed by the production of suckers, or by the division of the plant, and not by the production of buds, as in the case of the ferns. These suckers may be removed when they are two or three inches long, and will soon form independent plants.

8. By Layers.—Layering consists in preparing the branch of a plant while still attached to the parent, bending it so that the part operated on is brought under ground, and then fixing it there by means of a stake. The branches are frequently cut only partly down; but in most cases the arrest of the returning sap to form a callus, and ultimately young roots, must be brought about artificially, either by twisting the branch, by splitting it, by girding it closely with wire, by taking off a ring of bark, or by "tonguing." In tonguing the leaves are cut off the portion which has to be brought under ground, and a tongue or slit is then cut from below upwards close beyond a joint, of such length that, when the cut part of the layer is pegged an inch or two (or in larger woody subjects 3 or 4 in.) below the surface, the elevation of the point of the shoot to an upright position may open the incision, and thus set it free, so that it may be surrounded by earth to induce it to form roots. The whole branch, except a few buds at the extremity, is covered with soil. The same reasons for the action of the nurseryman in the spring, that is, before the sap begins to flow, and after the first flush of growth has passed off. One whole summer, sometimes two, must elapse before the layers will be fully rooted in the case of woody plants. Such plants as are easily propagated in this way, in favourable seasons take only a few weeks to root, as they are layered towards the end of the blooming season, Jut and August, and the young plants are taken from the parent in the autumn. Fig. 15 shows a woody plant with one layer prepared by tonguing and another by ringing.

In general, each shoot makes one layer, but in plants like the Barberry, or "demals," which make long shoots, what is called successive layering may be adopted; that is, the shoot is taken alternately below and above the surface, as frequently as its length permits. There must, however, be a joint left on the underground and parent, and at least one sound bud in each exposed part, from which a shoot may be developed to form the top of the young plant.

9. By Circumposition.—When a plant is too high or its habit does not conveniently admit of its being layered, it may often be increased by what is called circumposition, the soil being carried up to the branch operated on. The branch is to be prepared by ringing or notching or wiring as in layering, and a temporary stand made to support the vessel which is to contain the soil. The vessel may be a flower-pot sown in two, so that the halves may be bound together. If the stem is very tough it may be bound and then the pot will admit the shoot; this vessel is to be filled compactly with suitable porous earth, the opening at the slit being stopped by pieces of slate or tile. The earth must be kept moist, and if the back mulch of old earth is being also broadly over the openings in the vessel, and all being kept damp by frequent syringings. Gardener often dispense with the pot, using sphagnum moss or leaf-mould or propagating indiarubber plants, perpetual carnations, dracaenas, &c.

10. By Grafts.—Grafting is so extensively resorted to that it is impossible here to notice all its phases. It is perhaps of most importance as the principal means of propagating our hardy kinds of fruit, especially the apple and the pear; but the process is the same with most other fruits and ornamental hardy trees and shrubs that are thus propagated. The stocks are commonly divided into two classes:—(1) free stocks, which consist of seedling plants, chiefly of the same genus or species as the trees from which the scions are taken; and (2) dwarfing stocks, which are of more diminutive growth, either varieties of the same species or species of the same or some allied genus as the scion, which have a tendency to lessen the expansion of the engrailed tree. The French Paradise is the best dwarfing stock for apples, and the quince for pears. In determining the choice of stocks, the nature of the soil in which the grafted trees are to grow should have full weight. In a soil, for example, naturally moist, it is proper to graft pears on the quince, because this plant is able to thrive in such a soil. In cases in which the scion and stock are not free from disease, it is often deemed advisable to use a second stock of a different species. In the case of the scion being propagated from a root-bud, it is often exacted from the parent stock to keep the scion and stock of the same species. The stock should be as much as possible of the same age as the scion, so as to avoid any disturbance in the scion. The scion should be open in the spring on a day when the shoots are from two to three inches long, and the stock should be cut just below the bud where it is to be grafted, with a sharp knife, and the bud lowered into the cut in the stock, so as to admit the scion and stock to unite. If the scion is taken from a shoot growing on the side of the stock, the scion should be thus cut so as to allow of the new shoot growing on. The scion should be well fixed, and there should be abundant water supplied, so as to prevent any shock. The scion should not be always cut from the shoot growing on, but should be cut from the lowest shoot that is likely to produce good growth. If the scion is taken from a shoot growing above, the scion should be thus cut so as to allow of the new shoot growing on. The scion should be well fixed, and there should be abundant water supplied, so as to prevent any shock. The scion should not be always cut from the shoot growing above, but should be cut from the lowest shoot that is likely to produce good growth. If the scion is taken from a shoot growing above, the scion should be thus cut so as to allow of the new shoot growing on. The scion should be well fixed, and there should be abundant water supplied, so as to prevent any shock. The scion should not be always cut from the shoot growing above, but should be cut from the lowest shoot that is likely to produce good growth.

WHIP-GRAFTING or TONGUE-GRAFTING (fig. 16) is the most usual mode of performing the operation when there is no great difference in thickness between the stock and scion. The stock is headed off by cutting into a V, so as to transverse it, but not to reach the side as at b, and on the face of this a tongue or notch is made, the cut being in a downward direction; the scion is pared off in a similar way, and the two clean sharp-cut, and this is tongued or tanged in the opposite direction as the figure indicates; the two are then fitted together as at d, so that the inner bark of each may come in contact at least on one side, and then tied round with damp soft moss. The next summer is then taken, and this is placed, and rolled closely round the union, so as to prevent the stock and scion from sticking to them. Various kinds of grafting wax are now obtainable, and are a great improvement upon the clay process. Various varieties of wax have been prepared to answer very well with the want of the hand. They are best applied with a piece of flat wood, or very liquid, waxes may be applied with a brush.
Cleft-grafting (fig. 17) is another method in common use. The stock a is cleft down from the horizontal cut d (but not nearly so much as the sketch would indicate), and the scion, when cut to a thin wedge form, as shown at e and f, is inserted into the cleft; the whole is then bound tip and clayed as in the former case. This is not so good a plan as whip-grafting; it is improved by sloping the stock on one side to the size of the graft.

Crown-grafting or Rind-grafting (fig. 18) is preferable to cleft-grafting, inasmuch as it leaves no open spaces in the wood. The stock b is cut off horizontally or nearly so in January or February. At grafting time a slit is cut in the bark f, g, a wedge-shaped piece of iron or a small chisel being inserted to raise the bark; the scion is then cut to the same wedge-shaped form g, h, and inserted in the space opened for it between the albumen and the bark, after which it is tied down and clayed or waxed over in the manner already described.

Side-grafting is performed like whip-grafting, the graft being inserted on the side of a branch and not at the cut end of the stock. It may be practised for the purpose of changing a part of the tree, and is sometimes very useful for filling out vacant spaces, in trained trees especially.

Inarching is another form of side-grafting. Here the graft is fixed to the side of the stock, which is planted or potted close to the plant to be worked. The branches are applied to the stock while yet attached to the parent tree, and remain so until united. In the case of trained trees, a young shoot is sometimes inarched to its parent stem to supply a branch where one has not been developed in the ordinary way.

For the propagation by grafts of stave and greenhouse plants the process adopted is whip-grafting or a modification of it. The parts are, however, sometimes so small that the tongue of the graft is dispensed with, and the two stems simply pared smooth and bound together. In this way hardy rhododendrons of choice sorts, greenhouse azaleas, the varieties of the orange family, camellias, roses, rare conifers, clematises and numerous other plants are increased. Raffia—which has taken the place of bast—is generally used for tying, and grafting wax is only used occasionally with such plants under glass. All grafting of this kind is done in the propagating house, at any season when grafts are obtainable in a fit state—the plants when operated on being placed in close frames warmed to a suitable temperature. Roses and clematis, however, are generally grafted from January to March and April.

Root-grafting is sometimes resorted to where extensive increase is an object, or where stem-grafting or other means of propagation are not available. In this case the scion is grafted directly on to a portion of the root of some appropriate stock, both graft and stock being usually very small; the grafted root is then potted so as to cover the point of junction with the soil, and is plunged in the bed of the propagating house, where it gets the slight stimulus of a gentle bottom heat. Dahlias (fig. 19), paeonies, and Wistarias may be grafted by inserting young shoots into the neck of one of the fleshy roots of each kind respectively—the best method of doing so being to cut a triangular section near the upper end of the root, just large enough to admit the young shoot when slightly pared away on two sides to give it a similar form. In the case of large woody plants thus worked (fig. 20) the grafted roots, after the operation is completed, are planted in nursery beds, so that the upper buds only are exposed to the atmosphere, as shown in the figure.

By Buds.—Budding is the inserting of a bud of a choice variety cut with a portion of bark into the bark of an inferior nature where it is bound gently but firmly. Stone fruits, such as peaches, apricots, plums, cherries, &c., are usually propagated in this way, as well as roses and many other plants. In the propagating house budding may be done at any season when the sap is in motion; but for fruit trees, roses, &c., in the open air, it is usually done in July or August, when the buds destined for the following year are completely formed in the axils of the leaves, and when the bark separates freely from the wood it covers. Those buds are to be preferred, as being best ripened, which occur on the middle portion of a young shoot, and which are quite dormant at the time.

The simplest and most generally practised form of budding is that called shield-budding or T-budding (fig. 21). The operator should be provided with a sharp budding knife having a thin ivory or bone handle, for raising the bark of the stock. A horizontal incision is made in the bark quite down to the wood, and from this a perpendicular slit is drawn upwards to the extent of perhaps an inch, so that the slit has a resemblance to the letter T, as at a. A bud is then cut by a clean incision from the tree intended to be propagated, having a portion of the wood attached to it, and so that the whole may be about 1 in. long, as at d. The bit of wood e must be gently withdrawn, care being taken that the bud adheres wholly to the bark or shield,
as it is called, of which f is a side view. The bark on each side of the perpendicular slit being then cautiously opened, at f, with the handle of the knife, the bud and stock are separated as at g.

The upper tip of the shield is cut off horizontally, and brought to fit the bark of the stock at the transverse incision. Slight tiges of soft cotton wool or worsted, or moist raffia, are then applied. In about a month or six weeks the ligatures may be removed or slit with the knife to allow for the swelling stem, when, if the operation has been successful, the bud will be fresh and full, and the shield firmly united to the wood. In the following spring a strong shoot will be thrown out, and to prevent its being blown out by the wind, must be fastened to a stake, or to the lower portion of the old stock which has been left for the purpose.

To be successful the operation should be performed with a quick and light hand, so that no part of the delicate tissues be injured, as would happen if they were left for a time exposed, or if the bud were forced in like a wedge. The union is effected as in grafting, by means of the organic sap or cambium, and the loss this is disturbed until the inner bark of the shoot is pressed and fixed against it the better. Trees to be grown in the form of a bush are usually budded low down on the stem of the stock as near the root as possible to obviate the development of wild suckers later on. Standard trees, however, are budded on a sturdy young shoot close to the top. In either case the stocks should have been carefully planted at least the previous November when the work is to be done in the open air the following July or August.

12. By Branch Cuttings.—Propagation by cuttings is the mode of increase most commonly adopted, next to that by seeds. It is effected either when taken from a branch or shoot of the plant, and placing it in the soil. There are great differences to be observed in the selection and treatment of cuttings. Sometimes soft green leafy shoots, as in Verbena (fig. 22.a), are used; sometimes the shoots as if kept from being exhausted they help to supply the elaborated sap out of which the roots are formed. Free-rooting subjects strike at any lightish sandy mixture; but difficult subjects should have the well-drained pots, a portion of the soil proper for the particular plants made very sandy, and a surfacing of clean sharp sand about as deep as the length of the cutting.

Various hardy plants as helichrysums, chrysanthemums, and chrysanthemum plants, a stratum of which is placed over the sandy peat soil in a specially prepared cutting pot, and thus the cuttings, though rooting in the sand under a bell-glass, find at once on the emission of roots congenial soil for them to grow in (fig. 23b).

Hardy plants, such as pinks, pansies, &c., are propagated by cuttings planted during early summer in light rich soil. The cuttings of pinks are called pinings (fig. 22.d), and are planted about June, while pansies may be removed in this way both in spring and in autumn.

13. By Leaf Cuttings.—Many plants may be propagated by planting their leaves or portions of the leaves as cuttings, as, for example, the Sempervivum, Echeveria, Pachyphytum and their allies, and such hard-leaved plants as Theophrastes (fig. 23.b). The leaves are best taken off with the blade of a sharp knife and should be planted in well-drained sandy soil in due time they form roots, and ultimately from some latent bud a little shoot which forms the young plant. The treatment is precisely like that of branch cuttings. Gypsophila, begonias, &c., grow readily from fragments of the leaves cut clean through the thick veins and ribs, and planted edgewise like cuttings. This class of subjects may also be fixed flat on the surface of the cutting pot, by means of little pegs or hooks, the main ribs being cut across at intervals, and from these points roots, and eventually young tubers, will be produced (fig. 24).

14. By Root Cuttings.—Some plants which are not easily increased by other means propagate readily from root cuttings. Amongst the indoor plants which may be so treated, Bernouaria, Pelargonium, and Begonia, and Wignedia may be mentioned. The mode operandi is to Fig. 24.—Leaf-Propagation of turn the plant out of its pot, shake away the soil so as to free the roots, and then select as many pieces of the stouter roots as may be required. These are cut up into half-inch lengths (more or less), and inserted in light sandy soil round the margin of a cutting pot, so that the upper end of the root cutting may be level with the soil or just covered by it. The pots should be watered so as to settle the soil, and be placed in the close atmosphere of the propagating pit or frame, where they will need scarcely any water until the buds are starting through the surface.

There are various herbaceous plants which may be similarly treated, such as sea-kale and horseradish, and, among ornamental plants, the beautiful autumn-blooming Anemone Japonica, Becoming cordata, Dichondra, Veronica Filiformis, the burning bush; the sea hollies (Eryngium), the globe thistle (Echinops ritro), the Oriental poppy (Papaver orientale), the sea lavender (Statice latifolia), Senecio pulcher, the sea kale, and horseradish require to be treated in the open garden, where the cut portions should be planted in pieces in well-worked soil; but the roots of the others should be planted in pots and kept in a close frame with a little warmth till the young shoots have been thoroughly hardened up.

Various hardy ornamental trees are also increased in this way, as the quince, elm, robinia and mulberry, and the rose amongst shrubs. The most important use to which this mode of propagation is put is, however, in the various plants used as stocks for working the choicer stone fruits. The method in the latter case is to select roots averaging the thickness of the little finger, to cut these into lengths of about 3 or 4 in., and to plant them
in lines just beneath the surface in nursery beds. The root cuttings of rose-stocks are prepared and treated in a similar way.

15. By Cuttings of Single Eyes.—This mode of propagation is by cutting the ripened young branches into short lengths, each containing one well-matured bud or eye, with a short portion of the stem above and below. It is a common mode of propagating vines, the eyes being in this case cut from the ripened leafless wood. The eyes (fig. 25. a) are planted just below the surface in pots of light soil, which are placed in a propagating house or propagating pit, and in due time each pushes up a young shoot which branches as the future stem, while from about its base the young roots are reduced (fig. 25. b) which convert it into an independent plant. In the case of plants with persistent leaves, the stem may be cut through just above and below the bud, retaining the leaf which is left. In the cutting, the old wood and eye being planted beneath the soil and the leaf left exposed. In this way the India-rubber tree (Ficus elastica), for example, and many other tender plants may be increased with the aid of a brisk bottom heat. Many of the plantings, where the tree or the stem is to be reduced as far as may seem necessary or practicable by means of a digging fork, the roots as soon as they are liberated being fixed on one side and carefully preserved. By working in this way all round the ball, the best roots will be got out and preserved, and the ball lightened of all superfluous soil. The tree will then be ready to lift if carefully pruned up from beneath the ball, and if it does not lift readily, it will probably be found that a root has struck downwards, which will have to be sought out and cut through. Whenever practicable, it is best to secure a ball of earth round the roots. On the tree being lifted from its hole the roots should be examined and if any of them have been severed roughly with the spade should have the ends cut smooth with the knife to facilitate the emission of fibres. The tree can then be transported to its new position. The hole for its reception should be of sufficient depth to allow the base of the ball of earth, or of the roots, to stand so that the point whence the uppermost roots spring from the stem may be 2 or 3 in. below the general surface level. Then the ball being regulated so as to leave the soil rather highest in the centre, the plant is to be set in the hole in the position desired, and steadied there by hand. Next the roots from the lower portion of the ball are to be sought out and laid outwards in lines radiating from the stem, being distributed equally on all sides as nearly as this can be done; some fine and suitable good earth should be thrown amongst the roots as they are thus being placed, and worked in well up to the base of the ball. The soil covering the roots may be gently pressed down, but the tree should not be pulled up and down, as is sometimes done, to settle the soil. This done, another set of roots higher up the ball must be laid out in the same way, and again another, until the whole of the roots, thus carefully laid, are embedded as firmly as may be in the soil, which may now receive another gentle treading. The stem should next be supported permanently, either by one stake or by three, according to its size. The excavation will now be filled up about two-thirds perhaps; and if so the tree may have a thorough good watering, sufficient to settle the soil closely about its roots. After twenty-four hours the hole may be levelled in, with moderate treading; if the water has soaked well in, the surface being left level and not sloping upwards towards the stem of the tree. In transplanting trees of the ornamental class, less need be attempted in respect to providing new soil, although the soil should be made as congenial as practicable. Generally speaking, fruit trees are best transplanted when three or four years of age, in which time they will have acquired the shape given by the nurseryman, who generally transplants his stock each autumn to produce large masses of root fibres. Nowadays, however, quite large trees, chiefly of an ornamental character, and perhaps weighing several tons, are lifted with a large ball of soil attached to the roots, by means of a special tree-lifting machine, and are readily transferred from the nursery to the garden to another, or even for a distance of several miles, without serious injury. The best season for transplanting deciduous trees is during the early autumn months. As regards evergreen opinions are divided, some preferring August and September, others April or May. They can be successfully planted at either period, but for subjects which are at all difficult to remove the spring months are to be preferred.

In transplanting smaller subjects, such as plants for the flower garden, much less effort is required. The plant must be lifted with as little injury to its rootlets as possible, and carefully set into the hole, the soil being filled in round it, and carefully pressed close by the hand. For moving small plants the garden trowel is a very convenient tool, but we are inclined to give the preference to the hand-fork. For larger masses, such as strong-growing herbaceous plants, a spade or digging-fork will be requisite and the soil may be trodden down with the feet.

When seedlings of vigorous plants have to be "pricked out," a dibble or dibber is the best implement to be used. The ground being prepared and, if necessary, enriched, and the surface made fine and smooth, a hole is made with the dibble deep enough and large enough to receive the roots of the seedling plants without doubling them up, and the hole filled in by working the soil close to the plant with the point of the dibble. The pricking out of seedlings in pots in the propagating pit is effected in a similar way. The plants, indeed, often require to be removed and set from 1 in. to 1 in. apart before they have become sufficiently developed to admit of being handled with any degree of facility, and for these a pointed stick of convenient size is used as a dibble. In delicate cases, such as seedling gloxinias and begonias, it is best to lift the little seedling on the end of a flattish pointed stick, often clutched at the apex, pressing this into the new soil where the plant is to be placed, and liberating it and closing the earth about it by the aid of a similar stick held in the other hand.

Potting and Rooting.—Garden pots are made with a comparatively large hole in the bottom, and those of the largest size have also holes at the side near the bottom; these openings are to prevent the soil becoming saturated or soured with superabundant water. To prepare the pot for the plant, a broadish piece of potsherd, called a "crock," is placed over the large hole, and if there be side holes they also are covered. The bottom crock is made from a piece of a broken pottery pot, and is laid with the convex side upwards; then comes a layer of irregular pieces of crock of various sizes, about 1 in. deep in a 4-in. pot, 2 in. in an 11-in. or 12-in. pot, &c. The mode of crocking a pot is shown in fig. 26. A few of the coarser lumps from the outer
edge of the heap of potting soil are spread over the crocks. The same end, that of keeping the finer particles of the soil from mixing with the drainage crocks, may be attained by shaking in a little clean moss. A handful or two of the soil is then put in, and on this the plant with its roots spread out is to be set, a trifle higher than the plant should stand in the pot when finished off. The soil is to be added around the roots, and the whole pressed firmly with the fingers, the base of the stem being just below the pot-rim, and the surface being smoothed off so as to slope a little outwards. When finished off, the pots should be watered well, to settle the soil; but they should stand till the water has well drained away, since, if they are moved about while the fresh soil is very wet, there will be a risk of its becoming puddled or too much consolidated. Larger plants do not need quite such delicate treatment, but care should be taken not to handle the roots roughly. The soil for these may be somewhat coarser, and the amount of drainage material more ample. Larger bodies of soil also require to be more thoroughly consolidated before watering; otherwise they would settle down so as to leave an unsightly void at the pot-rim.

Some plants, especially when potted temporarily, may be dealt with in a simpler way. A single crock may be used in some cases, and in others no crock at all, but a handful of half-decayed leaves or half-decayed dung thrown into the bottom of the pot. This mode of potting does well for bulbs, such as hyacinths, which are either thrown away or planted out when the bloom is over. The bedding plants generally may be potted in this way, the advantage being that at planting-out time there is less risk of disturbing the roots than if there were potsherds to remove. Plants of this character should be potted a little less firmly than specimens which are likely to stand long in the pot, and indeed the soil should be made comparatively light by the intermixture of leaf-mould or some equivalent, in order that the roots may run freely and quickly into it.

For epiphytal plants like orchids the most thorough drainage must be secured by the abundant use of potsherds, small pots being sometimes inserted inside the larger ones, or by planting in shallow pots or pans, so that there shall be no large mass of soil to get consolidated. For most of these the lightest spongy but sweet turfy peat must be used, this being packed lightly about the roots, and built up above the pot-rim, or in some cases freely mixed before use with chopped sphagnum moss and small pieces of broken pots or nodules of charcoal. The plants under these conditions often require to be supported by wooden pegs or sticks. Some of the species grow better when altogether taken out of the soil and fixed to blocks of wood, but in this case they require a little coaxing with moss about the roots until they get established. In other cases they are planted in open baskets of wood or wire, using the porous peat and sphagnum compost. Both blocks and baskets are usually suspended from the roof of the house, hanging free, so that no accumulation of water is possible. These conditions of orchid-growing have undergone great changes of late years, and the plants are grown much as other stave and greenhouse plants in ordinary pots with composts not only of peat but of leaf-mould, and fibres from osmund and polypodium ferns.

When potting is adopted as a temporary expedient, as in the case of bedding-out plants which it is required to push forward as much as possible, it will suffice if provision is made to prevent the drainage hole from getting blocked, and a rich light compost is provided for the encouragement of the roots. When, however, a hard-wooded plant has to be repotted, the case is different; it may stand without further potting for one year or more and to grow, and therefore much more care is necessary. The old ball of earth must be freed from all or most of the old crocks without doing injury to the roots, and the sharp edge of the upper surface gently rubbed off. If there be any sour or sodden or effete soil into which the roots have not run, this should be carefully picked out with a pointed stick. The ball is to be set on the new soil just high enough that when finished off the base of the stem may be somewhat below the pot-rim, and the space between the old ball and the sides of the pot is to be filled in gradually with the prepared compost, which is from time to time to be pressed down with a blunt-ended flat piece of wood called a potting-stick, so as to render the new soil as solid as the old. The object of this is to prevent the plant from starving by the water applied all running off by way of the new soil and penetrating the original ball of earth. When this amount of pressure is not necessary, but in the case of such as do not like water retentive comports, the soil itself should be rather inclined to dryness, and should in no case be sufficiently moist to knead together into a pasty mass. In ordinary cases the potting soil should be just so far removed from dryness that when a handful is gently pressed it may hang together, but may lose its cohesion when dropped.

When plants are required to stand in ornamental china pots or vases, it is better, both for the plants and for avoiding risk of breakage, to grow them in ordinary garden pots of a size that will drop into the more valuable vessels. Slate pots or tubs, usually square, are sometimes adopted, and are durable and otherwise unobjectionable, only, their sides being less porous, the earth does not dry so quickly, and some modification of treatment as to watering is necessary. For large conservatory specimens wooden tubs, round or square, are frequently used; these should be coated with pitch inside to render them more durable.

Various other contrivances take the place of garden pots for special purposes. Thus shallow square or oblong wooden boxes, made of light, inexpensive wood, are very useful for seed- sowing, for pricking out seedlings, or for planting cuttings. When the disturbance of the roots incidental to all transplanting is sought to be avoided, the seed or plant is started in some cases in squares of turf (used grassy-side downwards), which can when ready be transferred to the place the plant is to occupy. Cucumber and melon plants and vines reared from eyes are sometimes started in this way, both for the reason above mentioned and because it prevents the curling of the roots apt to take place in plants raised in pots. Strips of turf are sometimes used in the rearing of early peas, which are sown in a warmhouse or frame and gradually hardened so as to bear exposure before removal to the open air.

Watering.—The guiding principle in watering plants is to do it thoroughly when it is required, and to abstain from giving a second supply till the first has been taken up.

When watering becomes necessary for kitchen-garden crops, the hose should be laid on and the lines of esculents allowed to drink their fill, if fresh succulent vegetables are desired. So also, if well-swelled and luscious fruits, such as strawberries, are required, there must be no parching at the roots. This applies even more strongly to conservatory borders and to forcing-houses than to the outside fruit-tree borders, because from these the natural rain supply is in most cases more distinctly cut off. In the case of forcing-houses, the water should be heated before being applied to the borders containing the roots of the trees.

In the watering of pot plants the utmost care is requisite if the plant be a shy-growing or valuable one, and yet it is almost impossible to give any intelligible instruction for performing the operation. The roots should never be suffered either to get thoroughly dry or to get sodden with excess of water. An adverb will know by the ring of the pot on striking it with his knuckles whether water is wanted or not, according as it rings loud and clear or dull and heavy. With very choice subjects watering may be necessary two or three times a day in drying summer weather. It is a wrong though common practice to press the surface of the soil in the pot in order to feel if it is moist enough, as this soon consolidates it, and prevents it from getting the full benefit of aeration.

When all heated houses the water used should be warmed at least up to the temperature of the atmosphere, so as to avoid chilling the roots. This is also necessary in the case of water used for syringing the plants, which should be done two or three times a day in all stoves and forcing-houses, especially during the period when the young growth is being developed. The damping of all absorbent surfaces, such as the floors or bare walls, &c., is frequently necessary several times a day in the growing season, so as to keep up a humid atmosphere; hence
the advantage of laying the floors a little rounded, as then the water draws off to the sides against the kerbstone, while the centre remains dry for promenaders.

In cooler structures it becomes necessary in the dull season of the year to prevent the slopping of water over the plants or on the floor, as this tends to cause "damping off"—the stems assuming a state of mildewy decay, which not infrequently, if it once attacks a plant, will destroy it piece by piece. For the same reason cleanliness and free ventilation under favourable weather conditions are of great importance.

Pruning.—Pruning is a very important operation in the fruit garden, its object being twofold—(1) to give form to the tree, and (2) to induce the free production of flower buds as the precursors of a plentiful crop of fruit. To form a standard tree, either the stock is allowed to grow up with a straight stem, by cutting away all side branches up to the height required, say about 6 ft., the scion or bud being worked at that point, and the head developed therefrom; or the stock is worked close to the ground, and the young shoot obtained therefrom is allowed to grow up in the same way, being pruned in its progress to keep it single and straight, and the top being cut off when the desired height is reached, so as to cause the growth of lateral shoots. If these are three or four in number, and fairly balanced as to strength and position, little pruning will be required. The tips of unripened wood should be cut back about one-third their length at an outwardly placed bud, and the chief pruning thereafter required will be to cut away inwardly directed shoots which cross or crowd each other and tend to confuse the centre of the tree. Bushy heads should be thinned out, and those that are too large cut back so as to remodel them. If the shoots produced are not sufficient in number, or are badly placed, or very unequal in vigour, the head should be cut back moderately close, leaving a few inches only of the young shoots, which should be pruned back to buds so placed as to furnish shoots in the positions desired. When worked at the top of a stem formed of the stock, the growth from the graft or bud must be pruned in a similar way. Three or four leading shoots should be selected to pass ere long into boughs and form a well-balanced framework for the tree; these boughs, however, will soon grow beyond any artificial system the pruner may adopt.

To form a dwarf or bush fruit tree the stock must be worked near the ground, and the young shoot produced from the scion or bud must be cut back to whatever height it is desired the dwarf stem should be, say 1½ to 2 ft. The young shoots produced from the portion of the new wood retained are to form the framework of the bush tree, and must be dealt with as in the case of standard trees. The growth of inwardly directed shoots is to be prevented, and the centre kept open, the tree assuming a cup-shaped outline. Fig. 27, reduced from M. Hardy's excellent work, *Traité de la taille des arbres fruitiers,* will give a good idea how these dwarf trees are to be manipulated, a showing the first year's development from the maiden tree after being headed back, and b the form assumed a year or two later.

In forming a pyramidal tree, the lateral growths, instead of being removed, as in the standard tree, are encouraged to the utmost; and in order to strengthen them the upper part of the leading shoot is removed annually, the side branches being also shortened somewhat as the tree advances in size. In fig. 28, reduced from M. Hardy's work, a shows a young tree with its second year's growth, the upright shoot of the maiden tree having been moderately headed back, being left longer if the buds near the base promise to break freely; or cut shorter if they are weak and wanting in vigour. The winter pruning, carried out with the view to shape the tree into a well-grown pyramid, would be effected at the places marked by a cross line. The lowest branch would have four buds retained, the end one being on the lower side of the branch. The two next would be cut to three buds, which here also are fortunately so situated that the one to be left is on the lower side of the branches. The fourth is not cut at all owing to its shortness and weakness, its terminal bud being allowed to grow to draw strength into it. The fifth is an example where the bud to which the shoot should be cut back is badly placed; a shoot resulting from a bud left on the upper side is apt instead of growing outwards to grow erect, and lead to confusion in the form of the tree; to avoid this it is tied down in its proper place during the summer by a small twig. The upper shoots are cut closer in. Near the base of the stem are two prominent buds, which would produce two vigorous shoots, but these would be too near the ground, and the buds should therefore be suppressed; but, to strengthen the lower part, the weaker buds just above and below the lowest branch should be forced into growth, by making a transverse incision close above each. Fig. 28, b, shows what a similar tree would be at the end of the third year's growth.
In order to bring a young tree into the cordon shape, all its side branches are shortened back, either to form permanent spurs, as in the case of pears, or to yield annual young shoots, as in peaches and nectarines. The single-stemmed cordon may be trained horizontally, obliquely at any required angle, or vertically if required, the first two arrangements being preferable. If a double cordon is required, the original young stem must be headed back, and the two best shoots produced must be selected, trained right and left, and treated as for the single cordon.

The forms chiefly adopted for trees trained to walls and espalier rails are the fan-shaped, the half-fan and the horizontal, with their various modifications.

The maiden tree is headed down, and two shoots led away right and left. Two laterals should be allowed to grow from the upper side of them, one from near the base, the other from near the middle, all others being pinched out beyond the second or third leaf during summer, but cut away to the last bud in winter. The tree will thus consist of six shoots, probably 3 ft. to 4 ft. long, which are not to be pruned unless they are unequal in strength, a defect which is rather to be remedied by summer pinching than by winter pruning. The second year three young shoots are to be left on each of the six, one close to the base, one about the middle, and one at the point, the rest being rubbed off. These three shoots will produce laterals, of which one or two may be selected and laid in; and thus a number of moderately strong fertile shoots will be obtained, and at the end of the season a comparatively large tree will be the result.

The method of pruning formerly adopted for the formation of a fan-shaped tree was to head down the maiden plant to about two eyes, so placed as to yield a young shoot on each side (fig. 29), the supernumerary shoots being rubbed off while quite young, and the reserved shoots trained against the wall during the year as to get them well matured. The next year they were cut back again, often nearly to the base, in order that the lower pair of these shoots might each produce two well-placed young shoots, and the upper pair three young shoots. The tree would thus consist of ten shoots, to be laid out at regular distances, and then if closely cut the frame-work of the tree would be as in fig. 30. These main shoots were not again to be shortened back, but from each of them three young shoots were to be selected and trained in two, on the upper side, one near the base, and the other halfway up, and one on the lower side placed about midway between these two; these with the leading shoot, which was also to be nailed in, made four branches of the current year from each of the ten main branches, and the form of the tree would therefore be that of fig. 31. The other young shoots produced were pinched off while quite young, to throw all the strength of the tree into those which were to form its basis, and to secure abundant light and air. In after years the leading shoot was not to be cut back, but all the lateral shoots were to be shortened, and from these year by year other shoots were to be selected to fill up the area occupied by the tree.

In pruning for a horizontal tree the young maiden has to be headed back nearly to its base, and from the young shoots three are to be selected, the two best-placed lower ones to form an opposite or nearly opposite pair of main branches, and the best-placed upper one to continue the erect stem (fig. 32). This upper shoot is at the next winter pruning to be cut down to within about a foot of the point whence it sprung, and its buds rubbed off except the upper one for a leader, and one on each side just below it to furnish another pair of side shoots; these being trained in position, the tree would appear as in fig. 33.

The same course is to be followed annually till the space is filled. Sometimes in very favourable soils and with vigorous trees two pairs of branches may be obtained in one season by summer-stopping the erect shoots and selecting others from the young growths thus induced, but more commonly the trees have to be built up by forming one pair of branches annually. The shoots are not at first lowered to the horizontal line, but are brought down gradually and tied to thin stakes; and while the tree is being formed weak shoots may be allowed to grow in a more erect position than it is ultimately intended they should occupy. Thus in four or five years the tree will have acquired something of the character of fig. 34, and will go on thus increasing until the space is filled.

The half-fan is a combination of the two forms, but as regards pruning does not materially differ from the horizontal, as two opposite side branches are produced in succession upwards till the space is filled, only they are not taken out so abruptly, but are allowed to rise at an acute angle and then to curve into the horizontal line.

In all the various forms of cordons, in horizontal training, and in fan and half-fan training, the pruning of the main branches when the form of the tree is worked out will vary in accordance with the kind of fruit under treatment. Thus in the peach, nectarine, apricot, plum and cherry, which are commonly trained fan-fashion, the first three (and also the morello cherry if grown) will have to be pruned so as to keep a succession of young annual shoots, these being their fruit-bearing wood. The others are generally pruned so as to combine a moderate supply of young wood with a greater or less number of fruit spurs. In the pear and apple the fruit is borne principally on spurs, and hence what is known as spur-pruning has to be adopted, the young shoots being all cut back nearly to their base, so as to cause fruit buds to evolve from the remaining eyes or buds. Cordons of apples and pears have to be similarly treated, but cordons of peaches and nectarines are pruned so as to provide the necessary annual succession of young bearing wood.
Fruit trees trained as espaliers, fans or cordons against walls, trellises or fences, are not only pruned carefully in the winter but must be also pruned during the early summer months. Many of the smaller, useless shoots are rubbed out altogether; the best are allowed to grow perhaps a foot or more in length, and then either have the tips pinched out with the finger and thumb, or the ends may be cracked or broken, and allowed to hang down, but are not detached completely. This is called summer pruning, and is an important operation requiring knowledge on the part of the gardener to perform properly. Shoots of peaches, nectarines and morello cherries are "laid in," that is, placed in between fruiting shoots where there is the space to be ripened for next year's crop.

Summer Pruning should be performed while the shoots are yet young and succulent, so that they may in most cases be nipped off with the thumb-nail. It is very necessary in the case of trees trained to a flat surface, as a wall or espalier rail, to prevent undue crowding. In some cases, as, for example, with peaches, the superfluous shoots are wholly removed, and certain selected shoots reserved to supply bearing wood for next year. In others, as pears, the tops of the young shoots are removed, leaving three or four-leaves and their buds at the base, to be developed into fruit buds by the additional nourishment thus thrown into them (fig. 35a). One or two may push out a late summer growth, but this will serve as a safety vent for the vigour of the tree, and if the lowermost only go to the formation of a fruit spur, the object will have been gained. They are cut to the last dormant bud in winter.

But summer pruning has been much extended since the introduction of restricted growth and the use of dwarfing stocks. Orchard-house trees, and also pyramidal and bush trees of apples, pears and plums, are mainly fashioned by summer pruning; in fact, the less the knife is used upon them, except in the necessary cutting of the roots in potted trees, the better. In the case of orchard-house plants no shoots are suffered to lengthen out, except as occasionally wanted to fill up a gap in the outline of the tree. On the contrary, the tops of all young shoots are pinched off when some three or four leaves are formed, and this is done again and again throughout the season. When this pruning is just brought to a balance with the vigour of the roots, the consequence is that fruit buds are formed all over the tree, instead of a thicket of sterile and useless wood. Pyramidal and bush trees out of doors are, of course, suffered to become somewhat larger, and sufficient wood must be allowed to grow to give them the form desired; but after the first year or two, when the framework is laid out, they are permitted to extend very slowly, and never to any great extent, while the young growths are continually nipped off, so as to clothe the branches with fruit buds as closely placed as will permit of their healthy development.

The nature of the cut itself in pruning is of more consequence, especially in the case of fruit trees, than at first sight may appear. The branches should be separated by a clean cut at an angle of about 45°, just at the back of a bud, the cut entering on a level with the base of the bud and passing out on a level with its top (fig. 36a), for when cut in this way the wound becomes rapidly covered with new wood, as soon as growth recommences, whereas if the cut is too close the bud is starved, or if less close an ugly and awkward snap is left. Fig. 36b and c, are examples of the former, and d, e, f of the latter. In fact there is only one right way to cut a shoot and that is as shown at a.

The Pruning of flowering plants is generally a much lighter matter than the pruning of fruit trees. If a young seedling or cutting of any soft-wooded plant is to be bushy, it must have its top nipped out by the thumb-nail or pruning-scissors at a very early stage, and this stopping must be repeated frequently. If what is called a well-furnished plant is required, an average of from 2 to 3 in. is all the extension that must be permitted—sometimes scarcely so much—before the top is nipped out; and this must be continued until the desired size is attained, whether that be large or small. Then generally the plant is allowed to grow away till bloom or blooming shoots are developed. To form a pyramidal plant, which is a very elegant and useful shape to give to a decorative pot plant, the main stem should be encouraged to grow upright, for a length of perhaps of 6 or 8 in. before it is topped; this induces the formation of laterals, and favours their development. The best-placed upper young shoot is selected and trained upright to a slender stake, and this also is topped when it has advanced 6 or 8 in. further, in order to induce the laterals on the second portion to push freely. This process is continued till the required size is gained. With all the difficult and slow-growing plants of the hard-wooded section, all the pruning must be done in this gradual way in the young wood as the plant progresses.

Some plants, like pelargoniums, can only be kept handsomely formed and well furnished by cutting them down severely every season, after the blooming is over. The plants should be prepared for this by keeping them rather dry at the root, and after cutting they must stand with little or no water till the stems heal over, and produce young shoots, or "break," as it is technically termed. The appearance of a specimen pelargonium properly pruned is shown in fig. 37, in which a shows a young plant, the head of which has been taken off to form a cutting, and whose buds are ready to break into young shoots. Three shoots will be produced, and these, after growing from 4 to 6 in. in length, should be stopped by pinching out the point, this giving rise to lateral shoots. These will blossom in due course, and, after being ripened thoroughly by full exposure to the sun, should be cut back as shown at b. This is the proper foundation for a good specimen, and illustrates how all such subjects should be pruned to keep them stocky and presentable in form.

Root-pruning is most commonly practised in fruit-tree cultivation. It is often resorted to as a means of restoring fertility in plants which have become over rank from an excess of nourishment in the soil, or sterile from want of it. The effect of root-pruning in the first case is to reduce the supply of crude sap to the branches, and consequently to cause a check in their development. In the second case all roots that have struck downwards into a cold uncongenial subsoil must be pruned off if they cannot be turned in a lateral direction, and all the lateral ones that have become coarse and fibreless must also be shortened back by means of a clean cut with a sharp knife, while a compost of rich loamy soil with a little bone-meal, and leaf-mould or old manure, should be filled into the trenches from which the old sterile soil has been taken. The operation is best performed early in autumn, and may be safely resorted to in the case of fruit trees.
of moderate age, and even of old trees if due care be exercised. In transplanting trees all the roots which may have become bruised or broken in the process of lifting should be cut clean away behind the broken part, as they then more readily strike out new roots from the cut parts. In all these cases the cut should be a clean sloping one, and made in an upward and outward direction.

The root-pruning of pot-plants is necessary in the case of many soft-wooded subjects which are grown on year after year—pelargoniums and fuchsias, for example. After the close pruning of the branches to which they are annually subjected, and when the young shoots have shot forth an inch or two in length, they are turned out of their pots and have the old soil shaken out from their roots, the longest shoots, to the extent of about half the existing quantity, are then cut clean away, and the plants repotted into small pots. This permits the growing plant to be fed with rich fresh soil, without having been necessarily transferred to pots of unwieldy size by the time the flowering stage is reached.

**Ringing.**—One of the expedients for inducing a state of fruitfulness in trees is the ringing of the branches or stem, that is, removing a narrow annular portion of the bark, by which means, it is said, the trees are not only rendered productive, but the quality of the fruit is at the same time improved. The advantage depends on the obstruction given to the descent of the sap. The ring should be cut out in spring, and be of such a width that the bark may remain separated for the season. A tight ligature of twine or wire answers the same end. The advantages of the operation may generally be gained by judicious root pruning, and it is not at all adapted for the various stone fruits.

**Training.**—What is called training is the guiding of the branches of a tree or plant in certain positions which they would not naturally assume, the object being partly to secure their full exposure to light, and partly to regulate the flow and distribution of the sap. To secure the former object, the branches must be so fixed as to shade each other as little as possible; and to realize the second, the branches must have given to them an upward or downward direction, as they may require to be encouraged or repressed. Something of the same vegetative vigour which is given to a plant or tree by hard pruning is afforded by training in an upward direction so as to promote the flow of the sap; while the repression effected by summer pruning is supplemented by downward training, which acts as a check. One main object is the preservation of equilibrium in the growth of the several parts of the tree; and for this various minor details deserve attention. Thus a shoot will grow more vigorously whilst waving in the air than when nailed close to the wall; consequently a weak shoot should be left free, whilst its stronger antagonist should be restrained; and a luxuriant shoot may be retarded for some time by having its tender extremity pinched off to allow a weaker shoot to overtake it.

By the prudent use of the knife, fruit trees may be readily trained into the forms indicated below, which are amongst the best out of the many which have been devised.

The training of standard and bush trees in the open ground has been already referred to under the section Pruning. When the growth of pyramids is completed, the outline is something like that of fig. 39, and very pretty trees are thus formed. It is better, however, especially if the tendency to bear fruit is rather slack, to adopt what the French call *en quenouille* training (fig. 40), which consists in tying or weighting the tips of the branches so as to give them all a downward curve. Pear trees worked on the quince stock, and trained *en quenouille*, are generally very fertile.

Wall trees, it must be evident, are placed in a very unnatural and constrained position, and would in fact soon be reduced to a state of utter confusion if allowed to grow unrestricted; hence the following modes of training have been adopted.

**Horizontal Training** (fig. 41) has long been a favourite form in England. There is one principal ascending stem, from which the branches depart at right angles, at intervals of about a foot. Horizontal training is best adapted to the apple and the pear; and for the more twiggy growing slender varieties, the forms shown in fig. 42 have been recommended. In these the horizontal branches are placed wider, 18 to 20 in. apart, and the smaller shoots are trained between them, either on both sides, as at a, or deflexed from the lower side, as at b. The latter is an excellent method of reclaiming neglected trees. Every alternate branch should be taken away, and the spurs cut off, after which the young shoots are trained in, and soon produce good fruit.

In **Fan Training** (fig. 43) there is no leading stem, but the branches spring from the base and are arranged somewhat like the ribs of a fan. This mode of training is commonly adopted for the peach, nectarine, apricot and morello cherry, to which

---

**Fig. 38.—Diagram illustrating Branch Distribution.**

**Fig. 39.—Pyramidal Training.**

**Fig. 40.—Training *en quenouille*.**

**Fig. 41.—Horizontal Training.**

**Fig. 42.—Forms of Horizontal Training.**
it is best adapted. Though sometimes adopted, it is not so well suited as the horizontal form for apples and pears, because, when the branches reach the top of the wall, where they must be cut short, a hedge of young shoots is inevitable. A modification of the fan shape (fig. 44) is sometimes adopted for stone fruits, such as the plum and apricot. In this the object is to establish a number of mother branches, and on these to form a series of subordinate members, chiefly composed of bearing wood. The mother branches or limbs should not be numerous, but well marked, equal in strength and regularly disposed. The side branches should be pretty abundant, short and not so vigorous as to rival the leading members.

The Half-fan mode of training, which is intermediate between horizontal and fan training, is most nearly allied to the former, but the branches leave the stem at an acute angle, a disposition supposed to favour the more equal distribution of the sap. Sometimes, as in fig. 45, two vertical stems are adopted, but there is no particular advantage in this, and a single-stemmed tree is more manageable. The half-fan form is well adapted for such fruits as the plum and the cherry; and, indeed, for fruits of vigorous habit, it seems to combine the advantages of both the foregoing.

Trees must be fixed to the walls and buildings against which they are trained by means of nails and shreds (neat medicated strips are now sold for this purpose), or in cases where it is desired to preserve the wall surface intact, by permanent nails or studs driven in in regular order. Sometimes the walls are furnished with galvanized wires, but this has been objected to as causing cankerling of the shoots, for which, however, painting is recommended as a remedy. By crossing the tying material between the wire and the wood, however, and so preventing them from coming in contact, there is no danger. If they are adopted, the wires should be a few inches away from the wall, to allow free circulation of air between it and the tree, and thus avoid the scorching or burning of leaves and fruits during the summer months in very hot places. Care should be taken that the ties or fastenings do not eventually cut into the bark as the branches swell with increased age. When shreds and nails are used, short thick wire nails and "medicated shreds" are the best; the ordinary cast iron wall nails being much too brittle and difficult to drive into the wall. It must be remembered that nails spoil a wall sooner or later, whereas a wire trellis is not only much neater, but enables the gardener to tie his trees up much more quickly.

For tying plants to trellises and stakes soft tarred string or raffia (the fibre from the Raphia palm of Madagascar) is used.

In training greenhouse plants the young branches should be drawn outwards by means of ties fastened to a string or wire under the pot-rim; the centre then fills up, and slender stakes are used as required; but the fewer these are in number the better. Climbers are trained from the bottom around or across trellises, of which the cylindrical or the balloon-shaped, or sometimes the flat oval or circular, are the best forms. The size should be adapted to the habit of the plant, which should cover the whole by the time flowers are produced. Bast fibre and raffia fibre are to be preferred for light subjects of this character, as they can be split to any degree of fineness. Very durable trellises for greenhouse climbers are made of slender round iron rods for standards, having a series of hooks on the inner edge, into which rings of similar metal are dropped; the rings may be graduated so as to form a broad open top, or may be all of the same size, when the trellis will assume the cylindrical form. Fig. 46 shows a pot specimen of clematis trained over a balloon-shaped trellis.

The training of certain bedding plants over the surface of the soil is done by small pegs of birch wood or bracken, by loops of wire or cheap hair-pins, or sometimes by loops of raffia having the ends fixed in the soil by the aid of the dibble. The object is to fill up the blank space as quickly and as evenly as possible.

Forcing is the accelerating, by special treatment, of the growth of certain plants, which are required to be had in leaf, in flower or in fruit before their natural season,—as, for instance, the leaves of mint at Eastertide or the leafstalks of sea-kale and rhubarb.
at Christmas, the flowers of summer in the depth of winter, or some of the choicest fruits perfected so much before their normal period as to complete, with the retarded crops of winter, the circle of the seasons.

In the management of artificial heat for this purpose, a considerable degree of caution is required. The first stages of forcing should, of course, be very gentle, so that the whole growth of the plants may advance in harmony. The immediate application of a very hot atmosphere would unduly force the tops, while the roots remained partially or wholly inactive; and a strong bottom heat, if it did not cause injury by its excess, would probably result in abortive growth.

Any sudden decrease of warmth would be very prejudicial to the progress of vegetation through the successive stages of foliation, inflorescence and fructification. But it is not necessary that one unvarying range of temperature should be kept up at whatever pains or risk. Indeed, in very severe weather it is found better to drop a little from the maximum temperature by fire heat, and the loss so occasioned may be made good by a little extra heat applied when the weather is more genial. Night temperatures also should always be allowed to drop somewhat, the heat being increased again in the morning. In other words, the artificial temperature should increase by day and decrease by night, should rise in summer and fall in winter, should, in short, imitate as nearly as possible the varying influence of the sun.

For the growth of flowers generally, and for that of all fruits, every ray of light to be obtained in the dull winter season is required, and therefore every possible care should be taken to keep the glass clean. A moist genial atmosphere too is essential, a point requiring unremitting attention on account of the necessity of keeping up strong fires. With moisture as with heat, the cultivator must hold his hand somewhat in very severe or very dull weather; but while heat must not drop so as to chill the progressing vegetation, so neither must the lack of moisture parch the plants so as to check their growth.

There are some few subjects which when forced do not require a light house. Thus amongst flowers the white blossoms of the lilac, so much prized during winter, are produced by forcing purple-flowered plants in darkness. Rhubarb and sea-kale among esculents both need not to be forced in darkness to keep them crisp and tender, and mushrooms also are always grown in dark structures. In fact, a roony mushroom house is one of the most convenient of all places for forcing the vegetables just referred to. The lilac would be better placed in a dark shed heated to about 70° or 80°, in which some dung and leaves could be allowed to lie and ferment, giving off both a genial heat and moisture.

One of the most important preliminaries to successful forcing is the securing to the plants a previous state of rest. The thorough ripening of the preceding season's wood in fruit trees and flowering plants, and of the crown in perennial herbs like strawberries, and the cessation of all active growth before the time they are to start into a new growth, are of paramount importance. The ripening process must be brought about by free exposure to light, and by the application of a little extra heat with dryness, if the season should be unfavourable; and both roots and tops must submit to a limitation of their water supply. When the ripening is perfected, the resting process must be aided by keeping the temperature in which they await the forcing process as low as each particular subject can bear. (See Retardation above.)

V. Flowers.

Flower Garden and Pleasure Grounds.—Wherever there is a flower garden of considerable magnitude, and in a separate situation, it should be constructed on principles of its own. The great object must be to exhibit to advantage the graceful forms and glorious hues of flowering plants and shrubs. Two varieties of flower gardens have chiefly prevailed in Britain. In one the ground is turf, out of which flower-beds, of varied patterns, are cut; in the other the flower-beds are separated by gravel walks, without the introduction of grass. When the flower garden is thus seen from the windows, or any other elevated point of view, the former is to be preferred; but where the surface is irregular, and the situation more remote, and especially where the beauty of flowers is mainly looked to, the choice should probably fall on the latter.

The flower garden may include several different compartments. Thus, for example, there is the "Rock Garden," which should consist of variously grouped masses of large stones, those which are remarkable for being figured by water-wearing, or containing petrifactions or impressions, or showing something of natural stratification, being generally preferred. In the cavities between the stones, filled with earth, alpine or trailing plants are inserted, and also some of the choicest flowers. In proper situations, a small pool of water may be introduced for the culture of aquatic plants. In these days the rock-garden is a most important feature, and it requires a good deal of care and skill to arrange the boulders, walks, pools or streams in natural and artistic fashion. The selection of suitable alpines, perennials and shrubs and trees also necessitates considerable knowledge on the part of the gardener. A separate compartment laid out for ground regular as that for roses, under the name of the "Rosery." A moat or rather a shady border, or a section of the pleasure ground supplied with bog earth, may be devoted to what is called the "American Garden," which, as it includes the gorgeous rhododendrons and azaleas, forms one of the grandest features of the establishment during the early summer, while if properly selected the plants are effective as a garden of evergreens at all seasons. The number of variegated and various-coloured hardly shrubs is now so great that a most pleasant plot for a "Winter Garden" may be arrayed with plants of this class, with which may be associated hardy subjects which flower during that season or very early spring, as the Christmas rose, and amongst bulbs the crocus and snowdrop. Later the spring garden department is a scene of great attraction; and some of the gardens of this character, as those of Cliveden and Belvoir, are among the most fascinating examples of horticultural art. The old-fashioned stereotyped flower garden that one met with almost everywhere is rapidly becoming a thing of the past, and grounds are now laid out more in accordance with their natural disposition, their climatic conditions and their suitability for certain kinds of plants. Besides the features already mentioned there are now bamboo gardens, Japanese gardens, water gardens and wall gardens, each placed in the most suitable position and displaying its own special features.

Lawns.—In the formation of lawns the ground must be regularly broken up so that it may settle down evenly, any deep excavations that may have to be filled in being very carefully rammed down to prevent subsequent settlement. The ground must also be thoroughly cleared of the roots of all coarse, perennial weeds, and be worked to a fine tilth ready for turfing or sowing. The more expeditious method is of course to lay down turf, which should be free from weeds, and is cut usually in strips of 1 ft. wide, 3 ft. long, and about 1 in. in thickness. This must be laid very evenly and compactly, and should then be beaten down firmly with the implement called a turf-beater (fig. 47). When there is a large space to cover, it is much cheaper to sow the lawn with grass-seeds, and equally effective, though the sward takes much longer to thicken. It is of the utmost importance that a good selection of grasses be made, and that pure seeds (SEEDS AND GRASSLAND). The following sorts can be recommended, the quantities given being those for sowing an acre of ground:—

---

**Fig. 47.—Turf-Beater.**
HORTICULTURE

**Cynoglossus cristatus**—Crested Dog's-tail...

**Festuca duriuscula**—Hard Fescue...

**Festuca ovina**—Sheep's Fescue...

**Lolium perenne** tenuum...

**Poa compressa**, *sciutic*—Evergreen Meadow-grass...

**Poa trivialis**—Trivial Meadow-grass...

**Trisetum flavescens**—Yellow Oat-grass...

**Trifolium repens**—Dutch Clover...

The seeds should be thoroughly mixed, and very evenly sown, after which the surface should be raked over to bury them, and then rolled down while dry so as to finish it off smooth and level. When thus sown, lawns require to be promptly weeded. During the growing season established lawns should be mown at least once a week. They should be occasionally rolled, and towards autumn they require frequent sweepings to remove worm-casts.

**Hardy Annuals.**—Annual plants are those which grow up from seed, flower, ripen seed, and die in the course of one season—one year. They are useful in the mixed garden, for though in some cases they are of short duration, many of them are possessed of much beauty of hue and elegance of form. Annuals may be divided into three classes: the hardy, which are sown at once in the ground they are to occupy; the half-hardy, which succeed best when sown in early March and transplanted to the beds or borders for open-air cultivation; and the tender, which are kept in pots, and treated as greenhouse or stove plants, to which departments they properly belong. Some of the hardiest annuals, hardy and half-hardy, have been very much valued as regards habit and the colour of the flowers, and purchases may be made in the seed-shops of such things as China asters, stocks, Chinese and Indian pinks, larkspurs, phloxes and others. Many of them are among the most beautiful of the summer flowers may be found.

The hardy annuals may be sown in the open ground during the latter part of March or beginning of April, as the season may determine. The hardy annuals should be sown in a well-prepared soil in a free-working condition before sowing is attempted. In favourable situations and seasons some of the very hardest, as *Silene perennis*, Saponaria, Nemophila, Galia, &c., may be sown in September or October, and transplanted to the beds or borders for early spring flowering. Those sown in spring begin to flower about June. The plants, if left to flower where they are sown, should be thinned out when they are large enough to occupy the space for their development. It is from having ample room that pricked out transplanted seedlings often make the finest plants. The soil should be rich and light.

The half-hardy series are best sown in pots or pans under glass in March or April, in order to accelerate germination. Those of them which are in danger of becoming leggy should be speedily removed to a cooler frame and placed near the glass, the young plants being pricked off into fresh soil, in other pots or pans or boxes, as may seem best, about the middle of April. They should be hardened off by being left on the borders of the open garden during the month of April, and may generally be planted out some time in May, earlier or later according to the season.

The class of half-hardy annuals, hardy and half-hardy, for greenhouse decoration, should be treated much the same as soft-wooded plants, being sown in spring, and grown on rapidly in brisk heat, near the glass, and finally hardened off to stand in the greenhouse when in flower.

We add a select list of some of the more distinct annuals desirable for general cultivation as decorative plants for the open air—:

**Accolium rosatum**—half-hardy, 1 ft., rose-pink or white; everlasting.

**Anagallis pulchella**—hardy, 6 in.; most graceful grass for bouquets.

**Amoborba moschat a atropurpurea** (Sweet Sultan); hardy, 1 ft., purple; musk-scented.

**Antirrhinum majus** (Snaphdragon); hardy, 6 in. to 2 ft., white, yellow, and red. This plant is perennial, but is best treated as an annual.

**Arnica cornu**—hardy, 1 ft., yellow.

**Bromus aereus**—hardy, 2 ft., golden yellow; showy and free.

**Brachycome iberidifolia**—half-hardy, 1 ft., blue or white with dark disk.

**Calendula officinalis**—Meteor; hardy, 1 ft., orange striped with yellow.

**Caliphas or Coreopsis bicolor** (tinctoria); hardy, 2 to 3 ft., yellow and chestnut-brown.

**Caliphas or Coreopsis Drummondii**—hardy, 1 to 2 ft., golden yellow with red disk.

**Calystegia hortensis or chinensis** (the China aster); half-hardy, 6 in. to 1½ ft.; there are several groups of various colours.

**Campanula Loreyi**—hardy, 1½ ft., purplish-lilac or white.

**Campanula macrostyla**—hardy, 1½ ft, purple, beautifully veined.

**Carnations, Marguerite**—hardy, 0 to 12 in., colours various.

**Convolvulus canus**—hardy, 3 ft., blue, purple, pink or white; showy.

**Centranthus macrostephon**—hardy, 1½ ft., rosy-carmine.

**Centranthus ruber** (known as Pretty Betsy and Red Valerian); hardy, 2 to 3 ft., red.

**Chrysanthemum carinatum**—a charming half-hardy annual, 2 to 3 ft. high, with several varieties, of which *C. Brainanus* with zones of white, crimson and yellow is best.

**C. coronarium**, a yellow-flowered species requires similar treatment.

**Coreopsis pulchella**—hardy, 1½ ft., rosy-purple; some varieties very handsome.

**Colinisia bicolor**—hardy, 1½ ft., white and purple; pretty.

**Colinisia verna**—hardy, 1 ft., white and azure; sow as soon as ripe.

**Comovisculus tricolor atrosanguineus**—hardy, 1½ ft., white, blue and yellow. This is the *Comovisculus minor* of gardens.

**Cosmos bipinnatus**—half-hardy, 3 ft., rose, purple, white; requires sunny spots.

**Dianthus chinensis** (Indian pink); half-hardy, 6 in. to 1 ft., various shades of red and white.

**Delphinium Ajacis and Delphinium Consolida** (Larkspurs); hardy, 3 ft., various colours.

**Erysimum Perfoliatiunium**—hardy, 2 ft., deep orange; in erect racemes.

**Euchalchela californica**—hardy, 1½ ft., yellow with saffron eye.

**Euchalchela florea floribuno**—hardy, 1½ ft., orange yellow; double.

**Eucaly faesida**—hardy, 2½ ft., bright blue, with white hair centre.

**Guillardia Drummondii** (picis); half-hardy, 1½ ft., crimson, yellow margin.

**Gilia achilleifolia**—hardy, 2 ft., deep blue; in large globose heads.

**Godetia Lindleyana**—hardy, 2 to 3 ft., rose-purple, with crimson spots.

**Godetia Whitney**—hardy, 1½ ft., rosy-red, with crimson spots. This variety Lady Albemarle is wholly crimson, and very handsome.

**Gypsophila elegans**—hardy, 1½ ft., pale rose; branched very gracefully.

**Helianthus annuus**—hardy, 3 to 4 ft., golden yellow, black disk; branching, free and bold without coarseness.

**Helichrysum bracteatum**—half-hardy, 2 ft.; the incurved crimson, rose and other forms very handsome.

**Hibiscus Trionum** (africanus)—hardy, 1½ ft., cream colour, dark purple centre.

**Iberis umbellata** (Candytuft); hardy, 1 ft., white, rose, purple, crimson. Some new dwarf white and flesh-coloured varieties are very handsome.

**Kaufussia amelodeus**—hardy, 1½ ft., blue or rose; the var. *kermesina* is deep crimson.

**Kochia scoparia** (Belvedere or lawn cypress); hardy, graceful green foliage, turning purple in autumn.
