**Kingsa maritima** (Sweet Alyssum); hardy, 1 ft., white; fragrant, compact.

**Lathyris odoratus** (Sweet Pea); hardy, there are two races, dwarf and tall, the latter—far and away the most beautiful—requires support; various colours; numerous immensely popular forms.

**Lupinus alpereus**—hardy, 1 ft., pale rose, showy malvaecous flowers.

**Leptosiphon densiflorus**—hardy in light soil, 1 ft., purplish or rose-lilac.

**Leptosiphon roseus**—hardy in light soil, 6 in., delicate rose; fine in masses.

**Lunaria bipartita**—half-hardy, 1 ft., splendent crimson; var. *roseum* is pink.

**Lupinus latius**—hardy, 2½ ft., bright yellow, fragrant.

**Lupinus mutabilis** (Creaxshanksii); hardy, 4 ft., blue and yellow; crimson.

**Lupinus nanus**—hardy, 1½ ft., bluish-purple; abundant flowering.

**Lycopsis Coeli rosa**—hardy, 1½ ft., rose-puceul, with pale centre; pretty.

**Lycopsis oculata cardinalis**—hardy, 1½ ft., rosy-crimson; very brilliant.

**Malcolmia maritima** (Virginia Stock); hardy, 6 in., lilac, rose or white.

**Malope trifida**—hardy, 3 ft., rich glossy purplish-crimson; showy.

**M. grandiflora** is a finer plant in every way.

**Matthiola annua**—ten-week Stock and its variety, the intermediate stock; hardy, 1½ ft., white, rose and red.

**Mathiola greaca** (Wallflower-lvd. Stock); hardy, 1 ft., various as in Stock.

**Mesembryanthemum tricolor**—half-hardy, 3 in., pink and crimson, with white centre.

**Mimulus capensis**—half-hardy, 6 in., coppery red, varying considerably.

**Mimulus lutes* trinervus*—half-hardy, 1½ ft., yellow spotted with red; duflexes has hose-in-hose flowers.

**Mirabilis Jalapa**—half-hardy, 3 ft., various colours; flowers evening-scented.

**Nemesia floribunda**—hardy, 1½ ft., white and yellow; pretty and numerous colours.

**Nemophila insignis**—hardy, 6 in., azure blue, with white centre.

**Nemophila maculata**—hardy, 6 in., white, with violet spots at the edge.

**Nicotiana affinis**—half-hardy, 2 to 3 ft., white.
FLOWERS

Horticulture

Nicotiana Sandrae: half-hardy, 2 to 3 ft, white, crimson, scarlet, etc.

Nigella hispida: hardy, 6 ft, various; the many-coloured twinflower

Platystemon californicus: hardy, 1 ft, sulphur yellow; neat and distinct

Portulaca grandiflora: hardy, 6 in, crimson, rose, yellow, white, &c., and single and double; splendid prostate plants for sunny rockwork

Pyrethrum aureum: hardy, 1 ft; grown for its golden foliage, and much used for bedding

Reseda odorata (Mignonette): hardy, 1 ft, greenish, but exquisitely fragrant; there are some choice new sorts.

Rudbeckia laciniata: half-hardy, 1½ ft., rosy-pink or white; larger flower-heads than the next.

Saponaria officinalis: hardy, 6 in, white, yellow, scarlet, and crimson; &c., much varied and beautifully veined.

Silene alabamensis: hardy, 2½ ft, yellow, orange, pink; continuous blooming, compact-growing

Sorbus virgiana: hardy, 1 ft, white, rose, yellow, crimson, &c.

Solanum dulcamara: half-hardy, 1½ ft, white, crimson, pink, scarlet, &c., and single and double; splendid prostate plants for sunny rockwork

Sorbus purpurea: hardy, 1½ ft, scarlet or orange; purple; young shoots are exquisitely veined

Spirea purpurea: hardy, 1½ ft, white, pink, red, crimson, &c., the leaves are very attractive and will act as ground cover

Tropaeolum majus (the nasturtium of gardens): hardy. There are two races, dwarf and tall, various shades of red and yellow

Wallasis aurea: hardy, 1½ ft, golden yellow; a showy and decorative

Xanthemum annuum: hardy, 3½ ft, white, yellow, crimson; &c.

Xanthion elegans: half-hardy, 1 to 2 ft, various colours.

Hardy Biennials.—Biennials live through one winter period. They require to be sown in the summer months, about June or July, in order to get established before winter; they should be pricked out as soon as large enough, and should have ample space so as to become hardy and stocky. They should be planted in good soil, but not of too stimulating a character. Those that are perfectly hardy are best planted where they are to flower in good time during autumn.

This transplanting acts as a kind of check, which is rather beneficial than otherwise. Of those that are liable to suffer injury in winter, as the Brontom and Queen Stocks, a portion should be potted and wintered in cold frames ventilated as freely as the weather will permit.

The number of biennials is not large, but a few very desirable garden plants, such as the following, occur amongst them:—

Astragalus coronaria (Rose Campion): hardy, 1½ ft, bright rose-purple or rose and white.

Bétula alnus variegata: hardy, 2½ ft, brightly coloured leaves and mistletoe, crimson, golden, &c.

Campanula Medium (Canterbury Bell): hardy, 2 ft, blue, white, rose, &c.

The double-flowered varieties of various colours are very handsome.

Campanula Medium calycanthemus: hardy, 2½ ft, blue or white, with pink-veined leaves.

Catananche caerulea: hardy, 2½ to 3 ft, blue or white.

Centaurea cyanus: hardy, 4 to 5 ft, yellow, with two dark spots near centre; in spikes

Cheiranthus Cheiri (Wallflower): hardy, 1½ to 2 ft, red, purple, yellow, &c.; really a perennial but better as a biennial.

Coreopsis grandiflora: hardy, 2 to 3 ft, bright yellow; the finest member of the genus.

Dianthus barbatus (Sweet William): hardy, 1 to 1½ ft, crimson, white, or particoloured.

Dianthus chinensis (Indian Pink): half-hardy, 1 ft, various; flower-beards must be treated as fresh from the field.

Digitalis purpurea (Foxglove): hardy, 3½ to 5 ft, rosy-purple or white; beautifully spotted; the variety called gloxiniosae has regular erect flowers.

Echium pyramidatum: hardy, 4 ft, rosy-pink.

Hedysarum coronarium (French Honeysuckle): hardy, 2½ to 3 ft, scarlet or white; fragrant.

Heliphius trilis (Night-shade Rocket): hardy, 3½ ft, dull purplish; fragrant at night.

Lunaria biennis (Honesty): hardy, 2½ to 3 ft, purple; the silvery disc glands are attractive and of a very tender character.

Mathiola incana (two groups, the Brompton and the Queen stocks): hardy, 2½ to 3 ft, white, red, and purple.

Mecanopsis: Charming members of the poppy family, of which M. grandiflora: hardy, 8 ft, white, purple and scarlet, close and mono-

M. purpurea (Indian Poppy): hardy, 3½ to 5 ft, purple; leaves are deeply veined, and quite as large as the flowers.

Summer flowers, but protected by glass, as they will not succeed in the open ground.

M. grandiflora: hardy, 3½ to 5 ft, white, yellow; very showy, to flower in the second half of June, and in the third or fourth part of July.

M. sulphurea: hardy, 3½ to 5 ft, sulphur yellow; M. integrifolia: yellow, M. gigantea: purple, and M. violacea: violet, purple, are grown with care in sheltered spots, and in rich, very gritty soil.

Nicotiana Sandrae: half-hardy, 2 to 3 ft, white, crimson, scarlet, &c.
the front line planted between suitable pieces of stone, or may be relegated to a particular spot, and placed on an artificial rock, of which the surface should be smooth throughout the border, care being taken not to disturb them while leafless and dormant.

Some deep-rooting perennials do not spread much at the surface, and only require refreshing from time to time by top-dressings. Others, however, spread rapidly, and should be cut back annually, and a small patch of new plants should be taken up every second or third year, and, a nice patch being selected for replanting from the outer portions, the rest may be either thinned, or a portion of the flower-ends for interest, and portions selected for replanting should be returned to its place, the ground having been prepared while been well broken up. Some plants are apt to decay at the base, frequently from exposure caused by the lifting process going on during the growing season, and shortly after. A. pseudacorus should be annually in early autumn, the soil refreshed, and the plants returned to their places, care being taken to plant them sufficiently deep.

Only a section of some of the best of the decorative hardy perennials are dealt with in this class which have been directly influenced by the hybridizer and improver. Many more might be added to the subjoined list:—

Acetabulum.—Pretty dwarf tufted plants, with needle-shaped leaves, adapted for rockwork. A. glaucescens and A. sextans bear bright pink flowers in July and August. Light sandy soil.

Achillea.—Handsome composite plants, the stronger ones of easy culture in common soil. A. Eupatorium and filipes, 3 to 4 ft., have white flowers on longish stalks, useful in late summer, and A. plena flore-pleno, 2 ft., double white flowers. Others suitable for front lines or rockwork are A. tomentosa, 9 in., bright yellow; A. aestivalis, 1 ft., silvery leaves and yellow flowers; A. arguta, 1 ft., white, and A. Chosen, 6 in., with silvery leaves and pure white flowers.

Aconitum.—Handsome border plants, the tall stems crowned by rows of showy hooved flowers. A. Camarum, 3 to 6 ft., has purple flowers in August; A. sinense, 1 to 2 ft., has large dark purple flowers in September; A. variegatum, 3 ft., has the white edge with blue; A. anemonifolium, 3 ft., has pale blue flowers; A. cammarum, 2 ft., white to greenish blue, and A. tomentosum, flowers, produced in September and October. A. Wilsoni, a new species from China, 6 ft. high, with bluish-purple flowers.

Adenophora.—Bell-shaped flowers. A. stylosa, 2 ft., pale blue, elegant; A. delavayi, 13 ft., dark blue; and in A. Lobelia, 1 ft., pale blue, sweet-scented—all blooming during summer. Light soil.

Adonis.—A. vernalis, 1 ft., has large bright yellow stellate flowers in April. Deep light soil. A. amurensis is a fine Chinese species.

Aesculus.—Also known as A. Wilsoni, is hardy, easy in growth, runs, which A. genesymus has not; both have handsome spikes of blue labiate flowers. Ordinary soil.

Ageratum.—The gauzy white heads of some species of which are ornamental; the inflorescence is umbellate. In A. azurum, 1 to 2 ft., the flowers are deep-blue; in A. Moly, 1 ft., golden yellow; in A. neapolitanum, 1 ft., white, very handsome; in A. tricolor, 5 ft., white, blue and purple, and A. snowman, 3 ft., all are提高了 extremely ornamental.

Alstroemeria.—Beautiful plants with fleshy tuberous roots, which are the best if not often disturbed. A. aurantiaca, 2 to 3 ft., orange; A. plantaginea, 3 ft., with var. nr., have broad white, A. longifoliae, 1 ft., has dark purple flowers; A. plena, 21 ft., white, changing to rose; A. pyrenea, 2 to 3 ft., lilac-blue; A. tuberosa, 2 to 3 ft., mauve-coloured, are showy border plants; and A. Nona Anguill., 5 to 7 ft., rose-velvet; A. delicioidea, 9 ft., blue to violet; A. glutinosa, 3 ft., violet, are especially useful from their late-flowering habit.

Astrantia.—A. japonica, 1 to 1½ ft., better known as Hoteio japonica or Spiroae japonica, thrives in peaty or sandy soil; its glossy bipinnate leaves, and feathery panicles of small white flowers early in summer, are very attractive. It proves to be a fine decorative pot plant, and invaluable for forcing during the spring.

Astrantia.—Showy the flowered plants, the smaller species adapted for rockwork; sandy soil A. dasygloits, 6 in., has bluish-purple flowers in August and September; and A. monspessulanus, 8 in., crimson-purple in July; while A. hypoglottis, 6 in., produces abundant tufts of showy flowers, the petals either purple or white. There are many very ornamental kinds.

Aubrieta.—Beautiful dwarf spring-blooming rock plants, forming plenty tufts of flowers of simple cruciferous form. A. dolichodes is a very pretty blue or lilac-blue; A. Campbell细微 is more compact and rather dark, approaching to purple; A. grandiflora and graeca are rather larger, but of a lighter hue. Light sandy soil.

Bambusa.—The bamboo family are elegant arborescent grasses (see Bambusa).

Baptisia.—Stoutish erect-growing, 2 to 3 ft., with smooth foliage and spikes of pea-like flowers. B. auriculata is purplish-blue, B. ask, white, B. exaltata, deep blue; all flowering in the summer months.

Bellis.—B. perennis flore-pleno, the Double Daisy, consists of dwarf showy plants 3 to 4 in. high, flowering freely in spring if grown in rich light soil, and frequently requires thinning out. The white and red quilled, and the variegated-leaved A. azureifolia, are some of the best.

Bocconia.—Stately poppyworts, 6 to 8 ft. B. cordata has heart-shaped leaves, and feathery panicles of small white flowers, sometimes called Macleaya. Deep sandy loam.
Brodiaeae.—Pretty bulbous plants. B. grandiflora, 1 ft., has large bluish-purple flowers; B. coccinea, 2 to 3 ft., has tubular campanulate nodding flowers of a rich crimson with green tips. Sandy loam. B. primuliflora, 1 ft., has small blue flowers of the cardinal-lily species. B. verum, 4 to 6 in. high, purple-plum Lilac blooms in March. Good garden soil.

Caryopteris.—Robust composite herbs with striking foliage, for the back of herbaceous or shrubby borders. B. cordifolia, 4 ft., has large coriaceous leaves and heads of rich orange flowers in panicles in July. It also called Teakia spectosa.

Ceratostigma.—Very early flowering hardy rockwock, in light sandy soil. C. umbellata, 3 to 4 ft., much branched, with narrow hairy leaves, and corymbs of magenta-flowered flowers in the summer months.

Calochortus.—Beautiful bulbous plants, called mariposa lilies, requiring warm sheltered spots in rich gritty and well-drained soil. There are several species known, the best being ablas, elegans, lutea, and Purpurea. Good for rock gardens.

Calla.—Showy marsh plants, adapted for the margins of lakes, streams or artificial bogs. C. palustris flore-pleno, 1 ft., has double brilliant flowers in May.

Calynegia.—Twining plants with running perennial roots. C. pubescens flore-pleno, 8 to 10 ft., has showy double-pink convolvuloid flowers in July; C. dahurica is a handsome single-flowered summer-blooming kind, with rosy-coloured flowers.

Camassia exulenta.—A beautiful bulbous plant 2 to 3 ft. high with large pale blue flowers. Also a white variety.

Campanula.—A richly-flowered genus with a wide variety of species. They are called bell-flowers. C. pulsa, 6 in., purplish, nodding, on slender erect stalks; C. turbinata, 9 in., purple, broad-bellied; C. carpatica, 1 ft., blue, broad-bellied; C. nobilis, 1 ft., long-bellied, with flower stalks tipped with violet; C. persica, 1 ft. high, is the golden bell; C. pyramidalis, 6 ft., blue or white, in tall branching spikes, are good, and C. avicularis are many other fine sorts.

Centranthus.—Bold-habited specimens of showy character; common soil. C. bulbifera, 5 to 7 ft., has winged stems, silvery leaves, and yellow flower-heads from June to September; C. montana, 3 ft., deep bright blue or white.

Centranthus.—Showy free-flowering plants, for rockwork, banks, or stony soil. C. ruber, 2 ft., branches and blooms freely all summer, and varies with rosy, or crimson, or white flowers. It clothes the chalky areas on the English railways with a sheet of colour in the blooming season.

Cheiranthus.—Pretty rock plants, for light stony soils. C. alpinus, 6 in., has starry yellow and sulphur-yellow flowers in May; C. ochroleucus is similar in character.

Chimonodoxa.—Charming dwarf hardy bulbous plants of the lilaceous order, blooming in the early spring in company with Scilla bifolia, and of equally easy cultivation. C. Luciliae, 6 in., has starry shapes of a brilliant blue with a white centre. C. gigantea is the finest of the few known species. It blooms from February to April.

Chrysanthemum.—Apart from the florist’s varieties of C. indicum, there are a few fine natural species. One of the best is C. maximum and its varieties—all with beautiful white flowers; C. coccineus, is another a fine specimen.

Colchicum.—Showy autumn-blooming bulbs (corms), with crocus-like flowers, all rosy-purple or white. C. speciosum, C. autumnale, single and double, C. byzantinum, and C. variegatum are all worth growing.

Consolilia.—C. majalis, the lily of the valley, a well-known sweet-scented favourite spring flower, growing freely in rich garden soil; its spires, 6 to 9 in. high, of pretty white fragrant bells, are produced in May and June. Requires shady places, and plenty of old manure each autumn.

Cotyledon.—Effective composite plants, thriving in good garden soil. C. auriculata, 2 to 3 ft., has yellow and brown flowers in July and August; C. lanceolata, 2 to 3 ft., bright yellow, in August; next to the biennial C. grandiflora it is the best garden plant.

Crepis.—Beautiful, as well as varied in habit and character, mostly in light gritty soil. C. bracteata, 9 in., has sulphur-coloured flowers in April, and C. nobilis, 1 ft., rich yellow, in May; C. solidia, with purplish, and C. tuberosa, with white flowers, are pretty spring-flowering plants, 6 to 10 in. high. C. biiturliflora, 1 ft., yellow, May to October.

Cyclamen.—Charming tuberous-rooted plants of dwarf habit, suitable for the rock garden, growing freely in light soil. C. europaea, reddish-purple, flowers in summer, and C. hederaeformis in autumn.

Cyprisphyllum.—Beautiful terrestrial orchids, requiring to be kept in shade. They bloom early, and are of a cool and rather flabby site. C. spectabile, 1 to 2 ft., white and rose colour, in June, is a lovely species as is C. Calceolus, 1 ft., yellow and brown, in May; all are full of interest.

Delphinium.—The Larkspur family, tall showy plants, with spikes of blue flowers in July. Distinct sorts are D. grandiflorum and D. grandiflorum flore-pleno, 2 to 3 ft., of the richest dazzling blue, flowering in July and August; D. blue, 2 ft., blue, and its double beauty, are good, as is D. Barbari, 3 ft., a brilliant double blue-purple. D. nudicaule, 2 ft., orange-scarlet, very showy, is best treated as a biennial, its brilliant flowers being produced freely in the second year from the seed.

Dianthus.—Chiefly of hardy rock plants with handsome and fragrant flowers, the smaller sorts growing in light sandy soil, and the larger plants better in rich garden earth. Of the dwarfer sorts for rock gardens are: D. alpinus; D. barbatus; D. purpureus, 1 ft., good in the rock garden. D. petraeus, and D. glaucescens are good examples; while for borders or larger rockwork D. plumarius, D. superbus, D. Fischeri, D. cruentus, and the clove square of D. Caryophyllus are most desirable. Sorts of each species; D. spectabile, 2 to 3 ft., has paonie-like foliage, and gracefully drooping spikes of heart-shaped pink flowers, about May, but it should have a sheltered place, as it suffers from frosts and winds; D. formosa and D. eximia, 1 ft., are also pretty rosy-flowered sorts.

Dictamnus.—D. albus is a very characteristic and attractive plant for a rock garden, 3 ft., with bright white leaves of a rosy-ginger variety, purple or white. It is everywhere hardy, and strongly scented.

Digitalis.—Stately erect-growing plants, with long racemes of pouched-shaped drooping flowers. The native D. purpurea, or foxglove, 3 to 5 ft., with its dense racemes of purple flowers, spotted inside, is very showy, but is surpassed by the garden varieties that have been raised. It is really a biennial, but grows itself so freely as to become perennial in the garden. An erect flowered form is called gleoximoides. The yellow-flowered D. lutea and D. grandiflora are well worth growing, also D. subspinosa, which has large flowers. D. purpurea (often called Redbeckia) is the showiest species. Height 3 to 4 ft., with rosy-purple flowers.

Dracocephalum.—Handsome labiate plants, requiring a warm and welldrained soil. D. argustemon, 1 ft., D. eucistachus, 1 ft., D. grandiflorum, 1 ft., and D. Raphicera, 1 ft., with its var. japonicum, all produce showy blue flowers during the summer months.

Echinacea.—Strongly growing showy composites for late summer and autumn flowering, requiring a deep, well-drained soil, and to be occasionally turbed. E. angustifolia, 3 to 4 ft., light purplish-rose, and E. intermedia, 3 to 4 ft., reddish-purple, are desirable kinds; E. purpurea (often called Redbeckia) is the showiest species. Height 3 to 4 ft., with rosy-purple flowers.

Eomecon chionanthus.—A lovely poppy-wort about 1 ft. high, with pure white flowers 2 to 3 in. across. Root-stocks thick, creeping.

Epimedium.—Pretty plants, growing about 1 ft. high, with elegant foliage, and curious flowers. E. macranthum, white flowers, and E. rubrum, red, are distinctly spurred; E. pinnatum and E. Perralderianum, yellow, less so. They bloom in spring, and prefer a shady situation and a peaty soil.

Eranthis hyemalis.—A charming tuberous rooted plant, called winter aconite. Flowers bright yellow, January to March, close to the ground.

Eremurus.—Noble plants with thick rootstocks, large-sword leaves, and spikes of flowers from 3 to 10 ft. high. They require warm, well-drained soil, and rich garden soil. The following sorts are: E. alpinus, 6 ft., has pink, 6 to 10 ft.; kinneti, 7 ft., to 8 ft., white; Alchisoni, 3 to 5 ft.; red; Bangei, 2 to 3 ft.; yellow, and auranticus, 2 to 3 ft., orange-yellow. There are now several hybrid forms.

Ericameria.—Composite plants, variable in character. E. purpureus, 1 ft., with pink flower-heads, having narrow twisted ray-flowers; E. Royles, 1 ft., dark blue; E. pulchella, 1 ft., rich orange, flowering during the summer, are among the best kinds. Good ordinary garden soil.

Eritrich.—E. alpinus is a beautiful little alpine for rockwork, 3 to 6 in., of tufted habit, with small-toothed leaves, and heads of palish-pink flowers, of a yellow variety, white flowers, early in summer. Sandy well-drained soil.

Erodium.—Handsome dwarf tufted plants. E. Manescani, 1 to 2 ft., has large purplish-red flowers in summer; E. Reichardi, a minute stemless plant, has small heart-shaped leaves in rosette-like tufts, and white flowers striped with pink, produced successively.

Light soil.

Erythronium.—Very remarkable plants of the umbelliferous order, mostly of an attractive character. E. amethystinum, 2 ft., has the upper part of the stem, the bracts, and heads of flowers all of an amethystine blue. Some of more recent introduction have the aspect of small pine-apples, E. californicum, E. panachifolium, and E. burnetum. Deep light soil.

Erythronium.—E. dens-canis, the Dog’s Tooth Violet, is a pretty dwarf bulbous plant with spotted leaves, and rosy or white flowers produced in spring, and having reflected petals. Mix peaty and sandy loam, soil, and cool. Several charming American species are now in cultivation.

Euphorbia.—Plants whose beauty resides in the bracts or floral leaves which surround the inconsiderable flowers. E. alepica, 2 ft.,
HORTICULTURE

It ft., G. close glauca, somest and roses leaves in warm armenum, Elwesi showy thick 770 Helenium.

Gaura. — Pretty liliaceous plants, with simple conspicuously longitudinal-ribbed leaves, the racemose flowers funnel-shaped and deep pink. One ft., G. ehrharta, 18 in., is white and fragrant; G. coerulea, 18 in., is violet-blue; G. albo-margiata, 15 in., has the leaves edged with white, and the flowers lilac. Rich garden plant.

Galliardia. — Showy composite plants, thriving in good garden soil. G. aristata, 2 ft., has large yellow flower-heads, 2 or 3 in. across, in summer; G. Bueselari and G. Loisellii have the lower part of the ray-flowers red, the upper part yellow.

G. sagittatum, a tidy flowering amaryllideous bulbs, with pretty drooping flowers, snow-white, having the tips of the enclosed petals green. The common sort is G. nivalis, which blossoms on the approach of the winter frosts; G. Imperati, G. Elvensi and G. plicatus have blossoms in red, pink and white.

Galax aphylla. — A neat little rock plant, 6 to 8 in. high, with pretty round white leaves and round white blossoms. Requires moist peaty soil. G. nana, a very small growing 2 to 3 in. high, with pinnate leaves, and masses of pinkish purple plume-like flowers. Also a white variety. Grows anywhere.

Galtonia candicans. — A fine bulbous plant, 3 to 4 ft. high, with drooping white flowers.

Gaura. — G. Lindheimeri, 3 to 5 ft. tall, is much branched, with elegant white and red flowers of the onagraceous type, in long slender ramosie spikes during the late summer and autumn months. Light garden, not long-lived.

Genianna. — Beautiful tufted erect-stemmed plants preferring a strong rich loamy soil. G. acuvis, known as the Gentianella, forms a close carpet of shining leaves, and in summer bears large erect tufted flowers 1 ft. across. G. angustifolia has, and sun loves the large deep blue flowers in clusters, the corollas closed at the mouth: G. asclepiadae, 18 in., purplish-blue, flowers in July.

Gentiana. — Showy border flowers, mostly growing to a height of 1½ to 2 ft., having deeply cut leaves, and abundant saucer-shaped blossoms of considerable size. G. iberica, platypetalum, armenum and Endressi are desirable purple- and rose-flowered sorts; G. sino-orientalis, a tufted grower, has the flowers a deep rose orange and the double-flowered white and blue forms of G. pratense and G. zybiacum make pretty summer flowers. Good garden plant.

Gerbira. — A South African genus of composites requiring very warm roots. G. grandiflora, 3 ft., has brilliant scarlet marguerite-like flowers, and G. viridiflora, with white flowers tinged with lilac, are best known. Numerous hybrids have been raised, varying in colour from creamy white to salmon, pink, yellow, red and violet.

Geum. — Pretty rosaceous plants. The single and double flowered forms of G. chiloense and its varieties grandiflorum and miniatum, 2 ft., with brilliant scarlet flowers; G. coccorum, 6 to 12 in., scarlet, and G. monanta, 9 in., yellow, are among the best sorts. Good garden plant.

Geliina trifolaisa. — A pretty rosaceous plant about 2 ft. high. Flowers white in graceful panicles; flourishes in a mixture of sandy peat and loam.

Gunnera. — Remarkable rhubarb-like plants with huge lobed leaves, often 6 ft. across. They should be grown near water as they like a sunny position. G. manicata and G. saccra are the two kinds grown.

Gynophora. — The Pampas-Grass, a noble species, introduced from Buenos Aires; it forms huge tussocks, 4 or 5 ft. high, above which towards autumn rise the bold dense plumes of grayish plume grass. It does best in sheltered nooks.

Gypsophila. — Interesting carphophyaceous plants, thriving in dry situations. G. aphylla, 1 ft., from Siberia, forms a dense semi-globular mass of small white flowers from July onwards till autumn, and is very useful for cutting.

Haberlea rhodo-pensis. — A pretty rocky plant with dense tufts of leaves and bluish-flower flowers. It likes fibrous peat in fissures of the rocks.

Helianthemum. — Dwarf subshrubby plants well suited for rockwork, and called Sun-Roses from their blossoms resembling small wild roses and their thriving best in sunny spots. Some of the hand- somest are H. roseum, mutabile, cupreum and rhodanthum, with red flowers; H. vulgare flore-pleno, grandiflorum and stramineum, with yellow flowers; and H. macranthos and papyraceum, with the flowers white.

Helianthus. — The Sunflower genus, of which there are several ornamental kinds. H. multiflorus, 4 ft., and its double-flowered varieties, bear showy golden yellow flower-heads in profusion, and are well adapted for rockwork. H. helianthus, 2 ft. or H. orgyalis, 8 ft., has drooping willow-like leaves. Many other showy varieties.

Helichrysum. — Composite plants, with the flower-heads of the scariose character known as Everlastings. H. arenarium, 6 to 8 in. high, is one of the best spreading herbs with woolly leaves and corymbs of golden yellow flowers, about July.

Helieorus. — Charming very early blooming dwarf ranunculaceous herbs, H. niger or Christmas Rose, the finest variety of which is called H. maculata, 8 in., is profuse and drooping flowers; H. tindals, 1 ft., rose-coloured; H. aironbenses, 1 ft., purplish-red, and H. colchicus, 1 ft., deep purple. Deep rich loam.

Helianthus. — The day lilies of which H. fulva, H. diathea, H. flavo, H. Dumortieri and H. aurantiaca are the most showy, all with yellow or orange flowers. They flourish in any garden soil.

Heteropogon. — Charming little tufted plants requiring good loamy soil, and sometimes included with Anemone. H. tribolea, 4 in., has three-lobed leaves, and a profusion of small white, blue, or pink single or double flowers, from February onwards; H. anguiosa, var. alba, 6 to 8 in., is a larger plant, with sky-blue flowers.

Hesperis. — H. matronalis, 1 to 2 ft., is the old garden Rocket, of which some double forms with white and purplish blossoms are amongst the choicest of border flowers. They require a rich loamy soil, with good drainage, and training them into fresh soil annually or every second year, in the early autumn season.

Heluchera. — H. sanguinea and its varieties are charming and showy, all with white blossoms. The single flowers with scarlet flowers in long racemes. Rich and well-drained soil.

Hibiscus. — Showy malvaceous plants. H. Moscheutos, coloured, and H. palustris, purple, both North American herbs, 3 to 5 ft. high, are suitable for moist borders or for boggy places near the margin of lakes.

Iberis. — The Candytuft, of which several dwarf spreading sub-shrubby species are amongst the best of rock plants, clothing the crevices with tufts of green shoots, and flowering in masses during May and June. The best are I. saisalis, 6 to 10 in.; I. sempervirens, 12 to 15 in.; and I. Pultotii (variously called coriaicea, carnosa, corroseifolia), 12 in. I. Delavayi is the best species for the open air. It grows 2 ft. high and has large tubular rosy carmine blossoms. It likes rich sandy loam and sunny spots.

Impatiens. — Dwarf trailing herbs, increased by seeds or division. L. grandiflorus, 3 ft., has large rose-coloured flowers with purplish-crimson wings, in June; L. lajolosus, the everlasting pep, 6 ft., has bright rosy flowers in the late summer and autumn; the variety var. alba, white, and superbus, deep rose, are distinct. Ordinary garden soil.

Lavatera. — L. rothura, 4 ft., is a fine erect-growing malvaceous plant, producing rosy-pink blossoms freely, about August and September. L. montana, 4 ft., which makes a handsome flowering hedge, is suitable for rockwork; L. hortensis, 2 ft., and L. rosea, 1 ft. tall, both are suitable for spreading white flowers, and are a good common British toad-flax, and its regular pelorata form, are very handsome and free flowering during the summer months.

Linum. — Flax. L. alpinum, 6 in., large, dark blue; L. marbonnense, 13 ft., large, blue; L. pumilo, 1 ft., colasit, blue; and L. arboresum (flavum), 1 ft., yellow, are all pretty. The last is liable to suffer from damp during winter, and some spare plants should be wintered in a frame. It is really shrubby in character.

Linum. — L. subcoccineum, in July and August, is a small green herb, with narrow hairy leaves, and paniculate brilliant blue flowers in May and June. Well adapted for rockwork or banks of sandy soil.

Lysichiton. — Showy, yellow flowering sedges, suitable for spreading flowers, thriving in good deep garden soil. L. polyphyllus, 3 ft., forms noble tufts of palmate leaves, and long spikes of blush-purple or white flowers in June and July; L. arboresum is subshubby, and makes a beautiful flowering shrub in May and June.

Lychnis. — Brilliant erect-growing carphophaceous plants, thriving best in beds of some earth or of deep sandy loam. L. chalcedonica, 3 ft., has deep heads of bright scarlet flowers, both single and double, in June and July; L. fulgesci, 1 ft., vermillon; L. Hoagena,
FLOWERS

Horticulture

1 ft., scarlet; and L. grandiflora, 1 to 2 ft., with clusters of scarlet, crimson, pink and white flowers. All large-flowered and showy, but require a little protection in winter.

Ornithogalum.—Heavenly Star. Very showy plants, often of strong growth, and of easy culture in ordinary garden soil. P. portulacaria, 1 to 2 ft., crimson-scarlet flowers, 6 in. across, and the variety bracteatum closely resembles it, but has leafy bracts just beneath the blossom. P. miniata, 1 to 2 ft., with white or purplish-blue to yellow, scented, and P. pilosum, 1 2 ft., deep orange, are ornamental smaller kinds.

Polemonium.—The popular garden varieties have sprung from P. Hortweegii and P. Coeber. Other distinct kinds are P. campounata, 1 ft., pale rose, of bushy habit; P. humilis, 9 in., bright blue; P. speciosus, cyananthus and Jaffrazenius, 2 to 3 ft., all bright blue; P. achatinus, 2 to 4 ft., with large, white, 4 in. across, and P. lanigerum, 6 in., with scarlet flowers and conate leaves; and P. Palmieri, 3 to 4 ft., with large, wide-tubed, rose-coloured flowers.

Petrosites.—P. fragrans, the Winter Heliotrope, though of weedy habit, makes a good ground cover; and February its abundant spikes, about 1 ft. high, of greyish flowers scented like heliotrope; it should have a corner to itself.

Phlox.—Bold and showy labiates, growing in ordinary soil. P. Russelliana (lunariscolia), 4 ft., yellow, and P. tuberosa, 3 ft., purplish-rose, both with downy hoary leaves, come in well in broad flower borders.

Physostegia.—P. capensis from South Africa is hardly south of the Thames and in favoured localities. Flowers tubular scarlet, on branching stems, 2 to 3 ft. high. Requires light, rich soil.

Phygelius.—In South Europe all the species of this genus have been known in gardens for its bright orange-red globular calyces. It has been surpassed by the much larger and finer P. Franchetii from Japan; the brilliant calyces are only 3 in. in diameter at autumn. Grows in the rock garden.

Physostegia.—Tall, autumn-blooming labiates, of easy growth in ordinary garden soils. P. imbricata, 5 to 6 ft., has pale purple flowers, with crimson-scarlet spikes. P. rhombifolia—Ornamental strong-growing perennials requiring much space. P. acinosa, from the Himalayas, 3 to 4 ft., with whitish flowers in erect spikes. P. decandra, the North American Poke Weed or Red Ink plant, grows 4 to 5 ft. high, has fleshy poisonous roots, erect purple stems and white flowers. P. dissecta, from Mexico, 2 to 3 ft., pinky white. The foliage in all cases is handsome, and ordinary garden soils are in most cases satisfactory.

Pityrodia.—P. grandiflorum, 6 to 24 in. high, is a fine Chinese perennial with flat-topped, bell-shaped flowers, 2 to 3 in. across, and purple in colour. The variety Muriest (or pusillum) is dwarf, with larger, deeper-coloured blooms, requiring well-drained soil.

Podophyllum.—Ornamental herbs with large lobed leaves. P. Emadi, 6 to 12 in. high, from the Himalayas, has large white or pale-rose flowers, and in autumn bright red, hen’s-egg-like fruits. P. pelicaria, the North American mandrake, has large umbrellalike leaves and white flowers; P. pleiantha, from China, purple. They all require moist, peaty soil in warm, sheltered nooks.

Polemonium.—Pretty border flowers. P. Coeberle (Jacob’s Ladder), 2 ft., has elegant pineate leaves, and long panicles of blue rotate flowers. The variety called variegatum has very elegantly marked leaves, and is sometimes used as a margin or otherwise in border arrangements.

Polygonatum.—Elegant liliaceous plants, with rhizomatous stems. P. multiflorum (Solomon’s Seal), 2 to 3 ft., with arching stems, and white flowers bearing both male and female flowers on separate plants, doing especially well in partial shade amongst shrubs, and also well adapted for pot culture for early forcing. Good garden soil.

Pomponium.—A large family, varying much in character, often weedy, but of easy culture in ordinary soil. P. vaccinifolium, 6 to 10 in. to is a pretty prostrate subaerubious species, with handsome red and white flowers, suitable for rockwork, and prefers boggy soil; P. affine (Brumonis), 1 ft., deep rose, is a showy border plant, flowering in the late summer; P. cuspidatum, 8 to 10 ft., is a grand object for planting where a screen is desired, as it suckers abundantly, and all its blue, green stems and variegated leaves, besides the beauty of the flower, have a noble appearance. Other fine species are P. baldschuanicum, a climber, P. sphaerochelera, P. lanigerum, P. polystachyum and P. sachalinicum, all bold and handsome.

Potentilla.—The double varieties are fine garden plants obtained from P. argyrophylla alborosea and P. nepetae. The colours include golden-yellow, red, orange-yellow, crimson, maroon and intermediate shades. They all flourish in rich sandy soil.

Primula.—Beautiful and popular spring flowers, of which many forms are highly esteemed in most gardens. P. vulgaris, 6 in., has numerous hybrids bred for the rock garden, all with various-coloured flowers for the spring flower-beds and borders. Besides this, P. Sieboldi (cortusoides amena), 1 ft., originally deep rose with white eye, but now including many varieties with the white eye, and as a special hybrid, P. japonica, 1 to 2 ft., crimson; P. denticulata, 1 ft., bright blush-lilac, with its allies P. eosa and P. purpurea, all best grown in a cold frame; P. Albiflora, 1 ft., white, P. purple, and its white variety nivalis, with P. pedemontana and P. spectabilis, in both purple; and the charming
little Indian P. rosea, 3 to 6 ft., bright cherry-rose colour, are but a few of the many beautiful kinds in cultivation.

**Pulmonaria.**—Handsome dwarf, boraginaceous plants, requiring good deep garden soil. *P. officinalis*, 1 ft., has prettily mottled leaves and blue flowers; *P. sibirica* is similar in character, but has broader leaves and larger blue flowers. *P. longifolia*, 1 ft., with its double variety *P. aconitifolia flore-pleno* (Fair Maids of France); and *P. acris flore-pleno* (Bachelor's Buttons), 2 ft., golden yellow, are pretty. Of dawler interesting plants there are *R. alpina*, 4 in., white; *R. grandiflorum*, 6 to 10 in. yellow; *R. pannosum*, 6 in., white; and *R. rattle*, 4 to 6 ft., white with orange centre.

**Rodgersia.**—Handsome herbs of the saxifrage family. *R. podophylla* has 3 large leaves and tall branching spikes 3 to 4 ft. high; the whole plant resembling one of the large meadow sweets. *R. aesculifolia*, yellowish-white; *R. hieraciifolia*, deep purple; *R. pinnata*, fleshy pink; and *R. sambucifolia*, with leaves resembling those of the elder, are all well adapted for rockwork. Theyrequire rich sandy peat and warm sheltered spots.

**Romneya.**—*R. Coulteri*, a fine Californian plant, with large white flowers on shoots often as high as 7 ft.; *R. trichocarpa* is similar. Both are suitable for the sunny spots and rich, sandy soil, and should not be disturbed often.

**Rudbeckia.**—Bold, composite plants, well suited for shrubbery borders, and thriving in light loamy soil. The flowerheads have a dark-coloured, elevated disk. *R. Drummondii*, 2 to 3 ft., with the ray-florets reflexed, yellow at the tip and purplish-brown towards the base; *R. fulgida*, 2 ft., golden-yellow with dark crimson rays and orange-yellow ray-buds; *R. hirta*, 2 to 3 ft., orange-yellow with blackish-purple disk, the flower-heads 3 to 4 in. across, are showy plants.

**Sagittaria.**—Graceful water or marsh plants, with hastate leaves, and terminal clusters of cymes of white flowers. *S. latifolia*, 3 ft., yellow, and its cultivar *S. lanuginosa*, 3 ft., macrophylla and *S. sagittifolia*, are among the best plants, all with white flowers.

**Salvia.**—The Sage, a large genus of labiates, often very handsome, but sometimes too tender for English winters. *S. Scarea*, 5 to 6 ft., is a very striking plant little more than a biennial, with branched panicles of bluish flowers issuing from rosy-coloured bracts; *S. caradonna*, 3 ft., with azure-blue flowers, is a late flowering species; *S. r. pungens*, 3 ft., yellow; *S. Lancesca*, *S. macrophylla* and *S. sagittifolia*, are among the best kinds, all with white flowers.

**Salvia.**—The Sage, a large genus of labiates, often very handsome, but sometimes too tender for English winters. *S. Scarea*, 5 to 6 ft., is a very striking plant little more than a biennial, with branched panicles of bluish flowers issuing from rosy-coloured bracts; *S. caradonna*, 3 ft., with azure-blue flowers, is a late flowering species; *S. r. pungens*, 3 ft., yellow; *S. Lancesca*, *S. macrophylla* and *S. sagittifolia*, are among the best kinds, all with white flowers.

**Salvia.**—The Sage, a large genus of labiates, often very handsome, but sometimes too tender for English winters. *S. Scarea*, 5 to 6 ft., is a very striking plant little more than a biennial, with branched panicles of bluish flowers issuing from rosy-coloured bracts; *S. caradonna*, 3 ft., with azure-blue flowers, is a late flowering species; *S. r. pungens*, 3 ft., yellow; *S. Lancesca*, *S. macrophylla* and *S. sagittifolia*, are among the best kinds, all with white flowers.

**Salvia.**—The Sage, a large genus of labiates, often very handsome, but sometimes too tender for English winters. *S. Scarea*, 5 to 6 ft., is a very striking plant little more than a biennial, with branched panicles of bluish flowers issuing from rosy-coloured bracts; *S. caradonna*, 3 ft., with azure-blue flowers, is a late flowering species; *S. r. pungens*, 3 ft., yellow; *S. Lancesca*, *S. macrophylla* and *S. sagittifolia*, are among the best kinds, all with white flowers.

**Salvia.**—The Sage, a large genus of labiates, often very handsome, but sometimes too tender for English winters. *S. Scarea*, 5 to 6 ft., is a very striking plant little more than a biennial, with branched panicles of bluish flowers issuing from rosy-coloured bracts; *S. caradonna*, 3 ft., with azure-blue flowers, is a late flowering species; *S. r. pungens*, 3 ft., yellow; *S. Lancesca*, *S. macrophylla* and *S. sagittifolia*, are among the best kinds, all with white flowers.

**Salvia.**—The Sage, a large genus of labiates, often very handsome, but sometimes too tender for English winters. *S. Scarea*, 5 to 6 ft., is a very striking plant little more than a biennial, with branched panicles of bluish flowers issuing from rosy-coloured bracts; *S. caradonna*, 3 ft., with azure-blue flowers, is a late flowering species; *S. r. pungens*, 3 ft., yellow; *S. Lancesca*, *S. macrophylla* and *S. sagittifolia*, are among the best kinds, all with white flowers.

**Salvia.**—The Sage, a large genus of labiates, often very handsome, but sometimes too tender for English winters. *S. Scarea*, 5 to 6 ft., is a very striking plant little more than a biennial, with branched panicles of bluish flowers issuing from rosy-coloured bracts; *S. caradonna*, 3 ft., with azure-blue flowers, is a late flowering species; *S. r. pungens*, 3 ft., yellow; *S. Lancesca*, *S. macrophylla* and *S. sagittifolia*, are among the best kinds, all with white flowers.

**Salvia.**—The Sage, a large genus of labiates, often very handsome, but sometimes too tender for English winters. *S. Scarea*, 5 to 6 ft., is a very striking plant little more than a biennial, with branched panicles of bluish flowers issuing from rosy-coloured bracts; *S. caradonna*, 3 ft., with azure-blue flowers, is a late flowering species; *S. r. pungens*, 3 ft., yellow; *S. Lancesca*, *S. macrophylla* and *S. sagittifolia*, are among the best kinds, all with white flowers.
6 in., white, are both pretty plants of the easiest culture, either for borders or rockeries.

Trilena.—Splendid stoutish-growing plants of noble aspect, for the rock garden. The Polar plant, from their erect, rigid spikes of flame-coloured flowers; sometimes called Kniphofia. T. Uvaria, 3 to 4 ft., bright orange-red, passing to yellow in the lower flowers, is a very handsome decorative plant. They should be shielded from frosts by a covering of ashes over the crown during winter.

Trollius.—Showy ranunculaceous plants, of free growth, flowering about May and June. T. europaenus, 18 in., lemon globular; T. aureus, 3 to 4 ft., deep yellow, are all fine showy kinds. Rich and rather moist soil.

Tulipa.—Splendid dwarf bulbous, thriving in deep, sandy, well-enriched garden soil, and increased by offsets. They bloom during the spring and early summer months. T. Gesneriana, the parent of the florists' tulip, 12 to 18 in., crimson and other colours; T. praecox, 1 ft., crimson with dark spot; T. Greigi, 1 ft., orange with dark spot edged with yellow, and having dark spotted leaves; T. corsicus, 1 ft., scarlet with black centre; and T. sylvestris, 12 to 18 in., bright yellow, are showy kinds.

Viburnum.—Distinct lilaceous plants with bold ornamental leaves regularly folded and plaited. V. album, 3 to 5 ft., has whitish blossoms in dense panicles, 1 to 2 ft. long. V. nigro-mosum, 2 to 3 ft., has black-purple flowers, also V. Maackii, 2 ft. Rich sandy loam and peat.

Verbasum.—Showy border flowers of erect spike-like habit, of the utmost beauty. V. Chatsis, 4 to 5 ft., yellow, in large pyramidal panicles, one of the finest; V. Chilense, 3 ft., rich purple or white; and V. for- mezum, 6 ft., golden yellow in dense panicles, are desirable species.

Veronica.—The Speedwell family, containing many ornamental species. All are of the easiest cultivation in ordinary garden soil. The rotate flowers are in close, erect spikes, sometimes branched. V. crispafoila, 2 ft., dark blue; V. incarnata, 1 ft., flesh-colour; V. corymbosa, 1 ft., pale blue in corymbose-arranged racemes; V. gentianoides, 2 ft., grey with blue streaks; V. speciosa, blue, and its charming white variety alba; and V. virginica, 5 ft., white, are distinct.

Yucca.—Periwinkle. Pretty rock plants, growing freely in ordinary soil. V. herbaeae, of creeping habit, with purplish-blue flowers; V. minor, of trailing habit, blue; and V. major, 1 to 2 ft. high, also trailing, are suitable for the rock garden. The last two are evergreen, and afford varieties which differ in the colour of their flowers, while some are single and others double.

Viola.—Violet. Charming dwarf plants, mostly evergreen and of the easiest cultivation. The white, requiring well-worked rich sandy soil. V. caerulea, 6 in., light blue; V. cornuta, 6 to 8 in., blue; V. lutea, 4 in., yellow; V. altaica, 6 in., yellow or violet with yellow eye; V. palmaensis, 6 to 8 in., lavender-blue; V. pedata, 6 in., pale blue; and V. odorata, the Sweet Violet, in its many single and double flowered varieties, are all desirable.

Yucca.—Noble subarborescent lilaceous plants, which should be grown in every garden. They do well in light, well-drained soils, and have a close family resemblance. The inflorescence being a panicle of white, drooping, tulip-shaped flowers, and the foliage roseate, sword-shaped and spear-pointed. Of the more shrubby-habited species, V. Acanthophyllum and Treculeana are good and distinct; and of the dwarfer and more hortaceous sorts V. flamen- tosissima, flaccida and angustifolia are distinct and interesting kinds, the first two flowering annually.

The list follows the class of plants, of which the following embraces some of the more prominent members, is on the increase, and gardens will benefit by its extension.

**HARDY TREES AND SHRUBS.**—Much of the beauty of the pleasure garden depends upon the proper selection and disposition of ornamental trees and shrubs. We can afford space here for lists of some of the better and more useful and ornamental trees and shrubs, old and new. The following list, which is not exhaustive, furnishes material from which a selection may be made to suit various soils and situations. The shrubs marked *are climbers.*

**Bedding Plants.**—This term is chiefly applied to those summer-flowering plants, such as ivy-leaved and zonal pelargoniums, petunias, dwarf lobelias, verbenas, &c., which are employed in masses for filling the beds of a geometrical parterre. Of late years, however, more attention has been bestowed on the raising of brilliant flowering plants with those of fine foliage, and the massing also of hardy early-blooming plants in parterre fashion has been very greatly extended. Bedding plants thrive best in a light soil, liberally manured with thoroughly rotten dung, or manured with old horse or thoroughly decomposed cow droppings and leaf-mould.
Summer Bedding.—There is great variety among the plants which are used for bedding-out in the garden during the summer season; but we can note only some of the most important of them. Amongst them are the Ageratum, the old tall-growing sorts of which have been superseded by dwarf blue and white flowered varieties; Alternantheras, the principal of which are A. oanema, A. brokenii, and A. macrophylla; and, the single-flowered varieties of the Primrose, Primula vulgaris; the Polyanthuses; Pyrethrum Parthenium aureum, called Golden Feather; Semprevivum calareum; the pink-flowered Stone pendent; self-coloured varieties of the Pansy, Viola triand; and of V. lutkenii and V. cornuta, as well as some variegated sorts. Besides these there are the various spring-flowering bulbs, such as the varieties of Hyacinthus, Tulipa, Narcissus, Fritillaria, Muscari or Grape Hyacinth, Crocus, Scilla, Chionodoxa and Galanthus or Snowdrop.

Summer Bedding.—There is great variety among the plants which are used for bedding-out in the garden during the summer season; but we can note only some of the most important of them. Amongst them are the Ageratum, the old tall-growing sorts of which have been superseded by dwarf blue and white flowered varieties; Alternantheras, the principal of which are A. oanema, A. brokenii, and A. macrophylla; and, the single-flowered varieties of the Primrose, Primula vulgaris; the Polyanthuses; Pyrethrum Parthenium aureum, called Golden Feather; Semprevivum calareum; the pink-flowered Stone pendent; self-coloured varieties of the Pansy, Viola triand; and of V. lutkenii and V. cornuta, as well as some variegated sorts. Besides these there are the various spring-flowering bulbs, such as the varieties of Hyacinthus, Tulipa, Narcissus, Fritillaria, Muscari or Grape Hyacinth, Crocus, Scilla, Chionodoxa and Galanthus or Snowdrop.

60° and 65°, and in winter from 45° to 60°. A genial moist atmosphere must be kept up in the hottest houses during the growing season, with a free circulation of air admitted very cautiously by well-directed ventilators. Only when the plants are used will a little water be necessary; but in the case of those plants which have no fleshy pseudobulbs to fall back upon for sustenance, they must not be allowed to become so dry as to cause the leaves to shrivel. In the Mexican house the plants will generally be able to withstand greater drought occasionally, being greatly assisted by their thick pseudobulbs. In the cool or odontoglossum house a considerable degree of moisture must be maintained at all times; for in these the plants keep growing more or less continuously.

For potting or basketing purposes, or for plants requiring block-rooting, the materials used are light loam, peat, special grade of peat moss or sphagnum, and a small percentage of Turf, mixed with a little gravel, to give the compost a fine texture. These, however, vary in each case according to the particular group of orchids. The water should, however, be so used as not to run down into the sheathing bases of the leaves. While in flower, orchids may with advantage be removed to a drier and cooler situation, and may be utilized in the drawing-room or boudoir. Of late years not only have many fine hybrids been raised artificially between various species, but some remarkable hybridic hybrids (between what are considered two distinct genera) have also been produced (indicated in the list below by *). To keep a valuable collection of orchids in good condition requires the services of an expert orchid grower.

The following is a select list of genera in cultivation:—

**Acineta**
**Ada**
**Aérides**
**Angraecum**
**Anguloa**
**Anoeochilus**
**Angraecum**
**Arachnane**
**Arachne**
**Aphlyophyllum**
**Barkeria**
**Batemania**
**Bifrenaria**
**Brassavola**
**Brassia**
**Brassia-Cattleya**
**Broughtonia**
**Bulbophyllum**
**Burlingtonia**
**Calanthe**
**Cataseta**
**Castella**
**Chysis**
**Cirrhophyllum**
**Cochlioda**
**Coelis**
**Coelogyne**
**Comarettia**
**Cycnoches**

For plants of the same form charming table and drawing-room plants when quite young. When more fully developed, and long before their full growth is attained, they are among the most decorative plants known for the conservatory and for sub tropical gardening. They are freely multiplied and cultivated, and should not be allowed to become dry. The soil should consist of about 3 parts turfy loam, 1 part leaf mould, 1 part coarse silver sand, with enough chemical or other moss added to render the whole moderately rich. The older plants will occasionally require the roots pruned in order to keep them in as small pots as possible without being starved. This should be done early in the spring, and the plants heavily shaded until feeding roots are again produced. It is of advantage to afford stove culture while the plants are quite young. A little later most of the genera succeed well under moderately cool conditions.

The following genera are among those most commonly cultivated:—

**Acanthophoenix**
**Acanthorhiza**
**Aerea**
**Bactris**
**Brahea**
**Calamus**
**Carya**
**Ceroxylon**
**Cera-dendron**

**Ferns.**—These popular plants are usually increased by means of their spores, the “dust” produced on the back of their fronds. The spores should be sown in well-drained pots or seed pans on the surface of a mixture of fibrous sifting peat and small broken crocks or sand, to be firm and well drained, and the spores scattered over it, and at once covered with propagating glasses or pieces of sheet glass, to prevent water or dry air getting to the surface. The pots should be placed in pans full of water, which they will absorb as required. A shady place is desirable, with temperature of 50° to 55° by night and 65° to 70° by day, or they may be set on a shelf in an airy propagating frame. The spores may be sown as soon as ripe, and when the young plants can be handled, or rather can be fitted with the end of a pointed flat instrument the germination should be perfect. The young plants will fill with similar soil and should be kept moist and shady. As they become large enough, pot them singly in 3-in. pots, and when the pots are fairly filled with roots shift on into larger ones.

The best time for a general propagation of ferns is just before growth commences. Those with creeping rhizomes can be propagated by dividing these into well-rooted portions, and, if a number of crowns is formed, they can be divided at that season. In most cases this can be performed with little risk, but the pleu-

**As sple
of the drain must be kept lower than the general level of the subsoil, else the soaking will gather in all the little depressions of its surface. Fruit-tree borders should not be at full cropped with culinary vegetables, or very slightly so, as the process of digging destroys the roots of the trees, and drives them from near the surface, where they ought to be.

Shallow planting, whether of wall trees or standards, is generally to be preferred, a covering of a few inches of soil being sufficient for the roots, but a surface of at least equal size to the surface of the hole should be covered with dung or litter so as to restrain evaporation and preserve moisture. In the case of wall trees, a space of 5 or 6 in. is usually left between the stem at the insertion of the roots and the wall, to allow for increase of girth. Young standard trees should be tied to sticks at the top until their roots are well-waved of the stems and to keep them erect. The best time for planting fruit trees in the open air is from the end of September till the end of November in open weather.

In the selection and distribution of fruit trees regard must of course be had to local situation and climate. The best walls having a south or south-east aspect are devoted to the peach, nectarine, apricot, dessert pears, plums and early cherries. Cherries and the generality of plums succeed very well either on an east or a west aspect. Morello cherries, apples and stewing pears succeed well on a north wall. In Scotland the mulberry requires the protection of a wall, and several of the finer apples and pears do not arrive at perfection without this help and a tolerably good aspect. The wall-trees intended to be permanent are called dwarfs, from their branches springing from near the ground. Between these, trees with tall stems, called riders, are planted as temporary occupants of the upper part of the wall. The riders should have been trained in the nursery into good-sized trees, in order that when planted out they may come into bearing as speedily as possible.

Standard Fruit Trees should not be planted, if it can be avoided, in the borders of the kitchen garden, but in the outer slips, where they either made borders when annexed their full size of may be kept dwarfed. Each sort of fruit should be planted by itself, for the sake of orderly arrangement, and in order to facilitate protection when necessary by a covering of nets. Their produce is often superior in flavour to that of the same kind of fruit grown on walls.

Orchard-house Trees.—Peaches, nectarines, apricots, figs and dessert plums, cherries, apples and pears are commonly cultivated in the orchard-house. Peaches and nectarines are generally planted out, while the rest are more commonly cultivated in pots. This allows of the hardier pot plants being removed out of doors while those planted out are in need of the roosters. The pot plants are overhauled in the autumn, the roots pruned, a layer being cut off to allow new soil to be introduced. Surface dressing and feeding by liquid manure should also be afforded these plants while the fruit is swelling. Every effort should be made to complete the growth of peaches and nectarines while the sun is sufficiently strong to ripen them. Tomatoes are frequently employed to fill gaps in the orchard-house. Should it be provided with a central path, requiring shade, Hambro and Sweet-water grapes serve the purpose well, and in favourable seasons afford excellent crops of fruit.

VII. Vegetables.

Under this head are included those esculents which are largely eaten as "vegetables" or as "salads." The more important are treated under their individual headings (see ARTICHOKE, ASPARAGUS, BEAN, &c. &c.). The culinary herbs used for flavouring and garnishing are for the most part dwarf perennial plants requiring to be grown on a rich soil in an open sunny aspect, or annuals for which a warm sheltered border is the most suitable place; and they may therefore be conveniently grown together in the same compartment—a herb garden. The perennials should be transplanted either every year or every second year. For winter use the tops of the most useful kinds of herbs should be cut when in flower or full leaf and quite dry, and spread out in an airy but shady place so as to part slowly with the moisture they contain and at the same time retain their aromatic properties. When quite dry they should be put into dry wide-mouthed bottles and kept closely corked. In this way such herbs as basil, marjoram, mint, sage, savoury, thyme, balm, chamomile, horbend, hyssop and rue, as well as parsley, may be had throughout the season with almost the full flavour of the fresh herb.

Intensive Cultivation.—This name has been applied to the method of forcing early vegetables and salads during the winter and spring months in the market gardens in the neighbourhood of Paris. The system is now popularly known in England as "French gardening." Although a few assert that it is an old English one that has been discarded in favour of superior methods, there seems to be little or no evidence in support of this contention. The system itself has been practised for about 300 years in the "marais" gardens round Paris. At one time these gardens were in the centre of the city itself, but owing to modern improvements they have been gradually pushed out beyond the city boundaries farther and farther. Most of these gardens are small—not more than a couple of acres in extent, and the rent paid by the maraicher, or market gardener, is very high—as much as £30 to £40 per acre.

The French maraicher does not use hot-water apparatus for forcing his plants into early growth. He relies mainly upon the use of cloches, a few shallow frames about 4 ft. wide, covered with lights, and a number of large bell glasses or "cloches." The work is carried on from October till the end of March and April, after which, with the exception of melons, the cultures are carried on in the open air.

The chief crops grown for early supplies, or "primeurs" as they are called, are special varieties of cos and cabbage lettuces, short carrots, radishes, turnips, cauliflowers, endives, spinach, onions, corn salad and celery. To these is added a very important crop of melons, a special large-fruit variety known as the Prescott Canteloup being the most favoured. The harvest is taken off one of these small intensive gardens during the year, and especially during the worst months when prices usually run fairly high. The fact that rents are so heavy around Paris is in itself an indication of the money that is realized by the growers not only in the Paris markets, but also in Covent Garden.

During the winter season narrow beds are made up of manure, either quite fresh or mixed with old manure, according to the amount of heat required. These beds are covered with a few inches of the fine old mould obtained from the decayed manure of previous years. In the early stages seeds of carrots and radishes are sown simultaneously on the same beds, and over them young lettuces that have been raised in advance are planted. In this way three crops are actually on the same beds at the same time. Owing, however, to the difference in their vegetative growth, they mature one after the other instead of simultaneously. Thus with the genial warmth and moisture of the hotbeds, all crops grow rapidly, but the radishes mature first, then the lettuces are taken off in due course, thus leaving the beds to finish up with the carrots by themselves. Later on in the season, perhaps small cauliflowers will be planted along the margins of the beds where the carrots are growing, and will be developing into larger plants requiring more space by the time all the carrots have been picked and marketed. So on throughout the year with other crops, this system of intercropping or overlapping of one crop with another is carried out in a most ingenious manner, not only under glass lights, but also in the open air. Spinach, corn salad, radishes and carrots are the favourite crops for sowing between others such as lettuces and cauliflowers.

Although enormous quantities of water are required during the summer season, great care must be exercised in applying water to the winter crops. When severe frost prevails the lights or cloches are rarely taken off except to gather mature specimens; and no water is given directly overhead to the plants for fear of chilling them and checking growth. They must secure their
supply of moisture from the rain that falls on the glass, and flows into the narrow pathways from 9 in. to 12 in. wide between each range of frames. As the beds are only about 4½ ft. wide, the water from the pathways is soaked up on each side by capillary attraction, and in this way the roots secure a sufficient supply.

Besides an abundant water in summer there must also be a generous quantity of good stable manure available during the winter months. This is necessary not only to make up the required hotbeds in the first place, but also to fill in the pathways between the frames, wherever it is considered advisable to maintain the heat within the frames at a certain point. As it is impossible to use an ordinary wheelbarrow, in these narrow pathways, the workman carries a specially made wicker basket called a “hotte” on his shoulders by means of two straps. In this way large quantities of manure are easily transported to any required spot, and although the work looks hard to an English gardener, the Frenchman says he can carry more manure with less fatigue in half a day than an Englishman can transport in a day with a wheelbarrow.

This is merely an outline of the system, which is now being taken up in various parts of the United Kingdom, but not too rapidly. The initial expenses for frames, lights, closets, mats and water-supply are in many cases prohibitive to men with the necessary gardening experience, while on the other hand those who have the capital lack the practical knowledge so essential to success.

For full details of this system see Fresh Market-Gardening, with details of Intensive Cultivation, by John Weathers (London, 1899).

VIII.—Calendar of Garden Operations (A) for Great Britain.

JANUARY

Kitchen Garden.—Wheel out manure and composts during frosty weather; trench vacant ground not turned up, thoughly in autumn. Sow early peas in a cold frame for transplanting. Sow also first-crop peas, the best common and William of Orange towards the end; Early Seville and Early Longpod beans; and short-topped radish in two or three sowings, at a week’s interval, all on a warm border; also Hardy Green and Brown cos lettuce in a frame or on south border. Plant shallots and Ashfield potatoes on a warm border. For an broccoli as it becomes fit for use, or remove to a dry shed or cellar; lettuces and endive, which are best planted in frames; and parsnips in frames so as to be accessible.

Fruit Garden.—Plant fruit trees in open weather, if not done in autumn, which is the proper season, mulching over the roots to protect them from frost, and from drought which may occur in spring; after the sun is up, plant peas, vining beans, or any other crops that can be sown in mild weather or in moderate frosts, nailing only in fine weather. Wash trees infested with insects with one of the many insecticides now obtainable. Take off grafts, and lay them aside in moist earth in a place kept warm. Propagate for making up hotbeds for early cucumbers and melons, where pits heated with hot water are not in use; also for Ashford potatoes. Sow also in heat mustard and cress for salad; pumpkins, onions for salting; tomatoes, celery to be pricked out for an early crop; and Early Horn carrot and kidney-beans on slight hotbeds. Force asparagus, sea-kale and rhubarb, in hotbeds, in pits, in the mushroom-house or in the open garden by the use of covers surrounded with warm litter; for cucumbers a top heat of 70°; for vines in leaf and flower a temperature ranging from 65° to 70°. Keep forced strawberries with swelling fruit well watered. Plant vine eyes for propagation in a brisk heat.

Plant Houses.—Give abundance of air to the greenhouse, conservatory and alpine frame in mild weather, but use little water. A supply of roses, kalmias, rhododendrons, &c., and of hardy flowers and shrubs, in the sheltered gorge valley, heathyma, tulips, daidofilia, &c., should be kept up by forcing.

Flower Garden.—Plant out tubers and bulbs of border flowers, with which the autumn, deferring the finer florists’ flowers till next month. Transplant herbaceous plants in light soils, if not done in autumn; also deciduous trees, shrubs and hedges. Lay edgings in fine weather. Sow mignonette, stocks, &c., in pots; sow several early cabbages to follow the late August; red cabbages and savages towards the end. Sow also Early Horn carrot; Early Purple-top Munich turnip; onions for a full crop in light soils, with a few leeks and some parsnips. Sow lettuce for succession, with radishes and Round-leaved spinach, twice in the course of the month; and small salads every fortnight. Plant biennials, artichokes, &c., in pots in the last week of December, for early planting in early April. Transplant to the bottom of a south wall a portion of the peas sown in pots in frames in November and January for the flower bed.

Sow Brussels sprouts for the greatest heat for an early crop of small heads.

Fruit Garden.—Prune apricots, peaches, nectarines and plums, before the buds are much swelled; finish pruning apples, pears, cherries, gooseberries, currants and raspberries, before the end of the month; also the dahlia; prune the grape from spoiled fruit, and shut it close. Cut down the double-bearing raspberries to secure strong young-fruiting shoots. Head back stem over preparatory to grafting.

Forcing.—Sow melons and cucumbers on hotbeds and in pits. Sow carrots, turnips, early celery, also aubergines or egg-plants, capsicums, tomatoes and succession crops of kidney-beans; also beets, kohlrabi in gentle heat, all planted out. Plant early potatoes on slight hotbeds. Continue the forcing of asparagus, rhubarb and sea-kale. Commence or continue the forcing of the various choice fruits, as vines, peaches, figs, cherries, strawberries, &c. Pot roots of mint and place in heat to produce syrups for mint sauce. Be careful to protect the stems of vines that are outside the forcing-houses.

Plant Houses.—Let the greenhouse and conservatory have plenty of air in mild weather. Pot and start tuberous-rooted begonias and gloxinias. Pot young plants of Hippeastrum, and start the establishment of the spring bulbs. Plant chrysanthemums in frames, under hand lights or frames. Put plants of fuchsias, petunias, verbenas, heliotropes, salvia and other soft-wooded subjects, into a propagating house to obtain cuttings, &c., for the flower garden. Transplant dahlias and hybrid-mallows and other tender and half hardy plants from a slight hotbed, or in pots. Propagate old roots of dahlias by cuttings of the young shoots in a hotbed. Sow petunias in heat, and prick out and harden for bedding out; also gloxinias to be grown in a heat till the end of the month.

Flower Garden.—In dry open weather plant dried roots, including most of the finer florists’ flowers; continue the transplanting of hardy biennials and herbaceous plants during the first week in January, mignonette, and hardy annuals, in a warm border, for subsequent transplanting.

MARCH

Kitchen Garden.—Sow main crops of wrinkled narrow pea; Longpod and Windsor beans; cabbage, onions, leeks, Endive, &c., as early as possible for forcing. These crops require a cold greenhouse, &c., and should be kept up by forcing.

Fruit Garden.—Finish the pruning of fruit trees before the middle of the month. Protect those coming into blossoms. Begin grafting in the third week; dig and dress the rows of gooseberries, currants and other fruit trees, if not already done. Kill wasps according to the season by then.

Forcing.—Continue the forcing of melons, cucumbers, tomatoes and the various fruits. In the vineyard and peach-house, attend to the keeping down of insects by syringing; and promote the growth of the young shoots, by damping the walls and opening the windows and evening. Sow capsicum and tomato, also in slight heat such tender herbs as basil and marjoram.

Plant Houses.—More water may be given than formerly. Sow seeds of greenhouse and hothouse plants; also the different sorts of tender annuals; put off those sown last month; sow cherinaria for the earliest bloom; also Chinese primulas. Shift heaths and other hardy herbaceous subjects into potted-plants; also those for forcing. Begin to propagate greenhouse plants by cuttings; also coleus by cuttings in heat, potting them off as soon as rooted.

Fower Garden and Shrubs.—In the last week; sow hardy annuals in the borders and biennials that flower the first season, as also perennials. Plant anemone and ranunculus roots and the corms of gladious. Transplant from the nursery to their final site, the bulbs in dry soil, and plant them with a warm slow heat. Propagate perennials from root-slips and offsets. Continue to propagate the finer sorts of dahlias, both by cuttings and by division of the roots. Finish the pruning of all deciduous trees and hedges as soon as possible. Attaching to the dressing of shrubbery; lay turf-edgings, and regulate the surface of gravel walks.

APRIL

Kitchen Garden.—Sow asparagus, sea-kale, Turnip-rooted beet, salalys, scorzonera, skirret, carrots and onions on heavy soils; also narrow peas, Longpod and Windsor beans, turnips, spinach, celery,
cabbage, savoys and Brussels sprouts for succession. Sow broccoli and kidney-beans both in the second and in the last week, and lettuces and small salads twice or thrice during the month; sow also red, white, and yellow radishes, parsnips, and carrots, disease, and shallots; plant cauliflower, cabbages, sea-kale, lettuce; and finish the sowing of the main crops of potatoes; divide and replant globe-artichokes. Propagate all sorts of pot-herbs, and attend to the hoeing and thinning of those already planted. Sow dwarf, sweet, beet, and savoys, cabbages, cauliflower, peas, beans and early potatoes. Stake up peas; plant white sea-kale and rhubarb in the open air by covering with straw or leaves.

**Fruit Garden.**—If vines have been neglected to be pruned, rub off the buds that are not wanted; this is safer than pruning now. Protect the finer sorts of fruit trees on the walls. The hardier ones may have walls moved outdoors under temporary awnings, to give the choice fruit trees some protection. —the lower ones protected by plunging the pots. Mulch all newly-planted fruit trees, watering abundantly in dry weather.

**Forcing.**—Continue the pot-sowing of succession beds and pits for cucumbers and melons. Sow; pot tomatoes and capsicums for succession. Pollinate tomatoes by hand to ensure early fruit on plants intended for outdoor culture. In the forcing-houses, from the variable state of the weather, considerable vigilance is required in giving air. Keep down red spider (Acarus) in the more advanced houses by frequent syringings and a well-moistened atmosphere. Consider the usual operations of disbudding and thinning of fruit, and take the proper precautions during the month.

**Plant Houses.**—Sow tender annuals if required; also cinerarias and primulas. Proceed with all necessary shiftings. Propagate rare and fine sorts of pot-herbs; increase by cuttings; and grow on for winter flowering. Put off tender coverings for chrysanthemums, and cuttings of half-hardy greenhouse plants put in during February to get them well established for use in the flower garden. Transfer chrysanthemums to their winter quarters and provide means of protecting them from frost and cutting winds.

**Flower Garden and Shrubbery.**—Sow main or successional crops of annuals of all sorts—half-hardy annuals in warm borders, or on the hotbeds. Biennials and perennials should be sown before the middle of the month. Plant out gladioli, if not done, tidigrias and fine stocks. Finish the transplanting of herbaceous plants by the end of the first week. Cuttings of border chrysanthemums may now be dibbled in, and some pot-herbs on the warm spot of outdoor. Protect weak seedlings and hyacinths from extremes of every description of weather; and tulips from hoar-frosts and heavy rains. Plant out tender deciduous trees and trees in pots, not large pots, mulching the roots. Remove part of the coverings of all tender shrubs and plants in the first week, and the remainder at the end of the month. Form and repair lawns and grass walks by laying turf and sowing perennial grass-seeds; now the lawns usually; plant evergreens.

**May Kitchen Garden.**—Sow main crop of beet in the first week, small salads every week, radishes and lettuces thrice, spinach once a fortnight, carrots and onions for late drawing, kidney-beans in the first week together with scarlet runners in the last fortnight; endive, red and white; also yellow. Sow; congo peas, broad beans, cauliflowers, Early York or Little Pixie cabbages, Brussels sprouts, borage, broccoli, savoys and kale for late crops. Sow vegetable narrows and hardy cucumbers on a warm border in the last week, also red and white endive. Sow; mignonette, dwarf nasturtiums, cabbage, peach, apricot, and plum trees, glass shelter; sow chicory for salading. Continue hoeing and earthing up the several crops.

**Fruit Garden.**—Disbud peaches, nectarines and other early trees against the walls; also attend to the thinning of fruit. Give occasional washings with the engine to keep down insects. Pick caterpillars from gooseberries and wall trees on their first appearance. Remove from raspberries and strawberries all suckers and runners that are not wanted.

**Forcing.**—Plant melons and cucumbers on the hotbeds prepared for vegetables in February, and now free. Plant out vegetable marrows, squash, cucumbers, melons, as soon as the last frosts are over. Plant out the remaining slips of worth in pots, or in the ground, for that purpose. Plant out in rich soil, if possible, to be potted up in autumn for flowering. Bedding plants should be placed to harden in sheltered positions out of doors towards end of month. Towards the end of the month of the main stock of chrysanthemums will be ready for the final potting.

**Flower Garden.**—Sow annuals for succession in the last week, also biennials and perennials in the nursery compartment, for planting out in May; also the blerina and the marigolds required either by cuttings or by dividing the roots. Plant out, during the last week, dahlias, hardy pelargoniums, stocks and callas, protecting the dahlias from slight frosts. By the end of the month, masses of the following plants may be formed with safety in warm localities:—pelargonium, heliotropium, fuchsia, petunia, nierembergia, salvia, verbenas, bouvardia and lobelia. Protect tulips, ranunculuses and anemones from the mid-day sun, and from rains and winds. Remove the coverings from all tender plants placed in the open air.

**Shrubbery.**—Transplant all kinds of evergreens, this month and September being the proper seasons. The rarer conifers should be planted now and in June, after they have commenced to grow. In the ordinary garden, deal with the laying down of lawns and gravel-walks, and keep the former regularly mown.

**June Kitchen Garden.**—Sow kidney-beans for succession; also the wrinkled marrow peas and Seville Longpod and Windsor beans for forcing. Sow Broad-leaved every ten days; also carrots, onions and radishes for drying; lettuces; pot marigolds; and for forcing, endive for a full crop. In the first week sow Early Munich and Golden Ball turnips for succession, and in the third week for a full autumn crop. Sow scarlet and white runner beans for a late crop, and cabbages for coverts. Make up successional mushroom beds early in the month. Plant full crops of broccoli, Brussels sprouts, savoys, kale, leeks and early celery, with successional crops of cucumbers and melons. In the first fortnight of the month, plant hardy cucumbers for picking, in a warm border, placing hand-glasses over them towards the end of the month. Plant out capiucums and tomatoes in sunny positions, and stake and tie securely. Pick cherries. Prepare winter drills for the next month.

**Fruit Garden.**—Train and prune the summer shoots of wall and trellis and other trained trees. Mulch and water fruit trees and shrubs. Keep the fruit shrubs thinned; the fruit must be picked and the ripening of the various fruits. Ventilation will still require constant care. Tomatoes will now be fruiting freely; thin out judiciously, avoiding excessive pruning at one time. Attend to the gathering of fruit as it ripens.

**Plant Houses.**—These will now be occupied with tender green-house plants and annuals, and the more hardy plants from the store. Shelves and props should be agitated all plants that are desirable. Sow fragrant or showy annuals to flower in pots during winter; and grow on a set of decorative plants for the same object. Continue the final potting of chrysanthemums; ensure their being well grown and kept in the best condition.

**Flower Garden.**—Plant out dahlias and other tender subjects, if risk of frost is past. Take up bulbs and tuberous roots and dry them in the shade before removing them to the store-room. Fill up with annuals and greenhouse plants those beds from which the bulbs and roots have been raised. After this season, keep always a reserve of annuals in pots, or planted on beds of thin layers of fibrous matter, so as to be readily transplanted. Layer carnations, and make the pinks in the end of the month. Keep the lawns closely mown.

**July Kitchen Garden.**—Watering will be necessary in each department, if the weather is hot and dry. In the first week, sow peas for the last crop of the season; also Longpod beans and French beans. In the second week, sow; scarlet and white runner beans, scarlet borago, spinach for an early winter supply and Enfield Market cabbage for early summer use. Sow endive, for autumn and winter use, in the beginning and end of the month; also successional crops of lettuce and small salads. Plant full crops of celery, celeriac, endive about the middle and end of the month; late crops of broccoli, cauliflower and cœlows in the last week. Gather and dry herbs; also propagate these by slips and cuttings.

**Fruit Garden.**—Continue the pruning and training of wall and espalier trees, and the destruction of noxious insects. Pot straw-waxing peas, the Express and Golden Wonder now in pots, as soon as well-rooted runners can be obtained. Propagate the different sorts of stone fruit trees by budding on other trees or on prepared stocks. Gather fruits of all kinds as they ripen.

**Plant Houses.**—Plant out pelargoniums and pelargoniums, and maintaining heat, &c. Continue the routine treatment in the tomato-houses. Feed the plants artificially as soon as good crops are set; and the signs of distress. The forcing-houses ought to have an abundance of fresh air and moisture where required, along with the necessary heat.

**Plant Houses.**—Ventilation will be necessary to keep down excessive heat; also peas and Longpod and Windsor, shifting and putting in cuttings, and giving abundance of water to the potted plants, both indoors and out. Sow seed of herbaceous callas, silvershuts; if they require it; cut down pelargoniums past flowering, and cut. 

**Flower Garden and Shrubbery.**—Take up the remaining tuberous roots, such as anemones, ranunculuses, &c., by the end of the first week; fill up their places, and any vacancies that may have occurred, with annuals or bedding plants from the reserve ground.
Repot auriculas, and sow auricula seed in boxes under glass. Propagation of the evergreen plants has gone out of fashion, by means of cuttings and slips, especially those required for spring bedding; propagate also the various summer bedding plants increased by cuttings. Increase roses and American shrubs, by layering, budding or cuttings. and go on with the laying of carnations and piolettes. Stake and tie dahlias and strong herbaceous plants.

**August**

*Kitchen Garden.*—Sow winter and spring spinach in the beginning and middle of the month, and the early hardy winter pot cauliflowers in full crop, in the first week; cabbages about the middle of the month, for planting out in spring; cauliflower in the first half (Scotland) and in the second half (England) of the month; Hardy Hops (Eng.) and Cossy Crescent (Scotland) the first and last week: small salads occasionally; and Black Spanish radish, for winter crops. Plant out kales and broccoli for late crops; plant celeriac (earliest), and other winter roots and tubers. Plant endive in the month, and a few cowslips. Take up shallots, garlic, &c.

*Fruit Garden.*—Proceed in training and regulating the summer shoots of all fruit trees as directed for the last three months. Net up, in dry weather, gooseberry and currant bushes, to preserve the fruit till late in the autumn. Make new strawberry beds if required. Preserve the ripening fruits on the wall and other trees from insects, and destroy wasp nests. Gather fruits as they ripen.

*Forcing.*—The routine of cultivation in hotbeds and pits may be continued. Sow tomatoes and cucumbers for a winter crop. Make up mushroom beds. In the forcing-houses, where the crops are past, part of the ashes may be removed, so as to permit thorough ventilation.

*Plant Houses.*—Attend to the propagation of all sorts of greenhouse plants by cuttings, and to the replacing in the greenhouse and stoves of more tender species, by the end of the month in ordinary seasons, but in wet weather in the second week. Sow half-hardy annuals, as Nemophila, Collinsia, Schizanthus, Rodanthe, &c., to flower early in the year. Sow the annuals, as foxgloves and auriculas in boxes. Propagate all sorts of herbaceous plants by rooted slips or suckers; take off layers of carnations, piolettes, and other such plants, from the edges of bedding pelargoniums in boxes for convenience of removal. Layer plants of chrysanthemums, to obtain dwarf flowering plants. Transplant evergreens in moist weather, about the end of the month; and propagate them by layers and cuttings. Pot Napoleonic violets for forcing; or plant out on a mild hotbed. Clip box edgings.

**September**

*Kitchen Garden.*—Sow small salading for late crops; and lettuce and spinach, if not done last month. Prepare the seed frames and lettuce at the foot of a south wall to stand the winter; plant out cabbages from the chief autumn sowing. Plant cauliflowers on a warm day, and eggplants, such as the 'Black Head,' protected by hand-lights. Thin the winter spinach, when large enough, so as not to check it in its growth. If broccoli be too rank or tall to withstand the winter, lift and lay nearly up to the neck in the earth, the heads sloping towards the frame. Sow winter radishes in frames early in the month, and put them out to ripen on a dry border or gravel-walk. Lift potatoes and store them.

*Fruit Garden.*—Finish the summer pruning and training. Where the walls are heated, assist the maturing of peaches and nectarines, and the ripening of the young wood for next year, by fires during the day. Gather and lay up in the fruit-room with care the autumnal sorts of apples and pears. Prepare borders and stations for fruit trees during dry weather. Plant strawberries for a main crop. Repot orchard-house trees,disconnecting where necessary.

*Forcing.*—Take care that late melons, cucumbers and tomatoes be not neglected, getting too much water and too little air. Sow a few kidney beans for forcing, early in the month. Plant the ripening of late grapes and peaches with fires during the day. Prune early vines and peaches.

*Flower Garden.*—Sow various pot plants should now be put in their winter quarters. Keep up moderate temperatures in the stove, and merely repel frosts in the greenhouse, guarding against damp, by ventilation and by the cautious use of water. Pot hycnias, tulips and other bulbs for forcing, and propagate half-hardy plants by cuttings. Begin the housing of the main stock of chrysanthemums.

*Flower Garden, &c.*—Sow in the beginning of this month half-hardy annuals required for early flowering; also begonias in pots, chinning the plants at an early stage; the different species of primula; and the seeds of such plants as, if sown in spring, seldom come up the right, as Adonis, Scilla, and October Glaucus. These and a few of the earliest flowering bulbs should be sown in the earliest possible part of the month. Put in cuttings of bedding pelargoniums, in boxes, which may stand outdoors exposed to the sun, but should be sheltered from excessive rains. Continue the propagation of herbaceous plants, taking off the layers of carnations, piolettes, pansies and chrysanthemums, by the end of the month; choice cuttings of piolettes may be potted and wintered in cold frames also, if the season is as warm. Examine and cut away the roots of old and put in cuttings of most of the hard-wooded sorts of shrubbery plants.

**October**

*Kitchen Garden.*—Sow small salading and radishes in the first week, and lettuces in frames on a shallow hotbed for planting out in spring. If the winter prove mild they will be somewhat earlier than those sown next month or in January. Plant parsley in pots or boxes to protect under those of the severest winter weather. Plant cabbages in beds or close rows till wanted in spring; and cauliflowers in the last week, to receive the protection of frames, or plant in frames for transplanting (though with care it may be done earlier), whether the leaves have fallen or not. Protect fig-trees, if the weather proves frosty, as soon as they have ceased their leaves. Plant out raspberries. The orchard-house plants should be got under glass before the end of the month. Gather and store all sorts of apples and pears, the longest-keeping sorts not before the end of the month, if the weather be mild.

*Forcing.*—Maintain the heat in hotbeds and pits by means of fresh dung linings. Give abundance of air in mild bright weather. Dress vines and peaches. Clean and repair the forcing-houses, and overhaul the heating apparatus to see it is in good working condition. Plant chive and other菜 beds in boxes, in the month. Gather and store all kinds of herbs. Make up successional winter mushroom beds.

*Plant Houses.*—Replace all sorts of greenhouse plants. Fill the place of stems of some of the annuals, and to plant out in spring, along with many of the hardy annuals required for the first half of the month. Sow half-hardy annuals; the whole ought to be thoroughly ventilated, except in frosty weather. From this time till spring keep succulent plants almost without water. Begin to force early apples, and sow the bulbs, for winter and early spring decoration. Plant hycnias in glasses for windows. The last of the pot chrysanthemums should be hardened by the end of the present month. Sow flowers for winter gardens.

*Flower Garden.*—Sow a few pots of hardy annuals in a frame, or on a sheltered border, for successional spring use if required. Plant the greater part of the common border bulbs, as hyacinths, narcissi, crocuses, and other early flowering bulbs, with care to see that the anemones for early flowering. Transplant strong plants of biennials and perennials to their final situations; also the select plants used for forcing bedding. Plant alpine plants, stuctu alugos, and choice carnations and piolettes with glass frames; and rose tubers and other tender plants with bracken or other protective material. Take up, dry and store dahlias and all tender tubers at the end of the month; put lebanas and similar hardy plants from the open borders. Transplant all sorts of hardy evergreens and shrubs, especially in dry soils, giving abundance of water. Put in cuttings of all sorts of evergreens, &c. Plant out the hardier sorts of roses.

**November**

*Kitchen Garden.*—Trench up all vacant ground as soon as cleared of the first crops, leaving the surface as free as possible. Sow early potatoes, and Early Dwarf Prolific beans in the second week, for an early crop; also in frames for transplanting. Protect endive, celeriac, artichoke and sea-kale with stable-litter or fern, or by planting the plants in frames; take the plants out in frames early, and place them in sheltered pits or lay them in an open shed; cut up celery; manure and dress up asparagus beds.

*Fruit Garden.*—Plant all sorts of fruit trees in fine weather—the earlier in the month the better. Protect fig-trees. Commence pruning and nailing. Gather and store the latest apples and pears. Examine the fruit-room and remove all decayed fruit.

*Forcing.*—Keep up the requisite degree of heat in hotbeds and pits. Cucumbers and tomatoes will require more than ordinary attention. Force asparagus, chard and sea-kale, in the mushroom-house, during the month, or in frames surrounded by well-fermented stable dung or dung manure. Sow the young 'Horn carrot' also kidney beans and radishes, on hotbeds. In the forcing-houses prune and train the trees; fork over and dress the borders of such house crops as can be done, and put in new plants, and lay down the stuff of old beds on a green manure.
December

Kitchen Garden.—Collect and smother-burn all vegetable refuse, and apply it to dressing to cellar. Sow a few peas and beans and, in case of accident to those sown in November, draw up, the soil towards the stems of those which are above ground as a protection; earth up celery; Blanch endive with flower-pots; sow radishes in a very sheltered place. Attend to trenching and digging in dry weather.

Fruit Garden.—Plant all sorts of fruit trees in mild weather. Prepare with pruning and nailling walls. Examine the fruit room every week, removing promptly all decaying fruits.

Forcing.—The same degree of attention to hotbeds and pits will be necessary as in the last month. Continue the forcing of asparagus, gladiolus, and bulbs; plant the remaining hot and cold-water pipes with sulphur mixture, as recommended in January.

Flower Garden, &c.—Plant shrubs in open weather. Prune shrubs. Sweep and roll the lawns, and put in repair the gravel-walks, keeping the surface frequently rolled.

(B) For the United States (chiefly for the latitude of New York).

January

Flower Garden and Greenhouse.—Little is to be done in either. In the greenhouse care must be used to protect against frost. Ventilate but little, and with care; raise the ventilating sash only high enough to let the heated air from the greenhouse drive back the outer wind, so as not to chill the plants. To destroy the red spider, syringe the plants copiously at night, and splash the paths with water. The aphids, or "green fly," must also be destroyed; tobacco may be used. Various new preparations are coming on the market for the destruction of greenhouse pests. Several new effective preparations of tobacco have been brought into use. The white-fly is now a common pest in greenhouses, the nymphs being greenish scale-like objects, and the adult being under sixe, and adults very small white flies. The remedy is to spray with kerosene emulsion or whale-oil soap; or if on cucumbers or tomatoes, it is best to fumigate with hydrocyanic acid gas, using one ounce of potassium cyanide, to each 100 cubic ft. of space. (This material is very poisonous.) Many greenhouse insects can be kept more or less in check by careful and effective hosing of the plants at proper times. At this season roses, grape vines and other plants are often affected by black spot; an effective remedy is spraying the hot-water pipes with a mixture of sulphur and lime, put on as thick as ordinary white-wash, once each week until it is checked; but care must be taken not to apply it on any surface at a higher temperature than 21°. Hyacinths and other bulbs that have been kept in a cellar or other dark cool place may now be brought into the light of the greenhouse or sitting-room, provided they have filled the pots with roots. If there are any ready for planting, they are best left, the others. In the outside flower garden little can be done except that shrubs may be pruned, or new work, such as making walls or grading, performed, if weather permits. See that the ornamental plants and trees are not injured by heavy weights of ice or snow.

Fruit Garden.—Pruning, staking up or mulching can be done if the weather is such that the workmen can stand out. In all warm or comfortable days the fruit trees may be pruned.

Grapery.—Grapes used for the forcing of foreign grapes may be started, beginning at a temperature of 50° at night, with 10° or 15° higher during the day. The borders must be covered with manure to prevent the soil from freezing, as it would be destruction to the vines to start the shoots if the roots were frozen; hence, when forcing is begun in January, the covering should be removed, before severe cold begins. Vegetable Garden.—But little can be done in the northern states except to prepare manure, and get sashes, tools, &c., in working order; but in sections of the country where there is little or no frost the preparation of the beds and plantings can now be begun; as asparagus, cabbage, cauliflower, carrot, leek, lettuce, onion, parsnip, peas, spinach, turnip, &c. In any section where these seeds can be sown in open ground, it is an indication that hotbeds may be started, except in sections of such temperate climates as hardier vegetables, &c.; though, unless in the extreme southern states, hotbeds should not be started before the beginning or middle of February. Make orders for the spring seeds.

February

Flower Garden and Greenhouse.—The directions for January will in the main apply to this month, except that now some of the hardier annuals may be sown in hotbed or greenhouse, and also the propagating of plants by cuttings may be done rather better now than in January, as the greater amount of light gives more vitality to the cutting.

Fruit Garden.—But little can be done in most of the northern states; and in the south, where there is no frost in the ground, it is likely to be too wet to work; but in many southern states this will be the best month for planting fruit trees and plants of all kinds, particularly strawberries, raspberries, blackberries, pear and apple trees, will grape vines will do, though they will also do well quite a month later. Continue the pruning. Fruit trees for spring planting should be ordered, if not already done.

Grappery.—The grapevines started last month at 50° at night, may now be increased to 60°, with a corresponding higher day temperature. Great care must be taken to syringe the leaves thoroughly at least once a day, and to delve the paths with water, so as to produce a heavy atmosphere over the hot-water pipes with sulphur mixture, as recommended in January.

Vegetable Garden.—Leaves from the woods, house manure or refuse hops from breweries may be got together towards the latter end of the month, if it is no frost in the ground, for making "green-manure" or "green-manure" for forming hotbeds. Cabbage, lettuce and cauliflower seeds, if sown early this month in hotbed or greenhouse, will make fine plants if transplanted into hotbed in March. This is preferable, or it is not available. As the cold-water pipes are frozen, in or near the kitchen to be. Unless one has square boxes, table-rooted, for planting, it should be broken up as fine as possible, for the more completely manure of any kind can be mixed with the soil the better the crop will be, and, if course, if it is dug thoroughly and in large, unbroken lumps it cannot be properly commingled.

March

Flower Garden and Greenhouse.—The long days and bright sunshine will now begin to tell on the plants under glass. Examine all plants that are vigorous and healthy; if the roots have matted the "ball" of earth they must be shifted into a larger-sized pot. Plants from cuttings struck last month may now be shifted, and the propagating of stock in the greenhouse, for the larger kinds of annuals may be sown; it is best done in shallow boxes, say 2 in. deep. A further supply can be raked off and mulched with short manure, or rich garden earth where manure cannot be obtained. Flower-beds on light soils may be dug up so as to forward the work of the coming busy spring season. Lawns may be benefited by a good dressing, in addition to the ordinary commercial fertilizer, the lawn is thin in spots, these places may be raked over heavily and new grass seed sown.

Fruit Garden.—In many sections, planting may now be done with safety, provided the soil is light and dry, but not otherwise. Although a tree or plant will receive no injury when its roots are undisturbed in the soil should a frost come after planting, the same amount of freezing will, and very often does, greatly injure the plant if the roots are frozen.

Grapery.—The grapevines started in January will have set its fruit, which should be thinned by one-third. The temperature may now be increased further advanced to 70° at night, with 15° higher in the daytime. The great injury to grapes is caused by flies, which are the greatest injury to grapes and insects as given in January. Grapery wanted for succession may be started in February or this month.

Perennials should, leave the greenhouses open as there is a busy mouth. In localities where the frost is out of the ground, if it is not wet, seeds of the hardier vegetables can be sown. The list of seeds given for the southern states in January may now be used at the north, while for most of the southern states tender vegetables, such as egg plant, okra, sweet potatoes, melon, squash, potatoes, tomatoes, &c., may be sown and planted. Hotbeds must now all be started. In March flower seeds and vegetable seeds may be sown in boxes or flats in the greenhouse, or in sections where the temperature is not so high. As may be sown under glass, or in hotbeds, in which the plants may be transplanted before they are set in the open ground, it is well not to start the seeds too early, inasmuch as the plants are likely to become too large or to be pot-bound, or to become deformed.

April

Flower Garden and Greenhouse.—Window and greenhouse plants require more water and ventilation. Due attention must be paid to shifting well-rooted plants into larger pots; and, if space is desired, many kinds of hardier plants can be safely put out in cold frames. Towards the end of the month it may be necessary slightly to shade the greenhouse, and great care must be taken to the greenhouses and shrubbery may be planted in the garden. The covering of leaves or litter should be taken off bulbs and tender plants that were covered up for winter, some being forked and raked. Sow tender annual and flower seeds in boxes inside.

Fruit Garden.—Strawberries that have been covered up with straw or leaves should be relieved around the plants, leaving the covering between them. Special care must be exercised that the manure which has not left on too long; the plants should not become whitened or "drawn." Raspberries, grape vines, &c., that have been laid down may now be uncovered and tied up to stakes or trellises, and all new...
plantations of these and other fruits may now be made. Fruit trees may be grafted.

Asparagus, rhubarb, spinach, &c., should be uncovered, and the beds hoed or dug lightly. Hardier sorts of vegetable seeds and plants, such as beets, cabbage, cauliflower, celery, lettuce, onions, parsley, parris, peas, potatoes, radishes, spinach, and so many others that all be placed in the garden in October or November, if the soil is dry and warm, in all cases, where practicable, before the end of the month. It is essential, in sowing seeds now, that they should be thoroughly dry. Any who expect to get early cabbage, cauliflower, lettuce or radishes, while planting out or sowing is delayed until the time of sowing tomato and egg plant in May, are sure to be disappointed of a full crop. Frequent rotation of crops is practiced in the vegetable garden, it is better to get off insects and diseases; and also to make the best use of the land. Every three or four years the vegetable garden should be laid out in some other place; but if this can be done, the crops should be rotated on different parts of the old garden.

May

Flower Garden and Greenhouse.—Window and greenhouse plants should be in their finest bloom. Firing may be entirely dispensed with, though care must still be exercised in ventilating. If weather is cold and backward, however, and in very northern regions, care must be taken not to stop firing too soon, or the plants will mildew and become stunted. Every precaution must be used to keep the air moist. "Moss culture" may be tried, the common sphagnum or moss of the swamps, mixed with one-twentieth of its bulk of bone-dust or guano, placed on the top of the earth of the flower-pots; its effect is to shield the pots from the sun, and at the same time stimulate the roots to come to the surface. When the greenhouse is not to be used during the summer months, cans, azaleas, and plants of that character should be set out of doors under partial shade; but most of the other plants usually grown in the conservatory or window garden in winter may be set in the open border. Flower-beds should be kept well hoed and raked to prevent the growth of weeds next month.

Pelargoniums, pinks, monthly roses and all the half-hardy kinds of flowering plants should be planted early, but coleus, heliotrope and the more tender sorts should be delayed until the end of the month. Annuals that have been sown in the greenhouse or hothouse may be planted out, and seeds of such sorts as mignonette, sweet alyssum, Phlox Drummondii, portulaca, &c., may be sown in the beds or borders. The Chinese aster is now one of the most popular of summer and fall plants. The seed may be sown in the north as late as the middle of May, or even the first of June, with good results for fall blooming. If the plants are started early in the greenhouse, they are likely to spend themselves before fall, and therefore a later sowing should be provided.

Lettuce and the edible mignonette should be kept in the beds or borders. The broken roots should be cut back to fresh wood, and the tops should be headed back in proportion.

Vegetable Garden.—Attention should be given to new sowings and planting in May. Crops can in most cases be thinned out in large enough. Howe deeply all transplanted crops such as cabbage, cauliflower, lettuce, &c. Tender vegetables, such as tomatoes, egg and pepper plants, sweet potatoes, &c., can be planted as long as the weather permits. Sow lettuce, beets, carrots, &c., should be sown; and sow for succession peas, spinach, lettuce, beans, radishes, &c., every ten days.

June

Flower Garden and Greenhouse.—Tropical plants can now be used to fill up the greenhouse during the summer months. It should be well watered. The bedding plants, layceonas, coleus, crotons, palms, ferns and such plants as are grown for the beauty of their foliage, will make a very attractive show. If these can be got in time, they may be used. The "moss culture" will be found particularly valuable for these plants. Yrains, tulips and other spring bulbs may be dug up, dried and placed away for next fall's planting, and their places filled with bedding plants, such as heliotropes, lantana, geraniums, white and yellow-leaved plants. It will be necessary to mow the lawn once a week, and sometimes oftener.

Flower Garden.—The small fruits should be mulched about the roots, if this has not yet been done. If the fruit garden is large enough to admit of horse culture, it is best to keep the bush-fruits well cultivated during the season; this tillage conserves the moisture and helps to make a full and plump crop of berries. In small areas the mulching system is sometimes practicable. Beets, carrots, corn, cucumbers, lettuce, peas and radishes may be sown for succession. This is usually a busy month, as many plants have to be gathered, and hoeing is not promptly seen, weeds are certain to give great trouble. The cucumbers should be tied up to trellises or stakes if fine-flavoured and handsome fruit is desired, for if left to ripen on the ground they are apt to have a gross earthy flavour.

July

Flower Garden and Greenhouse.—Watering, ventilating and fumigating (or the use of tobacco in other forms for destruction of aphides) must be attended to. The atmosphere of the greenhouse must be kept moist. Watch the plants that have been plunged out of doors, and the young ones that require much care, such as dahlias, roses, gladioli and many herbaceous plants, should now be looked to. Carnations and other plants that are throwing up flower stems, if sown to flower in winter, should be cut back, that is, the flower stems should be cut off to say 5 in. from the ground.

Fruit Garden.—If grape vines show any signs of mildew, dust them over with dry sulphur, selecting a still warm day. The fruit having now been gathered from strawberry plants, if new beds are to be formed, the system of layering the plants in small pots is the best. In general, field strawberries are not grown from potted layers, but the best and strong layers that strike naturally in the field. In the north, the planting of strawberries is most successful when the ground is well prepared and when it does not remain too wet, but is firm and light. Tomatoes are set fruit thickly, thin out at least one-half to two-thirds of the young fruit.

Vegetable Garden.—The first ten days of this month will you time enough to sow sweet corn, beets, lettuce, beans, cucumbers and rutabaga turnips. Such vegetables as cabbage, cauliflower, celery, &c., wanted for fall or winter use, are best planted this month, though in some sections they will do later. Keep sweet potatoes hoed to prevent the vines rooting at the joints.

August

Flower Garden and Greenhouse.—But little detail is required in these departments from the instructions for July. See that sufficient water is allowed to all the plants in the house.

Fruit Garden.—Strawberries that have fruited will now be making "runners," or young plants. These should be kept cut off close to the old plant, so that the full force of the root is expended in making the "crowns" or fruit buds for next season's crop. If plants are required for new beds, only the required number should be allowed to grow, and these may be layered in pots as recommended in July.

Vegetable Garden.—Hoe deeply such crops as cabbage, cauliflower and celery. The earthing up of celery this month is not to be recommended, unless a little very early supply is wanted. Onions in the south can be now thinned out. If the onions are between 4 and 5 ft. high, they will form three or four branches on a cane, and will make fewer fruiting tops in the hot weather.

September

Flower Garden and Greenhouse.—The flower-beds in the lawn should be at their best. If planted in "ribbon lines" or "massing," strict attention must be given to pinching off the tops, so that the lines or masses present an even appearance. The young plants should require to be put in the greenhouse or housed in some way towards the close of this month: but be careful to keep them as cool as possible during the day. Cuttings of bedding plants may now be made freely if wanted for next season's crop. The plants will make better plants for next spring's use than old plants, in the case of such soft-wooded plants as pelargoniums, fuchsia, verbena, heliotropes, &c., and marigolds, heliandra, pelargoniums, herbs, although old plants usually do best. Dutch bulbs, such as tulips, hyacinths, crocus, &c., and most of the varieties of lilies, may be planted. Violets that are wanted for winter flowering will now be growing freely; the nurserymen should have a large stock of all sorts; some for winter, some for market; many for cut flowers. The nodding purple False forget-me-not, candytuft, daisies, monigot, pansies, &c., Visit the roadside and woods for interesting plants to plant in the hardy borders.

Fruit Garden.—Strawberries that have been layered in pots may yet be planted, or in southern districts the ordinary ground layers may be planted. The sooner in the month both are planted the better crop they will give next season; and, as these plants soon
make runners, it will be necessary to trim them off. Attend to raspberries and blackberries as advised for last month, if they have not already been attended to. All fruit trees should be gone over for borers before cold weather sets in; they also should have been gone over for the season. For May:

Vegetable Garden.—If cabbage, cauliflower and lettuce are wanted to be planted in cold frames, the seed should be sown from about the 10th to the 20th of this month; but for winter, it should be sown at the same time. The chicory should be drawn up to celery with a hoe preparatory to earthing up with a spade. Onions that were not harvested and dried last month must now be attended to. Turnips of the early or flat sorts may yet be sown the first of the month in the northern states, and in the south from two to four weeks later.

October

Flower Garden and Greenhouse.—In northern sections of the United States, tender plants that are still outside should be put under cover as early as possible. Delay in using fire heat as long as possible, unless the nights become so cold as to chill the plants inside the house. Roses, carnations, camellias, azaleas, pelargoniums and the harder sorts of plants will do better if placed in a cold frame or pit until the middle of November than they would in an ordinary greenhouse. Look out for insects. Fall bulbs of all kinds may be planted. Take up the rhubarb, pokeweed, amaranth, and dahlia heads, and the gladiolus, canna, caladiums, tidigras, and dry them off thoroughly, stowing them away afterwards in some place free from frost and moisture during the winter. Before winter sets in so that the lawn is freely top-dressed. Be careful not to mow the grass too short in fall.

Fruit Garden.—Strawberries that have been grown from pot-grown layers may yet be planted in southern states; keep the runners trimmed and cut off as near the main plant as possible. If plants are deferred to the last of the month, the ground around the roots should be mulched to the thickness of 3 or 4 in. with straw, leaves or rough manure, as a protection against frost. The fruit garden must be protected from the ravages of mice in winter. Mice will nest about the plants if there is straw or other litter around them. Before winter, all tall grass and loose litter should be taken away; if this is not done, then the first snow should be piled heavily around the plants, in order to destroy any nesting-places.

Vegetable Garden.—Celery will now be in full growth, and will require close attention to earthing up, and during the last part of the month the first lot may be stored away in trenches for winter. All vegetable roots not designed to be left in the ground during the winter should be dug up, such as beets, carrots, parsnips, sweet potatoes, &c. The cabbage, cauliflower and lettuce plants grown for winter use may now be harvested; they should be cut back, but if planting is deferred to the last of the month, the ground around the roots should be mulched to the thickness of 3 or 4 in. with straw, leaves or rough manure, as a protection against frost. The fruit garden must be protected from the ravages of mice in winter. Mice will nest about the plants if there is straw or other litter around them. Before winter, all tall grass and loose litter should be taken away; if this is not done, then the first snow should be piled heavily around the plants, in order to destroy any nesting-places.

November

Flower Garden and Greenhouse.—Plants intended to be grown inside should now all be indoors. Keep a sharp look-out for cold snaps, as they come very unexpectedly in November, and many plants are lost through being exposed. In cases where no cold can be resisted by covering the plants over with paper, and by using this before frost has struck the plants valuable collections may be saved. When fire heat is freely used, be careful to keep the temperature up, and as the days grow colder, more frequent ventilation is required. Many gardens often become infected with diseases that are carried over from year to year in the old plants and litter; this is specially true of water-melons and of some diseases of tomatoes. It is well, therefore, to burn the fruits of the fall, rather than to plough them under or to throw them on the compost heap.

December

Flower Garden and Greenhouse.—Close attention must be paid to protecting all tender plants, for it is not uncommon to have the care of a whole year spoiled by one night’s neglect. Vigilance and extra hard work may then have to be exercised, if there be a frost between 30° and 35° in the parlour or conservatory. It is well to set the plants under the benches or on the walks of the greenhouses; if they are in the parlour, move them away from the cold point and protect them from the draughts. With plants outside that require straining up or to be mulched, this will have now to be finished.

Fruit Garden.—In sections where it is an advantage to protect grapes, raspberries, strawberries, and other fruits from severe winter weather, they should be planted down as close to the ground as possible, and covered with leaves, straw or hay, or with a few inches of soil. Grapes may be pruned. Fruit trees may be pruned from now till March in the north.

Vegetable Garden.—Celery in trenches should receive the final covering for the winter, which is best done by leaves or light stable litter; in the latitude of New York it should not be less than 12 in. thick. Potatoes, beets, turnips or other roots in pits, the spinach crop in the ground, or any other article in need of protection, should be attended to before the end of the month; manure and compost heaps should be forwardly as rapidly as possible, and turned and mixed. As soon as the snow has melted, it is a good plan with the manure heap to allow for the air to get in, and to cover it for eight or ten days. If roots have been placed in cellars, attention must be given to ventilation, which can be done by making a wooden box, say 6 by 8 in., to run from the ceiling of the cellar to the caves of the building. It does not require H. A. Anderson, R. F. B., Cultivator’s Handbook; B. Williams, The Orchid Grower’s Manual.
HORNE, C.—HOSE

HORTON, CHRISTIANA (c. 1596–c. 1756), English actress, first appeared in London as Melinda in The Recruiting Officer in 1714 at Drury Lane. Here she remained twenty years, followed by fifteen at Covent Garden. At both houses during this long career she played all the leading tragedy and comedy parts, and Barton Booth (who “discovered” her) said she was the best successor of Mrs. Oldfield. She was the original Mariana in Fielding’s Miser (1733).

HORNT, ROBERT FORMAN (1835–1919), British Nonconformist divine, was born in London on the 18th of September 1835. He was educated at Shrewsbury school and New College, Oxford, where he took first classes in classics. He was president of the Oxford Union in 1877. He became a fellow of his college in 1879, and lectured on history for four years. In 1880 he accepted an influential invitation to become pastor of the Lyndhurst Road Congregational church, Hampstead, and subsequently took a very prominent part in church and denominational work generally. He delivered the Lyman Beecher lectures at Yale in 1893; in 1898 he was chairman of the London Congregational Union; and in 1903 of the Congregational Union of England and Wales; in 1906 a prominent part in the 75th anniversary celebration of Hartford Theological Seminary. His numerous publications include books on theological, critical, historical, biographical and devotional subjects.

HORTON, SAMUEL DANA (1844–1895), American writer on bimetallism, was born in Pomeroy, Ohio, on the 16th of January 1844. He graduated at Harvard in 1864, and at the Harvard Law School in 1868, studied Roman law in Berlin in 1869, and in 1871 was admitted to the Ohio bar. He practised law in Cincinnati, and then in Pomeroy until 1885, when he gave up law for the advancement of bimetallism. His attention had been turned to monetary questions by the “greenback campaign” of 1875 in Ohio, in which, as in former campaigns, he had spoken, particularly effectively in German, for the Republican party. He was secretary of the American delegation to the Monetary Conference which met in Paris in 1878, and edited the report of the delegation. To the conference of 1881 he was a delegate, and thereafter he spent much of his time in Europe, whither he was sent by President Harrison in 1883 as special commissioner to promote the international restoration of silver. He died in Washington, D.C., on the 23rd of February 1895. Horton’s principal works were The Silver Pound (1883) and Silver in Europe (1890), a volume of essays.

HORUS (Egyptian Hör), the name of an Egyptian god, if not of several distinct gods. To all forms of Horus the falcon was sacred; the name Hör, written with a standing figure of that bird, is connected with a root signifying “upper,” and probably means “the high-flier.” The tame sacred falcon on its perch is the commonest symbol of divinity in early hieroglyphic writing; the commonest title of the king in the earliest dynasties, and his first title later, was that which named him Hor. He and his brother Seth were the presiding deities of Pto (Bo) and Nephen, which had been the two royal capitals in the capitals of the two primeval kingdoms of Upper and Lower Egypt, at Buto and opposite El Kab. A principal festival in very early times was the “worship of Horus,” and the kings of the prehistoric dynasties were afterwards called “the worshippers of Horus.” The Northern Kingdom in particular was under the patronage of Horus. He was the solar divinity, but appears very early in the Osiris cycle of deities, a son of Isis and probably of Osiris, and opponent of Seth. On monuments of the Middle Kingdom or somewhat later we find besides Hör the following special forms: Har-bhet, i.e. Hör of the Beh, the winged solar disk-god of Edfu (Apollonopolis Magna); Har-khetektah, god of Aithris; Har-mesen (whose principal sacred animal was a lion), god of the Sethroite (?) nome; Har-khetmena, i.e. the blind (?) Horus (with a shrew-mouse) at Letopolis; Har-mert (“of two eyes”) at Pharbuthus; Har-akht, Ra-har-akht, or Har-makht (Harmakhis, “Hör of the horizon”), the sun-god of Heliopolis.

As a sun-god Horus not only worshipped the hostile darkness and avenged his father, but also daily renewed himself. He was thus identical with his own father from one point of view. In the mythology, especially that of the New Kingdom, or of quite late times, we find the following standing epithets applied to more or less distinct forms or phases: Harendotes (Hör-ent-yt), i.e. Hör, avenger of his father (Osiris)”; Harpolkhretes (Har-p-khret), i.e. “Hör the child,” i.e. finger in mouth, beak in breast, and held in front of the Horus (Athribis); Harpolkhretes (Har-p-khret), i.e. “Hör, son of Isis,” as a child; Har-en-khēh, “Hör in Chemmis,” a child nursed by Isis in the papyrus marshes; Haroeris (Har-oeris), i.e. “the elder Hör,” at Ombos, &c., human-headed or falcon-headed; Harsemteus (Har-sem-teus), i.e. “Hör, uniter of the two lands,” and others.

In the judgment scene Horus introduces the deceased to Osiris. To the Greeks Horus was equivalent to Apollo, but in the name of Hermopolis Parva (see DAMANHUR), which must have been among the first of the Egyptian cities to be known to them, he was apparently identified with Hermes. Although the falcon was the bird most properly sacred to Horus, not only its varieties, but also the sparrow-hawk, kestrel and other small hawks were mumified in his honour in late times.

See Egypt; section Religion; Meyer, art. “Horus” in Röscher, Lexicon der Griech. und Röm. Mythologie; (F. L. G.)

HOBOR, an urban district in the Westhoughton parliamentary division of Lancashire, England, 4 m. W.N.W. of Bolton, on the Lancashire and Yorkshire railway. Pop. (1901) 15,084. It lies beneath the considerable elevation of Rivington Pike, where formerly was a great forest. It has extensive locomotive works, and there are large stone quarries in the district. Bleaching and cotton-spinning and the manufacture of fire-bricks and tiles are carried on.

HOZANA, the cry of praise or admiration shouted in recognition of the Messiah’s name on his entry into Jerusalem (Matt. xxii. 9, 15; Mark xi. 9 sq.; John xii. 13), and since used in the Christian Church. It is also a Jewish liturgical term, and was applied specifically to the “hozana” branches carried in procession in the Feast of Booths or Tabernacles, the seventh day of which was called the Hozana-day (so also in Syrian usage; cf. “Palm” Sunday). This festival (for which see Lev. xxiii. 39 sqq.; 2 Mac. x. 7; Jos. Ant. xii. 10, 14; xiii. 15; 13, and the Talmudic tractate Sukkah) already suggested a Dionysiac celebration to Plutarch (Symp. iv. 6), and was associated with a ceremonial drawing of water which it, believed, secured fertilizing rains in the following year; the penalty for abstinence was drought (cf. Zech. xiv. 16 sqq.). The evidence (see further Ency. Bib. cols. 3354, 4880 seq.; I. Levy, Rev. des Ét. juives, 1901, pp. 102 sqq.) points to rites of nature worship, and it is possible that in these the term Hosanna had some other application.

An interpretation “save, now!” which may be a popular etymology, is based on Ps. cxvii. 25 (Heb. ḥōzānāh-mān), but this does not explain the occurrence of the word in the Gospels, a complicated problem, on which see the articles of H. Thayer in Hastings’s Dict. of the Bible, and more especially T. K. Cheyne, Ency. Bib. s.v.

HOSE (a word common to many Teutonic languages; cf. Dutch, hoos, stockling; Ger. Hose, breeches, tights; the ultimate origin is unknown), the name of an article of dress,
used as a covering for the leg and foot. The word has been used for various forms of a long stocking covering both the foot and leg (see Hosea), and this is the usual modern sense. But it also formerly meant a kind of garter covering the leg from the knee to the ankle only, of the long tight covering for the whole of the lower limbs, and later of the shortuffed or slashed breeches worn with the doublet—at this period, from the early part of the 16th century onwards, comes the distinction between the "hose" or "trunk hose" and the stocking (see Costume). The term is applied to certain objects resembling such a covering, as in its application to flexible rubber or canvas piping used for conveying water (see Hosepipe), and in botany, to the "sheath" covering, e.g., the ear of corn. The term "hose-in-hose" is thus used in botany for a flower in which the corolla has become doubled, as though a second were inserted in the throat of the first; it occurs sometimes in the primrose.

**HOSEA**

The first part of Hosea's prophetic work, corresponding to chs. i.-iii., lay in the years of external prosperity immediately preceding the catastrophe of the house of Jehu in or near the year 743. The second part of the book is a summary of prophetic teaching during the subsequent troublous reign of Menahem, and, perhaps, that of his successor, Pekahiah, and must have been completed before 734 B.C. Apart from the narrative in chs. i.-iii., to which we shall presently recur, the book throws little or no light on the details of Hosea's life. It appears from ix. 7, 8, that his prophetic work was greatly embarrassed by opposition: "As for the prophet, a fowler's snare is in all his ways, and enmity in the house of his God." The enmity which had its centre in the sanctuary probably proceeded from the priests (comp. Amos vii.), against whose profi- anguish and profanation of their office our prophet frequently declares—perhaps also from the degenerate prophetic gilds which had their seats in the holy cities of the northern kingdom, and with whom Hosea's elder contemporary Amos so indignantly refuses to be identified (Amos vii. 14). In ch. iv. 5 Hosea seems to comprise priests and prophets in one condemnation, thus placing himself in direct antagonism to all the leaders of the religious life of his nation. He is not less antagonistic to the kings and princes of his day (vii. 3-7, viii. 4, vii. 10 Septuagint, x. 7-15, xiii. 11). In view of the familiarity shown with the intrigues of rulers and the doings of priests, it has been conjectured that Hosea held a prominent position, or even (by Duhm) that he was himself a priest (Martí, p. 2).

The most interesting problem of Hosea's history lies in the interpretation of the story of his married life (chs. i.-iii.). We read in these chapters that God's revelation to Hosea began when in accordance with a divine command he married a profligate wife, Gomer, the daughter of Diblaim. Three children were born in this marriage and received symbolic names, illustrative of the divine purpose towards Israel, which are expounded in ch. i. In ch. ii. the faithlessness of Israel to Jehovah (Yahweh), the long-suffering of God, the moral discipline of sorrow and tribulation by which He will yet bring back His erring people and betroth it to Himself for ever in righteousness, love and truth, are depicted under the figure of the relation of a husband to an erring spouse. The suggestion of this allusion lies in the prophet's marriage with Gomer, but the details are worked out quite independently, and under a rich multiplicity of figures derived from other sources. In the third chapter we return to the personal experience of the prophet. His faithless wife had at length left him and fallen, under circumstances which are not detailed, into a state of misery, from which Hosea, still following her with tender affection, and encouraged by a divine command, brought her back and restored her to his house, where he kept her in seclusion, and patiently watched over her for many days, yet not readmitting her to the privileges of a wife.

In these experiences the prophet again recognizes a parallel to Yahweh's long-suffering love to Israel, and the discipline by which the people shall be brought back to God through a period in which all their political and religious institutions are overthrown. Throughout these chapters personal narrative and prophetic allusion are interwoven with a rapidity of transition very puzzling to the modern reader; but an unbiased exegesis can hardly fail to acknowledge that chs. i. and iii. narrate an actual passage in the prophet's life. The names of the three children are symbolic, but Isaiah in like manner gave symbolic names to his sons, embodying prominent points
in his prophetic teaching (Shear-jashub, Isa. vii. 3, comp. x. 21; Mahler-shalal-hash-baz, viii. 3). And the name of Gomer bath Didlaim is certainly that of an actual person, upon which all the allegorists, from the Targum, Jerome and Ephiama Syrus downwards, have been at variance, whereas the names of biblical names in the book are perfectly easy of interpretation. \(^1\)

That the ancient interpreters take the whole narrative as a mere parable is no more than an application of their standing rule that everything in the Biblical history is allegorical which in its literal sense appears offensive to propriety (comp. Jerome's proem to the book). But the supposed offence to propriety seems to rest on mistaken exegesis and too narrow a conception of the way in which the Divine word was communicated to the prophets. \(^2\)

There is no reason to suppose that Hosea knowingly married a woman of prostitution, as some have charged. The mode of his departure from the covenant God, and a profligate wife (coele saera) is not the same thing with an open prostitute (cf.). The marriage was marrid by Gomer's infidelity; and the struggle of Hosea's affection for his wife with this great unhappiness—a struggle inconceivable unless his first love had been pure and full of trust in the purity of its object—furnished him with a new insight into Yahweh's dealings with Israel. Then he recognized that the great carelessness of his life, the sin and apostasy means God intended him to communicate to him a deep prophetic lesson.

The recognition of a divine command after the fact has its parallel, as Wellhausen observes, in Jer. xxxix. 8.

It was in the experiences of his married life, and in the spiritual lessons opened to him through these, that Hosea first heard the revealing voice of Yahweh (i. 2). \(^3\) Like Amos (Amos iii. 8), he was called to speak for God by an inward constraining voice, and there is no reason to think that he had any connexion with the recognized prophetic societies, or ever received such outward office to as was given to Elisha. His position in Israel was one of tragic isolation. Amos, when he had discharged his mission at Bethel, came to his home and to his friends; Hosea was a stranger among his own people, and his voice was full of sorrow and shame. Isaiah in the gloomiest days of Judah's declensions had faithful disciples about him, and knew that there was a believing remnant in the land. Hosea knows no such remnant, and there is not a line in his prophecy from which we can conclude that his words ever found an obedient ear.

As already stated, this prophecy falls into two clearly distinguished sections, \(^4\) the former (i.-iii.), already dealt with, accounting for the general standpoint of the latter (iv.-xiv.). It is not possible to make any convincing subdivisions of this latter section (cf. G. A. Smith, i. p. 223) which is best regarded as a series of separate discourses on certain recurrent topics, viz. (a) the cultus, (b) the social disorder and immorality, (c) political tendencies (alliance with either Assyria or Egypt sought). \(^5\)

In regard to each of these topics, the attitude of the prophet involves the discernment of present guilt, and the assertion of future punishment. For him the present condition of the people contained no germ or pledge of future amendment, and he described the impending judgment, not as a slumbering process (Amos ix. 9, 10) in which the wicked perish and the righteous remain, but as the total wreck of the nation which has wholly turned aside from its God. In truth, while the idolatrous feasts of Ephraim still ran their joyous round, while the careless people crowded to the high places, and there in unbridled and licentious mirth flattered themselves that their many sacrifices ensured the help of their God against all calamity, the nation was already in the last stage of internal dissolution. To the prophet's eye there was "no truth, nor mercy, nor knowledge of God in the land—nowhat but swearing, and lying, and killing, and stealing and adultery; they break out, and blood toucheth blood" (iv. 1, 2). The root of this corruption lay in total ignorance of Yahweh, whose precepts were no longer taught by the priests, while in the national calf-worship, and in the local high places, this worship was confounded with the service of the Canaanite Baalim. Thus the whole religious constitution of Israel was undermined. And the political state of the realm was in Hosea's eyes not more hopeful. The dynasty of Jehu, still great and pious, when the prophet's labours began, is itself an incorporation of national sentiment. For Hosea to the idea of a marriage between the deity and individual worshipping was actually current and connected with the immorality which Hosea often condemns in the worship of the local Baalim whom the ignorant people identified with Yahweh. For we have a 'Punic woman's name, ') which was the betrothed of Baal' (Eating, Punische Steine, pp. 9, 15), and a similar conception existed among the Babylonians (Herod. i. 181, 182). But Hosea takes the idea of Yahweh as husband, and gives it an altogether different turn, filling it with a new and profound meaning, based on the psychological experiences of a deep human affection in context with outraged honor and heart-degradation of the house. It may be supposed that all that lies in these chapters is an abstract study in the psychology of the emotions. It is actual human experience that gives Hosea the key to divine truth.

\(^1\) Theodor Mora, remarks very justly, καὶ τὸ δόμα καὶ τὸ πατρίς λέγει, ως μὴ πλήγγα ὡς λέγοντι τὸ λεγόμενον, ἵστορια ἡ ἅλλη τῆς προγένετος.

\(^2\) This explanation of the narrative, which is essentially Ewald's, is generally accepted. It has the great advantage of supplying a psychological key to the conception of the land or Israel (i. 2) as the spouse of Yahweh, which dominates these chapters, but in the later part of the book gives way to the personification of the nation as God's son. This conception has, indeed, formal points of contact with notions previously current, and even with the ideas of Semitic heathenism. On the one hand, it is a standing Hebrew usage to represent the land as mother of its people, while the representation of worshippers as children of their god is found in Num. xxii. 29, where the Moabites are called children of Chemosh, and is especially frequent throughout the Book of Zachariah (Arch. vi. 43; Jour. of Phil. ix. 82). The combination of these two notions gives at once the conception of the national deity as husband of the land. On the other hand, the designation of Yahweh as a husband in accordance with the view of marriage as a means husband as well as lord and owner, was current among the Israelites in early times, perhaps, indeed, down to Hosea's age (iii. 1-4). Now it is highly probable that among the idolatrous Israelites the idea of a marriage between the deity and individual worshippers was actually current and connected with the immorality which Hosea often condemns in the worship of the local Baalim whom the ignorant people identified with Yahweh. For we have a 'Punic woman's name, ') which was the betrothed of Baal' (Eating, Punische Steine, pp. 9, 15), and a similar conception existed among the Babylonians (Herod. i. 181, 182). But Hosea takes the idea of Yahweh as husband, and gives it an altogether different turn, filling it with a new and profound meaning, based on the psychological experiences of a deep human affection in context with outraged honor and heart-degradation of the house. It may be supposed that all that lies in these chapters is an abstract study in the psychology of the emotions. It is actual human experience that gives Hosea the key to divine truth.

\(^3\) Davidson (D.B. ii. 432) remarks that "it was not his misfortunes that gave Hosea his prophetic word. Israel's apostasy was plain to him, and he foreshadowed her doom in Jezreel, the name of which, pronounced, in accordance with the Canaanite rule, and his misfortunes may at a later time have given a complexion to his prophetic thoughts."

\(^4\) Wellhausen (p. 108) objects to the emergence of the call from the experience, on the ground that the name given to his mistress was due to mere indication, which had yet reached his specific message, the infidelity of his wife and of Israel, though it shows him already as a prophet. Marti (p. 15) agrees with Davidson in maintaining this view, but another view, that his mistress is identified with a prophetess, and that his misfortunes are a punishment for her infidelity, is not inconsistent with Hosea's own statement: "It is the wish of Yahweh, the God of Israel, who hath spoken the words before me, to humble me in the eyes of the wife, to the end that I may perceive the infidelity of my wife and of Israel, though it shows him already as a prophet. Marti (p. 15) agrees with Davidson in maintaining this view, but another view, that his mistress is identified with a prophetess, and that his misfortunes are a punishment for her infidelity, is not inconsistent with Hosea's own statement: "It is the wish of Yahweh, the God of Israel, who hath spoken the words before me, to humble me in the eyes of the wife, to the end that I may perceive the infidelity of my wife and of Israel, though it shows him already as a prophet.

\(^5\) Comprehensive of the significance of marriage for himself and for Israel. The statement above must be interpreted of Hosea's specific message from Yahweh, as recorded in his book.
Hosea could discern no faithful remnant in Ephraim, yet Ephraim in all his corruption is the son of Yahweh, a child nurtured with tender love, a chosen people, whose past history declares in every episode the watchful and patient affection of his father. And that father is God and not man, the Holy One who will not and cannot sacrifice His love even to the justest inclination (chap. xii.). To the prophet who knows this love of Yahweh, and seeks to understand it in the like experience of his own life, the very ruin of the state of Israel is a source of loving guidance which makes the valley of trouble a door of hope (ii. 13), and the wilderness of tribulation as full of promise as the desert road from Egypt to Canaan was to Israel of old. Of the manner of Israel's repentance and conversion Hosea presents no clear image—nay, it is plain that on this point he had nothing to tell. The certainty that the people will at length return and seek Yahweh their God rests, not on any germ of better things in Israel, but on the invincible supremacy of Yahweh's love. And so the two sides of his prophetic declaration, the passionate denunciation of Israel's sin and folly, and the not less passionate tenderness with which he describes the final victory of loving love, are united by no logical bond. The unity is one of feeling only, and the sob of anguish in which many of his appeals to a heedless people seem to end turns once and again with sudden revulsion into the clear accents of evangelistic promise, which in the closing chapter swell forth in pure and strong cadence out of a heart that has found its rest with God from all the troubles of a stormy life.

The strongly emotional temperament of Hosea suggests comparison with that of Jeremiah, who like himself is the prophet of the decline and fall of a kingdom. The subsequent influence of Hosea on the development of prophetic art in the Old and New Testaments is very marked. Not only is it seen in the concentration of the relation between God and His people as a marriage, which he makes current coin (cf. Marti, p. 15), but still more in the fact that his conception of the divine character becomes the inspiration of the book of Deuteronomy and so of the whole canon of Scripture. "In a special degree, the author of Deuteronomy is the spiritual heir of Hosea."

**Biblica, ii. c. 2119 (1901) (a revision of the original article by W. R. Smith, in the Ency. Britannica, partially reproduced above); Marti, Deutero prophetein (1903); W. R. Harper, "Amos and Hosea" in Inter. Critical Commentary (1905) (with copious bibliography) (W. R. S.; H. W. R.)*

**HOSE-PIPE, or simply "hose," the name given to flexible piping by means of which water may be conveyed from one place to another. One end of the pipe is connected to the source of the water, while the other end is free, so that the direction of the stream of water which issues from the pipe may be changed at will. The method of manufacture and the strength of the materials used depend generally upon the particular use to which the finished article is to be put. Simple garden hose is often made of India-rubber or composition, but the hose intended for fire brigade and similar important purposes must be of a much more substantial material. The most satisfactory material is the best long flax, although cotton is also extensively used for many types of this fabric.

The flax fibre, after having been carefully spun into yarn, is boiled twice and then beatled; these two processes remove all injurious matter, and make the yarn soft and lustrous. The yarn is then wound on to large bobbins, and made into a chain; the number of threads in the chain depends upon the size of the hose, which may be anything from half an inch to 15 in. or even more in diameter. When the chain is warped, it is then alternately drawn through the leaves of the cambs of heddles, passed through the reed and finally tied to the cloth beam. The preparation of the warp for any kind of loom varies very little, but the weaving may vary greatly. In all the hose fabric is essentially circular, although it appears quite flat during the weaving operation.

There are very few hand-made fabrics which can compete with the machine-made article, but the very best type of hose-pipe is certainly one of the former class. The cloth can be made much more cheaply in the power-loom than by hand. But, up to the present, no power-loom has been made which can weave as substantial a cloth as the hand-loom product; the weak part in all hose-pipes is where the weft passes round the sides from top to bottom of the fabric or vice versa, that is, the side corresponding to the selvages in an ordinary cloth; the hand-loom weaver can draw the weft tighter than is possible in the power-loom, hence the threads at the sides can be brought close together, and by this means the fabric is made almost, but not quite, as perfect here as in other parts. It is essential that the warp be held tightly in the loom, and to secure this, they pass alternately over and under three or four back rests before reaching the heddles or cambs, which are also generally made of wire. Although the warp yarn is made very soft and pliable by boiling and beating, the weaver always allows it in order to make it work more easily.

The commonest type of hose-pipe is made on the double-plain principle of weaving, the cloth being perfectly plain but woven in such a manner that the pipe is without seams of any kind. Fig. 1 is a design showing two repeats or eight shots in the way of the weft, and six repeats or twenty-four threads in the way of the warp, consequently the weave is complete on four threads, or leaves, and four picks. Fig. 2 illustrates the method of interlacing the threads and the picks: this figure shows that twenty-three threads only are used, the first thread—shown shaded in fig. 1—having been left out. It is necessary to use a number of threads which is either one less or one more than some multiple of four—the number of threads in the weft. The sectional view (fig. 2), although indicating the crossings of the warp and the weft, is quite different from an actual section through the threads: the warp is almost invariably two or three ply, and in addition two or more of these twisted threads pass through the same heddle-eye in the cam; moreover, they are set very closely together—so closely, indeed, that the threads entirely conceal the weft; it is, therefore, impossible to give a correct
HOSHANGABAD—HOshIARPUR

sectional view with satisfactory clearness, as the threads are so very rank, but fig. 3 gives some idea of the structure of the warp and weft. The view shows nine horizontal and one complete round of weft; this round is, of course, equal to two picks or shots—one pick for the top part of the cloth and one for the bottom part. A comparison of this figure with fig. 2 will, perhaps, make the description clearer.

The weft in fig. 3 is thinner than the warp, but, in practice, it is always much thicker, and may consist of from two to seventy threads twisted together.

The weft threads are also woven with the three-leaf twill on both sides, and occasionally with the four-leaf twill. These threads, woven with the twill weft, were originally lined with a rubber tube which is fixed to the inside of the cloth by another layer of rubber after the cloth leaves the loom. Such pipes have usually, but not invariably, a smoother inner surface than those which are unlined, hence, when they are used, less friction is presented to the flow of water, and there is less tendency for the pipe to leak. They are, therefore, suitable for hotels, public buildings and similar places where their temporary use will not result in undue damage to articles of furniture, carpets and general decorum.

The greatest care must be observed in the weaving of these fabrics; the slightest flaw in the structure rendering the article practically useless. After the cloth has been woven, it is examined, and then steeped in a chemical solution which acts as an antiseptic. The cloth is thus effectively preserved from mildew, and, in addition, made more pliable. Finally, the hose-pipe is dried critically, and then fitted with the necessary coupling.

For a more detailed description of circular weaving see Woodhouse and Milne, Textile Design: Pure and Applied. 

T. Wo.

HOSHANGABAD, a town and district of British India, in the Nerbudda division of the Central Provinces. The town stands on the left bank of the Nerbudda, 1009 ft. above the sea, and has a railway station. Pop. (1901), 14,940. It is supposed to have been founded by Hoshang Shah, the second of the Ghori kings of Malwa, in the 15th century; but it remained an insignificant place till the Bhopal conquest about 1720, when a massive stone fort was constructed, with its base on the river, commanding the Bhopal road. It sustained several sieges during the 18th century, and passed alternately into the hands of the Bhopal and Jindpur rulers. Since 1818 it has been the residence of the chief British officials in charge of the district. It has a government high school, agricultural school and a brass-working industry.

The District of Hoshangabad has an area of 3676 sq. m. Pop. (1901), 449,163, showing a decrease of 10% in the decade, due to famine. It may be described as a valley of varying breadth, extending for 150 m. between the Nerbudda river and the Satpura mountains. The soil consists chiefly of black basaltic alluvium, often more than 20 ft. deep, but along the banks of the Nerbudda the fertility of the land compensates for the tameness of the scenery. Towards the west, low stony hills and broken ridges cut up the level ground, while the Vindhyas and the Satpuras throw out jutting spurs and ranges. In this wilder country considerable regions are covered with jungle. On the south the lofty range which shuts in the valley is remarkable in mountain scenery, surpassing in its picturesque irregularity the Vindhyan chain in the north. Many streams take their rise amid its precipices, then, winding through deep gorges, flow across the plain between sandy banks covered with low jungle till they swell the waters of the Nerbudda. None is of any importance except the Tawa, which is interesting to the geologist on account of the many minerals to be found along its course. The boundary rivers, the Nerbudda and Tapti, are the only considerable waters in Hoshangabad. The principal crops are wheat, millets and oil-seeds. The district is traversed throughout by the Great Indian Peninsula railway.

HOsHEA (Heb. for "deliverance"), the last king of Israel, in the Bible. The attempt of his predecessor Pekah to take Jerusalem with the help of his father-in-law was frustrated by the intervention of Tiglath-Pileser IV. (see AHAZ), who attacked Gilead, Galilee and the north frontier, and carried off some of its population (cp. 1 Chron. v. 26). Pekah's resistance to Assyria led to a conspiracy in which he lost his life, and Hoshea the son of Elah became king (2 Kings xv. 27-30). The Assyrian king held him as his vassal (and indeed claims to have set him on the throne), and exacted an annual tribute. Meanwhile, Damascus was captured (733-732 B.C.), Ra'am was slain and the inhabitants deported (2 Kings xvi. 9; LXX. omits "to Kir," but see Amos i. 5). The impending fate of Damascus is illustrated by Issiah (vii. 16, viii. 4, xvi. 11), who also gives a vivid description of the impression left by the Assyrian army (v. 26-30). After the death of Tiglath-Pileser, Israel regained confidence (Isa. ix. 8-5.4) and took steps to recover its independence. Its policy vacillated at times like a silly dove (Hos. vii. 11), and at length negotiations were opened with Meroë. The annual payment of tribute ceased and Shalmaneser IV. (who began to reign in 727 B.C.) at once laid siege to Samaria, which fell at the end of three years (722-721 B.C.). The achievement is claimed by his successor Sargon. Hoshea was killed, the land was again partly depopulated and a governor appointed (2 Kings xviii. 9-12; cp. xviii. 1 sqq.). For other allusions to this period see Hosea, ISAIAH.

2 Kings xxvii. 3 and 5 imply two attacks by Shalmaneser: in the first, by which Hoshea was captured (Cheyne, ed., "shut him up" in v. 4), although in v. 6 he is still reigning; see on this Winckler, Keilinschr. u. Alter Test., p. 268; Burney, Kings, p. 328 seq.; Skinner, Kings, p. 372 seq. The chronological confusion, however, is not great, and the cartouches of the Assyrian monarchs are dated 598, 596 and 593 B.C. While, therefore, the invasion of Hoshea was later than 598 B.C., it was not in the year 593 B.C., the last year of his reign.

From the conclusion of the Assyrian treaty, it is clear that two tenths of the land and two fiftieths of the produce was to be paid to Assyria, and that the Assyrians were to protect the country against the threats of Egypt. Nevertheless, there is no positive evidence that Assyria had in fact any compunction to make good its promise of protection. The Assyrian records name a certain Sibi as officer, and also Piru (Pharaoh) as king of Mussiri, and it is doubtful whether Hoshea's ally was a petty prince of Egypt or of a N. Arabian district (see MIZRAIM). If the latter, Hoshea's policy becomes more intelligible; see Whitehouse, Isaiah, p. 17 seq.; Jews: History; Philistine. On the depopulation of Samaria and the introduction of Assyrians, see Whittaker's Oriental Allusions, pp. 95-107, with Burney's criticisms, Kings, P. 334 seq. 

HOshIARPUR, a town of British India, in the Jullundur division of the Punjab. Pop. (1901), 17,549. It was founded, according to tradition, about the early part of the 14th century. In 1809 it was occupied by Ranjit Singh. The maharaja and his successors maintained a considerable cantonment of 13 m. S.E. of the town, and the British government kept it up for several years after the annexation of the Punjab in 1849. There are manufactories of cotton goods, inlaid woodwork, lacquered ware, shoes and copper vessels.

The District of Hoshiarpur comprises an area of 2244 sq. m.; pop. (1901) 98,782, showing a decrease of 2% in the decade, compared with an increase of 12% during the previous decade. It falls into two nearly equal portions of hill and plain country. Its eastern face consists of the westward-facing range of the Solar Singhis; parallel with that ridge, a line of lower heights belonging to the Siwalik range traverses the district from south to north, while between the two chains stretches a valley of uneven width, known as the Jaswan Dun. Its upper portion is crossed by the Sohan torrent, while the Sutlej sweeps into its lower end through a break in the hills, and flows in a southerly direction till it turns the flank of the central range, and debouches westwards upon the plains. This western plain consists of alluvial formation, with a general westerly slope owing to the deposit of silt from the mountain torrents in the sub-montane tract. The Beas has a fringe of lowland, open to moderate but not excessive inundations, and considered very fertile. A considerable area is covered by government woodlands, under the care of the forest department. Rice is largely grown, in the marshy flats along the banks of the Beas. Several religious fairs are held, at Anandpur, Mukerian and Chinipuri, all of which attract an enormous concourse of people. The district, owing to its proximity to the hills, has a characteristic type of Cordilleran and humid climate. Cotton fabrics are manufactured, and sugar-cane and other grains, tobacco and indigo are among the exports.
The country around Hoshiarpur formed part of the old Hindu kingdom of Katoch in Jullundur. The state was eventually broken up, and the present district was divided between the rajas of Ditarpur and Jaswan. They retained undisturbed possession of their territories until 1759, when the rising Sikh chieftains commenced a series of encroachments upon the hill tracts. In 1815 the aggressive maharaja, Ranjit Singh, forced the ruler of Jaswan to resign his territories in exchange for an estate on feudal tenure; three years later the raja of Ditarpur met with similar treatment. By the close of the year 1818 the whole country from the Satlej to the Beas had come under the government of Lahore, and after the first Sikh war in 1846 passed to the British government. The deposed rajas of Ditarpur and Jaswan received cash pensions from the new rulers, but expressed bitter disappointment at not being restored to their former sovereign position. Accordingly the outbreak of the second Sikh war, in 1848 found the disaffected chieftains ready for rebellion. They organized a revolt, but the two rajas and the other ringleaders were captured, and their estates confiscated.

**HOISERY**, a term used to designate all manufactured textile fabrics which in their process of manufacture have been built on the principle of looping or loop structure. The origin of the term is obvious, being derived from "hose" or stocking, this being one of the earliest garments made by the process of knitting (q.v.). While it still forms one of the staples of the trade, it is only one of a very numerous and diversified range of applications of the entire industry. The elastic structure of knitting makes it very adaptable for all kinds of body or underwears. There is scarcely a single textile article manufactured but can be reproduced on the knitting or loop structure principle. The art of knitting is of very modern origin as compared with that of weaving. No certain allusion to the art occurs before the beginning of the 15th century. In an act of parliament of Henry VII. (1489) knitted woollen caps are mentioned. It is supposed that the art was first practised in Scotland, and thence carried into England, and that caps were made by knitting for some period before the more difficult feat of stocking-making was attempted. In an act of Edward VI. (1553) "knitte hose, knitte peticotes, knitte gloves and knitte sleeves" are enumerated, and the trade of hosiers, among others, included in an act dated 1563. Spanish silk stockings were worn on rare occasions by Henry VIII., and the same much-prized articles are also mentioned in connexion with the wardrobe of Edward VI.

Knitting, or loop formation by mechanical means, is divided into two distinct principles—frame-work knitting and warp knitting. Both principles may be employed in the formation of a large variety of plain and fancy stitches or a combination of the two.

**Frame-work Knitting** in its simplest form consists of rows of loops supporting each other—built from one continuous thread of yarn and running from one side of the fabric to the other and back frame-work knitting. For this reason it is largely used in the shawl, glove and fancy hosiery industries.

**Machinery.**—In hand knitting the implements employed (a few needles or wires) are very simple and inexpensive. In the manufacturing industry the most complex and ingenious machinery is used. In 1858 the Rev. William Lee a graduate of St. John's College, Cambridge, while acting as curate (or vicar) of Silverton, Nottinghamshire, introduced his stock-keeping-frame. This frame was the first mechanical means employed to produce a looped or loops or work hanging round the needle shanks. This frame or machine of Lee's was the origin of all the hosiery and lace machines at present in use. One of the most remarkable points about his invention was its completeness and adaptability for the work for which its inventor intended it. The main principles of Lee's frame are embodied in most of the rotary or power frames of the present day. Fig. 3 shows a hand frame of the present day.

In hand knitting an indefinite number of loops are skrewed on a wire or pin, but, in Lee's frame, an individual hooked or beaded needle is employed for the support and formation of each loop in the breadth of the fabric. This needle consists of a shank with a round or double-pointed hook (or beard), the point of which can be pressed at will into a groove or eye in the shank. For method by which the loops are formed on the needles of the frame see fig. 4. This shows a few of Lee's hooked or beaded needles having the old looped beard, or beard being made, so that a regular and level fabric will be produced. The looping or waving is obtained by having thin plates of shaped metal, called sinksers, which have a nose-shaped point and hang between the needles. When looping they have an individual movement downward between the needles, and as they fall the nose-shaped point carries the yarn down, thus forming the new loop (fig. 5). The size of the loop is regulated by the distance the sinker is allowed to fall. After the thread of yarn has been looped between the needle shanks by the sinkers, the loops are brought forward under the needle heads or hooks. A presser bar is now brought down to close or press all the points of the needle heads together, thus binding the loops tightly. When all the head ends of the needles are temporarily closed, with the newly formed loops under them. While in this position, the old loops hanging round the needles are brought forward and landed on to the top of the needle-beard and the needle together, being thus left hanging round, or supported by the loops newly formed. The needle beards are now released, and the loops drawn back along the shanks to be in position for the next new course of loops. The foregoing is only an outline of how the loops are formed on the needles. It is not necessary here to enter into a description of the complex mechanical movements of Lee's stock-ing-frame. The first fabric made by Lee was of a

---

**Fig. 2.**—A Single Thread formed into a Chain of Crochet Work, showing the Loop Structure of the plain Warp-knitted Fabric. It is built up as shown in the diagram by a number of threads running up the fabric (fig. 1). It is on this principle of stitch that the greatest amount of hosiery is built (hose, shirts, pants).

**Warp Knitting** in its simplest form consists of rows of loops, but the number of threads employed are equal to the number of loops in the width of the fabric. Thus it will be seen that the threads run lengthwise of the fabric (fig. 2). This principle gives greater scope for reproducing designs in openwork and colour than that of...
flat, even-selvedged nature, so that garments had to be cut to
shape from the fabric. He soon learned to fashion or shape the
garment at will, during the process of making, by transferring loops

![Diagram 1](image1)

**FIG. 1.**

**FIG. 5.—Formation of a Loop on a Hand Frame.**

1. Beaded needle cast in the lead. A, Lead; B, Shank; C, Eye; D, Beard.
2. The thread is laid over the needles and formed into loops between
the needles by means of the sinkers, those new-formed loops
being brought under the needle beards (as at 3).
3. The beards pressed or closed to allow the old loops to be passed
on to the top.
4. The old loops knocked off the needles and left hanging round the
newly formed loops.
5. At the edges, inwards to narrow, or outwards to widen. This process
at the present day is known as fashioning, and all garments of the
best make are shaped or fashioned in this manner. After Lee had
practised his new art for a few years at Calverton he removed to
London, but on his receiving no help or encouragement from Queen
Elizabeth or her successor, King James, he was induced to cross over
to France with his frames. There he built up a flourishing industry
at Rouen, under the patronage of the French King, Henry IV.
Through the murder of this monarch he lost his patronage and died of
want about the year 1610. He was buried in an unknown grave in
Paris.

A number of improvements had been made on Lee’s frame during
the 18th century. The one of greatest importance was the rib
machine invented by Jedediah Strutt of Belper in 1758. It was
not what could be actually termed an improvement on Lee’s frame,
but an addition to it. Lee’s frame was not altered in any way,
Strutt’s machine being added to it, and the two being worked in
conjunction produced a fabric of a more elastic nature and alike
on both sides (Fig. 6). Strutt’s machine consisted of a set of needles
placed at right angles to and between Lee’s plain needles, with the result that, when
knitting, the frame needles drew their loops to one side and the machine needles their
loops to the opposite side of the fabric. The
first offshoot from frame-work knitting was
the invention of the hand warp loom in
1775. It was improved by the addition of
the Dawson wheel by William Dawson in
1791. This machine is the origin of the various
complex machines now working on
this principle. Some of these have Jacquard mechanism attached,
and nearly all of them are driven by motive power. About the
middle of the 19th century a close on 5,000 of Lee’s hand frames
were in use, finding employment for nearly 100,000 persons. Many
attempts had been made previously to transform Lee’s frame into a
power or rotary frame. One of the first and most successful was
that invented by Luke Barton in 1857. This frame was fitted with
self-acting mechanism for fashioning, and was practically Lee’s
frame having rotary shafts with cams added to give the various
movements, this type of frame being known as straight bar rotary
frames. In 1864 William Cotton of Loughborough altered this
frame by reversing the positions of the needles and sinkers. Although
made by various builders it is still known as the “Cotton Patent
Rotary Frame” (Fig. 7). Since 1864 a great number of important
improvements and additions have been made to this frame. Single
frames are built which will turn off a dozen pairs of hose at once,
with the attention of one person. One of the most important
inventions in connection with the hosiery trade was the latch, tumbler,
or self-acting needle invented by Matthew Townsend and
David Moulding of Leicester in 1858. Previous to this
Lee’s type of needle was the only one in use. This latch-
neddle (Fig. 8) consists of a stem having a butt at lower
end by which it receives its knitting action from cams.

![Diagram 2](image2)

HOSIUS—HOSKINS

the upper end being turned into a hook. Near the hook end and attached to the stem by a pin is the spoon-shaped latch, which closes over the hook as the plain and fancy hosiery is made. Machines fitted with needles have grooves in which the stem of the needle works. Cams, which act on the needle points, give the machine an individual knitting action in rotation. This needle is self-threading and has a special hook that it is made to draw its own loop, sinners being dispensed with.

Fig. 9 shows the looping action of this needle. The needle, when not knitting, has a loop round their Shank, thus holding the latch open. When about to knit, they are raised individually and in rotation (by the cams acting on the needle butts) to receive the new loop of yarn.

Down till almost the middle of the 19th century only a flat web could be knitted in the machines in use, and for the finishing of stockings, &c., it was necessary to seam up the selvedges of web shaped on the frame (fashioned work), or to cut and seam them from even web (cut work). The introduction of a device for unfolding which seamless garments could be fabricated was obviously a great desideratum, and it is a singular fact that a machine capable of doing this was patented in 1816 by Sir Marc J. Brunel. This frame was the origin of the French-German loop-wheel circular frame of the present day. Brunel's frame was greatly improved by Peter Claussen of Brussels and was shown at an exhibition in Nottingham in 1845. This frame had horizontal placed needles fixed on a rotating rim. A few years later Moses Mellor of Nottingham transformed this type of frame by altering the position of the needles to perpendicular. This is now known as the English loop-wheel circular frame. After the invention of the latch-needle there was a revolution in the hosiery machine-building industry, new types of machines being invented, fitted to work with latch-needles. Among others there was the latch-needle circular frame, invented by Thomas Thompson, which was the origin of the English latch-needle circular frame, a frame largely used for the production of wide circular fabrics.

A circular knitting machine of American origin is the type of machine on which is produced the seamless hosiery of to-day. Like the sewing machine it is largely used in the home as well as in the factory. From this machine all the circular automatic power machines for making plain and rib seamless hose and half hose have been developed. The "flat" or "lamb" type of machine, an American invention, was introduced by J. W. Lamb in 1863. This machine has two needle beds or rows of needles sloping at an angle of nearly 90°.

A great many varieties of this type of machine have been invented for the production of all kinds of plain and fancy hosiery. They have been built in small sizes to be wrought by hand or in large power machines. A large variety of sewing, seaming and linking machines are employed in the hosiery industry for the purpose of putting together or joining all kinds of hosiery and knitted goods. These machines have almost entirely superseded the sewing or joining of the garments by hand.

The principal centres in Great Britain of the hosiery industry are Leicester and Nottingham and the surrounding districts, which is also an industry of some extent in the south of Scotland. (T. B.)

HOSIUS, or OSISUS (c. 257-359), bishop of Cordova, was born about A.D. 257, probably at Cordova, although from a passage in Zosimus it has sometimes been conjectured that he was believed by that writer to be a native of Egypt. He attended the council of Illybris or Elvira (his name appearing second in the list of those present), and upheld its severe canons concerning such points of discipline as the treatment of the lapsed and clerical marriages. In 313 he appears at the council of Constantine, being expressly mentioned by name in a constitution directed by the emperor to Caecilianus of Carthage in that year. In 323 he was the bearer and possessor of Constantine's letter to Bishop Alexander of Alexandria and Arius his deacon, bidding them cease disturbing the peace of the church; and, on the failure of the negotiations in Egypt, he was doubtless with the active concurrence of Hosius that the council of Nicaea was convened in 325. He certainly took part in its proceedings, and was one of the large number of "confessors" present; that he presided is a very doubtful assertion, as also that he was the principal author of the Nicene Creed. Still he powerfully influenced the judgment of the emperor in favour of the orthodox party. After a period of quiet life in his own diocese, Hosius presided in 343 at the fruitless synod of Sardica, which showed itself so hostile to Arianism; and afterwards he spoke and wrote in favour of Athanasius in such a way as to bring upon himself a sentence of banishment to Sirmium (349). He, however, wrote to Constantius II. his only extant composition, a letter not very properly characterized by the great French historian Sebastian Tillemon as displaying gravity, dignity, gentleness, wisdom, generosity and in fact all the qualities of a great soul and a great bishop. Subjected to continual pressure the old man, who was near his hundredth year, was weak enough to sign the formula adopted by the second synod of Sirmium in 355, which involved communion with the Arians but not the condemnation of Athanasius. He was then permitted to return to his diocese, where he died in 359. See S. Tillemon, Mémoires, vii. 300-321 (1700); Heike, Con- cilia eclesiasticum, vol. i.; H. M. Gwatkin, Studies in Ariantism (Cambridge, 1882, 2nd ed., 1900); A. W. W. Dale, The Synod Elvira (London, 1882); and article s.v. in Herzog-Hauck, Real- enzyklopädie (3rd ed., 1900), with bibliography.

HOSIUS, STANISLAUS (1504-1579), Polish cardinal, was born in Cracow on the 5th of May 1504. He studied law at Padua and Bologna, and entering the church became in 1549 bishop of Kulm, in 1551 bishop of Ermland, and in 1561 cardinal. Hosius had Jesuit sympathies and actively opposed the Protestant reformation, going so far as to desire a repetition of the St Bartholomew massacre in Poland. Apart from its being the "property of the Roman Church," he regarded the Bible as having no more worth than the fables of Aesop. Hosius was not distinguished as a theologian, though he drew up the Confessio fidei christianae catholica adopted by the synod of Piotrkow in 1557. He was, however, supreme as a diplomatist and administrator. Besides carrying through many difficult negotiations, he founded the lyceum of Braunschweig, which became the centre of the Roman Catholic mission among Protestants. He died at Capranica near Rome on the 5th of August 1579. A collected edition of his works was published at Cologne in 1584. Life by A. Eichhorn (Mainz, 1854), 2 vols.

HOSKINS, JOHN (d. 1664), English miniature painter, the uncle of Samuel Cooper, who received his artistic education in Hoskins's house. His finest miniatures are at Ham House, Montagu House, Windsor Castle, Amsterdam and in the Pierpont Morgan collection. Virtue stated that Hoskins had a son, and Redgrave added that the son painted a portrait of James II. in 1686 and was paid £10, £5 for it, a statement for which there must have been some evidence, although it is not supported by any reference in the State Papers. Some contemporary inscriptions on the miniatures at Ham House record them as the work of "Old Hoskins," but the fact of the existence of a younger artist of the same name is settled by a miniature in the Pierpont Morgan collection, signed by Hoskins, and bearing an authentic engraved inscription on its contemporary frame to the effect that it represents the duke of Berwick at the age of twenty-nine in 1700. The elder Hoskins was buried on the 22nd of February 1644, in St Paul's, Covent Garden, and as there is no doubt of the authenticity of this miniature or of
the signature upon it, it is evident that he had a son who survived him thirty-six years and whose monogram we find upon this portrait. The frame of it has also the royal coat of arms debruised, the batons of a marshal of France, the collar of the Golden Fleece and the ducal coronet.

HOSMER, HARRIET GOODHUE (1830-1908). American sculptor, was born at Watertown, Massachusetts, on the 9th of October 1830. She early showed marked aptitude for modeling, and studied anatomy with her father, a physician, and afterwards at the St. Louis Medical College. She then studied in Boston until 1852, when, with her friend Charlotte Cushman, she went to Rome, where from 1853 to 1860 she was the pupil of the English sculptor John Gibson. She lived in Rome until a few years before her death. There she was associated with Nathaniel Hawthorne, Thorewaldsen, Flaxman, Thackery, George Elliot and George Sand; and she was frequently the guest of the Brownings at Casa Guidi, in Florence. Among her works are “Daphne” and “Medusa,” Ideal heads (1853); “Puck” (1859), a spirited and graceful conception which she copied for the prince of Wales, the Duke of Hamilton and others; “Oenone” (1855), her first life-sized figure, now in the St. Louis Museum of Fine Arts; “Beatrice Cenci” (1857), for the Mercantile Library of St. Louis; “Zenobia, Queen of Palmyra, in Chains” (1859), now in the Metropolitan Museum of Art, New York City; “A Sleeper and Faun” (1860); “A Waking Faun”; a bronze statue of Thomas H. Benton (1868) for Lafayette Park, St. Louis; bronze gates for the earl of Brownlow’s art ash at Ashridge Hall; a Siren fountain for Lady Marian Alford; a fountain for Central Park, New York City; a monument to Abraham Lincoln; and, for the Columbian Exhibition, Chicago, 1893, statues of the queen of Naples as the “heroine of Gaeta,” and of Queen Isabella of Spain. Miss Hosmer died at Watertown, Mass., on the 21st of February 1908.

HOSPICE (Lat. hospitium, entertainment, hospitality, inn, hospitable place usually given to the homes of rest and refuge kept by religious houses for pilgrims and guests. The most famous hospices are those of the Great and Little St Bernard Passes in the Alps.

HOSPITAL (Lat. hospitalis, the adjective of hospes, host or guest), a term now in general use for institutions in which medical treatment is given to the sick or injured. The place where a guest was received was in Lat. hospitium (Fr. hospice), but the terms hospitalis (sc. domus), hospitale (sc. cubiculum) and hospitalis (sc. cubicula) came into use in the same sense. Hence we derived on the one hand the Fr. hospital, hôpital, applied to establishments for temporary occupation by the sick for the purpose of medical treatment, and hospice to places for permanent occupation by the poor, infirm, incurable or insane; on the other, the form hôtel, which became restricted (except in the case of hôtel-Dieu) to private or public dwelling-houses for ordinary occupation. In English, while “hostel” retained the earlier sense and “hotel” has become confined to that of a superior inn (q.v.), “hospital” was used both in the sense of a permanent retreat for the poor infirm or for the insane, and also for a regular institution for the temporary reception of sick cases; but modern usage has gradually restricted it mainly to the latter, other words, such as almshouse and asylum, being preferred in the former cases.

The Origin of Hospitals.— In spite of contrary opinions the germ of the hospital system may be seen in pre-Christian times (see Charity and Charities). Pinel goes so far as to declare that there were asbestos distinctly set apart for the insane in the temples of Saturn in ancient Egypt. But this is probably an exceptional case, and historical writers are contenting to the existence of medical schools in connexion with the temples generally, to the knowledge that the priests possessed what medical science existed, and finally to the rite of “Incubation,” which involved the visit of sick persons to the temple, in the shade of which they slept, that the god might inform them by dreams of the treatment they ought to follow. The temples of Saturn are known to have existed some 4000 years before Christ; and that those temples were medical schools in their earliest form is beyond question. The reason why no records of these temples have survived is due to the fact that they were destroyed in a religious revolution which swept away the very name of Saturn from the monuments in the country. Professor Georg Ebers of Leipzig, whose possession of the impression and bow, an Egyptian medicine called the Papyrus Ebers constitutes him an authority, says the Heliopolis certainly had a clinic united to the temple. The temples of Dendera, Thebes and Memphis, are other examples. Those early medical works, the Books of Hermes, were preserved in the shrines. Patients coming to them paid contributions to the priests. The most famous temples in Greece for the cure of disease were those of Aesculapius at Cos and Trikka, while others at Rhodes, Cnidus, Pergamum and Epidaurus were less known but frequented. Thus it is clear that both in Egypt and in Greece the custom of laying the sick in the precincts of the temples was a national practice.

Alexandria again was a famous medical centre. Before describing the European growth of the hospital system in modern times, to which its development in the Roman Empire is the natural introduction, it will be well to dispose very briefly of the facts relating to the hospital system in the East. Harun al-Rashid (A.D. 763-809) attached a college to every mosque, and to that again a hospital. He placed at Bagdad an asylum for the insane open to all believers; and there was a large number of public infirmaries for the sick without payment in that city. Benjamin, the Jewish traveller, notes an efficient scheme for the reception of the sick in A.D. 1173, which had long been in existence. The Buddhists no less than the Mahommedans had their hospitals, and as early as 260 B.C. the emperor Asoka founded the many hospitals of which Hindostan could then boast. The one at Surat, made famous by travellers, and considered to have been built under the emperor’s second edict, is still in existence. These hospitals contained provision so extensive as to be quite comparable to modern institutions. In China the only records that remain are those of books of very early date dealing with the theory of medicine. To return to India, the hospitals of Asoka were swept away by a revival of Brahmanism, and a practical hiatus exists between the hospitals he introduced and those that were refounded by the British ascendancy. Hadrian’s reign contains the first notice of a military hospital in Rome. At the beginning of the Christian era we hear of the existence of open surgeries of various price and reputation, the specialization of the medical profession, and the presence of women among the practitioners. Iatris, or tabernae-medicae, are described by Galen and Plautus: many towns built them at their own cost. These iatria attended almost entirely to out-patients, and the system of medicine fostered by them continued without much development down to the middle of the 18th century. It is to be noted that these out-patients paid reasonable fees. In Christian days no establishments were founded for the relief of the sick till the time of Constantine. A law of Justinian referring to various institutions connected with the church mentions among them the Nosocomia, which correspond to our idea of hospitals. In A.D. 370 Basil had one built for lepers at Caesarea. St Chrysostom founded a hospital at Constantinople. At Alexandria an order of 600 Parabolaen attended to the sick, being chosen for the purpose for their experience by the prelate of the city (A.D. 416). Fabiola, a rich Roman lady, founded the first hospital at Rome possessed of a convalescent home in the country. She even became a nurse herself. St Augustine founded one at his see of Hippo. These Nosocomia fell indeed almost entirely into the hands of the church, which supported them by its revenues when necessary and controlled their administration. Salerno became famous as a school of medicine; its most days were between A.D. 1000 and 1590. Frederick II. prescribed the course for students there, and founded a rival school at Naples. At this period the connexion between monasteries and hospitals becomes a marked one. The crusaders also created another bond between the church and hospital development, as the route they traversed was marked by such foundations. Lepers were some of the earliest patients for whom a specialized treatment was recognized.
HOSPITAL

and in 1118 a leprosarium was built in London for isolation purposes. Russia seems the one country where the interconnexion of hospital and monastery was not to be observed. After the period already reached, the 13th century, hospitals became common enough to demand individual or at any rate national treatment.

History of the Hospital Movement. — We have now to consider the principles upon which the provision of the best form of medical care in hospitals can be secured for all classes of people. Though hospitals cannot be claimed as a direct result of Christianity, no doubt it softened the relations between men, and gradually tended to instil humanitarian views and to make them popular with the civilized peoples of the world. These principles, as civilization grew, education improved, and the tastes and requirements of the common people were developed, made men and women of many races realize that the treatment of disease in buildings set apart exclusively for the care of the sick was, in fact, a necessity in urban districts. The establishment of a hospital freed the streets of the abuses attendant upon beggars and other poor creatures, who made their ailmens the chief ground of appeal for alms. As the knowledge of hygiene and of the doctrine of cleanliness and purity in regard to dwellings and dwellers, but in reality, as a few of the larger towns in most countries contained hospitals of sorts, up to and including the middle ages, it was not until the commencement of the 18th century that inhabitants of important but relatively small towns of from 50,000 to 100,000 inhabitants began to provide themselves with a hospital for the care of the sick. Thus, twenty-three of the principal English counties appear to have had no general hospital prior to 1710, while London itself at that date, so far as the relief of the sick was concerned, was mainly, if not entirely, dependent upon St Bartholomew's and St Thomas's Hospitals. These facts are interesting to note, because we are enabled from them to deduce from recent events that hospital buildings in the past, though the planning of most of them was faulty to begin with and became more and more faulty as extensions were added to the original buildings, did in fact tend to satisfy the requirements of the administrators, if not of the patients, for nearly two centuries. In other words, under the old condition of affairs the life of a building devoted to the care of the sick might be considered as at least 150 years. To-day, under the conditions which modern science impose upon the management, probably few hospital buildings are likely to be regarded as efficient for the purpose of treating the sick for more than from 30 to 50 years.

The foregoing statement is based upon the history of British hospitals of importance throughout the country, but the same remark will apply in practice to hospital buildings almost everywhere, though for some of the large hospitals the truth is obscured. In the days of the great hospitals, the doctors and the medical profession were already of influence and authority, and the state had not yet assumed any responsibility; the hospitals or almshouses were, in short, simply religious establishments. With the growth of science, and the increasing power of the state, the question of the organization of hospitals has come to be a matter of public policy, and a system of public administration has been evolved for meeting the needs of the sick.

The history of the hospitals of Great Britain, as described in the following pages, shows very clearly the increase of efficiency which has resulted from the introduction of public administration, and the reliance upon it as an instrument of effecting great social improvement. The first step was the establishment of a board of control to look after the finances, and in many cases to appoint the medical officers. In later years the board of control has usually been strengthened by the appointment of medical officers, and the disease of the sick has been placed in the hands of the medical profession. The object of the board of control is to see that the sick are properly cared for, and to protect the good name of the hospital. The management of the hospital is in the hands of the medical officers, and the sick are under the care of the medical profession.

The changes which have taken place in the administration of hospitals have been far more extensive than those which have taken place in the medical profession. The medical profession has been more and more under the influence of the state, and the state has been more and more in control of the medical profession. The result has been a great improvement in the management of the hospitals, and a great increase in the efficiency of the medical profession.

The history of the hospitals of Great Britain, as described in the following pages, shows very clearly the increase of efficiency which has resulted from the introduction of public administration, and the reliance upon it as an instrument of effecting great social improvement. The first step was the establishment of a board of control to look after the finances, and in many cases to appoint the medical officers. In later years the board of control has usually been strengthened by the appointment of medical officers, and the disease of the sick has been placed in the hands of the medical profession. The object of the board of control is to see that the sick are properly cared for, and to protect the good name of the hospital. The management of the hospital is in the hands of the medical officers, and the sick are under the care of the medical profession.

The changes which have taken place in the administration of hospitals have been far more extensive than those which have taken place in the medical profession. The medical profession has been more and more under the influence of the state, and the state has been more and more in control of the medical profession. The result has been a great improvement in the management of the hospitals, and a great increase in the efficiency of the medical profession.

course of every year. Again, each voluntary hospital has to live by competition, a fact which guarantees that everything in the way of new treatment and scientific development shall in due course find its proper place within the walls of such an establishment. Open as they are to the full inspection of everybody whose knowledge and presence can promote efficiency, the voluntary hospitals have shown, especially since the last quarter of the 19th century, a continuous development and improvement. Here the patients are treated with invariable kindness and consideration, as human beings rather than cases to the greatest benefit of the whole human family. It is represented by the officials, the patients and the students, with their relations and friends, the honorary medical officers, hundreds of medical practitioners and nurses, who receive their medical training in the hospitals, and the ever-increasing number of governors and supporters by whose contributions voluntary hospitals live.

The voluntary hospitals are attended, however, by certain disadvantages which do not attach to municipal institutions. A municipality which undertakes the provision of hospitals for the entire community is largely able to plan out the urban area, and to provide that each hospital site selected shall not only be suitable for the purpose, but that it shall be so chosen as to contribute to make the whole system of hospital provision easily accessible to all, and that the whole system shall be easily accessible to all. The voluntary hospitals, on the contrary, have grown up without any comprehensive plan of the districts or any real regard to the convenience or necessities of their poorer inhabitants. Voluntary hospital sites were almost invariably selected to suit the convenience of the honorary medical staff and the general convenience of the hospital economy rather than to save the patients and their friends long journeys in search of medical aid. The best of the municipal systems too enables economy to be enforced in the administration by a plan which provides for a central office in every town where the number of vacant beds in each hospital is known, so that the average of occupied beds in all the hospitals can be well maintained from an economical point of view. This speedy and ready inter-communication between all hospitals in a great city, which might perfectly well be secured under the voluntary system if the managers could only be brought into active co-operation, prevents delay in the admission of urgent cases, promotes the absence of waste by keeping the average of beds occupied in each establishment high and uniform, and has often proved a real gain to the poor by the reduction of this kind in the cost to the patients and their friends, under whom the best municipal systems can find a hospital within reasonable distance of their home in a large city wherever it may be placed. Another advantage of the municipal system should be that central control makes for economical administration. Unfortunately a close study of this question tends to prove that municipal hospitals for the most part have resulted in a dead monotony of relative inefficiency, often entailing great extravagance in buildings, and accompanied by much waste in many directions. Existing municipal hospital systems are attended by several grave disadvantages. The administration shows a tendency to lag and grow sleepy and inert. The absence of competition, and the freedom from continuous publicity and criticism such as the voluntary hospitals enjoy, make for inefficiency and indifferent work.

Rate-supported hospitals, as a rule, are administered by permanent officials who reside in houses usually situated on the hospital sites, and who are paid salaries which attract the younger men, who, once appointed, tend to continue in office for a long period of years. This fixture of tenure is apt to bring about a decline in the general interest in the work of the municipal hospital, due mainly to the absence of a continuous criticism from outside, and so the average of efficiency, both in regard to treatment and other important matters, may become lower and lower. Those who have habitually inspected great rate-supported hospitals must have met instances over and over again where a gentleman who has held office for twenty or thirty years has frankly stated that his income is fixed, that his habits have become crystallized, that he finds the work terribly monotonous, and yet, as he hopes ultimately to retire upon a pension, he has felt there was no course open to him but to continue in office, even though he may feel conscientiously that a change would be good for the patients, for the hospital and for himself. Under the voluntary system evils of this kind are seldom or never met with, nor have these latter establishments, within living memory, ever been so conducted as to exhibit the grave scandals which have marred the administration of rate-supported hospitals not only in Great Britain but in other parts of the world. We believe that the more thoroughly the advantages and disadvantages of rate-supported and voluntary hospitals for the care of the sick are weighed and considered, and the more accurate and full the knowledge which is added to the judgment upon which a decision can be based, the more certain will it be that every capable administrator will come to the conclusion that on the whole it is good for the sick and for the whole community that these establishments should, at any rate in Great Britain, be maintained upon the voluntary system. Of course it is essential to have rate-supported hospitals where cases of infectious disease and the poorest of the people who are dependent largely upon the poor-law for their maintenance can be cared for.

It is satisfactory to be able to state that of late years the administration of both these types of rate-supported hospitals has greatly improved. This is of importance and it should be noted that it is shown as a result of the professional officers of health, and the disposition exhibited, both by parliament and government departments, to make the position of these officers more important and valuable than ever before, have tended largely to improve the administrative efficiency of hospitals for infectious diseases. No doubt the whole community would benefit if residents in every part of the country could be moved to take a personal interest in the infectious hospital in their immediate neighbourhood. Amongst the smaller of these establishments there has been so marked an inefficiency at times as to cause much avoidable suffering. The existence of such inefficiency casts a grave reflection upon the local authorities and others who are responsible for the evils which undoubtedly exist in various places at the present time. Unfortunately knowledge has not yet sufficiently spread to enable the public to overcome its fear and dread of infectious maladies. It is therefore very difficult to induce people to take an active interest in one of these hospitals, but we look forward to the time when, owing to the activity of the medical officers of health who have immediate charge of the buildings of this kind, it will be shown that the avoidable dangers and risks and the appalling discomfort which a poor sufferer from a severe infectious disease in a rural district may suddenly have to encounter under existing circumstances, would be rendered impossible.

The poor-law infirmary in large cities, so far as the buildings and equipment are concerned, very often leaves little to desire. Poor-law infirmaries lack, however, the stimulus and the checks and advantages which impartial criticism continuously applied brings to a great voluntary hospital. Such disadvantages might be entirely removed if parliament should decide to throw open every poor-law infirmary for clinical purposes, and to have connected with each such establishment a responsible visiting medical staff, consisting of the best qualified men to be found in the community which each hospital serves. The old prejudice against hospital treatment has disappeared, for the least intelligent members of the population now understand that, when a citizen is sick, there is no place so good as the wards of a well-administered hospital. Looking at the question of hospital provision in Great Britain, and indeed in all countries at the present time, it may be said, that there is everywhere evidence of improvement and development upon the right lines, so that never before in the history of the world has the lot of the sick man or woman been so relatively fortunate and safe as it is in...
the present day. Probably it is not too much to say that to-day hospitals occupy the most important position in the social economy of nations.

Classification of Hospitals.—Having dealt with hospitals as a whole it may be well very briefly to classify them in groups, and explain as tersely as possible what they represent and how far it may be desirable to eliminate by consolidation or to increase by disintegration the number of special hospitals.

General Hospitals.—These establishments consist of two kinds, (a) clinical and (b) non-clinical, each of which, under the modern system, should include every department of medicine and surgery, and every appliance and means for the alleviation of suffering, the healing of wounds, the reduction of fractures, the removal of mal-formations and foreign growths, the surgical restoration of damaged and diseased organs and bones, and every appliance of every kind which experience and knowledge prove to be necessary to the rapid promotion and cure of the diseases which they are treated.

Special Hospitals.—Up to about 1840 the general hospital was, speaking generally, the only hospital in existence. Twenty years later, as the population increased and medical science became more and more active, some of the more ardent members of the medical profession, especially amongst the younger men, proposed a substitute for opportunities to develop the utmost power of treatment in regard to special diseases for which neither accommodation nor appliances were at that time forthcoming in general hospitals. In a few cases, where the managers of the great general hospitals were men of action and initiative special departments were introduced, and an attempt was made to make them efficient. The conservative spirit which, on the whole, represents the British character for the most part, resulted, however, in a steady resistance being offered by the older members of the medical staffs and existing committees to the advocates of special departments. In the result, especially as such special departments as were then in connexion with general hospitals were too often starved for want of means and men for their development and improvement, the younger spirits called their friends together and began to start special hospitals.

To-day every really efficient clinical general hospital has within its walls special departments of almost every description, which have been made as efficient and up-to-date as money and knowledge can make them. Unfortunately the causes already referred to led to the establishment of hundreds of the smaller special hospitals, many of which were started in unsuitable buildings, and some of which have ever since maintained a struggling existence. Others, on the contrary, through the energy of their original promoters and the tie of connexion with a great hospital, have thriven. As they have done, have obtained a position of authority and reputation which has had a very important bearing for good upon the development of medical science in the treatment of disease.

If the world had to-day to organize the very best system of hospital accommodation which could be evolved, there is no doubt that few or none of the special hospitals would find any place in that system. As matters stand, however, the special hospital has had to be accepted, and nothing which King Edward’s Hospital Fund has done in London has met with greater popularity and professional approval than the labours which its council have undertaken in promoting the amalgamation of the smaller special hospitals of certain kinds, so as to secure the provision of one really efficient special hospital for each speciality. No doubt this policy of amalgamation will be steadily pursued, and in the course of years every great city will gradually reorganize its hospital methods so as to secure that, whether the patients are treated in a general hospital or in a special hospital, the average efficiency in every institution shall be as high and as good as possible.

We will now consider the special hospitals in detail.

Cancer Hospitals.—The justification for efficient cancer hospitals must be found in the circumstance that most scientific men of experience believe that, if adequate resources were placed at the disposal of the medical profession, the origin of cancer might be discovered, and so the human race would be delivered from one of the most awful diseases which affect humanity. Pending such a discovery the experience of the cancer department connected with the Middlesex Hospital proved to demonstration that the provision of adequate and special accommodation for the exclusive treatment of cases of cancer is not only desirable but necessary on humanitarian grounds alone.

Medical Care for Consumers.—For many years it was held that this group of hospitals was not a necessity, and the patients were treated in the ordinary medical wards of the general hospitals. Since the coming of the Middlesex Hospital this view has ceased to hold, and the general hospitals have shown the importance of the treatment of cancer with regard to its complicated and serious nature. Many of the large voluntary hospitals have a very valuable asset to the physicians, so long as the children are treated in separate wards. There is no reason of course why a hospital should confine its work to the treatment of children, if one could be found which is popular with the public; it has led to many discoveries and developments in the treatment of children’s diseases; on the whole this administration of the infected child has been good; and we believe they will continue to flourish, however many of the children’s wards may be provided in general hospitals. Children’s hospitals with country branches for the treatment of chronic ailments, such as club-feet, are a valuable addition to the relief of suffering in cities.

Cottage Hospitals.—These hospitals, established originally in 1839 by Mr Albert Napper at Cranleigh, Surrey, have fulfilled a more limited function than the general hospitals, though it was intended that they should be adapted to the needs of the working classes and to give special attention to equipment and treatment. They have become essential to the well-being and adequate medical care of rural populations, as they attract to the country some of the best members of the profession who are able, with the aid of the cottage hospital, to keep themselves efficient and up-to-date, so that all classes of the community are benefited in this way by this type of hospital.

Sanatoriums and Ed. Hospitals.—Very much the same type of hospital bears out in every particular the reason we have given above for the establishment of special hospitals in the first instance. There can be no doubt that the best conducted throat hospitals have been beneficial in the poorer inhabitants of great cities.

Malaria and Lying-in Hospitals.—This is one of the oldest types of special hospitals, and has done a great deal of good in its time. Owing to modern methods of treatment and hygienic development the maternity hospital never occupied a stronger position than it does to-day.

Mental Hospitals.—In Great Britain the insane are provided for in state and private Lunatic Asylums. If properly managed and properly conducted, are essentially hospitals. Scientific and public opinion tend towards the establishment of mental hospitals to which all acute cases of mental disease should be first relegated for treatment, and they are regarded as the forerunners of the modern lunatic hospital. Too little attention on an organized plan has been given to the continuous study of mental disease in its clinical and pathological aspects. It is probable, therefore, that the advent of the mental hospital may lead to important developments in treatment in many ways.

Ophthalmic Hospitals.—Of all special hospitals this is one which would probably be the least necessary, providing general hospitals were properly equipped and organized. So many of these hospitals have probably been so abused in the material sense by the free relief of patients who could well afford to pay for their treatment at a hospital properly provided for their case, that these hospitals have entailed an enormous expenditure, and their modern equipment is wonderfully efficient.

Orthopaedic Hospitals.—It is very doubtful whether this type of hospital is really necessary. The facilities afforded by the orthopaedic hospital have been beneficial to the poorer inhabitants of great cities.

Paralysis and Epileptic Hospitals.—Seeing that the percentage of those who are at present attacked by paralysis and nervous disease shows a continued tendency to increase under modern conditions, hospitals for the treatment of these diseases have increased in number. London at any rate, like most foreign towns of importance, possesses, at present, far too little accommodation for this class of case.

Septic Fever, Typhoid Fever, etc.—These are another type of hospital. Many of these developing in the past century for the treatment of diseases of the skin were a constant cause of scandal and criticism. The introduction of modern methods of treatment of
light and electricity, including photo-therapy, has given an importance to this department and treatment which it did not previously possess. We are of opinion that, on the whole, it is better and more economical to treat these cases in properly equipped departments of general hospitals than in separate institutions.

Women's Hospitals.—These hospitals are not absolutely necessary, but considering their popularity with the women themselves, and that the nurses have done excellent work, remembering that women constitute the majority of the population, there seems to be some reason for their continuance.

The Evolution of the Modern Hospital.—The evolution of the modern hospital affords one of the most marvellous excellences of the advance of scientific and humanitarian principles which the world has ever seen. At the outset hospitals were probably founded by the healthy for their own comfort than out of any regard for the sick. Nowadays the healthy, whilst they realize that the more efficient they can make the hospital, the more certain, in the human sense, is their own chance of prolonged life and health, are, as the progress of the League of Mercy has shown in recent years, genuinely anxious for the most part to do something as individuals in the days of health in the cause of the sick. Formerly the hospital was merely a building or buildings, very often unsuitable for the purposes to which it was put, where sick and injured people were retained and more frequently than not died. In other words the hygienic condition, the methods of treatment and the hospital atmosphere were all so relatively unsatisfactory as to yield a mortality in serious cases of 40%. Nowadays, despite, or possibly because of, the fact that operative interference is the rule rather than the exception in the treatment of hospital patients, and in consequence of the introduction of antisepic and aseptic methods, the mortality in hospitals, is, in all the circumstances, relatively less, and probably materially less, than it is even amongst patients who are attended in their own homes. Originally hospitals were unsystematic, crowded, ill-organized necessaries, which wise people refused to enter, if they had any voice in the matter. At the present time in all large cities, and in crowded communities in civilized countries, great hospitals have been erected upon extensive sites which are so planned as to constitute in fact a village with many hundreds of inhabitants. This type of modern hospital has common characteristics. A multitude of separate buildings are dotted over the site, which may cover 20 acres or upwards. In one such institution, within an area of 20 acres, there are 6 m. of drains, 29 m. of water and steam pipes, 3 m. of roof gutters, 42 m. of electric wires, and 42 separate buildings, which to all intents and purposes constitute a series of distinct, isolated hospitals, in no connection amongst themselves. For years, the cost of European buildings of this class are usually of one storey; in the United States, owing to the difficulty of obtaining suitable sites and for reasons of economy, some competent authorities strenuously advocate high buildings with many storeys for town hospitals. In England the majority have two to three storeys each, the ward unit containing a ward for twenty beds and two isolation wards for one and two beds respectively. The two storeys in modern fever hospitals, however, are absolutely distinct—that is, there is no internal staircase going from one ward to the others, for each is entered separately from the outside. This system carries to its extreme limits the principle of separating the patients as much as possible into small groups; the acute cases are usually treated in the upper ward, and as they become convalescent are removed downstairs. In this way the necessity for an entirely separate convalescent block is done away with and the patients are kept under the same charge nurse, an arrangement which promotes necessary distinctness of the cases in the hospital, and consists of an acute ward, a convalescent ward, separation wards, nurses' duty rooms, store-rooms for linen, an open-air balcony upstairs into which beds can be wheeled in suitable weather, and a large airing-ground for convalescent patients directly accessible from the downstairs ward. Each of the pavilions is raised above the ground level, so that air can circulate freely underneath. The wall, floor, and air spaces in the scarlet fever wards of one of these hospitals are respectively 12 ft., 156 ft. and 2028 ft. per bed; and in the enteric and diphtheria wards they have been increased to 15 ft., 195 ft. and 2535 ft. respectively. The provision of so large a floor and linear space, especially in the diphtheria wards, is an experiment the effect of which will be watched with considerable interest. A building of this type is a splendid example of the separate pavilion hospital, and is doing great service in the treatment of fevers wherever it has been introduced. Some idea of a hospital village, some of the wards of which we have been describing, may be gathered from the circumstances that it costs from £300,000 to £400,000, that it usually contains from 500 to 700 beds, and that the staff numbers from 350 to 500 persons. The medical superintendent lives in a separate house of his own. The nurses are provided with a home, consisting of several blocks of buildings under the control of the matron; the charge nurses usually occupy the main block, where the dining and general sitting-rooms are placed; the day assistant-nurses another block; and lastly, by a most excellent arrangement, the night nurses, 80 to 120 in number, have one whole block entirely given up to their use. The female servants have a second home under the control of the housekeeper, and the male servants occupy a third home under the supervision of the steward. The two main ideas aimed at are to disconnect the houses occupied by the staff from the infected area, and to place the members of each division of the staff together in separate buildings, under their respective heads. These objects are highly to be commended, as they have important bearings upon the well-being and discipline of the whole establishment and constitute a lesson for all who have to do with buildings where a great number of people are constantly employed.

The Hospital City.—We have shown that the modern hospital where an adequate site is available under the most favourable conditions has developed into a hospital village. No one who is familiar with the existing disadvantages of many of the sites and their surroundings of town hospitals can deny that a large city can have any doubt that, if the well-being of the patients and the good of the whole community, combined with economical and administrative reasons, together with the provision of an adequate system for the instruction and training of medical students and nurses, are to be the first considerations with those responsible for the hospitals of the future, the time will come, and is probably not far distant, when each great urban community will provide for the whole of its sick by removing them to a hospital city, which will be situated upon a specially selected site, and for which administrative and medical reasons. The atmosphere of a great city grows less and less suitable to the rapid and complete recovery of patients who may undergo the major operations or be suffering from the severe and acute forms of disease. Aspesis, it is true, has reduced the average residence in hospital from about 35 to less than 20 days. It has thereby added quite one million working days each year to the earning power of the artisan classes in London alone. Medical opinion is more and more favouring the provision of convalescent and suburban hospitals, to which patients suffering from open wounds may be removed from the city hospitals. This course, which entails much additional expenditure, is advocated to overcome the difficulty arising from the fact that, in operation and other cases, the patients cease to continue to make rapid progress towards recovery after the seventh or ninth day's residence in a city hospital. A change of such cases to the country restores the balance and completes the recovery with a rapidity often remarkable.

Thinking out the problem here presented in all its bearings, realizing the great and ever-increasing cost of sites for hospitals in great cities, the heavy consequential taxes and charges which they have to meet there, and all the attendant disadvantages and drawbacks, the present writer has ventured upon an anticipation which he hopes may prove intelligent and well-founded. Nearly every difficulty in regard to the cost of hospitals and in respect to all the many problems presented by securing
the material required, under present systems, for the efficient training of students and nurses, would be removed by the changes of the Hospital City, which, he foresees, must ultimately be recognized by intelligent communities throughout the civilized world. Why should we not have, on a carefully selected site well away from the contaminations of the town, and adequately provided with every requisite demanded from the site of the most perfect modern hospital which the mind of man can conceive, a "Hospital City"? Here would be concentrated all the means for relieving and treating every form of disease to the abiding comfort of all responsible for their adequacy and success. At the present time all the traffic and all the citizens give way to fire engines and the ambulance in the public streets. Necessity means of transit to and from the "Hospital City," and its rapidity, would be the most perfect in the world. So the members of the medical staff, the friends of the patients, and all who had business in the "Hospital City," would find it easier and less exacting in time and energy to be attached to one of the hospitals located therein than to one situated in the centre of a big population in a crowded town. To meet the urgent and accident cases a few receiving houses, or outposts relief stations, with a couple of wards, would be situated in various quarters of the working city, where patients could be temporarily treated, and whence they could be removed to the "Hospital City" by an efficient motor ambulance. The first twenty or thirty years after the "Hospital City" established, can realize the comfort it will prove in practice to the medical profession, to the patients' friends, to those who have to manage the hospitals and train the medical and nursing students, and indeed to all who may go there as well as to the whole community. The initial cost of hospital buildings should be reduced at once to a quarter or less of the present outlay. They could then be built of the cheapest but most suitable material, which would have many advantages, whilst the actual money forthcoming from the realization and sale of the existing hospital sites in many cities would, in all probability, produce a sum which in the aggregate would be adequate, or nearly adequate, or in some cases more than adequate, to defray the entire cost of building the "Hospital City" and of equipping it too. The cost of administration and working must be everywhere reduced to a minimum. The hygienic completeness of the whole city, its buildings and appliances, must expedite recovery to the maximum extent. In all probability the removal of the sick from contact with the healthy would tend in practice so to increase the healthiness of the town population, i.e. of the workers of the city proper, as to free them from some of the most burdensome trials which now cripple their resources and diminish materially the happiness of their lives. Probably the average daily mortality in a city as large and as well provided as New York, or Berlin, or London, or Paris may be the home where this idea may first find its realization in accomplished fact. The writer may never live to see such a city in actual working or in its entirety, but he makes bold to believe its adoption will one day solve the more difficult of the problems involved in providing adequately for the sick in crowded communities. He has formulated the idea because it seems desirable to encourage discussion as to the best method of checking the growing tendency to make hospital buildings everywhere too costly. If the idea of the "Hospital City" commends itself to the profession and the public, the practice of treating in the hospital accommodation in each city as a whole will gradually increase and spread, until most of the present pressing difficulties may disappear altogether. That is a consummation devoutly to be wished.

The Problem of Hospital Administration.—A study of the hospital problem in various countries, and especially in different portions of the English-speaking world, convinces the writer that, apart from local differences, the features presented are everywhere practically identical. A number of hospitals under independent administration, dependent in whole or in part on voluntary contributions, administered under different regulations originally representing the idiosyncrasies of individual managers for the time being, without any standard of efficiency or any system of co-operation, which would bring the whole of the medical establishments of each or all of the great cities of the world under the direction, or control of a hospital administration which combined wisdom and experience of hospital managers as a whole might agree to be the best, must mean in practice a material gain in every way to each and all of the hospitals and their supporters on economical, scientific and other grounds. Such an absence of system throughout the world has everywhere led to overlapping, to the perpetuation of many abuses, to the admission of an increasing number of patients whose social position does not entitle them to claim free medical relief at all, and, often too, to the admission of patients belonging to a humbler grade of society who are already provided for by the rates in institutions which they do not care to enter and who find their way to the wards of hospitals which were established to bring relief to patients of an entirely different social grade. These evils have continued to grow and increase almost everywhere, despite many and varied attempts to grapple with and remove them. Amongst these attempts we may mention the assembling of hospital conferences, the establishment of special funds and committees, and the holding of inquiries of various kinds in London and other British cities and also in the United States. The most remarkable proof of the impossibility of inducing those responsible to act together and enforce the necessary reforms is afforded by the historical fact that the famous Commission on Hospital Abuse, known as Sir William Fergusson's Commission, in 1871, after an exhaustive inquiry, made the following recommendations: (1) to improve the administration of poor-law medical relief; (2) to place all free dispensaries under the control of the poor-law authorities; (3) to establish an adequate system of provident dispensaries; (4) to curtail the unrestricted system of gratuitous relief, partly by the selection of cases possessing special clinical interest and partly by the exclusion of those who on social grounds are not entitled to gratuitous medical advice; (5) the payment of the medical staff engaged in both in- and out-patient work, and the payment of fees by patients of the world under one administration which combined wisdom and experience of hospital managers as a whole might agree to be the best, must mean in practice a material gain in every way to each and all of the hospitals and their supporters on economical, scientific and other grounds. Such an absence of system throughout the world has everywhere led to overlapping, to the perpetuation of many abuses, to the admission of an increasing number of patients whose social position does not entitle them to claim free medical relief at all, and, often too, to the admission of patients belonging to a humbler grade of society who are already provided for by the rates in institutions which they do not care to enter and who find their way to the wards of hospitals which were established to bring relief to patients of an entirely different social grade. These evils have continued to grow and increase almost everywhere, despite many and varied attempts to grapple with and remove them. Amongst these attempts we may mention the assembling of hospital conferences, the establishment of special funds and committees, and the holding of inquiries of various kinds in London and other British cities and also in the United States. maximum efficiency is secured by the poor-law system of medical relief. The remedy is very simple and easy of application. Every voluntary hospital, while admitting all accidents and urgent cases needing immediate attention, should institute a system whereby each applicant would be asked to prove that he or she was a fit object of charity. The only real attempt at reform, up to 1909, was the appointment by many of the larger hospitals of a medical authority to ascertain to what extent the poor-law patients were in a position to pay or not. By putting the burden of proof of eligibility to receive free medical relief upon the patients and their friends, all abuse of every kind must speedily cease. There would be no hardship entailed upon the patients by such a system, as experience has proved, but, to make it effective, the system of providing for in- and out-patients in Great Britain requires radical change, for, in existing circumstance, if a voluntary hospital attempted to enforce this simple method, it would be met with the difficulty that, where it was found that a patient or his friends could pay at any rate something, no department connected with British hospitals existed—as is the case in regard to hospitals in the United States—enabling such in-patients to be transferred to accommodation provided in paying wards. In the same way, directly the out-patients were dealt with under such a system, it would be made apparent, where a case could be properly treated under the poor law, that no plan of co-operation to secure this was organized under existing conditions. If the patient, being of a better class, were suffering from a minor ailment, and could be properly dealt with at a provident dispensary, the fees of which he could easily pay, the same absence of co-operation must make it practically impossible readily to enforce the system. When, again, an out-patient of the better class was entitled, from the severity of his ailment, to receive the advantages of a consultation by the medical staff, no method existed whereby this aid could be rendered to him, and his transfer afterwards to the care of a medical practitioner attached to some provident dispensary, or resident near the patient’s home, could be properly provided for. Such a system must eventually lead to the extinction of voluntary hospitals. If this disaster ever happens, it must result in the gravest evils, for it could not fail to injure the morale of all classes and tend to harden unnecessarily the relations between the rich and poor, who, under the voluntary system, have come to share each other’s sufferings and to be animated by respect and confidence towards each other.

HOSPITAL CONSTRUCTION, LOCALITY AND SITE. Hospitals are required for the care of the community in a certain locality, and to be of use they must be within reach of the centre of population. Formerly the greater difficulty of locomotion made it necessary that they should be sited actually in the midst of towns and cities, and until of late this custom continues to prevail. It is now proved to demonstration that this is not the best plan. Fresh and pure air being a prime necessity, as well as a considerable amount of space of actual area in the locality in which the population, the care of such hospitals as much in the outskirts as is consistent with considerations of usefulness and convenience. In short, the best site would be open fields; but if that be impracticable, a large space, “a sanitary grave,” as it is called by Trollet, should be kept permanently free between them and surrounding buildings, certainly never less than double the height of the highest building. In the selection of a site various factors must be taken into consideration. If the hospital is to be used as the school of a university or medical college, then the most suitable ground available within easy reach of the college must be selected. If the hospital is to be a teaching hospital not to be used as a teaching school, a site more in the country should be favoured. In any case ample ground must be purchased to permit of the wards receiving the maximum of sunlight, an abundant supply of fresh air, and leave room for possible future extensions. The site should be self-contained; it should be in such a position as to prevent the hospital being shadowed by other buildings in the neighbourhood, and there should be a belt or buffer of grass, or the like, around the hospital. The slope of the land should be such as to prevent the accumulation of any form of sewage precautionary measures and other sanitary arrangements. The difference between the expense of purchase of land in a town and in the environs is generally considerable, and this is therefore an additional reason for choosing a suburban locality.

In London and in other large towns like Manchester and elsewhere the provident dispensary has not succeeded as it has done in Northampton, because so many members of the medical profession are not alive to the importance of making their first business to provide that every patient connected with the provident dispensary who attends at the surgery of a private medical practitioner shall receive at least equal attention and accommodation to that afforded to every other private patient, whatever the fee he may pay. In the same way, poor-law dispensaries must be radically reformed. Everything which tends to excite a feel of necessity on the part of the patient is of the poorest assistance, such as the printing of the word “pauper” at the beginning of the space on which the patient’s name is entered, must be abolished, and the class of medical service and all the arrangements for the treatment of the patients, however poor, at the poor-law dispensary, must be made at least as efficient as those provided by voluntary hospitals. There undoubtedly is considerable overlapping between the voluntary hospitals and the poor law in Great Britain. The Royal Commission on the Poor Laws and Relief of Distress (1900) deals with this point with a view to set up a standard of medical relief to be granted by each class and type of hospitals, provides for adequate co-operation between all classes of institutions; and these reforms may be commended. It is too often forgotten that the function of the poor law is the relief of destitution, while it should be the object and duty of each voluntary hospital and indeed of all hospitals other than poor-law institutions to apply their resources entirely to the prevention of destitution, by stepping in to grant free medical relief to the fifty thousand of the poor-law population who are not as yet, or who, if the law be as is at present, will, in the strictest sense be destitute of means to pay. Such a system must eventually lead to the extinction of voluntary hospitals. If this disaster ever happens, it must result in the gravest evils, for it could not fail to injure the morale of all classes and tend to harden unnecessarily the relations between the rich and poor, who, under the voluntary system, have come to share each other’s sufferings and to be animated by respect and confidence towards each other.
and the Royal Infirmary in Manchester, are all good examples where this might have been carried out. In none, however, has this been done; these hospitals have been rebuilt, at enormous outlay, in the cities as before, although not exactly in the same locality; and the mode of choice, a dry gravelly or sandy soil should be selected, in a position where the ground water is low and but little subject to fluctuations of tide. In Folsom's dislike of windowless buildings is carried out, and of air round each ward, with no cul-de-sac or enclosed spaces where air can stagnate; (b) free play of sunshine upon each ward during some portion at least of the day; (c) the possibility of isolating any ward from the rest of the house, to facilitate effective sleep in the case of infectious diseases breaking out; (d) the possibility of ventilating every ward independently of any other part of the establishment. Those conditions can only be fulfilled by one system, viz., a congeries of houses or pavilions, one for each department, or a few blocks of connected wards, so as to facilitate convenient and economical administration. The older plans of huge blocks of buildings, arranged in squares or rectangles, enclosing spaces without sufficient circulation of air, are obviously objectionable. Even when arranged in single lines or crosses they are not desirable, as the wards either communicate with each other or with common passages or corridors, rendering separation difficult. One of the main advantages, that some of the buildings of the 18th century were more wisely constructed than many of those in the first half of the 19th century, and that the older buildings have been from time to time spoilt by ignorance or later times.

The question next arises, is it better to have pavilions of two or more storeys high, or to have single-storeyed huts or cottages scattered more widely, or to adopt the treatment of tuberculosis that can be doubted, that the 40 or 50 beds or patient huts is the best for the patients for the acute stages; for economical reasons the helmet has not been heretofore as popular as it deserves to be, but if the welfare of the patient is to be the first consideration there is no doubt that the helmet will ultimately prevail. It has the merit of being easily adapted to villages and houses where there is a garden, and in this way poor families may readily isolate themselves. The treatment of tuberculosis, however, though it may be probable that the majority of the pavilions will be single-storeyed. Still some hospital authorities prefer the multiple-storeyed system for administrative reasons, contending that single-storeyed pavilions have no special advantages over two or three-storeyed buildings, whereas the difficulties in administration and service of a hospital and the single-storey principle outweigh any argument against the multiple. One clear building, if it is properly fed, that we hope the time is approaching when architects and those members of the public who have to provide the money for hospital buildings will insist upon the erection of single-storeyed buildings. A single-storeyed building may, as it ought to be, be reduced by at least half when compared with the expenditure of the past.

The pavilions may be arranged in various ways; they may be joined together, or the corridor, not being much used, may be sunk down, or grouped, or any arrangement may be made. A certain distance, not less than twice the height of the pavilions, ought to be preserved between them. By this means free circulation of air and plenty of light are secured, whilst separation or isolation may be at once accomplished if required.

Foundations, Building Materials, &c.—It is of the first consequence that a hospital should be dry; therefore the foundation and walls ought to be carried out so as to prevent the inroads of damp. An impervious foundation has the further advantage of preventing earth Liquors rising up into the building. It is well known that the force produced by the higher temperature of the internal atmosphere of the building itself. There should be free ventilation in the base- ment, and the raising of the whole of arches is a good plan, now generally adopted, as the conditions affected by tuberculosis at a cost within their means. For hospital purposes, so long as the system of placing hospital buildings in densely crowded areas prevails, many-storeyed buildings for hospital purposes are likely to continue. Should the population, however, increase, it is probable that the majority of the pavilions will be single-storeyed. An impervious foundation has the further advantage of preventing earth Liquors rising up into the building. It is well known that the force produced by the higher temperature of the internal atmosphere of the building itself. There should be free ventilation in the base-
outlet, where the rate may be somewhat higher; about 64 sq. in. of inlet and outlet sectional area ought to be supplied per head as a minimum, and the capacity of the outlet as a maximum. The provision of open-air places must precede the system of ventilation, the wards with air, by means of open windows, when this can be done with safety.

Ward Ventilation is of very great importance in all climatic conditions, especially in such a climate as that of Great Britain, where every system of ventilation must involve either the warming of some portion of the incoming air, or the contrivance of its delivery without too great a loss of heat. In a climate such as this, which is too strongly inclined towards the tendency that is too much in the direction of allowing warmth to supersede freshness of air. There are very few cases of disease (if any) that are not more injured by foul air than by cold air. In excess of both these conditions, in such as typhus, enteric fever, smallpox, &c., satisfactory results have been obtained even in winter weather by almost open-air treatment. It appears a rational one, and is a rule for all grounds if it can be obtained without sacrificing purity of atmosphere. For all practical purposes 60° to 63° F. is quite sufficient, and surgical and lying-in cases do well in lower temperatures. Various plans of warming have been recommended, but probably a combination is the best. It is inadvisable to do away altogether with radiant heat, although it is not always possible to supply sufficient warmth with open-air places alone. A portion of the air may be warmed by being passed over a heating apparatus before it enters the ward, by having an air-chamber round the fire-place or stove, or by the use of radiators in the ward itself. In each case, however, the air must be supplied independently to each ward, so that no general system of air supply is applicable.

In each case, however, the air must be supplied independently to each ward, so that no general system of air supply is applicable.

The same attention should be paid to the ventilation of the individual wards. Each bed should have a sufficient quantity of air to it, and it is essential that the air should be carefully filtered. The use of a separate system of ventilation for each ward is desirable, and it is recommended that each bed should be provided with a special ventilator to carry off combustion products, as in the Edinburgh Infirmary.

The Furniture of Wards should be simple, clean and non-abrasive. Beds of iron, as tables, benches, and bedsprings must be as free from projections as possible. No curtains should be permitted. The water-supply ought to be on the constant system, and plentiful 50 gallons per head per diem may be taken as a fair minimum estimate.

The closets ought to be of the simplest construction, the pans of earthenware all in one piece, the flushing arrangements simple but perfect, and the supply of water ample. Each ward should have its own closets, lavatories, &c., built in small annexes, with cross-ventilated vestibule separating them from the ward. All the pipes should be of lead, and carried on the frames. The closets, basins, sinks, traps, the sink and waste pipes by being made to pour their contents over trapped gratings. The soil pipes should be ventilated, and placed outside the walls, protected as may be necessary from frost. Each ward should have a movable bath, which can be wheeled to the patient’s bedside. Each ward should have attached to it a small kitchen for any special cooking that may be required, a room for the physician or surgeon, and generally a room with one or two separate beds. No cooking should be done in the wards, nor ought washing, airing or drying of linen to be allowed there.

It is a common opinion that there is no doubt that the voluntary system of hospital government is far more economical than any system of state or rate-supported hospitals. That the present condition of the voluntary hospitals in regard to economy is all that can be desired cannot be denied. Still, as resting as this system does upon the goodwill of the public for its continuance and maintenance, it is satisfactory to note that there is a continuous improvement in method and management which makes it hopeful. It has taken many years to perfect and enforce the uniform system of hospital accounts, but this system with the co-operation of the great funds has produced economical results of the first importance.

This system originated at the Queen’s Hospital, Birmingham, in 1859, and was devised by an eminent Birmingham accountant, William Laundry, and Sir Henry Burdett. It proved so fruitful in practice that six years later it was introduced at the “Dreadnought” and “Seamen’s Hospital, the first London hospital to use it, and was then adopted spontaneously by a few of the best-administered hospitals where the managers were keen in enforcing economy. In 1891, in order to determine definitely the charge of the items and charges included in the system, a glossary or index of classification was prepared and published in the Hospital Administration circulars, and the new index was adopted by a general meeting of hospital secretaries in January 1892. The Council of the Metropolitan Hospital Sunday Fund has reviewed and revised the index, and the Uniform System of Accounts was formulated by that body for the use of the metropolitan hospitals. In 1906 the whole of this system was inquired into on behalf of the King’s Fund by Mr John G. Griffiths, F.C.A., when a committee of hospital secretaries was appointed to review and revise the system. This was completed in the course of the year and adopted by the King’s Fund, the Hospital Sunday Fund and the Hospital Saturday Funds. The publication of a book by Sir Henry Burdett led to the adoption of the system in several of the British Colonies, and the Uniform System of Accounts has been recently set up and adopted by the principal hospitals of the United States of America. The prince of Wales (George V) testified to the value of this system in enrolling the control over hospital expenditure and adopting it for the use of the authorities of all charities of every class. It is probably that no single reform has had a greater influence for good than the introduction and adoption of the uniform system of accounts and the enforcement and uniformity of the system of accounts.

Nursing.—The arrangements for nursing the sick have improved in recent times, although controversy still goes on as to whether they are satisfactory and economical, and whether a hospital both efficiency and economy have to be considered. No ward in a general hospital for acute cases should contain more than 12 patients, and it is recommended that the proportion of nurses to patients should be about one nurse to every three patients, and if possible every ward should have a probationer on duty at night in addition to the night nurse. In all well-conducted hospitals it is now arranged that the nurses on night duty have a hot meal served in the general dining-room during the night, and this is only possible where a nurse and a probationer are allowed for each ward. The nurses’ quarters should be separate from the hospital proper, and connected by a conservatory or covered way. Each nurse should have a separate bedroom, measuring not less than 12 ft. long, 9 ft. broad and to ft. high. A bath should be allowed for every eight rooms, and the water-closets and sinks should, if possible, be in sanitary towers cut off from the main block of buildings.

Circumstances must to a large extent determine the arrangement, but it is a good rule that nurses should not be confined to a single ward at a time if possible. The duties of nurses ought also to be distinctly confined to attendance on the sick, and no menial work, such as scrubbing floors and the like, should be assigned to them, except in some special cases where it is employed for such purposes. It is also desirable that a separate pavilion for lodging the nurses should be set apart, and that fair wages be paid, in order to secure the best possible service. The discussion has taken place as to the advisability of placing the nursing of a hospital in the hands of a sisterhood or a separate corporation. It will, however, be admitted that the best plan is for the nursing staff of each hospital to be special and under one head directly within the establishment itself, even though it may be connected with some main institution outside. The nursing must, of necessity, be in perfect accordance with the directions and treatment of the physicians and surgeons.

General.—The kitchen, laundry, dispensary and other offices must be in a separate pavilion or pavilions, away from the wards, but within convenient access. A separate pavilion for isolation of infectious cases is desirable. This may be a wooden hut, or in some cases even a tent; either is probably preferable to a permanent block of buildings. A disinfecting chamber ought to be provided where heat may be applied to clothes and bedding for the destruction both of vermin and of the germs of disease. It is advisable to expose all bedding and clothing to its influence after the patient has been removed from the ward, to avoid the deterioration of fabric, and thereby make the ward safe for not less than one month in every year, and longer if possible. During such period thorough cleansing and flushing with air should be carried out, so as to prevent any continuous deposit of organic matter.

Gate House or Admission Block.—If the efficiency of a hospital and the regular and smooth working of its departments are to be secured, the proper management and control of the admission department is of the greatest importance. When one considers for a moment the number of applicants of all ages in various stages of disease, and the number of accident cases of every degree of severity who present themselves every day seeking admission, it will be evident that the most careful supervision must be exercised on the very threshold. It is essential that every precaution be taken against the admission of any delirious, faint, or mentally diseased person, without previous examination, of any patient seeking admission. It is only necessary to instance the case of a patient with delirium tremens being admitted, and when once changed to menial work, may have been admitted through an overlook, or a case refused admission and expiring on the way home, in order to illustrate the danger and trouble which might arise should the supervision exercised over this department not be adequately performed.

To secure this proper control it is necessary that the admission department should be designed on a definite plan suitable for the purpose. It should be kept separate from the other departments, say, in the basement of the building, where patients may be casually interviewed by a house surgeon or physician. This department should be as carefully designed and equipped as any other department of the hospital.

Within recent years much more attention has been devoted to the details of construction than was formerly considered necessary,
but even in the best type of hospital there is still much to be desired in this respect. It is essential for an architect in designing any building to have before him an accurate idea of all the requirements, and the consideration of each point in the design of the building is to be put; for unless he is furnished with this information it is not possible for him to design his building so as to give effect to all the details which are so necessary. The following is an endeavour in a general way to enumerate the principal points which an architect should have before him in designing the admission department of a general hospital:

The admission department should be conveniently placed on the ground floor of the hospital—or it may be a detached building—with a large courtyard where ambulance wagons or other vehicles may easily pass each other on approaching or retiring from the institution. The entrance to the admission department for patients should, if possible, be entirely separate and distinct from that for the staff and visitors. A small entrance should be provided for patients' friends on visiting days, in order that they may be able to enter the hospital without passing through the patients' entrance, or coming into contact with an accident case or other patient seeking admission. The main entrance door should be protected by a covered porch so that patients may be removed from the ambulance or cab to the examination room without being exposed to the weather or the gaze of inquisitive onlookers. This door should be sufficiently wide to allow two hand ambulances or bars to pass should they require to be brought out to the ambulance or cab, and to facilitate this the floor of the entrance hall should be as nearly on a level with that of the outside porch. Adjoining the entrance vestibule, lavatory accommodation should be provided for males and females who may accompany the patient. Lavatory accommodation should also be provided for porters on duty, and all lavatories should have a cut-off ventilating passage.

Ambulance bars should adjoin the entrance, and this recess must be in proportion to the size of the hospital, and made so that a hand ambulance may always be available when an accident or urgent case arrives. The vestibule should lead into a basin with a large wash-stand and semi-circular recess, with a supply of hot and cold water.

Two rooms, with recovery rooms adjoining, should be fitted up as small operating-rooms for the treatment of minor casualties. A large central hall should be fitted up with an X-ray machine, and the adjoining walls should be constructed of a hard material. The arrangements should be made whereby this room can be readily darkened so that suspected fractures, &c., may be examined with the fluorescent screen.

Adjoining the admission department two small wards should be provided for the accommodation of drunk or noisy cases unfit to be placed in the general wards. To these "emergency wards" must be attached the usual bathroom and lavatory accommodation, and two toilets, each with a wash-stand and wash-basin.

The interior walls of the admission department should, as far as possible, be fitted with impervious surface, in order that they may be easily cleaned. All angles should be avoided and all corners rounded. Although glazed tiles are open to the criticism that they have numerous joints, they probably make a more suitable wall than masonry, and the use of a hard wood, preferably teak, and have no mouldings or grooves where dust can lodge. They should be wide enough to admit an ambulance barrow or bed with case. In no case should the doors of an examination room be less than 3 ft. 6 in. in width.

As an aid to a complete understanding of the varied work which has to be provided for, and the most effective method of carrying it out, the accompanying plans are given of an admission block designed to embody the main principles which govern the construction of such a department.

All accidents and patients seeking admission to this hospital enter through the central gateway, and on the left is shown the porters' room, where a porter is always in readiness to attend to applicants. This room has suitable accommodation for parcels, letters, telephones, &c., and adjoining it is a small lavatory for the use of porters. At the side of the porters' room is the entrance to the central waiting-hall, which is lit from the roof. On one side of this hall are examination and dressing-rooms for males, with lavatory accommodation; and on the other side similar provision for females, with the addition of a nurses' duty station. The end of the central hall leads into the operating-theatres, with recovery room adjoining each; one theatre for males, and the other for females. Between these theatres are rooms for sterilizers and dressings. An X-ray examination room is provided beyond the male examination room on the right of the hall. In the basement, under the entrance-hall and operating theatres are two bathrooms for males and two for females, with W.C.'s for each. The remainder of the basement is used as a store for patients' clothes, and a hot-water chamber is provided for purposes of disinfection. The basement can be reached by a lift or by a wide staircase which is situated at the end of the waiting-hall.

In the above plan provision is made for a sitting-room for the medical officer on duty. This is a new and essential feature in the admission block unit of all hospitals in large cities, for it should secure that no patient is kept waiting for many minutes before being seen. One of the blots on the management of many hospitals is that regrettable delays often take place, and much dissatisfaction and avoidable suffering may arise from this difficulty in the administration of a general hospital. We have given this plan of a model gatehouse or admission block for a modern hospital, because the block as it stands contains all the elements necessary for a receiving-house block in cities in connexion with a great hospital city situated outside its area, in fulfilment of the suggestion for a Hospital city made above. Apart from its interest as a new feature which all new hospitals should adopt, the gatehouse or admission block has an importance in the wider sense, that it may come to form the key to the solution of the problem of how best to provide hospital accommodation for poverty-stricken great cities under the best hygienic conditions, while protecting them from the misery and danger of prolonged delay in first treatment, especially in connexion with accidents and other cases of urgency.

HOSPITIUM—HOSTAGE

origine jusqu'à nos jours (Paris, 1892); Sir H. Burdett, Hospitials and Asylums of the World, with large portfolio of plans to a uniform scale (London, 1843); a supplement is published every year bringing the information up to date, entitled Burdett's Hospitials and Charities); I. S. Billings, The Principles of Ventilation, Heating and their Practical Application (New York, 1893); Catalon, Health Hospitals, Asylums and Dispensaries (Paris, 1891); Tolver, Les Hospitials et Asylums de France (Paris, 1894); Billings and Hurt, Suggestions to Hospital and Asylum Visitors (Philadelphia 1895); Oswald Kuhn, "Hospitials," Handbuch der Architektur, 4th part, 5th half-volume, part 1 (Stuttgart, 1897); Plans for the John Hopkins Hospital (Baltimore, 1875); Report of State Board of Health for Massachusetts for 1879. (H. Br.)

HOSPITIUM (Gr. ἡσυχία, ποιειώδες), "hospitality," among the Greeks and Romans, was of a twofold character: (1) private; (2) public.

(1) In Homeric times all strangers without exception were regarded as being under the protection of Zeus Xenios, the god of strangers and suppliants. It is doubtful whether, as is commonly assumed, they were considered as ipso facto enemies; they were rather guests. Immediately on his arrival, the stranger was clothed and entertained, and no inquiry was made as to his name or antecedents until the duties of hospitality had been fulfilled. When the guest parted from his host he was often presented with gifts (ξηραμα), and sometimes a dirhama was broken between the two (Δυτικανων). Each they gave was, as a part, a family donation; the service was established, and the broken die served as a symbol of recognition; thus the members of each family found in the other hosts and protectors in case of need. Violation of the duties of hospitality was likely to provoke the wrath of the gods; but it does not appear that anything beyond this religious sanction existed to guard the rights of a traveller. Similar customs seem to have existed among the Italian races. Amongst the Romans, private hospitality, which had existed from the earliest times, was more accurately and legally defined than amongst the Greeks, the tie between host and guest being almost as strong as that between patron and client. It was of the nature of a contract, entered into by mutual promise, the clasping of hands, and exchange of an agreement in writing (tabula hospitalis) or of a token (tessera or symbolon), and was rendered hereditary by the division of the tesserac. The advantages thus obtained by the guest were, the right of hospitality when travelling and, above all, the protection of his host (representing him as his patron) in a court of law. The contract was sacred and inviolable, undertaken in the name of Jupiter Hospitalis, and could only be broken by a formal act.

(2) This private connexion developed into a custom according to which a state appointed one of the citizens of a foreign state as its representative (πρόξυνος) to protect any of its citizens travelling or resident in his country. Sometimes an individual came forward voluntarily to perform these duties on behalf of another state (ἐξοικεστεψαν). The proxenus was generally compared to the modern consul or minister resident. His duties were to afford hospitality to strangers from the state whose proxenus he was, to introduce his ambassadors, to procure them admission to the assembly and seats in the theatre, and in general to look after the commercial and political interests of the state by which he had been appointed to his office. Many cases occur where such an office was hereditary; thus the family of Callias at Athens were proxeni of the Spartans. We find the office mentioned in a Cynoaryacan inscription dating probably from the 7th century B.C., and it continued to grow more important and frequent throughout Greek history. There is no proof that any direct emolument was ever attached to the office, while the expense and trouble entailed by it must often have been very great. Probably the honours which it brought with it were sufficient remuneration. These consisted partly in the general respect and esteem paid to a proxenus, and partly in many more substantial honours conferred by special decree of the state whose representative he was, such as freedom from taxation and public burdens, the right of acquiring property in Attica, admission to the senate and popular assemblies, and perhaps even full citizenship. Public hospitalism seems to have existed among the Italian races; but the circumstances of their history prevented it from becoming so important as in Greece. Cases, however, occur of the establishment of public hospitality between two cities (Rome and Caere, Livy v. 50), and of towns entering into a situation of clientship to some distinguished Roman, when the famae patronum of the family were frequently granted the right of public hospitality by the senate down to the end of the republic. The public hospes had a right to entertainment at the public expense, admission to sacrifices and games, the right of buying and selling on his own account, and of bringing an action at law without the intervention of a Roman patron.

A full bibliography of the subject will be found in the article in Dambrowski and Saglio, Dictionnaire des ambassades, to which may be added R. von Thiering, Die Gastfreundschaft im Altenrum (1887); see also Smith's Dictionary of Greek and Roman Antiquities (3rd ed., 1861).

HOSPODAR, a term of Slavonic origin, meaning "lord" (Russ. господарь). It is a derivative of gospodar, "lord," and is akin to geoswar, which primarily means "sovereign," and is now also used in Russia as a polite form of address, equivalent to "sir." The pronunciation as hospodar of a word written gospodar in all but one of the Slavonic languages which retain the Cyrillic alphabet is not, as is sometimes alleged, due to the influence of Little Russian, but to that of Church Slavonic. In both of these ɣ is frequently pronounced k. In Little Russian the title hospodar is specially applied to the master of a house or the head of a family. The rulers of Walachia and Moldavia were styled hospodari from the 15th century to 1866. At the end of this period, as the title had been held by many vassals of Turkey, its retention was considered inconsistent with the growth of Rumanian independence. It was therefore discarded in favour of domn (dominus, "lord"), which continued to be the official princely title up to the proclamation of a Rumanian kingdom in 1881.

HOBIT (1) (Through the O. Fr. ostie, modern hôte, from Lat. hospes, a guest or host; hospes being probably from an original hostipes, one who feeds a stranger or enemy, from hostis and the root of pascre), one who receives another into his house and provides him with lodging and entertainment, especially one who does this in return for payment. The word is thus transferred, in biology, to an animal or plant upon which a parasite lives. (2) (From Lat. hostis, a stranger or enemy; in Med. Latin a military expedition), a very large gathering of men, armed for war, an army, and so used generally of any large collection. In biblical use the word is applied to the company of angels in heaven; or to the sun, moon and stars, the "hosts of heaven," and also to translate "Jehovah Sabaoth," the Lord God of hosts, the lord of the armies of Israel or of the hosts of heaven. (3) (From Lat. hostia, a victim or sacrifice), the sacrifice of Christ's body and blood in the Eucharist, more particularly the consecrated wafer used in the service of the mass in the Roman Church (see Eucharist).

HOSTAGE (through Fr. ostage, modern ostage, from Lat. obstatuum, the state of being an obstes or hostage; Med. Lat. obstaticum, ostalium), a person handed over by one of two belligerent parties to the other or seized as security for the carrying out of an agreement, or as a preventive measure against certain acts of war. The practice of taking hostages is very ancient, and has been used constantly in negotiations with conquered nations, and in cases such as surrenders, armistices and the like, where the two belligerents depended for its proper carrying out on each other's good faith. The Romans were accustomed to take the sons of tributary princes and educate them at Rome, thus holding a security for the continued loyalty of the conquered nation and also instilling a possible future ruler with ideas of Roman civilization. This practice was also adopted in the early period of the British occupation of India, and by France in her relations with the Arab tribes in North Africa. The position of a hostage was that of a prisoner of war.

1 The sultan of Bagieni, in Central Africa, in 1906 sent his nephew to undergo military training with a squadron of Spahis, and at the same time to serve as a guarantee of his fidelity to the French (Bulletin du Comité d'Afrique Française, Oct. 1906).
HOSTE—HOSUR

to be retained till the negotiations or treaty obligations were carried out, and liable to punishment (in ancient times), and even to death, in case of treachery or refusal to fulfil the promises made. The practice of taking hostages as security for the carrying out of a treaty between civilized states is now obsolete. The last occasion was at the treaty of Aix-la-Chapelle in 1748, when two British peers, Henry Bowes Howard, 11th earl of Suffolk, and Charles, 9th Baron Cathcart, were sent to France as hostages for the restitution of Cape Breton to France.

In modern times the practice may be said to be confined to two occasions: (1) to secure the payment of enforced contributions or requisitions in an occupied territory, and the obedience to regulations the occupying army may think fit to issue; (2) as a precautionary measure, to prevent illegitimate acts of war or violence by persons not members of the recognized military forces of the enemy. During the Franco-Prussian War of 1870, the Germans took as hostages the prominent people or officials from towns or districts when making requisitions and also when foraging, and it was a general practice for the mayor and adjoint of a town which failed to pay a fine imposed upon it to be seized as "hostages" and retained till the money was paid. The last case where "hostages" have been taken in modern warfare has been the subject of some controversy in 1914. The Germans found it necessary to take special measures to put a stop to train-wrecking by parties in occupied territory not belonging to the recognized armed forces of the enemy, an illegitimate act of war. Prominent citizens were placed on the engine of the train "so that it might be understood that in every accident caused by the hostility of the inhabitants their compatriots will be the first to suffer." The measure seems to have been effective. In 1900 during the Boer War, by a proclamation issued at Pretoria (June 19th), Lord Roberts adopted the plan for a similar reason, but shortly afterwards (July 29) it was abandoned (see The Times' History of the War in S. Africa, iv. 425). The Germans also, between the surrender of a town and its final occupation, took "hostages" as security against outbreaks of violence by the inhabitants. Most writers on international law have regarded this method of preventing such acts of hostility as unjustifiable, on the ground that the persons taken as hostages are not the persons responsible for the act; that, as by the usage of war hostages are to be treated strictly as prisoners of war, such an exposure to danger is transgressing the rights of a belligerent; and as useless, for the mere temporary removal of important citizens till the end of a war cannot be a deterrent unless their mere removal deprives the combatants of persons necessary to the continuance of the acts and (ibid: W. E. Hall, International Law, 1905, vol. iii., p. 418, 425). On the other hand it has been urged (L. Oppenheim, International Law, 1905, ed. ii., "War and Neutrality," pp. 271-273) that the acts, the prevention of which is aimed at, are not legitimate acts on the part of the armed forces of the enemy, but illegitimate acts by private persons, who, if caught, could be quite lawfully punished, and that a precautionary and preventive measure is more reasonable than "reprisals." It may be noticed, however, that the hostages would suffer should the acts aimed at be performed by the authorized belligerent forces of the enemy.

In France, after the revolution of Prairial (June 18, 1799), the so-called "law of hostages" was passed, to meet the insurrection in La Vendée. Relatives of émigrés were taken from disturbed districts and imprisoned, and were liable to execution at any attempt to escape. Sequestration of their property and deportation from France followed on the murder of a republican, four to every such murder, with heavy fines on the whole body of hostages. The law only resulted in an increase in the insurrection. Napoleon in 1796 had used similar measures to deal with the insurrection in Lombardy (Correspondance de Napoléon I. i. 323, 327, quoted in Hall, International Law). In May 1781, at the close of the Paris Commune, took place the massacre of the so-called hostages. Strictly they were not "hostages," for they had not been handed over or seized as security for the performance of any undertaking or as a preventive measure, but merely in retaliation for the death of their leaders E. V. Duval and Gustave Flourens. It was an act of maniacal despair, on the defeat at Mont Valérion on the 4th of April and the entry of the army into Paris on the 21st of May. Among the many victims who were shot in batches the most noticeable were Monsignor Darboy, archbishop of Paris, the Abbé Deguery, curé of the Madeleine, and the president of the Court of Cassation, Louis-Henri Bonjean.

HOSTE, SIR WILLIAM (1780-1828), British naval captain, was the son of Dixon Hoste, rector of Godwick and Tittleshill in Norfolk. He was born on the 26th of August 1780 at Ingoldthorpe, and entered the navy in April 1793, under the special care of Nelson, who had a lively affection for him. He became lieutenant in 1798, and was appointed commander of the "Mutine" brig after the battle of the Nile, at which he was present as lieutenant of the "Theseus." In 1802 he was promoted post captain by Lord St Vincent. During all his active career, he was employed in the Mediterranean and the Adriatic. From 1815 to 1816, he was a member of the council of war in the Mediterranean. From 1816 to 1817, he commanded the frigate "Erebus," and was engaged in operations against the French who held Dalmatia at the time, and in watching, or, when they came out, fighting, the ships of the squadron formed at Venice by Napoleon's orders. The work was admirably done, and was also lucrative; and Hoste, although he occasionally complained that his exertions did not put much money in his pocket, made a fortune of at least £60,000 by the capture of Italian and Dalmatian merchant ships. He also made many successful attacks on the French military posts on shore. His most brilliant feat was performed on the 13th of March 1811. A Franco-Venetian squadron of six frigates and five armed vessels, under the command of a French officer named Dubourdieu, assailed Hoste's small force of four frigates near the island of Lissa. The French officer imitated Nelson's attack at Trafalgar by sailing down on the English line from windward with his ships in two lines. But the rapid manœuvring and gunnery of Hoste's squadron proved how little virtue there is in any formation in itself. Dubourdieu was killed, one of the French frigates was driven on shore, and two of the Venetians were taken. After the action, which attracted a great deal of attention, Hoste returned to England, but in 1812 he was back on his station, where he remained till the end of the war. During the peace he did not again go to sea, and he died on his 6th of April, 1828. He married Lady Harriet Walpole in April 1817, and left three sons and three daughters.

In 1833 his widow published his Memoirs and Letters. See also Marshall, Roy. Nav. Biog. vol. iii., and James, Naval History.

HOSTEL, the old name for an inn (see HOSPITAL, ad initii.; also employed at Oxford and Cambridge to designate the lodgings which were in ancient times occupied by students of the university and to a certain extent regulated by the authorities. In some English public schools what is known as the "hostel" system provides for an organization of the lodging accommodation under separate masterships.

HOSTIUS, Roman epic poet, probably flourished in the 2nd century B.C. He was the author of a bellum Hispam in at least seven books, of which only a few fragments remain. The poem is probably intended to celebrate the victory gained in 129 by Gaius Sempronius Tuditanus (consul and himself an annalist) over the Ilyrian Iapydes (Appian, Ilyrica, 10; Livy, epit. 59). Hostius is supposed by some to be the "doctus avus" alluded to in Propertius (iv. 20. 8), the real name of Propertius's Cynthia, according to Apuleius (Apologia x.) and the scholiast on Juvénal (vi. 7), being Hostia (perhaps Roscia).

Fragments in E. Bührens, Fragmenta poëtarum Romanorum (1884) T. A. Weichsel, Posthorses Landerz religiosa (1891).

HOSUR, a town of British India, in the Salem district of Madras, 24 m. E. of Bangalore. Pop. (1901) 6695. It contains an old fort, frequently mentioned in the history of the Mysore wars, and a fine castellated mansion built by a former collector.
HOTHAM, WILLIAM HOTHAM, 1ST BARON (1756-1813), British Admiral, son of Sir Beaumont Hotham (d. 1771), a lineal descendant of the above Sir John Hotham, was educated at Westminster School and at the Royal Naval Academy, Portsmouth. He entered the navy in 1771, and spent most of his early days in the Mediterranean. In 1759 he became lieutenant in Sir Edward Hawke's flagship the “Sovereign of the Seas” and he soon received a small command, which led gradually to higher posts. In the “Syren” (1760) he fought a sharp action with the French “Télémaque” of superior force, and in the “Fortune” sloop he carried, by boarding, a 26-gun privateer. For this service he was rewarded with a more powerful ship, and from 1765 onwards commanded various frigates. In 1759 his ship the “Melampus” was attached to Keppel’s squadron in 1761, but was in the main employed in detached duty and made many captures. In 1776, as a commodore, Hotham served in North American waters, and he had a great share in the brilliant action in the Cul de Sac of St Lucia (Dec. 17th, 1778). Here he continued till the spring of 1781, when he was sent home in charge of a large convoy of merchants. Off Scilly Hotham fell in with a powerful French squadron, against which he could effect nothing, and many of the merchantmen went to France as prizes. In 1782 Commodore Hotham was with Howe at the relief of Gibraltar, and at the time of the Spanish armament of 1790 he flew his flag as rear-admiral of the red. Some time later he was made vice-admiral. As Hood’s second-in-command in the Mediterranean he was engaged against the French Revolutionary navy, and when his chief retired to England the command devolved upon him. On March 12th, 1794 he fought an indecisive fleet action, in which the brunt of the fighting was borne by Captain Horatio Nelson, and some months later, now a full admiral, he again engaged, this time under conditions which might have permitted a decisive victory;
HOTHO—HOT SPRINGS

of this affair Nelson wrote home that it was a "miserable action." A little later he returned to England, and in 1797 he was made a peer of Ireland under the title of Baron Hotham of South Dalton, near Hull. He died in 1813. Hotham lacked the fiery energy and genius of a Nelson or a Jervis, but in subordinate positions he was a brave and capable officer.

As Hotham died unmarried his barony passed to his brother, Sir Beaumont Hotham (1757–1814), who became 2nd Baron Hotham in May 1813. Beaumont, who was a baron of the exchequer for thirty years, died on the 4th of March 1814, and was succeeded as 3rd baron by his grandson Beaumont Hotham (1794–1870), who was present at the battle of Waterloo, being afterwards a member of parliament for forty-eight years. He died unmarried in December 1870 and was succeeded by his nephew, Charles (1836–1872), and then by another nephew, John (1838–1907). In 1907 his cousin Frederick William (b. 1863) became the 6th baron.

Other distinguished members of this family were the 2nd baron's son, Sir Henry Hotham (1777–1853), a vice-admiral, who saw a great deal of service during the Napoleonic wars; and Sir William Hotham (1772–1848), a nephew of the 1st baron, who served with Duncan in 1797 off Camdenport and elsewhere.

See Charnock, Biographia navalis, vi. 236.

HOTH, HEINRICH GUSTAV (1802–1873), German historian of art, was born at Berlin in 1802, and died in his native city on Christmas day 1873. During boyhood he was affected for two years with blindness consequent on an attack of measles. But recovering his sight he studied so hard as to take his degree at Berlin in 1826. A year of travel spent in visiting Paris, London and the Low Countries determined his vocation. He came home delighted with the treasures which he had seen, worked laboriously for a higher examination, and passed as "doctor in aesthetics and art history. In 1829 he was made professor at the university of Berlin. In 1833 G.F. Waagen accepted him as assistant in the museum of the Prussian capital; and in 1838 he was promoted to the directorship of the print-room. During a long and busy life, in which his time was divided between literature and official duties, Hotho's ambition had always been to master the history of the schools of Germany and the Netherlands. Accordingly what he published was generally confined to those countries. In 1842–1843 he gave to the world his account of German and Flemish painting. From 1855 to 1859 he revised and published another part of his work, which he called "The schools of Hubert van Eyck, with his German predecessors and contemporaries." His attempt later on to write a history of Christian painting overtasked his strength, and remained unfinished. Hotho is important in the history of aesthetics as having developed Hegel's theories; but he was deficient in knowledge of Italian painting.

HOTI-MARDAN, or MARDAN, a frontier cantonment of British India in the Peshawar district of the North-West Frontier Province, situated 15 m. N. of Nowshera. Pop. (1901) 3572. It is notable as the permanent headquarters of the famous corps of Guides, and also contains a cavalry brigade belonging to the 1st line of the northern army. Population, 6,395

HOTMAN, FRANCOIS (1524–1590), French publicist, eldest son of Pierre Hotman, was born on the 23rd of August 1524, at Paris, his family being of Silesian origin. His name is latinized by himself Hotomans, by others Hotomanni and Hotomans. His father, a zealous Catholic, and a counsellor of the parlement of Paris, destined him for the law, and sent him at the age of fifteen to the university of Orleans. He obtained his doctorate in three years, and became a pleader at Paris. The arts of the barrister were not to his taste; he turned to the study of jurisprudence and literature, and in 1546 was appointed lecturer in Roman Law at the university of Paris. The fortitude of this young man was so great that throughout his life he never relaxed on the cause of Reform. Giving up a career on which he had entered with high repute, he went in 1547 to Lyons, and thence to Geneva and to Lausanne, where, on the recommendation of Calvin, he was appointed professor of belles-lettres and history, and married Claudine Aubelin, a refugee from Orleans. On the invitation of the magistracy, he lectured at Strassburg on law in 1555, and became professor in 1556, superseding Francois Baudouin, who had been his colleague in Paris. His fame was such that overtures were made to him by the courts of Prussia and Hesse, and by Elizabeth of England. Twice he visited Germany, in 1556 accompanying Calvin to the Diet at Frankfurt. He was entrusted with confidential missions from the Huguenot leaders to German potentates, carrying at one time credentials from Catherine de Medici. In 1568 he was one of the principal instigators of the conspiracy of Amboise; in September of that year he was with Antoine of Navarre at Nérac. In 1562 he attached himself to Condé. In 1564 he became professor of civil law at Valence, retrieving by his success the reputation of the university. In 1567 he succeeded Cujas in the chair of jurisprudence at Bourges. Five months later his house and library were wrecked by a Catholic mob; he fled to Orleans, where L'Hôpital made him historiographer to the king. As agent for the Huguenots, he was sent to Blois to negotiate the peace of 1568. He returned to Bourges, only to be again driven away by the outbreak of hostilities. At Sancerre, during its siege, he composed his Consolatio (published in 1593). The peace of 1570 restored him to Bourges, whence a third time he fled, in consequence of the St Bartholomew massacre (1572). In 1573, after publishing his Franco-Gallia, he left France for ever with his family, and became professor of Roman law at Geneva. On the approach of the duke of Savoy he removed to Basel in 1579. In 1580 he was appointed councillor of state to Henry of Navarre. The plague sent him in 1582 to Montbéliard; here he lost his wife. Returning to Geneva in 1584 he developed a kind of scientific turn, dabbling in alchemy and the research for the philosopher's stone. In 1589 he made his final retirement to Basel, where he died on the 12th of February 1590, leaving two sons and four daughters; he was buried in the cathedral.

Hotman was a man of pure life, real piety (as his Consolatio shows) and warm domestic virtues. His constant removals were inspired less by fear for himself than by care for his family, and by a temperament averse to the conditions of warfare, and a constitutional desire for peace. He did much for 16th-century jurisprudence, having a critical knowledge of Roman sources, and a fine Latin style. He broached the idea of a national code of French law. His works were very numerous, beginning with his De gradibus cognationis (1546), and including a treatise on the courts of Rome (1557), which has an important place, since it showed that French law could not be based on Justinian; a life of Coligny (1575); a polemic (Brutum fulmen, 1585) directed against a bull of Sixtus V., with many other works on law, history, politics and classical learning. His most important work, the Franco-Gallia (1573), was in advance of his age, and found favour neither with Catholics nor with Huguenots in its day; yet its vogue has been compared to that obtained later by Rousseau's Contrat Social. It presented an ideal of Protestant statesmanship, pleading for a representative government and an elective monarchy. It served the purpose of the Jesuits in their pamphlet war against Henry IV. See also, Dictionnaire R. Hébert. Essai sur F. Hotman (1860); E. Grégoire, in Nouv. Biog. générale (1858). (A. Go.)

HOT SPRINGS, a city of Arkansas, U.S.A., the county-seat of Garland county, at the easterly base of the Ozark mountains, 55 m. by rail W.S.W. of Little Rock. Pop. (1880) 3554; (1890) 8086; (1900) 9973, of whom 3102 were of negro descent and 561 were foreign-born; (1910 census) 14,434. The transient population numbers more than 100,000 annually. Hot Springs is served by the Chicago, Rock Island & Pacific, the Little Rock & Hot Springs Western, and the St Louis, Iron Mountain & Southern railways. The city lies partly in several mountain ravines and partly on a plateau. A creek, flowing through the surrounding hills is about 1200 ft. above the sea and 600 ft. above the surrounding country. The scenery is beautiful, and there is a remarkable view from a steel tower observatory, 150 ft. high, on the top of Hot Springs mountain. The climate is delightful. The
average rainfall for the year is about 55 in. The springs are about forty-four in number, rising within an area of 3 acres on the slope of Hot Springs mountain. They are all included within a reservation held by the United States government, which (since 1903) exercises complete jurisdiction. The daily flow from the springs used is more than 800,000 gallons. Their temperature varies from 93° to 147° F. The waters are tasteless and inodorous, and contain calcium and magnesiu bicarbonates, combinations of hydrogen and silicon, and of iodides, bromides and lithium. The national government maintains at Hot Springs an army and navy hospital, and a bath-house open gratuitously to indigent bathers. The business of Hot Springs consists mainly in caring for its visitors. Fruit-raising and small gardening characterize its environs. There are sulphur, lithia and other springs near the city, and an ostrich farm and an alligator farm in the suburbs. The finest of the novaculite rocks of central Arkansas are quarried near the city. The total value of its factory product in 1905 was $597,029, an increase of 213.1% since 1900.

The Springs were first used by the itinerant trappers. They were visited about 1800 by French hunters; and by members of the Lewis and Clark party in 1804 under instructions from President Thomas Jefferson. The permanent occupation of the town site dates only from 1828, though as early as 1807 a temporary settlement was made. In 1876 Hot Springs was incorporated as a town, and in 1879 it was chartered as a city. In 1832 Congress created a reservation, but the right of the government as against private claimants was definitely settled only in 1876, by a decision of the United States Supreme Court. The city was almost destroyed by fire in 1878, and was greatly improved in the rebuilding.

**HOT SPRINGS,** a hamlet and health-resort in Cedar Creek District, Bath county, Virginia, U.S.A., 25 m. by rail (a branch of the Chesapeake & Ohio railway) N. by E. of Covington and near the N.W. border of the state. It lies in a narrow valley, about 2200-2500 ft. above the sea, with rugged mountains on either side. Pop. of the district (1890) 761; (1910) 2047. The mean annual temperature is 69° F., and the summer nights are always cool. There is a good golf-course. Mineral waters (with magnesium, soda-lithia and alum) issue from several springs, some at a temperature as high as 106° F., and are used both for drinking and for bathing. The Warm Sulphur Springs (about 98° F.) are 5 m. N.; Healing Springs (95° F.) are 23 m. S. of Hot Springs; and a few miles to the S.E., in Rockbridge county, are Rockbridge and Jordan Alum Springs.

**HOTTENTOTS,** an African people of western Cape Colony and the adjoining German territory, formerly widely spread throughout South Africa. The name is that given them by the early Dutch settlers at the Cape, being a Dutch word of an onomatopoeic kind to express stammering, in reference to the staccato pronunciation and clicks of the native language. Some early writers termed them Hodmados or Hodmандos, and others Hot-nots and Ottentots—all corruptions of the same word. Their name for themselves was Khoi-Khoi (men of men), or Quae Quae, Kwekhena, 1.Кухеба, the forms varying according to the several dialects. Early authorities believed them to be totally distinct from all other African races. The researches of Gustav Fritsch, Dr E. T. Hamy, F. Shrubsole and others have demonstrated, however, that they are not so much a distinct or independent variety of mankind as the result of a very old crossing between two other varieties—the Bantu Negro (containing a distinct Hamitic element) and the Bushman. Hamy calls them simply "Bushman-Bantu half-breeds," the Bushman element being seen in the leathery colour, compared to that of the "saw and yellow" of the Bantu. They are now long hair, pointed chin, giving the face a peculiarly triangular shape; and lastly, in such highly specialized characters as the *tablier* and the *stactypygia* of the women. The cranial capacity is also nearly the same (1331 c.c. in the Bushman, 1365 c.c. in the Hottentot), and on these anatomical grounds Shrubsole concludes that the two are essentially one race, allowing for the undeniable strain of Bantu blood in the Hottentot. This view is further strengthened by the vast range in prehistoric times of the Hottentot variety, which, since the time of Martin H.K. Lichtenstein (1800-1804), was known to have comprised the whole of Africa south of the Zambesi, and has since been extended as far north as the equatorial lake region.

Fritsch divides the Hottentots into three bodies; the Cape Hottentots, from the Cape peninsula eastward to Kaffirria, the Koranna, chiefly on the right bank of the Orange river, but also found on the Harms and the Vaal, and the Namaqua in the western portion of South Africa. Of the last mentioned have ceased to exist in any racial purity. The name which the Namaqua give to themselves is *Khoi-Khoi*, and this name must be distinguished from that of the Berg-Damaras or *Hau-Khoi*, since the latter are physically of Bantu origin though they have borrowed their speech from the Hottentots. While the Namaqua preserve the racial type and speech, the other so-called Hottentots are more or less Hottentot-Dutch or Hottentot-Bantu half-breeds, mainly of debased Dutch speech, although the Koranna still here and there speak a moribund Hottentot jargon flooded with Dutch and English words and expressions. When the Cape Colony became a part of the British empire the protection given to the natives arrested the process of extermination with which the Hottentots were then threatened, but it did not promote racial purity. Sir John Barrow, describing the condition of the Hottentots in 1798, estimated their number at about 15,000 souls. In 1806 the official return gave a Hottentot population of 17,800 males and 17,500 females. At the census of 1806 they numbered 81,580, but by this time the official classification "Hottentot" signified little more than a half-breed. The returns for 1804 showed a "Hottentot" population of 85,892. Very few of these were pure-bred Hottentots, while the official estimate of those in which Hottentot blood was strongly marked was 96,000.

*Customs and Culture.*—The primitive character of the race having greatly changed, the treatment to their original customs and traditions must be found in the older writers. All these agree in describing the Hottentots as a gentle and friendly people. They hold in contempt the man who could eat, drink or smoke alone. They were hospitable to strangers, even to the point of impoverishing themselves. Although mentally and physically indolent, they were active in the care of their cattle and, within certain limits, clever hunters. They were of a medium height, the females rather smaller than the men, slender but well proportioned, with small hands and feet. Their skin was of a leathery brown colour; their face oval, with a prominent nose; the lips were thick, usually naked, and darkly stained; they were fastened to the prominent forehead, and the top of the head was shaved bald except for tufts of hair. Their woolly hair grew in short thick curly tufts and the beard was very scanty. Amongst the Hottentots and females of the same clan, of whom there were a large number, the social regulations were somewhat common; and cases occurred of extraordinary elongation of the *labia minora* and of the *procuptamus chordis.*

The Hottentots wore a cloth cloak (kaross) worn across the shoulders and a smaller one across the loins. They wore these cloaks all the year round, turning the hairy side inward in winter and outward in summer; they slept in them at night, and when they died they were buried in them. They had suspended around their necks little bags or pouches, containing their knives, their pipes and tobacco or dacka (*Commonabis*, or hemp), and an amulet of burnt wood. On their arms were rings of ivory. Sometimes they wore sandals and carried a jackal's tail fastened on a stick, which served as a handle when turning a stick or a large staff. The women, besides the kaross, a little apron to which were hung their ornaments; and underneath this one or two black circles; and a skin cap. Both sexes smeared themselves and even their dress with an ointment made of soot, butter or fat, and the powdered leaves of a shrub called by them *bucku* (*Discoma cretica*).

Their villages were usually on meadow grounds. They never entirely exhausted the grass but kept moving from one pasture to another. The huts were in circles, the area of which varied with the wealth of the owner; the wealthiest usually had a hut that was a whole served for a fire-place, and at each side of this small excavations an inch or two deep were made in the ground in which both sexes, rolled up in their karosses, slept. A few earthen vessels, well-made bowls of wood, untied for sponging and dish-washing, bamboo for holding milk and butter, and mats of rushes interwoven with bast, were all their furniture. Their weapons were mostly bows and arrows, but they also used spears.

---

and knob-berries. To women much respect was shown; the most sacred oath a Hottentot could take was to swear by his sister or mother, for women were regarded as the keepers and upholders of the work of the kral with the exception of the tending of cattle and of the curing of the hides; the men, however, assisted in the erection of the framework of the huts. The usual food of the Hottentots was milk, heath, or bread. On the coast milk was kept in wooden vessels, and edible roots and bulbs or wild fruits. On the coast fish captured by hooks and lines or spears were also eaten. Cows' milk was commonly drunk by both sexes, but ewes' milk only by the women, who considered it to keep them more lithe and keep to ewes' milk or water. Milk was drunk fresh, and not allowed to turn sour as among the Bantu. Meats were eaten either roasted or boiled. They ate the root of the rhubarb, paprika, watercress, salt, spices or bread. From some meats they carefully abstained, such as the flesh of snakes, and edibles were forbidden to the men, but to the women; the pure blood of beasts and the flesh of the mole were forbidden to the men, but eaten by the women.

In occupation they were essentially cattle-breeder, and showed great skill in this pursuit, especially the Namaqua, who were capable of training the horns of their cattle so that they grew in spirals. Their social pleasures consisted in feasting, smoking, dancing and singing. Dances were held every first quarter of the moon and lasted all night, often for eight days in succession. Every signal event of life, and every change of abode and condition was celebrated with a dance. One of the dances was the construction of an idol in the centre, and the women and children adorned and perfumed it with flowers and branches of trees and odoriferous herbs. The women danced and cooked, and to the men ate of it in the harbour, while the women sitting apart regaled themselves on the shore. Upon such occasions the only intoxicant was tobacco or dakkak.

Circumcision, which is common to the Kaffir tribes, was unknown to the Hottentot, and a special ceremony was performed. One of the elders, using a knife of quartz, made incisions in the young man's body, afterwards besprinkling them with urine. When a man killed his first elephant, hippopotamus, rhinoceros, or ox, the mark was afterwards taken up and the ceremony was concluded by an elder besprinkling the happy pair. Among the southern Hottentots these ancient usages have ceased; but they are continued among some tribes north of the Orange river. Children's names were perpetuated in a peculiar manner—the sons took the family name of the mother, the daughters that of the father. The children were very respectful to their parents, by whom they were kindly treated; if they were treated in any other way, they were sometimes put in the bush and left to die. Namaqua says this was done by very poor people if they had no food for their parents. But even when there was food enough, aged persons, especially women, who were believed to be possessed of the evil spirit, were sometimes treated.

The Hottentots had few musical instruments. One named the "gorah" was formed by stretching a piece of the twisted entails of a sheep from end to end of a thin hollow stick about 3 ft. in length in the manner of a bow and string. At one end there was a piece of quill fixed into the stick, to which the mouth of the player was applied. The "rommel-pot" was a kind of drum shaped like a bowl and containing water to keep the membrane moist. Reeds several feet long were used as flutes.

Government and Laws.—The system of government was patriarchal. Each country was divided into quarters and each kraal its captain. These met in council whenever any great matters had to be decided. The post was honorary, and the councillors held in great reverence, and were installed in office with solemnities and feasting. In certain tribes the head part of every bullock slaughtered was sent to the chief, and this he distributed among the males of the village. He also collected sufficient milk from the herd to make a deal of curd. In the case of the poor, every animal taken in hunting was exacted by the chief, even though it was in a state of putrefaction when brought to him. The captains, assisted by the men of each kraal, settled disputes regarding theft or murder; but if one escaped and was at large for a whole year, he was allowed to go unpunished. Adultery seldom occurred; if any one found parties in the act and killed them he was no molested, but if a man was wounded and his wife, or even his horse was injured, or his property stolen, he was allowed to burn the thief, or to make him pay compensation for his losses. If the owner of a horse was killed, every one of the beasts were killed in revenge. If any one went with his party, he was driven out of the kraal, and if he was pursued, and the dog that did so. Theft, especially cattle-stealing, was severely punished. The thief was bound hand and foot, and left on the ground without food for a long time; then, if his offence was slight, he received some blows with a stick, but if the case was an aggravated one, he was severely beaten, and then unloosed and banished from the kraal. The family of even the worst criminal had not to be punished. Nothing was esteemed more than his account in reputation, privilege or property. The dead was an object of curiosity, and his enemy by offering him a handful of earth. If the latter seized the hand and the dust fell to the ground, the challenge was accepted.

Religious Ideas.—The religious ideas of the Hottentots were very obscure. They seem to have lived amongst the Bantu in prehistoric times, and to have mixed with them. They were greatly addicted to divination and singing. 1 George Schmidt, the first missionary to the Hottentots, says they also celebrated and the annual appearance of the Pleiades above the eastern horizon. As soon as the constellation appeared, all the mothers ascended the nearest hill, carrying their babies without a blanket. Both arms are towards the friendly stars. Some of the tribes are said to worship a being whom they name Tsub, the rain god. An old Namaqua was once heard to say: 'The stars are the souls of the deceased, and a man who believes this, if he be assemblies by any one, may misfortune fall on thee from the star of my grandfather.'

Such as was the Hottentott religion was largely ancestor-worship. Their deified hero was named Heisit-Eibib; and of him endless stories were told. He was a most valiant warrior, a notable warrior of great physical strength, who once ruled the Khoi-Khoi, and that in a desperate struggle with one of his enemies, by the name of Kalagas. When his people in a wound in the knee, from which event he got the name of Woumba, remained for an extraordinary powers during life, and after death he continued to be invoked as one who could still relieve and protect. According to some, Heisit-Eibib was present among the Namaqua, Heisit-Eibib came from the east. Therefore they make the doors of their huts towards the east, and those who possess waggons and carts put their vehicles alongside the mat-house with the front turned towards the east. For this reason the Hottentots display at their deceased looks towards the east. The spirit of Heisit-Eibib is supposed to exist in the old burial places, and, whenever a heathen Hottentot passes them, he throws stones on the spot as an offering, at the same time invoking the spirit of Heisit-Eibib. Johann Georg von Hahn asserts that there are many proofs which justify the conclusion that Heisit-Eibib and Tsub-gob (the supreme being) are not one and the same place. 2 They believed to have died and risen again. They killed the bad beings and restored peace on earth; they promised men immortality, understood the secrets of nature, and could foretell the future. 3

Signs and Invocations.—The Hottentots were confused as to ghosts and spirits, and charms were freely employed. If a Khoi-Khoi went hunting his wife kindled a fire, and assiduously watched by it to keep it alive; if the fire should be extinguished her husband would not return. They believed that a person who dared to cut a snake or kill a squirrel, and threw them to the water and kept on throwing it about on the ground, believing that thereby her husband would be successful in getting game. Charms, consisting of bones, burnt wood, and roots of various kinds, were cut into small pieces, were generally made in the same place. There was also a belief that in every fountain there was a snake, and that as long as the snake remained there water would continue to flow, but that if the snake was killed or left the fountain it would cease. Offerings were sometimes made to the spirit of the fountain. In common with the Bushmen, the Hottentots venerated the mantis fausta, a local variety of the insect known as "the praying mantis" (mantis religiosa). Kolbe saw sacrifices made in its honour when it appeared inside a kraal; to kill it was strictly forbidden. The Hottentots had great faith in witch-doctors, or sorcerers. When called to a sick-bed these ordered the patient to take no food, to cut off the hair, and to let it fall on the floor. If they expelled the illness. After that they produced a bone, small snake, frog or other object which they pretended to have extracted from the patient's body. If the treatment did not succeed, the person was declared incurable, and was left to die. If death occurred, it was believed that the deceased was interred on the day of decease. It was wrapped in skins, and placed in the ground in the same position it once occupied in the mother's womb. Death was generally regarded in a very stoical manner.

Language.—The existence of a fundamental connexion between the language of the Hottentot and that of the Bushman was

---

1 An interesting notice of this form of worship occurs in the journal of an expedition which the Dutch governor, Ryk van Tulbagh, sent to the Great Namaqua in 1753, which reached as far as the Kiske, and followed his instructions (Zambezi, p. 110, 111.)

suggested by Dr Bleek and is supported by further evidence ad

The Hottentot language was regarded by the early travellers and colonists as an uncouth and barbarous tongue. The Portuguese called it the Dutch

of the contact follows: F. Jour. The Kaffirland; articulated

around the tsu-b, clicking the teeth as flat a surface as possible against the termination of the palate at the gums, so that the top of the tongue touches the upper front teeth and the back of the tongue lies towards the palate, and then suddenly and forcibly withdrawing it. The cerebral click (compared to the clapping of a bottle of champagne) is imitated by curling up the tip of the tongue against the roof of the palate, and withdrawing it suddenly and forcibly. The lateral click (similar to the "lisp") is imitated by an oscillating action of the tongue by covering with the tongue the whole of the palate and producing the sound as far back as possible; Europeans imitate it by placing the tongue against the side teeth and then withdrawing it. The ejective click is imitated by the dental, having the click produced by the Kaffirs; and it is a striking circumstance, in evidence of the past Hottentot influence upon the Kaffir languages, that the clicks of the Hottentot are recognized in proportion to their distance from the former Hottentot domain.

The language in its grammatical structure is beautiful and regular.

Dr Bleek describes it as having the distinctive features of the suffix-pronominal order or higher form of languages, in which the pronouns are identical with and borrowed from the derivative suffixes of the nouns. The words are mostly monosyllables, always ending, with two exceptions, in a vowel or nasaled vowel. Among the consonants needed for the latter are p, b, g, b, p, m, k, and a deeper guttural kk. Diphthongs abound. There is no article, but the definite or indefinite sense of a noun is determined by the gender. In the fullest known dialect (that spoken by the Namaqua) the nouns are formed with eight different suffixes, which in nouns designating persons distinguish masc. sing. (-bo), masc. plur. (-ku), masc. dual (-kha), fem. sing. (-i), fem. plur. (-it), com. sing. (-o), com. plur. (-a), com. dual (-ra). The adjective is either prefixed to a noun referred to by a suffixed pronoun. This grammatical division of the nouns according to gender led to the classification of the languages as formed. It is, therefore, one of the most characteristic features of the language, as well as its length, in original structure, with the Galia and others.

There are four dialectal varieties of the language, with well-marked characteristics: the Nama dialect, spoken by the Namaqua and the Hottentot of the Orange Free State; the Karoi dialect, spoken by the korana, or Koraqua, dwelling about the middle and upper part of the Orange, Vaal and Modder rivers; the Damara dialect, spoken by the Damara of Kaffiland, and the Cape dialect, now no longer spoken but preserved in the records of early voyagers and settlers. Of the Nama dialect there are three grammars: Wallmann's (1857) and Hahn's in German, and Tindall's (1871) in English, the last being the best; and the four Gospels, with a large amount of missionary literature, have been published in it.

The vocabulary is not limited merely to the expression of the rude conceptions that are characteristic of primitive races. It possesses such words as koi, human being; khoi-si, kindly or friendly; koi-si-b, philanthropist; khoi-si-a, humanity; ≤, to eat; ≥, to drink; ≤, to talk; tso-b, feeling, sentiment; tsa-kha, to condole; ama, true; ama-b, the truth; ana, sacred; anu-si-b, holiness; esu, pretty; anu-xa, for beauty.

Literature and History.—Much traditionary literature—fables, myths and legends—exists amongst the Hottentots,—a fact first made known by Sir James Alexander, who in his journeys through Cape Colony, published a translation of the stories around the camp fire by his Hottentot followers. These Hottentot tales generally have much of the character of fables; some are in manuscript, others are written on the books of European origin or of contact with the white man; but the majority bear evidence of being true native products. Bleek's "Reword the Fox in South Africa" (1864) contains a translation of a legendary narration from the Eastern Damara of G. Knörrlein, which is regarded as an excellent specimen of the national style. Another legend relating to the moon and the hare conveys the idea of an early conception of the hope of immortality.

HOTTINGER—HOUDENC

It is found in various versions, and, like many other stories, occurs in Burmese as well as in the Cape.

The earliest accounts of the Hottentots occur in the narratives of Vasco da Gama's first voyage to India round the Cape in 1497-1498. The most accurate account of these early contacts is that of Fransisco d'Almeida, Count of Abrantes, who met his death in a dispute with the natives. "Till the 17th century they were believed to be cannibals, but with the occupation of the Cape by the Dutch, in 1652, more accurate knowledge was obtained. A century later, the Dutch were compelled by the Hottentots becoming a nation of slaves and in serious danger of extermination, and thus the arrival of the English in 1795 was welcomed by them. In 1828 an ordinance was passed declaring "all Hottentots and other free wanderers who do not attempt to live by agriculture or by using any other British subjects were entitled. (See Cape Colony; History, and South Africa.)"

HOTTINGER, JOHANN HEINRICH (1620-1667), Swiss philologist and theologian, was born at Zürich on the 10th of March 1620. He studied at Geneva, Groningen and Leiden, and after visiting France and England was in 1642 appointed professor of church history in his native town. The chair of Hebrew at the Carolinum was added in 1643, and in 1653 he was appointed professor ordinarius of logic, rhetoric and theology. He published such works as an oriental philologist, and an election palatine in 1655 appointed him professor of Oriental languages and biblical criticism at Heidelberg. In 1660, however, he returned to Zürich, where in 1662 he was chosen principal of the university. In 1667 he accepted an invitation to succeed Johann Hoornbeck (1617-1666) as professor in the university of Leiden, but he was drowned with three of his children by the upsetting of a boat while crossing the river Limmat. His chief works are Historia ecclesiastica Nov. Test. (1651-1667), Thesaurus philologicus seu clavis scripturae (1649-53 ed. 1658), Elmylo logic oriental, sive lexicon harmonicum belegantium (1661). He also wrote a Hebrew and an Aramaic grammar.

His son, JOHANN JAKOB HOTTINGER (1652-1735), who became professor of theology at Zürich in 1698, was the author of a work against Roman Catholicism, Herveliche Kirchengeschichte (4 vols., 1689-1709); and his grandson, JOHANN HEINRICH HOTTINGER (1681-1750), who in 1721 was appointed professor of theology at Heidelberg, wrote a work on dogmatists, Typus doctrinae christi (1714).

HOUBRAKEN, JACOBUS (1660-1786), Dutch engraver, was born at Dort, on the 25th of December 1668. All that his father, Arnold Houbraek (1660-1719), bequeathed to him was a fine constitution and a pure love for work. In 1707 he came to reside at Amsterdam, where for years he had to struggle incessantly against difficulties. He commenced the art of engraving by studying the works of Cornelis Cort, Suyderhoef, Edelinck and the Vischers. He devoted himself almost entirely to portraiture. Among his best works are scenes from the "Diary of a Dutch Traveler", De Ontwaak Of Schilderdek, executed in his eighty fourth year, after Cornelis Troost, who was his master. He emigrated to America between the Dutch Hogarth. He died on the 14th of November 1780.

See A. Ver Hull, Jacobus Houbraeken en zijn aarne (Arnhem, 1875), where 120 engraved works are fully described.

HOUDENC (or HOUDAN), RAOUL DE, 12th-century French troubadour, takes his name from his native place, generally identified with Houdain (Artois), though it is thought in twelve places bearing the name in one or other of its numerous variants. It has been suggested that he was a monk, but from the scattered hints in his writings it seems more probable that he followed the trade of jongleur and recited his chansons, with small success apparently, in the houses of the great. He was well acquainted with Paris, and probably spent a great part of his life there. His undoubted works are: "Le Songe d'enfer, La Voie du paradis, Le Roman des élus." (pr. by A. Scheler in Trouvères bénés, New
Houdetot—Houghton, Baron

Series, 1897) and the romance of Méragis de Porteslegues, edited by M. Michelant (1869), and by Dr M. Friedwagner (Halle, 1897). Houdenc was an imitator of Chrétiens de Troyes; and Hound de Méry, in his Tournei de l’antichrist (1236) praises him with Chrétiens in words that seem to imply that both were dead. Méragis de Porteslegues, the hero of which perhaps derives his name from Lescuez, the port of Saint Brieuc in Brittany, is a roman d’ aventures loosely attached to the Arthurian cycle.

Houdetot, a French noble family, taking its name from the lordship of Houdetot, between Argues and St Valéry. Louis de Houdetot went with Robert, Duke of Normandy, to Palestine in 1034, and the various branches of the family trace descent from Richard II. de Houdetot (fl. 1229), who married Marie de Montfort. Charles Louis de Houdetot received a marquisate in 1722, and on his son Claude Constance César, lieutenant-general in the French army, was conferred the hereditary title of count in 1753. His wife (see below) was the Madame de Houdetot of Rousseau’s Confessions. Their son César Louis Marie François Ange, comte de Houdetot (1749-1823), was governor of Martinique (1803-1809) and lieutenant-general (1814) under the Empire. His son Frédéric Charles Joseph, comte de Houdetot (1778-1859), was director-general of indirect imposts in Prussia after Jena, and prefect of Brussels in 1813. He acquiesced in the Restoration, but had to resign from the service after the Hundred Days. He became a peer of France in 1819, and under the Second Empire he was returned by the department of Calvados to the Corps Législatif. His half-brother, Charles Ilé de France, comte de Houdetot (1780-1866), was wounded at Trafalgar and transferred to the army, in which he served through the Napoleonic wars. He retired at the Restoration, but returned to the service in 1823, and in 1826 became aide-de-camp to the duke of Orleans, becoming lieutenant-general in 1842. He sat in the Chamber of Deputies from 1837 to 1848, when he followed Louis Philippe into exile. A third brother, César François Adolphe, comte de Houdetot (1790-1869), was a well-known writer on military and other subjects.

Houdetot, Elisabeth Françoise Sophie de la Live de Bellegarde, Comtesse de (1730-1813), was born in 1730. She married the comte de Houdetot (see above) in 1748. In 1753 she formed with the marquis de Saint Lambert (q.v.) a connexion which lasted till his death. Mme de Houdetot has been made famous by the chapter in Rousseau’s Confessions in which he describes her unreciprocated passion for her. When questioned on the subject she replied that he had much exasperated her. A view differing considerably from Rousseau’s is to be found in the Mémoires de Mme d’Epinay, Mme de Houdetot’s sister-in-law.

For a discussion of her relations with Rousseau see Saint-Marc Girardin in the Revue des deux mondes (September 1833).

Houdon, Jean Antoine (1740-1828), French sculptor, was born at Versailles on the 18th of March 1740. At the age of twenty, having learnt all that he could from Michel Ange Slodtz and Pigalle, he carried off the prix de Rome and left France for Italy, where he spent the next ten years of his life. His brilliant talent, which seems to have been formed by the influence of that world of statues with which Louis XIV. peopled the gardens of Versailles rather than by the lessons of his masters, delighted Pope Clement XIV, who, on seeing the St Bruno executed by Houdon for the church of St Maria degli Angeli, said “he would speak, were it not that the rules of his order impose silence.”

In Italy Houdon had lived in the presence of that second Renaissance with which the name of Winckelmann is associated, and the direct and simple treatment of the Morpheus which he saw to the Salon of 1771 bore witness to its influence. This work procured him his “agréation” to the Academy of Painting and Sculpture, of which he was made a full member in 1775. Between these dates Houdon had not been idle; busts of

Catharine II., Diderot and Prince Galitzin were remarked at the Salon of 1773, and at that of 1775 he produced, not only his Morpheus in marble, but busts of Turgot, Gluck (in which the marks of small-pox in the face were reproduced with striking effect) and Sophie Arnould as Jphigeniea (now in the Wallace Collection, London), together with his well-known marble relief, “Grive suspendue par les pattes.” He took also an active part in the teaching of the academy, and executed for the instruction of his pupils the celebrated Écorché still in use. To every Salon Houdon was a chief contributor; most of the leading men of the day were his sitter; busts of d’Alemert, Prince Henry of Prussia, Gérard, Buffon (for Catharine of Russia), and Mirabeau are remarkable portraits; and in 1778, when the news of Rousseau’s death reached him, Houdon started at once for Ermenonville, and there took a cast of the dead man’s face, from which he produced the grand and life-like head now in the Louvre. In 1779 his bust of Molière, at the Théâtre Français, won universal praise, and the celebrated draped statue of Voltaire, in the vestibule of the same theatre, was exhibited at the Salon of 1781, to which Houdon also sent a statue of Marshal de Toulouse, commissioned by the King, and the Diana executed for Catharine II. This was an exhibition sale, and it is alleged that a statue of Diana demanded drapery; without drapery. They said, the goddess became a “suivante de Vénus,” and not even the proud and frank chastity of the attitude and expression could save the Diana of Houdon (a bronze reproduction of which is in the Louvre) from insult. Three years later he went to America, there to carry out a statue of Washington. With Franklin, whose bust he had recently executed, Houdon left France in 1785, and, staying some time with Washington at Mount Vernon, he modelled the bust, with which he decided to go back to Paris, there to complete the statue destined for the capitol of the State of Virginia. After his return to his native country Houdon executed for the King of Prussia, as a companion to a statue of Summer, La Frileuse, a naïf embodiment of shivering cold, which is one of his best as well as one of his best-known works.

The Revolution interrupted the busy flow of commissions, and Houdon took up a half-forgotten project for a statue of St Scholastica. He was immediately denounced to the convention, and his life was only saved by his instant and ingenious adaptation of St Scholastica into an embodiment of Philosophy. Under Napoleon, of whom in 1806 he made a nude statue now at Dijon, Houdon received little employment; he was, however, commissioned to execute the colossal reliefs intended for the decoration of the colonnade of the Grande Armée” at Boulogne (which ultimately found a different destination as a statue of Cicero for the senate, and various busts, amongst which may be cited those of Marshal Ney, of Josephine and of Napoleon himself, by whom Houdon was rewarded with the legion of honour. He died at Paris on the 16th of July 1828.

See memoir by Émile Delerot and Armand Legrelle in Mémoires de la société des sciences Morales . . . de Seine-et-Oise, iv. 49 et seq. (1857); Anatole de Montaiglon and Georges Duplessis in Revue universelle des arts, i. and ii. (1855-1866); Hermann Dierks, Houdens Leben und Werke (Gotha, 1885); Albert Terrade, Autour de la statue de Jean Houdon (Versailles, 1892); P. E. Mangenot, Houdon and his Statues (London, 1884). HOUFFALIZE, a small town occupying an elevated position (nearly 1100 ft.) in the extreme south-east of the province of Luxembourg, Belgium, much visited during the summer on account of its fine bracing air. There are the ruins of an old castle, and some remains of the still older abbey of Val St Catherine. The parish church dates from the 13th or 14th century. It contains two old black marble tombs to Thierry of Houffalize and Henri his son, the latter killed at Woringen in 1288. Houffalize is on the eastern Ourthe, and is connected by a steam tramway with Bourcy on the line from Libramont to Bastogne, Spa and Liège. Pop. (1904) 1486.

Houghton, Richard Monckton Milnes, 1st Baron (1800-1885), English poet and man of letters, born the son of Robert Pemberton Milnes, of Fryston Hall, Yorkshire, and the Hon. Henrietta Monckton; daughter of the fourth Lord Galway, was born in London on the 19th of June 1809. He was educated
privately, and entered Trinity College, Cambridge, in 1837. There he was at once drawn into a literary set, and became a member of the famous "Apostles" Club, which then included Tennyson, Hallam, Trench, J. W. Blakeley, afterwards dean of Lincoln, and others. After taking his degree, Milnes travelled abroad, spending some time at Bonn University. Thence he went to Italy and Greece, and published in 1834 a volume of Memoriai of a Tour in some Parts of Greece, describing his experiences. He returned to London in 1837, and was in that year elected to Parliament as member for Pontefract. His parliamentary career was marked by much strenuous activity. He interested himself particularly in the question of copyright and the reformation of the Corn Law controversy, and was afterwards divided in politics with Palmerston, at whose instance he was made a peer in 1863. His literary career was industrious and cultured, without being exceptionally distinguished. Church matters had always a claim upon him: he wrote a striking tract in 1841, which was praised by Newman; and took part in the discussion about "Essays and Reviews," defending the tractarian position in One Tract More (1841). He published two volumes of verse in 1842, Memorials of Residence upon the Coast and Poems of Many Years, Poetry for the People in 1840 and Palm Leaves in 1844. He also wrote a Life and Letters of Keats in 1848, the material for which was largely provided by the poet's friend, Charles Armitage Brown. Milnes also contributed largely to the reviews. His poetry is meditative and delicate; some of his ballads were among the most popular of their day, and all his work was marked by refinement. But his chief distinctions were his keen sense of literary merit in others, and the judgment and magnanimity with which he fostered it. He was surrounded by the most brilliant men of his time, many of whom he had been the first to acclaim. His chief title to remembrance rests on the part he played, as a man of influence in society and in moulding public opinion on literary matters, in connexion with his large circle of talented friends. He secured a pension for Tennyson, helped to make Emerson known in Great Britain, and was one of the earliest champions of Swinburne. He helped David Gray and wrote a preface for The Lizzie. He was, in the old sense of the word, a patron of letters, and one who never abused the privileges of his position. Milnes married in 1851 the Hon. Annabel Crewe (d. 1874). He died at Vichy on the 13th of August 1885, and was buried at Fryston. His son, the second Baron Houghton, was created Earl of Crewe (q.v.) in 1895.

Houghton-le-Spring, an urban district in the Houghton-le-Spring parliamentary division of Durham, England, 6 m. N.E. of the city of Durham. Pop. (1901) 7858. It is well situated at the head of a small valley branching from that of the Wear. St Michael's church is a cruciform Early English and Decorated building, with a picturesque embattled rectory adjoining. Bernard Gilpin, "the Apostle of the North," was rector of this parish from 1556 to 1583, and the founder of the grammar school. The principal public buildings are a town hall, market house and church institute. Houghton Hall is a fine mansion of the late 17th century. In the orchard stands a tomb, that of the puritan Sir Robert Hutton (d. 1680), of whom a curious tradition states that he desired burial beside his war-horse, the body of which was denied interment in consecrated ground. The main road from Durham to Sunderland here passes through a remarkable cutting in the limestone 80 ft. deep. The district affords frequent evidence of ice activity in the glacial period. The town is the centre of a large system of electric tramways. The population is mainly dependent on the neighbouring collieries, but limestone quarrying is carried on to some extent.

Hound, a dog, now used, except in poetry, only of dogs of the chase, and particularly of the breed used in hunting the fox, the beaver, the otter, and the mink. The word is prefixed, e.g. boar-hound, stag-hound, &c. (see Doc.). The O. Eng. hound is the common Teutonic name for the animal, cf. Du. hond, Ger. Hund, &c., and is cognate with Sansk. śvānu, Gr. θάνδω, Lat. canis, Ir. and Gael. caun.

Hounslow floats, a town in the Brentford parliamentary division of Middlesex, England, 123 m. W. by S. of St Paul's Cathedral, London, on the District and London & South Western railways. Pop. (1901) 11,377. It has grown into an extensive residential suburb of London. Its situation at the junction of two great roads from the west of England made it an important coaching station, and some 500 coaches formerly passed through it daily. A priory of friars of the Holy Trinity was founded at Hounslow in 1256, and existed till the dissolution of the monasteries. The priory chapel was used as a church till 1830, after which its building was taken over by the existing church of the Holy Trinity (1835). Hounslow Heath, west of the town, had, according to the survey of 1656, an area of 4203 acres. It was the site of Roman and British camps, and in the wars of the 17th century was the scene of several important military rendezvous. It was a popular resort of highwaymen, whose bodies were exposed on gibbets along the road. In 1784 the base-line of the first trigonometrical survey in England was laid down on the heath. In 1793 large cavalry barracks were erected upon it, and it is also the site of extensive pleasure-grounds. It began to be enclosed towards the end of the reign of George III. In Onslow Park, N.E. of Hounslow, Sir Thomas Gresham built a mansion in 1577, and this was rebuilt with great magnificence by Frances and Robert Child c. 1770. Hounslow is divided between the parishes of Heston and Isleworth. Pop. of urban district of Heston and Isleworth (1901) 30,863.

Hour, the twenty-fourth part of a civil day, the twelfth part of a natural day or night, a space of time of sixty minutes' duration. The word is derived through the O. Fr. ure, ore, hours, mod. heure, from Lat. hora, Gr. ωρά, season, time, day, hour (see Calendar).

Hour Angle, the angular distance of a heavenly body from the meridian, as measured around the celestial pole. It is equal to the angle at the pole between the hour circle through the body and the meridian, but is usually expressed in time.

Hour-Glass, a device for measuring intervals of time, also known as sand-glass, and as log-glass when used in conjunction with the common log for ascertaining the speed of a ship. It consists of two pear-shaped bulbs of glass, united at their apices and having a minute passage formed between them. A quantity of sand (or occasionally of mercury) is enclosed in the bulbs, and the size of the passage is so proportioned that this sand will completely run through from one bulb to another in the time it is desired to measure—e.g. an hour or a minute. Instruments of this kind, which have no great pretensions to accuracy, were formerly common in churches. In the English House of Commons, as a preliminary to a division, a two-minute sand-glass is still used, and while the sand is running the "division bells" are set in motion in every part of the building, to give members notice that a division is at hand.

Hour, the term for a beautiful virgin who awaits the devout Mahomedan in Paradise. The word is the French representative of the Pers. hūrī, Arab. hawra', a black-eyed virgin, from hawra, to be black-eyed, like a gazelle.

Hours, Canonical, certain portions of the day set apart by rule (canon) of the church for prayer and devotion. The Jewish custom of praying three times a day, i.e. at the third, sixth and ninth hours, was perpetuated in the early Christian Church (Acts ii. 15; lii. 1, 2.) and to these were added midnight (when Paul and Silas sang in prison), and the beginning of day and of night. Ambrose, Augustine and Hilary commended the example of the psalmist who gave praise "seven times a day" (Ps. cxxix. 164). The seventh (Compline, Completorium) was added by Benedict. These hours were adopted especially in the monasteries as a part of the canonical life, and spread thence to the cathedral and collegiate chapters.

Since the 6th century the number and order of the hours have been variously thus: matins, lauds, prime, terce, sext, none, vespers, compline.

Matins theoretically belongs to midnight, but in Italy it is
HOUSE

said about 7 or 8 a.m. and in France often on the preceding evening in accordance with the statement “evening and morning were one day.” At matins is said the Venite (Ps. xc.v.) and a hymn, followed by a Nocturna or night-watch (on Sundays three) which consists of twelve psalms. After the nocturna comes a lesson divided into three parts, one biblical and two patristic, and finally the Te Deum.

Lauds is proper to sunrise, but is mostly grouped with matins. It consists of four psalms, a canticle, psalms 148-150, a hymn, the Benedictus (Luke i. 68-70) and prayers.

Prime (6 a.m.), Tenea (9 a.m.), Sext (noon) and None (3 P.M.) are called the Little Day Hours, are often said together, and are alike in character, consisting of a hymn and some sections of Ps. cxix., followed by a prayer. On Sundays the Athanasian Creed is said at prime.

Vesper or Evensong consists of five varying psalms, a hymn, the Magnificat (Luke i. 46-53) and prayers. It belongs theoretically to sunset.

Compline, technically 9 P.M., but usually combined with vespers, is a prayer for protection during the darkness. It consists of the general confession, four fixed psalms, a hymn, the Nunc dimittis (Luke ii. 29-32), prayers and a Commemoration of the Virgin.

The term “canonical hours” is also used of the time during which English marriages may be solemnized without special licence, i.e. between 8 a.m. and 9 P.M.

HOUSE (O. Eng. hüs, a word common to Teutonic languages, cf. Dut. huis, Ger. Haus; in Gothic it is only found in gudhia, a temple; it may be ultimately connected with the root of “hide,” conceal), the dwelling-place of a human being (treated, from the architectural point of view, below), or, in a transferred sense, of an animal, particularly of one whose abode, like that of the beaver, is built by the animal itself, or, like that of the snail, resembles in some fancied way a human dwelling. Apart from the numerous compound uses of the word, denoting the purpose for which a building is employed, such as custom-house, lighthouse, bakehouse, greenhouse and the like, there may be mentioned the particular applications to a chamber of a legislative body, the Houses of Parliament, House of Representatives, &c.; to the upper and lower assemblies of convocation; and to the colleges at a university; the heads of these foundations, known particularly as master, principal, president, provost, rector, &c., are properly called heads of houses. At English public schools a “house” is the usual unit of the organization. In the “houses” the boys sleep, have their “studies” and their meals, if the school is arranged on the “boarding-house” system. The houses have their representative teams in the school games, but have no place in the educational class-system of the school. It may be noticed that in Scotland the words “house” and “tenement” are used in a way distinct from the English use, “tenement” being applied to the large block containing “houses,” portions, i.e. occupied by separate families. “The House” is the name colloquially given to such different institutions as the London Stock Exchange, the House of Commons or Lords, and to a workhouse.

In the transferred sense, “house” is used of a family, genealogically considered, and of the audience at a public meeting or entertainment, especially of a theatre. A “house-physician” and “house-surgeon” is a member of the resident medical staff of a hospital. In astrology the twelve divisions into which the heavens are divided, and through which the planets pass, are known as houses, the first being called the “house of life.” The word “house,” “housing,” used of the trappings of a horse, especially of a covering for the back and flanks, attached to the saddle, is of quite distinct origin. In medieval Latin it appears as hucia, husia, and houia (see Ducange, Glossarium s.v. houiaia), and comes into English from the O. Fr. huche, modern house. It has been supposed to have been adopted, at the time of the crusades, from the Arabic yushahia, a covering.

Architecturally considered, the term “house” is given to a building erected for habitation, in contradistinction to one built for secular or ecclesiastical purposes. The term extends, therefore, to a dwelling of any size, from a single-room building to one containing as many rooms as a palace; thus in London some of the largest dwellings are those inhabited by royalty, such as Marlborough House, or others by men of rank, such as Devonshire House, Bridgewater House, Spencer House, &c.; and even those which, formerly built as habitations, have subsequently been devoted to other purposes, such as Somerset House and Burlington House, retain the term. In Paris the larger houses thus named would be called hôtel.

So far as the history of domestic architecture is concerned, the earliest houses of which remains have been found are those of the village of Kahun in Egypt, which were built for the workmen employed in the building of the pyramid at Ilahun, and deserted on its completion. They varied in size from the habitations of the chief inspectors to the single room of the ordinary labourer, and were built in unburnt brick with open courts in the larger examples, to give light and air to the rooms round. The models found in 1907 at Deir-Rifa opposite Assiut in Upper Egypt, by Flinders Petrie, and assumed by him to be those of “soul-houses,” suggest that the early type of building consisted of a hut, to which later a porch or lean-to, with two poles in front, has been added; subsequently, columns replaced the poles, and a flat roof with parapet, suggesting the primitive forms of the Egyptian temple.

The only remains of early houses found in Mesopotamia are those within the precincts of the Temple of Bel, at Nippur, occupied by the king; but beyond the fact that the walls were built in unburnt brick and were sometimes of great thickness, nothing is known.

The houses in Crete would seem to have been small in area, but this was compensated for in height, as the small plaques found in the palace at Cnosus show houses in two or three storeys, with gable roofs and windows subdivided by mullions and transomes, corresponding with those of the 11th to 17th centuries in England. The stone staircase in the palace rising through two storeys shows that even at this early period the houses in towns had floors superposed one above the other; to a certain extent the same extension existed in the later Greek houses found in Delos, in two of which there was clear evidence of wooden staircases leading within to the roof or to an upper storey. The largest series hitherto discovered is that at Priene in Asia Minor, of which the three external storeys varied in dimensions, but all based on the same plan; this consisted of an entrance passage leading to an open court, on the north side of which, and therefore facing south, was an open portico, corresponding to the proostas in Vitruvius (vi. 7), and in the rear two large rooms, one of which might be the oecus or sitting-room, and the other the thalamus or chief bedroom. Other rooms round the court were the triclinium, or dining room, and cubicles or bedchambers. The largest of these houses occupied an area measuring 75 x 30 ft. Those found in Delos, though fewer in number, are of much greater importance, the house in the street of the theatre having twelve rooms exclusive of the entrance passage and the great central court, surrounded on all four sides by a peristyle; in this house the oecus measured 26 x 18 ft. In a second example the proostas consisted of a long gallery, the whole width of the site, which was lighted by windows at each end, the sills of which were raised 8 ft. or 9 ft. from the floor.

The remains of the houses found in the Peiraean are of the same simple plan as those at Priene, and suggest that the Greek house was considered to be the private residence only for the members of the family, and without any provision for entertaining guests as in Rome and Pompeii. From the descriptions given by Vitruvius (ii. 9) it may be gathered that in his time many of the houses in Rome were built in unburnt brick, the walls of which, if properly protected at the top with a course of burnt brick projecting over the face of the brickwork, and coated inside and outside with stucco, were considered to be more lasting than those built in soft stone. Vitruvius refers also to Greek houses thus built, and states that in the house of Mausolus, at Halicarnassus, the walls were of unburnt brick, and the

plastering with which they were covered was so polished that they sparkled like glass. In Rome, however, he points out, such walls ought to be forbidden, as they are not fit to carry an upper storey, unless they are of great thickness, and as upper storeys become necessary in a crowded city such walls would occupy too much space. The houses in Pompeii (q.v.) were built in tufa blocks, and their walls were protected at the top by burnt brick courses and their faces with stucco; they were, however, of a second- or third-rate class compared with those in Rome, the magnificence of which is attested in the descriptions given by various writers and substantiated by the remains occasionally found in excavations. Vitruvius refers to upper storeys, which were necessary in consequence of the limited area in Rome, and representations in mosaic floors and in bas-relief sculptures have been found on which two or three storeys are indicated. The plans of many Roman houses are shown on the Marble Plan, and they resemble those of Pompeii, but it is probable that the principal reception rooms were on an upper storey, long since destroyed. The house of Livia on the Palatine Hill was in two storeys, and the decoration was of a much finer character than those of Pompeii; this house and the house of the Vestals might be taken as representative of the Roman house in Rome itself. In those built in colder climates, as in England and Germany, account has to be taken of the special provision required for warming the rooms by hypocausts, of which numerous examples have been found, with rich mosaic floors over them.

Of the houses in succeeding centuries, those found in the cities of central Syria, described in the article Architecture, are wonderfully perfect, in consequence of their desertion at the time of the Mahommedan invasion in the 7th century. Very little is known of the houses in Europe during the dark ages, owing to the fact that they were generally built in wood, with thatched roofs. The only examples in stone which have been preserved are those in the island of Skellig Michael, Kerry, which were constructed like the beehive tombs at Mycenae with stone courses overlapping inside until they closed in at the top. These houses or cells were rectangular inside and round or oval outside, with a small low door at one end, and an opening above to let the smoke out.

The houses, even in large towns like London, were built mainly in wood, in some cases down to the 17th century; in the country, the smaller houses were constructed with trunks of trees in pairs, one end of the trunk being sunk in the ground, the other bent over and secured by a ridge piece, thus forming a pointed arch, the opening of which was about 11 ft. The pairs were fixed 16 ft. apart, and the space included constituted a bay, any requisite increase in the size of the house being made by doubling or trebling the bays. The roofs were thatched with straw on battens, and sometimes with a collar beam carrying a floor, which constituted an upper storey. The end walls were closed with wooden studs and wattle-and-daub filling. The pairs of trees were known as forks or crucks. Vitruvius (ii. 1) suggests a similar kind of building in ancient times, except that the interlaced twigs were covered with clay, so as to carry off the rain. In Yorkshire there was another type of house, known as a coit, which was a dwelling-house and barn (shIPPON) united; the latter contained the cow-stalls with loft above, and the former was in two storeys, with a ladder inside the room leading to the upper floor.1

Passing now to structures of a less ephemeral character, the earliest houses of which there still remain substantial relics are those built in stone (see Manor House). The Jew’s House at Lincoln, 12th century, is one of the best-known examples, and still preserves its street front in Roman fashion, with rich entrance doors, with archway and first-floor windows lighting the principal room, which seems invariably in those early houses to have been on the first floor, the ground floor being used for service and stores (see Plate I. fig. 5). To the 13th century belongs the old Rectory House at West Dean, Sussex, and to the 14th century the

1 A complete description of these houses will be found in The Evolution of the English House, by S. O. Addy.

Parsonage House at Market Deeping, Lincolnshire. The principal examples of the domestic architecture of this early period in the country are castles, manor houses and farm buildings, as town houses occupied sites too valuable to be left untouched; this, however, is not the case in France, and particularly in the south, where streets of early houses are still to be found in good preservation, such as those at Cluny (fig. 1) and Cordes (Tarn), and others at Montferrand, Cahors, Figeac, Angers, Provins, Sarlat (fig. 2), St Emilion, Perigueux, Soissons and Beauvais, dating from the 12th to the 14th centuries. One of the most remarkable examples is the Musician’s House at Reims (see Plate I., fig. 4), with large windows on the first floor, between which are niches with life-size figures of musicians seated in them. Generally speaking, the ground storeys of these houses, which in many cases were occupied by shops, have been transformed, but occasionally the old shop fronts remain, as in Dinan, Morlaix and other old towns in Brittany. Houses of the first Renaissance of great beauty exist in Orleans, such as the house of Agnes Sorel; and the example in the Market Place illustrated in fig. 3; in Tours, Tristan’s house in brick with stone quoins and dressings to windows; in Rouen, Caen, Bayeux, Toulouse, Dijon and, in fact, in almost every town throughout France. Of houses of large dimensions, which in France are termed hôtels, there are also many other fine examples, the best known of which are the hôtel de Jacques Cœur (see Plate II., fig. 7), at Bourges, and the hôtel de Cluny at Paris (see Plate I., fig. 6). In the 15th and 16th centuries in France, owing to the value of the sites in the towns, the houses rose to many storeys, the upper of which were built in half-timber, sometimes projecting on corbels and richly carved; of these numerous examples exist at Rouen, Beauvais, Bayeux and other towns in Normandy and Brittany. Of such structures in English towns (see Plate II. fig. 9) there are still preserved some examples in York, Southampton, Chester, Shrewsbury, Stratford-on-Avon, and many smaller towns; the greatest development in half-timbered houses in England is that which is found more particularly throughout Kent, Sussex and Surrey, in houses of modest dimensions, generally consisting of ground and first floor only, with sometimes additional rooms in the roof; in these the upper storey invariably projects in front of the lower, giving increased dimensions to the rooms in the former, but adopted in order to protect the walls of the ground storey from rain, which in the upper storey was effected by the projecting caves of the roof. In the north and west of England, where stone could be obtained at less cost than brick, and in the east of England, where brick, often imported from the Low Countries, was largely employed, the ordinary houses were built in those materials,
and in consequence of their excellent construction many houses of the 16th and 17th centuries have remained in good preservation down to the present day; they are found in the Cotswolds generally, and (among small towns) at Broadway in Worcestershire and (of brick) throughout Essex and Suffolk. Among the larger half-timber houses built in the 16th and 17th centuries, mention may be made of Bramhall Hall, near Manchester; Speke Hall, near Liverpool (see Plate III., fig. 10); The Oaks, West Bromwich; and Moreton Old Hall, Cheshire, one of the most elaborate of the series (see Plate III., fig. 11).

On the borders of the Rhine, as at Bacharach and Rhense, and throughout Germany, half-timber houses of the most picturesque character are found in every town, large and small, those of Hildesheim (see Plate II., fig. 8) dating from the 15th and 16th centuries, and in some cases rising to a great height with four or five storeys, not including those in the lofty roofs. Houses in stone from the 12th to the 16th century are found in Cologne, Metz, Trier, Hanover and Münster in Westphalia, where again there are whole streets remaining; and in brick at Rostock, Stralsund, Lübeck, Greifswald and Danzig, forming a very remarkable series of 15th and 16th-century work.

Of half-timber work in Italy there are no examples, but sometimes (as at Bologna) the rooms of the upper floors are carried on arcades, and sometimes on corbels, as the casa dei Carracci in the same town. The principal feature of the Italian house is the courtyard in the rear, with arcades on one or more sides, the front in stone or brick, or both combined, being of the greatest simplicity (examples in San Gimignano and Pisa). At Viterbo are small houses in stone, two of which have external stone staircases of fine design, and the few windows on the ground floor suggest that the rooms there were used only for stores.

Houses with external staircases, but without any architectural pretensions, are found throughout the Balkan provinces.

The introduction of the purer Italian style into England in the 17th century created a great change in domestic architecture. Instead of the projecting wings and otherwise picturesque contour of the earlier work the houses were made square or rectangular on plan, in two or three storeys, crowned with a modillion cornice carrying a roof of red tiles; the only embellishments of the main front were the projecting courses of stone on the quoins and architraves round the windows, and flat pilasters carrying a hood or pediment flanking the entrance doorway. In the larger mansions more thought was bestowed on the introduction of porticoes (scarcely necessary in the English climate), with sometimes great flights of steps up to the principal floor, which was raised above a basement with cold and dark passages; a great saloon in the centre of the block, lighted from above, took the place of the great entrance hall of the Tudor period, and the rooms frequently led one out of the other, without an independent entrance door. On the other hand, in the ordinary houses, the deficiency in external ornament was amply made up for by the comfort in the interior and the decoration of the staircase and other rooms. Towards the close of the century the square mulioned and transomed windows, with opening casements, gave way to sash windows, introduced from Holland, and these with moulded and stout sash-bars gave a certain character to the outside of the houses, which are valued now for their quiet unpretentious character and excellent construction. In the closes of many English cathedrals, on the outskirts of London, and in some of the older squares, as Lincoln's Inn Fields and Queen Square, are examples of this style of house. The substitution of thin sash-bars in the 19th century,

and their omission occasionally, in favour of plate-glass, deprived the house-front of one of its chief attractions; but the old English casements and oriel or bow-windows have been again introduced, and a return has been made to the style which prevailed in the beginning of the 18th century, commonly known as that of Queen Anne.

Perhaps the greatest change which has been made in the English house is the adoption of "flats;" commenced some time in the 'fifties in Ashley Gardens, Westminster, they have spread throughout London. In consequence of the great value of the sites on which they are sometimes built, to which must be added the cost of the houses pulled down to make way for them, the question of expense in material and rich decoration has not always been worth considering, so that frontages in stone, with the classic orders brought in with many varieties of design, have given the character of a palace to a structure in which none of the rooms exceeds the modest height of 10 ft. The increasing demand for these, however, shows that they meet, so far as their accommodation and comfort are concerned, the wants and tastes of the upper and middle classes. In some of the London streets, where shops occupy the ground floor, a far finer type of house has been erected than which could have been afforded for the shopkeeper's residence above, as in old times, so that London promises in time to become a city of palaces. The same change in the aspects of its streets has long been evident in Paris, but there is one feature in the latter city which has never yet found its way into London, much to the surprise of French visitors, viz. the porte-cochère, through which the occupants of the house can in wet weather drive and be landed in a covered hall or vestibule. This requires, of course, a small court at the back, so small that one wonders sometimes how it is possible for the carriage to turn round in it. The porte-cochère also, from its dimensions, is a feature of more importance than the ordinary street doorway, even when a portico of some kind is added; on the other hand, the strict regulations in Paris as regards the projection of cornices and other decorative accessories gives to the stranger the appearance of monotony in their design, which certainly cannot be said of the houses in flats lately built in London. Within recent years an old English feature, known as the bow-window, has been introduced into Paris, the primary object of which does not seem yet to have been thoroughly understood by the French architect. An English bow-window, by its slight projection in front of the main wall, increases greatly the amount of light entering the room, and it is generally placed between solid piers of stone or brick. The French architect, however, project their piers on immense corbels, and then sink their windows with deep external reveals, so that no benefit accrues to the room, so far as the increased light is concerned. In Paris, since 1900, there has been a tendency to introduce a style of design in French houses which is known as "l'art nouveau," a style which commenced in furniture as a reaction against the revival of the Empire and Louis XIV, and XVI. periods, and was then extended to house fronts; this style has unfortunately spread through the various towns in France and apparently to Germany, again as a reaction against the formal classic style of the latter half of the 19th century. It is probable that in Italy and Spain "l'art nouveau" may meet with the same success, and for the same reasons, so that in the latter country it will be a revival, with modifications, of the well-known Churriuguesque style, the most dehased Rocco style which has ever existed. In England it has never met with any response. (R. P. S.)

HOUSEHOLD, ROYAL. In all the medieval monarchies of western Europe the general system of government sprang from, and depended for its effectiveness upon, the monarchical household. The sovereign household was at once the state and the court. The sovereign and his consort as its head were his officers of state, and the leading dignitaries of the palace were the principal administrators of the kingdom. The royal household itself had, in its turn, grown out of an earlier and more primitive institution. It took its rise in the comitatus described by Tacitus, the chosen band of comrades or companions who, when the Roman historian wrote, constituted the personal following, in peace as well as in war, of the Teutonic chieftain. In England before the Conquest the comitatus had developed or degenerated into the thanehood, and among the most eminent and powerful of the king's thegns were his thane, his bovar, and his bowser and staller. In Normandy at the time of the Conquest a similar arrangement, imitated from the French court, had long been established, and the Norman dukes, like their overlords the kings of France, had their household or steward, their chamberlain and their constable. After the Conquest the ducal household of Normandy was reproduced in the royal household of England; and since, in obedience to the spirit of feudalism, the great offices of the first had been made hereditary, the great offices of the second were made hereditary also, and were thenceforth held by the greatees and their descendants as grand-serjeanties of the crown. The consequence was that they passed out of immediate relation to the practical conduct of affairs either in both state and court or in the one or the other of them. The steward and chamberlain of England were superseded in their political functions by the justiciar and treasurer of England, and in their domestic functions by the steward and chamberlain of the household. The marshal of England took the place of the constable of England in the royal palace, and was associated with him in the command of the royal armies. In due course, however, the marshalship as well as the constableship became hereditary, and, although the constable and marshal of England retained their military authority until a comparatively late period, the duties they had hitherto performed were transferred to the master of the horse. In these circumstances the holders of the original great offices of state and the household ceased to attend the court except on occasions of extraordinary ceremony, and their representatives either by inheritance or by special appointment have ever since continued to appear at coronations and some other public solemnities, such as the opening of the parliament or trials by the House of Lords.

The materials available for a history of the English royal household and its duties are somewhat scanty. There is a record relating to it is of the reign of Henry II. and is contained in the Black Book of the Exchequer. It enumerates the various inmates of the king's palace and the daily allowances made to them at the period at which it was compiled. Hence it affords valuable evidence of the antiquity and relative importance of the court offices to which it refers, notwithstanding that it is silent as to the functions and formal subordination of the persons who filled them. In addition to this record we have a series of far later, but for the most part equally meagre, documents bearing more or less directly on the constitution of the royal household, and extending, with long intervals, from the reign of Edward III. to the reign of William and Mary. Among them, however, are what are known as the Black Book of the Household and the Statutes of Etham, the first compiled in the reign of Edward IV. and the second in the reign of Henry VIII., from which a good deal of detailed information may be gathered concerning the arrangements of the court in the 15th and 16th centuries. The Statutes of Etham were meant for the practical guidance merely of those who were responsible for the good order and the sufficient supply of the sovereign's household at the time they were issued.

1 The great officers of state and the household whom we have particularly mentioned do not of course exhaust the catalogue of them. We have named those only whose representatives are still dignitaries of the court and functionaries of the palace. If the reader consults Hallam (Middle Ages, l. 181 sq.), Freeman (Norman Conquest, i. 91 sq., and v. 426 sq.), and Stubbs (Const. Hist. i. 343 sq.), he will be able to fill in the details of the outline we have given above.

2 The record in question is entitled Consistenti Domini Regis de Primis Fastibus, and is contained in Liber Nunnorum, i. 341 sq.

3 The record is in question is entitled Constante Domini Regis de Secondis Fastibus, and is contained in Liber Nunnorum, i. 341 sq.

4 The record in question is entitled Collecion of Ordinances and Regulations for the Government of the Royal Household, made in Divers Reigns from King Edward III. to King William and Queen Mary, printed for the Society of Antiquaries, (London, 1790). See also Pegge's Curialia, published partly before and partly after this volume, and Carlisle's Gentlemen of the Privy Chamber, published in 1829. Pegge and Carlisle, however, deal with small and insignificant portions of the royal establishment.
But the Black Book of the Household, besides being a sort of treatise on princely magnificence generally, professes to be based on the regulations established for the governance of the court by Edward III., who, it affirms, was “the first seeter of certeinties among his domestical meyne, upon a grounded rule” and whose palace it describes as “the house of very policie and floewe of England”; and it may therefore possibly, and even probably, take us back to a period much more remote than that at which it was actually put together. Various orders, returns and accounts of the reigns of Elizabeth, James I., Charles I., Charles II., and William and Mary throw considerable light on the organization of particular sections of the royal household in times nearer to our own. Moreover, there were several parliaments which, connected with the royal financial transactions, were in connexion with the settlement or reform of the civil list during the reigns of George III., George IV. and William IV. But they add little or nothing to our knowledge of the subject in what was then its historical as distinguished from its contemporary aspects. So much, indeed, is this the case that, on the accession of Queen Victoria, Chamberlayne’s Present State of England, which contains a catalogue of the official at the court of Queen Anne, was described by Lord Melbourne the prime minister as the “only authority which the advisers of the crown could find for their assistance in determining the appropriate constitution and dimension of the domestic establishment of a queen of our time.”  

In its main outlines the existing organization of the royal household is essentially the same as it was under the Tudors or the Plantagenets. It is now, as it was then, divided into three principal departments, at the head of which are severally the lord steward, the lord chamberlain and the master of the horse, and the respective provinces of which may be generally described as “below stairs,” “above stairs” and “out of doors.” The duties of these officials, and the various officers under their charge are dealt with in the articles under those headings. When the reigning sovereign is a queen, the royal household is in some other respects rather differently arranged from that of a king and a queen consort. When there is a king and a queen consort there is a separate establishment “above stairs” and “out of doors” for the queen consort. She has a lord chamberlain’s department of her own, and all the ladies of the court from the mistress of the robes to the maids of honour are in her service. At the commencement of the reign of Queen Victoria the two establishments were combined, and on the whole considerably reduced. On the accession of Edward VII. the civil list was again reconstituted; and while the household of the king and his consort became larger than during the previous reign, there was a tendency towards increased efficiency by abolishing certain offices which were either redundant or unnecessary.  

It is of interest to note that countries such as the continental monarchies of Europe have had a continuous history from medieval times resemble in general outlines that described above. There are, common to many, certain great offices, which have become, in course of time, merely titular and sometimes honorary. In most cases, as the name of the office would suggest, they are held by those who discharged personal functions about the sovereign. Gradually, in ways or for reasons which might vary in each individual case, the office alone survived, the duties either ceasing to be necessary, or being transferred to officers of less exalted station and permanently attached to the sovereign’s household. For example, in Prussia, there are certain great titular officers, such as the Obersstromschläifer (great chamberlain); the Obersjägermeister (grand master of the hunt); the Oberstrachen (grand cup-bearer) and the Oberstruchess (grand carver), while, at the same time, there are also departments which correspond, to a great extent—both as to offices and their duties—to those of the household of the English sovereigns. This is a feature which must necessarily be reproduced in any monarchical country, whatever the date of its foundation, to a more or less limited extent, and varying in its constitution with the needs or customs of the particular countries.

HOUSEL, the English name, until the time of the Reformation, for the Eucharist. The word in O. Eng. was hæstel. Its proper meaning is “sacrifice,” and thus the word housel appears in Ullian’s Gothic version of Matt. ix. 13: “I will have mercy and not sacrifice.” The ultimate origin is doubtful. The New English Dictionary connects it with a Teutonic stem meaning “holy”; from which is derived the Lithuanian sviežušis, and Lettish svēts. Sket refers it to a root meaning “to kill,” which may connect it with Gr. καίνειν.

HOUSELEEK, Semprevivum, a genus of ornamental evergreen plants belonging to the natural order Crassulaceae. About 30 species are known in gardens, some of which are hardy perennial herbs, and grow well in dry or rocky situations; the others are evergreen shrubs or undershrubs, fit only for cultivation in the greenhouse or conservatory. The genus Semprevivum is distinguished from the nearly allied Sedum by having more than five (about 12) petals, and by the glands at the base of the ovary being laciniated if present. The common houseleek, S. leucotom (Ger. Hauswurzel, Fr. joubarbe), is often met with in Britain on roofs of outhouses and wall-tops, but is not a native. Originally it was indigenous in the Alps, but it is now widely dispersed in Europe, and has been introduced into America. The leaves are thick, fleshy and succulent, and are arranged in the form of a rosette lying close to the soil. The plant propagates itself by offsets on all sides, so that it forms after a time a dense cushion or aggregation of rosettes. The flowering stem, which is of rather rare occurrence, is about 1 ft. high, reddish, and branched and生产 units in the axils, the flowers being more or less flexed at the circumference, of reddish flowers, which bloom from June to September. The houseleek has been known variously as the houseleek, homewort or great houseleek. Sedum acre (stone-crop) is styled the little houseleek. In Germany it is sometimes called Donnerkraut, from being supposed to protect the house on which it grows from thunder. The leaves are said to contain malic acid in considerable quantity, and have been eaten as salad, like Portulaca. S. glaucescens and S. bolosperum, natives respectively of Madeira and the Canary Islands, contain a very viscous substance in large quantity, and are used for the preparation of bird-lime; fishermen in Madeira, after dipping their nets in an alkaline solution, rub them with this substance, rendering them as tough as leather. S. montavum, indigenous in Central Europe, according to Gmelin, causes violent purging; S. arborescens, το μέγα δέντων of Dioscorides, is employed in Cyprus, the East, and northern Africa as an external remedy for malignant ulcers, inflammations and burns, and internally for mucous discharges.

HOUSING. The housing of the poorer classes has become a pressing problem in all populous Western countries, and has engaged, in a varying but constantly increasing measure, the attention of legislative and administrative bodies and of philanthropic individuals and societies. The general interest was

FIG. 17.—HOUSES IN CAVENDISH SQUARE, LONDON. EIGHTEENTH CENTURY.
Housing

signalized by an International Congress held in London in 1907. The recognition of the problem is due in the first instance to the science of public health, the rise of which dates from the second quarter of the 19th century; and in the second instance to the growth of urban populations consequent on the development of the coal mining industries and of trading and transporting agencies, both of which tend to mass increasing numbers of people in convenient centres. To have a clear view of the subject it is necessary to distinguish these factors and their respective influence upon the problem. Urban congestion is quite secondary, and only important because and so far as it has a prejudicial effect upon health and strength. Further, the requirements on the scientific side, made on behalf of public health, are of very much wider application and more expansive than those which arise from the mere growth of urban population. That is obvious at once from the fact that they extend to rural housing, which has indeed become a prominent feature of the question in recent years. To ascribe the housing problem to the "factory system," as some writers have done, is to put forward an inadequate and misleading view of it. It is, in fact, particularly acute in some places totally devoid of factories and least acute in some purely factory towns. If the factory system were abolished with all its effects the housing question would remain. But there is a more important distinction than extent of application. The requirements of public health are indeterminate and interminable; knowledge increases, or rather changes, and the standard constantly rises. It is the changing standard which gives most trouble; housing at one period thought good enough is presently condemned. Fifty years ago no house existed which would satisfy modern sanitary standards, and the mansions of the great were in some respects inferior to the worst quarters to-day. And to this process there is no end. It is quite conceivable that urban congestion might cease to be a danger to all. That actually happens in particular towns where the population is stationary or diminishing. One whole nation (France) has already reached that point, and others are moving towards it at varying rates. But even where the supply of houses exceeds the demand and many stand empty, the housing problem remains; condemnation of existing accommodation continues and the effort to provide superior houses goes on. In other words, there are two main aspects of the housing question, quality and quantity; they touch at various points and interact, but they are essentially distinct. The problem of quantity may be settled, but quality is more permanent. The importance attached to housing is much enhanced by the general tendency to lay stress on the material conditions of life, which characterizes the present age. Among material conditions environment takes a leading place, largely under the influence of the theory of evolution in a popular and probably erroneous form; and among the factors of environment the home assumes a more and more prominent position. There is reason in this, for whatever other provision be made for work or recreation the home is after all the place where people spend most of their time. Life begins there and generally ends there. At the beginning of life the whole time is spent there and home conditions are of paramount importance to the young, whose physical welfare has become the object of increasing care. But the usual tendency to run to extremes has asserted itself. It may be added that it is extremely difficult to raise the character and condition of those who live in thoroughly bad home surroundings, and that an indispensable or preliminary step is to improve the dwelling. But if in pursuit of this object other considerations are lost sight of, the result is failure. Bad housing is intimately connected with poverty; it is, indeed, largely a question of poverty now that the difference between good and bad housing is understood and the effects of the latter are recognized. The poorest people live under the worst housing conditions because they are the cheapest; the economic factor governs the situation. Poverty again is associated with bad habits, with dirt, waste, idleness and vice, both as cause and as effect. These factors cannot be separated in real life; they act and react upon each other in such a way that it is impossible to disentangle their respective shares in producing physical and moral evils. To lay all responsibility upon the structural environment is an error constantly exposed by experience.

Defective quality emerged in or all of the following conditions—darkness, bad air, damp, dirt and dilapidation. Particular insanitary conditions independent of the structure are often associated, namely defects of water-supply, drainage, excrement and house refuse removal, back-yards and surrounding ground; they contribute to dirt, damp and bad air. Defective quantity produces high rents and overcrowding, both of which have a prejudicial effect upon health; the one by diminishing expenditure on other necessaries, the other by fouling the atmosphere and promoting the spread of infectious illness. The physical effects of these conditions have been demonstrated by comparative statistics of mortality general and special; among the latter particular stress is laid on the mortality of infants, that from consumption and from "zymotic" diseases. The statistical evidence has been especially directed to the effects of overcrowding, which can be stated with greater precision than other insanitary conditions. It generally takes the form of comparing the death-rates of different areas having widely contrasted densities of population or proportions of persons to a given space. It is not necessary to quote any of these figures, which have been produced in great number. They broadly establish a connexion between density and mortality; but the inference that the connexion can be reduced to a precise numerical statement and that the difference of mortality shown is all due to overcrowding or other housing conditions is highly fallacious. Many other factors ought to be taken into account, such as the age-distribution of the population, the birth-rate, the occupations, means, character and habits of the people, the geographical situation, the number of public institutions, workshops and so forth. The fallacious use of vital statistics for the purpose of proving some particular point has become so common that it is necessary to enter a warning against them; the subject of housing is a popular field for the exercise of that art, though there is no need of it.

The actual state of housing in different countries and localities, the efforts made to deal with it by various agencies, the subsidiary points which arise in connexion with it and the results attained—all these heads embrace such a vast mass of facts that any attempt to treat them fully in detail would run to coordinate length. It must suffice to review the more salient points; and the most convenient way of doing so is to deal first with Great Britain, which has led the way historically in extent of need, in its recognition and in efforts to meet it, adding some notes upon other countries, in which the question is of more recent date and for which less information is available.

The United Kingdom

The importance of housing and the need of improvement had by 1890 received public recognition in England for nearly 70 years, a period coinciding almost exactly with the systematic study of sanitation or public health. The active movement definitely began about 1845 with voluntary effort in which Lord Shaftesbury was the most prominent and active figure. The motive was philanthropic and the object was to improve the condition of the working classes. It took the form of societies; one was the "Metropolitan Association for Improving the Dwellings of the Industrial Classes," incorporated in 1845 but founded in 1841; another was the "Society for Improving the Condition of the Labouring Classes," originally the "Labourers' Friend Society" of which the Prince Consort became president. That fact and the statement of the Society concerning improved housing that "the moral were almost equal to the physical benefits," sufficiently prove that public interest in the subject and a grasp of its significance already existed at that date. Legislation followed not long after and has continued at intervals ever since.

Legislation.—Twenty-eight Housing and Health Acts, passed between 1851 and 1903, are enumerated by Mr Dewswup, whose monograph on The Housing Problem in England is the fullest account
HOUSING

of the subject published. The first was the Shaftesbury Act of 1851 for the establishment of lodging-houses for the working classes; then, the Public Health Act of 1848 and the Board of Health Acts. The Shaftesbury Act had in view the provision by local authorities of good lodging-houses for the better class of artisans, and particularly of single persons, male and female, though families were also considered. It was not included in the list of twenty-eight, for the regulation and control of common lodging-houses, from which Mr. Dewsnup reasonably infers that the object of Lord Shaftesbury, who inspired both acts, was to remove the casual and degrading evils incident to the tenures of the common lodging-houses from the more regularly employed and respectable workers who were sometimes driven to use them for lack of other means. In this early measure, Shaftesbury embodied the principle of differential treatment and showed a grasp of the problem not always visible in later procedure. The most important of the subsequent acts were those of 1855 and 1866, both intended to destroy the provision of insanitary lodging-houses and class dwellings; the Torrens Act of 1868 (Artisans' and Labourers' Dwellings Act) for the improvement or demolition of existing buildings; the Cross Act of 1875 (Artisans' and Labourers' Dwellings Improvement Act), for extending that process to larger areas; the Public Health Act of 1875; the Housing of the Working Classes Act of 1885 following the report of the Royal Commission on the Housing of the Working Classes, of which King Edward, then prince of Wales, was a member: the Housing of the Working Classes Act of 1890; the Public Health (London) Act of 1891. The acts of 1875 (Public Health), of 1890 and of 1891 are still in force. The story of the Health Acts is the story of local drainage, which includes the Scotch and Irish acts, local private acts and others bearing on the question. The first head is further subdivided into (a) municipal action, (b) private action. These objects have been alternately promoted by legislative measures conceived and carried out on no systematic plan, but gradually and continuously developed into an effective body of law, particularly with regard to the means of dealing with existing insanitary dwellings. The advancing requirements of public health and the reactions of social unrest have made this a continuous problem. The nuisance arising from overcrowding obtained statutory recognition as a condition dangerous or prejudicial to health, and provision was made for compelling its abatement. The campaign against bad housing conditions thus inaugurated by the legislature was extended by subsequent acts in 1860, 1866 and 1868, culminating in the Cross Act of 1875 for the demolition (and reconstruction) of large insanitary areas and the execution of schemes for other purposes. The same story, with constructive policy, began still earlier in 1851 by Lord Shaftesbury's Act, was concurrently pursued, and for some years more actively than the destructive; but after 1866 the latter became more prominent. That was the act of 1866, of which the Shaftesbury background until revived by the Royal Commission of 1885 and the housing legislation which followed, particularly the Housing of the Working Classes Act of 1890, amending and consolidating previous acts.

The laws in operation at the beginning of 1900 were the Public Health Acts of 1875 and 1891 (as amended by subsequent minor measures), and the Housing of the Working Classes Act of 1890, amended in 1894, 1900 and 1903. The Public Health Acts place upon the local sanitary authority the obligation of securing, under by-laws, the proper construction, draining and cleaning of streets, removal of house refuse and building of houses, including structural details for the prevention of damp and decay, the provision of sanitary conveniences and an adequate water-supply; also of inquiring into and removing nuisances, which include any premises in such a condition as to be a nuisance or injurious to health and any house so overcrowded as to be dangerous or injurious to health. For the purpose of accomplishing these duties they are empowered with the power of inspection, of declaring a building unfit for human habitation and of closing it by order. The Housing Acts give more extended power to the local authority to demolish insanitary dwellings and clear whole areas or "slums," and also to construct dwellings for the working classes with or without such clearance; they also retain the older provisions for encouraging private enterprise in the erection of superior dwellings for the working classes. The procedure for dealing with insanitary property under these Acts is too intricate to be stated in detail; but, briefly, there are two ways of proceeding. In the first case, the local authority, on receiving formal complaint of an unhealthy area, cause an inspection to be made by their medical officer, and if the report in their opinion justifies action, they may prepare an "improvement scheme," which is submitted to the Local Government Board. The Board holds an inquiry, and, if satisfied, issues a provisional order, which has to be confirmed by a special act of parliament, under which the local authority can proceed to demolish the houses concerned after paying compensation to the owners. This procedure, which is authorized by part i. of the act of 1890, is obviously both cumbersome and costly. The second way, provided for by part ii. of the act, is much simpler and less ambitious; it only applies to single houses or groups of houses. The medical officer in the course of his duty reports to the local authority any houses which are in his opinion unfit for human habitation; the local authority can then make an order to serve notices on the owners to repair the houses at their own expense. Failing compliance on the part of the owners, an order for closing the houses can be obtained; and if nothing is done at the end of three months an order for demolition can be made. Buildings injurious by reason of their obstructive character (e.g. houses built back to back so as to be without through ventilation and commonly called "back-to-back" houses) can be dealt with in a similar manner. Small areas containing groups of objectionable houses of either kind may be made the subject of an improvement scheme, as above. Where areas are dealt with under improvement schemes there is a certain obligation to re-house the persons displaced. Building schemes are provided for under part iii. of the act. Land may be compulsorily purchased for the purpose and the money required may be raised by loans under certain conditions. The provisions thus summarized were considerably modified by the Housing, Town Planning, &c., Act," passed at the end of 1909. It rendered obligatory the adoption (previously permissive) of the housing provisions (part iii.) of the act of 1890 by local authorities, simplified the procedure for the compulsory purchase of land required for the purpose and extended the facilities for obtaining loans. It further gave power to the Local Government Board to compel local authorities to put in force the act of 1890 in regard both to existing insanitary housing and the provision of new housing. Power was also given to county councils to act in default of rural district councils in regard to new housing. The procedure for dealing with insanitary houses by closed and demolition under part ii. (see above) was rendered more stringent. The general intention of the new act was partly to facilitate the administration of the previous one by local authorities and partly to provide means of compelling supine authorities to take action. Its town-planning provisions are noted below.

Effects of Legislation.—The efficacy of laws depends very largely upon their enforcement; and when they are permissive and dependent on the energy and discretion of local bodies their administration varies greatly in different localities. That has been the case with the British housing and health laws, and is one cause of dissatisfaction with them. But in the aggregate they have effected very great improvement. Public action has chiefly taken effect in sanitary reform, which includes the removal of the worst housing, through demolition or alteration, and general sanitary improvements of various kinds. In some large towns the worst parts have been transformed, masses of old, narrow, crowded, dilapidated and filthy streets and courts have been swept away at one blow or by degrees; other parts have been reconstructed, and the thoroughfares and other public thoroughfares have been improved. What has been accomplished is not generally recognized. It is not easily demonstrated, and to realize it local knowledge, observation and memory are needed. The details of the story are hidden away in local annals and official reports; and writers on the subject are usually more concerned with what has not than with what has been done. Both the Public Health and the Housing Acts have had a share in the improvement effected.
The operation of the former is slow and gradual, but it is continuous and far more general than that of the latter. It embraces many details which are not usually taken into account in discussing housing, but which have as much bearing on the healthiness of the home as the structure itself. The Public Health Acts have further had a certain preventive influence in laying down a standard for the erection of new houses by the ordinary commercial agencies. Such houses are performed as a matter of economy, and the question of rent; but the standard has risen, and building plans involving insufficient light and air, such as once were general, have now for several years been forbidden almost everywhere. Supervision of commercial building is, in fact, vastly more important than the erection of dwellings by public or philanthropic agencies, because it affects a vastly larger proportion of the population. The influence of the Public Health Acts in improving the conditions of home life cannot be estimated or summarized, but it is reflected in the general death-rate, which fell steadily in the United Kingdom from 21.1 per 1000 in 1875 to 15.4 per 1000 in 1907.

Insanitary Areas.—The operation of the Housing Acts is more susceptible of being stated in figures, though no fully comprehensive information is available. The original Shaftesbury Act of 1849 for erecting municipal lodging-houses appears to have been practically inoperative, and little progress was made in the matter for many years. In 1864, however, Liverpool obtained a private act and entered on the policy of improvement by the demolition of insanitary dwellings on a considerable scale, following it up in 1869 by the introduction of borough and municipal improvement acts. Birmingham, in 1878, obtained an Improvement Trust, administered by the city council, and embarked on a large scheme of improvement. These seem to have been the earliest examples. The Torrens Act of 1868, which embodied the improvement policy, did not produce much effect. According to a parliamentary return, during the years 1863-1868, proceedings were only taken under this act in respect of about 2000 houses in London and outlying towns. Under the Cross Act of 1875, which was intended to promote large improvement schemes, between 1875 and 1885 23 schemes involving a total area of 14 acres, and a population of about 2500, were undertaken in London and 11 schemes in provincial towns. By far the most important of these, and the largest single scheme ever undertaken, was one carried out in Birmingham. It affected an area of 93 acres and involved a cost of £500,000. Altogether between £4,000,000 and £5,000,000 were raised for improvement schemes under those acts. After the Housing Act of 1890 the clearance policy was continued in London and extended in the provinces. During the period 1891-1905 loans to the amount of about £2,300,000 were raised for improvement schemes by 28 provincial towns in England and Wales. The largest of these wereLiverpool (17,772), Birmingham (11,230), Liverpool (523), Sheffield (333,000), Brighton (112,000). The Leeds scheme affected an area of 75 acres, which was cleared at a cost of £500,000. In London the area cleared was raised to a total of 104 acres; the Greater London Council (31, 1905) is getting £2,434,006, and the number of persons displaced 48,528. Glasgow has under its Improvement Trust cleared an area of 88 acres with a population of 9,000. At the same time the policy of dealing with houses unfit for habitation singly or in small groups by compelling owners to improve them has been pursued by certain number of local authorities. In the six years 1899-1904 action was taken each year on the average in respect of about 900 houses by some 400 local authorities large and small outside London. Representations were made against 33,746 houses, 17,210 were rendered unfit for habitation, closing orders were obtained against 4,220 and demolition orders against 748. These figures do not include cases in which action was taken under local acts and Public Health Acts. In Manchester, between 1895 and 1905, nearly 10,000 "back-to-back" houses were closed and about half of them opened after reconstruction. Hull, an old seaport town with a great deal of extremely bad housing, has made very effective use of the method of gradual improvement and has transformed its worst areas without appearing in any list of improvement schemes. In recent years this procedure has been systematically adopted in Birmingham and other places, and has been strongly advocated by Mr. J. E. Torrens in his "Practical town improvement schemes on account of the excessive expense involved by the latter in buying up insanitary areas. In the six years 1902-1904 the City of Birmingham with £411,000 cleared 164 acres of insanitary habitation; 1780 were thoroughly repaired, 1005 were demolished; the rest were under notice or in course of repair at the end of the period. Among other towns which have adopted this policy are Liverpool, 1887; Cardiff, 1893; Warrington, 1899.

Building.—On the constructive side the operation of the Housing Acts has been less extensive and much less general. In London alone has the erection of working-class dwellings by municipal action and organized private enterprise assumed large proportions. Philanthropic societies were first in the field and date from a period anterior to legislation, which however, stimulated their activity for many years by affording facilities. Fourteen organizations were in operation in London prior to 1890 and some of them on a large scale; but much has been built since 1895. Some of these enterprises are the Improved Industrial Dwellings Company (1864), which has built 5421 tenements containing 19,945 rooms; the Peabody Fund (1864) with 5469 tenements containing 12,238 rooms; the Artisans', Workmen's, and Agricultural Labourers' Dwellings and General Improvement Company (1867), which has built 3495 tenements containing 11,348 rooms, and 6195 cottage dwellings; the East-End Dwellings Company (1885) with 2096 tenements containing 7176 rooms and 306 cottages; the Carrington Tenement Company (1885) containing 5338 rooms. The Artisans' Dwellings Company alone has housed upwards of 50,000 persons. In addition to these there are the Rowton Houses (1892), which are hotels for working men, six in number, accommodating 1562 persons. So far as can be estimated, private enterprise has housed some 150,000 persons in improved dwellings in London on a commercial basis. The early activity of the building companies was largely due to the policy of the Metropolitan Board of Works, which adopted extensive improvement schemes and sold the cleared sites to the companies, who carried out the re-housing obligations imposed by the law. Soon after the London County Council was replaced by the Board of Works in 1889, adopted the policy of undertaking its own re-housing, their activity has greatly diminished. The buildings erected by them have been either in blocks of the type of the local Dwellings Company, which has built small houses and shops in outlying parts of London, is an exception. The tenement blocks are scattered about London in many quarters. For instance the Peabody Improvement Company, which is under the supervision of the Metropolitan Association has 14; the Artisans' Dwellings Company has 10; the Guinness Trust has 8. In 1909 an important addition to the list of philanthropic enterprises in London was the Greenford Dwellings Company, which has begun a site in the Greenford Road. In only a few provincial towns has private enterprise contributed to improved housing in a similar manner and that not upon a large scale; among them are Newcastle, Leeds, Hull, Salford and Dublin.

Municipal Building has been more widely adopted. The following details are taken from Mr W. Thompson's Housing up to Date, which gives comprehensive information down to the end of 1906. The number of local authorities which had then availed themselves of powers of the Act of 1890, which provides for the erection of working-class dwellings, was 142. They were the London County Council, 12 Metropolitan Boroughs, 69 County Councils and Town Councils, 49 Urban District Councils and 12 Rural District Councils. The dwellings erected are classed as lodging-houses, block dwellings, tenement houses, cottage flats and cottages. In London and other parts of England and Wales in 1907 there are 8 in England, 3 in Scotland (Glasgow, Aberdeen and Leith) and 1 in Ireland (Belfast). The total number of beds provided was 6216, of which Glasgow accounts for 2414, London for 1856, Manchester 676, Liverpool 474; and Hull 128. 930 more beds are or will be built. Many of these will be cottages which are or will be building municipal lodging-houses for which no details are available. The other municipal dwellings erected are summarized as follows:—

It appears from these figures that municipal building has provided for a smaller number of persons in the whole of the United Kingdom than the government has been able to effect through national legislation. Of the total 72,866 blocks which have erected dwellings in blocks are London (7726), Glasgow (2300), Edinburgh (596), Liverpool (501), Dublin (460) and Manchester (420). The great majority of such buildings are in rooms. Tenement houses have been built in Liverpool (1424), Manchester (308), Sheffield (192), Aberdeen (128), and in seven other towns on a small scale. Such tenements are generally of one or two rooms and are for the working men. In London and other places the majority of the cottage flats contain three or more rooms, a considerable proportion have four rooms. Cottages
HOUSING

have been built in 67 places, chiefly small towns and suburban districts.

The large towns which have adopted this class of dwellings Salford stands first with 633 cottages; the London boroughs, all on the south side of the Thames, have built 254; Manchester 226, Sheffield 173, Huddersfield 157, Birmingham 103. The number of rooms in municipal cottages ranges from three to eight, but the great majority of these dwellings have four or five rooms.

Some further details of municipal housing in particular towns are of interest. In London, the work of building has been almost completed down to March 31, 1908, not including three lodging-homes containing 1854 cubicles, as is given in the official volume of London Statistics, published by the Council, as follows:

<table>
<thead>
<tr>
<th>No. of Dwellings</th>
<th>No. of Rooms</th>
<th>Cost of Land and Building</th>
<th>No. of Persons in Occupation</th>
</tr>
</thead>
<tbody>
<tr>
<td>8,373</td>
<td>23,839</td>
<td>£2,435,263</td>
<td>26,687</td>
</tr>
</tbody>
</table>

With regard to the cost, it is to be noted that the actual cost of the land purchased for improvement schemes was very much greater than that stated, having been written down to an arbitrary figure called "housing valuation." The financial accounts of L.C.C. dwellings for the year ending March 31, 1908, are thus summarized:

<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>£180,169</td>
<td>£1945</td>
<td>£160,714</td>
<td>£157,141</td>
<td>£3,573</td>
</tr>
</tbody>
</table>

It appears from this that if the actual commercial cost of the land were deducted from the charges of the Council, the work would run at an annual loss.

The occupations of the tenants are stated in the following proportions: labourers 789, clerks 312, policemen 251, shop assistants 202, warehousemen 185, printers 182, charwomen 125, contingents of all kinds, carvers 122, bigitters 118, widows 116, tram drivers 110, postmen 107, packers 97, engineers 87, dressmakers 41, coachmen 31, motormen 26, milliners 19. These proportions figure so that a considerable number of these tenants cannot be classed as average wage earners who are occupied in the great mass of the occupations of London municipal dwellings are of a superior class.

The mean weekly rent in London County Council dwellings is 2s. 10d. per room against 2s. 4d. in dwellings erected by other agencies.

The most important feature of the County Council's policy in recent years has been the acquisition of suburban sites for the erection of cottages. There are four such sites, two on the south, one on the north and one on the west side of London; the total area is 349 acres, and the total accommodation contemplated is for 66,000 persons at an estimated cost of £3,105,840; the present accommodation is for about 8000. In addition to the housing provided by the London County Council, the London Borough Councils and the City Corporation had at the beginning of 1909 erected or adapted 3136 dwellings containing 7999 rooms.

Liverpool, down to 1907, about 59,000 had been spent in clearing insanitary areas and building new dwellings; the demolition of about 8500 houses and purchase of land cost about £500,000; and the erection of 2406 dwellings, containing 4961 rooms, cost about £150,000. The size of the dwellings and the number of each class are: 1 room, 193; 2 rooms, 965; 3 rooms, 719; 4 rooms, 167. The great majority are in tenement houses of three stores. The mean weekly rent is 1s. 6d. per room, but a larger number are let at less. The net return on the total output is just over 1% on the building outlay it is 2%.

The principal classes of persons occupying the dwellings are labourers 675, carters 120, charwomen 103, firemen 93, porters 86, hawkers 64, sailors 45, seamen 42, domestics 26. The least claimants are the casual or irregular work. Liverpool has, in fact, succeeded more than any other town in providing municipal dwellings in which the rent is fixed.

In Manchester 956 dwellings have been built at a total cost for building and improvement of £451,932; of the whole number 420 are in blocks, 308 in tenement houses and 228 in cottages. The number of rooms in the dwelling houses is 2850. The mean weekly rent is about 6d. per room more than in Liverpool. The gross profit on the block dwellings is 11½% on the capital outlay, on the tenement houses 3% on the cottages 2½%. The total loss during the last seven to ten years, including loan charges, has amounted to about £54,240." (Thompson).

In Glasgow the corporation has built under improvement schemes 2280 new dwellings containing 4013 rooms and 241 shops. The dwellings which are all in blocks and centrally situated, are occupied chiefly by artisans; only 28% have been reserved for the poorest class of tenants. The total amount taken from the rates on this account in 30 years is £600,000. Dwellings valued at £400,000 for building and £100,000 for land have a net return of 3.6% on outlay; dwellings valued at £280,000 for land and building return most 3% on outlay; leaving the sinking fund charges to be defrayed out of rates.

In Edinburgh the same is true. New and old dwellings containing 1052 rooms have been built for £87,970. No details of the underwriting board are given, but the net profit is charged average about 28. a week per room; actual rents received average 1s. 4d. per room and they have to be subsidized out of the rates to an extent of 2s. 3d. per room to meet the cost of site.

In Dublin provision is made for 950 tenants in 350 houses for making for housing 5594 families or 19,000 persons; of which 1041 families, or about one-fifth, are housed by the Corporation, the rest by companies. New and old dwellings containing 1665 houses, have been declared unhealthy areas by the medical officer, and between 1879 and 1909 more than 3000 houses were built, as unfitness for human habitation.

Co-operative Building.—Municipal and philanthropic housing by no means exhaust the efforts that have been made to provide working-class dwellings outside the ordinary building market. Their special function has been to substitute better housing for bad ones, which is the most costly and difficult, as well as the most urgent, part of the problem in old towns. But in the provision of new dwellings alone they have been far surpassed by organized self-help in different forms. Down to 1906 there had been built 46,707 houses by 413 co-operative societies at a cost of nearly 16,000,000. They are most numerous in the manufacturing towns and particularly in the north of London. In all about 8500 were owned by the societies which built them; 5557 had been sold to members, and 32,600 had been built by members on money lent by the societies. These figures do not include the part taken from building cooperatives, such as the immense scale; at the end of 1908 the invested funds of the registered building societies exceeded £72,000,000. An agency working on this scale, which far exceeds the operations of all the others put together, but is on an immense scale of business, is entirely doing useful work by building, which will be mentioned later on, or the operations of the co-operative building societies, which are really companies lending mainly to their own members, for the purpose of building. The difference between them and the previous ones is that the same thing is that the latter retain the element of co-operation by lending only to their own members, whereas the building societies lend to all open market and on the same commercial scale; the co-operative housing, which will be mentioned later on, or the operations of the co-operative building societies, which are really companies lending mainly to their own members, for the purpose of building.

The building of houses for their workpeople by industrial employers has never been widely adopted in this country, but it has received considerable attention at different periods. Sir Titus Salt was a pioneer in this direction, when he built his workmen's dwellings at Saltaire, on the outskirts of Bradford, and housed his workpeople on the spot. That plan was maintained by his successors, who still own some 900 excellent and cheap cottages, and was adopted by a few other manufacturers in the same neighbourhood. Saltaire was a model settlement with many institutions for the benefit of the mill-hands, and as such it attracted much attention; but the example was not generally followed, and the idea was lost.

Recently it has been revived by the model settlements at Port Sunlight, near Liverpool, started about 1888, Bourneville near Birmingham (1895), and Earlswick, near York (1904), which are of a much more elaborate kind. The great difference as between these is that while Earlswick works in some new locality where no provision existed, had to build houses for their workmen; but they have done so in a plain way, and this sort of housing has not assumed large proportions.

Conditions in 1909.—It has been said above that great improvements have been effected, and of that there is no doubt at all. Both quantity and quality are more satisfactory than they were, though both are still defective. The conditions vary greatly in different places, and no general indictment can be sustained. The common practice of citing some exceptionally bad cases, and by tacit inference generalizing from them to the whole country, is in nothing more misleading than in the matter of housing. Local differences are due to several causes—age,
population, occupations and means of the people, public opinion and municipal energy. The first three chiefly determine the difficulty and extent of the problem, the last two influence its treatment. The difficulty is greatest in towns which are old, have large populations and a high percentage of poor. Such problems must be solved, however much else may go on, with much care and regard to their great importance. London, Liverpool, Glasgow, the Tyne, Hull, Sunderland are examples. Old inland towns having a large trading as well as an industrial element present the same features. Such are Manchester, Birmingham, Leeds, Sheffield and Bradford. In all these, and some others like them, the past has left a heavy legacy of bad housing by malconstruction and dilapidation, which has been increased by growth of population and overcrowding. They have attacked it with varying degrees of energy according to the prevalent local spirit and with varying results.

Overcrowding.—The one condition which permits of precise and comprehensive statement is overcrowding. A standard has been officially adopted in England based on the number of persons to a room in each dwelling; and the facts in relation to this standard are embodied in the census returns. It is a much better criterion than that of "density" or number of persons per acre, which is very deceptive; for an apparently low density may conceal much overcrowding within walls and an apparently high one may be comparatively guiltless. The room-density is the important thing in actual life. Some light is also thrown on this question by the number of rooms contained in each dwelling, and that is also given in the census. The standard of overcrowding is more than two persons to a room. In 1901 there were in England and Wales 2,667,506 persons or 8-2% of the population living in a state of overcrowding according to this definition. Their distribution is extremely irregular and capricious. In rural districts the proportion was only 5-8%, in urban districts 8-9%; but these summary figures give no idea of the actual state of things in different localities. In both rural districts and in towns the proportion of overcrowding varies in different localities from less than 1% to over 30% of the population. The towns are the most important and we shall confine attention chiefly to them. A list of 84 having a population of 50,000 and upwards, exclusive of London, is given by Mr Dewsnip. The overcrowding ranges from 38-54% in Gateshead and 32-43% in South Shields to 0-97% in Northampton and 0-62% in Bournemouth. Of the whole number exactly one-half have less than 5%; 10 have less than 3% and 22 have 10% or more. Neither size nor character has much to do with the variation. Bournemouth, at the bottom of the list with 0-62%, is a residential place and health resort with a population of about 50,000; so is Tynemouth, which is near at the top, with 30-71%. The two largest towns, Liverpool and Manchester, are 20th and 23rd on the list, with only 7-94% and 6-28% respectively, or considerably less than the average; and on the other hand none of the first 17 towns with the highest proportion of overcrowding are of the largest size. Again, with regard to character, Leicester and Northampton, which are almost at the bottom of the list, with 1-04% and 0-97% respectively, are both purely industrial towns. The most striking facts are that the six towns, which alone have more than 20% of overcrowding, namely Gateshead (34-5), South Shields (32-4), Tynemouth (30-7), Newcastle (30-4), Sunderland (30-10), Plymouth (20-1) are all old seaports, that four of them at the head of the list are on the Tyne and the fifth on the Wear. This points strongly to special local conditions and it is borne out by the facts with regard to rural districts. Northumberland and Durham show a great excess of overcrowding over the whole; and some of their rural districts even surpass any of the towns. The highest of all is the district of Tynemouth, with 38-18% of overcrowding. The explanation lies in a special combination of large families and small houses prevalent in this area. All the rural districts are seats of coal-mining, and miners are the most prolific section of the population. They also live in small houses of a traditional and antiquated character, often of one storey only or built back to back. Many are built by colliery proprietors. Large families and small houses also prevail in the towns. Some of them contain coal-pits and the rest of their industrial population is engaged chiefly in engineering and shipbuilding works, occupations also usually associated with a high birth-rate. The men live as near their work as possible and the practice of living in flats or occupying part of a house prevails extensively.

In London the number of persons living in overcrowded conditions in 1901 was 726,096 or 16-0% of the population. The proportion varied from 2-6% in Lewisham to 35-2% in Finsbury, but in 23 out of the 26 boroughs into which the county is divided it exceeded the urban mean for the whole country, and in 9 boroughs having an aggregate population of 1,430,000 it was more than double the mean. Conditions in London are evidently unsatisfactory of English towns.

In the light of the census figures it is clear that no large proportion of the English industrial population is living under conditions of serious overcrowding, outside the special districts mentioned and that the expression "house famine" cannot be properly applied to England or English towns in general. In the House of Commons, on the 16th of August 1909, the president of the Local Government Board, Mr John Burns, gave a list of the number of unoccupied houses and tenements in each of the London boroughs and in the eight largest provincial towns, including Glasgow; the total was 104,357. By a further analysis of the census returns Mr Dewsnip showed that a great deal of the overcrowding is of a comparatively mild character and that it is due to a relatively small excess of population. Bradford, for instance, is credited with 40,896 overcrowded persons, representing the high percentage of 14-61 of the population; but in the case of nearly 20,000 the excess over the standard is very slight, and the proportion of gross overcrowding comes down to 7-55%. Moreover, this serious overcrowding is produced by no more than 2-79 of the population, so that its cure presents no insuperable difficulty. The argument is confirmed by the very substantial diminution which actually took place between 1891 and 1901. The facts are so striking that they deserve to be presented in tabular form:—

<table>

</tbody>
</table>
To what is this remarkable movement due? It is far too general to be attributed to the operation of the Housing Acts; for, though they have helped in some cases, a great diminution has occurred in many places in which no use has been made of them. Towns of all kinds and in all parts of the country exhibit the same movement in some degree; those which had little and those which had much overcrowding, the worst and the best. In London the percentage fell by 3.7, and the number of persons overcrowded was reduced by 103,669 in spite of an increase of population of 324,758. In Gateshead a fall of 6.2% in Newcastle one of 4.6% took place; while at the other end of the scale Leicester and Derby reduced their already very low proportions by more than one-half. Nottingham is the only exception in the whole list. And in 28 out of the 35 towns the decrease of overcrowding was absolute as well as relative in spite of a large increase of population. London has been cited. The other large towns may be tabulated with it, thus:

<table>

</table>

The very divergencies make the uniform diminution of overcrowding the more remarkable. The large increase of population in Liverpool and Bristol no doubt means extension of boundaries, which might have the effect of reducing the proportions of overcrowding, but it cannot account for the actual decrease of overcrowded persons. The change seems to be due to three factors all of which have been in general operation though in varying degrees. They are (1) the centrifugal movement promoted by improved locomotive facilities, (2) the declining birth-rate, (3) public health administration. (1) The first is the most important and the chief element has been tramways, of which a great extension accompanied by electrification took place in the decade. Thus the process of urbanization has been modified by one of suburbanization. Bristol is a prominent case; its overcrowding has been reduced by more than one-half without any large and costly municipal interference, mainly through the operation of ordinary economic forces. Tramways have made the outskirts accessible and builders have utilized the opportunity. They have built good houses, too, under supervision, and Bristol, though an old seaport and industrial town with much poverty, has the lowest general death-rate and the lowest infantile death-rate of all the great towns. (2) The birth-rate and the size of families are conditions which affect overcrowding in a very marked degree, though no attention is paid to them in that connection. The case of the mining districts and the towns on the Tyne has been mentioned above; the same thing is seen in London, where all the most overcrowded districts (Finsbury, Stepney, Shoreditch and Bethnal Green) have high birth-rates, ranging from 31.3 to 36.4 per 1000 in 1902-1906. The necessity imposed on poor parents of putting several children into a cheap and therefore small dwelling accounts for a large proportion of overcrowding, which automatically diminishes with a falling birth-rate. The ultimate advantage of this method of reducing overcrowding is a question on which opinions may differ, but there is little doubt about the secondary cause; it attracts no notice and works very gradually, but it does work. The last annual report (for 1907) of the medical officer to the London County Council says of overcrowding: "There is reason for thinking that in recent years greater attention has been paid by sanitary authorities to the abatement of the nuisance, and Dr Newman states that in Finchley there has been an enormous reduction in overcrowding, the reduction having been effected mainly in the years 1901-1905." The medical officers of the metropolitan boroughs reported in 1927 2613 dwellings overcrowded in 23 boroughs and 3216 such dwellings remedied in 27 boroughs. It should not be forgotten that a good deal of overcrowding is voluntary. Families which have not enough room for their own members nevertheless take in lodgers; and in some places, of which London is the most conspicuous but not the only example, foreigners herd together thickly in a very small space.

The general report accompanying the census says: "However the tenement figures for England and Wales are compared it is impossible to avoid the conclusion that the comparison affords satisfactory evidence of distinct improvement in the housing of the people during the ten years 1891-1901." In short, the problem of quantity is only acute in a few places and steadily becoming less so.

The foregoing facts apply only to England and Wales. In Scotland the state of things is much less satisfactory. No statistics of overcrowding are available, but the following comparative table shows how different the housing conditions are in the two countries:

<table>
<thead>
<tr>
<th>Size of Dwellings, England and Scotland, 1901.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dwelling.</td>
</tr>
<tr>
<td>1 room</td>
</tr>
<tr>
<td>2 rooms</td>
</tr>
<tr>
<td>3 rooms</td>
</tr>
<tr>
<td>4 rooms</td>
</tr>
<tr>
<td>5 rooms and over</td>
</tr>
</tbody>
</table>

Over 50% of the population of Scotland live in tenements of one or two rooms; only 8.2% in England. A comparison of the largest towns in the two countries gives the following result:

<table>

</tbody>
</table>

The conditions in Scottish towns where very tall tenement houses are common, resemble those in other countries, in which overcrowding is far greater than in England. All these matters are comperative, and the superiority of conditions in England ought to be recognized. Yet, in Scotland, too, great improvements have been effected. In 1861 there were 25,559 houses without windows; in 1901 only 130. These facts throw light on the long standing of the housing question, the change of standard and the improvement effected.

In Ireland there is more overcrowding than in England, though reports from Ireland, with the possible exception of Dublin, which has a larger proportion of one-roomed dwellings than any Scottish town, namely, 247.7%. The percentage of population living in overcrowded conditions in the principal towns is—Dublin 40.6, Limerick 51.7, Cork 23.4, Waterford 20.6, Londonderry 16.7, Belfast 8.2.
**Sanitary Conditions.**—With regard to the quality of existing housing reference has already been made to the effect of the Public Health Acts and the general improvement in sanitation. The only numerical measure is afforded by the death-rates, which have fallen in England from 20-9 per 1000 in 1871-1875 to 15-4 per 1000 in 1903-1907 and in the United Kingdom from 21-3 to 15-7 per 1000 in the same period. The condition of the dwelling must be credited with a considerable share in this fall. There have, in fact, been great changes and all in the direction of improvement. The rise and development of sanitation, of house and main drainage and sewage disposal, the purification of water and provision of a constant service in the house, the removal of refuse, the segregation of infectious illness, sanitary inspection—all these, apart from the demolition of the worst housing and the provision of better, have raised the general healthiness of the dwellings of the people. In face of these facts and of the vital statistics, to say that the people are physically deteriorating through the influence of bad housing is to talk obvious nonsense, for all conditions have been improving for more than a generation. If physical deterioration is going on, of which there is no proof, either it is not caused by bad housing or there is less than there was. Deterioration may be caused by the continued process of urbanization and the congregating of an ever larger proportion of the population in towns; but that is a different question. If the town has any injurious influence it is not due to the sanitary condition of the houses, which is in general superior to that of houses in the country, but to the habits and occupations of the people or to the atmosphere and the mere aggrandizement. But much misapprehension prevails with regard to towns. The most distinctive and the most valuable feature of English housing is the general predominance of the small house or cottage occupied by a single family. Only in London and a few other towns do blocks of large tenement houses of the continental type exist, and even there they are comparatively few. In England and Wales 84% of the population live in dwellings of 4 rooms and upwards, which means broadly separate houses. Now the prevalence of small houses involves spreading out and the covering of much ground with many little streets, which produce a monotonous effect; a smoky atmosphere makes them grimy and dull skies contribute to the general dinginess. The whole presents to the eye a vast area of dreary meanness and monotony. Thus the best feature of English national housing turns to its apparent disadvantage and the impression is gained by superficial observers that the bulk of our working-class populations lives in "slums." The word "slum" has no precise meaning, but if it implies serious sanitary defects it is not applicable to most of our town housing. There are real slums still, but the bulk of the working class population does not live in them; they live in most of them of a rather dirty and dingy exterior but in essential respects more sanitary than the large and often handsome blocks to be seen in foreign towns, which are not put down as slums because they do not look dirty. A smoky atmosphere is injurious to health, but it must be distinguished from defects of housing. Ideal houses in a smoky place soon look bad; inferior ones in a clean air look brighter and deceive the eye. The worst of the old housing has disappeared; the filthy, dilapidated, airless and sunless rookeries—the real slums—and the underground dwellings have been swept away in most cases, and what remains of them is not so bad as what has gone. But reform has been very regularly applied. Some towns have done much, others little. The large towns, in which the evil was most intense and most conspicuous in bulk, have as a class done far more than smaller ones in which the need perhaps was less great, but in which also a less healthy public spirit prevailed. The worst housing conditions to-day are probably to be found in old towns of small and medium size, in which the ratepayers have a great disinclination to spend money on anything, and the control of local affairs is apt to be in the hands of the owners of the most insanitary property. Nor is this state of things altogether confined to old places. Some of recent growth have been allowed, for the same reason, to spring up and develop without any regard to sanitary principles or the requirements of public health.

There is therefore abundant scope for further reform and in not a few cases urgent need of it. On the other hand, we have a number of towns, particularly manufacturing towns, both large and small in the Midlands and the north of England, which have already reached a good general standard of housing in all essential requirements, and only need the regular and steady exercise of vigilance by the public health service to remove such defects as still remain or may reveal themselves with the lapse of time.

**Rents.**—Rent is a matter of great importance from every point of view, and that is now being realized. A quantity of official information on the subject has been collected and made available by an elaborate inquiry ordered by the Board of Trade in 1905 and published in 1908 (Cd. 3864). It relates to working class dwellings the principal industrial towns in the United Kingdom, 94 in all—namely, 77 in England and Wales, 11 in Scotland and 6 in Ireland. The following tables give in a condensed form the chief statistical results obtained in October 1908—

**Predominant Range of Weekly Rents.**

Rents are lowest in Ireland and next lowest in English provincial towns, considerably higher in Scotland and highest of all in London, for which further special details are given. It is divided into three zones (1) central, (2) middle, (3) outer, which have the following mean weekly rents:

**London Mean Weekly Rents.**

In central London—which extends to Stepney in the East, Lambeth Bridge, Totham Hill, Islington in the North, and includes Westminster, Holborn, Finsbury, Marylebone, Shoreditch, most of Bethnal Green, Southwark and Bermondsey—the rent of a single room may be as high as 5/-, or even 6s. 6d. (Hobber) a week. It is here that overcrowding is greatest, and block tenements, philanthropic and municipal, most numerous. The rents of the block dwellings have not been taken into account in the foregoing official statistics; they range as follows: 1 room, 2s. 6d. to 5s.; 2 rooms, 5s. to 8s.; 3 rooms, 6s. 6d. to 11s. The lowest rent for which a single room can be obtained in this area is 2s. 6d. a week. In no English town are rents nearly so high as in London. If 100 is taken as the number for rent in London the nearest towns to it (Croydon and Plymouth) only reach 81, and one town on the list (Macclesfield) is as low as 32. The index number of twenty-one towns out of the white and purple, and these include a number of important industrial centres—Croydon, Oldham, Blackburn, Northampton, Warrington, Crewe, and others. The index numbers of the great towns are: Liverpool, 45; Manchester and Salford 62; Birmingham 59; Leeds 56; Sheffield 55; Bristol 53; Bradford 59; Hull 48; that is to say the level of rents in these towns is little more than half that in London. This is one more proof of the untypical character of London, and of the fallacy of generalizing from it to the rest of the country. Even in the overcrowded towns on Tyneside rents do not run to three-fourths of the London level. When the towns are divided into geographical groups the index numbers run thus: London 100; Northern Counties 62; Yorkshire 56; Lancashire and Cheshire 54; Midlands 51; Eastern Counties 50; Southern Counties 61; Wales and Monmouth 60. Rents are always highest in capitals, and diminish as you go southwards. The value slightly in advance of Glasgow, and in Scotland generally the range is much smaller than in England. Dublin, on the other hand, is differentiated from the other Irish towns as widely as London from English ones. A general and progressive rise in rents has been taken place for many years. The following index numbers for the great towns are
given in the second series of memonenda published by the Board of Trade in 1904 (Cd. 1761):—

**Relative Working-Class Rents.**

The tendency to rise is attributable to increased cost of labour, due to the higher prices of less work, increased cost of materials and higher rates. Weekly working-class rents generally include rates which are paid by the landlord. Housing reform has contributed to the rise, both directly and through the rates, on which it has thrown a heavy burden in various ways. When slums are cleared away and replaced by superior dwellings the new rents are generally higher than the old and this fact has proved a great difficulty. Most of the improved housing is beyond the means of those who need it most; and the desire to quarter the old inhabitants in the old houses is not as possible. The example of Liverpool, which has the largest proportion of casual and ill-paid labour of all the great towns, and has been the most successful in providing new dwellings of a fair quality for the poorer classes, is offset by other conditions; but it has recently attracted much attention and was made the subject of inquiry by a Select Committee of the House of Commons in 1906. The report laid stress chiefly on the inaction of local rural authorities under the Public Health and Housing Acts, and on various obstacles in the way of improving existing houses and of providing more and better ones at rents which agricultural labourers can afford to pay. The available facts with regard to rural housing are scrappy and unsatisfactory. The word "rural" has no precise meaning and it includes several very different sections of the population; for instance, the inhabitants of suburbs, mining villages and mill villages as well as the real agricultural population. Complaint is made of both the quantity and the quality of rural housing. With regard to quantity it is said that in spite of migration to the towns there is a dearth of cottages through dilapidation and demolition without rebuilding. That may happen in particular localities, but there is no evidence to support a general allegation. Inquiries issued by the Board of Trade to agricultural correspondents brought the following replies: insufficient 56, sufficient 111, more than sufficient 32. Similar inquiries of land agents and owners resulted thus: insufficient 9, sufficient 11, more than sufficient 4, variable 6. From which it appears that insufficiency exists but is not general. The official evidence with regard to overcrowding is that it is much less acute than in the towns. The proportion of the rural population in England living in overcrowded conditions in 1901 was 5.8%; if the rural mining districts, the exception overcrowding of which has been noted above, be eliminated, the rest cannot be very bad. Moreover, the percentage has appreciably diminished; in 1891 it was 8.46. The complaint of bad quality is better founded. Some landowners take great pride in the state of their property, and excellent cottages may be found in model villages and elsewhere in many parts of the country; but much rural housing is of an extremely insanitary character. A good deal of evidence on this head has been published in the reports of public health inspectors to the Local Government Board. And local authorities are very reluctant to set the law in motion against insanitary dwellings. On the other hand, they have in some cases hindered and prevented building by too rigid insistence on by-laws, framed with a view to urban housing and quite unsuited to rural conditions. A few rural authorities have taken action with regard to building schemes under Part III. of the Housing Act. A list of 31 in 17 counties is given in "Housing up to Date"; 13 applications were refused and 13 granted by the respective county councils and others were dropped. Details are given by the same authority of 34 houses built by 17 rural district councils. Public action may thus be said to amount to nothing at all. Landowners, however, have borrowed under the Improvements of Lands Acts upwards of £4,250,000 for building labourers' cottages; and this is probably only a fraction of the amount spent privately.

In Ireland a special condition of affairs exists. A series of about a dozen acts, dating from 1881 and culminating in the Labourers (Ireland) Act of 1906, have been passed for promoting the provision of labourers' cottages; and under them 20,634 cottages had been built and some thousands more authorized previous to the act of 1906, which extended the pre-existing facilities. The principle is that of the English Housing Acts applied to rural districts, but the procedure is simpler and quicker. The law provides that a representation may be made to the local authority by three ratepayers to the effect that "the existing house accommodation for agricultural labourers and their families is deficient having regard to the ordinary requirements of the district, or is unfit for human habitation owing to dilapidation, want of air, light, ventilation or other convenience or to any other sanitary defects," whereas the local authority shall make an improvement scheme. It may also initiate a scheme without representation, or the Local Government Board may do so in default of the local authority. The scheme is published, an inquiry held, notice given and an order made with very much less delay and expense than under the English law. The cottage is purchased by agreement, or compulsorily and the money for land and building raised by loan. Loans amounting to about 31 millions sterling had been raised down to 1906. The great majority of the cottages built are in Munster and Leinster. They must have at least 2 bedrooms and a kitchen, and the habitable rooms must be 8 ft. high. One of the most remarkable features is the low cost—about £150— at which these cottages have been built, including land and the expenses of procedure.

**Recent Developments.**—It is clear from a general review of the subject that the problem of housing the working classes in a satisfactory manner has proved more complex than was at one time realized. Experience has falsified hopes and led to a change of attitude. It is seen that there are limits to drastic interference with the normal play of economic forces and to municipal action on a large and ambitious scale. A reaction has set in against it. At the same time the problem is being attacked on other sides and from new points of departure. The tendency now is towards the more effectual application of gradual methods of improvement, the utilization of other means and the exercise of prevention in preference to cure. Under each of these heads certain movements may be noted.

The most troublesome problem is the treatment of existing bad housing. In regard to this the policy of large improvement schemes under which extensive areas are bought up and demolished has had its day, and is not likely to be revived to any considerable extent. That is not only because it is extremely costly but also because it has in the main done its work. It has done what could not have been done otherwise, and has swept away the worst of the old housing en masse. To call it a failure because it is costly and of limited application would be as great a mistake as to regard it as a panacea. The procedure which seems to be coming into favour in place of it is that adopted in Birmingham and advocated by Mr J. S. Nettlefold (Practical Housing) coupled with a more general and effective use of the Public Health Acts. The principle is improvement in detail effected by pressure brought to bear on owners by public authority. The embodiment of this principle forms an important part of the Housing and Town Planning Bill introduced by the Local Government Board in 1908, which contained clauses empowering the central authority to compel apathetic local authorities to do their duty in regard to the closing of unfit houses, and authorizing local authorities both to issue closing orders and to serve notices on landlords requiring them "to execute such works as the local authority may specify as being necessary to
make the house in all respects reasonably fit for human habitation."

Among the other and less direct means to which attention is being turned is the policy of getting people away from the towns. The effect of improved travelling facilities in reducing urban overcrowding has been noted above. That object was not specifically contemplated in the building and electrification of tramways, and in the development of other means of cheap local travel, but the beneficial effect has caused them to be recognized as an important factor in retaining rural housing and to be more systematically applied in that connexion. A newer departure, however, is to encourage migration not to the outskirts of towns but altogether into the country by facilitating the acquisition of small holdings of land. This has been done by private landowners in an experimental way for some years, and in 1907 the policy was embodied in the Small Holdings Act, which gives county and borough councils power to purchase or hire land compulsorily and let it in holdings of not more than 30 acres or £50 annual value. Failing action on their part the Board of Agriculture may frame schemes. Power is also conferred on the Board and on County Councils to establish co-operative agricultural societies and credit banks. These measures have been adopted from foreign countries, and particularly from Denmark and Germany. A very large number of applications for holdings have been made under this act, but it is too early to state the effects. They will depend on the success of tenants in earning a livelihood by agricultural produce.

Another new and quite different departure is the attempt to establish a novel kind of town, called a "Garden City," which shall combine the advantages of the town and the country. The principal points are the choice of a site, which must be sufficiently convenient to enable industries to be carried on, yet with rural surroundings, the laying out of the ground in such a way as to ensure plenty of open space and variety, the insistence on building of a certain standard and the limitation of size. One has been established at Letchworth in Hertfordshire, 34 m. from London, and so far seems to be prospering. It consists of an area of 3800 acres, bought from the previous owners by a company registered in 1903 and entitled First Garden City Ltd., with a capital of £500,000 in £5 shares. The interest is limited to a dividend of 5%, all further profits to be devoted to the benefit of the town. The estate is divided into a central urban area of 1200 and a surrounding agricultural belt of 2600 acres. The town is planned for an eventual population of 30,000 and at present (1909) has about 5000. Some London printing works and other small industrial establishments have been planted there, and a number of model cottages have been built. In this connexion another recent novelty has appeared in the shape of an exhibition of cottages. The idea, originated by Mr St Loe Strachey, was to encourage the art of designing and building cheap but good and convenient cottages, especially for the country. Two exhibitions have been held at Letchworth in 1905 and 1907, and others at Sheffield (1907) and Newcastle (1908). The two latter were held on municipal land, and it is proposed by the National Housing Reform Council to hold one every year.

The "Garden City" has led to the "Garden Suburb," an adaptation of the same idea to suburban areas. One was opened near Hampstead Heath in 1907; it consists of 240 acres, of which 72 have been reserved for working-class cottages with gardens. These developments, with which may be associated the model industrial villages, mentioned above, at Bournville, Port Sunlight and Earlswood, represent an aspiration towards a higher standard of housing for families belonging to the upper ranks of the working classes; and the same movement is demonstrated in a still more interesting fashion by a particular form of co-operative activity known as Co-partnership Housing. The first complete example of this method of organization is the Edling Tenants' Limited, a society registered under the Industrial and Provident Societies Act in 1901, though the Tenant Co-operators Limited, formed in 1888, was a precursor on very nearly the same lines. The essential principle is self-help applied by combination to the provision of superior homes, and the chief material feature is the building of houses which are not only of good design and workmanship, but disposed on a systematic plan so as to utilize the ground to the best advantage. Land is bought and houses are built with combined capital to which each tenant contributes a substantial share; the houses are let at rents which will return 5% on share capital and 4% on loan capital after defraying all expenses, and the surplus profits are divided among the tenant members in proportion to the rents paid by them. Each tenant's share of profits is credited to him in shares until his share capital equals the value of the house he occupies; after which it is paid in cash. There is thus common ownership of the whole group, which forms a little community. This system has caught on in a remarkable way and has spread with great rapidity. In 1905 a central organizing body was formed called the Co-partnership Housing Council, for the purpose of promoting the formation of societies and assisting them with advice; it is supported by voluntary contributions. In 1909 twelve societies, including the original Tenant Co-operators, had been formed with a total investment of £536,300. They are situated at Ealing, Letchworth, Sevenoaks, Leicester, Manchester, Hampstead (two), Harborne near Birmingham, Fulings Park, Stoke-on-Trent, Wayford and Derwentwater. The rapidity with which the movement has developed and spread since the establishment of the Co-partnership Housing Council indicates great vitality, and since it is based on thoroughly sound lines it has probably a large future. It is the most interesting and in many respects the best of all recent developments. The Report of the Select Committee on Rural Housing mentioned above suggested that a Co-partnership Housing Society should be formed in every county in England.

All the enterprises just described have one feature in common, namely, the laying out of sites on a plan which takes cognizance of the future, secures a due proportion of open space, variety in the arrangement of streets and the most advantageous disposition of the houses and other buildings. They go beyond sanitary requirements and take account of higher needs. They have lent force to the advocacy of municipal "town-planning," as practised by several towns in Germany; and provision was made for this procedure in the Housing and Town Planning Act of 1909. The act contains clauses giving local authorities power to prepare plans with reference to any land which appears likely to be used for building purposes within or near their own boundaries; and also to purchase land comprised in a town-planning scheme and either build on it themselves or let plots for building in accordance with the plan. The chief object is to safeguard the future, prevent the repetition of past defects and encourage a high standard of building.

These new developments represent an upward movement at the higher end of the scale. They cater for the superior ranks of working classes, those who attach some importance to the aesthetic and moral influence of pleasant and wholesome surroundings, and are willing to sacrifice immediate gratifications to a higher end. They embody an aspiration, act an example and exercise an educative influence. But they have nothing to do with the housing of the really poor, which is the great difficulty; and their very tractiveness seems to make the danger of overdrawn attention from it. Garden cities and suburbs will never house the poor or even the bulk of our working-class population, and it would be a pity if the somewhat sentimental popularity of romantic schemes led to a distaste for the plodding effort which alone can effect a real cure of deep-seated social evils of long standing. All the new schemes and legislative proposals leave untouched the greatest difficulty of all, which lies not in the dwelling but in the tenant. It is comparatively easy to afford better opportunities to those who are willing to take advantage of them, but how to raise those who are not? The lesson taught by Miss Octavia Hill's classical experiment is, if not forgotten, certainly neglected in the presence of more showy efforts. Or perhaps it would be more true to say that half of it is neglected. Miss Hill was one of the pioneers in the comparatively modest
method of improving and reconstructing bad houses, which, as we have noted, is now being more generally recognized and pursued; but that was only half her work. She improved bad dwellings and made them decent, but she also managed them on a business basis, and raised rents. A similar procedure was adopted and rent collection which combined a judicious discipline with the stimulus of reward. This was done by means of personal service, which is the secret of all really effective work among the poor. Her words written years ago remain true to-day: "The people's homes are bad partly because they are badly built and arranged; they are tenfold worse because the tenants' habits and lives are what they are. Transplant them to-morrow to healthy and commodious homes and they will pollute and destroy them.

The following is a list of the principal associations abridged for the purpose of the Housing and Sanitation Commission on the Dwellings of the Poor, Rural Housing and Sanitation Association, Workmen's National Housing Council, National Housing Reform Council, Co-partnership Tenants Housing Council. They are all in existence, except the first. There are also local associations at Liverpool, Oldham, Rochdale, York, Plymouth, and elsewhere.

Other Countries

At the International Housing Congress organized by the National Housing Reform Council and held in London in 1907 report was given of the great amount of foreign work being done, and a good deal of information was collected and published in the report of the Congress. Further detailed data have been supplied by foreign correspondents to Mr W. Thompson and published in Housing up to Date. The more important facts relating to the principal industrial countries are here condensed from this and other sources of information.

Austria.—An act for encouraging the building of cheap working-class dwellings was passed in 1902; it provides for exemption from taxes for 24 years of working-class dwellings which fulfil certain conditions including sanitary requirements, a minimum area per room, minimum height, minimum door and window spaces, thickness of walls (not less than 50 centimetres), prohibition of lodgers, fixed rent and maximum profit. The municipalities are the authority for administering sanitary and housing laws; they have no power of compulsory purchase of land without a special act of the legislature. Exceptions to overcrowding in the large towns; in Vienna (1900) 43% of the population live in dwellings of 1 room or 1 room and a kitchen; in 60 provincial towns the proportion is 63%. Overcrowding is reckoned at more than 3 persons to a room and more than 9 to 2 rooms; the proportion of overcrowded on this basis is nearly one-fifth in Vienna and one-fourth in the provincial towns (Thompson).

Belgium.—In 1889 instituting Comités de Patronage; since then other Acts relating to loan societies, and to inheritance and succession in the case of small properties. Comités de Patronage are semi-official bodies, but without legal power, whose functions are to see that the local authorities and the poor are kept informed of existing conditions, to advise, to collect funds and promote the provision of good houses by any means in their power. They influence public opinion and stimulate the activity of local authorities. Many thousands of improvements and close dwellings unfit for habitation; they have led to the formation of numerous societies for erecting working-class dwellings. The latter are encouraged by the law in various ways; they are exempt from the payment of some government duties and partly exempt from others. Working men buying or building houses liable to registration fees up to from 72 to 171 francs are exempted from personal, provincial and communal taxes. The National Savings Bank of Belgium is empowered to lend money to working men for buying or building houses and to insure the lives of those doing so, to preserve the home for the family. In 1904 the number of workmen’s houses erected under this act was 16,340; the total amount remitted considerably exceeded 3 million francs; workmen had acquired lands and houses valued at nearly 45,000,000 francs; there were 161 societies for building working-class dwellings; 30,000 workmen representing a population of 500,000 had become owners of property; and 70,000 representing a population of 350,000 had availed themselves of the law in obtaining exemptions and loans (O. Vedghe).

The foregoing results effected in 15 years are remarkable and indicate a great development of housing effort on the part of the people and suitable and well-considered assistance. But this movement, in common with those of a similar character in other countries, does not touch the problem of the great public poor. No corresponding means of improvement are available, but the average number of persons to a dwelling is over 5 for the whole country and nearly 9 in Brussels. The communal administrations are the authorities for health and housing; they have power to alter nuisances but not to compel landowners to sell land for building, though they have the right to dispossess for "public purposes." No town has constructed quarters devoted entirely to working-class dwellings and only one community (St Giles) has built any. In those places where population is regulated by the width of streets; generally it is the width 4½ metres. The height of rooms and thickness of walls are prescribed by local regulations but not the area of rooms. The housing difficulty has received less emphasis. The rent of post offices, railways and tramways, including railroads, light railroads and tramways; a large proportion of the populous travel long distances to and from work. One questionnaire placed on the working-class dwellers living in Paris for a daily journey of 20 m., 28 for 44 m. and 28½ d. for 66 m. The area of the labour market of Liége extends nearly to Ostend and out of 5830 workmen travelling over 1000 live more than 24 kilometres in 1 hour. In the same general way the National Co-partnership of France, founded in 1878, has 161,824 members paying a share of 9 francs a year, whilst the Société Française des Habitations à Bon Marché was founded under the inspiration of M. Siegfried. This led to the formation of several societies, which increased rapidly after the passage of la loi Siegfried in 1904, for promoting the provision of working-class dwellings. A Public Health Act and in 1906 a Housing of the Working Classes Act were passed, and these three enactments with regulations made in 1907 govern the procedure. The Act of 1906 embodies the Belgian system of Comités de Patronage, of which at least one was to be established in each department with grants in aid, and exemptions from certain taxes of working-class dwellings fulfilling specified conditions. It also enables the formation of the Housing Societies by granting various facilities for the investment of money in building public bodies and benevolent institutions by taking shares or by loans. Down to the end of 1906 the Société des 6000 was the largest of the organizations, with a capital of £35,000 by the Caisse des Dépôts, and £14,000 by charitable institutions. The law does not authorize municipalities to build houses, but none of the societies can acquire land for this purpose.

Under the Public Health Act of 1906, public bodies are empowered to form associations with the consent of the landowners, and compulsorily in connexion with unhealthy areas. The Public Health and Housing Acts are administered by the local authority, which makes regulations for building and for laying out building land. A minimum height of 2·6 metres and a minimum cubic content of 25 cubic metres are prescribed for rooms; there are no regulations for thickness of walls. Housing societies are under the Ministry of Workmen’s Housing (Superior Housing Societies). The chief stockholders are the society members called maisons des enfants which are at low rents only to persons with large families. In 1907 it had housed 168 families, averaging 67 persons, in two blocks at Belval at Honsart. The great defect in France is the large quantity of old, bad, insanitary housing. Real slums exist in all the old towns and in some of them, such as Marseilles and Lyons, on an extensive scale. Very little has been done to improve the sanitary condition of the housing of the poor. Conditions in Paris are better, especially in the extreme eastern parts, which are largely Flemish and distinguished by the prevalence of small houses after the English fashion, than in the central or southern districts where tall old tenement houses of six and seven storeys abound. There are no statistics and no standard of overcrowding; but the careful inquiry carried out by the Board of Trade and published in 1909 shows the extraordinary prevalence of tenements consisting of 1, 2 or 3 rooms. In 16 towns for which information was obtained the average proportion of dwellings containing less than 4 rooms was 75% of the whole; in some it was as high as 89% and in none lower than 61%. In 8 towns, including Paris, the number of one-roomed dwellings was less than a quarter of the whole, and in two towns (Brest and Fougères) it was more than half. Some corresponding statistics for English and German towns are given below in the section on Germany. According to the same report, the general accuracy and the substantial fairness of the investigation was confirmed in 1909 by the writer in a number of towns, rents are decidedly lower in France. If the London level be taken as 100 that of Paris is only 78 and the other French towns are considerably lower, 21 out of 44 being less than 70. The proportion between a number of English and French towns shows the average level of France rents to be less than three-fourths of English ones. A noticeable feature of housing in France is the large number of dwellings built on the Belgian model, and many of the poor houses in the provinces, particularly in the Pas de Calais, have built whole groups of villages; the railway companies and various manufacturers have also done much great work. No statistics are available, but the manufacturers MM. Schneider at Le Creusot and the textile mill-owners in the Vosges are noticeable. The houses provided are of a charming type, white with red roofs; the rooms are of good size, the rents low, and a large garden is usually attached to every house.

Germany.—In no country is the problem of housing more acute
than in Germany, where the increase of population, the growth of manufacturing industry and the urbanization of the people have proceeded at an exceptionally rapid pace in recent years and have combined with increasing wealth and a rising standard of living to form a peculiar situation in comparison with England; for the empire had been framed and no central authority existed for dealing with housing; but the several states have their own public health and housing laws and great activity has been displayed in various directions. The most general difficulty is deficiency of consequence on the rapid change in the distribution of the population. The proportion of the whole population living in towns increased from 15-2% in 1849 to 16-2% in 1853; the proportion of the population living in German towns, containing more than doubled between 1840 and 1900; in England it only increased by about one-tenth. Slums are a much less conspicuous feature than in England because of the comparatively recent development of German towns, but where old quarters exist on a large scale, as in Hamburg, the conditions are quite as bad as anything in English towns, and call for similar measures. Public sanitation in Germany is still far from being up to the standards of this century. The proportion of the slums was more than doubled between 1890 and 1900; in England and in many of the large towns, much history, and in some cases it is superior and in general it is coming up rapidly; the administration of sanitary laws, as of others, is more effective and uniform, and less subject to evasion. This also contributes to the comparative absence of slums. There is a third factor which has perhaps the greatest influence of all, and that is the superior manner in which German homes are kept. But the pressure of increased population is urgent; it has caused high rate of overcrowding, and the development of large barrack or block dwellings which are becoming the prevailing type. At the same time it has led to many and varied efforts to meet the difficulty. Isolated attempts go back to an early date. For instance a building society was formed in Berlin in 1849, Alfred Krupp began to build his "colonies" at Essen in 1863, Barmen started a society in 1871 and there have been numerous cases; in other general towns, tenement-houses have been drawn to the subject by the reforming efforts of Pastor Bodelschwing and Biedefeld about 1884 in connexion with his Arbeiterheim. In short, housing reform in Germany is really a matter of the last 20 years. The first efficient by-laws for regulating building in Berlin were not adopted till 1887; the previous regulations dating from 1853 permitted many abuses and under them a great deal of bad housing was constructed, especially after the establishment of the empire and the beginning of the great development of the capital.

The worst feature is the general prevalence of dwellings containing very small number of rooms from 1 to 3 and considerable overcrowding. The following figures are extracted from the Report to the Board of Trade on Rents, Housing, &c., in Germany (1908, Cd. 4023). They indicate the proportion of dwellings containing 1, 2 or 3 rooms, or (in a few cases) the proportion of the population living in such dwellings. The towns are those for which the information is given. They are not selected as particularly bad specimens but as representative, and they include most of the capitals and chief industrial centres. The figures relate to the year 1900, except in a few cases, in which they are taken from a municipal house census in 1905.

Rents are higher in Berlin than in any other town, though Stuttgart comes very near it. The following table of index numbers shows the rent of 32 towns to Berlin:

The figures must be read with a certain amount of caution, as they are not standardized, and the returns are not unidirectional, and we have no method with regard to inclusion of kitchens and attics. For this reason the position of Bremen and Elberfeld is probably more unfavourable than it is in reality. It is shown that the population of the large towns in Germany more than half, and in some cases more than three-quarters of the dwellings have less than 4 rooms. Leipzig is the most striking exception. If working-class quarters alone are taken it is found that dwellings of more than 3 rooms are so few as to be negligible. In Stuttgart, where housing is very dear, the percentages for working-class quarters are—1 room 21-0, 2 rooms 51-8, 3 rooms 26-9; total under 4 rooms 98-7. Königsbrücke, the chief coal and iron centre in Silesia and a purely working-class town, shows the general state of things; 60% of the whole population live in dwellings of 2 rooms and 78% in less than four. It is interesting to compare English towns. The proportion of dwellings containing less than 4 rooms in London was (1901) 52-2%, in Berlin 75-8%; in the proportion of the population living in small dwellings in London 98-7%, Berlin 71-5%. Not only is the proportion of small dwellings very much higher in Berlin but the proportion of the population living in them shows a far greater discrepancy. This indicates a much higher degree of overcrowding. The point only in which Berlin has the advantage is the smaller number of single-room dwellings. The proportions are London 14-7%, Berlin 8-0%. But it is to be observed that overcrowding is not so common in 1-room dwellings, which are often occupied by a single person, as in those with 2 or 3 rooms, which are occupied by families, though probably the most extreme cases of overcrowding occur in particular 1-room dwellings. In the English county boroughs the proportion of dwellings with less than 4 rooms was 24-0% in other urban districts 17-4, and in all urban areas including London 26-4%. When all allowance is made for minor errors and discrepancies it may be fairly concluded that the proportion of small dwellings containing less than 4 rooms is at least twice as great in German as in English towns, and that the conditions as to accommodation which in England prevail only in London are general in urban Germany. As a set-off German rooms are generally larger than English ones and in block dwellings there is often a little ante-room or landing which does not count but really increases the space.

With regard to rents the Board of Trade (London) Report gives the following figures for Berlin and a number of other towns:

Compressing the rent for Germany and England, the Board of Trade Report gives the following table, to which the corresponding ratio of French towns have been added.
If the mean of the English and German figures be taken it shows a very slight difference in favour of Germany; the mean weekly rent per room being 18s. 5d. in England and 1s. 42d. in Germany. But in England rent usually includes local taxation (rates) whereas in Germany it does not. As this be true German rents are to English as 123 to 100, or nearly one-fourth more.

The statistics given above indicate a wide range of variation in the conditions prevailing in different towns in Germany; and that holds good with regard to improvements. The administration of the laws relating to public health and housing is in the hands of the local authorities. The public health service is generally efficient and sometimes very good. Increasing attention has been paid in recent years to the sanitary inspection of houses and in some towns it is now thorough and systematic, but active efforts to deal with old and insanitary quarters en masse are isolated and exceptional. Hamburg is an instance; scorned by the vizehauptof choleza in 1892 the authorities put in hand an extensive improvement scheme on the English plan at a cost of half a million sterling. But demolition is exceptional; slums are usually subjected to supervision and are not allowed to lie in a state of stagnation. In Mannheim, notices are served to abate overcrowding. In Munich a policy of gradually buying up insanitary houses has been adopted. But improvement has principally been promoted by new building and the reduction of the population in the sanitary quarters to which cheap locomotive facilities have greatly contributed. The great bulk of urban Germany is new, and the most valuable contribution made by it to the housing question is the more effective conversion of basements and cellar rooms into living rooms. A general act providing for the planning of streets was passed in Prussia in 1875 and still forms the basis of building legislation; but as noted above no effective by-laws were adopted even in Berlin until 1900. The exclusion of garbage and the rapidity with which dwellings of 4 rooms and upwards. Yet it is a great commercial city, the fifth in the empire, with a population of upwards of half a million. It also stands out prominently having an index number little more than half that of Berlin. All the remaining cities, Chemnitz and Zwickau particularly so, and the position of Dresden, being a capital, is more. More than two-thirds of the population of Leipzig and almost all of the population of Dresden live in single rooms, that is only 54.

In Saxony a general Building Act, especially providing for town planning, was passed in 1900; and the Grand Duchy of Hesse, which alone among the German states has a government Housing and Town Planning Act, containing the principles of the Saxony Act in 1902. Other states have followed or are following and the act is full of movement. The distinctive features of urban housing reform in Germany are (1) the systematic planning of extensions, (2) the investment in public capital in this (3) letting out to the Corporations of land for building under prescribed conditions. Many of the great towns, including Berlin, Munich, Dresden, Leipzig, Cologne, Frankfort and Düsseldorf, are owners of land to a variable but sometimes large extent. This policy seems itself to have been originally adopted on economic grounds and those municipalities which bought or otherwise came into possession of town land at an early date have derived a substantial return from it, and besides being a revenue, (4) a source of profit to promote housing improvement. There is comparatively little municipal building, and that as a rule only or principally for municipal servants, as at Düsseldorf, Mannheim and Nuremberg; but the term seems to be a temporary venture and it is general that extensions and some towns have built houses for letting. The municipalities generally sell or let their land, and the building agencies which enjoy most official favour are the "of public utility"; they are conscious that the public land has been advanced to building societies, and one very important source of supply has been developed, since the Old Age and Infirmity Insurance Act of 1889, in the National Insurance Funds which the Corporation of the Corporation of the Boards of Insurance had lent £8,650,000 to societies for building;

This was the earliest. The Imperial Government had lent £1,250,000, the Prussian Government £1,000,000, and the other states further sums. In the Rhine provinces, under its influence one-fifth of the population in 1901 was erected by the societies. The example was followed at Wiesbaden, in 1901 were 221,000 dwellings having a cost of £30,000,000; more than half the families housed belonged to the mining industry, the rest to various manufactures. These two provinces, in which industrial development has been extremely rapid, are exceptional; but housing by the authorities is not confined to them. At Mannheim for instance 3,100 working-class households have been so provided. At Nuremberg the Siemens Schuckert Company have encouraged an interesting system of tenements among their employees, by which 722 dwellings have been provided.

In 1901 a Public Health and a Housing Act were passed, and these two embody most of the features of housing reform adopted in other countries. The Corporation of the Corporations have to undertake the publicity to which cheap locomotive facilities have greatly contributed. The great bulk of urban Germany is new, and the most valuable contribution made by it to the housing question is the more effective conversion of basements and cellar rooms into living rooms. A general act providing for the planning of streets was passed in Prussia in 1875 and still forms the basis of building legislation; but as noted above no effective by-laws were adopted even in Berlin until 1900. The exclusion of garbage and the rapidity with which dwellings of 4 rooms and upwards. Yet it is a great commercial city, the fifth in the empire, with a population of upwards of half a million. All the remaining cities, Chemnitz and Zwickau particularly so, and the position of Dresden, being a capital, is more. More than two-thirds of the population of Leipzig and almost all of the population of Dresden live in single rooms, that is only 54.

In Saxony a general Building Act, especially providing for town planning, was passed in 1900; and the Grand Duchy of Hesse, which alone among the German states has a government Housing and Town Planning Act, containing the principles of the Saxony Act in 1902. Other states have followed or are following and the act is full of movement. The distinctive features of urban housing reform in Germany are (1) the systematic planning of extensions, (2) the investment in public capital in this (3) letting out to the Corporations of land for building under prescribed conditions. Many of the great towns, including Berlin, Munich, Dresden, Leipzig, Cologne, Frankfort and Düsseldorf, are owners of land to a variable but sometimes large extent. This policy seems itself to have been originally adopted on economic grounds and those municipalities which bought or otherwise came into possession of town land at an early date have derived a substantial return from it, and besides being a revenue, (4) a source of profit to promote housing improvement. There is comparatively little municipal building, and that as a rule only or principally for municipal servants, as at Düsseldorf, Mannheim and Nuremberg; but the term seems to be a temporary venture and it is general that extensions and some towns have built houses for letting. The municipalities generally sell or let their land, and the building agencies which enjoy most official favour are the "of public utility"; they are conscious that the public land has been advanced to building societies, and one very important source of supply has been developed, since the Old Age and Infirmity Insurance Act of 1889, in the National Insurance Funds which the Corporation of the Corporation of the Boards of Insurance had lent £8,650,000 to societies for building;
families, are common, but they have more room space than is usual in Europe. The 18th annual report (1903) of the Commissioner of Labour gives the result of a special inquiry embracing 25,447 families in New York City. The number of persons in the New York, Pennsylvania, Massachusetts, Ohio and Illinois; and in all these the average number of rooms to a family exceeded 4, ranging from 14 in Massachusetts to 19 in Illinois. In New York, as to sanitation and cleanliness was statistically stated thus: Sanitary condition—good 61-46 %, fair 32-96 %, bad 5-95 %; Cleanliness—good 79-03 % fair 14-66 %, bad 5-71 %. Other special investigations and compilations of material stated that 1891–1892 the tenements in Boston were investigated for the Massachusetts Labour Bureau, which found 3657 sleeping rooms with no light, 17% of the total, and a population of 100,000 in conditions objectionable from one cause or another. In 1892 Congress authorized a special inquiry into the slum population of New York, Chicago, Philadelphia and Baltimore, the results of which were published in the several special report (1894) of the United States Commissioner of Labour. It was estimated that the total "slum population" (presumably those living in unhealthy conditions) was—New York 360,000, Chicago 162,000, Philadelphia 35,000, Baltimore 25,000. In Baltimore 390 families, consisting of 1648 persons, were living in single rooms with an average of 3-15 persons to a room; in Philadelphia 401 families were so living with an average of 3-98 persons in a room; the average number of American dwellings was less in New York and Chicago. In New York 44-55 % or nearly half the families investigated were found living in 2-roomed dwellings, in Baltimore 27-88 %, in Philadelphia 19-41 % and in Chicago 14-14 %. There were 79,000 single-roomed homes, but the European conditions reproduce themselves in American cities.

Poverty was not the cause, as the average earnings per family ranged from $330 to $425 in Baltimore, $450 to $500 in Philadelphia, and $525 in New York. Another official investigation in New York was carried out in 1895 by the Tenement House Commission appointed by the State of New York. It reported "many houses in the City in an insanitary condition which absolutely unfit them for habitation."

Details of census have been compiled from the census by the New York Federation of Churches, chiefly relating to density of population in the city. In 1900 the density, early 250–280 persons per dwelling, 0.55, was contained from 2 to 6 persons, 60,672 (24-2 %) from 7 to 10 persons and 89,654 (35-4 %) 11 persons or more. The density of population for the whole city as now constituted was 19 persons to the acre, in Manhattan 149; in the south-eastern district of Manhattan 382 and in one ward 735. Between 1900 and 1905 the density increased in every district, and in the latter year there were 12 blocks with from 1000 to 1400 persons to the acre. The number of persons to the acre in London (1901) is 60-6; in the most densely populated borough 182, and in the most densely populated district (a very small one) 306. This will give a measure of comparison. The large tenement houses of New York have been constructed with no regard to health than those in Berlin, and reproduce in an aggravated form the same evil of insufficient light and air. In place of the inevitable light each section which many are built in Berlin, the New York tenements have merely narrow slits. In 1905 there were reported to be 362,000 dark interior rooms, that is with no outside windows.

In American cities have nothing to learn from other countries in regard to bad housing, they have nothing to teach in the way of reform. They are following Europe slowly and a long distant behind. There is no serious attempt to deal with insanitary areas as they have been dealt with in England, or to prevent the creation of new ones by regulation and planning of extensions as in Germany, or to promote the provision of superior houses by organized public effort as in several countries. A little has been done to improve the worst housing. A Tenement House Act was passed after the report of the Commissioner of 1895 and a Department formed to give effect to it. Some cleansing and repairing and insertion of wire has been done, but more attention seems to be required to fire escapes. Societies for providing improved dwellings exist in New York, Boston, Chicago and Philadelphia. The oldest is 1878, founded by Henry Boos. A new movement has been in progress to construct large public housing for the poor, but no results have been achieved.

For the comparative study of housing in New York, Boston, Chicago and Philadelphia, the number of persons in families having 1871 was 4-95 per family and 1-04 per individual. It is a fair inference that overcrowding is confined to a comparatively small number of exceptional places. A large number of the schedules were furnished by owners or their agents, and the total area of land amounted to about $133,000,000. In 1905 there were 536 associations with an aggregate membership of 1,686,611 and assets of $12,900,000. The most populous states of Pennsylvania and Ohio head the list, but the movement is very strong in New York.

The comparatively large number of houses owned by working-class families in the United States. With regard to housing by employers in the United States, whereas no information is available, but the large number is certainly considerable though probably not so large as in Germany or in France. Some of the better-known instances are the Western Lumber Manufacturing Company at Pozer in South Carolina, which has built about 1000 dwellings; the Maryland Steel Company at Sparrows Point, Maryland, 800 dwellings; Ludlow Manufacturing Associates at Ludlow, Mass., 500 dwellings; Whitin Machine Works at Whitinsville, Mass., 600 dwellings; Westinghouse Air Brake Co. at Wilmerding, Penn., 360 dwellings; Draper Co., Hopedale, Mass., 250 dwellings. These are all more or less "model" settlements, not in cities, but in outlying or country places, where laboring men have been established, and that generally is true of those by employers in the United States, whereas in Germany much has been provided by them in the large towns. Rents are very much lower than in New York.

In 1867, English writer and artist, was born on the 18th of June 1867. Having studied at South Kensington, he first made a reputation as a book illustrator. Some of his best pictorial work may be seen in the editions of Meredith's "The Trump of Glory" (1896), the "Tales of Don Quixote" (1892), Jane Barlow's "Theologon" (1894), Christina Rossetti's "The Goblin Market" (1893), W. H. and T. C. W. (1896), by his sister, Miss Clemence Housman, Shelby's "Sensitive Plant" (1898), and his "In Fairyland" (1894). His drawings were engraved on wood by Miss Housman. His volumes of verse include "Love and Loss" (1890) and "Meditations and Novelties" (1898) and "Mendicant Rhymes" (1900); and the mysticism which characterizes the devotional poems in Spenser recurs in his half-obscurantical tales, "All Fellowes" (1896), "The Blue Moon" (1894) and "The Cock of Friendship" (1896). His native play, "Bethlehem", was presented in the Great Hall of London University at South Kensington for a week in December 1902. In 1900 he published anonymously "An Englishwoman's Love Letters", which created a temporary sensation; and he followed this essay in popular Provençal fiction by the novels "A Modern Antoines" (1900) and "Sister Warham" (1904). On the 23rd of December 1904 his fantastic play "Prunella", written in collaboration with Mr Granville Barker, was produced at the Court Theatre. His brother, Alfred Edward Housman (b. 1859), an accomplished scholar, professor of Latin at University College, London, is known as a poet by his striking literary style, "A Shropshire Lad" (1896).
HOULDAL—HOWARD 829

oil, sugar, rice,1 lumber and citrus fruits. Houston is important also as a manufacturing center, its factory product being valued at $13,594,019 in 1905, an increase of 81% over the factory product in 1900. There are extensive railway car-shops, cottonseed oil, petroleum and sugar refineries, cotton gins and comp- ound rolling-mills, saw-mills, many of the world's leading engine works, flour mills, rice mills and a rice elevator, breweries, planing and saw-mills, pencil factories, and brick and tile factories. Its proximity to the Texas oil fields gives the city a cheap factory fuel. The assessed valuation of taxable property in the city increased from $27,480,898 in 1900 to $51,513,615 in 1908. The No-Ta-Oh Carnival week each November is a distinctive feature of the city. Houston, like Galveston, adopted in 1905 a very successful system of municipal government by commission, a commission of five (one of whom acts as mayor) being elected simultaneously and having both executive and legislative powers. The waterworks are owned and operated by the municipality, which greatly improved them from the city's surplus under the first two years of government by commission. In 1908 extensive improvements in paving, drainage and sewerage were undertaken by the city. The payment of an annual poll-tax of $2-50 is a prerequisite to voting. Houston was settled and laid out in 1836, and was named in honor of General Sam Houston, whose home in Caroline Street was standing in 1808. In 1837-1839 and in 1842-1845 Houston was the capital of the Republic of Texas. About 15 m. E.S.E. of the city is the battleground of San Jacinto, which was fought by the state in 1860 for a national memorial park.

HOUWALD, CHRISTOPH ERNST, Freiherr von (1778-1849), German dramatist and author, was born at Straupitz in Lower Lusatia, a son of the president of the district court of justice, on the 28th of November 1778. He studied law at the university of Halle, and on completion of his academic studies returned home, married, and managed the family estates. In 1816 he afforded a home to his friend J. W. S. Contessa (1777-1832), himself a poet, who had met with serious reverses of fortune; Contessa lived with Houwald, assisting and stimulating him in his literary work, for eight years. In 1821 Houwald was unanimously elected syndic for Lower Lusatia, an office which placed him at the head of the administration of the province. He died at Neuhaus, near Lübben, on the 28th of January 1845. Houwald is remembered as the author of several so-called "Fate tragedies" (see German Literature), of which the best known is Das Bild, Der Leuchtturm, Die Heimkehr, Fluch und Segen (all published in 1821). They have, however, small literary value, and Houwald is seen to better advantage in his narratives and books for juvenile readers, such as Romanische Abhöre (publ. by W. Contesss, Berlin, 1817); Buch für Kinder gebildeter Stände (1819-1824); and Johann Samuel Hofmann (1821). Houwald's collected works, Sämtliche Werke, were published in five volumes (Leipzig, 1851-2nd ed., 1858-1859). See J. Minor, Die Schicksalstragödie in ihren Hauptverehrern (Frankfort, 1883), and Das Schicksalsdrama in Künstler's Diät. (Körschen's Diät. [2nd ed.), vol. xix. (Stuttgart, 1884); O. Schmittborn, C. E. von Houwald als Dramatiker (1909).

HÖVA, the name originally applied to the middle-class Malayo-Indonesian natives of Madagascar (q.v.), as distinct from the noble class Andrana and the slave class Andako. Höva has now come to mean the most numerous and powerful of the tribes which form the native population of Madagascar. The Höva, who occupy the province of Iméjna, the central plateau of the island, are of Malay-Indonesian origin. The period at which the Höva arrived in Madagascar is still a subject of dispute. Some think that the immigration took place in very early times, before Hinduism reached the Malay Archipelago, since no trace of Sanskrit is found in Madagascar. Others believe that the Höva did not reach the island until the 12th or 13th century. At the French conquest of Madagascar (1895), the Höva were the most powerful and, Politically, the dominant people; but were far from having subjected the whole of the island to their rule. The Höva are short and slim, with a complexion of a yellowish olive, many being fairer than the average of southern Europeans. Their hair is long, black and smooth but coarse. Their heads - 1 Much rice is cultivated in the vicinity of Houston by Japanese farmers. are round, with flat straight foreheads, flat faces, prominent cheekbones, small straight noses, fairly wide nostrils, and small black and slightly oblique eyes. The physical contrast to the negro is usually very obvious, but, especially among the lower classes, there is a tendency to thick lips, kinky hair and dark skin. Their skin, especially that of the tattoo, infanticide, marriage and funeral rites, they show their Indonesian origin. Most of them now profess Christianity.

HOVE, a municipal borough of Sussex, England, adjoining the watering-place of Brighton on the west, on the London, Brighton, & South Coast railway. Pop. (1901) 36,535. The great seaport of Brighton continues along the front at Hove, forming a pleasant promenade. Here is the Sussex county cricket ground. The municipal borough, incorporated in 1898, includes the parishes of Hove and Aldrington, of which the first is within the parliamentary borough of Brighton, but the second is in the Lewes division of the county. The corporation consists of a mayor, 10 aldermen and 30 councillors. Area, 5,21 acres.

HOVENDEN, THOMAS (1840-1893), American artist, was born in Dunmanway, Co. Cork, Ireland, on the 28th of December 1840. He was a pupil of the South Kensington Art Schools and those of the National Academy of Design, New York, whither he had removed in 1863. Subsequently he went to Paris and studied in the École des Beaux Arts under Cahalen, but passed most of his time with the American colony in Brittany, at Pont-Aven, where he painted many pictures of the peasant life. Returning to America in 1880, he became an academician in 1882, and attracted attention by an important canvas of "The Last Moments of John Brown" (now in the Metropolitan Museum of Art). His "Breaking Home Ties," a picture of American farm life, was engraved with considerable popular success. Hovenden was mortally injured in a heroic effort to save a child from a railroad train in the station at Germanton, near Philadelphia, and died at Norristown, Pennsylvania, on the 14th of August 1895. Among his principal works are: "Neptune from the Conscript" (1877), "Loyalist Peasant Soldier of La Vendée" (1879). A Breton Interior," "Image Seller" and "Jerusalem the Golden" (in the Metropolitan Museum of Art).

HOW, WILLIAM WALSHAM (1823-1897), English divine, son of a Shrewsbury solicitor, was born on the 13th of December 1823, and was educated at Shrewsbury school and Wadham College, Oxford. He was ordained in 1846, and for upwards of thirty years was actively engaged in parish work at Whittington St. Cross (rural deanery) in Shropshire. He refused preferment on several occasions, but his energy and success made him well known, and in 1879 he became a suffragan bishop in London, under the title of bishop of Bedford, his province being the East End. There he became the inspiring influence of a revival of church work. He founded the East London Church Fund, and enlisted a large band of enthusiastic helpers, his popularity among all classes being immense. He was particularly fond of children, and was commonly called "the children's bishop." In 1888 he was made bishop of Wakefield, and in the north of England he continued to do valuable work. His sermons were straightforward, earnest and attractive; and besides publishing several volumes of these, he wrote a good deal of verse, including such well-known hymns as "Who is this so weak and helpless," "Lord, Thy children guide and keep." In 1865-1868 he brought out a Commentary on the Four Gospels; and he also wrote a Manual for the Holy Communion. In the movement for infusing new spiritual life into the church services, especially among the poor, How was a great force. He died on the 10th of August 1897. He was much helped in his earlier work by his wife, Frances A. Douglas (d. 1887). See his Life by his son, F. D. How (1898).

HOWARD (FAMILY). Among English families, the house of Howard has long held the first place. Its seat, the duke of Norfolk, is the first of the dukes and the hereditary earl marshal of England, while the earls of Suffolk, Carlisle and Eifingham and the Lord Howard of Glossop represent in the peerage its younger lines.

Its founder was a Norfolk lawyer, William Howard or Heward,
who was summoned to parliament as a justice in 1205, being appointed a justice of the common pleas in 1207. Over the parentage of this man genealogists have disputed for centuries. The pedigree-makers have hailed him in turn as the descendant of a Norman "Auber, earl of Passy" and as the heir of Hereward, "the last of the English." But out of the copies of Norfolk deeds and records collected for Thomas, earl of Arundel, in the early part of the 17th century, it seems clear enough that he sprang from a Norfolk family, several of whose members held lands at Wiggenhall near Lynn. These notes from deeds, evidently collected by an honest inquirer, make no extravagant claims of ancient ancestry or illustrious origin for the Howards, although the facts contained in them were recklessly manipulated by subservient genealogists. Doubtless the judge was the son of John Howard of Wiggenhall, living about 1260, whose widow Lucy, called by the genealogists the daughter of John Germund, was probably the wife of John Germund by her second marriage. William Howard was employed as counsel by the corporation of Lynn, and it is worthy of note that the "crooklets fitchy" in his shield of arms suggest the cross with which the dragon was discomfited by St. Margaret, the patroness of Lynn. Prospering by the laws, he married Alice, a daughter of Sir John Scales, of Norwich, and in 1292 brought to his knight's rank and acquired by purchase Grancourt's manor in East Winch, near Lynn, where he had his seat in a moated house whose ruins remain. He was probably dead and buried in his chapel at East Winch before November 27, 1308, the date of the patent by which Henry Scrope succeeded him as a commissioner of trailblaston. His two wives, Alice Ufford and Alice Fitton—heir of Fitton's manor in Wiggenhall—were both daughters of knightly houses. Before his death his eldest son, John Howard, was a knight and already advanced by his marriage with Joan of Cornwall, one of the bastard line founded by Richard of Cornwall, king of the Romans.

Sir John Howard served in Edward II.'s wars in Scotland and Gascony, was sheriff of Norfolk and Suffolk and governor of Norwich Castle. When he died in 1331 he was seized of many Norfolk manors. His son and heir, another Sir John, admiral of the king's navy in the north, was abanneret who displayed his banner in the army that laid siege to Calais. By the admiral's wife Alice, sister and heir of Sir Robert de Boys, the Howards had the Boys manor of Fersfield, near Diss, which is still among the possessions of the dukes of Norfolk. His son Sir Robert Howard, who had married a daughter of Sir Robert Scales (Lord Scales), died in 1388. From Sir John Howard, the only son of Sir Robert, two bastard lines of the house of Howard spring. The elder line was soon extinct. By his first wife, Margaret, daughter and heir of Sir John Plays, Sir John Howard had a son who died before him, leaving a daughter through whom descended to her issue, the Veres, earls of Oxford, the ancient Norfolk estates of the Howards at East Winch and elsewhere, with the lands of the houses of Scales, Plays and Walton, brought in by the brides of his forefathers. After the death of Margaret Plays, her widower found, with the peculiar instinct of his race, a second well-endowed wife. By her, the heir of the Tendrings of Tendir, he had a second son, Sir Robert Howard, a knight who fought under Henry V, and would, like his half-brother, before the old knight's career ended in 1436.

It is to the marriage of this young knight that the house of Howard owes the tragedy of its greatness. He was a younger son, although he had some of his mother's inheritance. Had he married the landless daughter of a neighbour he might have been the ancestor of a line of Essex squires, whose careers would have had the parish topographer for chronicler. But his bride was Margaret Mowbray, daughter of the banished duke of Norfolk. Although this was a noble alliance, it is probable that the lady had no great portion. The head of her elder brother, the boy earl marshal, had been stricken off in the cornfield under the walls of York, but her younger brother's right to his father's dukedom was allowed by parliament in 1425.

Sir John Howard, only son of the match between Howard and Mowbray, took service with his cousin the third duke of Norfolk, who had him returned as knight of the shire for Norfolk, where, according to the Paston Letters, this Howard of the Essex branch was regarded by the gentry as a strange man. He followed the White Rose and was knighted at the crowning of King Edward IV., who pricked him for sheriff of Norfolk and Suffolk. In the duke's quarrel he brawled with the Pastons, his wife boasting that, should her husband's men meet with John Paston "there should go no penny for his life." And Howard," writes Clement Paston, "hath with the king a great fellowship." Offices and lands came to John Howard by reason of that fellowship. Henry VI., when restored, summoned him to parliament in 1470 as Lord Howard, a summons which may have been meant to lure him to London. In Warwick's Parliament he was a member, but he proclaimed the Yorkist sovereign on his return and fought at Barnet and Tewkesbury. When peace was made, Edward summoned him again as a baron and gave him the Garter and the treasurership of his household. After Edward's burial, at which he bore the king's banner, Howard, an enemy of the Wydevil, linked his fortunes with those of the duke of Gloucester. At this time came his sudden lifting to the highest rank in the peerage. The last of the dukes of Norfolk had left a child heir, Anne Mowbray, married to the infant duke of York, who was the son of the infant king, Richard, of Scotland.

By the death of this little girl, John Howard became one of the coheirs of her illustrious house, which was now represented by the issue of Margaret Mowbray, his mother, and of her sister Isabel, who had married James, Lord Berkeley. A lion's share of the Mowbray estates, swollen by the great alliances of the house, heir of Breouse and Segrave, and, through Segrave, of Thomas of Brotherton, son of Edward I., fell to Howard, who, by a patent of June 28, 1453, was created duke of Norfolk and Earl Marshal of England with a remainder to the heirs male of his body. On the same day the lord Berkeley, the other coheir, was made earl of Nottingham. High steward at Richard's crowning, the duke bore the crown and rode as marshal into Westminster Hall. For the rest of his life he was Richard's man, though warned by the famous couplet that "Dykon his master" was bought and sold, "Jack of Norfolk" led the archer vanguard at Bosworth and died in the fire, from which his son the earl of Surrey was carried away a wounded prisoner. An attainer by the first parliament of Henry VII. extinguished the honours of the father with those of the son, who had been created an earl when the lord Howard was raised to the dukedom. Their estates were forfeited.

Thomas Howard, a politic mind, loyal to the powers that be, was released from the Tower of London in 1489, his earldom of Surrey and his Garter restored. Accepting the position in which the Tudor king would have his great nobles, he became the faithful soldier, diplomatist and official of the new power. In his seventieth year, as lieutenant-general of the North, he led the English host on the great day of Flodden, a patent of the dukedom of Norfolk, dated 1 February 1531/2, and that strange patent which granted to him and his heirs that they should bear in the midst of the silver bend of their Howard shield a demi-lion stricken in the mouth with an arrow, in the right colours of the arms of the king of Scotland. This unwieldy beast has been interpreted as a golden scrochten with the demi-lion within the Scottish treasured. Thus charged on the silver bend, it makes bad armory and it is worthy of note that, although the grant of it is clearly to the duke and his heirs in fee simple, Howards of all branches descending from the duke bear it in their shields, even though all right to it has long passed from the house to the duke's heirs general, the Stourtons and Petres.

The victor of Flodden is the common ancestor of all living Howards that can show a descent from the main stock. The second duke, twice married, was father of at least eleven sons and six daughters, the sons including Edward the lord high steward, killed in bastard Pregent's gallies at Brest, Edmund the knight marshal of the army at Flodden, and William the first Lord Howard of Effingham. The eldest son, Thomas, succeeded as the third duke of his name, although the second under the patent of 1514. He had fought as captain of the
vanguard at Flodden and after the victory was created earl of Surrey. When Richard III. was alloying himself with the Howards, Thomas Howard, a boy of eleven, had been betrothed to Anne, daughter of the late King Edward IV., and Henry VII. allowed the marriage with his queen's sister to take place in 1495. This royal bride died of consumption, leaving no living child, and her husband took in 1513, as his second wife, Elizabeth Stafford, daughter of that duke of Buckingham upon whom the old duke of Norfolk, the tears upon his cheeks, was forced to pass sentence of death. Succeeding his father in 1524, Norfolk was created earl marshal in 1533. An unsuccessful diplomatist, his chief services in arms were the butchery in the north after the Pilgrimage of Grace and the raid into Scotland which ended with the rout of Solway Moss. He left his wife for a mistress, Elizabeth Holland, was in discord with his family, and lived to see his two nieces, Anne Boleyn and Catherine Howard, and his own son, the fiery-tempered poet, go in turn to the block. He himself was attainted and was lying a prisoner in the Tower, doomed to die in the morning, on the night of the death of Henry VIII. He was not released until the accession of Mary, parliament restoring his dukedom on his petition for reversal of the attainder. His grandson Thomas succeeded him in 1554, and in 1556 made the second of those marriages which have given the Howards their high place among the English nobility. The bride was Mary, sole heir in her issue of her father Henry, the last of the Fitzalan earls of Arundel. Her father's line and the royal Stewards of Scotland sprang from one forefather, Alan, son of Ffledl the Breton. The Mowbray match had already brought to the Howards the representation of an elder line of the Fitzalan earls, who sat in the seats of their ancestors, the Aubignys and Warennes, great earls near akin to their sovereigns. And now the younger line, earls of Arundel and Lords Mautravers, were also to have a Howard to represent them. From this time the spreading genealogy of the Howards drew its origins from most of the illustrious names of the houses forgive me, I have wandered into. But I was interested by the fact that Howard was one of the leading figures in the scheming and plotting of the Wars of the Roses. 

The young duchess died in her seventeenth year after giving birth to a son, and the duke took a second wife from a humble stock, newly enriched and honoured, the daughter of Henry VIII.'s subservient chancellor, the Lord Audley of Walden. Within ten years he married a third time, the lady being Elizabeth Leybourne, the widow of Lord Dacre of Gilsland. She survived her marriage but a few months and her husband then obtained the wardship of her Dacre offspring, a son who died young, and three daughters whom the duke, with the true Howard eye for a rich inheritance, gave as brides to three of his sons. After three such good fortunes by marriage Norfolk in his folly looked for a crown with a fourth match, listening to the laird of Lethington when he set forth the scheme by which the duke was to marry a restored queen of Scots and rule Scotland with her who should be recognized as Elizabeth's successor. Ten months in the Tower under strong suspicion would have warned another man, but Norfolk was unstable and false. After promising fidelity and the abandonment of the Scots marriage scheme, Cecil took him corresponding with Mary and tampering with the Ridolfi plot. He died on Tower Hill in 1572 for an example to the disloyal counties, protesting innocence and repentance, warning his children in a last letter to discredit all "false bruits" that he was a papist.

By his attainder the Norfolk titles were once more forfeited. But Philip Howard, the son and heir, succeeded to the ancient earldom of Arundel in 1580, on the death of his maternal grandfather, while the Lord Lumley, his uncle by marriage, surrendered to the honors of his own in the castle and honour of Arundel. The next year an act of parliament restored the earldom. After a profligate youth at court, he followed his wife in professing the Roman faith, and in 1585 made an attempt to leave England to seek safety from the penal laws. But his ship was boarded in the Channel and the earl, condemned by the Star-Chamber to a heavy fine and to imprisonment during the queen's pleasure, suffered a harsh captivity in the Tower. After the defeat of the Armada he had been condemned to death on a charge of high treason, founded on the tale drawn by torture from a priest, that Arundel had urged him to say a mass for the success of the Spaniards. But he was allowed to linger in his prison until 1595 when he died, the sight of his wife and children being cruelly refused to the dying man. Thus it beffiled that, of the chiefs of the Howards born since the great Mowbray alliance, two had died by the axe and one in the prison from which a fourth had hardly escaped. At Arundel had fallen in a lost battle, and only one perished for his own house.

The ill fate of the Howards seemed to be appeased by the death of Philip, earl of Arundel. Tudor policy did its work well, and noblemen, however illustrious their pedigrees, could no longer he counted as menaces by the Crown, which was, indeed, finding another rival to its power. In the first year of James I., Thomas, the young son of Earl Philip, was restored in blood and the titles of Arundel and Surrey. But the lands belonging to these titles remained with the Crown and he had to repair his fortunes by one of those marriages which never failed his house, his wife being Alathea Talbot, who was at last the heir of Gilbert, earl of Shrewsbury. To the grief of his mother he left the Roman church. A knight of the Garter, he was in 1621 created earl marshal for life, and revived the jurisdiction belonging to the office. An act of 1627, one of several aimed at aggrandizing families by diverting the descent of dignities in fee from heirs general, entailed the earldom and castle of Arundel upon Thomas, earl of Arundel and Surrey and the heirs male of his body "and all their right, inheritance, and issue of such descent," as also to the heirs male of Philip, eighth Duke of Norfolk, and Henry, the earl's second son. His pride and avarice made him unpopular at court and he left the country in 1642, settling at last in Padua, where he died in 1646, impoverished by the sequestrations of the parliament, whose forces had taken and retaken his castle of Arundel. In answer to his petition for the dukedom, the king had, on the 6th of June 1644, given him a patent of the earldom of Norfolk, in order, as it would seem, to flatter him by suggesting that the title of Norfolk would at least he refused to any other claimant. It was claimed by the Donges. This claim was a receptacle of paintings, books, gems and sculpitures, his "Arundel marbles" being received by his grandson in 1667 to the University of Oxford. The dukedom for which Arundel had petitioned Charles I. in vain was restored by act of the first parliament of Charles II. to his grandson Thomas, a lunatic living at Padua, on whose death in 1677 it passed to this Thomas's brother, Henry Frederick, who had been created earl of Norwich and hereditary earl marshal of England in 1672. In 1777 Edward, the ninth of the Howard dukes, died childless in his ninety-second year. With him ended the earldom of Arundel. The title had ended also with the last earls of Richmond, the marriage of one of the Howards to a Segraves passed to his nieces, the Ladies Stourton and Petre, the abeyance of the two baronies being determined in 1878 in favour of Lord Stourton. Under the act of 1677 the earldom of Arundel and the castle passed with the dukedom to a second cousin, Charles Howard of Greystoke (d. 1780), an eccentric recluse. At his death in 1780 he was succeeded by his son Charles, the notorious "Jockey of Norfolk," the big, coarse, generous, slovenly, hard-drinking Whig of whom all the memor-writers of his age have their anecdotes. He conformed to the Church of England and spent a vast sum in restoring Castle Howard. A first cousin succeeded him in 1815, Bernard Edward Howard, who, although a Roman Catholic, was enabled, by the act of 1824, to act as earl marshal. This was the grandfather of the fifteenth duke, earl of Arundel, Surrey and Norfolk, and hereditary earl marshal of England.

The eldest of the cadet branches of the ducal house has its origin in William (c. 1510-1572), eldest son of the victor of Flodden by his second marriage. He survived the reign of Henry VIII., that prolific one for the Howards, with no worse misadventure than the conviction of himself and his wife of misprision of treason in concealing the offences of his niece, Queen Catherine. But both were pardoned. For the King had the office of lord admiral of England, and in the next year the Garter. For his services against Sir Thomas Wyatt he was created (March 11, 1553/4) Lord Howard of Effingham, the title being taken from a Surrey manor granted him by Edward VI. Elizabeth confirmed his appointment when he had been richer he might have had an earldom. His eldest son Charles (1536-1624), lord admiral of England in 1585, sailed as
commander in chief against the Spanish Armada, and, although giving due weight to the counsel of Drake and his other officers, showed himself a leader as prudent as courageous. He was created earl of Arundel in 1557 and died in 1563. The living of Arundel was a Roman Catholic has no authority. Two of his sons succeeded in turn to the earldom of Nottingham, extinct on the death of Charles, the third earl in 1618, Sir William Howard of Lingfield, younger brother of the great admiral, carried on the Livingham line, his great-grandson succeeding to the barony on the extinction of the earldom. Francis, seventh Lord Howard of Effingham, was created Duke of Effingham in 1734, a title he had married to Catherine Howard, of the family of Corby, the eldest daughter and grand-daughter of Thomas Howard, 2nd Duke of Norfolk (d. 1524), a grand-daughter of Thomas Howard, 2nd Duke of Norfolk (d. 1524).

Howard, Catherine (d. 1542), the fifth queen of Henry VIII., was a daughter of Lord Edmund Howard and a grand-daughter of Thomas Howard, 2nd duke of Norfolk (d. 1524). Her father was very poor, and Catherine lived mainly with Agnes, widow of the 2nd duke of Norfolk, meeting at the house of Stephen Gardiner, bishop of Winchester. Henry was very pious and MCC, and his second wife, Catherine Howard, who disliked the marriage with Anne of Cleves, encouraged his attentions; and after Anne’s divorce he was privately married to Catherine at Oatlands in July 1540. Soon afterwards she was publicly acknowledged as queen. Before her marriage Catherine had had several lovers, among them being a musician, Henry Mannock, or Manox; her cousin, Thomas Culpepper; and Francis Dereham, to whom she had certainly been betrothed. After becoming queen she occasionally met Dereham and Culpepper, and in November 1541 Archbishop Cranmer informed Henry that his queen’s past life had not been stainless. Cranmer had obtained his knowledge indirectly from an old servant of the duchess of Norfolk. Dereham confessed to his relations with Catherine, and after some denials the queen herself admitted that this was true; but denied that she had ever been betrothed to Dereham, or that she had misconducted herself since her marriage. Dereham and Culpepper were executed in December 1541 and their accomplices were punished, but Catherine was released from prison. Some fresh information, however, very soon came to light showing that she had been unchaste since her marriage; a bill of attaintder was passed through parliament, and on the 13th of February 1542 the queen was beheaded.

See A. Strickland, Lives of the Queens of England (vol. iii. 1877).

Howard, John (1726-1790). English philanthropist and prison reformer, was born at Hackney, probably on the 2nd of September 1726. His childhood was passed at Cardington, near Bedford, where his father, a retired merchant of independent means, had a small estate. He was apprenticed to a firm of grocers in the city of London, but on the death of his father in 1742, by which he inherited considerable property, he bought up his indenture, and devoted more than a year to foreign travel. Never constitutionally strong, he became, on his return to England, a confirmed invalid. Having been nursed through an acute illness by an attentive landlady, a widow of fifty-three years of age, Howard, in return for her kindness, offered her marriage and they were united in 1752. Becoming a widower in less than three years, he determined to go abroad again, Portugal being his destination. The ship, however, in which he sailed was taken by a French privateer, the crew and passengers being carried to Brest, where they were treated with great severity. Howard was permitted to return to England on parole to negotiate an exchange, which he accomplished, as well as successfully representing the case of his fellow-captives. He now settled down on his Cardington property, interesting himself in meteorological observations. He was a member of the Royal Society in 1756. In 1758 he married Henrietta, daughter of Edward Leods, of Croxton, Cambridge-shire. He continued to lead a secluded life at Cardington and at Watcombe, Hampshire, busying himself in the construction of model cottages and the erection of schools. In 1765 his second wife died after giving birth to a son. In the following year Howard went for a prolonged foreign tour, from which he returned in 1770.

In 1773 the characteristic work of his life may be said to have begun by his acceptance of the office of high sheriff of Bedford. When the assizes were held he did not content himself with sitting out the trials in open court, his inquisitiveness and his benevolence alike impelled him to visit the gaols. Howard found it, like all the prisons of the time, wretchedly defective in its arrangements; but what chiefly shocked him was the circumstance that neither the gaoler nor his subordinates were salaried officers, but were dependent for their livelihood on fees from the prisoners. He found that some whom the juries had declared not guilty, others in whom the grand jury had not found even such appearance of guilt as would warrant a trial, others whose prosecutors had failed to appear, were frequently detained in prison for months after they had ceased to be in the position of accused parties, until they should have paid the fees of gaol delivery (see Introduction to The State of the Prisons of England and Wales). His prompt application to the justices of the county for a salary to the gaoler in lieu of his fees was met by a demand for a precedent in charging the county with an expense. This he undertook to supply. Having obtained a majority (in some cases) against payment, and having arranged the accounts accordingly from county to county, and though he could find no precedent for charging the county with the wages of its servants he did find so many abuses in prison management that he determined to devote himself to their reform.

In 1747 he gave evidence before a committee of the House of Commons, and received the thanks of the house for “the humanity and zeal which have led him to visit the several gaols...

Howard, Catherine—Howard, J.
of this kingdom, and to communicate to the House the interesting observations which he has made on that subject.1 Almost immediately an act was passed which provided for the liberation, free of all charges, only very prisoners against whom the grand jury failed to find a true bill, giving the gaoler a sum from the county rate in lieu of the abolished fees. This was followed in June by another requiring justices of the peace to see that the walls and ceilings of all prisons within their jurisdiction were scraped and whitewashed once a year at least; that the rooms were regularly cleaned and ventilated; that infirmaries were provided for the sick, and proper care taken to get them medical advice; that the naked should be clothed; that underground dungeons should be used as little as could be, and generally that such courses of action taken would tend to restore and preserve the health of the prisoners. It was highly characteristic of the man that, having caused the provisions of the new legislation to be printed at his own private cost in large type, he sent a copy to every gaoler and warden in the kingdom, that no one should be able to plead ignorance of the law if detected in the violation of its provisions. He then set out upon a new tour of inspection, from which, however, he was brought home by the approach of a general election in September 1774. Standing as one of the anti-ministerial candidates for Bedford, he was returned by a narrow majority but was unseated after a scrutiny.

After a tour in Scotland and Ireland, he set out in April 1775 upon an extended tour through France, the Low Countries and Germany. At Paris he was at first denied access to the prisons; but, by recourse to an old and almost obsolete law of 1717, according to which any person wishing to distribute alms to the prisoners was to be admitted, he succeeded in inspecting the Bicêtre, the Force l’Évêque and most of the other places of confinement, the only important exception being the Bastille. Even in that case he succeeded in obtaining possession of a suppressed pamphlet, which he afterwards translated and published in English, to the unconcealed chagrin of the French authorities. At Ghent he examined with special interest the great Maison de Force, then recently erected, with its distinctive features—useful labour, in the profits of which the prisoners had a share, and complete separation of the inmates by night. At Amsterdam, as in Holland generally, he was much struck with the comparative absence of crime, a phenomenon which he attributed to the industrial and reformatory treatment there adopted. In Germany he found little that was useful and much that was repulsive; in Hanover and Osnabrück, under the rule of a British sovereign, he even found traces of torture. After a short tour in England (Nov. 1775 to May 1776), he again went abroad, extending his tour to several of the Swiss cantons. In 1777 appeared The State of the Prisons in England and Wales, with Preliminary Observations, and an Account of some Foreign Prisons. One of the immediate results was the drafting a bill for the establishment of penitentiary houses, where by means of solitary imprisonment, accompanied by well-regulated labour and religious instruction, the object of reforming the criminal and inuring him to habits of industry might be pursued. New buildings were manifestly necessary; and Howard volunteered to go abroad again and collect plans. He first went to Amsterdam (April 1778), and carefully examined the “spin- houses” and “rasp-houses”11 for which that city was famous; next he traversed Prussia, Saxony, Bohemia and Austria, Italy, everywhere inspecting prisons, hospitals and workhouses, and carefully recording the merits and defects of each. The informa-
tion he thus obtained having been placed at the service of parliament, a bill was passed for building two penitentiary houses, and Howard was appointed first supervisor, but he resigned the post before anything practical had been achieved. In 1780 he had published a quarto volume as an appendix (the first) to his State of Prisons; about the same time also he caused to be printed his translation of the suppressed French pamphlet on the Bastille; but on obtaining release from his employment at home his passion for accumulating statistics urged him to new and more extended continental tours, as far as to Denmark, Sweden and Russia in 1781, and to Spain and Portugal in 1783. The results of these journeys were embodied in 1784 in a second appendix, with the publication of which his direct labours in connexion with the subject of prison reform may be said to have ceased.

The five remaining years of his life were chiefly devoted to researches on the means for prevention of the plague, and for guarding against the propagation of contagious distempers in general. After an extended tour on the continent his researches seemed to be complete; and with a great accumulation of papers and memoranda, he was preparing to return homewards from Constantinople by Vienna, when it occurred to his scrupulous mind that he still lacked any personal experience of quarantine discipline. He returned to Smyrna, and, deliberately choosing a foul ship, took a passage to Venice. A protracted voyage of sixty days, during which an attack by pirates gave Howard an opportunity of manifesting his personal bravery, was followed by a weary term of confinement which enabled him to gain the experience he had desired. While imprisoned in the Venetian gaoler, he received the information that his only son, a youth of twenty-two years of age, had lost his reason and had been put under restraint. Returning hastily by Trieste and Vienna (where he had a long and singular interview with the emperor Joseph II.), he reached England in February 1787. His first care related to his domestic concerns; he then set out upon another journey of inspection of the prisons of the United Kingdom, at the same time busy preparing himself in preparing for the press the results of his recent tour. The somewhat rambling work containing them was published in 1798 at Warrington, under the title An Account of the Principal Lazarettos in Europe, with various Papers relative to the Plague, together with further Observations on some Foreign Prisons and Hospitals, and additional Remarks on the present State of those in Great Britain and Ireland.

In July 1780 he embarked on what proved to be his last journey. Travelling overland to St Petersburg and Moscow, and so southwards, and visiting the principal military hospitals that lay on his route, he reached Kherson in November. In the hospitals of this place and of the immediate neighbourhood he found more than enough to occupy his attention while he awaited the means of transit to Constantinople. Towards the end of the year his medical advice was asked in the case of a young lady who was suffering under the camp fever then prevalent, and in attending her he himself took the disease, which terminated fatally on the 20th of January 1790. He was buried near the village of Daughigny on the road to St Nicholas. There is a statue by Bacon to his memory in St Paul’s, London, and one at Bedford by A. Gilbert. In personal appearance Howard is described as having been short, thin and sallow—unprepossessing apart from the attraction of a penetrating eye and a benevolent smile.

Authorities.—Anecdotes of the Life and Character of John Howard, written by a Gentleman (1790); Aikin, View of the Character and Public Services of the late John Howard (1792); Memoirs by J. Baldwin Brown (1818); T. Taylor (1836), Frederick Dixon (1849), J. Field (1850), and J. Stoughton, Howard on Prison Life and Management.

HOWARD, OLIVER OTIS (1830–1900). American soldier, was born in Leeds, Maine, on the 8th of November 1830. He graduated at Bowdoin College in 1850, and at the U.S. Military Academy in 1854. In 1857 he served in Florida against the Seminole Indians, and from 1857 to 1861 he was assistant professor of mathematics at West Point. At the beginning of the Civil War he resigned to become colonel of the 3rd Maine volunteer regiment, and at the first battle of Bull Run was in command of a brigade. In September he was promoted brigadier-general of volunteers. He served in the Peninsula Campaign, and at the battle of Seven Pines was shot in the neck, losing his life. On his return to active service in August 1862 he took part in the Virginia campaigns of 1862–63; at
Antietam he succeeded Sedgwick in command of a division, and he became major-general of volunteers in March 1863. In the campaign of Chancellorsville (see above) he commanded the XI. corps, which was routed by "Stonewall" Jackson, and in the first day's battle at Gettysburg he was for some hours (succeeding Doubleday after Reynolds's death) in command of the Union troops. The XI. corps was transferred to Tennessee after Rosecrans's defeat at Chickamauga, and formed part of Hooker's command in the great victory of Chattanooga. When Sherman prepared to invade Georgia in the spring of 1864 the XI. corps was merged with the XII. into the new XX., commanded by Hooker, and Howard was then placed in command of the new IV. corps, which he led in all the actions of the Atlanta campaign, receiving another wound at Pickett's Mills. On the death in action of General Hooker in July 1864, he was selected to command the Army of the Tennessee. In January 1865 he took part in the "March to the Sea" and the Carolinas campaign. In March 1865 he was breveted major-general U.S. "for gallant and meritorious service in the battle of Ezra Church and during the campaign against Atlanta," and in 1863 received a congressional medal of honour for bravery at Fair Oaks. After the peace he served as commissioner of the Bureau of Refugees, Freedmen and Abandoned Lands from 1865 until 1874; in 1872 he was special commissioner to the hostile Apaches of New Mexico and Arizona; in 1874-1881 was in command of the Department of the Columbia and conducted the campaign against Chief Joseph in 1877 and that against the Bannocks and Piatos in 1878. In 1881-1882 he was superintendent of West Point; and in 1882-1886 he commanded the Department of the Platte, in 1886-1888 the Department of the Pacific, and in 1888-1894 the Department of the East. In 1886 he was promoted major-general and in 1894 he retired. He died at Burlington, Vermont, on the 26th of October 1909.

Howard was deeply interested in the welfare of the negroes; and the establishment by the U.S. Government in 1867 of Howard University, at Washington, especially for their education, was largely due to him; it was named in his honour, and from 1869 to 1873 he presided over it. In 1895 he founded for the education of the "mountain whites," the Lincoln Memorial University at Cumberland Gap, Tenn. (see Cumberland Mountains), and became president of its board. He held honorary degrees of various universities, and was a chevalier of the Legion of Honour. He wrote, amongst other works, Donald's Schooldays (1877); Chief Joseph (1881); a life of General Zachary Taylor (1892) in the "Great Commanders" series; Isabella of Castile (1894); Fighting for Humanity (1898); Henry in the War (1898); papers in the "Battles and Leaders" collection on the Atlanta campaign; My Life and Experience among our Hostile Indians (1907); and Autobiography of O. O. Howard (2 vols. New York, 1907).

HOWARD, SIR ROBERT (1606-1669), English dramatist, sixth son of Thomas Howard, 1st earl of Berkshire, was born in 1626. He was knighted at the second battle of Newbury (1644) for his signal courage on the Royalist side. Imprisoned in Windsor Castle under the Commonwealth, his loyalty was rewarded at the Restoration, and he eventually became auditor of the exchequer. His best play is a comedy, The Committee, or the Faithful Irishman (1663; printed 1665), which kept the stage, long after its interest as a political satire was exhausted, for the character of Teague, said to have been drawn from one of his own servants. He was an early patron of Dryden, who married his sister, Lady Elizabeth Howard, and in the Indian Queen, a tragedy in heroic verse (1664; pr. 1665) Howard had assistance from Dryden, although the fact was not made public until the production of Dryden's Indian Emperor. The magnificence of the spectacle, and the novelty of the costume of the heroes, presented by Mrs. Aphra Behn, that was worn by Zempeola, the Indian queen, made a great sensation. The scenery and accessories were unusually brilliant, the richest ever seen in England, according to Evelyn. In 1665 Howard published Four New Plays, in the preface to which he opposed the view maintained by Dryden in the dedicatory epistle to The Rival Ladies, that rhyme was better suited to the heroic tragedy than blank verse. Howard made an exception in favour of the rhyme of Lord Orrery, but by his silence concerning Dryden implicated him in the general censure. Dryden answered by placing Howard's sentiments in the mouth of Crites in his own Essay on Dramatic Poesy (1668). The controversy did not end here, but Dryden completely worsted his adversary in the 1668 edition of The Indian Emperor. Howard died on the 3rd of September 1668.

His brother, James Howard, wrote two comedies, All Mistaken, or the Mad Couple, a comedy (1667; pr. 1672), and The English Mounsinse (1668; pr. 1674), the success of which seems to have been partly due to the acting of Nell Gwyn.

HOWARD, LORD WILLIAM (1563-1640), known as "Belted or Bauld (bold) Will," 3rd son of Thomas Howard, 4th duke of Norfolk (executed in 1572), and of his second wife Margaret, daughter of Lord St John, was born at Audley End in Essex on the 19th of December 1563. He married on the 28th of October 1577 Elizabeth, daughter of Thomas, Lord Dacre, and proceeded subsequently to the University of Cambridge. Being suspected of treasonable intentions together with his elder brother, Philip, earl of Arundel, he was imprisoned in 1583, 1585 and 1589. He joined the church of Rome in 1584, both brothers being dispossessed by the queen of a portion of their Dacre estates, which were, however, restored in 1600 for a payment of £10,000. Howard then took up his residence with his children and grandchildren at Naworth Castle in Cumberland, which he had been permitted to retain, and in 1610 he was beseiged by the Scots. In 1616 he was imprisoned in the Tower, and he had been restored in blood. In 1618 he was made one of the commissioners for the border, and performed great services in upholding the law and suppressing marauders. Lord William was a learned and accomplished scholar, praised by Camden, to whom he sent inscriptions and drawings from relics collected by him from the Roman wall, as "a singular lover of valuable antiquity and learned withal." He collected a valuable library, of which most of the printed works remain still at Naworth, though the MSS. have been dispersed, a portion being now in the Arundel MSS. in the Royal College of Arms; he corresponded with Ussher and was intimate with Camden, Spelman, and Cotton, whose eldest son married his daughter. He published in 1592 an edition of Florence of Worcester's Chronicle or Chronicles, dedicated to Lord Burghley, and drew up a genealogy of his family, now among the duke of Norfolk's MSS. at Norfolk House. He died in October 1640 at Greystock, to which place he had been removed when falling in health to escape the Scots who were threatening an advance on Naworth. He had a large family of children, of whom Philip, his heir, was the grandfather of Charles, 1st earl of Carlisle, and Francis was the ancestor of the Howards of Corby.

HOWARD OF EFFINGHAM, WILLIAM HOWARD 1st BARON (c. 1510-1573), English lord high admiral, was the son of the 2nd duke of Norfolk. He was popular with Henry VIII, and at Anne Boleyn's coronation was deputy earl marshal; and he was sent on missions to Scotland and France; but in 1541 he was charged with abetting his relative Queen Catherine Howard, and was convicted of misprision of treason, but pardoned. In 1552 he was made governor of Calais, and in 1553 lord high admiral, being created Baron Howard of Effingham in 1554 for his defence of London in Sir Thomas Wyatt's rebellion against Queen Mary. He befriended the princess Elizabeth, but her popularity with the navy saved him from Mary's resentment; and when Elizabeth became queen he had great influence with her and filled several important posts. His son, the second baron, who is famous in English naval history, was created earl of Nottingham (q.v.), and from a younger son the later earls of Effingham were descended. William's descendant, Francis (d. 1605), inherited the barony of Howard of Effingham on the death of his cousin, Charles, in 1618; and Francis's son, Francis (1683-1743), was created earl of Effingham in 1731. This earldom became extinct on the death of Richard, the fourth holder, in 1816; but it was created again in 1837 in favour of Kenneth Alexander (1767-1845), another of William Howard's descendants,
who had succeeded to the barony of Howard of Effingham in 1685.

HOWE, ELIAS (1819–1867), American sewing-machine inventor, was born in Spencer, Massachusetts, on the 9th of July 1819. His early years were spent on his father's farm. In 1835 he entered the factory of a manufacturer of cotton-machinery at Lowell, Massachusetts, where he learned the machinist's trade. Subsequently, while employed in a machine shop at Cambridge, Mass., he conceived the idea of a sewing machine, and for five years spent all his spare time in its development. In September 1846 a patent for a practical sewing machine was granted to him; and Howe spent the following two years (1847–1849) in London, employed by William Thomas, a corset manufacturer, to whom he had sold the English rights for £250. Years of disappointment and discouragement followed before he was successful in introducing his invention, and several imitations which infringed his patent, particularly that of Isaac Merritt Singer (1811–1875), had already been successfully introduced and were widely used. His rights were established after much litigation in 1854, and by the date of expiration of his patent (1867) he had realized something over $2,000,000 out of his invention. He died in Brooklyn, New York, on the 3rd of October 1867.

See History of the Sewing Machine and of Elias Howe, Jr., the Inventor (Detroit, 1867); P. G. Hubert, Jr., Inventors, in "Men of Achievement" series (New York, 1893).

HOWE, JOHN (1630-1700), English Puritan divine, was born on the 17th of May 1630 at Loughborough, Leicestershire, where his father was vicar. On the 9th of May 1647 he entered Christ's College, Cambridge, as a sizar, and in the following year took his degree of B.A. During his residence at the university he made the acquaintance of Ralph Cudworth, Henry More and John Smith, from intercourse with whom, as well as from direct acquaintance with the Dialogues themselves, his mind received that "Platonic tinge" so perceptible in his writings. Immediately after graduation at Cambridge, he migrated to Oxford, where he became fellow and chaplain of Magdalen College, proceeding M.A. in 1652. He was then ordained by Charles Herle (1658-1659), the Puritan rector of Winwick, and in 1654 went as perpetual curate to Great Torrington in Devon, where he preached the discourses which latter took shape in his treatises on The Blessedness of the Righteous and on Delighting in God. In the beginning of 1657 a journey to London accidentally brought Howe under the notice of Cromwell, who made him his domestic chaplain. In this position his conduct was such as to win the praise of even the bitterest enemies of his party. Without overlooking his fellow-Puritans, he was always ready to help pious and learned men of other schools. Seth Ward (afterwards bishop of Exeter) and Thomas Fuller were among those who profited by Howe's kindness, and were not ashamed subsequently to express their gratitude for it. On the resignation of Richard Cromwell, Howe returned to Great Torrington, to leave it again in 1662 on the passing of the Act of Uniformity. For several years he led a wandering and uncertain life, preaching in secret as occasion offered to handfuls of trusted hearers. Being in straits he published in 1668 The Blessedness of the Righteous; the reputation which he thus acquired procured him an invitation from Lord Massereene, of Antrim Castle, Ireland, with whom he lived for five or six years as domestic chaplain, frequently preaching in public, with the approval of the bishop of the diocese. Here too he produced the most eloquent of his shorter treatises, The Vanity of Man as Mortal, and On Delighting in God, and planned his best work, The Living Temple. In the beginning of 1676 he accepted an invitation to become joint-pastor of a non-conformist congregation at Haberdashers' Hall, London; and in the same year he published the first part of The Living Temple entitled Concerning God's Existence and his Conversableness with Men: Against Atheism or the Epicurean Dæmon. In 1677 he appeared his tractate On the Reconcileableness of God's Presence of the Sinns of Men with the Wisdom and Sincerity of His Counsels, Exhortations and whatsoever Me his use to prevent them, which was attacked from various quarters, and had Andrew Marvell for one of its defenders. On Thoughts for the Morning he followed in 1681; Self-Dedication and Union among Protestants in 1682, and The Redeemer's Tears went over Lost Souls in 1684.

For five years after his settlement in London Howe enjoyed comparative freedom, and was on not unfriendly terms with many eminent Anglicans, such as Stillingsfleet, Tillotson, John Sharp and Richard Kidder; but the greater severity which began to be exercised towards nonconformists in 1681 so interfered with his liberty that in 1683 he gladly accepted the invitation of Philip, Lord Wharton, to travel abroad with him. In 1687 he determined to settle for a time at Utrecht, where he officiated in the English chapel. Among his friends there was Gilbert Burnet, by whose influence he obtained several confidential interviews with William of Orange. In 1687 Howe availed himself of the declaration for liberty of conscience to return to England, and in the following year he headed the deputation of nonconformist ministers who went to congratulate William on his accession to the English throne. The remainder of his life was uneventful. His influence was always on the side of forbearance, between conformists and dissenters in 1689, and between Congregationalists and Independents in 1690. In 1693 he published three discourses On the Carnality of Religious Contention, suggested by the disputes that became rife among nonconformists as soon as liberty of doctrine and worship had been granted. In 1694 and 1695 he published various treatises on the subject of the Trinity, the principal being A Calm and Solemn Inquiry concerning the Possibility of a Trinity in the Godhead. The second part of The Living Temple, entitled Animadversions on Spinosa and a French writer pretending to confute him, with recapitulation of the former part and an account of the destination and restitution of God's Temple among Men, appeared in 1702. In 1701 he had some controversy with Daniel Defoe on the question of occasional conformity. In 1705 he published a discourse On Patience in the Expectation of Future Blessness, but his health had begun to fail, and he died in London on the 2nd of April 1706. Richard Cromwell visited him in his last illness.

Though excelled by Baxter as a pulpif orator, and by Owen in exagetical ingenuity and in almost every department of theological learning, Howe compares favourably with either as a sagacious and profound thinker, while he was much more successful in combining religious earnestness and fervour of conviction with large-hearted tolerance and cultured breadth of view. He was a man of high principle and fine presence, and it was said of him "that he never made an enemy and never lost a friend."

The works published in his lifetime, including a number of sermons, were collected into 2 vols. fol. in 1724, and again reprinted in 3 vols. 8vo. in 1848. A complete edition of The Whole Works, including much posthumous and additional matter, appeared with a memoir in 8 vols. in 1822; this was reprinted in 1 vol. in 1838 and in 6 vols. in 1862-1863. E. Calamy's Life (1724) forms the basis of The Life and Character of Howe, with an Analysis of his Writings, by Henry Rogers (1836, new ed. 1863). See also a sketch by R. F. Horton (1860).

HOWE, JOSEPH (1804-1873), Canadian statesman, was born at Halifax, Nova Scotia, on the 13th of December 1804, the son of John Howe (1752-1835), a United Empire Loyalist who was for many years king's printer and postmaster-general for the Maritime Provinces and the Bermudas. He received little regular education, and at the age of 13 entered his father's office. In 1827 he started the Acadian, a weekly non-political journal, but soon sold it, and in 1828 purchased the Nova Scotian, which later became amalgamated with the Morning Chronicle. From this date he devoted increasing attention to political affairs, and in 1835 was prosecuted for libelling the magistrates of Halifax. Being unable to find a lawyer willing to undertake his case, he pleaded it himself, and won his acquittal by a speech of over six hours, which secured for Nova Scotia a larger measure of self-government, and for himself the reputation of an orator. In 1836 he was elected member for Halifax in the provincial assembly, and during the next twelve years devoted himself to attaining
HOWE, JULIA WARD—HOWE, EARL

responsible government for Nova Scotia. This brought him into fierce conflict with the reigning oligarchy and with the lieutenant-governor, Lord Falkland (1863-1884), whom he forced to resign. Largely owing to Howe's statesmanship responsible government was finally conceded in 1868 by the imperial authorities, and was thus gained without the bloodshed and confusion which marked its acquisition in Ontario and Quebec. In 1850 he was appointed a delegate to England on behalf of the Intercolonial railway, for which he obtained a large imperial guarantee. In 1854 he resigned from the cabinet, and was appointed chief commissioner of railways. In 1855 he was sent by the imperial government to the United States in connexion with the Foreign Enlistment Act, to raise soldiers for the war in the Crimée. Through the rashness of others he got into difficulties, and was attacked in the British House of Commons by Mr Gladstone, whom he compelled to apologise.

In 1855 he was defeated by Mr. (afterwards Sir Charles) Tupper, but was elected by acclamation in the next year in Hants county, and was from 1866 to 1869 premier of Nova Scotia. In the latter years he was appointed by the imperial government fishery commissioner to the United States, and thus took no part in the negotiations for confederation. Though his eloquence had done more than anything else to make practicable a union of the British North American provinces, he opposed confederation, largely owing to wounded vanity; but on finding it impossible to obtain from the imperial authorities the repeal of the British North America Act, he refused to join his associates in the extreme measures taken and advocated, and on the promise from the Canadian government of better financial terms to his native province, entered (on the 30th of January 1869) the cabinet of Sir John Macdonald as president of the council. This brought upon him a storm of obloquy, under which his health gradually gave way. In May 1873 he was appointed lieutenant-governor of Nova Scotia, but died suddenly on the 1st of June of the same year.

Howe's eloquence, and still more his unfailing wit and high spirits, made him for many years the idol of his province. He is the finest orator whom Canada has produced, and also wrote poetry, which shows in places high merit. Many of his sayings are still current in Nova Scotia. In 1904 a statue in his honour was erected in Halifax.

His Letters and Speeches were published in 1858 in Boston, Mass., in 2 vols., edited nominally by William Amand, really by himself. See also Public Letters and Speeches of Joseph Howe (Halifax, 1891), edited by G. L. Butterfield; Life of the Hon. James W. Longley (Toronto, 1904) is dispassionate, but otherwise mediocre. Joseph Howe, by George Monro Grant (reprinted Halifax, 1904), is a brilliant sketch. (W. L. G.)

HOWE, JULIA WARD (1819-1910), American author and reformer, was born in New York City on the 27th of May 1819. Her father, Samuel Ward, was a banker; her mother, Julia Rush [Cutler] (1796-1824), a poet of some ability. When only sixteen years old she had begun to contribute poems to New York periodicals. In 1843 she married Dr Samuel Gridley Howe (q.v.), with whom she spent the next year in England, France, Germany and Italy. She assisted Dr Howe in editing the Commonwealth in 1851-1853. The results of her study of German philosophy were seen in philosophical essays; in lectures on "Doubt and Belief," "The Duality of Character," &c., delivered in 1860-1861 in her home in Boston, and later in Washington; and in addresses before the Boston Radical Club and the Concord school of philosophy. Samuel Longfellow, his brother Henry, Wendell Phillips, W. L. Garrison, Charles Sumner or Charles Skeeter, James Fenimore Cooper were among her friends; she advocated abolition, and preached occasionally from Unitarian pulpits. She was one of the organizers of the American Woman-Suffrage Association and of the Association for the Advancement of Women (1869), and in 1870 became one of the editors of the Woman's Journal, and in 1872 president of the New England Women's Club. In the same year she was a delegate to the Prison Reform Congress in London, and founded there the Woman's Peace Association, one of the many ways in which she expressed her opposition to war. She wrote The World's Own (unsuccessfully played at Wallack's, New York, in 1855, published 1857), and in 1858, for Edwin Booth, Hippolyta, never acted or published. Her lyric poetry, thanks to her temperament, and possibly to her musical training, was her highest literary form: she published Passion Flowers (London, privately, 1852), Contributions for the Hour (London, Lyric Lyrics (1866), and From Sunset Ridge: Poems Old and New (1888); her most popular poem is The Battle Hymn of the Republic, written to the old folk-tune associated with the song of "John Brown's Body," when Mrs Howe was at the front in 1861, and published (Feb. 1862) in the Atlantic Monthly, to which she frequently contributed. She edited Sex and Education (1874), an answer to Sex in Education (1873) by Edward Hammond Clarke (1830-1877); and wrote several books of travel, Modern Society (1880) and Is Polite Society Polite? (1895), collections of addresses, each taking its title from a lecture critically-argued in the "Scrutator," (24) in the West Indies. As captain of the "Hippolyta" (b. 1855), wife of John Elliott, the painter of a fine ceiling in the Boston library,—both these daughters being contributors to literature. Mrs Howe died on the 17th of October 1910.

HOWE, RICHARD Howe, Earl (1726-1799), British admiral, was born in London on the 8th of March 1726. He was the second son of Emmanuel Scrope Howe, 2nd Viscount Howe, who died governor of Barbadoes in March 1735, and of Mary Sophia Charlotte, a daughter of the baroness Kilmansegge, afterwards countess of Darlington, the mistress of George I,—a relationship which does much to explain his early rise in the navy. Richard Howe entered the navy in the "Severn," one of the squadron sent into the south seas with Anson in 1740. The "Severn" failed to round the Horn and returned home. Howe next served in the West Indies in the "Burford," and was present in her when she was very severely damaged in the unsuccessful attack on La Guayra on the 18th of February 1742. He was made acting-lieutenant in the West Indies in the same year, and the rank was confirmed in 1744. During the Jacobite rising of 1745 he commanded the "Baltimore" sloop in the North Sea, and was dangerously wounded in the head while co-operating with a frigate in an engagement with two strong French privateers. In 1746 he became post-captain, and commanded the "Magnanimous" (64) in the magnificent victory of Quiberon Bay. By the death of his elder brother, killed near Ticonderoga on the 6th of July 1758, he became Viscount Howe—an Irish peerage. In 1762 he was elected M.P. for Dartmouth, and held the seat till he received a title of Great Britain. During 1763 and 1765 he was a member of the Admiralty board, and from 1765 to 1770 was treasurer of the navy. In that year he was promoted rear-admiral, and in 1775 vice-admiral. In 1776 he was appointed to the command of the North American station. The rebellion
of the colonies was making rapid progress, and Howe was known to be in sympathy with the colonists. He had sought the acquaintance of Benjamin Franklin, who was a friend of his sister Miss Howe, a clever eccentric woman well known in London society, and had already tried to act as a peacemaker. It was doubtless because of his known sentiments that he was selected to command in America, and was joined in commission with his brother Sir William Howe, the general at the head of the land forces, to make a conciliatory arrangement. A committee appointed by the Continental Congress conferred with the Howes in September 1776 but nothing was accomplished. The appointment of a new peace commission in 1778 offended the admiral deeply, and he sent in a resignation of his command. It was reluctantly accepted by Lord Sandwich, then First Lord, but before it could take effect France declared war, and a powerful French squadron was sent to America under the count d'Estaing. Being greatly outnumbered, Howe had to stand on the defensive, but he baffled the French admiral at Sandy Hook, and defeated his attempt to take Newport in Rhode Island by a fine combination of caution and calculated daring. On the arrival of Admiral John Byron from England with reinforcements, Howe left the station in September. Until the fall of Lord North's ministry in 1782 he refused to serve, assigning as his reason that he could not trust Lord Sandwich. He considered that he had not been properly supported in America, and was embittered both by the supersession of himself and his brother as peace commissioners, and by attacks made on him by the ministerial writers in the press.

On the change of ministry in March 1782 he was selected to command in the Channel, and in the autumn of that year, September, October and November, he carried out the final relief of Gibraltar. It was a difficult operation, for the French and Spaniards had in all 46 line-of-battle ships to his 33, and in the exhausted state of the country it was impossible to fit his ships properly or to supply them with good crews. He was, moreover, hampered by a great convoy carrying stores. But Howe was eminent in the handling of a great multitude of ships, the enemy was awkward and unenterprising, and the operation was brilliantly carried out. From the 28th of January to the 16th of April 1783 he was First Lord of the Admiralty, and he held that post from December 1783 till August 1788, in Pitt's first ministry. The task was no pleasant one, for he had to agree to economies where he considered that more outlay was needed, and he had to disappoint the hopes of the many officers who were left unemployed by the peace. On the outbreak of the Revolutionary war in 1793 he was again named to the command of all British vessels, and he made the most glorious period of his life, for in it he won the epoch-making victory of the 1st of June (see First or June, Battle of). Though Howe was now nearly seventy, and had been trained in the old school, he displayed an originality not usual with veterans, and not excelled by any of his successors in the war, not even by Nelson, since they had his example to follow and were served by more highly trained squadrons than his. He continued to hold the nominal command by the wish of the king, but his active service was now over.

In 1797 he was called to the House of Commons, representing Spittal, and his great influence with the seamen who trusted him was conspicuously shown. He died on the 5th of August 1799, and was buried in his family vault at Langar. His monument by Flaxman is in St Paul's Cathedral. In 1782 he was created Viscount Howe of Langar, and in 1788 Baron and Earl Howe. In June 1797 he was made a knight of the Garter. With the sailors he was always popular, though he was no popularity hunter, for they knew him to be just. His nickname of Black Dick was given on account of his swarthy complexion, and the well-known portrait by Gainsborough shows that it was apt.

Lord Howe married, on the 10th of March 1758, Mary Hartop, the daughter of Colonel Chiverton Hartop of Welby in Leicestershire, and had issue two daughters. His Irish title descended to his brother William, the general, who died childless in 1814. The earldom, and the viscounty of the United Kingdom, being limited to heirs male, became extinct, but the barony, being to heirs general, passed to his daughter, Sophia Charlotte (1762–1835), who married the Hon. Penn Assheton Curzon. Their son, Richard William Curzon (1796–1879), who succeeded his paternal grandfather as Viscount Curzon in 1820, was created Earl Howe in 1821; he was succeeded by his son, George Augustus (1821–1879), and then by another son, Richard William (1822–1900), whose son Richard George Penn Curzon-Howe (b. 1861) became 4th Earl Howe in 1900.

The standard Life is by Sir John Barrow (1838). Interesting reminiscences will be found in the Life of Codrington, by Lady Bourchier. Accounts of his professional services are in Charnock's 'Biography Nautalis,' v. 457, and in Rall's 'Naval Biographies,' i. 85. His Table of 'Nelson's Admiral Howe' appears in 'Les Histoires, History, and Chevalier's 'Histoire de la Marine française,' vols. i. and ii.

HOWE, SAMUEL GRIDLEY (1801–1876), American philanthropist, was born at Boston, Massachusetts, on the 10th of November 1801. His father, Joseph N. Howe, was a ship-owner and cordage manufacturer; and his mother, Patty Gridley, was one of the most beautiful women of her day. Young Howe was educated at Boston and at Brown University, Providence, and in 1821 began to study medicine in Boston. But fired by enthusiasm for the Greek revolution and by Byron's example, he was no sooner qualified and admitted to practice than he abandoned these prospects and took ship for Greece, where he joined the army and spent six years of hardship amid scenes of warfare. Then, to raise funds for the cause, he returned to America; his fervid appeals enabled him to collect about $50,000, which he spent on provisions and clothing, and he established a relief depot near Aegina, where he started works for the refugees, the existing quay, or American Mole, being built in this way. He formed another colony of exiles on the Isthmus of Corinth. He wrote a 'History of the Greek Revolution,' which was published in 1828, and in 1831 he returned to America. Here a new object of interest engaged him. Through his friend Dr John D. Fisher (d. 1859), a Boston physician who had started a movement there as early as 1826 for establishing a school for the blind, he had learnt of the similar school founded in Paris by Valentin Haüy, and it was proposed to Howe by a committee organized by Fisher that he should direct the establishment of a "New England Asylum for the Blind" at Boston. He took up the project with characteristic ardour, and set out at once for Europe to investigate the problem. There he was temporarily diverted from his task by becoming mixed up with the Polish revolt, and, in pursuit of a mission to carry American contributions across the Prussian frontier, he was arrested and imprisoned at Berlin, but was at last released through the intervention of the American minister at Paris. Returning to Boston, he began receiving a few blind children at his father's house in Pleasant Street, and thus sowed the seed which grew into the famous Perkins Institution. In January 1833 the funds available were all spent, but so much progress had been shown that the legislature voted $6000, later increased to $30,000 a year, to the institution on condition that it should educate gratuitously twenty poor blind from the state; money was also contributed from Salem, and from Boston, and Colonel Thomas H. Perkins, representative of Bostonian, presented his mansion and gardens in Pearl Street for the school to be held there in perpetuity. This building being later found unsuitable, Colonel Perkins consented to its sale, and in 1839 the institution was moved to South Boston, to a large building which had previously been an hotel. It was henceforth known as the "Perkins Institution and Massachusetts Asylum (or, since 1877, School) for the Blind." Howe was director, and the life and soul of the school; he opened a printing-office and organized a fund for printing for the blind—the first in John Jos; and he was unceasing in calling public attention to the work. The Institution, through him, became one of the intellectual centres of American philanthropy, and by degrees obtained more and more financial support. In 1837 Dr Howe went still further and brought the famous blind deaf-mute, Laura Bridgman, to the school.
It must suffice here to chronicle the remaining more important facts in Dr Howe's life, outside his regular work. In 1843 he married Julia Ward (see above), daughter of a New York banker, and they made a prolonged European trip, on which Dr Howe spent much time in visiting those public institutions which carried out the objects specially interesting to him. In Rome, in 1844, his eldest daughter, Julia Romana (afterwards the wife of Michael Anagnos, Dr Howe's assistant and successor), was born, and in September the travellers returned to America, and Dr Howe resumed his activities. In 1846 he became interested in the condition and treatment of idiots, and particularly in the experiments of Dr Guggenbühl on the cretins of Switzerland. He became chairman of a state commission into the number and condition of idiots in Massachusetts, and the report of this commission, presented in 1848, caused a profound sensation. An appropriation of $2500 per annum was made for training ten idiot children under Dr Howe's supervision, and by degrees the value of his School for Idiotic and Feeble-minded Youths, which, starting in South Boston, was in 1860 removed to Waltham, was generally appreciated. It was the first of its kind in the United States. An enthusiastic humanitarian organization was formed, an association was formed and a member of the Free Soil party, and had played a leading part at Boston in the movements which culminated in the Civil War. When it broke out he was an active member of the sanitary commission. In 1871 he was sent to Santo Domingo as a member of the commission appointed by President Grant to examine the condition of the island, the government of which desired annexation; and that scheme was defeated through Sumner's opposition he returned (1872) as the representative of the Samana Bay Company, which proposed to take a lease of the Samana peninsula; but though in 1874 he revisited the island, it was only to see the flag of the company hauled down. His health was then breaking and began soon after to fail rapidly, and on the 9th of January 1876 he died at Boston. The governor of the state sent a special message of grief to the legislature on his death, eulogies were delivered in the two houses, and a public memorial service was held, at which Dr O. W. Holmes read a poem. Whittier had in his lifetime commemorated him in his poem "The Hero," in which he called him "the Cadmus of the blind"; and in 1901 a centennial celebration of his birth was held at Boston, at which, among other notable tributes, Senator Hoar spoke of Howe as "one of the great figures of American history."

"A Memoir of Dr Howe by his wife appeared in 1876. See also the Authors and Journals of S. G. Howe, edited by Laural R. Richotes (1910)."

HOWE, WILLIAM HOWE, 5TH VISCOUNT (1729–1814), British general, was the younger brother of George Augustus, 3rd viscount, killed in the Ticonderoga expedition of 1758, and of Richard, 4th viscount and afterwards Earl Howe, the admiral. He entered the cavalry in 1746, becoming lieutenant a year later. On the disbanding of his regiment in 1749 he was made captain-lieutenant and shortly afterwards captain in Lord Bury's (20th) regiment, in which Wolfe was then a field officer. Howe became major in 1756 and lieutenant-colonel in 1757 of the 58th (now Northampton) regiment, which he commanded at the capture of Louisburg. In Wolfe's expedition to Quebec he distinguished himself greatly at the head of a composite light battalion. He led the advanced party in the landing at Wolfe's Cove and took part in the battle of the Plains of Abraham which followed. He commanded his own regiment in the defence of Quebec in 1759–1760, led a brigade in the advance on Montreal and took part on his return to Europe in the siege of Belleisle (1761). He was adjutant-general of the force which besieged and took Havana in 1762, and at the close of the war had acquired the reputation of being one of the most brilliant of the junior officers of the army. He was made colonel of the 46th foot in 1764 and lieutenant-general of that foot four years later. From 1768 to 1780 he was M.P. for Nottingham. In 1772 he became major-general, and in 1774 he was entrusted with the training of light infantry companies on a new system, the training-ground being Salisbury Plain.

Shortly after this he was sent out to North America. He did not agree with the policy of the government towards the colonists, and regretted in particular that he was sent to Boston, where the memory of his eldest brother was still cherished by the inhabitants, and General Gage, in whom he had no confidence, commanded in chief. He was the senior officer after Gage, and led the troops actively engaged in the storming of Bunker Hill, he himself being in the thickest of the fighting. In the same year Howe was made a K.B. and a lieutenant-general, and appointed, with the local rank of general, to the chief command in the seat of war. For the events of his command see American War of Independence. He retained it until May 1778—on the whole with success. The cause of his resignation was his feeling that the home government had not afforded the proper support, and after his return to England, he and his brother engaged in a heated but fruitless controversy with the ministers. Howe's own defence is embodied in Narrative of Sir William Howe before a Committee of the House of Commons (London, 1780). In 1782 Howe was made lieutenant-general of the ordnance; in 1790 he was placed in command of the forces organized for action against Spain, and in 1793 he was made a full general. He held various home commands and in 1795 was appointed to the War Department, in particular that of the eastern district at the critical moment when the French established their forces on the Dutch coast. When Earl Howe died in 1799, Sir William succeeded to the Irish viscountcy. He had been made governor of Berwick-on-Tweed in 1795, and in 1805 he became governor of Plymouth, where he died on the 12th of July 1814. With his death the Irish peerage became extinct.

HOWEL DDWA ("the Good") (d. 930), prince of Deheubarth (South Central Wales) from before 915, and king of Wales from 943 to 950, was the grandson of Rhodri Mawr (the Great), who had united practically the whole of Wales under his supremacy. As Idwal Foel succeeded his father Anarawd, the elder son of Rhodri, as lord of Gwynedd in 915, so Howell at some time before that date succeeded Rhodri's younger son Cadell as prince of Deheubarth. Howell married Elen, daughter of the last king of Dyfed, and also added Kidwelly and Gwyrf to his dominions, while on the death of Idwal, who was slain by the English in 943, he took possession of Gwynedd. Both these princes had done homage to the English kings, Edward the Elder and Aethelstan, in 922 and 926, and we find that Howell attended the witan of the English kingdom and witnessed about ten charters between the years 931 and 949. He was secure, therefore, from attack on his own side of the kingdom, and it is certain what he was engaged in any of the battles recorded during these years in Wales, either in Môn 914, at Dinas Newydd 919 or at Brun 935. To the peaceful character of his reign is probably due the high place which he holds among the Welsh princes. From 943 to 950 Howell Dda was probably ruler of all Wales except Powys (apparently dependent on Mercia), Breconnog, Buallt, Gwent and Morganwg. With Morgan Hen, king of Morganwog, Howell had a dispute which was eventually settled in favour of the former at the court of the English king. Howell died in 950, and such unity as he had preserved at once disappeared in a war between his sons and those of Idwal Foel. The Charles of this family were clan chiefs, and those Olden had the title of prince of Dyfed. The present chief, called Prince of Dyfed, was also claimed by the chief of the district of Voel, who in 1163 and 1165 captured Dinas Newydd and Deheubarth, and the title of prince is perhaps his chief claim to fame.

He is said to have summoned four men from each cantref in his dominions to the Ty Gwyn (perhaps Whitland in Carmarthenshire) to codify existing custom. Three codes, accordingly called Venedotian, Demetian and Gwentian, are said to have been written down by Blegwyrwog, archdeacon of Llandaff (see Welsh Laws).

workmen. It was not till 1622 that he returned, having visited Holland, France, Spain and Italy. With the intention of utilizing to better purpose his knowledge of continental languages and methods, he left the glass business and applied for a diplomatic post. Failing to obtain this, he was for a short time tutor in a nobleman's family. At the close of 1622 he was sent on a special mission to Madrid to obtain redress for the seizure of an English vessel, but, owing to the presence at the Spanish court of Prince Charles and the duke of Buckingham to arrange a marriage between the prince and the Infanta of Spain, the negotiations had to be broken off. He made many friends among the prince's retinue, and, after his return in 1624, applied for employment to the duke of Buckingham, but without success. In 1626 he became secretary to Lord Scrope, Lord President of the North and York, and retained the office under Scrope's successor, Thomas Wentworth. In 1627 he was elected M.P. for Richmond; in 1632 he was sent as secretary to the embassy of the earl of Leicester to Denmark; and in 1642 the king appointed him one of the clerks of the privy council. In 1643 he was committed to the Fleet prison by the parliament, according to the king's wishes, with the reason given, or, as Anthony à Wood says, for debt. Whatever the cause, he remained in prison until 1651. He had acquired considerable fame by his allegorical Δηφορωγία: Οδόντος Γράμμα, or the Vocal Forest, published in 1649, and his Instructions for Forreigne Travell (1642), which has been described as the first continental handbook; and now he was driven to maintain himself by his pen. He edited and supplemented (1650) Cotgrave's French and English dictionary, compiled Lexicon Tetraglotton, or an English, French, Italian and Spanish Dictionary (London, 1666), translated various works from Italian and Spanish, wrote a life of Louis XIII. and issued a number of political pamphlets, varying the point of view somewhat to suit the changes of the time. Among these tracts may be mentioned a rather malicious Perfect Description of the People and Country of Scotland, which was revived by John Wilkes and printed in the North Briton during the agitation directed against Lord Bute. In 1660 he asked for the place of clerk of the privy council; and, though this was not granted him, the post of historiographer royal was created for him. In 1663 he applied for the office of tutor in foreign languages to the infants Catherine of Braganza, and in 1662 published an English Grammar translated into Spanish. He was buried in the Temple Church on the 3rd of November 1666, having realized to the last his favourite motto, "Senesco non segnose." All Howell's writings are imbued with a certain simplicity and quaintness. His elaborate allegories are forgotten; his linguistic labours, of value in their time, are now superseded; but his Letters, the Epistolae Ho-dieanae (four volumes issued in 1645, 1647, 1650 and 1655), are still models of their kind. Their dates are often fictitious, and they are, in nearly every case, evidently written for publication. Thackeray said that the Letters was one of his bedside books. He classes it with Montaigne and says he scarcely ever tired of "the artless prattle" of the "priggish little clerk of King Charles's council." The Epistolae have been frequently edited, notably by J. Jacobs in 1890, with a commentary (1891), and Agnes Reppel (1907).

HOWELLS, WILLIAM DEAN (1837- ). American novelist, was born at Martins Ferry, Ohio, on the 1st of March 1837. His father, William Cooper Howells, a printer-journalist, moved in 1840 to Hamilton, Ohio, and here the boy's early life was spent successively as type-setter, reporter and editor in the offices of various newspapers. In the midst of routine work he contrived to familiarize himself with a wide range of authors in several modern tongues, and to drill himself thoroughly in the use of good English. In 1860, as assistant editor of the leading Republican newspaper in Ohio, he wrote—in connexion with the Presidential contest—the campaign life of Lincoln; and in the autumn of that year he was appointed consul at Venice, where he remained till 1865. On his return in 1866 he joined the staff of the Atlantic Monthly, and from 1872 to 1881 he was its editor-in-chief. Since 1885 he has lived in New York. For a time he conducted for Harper's Magazine the department called "The Editor's Study," and in December 1900 he revived for the same periodical the department of "The Easy Chair," which he had filled on the death of George William Curtis. Of Mr Howells' many novels, the following may be mentioned as specially noteworthy: Their Wedding Journey (1872); The Lady of the Aroostook (1879); A Modern Instance (1882); The Rise of Silas Lapham (1885); The Minister's Charge (1886); A Hazard of New Fortunes (1886); The Quality of Mercy (1892); The Landlord at Lion's Head (1897). He also published Poems (1873 and 1886); Stips of Various Quills (1895), a book of verse; books of travel; several amusing fables; and volumes of essays and literary criticism, among others, Literary Priciples and Acquaintance (1901), which contains much autobiographical matter, Literature and Life (1902), and English Films (1905).

Howells is by general consent the foremost representative of the realist school of indigenous American fiction. From the outset his aim was to portray life with entire fidelity in all its commonplaceness, and yet to charm the reader into a liking for this commonplaceness and into reverence for what it conceals. Though in his earliest novels his method was not consistently realistic, he is at times almost as personal and as whimsical as Thackeray—yet his vivid impressionism and his choice of subjects, as well as an occasional explicit protest that "dulness is dear to him," already revealed unmistakably his realistic bias. In A Modern Instance (1882) he gained complete command of his method, and began a series of studies of American life that are remarkable for their loyalty to fact, their truth of tone, and their power to reveal, despite their strictly objective method, both the inner springs of American character and the sociological forces that are shaping American civilization. He refuses to over-sophisticate or to over-intellectualize his characters, and he is very sparing in his use of psychological analysis. He insists on seeing and portraying American life as it exists in and for itself, under its own skies and with its own atmosphere; he does not scrutinize it with foreign comparisons in mind, and thus try to find and to throw into relief unsuspected configurations of surface. He keeps his dialogue toned down to almost the pitch of everyday conversation, although he has shown in his comedy sketches how easy a master he is of adroit and witty talk.

HOWITT, WILIAM (1792-1879), English author, was born on the 18th of December 1792 at Heanor, Derbyshire. His parents were Quakers, and he was educated at the Friends' public school at Ackworth, Yorkshire. In 1814 he published a poem on the "Influence of Nature and Poetry on National Spirit." He married, in 1821, Mary Botham (1799-1888), like himself a Quaker and a poet. William and Mary Howitt collaborated throughout a long literary career, the first of their joint productions being The Forest Minstrels and other Poems (1821). In 1831 William Howitt produced a work for which his habits of observation and his genuine love of nature peculiarly fitted him. It was a history of the changes in the face of the outside world in the different months of the year, and was entitled The Book of the Seasons, or the Calendar of Nature (1831). His Popular History of Pricestraft (1833) won for him the favour of active Liberals and the office of alderman in Nottingham, where the Howitts had made their home. They removed in 1837 to Esher, and in 1840 they went to Heidelberg, primarily for the education of their children, remaining in Germany for two years. In 1841 William Howitt produced, under the pseudonym of "Dr Cornelius," The Student Life of Germany, the first of a series of works on German social life and institutions. Mary Howitt devoted herself to Scandinavian literature, and between 1842 and 1863 she translated the novels of Frederika Bremer and many of the stories of Hans Andersen. With her husband she wrote in 1852 The Literature and Romance of Northern Life, and in June of that year William Howitt, with two of his sons, set sail for Australia, where he spent two years in the goldfields. The results of his travels appeared in A Boy's
Adventures in the Wilds of Australia (1854), Land, Labour and Gold; or, Two Years in Victoria (1853) and Tallangatta, the Squatter’s Home (1857). On his return to England Howitt had studied at Highgate and resumed his indefatigable book-breaking. From 1856 to 1862 he was engaged on Cassell’s Illustrated History of England, and from 1861 to 1864 he and his wife worked at the Rained Abbeys and Castles of Great Britain. The Howitts had left the Society of Friends in 1847, and became interested in spiritualism. In 1863 appeared The History of the Supernatural in all Ages and Nations, and in all Churches, Christian and Pagan, demonstrating a Universal Faith, by William Howitt. He added “his own conclusions from a practical examination of the higher phenomena through a course of seven years.” From 1870 onwards Howitt spent the summers in Tirol and the winters in Rome, where he died on the 3rd of March 1870. William Howitt wrote some fifty book-markings and his wife’s publications, inclusive of translations, number over a hundred.

HOWITZER (derived, through an earlier form howizet, and the Ger. Howitz, from the Bohemian houfnice = catapult, from which come also, through the Ital. obzata or obice, the French forms obus = shell and obusier = howitzer), a form of mobile ordnance in use from the 16th century up to the present day. It is a short and therefore comparatively light gun, which fires a heavy projectile at low velocity. A high angle of elevation is always given and the angle of descent of the projectile is consequently steep (up to 90°). On this fact is based the tactical use of the howitzer. The chief use for which this form of howitzer is of the greatest value for “searching” trenches, folds of ground, localities, &c., which are invulnerable to direct fire, while the more powerful siege howitzer has, since the introduction of modern artillery and, above all, of modern projectiles, taken the foremost place amongst the weapons used in siege warfare.

See Artillery, Ordnance and Fortification and Siegecraft.

HOWLER, a name applied to the members of a group of tropical American monkeys, now known scientifically as Alouata, although formerly designated Mycetes. These monkeys, which are of large size, with thick fur, sometimes red and sometimes black in colour, are characterized by the inflation of the hyoid bone (which supports the roof of the tongue) into a large shell-like prominence. The head is large, and its peculiar resonance to the voice from which they take their title. To allow space for the hyoid, the sides of the lower jaw are very deep and expanded. The muzzle is projecting, and the profile of the face slopes regularly backwards from the muzzle to the crown. The long tail is highly prehensile, thickly furred, with the under surface of the extremity naked. Howlers dwell in large companies, and in the early morning, and again in the evening, make the woods resound with their cries, which are often continued throughout the night. They feed on leaves, and are in the habit of sitting on the topmost branches of trees. When active, they progress in regular order, led by an old male. (R. L. *)

HOWRAH, a city and district of British India, in the Burdwan division of Bengal. The city is situated opposite Calcutta, with which it is connected by a floating bridge. The municipal area is about 11 sq. m.; pop. (1901) 157,504, showing an increase of 35% in the decade. Since 1872 the population has almost doubled, owing to the great industrial development that has taken place. Howrah is the terminus of the East Indian railway, and also of the Bengal-Nagpur and East Coast lines. It is also the centre of two light railways which run to Amta and Sheakhala. Further, it is the headquarters of the jute-manufacturing industry, with many steam mills, steam presses, also cotton mills, oil mills, rope-works, iron-works and engineering works. Shibpur Engineering College lies on the outskirts of the town. There is a hospital, with a department for Europeans, and Howrah forms a suburban residence for many people who have their place of business in Calcutta.

The District of Howrah extends southwards down the right bank of the Hugli to the confluence of the river Damodar. For revenue purposes it is included within the district of Hugli. Its area is 310 sq. m.; pop. (1901) 850,514, showing an increase of 11% in the decade. In addition to the two steam tramways and the East Indian railway, the district is crossed by the high-level canal to Midnapore, which communicates with the Hugli at Ulubaria. The manufacturing industries of Howrah extend beyond the city into the district. One or two systems of draining low-lying lands are maintained by the government.

HOWSON, JOHN SAIL (1816–1883), English divine, was born at Giggleswick-in-Craven, Yorkshire, on the 5th of May 1816. After receiving his early education at Giggleswick school, of which his father was head-master, he went to Trinity College, Cambridge, and there became tutor successively to the marquis of Sligo and the marquis of Lorne. In 1845 Howson, having taken orders, accepted the post of senior classical master at the Liverpool College under his friend W. J. Conybeare, whom he succeeded as principal in 1849. This post he held until 1855, and it was largely due to his influence that a similar college for girls was established at Liverpool. In 1866 he left Liverpool for the parish of Wisbech in Cambridgeshire, where he was appointed dean of Chester Cathedral, where he gave himself vigorously to the work of restoring the crumbling fabric, collecting nearly £100,000 in five years for this purpose. His sympathies were with the evangelical party, and he stoutly opposed the “Eastward position,” but he was by no means narrow. He did much to reintroduce the ministry of women as deaconesses. The building of the King’s School for boys, and the Queen’s School for girls (both in Chester), was due in a great measure to the active interest which he took in educational matters. He died at Bournemouth on the 5th of December 1885, and was buried in the cloister of Chester. Howson’s chief literary production was The Life and Epistles of St Paul (1852) in which he collaborated with Conybeare.

The book is still of interest, especially for its descriptive passages, which were mostly done by Howson; but later researches (such as those of Sir W. M. Ramsay) have made the geographical and historical sections obsolete, and the same may be said of the treatment of the Pauline theology.

HOWTH [pronounced Hoth], a seaside town of Co. Dublin, Ireland, on the rocky hill of Howth, which forms the northern horn of Dublin Bay, 9 m. N.E. by N. of Dublin by the Great Northern railway. Pop. (1901) 1166. It is frequented by the residents of the capital as a watering-place. The artificial harbour was formed (1897–1932) between the mainland and the picturesque island of Ireland’s Eye, and preceded Kingstown as the station for the mail-packets from Great Britain, but was found after its construction to be liable to silt, and is now chiefly used by fishing-boats and yachts. The collegiate church, standing picturesquely on a cliff above the sea, was founded about 1235, and has a monastic building attached to it. The embattled castle contains the two-handed sword of Sir Almeric Tristram, the Anglo-Norman conqueror of the hill of Howth, and a portrait of Dean Swift holding one of the Drapier letters, with Wood, the closer against whom he directed these attacks, prostrate before him. The view of Dublin Bay from the hill of Howth is of great beauty. Howth is connected with the capital by electric tramway, besides the railway, and another tramway encircles the hill.

HÖXTER, a town of Germany, in the Prussian province of Westphalia, prettily situated on the left bank of the Weser, and on the Prussian state railways Börsum-Soest and Scherfede-Holzminden, 32 m. N. of Cassel. Pop. (1905) 7609. It has a medieval town hall, and interesting houses with high gables and wood-carved façades of the 15th and 16th centuries. The most interesting of the churches is the Protestant church of St. Kilian,
HOY, Edmund, or Edmond (1672-1769), the first systematizer of the laws of whist, and author of a book on games, was born in 1672. His parentage and place of birth are unknown, and few details of his life are recorded. For some time he was resident in London, and partially supported himself by giving instruction in the game of whist. For the use of his rules he drew up a Short Treatise on the game, which after circulating for some time in manuscript was printed by him and entered at Stationers' Hall in November 1742. The laws of Hoye were continued to be regarded as authoritative until 1864, since which time they have been gradually superseded by the new rules adopted by the Arlington and Portland clubs in that year (see Whist). He also published rules for various other games, and his book on games, which includes the Short Treatise, has passed into many editions. The weight of his authority is indicated by the phrase "according to Hoye," which, doubtless first applied with reference to whist, has gained currency as a general proverb. Hoye died in London on the 29th of August 1769.

HOZIER, Pierre d', Seigneur de la Garde (1592-1660), French genealogist, was born at Marseilles on the 10th of July 1592. In 1616 he entered upon some very extensive researches into the genealogy of the noble families of the kingdom, in which work he was aided by his prodigious memory for dates, names and family relationships, as well as by his profound knowledge of heraldry. In 1654 he was appointed historiographer and genealogist of France, and in 1654 juge d'armes of France, an officer corresponding nearly to the Garter king-of-arms in England. In 1643 he was employed to verify the claims to nobility of the pages and equerries of the king's household. He accumulated a large number of documents, but published comparatively little, his principal works being Recueil armorial des anciennes maisons de Bretagne (1638); Les noms, surmons, qualités, armes et blasons des chevaliers et officiers de l'ordre du Saint-Esprit (1641); and the genealogies of the houses of the Rochechouart (1654), Bourbonnais (1657) and Amanzé (1659). He was renowned as much for his uprightness as for his knowledge, no slight praise in a profession exposed to so many temptations to fraud. He died in Paris on the 1st of December 1660. At his death his collections comprised more than 150 volumes or portfolios of documents and papers relating to the genealogy of the principal families in France. Of his six sons, only two survived him. His eldest son, Louis Roger d'Hozier (1634-1708), succeeded him as juge d'armes, but became blind in 1675, and was obliged to surrender his office to his brother,

Charles René d'Hozier (1640-1703), younger son of Pierre, was the true continuator of his father. In addition to his commentary appended to Antoine Varillas's history of King Charles IX. (1686 ed.), he published Recherches sur la noblesse de Champagne (1673). On the promulgation in 1666 of an edict directing all who had armorial bearings to register them on payment of 20 livres, he was employed to collect the declarations returned in the various généralités, and established the Armorial général de France. This work, which contained not only the armorial bearings of noble families, but also of those commoners who were entitled to bear arms, is not complete, inasmuch as many refused to register their arms, either from vanity or from a desire to evade the fee.

The collection (now in the Bibliothèque Nationale) consists of 34 volumes of text and 35 of coloured armorial bearings, and in spite of its deficiencies is a useful store of information for the history of the old French families. It contains 60,000 names, grouped according to provinces and provincial subdivisions. The sections relating to Burgundy and Franche-Comté were published by Henri de Saint-Ésprit (1745-1780), those relating to the généralité of Limousin, by Moreau de Pravieux (1805), and those for the dioceses of Reims, by P. Gossot (1903).

In 1717, in consequence of a quarrel with his nephew Louis Pierre, son of Louis Roger, Charles sold his collection to the king. It then comprised 160 portfolios of genealogical papers arranged alphabetically, 175 volumes of documents, and numerous printed books profusely annotated. In 1720 it was inventoried by P. de Clairambault, who added a certain number of genealogies taken from the papers of F. R. de Gaignet, increasing the
total to 217 boxes and portfolios. Thus originated the Cabinet des titres of the Bibliothèque Nationale. Charles subsequently became reconciled to his nephew, to whom he left all the papers he had accumulated from the date of the quarrel until his death, which occurred in Paris on the 13th of February 1732.

LOUIS PIERRE d'HOZIER (1685-1767), son of Louis Roger, published the Armorial général, ou registre de la noblesse de France (10 vols., 1736-1768), which must not be confused with the publication mentioned above, inasmuch as it related solely to noble families and was not an official collection. Complete copies of this work, which should contain six registres, are comparatively rare.

A seventh registre, forming vol. xi., prepared by Ambroise Louis Marie, nephew of Louis Pierre, was published in 1847 by comte Charles d'Hozié. Louis Pierre died on the 29th of September 1767. His eldest son, Antoine Marie d'Hozié de Sérigny (1721-1810), was his father's collaborator and continuator; and his fourth son, Jean François Louis, wrote an account of the knights of St Michael in the province of Poitou, which was published in 1856 by the vicomte P. de Chabot.

His nephew, AMBROISE LOUIS MARIE d'HOZIER (1764-1840), was the last of the juges d'armes of France. He held the position of first of the following three periods, including his time of office. He was born, however, on the 24th of August 1846. (C. B.*)

HARBANUS MAURUS MAGNENTIUS (c. 776-856), archbishop of Mainz, and one of the most prominent teachers and writers of the Carolingian age, was born of noble parents at Mainz. Less correct forms of his name are Rabanus and Rabhanus. The date of his birth is uncertain, but in 801 he received deacon's orders at Fulda, where he had been sent to school; in the following year, at the instance of Ratgar, his abbot, he went together with Haimon (afterwards of Halberstadt!) to complete his studies at Tours under Alcuin, who, in recognition of his diligence and of the benefaction of his father, gave him the surname Maurus, after St Maur the favourite disciple of Benedict. Returning after the lapse of two years to Fulda, he was entrusted with the principal charge of the school, which under his direction rose into a state of great efficiency for that age, and sent forth such pupils as Walafrid Strabo, Servatus Lupus of Ferrières and Otfried of Weissenburg.

At this period it is most probable that his Excerptio from the grammar of Priscian, long so popular as a text-book during the middle ages, was compiled. In 814 he was ordained a priest; but shortly afterwards, apparently on account of disagreement with Ratgar, he was compelled to withdraw from his abbot's house at Tournai, and to seek a new home at Fulda. This "banishment" is understood to have occasioned the pilgrimage to Palestine to which he alludes in his commentary on Joshua. He returned to Fulda on the election of a new abbot (Egil) in 817, upon whose death in 823 he himself became abbot.

The duties of this office he discharged with efficiency and success, and in 842, when, in order to secure greater leisure for literature and for devotion, he resigned and retired to the neighbouring cloister of St Peter's. In 847 he was again constrained to enter public life by his election to succeed Otag in the archbishopric of Mainz, which see he occupied for upwards of eight years. The principal incidents of historical interest belonging to this period of his life are his hostilities with Gottschalk (q.v.); they may be regarded as thoroughly typical of that cruel intolerance which he shared with all his contemporaries, and also of that ardent zeal which was peculiar to himself; but they hardly do justice to the spirit of kindly benevolence which in less trying circumstances he was ever ready to display.

He died at Winkel on the Rhine, on the 4th of February 856. He is frequently referred to as St Rabanus, but incorrectly.

His voluminous works, many of which remain unpublished, comprise commentaries on a considerable number of the books both of canonical and of apocryphal Scripture (Genesis to Judges, Ruth, Esther, Lamentations, Ecclesiastes, Jeremiah, Lamentations, Ezekiel, Maccabees, Matthew, the Epistles of St Paul, including Hebrews); and various treatises relating to doctrinal and practical subjects, including more than one complete series of Homilies. Perhaps the most important is that De institutione clericorum, in three books, by which he did much to bring into prominence the views of Augustine and Gregory the Great. This treatise is the direct origin of the clerical training of the clergy and the right discharge of the clerical function; the most popular has been an apocryphal worthless tract De laudibus sanctae crucis. Among the others may be mentioned the De universo libri sev., seu etymologiarum against his brother-in-law Hiorvat, the name Kraki (pole) towards the historical and mystical interpretation of Scripture, the De sacratis ordinaribus, the De disciplina ecclesiastica and the Mariology. All of them are characterized by erudition (he knew even some Greek and Hebrew) rather than by originality of thought.

The poems are of singularly little interest or value, except as including one form of the "Veni Creator." In the annals of German scholarship they are of special interest in the form of the Latin-Old-German "beowulf," a commentary, Super Porphyrius, printed by Courcelle, in the Oeuvres initides d'Abélard, and assigned both by that editor and by Hauréau to Hrabanus Maurus, is now generally believed to have been the work of Abélard.

The first nominally complete edition of the works of Hrabanus Maurus was that of Colvener (Cologne, 6 vols. fol., 1627). The Opera omnia form vols. cxi.-cxii. of Migne's Patrologiae cursus completes. The De universo, in the subject of Compendiose Naturwissenschaften an der Schule zu Fulda im IX. Jahrhundert (Berlin, 1880), Maurus is the subject of monographs by Schwarz (De Rhahano Mauro primo Germaniae prosectori, 1811), Kunmann (Historische Monographie über Rabanus Magnentius Maurus, 1841), Spengler (Leben des heil. Rabanus Maurus, 1856) and Köhler (Rabanus Maurus u. die Schule zu Fulda, 1750). Lives by his contemporaries Thietmar, Walbert and Joachim von Keßelsbach are all published in the Cologne edition of the Opera. See also Pertz, Monastika Germaniae ii. and iii. (ii. and ii.); Bähr, Gesch. d. römischen Literatur im Karoling. Zeitalter (1840), and Hauck's article in the Herzog-Hauck Realen (1867), ed. 3.

HÖLFR KRÁKI, perhaps the most famous of the Danish kings of the heroic age. In Beowulf, he is represented as reigning over Denmark in conjunction with his uncle Hrothgar, one of the three sons of an earlier king called Healfdene. In the Old Norse sagas Hrólf is the son of Helgi (Halga), the son of Haldian (Hallfiden). He is represented as a wealthy and peace-loving monarch similar to Hrothgar in Beowulf, but the latter (Hroar, or Roe) is quite overshadowed by his nephew in the Northern authorities. The chief incidents in Hrólf's career are the visit which he paid to the Swedish king Áslís (Becuwulf's Eadgils), of which several different explanations are given, and the war, in which he eventually lost his life, against the Jomsvikings, which is described in the two poems composed in the Cologne edition of the Opera. The name Kraki (pole-ladder) is said to have been given to him on account of his great height by a young knight named Vögg, whom he handsomely rewarded and who eventually avenged his death on Hörüvar. There is no reason to doubt that Hrólf was an historical person and that he reigned in Denmark during the early years of the 6th century, but the statement found in all the sagas that he was the stepson of Áslís seems hardly compatible with the evidence of Beowulf, which is a much earlier authority.

See Saxo Grammaticus, Gesta Danorum, pp. 52-58, ed. A. Holder (Strassburg, 1886); and A. Orlin, Danmarks Hetsedigtning (Copenhagen, 1903).

HROSVITHA (frequently Roswitha, and properly Hrotsvit), early medieval dramatist and chronicler, occupies a very notable position in the history of modern European literature. Her endeavours formed part of the literary activity by which the age of the emperor Otto the Great sought to emulate that of Charles the Great. The famous nun of Gandersheim has occasionally been confounded with the other nuns of the same name, who must have died at least half a century earlier.

The younger Hrosvitha was born in all probability about the year 935; and, if the statement be correct that she sang the praises of the three Ottos, she must have lived to near the close of the
The literary works of Hrosvitha, all of which were as a matter of course in Latin, divide themselves into three groups. Of these the first is comprised by such a series of religious poems, in leonine hexameters or distichs. Their subjects are the Nativity of the Virgin (from the apocryphal gospel of St James, the brother of our Lord), the Ascension and a series of legends of saints (Gandolf, Pelagius, Theophilus, Basil, Denis, Agnes). Like these narrative poems, the dramas to which above all Hrosvitha owed her fame seem to have been designed for reading aloud or recitation by sisters of the convent. For though there are indications that the idea of their representation was at least present to the mind of the authoress, the fact of such a representation appears to be an unwarrantable assumption. The comedies of Hrosvitha are six in number, being doubtless in this respect also intended to recall their nominal model, the comedies of Terence. They were devised on the simple principle that the world, the flesh and the devil should not have all the good plays to themselves. The experiment upon which the young Christian dramatist ventured was accordingly, although not absolutely novel, audacious enough. In form the dramas of the "strong voice of Gandersheim," as Hrosvitha (possibly alluding to a supposed etymology of her name) calls herself, are by no means Terentian. They are written in prose, with an element of something like rhythm, and an occasional admixture of rhyme. In their themes, and in the treatment of these, they are what they intended to be, the direct opposites of the lightsome adapter of Menander. They are founded upon legends of the saints, selected with a view to a glorification of religion in its supremest efforts and most transcendentals aspects. The emperor Constantine's daughter, for example, Constantia, gives her hand in marriage to Galluscanus, just before he starts on a Scythian campaign, though she has already taken a vow of perpetual maidenhood. In the hour of battle he is himself converted, and, having on his return like his virgin bride chose the more blessed unmarried state, dies as a Christian martyr in exile. The three holy maidens, Agape, Chionia and Irene, are preserved by a humorous miracle from the evil designs of Dulcitius, to offer up their pure lives as a sacrifice under Diocletian's persecutions. Callimachus, who has Romeo-like carried his earthly passion for the saintly Drusiana into her tomb, and among its horrors has met with his own death, is by the mediation of St John raised with her from the dead to a Christian life. All these themes are treated with both spirit and skill, often with instinctive knowledge of dramatic effect—often with genuine touches of pathos and undeniable felicities of expression. In Dulcitius there is also an element of comedy, or rather of farce. How far Hrosvitha's comedies were an isolated phenomenon of their age in Germany must remain undecided; in the general history of the drama they form the visible bridge between the few earlier attempts at utilizing the forms of the classical drama for Christian purposes and the miracle plays. They are in any case the productions of genius; nor has Hrosvitha missed the usual tribute of the supposition that Shakespeare has borrowed from her writings.

The third and last group of the writings of Hrosvitha is that of her verified historical chronicles. At the request of the abbess Gerberga, she composed her Carmen de gesis Oddonis, an epic attempting in some degree to follow the great Roman models, attempted and completed by the year 968, and presented by the authoress to both the old emperor and his son (then already crowned as Otto II). This poem so closely adheres to the materials supplied to the authoress by members of the imperial family that, notwithstanding its courtesies omissions, it is regarded as an historical authority. Unfortunately only half of it remains; but the beginning, consisting of the period from 953 to 962 is lost, except the exception of a few fragments, and the period from 962 to 967 is summarized only. Subsequently, in a poem (of 837 hexameters) De primaritis et fundatoribus coenobii Gandersheimensis, Hrosvitha narrated the beginnings of her own convent, and its history up to the year 919.

The Munich MS., which contains all the works enumerated above except the Chronicle of Gandersheim, was edited by the great Vienna scholar, Abadler Ceteles, in 180. The edition of Ceteles was published at Nuremberg, with eight wood-cuts by Albrecht Dürer. It was re-edited by H. L. Schurzschleissch and published at Wittenberg in 1856. A more recently published edition was made by J. Bendschin (Lübeck, 1879), and into French by C. Magnin (Paris, 1845), whose introduction gives a full account of the authoress and her works. See also her Poésies latines, with a translation into French verse by V. Rétif de la Bretonne (Paris, 1854). A copious analysis of her plays will be found in Klein, Geschichte des Dramas, iii. 665-754. See also W. Creizenach, Geschichte des neueren Dramas, i. 17 sqq. (Halle, 1893), and A. W. Ward, History of English Dramatic Literature, i. 6 sqq. (Cambridge, 1899). Gustav Freytag wrote a dissertation, De Rosvitha poetria (Breslau, 1839), to qualify himself as an academical teacher, which, as he records (Erinnerungen aus dem Theater, 1836), Leipsic, 1836), was to the German, a thousand years since, to compose dramatically; and at the beginning of Albart Cohn's Shakespeare in Germany, 1865, Shakespeare, his plays, and passages in Hrosvitha's dramas. Her two chronicles in verse were edited by Z. H. Pertz in the Monumenta Germaniae, iv. 365-335 (Hanover, 1841). See also J. P. Migeon, Pathologies cur., compl. en un tableau historique, vol. iii. (Paris, 1843). As a commentary in his Scripere ur. Brunsvicii. (Hanover, 1707-1711). For other early editions of these see A. Potthast, Bibliotheca historiae mediæ aevi (supplement, Berne, 1563); and for an appreciation of them see Wattenbach, Geschichtsquellen, pp. 214-216, and Geschichtl. Deutsche Kaiserzeit, i. 780, who mentions a German translation by Pund (1866). There is a complete edition of the works of Hrosvitha in the Deutsche Texte, ed. Alexander Koch (Nürnberg, 1866-1869), from which it seems to prove that Celtes had forged the productions which he published under the name of Hrosvitha, but he was refuted by R. Köppel, Le Vieux Texte, France, Livre 3 (Paris, 1869), cited by Creizenach, mentions a curious experience of the performance of Hrosvitha's comedies in the Théâtre des Marionnettes at Paris.

HÜAN TSANG (Huouen Tshang, Hiwén T'Shang, Yuan Tsang, Yuan-Chwang), the most eminent representative of a remarkable and valuable branch of Chinese literature, consisting of the narratives of Chinese Buddhist monks who travelled to India, whilst their religion flourished there, with the view of visiting the sites consecrated by the history of Sakya Muni, of studying at the great convents which then existed in India, and of collecting books, relics and other sacred objects.

The importance of these writings as throwing light on the geography and history of India and adjoining countries, during a very important epoch, is great, and they have been the source of important commentaries by modern students. Several Chinese memoirs of this kind appear to have perished; and especially to be regretted is a great collection of the works of travellers to India, religious and secular, in sixty books, with forty more of maps and illustrations, published at the expense of the emperor Kao-Tung of the T'ang dynasty, A.D. 606, with a preface from the imperial hand. We will mention the classical travellers of this description who are known to us by name:

1. Shi-ko-an (d. 585) wrote a work on his travels to the western lands (an expression applying often to India), which is said to have been lost. It was translated into Japanese by a disciple of the great emperor Tai-Tsong, and returned by sea in 414. His work, called Fo-Kuan Ki, or, A Journey on the Buddha Realms, has been translated by Abel-Rémusat and Landresse, and again into English by the Rev. S. Beale; Mr Laydlay of Calcutta also published a translation from the French, with interesting notes.
2. Hsuan Seng and Sung-Yun, monks, travelled to India to collect books and relics, 518-521. Their short narrative was translated by Kame Friedrich Neumann, and also by Mr Beale (along with Fa-Hien). 3. Hsuan Tsang, the subject of this notice. In relation to his travels there are two Chinese works, both of which have been translated with an immense absorption of labour and scholarship by M. Stanišić in the Memos on Western Countries issued by the T'ang Dynasty, which was compiled under the traveller's own supervision, by order of the great emperor Tai-Tsong; and (b) A Biography of Hsuan Tsang by Dr Charles Higham, in the Travellers, compiled and published under imperial authority, 1890. The Itinerary of Khi-Wie, which travelled (964-976) at the head of a large body of monks to collect books, &c. Neither of the last two has been translated.
Hsien Tsang was born in the district of Keu-Shi, near Honan-Fu, about 605, a period at which Buddhism appears to have had a powerful influence upon a large body of educated Chinese. From childhood grave and studious, he was taken in charge by an older brother who had adopted the monastic life, in a convent at the royal city of Loyang in Honan. Hsien Tsang, as a youth, followed his brother's example. For some years he travelled over China, teaching and learning, and eventually settled for a time at the capital Chang-gan (now Si-gan-fu in Shensi), where his fame for learning became great. The desire which he entertained to visit India, in order to penetrate all the doctrines of the Buddhist philosophy, and to perfect the collections of Indian books which existed in China, grew irresistible, and in August 629 he started upon his solitary journey, eluding with difficulty the strict prohibition which was in force against crossing the frontier.

The "master of the law," as his biographers call him, plunged alone into the terrible desert of the Gobi, then known as the Sha-mo or "Sand River," between Kwa-chow and Igu (now Hami or Kamil). At long intervals he found help from the small garrisons of the towers that dotted the desert track. Very striking is the description, like that given six centuries later by Marco Polo, of the quasi-supernatural horrors that beset the lonely traveller in the wilderness—the visions of armies and banners; and the manner in which they are dissipated singularly recalls passages in Bunyan's Pilgrim's Progress. After great suffering Hsien Tsang reached Igu, the seat of a Turkish principality, and plunders the way by the fear of T'ian-shan, which he crossed by a glacier pass (vividly described) in the longitude of Lake Issyk-kul. In the valley of the Talas river he encounters the great khans of the Turks on a hunting party,—a rencontre which it is interesting to compare with the visit of Zemarchus to the great khan Dizabul, sixty years before, in the same region. Passing by the present Tashkend, and by Samarkand, then inhabited by fire worshippers, he reached the basin of the Upper Oxus, which had recently been the seat of the powerful dominion of the Hiaitheth, Epltithalites or White Huns, known in earlier days to the Greeks as Tochari, and to Hsian Tsang (by the same name) as Tubu-lo or Tubhara. His account of the many small states into which the Tubhara empire had broken up is of great interest, as many of them are identical in name and topography with the high valley states and districts on the Upper Oxus, which are at this day the object of so much geographical and political interest.

Passing by Biamin, where he speaks of the great idols still so famous, he crosses Hindu-Kush, and descends the valley of the Kabul river to Nagararaha, the site of which, still known as Nagar, adjoining Jalalabad, has been explored by Mr W. Simpson. Travelling thence to Peshawar (Parushapura), the capital of Gandhara, he made a digression, through the now inaccessible valley of Swat and the Dard states, to the Upper Indus, returning to Peshawar, and then crossing the Indus (Sinua) into the decayed kingdom of Taxila (Ta-chha-si-lo, Takhasila), then subject to Kashmir. In the latter valley he spent two whole years (631-633) studying in the convents, and visiting the many monasteries of his faith. In his further travels he visited Mathura (Mot'ula, Muttra), whence he turned north to Thanesar and the upper Jumna and Ganges, returning south down the valley of the latter to Kanyakubja or Kanauj, then one of the great capitals of India. The pilgrim next entered on a circuit of the most famous sites of Buddhist and of ancient Indian history, such as Ajodhya, Prayaga (Allahabad), Kausambi, Sravasti, Kapila, the "high"-place of Sukya, Kusinagara, his death-place, Patliputra (Patna, the Patilothra of the Greeks), Gaya, Rajagirha and Nalanda, the most famous and learned monastery and college in India, adored by the gifts of successive kings, of the splendour of which he gives a vivid description, and of which traces have recently been recovered. There he again spent nearly two years in mastering Sanskrit and the depths of Buddhist philosophy. Again, proceeding down the banks of the Ganges, he diverged eastward to Kamarupa (Assam), and then past by the great ports of Tamlalpi (Tamluk), the mis-

placed Tamalitis of Ptolemy), and through Orissa to Kanchipuram (Conjeeveram), about 640. Thence he went northward through the Carnatic and Maharashtra to Barakacheva (Broach of our day, Bara-gaza of the Greeks). After this he visited Malwa, Cutch, Surashtra (peninsular Gujarath, Syraetren of the Greeks), Sind, Multan and Ghazni, whence he rejoined his former course in the basin of the Kabul river.

This time, however, he crosses Pamir, of which he gives a remarkable account, and passes by Kasghar, Khotan (Kustana), and the vicinity of Lop-nor across the desert to Kwa-chow, whence he had made his venturous and lonely plunge into the waste fifteen years before. He carried with him great collections of books, precious images and reliques, and was received (April 645) with public and imperial enthusiasm. The emperor T'ai-Tsong desired him to commit his journey to writing, and also that he should abandon the eremitic rule and serve the state.

Again he embarked on his "journey into the compilation of his narrative and the translation of the books he had brought with him from India. The former was completed A.D. 648. In 654 Hsian Tsang died in a convent at Chang-gan. Some things in the history of his last days, and in the indications of beatitude recorded, strongly recall the parallel history of the saints of the Roman calendar. But on the other hand we find the Chinese saint, on the approach of death, causing one of his disciples to frame a catalogue of his good works, of the books that he translated or committed to be transcribed, of the sacred pictures executed at his cost, of the arts that he had given, of the living creatures that he had distributed before his death. When Ka-shang had ended writing this list, the master ordered him to read it aloud.

After hearing it the devotees clasped their hands, and showered their felicitations on him." Thus the "well-done, good and faithful" comes from the servant himself in self-applause.

The book of the biography, by the disciples Hwai-li and Yen-tsung, as rendered with judicious omissions by Stan. Julien, is exceedingly interesting; its Chinese style receives high praise from the translator, who says he has often had to regret his inability to reproduce its grace, elegance and vividness.

HUAMBISAS, a tribe of South American Indians on the upper Marañon and Santiago rivers, Peru. In 1841 they drove all the civilized Indians from the neighbouring missions. In 1843 they killed all the inhabitants of the village of Santa Teresa, between the mouths of the Santiago and Morona. They are fair-skinned and bearded, sharing with the Jevers a descent from the Spanish women captured by their Indian ancestors at the sack of Sevilla del Oro in 1599.

HUANCAVELICA, a city of central Peru and capital of a department, 160 m. S.E. of Lima. The city stands in a deep valley near the Andes at an elevation of 7000 ft. above sea; the mine has a working length of 1 m. Pop. (1906 estimate) 6000. The city is solidly and regularly built; the houses being of stone and the stream that flows through the town being spanned by several stone bridges. Near Huancavelica is the famous quicksilver mine of Santa Barbara, with its subterranean church of San Rosario, hewn from the native cinnamon-bearing rock. Huancavelica was founded by Viceroy Francisco de Toledo in 1572 as a mining town, and mining continues to be the principal occupation of its inhabitants. The
department is traversed by the Cordillera Occidental, and is bounded by N. E. and S. by Junin and Ayacucho. Pop. (1906 official estimate) 167,358; area, 9254 sq. m. The principal industry is mining for silver and quicksilver. The best-known silver mines are the Castrovirirena.

HUÁNUCO, a city of central Peru, capital of a department, 170 m. N.N.E. of Lima in a beautiful valley on the left bank of the Huallaga river, nearly 6000 ft. above sea-level. Pop. (1906 estimate) about 6000. The town was founded in 1539 by Gomez Alvarado. Huánuco is celebrated for its fruits and sweetmeats, the "chirimoya" (Anona chirimolica) of this region being the largest and most delicious of its kind. Mining is one of the city's industries. Huánuco was the scene of one of the bloodthirsty massacres of which the Chincas were guilty during their occupation of Peruvian territory in 1881-1883. The department of Huánuco lies immediately N. of Junin, with Ancachs on the W. and San Martin and Loreto on the N. and E. Pop. (1906 estimate) 168,950; area, 14,258 sq. m. It lies wholly in the Cordillera region, and is traversed from S. to N. by the Marañón and Huallaga rivers.

HUARAZ, a city of northern Peru and capital of the department of Ancachs, on the left bank of the Huara or Santa river, about 190 m. N.N.W. of Lima and 58 m. from the coast. Pop. (1876) 4851, (1906 estimate) 6000. Huaraz is situated in a narrow fertile valley of the Western Cordillera, at a considerable elevation above sea-level, and has a mild climate. A railway projected to connect Huaraz with the port of Chimbote, on the Bay of Chimbote, a few miles S. of the mouth of the Santa river, was completed from Chimbote to Suchetamán (33 m.) in 1872, when work was suspended for want of money. In the valley of the Huaraz cattle are raised, and wheat, sugar and fruit, gold, silver, copper and coal are produced. Alfalfa is grown by stock-raisers, and the cattle raised here are among the best in the Peruvian market. In the vicinity of Huaraz are megalithic ruins similar to those of Tiahuanaco and Cuzco, showing that the aboriginal empire preceding the Incas extended into northern Peru.

HUARTE DE SAN JUAN, or Huarte Y NAVARRO, Juan (c. 1539-1562), Spanish physician and psychologist, was born at Saint-Jean-Pied-de-Port (Lower Navarre) about 1539, was educated at the university of Huesca, where he graduated in medicine, and, though it appears doubtful whether he practised as a physician at Huesca, distinguished himself by his professional skill and heroic zeal during the plague which devastated Baeza in 1566. He died in 1592. His Examen de ingenios para las ciencias (1575) won him a European reputation, and was translated by Lessing. Though now superseded, Huarte's treatise is historically interesting as the first attempt to show the connexion between psychology and physiology, and its acute ingenuity is as remarkable as the boldness of its view.

HUASTECS, a tribe of North American Indians of Mayan stock, living to the north of Vera Cruz. They are of interest to the ethnologist as being so entirely detached from the other Mayan tribes of Central America. The theory is that the Mayas came from the north and that the Huastecs were left behind in the migration southward.

HUBER, FRANÇOIS (1739-1831), Swiss naturalist, was born at Geneva on the 2nd of July 1739. He belonged to a family which had already made its mark in the literary and scientific world: his great-uncle, Marie Huber (1603-1753), was known as a voluminous writer on religious and theological subjects, and as the translator and epitomizer of the Spectator (Amsterdam, 3 vols., 1753); and his father Jean Huber (1721-1786), who had served many years as a soldier, was a prominent member of the coterie at Ferney, distinguishing himself by his Observations sur le vol des oiseaux (Geneva, 1754). François Huber was only fifteen years old when he began to suffer from an affection of the eyes which gradually resulted in total blindness; but, with the aid of his wife, Marie Aimée Lüdtke, and of his servant, François Burnens, he was able to carry out investigations that laid the foundations of our scientific knowledge of the life history of the honey-bee. His Nouvelles Observations sur les abeilles was published at Geneva in 1792 (Eng. trans., 1806). He assisted Jean Senecier in his Mém. sur l'influence de l'air, etc., dans la germination (Geneva, 1800); and he also wrote "Mém. sur l'origine de la cire" (Bibliothèque britannique, tome xxv.), a "Lettre à M. Pictet sur certains dangers que courent les abeilles" (Bibl. brit. xxvii.), and "Nouvelles Observ. rel. au sphinx Atropos" (Bibl. brit. xxvii.). He died at Lausanne on the 22nd of December 1831. De Candolle gave his name to a genus of Brazilian trees—Huberia laurina.

PIERRE HUBER (1777-1840) followed in his father's footsteps.

His best-known work is Recherches sur les maurs des fourmis indigènes (Geneva and Paris, 1819; new ed., Geneva, 1861), and he also wrote various papers on entomological subjects.

See the account of François Huber, by De Candolle, in Bibl. universelle (1832); and the notice of Pierre in Bibl. univ. (1866); also A. de La Franaye, Histoire des fourmis indigènes (1840).

HUBER, JOHANN NEPOMUK (1839-1879), German philosophical and theological writer, a leader of the Old Catholics, was born at Munich on the 18th of August 1839. Originally destined for the priesthood, he early began the study of theology. By the writings of Spinoza and Oken, however, he was strongly drawn to philosophical pursuits, and it was in philosophy that he "habilitated" (1854) in the university of his native place, where he ultimately became professor (extraordinarius, 1859; ordinarius, 1864). With Döllinger and others he attracted a large element of public attention in 1860 by the commission of the Ultramontane promoters of the Vatican council in the treatise Der Pöpft und das Konzil, which appeared under the pseudonym of "Janus," and also in 1870 by a series of letters (Römische Briefe, a redaction of secret reports sent from Rome during the sitting of the council), which were published over the pseudonym Quirinus in the Allgemeine Zeitung. He died suddenly of heart disease at Munich on the 20th of March 1879.

HUBER, LUDWIG FERDINAND (1764-1840), German author, was born in Paris on the 14th of September 1764, the son of Michael Huber (1727-1804), who did much to promote the study of German literature in France. In his infancy young Huber removed with his parents to Leipzig, where he was carefully instructed in modern languages and literature, and showed a particular inclination for those of France and England. In Leipzig he became intimate with Christian Gottfried Körner, father of the poet; in Dresden Huber became engaged to Dora Stock, sister of Körner's betrothed, and associated with Schiller, who was one of Körner's staunchest friends. In 1787 he was appointed secretary to the Saxon legation in Mainz, where he remained until the French occupation of 1792. While he was there he interested himself for the welfare of the family of his friend Georg Forster, who, favouring republican views, had gone to Paris, leaving his wife Therese Forster (1764-1829) and family in destitute circumstances. Huber, enamoured of the talented young wife, gave up his diplomatic post, broke off his engagement to Dora Stock, removed with the Forster family to Switzerland, and on the death of her husband in 1794 married Therese Forster. In 1798 Huber took over the editorship of the Allgemeine Zeitung in Stuttgart. The newspaper having been prohibited by Württemberg, Huber continued his opposition in 1806 at Ulm in 1807. He was created "counselor of education" for the new Bavarian province of Swabia in the following year, but had hardly entered upon the functions of his new office when he died on the 24th of December 1804.
Huber was well versed in English literature, and in 1785 he published the drama Ethelwolf, with notes on Beaumont and Fletcher and the old English stage. He also wrote many dramas, comedies and tragedies, most of which are now forgotten, and among them only Das heimliche Gericht (1790, new ed. 1795) enjoyed any degree of popularity. As a critic he is seen to advantage in the Vermischte Schriften von dem Verfasser des heimlichen Gerichts (2 vols. 1793). As a publicist he made his name in the historical-political periodicals Friedenspräludien (1794-1796, 10 vols.) and Klio (1795-1798, 1819).

Hubert's collected works, Ständische Werke seit dem Jahre 1802 (4 vols., 1807-1819), were published with a biography by his wife Therese Huber. See L. Speidel and H. Wittmann, Bilder aus der Schiller-Zeit (1942, important).

HUBERT (HucBERTUS, HUBERTUS), ST. (d. 727), bishop of Liége, whose festival is celebrated on the 3rd of November. The Bollandists have published seven different lives of the saint. The first is the only one of any value, and is the work of a contemporary. Unfortunately, it is very sparing of details. In it we see that Hubert in 708 succeeded Lambert in the see of Maastricht (Tongres), and that he erected a basilica to his memory. In 825 Hubert's remains were removed to a Benedictine cloister in the Ardennes, which thenceforward bore his name (St Hubert, province of Luxemburg, Belgium), and ultimately became a considerable resort of pilgrims. The later legends (Bibliotheca hagiographica latina, nos. 3994-4000) are dependent probably directly or indirectly on Hubert's own life, which is closely following the legend of St Eustace, the miracle of the conversion of St Hubert. This conversion, represented as having been brought about while he was hunting on Good Friday by a miraculous appearance of a stag bearing between his horns a cross or crucifix surrounded with rays of light, has frequently been made the subject of artistic treatment. He is the patron of hunters, and is also invoked in cases of hydrophobia. Several orders of knighthood have been under his protection; among these may be mentioned the Bavarian, the Bohemian and that of the electorate of Cologne.

HUBERTSBURG, a château in the kingdom of Saxony, near the village of Wormsdorf and midway 6 m. between the towns Oschatz and Grimma. It was built in 1721-1724 by Frederick Augustus II., elector of Saxony, subsequently King Augustus III. of Poland, as a hunting box, and was once the scene of brilliant festivities. It is famous for the peace signed here on the 15th of February 1763, which ended the Seven Years' War. After undergoing various vicissitudes, it now serves the purpose of a lunatic asylum and a training school for nursing sisters.

See Riemer, Das Schloss Hubertsburg, sonst und jetzt (Oschatz, 1881).

HUBILLI, a town of British India, in the Dharwar district of Bombay, 15 m. S.E. of Dharwar town. Pop. (1901) 60,214. It is a railway junction on the Southern Maratha system, where the lines to Bangalore and Beawada branch off south and west. It is an important centre of trade and of cotton and silk weaving, and has two cotton mills and several factories for ginning and pressing cotton. Hubili was in early times the seat of an English factory, which, with the rest of the town, was plundered in 1673 by Sivaji, the Maratha leader.

HÜBNER, EMIL (1834-1901), German classical scholar, son of the historical painter Julius Hübner (1866-1885), was born at Düsseldorf on the 7th of July 1834. After studying at Berlin and Bonn, he travelled extensively with a view to antiquarian and epigraphical researches. The results of these travels were embodied in several important works: Inscriptiones Hispaniae Latinae (1860, supplement 1862), I.H. Christianae (1871, supplement 1900); Inscriptiones Britanniae Latinae (1873), I.B. Christianae (1876); La Arqueologia de España (1888); Monumenta linguae Hibernicae (1893). Hübner was also the author of two books of the greatest utility to the classical student: Grundriss zu Vorlesungen über die römische Literaturgeschichte (4th ed. 1878, edited, with large additions, by J. E. B. Mayor as Bibliographical Clue to Latin Literature, 1873), and Bibliographie der klassischen Altertumswissenschaft (2nd ed., 1889); mention may also be made of Römische Epigraphik (2nd ed., 1892); Exempla Scripturae Epigraphicae Latinae (1885); and Römische Epigraphik (3rd ed., 1889). Hübner was appointed professor of Classical Philology in the university of Berlin, where he died on the 21st of February 1901.

HÜBNER, JOSEPH ALEXANDER, Count (1811-1892), Austrian diplomatist, was born in Vienna on the 26th of November 1811. His real name was Hafenbrödl, which he afterwards changed to Hübner. He began his public career in 1833 under Metternich, whose confidence he soon gained, and who sent him in 1837 as attaché to Paris. In 1841 he became secretary of embassy to Lisbon, and in 1844 Austrian consul-general at Leipzig. In 1848 he was sent to Milan to conduct the diplomatic correspondence of Archduke Rainer, viceroy of Lombardy. On the outbreak of the revolution he was seized as a hostage, and remained a prisoner for some months. Returning to Austria, he was entrusted with the compilation of the documents and proclamations relating to the abdication of the Emperor Ferdinand and the accession of Francis Joseph. His journal, an invaluable clue to the complicated intrigues of this period, was published in 1891 in French and German, under the title of Une Année de ma vie, 1848-1849. In March 1849 he was sent on a special mission to Paris, and later in the same year was appointed ambassador to France. To his influence was in large measure due the friendly attitude of Austria to the Allies in the Crimean War, at the close of which he represented Austria at the congress of Paris in 1856. He allowed himself, however, to be taken by surprise by Napoleon's intervention on behalf of Italian unity, of which the first public intimation was given by the French emperor's cold reception of Hübner on New Year's Day, 1859, with the famous words: "I regret that our relations with your Government are not so good as they have hitherto been." He did not return to Paris after the war, and after holding the ministry of police in the Goulchowski cabinet from August to October 1859, lived in retirement till 1865, when he became ambassador at Rome. Quitting this post in 1867, he undertook extensive travels, his descriptions of which appeared as Promenade durch Arabien (1867), Elvbegriff in Transjordanien und Palästina (1872), geschrieben durch Lady Herbert, 1874) and Through the British Empire (1886). Written in a bright and entertaining style, and characterized by shrewd observation, they achieved considerable popularity in their time. A more serious effort was his Sixte-Quint (1870, translated into English by H. E. H. Jerningham under the title of The Life and Times of Sixtus the Fifth, 1872), an original contribution to the history of the period, based on unpublished documents at the Vatican, Simancas and Venice. In 1879 he was made a life-member of the Austrian Upper House, where he sat as a Clerical and Conservative. He had received the rank of Baron (Freiherr) in 1854, and in 1888 was raised to the higher rank of Count (Graf). He died at Vienna on the 30th of July 1892.

Though himself of middle-class origin, he was a profound admirer of the old aristocratic régime, and found his political ideals in his former chiefs, Metternich and Schwarzenberg. As the last survivor of the Metternich school, he became towards the close of his life more and more out of touch with the trend of modern politics, but remained a conspicuous figure in the Upper House and at the annual delegations. That he possessed the breadth of mind to appreciate the working of a system at total variance with his own school of thought was shown by his grasp of British colonial questions. It is interesting, in view of subsequent events, to note his emphatic belief in the loyalty of the British colonies—a belief not shared at that time by many statesmen with far greater experience of democratic institutions.

HUC, ÉVARISTE RÉGIS (1813-1860), French missionary-traveller, was born at Toulouse, on the 1st of August 1813. In his twenty-fourth year he entered the congregation of the Lazarists at Paris, and shortly after receiving holy orders in
HUCBOLD—HUCHOWN

1839 went out to China. At Macao he spent some eighteen months in the Lazarist seminary, preparing himself for the regular work of a missionary. Having acquired some command of the Chinese tongue, and modified his personal appearance and dress in accordance with Chinese taste, he started from Canton an intrepid Christian mission in the southern provinces, and then proceeding to Peking, where he perfected his knowledge of the language, eventually settled in the Valley of Black Waters or He Shu, a little to the north of the capital, and just within the borders of Mongolia. There, beyond the Great Wall, a large but scattered population of native Christians had found a refuge from the persecutions of the reign of Kang, to be united half a century later in a vast but vague apostolic vicariate. The ascendency with which Huc devoted himself to the study of the dialects and customs of the Tartars, for whom at the cost of much labour he translated various religious works, was an admirable preparation for undertaking in 1844, at the instigation of the vicar apostolic of Mongolia, an expedition whose object was to dissipate the obscurity which hung over the country and habits of the Tibetans. September of that year found the missionary at Dolon Nor occupied with the final arrangements for his journey, and shortly afterwards, accompanied by his fellow-Lazarist, Joseph Gabet, and a young Tibetan named Dolon Kham, his views were carried into effect. They now attracted attention the little party assumed the dress of lamas or priests. Crossing the Hwang-ho, they advanced into the terrible sandy tract known as the Ordoes Desert. After suffering dreadfully from want of water and fuel they entered Kansu, having recrossed the flooded Hwang-ho, but it was not till January 1845 that they reached Tang-Kiul on the boundary. Rather than encounter alone the horrors of a four months' journey to Lhasa they resolved to wait for eight months till the arrival of a Tibetan embassy on its return from Peking. This embassy, which had been employed to study the Tibetan language and Buddhist literature, and during three months of their stay they resided in the famous Kunbum Lamasery, which was reported to accommodate 4000 persons. Towards the end of September they joined the returning embassy, which comprised 2000 men and 3700 animals. Crossing the deserts of Koko Nor, they passed the great lake of that name, with its island of contemplative lamas, and, following a difficult and tortuous track across snow-covered mountains, they at last arrived in the month of February. By this time the native language, and by the regent, they opened a little chapel, and were in a fair way to establish an important mission, when the Chinese ambassador interfered and had the two missionaries conveyed back to Canton, where they arrived in October of the same year. For nearly three years Huc remained at Canton, but Gabet, returning to Europe, proceeded thence to Rio de Janeiro, and died there shortly afterwards. Huc returned to Europe in shattered health in 1852, visiting India, Egypt and Palestine on his way, and, after a prolonged residence in Paris, died on the 31st of March 1860.

His writings comprise, besides numerous letters and memoirs in the Annales de la propagation de la foi, the famous Souvenirs d'un voyage dans la Tartarie, le Tibet, et la Chine pendant les années 1844–1858 (2 vols., Paris, 1858; Eng. trans. by W. Hazlitt, 1859; abbreviated by M. Jones, London, 1867); its supplement, crowned by the Academy, entitled L'Empire chinois (2 vols., 1854; Eng. trans., London, 1859); and an elaborate historical work, Le Christiamisme en Chine, 2 vols., Paris, 1857–1858; Eng. trans., London, 1857–1858). These works are written in a lucid, racy, picturesque style, which secured for them an unusual degree of popularity. The Souvenirs is a narrative of a remarkable feat of travel, and contains passages of so singular a character as in the absence of corroborative testimony to stir up a feeling of incredulity. That Huc was suspected unjustly was amply proved by later research. But he was by no means a mere itinerant, and the record of his travels loses greatly in value from the want of precise scientific data. So far for information specially relating to the whole subject, the Abbé Desgodin's Mission du Tibet de 1853 à 1870 (Verdun, 1874); and " Account of the Pundit's Journey in Great Tibet," in the Royal Geographical Society's Journal for 1877.

HUCBOLD (Huchaldus, Huchaldus), Benedictine monk, and writer on music, was born at the monastery of Saint Amand near Tourmau, in or about 840, if we may believe the statement of his biographers, to the effect that he died in 930, aged 90. He studied at the monastery, where his uncle Milo occupied an important position. Hucbald made rapid progress in the acquirement of various sciences and arts, including that of music, and at an early age composed a hymn in honour of St Andrew, which met with such success as to excite the jealousy of his uncle. It is said that Hucbald in consequence was compelled to leave St Amand, and started an independent school of music and other arts at Nevers. In 860, however, he was at St Germain d'Auxerre, bent upon completing his studies, and in 872 he was back again at St Amand as the successor in the headship of the convent school of his uncle, to whom he had been reconciled in the meantime. Between 883 and 900 Hucbald went on several missions of reforming and reconstructing various schools of music, including that of Rheims, but in the latter year he returned to St Amand, where he remained to the day of his death on the 25th of June 930, or, according to other chronicles, on the 20th of June 932. The only work which can positively be ascribed to him is his Harmonica Institutio. The Musica Euchridiada, published with other writings of minor importance in Gerbert's Scriptores de Musica, and containing a complete system of musical science as well as instructions regarding notation, had now been proved to have originated about half a century later than the death of the monk Hucbald, and to have been the work of an unknown writer belonging to the close of the 10th century and possibly also bearing the name of Hucbald. This work is celebrated chiefly for an essay on a new form of notation described in the present day as Dasia Notation. The author of the Harmonica Institutio wrote numerous lives of the saints and a curious poem on bald men, dedicated to Charles the Bald.

Authorities.—Sir John Hawkins, General History of the Science and Practice of Music (London, 1653); Histoire littéraire de la France (vii. 216 et seq.); Coussemaker, Mémoire sur Hucbald (Paris, 1841); Hans Müller, Hucbald's éCACHE et uneche Schriften über Musik (Leipzig, 1884); Spitta, Die Musik Euchridiada und seine Zeitgenossen (Vierteljahresschr. für Musikwissenschaft, 1889, 5th year).

HU-CHOW-FU, a city of China, in the province of Cheh-Kiang (30° 48′ N., 120° 3′ E.), a little S. of Tai-hu Lake, in the midst of the silk belt. According to Chinese authorities it is 6 m. in circumference, and contains about 100,000 families. A broad stream or canal crosses the city from south to north, and is the principal highway for boat traffic. The main trade of the place is in silk, but it manufactures silk fabrics, such as figured crepe (chousha), and is also manufactured. Silk is largely worn by even the lowest classes of the inhabitants.

HUCHOWN, "of the Awle Ryele" (fl. 14th century), Scottish poet, is referred to by Wyntoun in his Chronicle in these words:—

"Huccheon, pat cunnande was in letterare. He made a greit Gest of Arthur, And pe Awtyer of Gawane, De Pustil als of Suet Susane. He was curvousy in his stille, Fayr of facunde and delyte, Mad in mery mett his dyte Lillit or moucht neir pe lisse Wauerande fra pe styfthasen."

(Cott. MS. bk. 11, 4308-4318.)

Much critical ingenuity has been spent in endeavouring to identify (a) the poet and (b) the works named in the foregoing passage. It has been assumed that "Huchown," or " Huchheon," represents the "gude Sir Hew of Eglytoun" named by Dunbar (1445) in his Lamant for the Makaris (l. 53). The only known Sir Hugh of Eglytoun of the century is frequently mentioned in the public records from the middle of the century onwards, as an auditor of accounts and as witness to several charters. By 1360 he had married Dame Egidia, widow of Sir James Lindsay and half-sister of Robert the Steward. His public office and association with the Steward sorts well with the designation "of the Awle Ryele," if that he interpreted as " Aula Regalis" or " Royal Palace." He appears to have died late in 1376 or early in 1377.
The first of the poems named above, the *Gest of Arthure of Gest Historyvall* (ib. i. 4288), has been identified by Dr Trautmann, "Anglia," *Der Dichter Huchoun* (1877), with the alliterative *Morgie Arthure* in the Thornton MS. at Lincoln, printed by the E.E.T.S. (ed. Brock, 1869). The problem of the second (The *Amityr of Gawane* ) is still in dispute. There are difficulties in the way of accepting the conjecture that the poem is the "Awn-tyres of Arthure at the Tern Wathelyne" (see S.T.S., *Scottish Alliterative Verse Poems*, 1857, and Introduction, pp. 11 et seq.), and little direct evidence in favour of the view that the reference is to the greatest of middle English romances, Sir Gawain and the Green Knight. The third may be safely accepted as the well-known *Pistil* [Epistle] of *Swete Susan*, printed by Laing (Select Remains, 1822) and by the S.T.S. (*Scottish Alliterative Poems, u.s.*).

See, in addition to the works named above, G. Neilson's *Sir New of Eglinhton and Huchoun of the Arule Royel* (Glasgow, 1901), which contains a full record of references to the historical Sir New of Eglinhton; *Huchoun of the Aulee Roye, the Alliterative Poet* (Glasgow, 1902) by the same; J. T. T. Brown's *Huchoun of the Aulee Royle and hii Poems* (Glasgow, 1902), in answer to the foregoing. See also the correspondence in the *Athenaeum*, 1900-1901, and the review of Mr Neilson's pamphlets, ib. (Nov. 22, 1902); and J. H. Millar's *Literary History of Scotland* (1903), pp. 8-14.

**HUCHTENBURG**, the name of two brothers who were Dutch painters. The elder of these brothers, Johannes Huchtenburg, was born at Haarlem, 1646, and died 1733, known, as a youth, in the oil-painting of the *Belvedere* faculty. Jacob, the elder, of whom little is known, studied under Berghem, and went early to Italy, where he died young about 1667. His pictures are probably condubed with those of his brother. In Copenhagen, where alone they are catalogued, they illustrate the style of a Dutchman who transfers Berghem's cattle and flocks to Italian landscapes and market-places.

John van Huchtenburg (1646-1733), born at Haarlem it is said in 1646, was first taught by Thomas Wyk, and afterwards induced to visit the chief cities of Italy, where, penetrating as far as Rome, he met and dwelt with his brother Jacob. After the death of his brother, he took up his headquarters, taking Paris on his way, and served under Van de Meulen, then engaged in illustrating for Louis XIV, the campaign of 1667-1668 in the Low Countries. In 1670 he settled at Haarlem, where he married, practised and kept a dealer's shop. His style had now merged into an imitation of Philip Wouwermans and Van de Meulen, which could not fail to produce pretty pictures of hunts and robber-camps, the faculty of painting horses and men in action and varied dress being the chief point of attraction. Later Huchtenburg ventured on cavalry skirmishes and engagements of regular troops generally, and these were admired by Prince Eugene and William III, who gave the painter sittings, and commanded him to throw upon canvas the chief incidents of the battles they fought upon the continent of Europe. When he died at Amsterdam in 1733, Huchtenburg had done much by his pictures and prints to make Prince Eugene, King William and Marlborough popular. Though clever in depicting a nèble or a skirmish of dragoons, he remained second to Philip Wouwermans in accuracy of drawing, and inferior to Van de Meulen in the production of landscapes. But, nevertheless, he was a clever and spirited master, with great facility of hand and considerable natural powers of observation.

The earliest date on his pictures is 1674, when he executed the "Stag-Hunt" in the *Museum of the Berlin, and the "Fight with Robbers* in the Lichtenstein collection at Vienna. A "Skirmish at Flours" (1690) in the Brussels gallery seems but the precursor of larger and more powerful works, such as the "Siege of Namur" (1696) in the Belvedere at Vienna, where William III is seen in the foreground accompanied by Max Emmanuel, the Bavarian elector. Three years before, Huchtenburg had had sittings from Prince Eugene (Hague, 1693), and William III (Amsterdam, 1694). After 1696 he regularly served as court painter to Prince Eugene, and we have at Turin (gallery) a series of eleven canvases all of the same size depicting the various battles of the great hero, commencing with the battle of *Feluy* in 1692 and including with the capture of Belgrade in 1717. Had the duke of Marlborough been fond of art he would doubtless have possessed many works of our artist. All that remains at Blenheim, however, is a couple of sketches of battles, which were probably sent to Churchill by his great contemporary. *The pictures of Huchtenburg are not very numerous now in public galleries. There is one in the National Gallery, London, another at the Louvre. But Copenhagen has four, Dresden six, Gotha two, and Munich has the well-known collection of *"Fallart taken Prisoner at Blenheim in 1704."*

**HUCKABACK**, the name given to a type of cloth used for towels. For this purpose it has perhaps been more extensively used in the linen trade than any other weave. One of the chief merits of a towel is its capacity for absorbing moisture; plain and other flat-surfaced cloths do not perform this function satisfactorily, but cloths made with huckaback, as well as those made with the honeycomb and similar weaves, are particularly well adapted for this purpose.

The body or foundation of the cloth is plain and therefore found in structure (see designs A and B in figure), but at fixed intervals some of the warp threads float on the surface of the cloth, while at the same time a number of weft threads float on the back. Thus the cloth has a somewhat similar appearance on both sides. Weave A is the ordinary and most used huck or huckaback, while weave B, which is usually woven with double weft, is termed the Devon or medical huck. The cloths made by the use of these weaves were originally all linen, but are too often adulterated with inferior fibres.

**HUCKFIELD**, one of the Roman Catholic primate of the north-eastern United States of the genus Gaylussacia, small branching shrubs resembling in habit the English bilberry (*Vaccinium*), to which it is closely allied, and bearing a similar fruit. The common huckleberry of the northern states is *G. resinosa*, while *G. brachycera* and *G. dumosa* are known respectively as box and dwarf huckleberry. The name *Gaylussacia* commemorates the famous French chemist Gay-Lussac.

**HUCKNALL TORKARD**, a town in the Rushcliffe parliametary division of Nottinghamshire, England; 132 m. N.N.W. from London by the Great Central railway, served also by the Great Northern and Midland railways. Pop. (1901) 15,250. The church of St Mary Magdalen contains the tomb of Lord Byron. There are extensive collieries in the vicinity, and the town has tobacco and hosier works. Small traces are found of Beauvale Abbey, a Carthusian foundation of the 14th century, in the hilly, wooded district W. of Hucknall; and 3 m. N. is Newstead Abbey, in a beautiful situation on the border of Sherwood Forest. This Augustinian foundation owed its origin to Henry II. It came into the hands of the Byron family in 1540, and the poet Byron resided in it at various times until 1818. There remain the Early English west front of the church, a Perpendicular cloister and the chapter-house; while in the mansion, wholly restored since Byron's time, and in the demeane, which are remarkably preserved. To the S. of Hucknall are traces of Gresley Castle, of the 14th century.

**HUCKSTER**, a dealer or retailer of goods in a small way. The word, in various forms, is common to many Teutonic languages. In Early English it is found as *hukseker, hokester, huxter*; in early modern Dutch as *heuker,* and Medieval Low German as *haker*; but the ultimate origin is unknown. Huckster apparently belongs to that series of words formed from a verb,—as brew, brewer; but the noun "huckster" is found in use before the verb to huck. Hawker and pedlar are nearly synonymous in meaning, but "huckster" may include a person in a small way of trade in a settled habitation, while a hawk or pedlar invariably travels from place to place offering his wares. In a contemptuous sense, huckster is used of any one who hatters, or makes gain or profit in underhand or mean ways, or who over-reaches another, to get advantage for himself.

**HUDDERSFIELD**, a municipal, county and parliamentary borough in the West Riding of Yorkshire, England, 190 m. N.N.W. from London. Pop. (1901) 95,047. It is served by the Lancashire & Yorkshire and London & North Western

1 Skeat, *Etym. Dict.* (1898), says, "The word bears so remarkable resemblance to Low Ger. *Hukkebok*; Ger. *Huckeback*, pick-a-back, that it seems reasonable to suppose that it at first meant, "peddling war." *The New English Dictionary* does not consider that the connexion can at present be assumed."
Hudson, G.—Hudson, H. 849

railways, and has connexion with all the important railway systems of the West Riding, and with the extensive canal system of Lancashire and Yorkshire. It is well situated on a slope above the river Colne, a tributary of the Calder. It is built principally of stone, and contains several handsome and picturesque warehouses and business premises, many of which are of high architectural merit. Of the numerous churches and chapels all are modern, and some of considerable beauty. The parish church of St Peter, however, though rebuilt in 1387, occupies a site which is believed to have carried a church since the 11th century. The town hall (1880) and the corporation offices (1877) are handsome classic buildings; the Ramsden Estate buildings are a very fine block of the mixed Italian order. The market hall (1856) surmounted by a clock-tower is in geometrical Decorated style. The cloth-hall dates from 1784, when it was erected as a clothiers' emporium. It is no longer used for any such purpose, but serves as an exchange news-room. The Armoury, erected as a riding-school, was the headquarters of a volunteer corps, and is also used for concerts and public meetings. The chief educational establishments are the Huddersfield College (1838), a higher-grade school, the technical school and several grammar-schools, of which Longwood school was founded in 1731. The Literary and Scientific Society possesses a museum. Of the numerous charitable institutions, the Infirmary, erected in 1831, is housed in a building of the Doric order. The chief open spaces are Greenhead and Beaumont parks, the last named presented to the town by Mr H. F. Beaumont in 1880. There is a sulphurous spa in the district of Lockwood.

Huddersfield is the principal seat of the fancy woollen trade in England, and fancy goods in silk and cotton are also produced in great variety. Plain cloth and worsteds are also manufactured. There are silk and cotton spinning-mills, iron foundries and engineering works. Coal is abundant in the vicinity. The parliamentary borough returns one member. The county borough was created in 1888. The municipal borough is under a mayor, 15 aldermen and 45 councillors. Area, 11,859 acres.

Huddersfield (Oderfale) only rose to importance after the introduction of the woollen trade in the 17th century. After the Conquest William I. granted the manor to Ilbert de Laci, of whom the Saxon tenant Godwin was holding as underlord at the time of the Domesday Survey. In Saxon times it had been worth 10s., but after being laid waste by the Normans was still of no value in 1086. From the Lacy the manor passed to Thomas Plantagenet, duke of Lancaster, through his marriage with Alice de Lacy, and so came to the crown on the accession of Henry IV. In 1599 Queen Elizabeth sold it to William Ramsden, whose descendants still own it. Charles II. in 1670 granted to John Ramsden a market in Huddersfield every Wednesday with the toll and other profits belonging. By the beginning of the 18th century Huddersfield had become a "considerable town," chiefly owing to the manufacture of woollen kersies, and towards the end of the same century the trade was increased by two events—the opening of navigation on the Calder in 1782, and in 1784 that of the cloth-hall or piece-hall, built and given to the town by Sir John Ramsden, baronet. Since 1832 the burgesses have returned members to parliament. The town possesses no charter before 1668, when it was created a municipal borough.

Hudson, George (1800-1871), English railway financier, known as the "railway king," was born in York in March 1800. Apprenticed to a firm of linendrapers in that city, he soon became a great merchant, and in 1837 was elected lord mayor of York. Having inherited, in 1837, a sum of £50,000, he invested it in North Midland Railway shares, and was shortly afterwards appointed a director. In 1833 he had founded and for some time acted as manager of the York Banking Company. He had for long been impressed with the necessity of getting the railway to York, and he took an active part in securing the passing of the York and North Midland Bill, and was elected chairman of the new company—the line being opened in 1839. From this time he turned his undivided attention to the projec-

tion of railways. In 1841 he initiated the Newcastle and Darlington line. With George Stephenson he planned and carried out the extension of the Midland to Newcastle, and by 1844 had over a thousand miles of railway under his control. In this year he managed the first febrile railway speculation, and in the light, and no man was more courted than the "railway king." He was delighted to honour him, and, as if a colossal fortune were an insufficient reward for his public services, the richest men in England presented him with a tribute of £20,000. Deputy-lieutenant for Durham, and thrice lord mayor of York, he was returned in the Conservative interest for Sunderland in 1845, the event being judged of such public interest that the news was conveyed to London by a special train, which travelled part of the way at the rate of 75 m. an hour. Full of rewards and honours, he was suddenly ruined by the disclosure of the Eastern Railway frauds. Sunderland clung to her generous representative till 1850, but on the bursting of the bubble he had lost influence and fortune at a single stroke. His later life was chiefly spent on the continent, where he benefited little by a display of unabated energy and enterprise. Some friends gave him a small annuity a short time before his death, which took place in London, on the 14th of December 1871. His name has long been used to point the moral of vulture ambition and unstable fortune. The "big swollen gambler," as Carlyle calls him in one of the Latter-Day pamphlets, was savagely and excessively reproved by the world which had blindly believed in his golden prophecies. He certainly ruined scrip-holders, and disturbed the great centres of industry; but he had an honest faith in his own schemes, and, while he beggarized himself in their promotion, he succeeded in overcoming the powerful landed interest which delayed the adoption of railways in England long after the date of their regular introduction into America.

Hudson, Henry. English navigator and explorer. Nothing is known of his personal history excepting such as falls within the period of the four voyages on which his fame rests. The first of these voyages in quest of new trade and a short route to China by way of the North Pole, in accordance with the suggestion of Robert Thorne (d. 1527), was made for the Muscovy Company with ten men and a boy in 1607. Hudson first coasted the east side of Greenland, and being prevented from proceeding northwards by the great ice barrier which stretches thence to Spitzbergen sailed along it until he reached "Newland," as Spitzbergen was then called, and followed its northern coast to beyond 80° N. lat. On the homeward voyage he accidentally discovered an island in lat. 71° which he named Hudson's Touches, and which has since been identified with Jan Mayen Island. Molines's chart, published by Hakluyt about 1600, was Hudson's blind guide in this voyage, and the polar map of 1611 by Pontanus illustrates well what he attempted, and the valuable results both negative and positive which he reached. He investigated the trade prospects at Bear Island, and recommended his patrons to seek higher game in Newland; hence he may be called the father of the English whale-fisheries at Spitzbergen.

Next year Hudson was again sent out by the Muscovy Company to open a passage to China, this time by the north-east route between Spitzbergen and Novaya Zemlya, which had been attempted by his predecessors and especially by the Dutch navigator William Barents. This voyage lasted from the 22nd of April to the 20th of August 1608. He sailed the Barents Sea in vain between 73° 30' N.W. and 71° 15' S.E. for an opening through the ice, and on the 6th of July, "out of hope of a north-east passage (except by the Waygats, for which I was not fitter to try or prove)," he resolved to sail to the north-west, and if time and means permitted to run a hundred leagues up Lumley's Inlet (Frobisher Strait) or Davis's "overfall" (Hudson Strait). But his voyage being delayed by contrary winds he was finally compelled to return without accomplishing his wish. The failure of this second attempt satisfied the Muscovy Company, which thenceforward directed all its energies to the profitable Spitzbergen trade.

Towards the end of 1608 Hudson "had a call" to Amsterdam,
Hudson, J.—Hudson

where he saw the celebrated cosmographer the Rev. Peter Plancius and the cartographer Hondius, and after some delay, due to the rivalry which was exhibited in the attempt to secure his services, he undertook for the Dutch East India Company his important third voyage to find a passage to China either by the north-east or north-west route. With a mixed crew of eighteen or twenty men he left the Texel in the "Half-Moon" on the 6th of April, and by the 5th of May was in the Barents Sea, and soon afterwards among the ice near Novaya Zemlya, where he had been the year before. Some of his men becoming disheartened and mutinous (it is now supposed that he had arrived two or three months too early), he lost hope of effecting anything by that route, and submitted to his men, as alternative proposals, either to go to Lumley's Inlet and follow up Waymouth's light, or to make for North Virginia and seek the passage in about 40° lat., according to the letter and map sent him by his friend Captain John Smith. The latter plan was adopted, and on the 14th of May Hudson set his face towards the Chesapeake and China. He touched at Stromo in the Faroe Islands for water, and on the 15th of June off Newfoundland the "Half-Moon" "sent overboard her forecast." This accident compelled him to put into the Kennebec river, where a mast was procured, and some communication and an unnecessary encounter with the Indians took place. Sailing again on the 26th of July, he began on the 28th of August the survey where Smith left off, at 37° 30' according to his map, and crossed northwards. On the 3rd of September, in 40° 30', he entered the fine bay of New York, and after having gone 150 m. up the river which now bears his name to near the position of the present Albany, treating with the Indians, surveying the country, and trying the stream above tide-water, he became satisfied that this course did not lead to the South Sea or China, a conclusion in harmony with that of Champlain, who the same summer had been making his way south through Lake Champlain and Lake St Sacrement (now Lake George). The two explorers by opposite routes approached within 20 leagues of each other. On the 4th of October the "Half-Moon" weighed for the Texel, and on the 7th of November arrived at Dartmouth, where she was seized and detained by the English government, Hudson and the other Englishmen of the ship being commanded not to leave England, but rather to serve their own country. The voyage had fallen short of Hudson's expectations, but it served many purposes perhaps as important to the world. Among other results it exploded Hakluyt's myth, which from the publication of Lok's map in 1582 to the 2nd charter of Virginia in May 1609 he had lost no opportunity of promulgating, that near 40° lat. there was a narrow isthmus, formed by the sea of Verrazano, like that of Tehuantepec or Panama.

Hudson's confidence in the existence of a North-West Passage had not been diminished by his three failures, and a new company was formed to support him in a fourth attempt, the principal promoters being Sir Thomas Smith (or Smythe), Sir Dudley Digges and John (afterwards Sir John) Wolstenholme. He determined this time to carry out his old plan of searching for a passage up Davis's "overfall"—so-called in allusion to the overfall of the tide which Davis had observed rushing through the strait. Hudson sailed from London in the little ship "Discovery" of 55 tons, on the 17th of April 1610, and entered the strait which now bears his name about the middle of June. Sailing steadily westward he entered Hudson Bay on the 3rd of August, and passing southward spent the next three months examining the eastern shore of the bay. On the 1st of November the "Discovery" went into winter quarters in the S.W. corner of James Bay, being frozen in a few days later, and during the long winter months which were passed there only a scanty supply of game was secured to eke out the ship's provisions. Discontent became rife, and on the ship breaking out of the ice in the spring Hudson had a violent quarrel with a dissolute young fellow named Henry Greene, whom he had befriended by taking him on board, and who now retaliated by inciting the discontented part of the crew to put Hudson and eight others (including the sick men) out of the ship. This happened on the 22nd of June 1611. Robert Bylot was elected master and brought the ship back to England. During the voyage home Greene and several others were killed in a fight with the Eskimos, while others again died of starvation, and the feeble remnant which reached England in September were thrown into prison. No more tidings were ever received of the deserted men.

Although it is certain that the four great geographical landmarks which to-day serve to keep Hudson's memory alive, namely the Hudson Bay, Strait, Territory and River, had repeatedly been visited and even drawn on maps and charts before he set out on his voyages, yet he deserves to take a very high rank among northern navigators for the mere extent of his discoveries and the success with which he pushed them beyond the limits of his predecessors. The rich fisheries of Spitzbergen and the fur industry of the Hudson Bay Territory were the immediate fruit of his labours.

See Henry Hudson, the Navigator (Hakluyt Society, 1866); and T. A. Janvier, Henry Hudson (1900). In 1909 a great celebration of the tercentenary of the death was held in the United States.

Hudson, John (1662–1719). English classical scholar, was born at Wythop in Cumberland. He was educated at Oxford, where the remainder of his life was spent. In 1701 he was appointed Bodley's librarian, and in 1711 principal of St Mary's Hall. His political views stood in the way of his preferment in the church and university. He died on the 26th of November 1719. As an editor and commentator he enjoyed a high reputation both at home and abroad. His works, chiefly editions of classical authors, include the following: Velleius Paterculus (1625); Thucydidès (1669); Geographiae Veteris Scriptores Graeci minores (1668–1712) containing the works and fragments of 21 authors and the learned, though diffuse, dissertations of H. Dodwell—a rare and valuable work, which in spite of its faulty text was not superseded until the appearance of C. W. Müller's edition in the Didot series: the editio princeps of Moeris, De Vobis Atticis et Hellenicis (1712); Josephus (1720, published posthumously by his friend Anthony Hall, the antiquary), a correct and beautifully printed edition, with various notes and translation.

Hudson, a city and the county-seat of Columbia county, New York, U.S.A., on the E. side of the Hudson river, about 114 m. N. of New York City and about 28 m. S. of Albany. Pop. (1890) 9970; (1900) 10528, of whom 1155 were foreign-born; (1910 census) 11,417. It is served by the Boston & Albany, the New York Central & Hudson River and the (electric) Albany & Hudson railways, by river steamboats, and by a steam ferry to Catskill across the river. The city is picture-quietly situated on the slope of Prospect Hill; and Promenade Park, on a bluff above the steamboat landing, commands a fine view of the river and of the Catskill Mountains. Among the public buildings and institutions are a fine city hall, the Columbia County Court House, a public library, a Federal building, a State Training School for Girls, a State Firemen's Home, an Orphan Asylum, a Home for the Aged and a hospital. The city's manufactures include hosiery and knit goods, Portland cement (one of the largest manufactories of that product in the United States being here), foundry and machine shop products, car wheels, ice tools and machinery, ale, beer, bricks and tiles and furniture. The value of the factory products in 1905 was $4,115,525, an increase of 50½% over that in 1900. The municipality owns and operates the water-works. Hudson, which was originally known as Claverack Landing, was for many years the seat of a large and prosperous Dutch settlement and storehouses, to which farmers in the neighbourhood brought their produce for shipment on the river. Late in 1783 the place was settled by an association of merchants and fishermen from Rhode Island, Nantucket, and Martha's Vineyard. The present name was adopted in 1784, and the city was chartered in 1785. For many years Hudson had a considerable foreign commerce and whaling interests, but these were practically destroyed by the war of 1812.
Hudson Bay—Hudson River

Hudson Bay (less often, but more correctly, Hudson's Bay), an inland sea in the N.E. of Canada, extending from 76° north latitude to 51° south of the equator. On the east it is bounded with the Atlantic Ocean by Hudson Strait, and on the north with the Arctic Ocean by Fox Channel and Fury and Hecla Strait. Its southern extremity between 55° and 51° N. is known as James Bay. It is 590 m. in width, and 1300 m. from S. to N., including James Bay (350 m.) and Fox Channel (350 m.). The customary use of the term includes James Bay, but not Fox Channel. The average depth of water is about 70 fathoms, deepening at the entrance of Hudson Strait to 100 fathoms. James Bay is much shallower, and unfit for shipping save for a central channel leading to the entrance and the mouth of the Moose. The entrances to the main bay are absolutely free from shoals, rocks, or islands, but down its east coast extend two lines of small islands, one close to shore, the other at 70 m. distance, and comprising a number of scattered groups (the Ottawa Islands, the Sleepers, the Belchers, etc.).

Into Hudson and James Bays flow numerous important rivers, so much so that the water of the latter is rather brackish than salt. Beginning at the north-west, the chief of these are Churchill, Nelson (draining Lake Winnipeg), and the numerous inland rivers of which it is the basin), Hayes (the old boat route of the voyageurs to Winnipeg), Severn, Albany, Moose, Rupert river (draining Lake Mistassini), Nottaway, East Main, Great Whale and Little Whale.

Save for some high bluffs on the east and north-east, the shores of the bay are low. Around much of James Bay extend marshes and swampy ground. Geologically the greater part of the Hudson Bay district belongs to the Laurentian system, though there are numerous outcrops of later formation: Cambro-Silurian on the south and west, and to the north of Cape Jones (the north-eastern extremity of James Bay) a narrow belt of Cambrian rocks, of which the islands are composed. Coal, plumbago, iron and other minerals have been found in various districts near the coast. The climate is harsh, though vegetables and certain root crops ripen in the open air as far north as Fort Churchill; cattle flourish, and are fed chiefly on the native grasses; spruce, balsam and poplar grow to a fair size as far as the northern limit of James Bay. Caribou, musk ox and other animals are still found in large numbers, and there is an abundance of feathered game—ducks, geese, loons and ptarmigan; hunting and fishing form the chief occupations of the Indians and Eskimo who live in scattered bands near the shore. The bay abounds with fish, of which the chief are cod, salmon, porpoise and whales. The last have long been pursued by American whalers, whose destructive methods have so greatly depleted the supply that the government of Canada is anxious to declare the bay a more classum.

Hudson Strait is about 450 m. long, with an average breadth of 100 m., narrowing at one point to 45. Its shores are high and bold, rarely less than 1000 ft., save on the coast of Ungava Bay, a deep indentation on the south-east. No islands or rocks impede navigation. Its depth is from 100 to 200 fathoms. Owing to the violence of the tides, which rise to a height of 35 ft., it never absolutely freezes over.

After three centuries of exploration, the navigability of Hudson Bay has beyond question increased out of all proportion. To Canada and the Hudson's Bay Company is of great commercial interest, and numerous expeditions have been made and reports issued by the Geological Survey. From Winnipeg to Liverpool via Churchill is over 500 m. less than via Montreal, and from Edmonton to Liverpool almost 1000 m. less. Were navigation open for a sufficient time, such a route for the grain of the Canadian and American west would be of enormous advantage. But the inlet from Lake Superior to Lake Nipissing is, in one word, which is about in the bay and the strait. Past the mouth of the strait flows a stream often over 100 m. wide, of berg and floe ice, carried by the current. Other obstacles to the progress of the great hole (in Boothia) the compass often refuses to work. For sailing ships as the Hudson's Bay Company has long employed, the season for safe navigation is from the 15th of July to the 1st of October. In over this progress the water is almost free from serious accident, though the company's ships within these limits. It is claimed that specially built and protected steamers would be safe from the 15th of June till the 1st of November, and the problem may be solved by ice-breaking vessels of great power. The only good harbour available is Fort Churchill, at the mouth of the Churchill river, which is large and easy of access. Moose Factory (at the foot of James Bay, and York Factory (at the mouth of the Nelson) are mere roadsteads. Marble Island, south of Chesterfield Inlet, where the whalers winter, is the far north for residence of man. The Cabots entered the strait in 1498, and during the next century a series of Elizabethan mariners; but the bay was not explored until 1610, when Henry Hudson pushed through the ice and explored the southern portion of James Bay.

See Lieutenant Gordon, R.N., Reports on the Hudson's Bay Expeditions (1881, 5 & 6); William Ogilvie, Exploratory Survey to Hudson Bay in 1832 (London, 1833), R. F. Stuyart, The Navigation of Hudson's Bay and Straits (Toronto, 1892).

Hudson River, the principal river of New York state, and one of the most important highways of commerce in the United States of America. It is not a river in the truest sense of the word, but a river valley into which the ocean water has been admitted by subsidence of the land, transforming a large part of the valley into an inlet, and thus opening it up to navigation.

The Hudson lies entirely in the state of New York, which it crosses in a nearly north-and-south direction near the eastern boundary of the state. The sources of the river are in the wildest part of the Adirondack Mountains, to the west of Lake Champlain, in north-eastern New York. There are a number of small mountain streams which contribute to the headwater supply, any one of which might be considered the main stream; but assuming the highest collected and permanent body of water to be the true head, the source of the Hudson is Lake Tear-of-the-Clouds, which lies near Mount Marcy at an elevation of about 4322 ft. This small mountain stream flows irregularly southward with a fall of 6 ft. per mile in the upper 52 miles, then, from the mouth of North Creek to the mouth of the Sacondaga, at the rate of nearly 14 ft. per mile. In this part of its course the Hudson has many falls and rapids, and receives a number of mountain streams as tributaries, the largest being Indian river, Schuon river and Sacondaga river. Below the mouth of the Sacondaga the Hudson turns sharply and flows eastward for about 12 m., passing through the mountains, and leaping over several falls of great height and beauty. At Glen's Falls there is a fall of about 50 ft.; and just below this, at Sandy Hill, the river again turns abruptly, and for the rest of its course to New York Bay flows almost due south. There are numerous falls and rapids between Glen's Falls and Troy which are used as a source of power and are the seats of busy manufacturing plants. Several large tributaries join this part of the river, including Batten Kill, Fish Creek, Hoosic river and the Mohawk, which is the largest of all the tributaries to the Hudson, and contributes more water than the main river itself.

From Troy to the mouth of the Hudson the river is tidal, and from this point also the river is navigable, not because of the river water itself, but because of the low grade of the river bed by which the tide is able to back up the water sufficiently to float good-sized boats. From Albany, 6 m. below Troy, to the mouth of the Hudson, a distance of 145 m., there is a total fall of only 5 ft. It is this lower, tidal, navigable portion of the Hudson that is of so much importance and general interest. Numerous tributaries enter this part of the Hudson from both the east and the west, the largest and most important being the Wallkill which enters at Kingston. In general there is in this part of the river a broad upper valley with a much narrower gorge cut in its bottom, with its rock floor below sea level and drowned by the entrance of the sea. Although this is true in a general way, the character of the river valley varies greatly in detail from point to point, under the influence of the geological structure of the enclosing rock walls.

Most of these variations may be included in a threefold division of the lower Hudson valley. The uppermost of these extends from the southeastern base of the Highlands to the western portal of the Highlands in Dutchess and Ulster counties. This is a lowland region of ancient Paleozoic rocks. Into the upper portion of this division of the river the non-tidal Hudson is depositing its load of detritus, building a delta below Troy. This, although swept by the currents, has interposed an obstacle to navigation which has called for extensive dredging and other work, for the purpose of maintaining a navigable channel. The width of the tidal river
HUDSON'S BAY COMPANY

varies somewhat, being about 300 yds., at Albany and thence to the Highland's varying from 300 yds., to 900 yds.

The scenery in this part of the river, though not tame, is a little monotonous, the gently sloping hills, with the variegated colours of wood, pasture, and field, and the desolate tracts of forest and waste, or village being repeated without any marked feature to break their regularity. Thirty miles from Troy noble views begin to be obtained of the Catskill Mountains towering up behind the west bank, the nearest considerable distance the divide in the Giant's way, the mediate banks of the river are great beds of clay which is extensively used in the manufacture of brick; and the brick-burning plants and huge ice houses are conspicuous features in the landscape. Although the river here and below Troy is not of very deep character that is not a favourite winter sport, the summer climate is warm enough for the cultivation of grapes and other fruits, and is aided to a considerable extent by the influence of the large body of water, the walls of which tend to retard both early and late frosts, and thus to extend the growing season. In addition to smaller towns and villages, there are a number of larger towns or villages, some of which are opposite each other, and farther down Kingston and the thriving city of Poughkeepsie. Near the extreme end of this section of the Hudson lies the city of Newburgh, a short distance below which Cornwell Landing, the junction of the second division of the tidal part of the Hudson and that of the greatest of all.

The river enters the northern portion of the Highlands between a series of hills whose frequently precipitous sides rise abruptly from the water's edge. For about 16 m. the river is bordered by steeply rising hills, giving picturesque and striking views of great beauty. They are formed of the more or less crystalline rocks of ancient crystalline rocks of moderately high relief, comparable in geological structure to the Adirondack region. The views in this part of the river, often compared with those along the Rhine, are in some manner unparallelled. The reader, when, at several points they have an impressiveness and surprising grandeur rarely equalled. About 10 m. after the Highlands are entered West Point is reached, a favourite landing-place of tourists and an extensive area of the American Academy of Sciences, the grounds fine views of the river may be had. This point is historically interesting as the seat of Fort Putnam, now in ruins, built during the American War of Independence, at which time a canal was stretched across the river to prevent the passage of British ships.

The third and lowest section of the tidal part of the Hudson extends from the lower end of the Highlands to New York City. This is a region of ancient and metamorphic Paleozoic rocks on the eastern side, and mainly Triassic rocks on the west. Because of their less resistance to denudation, these rocks have permitted a broadening of the valley in this part of the course. Between Peekskill the river broadens out to form Haverstraw Bay, at the extremity of which is the headland of Croton Point. Below this is the wider expanse of Tappan Bay, which has a length of 12 m., and a breadth of 2 m., while below this bay the river narrows to a breadth between 1 and 2 m. On Tappan Bay stands Tarrytown, famous both historically and from its connexion with Washington Irving, whose cottage of Sunnyside is in the vicinity. At Peekskill, the Hudson enters the city of New York, which lies picturesquely from the water's edge at the height of between 300 and 500 ft., extending along the west bank for about 20 m., the opposite shore being level and dotted with hamlets, villages, towns. The Palisades are a lava-rock of the variety called trap, which has been intruded as a sheet into the Triassic sandstones, and, on, cooling, developed the prismatic junction which is so much more perfectly seen at Fingal's Cave in Scotland and Giant's Causeway in Ireland. It is this imperfect hexagonal junction that has given rise to the name "palisade", applied to the range whose face fronts the lower Hudson. At its mouth the Hudson both broadens and bends forming a series of islands and an excellent harbour, owing to the fact that the sinking of the land here has permitted the sea to fill the valleys and even to flood low divides. A submerged valley, traceable over the continental shelf, south-east of the Hudson, and believed to have been there at an extreme of the Hudson when the land stood 2000 or 3000 ft. higher than at present, and when the inner gorge above New York was being excavated.

Although the Hudson river has a total length of only about 300 m., and a drainage area of about 13,470 sq. m., it has been one of the most significant factors in the development of the United States. With an excellent harbour at its mouth, and navigable waters leading into a fertile interior for a distance of 150 m., it early invited exploration and settlement. Verrazano proceeded a short distance up the Hudson in a boat in 1524; but the first to demonstrate its extent and importance was Henry Hudson, from whom it derives its name. He sailed above the mouth of the Mohawk in September 1609. The Dutch later explored and settled the valley and proceeded westward along the Mohawk. The Dutch place-names of the region clearly show the significance of this early use of the Hudson highway. Later, in wars, American War of Independence, and War of 1812, the valley became a region of great strategic importance. This was increased by the fact that from the Hudson near Sandy Hill there are two low gaps into the northern country, one along the valley occupied by Lake George, the other into the Lake Champlain valley. The divide between this part of the Hudson and Lake Champlain is only 147 ft. above sea level, and a depression of the land of only 200 ft. in the region between Albany and the St Lawrence river would convert the Hudson and Champlain valleys into a navigable strait having a depth sufficient for the largest vessels. Movements of armies across these gaps were noteworthy events in the war. Before the railroads were completed, but modern commerce has made far less significant use of this highway, mainly because the gaps lead to a region of little economic importance, and thence to the boundary line of a foreign country. Far more important has been the highway westward along the Mohawk, which has cut a gap across the mountains that has been the most useful of all the gaps through the Appalachians. It has been useful in exploration, in war and in commerce, the latter especially because it leads to the fertile interior and to the waterway of the Great Lakes. By the Erie canal the river is connected with Lake Erie, with a branch to Lake Ontario, and other branches to supply the Champlain canal connects the Hudson with Lake Champlain. Although these canals are far less used than formerly, the Hudson is still a busy highway for navigation. It is of interest to note that it was on the Hudson that Fulton, the inventor of steam navigation, made his first successful experiment; and that it was along this same highway, from Albany, that one of the first successful railways of the country was built. A railway line now runs parallel to each bank of the Hudson, the New York Central & Hudson River on the eastern side and the West Shore on the western side, each with connexions to the north, east and west, and each turning off from the road along the rivers and into the valleys.

It is largely because of the importance of this highway of commerce, by water and by rail, from the coast to the interior, that the greatest and densest population in the United States has gathered at the seaside end of the route in New York City, Jersey City, Hoboken and other places on and near New York Bay, making one of the leading industrial and commercial centres of the world.

HUDSON'S BAY COMPANY, or "the Governor and Company of Adventurers of England trading into Hudson's Bay," a corporation formed for the purpose of importing into Great Britain the furs and skins which it obtains, chiefly by barter, from the Indians of British North America. The trading stations of the Company are dotted over the immense region (excluding Canada proper and Alaska), which is bounded E. and W. by the Atlantic and Pacific Oceans, and N. and S. by the Arctic Ocean and the United States. From these various stations the furs are despatched in part to posts in Hudson Bay and the coast of Labrador for transportation to England by the Company's ships, and in part by steamboat or other conveyances to points on the railways from whence they can be conveyed to Montreal, St John,
NU. B. or other Atlantic port, for shipment to London by Canadian Pacific Railway Company's mail ships, or other line of steamers, to be sold at auction.

In the year 1670 Charles II, granted a charter to Prince Rupert and seventeen other noblemen and gentlemen, incorporating them as the Hudson's Bay Company of Rupert's Land, to trade into Hudson's Bay, and securing to them "the sole trade and commerce of all those seas, straits, bays, rivers, lakes, creeks and sounds, in whatsoever latitude they shall be, that lie within the extent of this company's Straits, together with all the lands and territories upon the countries, coasts and confines of the seas, bays, &c., aforesaid, that are not already actually possessed by any of Her Majesty's subjects, or persons, or companies of any other Christian prince or state." Besides the complete lordship and entire legislative, judicial and executive power within these vague limits (which the Company finally agreed to abandon in the 1821 Treaty of Peace), the Company was also granted a "patent," which entitled them to "set up a government, laws, to administer justice, and hold courts throughout the territories ..." The Company, however, was not to interfere with the "religion, laws, or customs" of the "indigenous" people of the territories. The Company also had the right to possess all the "fish, fishery, furs, skins, fowl, and other goods whatever, which shall be raised or caught in the said parts of the land, or in the said water or land out of the territories, limits or places aforesaid.

The first settlements in the country thus granted, which was to be known as Rupert's Land, were made on James Bay and at Churchill and Hayes rivers; but it was long before there was any advance into the interior, for in 1749, when an unsuccessful attempt was made in parliament to deprive the Company of its charter on the grounds of non-performance, the Company had about 120 regular employees. Although the commercial success of the enterprise was from the first immense, great losses, amounting before 1800 to £17,514, were inflicted on the Company by the French, British and American military expeditions again the Hudson's Bay Company. After the cession of Canada to Great Britain in 1763, numbers of fur-traders spread over that country, and, into the north-western parts of the continent, and begun even to encroach on the Hudson's Bay territory. The Company's individual speculators finally combined into the North-West Fur Company of Montreal.

The fierce competition which at once sprang up between the companies was marked by features which sufficiently demonstrate the advantages of a monopoly in commercial dealings with savages, even although it is the manifest interest of the monopolists to retard the advance of civilization towards their hunting grounds. The Hudson's Bay Company, by the sale of tobacco, tobacco roots and spiced tobacco, and the sale of the ardent spirits with which the rival traders sought to attract them to themselves; the supply of furs threatened soon to be exhausted by the depredations of the European competitors, and the breeding season of both male and female animals; the worst passions of both whites and Indians were inflamed to their fiercest (see Red River Settlement). At last, in 1821, the companies, mutually exhausted, amalgamated, obtaining a licence to hold for 21 years the monopoly of trade in the vast regions lying to the west and north-west of the older company's grant. In 1828 the Hudson's Bay Company retained the rights and obligations, and the period was limited also for 21 years. On the expiry of this it was not renewed, and since 1859 the district has been open to all.

The licences to trade did not of course affect the original possessions of the Hudson's Bay Company on the whole of the land of surrender by the 10th November, 1869, the Hudson's Bay Company surrendered "to the Queen's Most Gracious Majesty, all the rights of Government, and other rights, privileges, liberties, franchises and immunities, of whatsoever kind and nature. to the said Government and Company by the said rected Letters Patent of His Late Majesty King Charles II.; and also all similar rights which may have been exercised or assumed by the said Governor and Company by in any parts of British North America, not forming part of Rupert's Land or of Canada, or of British Columbia, and all the lands and territories within Rupert's Land (except and subject as in the said terms and conditions mentioned) granted to the said Governor and Company by the said Letters Patent," subject to the terms and conditions set out in the Deed of Surrender.

Besides the surrender of all the previously retained territory, the Government of a sum of £300,000 sterling on the transfer of Rupert's Land to the Dominion of Canada, the retention by the Company of its posts and stations, with a right of selection of a block of land adjoining each post in conformity with a schedule annexed to the Deed of Surrender; and the right to claim in any township or district within the Fertile Belt in which land is set out for settlement, the one-twentieth part of such township or district so set out. The boundaries of the Fertile Belt were in terms of the Deed of Surrender to be as follows:—"On the south by the United States' boundary; on the west by the Rocky Mountains; on the north by the sources of the Mississippi and the Missouri, Lake Winnipeg, the Lake of the Woods, and the waters connecting them, and the Company was to be at liberty to carry on its trade within this area, so long as it was to be carried on by the Corporation on the same terms and conditions as to the introduction of goods previously introduced by them previous to the surrender."

An Order in Council was passed confirming the terms of the Deed of Surrender at the Court of Windsor, the 23rd of June 1870.

In 1872, in terms of the Dominion Lands Act of that year, it was mutually agreed in regard to the one-twentieth of the lands in the Fertile Belt reserved to the Company under the terms of the Deed of Surrender that they should be taken as follows:—

"Whereas by article third of the preceding in the Deed of Surrender from the Hudson's Bay Company to the Crown, the said Company is entitled to one-twentieth of the lands surveyed and described and designated as the Fertile Belt."

And whereas by the terms of the said deed, the right to claim the said one-twentieth is extended over the period of fifty years, and it is provided that the land contained within the same shall be determined by lot, and whereas the said Company and the Government of the Dominion have mutually agreed that with a view to an equitable distribution of the lands in the Fertile Belt and the said one-twentieth of the lands, and in order further to simplify the setting apart thereof, certain sections or parts of sections, alike in numbers and position in each township throughout the said area shall be set and designated to and meet to cover such one-twentieth:

And whereas it is found by computation that the said one-twentieth will be exactly met, by allotting in every township two whole sections of 630 acres each, and in all other townships one section and three quarters of a section each, therefore—

"In every fifth Township in the said Territory; that is to say: in the townships numbered 15, 26, 37, 48, 59, and so on in regular succession northerly from the International boundary, the whole of sections Nos. 8 and 26, and in each and every of the townships the one-half and one-twentieth of north-west half and north-west quarter of section 26 (except in the cases hereafter provided for) shall be set and designated as the lands of the said Company."
by hue and cry, if he still had about him the signs of his guilt. 
If he resisted he could be cut down, while, if he submitted to capture, his fate was decided. Although brought before a court, he was not allowed to say anything in self-defence, nor was there any need for accusation, indictment or appeal. Although regulated from time to time by writs and statutes, the process of hue and cry continued to retain its summary method of procedure, and proof was not required of a culprit’s guilt, but merely that he had been taken red-handed by hue and cry. The various statutes relating to hue and cry were repealed in 1827 (7 and 8 Geo. IV. c. 27). The Sheriffs Act 1887, re-enacting 3 Edw. I. c. 9, provides that every person in a county must be ready and apperellated at the command of the sheriff and at the county of the county to arrest a felon, and in default shall on conviction be liable to a fine.

"Hue and cry" has, from its original meaning, come to be applied to the secret apprehension of an offender or for the finding of stolen goods, and to an official publication, issued for the information of the authorities interested, in which particulars are given of offenders "wanted," offences committed, &c.

For the early history, see Pollock and Maitland, History of English Law, vol. ii.; W. Stubbs, Select Charters.

**HUEHUETANANGO** (i.e. in the local Indian dialect, "City of the Ancients"); the capital of the department of Huehue- tanango, western Guatemala, 166 m. W.N.W. of Guatemala city, on the right bank near the source of the river Salegna, a tributary of the Chupas. Pop. (1900) 2,842. Huelu- tanango was built near the site of the ancient Indian city of Zakuile, now represented by some ruins on a neighbouring ridge surrounded by deep ravines. It is the principal town of a fertile upland region, which produces coffee, cocoa and many European and tropical fruits. Chiantla, a neighbouring town mainly inhabited by Indians, was long the headquarters of a successful Dominican mission; its convent, enriched by the gifts of pilgrims and the revenues of the silver mines owned by the monks, became one of the wealthiest foundations in Central America. It was secularized in 1873, and the mines have been abandoned.

**HUELVA**, a maritime province of south-western Spain, formed in 1833 of districts taken from Andalusia, and bounded on the N. by Badajoz, E. by Seville, S. by the Gulf of Cadiz and W. by Portugal. Pop. (1900) 260,880; area 3,913 sq. m. With the exception of its south-eastern angle, where the province merges into the flat waste lands known as Las Marismas, at the mouth of the Guadalquivir, Huelva presents throughout its entire extent an agreeably varied surface. It is traversed in a south-westery direction by the Sierra Morena, here known, in its main ridge, as the Sierra de Aracena. The principal streams are the navigable lower reaches of the Guadalquivir and Guadiana, which respectively form for some distance the south-eastern and south-western boundaries of the Odiel and the Tinto, which both fall into the Atlantic by navigable rías or estuaries; the Malagón, Chanza, Alcalaboz and Murtiga, which belong to the Guadiana system; and the Huelva, belonging to that of the Guadalquivir. Huelva has a mild and equable climate, with abundant moisture and a fertile soil. Among the mountains there are many valuable woodlands, in which oaks, pines, beeches, cork-trees and chestnuts predominate, while the lowlands afford excellent pasturage. But agriculture and stock-breeding are here less important than in most Spanish provinces, although the exports comprise large quantities of fruit, oil and wine, besides cork and esparto grass. The head- quarters of the fishing trades, which include the drying and salting of fish, are at Huelva, the capital, and Ayamonte on the Guadiana. There are numerous brandy distilleries; and bricks, pottery, soap, candles and flour are also manufactured; but the great local industry is mining. In 1903 no fewer than 470 mines were at work; and their output, consisting chiefly of copper with smaller quantities of manganese and iron, exceeded £1,500,000 in value. The celebrated Rio Tinto copper mines, near the sources of the Tinto, were, like those of Tharsis, 30 m. N.N.W. of Huelva, exploited long before the Christian era, probably by the Carthaginians, and certainly by the Romans. They are still among the most important copper mines in the world (see Rio Tinto). Saline and other mineral springs are common throughout the province. Huelva is the principal seaport, and is connected with Seville on the east and Mérida on the north by direct railways, while a network of narrow-gauge railways gives access to the chief mining centres. The principal towns, besides Huelva (21,359) and Rio Tinto (11,603), which are described in separate articles, are Alcudia, San Esteban, Huelva and Rio Tinto-Huelva railways, the last-named being a narrow-gauge line. Pop. (1900) 21,357. Huelva is built on the western shore of a triangular peninsula formed by the estuaries of the Odiel and Tinto, which meet below the town. It is wholly modern in character and appearance, and owes its prosperity to an ever-increasing transit trade in copper and other ores, for which it is the port of shipment. After 1872, when the famous Rio Tinto copper mines were for the first time properly exploited, it progressed rapidly in size and wealth. Dredging operations removed a great part of the sandbanks lining the navigable estuary, and by straightening and deepening the water over the bar at its mouth; new railways were opened, and port works were undertaken on a large scale, including the construction of extensive quays and two piers, and the installation of modern appliances for handling cargo. Many of these improvements were added after 1900. Besides exporting copper, manganese and other minerals, which in 1903 reached 2,750,000 tons, valued at more than £1,500,000, Huelva is the headquarters of profitable sardine, tunny and bonito fisheries, and of a trade in grain, grapes, olives and cork. The copper and cork industries are mainly in British hands, and the bulk of the imports, which consist chiefly of coal, iron and steel and machinery, comes from Great Britain. Foodstuffs and Australasian hardwood are also imported.

Huelva was originally a Carthaginian trading-station, and afterwards a Roman colony; but it retains few memorials of its past, except the Roman aqueduct, repaired in modern times, and the colossal statue of Columbus. This was erected in 1892 to commemorate the fourth centenary of his voyage to the new world in 1492-1493, which began and ended in the village of San Pablo de la Frontera on the Tinto. Columbus resided in the neighbouring monastery of Santa Maria la Rabida after his original plans for the voyage had been rejected by King John II. of Portugal in 1484. An exact reproduction of this monastery was erected in 1893 at the World’s Fair, Chicago, U.S.A., and was afterwards converted into a sanatorium. Higher up the Tinto, above San Pablo, is the town of Moguer (pop. 8,452), which exports large quantities of oil and wine.

**HUÉRCAL OVERA**, a town of south-eastern Spain, in the province of Almería, on the Lorca-Baza railway, and between two branches of the river Almanzora. Pop. (1900) 15,763. Huércal Overa is the chief town of a thriving agricultural district, largely dependent for its prosperity on the lead mining carried on among the surrounding highlands.

**HUESCA**, a frontier province of northern Spain, formed in 1833 of districts previously belonging to Aragon; and bounded on the N. by France, E. and S.E. by Lérida, S.W. and W. by Saragossa, and N.W. by Navarre. Pop. (1900) 244,867; area 538 sq. m. The entire northern half of Huesca belongs to the mountain system of the Pyrenees, which here attain their greatest altitudes in Aneto, the highest point of the Maladetta ridge (11,168 ft.), and in Monte Perdido (10,997 ft.). The southern half forms part of the rugged and high-lying plateau of Aragon. Its only conspicuous range of hills is the Sierra de Añisclo on the south-western border. The whole province is included in
HUESCA—HUET

855

the basin of the Ebro, and is drained by four of its principal tributaries—the Aragon in the north-west, the Gallego in the west, the Cinca in the centre, and the Noguera Ribagorzana along part of the eastern border. These rivers rise among the Pyrenees, and take a southerly course; the two last-named unite with the Segre and Aragón, joining the Ebro in their way. The Ebro, like the Ebro, has received the combined waters of the Alcanadre and Isuela on the right and the Esera on the left.

The climate varies much according to the region; in the north, cold winds from the snow-capped Pyrenees prevail, while in the south, the warm summers are often unhealthy from the humidity of the atmosphere. Agriculture, the leading industry of Huesca, is facilitated by a fairly complete system of irrigation, by means of which much waste land has been reclaimed, although large tracts remain barren. There is good summer pasturage on the mountains, where cattle, sheep and swine are reared. The mountains are richly clothed with forests of pine, beech, oak and fir; and the southern regions, wherever cultivation is possible, produce abundant crops of wheat and other cereals, vines, mulberries and numerous other fruits and vegetables.

The mineral resources include argentiferous lead, copper, iron and cobalt, with salt, lignite, limestone, millstone, gypsum, granite and slate. None of these, however, occurs in large quantities; and in 1903 only salt, lignite and fluor-spar were worked, while the total output was worth less than £1,000. Mineral springs are numerous, and the mining industry was formerly much more important; but the difficulties of transport hinder the development of this and other resources. Trade is most active with France, whither are sent timber, millstones, cattle, leather, brandy and wine. Between 1882 and 1892 the wine trade thrived greatly, owing to the demand for common red wines, suitable for blending with finer French vintages; but the exports subsequently declined, owing to the protective duties imposed by France. The manufactures, which are of little importance, include soap, spirits, leather, pottery and coarse cloth.

The Saragossa-Lérida-Barcelona railway traverses the province, and gives access, by two branch lines, to Jaca, by way of Huesca, the provincial capital, and to Barbastro. Up to the beginning of the 20th century this was the only railway completed, although it was supplemented by many good roads. But by the Railway Convention of 1904, ratified by the Spanish government in 1906, France and Spain agreed jointly to construct a railway from Jaca (in the Basque Pyrénées) to Barbastro, which should pass through the Port de Canfranc, and connect Saragossa with Pau. Apart from the episcopal cities of Huesca (pop. 1900, 12,626) and Jaca (4034), which are separately described, the only towns in the province with more than 5000 inhabitants are Barbastro (7033), an agricultural market, and Fraga (6890), an ancient residence of the kings of Aragon, with a fine 12th century parish church and a ruined Moorish citadel. Monzon, long celebrated as the meeting-place of the Aragonese and Catalonian parliaments, is a town on the lower Cinca, with the ruins of a Roman fortification, and of a 12th century castle, which was owned by the Knights Templar. (See also Aragon.)

HUESCA (anc. Osca), the capital of the Spanish province of Huesca, 35 m. N.N.E. of Saragossa, on the Tardienta-Huesca-Jaca railway. Pop. (1900), 12,626. Huesca occupies a height near the right bank of the river Isuela, overlooking a broad and fertile plain. It is a very ancient city and bears many traces of its antiquity. The streets in the older part are narrow and crooked, though clean, and many of the houses witness by their size and style of panelling the old fifteenth-century and even earlier origins. An imposing Gothic cathedral, begun in 1400, finished in 1515, and enriched with fine carving. In the same plaza is the old palace of the kings of Aragon, formerly given up for the use of the now closed Sertorius (the university), so named in memory of a school for the sons of native chiefs, founded at Huesca by Sertorius in 77 B.C. Among the other prominent buildings are the interesting parish churches (San Pedro, San Martin and San Juan), the episcopal palace, and various benevolent and religious foundations. Considerable attention is

paid to public education, and there are not only several good primary schools, but schools for teachers, an institute, an ecclesiastical seminary, an artistic and archaeological museum, and an economic society. Huesca manufactures cloth, pottery, bricks and leather; but its chief trade is in wine and agricultural produce. The development of these industries caused an increase in the population which, owing to emigration to France, had declined by nearly 2000 between 1887 and 1897.

Strabo (iii. 161, where some editors read Iloesoa) describes Osca as a town of the Ilergetes, and the scene of Sertorius's death in 72 B.C.; while Pliny places the Oscenses in regio Vesculania. Plutarch (loc. cit.) calls it a large city. Julius Caesar names it Vencedora; and the name by which Augustus knew it, Urbs victrix Osca, was stamped on its coins, and is still preserved on its arms. In the 8th century A.D. it was captured by the Moors; but in 1066 Pedro I. of Aragon regained it, after winning the decisive battle of Alcoraz.

HUET, PIERRE DANIEL (1630–1721), bishop of Avranches, French scholar, was born at Caen in 1630. He was educated at the Jesuit school of Caen, and also received lessons from the Protestant pastor, Samuel Bochart. At the age of twenty he was recognized as one of the most promising scholars of the time. He went in 1651 to Paris, where he formed a friendship with Gabriel Naudé, conservator of the Mazarin library. In the following year Samuel Bochart, being invited by Queen Christina to her court at Stockholm, took his friend Huet with him. This journey, in which he saw Leiden, Amsterdam and Copenhagen, as well as Stockholm, resulted chiefly in the discovery, in the Swedish royal library, of some fragments of Origen's Commentary on St Matthew, which gave Huet the idea of editing Origen, a task he completed in 1668. He eventually quarrelled with his friend Bochart, who accused him of having suppressed a line in Origen in the Eucharistic controversy. In Paris he entered into close relations with Chapelain. During the famous dispute of Ancients and Moderns Huet took the side of the Ancients against Charles Perrault and Desmares. Among his friends at this period were Conrat and Pellisson. His taste for mathematics led him to the study of astronomy. He next turned his attention to anatomy, and, being himself short-sighted, devoted his inquiries mainly to the question of vision and the formation of the eye. In this pursuit he made more than 800 dissections. He then learned all that was then to be learned in chemistry, and wrote a Latin poem on salt. All this time he was writing a treatise on the planets. In 1672 he was appointed to a professorship at the collège Louis-le-grand, but was haunting the salons of Mlle de Scudéry and the studios of painters; nor did his scientific researches interfere with his classical studies, for during this time he was discussing with Bochart the origin of certain medals, and was learning Syrac and Arabic under the Jesuit Parvilliers. He also translated the pastoral of Longus, wrote a tale called Diane de Castro, and defended, in a treatise on the origin of romance, the reading of fiction. On being appointed assistant tutor to the Dauphin in 1679, he edited with the assistance of Anne Lefèvre, afterwards Madame Dacier, the well-known edition of the Delphic Classics. This series was a comprehensive edition of the Latin classics in about sixty volumes, and each work was accompanied by a Latin commentary, ordo verborum, and verbal index. The original volumes have each an engraving of Arion and the Dolphin, and the appropriate inscription in usum serenissimi Delphini. Huet was admitted to the Academy in 1674. He issued one of his greatest works, the Demonstratio evangelica, in 1679. He took holy orders in 1676, and two years later the king gave him the abbey of Aullay, where he wrote his works. The death of Anne of Austria (1690), his friend Casimir Pelletan (Paris, 1680), Studium historico philosophers Cartesienses (Paris, 1682), his Nouveau mémoire pour servir à l'histoire du Cartésisme (1682), and his discussion with Bolleau on the Sublime. In 1685 he was made bishop of Soissons, but after waiting for installation for four years he took the bishopric of Avranches instead. He exchanged the cares of his bishopric for what he thought would be the easier chair of the Abbey of Fontenay, but there he was vexed with continual lawsuits. At length he retired to the Jesuits' House in the Rue Saint Antoine at Paris, where he died in 1721. His great library
HUG, JOHANN LEONHRD (1765-1846), German Roman Catholic theologian, was born at Constance on the 1st of June 1765. In 1783 he entered the university of Freiburg, where he became a pupil in the seminary for the training of priests, and soon distinguished himself in classical and Oriental philology as well as in biblical exegesis and criticism. In 1787 he became superintendent of studies in the seminary, and held this appointment until the breaking up of the early dynasty, and the following year he was called to the Freiburg chair of Oriental languages and Old Testament exegesis; to the duties of this post were added in 1793 those of the professorship of New Testament exegesis. Declining calls to Breslau, Tübingen, and thrice to Bonn, Hug continued at Freiburg for upwards of thirty years, taking an occasional literary tour to Munich, Paris or Italy. In 1827 he resigned some of his professorial work, but continued in active duty until in the autumn of 1845 he was seized with a painful illness, which proved fatal on the 11th of March 1846.

His first publication was the first instalment of his Einleitung; in it he argued with much acuteness against J. G. Eichhorn in favour of the "borrowing hypothesis" of the origin of the synoptical gospels, maintaining the priority of Matthew, the present Greek text of which had been the subject of considerable discussions on the origin of alphabetical writing (Die Entdeckung der Buchstabenreihe, 1801), on the antiquity of the Codex Vaticanus (1810), and on ancient mythology (Über den Mythos der alten Völker, 1812); and a preparation for the History of Solomon (Salomo oder die nicht noch unversuchten Deutungen, 1813), to the effect that the lover represents King Hezekiah, while by his beloved is intended the remnant left after the destruction of his city. In 1814 he was appointed to a chair of criticism on the indissoluble character of the matrimonial bond (De conjugi christiani vinculo indissolubili commentatio exegetica, 1816) and on the Alexandrian version of the Pentateuch (1818). His Einleitung in die Schriften des Neuen Testaments, undoubtedly his most important work, was completed in 1808 (fourth German edition, 1847; English translations by D. G. Wait, London, 1827, and by Fosdick, New York, 1836; French partial translation by J. E. Cellery, Geneva, 1834). It is specially valuable in the portion relating to the history of the text which (up to the middle of the 3rd century he holds to have been current only in a common edition (curtus lectoribus), of which recensions were afterwards made the object of Hug's, an Egyptian bishop, by Lucian of Antioch, and by Origen) and in its discussion of the ancient versions. The author's intelligence and acuteness are more completely hampered by doctrinal presuppositions when he comes to treat questions relating to the history of the individual books of the New Testament canon. From 1839 to his death Hug was a regular and important contributor to the Freiburger Zeitschrift für kathol. Theologie. See Stieglitz, Gedächtnisrede auf J. L. Hug (1847); W. Werner, Geschichte der kath. Theol. in Deutschland, 527-533 (1866).

HUGGINS, SIR WILLIAM (1824-1910), English astronomer, was born in London on the 7th of February 1824, and was educated first at the City of London School and then under various private teachers. Having determined to apply himself to the study of astronomy, he built in 1856 a private observatory at Tulse Hill, in the south of London. At first he occupied himself with ordinary routine work, but being far from satisfied with the scope which this afforded, he seized eagerly upon the opportunity for research offered by Kirchhoff's discoveries in spectrum analysis. The chemical constitution of the stars was the problem to which he turned his attention, and his first results, obtained in conjunction with Professor W. A. Miller, were presented to the Royal Society in 1863, in a preliminary note on the "Lines of some of the fixed stars." His experiments, in the same year, on the photographic registration of stellar spectra, marked an innovation of a momentous character. But the wet collodion process was then the only one available, and its inconveniences were such as to preclude its extensive employment; the real triumphs of photographic astronomy began in 1873 with Huggins's adoption and adaptation of the gelatin-plate method, by which the exposures were of any desired length, and, through the cumulative action of light on extremely sensitive surfaces, to obtain permanent accurate pictures of celestial objects so faint as to be completely invisible to the eye, even when aided by the most powerful telescopes. In the last quarter of the 19th century spectroscopy and photography together worked a revolution in observational astronomy, and in both branches Huggins acted as pioneer.
Many results of great importance are associated with his name. Thus in 1864 the spectroscope yielded him evidence that planetary and irregular nebulae consist of luminous gas—a conclusion tending to support the nebular hypothesis of the origin of stars and planets by condensation from glowing masses of fluid material. On the 18th of May 1866 he made the first spectroscopic examination of a temporary star (Nova Coroneae), and found it to be enveloped in blazing hydrogen. In 1868 he proved incandescent carbon-vapours to be the main source of cometary light; and on the 23rd of April in the same year applied Doppler's principle to the detection and measurement of stellar velocities in the line of sight. Data of this kind, which are by other means inaccessible to the astronomer, are obviously indispensable to any adequate conception of the stellar system as a whole or in its parts. In solar physics Huggins suggested a spectroscope method for viewing the red prominences in daylight; and his experiments went far towards setting a much-disputed question regarding the solar distribution of calcium. In the general solar spectrum this element is represented by a large number of lines, but in the spectrum of the prominences and chromosphere one pair only can be detected. This circumstance appeared so anomalous that some astronomers doubted whether the surviving lines were really due to calcium; but Sir William and Lady Huggins (née Margaret Lindsay Murray, who, after their marriage in 1875, actively assisted her husband) successfully demonstrated in the laboratory that calcium vapour, if at a sufficiently low pressure, gives under the influence of the electric discharge precisely these lines and no others. The striking discovery was, in 1903, made by the same investigators that the spontaneous luminosity of radium gives a spectrum of a kind never before obtained without the aid of powerful excitation, electrical or thermal. It consists, that is to say, in a range of bright lines, the agreement of which with the negative pole bands of nitrogen, together with details of interest connected with its mode of production, was ascertained by a continuance of the research. Sir William Huggins, who was made K.C.B. in 1857, received the Order of Merit in 1902, and was awarded many honours, academic and other. He presided over the meeting of the British Association in 1891, and during the five years 1900-1905 acted as president of the Royal Society, from which he at different times received a Royal, a Copley and a Rumford medal. Four of his presidential addresses were republished in 1906, in an illustrated volume entitled The Royal Society. A list of his scientific papers is contained in chapter ii. of the magnificent Atlas of Representative Stellar Spectra, published in 1891, by Sir William and Lady Huggins conjointly, for which they were adjudged the Actonian prize of the Royal Institution. Sir William Huggins died on the 12th of May 1910. See ch. i. of Atlas of Stellar Spectra, containing a history of the Tulse Hill observatory; Sir W. Huggins's personal retrospect in the Nineteenth Century for June 1897; Scientific Worthies, with photogravure portrait (Nature); Astronomers of To-Day, by Hector Macpherson, junr. (1905) (portrait); Monlth. Notices Roy. Astr. Society, xxvii. 146 (C. Pritchard). (A. M. C.)

HUGH, ST. ST. HUGH OF AVALON (c. 1140-1206), bishop of Lincoln, who must be distinguished from Hugh of Wells, and also from St. Hugh of Lincoln (see below), was born of a noble family at Avalon in Burgundy. At the age of eight he entered along with his widowed father the neighbouring priory of canons regular at Villard-Benoit, where he was ordained deacon at nineteen. Appointed not long after prior of a dependent cell, Hugh was attracted from that position by the holy reputation of the monks of the Grande Chartreuse, whose house he finally entered despite an oath to the contrary which he had given his superior. There he remained about ten years, receiving priest's orders, and rising to the important office of procurator, which brought him into contact with the outer world. The holy reputation for energy and tact which Hugh speedily attained penetrated to the ears of Henry II. of England, and induced that monarch to request the procurator's assistance in establishing at Witham in Somersetsire the first English Cistercian monastery. Hugh reluctantly consented to go to England, where in a short time he succeeded in overcoming every obstacle, and in erecting and organizing the convent, of which he was appointed first prior. He speedily became prime favourite with Henry, who in 1186 procured his election to the see of Lincoln. He took little part in political matters, maintaining as one of his chief principles that a churchman should hold no secular office. A sturdy upholder of what he believed to be right, he let neither royal nor ecclesiastical influence interfere with his conduct, but fearlessly resisted whatever seemed to him an infringement of the rights of his church or diocese. But with all his bluff firmness Hugh had a calm judgment and a ready tact, which almost invariably left him a better friend than before of those whom he opposed; and the astute Henry, the impetuous Richard, and the cunning John, so different in other points, agreed in respecting the bishop of Lincoln. Hugh's manners were a little rigid and harsh; but, though an ascetic to himself, he was distinguished by a broad kindness to others, so that even the Jews of Lincoln wept at his funeral. He had great skill in taming birds, and for some years had a pet swan, which occupies a prominent place in all histories and representations of the saint. In 1200 Bishop Hugh revisited his native country and his first convents, and on the return journey was seized with an illness, of which he died at London on the 16th of November 1200. He was canonized by Honorius III. on the 17th of February 1220. His feast day is kept on the 17th of November in the Roman Church.

The life of St. Hugh, the Magna vita St. Hugonis, probably written by Adam, afterwards abbot of Eynsham, the bishop's chaplain, was edited by J. F. Dinomck in Rec. Brittan. med. avicript, No. xxxvii. (London, 1864). MSS. of this are in the Bodleian Library (Dibgy, 165 of the 17th century) and in Paris ( Bib. Nat. 5575, Fonds Latin); the Paris MS. fortunately makes good the portions lacking in the Oxford one. Mr Dinonck also edited a Matrical Life of St Hugh of Avalon (London, 1860), from two MSS. in the British Museum and the Bodleian Library. The best modern source for information as to St Hugh and his time is the Vie de St Hugues, époque de Lincoln (1140-1200) par un religieux de la Grande Chartreuse, (Monceuil, 1899), Eng. trans, edited by H. T. White, S.J., with valuable appendices and notes (London, 1898). A complete bibliography is given in U. Chevalier, Bio-biographie (Paris, 1895, 2266-2207); see also A. Potthast, Bibliotheca med. aev., 1360.

HUGH OF WELLS, one of King John's officials and councillors, became bishop of Lincoln in 1200. He soon fell into disfavour with John, and the earlier years of his bishopric were mainly spent abroad, while the king seized the revenues of his see. However, he was one of John's supporters when Magna Carta was signed, and after the accession of Henry III. he was able to turn his attention to his episcopal duties. His chief work was the establishment of vicarages in his diocese, thus rendering the parishioner more easy access to the diocesan clergy. His policy, and consequently Hugh himself, was heartily disliked by Matthew Paris and other monastic writers. The bishop, who did some building at Lincoln and also at Wells, died on the 7th of February 1235.

ST HUGH OF LINCOLN, a native of Lincoln, was a child about ten years old when he was found dead on premises belonging to a Jew. It was said, and the story was generally believed, that the boy had been scourged and crucified in imitation of the death of Jesus Christ. Great indignation was excited, and a number of Jews were hanged or punished in other ways. The incident is referred to by Chaucer in the Prioresses Tale and by Marlowe in the Jew of Malta.

HUGH, called THE GREAT (d. 956), duke of the Franks and count of Paris, son of King Robert I. of France (d. 923) and nephew of King Odo or Eudes (d. 898), was one of the founders of the power of the Capetian house in France. Hugh's first wife was Eadhild, a sister of the English king, Æthelstan. At the death of Raoul, count of Burgundy, in 936, Hugh had in his blueright hand the king, who had recently had the Seine, corresponding to the ancient Neustria, with the exception of the territory ceded to the Normans in 911. He took a very active part in bringing Louis IV. (d'Outreme) from England in 936, but in the same year Hugh married Hadwige, sister of the emperor Otto the Great, and soon quarrelled with Louis. Hugh
even paid homage to Otto, and supported him in his struggle against Louis. When Louis fell into the hands of the Normans in 945, he was handed over to Hugh, who released him in 946 on the condition that he should surrender the fortress of Laon. At the council of Ingelheim (948) Hugh was condemned, under pain of excommunication, to make reparation to Louis. It was not, however, until 950 that the powerful vassal became reconciled with his suzerain and restored Laon. But new difficulties arose, and peace was not finally concluded until 953. On the death of Louis IV. Hugh was one of the first to recognize Lothair as his successor, and, at the intervention of Queen Gerberga, was instrumental in having him crowned. In recognition of this service Hugh was invested by the new king with the dukedom of Burgundy (his suzerainty over which had already been nominally recognized by Louis IV.) and Aquitaine. But his expedition in 955 to take possession of Aquitaine was unsuccessful. In the same year, however, Giselbert, duke of Burgundy, acknowledged himself his vassal and betrothed his daughter to Hugh's son Otto. At Giselbert's death (April 8, 956) Hugh became effective master of the duchy, but died soon afterwards, on the 16th or 17th of June 956.

HUGH CAPET (c. 938-996), king of France and founder of the Capetian dynasty, was the eldest son of Hugh the Great by his wife Hadwig. When his father died in 956 he succeeded to his numerous fiefs around Paris and Orleans, and thus becoming one of the most powerful of the feudatories of his day, the young Hugh, king Lothair, he was recognized somewhat reluctantly by that monarch as duke of the Franks. Many of the counts of northern France did homage to him as their overlord, and Richard I., duke of Normandy, was both his vassal and his brother-in-law. His authority extended over certain districts south of the Loire, and, owing to his interference, Lothair was obliged to recognize his brother Henry as duke of Burgundy. Hugh supported his royal suzerain when Lothair and the emperor Otto II. fought for the possession of Lorraine; but chagrined at the king's conduct in making peace in 980, he went to Rome to conclude an alliance with Otto. Laying more stress upon independence than upon loyalty, Hugh appears to have acted in a haughty manner toward Lothair, and also towards his son and successor Louis V.; but neither king was strong enough to punish this powerful vassal, whose clerical supporters already harboured the thought of securing for him the Frankish crown. When Louis V. died without children in May 987, Hugh and the late king's uncle Charles, duke of Lower Lorraine, were candidates for the vacant throne, and in this contest the energy of Hugh's champions, Adalberon, archbishop of Reims, and Gerbert, afterwards Pope Sylvester II., prevailed. Declaring that the Frankish crown was an elective and not an hereditary dignity, Adalberon secured the election of his friend and cousin, by force of arms, Louis the Great, son of Hugh and his wife, Ermengarde, and he became king of the Franks.

The authority of the new king was quickly recognized in his kingdom, which covered the greater part of France north of the Loire with the exception of Brittany, and in a shadowy fashion he was acknowledged in Aquitaine; but he was compelled to purchase the allegiance of the great nobles by large grants of royal lands, and he was hardly more powerful as king than he had been as duke. Moreover, Charles of Lorraine was not prepared to bow before his successful rival, and before Hugh had secured the coronation of his son Robert as his colleague and successor in December 987, he had found allies and attacked the king. Hugh was worsted during the earlier part of this struggle, and was in serious straits, until he was saved by the wiles of his parvis, Adalberon, bishop of Laon, who in 991 treacherously seized Charles and handed him over to the king. This capture virtually ended the war, but one of its side issues was a quarrel between Hugh and Pope John XV., who was supported by the empire, then under the rule of the empress Adelaide and Theophano as regents for the young emperor Otto III. In 989 the king had appointed to the vacant archbishopric of Reims a certain Arnulf, who at once proved himself a traitor to Hugh and a friend to Charles of Lorraine. In June 991, at the instance of the king, the French bishops deposed Arnulf and elected Gerbert in his stead, a proceeding which was displeasing to the pope, who excommunicated the new archbishop and his partisans. Hugh and his bishops remained firm, and the dispute was still in progress when the king died at Paris on the 24th of October 996.

Hugh was a devoted son of the church, to which, it is not too much to say, he owed his throne. As lay abbot of the abbey of St Martin at Tours and of St Denis he was interested in clerical reform, was fond of participating in religious ceremonies, and had many friends among the clergy. His wife was Adelaide, daughter of William III., duke of Aquitaine, by whom he left a son, Robert, who succeeded him as king of France. The origin of Hugh's surname of Capet, which was also applied to his father, has been the subject of some discussion. It is derived undoubtedly from the Lat. capa, capa, a cape, but whether Hugh received it from the cape which he wore as abbot of St Martin's, or from his youthful and playful habit of seizing caps, or from some other cause, is uncertain.

HUGH DE PUISET (c. 1125-1195), bishop of Durham, was the nephew of Stephen and Henry of Blois; the latter brought him to England and made him an archdeacon of the see of Winchester. Hugh, however, soon proved himself as much a friend of his young kinsman as a vassal, and in 1153 he was chosen bishop of Durham, in spite of the opposition of the archbishop of York; but he only obtained consecration by making a personal visit to Rome. Hugh took little part in politics in the reign of Henry II., remaining in the north, immersed in the affairs of his see. He was, however, present with Roger, archbishop of York, at the coronation of young Henry (1170), and was in consequence suspended by Alexander III. He remained neutral, as far as he could, in the quarrel between Henry and Becket, but he at least connived at the rebellion of 1173 and William the Lion's invasion of England in that year. After the failure of the rebellion the bishop was compelled to surrender Durham, Norham and Northallerton to the king. In 1179 he attended the Lateran Council at Rome, and in 1181 by the pope's order he left Scotland under an interdict. In 1184 he took the cross. At the general sale of offices with which Richard began his reign (1189) Hugh bought the earldom of Northumberland. The archbishopric of York had been vacant since 1181. This vacancy increased Hugh's power vastly, and when the vacancy was filled by the appointment of Geoffrey he naturally raised objections. This quarrel with Geoffrey lasted till the end of his life. Hugh was nominated justiciar jointly with William Longchamp when Richard left the kingdom. But Longchamp soon deprived the bishop of his place (1196), even going so far as to imprison Hugh and make him surrender his castle, his earldom and hostages. Hugh's chief object in politics was to avoid acknowledging Geoffrey of York as his ecclesiastical superior, but this he was compelled to do in 1195. On Richard's return Hugh joined the king and tried to buy back his earldom. He seemed on the point of doing so when he died. Hugh was one of the most important men of his day, and left a mark upon the north of England which has never been effaced. Combining in his own hands the palatinate of Durham and the earldom of Northumberland, he held a position not much dissimilar to that of the great German princes, a local sovereign in all but name.

See K. Norgate's England under the Angevin Kings (1887); Stubbs's preface to Hoveden, iii.

HUGH OF ST CHER (c. 1200-1263), French cardinal and Biblical commentator, was born at St Cher, a suburb of Vienne, Dauphiné, and while a student in Paris entered the Dominon convent of the Jacobins in 1225. He taught philosophy, theology and canon law. As provincial of his order, which office he held during most of the third decade of the century, he contributed largely to its prosperity, and won the confidence of the popes Gregory IX., Innocent IV. and Alexander IV., who charged him with several important missions. Created cardinal-priest in 1244, he played an important part in the council of Lyons in
Hugh of St Victor—Hughes, D. E.

1245, contributed to the institution of the Feast of Holy Saturday, the reform of the Carmelites (1247), and the condemnations of the fourteenth general chapter of the Premonstratensian Order of Ghent. He died at Orvieto on the 9th of March 1263. He directed the first revision of the text of the Vulgate, begun in 1236 by the Dominicans; this first "correctorium," vigorously criticized by Roger Bacon, was revised in 1248 and in 1256, and forms the base of the celebrated Correctorium Bibliae Sorbonicae. With the aid of many of his order he edited the first concordance of the Bible (Concordantiae Biblicorum or Concordantiae S. Jacobi), but the assertion that we owe the present division of the chapters of the Vulgate to him is false.

Besides a commentary on the book of Sentences, he wrote the Postilla in sacram scripturam iuxta quadruplium sensum, litteralem, allegoricam, anagogicam et moralern, published frequently in the 15th and 16th centuries. His Sermones de tempore et sanctis are apparently only extracts. His exegetical works were published at Venice in 1754 in 4 vols.

See, for sources, Quétel-Echard, Scriptorum ordinis praedicatorum; Denifle, in Archiv für Literatur und Kirchengeschichte des Mittelalters, i. 149, ii. 171, iv. 263 and 471; L'Année dominicaine, iii. (1886) 990 and 1890, iv. (1891) 131 and 471; Pasquier, Histoire des dominicains (1898).

HUGH OF ST VICTOR (c. 1078-1141), mystical philosopher, was probably born at Hartingam, in Saxony. After spending some time in a house of canons regular at Hamersleben, in Saxony, where he completed his studies, he removed to the abbey of St Victor at Marseilles, and thence to the abbey of St Victor in Paris. Of this last house he rose to be canon, in 1125 scholasticus, and perhaps even prior, and it was there that he died on the 11th of February 1141. His eloquence and his writings earned for him a renown and influence which far exceeded St Bernard's, and which held its ground until the advent of the Thomist philosophy.

Hugh was more especially the initiator of a movement of ideas—the mysticism of the school of St Victor—which filled the whole of the second part of the 12th century. "The mysticism which he inaugurated," says Ch. V. Langlois, "is learned, unctuous, ornate, florid, a mysticism which never indulges in dangerous terrors; it is the orthodox mysticism of a subtle and prudent rhetorician." This tendency undoubtedly shows a marked reaction from the contentious theology of Roscellinus and Abelard. For Hugh of St Victor dialectic was both insufficient and perilous. Yet he did not profess the haughty contempt for science and philosophy which his followers the Victorines expressed; he regarded knowledge, not as an end in itself, but as the vestibule of the mystical life. The reason, he thought, was but an aid to the understanding of the truths which faith reveals. The ascent towards God and the functions of the "threelfold eye of the soul"—cogitation, meditation and contemplation—were minutely taught by him in language which is at once precise and symbolical.

Manuscript copies of his works abound, and are to be found in almost every library which possesses a collection of ancient writings. The works themselves are very numerous and very diverse. The middle ages attributed to him ninety works, and the edition in历史新高's Patrologia Latina, vols. clxxv-clxxvii. (Paris, 1854) contains no fewer than forty-seven treatises, commentaries and collections of sermons. Of that number, however, B. Hauréau (Les Œuvres de Hugues de St Victor, t. iii. Paris, 1886) and the authenticity of several, which he ascribes with some show of probability to Hugh of Fouillou, Robert Paulinus or others. Among them, however, are the Compendium Distinctionum, a Collection of Sermons and Commentaries, which can be credited may be mentioned the De sacramentis christiani fidei; the Didascalicon di studio legendi; the treatises on mysticism entitled Soliloquium de aranea animae, De contemplatione et ejus effusione, De arca Noë mystica, De vanitate mundi, De aranea animae, De amore sponsad, &c.; the introduction (Praemiatione) to the first part of the (Scriptures); homilies on the book of Ecclesiastes; commentaries on various books of the Bible, e.g. the Pentateuch, Judges, Kings, Jeremias, &c.

See B. Hauréau, op. cit. and Notices et extraits des MSS. latins de la bibliothèque royale de Bruxelles; see also also the introduction of the translation by Dr. D. Verbruggen, Les origines de la scholasticque du Moyen Age, ou Histoire de St Victor (Paris, 1851); J. Kilgenstein, Die Gottschatze des Hugus von St Victor (1898).

Hughes, David Edward (1831-1900), Anglo-American electrician, was born on the 16th of May 1831 in London, but the earlier part of his life was spent in America, where his parents emigrated when he was about seven years old. In 1850 he became professor of music at the college of Bardstown, Kentucky; and soon afterwards his attainments in physical science procured his appointment as teacher of natural philosophy at the same place. His professorial career, however, was brief, for in 1854 he removed to Louis ville to superintend the manufacture of the type-printing telegraph instrument which he had been thinking out for some time, and which was destined to make both his name and his fortune. The patent for this machine was taken out in the United States in 1835, and its success was immediate. After seeing it well established on one side of the Atlantic, Hughes in 1837 brought it over to his native country, where, however, the telegraph companies did not receive it with any favour. Two or three years afterwards he introduced it to the notice of the French Government, who, after submitting it to severe tests, ultimately adopted it, and in the succeeding ten years it came into extensive use all over Europe, gaining for its inventor many honours and prizes. In the development of telephony also Hughes did an important share, and the telephone has attained its present perfection largely as a result of his investigations. The carbon transmitters which in various forms are in almost universal use are modifications of a simple device which he called a microphone, and which consists essentially of two pieces of carbon, in loose contact one with the other. The arrangement constitutes a variable electrical resistance of the most delicate character; if it is included in an electric circuit with a battery and subjected to the influence of sonorous vibrations, its resistance varies in such a way as to produce a undulatory current which affords an exact representation of the sound waves as to height, length and form. These results were published in 1878, but Hughes did much more work on the properties of such microphonic joints, of which he said nothing till many years afterwards. When towards the end of 1879 he found that they were also sensitive to "sudden electric impulses, whether given out to the atmosphere through the extra current from a coil or from a frictional machine," he in fact discovered the phenomena on which depends the action of the so-called "coherers" used in wireless telegraphy. But he went further and practised wireless telegraphy himself, surmising, moreover, that the agency he was employing consisted of true electric waves. Setting some source of the "sudden electric impulses" referred to above into operation in his house, he walked along the street carrying a telephone in circuit with a small battery and one of these microphonic joints, and found that the sounds remained audible in the telephone until he had traversed a distance of 500 yards. This experiment he showed to several European men of science, among others to Sir G. G. Stokes, to whom he broached the theory that the results were due to electric waves. That physicist, however, was not disposed to accept this explanation, considering that a sufficient one could be found in well-known electromagnetic induction effects, and Hughes was so discouraged at that high authority taking this view of the matter that he resolved to publish no account of his inquiry until further experiments had enabled him to prove the correctness of his theory. These experiments were still in progress when H. R. Hertz settled the question by his researches on electric waves in 1887-1889. Hughes, who is also known for his invention of the induction balance and for his contributions to the theory of magnetism, died in London on the 22nd of January 1900. As an investigator he was remarkable for the simplicity of the apparatus which served his purposes, domestic articles like jam-pots, pins, &c., forming a large part of the equipment of his laboratory. His manner of life, too, was simple and frugal in the extreme. He amassed a large fortune, which, with the exception of £10,000 bequests to the Royal Society, the Paris Academies of Sciences, the Institution of Electrical Engineers, and the Paris Société Internationale des Électriciens, for the establishment of scholarships and prizes in physical science, was left to four London hospitals, subject only to certain life annuities.
HUGHES, SIR E.—HUGHES, J.

HUGHES, SIR EDWARD (c. 1720-1794), British admiral, entered the Royal Navy in 1735, and four years later was present at Porto Bello. In 1740 he became lieutenant, and in that year served in the Cartagena expedition of 1741, and at the indecisive battle of Toulon (1744). In H.M.S. "Warwick" he distinguished himself at the taking of Minorca, and in the capture of proper support from the "Lark" (which was sailing in company with the "Warwick"), the combat ended with the enemy's escape. The commander of the "Lark" was subsequently tried and condemned for his conduct, and Hughes received the vacant command. Captain Hughes was with Boscawen at Louisburg and with Saunders at Quebec. He was in continual employment during the peace, and as Commodore commanded in the East Indies from 1773 to 1777. It was not long before he returned to the East as a rear-admiral, with an overwhelming naval force. On his outward voyage he retook Goree from the French, and he was called upon to conduct only minor operations for the next two years, as the enemy could not muster any force fit to meet the powerful squadron Hughes had brought from the Channel. In 1782 he stormed Trincomalee a few days before the squadron of Suffren arrived in the neighbourhood. For the next year these Indian waters were the scene of one of the most famous of naval campaigns. Suffren (q.v.) was perhaps the ablest sea-commander that France ever produced, but his subordinates were factious and unskilful; Hughes on the other hand, whose ability was that born of long experience rather than genius, was well supported. No fewer than five fiercely contested general actions were fought by two fleets, neither of them gaining a decisive advantage. In the end Hughes held his ground. After the peace he returned to England, and, though further promotions came to him, he never again hoisted his flag. He had accumulated considerable wealth during his Indian service, which for the most part he spent in unostentatious charity. He died at his seat of Lutonborough in Essex in 1794.

HUGHES, HUGH PRICE (1847-1902), British Nonconformist divine, was born at Carmarthen on the 8th of February 1847, the son of a surgeon. He began to preach when he was fourteen, and in 1865 entered Richmond College to study for the Wesleyan Methodist ministry under the Rev. Alfred Barrett, one of whose daughters he married in 1875. He graduated at London University in 1869, the last year of his residence. He established in 1887 the West London Mission, holding popular services on Sunday at St James's Hall, Piccadilly, where he preached from time to time on the housing of the poor, sweating, gambling and other subjects of social interest. In connexion with this mission he founded a sisterhood to forward the social side of the work, which was presided over by Mrs Hughes. He had started in 1885 the Methodist Times, and rapidly made it a leading organ of Nonconformist opinion. He was a born fighter, and carried the fire and eloquence he showed on the platform and in the pulpit into journalism. He supported Mr W. T. Stead in 1889, as he had earlier supported Mrs Josephine Butler in a similar cause; he attacked the trade in alcohol: was an anti-vivisectionist; he advocated arbitration; and his vehement attacks on Sir Charles Dilke and Charles Stewart Parnell originated the phrase the "Nonconformist conscience." He differed strongly, however, from a large section of Nonconformist opinion in his defence of the South African War. He was long regarded with some distrust by the more conservative section of his own church, but in 1898 he was made president of the Wesleyan Conference. He raised large sums for church work, amounting it is said to over a quarter of a million of money. His energies were largely devoted to "co-operation" among the various Nonconformist bodies, especially the Wesleyans, and in May, 1893, he presided at the meeting of the All-Connexion Wesleyan Conference, of which he was subsequently one of the founders and the first general president. He had long been in failing health when he died suddenly in London on the 17th of November 1902.

See his Life (1904) by his daughter, Dorothèe Price Hughes.

HUGHES, JOHN (1767-1870), English poet and miscellaneous writer, was born at Marlborough, Wiltshire, on the 29th of January 1877. His father was a clerk in a city office, and his grandfather was ejected from the living of Marlborough in 1662 for his Nonconformist opinions. Hughes was educated at a dissenting academy in London, where Isaac Watts was among his fellow scholars. He became a clerk in the Ordnance Office, and served on several commissions for the purchase of land for fortifications, and on the Board of Ordnance. In 1854 the Chancery Court of Requests made him secretary to the commissions of the peace in the county of Cheshire. He died on the night of the production of his most celebrated work, The Siege of Damascus, the 17th of February 1720. His poems include occasional pieces in honour of William III, imitations of Horace, and a translation of the tenth book of the Pharsalia of Lucan. He was an amateur of the violin, and played in the concerts of Thomas Britton, the "musical small-coal man." He wrote some of the librettis of the cantatas (2 vols., 1712) set to music by Dr John Christopher Pepusch. To these he prefixed an essay advocating the claims of English libretti, and insisting on the value of recitative. Others of his pieces were set to music by Ernest Galliard and by Händel. In the masque of Apollo and Daphne (1716) he was associated with Pepusch, and in his opera of Calypso and Telemachus (1712) with John E. Galliard. He was a contributor to the Tailor, the Spectator and the Guardian, and he collaborated with Sir Richard Blackmore in a series of essays entitled The Lay Monastery (1713-1714). He persuaded Joseph Addison to stage Cato. Addison had requested Hughes to write the last act, but eventually completed the play himself. He wrote a version of the Letters of Abélard and Heloise. . . . (1714) chiefly from the French translation printed at the Hague in 1693, which went through several editions, and is notable as the basis of Pope's "Eloisa to Abélard" (1717). He also made translations from Molière, Fontenelle and the Abbé Vertot, and in 1715 edited The Works of Edmund Spenser ... (another edition, 1750). His last work, the tragedy of The Siege of Damascus, is his best. It remained on the list of acting plays for a long time, and is to be found in various collected editions of British drama.

His Poems on Several Occasions, with some Select Essays in Prose ... were edited with a memoir in 1715, by William Duncombe, who had married his sister Elizabeth. See also Letters by several eminent persons (2 vols., 1772) and The Correspondence of John Hughes, Esq. . . . and Several of his Friends ... (2 vols., 1773), with some additional poems. There is a long and eulogistic account of Hughes, with some letters, in the Biographia Britannica.

HUGHES, JOHN (1797-1864), American Roman Catholic divine, was born in Annalaghen, Co. Tyrone, Ireland, on the 24th of June 1797. In 1817 he followed his father to Chambersburg, Pennsylvania. He was ordained deacon in 1825 and priest in 1826; and as vicar in St Augustine's and other churches in Philadelphia he took a prominent part in the defence of ecclesiastical authority against the lay trustee system. In 1857 he was consecrated coadjutor to Bishop Dubois in New York. In the New York diocese, of which he was made administrator in 1839 and bishop in 1842, besides suppressing (1841) church control by lay trustees, he proved himself an active, almost pugnacious, leader. His unsuccessful attempt to build in LaFargueville, Jefferson county, a seminary of St Vincent de Paul, was followed by the transfer of the school to Fordham, where St John's College (now Fordham University) was established (1841), largely out of funds collected by him in Europe in 1839-1846. His demand for state support for parochial schools was favoured by Governor Seward and was half victorious: it was in this controversy that he was first accused of forming a Catholic party in politics. John McCloskey was consecrated his coadjutor in 1845; in 1847 the diocese of New York was divided; and in 1850 Hughes was named the first archbishop of New York, with suffragan bishops of Brooklyn, Albany, and Buffalo. In the formation of the "Native American" disturbances of 1844, he had been viciously attacked together with his Church; he kept his parishioners in check, but bade them protect their places of worship. His attitude was much the same at the time of the Anti-Popery outcry of the "Know-Nothing"s in 1854. His early anti-slavery views had been made much less radical by his travels in the South and in the West Indies, but at the outbreak of the Civil War he was strongly...
Hughes, T. — Hugli 861

pro-Union, and in 1861 he went to France to counteract the influence of the Slidell mission. He met with success not only in France, but at Rome and in Ireland, where, however, he made strong anti-English speeches. He died in New York City on the 3rd of January 1864. Hughes was a hard fighter and delighted in controversy. In 1826 he wrote An Answer to Nine Objections Made by an Anonymous Writer Against the Catholic Religion; he was engaged in a bitter debate with Dr John Breckenridge (Presbyterian), partly in letters published in 1835 and partly in a public discussion in Philadelphia in 1835, on the subject of civil and religious liberty as affected by the Roman Catholic and the Presbyterian "religions"; in 1836, through his organ, the Metropolitan Record, he did his best to discredit any attempts by the Catholic press to forward either the movement to "Americanize" the Catholic Church or that to disseminate the principles of "Young Ireland."

Hughes, Thomas, English dramatist, a native of Cheshire, entered Queens' College, Cambridge, in 1571. He graduated and became a fellow of his college in 1576, and was afterwards a member of Gray's Inn. He wrote The Misfortunes of Arthur. Under the pseudonym "Ludlow." With biographical notes, Hughes, which was performed at Greenwich in the Queen's presence on the 28th of February 1588. Nicholas Trotte provided the introduction, Francis Flower the choruses of Acts I and II. William Fulbeck two speeches, while three other gentlemen of Gray's Inn, one of whom was Francis Bacon, undertook the care of the dumb show. The argument of the play, based on a story of incest and crime, was borrowed, in accordance with Senecan tradition, from mythical history, and the treatment is in close accordance with the model. The ghost of Gorlois, who was slain by Uther Pendragon, is represented with a speech that reproduces passages spoken by the ghost of Tantalus in The Thesee; the tragic events are announced by a messenger, and the chorus comments on the course of the action. Dr W. J. Cunliffe has proved that Hughes's memory was saturated with Seneca, and that the play may be resolved into a patchwork of translations, with occasional original lines. Appendix II to his exhaustive essay On the Influence of Seneca on Elizabethan Tragedy (1893) gives a long list of parallel passages.

The work was written for the poet's friend, P. Collier's supplement to Dodsley's Old Plays; and by Harvey Carson Granville (Berlin, 1900), who points out that Hughes's source was Geoffrey of Monmouth's Historia Brimmion, not the Morte D'Arthur.

Hughes, Thomas (1822-1896), English lawyer and author, second son of John Hughes of Donnington Priory, editor of The Boscoed Tracts (1830), was born at Uffington, Berks, on the 30th of October 1822. In February 1834 he went to Rugby School, to be under Dr Arnold, a contemporary of his father at Oriel. He rose steadily to the sixth form, where he came into contact with the headmaster whom he afterwards idealized; but he excelled rather in sports than in scholarship, and his school career culminated in a cricket match at Lord's. In 1842 he proceeded to Oriel, Oxford, and graduated B.A. in 1845. He was called to the bar in 1848, became Q.C. in 1869, a bencher in 1870, and was appointed to a county court judgeship in the Chester district in July 1885. While at Lincoln's Inn he came under the dominating influence of his life, that of Frederick Denison Maurice. In 1848 he joined the Christian Socialists, under Maurice's banner, among his closest allies being Charles Kingsley. In January 1854 he was one of the original promoters of the Working Men's College in Great Ormond Street, and whether he was speaking on sanitation, sparring or singing his favourite ditty of "Little Billee," his work there continued one of his chief interests to the end of his life. After Maurice's death he held the principalship of the college. His Moniiness of Christ (1879) grew out of a Bible class that he held there. Hughes had been influenced mentally by Arnold, Carlyle, Thackeray, Lowell and Maurice, and had developed into a liberal churchman, extremely religious, with strong socialist leanings; but the substratum was still and ever the manly courage to use old-fashioned, sport-loving England. In Parliament, where he sat for Lambeth (1865-1868), and for Frome (1868-1874), he reproduced some of the traits of Colonel Newcome. Hughes was an energetic supporter of the claims of the working classes, and introduced a trades union Bill which, however, only reached its second reading. Mr Gladstone's home rule policy he was an uncompromising opponent. Thrice he visited America and received a warm welcome, less as a propagandist of social reform than as a friend of Lowell and of the North, and an author. In 1879, in a lugubrious humour of Mark Twain, he planned a co-operative settlement, "Rugby," in Tennessee, over which he lost money. In 1848 Hughes had married Frances, niece of Richard Ford, of Spanish Handbook fame. They settled in 1853 at Wimbledon, and there was written his famous story, Tom Brown's School-Days, "by an Old Boy" (dedicated to Mrs Arnold of Fox Howe), which came out in April 1857. It is probably impossible to depict the schoolboy in his natural state and in a realistic manner; it is extremely difficult to portray him at all in such a way as to interest the adult. Yet this last book has been read twice in as many years by Dickens in Nicholas Nickleby, and by Hughes in Tom Brown. In both cases interest is concentrated upon the master, in the first a demon, in the second a demigod. Tom Brown did a great deal to fix the English concept of what a public school should be. Hughes also wrote The Scouring of the White Horse (1859), Tom Brown at Oxford (1861), Religion late (1868), Life of Alfred the Great (1869) and the Memoir of a Brother. The brother was George Hughes, who was in the main the original "Tom Brown," just as Dean Stanley was in the main the original "Arthur." Hughes died at Brighton, on 22nd March 1896. He was English of the English, a typical broad-churchman, full of "muscular Christianity," straightforward and unsuspicious to a fault, yet attaching a somewhat exorbitant value to "earnestness" — a favourite expression of Doctor Arnold. (T. Se.)

HUGLI, or Hooghy, the most westerly and commercially the most important channel by which the Ganges enters the Bay of Bengal. It takes its distinctive name near the town of Santipur, about 120 m. from the sea. The stream now known as the Hugli represents three western deltaic distributaries of the Ganges — viz. (1) the Bhagirathi, (2) the Jangal and (3) part of the Matabhanga. The Bhagirathi and Jangal unite at Nadia, above the point of their junction with the lower waters of the Matabhanga, which has taken the name of the Churni before the point of junction and thrown out new distributaries of its own. These three western distributaries are known as the Nadia rivers, and are important, not only as great highways for internal traffic, but also as the headwaters of the Hugli. Like other deltaic distributaries, they are subject to sudden changes, their channels, and to constant silting up. The supervising and keeping open of the Nadia rivers, therefore, forms one of the great tasks of fluvial engineering in Bengal. Proceeding south from Santipur, about a twist to the west, the Hugli river divides Nadia from Hugli district, until it reaches the district of the Twenty-Four Parganas. It then proceeds almost due south to Calcutta, next twists to the south-west and finally turns south, entering the Bay of Bengal in 21° 41' N., 88° E.

In the 10 miles above Calcutta, the channels of the Hugli are under no supervision, and the result is that they have silted up and shifted to such an extent as to be no longer navigable for sea-going ships. Yet it was upon this upper section that all the famous ports of Bengal lay in olden times. From Calcutta to the sea (about 80 m.) the river is a record of engineering improvement and success. A minute supervision, with steady dredging and constant readjustment of buoys, now renders it a safe waterway to Calcutta for ships of the largest tonnage. Much attention has also been paid to the port of Calcutta (q.v.).

The tide runs rapidly on the Hugli, and produces a remarkable sample of the fluid peregrinations of "cake." This consists of the head-wave of the advancing tide, hemmed in when the
estuary narrows suddenly into the river, and often exceeds 7 ft. in height. It is felt as high up as Calcutta, and frequently destroys small boats. The difference from the lowest point of low-water in the dry season to the highest point of high-water in the rains is reported to be 20 ft. 10 in. The greatest mean rise of tide, about 16 ft., takes place in March, April or May—with a declining range during the rainy season to a mean of 10 ft., and a minimum during freshets of 3 ft. 6 in.

HUGLI, or HOOGHIJ, a town and district of British India, in the Burdwan division of Bengal, taking their name from the river Hugli. The town, situated on the right bank of the Hugli, 24 m. above Calcutta by rail, forms one municipality with Chinsura, the old Dutch settlement, lower down the river. Pop. (1901) 29,383. It contains the Hooghly College at Chinsura, a Mahomedan college, two high schools and a hospital with a Lady Dufferin branch for female patients. The principal building of which Satgaon was situated, the town became inaccessible to which had accumulated from an endowment originally left for the purpose by a wealthy Shia gentleman, Mohammed Mohsin. The town was founded by the Portuguese in 1537, on the decay of Satgaon, the royal port of Bengal. Upon establishing themselves, they built a fort at a place called Ghoghat (close to the present jail), vestiges of which are still visible in the bed of the river. This fort gradually grew into the town and port of Hugli.

The District comprises an area of 1191 sq. m. In 1901 the population was 1,040,282, showing an increase of 1% in the decade. It is flat, with a gradual ascent to the north and northwest. The scenery along the high-lying bank of the Hugli has a quiet beauty of its own, presenting the appearance of a connected series of orchards and gardens, interspersed with factories, villages and temples. The principal rivers, besides the Hugli, are the Damodar and the Rupnarayan. As in other deltaic districts, the highest land lies nearest the rivers, and the lowest levels are found midway between two streams. There are in consequence considerable marshes both between the Hugli and the Damodar and between the latter river and the Rupnarayan. The district is traversed by the main line of the East Indian railway, with a branch to the pilgrim resort of Tarakeswar, whence a steam tramway has been constructed for a further distance of 31 m. The Eden canal furnishes irrigation, and there are several embankments and drainage works. Silk and indigo are both decaying industries, but the manufacture of brass and bell-metal ware is actively carried on at several places. There are several jute mills, a large flour mill, bone-crushing mills and a brick and tile works.

From an historical point of view the district possesses as much interest as any in Bengal. In the early period of Mahomedan rule Satgaon was the seat of the governors of Lower Bengal and a mint town. It was also a place of great commercial importance. In consequence of the sifting up of the Saraswati, the river on which Satgaon was situated, the town became inaccessible to large ships, and the Portuguese settled at Hugli. In 1632 the latter place, having been taken from the Portuguese by the Mahomedans, was made the royal port of Bengal; and all the public offices and records were withdrawn from Satgaon, which rapidly fell into decay. In 1640 the East India Company established a factory at Hugli, their first settlement in Lower Bengal. In 1685, a dispute having taken place between the English factors and the nawab, the town was bombarded and burned to the ground. This was not the first time that Hugli had been the scene of a struggle deciding the fate of a European power in India. In 1620, when held by the Portuguese, it was besieged for three months and a half by a large Mahomedan force sent by the emperor Shah Jahan. The place was carried by storm; more than 1000 Portuguese were killed, upwards of 4000 prisoners taken, and of 300 vessels only 3 escaped. But Hugli district possesses historical interest for other European nations besides England and Portugal. The Dutch established themselves at Chinsura in the 17th century, and held the place till 1825, when it was ceded to Great Britain in exchange for the island of Sumatra. The Danes settled at Serampur in 1616, where they remained till 1845, when all Danish possessions in India were transferred to the East India Company. Chandernagore became a French settlement in 1688. The English captured this town twice, but since 1816 it has remained in the possession of the French.

See D. G. Crawford, A Brief History of the Hooghly District (Calcutta, 1903).

HUGO, GUSTAV VON (1764–1844). German jurist, was born at Lorrach in Baden, on the 23rd of November 1764. From the gymnasium at Carlsruhe he passed in 1782 to the university of Göttingen, where he studied law for three years. Having received the appointment of tutor to the prince of Anhalt-Dessau, he took his doctor's degree at the university of Halle in 1788. Recalled in this year to Göttingen as extraordinary professor of law, he became ordinary professor in 1792. In the preface to his Beiträge zur zivilistischen Bücherkenntnis der letzten vierzig Jahre (1818–1820) he gave a sketch of the condition of the civil law teaching at Göttingen at that time. It was considered that the German elements of the existing law were, without criticism or differentiation, welded into an ostensibly whole for practical needs, with the result that it was difficult to say whether historical truth or practical ends were most prejudiced. One man handed on the inert mass to the next in the same condition as he had received it, new errors crept in, and even the best of teachers could not escape from the false method which had become traditional. These were the evils which Hugo set himself to combat, and he became the founder of that historical school of jurisprudence which was continued and further developed by Savigny. His Gesammelte Werke (Berlin, 1828–1844) are theBURBRUCH EINER ZIVILISTISCHEN KURSUS (1792–1821), in which his method is thoroughly worked out, and the Zivilistisches Magazin (6 vols., 1790–1837). He died at Göttingen on the 15th of September 1844.

For an account of his life see Eysenhardt, Zur Erinnerung an Gustav Hugo (Berlin, 1845).

HUGO, VICTOR MARIE (1802–1885). French poet, dramatist and romance-writer, youngest son of General J. L. S. Hugo (1773–1828), a distinguished soldier in Napoleon’s service, was born at Besançon on the 26th of February 1802. The all but still-born child was only kept alive and reared by the indefatigable devotion of his mother Sophie Trévèquet (d. 1821), who carried his cousin Adèle Foucher (d. 1868). In the same year his first romance, HAN D'ISLANDE, was given to the press; his second, Bug-Jargal, appeared three years later. In 1827 he published the great dramatic poem of Cromwell, a masterpiece at all points except that of fitness for the modern stage. Two years afterwards he published Les Orientales, a volume of poems so various in style, so noble in spirit, so perfect in workmanship, in music and in form, that they might alone suffice for the foundation of an immortal fame. In the course of nine years, from 1831 to 1840, he published Les Feuilles d'automne, Les Chants du crépuscule, Les Voix interieures and Les Rêveries et les ombres.

That their author was one of the greatest elegiac and lyric poets ever born into the world, any one of these volumes would amply suffice to prove. That he was the greatest tragic and dramatic poet born since the age of Shakespeare, the appearance of Hernani in 1830 made evident for ever to all but the meanest and most perverse of dunces and malignants. The earlier and even greater tragedy of Marion de Lorme (1828) had been proscribed on the ground that it was impossible for royalty to tolerate the appearance of a play in which a king was represented as the puppet of a minister. In all the noble and glorious life of the greatest poet of his time there is nothing on record
more chivalrous and characteristic than the fact that Victor Hugo refused to allow the play which had been prohibited by the government of Charles X. to be instantly produced under the government of his supersessor. Le Roi s'amuse (1832), the next play which Hugo gave to the stage, was prohibited by order of Louis Philippe after a tumultuous first night—to reappear fifty years later on the very same day of the same month, under the eyes of his author, with atoning acclamation from a wider audience than that of the first. Terror and pity had never found on the stage word or expression which so exactly realized the ideal aim of tragic poetry among the countrymen of Aeschylus and Sophocles since the time or since the passing of Shakespeare, of Marlowe and of Webster. The tragedy of Lucrece Borgia, coequal in beauty and power with its three precursors, followed next year in the humber garb of prose; but the prose of Victor Hugo stands higher on the record of poetry than the verse of any lesser dramatist or poet. Marie Tudor (1833), his next play, was hardly more daring in its Shakespearean defiance of historic fact, and hardly more triumphant in its Shakespearean loyalty to the everlasting truth of human character and passion. Angelo, Tyrant de Padoue (1835), the last of the tragic triad to which their creator denied the transfiguration of tragic verse, is inferior to neither in power of imagination and of style, in skill of invention and construction, and in mastery over all natural and noble sources of pity and of terror. La Esmeralda, the libretto of an opera founded on his great tragic romance of Notre-Dame de Paris, is a miracle of lyric melody and of skilful adaptation. Ray Blas (1838) was written as a drama and in such verse as none but he could write. In command and in expression of passion and of pathos, of noble and of evil nature, it equals any other work of this great dramatic poet; in the lifelike fusion of high comedy with deep tragedy it excels them all. Les Burgraves, a tragic poem of transcendent beauty in execution and imaginative audacity in conception, found so little favour on the stage that the author refused to submit his subsequent plays to the verdict of a public audience.

Victor Hugo's first mature work in prose fiction, Le Dernier Jour d'un condamné, has appeared thirteen years earlier (1829). As a tragic monodrama it is incomparable for sustained power and terrible beauty. The story of Claude Gueux, published five years later (1834), another fervent protest against the in-fliction of capital punishment, was followed by many other eloquent and passionate appeals to the same effect, written or spoken on various occasions which excited the pity or the indignation of the orator or the poet. In 1831 appeared the greatest of all tragic or historic or romantic poems in the form of the written drama. Les Misérables. Three years after-wards the author published, under the title of Littérature et philosophie mêlées, a compilation or selection of notes and essays ranging and varying in date and in style from his earliest effusions of religious royalty to the magnificent essay on Mirabeau which represents at once the historical opinion and the critical capacity of Victor Hugo at the age of thirty-two. Next year he published Le Rhin, a series of letters from Germany, brilliant and vivid beyond all comparison, containing one of the most splendid stories for children ever written, and followed by a political supplement rather pathetically unprophetic in its predictions.

At the age of thirty-eight he honoured the French Academy by taking his place among its members; the speech delivered on the occasion was characteristically generous in its tribute to an undeserving memory, and significantly enthusiastic in its glorification of Napoleon. Idolatry of his father's hero and leader had now superseded the earlier superstition inculcated by his mother. In 1846 his first speech in the chamber of peers—Les Misérables—brought of Louis Philippe a breach of peace on behalf of Poland; his second, on the subject of coast defence, is memorable for the evidence it bears of careful research and practical suggestion. His pleading on behalf of the exiled family of Bonaparte induced Louis Philippe to cancel the sentence which excluded its members from France. After the fall and flight of the house of Orleans, his parliamentary eloquence was never less generous in aim and always as fervent in its constancy to patriotic and progressive principle. When the conspiring forces of clerical venality and political prostitution had placed a putative Bonaparte in power attained by perjury after perjury, and supported by massacre after massacre, Victor Hugo, in common with all honourable men who had ever taken part in political or public life under the government superseded by force of treason and murder, was driven from his country into an exile of well-nigh twenty years. Next year he published Napoléon le petit; twenty-five years afterwards, Histoire d'un crime. In these two books his experience and his opinion of the tactics which founded the second French empire stand registered for all time. In the deathless volume of Châtiments, which appeared in 1853, his indignation, his genius, and his faith found such utterance and such expression as must recall to the student alternately the lyric inspiration of Coleridge and Shelley, the prophetic inspiration of Dante and Isaiah, the satiric inspiration of Juvenal and Dryden. Three years after Les Châtiments, a book written in lightning, appeared Les Contemplations, a book written in sunlight and starlight. Of the six parts into which it is divided, the first translates into many-sided music the joys and sorrows, the thoughts and fancies, the studies and ardours and speculations of youth; the second, as full of light and colour, grows gradually deeper in tone of thought and music; the third is yet riper and more various in form of melody and in fervour of meditation; the fourth is the noblest of all tributes ever paid by song to sorrow—a series of poems (orations and orations) to the memory of the poet's eldest daughter, who was drowned, together with her husband, by the upsetting of a boat off the coast of Normandy, a few months after their wedding-day, in 1843; the fifth and the sixth, books written during his first four years of exile (all but one noble poem which bears date nine years earlier than its epilogue or postscript), contain more than a few poems unsurpassed and unsurpassable for depth and clarity and trenchancy of thought, for sublimity of Inspiration, for intensity of faith, for loyalty in translation from nature, and for tenderness in devotion to truth, crowned and glorified and completed by their matchless dedication to the dead. Three years later again, in 1859, Victor Hugo gave to the world the first instalment of the greatest book published in the 19th century, La Légende des siècles. Opening with a vision of Eve in Paradise which eclipses Milton's in beauty no less than in sublimity—a dream of the mother of mankind at the hour when she knew the first sense of dawning motherhood, it closes with a vision of the trumpet to be sounded on the day of judgment which transcends the imagination of Dante by right of a divinized idyllic symmetry to which we are led to a believer in Dante's creed: the idea of real and final equity; the concept of absolute and abstract righteousness. Between this opening and this close the pageant of history and of legend, marshalled and vivified by the will and the hand of the poet, ranges through an infinite variety of action and passion, of light and darkness, of terror and pity, of lyric rapture and of tragic triumph.

After yet another three years' space the author of La Légende des siècles reappeared as the author of Les Misères, the greatest epic and dramatic work of fiction ever created or conceived: the epic of a soul transfigured and redeemed, purified by heroism and glorified through suffering; the tragedy and the comedy of life at its darkest and its brightest, of humanity at its best and at its worst. Two years afterwards the greatest man born since the death of Shakespeare paid homage to the greatest of his predecessors in a volume of magnificent and discursive eloquence which bore the title of William Shakespeare, and might itself have served as the necessary introduction to a volume entitled À propos de Shakespeare. It was undertaken with the simple design of furnishing a preface to his younger son's translation of Shakespeare; a monument of perfect scholarship, of indefatigable devotion, and of literary genius, which eclipses even Urquhart's Rabelais—its only possible competitor; and to which the translator's father prefixed a brief and admirable note of introduction in the year after the
HUGUENOTS

publication of the volume which had grown under his hand into
the bulk and the magnificence of an epic poem in prose. In
the same year Les Chansons des rues et des bois gave evidence of
new power and fresh variety in the exercise and display of an
unequalled skill and a subtle simplicity of metre and of style
employed on the everlasting theme of lyric and idyllic fancy, and
touched now and then with a fire more sublime than that of
youth and love. Next year the exile of Guernsey published
his third great romance, Les Travailleurs de la mer, a work
unsurpassed even among the works of his author for splendour of
imagination and of style, for pathos and sublimity of truth.
Three years afterwards the same theme was rehandled with less
magnificent mastery in L'Homme qui rit; the theme of
human heroism confronted with the superhuman tyranny of
blind and unimaginable chance, overpowered and unbroken,
defeated and invincible. Between the dates of these two great
books appeared La Voix de Guernesey, a noble and terrible
poem on the massacre of Mentana which branded and com-
memorated for ever the papal and imperial infamy of the col-
leagues in that crime. In 1872 Victor Hugo published in
incomparable verse his record of the year which followed the
collapse of the empire, L'Ane à terre. All the poet and all the
intelligence and all the power was found evident in the
perferved patriotism, the filial devotion, the fatherly tenderness, the
indignation and the pity, which here find alternate expression in passionate
and familiar and majestic song. In 1874 he published his last
great romance, the tragic and historic poem in prose called
Quatrevingt-treize; a work as rich in thought, in tenderness,
and wisdom and in humour and in paths, as ever was cast into
the mould of poetry or of fiction.
The introduction to his first volume of Actes et paroles, ranging
in date from 1841 to 1851, is dated in June 1875; it is one of his
most earnest and most eloquent appeals to the conscience
and intelligence of the student. The second volume contains his
record of his deeds and words during the years of his exile; like
the first and the third, it is headed by a memorable preface, as
well worth the reverent study of those who may dissent from
some of the writer's views as of those who may assent to all.
The third and fourth volumes preserve the register of his deeds
and words from 1870 to 1883; they contain, among other things
memorable, the nobly reticent and pathetic tribute to the
memory of the two sons, Charles (1826-1871) and François
(1828-1873), he had lost since their common return from exile.
In 1877 appeared the second series of La Légende des siècles;
and in the same year the author of that colossal work, treating
no less years afterwards than those of his own existence,
left, and most various book of song on the loveliest and simplest
of subjects ever given to man, L'Art d'être grandpère. Next year
he published Le Page, a vision of the spirit of Christ in appeal
against the spirit of Christianity, his ideal follower confronted
and contrasted with his nominal vicar; next year again
La Piété suprême, a plea for charity towards tyrants who know not
what they do, perverted by omnipotence and degraded by
adoration; two years later Religions et religion, a poem which
is at once a cry of faith and a protest against the creeds which
deform and distort and leave it misshapen and envenomed and
defiled; and in the same year L'An, a poem of satiric inventive
against the past follies of learned ignorance, and lyric capture of
confidence in the future wisdom and the final conscience of
the world. These four great poems, one in sublimity of spirit
and in supremacy of style, were succeeded next year by a fourfold gift
of even greater price, Les Quatre Vents de l'esprit: the first
book, that of satire, is as full of fiery truth and radiant reason
as any of his previous work in that passionate and awful kind;
the second or dramatic book is as full of fresh life and living
nature, of tragic humour and of mortal pathos, as any other
work of the one great modern dramatist's; the third or lyric
book would suffice to reveal its author as incomparably and
inherently the greatest poet of his age, and one great among
the greatest of all time: the fourth or epic book is the sublimest
and most terrible of historic poems—a visionary pageant of
French history from the reign and the revelations of Henry IV.
to the reign and the execution of Louis XVI. Next year the
great tragic poem of Torgemada came forth to bear witness
that the hand which wrote Ray Blas had lost nothing of its
godlike power and its matchless cunning, if the author of
Le Roi s'amuse had ceased to care much about coherence of con-
struction from the theatrical point of view as compared with the
perfection of a tragedy designed for the devotion of students not
unworthy or incapable of the study; that his command of pity
and terror, his powers of intuition and invention, had never been
more absolute and more sublime; and that his infinite and
illimitable charity of imagination could transfigure even the
simplest of all historic representations of Christian or Catholic
diaboltry into the likeness of a terribly benevolent and a
tragically magnificent monomaniac. Two years later Victor
Hugo published the third and concluding series of La Légende des siècles.

On the 22nd of May 1885 Victor Hugo died. He was given a
magnificent public funeral, and his remains were laid in the
Pantheon. The first volume published of his posthumous works
was the exquisite and splendid Théâtre en liberté, a sequence if
not a symphony of seven poems in dramatic form, tragic
or comic or fanciful eclogues, incomparable with the work of any
poet who has written in any language. The second volume
published of his works, Les Feux du soir, a collection of
tale in combination and alternation of gayer and of graver harmonies.
The unfinished poems, Dieu et La Fin de Satan, are full
to overflowing of such magnificent work, such wise simplicity of
noble thought, such heroic and pathetic imagination, such
reverent and daring faith, as no other poet has ever cast into
deathless words and set to deathless music. Les Jumeaux, an
unfinished tragedy, would possibly have been the very greatest
of his works if it had been completed on the same scale and on
the same lines as it was begun and carried forward to the point
at which it was cut short for ever. His reminiscences of "Things
Seen" in the course of a strange variety of experiences, his
notes of travel among the Alps and Pyrenees, in the north of
France and in Belgium, in the south of France and in Burgundy,
are all recorded by such a pen and registered by such a memory
as no other man ever had at the service of his impressions or his
thoughts. Toute la lyre, his latest legacy to the world, would
be enough, though no other evidence were left, to show that
the author was one of the very greatest among poets and among
men; unsurpassed in sublimity of spirit, in spontaneity of
utterance, in variety of power, and in perfection of workmanship;
infinite and profound beyond all reach of praise at once in thought
and in sympathy, in perception and in passion; master of all the
themes that love to vary; writer of all the forms and the
styles; his heart living among the ancients and his words
that ever found expression in a Border ballad or a Pythian
ode. (A. C. S.)

BIBLIOGRAPHY.—Victor Hugo's complete works were published
in a definitive edition at Paris in 58 volumes (1885-1902). The
critical literature which has grown up round his name is very exten-
tive, from the time of Sainte-Beuve onwards, and only a few of
the more important books need here be mentioned for reference on
biographical and other details: F. T. Marzials, Life of Hugo, with
bibliography (1888); A. C. Swinburne, Study of Hugo (1886); E.
Dupuy, Victor Hugo, l'homme et le poète (1886); Paul de Saint
Victor, Victor Hugo (1885); F. Brunetière, Victor Hugo (1903);
Jules Clercet, Victor Hugo, souvenirs intimes (1902). See also The
Bookman for August 1904; Francis Gribble, "The Hugo Legend," in
Fortnightly Review (February 1910); and the article FRENCH LITERATURE.

HUGUENOTS, the name given from about the middle of the 16th
century to the Protestants of France. It was formerly explained as
coming from the German Eidgenossen, the designation
of the people of Geneva at the time when they were admitted to
the Swiss confederation. This explanation is now abandoned.
The words Huguenot, Huguenode are old French words, common
in 14th and 15th-century charters as the Protestants called
the Catholics papistes, so the Catholics called the Protestants
huguenots. Henri Estienne, one of the great savants of his time,
in the introduction to his Apologie d'Huguenots (1559) gives the
very clear explanation of the term huguenot. The Protestants at
Tours, he says, used to assemble by night near the gate of King
Hugo, whom the people regarded as a spirit. A monk, therefore,
in a sermon declared that the Lutherans ought to be called Huguenots as kinmen of King Hugo, inasmuch as they would obey him at night as he did. This nickname began to fall from 1560 onwards, and for a long time the French Protestants were always known by it.

France could not stand outside the religious movement of the 16th century. It is true that the French reform movement has often been regarded as an offshoot of Lutheranism; up to the middle of the century its adherents were known as Lutherans. But it should not be forgotten that so early as 1512 Jacobus Fabric (q.v.) of Étampes published his Sunti Pauli Epistulae xxii. dictaque, in which enunciates the cardinal doctrine of reform, justification by faith, and thus anticipated his French translation of the New Testament. The first Protestants were those who set the teachings of the Gospel against the doctrines of the Roman Church. As early as 1525 Jacques Pauvnes, the hermit of Lyvry, and shortly afterwards Louis de Berquin, the first martyrs, were burned at the stake. But no persecution could stop the Reform movement, and on the walls of Paris and even at Amboise, on the very door of Francis I.'s bedroom, there were found placards condemning the mass (1534).

On the 29th of January, 1535, an edict was published ordering the extermination of the heretics. From this edict dates the emigration of French Protestants, an emigration which did not cease till the middle of the 18th century. Three years later (1538) at Strasbourg the first French Protestant Church, composed of 1500 refugees, was founded.

Of all these exiles the most famous was John Calvin (q.v.), the future leader of the movement, who fled to Basel, where he is said to have written the famous Institutione Christiane Religionis, preceded by a letter to Francis I. in which he pleaded the cause of the reformers. The first Protestant community in France was that of Meaux (1546) organized on the lines of the church at Strasbourg of which Calvin was pastor. The Catholic Florimond de Remond paid it the beautiful tribute of saying that it seemed as though “la chrétienté fut revenue en elle à sa primitive innocence.”

Persecution, however, became more rigorous. The Vaudois of Cabrières and Mérindol had in 1545 been massacred by the orders of Jean de Maynier, baron d'Oppede, lieutenant-general of Provence, and at Paris was created a special court in the parlement, for the suppression of heretics, a court which became famous in history as the Chambre arbrente (1549). In spite of persecution the churches became more numerous; the church at Paris was founded in 1556. They realized the necessity of uniting in defence of their rights and their liberty, and in 1558 at Poitiers it was decided that all the Protestant churches in France should formulate by common accord a confession of faith and an ecclesiastical discipline. The church at Paris was commissioned to summon the first synod, which in spite of the danger of persecution met on the 26th of May 1559. The Synod of Paris derived its inspiration from the constitution introduced by Calvin at Geneva, which has since become the model for all the presbyterian churches. Ecclesiastical authority resides ultimately in the people, for the faithful select the elders who are charged with the general supervision of the church and the choice of pastors. The churches are independent units, and there can be no question of superiority among them; at the same time they have common interests and their unity must be maintained by an authority which is capable of protecting them. The association of several neighbouring churches forms a local council (colloque). Over these stands the provincial synod, on which each church is equally represented by lay delegates and pastors. Supreme authority resides in the National Synod composed of representatives, lay and ecclesiastic, elected by the provincial synods. The democratic character of this constitution of elders and synods is particularly remarkable in view of the early date at which it began to flourish. The striking individuality of the Huguenot character cannot be fully realized without a clear understanding of this powerful organization which contrived to reconcile individual liberty with a central authority.

The synod of 1559 was the beginning of a remarkable increase in the Reform movement; at that synod fifteen churches were represented, two years later, in 1561, the number increased to twenty. The parlements had been powerless before this increase; thousands left the Catholic Church, and it was found that execution and popular massacre provided no solution of the difficulty the struggle was carried into the arena of national politics. On the side of the reformers were ranged some among the noblest Frenchmen of the age, Coligny, La Noue, Duplessis Mornay, Jean Cousin, Ramus, Morat, Ambroise Paré, Olivier de Serres, Bernard Palissy, the Estiennes, Hotman, Jean de Serres, with the princess Renée of France, Jeanne d'Albret, Louise de Coligny. The policy which refused liberty of conscience to the Huguenots was furthered by the application of their doctrine. In the space of fifty years the history of the Huguenots is that of France (1560-1629). Francis II., who succeeded Henry II. at the age of sixteen, married Mary Stuart, and fell under the domination of the queen's uncles, the Guises, who were to lead the anti-Reform party. The Bourbons, the Montmorencies, the Chatillons, out of hostility to them, became the chieftains of the Huguenots.

The conspiracy of Amboise, formed with the object of kidnap\-ping the king (March 1560), was discovered, and resulted in the downfall of the plot. The next following is the publication of the Edict of Romorantin which laid an interdict upon the Protestant religion. But the reformers had become so powerful that Coligny, who was to become their most famous leader, protested in their name against this violation of liberty of conscience. The Guise party caused the prince of Condé to be arrested and condemned to death, but the sentence was not carried into effect, and at this moment Catherine de' Medici became regent on the accession of Charles IX. She introduced Italian methods of government, alternating between concessions and vigorous persecution, both alike devoid of sincerity. For a moment, at the colloquy of Poissy (Oct. 1561), at which Roman Catholic and Protestant divines were assembled together and Theodore Beza played so important a part, it seemed as though a modus vivendi would be established. The attempt failed, but by the edict of January 1562, religious liberty was assured to the Huguenots. This, however, was merely the prelude to civil war, the signal for which was given by the Guises, who slaughtered a number of Huguenots assembled for worship in a barn at Vassy (March 1, 1562). The duke of Guise, entering Paris in triumph, transferred the court to Fontainebleau by a daring coup de main and in defiance of the queen. It was then that Condé declared "qu'on ne pouvait plus rien espérer que de Dieu et ses armes," and with the Huguenot leaders signed at Orleans (April 11, 1562) the manifesto in which, having declared their loyalty to the crown, they stated that as good and loyal subjects they were driven to take up arms for liberty of conscience on behalf of the persecuted saints. The first civil war had already broken out; till the end of the century the history of France is that of the struggle between the Huguenots upholding "The Cause" (La Cause) and the Roman Catholics fighting for the Holy League (La Sainte Ligue).

The leading events only will be related here (see also FRANCE: History). The Huguenots lost the battle of Dreux (Dec. 19, 1562), the duke of Guise was assassinated by Poltro de Méré (Feb. 18, 1563) and finally Condé signed the Edict of Amboise which put an end to this first war. But the League gradually extended its action and Catherine de' Medici entered into negotiations with Spain. The Huguenots, seeing their danger, renewed hostilities, but after their defeat at St Denis (Nov. 19, 1567) and the revolt of La Rochelle, peace was concluded at Longjumeau (March 23, 1568). This truce lasted only a few months. Pope Pius V. did not cease to demand the extermination of the heretics, and the queen mother finally issued the edict of the 28th of September 1568, which put the Huguenots outside the protection of the law. The Huguenots once more took up arms, but were defeated at Jarnac (March 13, 1569), and Condé was taken prisoner and assassinated by Montesquieu. But Jeanne d'Albret renewed the cause of the vanquished by presenting to them her son Henri de Bourbon, the future Henry IV. Coligny, whose heroic courage rose with adversity, collected the
remnants of the Protestant army and by a march as able as it was audacious moved on Paris, and the Peace of St Germain was signed on the 8th of August 1570.

For a moment it seemed reasonable to hope that the war was at an end. Coligny had said that he would prefer to be dragged through the streets of Paris than to recommence the fighting; Charles IX. had realized the nobility and the patriotism of the man who wished to drive the Spaniards from Flanders; Henri de Bourbon was to marry Marguerite of France. Peace seemed to be assured when on the night of the 24th of August, 1572, after a council at which Catherine de' Medici, Charles IX., the duke of Anjou, and other leaders of the League assembled, there occurred the treacherous Massacre of St Bartholomew (q.v.), in which Coligny and all the leading Huguenots were slain. This date marks a disastrous epoch in the history of France, the long period of triumph of the Catholic reaction, during which the Huguenots had to fight for their very existence. The Paris massacre was repeated throughout France; few were those who were noble enough to declare to become the executioners of their friends, and the Protestants were slain in thousands.

The survivors resolved upon a desperate resistance. It was at this time that the Huguenots were driven to form a political party; otherwise their doom must have been sealed. The Protestants of Spain had been exterminated. This party was formed at Milhau in 1573, definitely constituted at La Rochelle in 1588, and lasted until the peace of Alais in 1629. The delegates selected by the churches bound themselves to offer a united opposition to the violence of the enemies of God, the king and the state. It is a profound mistake to attribute to them, as their enemies have done, the intention of overthorwing the monarchy and substituting a republic. They were royalists to the core, as is shown by the sacrifices they made for the sake of setting Henry IV. on the throne. It is true, however, that among themselves they formed a kind of republic, which, according to the historian J. Al. de Thou, had been founded by the civilizing party. The object was to continue the struggle without Spanish help, promised to assist him, but Henry neutralized this danger by declaring himself a Roman Catholic at St Denis (July 25, 1593), “Paris after all is worth a mass, in spite of the advice and the prayers of my faithful Huguenots.” “It is with anguish and grief,” writes Beza, “that I think of the fall of this prince in whom so many hopes were placed.” On the 22nd of March 1594 Henry entered Paris. The League was utterly defeated. Thus the Huguenots after forty years of strife obtained by their constancy the promulgation of the Edict of Nantes (April 13, 1598), the charter of religion and political freedom (see NANTES, EDICT OF).

The Protestants might reasonably hope that Henry IV., in spite of his abjuration of their faith, would remember the devoted support which they had given him, and that his authority would guarantee the observance of the provisions of the Edict. Unhappily twelve years afterwards, on the 14th of May 1610, Henry was assassinated by Ravaillac, leaving the great work incomplete. Once more France was to undergo the misery of civil war. During the minority of Louis XIII., power resided in the hands of counsellors who had not inherited the wisdom of Henry IV. and were only too ready to favour the Catholic party. The Huguenots, realizing that their existence was at stake, once more took up arms in defence of their liberty under the leadership of Henri de Rohan (q.v.). Their watchword had always been that, so long as the state was opposed to liberty of conscience, so long there could be no end to religious and civil strife, that misfortune and disaster must attend an empire of which the sovereign identified himself with a single section of his people. Richelieu had entered the king’s council on the 4th of May 1624; the destruction of the Huguenots was his policy and he pursued it to a triumphant conclusion. On the 28th of October 1628, La Rochelle, the last stronghold of the Protestants, was besieged. After five months of siege the city was taken, Mayenne was saved, the duke of Anjou, his brother, declared war to the knife upon him and caused him to be excommunicated. In his isolation Henry III. threw himself into the arms of Henry of Navarre, who saved the royalist party by defeating Mayenne and escorted the king with his victorious army to St Cloud, whence he proposed to enter Paris and destroy the League. But Henry III., on the 1st of August 1589, was assassinated by the monk Jacques Clement on his deathbed appointing Henry of Navarre as his successor.

This only spurred the League to redoubled energy, and Mayenne proclaimed the cardinal of Bourbon king with the title of Charles X. But Henry IV., who had already promised to maintain the Roman Church, gained new adherents every day, defeated the Leaguers at Arques in 1589, utterly routed Mayenne at Ivry on the 14th of March 1590, and laid siege to Paris. Cardinal de Bourbon having died in the same year and France being in a state of anarchy, Philip II. of Spain, in concert with Pope Gregory XIV., who excommunicated Henry IV., Huguenots, who were assisted, and was forced to surrender Lisieux. Mayenne and his adherents were excommunicated.

The Edict of Nantes was not renewed, and the Huguenots were in constant fear of the repetition of the Massacre of St Bartholomew. They were not allowed to hold their synods (see HUGUENOT, SYNDICATE). The king could not, however, endure the humiliation of hearing Henry of Guise described as “king of Paris” and on the 23rd of December 1588 had him murdered together with the cardinal of Lorraine at the chateau of Blois. The League, now led by the duke of Mayenne, Guise’s brother, declared war to the knife upon him and caused him to be excommunicated. In his isolation Henry III. threw himself into the arms of Henry of Navarre, who saved the royalist party by defeating Mayenne and escorted the king with his victorious army to St Cloud, whence he proposed to enter Paris and destroy the League. But Henry III., on the 1st of August 1589, was assassinated by the monk Jacques Clement on his deathbed appointing Henry of Navarre as his successor.

This only spurred the League to redoubled energy, and Mayenne proclaimed the cardinal of Bourbon king with the title of Charles X. Mayenne and his adherents were excommunicated. The
At long as Mazarin was alive the complaints of the clergy were in vain, but when Louis XIV. attained his majority there commenced a legal persecution which was bound in time to bring about the ruin of the reformed churches. The Edict of Nantes, which was part of the law of the land, might seem to defy all attacks, but the clergy found means to evade the law by demanding that it should be observed with literal accuracy, disregarding the changes which had been produced in France during more than half a century. The clergy in 1661 successfully demanded that commissioners should be sent to the provinces to report infractions of the Edict, and thus began a judicial war which was to last for more than twenty years. All the churches which had been built since the Edict of Nantes were condemned to be demolished. All the privileges which were not explicitly stated in the actual text of the Edict were suppressed. More than four hundred proclamations, edicts or declarations attacking the Huguenots in their households and their civil freedom, their property and their liberty of conscience were promulgated during the years which preceded the revocation of the Edict of Nantes. In spite of constant suffering which this rigorous legislation inflicted upon them they did not cease to resist, and in order to crush this resistance and to compel them to accept the "king's religion," there were organized the terrible dragomannes (1683-1686) which effected the forcible conversion of thousands of Protestants who gave way under the tortures which were inflicted upon them. It was then that Louis XIV. declared that "the best of the larger part of our subjects, who formerly held the so-called reformed religion, have embraced the Catholic religion, and therefore the Edict of Nantes has become unnecessary"; on the 18th of October 1685 he pronounced its revocation. Thus under the influence of the clergy was committed one of the most flagrant political and religious blunders in the history of France, which in the course of a few years lost more than 400,000 of its inhabitants, men who, having to choose between their conscience and their country, endowed the nations which received them with their heroism, their courage and their ability.

There is perhaps no example in history of so cruel a persecution as this, which destroyed a church of which Protestant Europe was justly proud. At no period in its career had it numbered among its adherents so many men of eminence, Abbadie, Claude, Bayle, Du Bosc, Jurieu, Élie Benoist, La Place, Basnage, Daille, Mestrezat, Du Quesne, Schomberg, Ruvigny. There were no Huguenots left in France; those who, conquered by persecution, remained there were described as "New Catholics." All the pastors who refused to abjure their faith were compelled to leave the country within fifteen days. The work was complete. Protestantism, with its churches and its schools, was destroyed. As Bayle wrote, "France was Catholic to a man under the reign of Louis the Great."

Persecution had succeeded in silencing, but it could not convert the people. The Huguenots, before the ruins of their churches, remembered the early Christians and held their services in secret. Their pastors, making light of death, returned from the lands of their exile and visited their own churches to restore their courage. If any one denied the Catholic faith on his deathbed, he was sentenced to death. The galleys were full of brave Huguenots condemned for remaining constant to the Protestant faith. For fifteen years the exiles continuously besought Louis XIV. to give them back their religious liberty. For a moment they hoped that the Treaty of Ryswick (1697) would realise their hopes, but Louis XIV. steadily declined to grant their requests. Despair armed the Cévennes, and in 1702 the war of the Camisards broke out, a struggle of giants supported by Jean Cavalier with his mountain men against the royal troops (see CAMISARDS and CAVALIER, Jean). The Huguenots seemed to be finally conquered. On the 8th of March 1715 Louis XIV. announced that he had put an end to all exercise of the Protestant religion; but in this very year, on the 21st of August, while the king was dying at Versailles, there assembled together at Monoblet in Languedoc, under the presidency of a young man twenty years of age, Antoine Court, a number of preachers, as the pastors were then called, with the object of raising the church from its ruins. This was the first synod of the Desert. To re-establish the abandoned worship, to unite the churches in the struggle for liberty of conscience, such was the work to which Court devoted his life, and which earned for him the name of the "Restorer of Protestantism" (see COURT, ANTOINE). In spite of persecution the Protestants continued their assemblies; the fear of death and of the galleys were alike powerless to break their resistance. On the second day of the clergy all marriages celebrated by their pastors were declared null and void, and the children born of these unions were regarded as bastards.

Protestantism, which persecution seemed to have driven from France, drew new life from this very persecution. Outlawed, exiles in their own country, deprived of all civil existence, the Huguenots showed an invincible heroism. The history of their church during the period of the Desert is the history of a church which refused to die. Amongst its famous defenders was Paul Rabaut, the successor of Antoine Court. Year by year the churches became more numerous. In 1776 there were already 40 pastors; several years later, in 1773, the date of the last synod of the Desert, their number had increased to 65. The question of Protestant marriages roused public opinion which could not tolerate the idea that Frenchmen, whose sole crime was their religious belief, should be condemned to civil death. The torture of Jean Calas, who was condemned on a false charge of having killed his son because he desired to become a Catholic, caused general indignation, of which Voltaire became the eloquent mouthpiece. Ideas of tolerance, of which Bayle had been the earliest advocate, became victorious, and owing to the devotion of Rabaut Saint-Étienne, son of Paul Rabaut, and the zeal of Lafayette, the edict of November 1787, in spite of the fierce opposition of the clergy, renewed the civil rights of the Huguenots by recognizing the validity of their marriages. Victories even greater were in store; two years later liberty of conscience was won. On the 22nd of August 1789 the pastor Rabaut Saint-Étienne, deputy for the sénechaussée of Nimes to the States General, cried out, "It is not tolerance which I demand, it is liberty, that my country should accord it equally without distinction of rank, of birth or of religion." The Declaration of the Rights of Man affirmed the liberty of religion; the Huguenots had not suffered in vain, for the cause for which their ancestors and themselves had suffered so much was triumphant, and it was the nation itself which proclaimed the victory. But religious passions were always active, and at Montauban as at Nimes (1790) Catholics and Protestants came to blows. The Huguenots, having endured the persecutions of successive monarchies, had to endure those of the Terror; their churches were shut, their pastors dispersed and some died upon the scaffold. On the 3rd of Ventose, year II. (February 21, 1793), the church was divorced from the state and the Protestants devoted themselves to reorganization. Some years later Bonaparte, having signed the Concordat of the 15th of July 1801, promulgated the law of the 18th of Germinal, year X., which recognized the legal standing of the Protestant church, but took it from the character of free church which it had enjoyed. In 1812 the legal status of Protestantism was again regained, a status which recalled to Protestants nothing but persecution, and a profession of which they enjoyed liberty of conscience, that they accepted with a profound gratitude a régime of which the ecclesiastical standpoint was so alien to their traditions. With enthusiasm they repeated the words with which Napoleon had received the pastors at the Tuileries on the 16th of Frimaire, year XII.: "The empire of the law ends where the undefined empire of conscience begins; law and prince are powerless against this liberty."

The Protestants, on the day on which liberty of conscience was restored, could measure the full extent of the misery which they had endured. Of this people, which in the 16th century formed more than one-tenth of the population of France, there survived only a few hundred thousands; migration and persecutions had more than decimated them. In 1636 there were 809
pastors in the service of 731 churches; in 1802 there were only 121 pastors and 177 churches; in Paris there was only a single church with a single pastor. The church had no faculty of theology, no schools, no Bible societies, no asylums, no orphanages, no religious literature. Everything had to be created afresh, and this work was pursued during the 19th century with the energy and the earnest faith which is characteristic of the Huguenot character.

At the fall of the Empire (1815) the reaction of the White Terror once more exposed the Protestants to outrage, and once more a number fled from persecution and sought safety in foreign countries. Peace having been established, attention was once more focussed on religious questions, and the process of reassembly into Protestant churches was a remarkable awakening. On all sides churches were built and schools opened. It was an epoch of the greatest importance, for the church concentrated itself more and more on its real mission. During this period were founded the great religious societies:—Société biblique (1810), Société de l'instruction primaire (1829), Société des traités (1821), Société des missions (1822). The influence of English thought on the development of religious life was remarkable, and theology drew its inspiration from the writings of Paley, David Bogue, Chalmers, Ebenezer Erskine, Robert and James Alexander Haldane, which were translated into French. Later on German theology and the works of Kant, Neander and Schleiermacher produced a far-reaching effect. This was due to the period of persecution which had checked development of religious thought which had been so remarkable a feature of French Protestantism of the 16th and 17th centuries.

Slowly Protestantism once more took up its place in the national life. The greatest names in its history are those of Guizot and Cuvier; Adolp Monod, with Athanas Coquerel, stood in the front rank of pulpit orators. The Protestants associated themselves with all the great philanthropic works—Baron Jules Delessert founded savings banks, Baron de Staël condemned slavery, and all France united in honour the pastor, Jean Frédéric Oberlin. But the reformers, if they had no longer to fear persecution, had still to fight in order to win respect for religious liberty, which was unceasingly threatened by their adversaries. Numerous were the cases tried at this epoch in order to obtain justice. On the other hand the old union of the reformed churches had ceased to exist since the revolution of July. Ecclesiastical strife broke out and has never entirely ceased. A schism occurred first in 1828, owing to the refusal of the synod to draw up a profession of faith, the comte de Gasparin and the pastor Frédéric Monod seceding and founding the Union des Églises Évangéliques, and the pastors of Delft and Rotterdam; which later on E. de Pressensé was to become the most famous pastor. Under the Second Empire (1852-1870) the divisions between the orthodox and the liberal thinkers were accentuated; they resulted in a separation which followed on the reassembly of the national synod, authorized in 1872 by the government of the Third Republic. The old Huguenot church was thus separated into two parts, having no other link than that of the Concordat of 1802 and each possessing its own peculiar organization.

The descendants of the Huguenots, however, remained faithful to the traditions of their ancestors, and extolled the great past of the French reform movement. Moreover, in 1859 were held the magnificent religious festivals to celebrate the third centenary of the convocation of their first national synod; and when on the 18th of October 1883 they recalled the 200th anniversary of the Revocation of the Edict of Nantes, they were able to assert that the Huguenots had been the first defenders of religious liberties in France. In the early days of the 20th century the work of restoring French Protestantism, which had been pursued with steady perseverance for more than one hundred years, showed great results. This church, which in 1802 had scarcely 100 pastors has seen its number increased to 1000; it possesses more than 1000 parishes or chapels; and Paris was marked in contrast with the poverty of religious life under the First Empire it presented a striking array of Bible societies, mission societies, and others for evangelical, educational, pastoral and charitable work, which bear witness to a church risen from its ruins. French Protestantism in the course of the 19th century reckoned among its members such names as Timothée Colani (1834-1888), who together with Edmond Schérer founded the celebrated Revue de théologie et de Strasbourg (1850); Edmond de Pressensé, editor of the Revue chrétienne, Charles Bois and Michel Nicolas, professors of theology at Montauban, Auguste Sabatier, professor of theology at the university of Paris, Albert Réville, professor at the Collège de France, Félix Pécot, &c.; well-known preachers such as Eugène Bersier, Ernest Dhombres, Ariste Vigouré, Numa Recolin, Auguste de Coppet, and missionaries, for example Eugène Casalis and Coillard; besides, there were the hospitals at Laforce; historians like Napoléon Peyrat, the Reverend Ch. A. D. de Bournonville, François Puaux, Charles Coquerel, Onesime Douen, Henri Bordier, Edouard Sayous, de Félice, Théophile Rollez; Jean Pédèzert, Léon Pilatte and others, who were journalists; such statesmen as Guizot, Léon Say, Waddington; such scholars as Cuvier, Broca, Wurtz, Friedel de Quatrefages; such illustrious soldiers and sailors as Rapp, Admirals Baudin, Jauréguiberly, Colonel Denfert-Rochereau. But the population of Protestant France does not exceed 750,000 souls, without counting the Lutherans, who are attached to the Confession of Augsburg, numbering about 75,000. Their chief centres are in the départements of Paris, Algiers, Ardèche, Drôme, Lorraine, the Deux Sèvres and the Seine.

The law of the 9th of December 1905, which separated the church from the state, has been accepted by the great majority of Protestants as a legitimate consequence of the reform principles. Nor has its application given rise to any difficulty with the state. They used their influence only in the direction of rendering the law more liberal and immediately devoted themselves to the organization of their churches under the new régime. If the two great parties, orthodox and liberal, have each their particular constitution, nevertheless a third party has been formed with the object of effecting a reconciliation of all the Protestant churches and of thus reconstituting the old Huguenot church.

BIBLIOGRAPHY.—A complete list of works is impossible. The following are the most important:

17th Century.—Élie Benoit, Histoire de l'Édit de Nantes (5 vols., Delft, 1693), a work of the first rank; Aymon, Tous les synodes
HUGUES—HULL

HULKE, JOHN WHITAKER (1830–1892), British surgeon and geologist, was born on the 6th of November 1832, being the son of a well-known medical practitioner at Deal. He was educated partly at a boarding-school in this country, partly at the Maronarian College at Newfield (1843–1845), where he gained an intimate knowledge of German and an interest in geology through visits to the Eifel district. He then entered King's College school, and three years later commenced work at the hospital, becoming M.R.C.S. in 1852. In the Crimean War he volunteered, and was appointed (1855) assistant-surgeon to Smyrna and subsequently at Sebastopol. On returning home he became medical tutor at his old hospital, was elected F.R.C.S. in 1857, and afterwards assistant-surgeon to the Royal Ophthalmic Hospital, Moorfields (1857), and surgeon (1868–1890). In 1870 he became surgeon at the Middlesex hospital, and here much of his more important surgical work was accomplished. His skill as an operator was widely known: he was an excellent general surgeon, but made his special mark as an ophthalmologist, while as a geologist he attained a European reputation. He was elected F.R.S. in 1867 for his researches on the anatomy and physiology of the retina in man and the lower animals, particularly the reptiles. He subsequently devoted all his spare time to geology and especially to the fossil reptiles, describing new genera of Dinosaurs and other groups of reptiles, with the result that he became a leading authority on the group. His name is associated in some of the larger catalogues of other Saurians he largely contributed. In 1887 the Wollaston medal was awarded to him by the Geological Society of London. He was president of both the Geological and Pathological Societies in 1883, and president of the Royal College of Surgeons from 1893 until his death. He was a man with a wide range of knowledge not only of science but of literature and art. He died in London on the 19th of February 1895.

HULL, ISAAC (1775–1843), commodore in the U.S. navy, was born at Derby in Connecticut on the 9th of March 1775. He went to sea young in the merchant service and was in command of a vessel at the age of nineteen. In 1798 he was appointed lieutenant in the newly organized U.S. navy. From 1803 to 1805 he served in the squadron sent to chastise the Barbary pirates as commander of the “Enterprise,” but was transferred to the “Argus” in November of 1803. When the War of 1812 broke out he was captain of the U.S. frigate “Constitution” (44), and was on a mission to Europe carrying specie for the payment of a debt in Holland. The “Constitution” was shadowed by British men-of-war, but was not attacked. In July of that year, however, he was pursued by a squadron of British vessels, and escaped by good seamanship and the fine sailing qualities of the “Constitution.” He was to have been superseded, but put to sea before the officer who was to have relieved him arrived—an action which might have been his ruin if he had not signaled his cruise by the capture of the British frigate “Guerrière” (38). Captain Hull had been cruising off the Gulf of St Lawrence, and the engagement, which took place on the 19th of August, was fought south of the Grand Bank. The “Constitution” was a fine ship of 1,553 tons, originally designed for a two-decker, but cut down to a frigate. The “Guerrière” was of 1,092 tons and very ill-manned, while the “Constitution” had a choice crew. The British ship was easily overpowered. Hull received a gold medal for the capture of the “Guerrière,” but had no further opportunity of distinction in the war. After the peace he held a variety of commands at sea, and was a naval commissioner from 1815 to 1817. He had a high reputation in the United States navy for practical seamanship. He died at Philadelphia on the 13th of February 1843.

HULL, a city (1875) and railway junction of the province of Quebec, Canada, and the capital of Wright county, opposite the city of Ottawa. Pop. (1901) 13,988. The magnificent water-power of the Chaudière Falls of the Ottawa is utilized for the lighting of the city, the operation of a system of electric railways connecting Hull with Ottawa and Aylmer, and a number of large saw-mills, pulp, paper and match manufactories. Hull has gone through several disastrous fires, but since that of 1900, which swept out most of the town, an efficient system of fire protection has been established. Three bridges unite Ottawa and Hull.

HULDA, in Teutonic mythology, goddess of marriage. She was a beneficent deity, the patroness and guardian of all maidens (see Berchta).
The city is governed by a council composed of a mayor and twelve aldermen elected annually. Champlain was the first white man to set foot on the site of Hull, but long before his visit it was a favourite meeting-place for the Indians. Later it became familiar to explorers and fur-traders as the foot of the Chaudière portage, and many a canoe has been carried shoulder high over the site of future busy streets. Philemon Wright, of Woburn, Massachusetts, was the first man to settle here in 1800. The report he sent back was so favourable that a number of other families followed from the same place and laid the foundations of the future city. His descendants have remained among the substantial men of the town.

**HULL** (officially KINGSTON-UPON-HULL), a city and county of a city, municipal, county and parliamentary borough, and seaport in the East Riding of Yorkshire, England, at the junction of the river Hull with that ofHigher-up, of the open sea, and 181 m. N. of London. Pop. (1891) 202,472; (1901) 240,259. Its full name, not in general use, is Kingston-upon-Hull. It is served by the North Eastern, Great Central and Hull & Barnsley railways, the principal station being Paragon Street. The town stands on a level plain so low as to render embankments necessary to prevent inundation. The older portion is completely enclosed by the Hull and Humber on the E. and S. and by docks on the N. and W. Here are narrow streets typical of the medieval mercantile town, though modern improvements have destroyed some of them; and there are a few ancient houses. In Holy Trinity church Hull possesses one of the largest English-parish churches, having an extreme length of 272 ft. It is cruciform and has a massive central tower. This and the transepts and choir are of Decorated work of various dates. The choir is largely constructed of brick, and thus affords an unusually early example of the use of this material in English ecclesiastical architecture. The nave is Perpendicular, a fine example of the style. William Mason the poet (1725-1797) was the son of a rector of the parish. The church of St Mary, Lowgate, was founded in the 14th century, but is almost wholly a reconstruction. Modern churches are numerous, but of no remarkable architectural merit. Among public buildings the town-hall, in Lowgate, ranks first. It was completed in 1866, but was subsequently extended and in great part rebuilt; it is in Italian renaissance style, having a richly adorned facade. The exchange, in the same street, was also completed in 1866, in a less ornate Italian style. There are also theatres, a chamber of commerce, a town-hall, custom-house, and the dock offices, a handsome Italian building. The principal intellectual institution is the Royal Institution, a fine classical building opened by Albert, prince consort, in 1854, and containing a museum and large library. It accommodates the Literary and Philosophical Society. The grammar school was founded in 1486. One of its most important figures was Samuel Fuller (1744-1797), author of a history of the Church; and among its students were Andrew Marvell the poet (1621-1678) and William Wilberforce the philanthropist (1759-1835), who is commemorated by a column and statue near the dock offices, and by the preservation of the house of his birth in High Street. This house belongs to the corporation and was opened in 1906 as the Wilberforce and Historical Museum. There are also to be mentioned the Hull and East Riding College, Hymer's College, comprising classical, modern and junior departments, the Trinity House marine school (1716), the Humber industrial school ship "Southampton," and technical and art schools. Charities and benevolent foundations are numerous. Trinity House is a charity for seamen of the merchant service; the building (1753) was founded by the Trinity House Gild instituted in 1360, and contains a noteworthy collection of paintings and a museum. The Charterhouse belongs to a foundation for the support of the old and feeble, established by Sir Michael de la Pole, afterwards earl of Suffolk, in 1384. The infirmary was founded in 1752. Of the three parks, Pearson Park was presented by a mayor of that name in 1860, and contains statues of Queen Victoria and the Prince Consort. A botanic garden was opened in 1886.

The original occupation had part of the river Hull which faced the old town, but in 1774 an act was passed for forming a dock on the site of the old fortifications on the right bank of the Hull. This afterwards became known as Queen's dock, and with Prince's and Humber docks completes the circle round the old town. The small railway dock opens from Humber dock. East of the Hull lie the Victoria dock and extensive timber ponds, and west of the Humber dock basin, parallel to the Humber, is Albert dock. Others are the Alexandra, St Andrew's and fish docks. The total area of the docks is about 180 acres, and the owning companies are the North Eastern and the Hull & Barnsley railways. The ports of Hull and Goole (q.v.) have been administratively combined since 1888, the conservancy of the river being under the Humber Conservancy Board. Hull is one of the principal shipping ports for the manufactories of Yorkshire and Lancashire, and has a direct line of communication with the coal-fields of the West Riding. Large quantities of grain are imported from Russia, America, &c., and timber from Norway and Sweden. Iron, fish, butter and fruit are among other principal imports. The port was an early seat of the wholesale fisheries. Of passenger steamship services from Hull the principal are those to the Norwegian ports, which are greatly frequented during the summer; these, with others to the ports of Sweden, &c., are in the hands of the large shipping firm of Thomas Wilson & Co. A ferry serves New Holland, on the Lincolnshire shore (Great Central railway). The principal industries of Hull are iron-foundry, shipbuilding and engineering, and the manufacture of chemicals, oil, cake, colours, cement, paper, starch, soap and cotton goods; and there are tanneries and breweries.

The parliamentary borough returns three members, an increase from two members in 1885. Hull became the seat of a suffragan bishop in the diocese of York in 1891. This was a revival, as the office was in existence from 1534 till the death of Edward VI. The county borough was created in 1888. The city is governed by a mayor, 16 aldermen and 48 councillors. Area, 8989 acres.

The first mention of Hull occurs under the name of Wyke- upon-Hull in a charter of 1160 by which Maud, daughter of Hugh Camin, granted it to the monks of Meaux, who in 1278 received licence to hold a market here every Thursday and a fair on the vigil, day and morrow of Holy Trinity and twelve following days. Shortly afterwards Edward I., seeing its value as a port, obtained the town from the monks in exchange for other lands in Lincolnshire and changed its name to Kingston-upon-Hull. To induce people to settle here he gave the town a charter in 1299. This granted two weekly markets on Tuesday and Friday and a fair on the eve of St Augustine lasting thirty days; it made the town a free borough and provided that the king would send his justices to deliver the prison when necessary. He sent commissioners in 1303 to inquire how and where the roads to the "new town of Kingston-upon-Hull" could best be made, and in 1321 Edward II. granted the burgesses licence to enclose the town with a ditch and "a wall of stone and lime." In the 14th century the burgesses of Hull disputed the right of the archbishop of York to prisage of wine and other liberties in Hull, which they said belonged to the king. The archbishop claimed under charters of King Æthelstand and Henry III. The dispute, after lasting several years, was at length decided in favour of the king. In 1361 Edward III., while inspecting former charters, granted that the burgesses might hold the borough with feasts, markets and free customs at a fee-farm of £50, and that every year they might choose a mayor and four bailiffs. The king in 1446 granted the burgesses Hesse, North Ferriby and other places in order that they might obtain a supply of fresh water. The charter also granted that the above places with the town itself should become the county of the town of Kingston-upon-Hull. Henry VIII. visited the town in 1541, and ordered that a castle and other places of defence should be built, and Edward VI. in 1552 granted the manor to the burgesses. The town was incorporated by Queen Elizabeth in 1576 and a new charter was granted by James II. in 1668. During the civil wars Hull, although the majority of the inhabitants were
HULL-HUMANE SOCIETY

royalists, was garrisoned by the parliamentarians, and Charles I. was refused admission by the governor Sir John Hotham. In 1643 it stood a siege of six weeks, but the new governor, Ferdinando Fairfax, and Baron Fairfax, obliged the Royalist army to retreat by opening the sluices and placing the surrounding country under water. Hull was represented in the parliament of 1695 and has sent members ever since, save that in 1384 the burgesses were exempted from returning any member on account of the expenses which they were incurring through fortifying their town. Besides the fields granted to the burgesses by Edward I., two others were granted by Charles II. in 1664 to Henry Hildiard who owned property in the town. See also the \textit{Register of Hull}.

HULL (in O.Eng. \textit{hulw}, from \\textit{hælan}, to cover, cf. Ger. \textit{Hülle}, covering), the outer covering, pod, or shell of beans, peas, \\&c., also the enclosing envelope of a chrysalis. The word may be the same as “hull,” meaning the body of a ship without its masts or superstructure. Its present use is in the phrase “to hull” which means to cover with “hold,” the interior cargo-carrying part of a vessel. This word was borrowed, as a nautical term, from the Dutch, \textit{hol} (cognate with “hole”), the \textit{d} being due to confusion with “to hold,” “grasp” (O.Eng. \textit{headan}). The meanings of “hull” and “hold” are somewhat far apart, and the closest sense resemblance is to the word “hulk,” which is not known till about a century later.

HULLAH, JOHN PYKE (1812-1884), English composer and teacher of music, was born at Worcester on the 27th June 1812. He was a pupil of William Howells from 1829, and entered the Royal Academy of Music in 1833. He wrote an opera, to words by Dickens, \textit{The Village Coquettes}, produced in 1836; \textit{The Barbers of Basset}, in 1837, and \textit{The Outpost} in 1838, the last two at Covent Garden. From 1839, when he went to Paris to investigate various systems of teaching music to large masses of people, he identified himself with Wilhem’s system of the “fixed Do,” and his adaptation of that system was taught with enormous success from 1840 to 1860. In 1847 a large building in Long Acre, called St Martin’s Hall, was built by subscription and presented to Hullah. It was inaugurated in 1856 and built over to the ground in 1860, a blow from which Hullah was long in recovering. He had risked all in the maintenance of the building, and had to begin the world again. A series of lectures was given at the Royal Institution in 1861, and in 1864 he lectured in Edinburgh, but in the following year was unsuccessful in his application for the Reid professorship. He conducted concerts in Edinburgh in 1866 and 1867, and the concerts of the Royal Academy of Music from 1870 to 1873; he had been elected to the committee of management in 1869. In 1872 he was appointed by the Council of Education musical inspector of training schools for the United Kingdom. In 1878 he went abroad to report on the condition of musical education in schools, and wrote a very valuable report, quoted in the memoir of him published by his wife in 1886. He was attacked by paralysis in 1886, and again in 1883. His compositions, which remained popular for some years after his death in 1884, consisted mainly of ballads; but his importance in the history of music is owing to his exertions in popularizing musical education, and his persistent opposition to the Tonic Sol-Fa system, which had a success he could not foresee. His objections to it were partly grounded on the character of the music which was in common use among the early teachers of the system. While it cannot be doubted that Hullah would have won more success if he had not opposed the Tonic Sol-Fa movement so strenuously, it must be confessed that his work was of great value, for he kept constantly in view and impressed upon all who followed him or learnt from him the supreme necessity of maintaining the artistic standard of the music taught and studied, and of not allowing trumpery compositions to usurp the place of good music on account of the greater ease with which they could be read.

HULME, WILLIAM (1631-1691), English philanthropist, was born in the neighbourhood of Manchester, and died on the 29th of October 1691. Having lost his only son Banastre, Hulme left his property in trust to maintain “four exhibitioners of the poorest sort of bachelors for the space of four years” at Brasenose College, Oxford. This was the beginning of the Hulme Trust. Its property was in Manchester, and owing to its favourable situation its value increased rapidly. Eventually in 1881 a scheme was drawn up by the charity commissioners, by which (as amended in 1907) the trust is now governed. Its income of about £10,000 a year is devoted to maintaining the Hulme Grammar School in Manchester and to assisting other schools, to erecting a theological college, Hulme Hall, attached to the university, and to providing a number of scholarships and exhibitions at Brasenose College.

See J. Croston, \textit{Hulme’s Charity} (1877).

HÜLS, a town of Germany, in the Prussian Rhine province, 4 m. N. of Crefeld and 17 N.W. of Düsseldorf by rail. Pop. (1895) 6510. It has two Roman Catholic churches, a synagogue and manufactures of damask and velvet. In the neighbourhood ironstone is obtained.

HULSE, JOHN (1708-1790), English divine, was born—the eldest of a family of nineteen—at Middlewich, in Cheshire, in 1708. He entered Oxford in 1728; and on taking orders (in 1729) was presented to a small country curacy. His father having died in 1753, Hulse succeeded to his estates in Cheshire, where, owing to feeble health, he lived in retirement till his death in December 1790. He bequeathed his estates to Cambridge University for the purpose of maintaining two divinity scholars (£30 a year each) at St John’s College, of founding a prize for a dissertation, and of instituting the offices of Christian advocate and of Christian preacher or Hulsean lecturer. By a statute in 1860 the Hulsean professorship of divinity was substituted for the office of Christian advocate, and the lectureship was considerably modified. The first course of lectures under the benefaction was delivered in 1820. In 1830 the number of annual lectures or sermons was reduced from twenty to eight; after 1861 they were further reduced to a minimum of four. The annual value of the Hulse endowment is between £800 and £900, of which eight-tenths go to the professor of divinity and one-tenth to the prize and lectureship respectively.

An account of the Hulsean lectures from 1820 to 1894 is given in \textit{J. Hunt’s Religious Thought in the 19th Century}, 332-358; among the lecturers have been Henry Alford (1541), R. C. Trench (1845), Charles Howitt, Wordsworth (1847), Charles Maurice (1861), w. Moorhouse (1865), F. W. Farrar (1870), F. J. A. Hort (1871), W. Boyd Carpenter (1878), W. Cunningham (1889), M. Creighton (1893).

HUMACAO, a small city and the capital of a municipal district and department of the same name, in Porto Rico, 46 m. S.E. of San Juan. Pop. (1899) of the city, 4428; and of the municipal district, 14,313. Humacao is attractively situated near the E. coast, 9 m. from the port of Naguabo and a little over 6 m. from its own port of Punta Santiago, with which it is connected by a good road; a railway was under construction in 1908, and some of the sugar factories of the department are now connected by rail with the port. The department covers the eastern end of the island and includes all the islands off its coast, among which are Culebra and Vieques; the former (pop. in 1899, 704) has two excellent harbours and is used as a U.S. naval station; the latter is 21 m. long by 6 m. wide and in 1899 had a population of nearly 6000. Grazing is the principal industry, but sugar-cane, tobacco and fruit are cultivated. There are valuable forests in the mountainous districts, a part of which has been set aside for preservation under the name of the Luquillo forest reserve. Humacao was incorporated as a city in 1899. It suffered severely in the hurricane of 1898, the damage not having been fully repaired as late as 1906.

HUMANE SOCIETY ROYAL. This society was founded in England in 1774 for the purpose of rendering “first aid” in cases of drowning and for restoring life by artificial means to those apparently drowned. Dr William Hawes (1736-1868), an
HUMANISM—HUMBERT, KING OF ITALY

English physician, became known in 1773 for his efforts to convince the public that persons apparently dead from drowning for the many can be rescued by artificial means. For a year he paid a reward out of his own pocket to any one bringing him a body rescued from the water within a reasonable time of immersion. Dr Thomas Cogan (1736-1818), another English physician, who had become interested in the same subject during a stay at Amsterdam, where was instituted in 1767 a society for preservation of life from accidents in water, joined Cawes in his crusade. In the summer of 1774 each of them brought fifteen friends to a meeting at the Chapter Coffee-house, St Paul's Churchyard, when the Royal Humane Society was founded. The society, the chief offices of which are at 4 Trafalgar Square, London, has upwards of 280 depôts throughout the kingdom supplied with life-saving apparatus. The chief and earliest of these depôts is the Receiving House in Hyde Park, on the north bank of the Serpentine, which was built in 1794 on a site granted by George III. Boats and boatmen are kept to render aid to bathers, and in the winter ice-men are sent round to the different skating grounds in and around London. The society distributes money-rewards, medals, clasps and testimonials, to those who save or attempt to save drowning people. It further recognizes "all cases of exceptional bravery in rescuing or attempting to rescue persons from asphyxia in mines, wells, blasting furnaces, or in sewers, where foul gas or water gas threaten life." It further awards prizes for swimming to public schools and training ships. Since 1873 the Stanhope gold medal has been awarded "to the case exhibiting the greatest gallantry during the year." During the year 1905 8,732 persons were rewarded for saving or attempting to save 947 lives from drowning. The society is maintained by private subscriptions and bequests. Its motto is Lateat scienti a fonsar., "a small spark may perhaps lie hid." (See also DROWNING and LIFE-SAVING.)

HUMANISM (from Lat. humanus, human, connected with homo, mankind), in general any system of thought or action which assigns a predominant interest to the affairs of mankind compared with those of God, their Creator, and their subject abstract. The term is specially applied to that movement of thought which in western Europe in the 15th century broke through the medieval traditions of scholastic theology and philosophy, and devoted itself to the rediscovery and direct study of the ancient classics. This movement was essentially a revolt against intellectual, and especially ecclesiastical authority, and is the parent of all modern developments whether intellectual, scientific or social (see RENAISSANCE). The term has also been applied to the philosophy of Comte in virtue of its insistence on the dignity of humanity and its refusal to find in the divine anything external or superior to mankind, and the same tendency has had much influence over the development of modern Christian theology which inclines to obliterate the old orthodox conception of the separate existence and overlordship of God. The narrow sense of the term survives in modern university terminology. Thus in the University of Oxford the curriculum known as Litterae Humaniores ("Human Literature") consists of Latin and Greek literature and philosophy, i.e. of the "arts," often described in former times as the "polite letters." In the Scottish universities the professor of Latin is called the professor of "humanity." The plural "humanities" is a generic term for the classics. In ordinary language the adjective "human" is restricted to the sense of "kind-hearted," "unsellable": the abstract "humanity" has this sense and also the sense of that which pertains to mankind derived in this case with the companion adjective "human." HUMANITARIANS, a term applied (1) to a school of theologians who repudi ate the doctrine of the Trinity and hold an extreme view of the person of Christ as simply human. The adoption of this position by men like Nathaniel Lardner, Joseph Priestley and Theophilus Lindsey in the middle of the 18th century led to the establishment of the first definitely organized Unitarian churches in England. (2) It is also applied to those who believe in the perfectibility of man apart from supernatural aid, especially those who follow the teaching of Pierre Leroux (q.v.).

The name is also sometimes given to the Positivists, and, in a more general sense, to persons whose chief principle of action is the desire to preserve others from pain and discomfort.

HUMAYUN (1508-1556), Mogul emperor of Delhi, succeeded his father Baber in India in 1530, while his brother Kamran obtained the sovereignty of Kabul and Lahore. Humayun was thus left in possession of his father's recent conquests, which were in dispute with the Indian Afghans under Sher Shah, governor of Bengal. After ten years of fighting, Humayun was driven out of India and compelled to flee to Persia through the desert of Sind, where his famous son, Akbar the Great, was born in the petty fort of Unmorkot (1542). Sher Shah was killed at the battle of Panipat (1543), and Humayun, returning to India with Akbar, then only thirteen years of age, defeated the Indo-Afghan army and reoccupied Delhi (1555). India thus passed again from the Afghans to the Moguls, but six months afterwards Humayun was killed by a fall from the parapet of his palace (1556), leaving his kingdom to Akbar. The tomb of Humayun is one of the finest Mogul monuments in the neighbourhood of Delhi, and it was here that the last of the Moguls, Bahadur Shah, was captured by Major Hodson in 1857.

HUMERUS, an estuary on the east coast of England formed by the rivers Trent and Ouse, the northern shore belonging to Nottinghamshire, the southern shore to Lincolnshire. The junction of these two important rivers is near the village of Fazeley, from which point the course of the Humber runs E. for 18 m., and then S.E. for 19 m. to the North Sea. The total area draining to the Humber is 9,293 sq. m. The width of the estuary is 1 m. at the head, gradually widening to 3½ m. at 8 m. above the mouth, but here, with a great shallow bay on the Yorkshire side, it increases to 8 m. in width. The seaward horn of this bay, however, is formed by a narrow protruding bank of sand and stones, thrown up by a southward current along the Yorkshire coast, and known as Spurn Head. This reduces the width of the Humber mouth to 3½ m. Humber estuaries through a low chalk ridge, between north and south Ferriby, dividing it into the Wolds of Yorkshire and of Lincolnshire, the shores and adjacent lands are nearly flat. The water is muddy; and the course for shipping considerably exceeds in length the distances given above, by reason of the numerous shoals it is necessary to avoid. The course is carefully buoyed and lighted, for the Humber is an important highway of commerce, having on the Yorkshire bank the great port of Hull, and on the Lincolnshire bank that of Grimsby, while Goole lies on the Ouse a little above the junction with the Trent. Canals connect with the great manufacturing district of South Yorkshire, and the Trent opens up with communications with the Midlands. The phenomenon of the tidal bore is sometimes seen on the Humber. The action of the river upon the flat Yorkshire shore towards the mouth alters the shore-line constantly. Many ancient villages have disappeared entirely, notably Ravenspur or Ravenser, once a port, represented in parliament under Edward I., and the scene of the landing of Bolingbroke, afterwards Henry IV., in 1399. Soon after this the town, which lay immediately inside Spurn Point, must have been destroyed.

HUMBERT, RANIERI CARLO EMANUELE GIOVANNI MARIA FERDINANDO EUGENIO, KING OF ITALY (1844-1900), son of Victor Emmanuel II. and of Adelaide, archduchess of Austria, was born at Turin, capital of the kingdom of Sardinia, on the 14th of March 1844. His education was entrusted to the most eminent men of his time, amongst others to Massimo d’Azeglio and Pasquale Stanislao Mancini. Entering the army on the 14th of March 1858 with the rank of captain, he was present at the battle of Solferino in 1859, and in 1866 commanded a division at Custozza. Attacked by the Austrian cavalry near Villafranca, he formed his troops into squares and drove the assailants towards Sommacampagna, remaining himself throughout the action in the square most exposed to attack. With Bixio he covered the retreat of the Italian army, receiving the gold medal for valour. On the 21st of April 1868 he married his cousin, Margherita Teresa Giovanna, princess of Savoy, daughter...
of the duke of Genoa (born at Turin on the 20th of November 1831). On the 11th of November 1869 Margherita gave birth to Victor Emmanuel, prince of Naples, afterwards Victor Emmanuel III. of Italy. Ascending the throne on the death of his father (9th January 1878), Humbert adopted the style "Humbert I of Italy" instead of Humbert IV., and consented that the remains of his father should be interred at Rome in the Pantheon, and not in the royal mausoleum of Superga (see CARLO). Accompanied by the premier, Cairoli, he began a tour of the provinces of his kingdom, but on entering Naples (November 17, 1878), amid the acclamations of an immense crowd, was attacked by a fanatic named Passannante. The king warding off the blow with his sabre, but Cairoli, in attempting to defend him, was severely wounded in the thigh. The would-be assassin was condemned to death, but the sentence was by the king commuted to one of penal servitude for life. The occurrence upset for several years the health of Queen Margherita. In 1881 King Humbert, again accompanied by Cairoli, resumed his interrupted tour, and visited Sicily and the southern Italian provinces. In 1882 he took a prominent part in the national mourning for Garibaldi, whose tomb at Caprera he repeatedly visited. When, in the autumn of 1882, Verona and Venetia were inundated, he hastened to the spot, directed salvage operations, and provided large sums of money for the destitute. Similarly, on the 28th of July 1883, he hurried to Ischia, where an earthquake had engulfed some 5000 persons. Countermanding the order of the minister of public works to cover the ruins with quicklime, the king prosecuted salvage operations for five days longer, and personally saved many victims at the risk of his own life. In 1884 he visited Busca and Naples, where cholera was raging, helping with money and advice the numerous sufferers, and raising the spirit of the population. Compared with the reigns of his grandfather, Charles Albert, and of his father, Victor Emmanuel, the reign of Humbert was tranquil. Scrupulously observant of constitutional principles, he followed, as far as practicable, parliamentary indications in his choice of premiers, only one of whom—Rudini—was drawn from the Conservative ranks. In foreign policy he approved of the conclusion of the Triple Alliance, and, in repeated visits to Vienna and Berlin, established and consolidated the pact. Towards Great Britain his attitude was invariably cordial, and he considered the Triple Alliance imperfect unless supplemented by an Anglo-Italian naval entente. Favourably disposed towards the policy of colonial expansion inaugurated in 1885 by the occupation of Massawa, he was suspected of aspiring to a vast empire in north-east Africa, a suspicion which tended somewhat to diminish his popularity after the disaster of Adowa on the 1st of March 1896. On the other hand, his popularity was enhanced by the firmness of his attitude towards the Vatican, as exemplified in his telegram declaring Rome "intangibilis" (September 20, 1886), and affirming the permanence of the Italian possession of the Eternal City. Above all King Humbert was a soldier, jealous of the honour and prestige of the army to such a degree that he promoted a duel between his nephew, the count of Turin, and Prince Henry of Orleans (August 13, 1897) on account of the aspersions cast by the latter upon Italian arms. The claims of King Humbert upon popular gratitude and affection were enhanced by his extraordinary benevolence, which was not merely displayed on public occasions, but directed to the relief of innumerable private wants into which he had made personal inquiry. It has been calculated that at least £100,000 per annum was expended by the king in this way. The regard in which he was universally held was abundantly demonstrated on the occasion of the unsuccessful attempt upon his life made by the anarchist Acquarito near Rome on the 22nd of April 1897, and still more after his tragic assassination at Monza by the anarchist Bretoni on the evening of the 20th of July 1900. Good-humoured, active, tender-hearted, somewhat fatalistic, but, above all, generous, he was spontaneously called "Humbert the Good." He was buried in the Pantheon in Rome, by the side of Victor Emmanuel II., on the 9th of August 1900.

(H. W. S.)

HUMBOLDT, FRIEDRICH HEINRICH ALEXANDER, Baron von (1769–1859), German naturalist and traveller, was born at Berlin, on the 14th of September 1769. His father, who was a major in the Prussian army, belonged to a Pomeranian family of consideration, and was rewarded for his services during the Seven Years' War with the post of royal chamberlain. He married in 1766 Maria Elizabeth von Colomb, widow of Baron von Holfwede, and had by her two sons, of whom the younger is the subject of this article. The childhood of Alexander von Humboldt was not a promising one as regards either health or intellect. His characteristic tastes, however, soon displayed themselves; and from his fancy for collecting and labelling plants, shells and insects he received the playful title of "the little apothecary." The care of his education, on the unexpected death of his father in 1779, devolved upon his mother, who discharged the trust with constancy and judgment. Destined for a political career, he studied finance during six months at the university of Frankfort-on-the-Oder; and a year later, April 25, 1789, he matriculated at Göttingen, then eminent for the lectures of C. G. Heyne and J. F. Blumenbach. His vast and varied powers were by this time fully developed; and during the vacation of 1789 he gave a fair earnest of his future performances in a scientific excursion up the Rhine, and in the treatise thence issuing, Mineralogische Beobachtungen über einige Basalte am Rhein (Brunswick, 1790). His native passion for distant travel was confirmed by the friendship formed by him at Göttingen with George Forster, Heyne's son-in-law, the distinguished companion of Captain Cook's second voyage. Henceforth his studies, which his rare combinations of parts enabled him to render at once multifarious, rapid and profound, were directed with extraordinary insight and perseverance to the purpose of preparing himself for his distinctive calling as a scientific explorer. With this view he studied commerce and foreign languages at Hamburg, geology at Freiberg under A. G. Werner, anatomy at Jena under J. C. Loder, astronomy and the use of scientific instruments under F. X. von Zach and J. G. Köhler. His researches into the vegetation of the mines of Freiberg led to the publication in 1795 of his Flora Fridericensis Specimen; and the results of a prolonged course of experiments on the phenomena of muscular irritability, then recently discovered by L. Galvani, were contained in his Versuche über die gereizte Muskel- und Nervenfaser (Berlin, 1797), enriched in the French translation with notes by Blumenbach.

In 1794 he was admitted to the intimacy of the famous Weimar coterie, and contributed (June 1795) to Schiller's new periodical, Die Horen, a philosophical allegory entitled Die Lebenskraft, oder der rhodische Genius. In the summer of 1799 he paid a flying visit to England in company with Forster. In 1799 and 1797 he was in Vienna; in 1795 he made a geological and botanical tour through Switzerland and Italy. He had obtained in the meantime official employment, having been appointed assessor of mines at Berlin, February 29, 1792. Although the service of the state was consistently regarded by him but as an apprenticeship to the service of science, he fulfilled its duties with such conspicuous ability that he not only rapidly rose to the highest post in his department, but was besides entrusted with several important diplomatic missions. His travels in America in 1796, set him free to follow the bent of his genius, and, finally severing his official connexions, he waited for an opportunity of executing his long-cherished schemes of travel. On the postponement of Captain Baudin's proposed voyage of circumnavigation, which he had been officially invited to accompany, he left Paris for Marseilles with Aimé Bonpland, the designated botanist of the frustrated expedition, hoping to join Bonaparte in Egypt. Means of transport, however, were not forthcoming, and the two travellers eventually found their way to Madrid, where the unexpected patronage of the minister d'Urquijo determined them to make Spanish America the scene of their explorations.

Armed with powerful recommendations, they sailed in the "Pizarro" from Corunna, on the 5th of June 1799, stopped six days at Teneriffe for the ascent of the Peak, and landed on the
HUMBOLDT, ALEXANDER VON

16th of July, at Cumana. There Humboldt observed, on the night of the 12-13th of November, that remarkable meteor-shower which forms the starting-point of our acquaintance with the periodicity of the phenomenon; thence he proceeded with Bonpland to Caracas; and in February 1800 he left the coast for the purpose of exploring the course of the Orinoco. This trip, which lasted four months, and covered 1725 m. of wild and uninhabited country, had the important result of establishing the existence of a communication between the water-systems of the Orinoco and Amazon, and of determining the exact position of the bifurcation. On the 24th of February the two friends set sail for Cuba, and after a stay of some months regained the mainland at Cartagena. Ascending the swollen stream of the Magdalena, and crossing the frozen ridges of the Cordilleras, they reached Quito after a tedious and difficult journey. on the 6th of January 1802. Their stay there was signalized by the ascent of Pichincha and Chimborazo, and terminated in an expedition to the sources of the Amazon en route for Lima. At Callao Humboldt observed the transit of Mercury on the 9th of November, and studied the fertilizing properties of guano, the introduction of which into Europe was mainly due to his writings. A second voyage brought him on the shores of the sea of the South, and after a year's residence in that province, followed by a short visit to the United States, they set sail for Europe from the mouth of the Delaware, and landed at Bordeaux on the 3rd of August 1804.

Humboldt may justly be regarded as having in this memorable expedition laid the foundation in their larger bearings of the sciences of physical geography and meteorology. By his delineation (in 1817) of "isothermal lines," he at once suggested the idea and devised the means of comparing the climatic conditions of various countries. He first investigated the rate of decrease in mean temperature with increase of elevation above the sea-level, and afforded, by his inquiries into the origin of tropical storms, the earliest clue to the detection of the more complicated law governing atmospheric disturbances in higher latitudes; while his essay on the geography of plants was based on the then novel idea of studying the distribution of organic life as affected by varying physical conditions. His discovery of the decrease in intensity of the earth's magnetic force from the poles to the equator was communicated to the Paris Institute in a memoir read by him on the 7th of December 1804, and its importance was attested by the speedy emergence of rival claims. His services to geology were mainly based on his attentive study of the volcanoes of the New World. They showed that they fell naturally into two groups, presumably corresponding with vast subterranean fissures; and by his demonstration of the igneous origin of rocks previously held to be of aqueous formation, he contributed largely to the elimination of erroneous views.

The reduction into form and publication of the encyclopaedic mass of materials—scientific, political and archaeological—collected by him during his absence from Europe was now Humboldt's most urgent desire. After a short trip to Italy with Gay-Lussac for the purpose of investigating the law of magnetic declination, and a sojourn of two years and a half in Paris, he found himself, in the autumn of 1808, settled in Paris with the purpose of securing the scientific co-operation required for bringing his great work through the press. This colossal task, which he at first hoped would have occupied but two years, eventually cost him twenty-one, and even then remained incomplete. With the exception of Napoleon Bonaparte, he was the most famous man in Europe. A chorus of applause greeted him from every side. Academies, both native and foreign, were eager to enrol him among their members. Frederick William III. of Prussia conferred upon him the honour, without exacting the duties, attached to the post of royal chamberlain, together with a pension of 2000 thalers, afterwards doubled. He refused the appointment of Prussian minister of public instruction in 1810. In 1814 he accompanied the allied sovereigns to London. Three years later he was summoned by the king of Prussia to attend him at the congress of Aix-la-Chapelle. Again in the autumn of 1822 he accompanied the same monarch to the congress of Verona, proceeded thence with the royal party to Rome and Naples, and returned to Paris in the spring of 1823. The French capital he had long regarded as his true home. There he found, not only scientific sympathy, but the social stimulus which his vigorous and healthy mind eagerly craved. He was equally in his element as the lion of the salons and as the savant of the institute and the observatory. Thus, when at last he received from his sovereign a summons to join his court at Berlin, he obeyed indeed, but with deep and lasting regret. The provincialism of his native city was odious to him. He never ceased to rail against the bigotry without religion, aestheticism without nature, and philosophy without common sense, which he found dominant on the banks of the Spree. The unerring benefits and sincere attachment of two well-meaning princes secured his gratitude, but could not appease his discontent. At first he sought relief from the "nebulous atmosphere" of his new abode by frequent visits to Paris; but as years advanced his excursions were reduced to accompanying the monotonous "oscillations" of the court between Potsdam and Berlin. On the 12th of May 1827 he settled permanently in the Prussian capital, where his first efforts were directed towards the furtherance of the science of terrestrial magnetism. For many years it had been considered a safe point to secure, by means of simultaneous observations at distant points, a thorough investigation of the nature and law of "magnetic storms"—a term invented by him to designate abnormal disturbances of the earth's magnetism. The meeting at Berlin, on the 18th of September 1828, of a newly-formed scientific association, of which he was elected president, gave him the opportunity of setting on foot an extensive system of research in combination with his diligent personal observations. His appeal to the Russian government in 1829 led to the establishment of a line of magnetic and meteorological stations across northern Asia; while his letter to the dukes of Sussex, then (April 1836) president of the Royal Society, successfully urged the undertaking of the British dominions. Thus that scientific conspiracy of nations which is one of the noblest fruits of modern civilization was by his exertions first successfully organized.

In 1811, and again in 1818, projects of Asiatic exploration were proposed to Humboldt, first by the Russian, and afterwards by the Prussian government; but on each occasion untoward circumstances interposed, and it was not until he had entered upon his sixtieth year that he resumed his early role of a traveller in the interests of science. Between May and November 1829 he, together with his chosen associates Gustav Rose and C. G. Ehrenberg, traversed in the wide expanse of the Russian empire from the Neva to the Yenesei, accomplishing in twenty-five weeks a distance of 9614 m. The journey, however, though carried out with all the advantages afforded by the immediate patronage of the Russian government, was too rapid to be profitable. Its most important fruits were the correction of the prevalent exaggerated estimate of the height of the Central-Asian plateau, and the discovery of diamonds in the gold-washings of the Ural—a result which Humboldt's Brazilian experiences enabled him to predict, and by predicting to secure.

Between 1830 and 1845 Humboldt was frequently employed in diplomatic missions, and in the last years of his life was made, to the ducal title of Sussex, by the king of Prussia, an 'honorary' and "profane" member of the Prussian chamber of peers, a rank which he was not, and that was not paid, and which he accepted as a mere act of courtesy; and in 1834, after a visit to the United States, he was elected a foreign member of the Royal Society.

Humboldt died on 6th May 1859, and was buried in the dome of the National Museum, opposite the University of Berlin. How few, then, are our sons of science who have the character of Humboldt, who have the taste of him, who are capable of the same grandeur of purpose. In the present generation we see not a man in the whole field of science who can claim to be a successor to Humboldt.
convey, not only a graphic description, but an imaginative conception of the physical world—which should support generalization by details, and dignity details by generalization, had floated before his mind for upwards of half a century. It first took definite shape in a set of lectures delivered by him before the university of Berlin in the winter of 1827-1828. These lectures formed, as his latest biographer expresses it, "the cartoon for the great fresco of the Kosmos!" The scope of this remarkable work may be briefly described as the representation of the unity amid the complexity of nature. In it the large and vague ideals of the 18th are sought to be combined with the exact scientific requirements of the 19th century. And, in spite of inevitable shortcomings, the attempt was in an eminent degree successful. Nevertheless, the general effect of the book is rendered to some extent unsatisfactory by its tendency to substitute the indefinite for the infinite, and thus to ignore, while it does not deny, the existence of a power outside and beyond nature. A certain heaviness of style, too, and laboured picturesqueueness of treatment make it more imposing than attractive to the general reader. But its supreme and abiding value consists in its faithful reflection of the mind of a great man. No higher eulogy can be passed on Alexander von Humboldt than that, in attempting, and not unworthily attempting, to portray the universe, he succeeded still more perfectly in portraying his own comprehensive intelligence.

The last decade of his long life—his "improbable" years, as he was accustomed to call them—was devoted to the continuation of this work, of which the third and fourth volumes were published in 1835-1836, while a fragment of a fifth appeared posthumously in 1865. In these he sought to fill up what was wanting of detail as to individual branches of science in the sweeping survey contained in the first volume. Notwithstanding their high separate value, it must be admitted that, from an artistic point of view, these additions were deformities. The characteristic idea of the work, so far as such a gigantic idea admitted of literary incorporation, was completely developed in its opening portions, and the attempt to convert it into a scientific encyclopedia was in truth to nullify its generating motive. Humboldt's remarkable industry and accuracy were never more conspicuous than in the erection of this latest trophy to his genius. Nor did he rely entirely on his own labours. He owed much of what he accomplished to his rare power of assimilating the thoughts and availing himself of the cooperation of others. He was not more ready to incur than to acknowledge obligations. The notes to Kosmos overflow with laudatory citations, the current coin in which he discharged his intellectual debts.

On the 24th of February 1857 Humboldt was attacked with a slight apoplectic stroke, which passed away without leaving any perceptible trace. It was not until the winter of 1858-1859 that his strength began to decline, and on the ensuing 6th of May he tranquilly expired, wanting six months of completing his ninetieth year. The honours which had been showered on him during life followed him after death. His remains, previously to being interred in the family resting-place at Tegel, were conveyed in state through the streets of Berlin, and received by the prince-regent with uncovered head at the door of the cathedral. The first centenary of his birth was celebrated on the 14th of September 1869, with equal enthusiasm in the New and Old Worlds; and the numerous monuments erected in his honour, and newly explored regions called by his name, bear witness to the universal diffusion of his fame and popularity.

Humboldt never married, and seems to have been at all times more social than domestic in his tastes. To his brother's family he was, however, much attached; and in his later years the somewhat arbitrary sway of an old and faithful servant held him in more than matrimonial bondage. By a singular example of weakness, he executed, four years before his death, a deed of gift, by which he alienated the property of his entire estate. It is right to add that no undue advantage appears to have been taken of this extraordinary conveyance. Of the qualities of his heart it is less easy to speak than of those of his head. The clue to his inner life might probably be found in a certain egotism of self-culture scarcely separable from the devotion of genius, and at the same time too ready to sacrifice sincere and lasting. He made innumerable friends; and it does not stand on record that he ever lost one. His benevolence was throughout his life active and disinterested. His early zeal for the improvement of the condition of the miners in Galicia and Franconia, his consistent detestation of slavery, his earnest patronage of rising men of science, bear witness to the large humanity which formed the ground-work of his character. The faults of his old age have been brought into undue prominence by the injudicious publication of his letters to Varnhagen von Ense. His chief biographer has truly remarked that they were almost amounting to flattery, which formed a painful contrast with the caustic sarcasm of his confidential utterances. His vanity, at all times conspicuous, was tempered by his sense of humour, and was so frankly avowed as to invite sympathy rather than ro provoke ridicule. After every deduction has been made, he yet stands before us as a colossal figure, not unworthy to take his place beside Goethe as the representative of the scientific side of the culture of the country.
Hermann und Dorothea, published in 1800, had already placed him in the first rank of authorities on aesthetics, and, together with his family connexions, had much to do with his appointment at Rome; while in the years 1795 and 1797 he had brought out translations of several of the odes of Pindar, which were held in high esteem. On quitting his post at Rome he was made councillor of state and minister of public instruction. He soon, however, retired to his estate at Tegel, near Berlin, but was recalled and sent as ambassador to Vienna in 1812 during the exciting period which witnessed the closing struggles of the French empire. In the following year, as Prussian plenipotentiary at the congress of Paris, he was mainly instrumental in inducing Austria to unite with Prussia and Russia against France; in 1815 he was one of the signatories of the capitulation of Paris, and the same year was occupied in drawing up the treaty between Prussia and Saxony, by which the territory of the former was largely increased at the expense of the latter. The next year he was at Frankfort settling the future condition of Germany, but was summoned to London in the midst of his work, and in 1818 had to attend the congress at Aix-la-Chapelle. The reactionary policy of the Prussian government made him resign his office of privy councillor and give up political life in 1819; and from that time forward he devoted himself solely to literature and study.

During the worst portion of his political career, however, he had found time for literary work. Thus in 1816 he had published a translation of the Agamemnon of Aeschylus, and in 1817 corrections and additions to Adelung's Mithridates, that famous collection of specimens of the various languages and dialects of the world. Among these additions that on the Basque language is the longest and most important, Basque having for some time specially attracted his attention. In fact, Wilhelm von Humboldt may be said to have been the first who brought Basque before the notice of European philologists, and made a scientific study of it possible. In order to gain a practical knowledge of the language and complete his investigations into it, he visited the Basque country itself, the result of his visit being the valuable "Researches into the Early Inhabitants of Spain by the help of the Basque language" (Prüfung der Untersuchungen über die Urbevölkerer Hispaniens vermittelt der vaskischen Sprache), published in 1821. In this work he endeavoured to show, by an examination of geographical names, that a race or races speaking dialects allied to modern Basque once extended through the whole of Spain, the southern coast of France and the Balearic Islands, and suggested that these people, whom he identified with the Iberians of classical writers, had come from northern Africa, where the name of Berber still perhaps perpetuates their old designation. Another work on what has sometimes been termed "the mysterious language" of the Basques resulted from his pen in 1828, under the title of Übers den Dualism; but the great work of his life, on the ancient Kawi language of Java, was unfortunately interrupted by his death on the 8th of April 1835. The imperfect fragment was edited by his brother and Dr Buschmann in 1836, and contains the remarkable introduction on "The Heterogeneity of Language and its Influence on the Intellectual Development of Mankind" (Über die Verschiedenheit des menschlichen Sprachbaues und ihren Einfluss auf die geistige Entwicklung des Menschengeschlechts), which was afterwards edited and defended against Steinthal's criticisms by Pott (2 vols, 1876). This essay, which has been called the text-book of the philosophy of speech, first clearly laid down that the character and structure of a language expresses the inner life and knowledge of its speakers, and that languages must differ from one another in the same way and to the same degree as those who use them. Sounds do not become words until a meaning has been put into them, and this meaning embodies the thought of a community. What Humboldt terms the inner form of a language is just that mode of denoting the relations between the parts of a sentence which reflects the manner in which a particular body of men regards the world about them. It is the task of the morphology of speech to distinguish the various ways in which languages differ from each other as regards their inner form, and to classify and arrange them accordingly. Other linguistic publications of Humboldt, which had appeared in the Transactions of the Berlin Academy of Sciences, the Royal Asiatic Society, or elsewhere, were republished by his brother in the seven volumes of Wilhelm von Humboldt's Gesammelte Werke (1841-1852). These volumes also contain poems, essays on aesthetic subjects and other creations of his prolific mind. Perhaps, however, the most generally interesting of his works, outside those which deal with language, is his correspondence with Schiller, published in 1830. Both poet and philosopher come before us in it in their most genial mood. For, though Humboldt was primarily a philosopher, he was a philosopher rendered practical by his knowledge of statesmanship and wide experience of life, and endowed with keen sympathies, warm imagination and active interest in the methods of scientific inquiry.

(A. H. S.)

HUMBUG, an imposture, sham, fraud. The word seems to have been originally applied to a trick or hoax, and appears as a slang term about 1750. According to the New English Dictionary, Ferdinando Killigrew's The Universal Jester, which contains the word in its sub-title "a choice collection of many conceits ... bonmots and humbugs," was published in 1754, not, as is often stated, in 1735-1740. The principal passage in reference to the introduction of the word occurs in The Student, 1750-1751, i. 41, where it is called "a word very much in vogue with the people of taste and fashion." The origin appears to have been unknown at that date. Skeat connects it (Etym. Dict. 1898) with "hum," to murmur applause, hence flatter, trick, cajole, and "bug," bogy, spectre, the word thus meaning a false alarm. Many fanciful conjectures have been made, e.g. from Irish uim-bog, soft copper, worthless as opposed to sterling money; from "Hamburg," as the centre from which fake coins came into England during the Napoleonic wars; and from the Italian uomo bugjardo, lying man.

HUME, ALEXANDER (c. 1557-1609), Scottish poet, second son of Patrick Hume of Polwarth, Berwickshire, was born, probably at Reidhares, one of his family's houses, about 1557. It has been generally assumed that he is the Alexander Hume who matriculated at St Mary's college, St Andrews, in 1571, and graduated in 1574. In An Epistle to Maister Gilbert Montcreif (Moncrieff), mediciner to the Kings Majesty, wherein is set downe the Experience of the Authors youth, he relates the course of his disillusionsment. He says he spent four years in France before beginning to study law in the courts at Edinburgh (L. 136). After three years' experience there he abandoned law in disgust and sought a post at court (ib. l. 241). Still dissatisfied, he took orders, and became in 1597 minister of Logie, near Stirling, where he lived until his death on the 4th of December 1609. His literary career was not a prolific one. His Hymns, and Sacred Songs (printed by Robert Waldegrave at Edinburgh in 1599, and dedicated to Elizabeth Melvill, Lady Comrie) containing an epistle to the Scottish youth, urging them to abandon vanity for religion. One poem of the collection, entitled "A description of the day Estivall," a sketch of a summer's day and its occupations, has found its way into several anthologies. "The Triumph of the Lord after the Manner of Men" is a song of victory of some merit, celebrating the defeat of the Armada in 1588. His prose works include Anet Treatise of Conscience (Edinburgh, 1594), A Treatise of the Felicitie of the Life to come (Edinburgh, 1594), and Anet Adjutonists to the Ministere of Scotland. The last is an argument against prelacy. Hume's elder brother, Lord Polwarth, was probably one of the combatants in the famous "Flying betwixt Montgomerie and Polwart."

The editions of Hume's verse are: (a) by Robert Waldegrave (1599); (b) a reprint of (a) by the Bannatyne Club (1832); and (c) by the Scottish Text Society (ed. A. Lawson) (1902). The last includes the prose tracts.

HUME, DAVID (1711-1776), English philosopher, historian and political economist, was born at Edinburgh, on the 26th of April (O.S.) 1711. His father, Joseph Hume or Home, a scion of the noble house of Home of Douglas (but see Notes and Queries, 4th ser. iv. 72), was owner of a small estate in
Berwickshire, on the banks of the Whiteadder, called, from the spring rising in front of the dwelling-house, Ninewells. David was the youngest of a family of three, two sons and a daughter, who after the early death of the father were brought up with great care and devotion by their mother, the daughter of Sir David Falconer, president of the college of justice.

Of Hume's early education little is known beyond what he has himself stated in his Life. He appears to have entered the Greek classes of the university of Edinburgh in 1723, and, he tells us, "passed through the ordinary course of education with success." From a letter printed in Burton's Life (i. 50-50), it appears that about 1726 Hume returned to the university with a fair knowledge of Latin, slight acquaintance with Greek and literary tastes decidedly inclining to "books of reasoning and philosophy, and to poetry and the polite authors." We do not know, except by inference, to what studies he especially devoted himself. It is, however, clear that from his earliest years he began to speculate upon the nature of knowledge in the abstract, and its concrete applications, as in theology, and that with this object he studied largely the writings of Cicero and Seneca and received his philosophical training largely from Locke, (especially Locke, and Butler). His acquaintance with Cicero is clearly proved by the form in which he cast some of the most important of his speculations. From his boyhood he devoted himself to acquiring a literary reputation, and throughout his life, in spite of financial and other difficulties, he adhered to his original intention. A man of placid and even phlegmatic temperament, he lived moderately in all things, and sought worldly prosperity only so far as was necessary to give him leisure for his literary work. At first he tried law, but was unable to give his mind to a study which he saw to him to be merely a barren waste of technical jargon. At this time the intensity of his intellectual activity in the area opened up to him by Locke and Berkeley reduced him to a state of physical exhaustion. In these circumstances he determined to try the effect of complete change of scene and occupation, and in 1734 entered a business house in Bristol. In a few months he found "the scene wholly unsuitable" to him, and about the middle of 1734 set out for France, resolved to spend some years in quiet study. He visited Paris, resided for a time at Rheims and then settled at La Flèche, famous in the history of philosophy as the school of Descartes. His health seems to have been perfectly restored, and during the three years of his stay in France his speculations were worked into systematic form in the Treatise of Human Nature. In the autumn of 1737 he was in London arranging for its publication and polishing it in preparation for the judgments of the learned. In January 1739 appeared the first and second volumes of the Treatise of Human Nature, being an Attempt to Introduce the Experimental Method of Reasoning into Moral Subjects, containing book i., Of the Understanding, and book ii., Of the Passions. The third volume, containing book iii., Of Morals, was published in the following year. The publisher of the first two volumes, John Nisone, gave him £50 and twelve bound copies for a first edition of one thousand copies. Hume's own words best describe its reception. "Never literary attempt was more unfortunate; it fell dead-born from the press, without reaching such distinction as even to excite a murmur among the zealots." But, he adds, "being naturally of a cheerful and sanguine temper, I very soon recovered the blow, and prosecuted with great ardour my studies in the country." This brief notice, however, is not sufficient to explain the full significance of the event for Hume's own life. The work undoubtedly failed to do what its author expected from it; even the notice, otherwise not unsatisfactory, which it obtained in the History of the Works of the Learned, then the principal critical journal, did not in the least appreciate the true bearing of the Treatise on current discussions. Hume naturally expected that the world would see as clearly as he did the connexion between the concrete problems agitating contemporary thought and the abstract principles upon which their solution depended. Accordingly he laboured for opposition, and expected that, if his principles were received, a change in general conceptions of things would ensue. His disappointment at its reception was great; and though he never entirely relinquished his metaphysical speculations, though all that is of vital importance in his later writings depends on the acute analysis of human nature to which he was from the first attracted, one cannot but regret that his high powers were henceforth withdrawn for the most part from the consideration of the foundations of belief, and expended on its practical applications. In later years he attributed his want of success to the immature style of his early exposition, to the rashness of a young innovator in an old and well-established province of literature. But this has little foundation beyond the irritation of an author at his own failure to attract such notice as he deems his due. None of the principles of the Treatise is given up in the later writings, and no addition is made to them. Nor can the superior polish of the more mature productions counterbalance the concentrated vigour of the more youthful work.

After the publication of the Treatise Hume retired to his brother's house at Ninewells and carried on his studies, mainly in the direction of politics and political economy. In 1741 he published the first volume of his Essays, which had a considerable reputation, and a second was called for in the following year, in which he appeared with the second and later volumes. These essays Butler, to whom he had sent a copy of his Treatise, but with whom he had failed to make personal acquaintance, warmly commended. The philosophical relation between Butler and Hume is curious. So far as analysis of knowledge is concerned they are in harmony, and Hume's sceptical conclusions regarding belief in matters of fact are the foundations on which Butler's defence of religion rests. Butler, however, retained, in spite of his destructive theory of knowledge, confidence in the rational proofs for the existence of God, and certainly maintains what may be vaguely described as an a priori view of conscience. Hume had the greatest respect for the author of the Analogy, ranks him with Locke and Berkeley as an originator of the experimental method in moral science, and in his specially theological essays, such as that on Particular Providence and a Future State, has Butler's views specifically in mind. (See Butler.)

The success of the Essays, though hardly great enough to satisfy his somewhat exorbitant cravings, was a great encouragement to him. He began to hope that his earlier work, if recast and lightened, might share the fortunes of its successor; and at intervals throughout the next four years he occupied himself in rewriting it in a more succinct form with all the literary grace at his command. Meantime he continued to look about for some post which might secure him the modest independence he desired. In 1744 we find him, in anticipation of a vacancy in the chair of moral philosophy at Edinburgh university, moving his friends to advance his cause with the electors; and though, as he tells us, "the accusation of heresy, delaim, scepticism or theism, &c., &c., was started" against him, it had no effect, "being bare down by the contrary authority of all the good people in town." To his great mortification, however, he found out, as he thought, that Hutchison and Leechman, with whom he had been on terms of friendly correspondence, were giving the weight of their opinion against his election. The after history of these negotiations is obscure. Failing in this attempt, he was induced to become tutor, or keeper, to the marquis of Annandale, a harmless literary lunatic. This position, financially advantageous, was absurdly false (see letters in Burton's Life, i. ch. v.), and when the matter ended Hume had to sue for arrears of salary. In 1746 Hume accepted the office of secretary to General St Clair, and was a spectator of the ill-fated expedition to France in the autumn of that year. His admirable account of the transaction has been printed by Burton. After a brief sojourn at Ninewells, doubtless occupied in preparing for publication his Philosophical Essays (afterwards entitled An Inquiry concerning Human Understanding), Hume was again associated in important, if not brilliant, literary circles at Edinburgh and Turin (1748). The notes of this journey are written in a light and amusing style, showing Hume's usual keenness of sight in some directions and his almost equal blindness in others.
During his absence from England, early in the year 1748, the Philosophical Essays were published; but the first reception of the work was little more favourable than that accorded to the Treatise. To the later editions of the work Hume prepared an "advertisement" referring to the Treatise, and desiring that the Essays "may alone be regarded as containing his philosophical sentiments and principles." Some modern critics have accepted this disclaimer as of real value, but in fact it has no significance; and Hume himself in a striking letter to Gilbert Elliott indicated the true relation of the two works. I believe the Philosophical Essays contain everything of consequence relating to the understanding which you would meet with in the Treatise, and I give you my advice against reading the latter. By shortening and simplifying the questions, I really render them much more complete. Addo dum minuo. The philosophical principles are the same in both. The Essays are undoubtedly wiser in art and skill than the Treatise; they contain in more detail application of the principles to concrete problems, such as miracles, providence, immortality; but the entire omission of the discussion forming part ii. of the first book of the Treatise, and the great compression of part iv., are real defects which must always render the Treatise the more important work.

In 1749 Hume returned to Ninewells, enriched with "near a thousand pounds." In 1751 he removed to Edinburgh, where for the most part he resided during the next twelve years of his life. These years are the richest so far as literary production is concerned. In 1751 he published his Political Discourses, which had a great and well-deserved success both in England and abroad. It was translated into French by Mauvillon (1753) and by the Abbé le Blanc (1754). In the same year appeared the recast of the third book of the Treatise, called Inquiry concerning the Principles of Morals, of which he says that "of all his writings, philosophical, literary or historical, it is incomparably the best." At this time also we hear of the Dialogues concerning Natural Religion, a work which Hume was prevailed on not to publish, but which he revised with great care, and evidently regarded with the greatest favour. The work itself, left by Hume with instructions that it should be published, did not appear till 1770.

In 1751 Hume was again unsuccessful in the attempt to gain a professor's chair. In the following year he received, in spite of the usual accusations of heresy, the librarianship of the Advocates' Library in Edinburgh, small in emoluments (4l a year) but rich in opportunity for literary work. In a playful letter to Dr Clephane, he describes his satisfaction at his appointment, and attributes it in some measure to the support of "the ladies."

In 1753 Hume was fairly settled in Edinburgh, preparing for his History of England. He had decided to begin the History, not with Henry VII., as Adam Smith recommended, but with James I., considering that the political differences of his time took their origin from that period. On the whole his attitude in respect to disputed political principles seems not to have been at first consciously unfair. As for the qualities necessary to secure success as a writer on history, he felt that he possessed them in a high degree; and, though neither his ideal of a historian nor his equipment for the task of historical research would now appear adequate, in both he was much in advance of his time. "But," he writes in the well-known passage of his Life, "miserable was my disappointment. I was assailed by one cry of reproach, disapprobation, and even detestation... what was still more mortifying, the book seemed to sink into oblivion. Mr Millar told me that in a twelvemonth he sold only forty-five copies of it." This account must be accepted with reservations. It expresses Hume's feelings rather than the real facts. In Edinburgh, as we learn from one of his letters, the book succeeded well, no fewer than 450 copies being disposed of in five weeks. Nor is there anything in Hume's correspondence to show that the failure of the book was so complete as he declared. Within a very few years the sale of the History was sufficient to gain for the author a larger revenue than had ever before been known in his country to flow from literature, and to place him in comparative affluence. He seems to have received £500 for the first edition of the first volume, £700 for the first edition of the second and £850 for the copyright of the two volumes; a striking instance of the value Hume attached to the influence of his feelings and their effect are of importance in his life. It is from the publication of the History that we date his virulent hatred of everything English, towards society in London, Whig principles, Whig ministers and the public generally (see Burton's Life, ii. 268, 417, 434). He was convinced that there was a conspiracy to suppress and destroy everything Scottish.1 The remainder of the History became little better than a party pamphlet. The second volume, published in 1756, carrying on the narrative to the Revolution, was better received than the first; but Hume then resolved to work backwards, and to show from a survey of the Tudor period that his Tory notions were grounded upon the history of the constitution. In 1759 this portion of the work appeared, and in 1761 the work was completed by the history of the pre-Tudor periods. The numerous editions of the various portions—for, despite Hume's wrath and grumblings, the book was a great literary success—gave him an opportunity of careful revision, which he employed to remove from it all the "villainous seditious Whig strokes," and "plaguy prejudices of Whiggism" that he could detect. In other words, he bent all his efforts toward making his History more of a party work than it had been, and in his effort he was entirely successful. The early portion of his History may be regarded as now of too obvious a character; the prejudices it contained were few, and he did not use them all. None the less, the History has its distinct place in the literature of England. It was the first attempt at a comprehensive treatment of historic facts, the first to introduce the social and literary aspects of a nation's life as only second in importance to its political fortunes, and the first historical writing in an animated yet refined and polished style.2

While the History was in process of publication, Hume did not entirely neglect his other lines of activity. In 1757 appeared Four Dissertations: The Natural History of Religion, Of the Passions, Of Tragedy, Of the Standard of Taste. Of these the dissertation on the passions is a very subtle piece of psychology, containing the essence of the second book of the Treatise. It is remarkable that Hume does not appear to have been acquainted with Spinoza's analysis of the affections. The last two essays are contributions of no great importance to aesthetics, a department of philosophy in which Hume was not strong. The Natural History of Religion is a powerful contribution to the deistic controversy; but, as in the case of Hume's earlier work, its significance was at the time overlooked. It is an attempt to carry the war into a province hitherto allowed to remain at peace, the theory of the general development of religious ideas. Deists, though raising doubts regarding the historic narratives of the Christian faith, had never disputed the general fact that belief in one God was natural and primitive. Hume endeavours to show that polytheism was the earliest as well as the most natural form of religious belief, and that theism or deism is

1 See Burton, ii. 265, 148 and 285. Perhaps our knowledge of John Millar's attitude is indicated by the Scripture connected with his expressions regarding Hume and Smith in particular, may lessen our surprise at this vehemence.

2 Macaulay describes Hume's characteristic fault as a historian: "I am afraid his power to accomplish the most difficult things without much more than he can prove, gives prominence to all the circumstances which support his case; he glides lightly over those which are unfavourable to it; his most solid witnesses are applauded and his most formidable arguments thrown down; his statements, which seem to throw discreditable upon the rest, are contended; the contradictions into which they fall are explained away; a clear and connected abstract of their evidence is impossible; every truth and fact is turned into a party weapon."

3 "...in its utmost severity; every suspicious circumstance is a ground for argument and invective; what cannot be denied is extenuated, or passed by without notice; concessions even are sometimes made; little inconsequent and notorious cases are urged as the effects of the vast mass of sophistry."—Miscell. Writings, "History." With this may be compared the more favourable verdict by J. S. Brewer, in the preface to his edition of the Student's Hume.
the product of reflection upon experience, thus reducing the validity of the historical argument to that of the theoretical proofs.

In 1763 he accompanied Lord Hertford to Paris, doing the duties of secretary to the embassy, with the prospect of the appointment to that post. He was everywhere received "with the most extraordinary honours." The society of Paris was peculiarly ready to receive a great philosopher and historian, especially if he were known to be an avowed antagonist of religion, and Hume made valuable friendships, especially with D'Alembert and Diderot, the latter of whom profited much by Hume's economical essays. In 1766 he left Paris and returned to Edinburgh. In 1767 he accepted the post of under-secretary to General Conway and spent two years in London.

He settled finally in Edinburgh in 1769, having now through his pension and otherwise an income of £1000 a year. The solitary incident of note in this period of his life is the ridiculous quarrel with Rousseau, which throws much light upon the character of the great sentimentalist. Hume certainly did his utmost to secure for Rousseau a comfortable retreat in England, but his usually sound judgment was here quite at fault with regard to his protégé. The quarrel which all the acquaintances of the two philosophers had predicted soon came, and no language had expressions strong enough for Rousseau's anger. Hume came well out of the business, and had the sagacity to conclude that his admired friend was little better than a madman. In one of his most charming letters he describes his life in Edinburgh. The new house to which he alluded was built under his own directions at the corner of what is now called St. David Street after him; it became the centre of the most cultivated society of Edinburgh. Hume's cheerful temper, his equanimity, his kindness to literary aspirants and to those whose views differed from his own won him universal respect and affection. He welcomed the work of his friends (e.g. Robertson and Adam Smith), and warmly recognized the worth of his opponents (e.g. George Campbell and Reid). He assisted Blackwell and Smollett in their difficulties and became the acknowledged patriarch of literature.

In the spring of 1775 Hume was struck with a tedious and harassing though not painful illness. A visit to Bath seemed at first to have produced good effects, but on the return journey more alarming symptoms developed themselves, his strength rapidly sank, and, little more than a month later, he died in Edinburgh on the 25th of August 1776.

No notice of Hume would be complete without the sketch of his character drawn by his own hand:—"To conclude historically with my own, I may say, for either the qualities or the defects now in use in speaking of myself, which emboldens me the more to speak my sentiments, —I was, I say, a man of mild dispositions, of command of temper, of an open, social and cheerful humour, capable of attachment, but little susceptible of enmity, and of great moderation in all my passions. Even my love of literary fame, my ruling passion, never soured my temper, notwithstanding my frequent disappointments. My company was not unacceptable to the young and careless, as well as to the studious and literary; and as I took a particular pleasure in the company of modest women, I had no reason to be displeased with the reception I met with from them. In a word, though most men anywhere eminent have for this or that complain of calumny, I never was touched, or even attacked, by her baleful tooth; and, though I wantonly exposed myself to the rags of both civil and religious faction, I never felt the least pain or inconvenience on whose account I went on my behalf of their wondred fury. My friends never had occasion to vindicate any one circumstance of my character and conduct; not but that the zealots, we may well suppose, would have been glad to inveigh against the story to their disadvantage, but they could never find any which they thought would bear the face of probability. I cannot say there is no vanity in making this funeral oration of myself and my virtues are not a minute consideration, but I think they are grounds of fact which is easily cleansed and ascertained." The more his life has become known, the more confidence we place in this admirable estimate.

The results of Hume's speculations may be discussed under two heads:—(1) philosophical, (2) economical.

1. The philosophical writings, which mark a distinct epoch in the development of philosophical thinking, form one of the many aspects in which they present themselves as of the highest interest to the historian of philosophy.

In the Treatise of Human Nature, which is in every respect the most complete exposition of Hume's philosophical conception, we have the first thorough-going attempt to apply the fundamental principles of Locke's empirical psychology to the construction of a theory of knowledge, and, as a natural consequence, the first systematic criticism of the chief metaphysical notions from this point of view. As such, it is, in that way, as noted, Berkeley as the late J.S. Mill held with his System of Logic to Hartley and James Mill. In certain of the later writings, pre-eminently in the Dialogues of Natural Religion, Hume brings the result of his speculative criticism to bear upon the problems of faith and of religious discussion, and gives in their regard, as previously with respect to general philosophy, the final word of the empirical theory in its spiritual development. The influence of this second Hume and J.S. Mill in this second feature will not be overlooked.

In the first instance, then, Hume's philosophical work is to be regarded as the attempt to supply for empiricism in psychology a consistent, that is, a logically developed and historically consistent philosophy. Locke, indeed, such theory is not wanting, but, of all the many inconsistencies in the Essay on the Human Understanding, none is more noticeable than the presence of certain thoughts and ideas between the view of knowledge developed in the fourth book and the psychological principles laid down in the earlier part of the work. Though Locke, doubtless, drew no distinction between the problems of psychology and of theory of knowledge, yet the discussion of the various forms of cognition given in the fourth book of the Essay seems to be based on grounds quite distinct from and in many respects opposite to those advanced as the psychological approach to work. The perception of relations, which, according to him, is the essence of cognition, the demonstrative character which he attaches to our inference of God's existence, the intuitive knowledge of being, and so forth, all being incompatible to some extent with the view of mind and its development which is the keynote of his general theory. To some extent Berkeley removed this radical incoherence, but in his philosophy there are two distinct developments of theory of knowledge, and we have two there are two distinct aspects, and while it holds of Locke on the one hand, it stretches forward to Kantianism on the other. Nor in Berkeley are these divergent features ever united into one harmonious whole. It was to Berkeley that Hume applied the theory of knowledge with full consciousness from the psychological point of view, and to work out the final consequences of that view so far as cognition is concerned. The terms in which he approached it are those which are called out and the scope of his work are not those which we should now employ. In the introduction to the Treatise, that the science of human nature must be treated according to the experimental method, with the fundamental problem of mankind reduced to the determination of the conditions of the origin and development of consciousness in the individual mind. And the answer to the problem which was furnished by Locke is in effect that with which Hume started. The conscious experience of the individual mind is the result of interaction between the individual mind and the universe of things. This solution presupposes a peculiar conception of the general relation between the mind and things which in itself requires justification, and which, so far at least as the empirical theory was developed by Locke and his successors, could not be obtained from psychological analysis. Either we have a right to the assumption made by Locke of a consciousness of the individual mind as standing in relation to things, in which case the grounds of the assumption must be sought elsewhere than in the results of this reciprocal relation, or else there is no mind, in which case, in any case, the view of a reciprocal relation can hardly be accepted as yielding any solution of the psychological problem. But in any case,—and, as we shall see, Hume endeavours to state his psychological premises as to conceal the conclusion to be drawn from the conception of the individual mind as standing in relation to things, of which the proposition must be sought elsewhere than in the results of this reciprocal relation, or else there is no mind, in which case, in any case, the view of a reciprocal relation can hardly be accepted as yielding any solution of the psychological problem. But in any case,—and, as we shall see, Hume endeavours to state his psychological premises as to conceal the conclusion to be drawn from the conception of the individual mind as standing in relation to things, in which case the grounds of the assumption must be sought elsewhere than in the results of this reciprocal relation, or else there is no mind, in which case, in any case, the view of a reciprocal relation can hardly be accepted as yielding any solution of the psychological problem.
the problem of knowledge, the fundamental peculiarity of cognition is obvious: perception, as it were, involves a certain synthesis or relation of parts of a characteristic nature, and if we attempt to discuss this synthesis as though it were in itself but one of the facts forming the matter of knowledge, we are driven to regard the fact that it is derived from the concurrence of sensory data as an observation among matters of knowledge. The difficulty of reconciling the two views is that which gives rise to much of the obscurity in Locke's treatment of the subject of indefiniteness of concepts; in Hume's account of it, to attempt to explain the synthesis which is essential to cognition as merely the accidental result of external relations among the elements of conscious experience, appears with the utmost clearness an illegitimate application of all the philosophical work he has done; the perplexity, concealed by various forms of expression, comes forward at the close of the Treatise as absolutely unsolved, and leads Hume, as he will be pointed out, to a truly remarkable confession of the weakness of his position.

While, then, the general idea of a theory of knowledge as based upon psychological analysis is the groundwork of the Treatise, it is a particular consequence of this idea that furnishes to Hume the characteristic criterion employed by him to all philosophical questions. If the relations involved in the fact of cognition are only those discoverable by observation of any particular portion of known experience, then such relations are quite external and contingent. The result which can be discovered in a given fact of experience is that of non-contradiction (i.e., purely formal); the thing must be what it is, and cannot be conceived as having qualities contrary to its being. The supposed philosophical principle is the possibility or impossibility of imagining its contradictory. All our knowledge is but the sum of our conscious experience, and is consequently material for imagination, and the intuition or perception of matters of our experience to let us chase our imagination to the heavens or to the utmost limits of the universe; we never really advance a step beyond ourselves, nor can conceive any kind of existence, but those perceptions which have appeared to be once real, and indeed are real to our consciousness. All the facts of cognition must be discovered by observation or analysis of experience so conceived. Hume wavers somewhat in his division of the various kinds of cognition, laying stress now upon one now upon another, the process he calls the comparison of ideas to the faculties or imagination, nor have we any idea but what is there produced.

The first thing Hume's work appears immediately from his fundamental principle, and the several divisions of the treatise, so far as the theoretical portions are concerned, are but its logical consequences. The first part of the first book contains a brief statement of the evidence and conclusions of our knowledge; the second and third portions elucidate the fundamental ideas of the treatise, and the fourth part deals with those judgments which rest upon the formal elements of experience, space and time. The third part discusses the principle of real connection, and thus forms the foundation of its fundamental principles and the fourth part is virtually a consideration of the ultimate significance of this conscious experience of the place it is supposed to occupy in the universe of existence, in other words, of the relations between the conscious experience of an individual mind as disclosed to observation and the supposed reality of self and external things.

In the first part Hume gives his own statement of the psychological foundation of the theory. He regards matter of experience, he can discover among them only one distinction, a distinction expressed by the terms impressions and ideas. Ideas are secondary in nature, while impressions are primary, and appear as a natural processes as a fact of consciousness as primary, as arising from some unknown cause, and therefore relatively as original, Hume designates by the term impression, and claims to imply by such term no theory whatever. He knows nothing of them, and he further.condemns the idea that appears in consciousness as experience, to imply in the universe of existence, in other words, of the relations between the conscious experience of an individual mind as disclosed to observation and the supposed reality of self and external things. Moreover, if we remain faithful to the fundamental conception that the contents of the mind are merely matters of experience, it is evident in the first place that as impressions are strict facts, ideas also must be strictly particular, and in the second place that the faculties of combining, discriminating, abstracting and judging, which Locke had admitted, are mere and accidental modes of having mental experience, i.e., are modifications of consciousness (cf. I. 128 n, 137, 192). By this theory, Hume is freed from all the problems of abstraction and judgment. A comparative judgment, in which a particular concept is isolated by a series of similar facts are grouped under a single symbol, representing a particular concept, and only by the accident of custom treated as universal (see I, iii, 37, 100).

Hume's main achievement of Locke's empirical view. Conscious experience consists of isolated states, each of which is to be regarded as a fact and is related to others in a quite external fashion. It remains to be seen how knowledge can be explained on this basis. For this reason, the proceeding is a logical one, and there is a question, it is necessary to draw attention, first, to the peculiar device invariably resorted to by him when any exception to his general principle is made, and secondly, to the principles of the new philosophy, and, thirdly, to the nature of the substitute offered by him for that perception of relations or synthesis which even in Locke's confounded states had appeared as the essence of cognition. Whenever two or more things are capable of a particular impression, he introduces the phrase "manner of conceiving." Thus general or abstract ideas are merely copies of a particular impression conceived in a particular manner. The idea of space and time, as will presently be pointed out, are copies of impressions conceived in a particular manner. The idea of necessary connection is merely the reproduction of an impression which the mind itself has produced, or conceives in a particular manner. The idea of absolute and relative position is the reproduction of an impression of disagreeing distances, of a comparative idea of size, and consistency in Hume's theory as stated by himself, but to the initial error on which it proceeds, for these perplexities are but the results of confusion. Hume's principles are formulated in such a way that no distinctions are impossible, however, for him to carry out this view consistently. The only combination which, even in appearance, could be explained satisfactorily by its means was the formation of a complex idea out of simpler parts, but the idea of a relation among facts is not accurately described as a complex idea; and, as such relations have no basis in impressions, Hume is finally driven to a confession of the absolute impossibility of explaining them. Such confusion, however, is only reached after a vigorous effort had been made to render some account of knowledge by the experimental method.

The psychological conception, then, on the basis of which Hume presents his theory of knowledge as consisting mainly of the intuition of simplicity or order of the ideas of space, the process of combining, and, as such, is reduced to the idea of the absolute, the idea of the impossibility of explaining them. Such confusion, however, is only reached after a vigorous effort had been made to render some account of knowledge by the experimental method.

The psychological conception, then, on the basis of which Hume presents his theory of knowledge as consisting mainly of the intuition of simplicity or order of the ideas of space, the process of combining, and, as such, is reduced to the idea of the absolute, the idea of the impossibility of explaining them. Such confusion, however, is only reached after a vigorous effort had been made to render some account of knowledge by the experimental method.
For he has to give some explanation of the nature of space and time which will enable him with impunity to be at his ease. He is compelled to recognize the fact that they are not identical with any single impression or set of impressions. Putting aside, then, the various obscurities of terminology, such as the distinction between the ideas of points and points in contact, and between impressions themselves, which disguise the full significance of his conclusion, we find Hume reduced to the following as his theory of space and time: the fundamental atomic units are space and time, which, when not coinciding, have in themselves the element of space, for these impressions (Hume skilfully transfers his statement to the points) have a certain order or mode of arrangement. This mode of arrangement or manner of touching, he says, is the only basis of the two great qualities, of number and magnitude. Considered separately, is the impression from which our idea of space is taken. All impressions and all ideas are received, or form parts of a mode of touch. Now the manner of these impressions, or the order of succession. This manner of presenting themselves is the impression from which the idea of time takes its rise.

It is almost superfluous to remark, first, that, Hume here deliberately gives up his fundamental principle that ideas are but the fainter copies of impressions, for it can never be maintained that order of disposition is an impression, and, secondly, that he fails to offer any explanation of the mode in which coexistence and succession are possible elements of cognition in a conscious experience made up of isolated presentations and representations. For the consistency of his theory, however, it was indispensable that he should insist upon the real, representative character of the ultimate units of space and time.

(b) How then are the primary data of mathematical cognition to be derived from these atomic units? The way in which the manner of touching is the manner just stated? It is important to notice that Hume, in regard to this problem, distinctly separates geometry from algebra and arithmetic, i.e., he views extensive as opposed to numerical cognition. With regard to geometry, he holds emphatically that it is an empirical doctrine, a science founded on observation of concrete facts. The rough appearance of figures and surfaces, he maintains, is the only basis of geometry. Hence, apparently, that the foundation of all the science of number is the fact that each element of conscious experience is presented as a unit, and adds that we are capable of considering any fact or collection of facts as a unit. This manner of conceiving is absolutely general and distinct, and accordingly affords the possibility of an all-comprehensive and perfect science, the science of discrete quantity. (See Works, l. 66, 69, 73, 97 and iv. 140.) It is impossible to give a complete statement regarding the doctrine of number. Hume, apparently, that the foundation of all the science of number is the fact that each element of conscious experience is presented as a unit, and adds that we are capable of considering any fact or collection of facts as a unit. This manner of conceiving is absolutely general and distinct, and accordingly affords the possibility of an all-comprehensive and perfect science, the science of discrete quantity. (See Works, l. 97, 99.)

(c) In respect to the third point, the nature, extent and certainty of the elementary propositions of mathematical science, Hume's utter-ances are so confused as to be almost wholly useless. The cause of this confusion, which follows his well-known distinction between relations of ideas and matters of fact, a distinction which Kant appears to have thought identical with his distinction between analytical and synthetic propositions. Of the synthetic judgments, which he maintained are incapable of being either necessary or a posteriori, the empirical judgments that are not hypothetically verified are not specified. This clear distinction has been demonstrated in the following illustration:

The hypothesis of the cause of the idea of equality is one of those which cannot be defined, and that it is sufficient to place two equal quantities before one any one in order to make his mind in any of these cases to be affected, provided he did not yet possess the idea of equality, and was not confused with the notion of the infinitely small or of the infinitely great. (See Works, l. 97, 99.) Upon the nature of the reasoning by which in mathematical science we pass from data to conclusions, Hume gives his familiar and satisfactory illustration. That the errors committed by the casual step must be the establishment of identities or equivalence, we should probably be doing justice to his doctrine of numerical reasoning, and should have some difficulty in showing the application of these to the establishment of geometrical and physical reasoning. For in the latter case we have from hypothesis or even from reasonings that appear to be of a directly logical character, to obtain that condition of the given facts and the effect, according to Hume, no standard of equivalence other than that supplied by immediate observation, and consequently transition from one premise to another by the way of reasoning must be, in general matters, a purely verbal process. Hume's theory of mathematics—the only one, perhaps, which is compatible with his fundamental principle of psychology—is a practical condemnation of his empirical theory of perception. He has not offered even a plausible explanation of the mode by which a consciousness made up of isolated momentary impressions and ideas can be aware of coexistence and number, or succession. The relations of ideas are accepted as facts of immediate observation, as being themselves perceptions or individual elements of conscious experience, and to all appearance they are regarded by Hume as being in a sense necessary, which is not the case with the relations of number. It is applicable, however, not because the predicate is contained in the subject, but on the principle of contradiction. If these judgments are admitted to be facts of immediate perception, the impossibility of their being excluded must be admitted. It is true, however, seems entirely to have escaped Hume's attention. A somewhat detailed consideration of Hume's doctrine with regard to mathematical science has been given for the reason that this portion of his theory has been very generally overlooked or misunderstood. It does not seem necessary to endeavour to follow his minute examination of the principle of real cognition with the same fulness. It will probably be sufficient to indicate the problem as conceived by Hume, and the relation of the method he adopts for solving it to the fundamental doctrine of his theory of knowledge.

Real cognition and causation. The idea in question is, therefore, the idea of something connected with the present impression as its cause or effect. But this is explicitly the idea of the said thing as having had or as about to have the consequence in question, and in other words as the character of the fact. What, for a conscious experience so constituted as Hume will admit, is the precise significance of such belief in real existence? It is, of course, a fact at the back of the belief. For whatever may be conceived not to be. "No negation of a fact can involve a contradiction." Existence of any fact, not present as a perception, can only be proved by arguments from cause or effect, and these, as such, are no objections to the conception of a non-existent fact, which might not be or might be other than it is, we must admit that the mind can conceive no necessary relations or connections among the several portions of its experience.
If, therefore, a present perception leads us to assert the existence of some other, this can only be interpreted as meaning that in some natural, i.e., psychological, manner the idea of this other perception is excited, and that the idea is viewed by the mind in some peculiar fashion as the result of consciousness. For each of our perceptions and ideas is accompanied by some sort of consciousness. When we see a man, we see him by an act of consciousness. When we think, we think by an act of consciousness. Everything that we experience is experienced through consciousness. The laws and regularities presented by experience. One fact or perception is discovered by experience to be uniformly or generally accompanied by another, and its occurrence therefore naturally excites the idea of that other. But the idea is so roused by a present impression, and when this idea, being a consequence of memory, has in itself a certain vivacity or liveliness, we regard it with a peculiar indefinable feeling, and we are the more inclined to believe the idea of the present perception is in some way or other connected with the idea of the past impression. It is the presence of consciousness that makes the idea vivid and distinct. The mind is led easily and rapidly from the present impression to the ideas of impressions found by experience to be the usual accompaniments of the present fact. The case and rapidity of the connection is so well known, and the necessity of the causal connexion between portions of experience is so fixed in the mind, that the only notion of experience that can be formed is that of the memory of the past impression. The idea of necessity is not intuitively obvious; the ideas of cause and effect are correlated in our minds, but only as a result of experience. Hobbes and Locke were wrong in saying that the mind must find in the relation the idea of Power. We mistake the subjective transition resting upon custom or past experience for an objective connexion independent of special feelings, and about matters of fact is therefore a species of feeling, and belongs to the sensitive rather than to the cognitive side of our nature. It should be noted that this theory of Causation entirely denies the doctrine of Natural connection. It is a personalistic, a voluntaristic theory in the same sense as that of Plato. All alleged uniformity is reduced to observed similarity of feeling. The idea is a mere convention, product of inaccurate thinking and custom.

But it is evident that some such conclusion must follow from the attempt to regard the cognitive consciousness as made up of disconnected feelings, it is equally clear, not only that the result is self-contradictory, but it involves a certain assumption concerning the nature of the past impression, or at least of the present object or relation. Deferring his criticism of the significance of the self and object, Hume yet makes use of both to aid his explanation of the belief attaching to reality. The reference of an idea to past experience has no logical necessity, unless we assume an identity in the object referred to. For a past impression is purely transitory, and, as Hume occasionally points out, can have no connexion of fact with the present object. His remarks on this point are thus of great plausibility, which would not belong to it if the final view of the permanent object had been already given.

The final problem of Hume's theory of knowledge, the discussion of the objective significance of the two factors of cognition, self and external things, is handled in the Treatise with great fulness and dialectical subtlety.

As in the case of the previous problem, it is unnecessary to follow the figures of the argument, which are at least possible but which substitute qualities of feeling for the relations of thought which appear to be involved. The results follow with the utmost ease from his original postulate. If there is nothing in a past experience which can disclose, while each act of observation is itself an isolated feeling (an impression or idea), it is manifest that a permanent identity of the object of experience is impossible. Whatever particularity or identity is ascribed to an impression or idea is the result of association, is one of those "propensities to feign" which are due to natural connections among ideas. We regard as successive presentations of one thing the resembling feelings which are experienced in succession. Identity, then, whether of self or object, there is none, and the supposition of objects, distinct from impressions, is but a further consequence of our "propensity to feign." Hume's explanation of the belief in external things by reference to association is well deserving of careful study and of comparison with the more recent analysis of the same problem by J. S. Mill.

The weak point of Hume's empiricism is the idea so admirably realized by the author himself that it is only fair to quote his own summary in the Appendix to the Treatise. He confesses that, in confining all cognition to single perceptions and supposing them to be the only things to which the mind can refer, recording and classifying their results, he has destroyed real knowledge altogether.

If perceptions are distinct existences, they form a whole only by being subjoined, and their distinctness is no more perceptible than is the distinctness of the objects to which they refer; and when we assert that all our distinct perceptions are distinct existences, and that the mind never perceives any real connexion among distinct existences. Did we accept perceptions either in something simple or individual, or did the mind perceive them, among them, there would be no difficulty in the case" (II, 531).

Hume sees distinctly that if conscious experience has been taken as containing only isolated states, no progress in explanation of cognition is possible, and that the only hope of further development of the subject lies in the assumption of the existence of a real connexion among perceptions. The work of the critical philosophy is the introduction of this new mode of regarding experience, a mode which, in the technical language of philosophers, has received the title of transcendent as opposed to the psychological method followed by Leibniz and Hume. It is because Kant alone perceived the full significance of the change required in order to meet the difficulties of the empirical theory that we regard his system as the only sequel to Hume.

The writers of the Scottish school, Reid in particular, did undoubtedly indicate some of the weaknesses in Hume's fundamental conception, and their attempts to show that the isolated states of consciousness are reducible to a single transitory experience are efforts in the right direction. But the question of knowledge was never generalized by them, and their reply to Hume, therefore, remains partial and inadequate, while its effect is weakened by the critical association of principles which is a characteristic feature of their writings.

The results of Hume's theoretical analysis are applied by him to the justification of belief in the pre-existence of the soul, and to the proofs of identity. In The Treatise he asserts, "I can not say of my mind that I must, because I have a memory of it which I consider as a principle of identity. As for the body, I am sometimes capable of being inferred from experience as regards the existence of God. For Phyllos lays upon the weakness of the analogical argument that it is not founded on any sort of proof. I am more satisfied by thought than by nature itself, shows that the argument from design cannot warrant the inference of a perfect or infinite or even of a single deity, and carrying his principles to the infinite extent, he arrives at the conclusion that the origin of the world, no argument from experience can carry us to its origin, and that the apparent marks of design in natural objects are only results from the conditions of their actual existence. For the examination of such a question as this, his faculty of judgment is our only reasonable resource. Nor does the a priori argument in any of its forms fare better, for reason can never demonstrate a matter of fact, and, unless we know that the world had a beginning, we can never determine the time, when and how life began. The argument from God, as a model of perception, shows that if there is any thing to be spoken of as the model of perception, it is the character of the revelation of the mind, as it is by us, and not by us, and that the character of the revelation of the mind, as it is by us, and not by us, what is to be said about the other exists, is not within our power to determine the character of the revelation of the mind, as it is by us, and not by us, what is to be said about the other exists, is not within our power to determine. Nature is throughout
corrupt and polluted, but "the present evil phenomena are rectified in part by a kind of partial and partial existence of people. A view satisfies neither of his interlocutors. Cleanthes, pointing out that from a nature thoroughly evil we can never prove the existence of an infinitely powerful and benevolent Creator, hazards the conjecture that disorder and disorder and disconnection are inherent in his system, but that the system, for all its imperfections, is not inferior to the perfect system of Philo, however, pushing his principles to their full consequences, shows that unless we assumed (or knew) beforehand that the system of nature is evil, and that the idea of God is not inherent in it, we could not, from the facts of nature, infer the benevolence of its creator. Cleanthes's view is, therefore, an hypothesis, and in no sense an inference.

The disproof sought here to conclude. There is, however, added one of those perplexing statements of personal opinion (for Hume declares Cleanthes to be his mouthpiece) not uncommon among philosophers. Cleanthes ends his Dialogue with the well-known dictum, in admitting a certain illogical force in the argument, or, at least, in expressing a conviction as to God's existence, which may not perhaps be altogether devoid of foundation. The precise value of such a declaration must be matter of conjecture. Probably the true statement of Hume's attitude regarding the problem is the somewhat melancholy utterance with which the Dialogue closes:

It is apparent, even from the brief summary just given, that the importance of Hume in the history of philosophy consists in the vigour and logical exactness with which he develops a particular method, and in the new and important conclusions he arrives at in his system, but that they arise from the limitations of the view itself, and not, as in the case of Locke and Berkeley, from imperfect grasp of general views of human nature, and of all human society. In other words, his system is not inconsistent with a belief in God. In Hume's theory of knowledge we have the final expression of what may be called psychological individualism or atomism, while his ethics and doctrine of religion are but the logical consequences. So he propounds, as the only view consistent with a belief in God, that it is not inconsistent with human happiness. Hume has given the final word of the empirical school, and all additions, whether from the specifically psychological side or from the general history of human culture, are subordinate in character, and affect in no way the nature of his results. It is no exaggeration to say that the later English school of philosophy represented by J. S. Mill was in theory no advance beyond Hume. In the logic of Mill, e.g., we find much of a special character that has been shown but a materialism which, when compared with the logical system of Hume, is not inconsistent with a belief in God. The System of Logic is a mere reproduction of Hume's doctrine. It is a fact that is important for the history of philosophy, and is not inconsistent with a belief in God. So far, we have in a remarkable posthumous essay on theism, to avoid the reflection that in substance the treatment is identical with that of the Dialogues on Natural Religion, while on the whole the superiority in critical force must be assigned to the earlier work.

2. Hume's eminence in the fields of philosophy and history must not be allowed to obscure his importance as a political economist.

Economics. The mercantile theory of the nature of national wealth and the functions of money, and Locke had, in a partial manner, shown that politics and the common wealth has always paused upon the modern system of political philosophy. But Hume was the first to apply to economics the economic principles of his philosophy. His services to economics may be summed up in two heads: (1) he established a connection between the economic forces of a nation and the phenomena of social life, and (2) he introduced into the study of these facts the new historical method. Thus, though he gave no special name to it, he yet describes the subject-matter, and indicates the true method, of economic science. His economic essays were published in the volumes entitled Political Discourses (1752) and Essays and Treatises on Several Subjects (1753); the most important are those on Commerce, on Money, on Interest and on the Balance of Trade, but, notwithstanding the disconnected form of the essays in general, the other less important essays combine to make a complete economic system. We have said that Berkeley and Locke had already begun the general work for which Hume is most important; in details also Hume had been anticipated to some extent. Nicholas Barbon and Sir Dudley North had already attacked the mercantile theory and the principle of absolute advantage which Barbon had anticipated his theory of interest. Yet when we compare Hume with Adam Smith, the advance which Hume made on this point is striking. Davison (98) has criticised Hume's position on this question, and modern criticism is agreed that the main errors of Adam Smith are to be found in those deductions which deviate from the results of the Political Discourses. A very few examples will suffice to indicate the chief of these errors.

In dealing with money, he refutes the Mercantile School, which had tended to confound it with wealth. "Money," said Hume, "is not the wheel of trade; it is the oil which makes the wheels go round.

Money. Money and commodities are the real strength of any community. From the internal, as distinct from the international, aspect, the absolute quantity of commodities is all that is required. Its activity is, in consequence, that a quantity larger than is required for the interchange of commodities is injurious, as tending to raise prices and to drive foreigners from the home market. It is only during

the period of acquisition of money, and before the rise in prices, that the"perpetual competition of prices, which is his most important economic discovery (cf. F. A. Walker's Money in its Relations to Trade and Industry, London, 1880, p. 84 seq.)

Hume, David

He goes on to show that the variations of prices are due to the supply of money, and that "the demand for money is not an independent fact, but a misconception to regard as injurious the passage of money into foreign countries." "A government," he says, "has great reason to restrain its insatiable desire to increase its total stores of money. The reduction in the rate of interest must, in general, result from the "increase of industry and frugality, of arts and commerce." In his discussion of the mercantile theory of the balance of trade, he shows that the mercantile theory that he is not inconsistent with a belief in God.

Dealing with the phenomena of interest, he exposes the old fallacy that the rate depends upon the amount of money, and concludes that it is not inconsistent with a belief in God.

Free trade.

Taxation and intercolonial debt.

3. Philosopher. (The more important only can be quoted.—Huxley's "Philosophy is a popular reproduction of Hume's views in "English Men of Letters" series); Sir L. Stephen's "English Thought in the XVIIIth Century" (1876. An important work by Sir L. Stephen's "English Thought in the XVIIIth Century" (1876), especially ch. vi.); J. Orr, David Hume and his Influence on Philosophy and Theology (1903, especially ch. ix. on "Moral Theory of Hume"); H. Caldecott, David Hume (1862, especially ch. vii. on Hume's attitude to religion); A. Seth, Scottish and German Answers to Hume (1892); F. Joll, Leben und Philosophie D. Humes (1872); E. Pfeifer, Empirismus und Skeptizismus in der Philosophie der Gegenwart (1878); A. Waterman, La Philosophie de D. Hume (1873); A. Meinong, Hume-Studien (1877, especially Hume's nominalism); H. H. Jahr, D. Hume's contributions to the theory of ideism (1882); G. Chevallier, La philosophic de D. Hume (1878); G. Loeb, D. Hume, moraliste et sociologue (1890); M. Kleine, Die wissenschaftlichen Anschauungen D. Humes (1900); E. Marcus, Kant's Revolution in Thought, or the Rise of the Ideal or Hegelianism (1906); C. Hedwall, Hume, Erkenntnistheorie (1906); R. Höngsberg, Uber die Lehre Humes von der Realität der Aussenschein (1904); O. Quast, Die neuen Sinne des Lebens in Deutschland (1907); J. Bonar, The Life of David Hume (1891); J. Carlyle's Autobiography. J. MacCosh published a short pamphlet (1884) on the question.

The most conclusive argument against the Agnosticism of Hume and Huxley.

4. Economic. (see also J. Bonar, "Philosophy and Political Economy" (1893), chapter on Hume; notes to W. G. F. Roscher's.

Hume, David
HUME, J.—HUMITE

HUME, JOSEPH (1777–1855). British politician, was born on the 22nd of January 1777, of humble parents, at Montrose, Scotland. After completing his course of medical study at the university of Edinburgh he sailed in 1797 for India, where he was attached as surgeon to a regiment; and his knowledge of the native tongues and his capacity for business threw open to him the lucrative offices of interpreter and commissary-general. In 1802, on the eve of Lord Lake's Mahatta war, his chemical knowledge enabled him to render a signal service to the administration by making available a large quantity of the repeat which dam had spoiled. In 1808, on the restoration of peace, he resigned all his civil appointments, and returned home in the possession of a fortune of £20,000. Between 1808 and 1811 he travelled much both in England and the south of Europe, and in 1812 published a blank verse translation of the Inferno. In 1812 he purchased a seat in parliament for Weymouth and was a Tory. When upon the dissolution of parliament the patron refused to return him he brought an action and recovered part of his money. Six years elapsed before he again entered the House, and during that interval he had made the acquaintance of Lord Byron and had discovered the doctrines of James Mill and the philosophical reformers of the school of Bentham. He had joined his efforts to those of Francis Place, of Westminster, and other philanthropists, to relieve and improve the conditions of the working classes, labouring especially to establish schools for them on the Lancasterian system, and promoting the formation of savings banks. In 1818, soon after his marriage with Miss Burnley, the daughter of an East India director, he was returned to parliament as member for the Border burghs. He was afterwards successively elected for Middlesex (1830), Kilkenny (1837) and for the Montrose burghs (1842), in the service of which constituency he died. From the date of his re-entering the House Hume became the self-elected guardian of the public purse, by challenging and bringing to a direct vote every single item of public expenditure. In 1820 he secured the appointment of a committee to report on the expense of collecting the revenue. He was incessantly on his legs in committee, and became a name for an opposition bandog who gave councillors of the exchequer no peace. He undoubtedly exercised a check on extravagance, and he did real service by helping to abolish the sinking fund. It was he who caused the word "retrenchment" to be added to the Radical programme "peace and reform." He carried on a successful attack on the old combination laws that hemmed workingmen and favoured masters, he brought about the repeal of the laws prohibiting the export of machinery and of the act preventing workmen from going abroad. He constantly protested against flogging in the army, the imprisonment of sailors and imprisonment for debt. He took up the question of light-houses and harbours; in the former he secured greater efficiency, in the latter he prevented useless expenditure. Apart from his pertinacious fight for economy Hume was not always fortunate in his political activity. He was conspicuous in the agitation raised by the so-called Orange plot to set aside King William IV. in favour of the duke of Cumberland (1835 and 1836). His action as trustee for the notorious Greek Loan in 1834 was at least not delicate, and was the ground of charges of downright dishonesty. He died on the 20th of February 1835.

A Memorial of Hume was published by his son Joseph Burnley Hume (London, 1855).

HUMILIATI, the name of an Italian monastic order created in the 12th century. Its origin is obscure. According to some chroniclers, certain noblemen of Lombardy, who had offended the emperor (either Conrad III. or Frederick Barbarossa), were carried captive into Germany and after suffering the miseries of exile for some time, "humiliated themselves before the emperor. Returning to their own country, they did penance and took the name of Humiliati. They do not seem to have had any fixed rule, nor did St Bernard succeed in inducing them to submit to one. The traditions relating to a reform of this order by St John of Media are ill authenticated, his Acta (Acta sanctissimae Ecclesiae, Sept., vii. 320) being almost entirely unsupported by contemporary evidence. The "Chronicon ab huius Lombar- densis canonici" (Mon. Germ. hist. Scriptores, xxvi. 449), at date 1178, states that a group of Lombards came to Rome with the intention of obtaining the pope's approval of the rule of life which they had spontaneously chosen; while continuing to live in their houses in the midst of their families, they wished to lead a more pious existence than of old, to abandon oaths and litigation, to content themselves with a modest dress, and all in a spirit of Catholic piety. The pope approved their resolve to live in humility and purity, but forbade them to hold assemblies to preach in public; the chronicler adding that they infringed the pope's wish and thus caused their excommunication. Their name, Humiliati ("Humiles" would have been more appropriate), arose from the fact that the clothes they wore were very simple and of one colour. This lay fraternity spread rapidly and soon put forth two new branches, a second order composed of women, and a third composed of priests. No sooner, however, had this order of priests been formed, than it claimed precedence of the others, and, though chronologically last, was called primus ordo by hierarchical right—propter tonsuram (see P. Sabattier, "Regula antiqua Fr. et S. dei, in compendio historico, critique historique, part i. p. 15). In 1201 Pope Innocent III. granted a rule to this third branch. Sabattier has drawn attention to the resemblances between this rule and the Regula de poenitentia granted to Franciscanism in the course of its development; on the other hand, it is incontestable that Innocent III. wished to reconcile the order with the Waldenses, and, indeed, its rule reproduces several of the Waldensian propositions, ingeniously modified in the orthodox sense, but still very easily recognizable. It forbade useless oaths and the taking of God's name in vain; allowed voluntary poverty and marriage; regulated pious exercises; and approved the solidarity which already existed among the members of the association. Finally, by a singular concession, it authorized them to meet on Sunday to listen to the words of a brother "of proved faith and prudent piety," on condition that the hearers should not discuss among themselves either the articles of faith or the sacraments of the church. The bishops were forbidden to oppose any of the utterances of the Humiliati brethren, "for the spirit must not be stifled." James of Vitry, without being unfavourable to their tendencies, represents their association as one of the peculiarities of the church of his time (Historia orientalis, Douai, 1597). So broad a discipline must of necessity have led back some wavering into the pale of the church, but the Waldenses of Lombardy, in their congregationes laboratorium, preserved the tradition of the independent Humiliati. Indeed, this tradition is confounded throughout the latter 12th century with the history of the Waldenses. The "Chronicon Urspergense" (Mon. Germ. hist. Scriptores, xxii. 376–377) mentions the Humiliati as one of the two Waldensian sects. The celebrated decreal promulgated in 1184 by Pope Lucius III. at the council of Verona against all heretics condemns at the same time as the "Poor Men of Lyons" "those who attribute to themselves falsely the name of Humiliati," at the very time when this name denoted an order recognized by the papacy. This order, though orthodox, was always held in tact and ever-increasing suspicion, and, in consequence of grave disorders. Pius V. suppressed the entire congregation in February 1570–71.

See Tiraboschi, Venera humilitiorum monumenta (Milan, 1766); K. Müller, Die Waldenser (Gotha, 1886); W. Preger, Beiträge zur Geschichte der Waldenser (Munich, 1875).

HUMITE, a group of minerals consisting of basic magnesium fluo-silicates, with the following formulæ:—Chondrodite, Mg₂(Mg,F,OH)₂Si₂O₇; Humite, Mg₂(Mg,F,OH)₂Si₂O₆; Clinohumite, Mg₂(Mg,F,OH)₂Si₄O₁₂. Humite crystallizes in the orthorhombic and the two others in the monoclinic system, but between them there is a close crystallographic relation: the
lengths of the vertical axes are in the ratio 5:7:9, and this is also the ratio of the number of magnesium atoms present in each of the three minerals. These minerals are strikingly similar in appearance, and can only be distinguished by the goniometric method. The crystals are almost perfect cubes, and all the faces are hexagons, which are brown or red in colour, and have a vitreous to resinous lustre; the hardness is 6-6, and the specific gravity 3-1-3. Further, they often occur associated together, and it is only comparatively recently that the three species have been properly discriminated. The name humite, after Sir Abraham Hume, Bart. (1749-1839), whose collection of diamond crystals is preserved at Cambridge in the University museum, was given by the comte de Bournon in 1813 to the small and brilliant honey-yellow crystals found in the blocks of crystalline limestone ejected from Monte Somma, Vesuvius; all three species have since been recognized at this locality. Chondrodite (from χόνδρος, "a grain") was a name early (1817) in use for granular forms of these minerals found embedded in crystalline limestones in Sweden, Finland and at several place in New York and New Jersey. Large hyacinth-red crystals of all three species are associated with magnetite in the Tilly Foster iron- mine at Brewster, New York; and at Kafeltorp in Örebro, Sweden, similar crystals (of chondrodite) occur embedded in galena and chalcopyrites.

The facts above mentioned show that the crystallographic constants and the chemical composition is unique amongst minerals, and is known as a morphotropic relation. S. L. Penfield and W. T. H. Howe, who in 1894 noticed this relation, predicted the existence of a new mineral of the series, the crystals of which would have a still shorter vertical axis and contain less magnesium, the formula being Mg[Mg (F,OH)]SilSO4; this has since been discovered and named prolectite (from ἀποκλείειν, "to foretell").

HUMMEL, JOHANN NEPOMUK (1797-1837), German composer and pianist, was born on the 14th of November 1797 at Pressburg, in Hungary, and received his first artistic training from his father, himself a musician. In 1785 the latter received an appointment as conductor of the orchestra at the theatre of Schikaneder, the friend of Mozart and the librettist of the Magic Flute. It was in this way that Hummel became acquainted with the composer, who took a great fancy to him, and even invited him to his house for a considerable period. During two years, from the age of seven to nine, Hummel received the invaluable instruction of Mozart, after which he set out with his teacher for an artistic tour through Germany, England and other countries, his clever playing winning the admiration of amateurs. He began to compose in his eleventh year. After his return to Vienna he completed his studies under Albrechtsberger and Haydn, and for a number of years devoted himself exclusively to composition. At a later period he learned song-writing from Salieri. For some years he held the appointment of orchestral conductor to Prince Eszterhazy, probably entering upon this office in 1807. From 1811 to 1815 he lived in Vienna. On the 18th of May 1815 he married Elisabeth Röckl, a singer, and the sister of one of Beethoven's friends. It was not till 1816 that he again appeared in public as a pianist, his success being quite extraordinary. His gift of improvisation at the piano was especially admired, but his larger compositions also were highly appreciated, and for a time Hummel was considered one of the leading musicians of an age in which Beethoven was in the zenith of his power. In Prussia, which he visited in 1822, the ovations offered to him were unprecedented, and other countries—France in 1825 and 1829, Belgium in 1826 and England in 1830 and 1832—added further laurels to his crown. He died in 1837 at Weimar, where for a long time he had been the musical conductor of the court theatre. His compositions are very numerous, and comprise almost every branch of music. He wrote, amongst other things, several operas, both tragic and comic, and two grand masses (Op. 80 and 111). Infinitely more important are his compositions for the pianoforte (his two concerti in A minor and B minor, and the sonata in F sharp minor), and his chamber music (the celebrated septet, and several trios, &c.). His experience as a player and teacher of the pianoforte was embodied in his Great Pianoforte School (Vienna), and the excellence of his method is further proved by such pupils as Henselt and Ferdinand Hiller. Both as a composer and as a pianist Hummel continued the traditions of the earlier Viennese school of Mozart and Haydn; his works show both capacities was marked by purity and correctness rather than by passion and imagination.

HUMMING-BIRD, a name in use, possibly ever since English explorers first knew of them, for the beautiful little creatures to which, from the sound occasionally made by the rapid vibrations of their wings, it is applied. Among books that are ordinarily in naturalists' hands, the name seems to be first found in the Museemm Tradescantianum, published in 1665, but it therein occurs (p. 3) so as to suggest its having already been accepted and commonly understood; and its earliest use, as yet untraced, is by Thomas Morton (in 1648) in his Discourse of the first knownland and who had a curiously adventurous career in New England, in the New English Canaan, printed in 1637—a rare work giving an interesting description of the natural scenery and social life in New England in the 17th century, and reproduced by Peter Force in his Historical Tracts (vol. ii., Washington, 1838). André Thevet, in his Singularitez de la France antarctique (Antwerp, 1558, fol. 92), has been more than once cited as the earliest author to mention humming-birds, which he did under the name "caparo" or "capare.

HUMMEL was a name early (1817) in use for granular forms of these minerals found embedded in crystalline limestones in Sweden, Finland and in several place in New York and New Jersey. Large hyacinth-red crystals of all three species are associated with magnetite in the Tilly Foster iron-mine at Brewster, New York; and at Kafeltorp in Örebro, Sweden, similar crystals (of chondrodite) occur embedded in galena and chalcopyrites.

The facts above mentioned show that the crystallographic constants and the chemical composition is unique amongst minerals, and is known as a morphotropic relation. S. L. Penfield and W. T. H. Howe, who in 1894 noticed this relation, predicted the existence of a new mineral of the series, the crystals of which would have a still shorter vertical axis and contain less magnesium, the formula being Mg[Mg (F,OH)]SilSO4; this has since been discovered and named prolectite (from ἀποκλείειν, "to foretell").

1 In the edition of Oviedo's work published at Salamanca in 1547, the account (lib. xiv. cap. 4) runs thus: "Ay así mismo esta otra frase que también se entiende con tan poco nombre que no son tan pequeños que ningunos he yo visto en Indias menores, excepto el que acá se llama paxaro mosquito. El que es tan pequeño que el bulto del es menor harto o assaz que la cabeza del dedo pulgar de la mano. Este no le le veo en ninguna isla pero dízen me que aquí los hayos: & por eso dexo de hablar enel pa lo dezido d los he visto que es en la tierra firme quálido dela se trate. A modern Spanish version of this passage will be found in the beautiful edition of Oviedo's works published by the Academy of Madrid in 1851 (i. 444)." 

2 See also Morley's Life of Girolamo Cardano (ii. 152, 153). 

3 Under this name Pliny perpetuated (Hist. naturalis, v. 25) the confusion that had doubtless arisen before his time of two very distinct birds. As Sundevall remarks (Tentamen, p. 67, note), "The name was evidently the name commonly given by the ancient Greeks to the smaller plowers, and was not improperly applied by Herodotus (ii. 68) to the species that feeds in the open mouth of the crocodile—the Pluvianus apygyus of modern ornithologists; and Aristotle (Met. anima, 273) uses it. But the received text of Aristotle has two other passages (ix. 1 and 11) wherein the word appears in a wholly different connexion, and can there be but one man to mean the word—as the usual Greek name of which would seem to be ἔντοδας (Sundevall, Om Aristot. Jur., Not. No. 54). Though none of his editors or commentators has suggested the possibility of such a thing, one can hardly help suspecting that in one or other of these passages there was some error, either of the text or of the transmission, and so laid the foundation of a curious error. It may be remarked that the crocodile of Santo Domingo is said to have the like office done for it by some kind of bird, which is called by Descourtilz..."
Pliny, applied that name in a generic sense (Ornith. spec. novum, pp. 47, 48) to both. Taking the hint thus afforded, Linnaeus very soon after went farther, and, including the wings, wrote his genus Trochilus for the reception of such humming-birds as were known to him. The fortunate and great moment came, however, when Linnaeus, the probable boat-builder he was, not very far as such, must be merely the result of an analogical function, and certainly indicates no affinity between the families. The result of this, then, was that he was able to recognize the structure of the tongue, and other parts correlated therewith, will be found subject to several and perhaps considerable modifications, as is the case in various members of the Pidicidae.

in the males of many species with fine, horny, sawlike teeth, and swallowed in the usual way. The stomach is small, moderately muscular, and with the inner coat slightly hardened. There seem to be no caeca. The trachea is remarkably short, the bronchi beginning high upon the throat, and song-muscles are wholly wanting, as in other Cypselomorphae.\(^6\)

Humming-birds comprehend the smallest members of the class Aves. The largest among them measures no more than 3\(\frac{3}{4}\) and the least 2\(\frac{1}{4}\) in. in length, for it is now admitted generally that Sloane must have been in error when he described (Voyage, ii. 308) the "least humming-bird of Jamaica" as "about 1\(\frac{1}{4}\) in. long from the end of the bill to that of the tail"—unless, indeed, he meant the proximal end of each. There are, however, several species in which the tail is very much elongated, such as the Ailurus polytum (fig. 1) of Jamaica, and the remarkable Lodigera mirabilis of Chanchapoyas in Peru, which last was for some time only known from a single specimen (Ibis, 1880, p. 152); but "trochilists" in giving their measurements do not take these extraordinary developments into account. Next to their generally small size, the best-known characteristic of the Trochilidae is the wonderful brilliancy of the plumage of nearly all their forms, in which respect they are surpassed by no other birds, and are only equalled by a few, as, for instance, by the Nectarinidae, or sun-birds of the tropical parts of the Old World, in popular estimation so often confounded with them.

The number of species of humming-birds now known to exist considerably exceeds 460; and, though none depart very widely from what a morphologist would deem the typical structure of the family, the amount of modification, within certain limits, presented by the various forms is surprising and even bewildering to the uninitiated. But the features that are ordinarily chosen by systematic ornithologists in drawing up their schemes of classification are found by the "trochilists," or special students of the Trochilidae, insufficient for the purpose of arranging these birds in groups, and characters on which genera can be founded have to be sought in the style and coloration of plumage, as well as in the form and proportions of those parts which are most generally deemed sufficient to furnish them. Looking to the large number of species to be taken into account, convenience has demanded what science would withhold, and the genera established by the ornithologists of a preceding generation have been broken up by their successors into multitudinous sections—the more adventurous making from 150 to 180 of such groups, the modest being content with 120 or thereabouts, but the last dignifying the species by the title of genus. It is of course obvious that these small divisions cannot be here considered in detail, nor would much advantage accrue by giving statistics from the works of recent trochilists, such as Gould,\(^4\) Mulsant\(^5\) and Elliot.\(^6\) It would be as unprofitable here to trace the successive steps by which the original genus Trochilus of Linnaeus, or the two genera Polytmus and Melittuga of Brisson, have been split into others, or have been added

---

\(^1\)Thus Doministes ensifer, in which the bill is longer than both head and body together.

\(^2\)This is especially the case with the smaller species of the group for then larger, though shooting with equal celerity from place to place, seem to flap their wings with comparatively slow but not less powerful strokes. The difference was especially observed with respect to the largest of all humming-birds, Polagoga gigas, by Darwin, who observed that when he saw it from a distance it seemed to be nearly as large as a sparrow, but that as it approached, must be merely the result of an analogical function, and certainly indicates no affinity between the families.

\(^3\)It is probable that in various members of the Trochilidae the structure of the tongue, and other parts correlated therewith, will be found subject to several and perhaps considerable modifications, as is the case in various members of the Pidicidae.

\(^4\)These are especially observable in Rhamphodon naevius and Androclus equatorium.\(^5\)

\(^5\)P. H. Gosse (Birds of Jamaica, p. 130) says that Melittuga minima, the smallest species of the family, has a "real song"—but this he finds neither recorded nor even described.

\(^6\)A Monograph of the Trochilidae or Humming-birds, 5 vols. imp. fol. (London, 1861, with Introduction in 8vo).

\(^7\)Histoire naturelle des oiseaux-mouches, ou colibris, 4 vols., with supplement, imp. 4to. (Lyon-Genève-Bale, 1874-1877).

\(^8\)Smithsonian Contributions to Knowledge, No. 317, A Classification and Synopsis of the Trochilidae, 1 vol. imp. 4to. (Washington, 1879).
to, by modern writers, for not one of these prelates has to arrive at any final, but only a provisional, arrangement; it seems, however, evident that in fact they hold the same recognition. A century 1 supposed themselves to have seen the way to dividing what we now know as the family Trochilidae into two groups, the distinctiveness of which bill was the chief point of division. The other straight, since that difference has been insisted on in many works. This was especially the view taken by Brisson and Buffon, who termed the birds having the arched bill "colibris," and those having the flat, beak-mouthed bill "Doricha." The distinction breaks down, not merely because there are Trochilidae which possess almost every gradation of decurvature of the bill, but some which have the flat bill in the arched, and the arched in the flat. What such a bird would appear to be, but it may be remarked that several of the species placed by those authors among the "colibris" are not humming-birds at all, but belong to the subfamily Trochilinae. A paper describing the extraordinary brilliant plumage which most of the Trochilidae exhibit, ornithologists have been compelled to adopt the vocabulary of the jeweller in order to give an idea of the indefinable brilliancy that so often breaks forth from some part or other of the investments of these feathered gems. In all, save a few other birds, the most imaginative writer sees gleams which he may adequately designate metallic, from their resemblance to burnished gold, bronze, copper or steel, but such similitudes wholly fail when he has to do with the Trochilidae, and there is hardly a precious stone—ruby, amethyst, sapphire, emerald or topaz—the name of which can be applied to the splendour of the light, irrespective of regard to humming-birds. In some cases this radiance beams from the brow, in some it glows from the throat, in others it shines from the tail-coverts, in others it sparkles from the tip only of elongated feathers. The emerald-spangled, or azure-spangled tail, with a frill, while again in others it may appear as a luminous streak across the cheek or auricula. The feathers that cover the upper parts of the body very frequently convey some which in other birds would be thought sufficiently beautiful, but in the Trochilidae its sheen is outdone by the almost dazzling splendour that radiates from the spots where Nature's lapidary has set her jewels. The flight feathers are almost invariably disky—the rapidity of their movement would, perhaps, render any display of colour ineffective, were it not for the brilliant flash of the bird, as the bird hovers over its food-bearing flowers, is almost always expanded, and is apt to attract the eye as if it were exhibiting a rapid succession of transluency, as of stained glass, but iridescent in a manner that no stained glass ever is—cinnamon merging into crimson, crimson changing to purple, purple to violet, and so to indigo and bottle-green. But this part of the humming-bird is subject to quite as much modification in form as in colour, though always consisting of a number of acute points. It may be nearly square at least but slightly rounded, or wedge-shaped with the middle quill prolonged beyond the rest; or, again, it may be deeply forked, sometimes by the over-growth of one or more of the intermediate pairs, but most generally by the development of the outer pair. In the last case the outer feathers may be either broadly webbed to their tip or acuminate, or, again, in some forms, may lessen to the filiform shaft, and suddenly enlarge into a terminal spatulation as in the forms known as "racquet tail." It must be remembered, however, that the offer of a number of groups in which modifications occur that require notice. The primaries are invariably ten in number, the outermost being the longest and the middle instar lacking. The plumage of the blacks, therefore, is brightest. Still there are many brilliant humming-birds common enough in the Brazil, Guiana and Venezuela. The Chrysolampis mosquitus is perhaps the most plentiful. Thousands of its skins are annually sent to Europe to be used in the manufacture of ornaments of its rich red-and-green, or, at the same rendering it one of the most beautiful objects imaginable. In the darkest depths of the Brazilian forests dwell the russet-crested brotherhood of the genus Phaethornis—the "hummers"—but the great wooded basin of the pantropical mountains seems to be particularly unfavourable to the Trochilidae, and from Pará to Ega there are scarcely a dozen species to be met with. There is no island of the Antilles but is inhabited by one or more humming-birds. In Northern and Central America there are some very remarkable singularities of geographical distribution to be found. Northwards from Panama the highlands present many genera whose names it would be a work to rouse us to investigate, is the series of species from America—though that must unquestionably be the supreme metropolis of the family—and advancing towards Mexico the numbers gradually fall off. Eleven species have been enrolled among the luxuriant forests of the United States, but there is some slender evidence, while others just cross the frontier line. The habits of humming-birds have been ably treated by writers like Wallis, Wilson and others; the "Avocet" of Guiana and A. emphatica of Colombia.

1 Seleren must be excepted, especially as he was rebuked by Buffon for doing what we now deem right.

2 For example Avocetula recurvirostris of Guiana and A. euphryia of Colombia.
of the beauties of nature who will not recall to memory with delight the time when a live humming-bird first met his gaze. The sudden movement of the bird before his eyes, and its beautifully developed wings, were alone enough to fix the fluttering vision on the mind's eye. The wings of the bird, if flying, are only visible as a thin grey film, bounded above and below by fine black threads, in form of a St Andrew's Cross. The effect on the observer's retina of the instantaneous reversal of the motion of the wing at each beat—the strokes being so rapid as to leave no more distinct image. Consequently an adequate representation of the bird of paradise cannot be given by any draughtsman. Humming-birds show to the greatest advantage when engaged in contest with another, for rival cocks fight fiercely, and, as may be expected, it is then that their plumage flashes with the most dazzling light. These are quite invisible to the ordinary spectator except when very near at hand, though doubtless efficient enough for their object, whether that be to inflame their mate or to irritate or daunt their opponent, or something that we cannot comprehend. However, they can sit still, and, chiefly in an exposed position, on a dead twig, occasionally darting into the air, either to catch a passing insect or to encounter an adversary; and so pugnacious are they that they will frequently attack birds many times bigger than themselves, without, as would seem, any provocation.

The food of humming-birds consists mainly of insects, mostly gathered in the manly already described from the flowers they visit; but, according to Wallace, there are many species which he has never seen so occupied, and the "hermits" especially seem to live almost entirely upon the insects which are found on the lower surfaces of the leaves, over which they will closely pass their bill, balancing themselves while vertically in the air. The same excellent observer also remarks that even among the common flower-frequenting species he has found the alimentary canal entirely constructed of a trace of nectar. It is this fact doubtless that has hindered almost all attempts at keeping them in confinement for any length of time—nearly every one making the experimenter regret his expenditure, which has been placed in the addition of some animal food, is insufficient as sustenance, and seeing therefore the wretched creatures gradually sink into inanition and die of hunger. With better management, however, several species have been brought on different occasions to Europe, some of them to England.

The beautiful nests of humming-birds, than which the work of fairies could not be conceived more delicate, are to be seen in most museums. Seldom do they excite the view, being very hastily and tenaciously built, though the materials are generally of the slightest—cotton-wool or some vegetable down and spiders' webs. They vary greatly in form and ornamentation—for it would seem that the position of the lichen which frequently beset them are affixed to their exterior with that object, though probably concealment was the original intention. They are mostly cup-shaped, and the singular fact is on record (Zoölog. Journal, v. 1. p. 1) that in one instance at least the young grew in size the walls were heightened by the parents, until at least the nest was more than twice as big as when the eggs were laid and hatched. Some species, however, suspend their nests from the branches of trees, in which position they are often more than one foot in length, and which have been known in which it has been attached to a hanging rope. These penile nests are said to have been found loaded on one side with a small stone or bits of earth to secure their safe balance, though how this is done the observer is at a loss to say. It is supposed that the hermit group, weave a frail structure round the side of a drooping palm-leaf. The eggs are never more than two in number, quite white, and having both ends nearly equal. The solicitude for her offspring displayed by the mother is not exceeded by that of any other birds, but it seems doubtful whether the male takes any interest in the brood.

HUMMOCK (of uncertain derivatin; cf. hump or hillock), a boss or rounded knob of ice rising above the general level of an ice-field, making sledge travelling in the Arctic and Antarctic region extremely difficult and unpleasant. Hummocky ice is caused by slow and unequal pressure in the main body of the packed ice, and by unequal structure and temperature at a later period.

HUMOUR (Latin humor), a word of many meanings and of strange fortune in their evolution. It began by meaning simply "liquid." It passed through the stage of being a term of art used by the old physicians—whom we should now call physiologists—and by degrees has come to be generally understood to signify a certain "habit of the mind," shown in speech, in literature and in action, or a quality in things and events observed by the human intelligence. The word reached its full development by slow degrees. When Dr Johnson compiled his dictionary, he gave nine definitions of, or equivalents for, "humour." They may be conveniently quoted: (1) Moisture. (2) The different kinds of moisture in man's body, reckoned by the old physicians to be phlegm, blood, choler and melancholy, which as they predominate are supposed to determine the temper of mind. (3) General turn or temper of mind. (4) Present disposition. (5) Grotesque imagery, jocularity, merri ment. (6) Tendency to disease, morbid disposition. (7) Petulance, peevishness. (8) A trick, a practice. (9) Caprice, whim, predominant inclination. The list was not quite complete, even in Dr Johnson's own time. Humour was then, as it is now, the name of the semi-fluid parts of the eye. Yet no dictionary-maker has been more successful than Johnson in giving the literal and conversational meaning of an English word, or the main lines of its history. It is therefore instructive to note that in no one of his nine clauses does humour bear the meaning it has for Thackeray or for George Meredith. "General turn or temper of mind" is at the best too vague, and has moreover another application. His list of equivalents only carries the history of the word up to the beginning of the last stage of its growth.

The limited original sense of liquid, moisture, mere wet, in which "humour" is used in Wycliffe's translation of the Bible, continued to attach to it until the 17th century. Thus Shakespeare, in the first scene of the second act of Julius Caesar, makes Portia say to her husband:—

"Is Brutus sick? and is it physical To walk unbraced and suck up the humours Of the daily morning?"

In the same scene Decius apphomples the word in the wide metaphorical sense in which it was used, and abused, then and afterwards. "Let me work," he says, referring to Caesar—

"For I can give his humour the true bent, And I will bring him to the Capitol." Here we have "the general turn or temper of mind," which can be flattened, or otherwise directed to "present disposition." We have travelled far from mere fluid, and have been led on the road by the old physiologists. We are not concerned with their science, but it is necessary to see what they mean by primary humours, and "second or third concoctions," if we are to understand how it was that a name for liquid could come to mean "general turn" or "present disposition," or "whim" or "jocularity." Part I, Section 1, Member 2, Subsection 2, of Burton's Anatomy of Melancholy will supply all that is necessary for literary purposes. "A humour is a liquid or fluent part of the body comprehended in it, and is either born with us, or is adventitious and acquisit". The first four primary humours are—"Blood, a hot, sweet, tempered, red humour, prepared in the meseraic veins, and made of the most temperate parts of the chylus (chyle) in the liver, whose office it is to nourish the whole body, to give it strength and colour, being dispersed through every part of it. And from it spirits are first begotten in the heart, which afterwards in the arteries are communicated to the other parts. Pittuita or phlegm is a cold and moist humour, begotten of the colder parts of the chylus (or white juice coming out of the meat digested in the stomach) in the liver. His office is to nourish and moisten the members of the body." &c. "Choler is hot and dry, begotten of the hotter parts of the chylus, and gathered to the gall. It helps the natural heat and senses. Melancholy, cold and dry, thick, black and sour, begotten of the more feulent part of nourishment, and purged from the spleen, is a bridge to the other two hot humours, blood and choler, preserving them in the blood, and nourishing the bones." Mention must also be made of serum, and of "those excrementitious humours of the third concoction, sweat and tears." An exact balance of the four primary humours makes the justly constituted man, and allows for the undisturbed production of the "concoctions"—or processes of digestion and assimilation. Literature seized upon these terms and definitions. Sometimes it applied them gravely in the moral and intellectual sphere. Thus the Jesuit Bouhours, a French critic of the 17th century, in his Entretiens d'Ariste et d'Eugène, says that in the formation of a bel esprit, "La bile donne le brillant et la pénétration, la mélancolie donne le bon sens et la solidité; le sang donne l'agrément et
la délicatesse." It was, in fact, taken for granted that the character and intellect of men were produced by—were, so to speak, concoctions dependent on—the "humours." In the fallen state of mankind it rarely happens that an exact balance is maintained. One or other humour predominates, and thus we have the long-established doctrine of the existence of the sanguine, the phlegmatic, the choleric, or the melancholy temperaments. Things being so, nothing was more natural than the passage of these terms of art into common speech, and their application in a metaphorical sense, when once they had been adopted by the literary class. The process is admirably described by Asper in the introduction to Ben Jonson's play—Every Man out of his Humour:

"Why humour, as it is 'ens, we thus define it, To be a quality of air or water; Air of itself holds these two properties Moisture and texture: as, for demonstration Four water on this floor. 'Twill wet and run. Likewise the air forced through a horn or trumpet Flows instantly away, and leaves behind A kind of dew; and hence we do conclude That whatsoe'er hath fluxure and humidity As wanting power to contain itself Is humour. So in every human body
The choleric, melancholy, phlegm and blood By reason that they flow continually, In some one part and are not continent Receive the name of humours. Now thus far It may, by metaphor, apply itself Uniting the properties of all. As when some one peculiar quality Doth so possess a man that it doth draw All his spirits, and animate his parts, In their confusion all to run one way,— This may be truly said to be a humour."

A humour in this sense is a "ruling passion," and has done excellent service to English authors of "comedies of humours," to the Spanish authors of comedias de figured, and to the French followers of Molière. Nor is the metaphor racked out of its fair proportions if we suppose that there may be a temporary, or even an "adventitious and acquittar" predominance of a humour, and that "deliveries of a man's self" to passing passion, or to imitation, are also "humours," though not primary, but only second or third concoctions. By a natural extension, therefore, "humours" might come to mean oddities, tricks, practices, mere whims, and the spicing of some model admired for the time being. "But," as Falstaff has told us, "it was always yet the trick of our English, if they have a good thing, to make it too common." The word "humour" was a good thing, but the Elizabethans certainly made it too common. It became a hack epithet of all work, to be used with no more discretion, though with less imbecile iteration, than the modern "awful." Shakespeare laughed at the folly, and pinned it for ever to the ridiculous company of Corporal Nym—"I like not the humour of lying. He hath wrung me in some humours. I should have borne the humoured letter to her... I love not the humour of bread and cheese; and there's the humour of it."

The humour of Jonson was that he tried to clear the air of this distendency by stamping on it. Asper ends in denunciation—

"But that a rook by wearing a pied feather, The nape hat-band, or the three-pipe ruff, A yard of shoe tie, or the Swisser knot On his French gaiters, should affect a humour, Of it is more than most ridiculous."

The abuse of the word was the peculiar practice of England. The use of it was not confined wholly to English writers. The Spaniards of the 16th and 17th centuries knew humorada in the same sense, and still employ the word as a name for caprices, whims and vapours. Humorada was, and is, the correct Spanish for a festive saying or writing of epigrammatic form. Martial's immortal reply to the critic who admired only dead poets—

Ignoscas petimus Vascura: tanti

Nor rest, ut placem tibi perire,

is a model humorada. It would be a difficult and would certainly be a lengthy task to exhaust all the applications given to so elastic a word. We still continue to use it in widely different senses. "Good humour" or "bad humour" are simply good temper or bad temper. There is a slight archaic flavour about the phrases "grim humour," "the humour they were in," in the sense of suspicious, or angry or careless mood, which were favourites with Carlyle, but though somewhat antiquated they are not entirely a thing of the past, or very unusual. With the proviso that the exceptions must always be excepted, we may say that for a long time "humour" came to connote comic matter less refined than the matter of wit. It had about it a smack of the Boar's Head Tavern in Eastcheap, and of the unyoked "humour" of the society in which Prince Henry was content to imitate the sun—

"Who doth permit the base contagious clouds
To smother up his beauty from the world."

The presence of a base contagious cloud is painfully felt in the so-called humorous literature of England till the 18th century. The reader who does not sometimes wonder whether humour in the mouths of English writers of that period did not stand for maniacal tricks, horse-play, and the foul names of foul things, material and moral, must be very determined to prove himself a whole-hearted admirer of the ancient literature. Addison, who did much to clean it of mere nastiness, gives an excellent example of the base use of the word in his day. In Number 371 of The Spectator he introduces an example of the "sort of men called Whims and Humourists." It is the delight of this person to play practical jokes on his guests. He is proud when "he has packed together a set of persons who had "an unlucky knot in the eye," or has filled his table with stammers. The humorist, in fact, was a mere practical joker, who was very properly answered by a challenge from a military gentleman of peppery temper. Indeed, the pump and a horse- whip would appear to have been the only effective forms of criticism on the prevalent humour and humours of the 16th, 17th and 18th centuries. But the pump and the horse-whip were themselves humours. Carlo Buffone in Jonson's play is put "out of his humour" by the counter humour of Signor Panturrolo, who "makes him down and gags him with candle wax. The brutal pranks of Fanny Burney's Captain Mirvan, who belongs to the earlier part of the 19th century, were meant for humour, and were accepted as such. Examples might easily be multiplied. A briefer and also a more convincing method of demonstration is to take the deliberate judgment of a great authority. No writer of the 18th century possessed a finer sense of humour in the noble meaning than Goldsmith. What did he understand the word to mean? Not the way in which he himself wrote when he created Dr Primrose. We have his express testimony in the 9th chapter of The State of Polite Learning. Goldsmith complains that "the critic, by demanding an impossibility from the comic poet, has, in effect, banished true comedy from the stage." This he has done by bannning "low" subjects, and by proscribing "the comic or satirical muse from every walk but high life, which, though abounding in foons as well as the humbler station, is by no means so fruitful in absurdity. ... Absurdity is the poet's game, and good breeding is the nice concealment of absurdity. The truth is, the critic generally mistakes 'humour' for 'wit,' which is a very different excellence; wit raises human nature above its level; humour acts a contrary part, and equally depresses it. To expect exalted humour is a contradiction in terms... The poet, therefore, must place the object he would have the subject of humour in a state of inferiority; in other words, the subject of humour must be love."

That no doubt may remain in his reader's mind, Goldsmith gives an example of true humour. It is nothing more or less than absurdity and of absurdity in itself. "To laugh, through wanting a nose," is extremely curious in the choice of his example. We applaud "the humour of it," for "we here see him guilty of an absurdity of which we imagine it impossible for ourselves to be guilty, and therefore applaud our own good sense on the comparison."

Nothing could be more true as an account of what the Elizabethans, the Restoration, the Queen Anne men, and the 18th century meant by "humour." Nothing could be more false
as an example of what we mean by the humour of Falstaff or of The Vicar of Wakefield.

When we pass from Goldsmith to Hazlitt—one of the greatest names in English criticism—we find that "humour" has grown in meaning, without quite reaching its full development. In the introduction to his Lectures on the English Comic Writers he attempts a classification of the comic spirit into wit and humour. "Humour," he says, "is the describing the ludicrous as it is in itself; wit is the exposing it, by comparing or contrasting it with something else. Humour is, as it were, the growth of nature and accident; wit is the product of art and fancy. Humour, as it is shown in books, is an imitation of the natural or acquired absurdities of mankind, or of the ludicrous in accident, situation and character; wit is the illustrating and heightening the sense of that absurdity by some sudden and unexpected likeness or opposition of one thing to another, which sets off the quality we laugh at or despise in a still more contemptible or striking point of view." Hazlitt's definition will, indeed, not stand analysis. The element of comparison is surely as necessary for humour as for wit. Yet his classification is valuable as illustrating the growth of the meaning of the word. Observe that Hazlitt has transferred to wit that power of pleasing as by a flattering sense of our own superiority which Goldsmith attributed to humour. He had not thought, and had not heard, that sympathy is necessary to complete humour. He cannot have thought it needful, for if he had he would hardly have said of the Arabians Nights that they are "an inexhaustible mine of comic humour and invention," "which from the manners of the East, which they describe, carry the principle of callous indifference in the jest as far as it can go." He might, and probably would, have dismissed Goldsmith's illustration as "low" in every conceivable sense. He would not have added, as we should to-day, that humour does not lie in laughter, according to the definition of Hobbes, in a "sudden glory," in a guile of self-conceited triumph over the follies and deficiencies of others. If there is any place for humour in Goldsmith's sordid example, it must be made by pity, and shown by a deft introduction of the de tefabula dear to Thackeray, by a reminder that the world is full of people, who, though wanting noses, are extremely curious in their choice of snuff-boxes, and that the more each of us thinks himself above the weakness the more likely he is to fall into it.

The critical definition of the difference between wit and humour lies in this, that he ignores the doctrine that the quality of humour lies in the thing or the action and not in the mind of the observer. The examples quoted above, to which any one with a moderate share of reading in English literature could add with ease, show that humour was first held to lie in the trick, the whim, the act, or the event and clash of incidents. It might even be a mere flavour, as when men spoke of the salt humour of sea-sand. Even when it stood for the "general turn or temper of mind" it was a form of the ruling passion which inspires men's actions and words. It was used in that sense by Decius when he spoke of the humour of Caesar, which is a liability to be led by one who can play on his weakness—

"for he loves to hear
That unicorns may be betrayed with trees
And bears with glasses, elephants with holes,
Lions with toils, and men with flattlers;
But when I tell him he hates flattlers.
He says he does; being then most flatteder."

It is plain that this is not what Hazlitt meant, or we now mean, by the humour displayed in "describing the ludicrous as it is shown in itself." Nor did he, any more than we do, suppose with Goldsmith that a "low" quality of actions and persons is inseparable from humour. It had become for Hazlitt what Addison called cheerfulness, "a habit of the mind" as distinguished from mirth, which is "an act." If in Addison's sentences the place of cheerfulness is taken by humour, and that of mirth by wit, we have a very fair description of the two. "I have always preferred cheerfulness to mirth. The latter I consider as an act, the former as a habit of the mind. Mirth is short and transient, cheerfulness is fixed and permanent." Humour is the fixed and permanent appreciation of the ludicrous, of which wit may be the short and transient expression.

If we now pass to an attempt to define "humour," the temptation to take refuge in the use of an evasion employed by Dr Johnson is very strong. When Boswell asked him, "Then, Sir, what is poetry?" the doctor answered, "Why, Sir, it is much easier to say what it is not. We all know what light is, but it is not easy to tell what it is." But George Meredith has come to our assistance in two passages of his Essay on Comedy and the uses of the Comic Spirit. "If you laugh all round him (to wit, the ridiculous person), tumble him, roll him about, deal him a smack, and drop a tear on him, own his likeness to you, and yours to your neighbour, spare him as little as you shun, pity him as much as you expose, it is spirit of Humour that is moving you.... The humourist of mean order is a refreshing laugher, giving tone to the feelings, and sometimes allowing the feelings to be too much for him. But the humourist, if high, has an embrace of contrasts beyond the scope of the comic poet." The third sentence is required to complete the first. The tumbling and rolling, the smacks and the exposure, may be of place where there is humour of the most humorous quality. Who could associate themselves with Sir Walter Scott's characters of Bradwardine or Monkbars? Bradwardine, one feels, would have stopped them as he did the ill-timed jests of Sir Hew Halbert, "who was so unthinking as to deride my family name." Monkbars was a man of peace who loved the company of Sir Priest better than that of Sir Knight. But there is that in him which crowns mere ridicule, be it ever so genial. He cared not what he knew so much of his valour, and by that very avowal of his preference took his position sturdily in the face of the world. But Meredith has given its due prominence to the quality which, for us, distinguishes humour from pure wit and the harder forms of jocularity. It is the sympathy, the appreciation, the love, which include the follies of Don Quixote, the prosaic absurdities of Sancho Panza, the oddities of Bradwardine, Dr Primrose or Monkbars, and the jovial animalism of Falstaff, in "an embrace of contrasts beyond the scope of the comic poets."

It is needless to insist that humour of this order is far older than the very modern application of the name. It is assuredly present in Horace. Chaucer, who knew the world not without "liquid," has left a masterpiece of humour in his prologue to the Canterbury Pilgrims. We look for the finest examples in Shakespeare. And if it is old, it is also more universal than is always allowed. National, or at least racial, partiality, has led to the unfortunate judgment that humour is a virtue of the northern peoples. Yet Rabelais came from Touraine, and if the creator of Panurge has not humour, who has? The Italians may say that amore in the English sense is unknown to them. They mean the word, not the thing, for it is in Ariosto. To claim the quality for Cervantes would indeed be to push at an open door. The humour of the Gospels has been rarely indeed of so high an order as his. It has been found where humanity has been combined with a keen appreciation of the ludicrous. The appreciation may exist without the humanity. When Rivalo met the Chevalier Florian with a manuscript sticking out of his pocket, and said, "How rash you are! if you were not known you would be robbed," he was making use of the comic spirit, but he was not humorous. When Rivalo himself, a man of dubious claim to nobility, was holding forth on the rights of the nobles, and calling them "our rights," one of the company smiled. "Do you find anything singular in what I say?" he said. "It is the plural which I find singular." The answer. There is certainly something singular in the neat overthrow of an insolent wit by a rival insolence, but the humour is in the spectator, not in the answer. The spirit of humour as described by George Meredith cannot be so briefly shown as in the rapid flash of the Frenchmen's wit. It lingers and expatiates, as in Dr Johnson's appreciation of Bet Flint. "Oh, a fine character, Madam! She was habitually a slut and a drunkard, and occasionally a thief and a harlot. And for heaven's
sake how came you to know her? Why, Madam, she figured in the literary world too! Bet Flint wrote her own life, and called herself Cassandra, and it was in verse; it began:—

When nature first ordained my birth
A diminutive I was born on earth
And then I came from a dark abode
Into a gay and gaudy world.

"So Bet brought her verses to me to correct; but I gave her half-a-crown, and she liked it as well. Bet had a fine spirit; she advertised for a husband, but she had no success, for she told me no man aspired to her. Then she hired very handsome lodgings and a footboy, and she got a harpsichord, but Bet could not play; however, she put herself in fine attitudes and drilled. And pray what became of her? Sir? Why, Madam, she stole a quilt from the man of the house, and he had her taken up; but Bet Flint had a spirit not to be subdued, so when she found herself obliged to go to gaol, she ordered a sedan chair, and bid her footboy walk before her. However, the footboy proved refractory, for he was ashamed, though his mistress was not. And did she ever get out of gaol, Sir? Yes, Madam, when she came to her trial, the judge acquitted her. "So now," she said to me, 'the quilt is my own, and now I'll make a petticoat of it.' Oh! I loved Bet Flint."

The subject is low enough to please Goldsmith. The humour may be of that mean order which has only a refreshing laugh, and gives tone to the feelings, but it is the pure spirit of humour.

We need not labour to demonstrate that a kindly appreciation of the ludicrous may find expression in art as well as in literature. But humour in art tends so inevitably to become caricature, which can be genial as well as ferocious, that the reader must be referred to the article on Caricature for an account of its manifestations in that field.

HUMPBACK WHALE (Megaptera longimana or M. boops), the representative of a genus of whalebones distinguished by the great length of the flippers. This whale (or a closely allied species) is found in nearly all seas; and when full-grown may reach from 45 ft. to 50 ft. in length, the flippers which are indented along their edges measuring from 10 ft. to 12 ft. or more. The general colour is black, but there are often white markings on the under surface; and the flippers may be entirely white, or parti-coloured like the body. Deep longitudinal furrows, folds or plaits occur on the throat and chest. It is said that the popular name refers to a prominence on which the back fin is set; but this "hump" varies greatly in size in different individuals. The humpback is a coast-whale, irregular in its movements, sometimes found in "schools," at others singly. The whalebone is short, broad and coarse; but the yield of oil from a single whale has been as much as 75 barrels. A few examples of this whale have been taken in Scotland and the north of England (see CETACEA).

HUMPERDINCK, ENGELBERT (1854— ). German musical composer, was born at Siegburg in the Rhine Province, and studied under F. Hiller at Cologne, and F. Lachner and J. Rheinberger at Munich. In 1879, by means of a scholarship, he went to Italy, where he met Wagner at Naples; and on the latter's invitation he went to Bayreuth and helped to produce Parsifal there next year. He traveled for the next few years in Italy and Spain, but in 1890 became a professor at Frankfurt, where he remained till 1896. In 1900 he became the head of a school in Berlin. His fame as a composer was made by his charming children's opera Hänsel und Gretel in 1893, founded very largely (like his later operas) on folk-tunes; but his works also include other forms of music, in all of which his mastery of technique is apparent.

HUMPHREY (or HUMPREY), LAWRENCE (1527?—1590), president of Magdalen College, Oxford, and dean successively of Gloucester and Winchester, was born at Newport Pagnel. He was educated at Magdalen College in 1546 and later at Oxford, and was admitted to the degree of B.D. in 1548. He graduated B.A. in 1549, M.A. in 1552, and B.D. and D.D. in 1562. He was noted as one of the most promising pupils of Peter Martyr, and on Mary's accession obtained leave from his college to travel abroad. He lived at Basel, Zurich, Frankfort and Geneva, making the acquaintance of the leading Swiss divines, whose ecclesiastical views he adopted. His leave of absence having expired in 1558, he ceased to be fellow of Magdalen. He returned to England at Elizabeth's accession, was appointed regius professor of divinity at Oxford in 1566, and was recommended by Archbishop Parker and others for election as president of Magdalen. The fellows refused at first to elect so pronounced a reformer, but they yielded in 1561, and Humphrey gradually converted the college into a stronghold of Puritanism. In 1564 he and his friend Thomas Sampson, dean of Christ Church, were called before Parker for refusing to wear the prescribed ecclesiastical vestments; and a prolonged controversy broke out, in which Bullinger and other foreign theologians took part as well as most of the leading divines in England. In spite of Bullinger's advice, Humphrey refused to conform; and Parker wished to deprive him as well as Sampson. But the presidency of Magdalen was elective and the visitor of the college was not Parker but the bishop of Winchester; and Humphrey escaped with temporary retirement. Parker, in fact, was not supported by the council; in 1566 Humphrey was selected to preach at St Paul's Cross, and was allowed to do so without the vestments. In the same year he took a prominent part in the ceremonies connected with Elizabeth's visit to Oxford. On 11 February 1590, he was elevated to the see of Salisbury in Magdalen College chapel. He died on the 1st of February 1590 and was buried in the college chapel, where there is a mural monument to his memory; a portrait is in Magdalen College school.

Humphrey was a voluminous writer on theological and other subjects. At Parker's desire he wrote a life of his friend and patron Bishop Jewel, which was published in 1573 and was also prefixed to the edition of Jewel's works issued in 1600. One of his books against the Jesuits was included in vol. iii. of the Doctrina Jesuistiarum per variis authores, published at La Rochelle (6 vols., 1585—1586).

HUMPHREYS, ANDREW ATKINSON (1810—1883), American soldier and engineer, was born at Philadelphia on the 2nd of November 1810. He was the son of Samuel Humphreys (1778—1846), chief constructor U.S.N., and grandson of Joshua Humphreys (1751—1838), the designer of the "Constitution" and other famous frigates of the war of 1812, sometimes known as the "father of the American navy." Graduating from West Point in 1831, he served with the 2nd Artillery in the Florida war in 1835. He resigned soon afterwards and devoted himself to civil engineering. In 1838 he returned to the army for survey duties, and from 1842 to 1849 was assistant in charge of the Coast Survey Office. Later he did similar work in the valley of the Mississippi, and, with Lieut. H. L. Abbott, produced in 1861 a valuable Report on the Physics and Hydraulics of the Mississippi River. In connexion with this work he visited Europe in 1851.
In the earlier part of the Civil War Humphreys was employed as a topographical engineer with the Army of the Potomac, and rendered conspicuous services in the Seven Days' Battles. It is stated that he selected the famous position of Malvern Hill, before which Lee's army was defeated. Soon after this he was assigned to command a division of the V. corps, and at the battle of Fredericksburg he distinguished himself greatly. In the last attack of Marye's heights, General Burnside recommended him for promotion to the rank of major-general U.S.V., which was not however awarded to Humphreys until after Gettysburg. He took part in the battle of Chancellorville, and at Gettysburg commanded a division of the III. corps under Sickles. Upon Humphreys' division fell the brunt of Lee's attack on the second day, by which in the end the III. corps was dislodged from its advanced position. His handling of his division in this struggle excited great attention, and was compared to Sheridan's work at Stone river. A few days later he became chief of staff to General Meade, and this position he held throughout the Wilderness campaign. Towards the end of the war General Humphreys succeeded General Hancock in command of the famous III. corps. The short campaign of 1865, which terminated in Lee's surrender, afforded him a greater opportunity of showing his capacity for leadership. His corps played a conspicuous part in the final operations around Petersburg, and the credit of the vigorous and relentless pursuit of Lee's army may be claimed hardly less for Humphreys than for Sheridan. After the war, now brevet major-general, he returned to regular engineer duty as chief engineer of the U.S. army, and retired in 1879. He was a member of the American Philosophical Society (1857) and of the American Academy of Arts and Sciences (1866), and received the degree of LL.D. from Harvard University in 1868. He died at Washington on the 27th of December 1883. Amongst his works may be mentioned From Gettysburg to the Rapidan (1882) and The Virginia Campaigns of 1864–1865 (1882).

See Wilson, Critical Sketches of some Commanders (Boston, 1895).

HUMPHREY, OZIAS (1742–1810), English miniature painter, was born at Honiton and educated at the Grammar School of that town. Attracted by the gallery of casts opened by the duke of Richmond, Humphry came to London and studied at Shipley's school, and later he left for Bath, where he lodged with Linley and became a great friend of his beautiful daughter, afterwards Mrs Sheridan. In 1766 he was in London warmly encouraged by Sir Joshua Reynolds, who was always interested in Devonshire painters. He was a great friend of Romney, with whom in 1773 he went to Italy, staying, on his way to Dover, at Knole, where the duke of Dorset gave him many commissions. In 1783 he went to India, visiting the native courts, painting a large number of miniatures, and making many beautiful sketches. His sight failed him in 1797, and he died in Hampstead in 1810. The bulk of his possessions came into the hands of his natural son, William Upcott, the book collector. From him the British Museum acquired a large number of papers relating to Humphry. He was Opie's first master, and is alluded to in some lines by Hayley. His miniatures are exquisite in detail and delightful in colouring. Many of the finest are in the collection of Mr J. Pierpoint Morgan.

HUMUS (a Latin word meaning the ground), a product of decomposing organic matter. It is especially present in peat bogs, and also occurs in surface soils, to which it imparts a brown or black colour. It is one of the most important soil-constituents from the agricultural point of view; it is the chief source of nitrogen for plants, and modifies the properties of the soil by increasing its water-holding capacity and diminishing its tenacity. Little is known with regard to its chemical composition. By treating with a dilute acid to remove the bases present, and then acting on the residue with ammonia, a solution is obtained from which a mineral acid precipitates humic acid; the residue from the ammonium extraction is termed humin. Both the humic acid and humin are mixtures, and several constituents have been separated; umic acid and umin, in addition to humic acid and humin, are perhaps the best characterized.

HUNALD, DUKE OF AQUITAINE, succeeded his father Odo, or Oues, in 735. He refused to recognize the high authority of the Frankish mayor of the palace, Charles Martel, whereupon Charles marched south of the Loire, seized Bordeaux and Blaye, but eventually allowed Humphry to remain. Martianus declared that he should promise fidelity. From 736 to 741 the relations between Charles and Hunald seem to have remained amicable. But at Charles's death in 741 Hunald declared war against the Franks, crossed the Loire and burned Chartres. Menaced by Pippin and at the beginning of the reign of Charlemagne, there was a last rising of the Aquitanians. This revolt was directed by a certain Hunald, and was repressed in 768 by Charlemagne and his brother Carloman. Hunald sought refuge with the duke of the Gascons, Lupus, who handed him over to his enemies. In spite of the opinion of certain historians, this Hunald seems to have been a different person from the old duke of Aquitaine.

HU-NAN, a central province of China, bounded N. by Hu-peh, E. by Kiang-si, S. by Kwang-si and Kwang-tung, and W. by Kwei-chow and Szech'uen. It occupies an area of 83,000 sq. m., and its population is estimated at 22,000,000. The provincial capital is Chang-sha Fu, in addition to which it has eight prefectural cities. It is essentially a province of hills, the only considerable plain being that around the Tung-t'ing lake, but this extends little beyond the area which in summer forms part of the lake. To the north of Heng-chow Fu detached groups of higher mountains than are found in the southern portion of the province are met with. Among these is the Heng-shan, one of the Wu-yo or five sacred mountains of China, upon which the celebrated tablet of Yu was placed. The principal rivers of the province are: (1) The Siang-kiang, which takes its rise in the Nan-shan, and empties into the Tung-t'ing lake; it is navigable for a great distance from its mouth, and the area of its basin is 39,000 sq. m.; (2) the Tsze-kiang, the basin of which covers an area of 19,000 sq. m., and which is full of rapids and navigable only for the smallest boats; (3) the Yuen-kiang, a large river, which has some of its head-waters in the province of Kwei-chow, and empties into the Tung-t'ing lake in the neighbourhood of Chang-tê Fu; its basin has an area of 35,000 sq. m., 22,500 of which are in the province of Hu-nan and 12,500 in that of Kwei-chow; its navigation is dangerous, and only small boats are able to pass beyond Hang-kia, a mart about 180 m. above Chang-tê Fu; and (4) the Ling-kiang, which flows from the tea district of Ho-feng Chow to the Tung-t'ing lake. Its basin covers an area of about 8000 sq. m., and it is navigable only in its lowest portion. The principal places of commerce are: (1) Siang-t'an, on the Siang-kiang, said to contain 1,000,000 inhabitants, and to extend 3 m. long by nearly 2 m. deep; (2) Chang-sha Fu, the provincial capital which stands on the same river 60 m. above the treaty port of Yo-chow, and between which mart and Han-kow steamers of 500 tons burden run; and (3) Chang-tê Fu, on the Yuen-kiang. The products of the province are tea (the best quality of which is grown at Gan-hwa and the greatest quantity at Ping-kiang), hemp, cotton, rice, paper, tobacco, tea-oil and coal. The whole of the south-eastern portion of the province is one vast coal-field, extending over an area of 21,700 sq. m. This area is divided into nearly two equal parts—one, the Loi river coal-fields, yielding anthracite, and the other the Siang river coal-fields, yielding bituminous coal. The people have been, as a rule, more anti-foreign in their ideas, and more generally prosperous than the
inhabitants of the other provinces. Baron von Richthofen noticed with surprise the number of fine country seats, owned by rich men who had retired from business, scattered over the rural districts. Almost all the traffic is conveyed through Hu-nan by water-ways, which lead northward to Han-kow on the Yangtze Kiang, and Fan-cheng on the Han River, eastward to Fu-kien, southward to Kwang-tung and Kwang-si and westward to Sze-chu'en. One of the leading features of the province is the Tung-t'ing lake. Yo Chow, the treaty port of the province, stands at the outlet of the river Siang into this lake.

HUNDRED—The English name of a territorial number equal to ten times ten. The O. Eng. hundred is represented in other Teutonic languages; cf. Dutch honderd, Ger. Hundert, Dan. hundrede, &c. It is properly a compound, HUND-red, the suffix meaning "reckoning"; the first part HUND is the original Teutonic word for 100 which became obsolete in English in the 13th century. It represents the Indo-European form kanta, seen in Gr. ἱκατός, Lat. centum, Sans. caṇa; kanta stands for dakanta and meant the tenth ten, and is therefore connected with Gr. βέκα, Lat. decem and Eng. 'ten,' the Teutonic form of Indo-European dakon being ten. In English the term "hundred" is particularly applied to an ancient territorial division intermediate between the villa and the county. Such subordinate districts were also known in different parts of the country by other names, e.g. wespenakes in Yorkshire, Lincolnshire, Nottinghamshire, Derbyshire, Rutland and Leicester; words in Northumberland, Durham and Cumberland; while some of the hundreds of Cornwall were formerly called shires. In some parts of England a further intermediate division is to be found between the hundred and the county. Thus we have the trifling, or as it is now called the riding, in Yorkshire, the lathe in Kent, and the rape in Sussex. In Lincolnshire the arrangement is peculiar. The whole county was divided into the three sub-counties of Lindsey, Kesteven and Holland; and of these Lindsey was again divided into three ridings. The division into hundreds is generally ascribed to the creative genius of Alfred, who, according to William of Malmsbury, divided his kingdom into counties, the counties into hundreds, and the hundreds into tithings or villae. It is probable, however, that he merely rearranged existing administrative districts in that part of England which was subject to his rule. The significance of the name hundred is a matter of some difficulty. The old theory, and perhaps the best, is that the hundred denoted first a group of a hundred families, and then the district which these families occupied. This is not inconsistent with another view, according to which the hundred was originally a term of measurement denoting a hundred hides of land, for there is good reason for considering that the hide was originally as much land as supported one family. It is important to notice that in the document compiled before the Norman Conquest, and now known as the County Hidage, the number of hides in all the counties are multiples of a hundred, and that in many cases the multiples agree with the number of hundreds ascribed to a county in Domesday Book. The hundreds of Devon, however, seem never to have contained a hundred hides; but various multiples of five, such as twenty, forty and sixty. Here, and in some of the other western counties, the hundreds are geographical divisions, to which a varying number of hides was attributed for fiscal purposes.

In the middle ages the hundred was chiefly important for its court of justice; and the word hundred was as often applied to the court as to the district over which the court had jurisdiction. According to the compilation known as Leges Henrici, written shortly before 1118, it was held twelve times a year, but an ordinance of 1234, after stating that it had been held fortnightly in the reign of Henry II., declares that its ordinary sessions were henceforth to take place every three weeks (Dunstable Annals, 130). Existing court rolls show that from the 13th to the 18th century, perhaps even earlier, a year, in some hundreds in a fixed place, in others in various places, but in no regular course of rotation. Twice a year a specially full court was held, to which various names such as hundredum legale or hundredum magnum were applied. This was the sheriffs' turn, held after Eton and Michelmans in accordance with the Magna Carta of 1217. The chief object of these sessions was to see that all who ought to be were in the frank-pledge, and that the articles of the view of frank-pledge had been properly observed during the preceding half-year. Each township of the hundred was represented by a varying number of suitsors who were bound to attend at these half-yearly sessions without individual summons. If the proper number failed to appear the whole township was amerced, the entry on the rolls being frequently of the form "Villata de A. est in intercorde quo non meret processum." All the seventeen courts, including the two full courts, had jurisdiction in trespass covenant and debt of less than forty shillings, and in these civil cases such of the freeholders of the county as were present were judges. But the sheriff or the lord of the hundred was the sole judge in the criminal business transacted at the full courts. A hundred court, especially in the west of England, was often appurtenant to the chief manor in the hundred, and passed with a grant of the manor without being expressly mentioned. In the 15th and 16th centuries large numbers of hundreds had come into private hands by royal grants and in Devonshire they were scarcely a hundred which still belonged to the king. In private hundreds the lord's steward took the place of the king's sheriff.

Owing to the great fall in the value of money the hundred court began to decay rapidly under the Tudor sovereigns. They were for the most part extinguished by a section in the County Courts Act 1867, which enacts that no action which can be brought in a county court shall thenceforth be brought in a hundred or other inferior court not being a court of record. Until lately the most important of the surviving duties of the hundred was its liability to make good damages occasioned by rioters. This liability was removed by the Riot (Damages) Act 1886, which threw the liability on the police rate.

See Pollock and Maitland, History of English Law; F. W. Maitland, Domestacy Book and Beyond (1897); J. H. Round, Feudal England (1895); Annales monastici, " Rolls" series, iii. (Dunstable), 159; various court rolls at the Public Record Office, London. (G. J. T.)

HUNDRED DAYS (Fr. Cent Jours), the name commonly given to the period between the 29th of March 1815, the date on which Napoleon arrived in Paris after his return from Elba, and the 28th of June 1815, the date of the restoration of Louis XVIII. The phrase Cent Jours was first used by the prefect of Paris, the comte de Chabrol, in his speech welcoming the king. See NAPOLEON, AND FRANCE: History.

HUNDRED YEARS' WAR. This name is given to the protracted conflict between France and England from 1337 to 1453, which continued through the reigns of the French kings Philip VI., John II., Charles V., Charles VI., and of the English kings Edward III., Richard II., Henry IV., Henry V. and Henry VI. The principal causes of the war, which broke out in Guienne in 1337, were the disputes arising in connexion with the French possessions of the English kings, in respect to which they were vassals of the kings of France; the pretensions of Edward III. to the French throne after the accession of Philip VI.; Philip's intervention in the affairs of Flanders and Scotland; and, finally, the machinations of Robert d'Artois. The genius of Philip VI.'s reign fortune favoured the English. The French fleet was destroyed at Sluys on the 24th of June 1340. After the siege of Tournai a truce was arranged on the 25th of September 1340; but the next year the armies of England and France were again at war in Brittany on account of the rival pretensions of Charles of Blois and John of Montfort to the succession of that duchy. In 1346, while the French were trying to invade Guienne, Edward III. landed in Normandy, ravaged that province, part of the Ile de France and Picardy, defeated the French army at Crécy on the 26th of August 1346, and besieged Calais, which surrendered on the 7th of January 1347. Hostilities were suspended for some years after this, in consequence of the truce of Calais concluded on the 28th of September 1347.
The principal feats of arms which mark the first years of John the Good's reign were the taking of St Jean d'Angely by the French in 1357, the defeat of the English near St Omer in 1357, and the English victory near Guines in the same year. In 1355 Edward III. invaded Artois while the Black Prince was pillaging Languedoc. On September 19th, in which John was taken prisoner, was the signal for conflicts in Paris between Stephen Marcell and the dauphin, and for the outbreak of the Jacquerie. The treaty of Brétigny, concluded on the 8th of May 1360, procured France several years' respite.

Under Charles V. hostilities at first obtained only between French, Anglo-Gascon, and Sabaudo-Navarrese (Du Guesclin's victory at Cocherel, May 13, 1364) and Bretons. In 1369, on the pretext that Edward III. had failed to observe the terms of the treaty of Brétigny, the king of France declared war against him. Du Guesclin, having been appointed Constable, defeated the English at Pontvallain in 1370, at Châlons in 1373, and drove them from their positions between the Loire and the Gironde, while the duke of Anjou retook part of Guienne. Edward III. thereupon concluded the truce of Bruges (June 27, 1375), which was prolonged until the 24th of June 1377. Upon the death of Edward III. (June 21, 1377) Charles V. recommended war in Artois and Guienne and against Charles the Bad, but failed in his attempt to reunite Brittany and France. Du Guesclin, who had refused to march against his compatriots, died on the 13th of July 1380, and Charles V. on the 16th of the following September.

In the beginning of Charles VI.'s reign the struggle between the two countries seemed to slacken. An attempt at reconciliation even took place on the marriage of Richard II. with Isabella of France, daughter of Charles VI. (September 26, 1369). But Richard, having been dethroned by Henry of Lancaster (Henry IV.), hostilities were resumed, Henry profiting little by the internal discord of France. In 1415 his son, Henry V., landed in Normandy on the expiry of the truce of the 29th of September 1413, which had been extended in 1414 and 1415. He won the victory of Agincourt (October 25, 1415), and then seized Caen and part of Normandy, while France was exhausting herself in the feuds of Armagnacs and Burgundians. By the treaty of Troyes (May 21, 1415) he obtained the hand of Catherine, Charles VI.'s daughter, with the titles of regent and heir to the kingdom of France. Having taken Meaux on the 2nd of May 1420, and made his entry into Paris on the 30th of May, he died on the 31st of August in the Bois de Vincennes, leaving the throne to his son, Henry VI., with the duke of Bedford as regent in France. Charles VI. died shortly afterwards, on the 21st of October.

His son, who styled himself Charles VII., suffered a series of defeats in the beginning of his reign: Cravant on the Yonne (1423), Verneuil (1424), St James de Beuvron (1426) and Rouvray (1429). Orleans, the last bulwark of royalty, had been besiezed since the 12th of October 1428, and was on the point of surrender when Joan of Arc appeared. She saved Orleans (May 8, 1429), defeated the English at Patay on the 18th of June, had Charles VII. crowned at Reims on the 17th of July, was taken at Compiegne on the 24th of May 1430, and was burned at Rouen on the 30th of May 1431 (see Joan of Arc). From this time on the English lost ground steadily, and the treaty of Arras (March 20, 1435), by which good relations were established between Charles VII. and Philip the Good, duke of Burgundy, dealt them a final blow. Normandy rose against them, while the constable De Richemont 1 drove them from Paris (1436) and retook Nemours, Montereau (1437) and Meaux (1439). The quickly repressed revolt of the Praguerie made no break in Charles VII.'s successes. In 1442 he relieved successfully Saint Sébastien, La Mamonne, La Rêole, and in 1444 Henry VI. had to conclude the truce of Tours. In 1448 the English were driven from Mâz; and in 1449, while Richemont was capturing Cotentin and Fougères, Dunois conquered Lower Normandy and Charles VII. entered Rouen. The defeat of Sir Thomas Kyriel, one of Bedford's veteran captains, at Formigny in 1450, and the taking of Cherbourg, completed the conquest of the province. During this time Dunois in Guienne was taking Bordeaux and Bayonne. Gueneuve revolted against France, whereupon Talbot returned there with an army of 5000 men, but was vanquished and killed at Castillon on the 17th of July 1453. Bourbon was disputed on the 7th of October, and the Hundred Years' War was terminated by the treaty of Chaumont (1444), which was by this time so fully occupied with the Wars of the Roses as to be unable to take the offensive against France anew.

HUNGARY (Hungarian Magyarország), a country in the south-eastern portion of central Europe, bounded E. by Austria (Bukovina) and Romania; S. by Rumania, Servia, Bosnia and Austria (Dalmatia); W. by Austria (Istria, Carniola, Styria and Lower Austria); and N. by Austria (Moravia, Silesia and Galicia). It has an area of 125,402 sq. m., being thus about 4900 sq. m. larger than Great Britain and Ireland.

I. GEOGRAPHY AND STATISTICS

The kingdom of Hungary (Magyarbírálalom) is one of the two states which constitute the monarchy of Austria-Hungary (q.v.), and occupies 51.8% of the total area of the monarchy, Hungary, unlike Austria, presents a remarkable geographical unity. It is almost exclusively continental, having only a short extent of seaboard on the Adriatic (a little less than 100 m.). Its most important rivers are the Danube, and the Tisza, the latter forming its boundary with the neighboring states of Austria and Servia. The principal boundaries: on the N.W., N., E. and S.E. the Carpathian mountains; on the S. the Danube, Save and Unna. On the W. they are not so clearly marked, being formed partly by low ranges of mountains and partly by the rivers March and Leitha. From the last-mentioned river are derived the terms Cisleithania and Transleithania, applied to Austria and Hungary respectively.

General Division.—The kingdom of Hungary in its widest extent, or the "Realm of the Crown of St Stephen," comprises Hungary proper (Magyarország), with which is included the former grand principality of Transylvania, and the province of Croatia-Slavonia. This province enjoys to a large extent autonomy, granted by the so-called compromise of 1868. The town and district of Fiume, though united with Hungary proper in respect of administration, possess a larger measure of autonomy than the other cities endowed with municipal rights. Of the total area of the kingdom Hungary proper has 108,982 sq. m. and Croatia-Slavonia 16,420 sq. m. In the present article the kingdom is treated mainly as a whole, especially as regards statistics. In some respects Hungary proper has been particularly dealt with, while special information regarding the other regions will be found under CROATIA-SLAVONIA, TRANSYLVANIA AND FIUME.

Mountains.—Orographically Hungary is composed of an extensive central plain surrounded by high mountains. These mountains belong to the Carpathians and the Alps, which are separated by the valley of the Danube. But by far the greater portion of the Hungarian highlands belongs to the Carpathian mountains, which begin to the north, on the left bank of the Danube at Dévény near Pressburg (Poszony), run in a north-easterly and easterly direction, sway round south-eastward and then westward in a vast irregular semicircle, and end near the headwaters of the rivers that meet the Balkan mountains. The greatest elevations are in the Tatra mountains of the north of Hungary proper, in the east and south of Transylvania (the Transylvanian Alps) and in the Carpathians proper. The portion of the Carpathians between the Bánffy Forest and Spítal or Gerlachfalva, situated in the Tatra group, has an altitude of 8700 ft. The portion of Hungary situated on the right bank of the Danube is filled by the Alpine system, namely, the eastern group of the Alps, the group of the Leitha mountains, the Styrian highlands, the Lower Hungarian highlands, which are a continuation of the former, and the Bakony Forest. Bakony Forest, which lies entirely within Hungary proper, extends to the Danube in the neighbourhood of Budapest, the highest peak being Körös-hegy (2320 ft.). The south-western portion of this range is specially called Bakony Forest, while the ramifications to the north-east are known as the Vértes group (1575 ft.), and the Pilis group (2475 ft.). The Lower Hungarian highlands extend between the Danube, the Mur, and Lake Balaton, and attain in the
HUNGARY

GEOGRAPHY AND STATISTICS

Mesék hills near Mohács and Pécs an altitude of 2200 ft. The plateau of Zónia extends mostly to the Karst region, and is traversed by the Dinaric Alps.

Plains.-The mountain systems enclose two extensive plains, the smaller of which, called the “Little Hungarian Alfold” or the “Middle Hungarian Alfold” and the larger known as the great Hungarian Alfold. This is the largest, and is a level tract of country 15,000 sq. m., its average elevation above sea-level of from 390 to 350 ft. The Pest Basin extends over the greater portion of central and southern Hungary, and is traversed by the Thies (Tisza) and its numerous tributaries, and by Duna. It is crossed by the Danube, which, through the marshy districts, is covered with barren wastes of sand, alternating with marshes, presents in general a very rich and productive soil. The monotonous aspect of the Alfold is in summer time varied by the dűli-bő, or Palm Harbor.

Caverns.-The numerous caverns deserve a passing notice. The Aggtelek (q.v.) or Baradla cave, in the county of Gömör, is one of the largest in the world. In it various fossil mammalian remains have been found. The Fonáczca cave, in the county of Bihar, has also yielded fossils. No less remarkable are the Ökno, Vodi and Demmelhalva caverns in the county of Lipó, the Marteini at the Banat and the ice cave at Dobsina (q.v.) in Gömör county. Of the many interesting caverns in Transylvania the most remarkable are the sulphurous Bódő in the county of Haromsom, the Almás to near Bethlen, and the Caveken near Berettyo, which is covered with sinter known as “eyes of the sea.”

The greater part of Hungary is well provided with both rivers and springs, but some trachyte and limestone mountainous districts show a marked deficiency in this respect. The Mátra group, e.g., is poorly supplied, while the outlets of the Vértes mountains towards the plain are the most important, as they supply mountain streams, but few water sources. A relative scarcity in water prevailing in the whole region between the Danube and the Drave. The greatest proportionate deficiency, however, is observable in the anomalous region between the Danube and Thiess, where for the most part only periodical floods occur. But in the north and east of the kingdom rivers are numerous. Owing to its orographical configuration the interior of Hungary presents several characteristic features. The first consists, in the parallelism in the course of its rivers, as the Danube and the Theiss, the Drave and the Save, the Waag with the Neutra and the Gran, etc. The second is the division of the plains which constitutes the great characteristic feature of the country, and are collected either mediatly or immediately by the Danube. Only the Zali, the Aluta and the Bodza or Buzeu pierce the Transylvanian Alps, and flow into the Danube outside Hungary. Another characteristic feature is the uneven distribution of the navigable rivers, of which Upper Hungary and Transylvania are almost completely devoid. But even the navigable rivers, owing to the course of their source, are incapable of any considerable external communication. The only river communication with foreign countries is furnished by the Danube, on the one hand to the Black Sea, and on the other to the Adriatic and the Adriatic Sea. All the rivers belong to the watershed of the Danube, with the exception of the Poprad in the north, which, as an affluent of the Dunajec flows into the Vistula, and of a few small streams near the Austrian frontier. The eastern river system of Hungary is called the Porta Hungarica at Děvěny near Presburg, and after a course of 585 m. leaves it at Orsowa near another narrow defile, the Iron Gate. Where it enters Hungary the Danube is 400 ft. above sea-level, and where it leaves it is 127 ft.; it has thus a fall within the country of 273 ft. It forms several large islands, as the Great Schlitt, called in Hungarian Csalákköz from the deceiving island, with an area of nearly 1000 sq. m.; the St Andrew’s or Szent-Erdei island; the Csepp island; and the Magitta island. The principal tributaries of the Danube in Hungary, of which some are amongst the largest rivers in Europe, are, on the right, the Raab, Drave and Save; and, on the left, the Waag, Neutra, Gran, Epel, Theiss (the principal affluent, which receives numerous tributaries) Temes and Cserna. The total length of the river system of Hungary is approximately 1600 m., and of which only about one-third is of the navigable part only one-half is available for steamers. The Danube is navigable for steamers throughout the whole of its course in Hungary. The small tributaries have been employed to form a rendering the country near their banks marshy. Notwithstanding the work already done, such as canalizing and regulating the rivers, the erection of dams, etc., the problems of drainage and of reclaiming the marshes, have yet been satisfactorily solved.

Canals.-Hungary is poorly supplied with canals. They are employed to a small extent for irrigation purposes, but also to transport the rivers from periodical overflow, and to drain the marshy districts. The most important canal is the Franz Joseph canal between Bécs and Bezđan, above Zombor it is about 70 m. in length, and considerably shortens the passage between the Theiss and the Danube. A branch of this canal called Uj Csatorna or New Channel, extends from Bugaj to Újpest, opposite Petervárd. The Béga canal runs from Temesvár to Nagy-Becskerek, and thence to Titel, where it flows into the Theiss. The canal of Kapos or Zichy canal between Lake Balaton and the Danube, joined by the Kocs canal, discharges the lake into the Danube, south of Sopron. The Berettyó canal between the Körös and the Berettyó rivers, and the Körös canal along the White Körös were connected with two drain, the numerous marshes of the Banat, including the Albinar marsh. The Berzava canal ends in the river Temes. The Canal, between the Kapos or Zichy canal between Lake Balaton and the Danube, joined by the Kocs canal, discharges the lake into the Danube, south of Sopron. Not far from the town of Sopron, and is about 23 m. in length by 6 to 8 m. in breadth. It is so shallow that it completely evaporated in 1895, but has filled again since 1870, at the same time changing its configuration. It lies in the marshy district known as the Hanság, through which it is in communication with the Danube. In the neighbourhood of this lake are very good vineyards. Several other small lakes are found in the Hanság. The other lowland lakes, as, for instance, the Pálics near Szabadka, and the Velence lake, in the county of Fehér, are much smaller. In the deep hollows of the Carpathians there are many lakes, especially in the county, called regularly “eyes of the sea.”

The most interesting features of the Carniola are the volcanic and the igneous rocks. The great plain itself is covered for the most part by loess and alluvium, which cover the whole of the lowland districts of the region. The last half of the 19th century many thousands of acres have been reclaimed for agricultural purposes.

Geology.—The hilly regions of Transylvania and of the northern part of Hungary consist of Palaeozoic and Mesozoic rocks and are closely connected, both in structure and origin, with the Carpathian system, but the more elevated regions are formed of Quaternary deposits, through which rise the Banady-wald and the Mescek ridge near Pécs (Fúnikkeren). These are composed chiefly of Triassic beds, but Jurassic and Cretaceous beds take some share in their formation. Amongst the most interesting features of the Banady-wald are the volcanic and the igneous rocks. The great plain itself is covered for the most part by loess and alluvium, which cover the whole of the lowland districts of the region. The last half of the 19th century many thousands of acres have been reclaimed for agricultural purposes.

Geography.—The hilly regions of Transylvania and of the northern part of Hungary consist of Palaeozoic and Mesozoic rocks and are closely connected, both in structure and origin, with the Carpathian system, but the more elevated regions are formed of Quaternary deposits, through which rise the Banady-wald and the Mescek ridge near Pécs (Fúnikkeren). These are composed chiefly of Triassic beds, but Jurassic and Cretaceous beds take some share in their formation. Amongst the most interesting features of the Banady-wald are the volcanic and the igneous rocks. The great plain itself is covered for the most part by loess and alluvium, which cover the whole of the lowland districts of the region. The last half of the 19th century many thousands of acres have been reclaimed for agricultural purposes.

Climate.—Hungary has a continental climate—cold in winter, hot in summer—but owing to the physical configuration of the country it varies considerably. If Transylvania be excepted, three separate zones are roughly distinguishable: the highland, comprising the counties in the vicinity of the Northern and Eastern Carpathians, where the winters are very severe and continue for half the year; the intermediate zone, comprising the counties between the Alps and the Apusenians, and the mountains of the Carniola, where the winters are severe but not exceeding the term of six months; and the plains, where the influence of the sea is considerable and the climate is mild and temperate. The plains of the Danube delta and of the crowded districts around Budapest are warmer than the lower Danube, where the heat during the summer months is almost tropical. In Transylvania the climate bears the name of continental, but also belongs to the mountainous and has a considerable influence of the mountains and the sea. 

The minimum of the temperature is attained in January and the
maximum in July. The rainfall in Hungary, except in the mountainous regions, is small in comparison with that of Austria, but is frequently heavy, though in some years the autumn showers are heavier. Hail storms are of frequent occurrence in the Carpathians. On the plains rain rarely falls during the heat of summer; and the showers thought of are generally of short duration, whilst the moisture is quickly evaporated owing to the aridity of the atmosphere. The vast sandy wastes mainly contribute to the dryness of the winds on the Great Hungarian Alföld. Generally, the whole country suffers much more drought; but disastrous floods not infrequently occur, particularly in the spring, when the beds of the rivers are inadequate to contain the increased volume of water caused by the rapid melting of the snows on the Carpathians. On the whole Hungary is a healthy country, excepting in the marshy tracts, where intermittent fever and diphtheria sometimes occur with great virulence.

The following gives the mean temperature, relative humidity, and rainfall (including snow) at a series of meteorological stations during the years 1896-1900—the

Fauna.—The horned cattle of Hungary are amongst the finest in Europe and are common in the oak forests. The wild animals are bears, wolves, foxes, lynxes, wild cats, badgers, otters, martens, stoats and weasels. Among the rodents there are hares, marmots, beavers, squirrels, rats and mice, the last in enormous swarms. Of the larger game the chamois and deer are specially noticeable. Among the birds are the vulture, eagle, falcon, buzzard, kite, lark, nightingale, heron, stork and bustard. Domestic and wild fowl are generally abundant. The rivers and lakes yield enormous quantities of fish, and lakes also are plentiful. The Thetis, once better supplied with fish than any other river in Europe, has for many years fallen off in its productivity. The culture of the silkworm is chiefly carried on in the south, and in Croatia-Slavonia.

Flora.—Almost every description of grain is found, especially wheat and maize, besides Turkish pepper or paprika, rape-seed, hemp and flax, beans, potatoes and root crops. Fruits of various descriptions, and there particularly melons and stone fruits, are abundant. In the southern districts almonds, figs, rice and olives are grown. Amongst the fruits and trees the oak is the most useful, which yields large quantities of gall, the beech, fir, pine, ash and alder, and the cherry, oak, hornbeam, and linden. The vine is cultivated almost every part of Hungary, the chief grape-growing districts being those of the Hegyalja (Tokaj), Sopron, and Rasz, Mézes, Somlyó (Schomlau), Bélye and Villány, Balaton, Nemeszly, Visonta, Eger (Erak) and Buda. Hungary is one of the greatest wine-producing countries in Europe, and the quality of some of the vintages, especially that of Tokaj, is unsurpassed. A great quantity of tobacco is also grown; it is wholly monopolized by the crown. In Hungary proper and in Croatia and Slavonia there are many species of indigenous plants, which are unrepresented in Transylvania. Besides 12 species peculiar to the former grand-principality, 14 occur only there and in Siberia.

Population.—Hungary had in 1900 a population of 19,254,559, equivalent to 153-7 inhabitants per square mile. The great Alfold and the eastern districts are the most densely populated parts, whereas the northern and eastern mountainous regions are sparsely inhabited. As regards sex, for every 1000 men there were 1011 women in Hungary, and 908 women in Croatia-Slavonia. The excess of females over males is great in the western and northern counties, while in the eastern parts and in Croatia-Slavonia there is a slight preponderance of males.

The population of the country at the censuses of 1880, 1890 and 1900 was:

<table>
<thead>
<tr>
<th>Year</th>
<th>Population</th>
</tr>
</thead>
<tbody>
<tr>
<td>1880</td>
<td>13,749,603</td>
</tr>

<td>1890</td>
<td>13,249,499</td>
</tr>
<tr>
<td>1900</td>
<td>15,421,102</td>
</tr>
</tbody>
</table>

Thus the relative increase of the population living in urban districts of more than 10,000 inhabitants amounted in 1900 to nearly 4% of the total population. In Croatia-Slavonia only 5-62% of the population was concentrated in such towns.

Races.—One of the prominent features of Hungary being the great complexity of the races residing in it (see map, "Distribution of Races.

1 See the table in Seton-Watson's "Racial Problems in Hungary," Appendix xiii, p. 470, and Drage, "Austria-Hungary," p. 289. Of the emigrants in 1906, 52,121 were Magyars, 32,504 Slovaks, 30,551 Germans, 20,895 Romanians and 16,016 Croats.

Races," in the article AUSTRIA), the census returns of 1880, 1890 and 1899, exhibiting the number of the different nationalities. Classifying the population according to the mother-tongue of each individual, there were, in the civil population of Hungary proper, including Fiume:

</table>

The censuses show a decided tendency of change in favour of the dominating nationality, the Magyar, which reached an absolute majority in the decade 1890-1900. This is also shown in the data relating to the percentage of members of other Hungarian races speaking this language. Thus in 1900 out of a total civil population of 8,142,740, whose mother-tongue is not Magyar, 1,365,764 could speak Magyar, or 16.89%, while in 1890 the number was 27.42%, so that the percentage was only 13.8. In Croatia-Slavonia the language of instruction and administration being exclusively Croat, the other races tend to be absorbed in this nationality. The Magyars formed but 46.7% of the population according to the census of 1900.

The various races of Hungary are distributed either in compact ethnographic districts or in larger or smaller communities scattered among other nationalities, or in the Banat—so intermingled as to defy exact definition.1 The Magyars occupy almost exclusively the great plain intersected by the Danube and the Theiss, being, in an overwhelming majority, in counties (97.9% in Hajdú, east of the Theiss). With these may be grouped the kindred population of the three Szekler counties of Transylvania. In 14 other counties, on the linguistic frontier, they are either in a small majority (42.7% in Nagy Kiskőröö, 17.6% in Kis Kiskőröö). The Germans differ from the other Hungarian races in that, save in the counties on the borders of Lower Austria and Styria, where they form a compact community in touch with their kin across the frontier, they are scattered in racial islets throughout the country. Excluding the above counties these settlements form three groups: (1) central and northern Hungary, where they form considerable minorities in seven counties (25% in Szepsz, 7% in Komárom); (2) the Swabians of southern Hungary, also fairly numerous in seven counties (35.5% in Baranya, 32.9% in Temes, 10.5% in Arad); (3) the Saxons of Transylvania, in three counties (50% in Temes, 42% in Nagy Kiskőröö, 17.6% in Kis Kiskőröö). The Germans are most numerous in the towns, and tend to become absorbed in the Magyar population. In Transylvania the number of all nationalities, except the Szekler, are divided into several groups: the Swabians, mainly massed in the mountainous districts of northern Hungary; the Ruthenians, established mainly on the slopes of the Carpathians between Poprad and Máramaros; the Serbs, settled in the south of Hungary from the bend of the Danube eastwards across the Theslovs into the Banat; the Croats, overwhelmingly preponderant in Croatia-Slovenia, with outlying settlements in the county of Zala, Vas and Sopron along the Croatian and Serbian frontiers. Of the Slovenes the most important, having an overwhelming majority in seven counties (94.7% in Arva, 66.1% in Sáros), a bare majority in three (Szepez, Bars and Pajazety) and a consider- able minority in five (40.6% in Gomör, 22.9% in Abauj-Torna). The Ruthenians are not in a majority in any county, but in four they form a minority of from 36 to 46% (Máramaros, Bereg, Udvardi, Ung, Komárom); in three counties (Szepez, Temes, Arad) a percentage of from 8 to 17.4%. The Serbs form considerable minorities in the counties of Torontál (31.4%), Bács-Bodrog (90.5%) and Temes (21.9%). Other nationalities are the Rumanians (Vlachs), who are in an immense majority in ten of the eastern and south-eastern counties (90.2% in Fagara), in eight others form from 30 to 60% of the population, and in two (Máramaros and Torontál) settled respectively.2

The Jews in 1900 numbered 851,378, not counting the very great number who have become Christians, who are reckoned as Magyars. They are as a rule all proportion to their number, but they monopolize a large portion of the trade, are with the Germans the chief employers of labour, and control not only the finances but to a great extent the government and press of the country. Owing to the impossibility of the Hungarian language being the property of the peasants the soil of the country is also gradually passing into their hands.3

The Gipsies, according to the special census of 1893, numbered 639,040. Of these, however, only 82,800 gave Romany as their language, while 104,000 described themselves as Magyars and 67,000 as Rumanians. They are scattered in small communities, especially in Gomör county and in Transylvania. Only some 9,800 are still nomads, while some 20,000 more are semi-nomadic. Other races, which are not numerous, are Armenians, Greeks, Bulgars, Albanians and Italians.

The ethnographic map of Hungary does much to explain the political problems of the country. The central plains, which have the most fertile soil, and from the geographical conditions of the country form its centre of gravity, are occupied almost exclusively by Magyars. The races of the mountainous districts are almost all round these, as far as the frontiers, the country is inhabited by the other races, which, as a rule, occupy it in large, compact and uniform ethnographic groups. The only exception is formed by those districts where Magyars, Serbians, Bulgars, Gipsies, and Germans live mixed together. Another important fact is that these races are all in direct contact with kindred peoples living outside Hungary: the Rumanians in Transylvania and Banat with those in Rumania and Bukovina; the Serbs and Croats with those on the other bank of the Danube, the Save and the Unna; the Germans in western Hungary with those in Upper Austria and Styria; the Slovaks in northern Hungary with those in Moravia; and lastly the Ruthenians with the Gipsies of Galicia, who occupy the opposite slopes of the Carpathians. The centrifugal tendency within the Hungarian kingdom are greatly increased by the attraction of kindred nationalities established beyond its borders, a fact which is of special importance in considering the vexed and difficult racial problem in Hungary.

1 The colouring of ordinary ethnographic maps is necessarily somewhat misleading. When an attempt is made to represent in colour the actual distribution of the races (as in Dr Chavanne's Geographischer und statistischer Handkarte) the effect is of occasional blotches of solid colour on a piece of shot silk.

2 The distribution of the races is analysed in greater detail in Mr Seton-Watson's "Racial Problems," p. 3 seq.

3 Seton-Watson, op. cit. pp. 173, 188, 252; Drage, Austria-Hungary, pp. 280, 588; Conrad, La Hongrie, p. 72.

</table>

In Croatia-Slavonia no crop statistics were compiled before 1885. Subsequent returns for maize and wheat show an increase both in the area cultivated and quantity yielded. The former is the principal product of this province. Certain districts are distinguished for particular kinds of grain, which form the principal article of commerce both for inland consumption and for export. The principal of these fruits are: apricots round Kecksméret, cherries round Körös, melons in the Sállfold and gourds in Croatia-Slavonia. The vineyards of Hungary, which have suffered greatly by the phylloxera since 1881, show since 1900 a tendency to recover ground, and their area is again slowly increasing.

In Hungary proper the productive area of Hungary 26-60% is occupied by forests, which for the most part cover the slopes of the Carpathians. Nearly half of them belong to the state, and in them foresters have been carried out on a scientific basis since 1879. The exploitation of the state forests has a fresh and important article of commerce, especially the export of wood for household purposes and fuel. In Austria-Hungary in 1895 the output of wood was estimated at 28,239,100 cu. m. of timber, 78,700,000 cu. m. of bark, and 21,200,000 tons of charcoal.

**Livestock.** —The number of live stock in Hungary proper in two different years is shown in the following table:

<table>
<thead>
<tr>
<th>Class</th>
<th>1884</th>
<th>1895</th>
</tr>
</thead>
<tbody>
<tr>
<td>Horses</td>
<td>1,479,302</td>
<td>1,072,930</td>

<td>10,354,300</td>
<td>7,079,758</td>
</tr>
<tr>
<td>Pigs</td>
<td>4,905,777</td>
<td>4,647,154</td>
</tr>
</tbody>
</table>

In Croatia-Slavonia the live stock was numbered in 1895 at: horses, 390,695; cattle, 408,774; sheep, 593,898; pigs, 882,957. But the returns of state of the live stock is more worthy of notice than the growth of it. The same care has been bestowed on improving the breed of horses as in the case of the cattle. The principal breeds are either native or Swiss (especially those that of Simmental). The export trade in cattle is considerable, amounting in 1905 to 1,203,296 head of

### Minerals.

Hungary is one of the richest countries in Europe as regards both the variety and the extent of its mineral wealth. Its chief mineral products are coal, nitre, sulphur, alum, soda, saltpetre, gyrol, pyrites, marl, sandstone, marlstone, porcelain, sandstone, and the salt and ores of silver, gold, mercury, copper, iron, lead, zinc, antimony, cobalt and arsenic. The principal mining regions are Zsépes-Gömör in Upper Hungary, the Kremnitz-Schemnitz district, the Nagybánya district, the Transylvania deposits and the Bánát. The salt and silver are chiefly found in Transylvania, where their exploitation dates back to the Roman period, and are mined at Zalatna and Abrudhánya; rich deposits are also found in the Kremnitz-Schemnitz, and the Nagybánya districts. The average yearly yield of gold is about £1,000,000, and that of silver at about £500,000. The sand and marl of the rivers, as for instance the Maros, Samos, Köros and Tisza, is auriferous, and is extensively worked. The alluvial deposits of Budapest-Oravicza, Nagybánya, Zalatna, at Bremberg near Sopron, at Salgó-Tárnaj, Pécs, in the counties of Krassó-Szórény, and of Esztergom, and in the valley of the river Zeli. Iron is extremely abundant. The coal and iron deposits are found in the counties of Zemplén, Pest, and Zala; the production of coal and iron trebled during the period 1880-1900, amounting in 1900 to 6,600,000 tons, and 493,000 tons respectively. The principal bituminous coal deposits are those of Zalatna, Torda, Parajd, Décsáka, and Maros-Ujvár; and in Hungary at Szalkai, Hámor, and Szatag. The salt-mines are a state monopoly. Hungary is the only country in Europe where the opal is found, namely in the famines of Istria. The whole of the Hungarian opal is obtained from the mine of Mihály in that of Zemplin. Other precious stones found are chalcedony, garnet, jacinth, amethyst, carnelian, agate, rock-crystals, &c. Ammon is found at Magura in Zsépes, while fine marble quarries are found in the counties of Pest, Zala, and Zemplin, and in the counties of Zala and Zemplin. The value of the mining (except salt) and smelting production in Hungary amounted in 1900 to £4,500,000, while in 1877 the output was only £1,400,000. The number of persons employed in mining and smelting was (1900) 5,000.

### Industrial Development.

—Efforts to create a native industry date back to 1867, and, considering the shortness of the time and other adverse circumstances, such as the difficulty of communication, the development of industry in the neighbouring state of Austria, &c., the industry of Hungary has made great strides. Much of this progress is due to the state, one of the principal aims of the Hungarian government has been the creation of a large and independent native industry. For this purpose legislation was promoted in 1867, 1881, 1890 and 1907. The principal facilities granted by the state are, exemption of taxation for a determined period of years, reduced railway fares for the goods manufactured, placing of government contracts, the grant of subsidies and loans and the foundation of industrial schools for the training of engineers and of mechanics. The first of the state aided industries which have received special encouragement are those whose products are in universal request, such as cotton and woollen goods, and those which are in the interest of native population. In this category are the manufacture of agricultural machines, of tools and implements for agriculture, forestry and mining; such industries as depend for their raw material on the exploitation of the natural resources of the country. These are, for instance, the salt mines and coal mines, the iron furnaces, the iron-works at Rákoscsaba, the textile mills at Pest and Székesfehérvár, the paper and china factories at Brunn and Győr, and the works at Sopron, and the sugar refineries and the distilleries at Pécs and Szolnok. Lastly, encouragement is given to all branches of industry concerned with the manufacture of articles used in the more important Hungarian industries, i.e. machinery, or semi-manufactured goods which are used as raw materials for the production of the many heavy industries which have received special encouragement. The number of these articles, which are estimated to be 3,100,000 in 1890, and to 3,800,000 in 1905. Between 3,000,000 and 3,200,000 tons of wheat-flour are produced annually. The principal steam-mills are at Héllér; large steam-mills are also established in many towns, while there are a great number of water-mills and some wind-mills.

---

An admirable account of this “little world, which produces almost everything and is almost self-sufficient” is given by M. Gonnard in his *Hongrie au XIXᵉ siècle*, p. 159 seq.

Ib. p. 349 seq.
The products of these mills form the principal article of export of Hungary. Brewing and distilling, as other branches of industry connected with agriculture, are also greatly developed. The sugar industry has made great strides; the amount of beetroot used having increased tenfold between 1880 and 1905. Other principal branches of industry are: tobacco manufactories, as already pointing to the state, tobacco being a government monopoly; iron foundries, mostly in the mining region; agricultural machinery and implements, notably at Budapest; leather manufactories; paper-mills, the largest at Fiume (the old name of the town); cotton-mills (notes the common sort) and earthenware; chemicals; wooden products; petroleum-refineries; woollen yarns and cloth manufactories, as well as several establishments of knitting and weaving, where the industrial establishments are located in the larger towns, but principally at Budapest, the only real industrial town of Hungary.

In 1900 the various industries of Hungary (including Croatia-Slavonia) employed 727,300 persons, or 12·8% of the earning population. In 1890 the number of persons employed was 613,810. Including families and domestic servants, 2,605,000 persons or 13.8% of the total population were dependent on industries for their livelihood in Hungary in 1900.

Commerce.—Hungary forms together with Austria one customs and commercial territory, and the statistics for the foreign trade is given in the table under Austria-Hungary. The foreign trade of Hungary only for a period of years in millions sterling:

The products of these mills form the principal article of export of Hungary. Brewing and distilling, as other branches of industry connected with agriculture, are also greatly developed. The sugar industry has made great strides; the amount of beetroot used having increased tenfold between 1880 and 1905. Other principal branches of industry are: tobacco manufactories, as already pointing to the state, tobacco being a government monopoly; iron foundries, mostly in the mining region; agricultural machinery and implements, notably at Budapest; leather manufactories; paper-mills, the largest at Fiume (the old name of the town); cotton-mills (notes the common sort) and earthenware; chemicals; wooden products; petroleum-refineries; woollen yarns and cloth manufactories, as well as several establishments of knitting and weaving, where the industrial establishments are located in the larger towns, but principally at Budapest, the only real industrial town of Hungary.

</table>
of agriculture, of industry and commerce, of justice, the minister for Croatia-Slavonia, and the minister ad latus or near the king's person. As regards local government, the country is divided into municipalities or counties, which possess a certain amount of self-government. Hungary proper is divided into sixty-three rural, and including Flómit twenty-six urban municipalities (see on Administrative Divisions). These urban municipalities are towns which for their local government are independent, and have, therefore, a larger amount of municipal autonomy than the communes or the other towns. The administration of the municipalities is carried on by an official appointed by the king, aided by a representative body. The representative body is composed half of elected members, and half of citizens who pay the highest taxes. Since 1876 each municipality has a council of twenty members to exercise control over its administration.

Administrative Divisions.—Since 1867 the administrative and political divisions of the lands belonging to the Hungarian crown have been in great measure remodelled. In 1868 Transylvania was definitely reunited to Hungary proper, and the town and district of Fiume declared autonomous. In 1873 part of the "Military Frontier" was transferred to Hungary proper and part with Croatia-Slavonia. Hungary proper, according to ancient usage, was generally divided into four great divisions or circles, and Transylvania up to 1876 into three, and for administrative purposes a new system was introduced. According to this new division Hungary proper is divided into seven circles, of which Transylvania forms one. The whole country is divided into the following counties:

- in the left bank of the Danube contains eleven counties:
  1. Arva,
  2. Bars, (e)
  3. Esztergom,
  4. Hort, (i)
  5. Liptó, (5)
  6. Nógrád, (7)
  7. Nyitra, (8)
  8. Pozsony, (9)
  9. Trenčín, (10)
  10. Žitomín, (11)

- in the right bank of the Danube contains eleven counties:

- the circle between the Danube and the county contains five counties:
  1. Békés, Bihar, Hajdú, Máramaros, Szabolcs, Szilágy and Ung姹.

- the circle between the Thessaloniki and the county contains five counties:
  1. Arad, Csákvár, Krass-Szérowy, Temes and Tolna.

- these thirty-six counties are divided into four urban municipalities:

- these thirty-six counties for Hungary, and eight for Croatia-Slavonia, Hungary has twenty-six urban counties or towns with municipal rights. These are, Nádasd, Baja, Debrecen, Győr, Hódmező-Vásárhely, Kassa, Kecskeméth, Kolozsvár, Komárom, Maros-Vásárhely, Nagyváz, Pávo, Pozsony, Selmecbánya, Sopron, Szabadka, Szolnok-Németi, Szeged, Székesfehérvár, Temesvár, Újvidék, Versecz, Zombor, the town of Fiume, and Budapest, the capital of the country.

In Croatia-Slavonia there are four urban counties or towns with municipal rights namely: Eszék, Varad, Zágráb and Zimony.

Justice.—The judicial power is independent of the administrative power. The administration in the districts is carried on by the district courts with single judges (156 in 1900); (2) the county courts with collegiate judgements (76 in number); to these are attached 15 jury courts for pres ess offences. These are courts of first instance. (3) The county courts, or Tatabánya, which are the county courts established at Budapest, Debrecen, Győr, Kassa, Kolozsvár, Maros-Vásárhely, Nagyváz, Pécs, Pressburg, Sárvár, Temesvár and Zágráb. (4) The Royal Supreme Court at Budapest, and the Superior Court of Appeals and the Court of Cassation are the highest judicial authorities. There are also a special commercial court at Budapest, a naval court at Fiume, and special army courts.

Finance.—After the revolution of 1848-49 the Hungarian budget was amalgamated with the Austrian, and it was only after the Compromise of 1867 that Hungary received a separate budget. The public revenue of the Hungarian crown was later appreciated by a comparison of the estimates for the year 1849-50 prepared by the Hungarian minister of finance, which shows a revenue of £1,335,000 and an expenditure of £1,366,000 (including £3,500,000 for warlike purposes), with the budget of 1899, which shows a revenue of £51,583,000, and an expenditure of about the same sum. Owing to the amount spent on railways, the Fiume harbour works and other public works, the Hungarian budgets after 1869 showed a deficit, until in 1888 great reforms were introduced and the finances of the country were established on a more solid basis. During the years 1895-1905 the annual revenue was £42,000,000, and the expenditure £39,000,000; in 1900 the revenue and expenditure balanced themselves at £45,400,000. The following figures in later years are typical:

<table>
<thead>

</tbody>
</table>

The ordinary revenue of the state is derived from direct and indirect taxation, monopolies, stamp dues, &c. In 1904 direct taxes amounted to £9,048,000, and the chief heads of direct taxes yield as follows: ground tax, £2,371,000; tax, £1,879,000; income tax, £1,400,000; house tax, £1,000,000. Indirect taxes amounted in 1904 to £7,363,000, and the chief heads of indirect taxation yielded as follows: taxes on alcoholic drinks, £4,375,000; on tobacco, £1,100,000; sugar, £650,000; liquor, £650,000. Other revenues yielded as follows: stamp taxes and duties, £3,634,000; state railways, £3,545,000; post and telegraphs, £710,000; state landed property and forests, £520,000.

The national debt of Hungary alone, excluding the debt incurred under the National Bank, which is not part of the Hungarian crown, was £192,175,000 at the end of 1903. The following table shows the growth of the total debt due to expenditure on public works, in millions sterling:

Religion.—There is in Hungary just as great a variety of religious confessions, as there is of nationalities and of languages. There are two religious communities, which possess an overwhelming majority, but perfect equality is granted to all religious creeds legally recognized. According to the census returns of 1900 in Hungary proper there were:

<table>
<thead>
<tr>
<th>Religion</th>
<th>Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>Roman Catholics</td>
<td>8,069,969</td>
</tr>
<tr>
<td>Greek Uniates</td>
<td>1,937,739</td>
</tr>
<tr>
<td>Greek Orthodox</td>
<td>2,086,680</td>
</tr>
<tr>
<td>Evangelicals</td>
<td>1,993,680</td>
</tr>
<tr>
<td>Augustan confession, or Lutherans</td>
<td>1,935,860</td>

<td>1,312,100</td>
</tr>
<tr>
<td>Others</td>
<td>13,466,008</td>
</tr>
</tbody>
</table>

In many instances nationality and religious faith are commingled. Thus the Servians are mostly Greek Orthodox; the Ruthenians are Uniates; the Rumanians are either Greek Orthodox or Greek Uniates; the Slovaks are Lutherans; the other only Lutherans are the Hungarian Calvinists. The Rumanian and the Hungarian Calvinists are composed mostly of Magyars, so that in the county the Lutherans are designated as the "German Church," and the Calvinists as the Hungarian Church. The Rumanians are all Magyars and only speak the Rumanian language. There are many different religious sects, including various nationalities. The Roman Catholic Church has 4 archbishoprics; Esztergom (Gran), Kalocsa, Eger (Erlau) and Zágráb (Agram), and 17 diocesan bishops; to the latter must be added the chief abbot of Pannonhalma, who like his sees enjoys episcopal rights. The primate is the archbishop of Esztergom, who also bears the title of prince, and whose special privilege it is to crown the sovereigns of Hungary. The Greek Uniat Church owes beside the archbishop of Esztergom the archbishop of Gyulafehér (Carlsburg), or rather Baliáskalva (i.e. "the city of Blasius") and 6 bishops. The Armenian Uniat Church is partly under the jurisdiction of the Roman Catholic bishop of Transylvania, and partly under that of the archbishop of Kalocsa. The Orthodox Eastern Church in Hungary is subject to the authority of the metropolitan of Carlowitz and the archbishop of Nagyszeben (Hermannstadt); under the former are the bishops of Bacs, Buda, Temesvár, Versecz and Pakse, and under the latter the bishops of Arad and Karánsebés. The two great Protestant communities are divided into ecclesiastical districts, five for each; the heads of these districts bear the title of superintendent. The Uniates, under their resident bishop, are under the authority of a bishop, whose see is Kolozsvár (Klausenburg). The Jewish communities are comprised in ecclesiastical districts, under the head diocesan bishop at Budapest.

Education.—Although great improvements have been effected in the educational system of the country since 1867, Hungary is still backward in the matter of general education, as in 1900 only a little over 50% of the population could read and write. The 1867 public instruction was entirely in the hands of the clergy of the various confessions, as is still the case with the majority of the

1. i.e. Catholics of the Oriental rite in communion with Rome.
primary and secondary schools. One of the first measures of newly established Hungarian government was to provide supplementary schools for the country's rural and urban areas, by a law passed in 1888. Attendance at school is obligatory on all children between the ages of 6 and 12 years. The communes or parishes are bound to maintain elementary schools, and they are entitled to levy an additional tax of between 1 and 2 forints per head to that effect. But the number of state-aided elementary schools is continually increasing, as the spread of the Magyar language to the other races throughout the whole of Hungary is a necessity of the present day.

In 1902 there were in Hungary 18,729 elementary schools with 15,020 teachers, attended by 2,573,777 pupils, figures which compare favorably with those of 1872, when there were 15,486 schools with 20,717 teachers, attended by 1,559,656 pupils. In about 61% of these schools the language used was exclusively Magyar, in about 20% it was partly Magyar, and in about 19% Magyar was not used at all. In 1907, 80-86% of the children of school age actually attended school. Since 1891 infant schools, for children between the ages of 3 and 6 years, have been maintained either by the communes or by the state.

The public instruction of Hungary contains three other groups of educational institutions: middle or secondary schools, high schools, and technical schools. The middle schools comprise classical schools (gymnasia) which are preparatory for the universities and other “high schools,” and modern schools (Realschulen) preparatory for the technical schools. Their course of study is generally four years, and they are attended mostly by boys. The state-maintained gymnasia are mostly of recent foundation, but some schools maintained by the various churches have been in existence for three, or sometimes four, centuries. The number of middle schools, in 1894, was 243, with 71,788 pupils; in 1880 their number was 185, attended by 40,477 pupils.

The high schools include the universities, of which Hungary possesses three, all maintained by the state: at Budapest (founded in 1635), at Kolozsvár (founded in 1872), and at Zágráb (founded in 1874). They have four faculties: of theology, law, philosophy and medicine. (The university at Zágráb without a faculty of medicine.) There are besides ten high schools of law, called academies, which in 1900 were attended by 1,569 pupils. The Polytechnicum in Budapest, founded in 1872, which contains four faculties and was attended in 1900 by 1,772 pupils, is also considered a high school. There were in Hungary in 1900 forty-nine high theological colleges, twenty-nine Roman Catholic; five Greek Uniat, four Greek Orthodox, ten Protestant and one Jewish. Among special schools the principal mining schools are at Selmecbánya, Nagyág and Pelsőbánya; the principal agricultural colleges at Debreczen and Kolozsvár; and there are a school of forestry at Selmecbánya, military colleges at Budapest, Kassa, Dvůra and Zágráb, and a naval school at Flume. There are besides an adequate number of training institutes for teachers, a great number of schools of commerce, of music, of painting, of drama, of agriculture, and of gymnastics, and of course of music, &c. Most of these special schools are of recent origin, and are almost entirely maintained by the state or the communes.

The National Library of Hungary is situated at Budapest; the University Library, also at Budapest, and the library of the abbey of Pannonháma. Besides the museums mentioned in the article Budapest, several provincial towns contain interesting museums, both public and private. At Kolozsvár there is a museum of natural history and geology; further, the national museum at Zágráb, the national (Székyé) museum at Maros-Vásárhely, and the Carpathian museum at Poppend should be mentioned.

At the head of the learned and scientific societies stands the Hungarian Academy of Sciences, founded in 1830; the Kisalföldy Society, the Páti Society, and numerous societies of specialists, as well as the historical, geographical, &c., with their centres at Budapest. There are besides a number of learned societies in the various provinces for the fostering of special provincial or national aims. There are also a number of societies for the propagation of culture, both against the Hungarian nation and among the Magyars. Worth mentioning are also the two Carpathian societies: the Hungarian and the Transylvanian.

J. K. Németh

1 The methods pursued to this end are exposed in pitiless detail by Mr Seton-Watson in his chapter on the Education Laws of Hungary, in Racial Problems, 205.
of the captives of the Magyars had been settled all over the country to teach their conquerors the arts of peace, and close contact with this civilizing element was of itself an enlightenment. The moral superiority of Christianity to paganism was speedily obvious. The only question was which form of Christianity were the Magyars to adopt, the Eastern or the Western? Constantineple was the first in the field. The splendour of the imperial city profoundly impressed all the northern barbarians, and the Magyars, during the 10th century, saw a great deal of the Greeks. One Transylvanian raider, Gyula, brought back with him from Constantineple a Greek monk, Hierothus (c. 950), who was consecrated "first bishop of Turka." Simultaneously a brisk border trade was springing up between the Greeks and the Magyars, and the Greek chapmen brought with them their religion as well as their wares. Everything at first tended to favour the propaganda of the Greek Church. But ultimately political prevalent over religious considerations. Alarmed at the sudden revival of the Eastern Empire, which under the Macedonian dynasty extended once more to the Danube, and thus became the immediate neighbour of Hungary, Duke Geza, who succeeded Taksí in 972, shrewdly resolved to accept Christianity from the more distant and therefore less dangerous emperor of the West. Accordingly an embassy was sent to Otto II. at Quedlinburg in 973, and in 975 Geza and his whole family were baptized. During his reign, however, Hungarian Christianity did not extend much beyond the limits of his court. The nation at large was resolutely pagan, and Geza, for his own sake, was obliged to act warily. Moreover, by accepting Christianity from Germany, he ran the risk of imperilling the independence of Hungary. Hence his cautious, dilatory tactics: the encouragement of Italian propagandists, who were few, the discouragement of German propagandists, who were many. Geza, in short, regarded the whole matter from a statesman's point of view, and was content to leave the solution to time and his successor.

That successor, Stephen I. (q.v.), was one of the great constructive statesmen of history. His long and strenuous reign (997–1038) resulted in the firm establishment of the Hungarian church and the Hungarian state. The great work may be said to have begun in 997, when Pope Silvester II. recognized Magyar nationality by endowing the young Magyar prince with a kingly crown. Less fortunate than his great exemplar, Charlemagne, Stephen had to depend entirely upon foreigners—men like the Saxon Atrík (c. 976–1010), the first Hungarian primate; the Lombard St. Gallert (c. 977–1049); the Besomanns, a German family, better known under the Magyarized form of their name Pámánya, and many others who came to Hungary in the suite of his enlightened consort Gisela of Bavaria. By these men Hungary was divided into dioceses, with a metropolitan see at Esztergom (Gran), a city originally founded by Geza, but richly embellished by Stephen, whose Italian architects built for him there the first Hungarian cathedral dedicated to St. Adalbert. Towns, most of them also the sees of bishops, now sprang up everywhere, including Székesfehérvár (Stuhlweissenburg), Veszprém, Pécs (Fünfkirchen) and Győr (Raab). Esztergom, Stephen's favourite residence, was the capital, and continued to be so for the next two centuries. But the Benedictines, whose settlement in Hungary dates from the establishment of their monastery at Pannonhalma (c. 1001), were the chief pioneers. Every monastery erected in the Magyar wildernesses was not only a centre of religion, but a focus of civilization. The monks cleared the forests, cultivated the recovered land, and built villages for the followers of St. Ciprian, who, like their companions elsewhere, were taught the teaching the people Western methods of agriculture and western arts and handicrafts. But conversion, after all, was the chief aim of these devoted missionaries, and when some Venetian priests had invented a Latin alphabet for the Magyar language a great step had been taken towards its accomplishment.

The monks were soon followed by foreign husbandmen, artificers and handicraftsmen, who were encouraged to come to Hungary by reports of the abundance of good land there and the promise of privileges. This immigration was also stimulated by the terrible condition of western Europe between 987 and 1060, when it was visited by an endless succession of bad harvests and epidemics.4 Hungary, now better known to Europe, came to be regarded as a Promised Land, and, by the end of Stephen's reign, Catholics of all nationalities, Greeks, Pagans, Jews and Mahommedans were living secretly together within her borders. For, inexorable as Stephen ever was towards fanatical fanatics, renegades and rebels, he was too good a statesman to inquire too closely into the private religious opinions of useful and quiet citizens.

In endeavouring, with the aid of the church, to establish his kingship on the Western model Stephen had the immense advantage of building on unencumbered ground, the greater part of the soil of the country being at his absolute disposal. His authority, too, was absolute, being tempered only by the shadowy right of the Magyar nation to meet in general assembly, and this authority he was careful not to compromise by any slavish imitation of that feudal polity by which in the West the royal power was becoming obscured. Although he broke off the Magyar tribal system, encouraged the private ownership of land, and even made grants of land on condition of military service—in order to secure an armed force independent of the national levy—he based his new principle of government, not on feudalism, but on the organization of the Frankish empire, which he adapted to suit the peculiar exigencies of his realm. Of the institutions thus borrowed and adapted the most notable was the famous county system which still plays so conspicuous a part in Hungarian national life. Central and western Hungary (the south and north-east still being desolate) were divided into forty-six counties (đvargyekek, Lat. comitatus). At the head of each county was placed a count, or lord-lieutenant4 (Főispán, Lat. comes), who nominated his subordinate officials: the castellan (đvangy), chief captain (hadnegy) and "hundredor" (szádos, Lat. centurio). The lord-lieutenant was nominated by the king, whom he was bound to follow to battle at the first summons. Two-thirds of the revenue of the county went into the royal treasury, the remaining third the lord-lieutenant retained for administrative purposes. In the county system were included all the inhabitants of the country save two classes: the still numerous pagan clans, and those nobles who were attached to the king's person, from whom he selected his chief officers of state and the members of his council, of which we now hear for the first time.

It is significant for the whole future of Hungary that no effort was or could be made by Stephen to weld the heterogeneous races under his crown into a united nation. The body politic consisted, after as before, of the king and the whole mass of Magyar freemen or nobles, descendants of Arpad's warriors, theoretically all equal in spite of growing inequalities of wealth and power, who constituted the popular; privileges were granted by the king to foreign immigrants in the cities, and the rights of nobility were granted to non-Magyars for special services; but, in general, the non-Magyars were ruled by the royal governors as subject races, forming—in contradistinction to the "nobles"—the mass of the peasants, the miséra contribuens plebs upon whom until 1848 nearly the whole burden of taxation fell. The right, not often exercised, of the Magyar nobles to meet in general assembly and the elective character of the crown, Stephen also did not venture to touch. On the other hand, his example in manumitting most of his slaves, together with the precepts of the church, gave rise to a new element of freedom and equality. In the 13th century, the slaves becoming for the most part serfs, who differed from the free peasants only in the fact that they were attached to the soil (adscript liberi).

At this time all the conditions of life in Hungary were simple. 2 At its worst, c. 1030-1033, cannibalism was common. 4 The English title of lord-lieutenant is generally used as the best translation of Főispán. The title of count (grof) was assumed later (15th century) by those nobles who had succeeded, in spite of the Golden Bull, in making their authority over whole counties independent and hereditary.—[Ed.]
HUNGARY

and primitive. The court itself was perambulatory. In summer the king dispensed justice in the open air, under a large tree. Only in the short winter months would he dwell in the palace built for him at Esztergom by Italian architects. The most valuable part of his property still consisted of flocks and herds, or the products of the labours of his serfs, a large proportion of whom were bee-keepers, hunters and fishers employed in and around the interminable virgin-forests of the rough-bewn young monarchy.

A troubled forty years (1038–1077) divides the age of St Stephen from the age of St Ladislaus. Of the six kings who reigned in Hungary during that period three died violent deaths, and the other three were fighting incessantly the Communion and the domestic foes. In 1046, and again in 1061, two dangerous pagan risings shook the very foundations of the infant church and state; the western provinces were in constant danger from the attacks of the acquisitive emperors, and from the south and southeast two separate hordes of fierce barbarians (the Petchenegs in 1067–1068, and the Kumanian in 1071–1072) burst over the land. It was the general opinion abroad that the Magyars would either relapse into heathendom, or become the vassals of the Holy Roman Empire, and this opinion was reinforced by the hopes held out in the house built by the Árpád Kings. The political independence of Hungary was ultimately secured by the outbreak of the quarrel about investiture (1076), when Geza I. (1074–1077) shrewdly applied to Pope Gregory VII. for assistance, and submitted to accept his kingdom from him as a fief of the Holy See. The immediate result of the papal alliance was to enable Hungary, under both Ladislaus and his capable successor Coloman (1005–1116), to hold her own against all her enemies, and extend her dominion abroad by conquering Croatia, and a portion of the Dalmatian coast. As an inept great power, she was beginning to feel the need of a seaport.

In the internal administration both Ladislaus I. and Coloman approved themselves worthy followers of St Stephen. Ladislaus planted large Petcheneg colonies in Transylvania and the trans-Duravian provinces, and established military cordons along the constantly threatened south-eastern boundary, the germs of the future banates.1(bőségek) which were to play such an important part in the national defence in the following century. Law and order were enforced with hostile attitude by the kings towards the house built by the Árpád Kings. The political independence of Hungary was ultimately secured by the outbreak of the quarrel about investiture (1076), when Geza I. As an inept great power, she was beginning to feel the need of a seaport.

In the internal administration both Ladislaus I. and Coloman proved themselves worthy followers of St Stephen. Ladislaus planted large Petcheneg colonies in Transylvania and the trans-Duravian provinces, and established military cordons along the constantly threatened south-eastern boundary, the germs of the future banates.1(bőségek) which were to play such an important part in the national defence in the following century. Law and order were enforced with the utmost rigour. In that rough age crimes of violence predominated, and the king's justiciars regularly perambulated the land in search of offenders, and decimated every village which refused to surrender fugitive criminals. On the other hand, both the Jews and the "Ishmaelites" (Mahommedans) enjoyed complete civil and religious liberty in Hungary, where, indeed, they were too valuable to be persecuted. The Ishmaelites, the financial experts of the day, were the official mint-masters, treasurers and bankers. The clergy, the only other educated class, supplied the king with his lawyers, secretaries and ambassadors. The Magyar clergy was still a married clergy, and their conœval privileges were solemnly confirmed by the synod of Szabolcs, presided over by the king, in 1002. So firmly rooted in the land was this practice, that Coloman, much as he needed the assistance of the Holy See in his foreign policy, was only with the utmost difficulty induced, in 1106, to bring the Hungarian church into line with the rest of the Catholic world by enforcing clerical celibacy. Coloman was especially remarkable as an administrative reformer, and Hungary, during his reign, is said to have been the best-governed state in Europe. He regulated and simplified the whole system of taxation, encouraged agriculture by differential duties in favour of the farmers, and promoted trade by a systematic improvement of the ways of communication.

The Magna via Colomanni Regis was in use for centuries after his death. Another important reform was the law permitting the free disposal of landed estate, which gave the holders an increased interest in their property, and an inducement to improve it. During the reign of Coloman, moreover, the number of freemen was increased by the frequent manumission of serfs.

1 The bős is equivalent to the margrave, or count of the marches.

The lot of the slaves was also somewhat ameliorated by the law forbidding their exportation.

Rivalry with the Eastern Empire.

Throughout the greater part of the 12th century the chief impediment in the way of the external development of the Hungarian monarchy was the Eastern Empire, which, under the first three princes of the Connen dynasty, dominated south-eastern Europe. During the earlier part of that period the Magyars competed on fairly equal terms with their imperial rivals for the possession of Dalmatia, Rascia (the original home of the Servians, situated between Bosnia, Dalmatia and Albania) and Râma or northern Bosnia (acquired by Hungary in 1135); but on the accession of the so-called Stupin in 1173 the struggle became acute. The grandson of St Ladislaus, Manuel had Hungarian blood in his veins; his court was the ready and constant refuge of the numerous Magyar malcontents, and he aimed not so much at the conquest as at the suzerainty of Hungary, by placing one of his Magyar kinsmen on the throne of St Stephen. He successfully supported the claims of no fewer than three pretenders to the Magyar throne, and finally made Béla III. (1173–1196) king of Hungary, on condition that he left him, Manuel, a free hand in Dalmatia. The intervention of the Church (the ringing of the bells of the church at Colomann in Hungary, the Greek Orthodox Church, which permitted a married clergy and did not impose the detested tithe (the principal cause of nearly every pagan revolt) attracting thousands of adherents even among the higher clergy. At one time, indeed, a Magyar archbishop and four or five bishops openly joined the Orthodox communion and willingly crowned Manuel's nominee despite the anathemas of their Catholic brethren.

The Eastern Empire ceased to be formidable on the death of Manuel (1080), and Hungary was free once more to pursue a policy of aggrandizement. In Dalmatia the Venetians were too strong for her; but she helped materially to break up the Byzantine rule in the Balkan peninsula by assisting Stephen Nemanya to establish an independent Servian kingdom, originally under nominal Hungarian suzerainty. Béla endeavoured to strengthen his own monarchy by introducing the hereditary principle, crowning his infant son Emerich, as his successor during his own lifetime, a practice followed by most of the later Árpáds; he also held a brilliant court on the Byzantine model, and replenished the treasury by his wise economies.

Unfortunately the fruits of his diligence and foresight were dissipated by the follies of his two immediate successors, Emerich (1166–1204) and Andrew II. (q.v.), who weakened the royal power in attempting to win support by lavish grants of the crown domains on the already over-inflationary magnates, a policy from which dates the supremacy of the semi-savage Magyar oligarchs, that insolent and self-seeking class which would obey no superior and trampled ruthlessly on every inferior. The most conspicuous event of Andrew's reign was the promulgation in 1227 of the so-called Golden Bull, which has aptly been called the Magna Carta of Hungary, and is in some of its provisions strikingly reminiscent of that signed seven years previously by the English king John.

The Golden Bull has been described as consecrating the humiliation of the crown by the great barons, whose usurpations it legalized; the more usually accepted view, however, is that it was directed not so much to weakening as to strengthening the crown by uniting its interests with those of the mass of the Magyar nobility, equally threatened by the encroachments of the great barons. The preamble, indeed, speaks of the curtailment of the liberties of the nobles by the power of certain of the kings, and at the end the right of armed resistance to any attempt to infringe the charter is conceded to "the bishops and the higher and lesser nobles" of the realm; but, for the rest, its contents clearly show that it was intended to strengthen the monarchy by ensuring "that the momentary folly of the nobles be no more".2

2 Andrassy, Development of Hung. Const. Liberty (Eng. trans., p. 93); Knutbole-Husse, G. 26 seq., where its provisions are given in some detail.
or weakness of the king should not endanger the institution itself." This is especially clear from clause xvi., which decrees that the title and estats of the lords-lieutenant of counties should not be hereditary, thus attacking feudalism at its very roots, while clause xiv. provides for the degradation of any lord-lieutenant who should abuse his office. On the other hand, the principle of the exemption of all large ducations is continued, as well as their refusal military service abroad, the defence of the realm being their sole obligation. All nobles were also to have the right to appear at the courts, and to be heard in any year by the king or his absence by the palatin, for the purpose of hearing causes. A clause also guarantees all nobles against arbitrary arrest and punishment at the instance of any powerful person.

This famous charter, which was amplified, under the influence of the clergy, in 1231, when its articles were placed under the guardianship of the archbishop of Esztergom (who was authorized to punish their violation by the king with excommunication), is generally regarded as the foundation of Hungarian constitutional liberty, though like Magna Carta it purported only to confirm immemorial rights; and as such it was expressly ratified as a whole in the coronation oaths of all the Habsburg kings from Ferdinand to Leopold I. Its actual effect in the period succeeding its promulgation was perhaps negligible, if indeed it did not actually give a new handle to the struggle for claims of the powerful barons.

Béla IV. (1235-1270), the last man of genius whom the Árpád produced, did something to curb the aristocratic misrule which was to be one of the determining causes of the collapse of his dynasty. But he is best known as the regenerator of the realm after the catastroph of 1241-1242 (see Béla IV.). On his return from exile, after the subsidence of the Tartar deluge, he found his kingdom in ashes; and his two great remedies, wholesale immigration and castle-building, only sowed the seeds of fresh disasters. Thus the Kumanian colonists, mostly pagans, whom he settled in vast numbers on the waste lands, threatened to overwhelm the Christian population; while the numerous strongholds, which he encouraged his nobles to build as a protection against future Tartar invasions, subsequently became so many centres of disloyalty. To bind the Kumanian still more closely to his dynasty, Béla married his son Stephen V. (1270-1272) to a Kumanian girl, and during the reign of her son Ladislaus IV. (1272-1290) the court was certainly more pagan than Christian. Vaillant and enterprising as both these princes were (Stephen successfully resisted the designs of the brilliant "golden King," Ottokar II. of Bohemia, and Ladislaus materially contributed to his utter overthrow at Durnkrüt in 1278), neither of them was strong enough to make head against the disintegrating influences all around them. Stephen contrived to hold his own by adroitly contracting an alliance with the powerful Neapolitan Angevins who had the ear of the pope; but Ladislaus (g.v.) was so completely caught in the toils of the Kumanians, that the Holy See, the suzerain of Hungary, was forced to intervene to prevent the relapse of the kingdom into barbarism, and the unfortunate Ladislaus perished in the crusade that was preached against him. An attempt of a patriotic party to keep the last Árpád, Andrew III. (1300-1301), on the throne was only temporarily successful, and after a horrible eight years' civil war (1301-1308) the crown of St. Stephen finally passed into the capable hands of Charles Robert of Naples.

During the four hundred years of the Árpád dominion the nomadic Magyar race had established itself permanently in central Europe, adopted western Christianity and founded a national monarchy on the western model. Hastily and violently converted, driven like a wedge between the Eastern and the Western Empires, the young kingdom was exposed from the first to extraordinary perils. But, under the guidance of a series of eminent rulers, it successfully asserted itself alike against pagan reaction from within, and aggressive, pressure from without, and, as it grew in strength and skill, expanded territorially at the expense of all its neighbours. These triumphs were achieved while the monarchy was absolute, and thus able to concentrate in its hands all the resources of the state, but towards the end of the period a political revolution began. The weakness and proclivity of the later Árpáds, the depopulation of the realm during the Tatar invasion, the infiltration of western feudalism and, finally, the endless civil discord of the 13th century, brought to the front a powerful and precocious class of barons who ultimately overshadowed the throne. The ancient county system was gradually absorbed by this new governing element. The ancient royal tenants became the feudatories of the great nobles, and fell naturally into two classes, the nobles bene possessionati, and the nobles unius sessionis, in other words the richer and the poorer gentry. We cannot trace the gradations of this political revolution, but we know that it met with determined opposition from the crown, which resulted in the utter destruction of the Árpáds, who, while retaining to the last their splendid physical qualities, now exhibited unmistakeable signs of moral deterioration, partly due perhaps to their too frequent marriages with semi-Oriental Greeks and semi-savage Kumanians. On the other hand the great nobles were the only class who won for themselves a recognized political position. The tendency towards a representative system of government had begun, but the almost uninterrupted anarchy which marked the last thirty years of the Árpád rule was no favourable time for constitutional development. The kings were fighting for their lives, the great nobles were indistinguishable from brigands and the whole nation seemed to be relapsing into savagery.

It was reserved for the two great princes of the house of Anjou, Charles I. (1310-1347) and Louis I. (1342-1382), to rebuild the Hungarian state, and lead the Magyars back to civilization. Both by character and education they were eminently fitted for the task, and all the circumstances were in their favour. They brought from their native Italy a thorough knowledge of the science of government as the middle ages understood it, and the decision of the Hungarian magnates during the civil wars enabled them to re-create the old state, and to establish a central power, which full allowance was made for Magyar idiosyncrasies. Both were princes of the house of Anjou.

End of the Árpád Dynasty.

House of Anjou.

Reforms of Louis I.

The lesser gentry were protected against the tyranny of the magnates, encouraged to appear at court and taxed for military service by the royal treasury direct—so as to draw them closer to the crown. Scores of towns, too, owe their origin and enlargement to the care of the Angevin princes, who were lavish of privileges and charters, and saw to it that the high-roads were clear of robbers. Charles, moreover, was a born financier, and his reform of the currency and of the whole fiscal system greatly contributed to enrich both the merchant class and the treasury. Louis encouraged the cities to surround themselves with strong walls. He himself erected a whole cordon of forts round the flourishing mining towns of northern Hungary. He also appointed Hungarian consuls in foreign trade centres, and established a system of protective tariffs. More important in its ultimate results was the law of 1351 which, while confirming the Golden Bull in general, abrogated the clause (iv.) by which the king had the right to alienate their lands. Henceforward their possessions were to descend directly and as of right to their brothers and their issue, whose claim was to be absolute. This "principle of avicity" ("ávicitatem," which survived till 1848), was intended to preserve the large feudal estates as part of the new military system, but its ultimate effect was to hamper the development of the country by preventing the alienation, and therefore the mortgaging of

1 The full title of the palatine (Mag. nador or nador-iszpán, Lat. palatinus) was comes palati regni, the first palatine being Abu Samuel (c. 1143). By the Golden Bull the palatine acquired something of the quality of a responsible minister, as "intermediary between the crown and people, guardian of the nation's rights, and keeper of the king's conscience" (Kniaticholl-Hugessen, l. 30).
lands, so long as any, however distant, scion of the original owning family survived. Louis' efforts to increase the national wealth were also largely frustrated by the Black Death, which ravaged Hungary from 1347 to 1356, and again during 1360-1361, carrying off at least one-fourth of the population. 

Externally, Hungary, under the Angevin kings, occupied a commanding position in the Balkans, and both Louis and his successors were diplomats as well as soldiers, and their foreign policy, largely based on family alliances, was almost invariably successful. Charles married Elizabeth, the sister of Casimir the Great of Poland, with whom he was connected by ties of close friendship, and Louis, by virtue of a compact made by his father thirty-one years previously, added the Polish crown to that of Hungary in 1370. Thus, during the last twelve years of his reign, the dominions of Louis the Great included the greater part of central Europe, from Pomerania to the Danube, and from the Adriatic to the steppes of the Dnieper.

The Angevins were less successful towards the south, where the first signs were appearing of that storm which ultimately swept away the Hungarian monarchy. In 1353 the Ottoman Turks crossed the Hellespont from Asia Minor and began that career of conquest which made them the terror of Europe for the next three centuries. In 1360 they conquered southern Bulgaria. In 1365 they transferred their capital from Brusa to Adrianople. In 1371 they overwhelmed the Servian tsar Vukaschin at the battle of Tarnarus and penetrated to the heart of old Servia. In 1368 they threatened Croatia and Dalmatia. Hungary herself was now directly menaced, and the very circumstances which had facilitated the advance of the Turks, enfeebled the potential resistance of the Magyars. The Árpád kings had succeeded in encircling their whole southern frontier with half a dozen military colonies or banates, comprising, roughly speaking, Little Walachia, and the northern parts of Bulgaria, Servia and Bosnia. But during this period a redistribution of territory had occurred in these parts, which converted most of the old banates into semi-independent and violently anti-Magyar principalities. This was due partly to the excessive proselytizing energy of the Angevins, which provoked rebellion on the part of their Greek-Orthodox subjects, partly to the natural dynamic competition of the Servian and Bulgarian tsars, and partly to the emergence of a new nationality, the Walachian. Previously to 1320, what is now called Walachia was regarded by the Magyars as part of the banate of Szörény. The base of the very mixed and ever-shifting population in these parts were the Walachians, perhaps the descendants of Trajan's colonists, who, under their voivode, Bazared, led King Charles into an ambuscade from which he barely escaped with his life (Nov. 9-12, 1350). From this disaster are to be dated the beginnings of Walachia as an independent state. Moldavia, again, ever since the 12th century, had been claimed by the Magyars as forming, along with Bessarabia and the Bukowina, a portion of the semi-mythical Ețelköz, the original seat of the Magyars before they occupied modern Hungary. This desolate region was subsequently peopled by Vilachs, whom the religious persecutions of Louis the Great had driven thither from other parts of his domains, and, between 1350 and 1360, their voivode Bogdan threw off the Hungarian yoke altogether. In Bosnia the persistent attempts of the Magyar princes to root out the stubborn, crazy and poisonous sect of the Bogomils had alienated the originally amicable Bosnians, and in 1353 Louis was compelled to buy the friendship of their Bar Tvtko by acknowledging him as king of Bosnia. Both Servia and Bulgaria were by this time split up into half a dozen principalities which, as much for religious as for political reasons, preferred payment to tribute to the Turks to acknowledging the hegemony of Hungary. Thus, towards the end of his reign, Louis found himself cut off from the Greek emperor, his sole ally in the Balkans, by a chain of bitterly hostile Greek-Orthodox states, extending from the Black Sea to the Adriatic.

Commercial greed of the Venetians, who refused to aid him with a fleet to cut off the Turks in Europe from the Turks in Asia Minor, nullified Louis' last practical endeavour to cope with a danger which from the first he had estimated at its true value. Louis the Great left two infant daughters: Maria, who was to share the throne of Poland with her betrothed, Sigismund of Pomerania; and Hedwig, who married the German king Jadwiga, who was to reign over Hungary with her young bridegroom, William of Austria. This plan was upset by the queen-dowager Elizabeth, who determined to rule both kingdoms during the minority of her children. Maria, her favourite, with whom she refused to part, was crowned queen of Hungary a week after her father's death (Sept. 17, 1385). Two years later Jadwiga, reluctantly transferred to the Poles instead of her sister, was crowned queen of Poland at Cracow (Oct. 15, 1384) and subsequently compelled to marry Jagiello, grand-duke of Lithuania. In Hungary, meanwhile, impatience at the rule of women induced the great family of the Horváthys to offer the crown of St Stephen to Charles III. of Naples, who, despite the oath of loyalty he had sworn to his benefactor, Louis the Great, accepted the offer, landed in Dalmatia with a small Italian army, and, after occupying Buda, was crowned king of Hungary on the 31st of December, 1385, as Charles II. His reign lasted thirty-eight days. On the 7th of February, 1386, he was treacherously attacked in the queen-dowager's own apartments, at her instigation, and died of his injuries a few days later. But Elizabeth did not profit long by this atrocity. In July the same year, while on a pleasure trip with her daughter, she was captured by the Horváthys, and tortured to death in her daughter's presence. Maria herself would doubtless have shared the same fate, but for the speedy intervention of her fiancé, whom a dicty, by the advice of the Venetians, had elected to rule the headless realm on the 31st of March 1387. He married Maria in June the same year, and she shared the sceptre with him till her sudden death by accident on the 17th of May 1395.

During the reign of Sigismund (1387-1437) Hungary was brought face to face with the Turkish peril in its most threatening shape, and all the efforts of the king were directed towards combating or averting it. However sorry a judge Sigismund may have cut as emperor in Germany, as king of Hungary he claims our respect, and as king of Hungary he should be judged, for he ruled her, not unsuccessfully, for fifty years during one of the most difficult crises of her history, whereas his connexion with Germany was merely casual and transitory. From the beginning he recognized that his chief duty was to drive the Turks from Europe, or, at least, keep them out of Hungary, and this noble ambition was the pivot of his whole policy. A domestic rebellion (1387-1395) prevented him at the outset from executing his design till 1396, and if the hopes of Christendom were shattered at Nicopolis, the failure was due to no fault of his, but to the haughty insubordination of the feudal classes. Again, his inaction during those memorable twelve years (1401-1413) when the Turkish empire, after the collapse at Angora (1402), seemed about to be swallowed up by the great "wolf" Tamerlane, was due entirely to the malice of the Holy See, which, enraged at his endeavours to maintain the independence of the Magyar church against papal aggression (the diet of 1404, on Sigismund's initiative, had declared bulls bestowing Magyar benefices on foreigners, without the royal consent, pernicious and illegal), saddled him with a fresh rebellion and two wars with Venice, resulting ultimately in the total loss of Dalmatia (c. 1430). Not till 1469 could Sigismund be said to be king in his own realm, yet in 1413 we find him traversing Europe in his endeavour to terminate the Great Schism, as the first step towards founding Christendom on the Western model. Hence the council of Constance to depose three rival popes; hence the council of Basel to pacify the Hussites, and promote another anti-Moslem league. But by this time the Turkish

1 Knobelacht-Bullvgeszen, i. 41.  
2 That is to say the western portion of Walachia, which lies between the Aluta and the Danube.
empire had been raised again from its ruins by Mahommed I. (1400–1421), and resumed its triumphal progress under Murad II. (1421–1451). Yet even now Sigismund, at the head of his Magyars, thrice (1432–1434, 1436–1437, and 1439–1441) encountered the Turks, not ingratiably, in the open field, till, recognizing that Hungary must thenceforth rely entirely on her own resources in any future struggle with Islam, he elaborately fortified the whole southern frontier, and converted the little fort of Nándorfehérvár, later Belgrade, at the junction of the Danube and Save, into an enormous first-class fortress, which proved strong enough to repel all the attacks of the Turks for more than a century. It argued no ordinary foresight thus to recognize that Hungary's strategy in her contest with the Turks must be strictly defensive, and the wisdom of Sigismund was justified by the social and political invasions that met him when he was raised kings whenever they ventured upon aggressive warfare with the sultans.

A monarch so overburdened with cares was naturally always in need of money, and thus obliged to lean heavily upon the support of the estates of the realm. The importance and influence of the diet increased proportionately. It met every year, sometimes twice a year, during Sigismund's reign, and was no longer, as in the days of Louis the Great, merely a consultative council, but a legislative body in partnership with the king. It was still, however, essentially an assembly of notables, lay and clerical, at which the gentry, though technically eligible, do not seem to have been directly represented. At Sigismund's first diet (1397) it was declared that the king might choose his counsellors where he listed, and at the diet of 1397 he invited the free and royal towns to send their deputies to the parliament. Subsequently this privilege was apparently erected into a statute, but how far it was acted upon we know not. Sigismund, more fortunate than the Polish kings, seems to have had little trouble with his diets. This was largely due to his friendly intimacy with the majority of the Magyar notables, from among whom he chose his chief counsellors. The estates loyally supported him against the attempted exactions of the papacy, and do not seem to have objected to any of his reforms, chief among which was the army-reform project of 1435, to provide for the better defence of the land against the Turks. This measure obliged all the great dignitaries, and the principal towns also, according to their means, to maintain a boderium of five hundred horsemen, or a proportional part thereof, and hold it ready, at the first summons, thus supplying the crown with a standing army 76,875 strong. In addition to this, a reserve force called the telekkatonaság was recruited from among the lesser gentry according to their teleks or holdings, every thirty-three teleks being held responsible for a mounted and fully equipped archer. Moreover, river fleets, built by Genoese masters and manned by Servians, were constructed to patrol and defend the great rivers of Hungary, especially on the Turkish frontier. Much as he owed to them, however, Sigismund was no mere nobles' king. His care for the common people was sincere and constant, but his beneficial efforts in this direction were thwarted by the curious interaction of two totally dissimilar social factors, feudalism and Hussitism. In Sigismund's reign the feudal system, for the first time, became deeply rooted in Magyar soil, and it is a lamentable fact that in 15th-century Hungary it is to be seen at its very worst, especially in those wild tracts, and they were many, in which the king's writ could hardly be said to run. Simultaneously from the west came the Hussite propagandists teaching that all men were equal, and that all property should be held in common. The suffering Magyars multitudes eagerly responded to these seductive teachings, and the result was a series of dangerous popular risings (the worst in 1433 and 1436) in which heresy and communism were inextricably intermingled. With the aid of inquisitors from Rome, the evil was literally burnt out, but not before provinces, especially in the south and south-east, had been utterly depopulated. They were repelled by Vlachs.

But despite the interminable wars and rebellions which darken the history of Hungary in the reign of Sigismund, the country, on the whole, was progressing. Its ready response to the king's heavy demands for the purpose of the national defence points to the existence of a healthy and self-sacrificing public spirit, and the eagerness with which the youth of all classes now began to flock to the foreign universities is another satisfactory feature of the age. Between 1362 and 1450 no fewer than 4151 Magyar students frequented the university of Vienna, nearly as many went by preference to Prague, and this, too, despite the fact that there were now two universities in Hungary itself, the old foundation of Louis the Great at Pécs, and a new one under Charles of Austria at Székesfehérvár.

Like Louis the Great before him, Sigismund had failed to found a dynasty, but, fifteen years before his death, he had succeeded in providing his only daughter Elizabeth with a consort apparently well able to protect both her and her inheritance in the person of Albert V., duke of Austria. Albert, a sturdy soldier, who had given brilliant proofs of valour and generalship in the Hussite wars, was crowned king of Hungary at Székesfehérvár (Stuhlweissenburg) on the 1st of January 1438, elected king of the Romans at Frankfort on the 18th of March 1438, and crowned king of Bohemia at Prague on the 29th of June 1438. On returning to Buda in 1439, he at once plunged into a war with the Turks, who, had in the meantime, captured the important Servian fortress of Semendria and subjugated the greater part of Bosnia. But the king got no farther than Servia, and was carried off by dysentery (Oct. 27, 1439), in the forty-second year of his age, in the course of the campaign.

Albert left behind him two infant daughters only, but his consort was big with child, and, in the event of that child proving to be an heir male, his father's will bequeathed to him the kingdoms of Hungary and Bohemia, under the regency of his mother. Thus, with the succession uncertain, with the Turk at the very door, with the prospect, dismal at the best, of a long minority, the political outlook was both embarrassing and perilous. Obviously a warrior-king was preferable to a regimen of women and children, and the eyes of the wiser Magyars turned involuntarily towards Wladislaus III. of Poland, who, though only in his nineteenth year, was already renowned for his martial disposition. Wladislaus accepted the proffered throne from the Magyar delegates at Cracow on the 8th of March 1440; but in the meantime (Feb. 22) the queen-widow gave birth to a son who, six weeks later, as Ladislaus V. (q.v.) was crowned king of Hungary (May 27) at Székesfehérvár. On the 22nd of May the Polish monarch appeared at Buda, was unanimously elected king of Hungary under the title of Wladislaus I. (June 24) and crowned on the 17th of July. This duumvirate proved even more injurious to Hungary than the dreaded interregnum. Queen Elizabeth, aided by her kinsmen, the emperor Frederick III. and the counts of Cilli, flooded northern and western Hungary with Hussite mercenaries, one of whom, Jan Giszkra, she made her captain-general, while Wladislaus held the central and south-eastern parts of the realm. The resulting civil war was terminated only by the death of Elizabeth on the 13th of December 1443.

All this time the pressure of the Turks upon the southern provinces of Hungary had been continuous, but fortunately all their efforts had so far been frustrated by the valour and generalship of the ban of Szőrény, John Hunyadi, the fame of whose victories, notably in 1442 and 1443, encouraged the Holy See to place Hungary for the third time at the head of a general crusade against the infidel. The experienced diplomatist Cardinal Cesarini was accordingly sent to Hungary to reconcile Wladislaus with the emperor. The king, who had just returned from the famous "long campaign" of 1443, willingly accepted the leadership of the Christian League. At the diet of Buda, early in 1444, supplies were voted for the enterprise, and Wladislaus was on the point of quitting
his camp at Szeged for the seat of war, when envos from Sultan Murad arrived with the offer of a ten years' truce on such favourable conditions (they included the relinquishment of Servia, Walachia and Moldavia, and the payment of an indemnity) that Hunyadi persuaded the king to conclude (in July) a peace which gave him more than could reasonably be anticipated from the most successful campaign. Unfortunately, two days later, Cardinal Cesarini absented the king from the oath whereby he had sworn to observe the peace of Szeged, and was thus mainly responsible for the catastrophe of Varna, when four months later (Nov. 10) the young monarch and the flower of the Magyar chivalry were overwhelmed by fourfold odds on Turkish soil. (See HUNYADI, JÁNOS; and VLADISLAUS III.)

The next fourteen years form one of the most interesting and pregnant periods of Hungarian history. It marks the dawn of a public spirit as represented by the gentry, who, alarmed at the national peril and justly suspicious of the ruling magnates, unhesitatingly placed their destinies in the hands of Hunyadi, the one honest man who by sheer merit had risen within the last ten years from the humble position of a country squire to a leading position in the state. This feeling of confidence found due expression at the diet of 1446, which deliberately passing over the palatine László Garai elected Hunyadi governor of Hungary, and passed a whole series of popular measures intended to be remedial, e.g. the decree ordering the demolition of the new castles, most of them little better than robber-strongholds; the decree compelling the great officers of state to suspend their functions during the session of the diet; the decree declaring illegal the new fashion of forming confederations on the Polish model, all of which measures were obviously directed against the tyranny and the lawlessness of the oligarchy. Unfortunately this salutary legislation remained a dead letter. It was as much as the governor could do to save the state from destruction, let alone reform it. At this very time northern Hungary, including the wealthy mining towns, was in the possession of the Hussites, their levies, consisting of the gentry, the best of the households and the peasants, were nominally for the infant king László V., still detained at Vienna by his kinsman the emperor. The western provinces were held by Frederick himself. Invaluable time was wasted in negotiating with these intruders before the governor could safely devote himself to the task of expelling the Turk from the southern provinces. He had to be content with armistices, reconciliations and matrimonial contracts, because the great dignitaries of the state, men like the palatine László Garai, Count Ulrich of Cilli, and the voivode of Transylvania, Mihály Ujváry, who were always on the lookout for some way to intrigue and envious. From them, the official guardians of Hungary's safety, he received no help, either during his governorship (1446–1453), or when, in 1454, on the eve of his departure for his last and most glorious campaign, the diet commanded a levée en masse of the whole population in his support. At that critical hour it was at his own expense that Hunyadi fortified Belgrade, now the sole obstacle between Hungary and destruction, with the sole assistance of the Franciscan friar Giovanni da Capistrano, equipped the fleet and the army which relieved the beleaguered fortress and overthrew Mohammed II. But the nation at least was grateful, and after his death (Aug. 11, 1456) it freely transferred its allegiance to his family as represented by his two sons, László, now in his 23rd, and Matthias, now in his 16th year. The judicial murder of László Hunyadi (q.v.) by the enemies of his house (March 16, 1457) was therefore a stupid blunder as well as the foulest of crimes, and on the death of his chief assassin, Lászlóváci, six months later (Nov. 23, 1457), the diet which assembled on the banks of the Rákócs, probably determined to assert the liberties and enthusiastically elected Matthias Hunyadi king of Hungary (Jan. 24, 1458).

In less than three years the young king had justified their confidence, and delivered his country from its worst embarrassments. (See Matthias I, king of Hungary.) This prodigy was accomplished in the face of every conceivable obstacle. His first diet grudgingly granted him supplies and soldiers for the Turkish war, on condition that under no circumstances whatever should they henceforth be called upon to contribute towards the national defence, and he was practically deprived of the control of the bundera or mounted militia. It was with a small force of mercenaries, raised at his own expense, that the young king won his first Turkish victories, and expelled the Czechs from his northern and the Habsburgs from his western provinces. But his line of resources, and, above all, the proved incapacity of the militia in the field, compelled him instantly to take in hand the vital question of army reform. In the second year of his reign he undertook personally the gigantic task of providing Hungary with an army adequate to her various needs on the model of the best military science of the day. The landless younger sons of the gentry and the Servian and Vlach immigrants provided him with exactly and practically inexhaustible military material. The old feudal levies he put aside. Bravery, though personally, as soldiers they were distinctly inferior both to the Janissaries and the Hussites, with both of whom Matthias had constantly to contend. It was a trained regular army in his pay and consequently at his disposal that he wanted. The nucleus of the new army he found in the Czech mercenaries, seasoned veterans who readily transferred their services to the best payer. This force, formed in 1459, was generally known as the Fekete Sereg, or "Black Brigade," from the colour of its armour. From 1455 the pick of the Magyars and Croatians were enlisted in the same way every year, till, towards the end of his reign, Matthias could count upon 20,000 horse and 8,000 foot, besides 6,000 black brigadiers. The cavalry consisted of the famous Hussars, or light horse, of which he may be said to have been the creator, and the heavily armed mounted musketeers on the Czech-German model. The infantry, in like manner, was divided into light and heavy. This army was provided with a regular commissariat, cannon and ballistics machines, and, being constantly on active service, was always in a high state of efficiency. The armed forces were supported by a larger fleet consisting (in 1470) of 300 vessels, mostly sloops and corvettes, manned by 2,600 sailors, generally Croats, and carrying 10,000 soldiers. Eight large military stations were also built at the chief strategic points on the Danube, Save and Thess. These armaments, which cost Matthias 1,000,000 florins per annum, equivalent to £200,000, did not include the auxiliary troops of the hospodars of Walachia and Moldavia, or the feudal levies of the barons and prelates.

The army of Matthias was not only a military machine of first-rate efficiency, but an insuperable civilising medium. It enabled the king to curb the lawlessness of the Magyar nobility, and explains why none of the numerous rebellions against him ever succeeded. Again and again, during his absence on the public service, the barons and prelates would assemble to compass his ruin or dispose of his crown, when, suddenly, "like a tempest," from the depths of Silésia or of Bosnia, he would himself appear among them, confounding and scattering them, often without resistance, always without bloodshed. He also frequently employed his soldiers in collecting the taxes from the estates of those magnates who refused to contribute to the public burdens, in protecting the towns from the depredations of the robber barons, or in conveying the caravans of the merchants. In fact, they were a police force as well as an army.

Despite the enormous expense of maintaining the army, Matthias, after the first ten years of his reign, was never in want of money. This miracle was achieved by tact and management. No Hungarian king had so little trouble with the turbulent diet of barons. By this time the gentry, as well as the barons and prelates, took part in the legislative business, at the diet the king, of the poorer deputies as an intolerable burden, and they frequently agreed to grant the taxes for two or three years in advance, so as to be saved the expense

1 Some of these were of gigantic size, e.g. the Varga Moszar, or great mortar, which sixty horses would scarce move from its place, and a ballistics machine invented by Matthias which could hurl stones of 3 cwt.
of attending every year. Moreover, to promote their own convenience, they readily allowed the king to assess as well as to collect the taxes, which consequently tended to become regular and permanent, while Matthias' reform of the treasury, which was now administered by specialists with separate functions, was economically of great benefit to the state. Yet Matthias never dispensed with the diet. During the thirty-two years of his reign he held at least fifteen diets,1 at which no fewer than 450 statutes were passed. He re-codified the Hungarian common law; strictly defined the jurisdiction of the whole official hierarchy from the palatine to the humblest village judge; cheapened and accelerated legal procedure, and in any case, when justice was right did his utmost to protect the weak from the strong. There is not a single branch of the law which he did not simplify and amend, and the iron firmness with which he caused justice to be administered, irrespective of persons, if it exposed him to the charge of tyranny from the nobles, also won for him from the common people the epithet of "the Just." To Matthias is also due the credit of creating an efficient official class. Merit was with him the sole qualification for advancement. One of his best generals, Pál Kínásy, was a miller's son, and his capable chancellor, Péter Várady, whom he made archbishop of Kálocsa, came of a family of small squires. For education so scholarly a monarch as Matthias naturally did what he could. He founded the university of Pressburg (Academia Istropolitana, 1467), revived the declining university of Pécs, and, at the time of his death, was mediating the establishment of a third university at Buda.

Unfortunately the civilizing efforts of Matthias made but little impression on society at large. The bulk of the Magyar nobility was still semi-barbaric. Immensely wealthy (it is estimated that most of the land, at this time, was in the hands of 25 great families, the Zapolayas alone holding an eighth of it), it was a point of honour with them to appear in public in costly raiment, studded with silver, gold and precious stones, followed at every step by armies of retainers scarcely less gorgeous. At the same time their ignorance was profound. Many of the highest dignitaries of state did not know their alphabet. Signatures to documents of the period are rare; seals served instead of signatures, because most of the nobles were unable to sign their names. Learning, indeed, was often ridiculed as pedantry in a gentleman of good family.

The clergy, the chief official class, were naturally less ignorant than the gentry. Some of the prelates—notably János Csemegezy, better known as Jánus Pannonius (1435-1472)—had a European reputation for learning. The primates, however, János Vitéz (1408-1472), at the beginning, and the primates, Cardinal Tamás Bakóczi (q.e.), at the end of the reign were men of eminent ability and the highest culture. But the moral tone of the Magyar church at this period was very low. The bishops prided themselves on being great statesmen, great scholars, great financiers, great diplomatists—anything, in fact, but good Christians. Most of them, except when actually celebrating mass, were indistinguishable alike in costume and conduct from the temporal magnates. Of twelve of them it is said that foreigners took them at first for independent temporal princes, so small were their estates, so splendid their courts, so numerous their armed retainers. Under such guides as these the lower clergy erred deplorably, and drunkenness, gross immorality, brawling and manslaughter were common occurrences in the lives of the parish priests. The regular clergy were if possible worse than the secular, with the exception of the Paulicians, the sole religious order which steadily resisted the general corruption, of whose abbot, the saintly Gregory, was the personal friend of Matthias.

What little culture there was outside the court, the capital and the palaces of a few prelates, was to be found in the towns, most of them of German origin. Matthias laboured strenuously to develop and protect the towns, multiplied municipal charters, and materially improved the means of communication, especially in Transylvania. His Silesian and Austrian acquisitions were also very beneficial to trade, throwing open as they did the western markets to Hungarian produce. Wine and meat were the chief exports. The wines of Hungary were already renowned throughout Europe, and cattle breeding was conducted on a great scale. Of agricultural produce there was barely sufficient for home consumption, but the mining industries had reached a very high level of excellence, and iron, tin and copper were very largely exported from the northern counties to Danzig and other Baltic ports. So highly developed indeed were the Magyar methods of smelting, that Louis XI. of France took the Hungarian mining system, as the model for his metallurgical reforms, and Hungarian master-miners were also in great demand at the court of Ivan the Terrible. Moreover, the keen artistic instincts of Matthias led him to embellish his cities as well as fortify them. Debreczen was practically rebuilt by him, and dates its prosperity from his reign. Breslau, his favourite town, he endowed with many fine public buildings. Buda he endeavoured to make the worthy capital of a great realm, and the palace which he built there was pronounced by the papal legates to be superior to any in Italy.

Politically Matthias raised Hungary to the rank of the greatest power in central Europe, her influence extending into Asia and often deciding by his weight which side of the balance the Teutonic Knights and the tsardom of Muscovy pointed. And his envosys appeared in Persia and in Egypt to combat the diplomacy of the Porte. He never, indeed, jeopardized the position of the Moslems as Europe's as his father had done, and thus the peace of Szeged (1444), which regained the line of the Danube and drove the Turk behind the Balkans, must always be reckoned as the high-water mark of Hungary's Turkish triumphs. But Matthias at least taught the sultan to respect the territorial integrity of Hungary, and throughout his reign the Eastern Question, though often vexatious, was never acute. Only after his death did the Ottoman empire become a menace to Christian Europe. Besides, his hands were tied by the unappeasable enmity of the emperor and the emperor's allies, and he could never count upon any material help from the West against the East. The age of the crusades had gone. Through-out his reign the Czechs and the Germans were every whit as dangerous to Hungary as the Turks, and the political necessity which finally compelled Matthias to partition Austria and Bohemia, in order to secure Hungary, committed him to a policy of extreme circumspection. He has sometimes been blamed for not crushing his incurably disloyal and rebellious nobles, instead of cajoling them, after the example of his contemporary, Louis XI., who laid the foundations of the greatness of France on the ruin of the vassals. But Louis XI. had a relatively civilized and politically developed middle class behind him, whereas Matthias had not. It was as much as Matthias could do to keep the civic life of Hungary from expiring altogether, and nine-tenths of his burgesses were foreigners with no political interest in the country of their adoption. Never was any dominion so purely personal, and therefore so artificial as his. His astounding energy and resource curbed all his enemies during his lifetime, but they were content to wait patiently for his death, well aware that the collapse of his empire would immediately follow. All that humankind might devise for the consolidation and perpetuation of the newly established Hungarian empire had been done by Matthias in the last years of his reign. He had designated as his successor his natural son, the highly gifted János (John) Corvinus, a youth of seventeen. He had raised him to princely rank, endowed him with property which made him the greatest territorial magnate in the kingdom, placed in his hands the sacred crown and half-a-dozen of the strongest fortresses, and won over to his cause the majority of the royal council. How János was j cajoled out of an almost impregnable position, and gradually reduced to insignificance, is told elsewhere (see Corvinus, János). The nobles and princes, who were always tied by the strongholds of the Matthias system, desired, as they expressed it, "a king whose beard they could hold in their fists," and they found a monarch after their own heart in Władysław Jagiello, since 1471.
HUNGARY

king of Bohemia, who as Wladislaus II. was elected unanimously king of Hungary on the 15th of July 1490. Wladislaus was the personification of helpless inertia. His Bohemian subjects had long since dubbed him “King All Right” because he said yes to everything. As king of Hungary he was, from first to last, the puppet of the Magyar oligarchs, who proceeded to abolish all the royal prerogatives and safeguards which had galled them under Matthias. By the compact of Farkasbida (1490) Wladislaus not only confirmed all the Matthias privileges, but also repealed all the Matthias novelties, including the system of taxation which had enabled his predecessor to keep on foot an adequate national army. The virtual suppression of Wladislaus was completed at the diet of 1492, when “King All Right” consented to live on the receipts of the treasury, which were barely sufficient to maintain his court, and engaged never to impose any new taxes on his Magyar subjects. The dissolution of the standing army, including the Black Brigade, was the immediate result of these decrees. Thus, at the very time when the modernization of the means of national defence had become the first principle, in every other part of Europe, of the strongly centralized monarchies which were rising on the ruins of feudalism, the Hungarian magnates deliberately plunged their country back into the chaos of medievalism.

The same diet which destroyed the national armaments and depleted the exchequer confirmed the disgraceful peace of Pressburg, concluded between Wladislaus and the emperor Maximilian on the 7th of November 1491, whereby Hungary retroceded all the Austrian conquests of Matthias, together with a long strip of Magyar territory, and paid a war indemnity equivalent to £200,000.

The thirty-six years which elapsed between the accession of Wladislaus II. and the battle of Mohács is the most melancholy and discreditable period of Hungarian history. Like Poland two centuries later, Hungary had ceased to be a civilized autonomous state because her prelates and her magnates, uncontrolled by any higher authority, and too ignorant or corrupt to look beyond their own selfish interests, availed themselves of the excoriating enjoyment of their inordinate privileges, while openly repudiating their primal obligation of defending the state against extraneous enemies. During these miserable years everything like patriotism or public spirit seems to have died out of the hearts of the Hungarian aristocracy. The great officers of state acted habitually on the principle that might is right. Stephen Bathory, voivode of Transylvania and count of the Szeklers, for instance, ruled Transylvania like a Turkish pasha, and threatened to behead all who dared to complain of his proceedings. “Secting condition,” he said, was better than living Szeklers. Thousands of Transylvanian gentlemen emigrated to Turkey to get out of his reach. Other great nobles were at perpetual feud with the towns whose wealth they coveted. Thus the Zapolys, in 1500 and again in 1507, burnt a large part of Brezbnóbánya and Besztercebánya, two of the chief industrial towns of north Hungary. Kronstadt, now the sole flourishing trade centre in the kingdom, defended itself with hired mercenaries against the robber barons. Everywhere the civic communities were declining; even Buda and Pressburg were half in ruins. In their misery the cities frequently appealed for protection to the emperor and other foreign potentates, as no redress was attainable at home. Compared even with the contemporary Polish diet the Hungarian national assembly was a tumultuous mob. The diet of 1497 passed most of its time in constructing, and then battering to pieces with axes and hammers, a huge wooden image representing the ministers of the crown, who were corrupt enough, but immovable, since they regularly appeared at the diet with thousands of retainers armed to the teeth, and openly derided the proceedings of the assembly. “Secting condition,” he said, was better than living Szeklers. That something was seriously wrong, yet were powerless to remedy it. All that the gentry could do was to depress the lower orders, and thus they did at every opportunity. Thus, many of the towns, notably Visegrád, were deprived of the charters granted to them by Matthias, and a whole series of anti-civic ordinances were passed. Noblemen dwelling within the walls of the towns were especially exempted from all civic burdens, while every bourgeois who bought an extra-mural estate was made to pay double for the privilege. Every noblemen had the right to engage in trade toll-free, to the great detriment of their competitors the burgesses. The peasant class suffered most of all. In 1496 Varady, archbishop of Kalocsa, one of the few good prelates, declared that his lot was worse than that of brute beasts. Even then, in the years 1495-1497, youths and children were said to be starved to death. Florid Hungary from 1490 to 1521, was as much an egoist as the other magnates, and so ground down were they by ingeniously multiplied exactions, that thousands of them were reduced to literal beggary.

Yet, despite this inward rottenness, Hungary, for nearly twenty years after the death of Matthias, enjoyed an undeserved prestige abroad, due entirely to the reputation which that great monarch had won for her. Circumstances, indeed, were especially favourable. The emperor Maximilian was so absorbed by German affairs, that he could do her little harm, and, under Bayezid II. and Selim I. the Turkish menace gave little anxiety to the court of Buda, Bayezid being no warrior, while Selim's energies were claimed exclusively by the East, so that he was glad to renew the triennial truce with Hungary as often as it expired. Hungary, therefore, for almost the first time in her history, was free to choose a foreign policy of her own, and had she been guided by a patriot, she might now have easily regained Dalmatia, and acquired besides a considerable sea-board. Unfortunately Tamás Bábkóc, her leading diplomatist from 1499 to 1521, was as much an egoist as the other magnates, and he sacrificed the political interests of Hungary entirely to personal considerations. Primate of Hungary since 1497, he coveted the p pope— and the red hat as the first step thereto above all things—and looked mainly to Venetian influence for both. He therefore supported Venice against her enemies, refused to enter the League of Cambrai in 1508, and concluded a ten years' alliance with the Signorin, which obliged Hungary to defend Venetian territory without any equivalent gain. Less reprehensible, though equally self-seeking, were his dealings with the emperor, which aimed at a family alliance between Jagiellon and the Habsburgs on the basis of a double marriage between the son and daughter of Wladislaus, Louis and Anne, and an Austrian archiepiscopal archduchess; this was concluded by the family congress at Vienna, July 22, 1575, to which Sigismund I. of Poland, the brother of Wladislaus, acceded. The Hungarian diet frantically opposed every Austrian alliance as endangering the national independence, but to any unprejudiced observer a union with the house of Habsburg, even with the contingencies probable of her actual absorbtion, would have been infinitely preferable to the condition into which Hungary, under native aristocratic misrule, was swiftly drifting. The diet itself had become as much a nullity as the king, and its decrees were systematically disregarded. Still more pitiable was the condition of the court. The penury of Wladislaus II. was by this time so extreme, that he owed his very meals to the charity of his servants. The diet, indeed, voted him aids and subsidies, but the great nobles neither forbade their collection within their estates, or confiscated the amount collected. Under the circumstances, we cannot wonder if the frontier fortresses fell to pieces, and the border troops, unpaid for years, took to brigandage.

The last reserves of the national wealth and strength were dissipated by the terrible peasant rising of György Dózsa (g.n.) in 1514, of which the enslavement of the Hungarian peasantry was the immediate consequence. The “Savage Diet” which assembled on the 18th of October the same year, to punish the rebels and restore order, was. Servile, its aim was to pass a list of seventy-one ordinances directed against the peasants, who were henceforth bound to the soil and committed absolutely into the hands of “their natural lords.” To this vindictive legislation, which converted the labouring population into a sullenly hostile
force within the state, it is mainly due that a healthy political life in Hungary became henceforward impossible. The same spirit of hostility to the peasantry breathed through the famous condensation of the Hungarian customary law known as the Tripartitum, which, though never actually formally passed into law, continued until 1835 to be the only document defining the relations of king and people, of nobles and their peasants, and of Hungary and her dependent states.\(^1\)

Whladislaus II. died on the 13th of March 1516, two years after the "Savage Diet,"\(^2\) the ferocity of whose decrees he had feebly endeavoured to mitigate, leaving his two kingdoms to his son Louis, a child of ten years, pronounced of age in order that his foreign guardians, the emperor Maximilian and Sigismund of Poland, might be dispensed with. The government remained in the hands of Cardinal Báthocz till his death in 1521, when the supreme authority at court was disputed between the lame palatine István Báthory, and his rival, the eminent jurist and orator István Verbocz (q.v.),—both of them incompetent, unprincipled place-hunters,—while, in the background lurked János Zapolya (see JOHN (ZAPOLYA), KING OF HUNGARY), voivode of Transylvania, patiently waiting till the death of the feeble and childless king (who, in 1522, married Maria of Austria) had opened the way for the Turk to receive the crown. Every one felt that a catastrophe was approaching. "Things cannot go on like this much longer," wrote the Venetian ambassador to his government. The war of each against all continued; no taxes could be collected; the holders of the royal domains refused to surrender them at the command of the diet; and the boy king had very often neither clothes to wear nor food to eat. The whole atmosphere of society was one of rapine and corruption, and only on the frontier a few self-sacrificing patriots like the ban-bishop, Peter Birisal, the last of Matthias's veterans, and his successor the saintly Pál Tomori, archbishop of Esztergom, showed how the nation could resist the war with the predatory Turkish bands, that the ancient Magyar valour was not yet wholly extinct. But the number of the righteous men was too few to save the state. The first blow fell in 1521, when Sultan Suleiman appeared before the southern fortresses of Sabac and Belgrade, both of which fell into his hands during the course of the year. After this Venice openly declared that Hungary was no longer worth the saving. Yet the coup de grace was postponed for another five years, during which time Suleiman was occupied with the conquest of Egypt and the siege of Rhodes. The Magyars fancied they were safe from attack, because the first assault was suspended; and everything that went on in the old world had its way. Every obstacle was opposed to the collection of the taxes which had been voted to put the kingdom in a state of defence. "If this realm could be saved at the expense of three florins," exclaimed the papal envoy, Antonio Burgio, "there is not a man here willing to make the sacrifice." Only on the southern frontier did Archbishop Tomori painfully assemble a fresh army and fleet, and succeed, by incredible efforts, in constructing at Pétervardein, on the right bank of the Danube, a new fortress which served him as a refuge and safe post in his intermittent guerilla wars with the Turks.

In the spring of 1526 came the tidings that Sultan Suleiman had quitted Constantinople, at the head of a countless host, to conquer Hungary. On the 28th of July Pétervardein, after a valiant resistance, was blown into the air. The diet, which met at Buda in hot haste, proclaimed the young king dictactor, granted him unlimited subsidies which there was no time to collect, and ordered a levée en masse of the entire male population, which could not possibly assemble within the given time. Louis at once formed a camp at Tolna, whence he issued despairing summonses to the liesges, and, by the middle of August, some 25,000 ill-equipped gentlemen had gathered around him. With these he marched southwards to the plain of Mohács, where, on the 29th of August, the Hungarians, after a two hours' fight, were annihilated, the king, both the archbishops, five bishops and 24,000 men perishing on the field. The sultan refused to believe that the pitiful army he had so easily overcome could be the national army of Hungary. Advancing with extreme caution, he again on the 17th of September but speedily returned to his own dominions, carrying off with him his 25,000 captives, and an amount of spoil which filled the bazaars of the East for months to come. By the end of October the last Turkish regular had quitted Magyar soil, and, to use the words of a contemporary observer, one quarter of Hungary was as utterly destroyed as if a flood had passed over it.

The Turks had no sooner quitted the land than John Zapolya, voivode of Transylvania, assembled a diet at Tokaj (Oct. 14, 1526) at which the towns were represented as well as the counties. The tone of the assembly was violently anti-German, and John being the only candidate, his election was a matter of course; but his misgivings were so great that it was not till the beginning of November that he very reluctantly allowed himself to be crowned at a second diet, held at Székesfehérvár. By this time a competitor had entered the field. This was the archduke Ferdinand, who claimed the Hungarian crown by right of inheritance in the name of his wife, Anne, sister of the late king. Ferdinand was elected (Dec. 16) by a scratch assembly consisting of deputies from Croatia and the towns of Pressburg and Sopron; but he speedily improved his position in the course of 1527, by driving King John, first from Buda and then from Hungary. In November the same year he was elected and crowned by a properly constituted diet at Székesfehérvár (Stuhlweissenburg). In 1529 Zapolya was reinstated in Buda by Suleiman the Magnificent in person, who, at this period, preferred setting up a rival to "the king of Vienna" to conquering Hungary outright. Thus the Magyars were saddled with two rival kings with equally valid titles, which proved an even worse disaster than the Mohács catastrophe; for in most of the counties of the unhappy kingdom despondency of every description plundered the estates of the gentry, and oppressed the common people. Buda and Pest were under the pretext that they were fighting the battles of the contending monarchs. The determination of Ferdinand to partition Hungary rather than drive the Turks out, which he might easily have done after Suleiman's unsuccessful attempts on Vienna in 1529-1530, led to a prolongation of the struggle till the 24th of February 1538, when, by the secret peace of Nagyvarad, Hungary was divided between the two competitors. By this treaty Ferdinand retained Croatia-Slavonia and the five western counties with Pressburg and Esztergom (Gran), while Zapolya kept the remaining two-thirds with the royal title. He was indeed the last national king of Hungary till modern times. His court at Buda was maintained according to the ancient traditions, and his gyüle, at which 67 of the 73 counties were generally represented, was the true national diet, the phantom assembly occasionally convened at Pressburg by Ferdinand scarcely deserving the title. Indeed, Ferdinand regarded his narrow strip of Hungarian territory as simply a barrier behind which he could better defend the hereditary states. During the last six years (1534-1540) of John's reign, his kingdom, beneath the guidance of the Paullician monk, Frater György, or George Martinuzzi (q.v.), the last great statesman of old Hungary, enjoyed a stability and prosperity marvellous in the difficult circumstances of the period, Martinuzzi holding the balance exactly between the emperor and the Porte with 2

\(^2\) He was just twenty.
HUNGARY

HISTORY

astounding diplomatic dexterity, and at the same time introducing several important domestic reforms. Zaporina died on the 17th July 1540, whereas on the estates of Hungary elected his baby son John Sigismund, king, in direct violation of the peace of Grosswardein which had formally acknowledged Ferdinand as John's successor, whether he left male issue or not. Ferdinand at once asserted his rights by force of arms, and attacked Buda in May 1541, despite the urgent remonstrances of Martinuzzi, who knew that the Turk would never suffer the emperor to reign at Buda. His fears were instantly justified. In August 1541, Suleiman, at the head of a vast army, invaded Hungary, and on the 30th of August, Buda was in his hands.

In the following years the sultan still further improved his position, capturing, amongst many other places, Pécs, and the primatial city of Esztergom; but, in 1547, the exigencies of the Persian war induced him to sell a truce of five years to Ferdinand for £100,000, on a uti possidetis basis.

Ferdinand holding thirty-five counties (including Croatia and Slavonia) for which he was to pay an annual tribute of 600,000; John Sigismund retaining Transylvania and sixteen adjacent counties with the title of prince, while the rest of the land, comprising most of the other counties, was annexed to the Turkish empire. Thus the ancient kingdom was divided into three separate states with divergent aims and interests, a condition of things, which, with frequent rearrangements, continued for more than 150 years.

A period of infinite confusion and extreme misery ensued, of which only the salient points can here be noted. The attempts of the Habsburgs to conquer Transylvania drove down upon them two fresh Turkish invasions, the first in 1552, when the sultan's generals captured Temesvár and fifty-four lesser forts or fortresses, and the second in 1566, memorable as Suleiman's last descent upon Hungary, and also for the heroic defence of Szigetvár by Miklós Zrínyi (q.v.), one of the classical sieges of history. The truce of Adrianople in 1568, nominally for eight years, but prolonged from time to time till 1593, finally suspended regular hostilities, and introduced the epoch known as "The Long Peace," though, throughout these twenty-five years, the guerilla warfare on the frontier never ceased for more than a few months at a time, and the relations between the Habsburgs and Transylvania were persistently hostile.

Probably no other country ever suffered so much from its rulers as Hungary suffered during the second half of the 16th century. This was due partly to political and partly to religious causes. To begin with, there can be no doubt that from 1558, when the German imperial crown was transferred from the Spanish to the Austrian branch of the Habsburg family, royal Hungary 1 was regarded by the emperors as an insignificant barrier province yielding far more trouble than profit. The visible signs of this contemptuous point of view were (a) the suspension of the august dignity of palatine, which, after the death of Tamás Mádiassy, "the great palatine," in 1562, was left vacant for many years; (b) the abolition or attenuation of all the ancient Hungarian court dignitaries; (c) the degradation of the capital, Pressburg, into a mere provincial town; and (d) the more and more openly expressed determination to govern Hungary from Vienna by means of foreigners, principally German or Czech.

During the reign of Ferdinand, whose consort, Anne, was a Hungarian princess, things were at least tolerable; but under Maximilian (1564-1576) and Rudolph (1576-1612) the antagonism of the Habsburgs towards their Magyar subjects was only too apparent. The diet, which had the power of the purse, could not be absolutely sanctioned; but it was summoned as seldom as possible, the king often preferring to forego his subsidies rather than listen to the unanswerable remonstrances of the estates against the illegality of his government. In the days of the semi-insane recluse Rudolph, things went from bad to worse. The Magyar nobles were now systematically plundered on trumped-up charges of treason; hundreds of them were ruined. At last they either durst not 'taint the diet, or "set like dumbe dogs" during its session, allowing the king to dictate and interpret the statutes at his good pleasure. Presently religious was superadded to political persecution.

The Reformation had at first produced little effect on Hungary. Except in the towns, mostly of German origin, it was generally detested, just because it came from Germany. The battle of Mohács, however, severely shook the faith of the Hungarians. "Where are the old Magyar saints? Why do they not defend the realm against the Turks?" was the general cry. Moreover, the imperial church had lost its hold on the affections of the people. Zaporina, a devout Catholic, is lauded by Archbishop Franjipan in 1553 for arresting the spread of the new doctrines, though he would not allow Martinuzzi to take the extreme step of burning perverts at the stake. These perverts were mostly to be found among nobles desirous of amassing church property, or among those of the clergy who clamoured for communion in both kinds. So long, however, as the old national kingdom survived, the majority of the people still clung to the old faith.

Under the second reigning national church which was proclaimed in 1568, the Habsburgs by the prospect of matrimony, and, in reply to the remonstrances of their bishops, declared that they would rather give up their cures than their wives. In Transylvania matters were at first ordered more peaceably. In 1552 the new doctrines obtained complete recognition there, the diet of Torda (1557) going so far as to permit every one to worship in his own way so long as he did not molest his neighbour. Yet, in the following year, the whole of the property of the Catholic Church there was diverted to secular uses, and the Calvinists were simultaneously banished, though they regained complete tolerance in 1564, a privilege at the same time extended to the Unitarians, who were now very influential at court and converted Prince John Sigismund to their views. In Turkish Hungary all the confessions enjoyed liberty of worship, though the Catholics, as possible partisans of the "king of Vienna," were liked the least.

It was only when the Jesuits obtained a footing both at Prague 2 and Donaueschingen that persecution began, but then it was very violent. In Transylvania the princes of the Bánffy family (1571-1604) were ardent disciples of the Jesuit fathers, and Sigismund Báthory in particular persecuted fiercely, his fury being especially directed against the queer judaizing sect known as the Sabbatarians, whose tenets were adopted by the Szeklers, the most savage of "the three nations" of Transylvania, many thousands of whom were, after a bloody struggle, forced to emigrate. In royal Hungary also the Jesuits were the chief persecutors. The extirpation of Protestantism was a deliberate prearranged programme, and as Protestantism was by this time identical with Magyarism 3 the extirpation of the one was tantamount to the extirpation of the other. The method generally adopted was to deprive the preachers in the towns of their churches by force, Italian mercenaries being preferably employed for the purpose. It was assumed that the Protestant nobles' jealousy of the burghers would prevent them from interfering; but religious sympathy proved stronger than caste prejudice, and the diets protested against the persecution of their fellow citizens so vehemently that religious matters were withdrawn from their jurisdiction.

This persecution raged most fiercely towards the end of what is generally called "The Long War," which began in 1593, and lasted till 1606. It was a confused four-cornered struggle between the emperor and the Turks, the Turks and Transylvania, Michael of Moldavia and Transylvania, and Transylvania and the emperor, desultory and languishing as regards the Turks (the one notable battle being Sigismund Báthory's brilliant victory over the Turks at the Habsburgs held their court at Prague instead of at Vienna. 4

4According to contemporary records the number of prelates and priests in the three parts of Hungary at the beginning of the 17th century was but 103, all told, and of the great families not above half a dozen still clung to Catholicism.
grand vizier in Walachia in 1595, when the Magyar army penetrated as far as Giurgevo, but very bitter as between the emperor and Transylvania, the principality being finally subdued by the imperial general, George Basta, in August 1604. A reign of terror ensued, during which the unfortunate principality was well-nigh ruined. Basta was authorized to Germanize and Catholicize without delay, and he began by dividing the property of most of the nobles among his officers, appropriating the lion's share himself. In royal Hungary the same object was aimed at by innumerable indictments against the richer landowners, indictments supported by false title-deeds and carried through by forged or purchased judgments of the courts. At last the estates of even the most devoted adherents of the Habsburgs were not safe, and some of them, like the wealthy István Illesházy (1540-1609), had to fly abroad to save their heads. Fortunately a peculiarly shameless attempt to blackmail Stephen Bocskay, a rich and powerful Transylvanian nobleman, converted a long-suffering friend of the emperor into a national deliverer. Bocskay (q.v.), a quiet but resolute man, having once made up his mind to rebel, never paused till he had established satisfactory relations between the Austrian court and the Hungarians. The two great achievements of his brief reign (he was elected prince of Transylvania on the 5th of April 1605, and died on the 29th of December 1666) were the peace of Vienna (June 23, 1666) and the truce of Zsitvátórik (November 1666). By the peace of Vienna, Bocskay obtained religious liberty and political autonomy, the restoration of all confiscated estates, the repeal of all unrighteous judgments and a complete retrospective amnesty for all the Magyars in royal Hungary, besides his own recognition as independent sovereign prince of an enlarged Transylvania. This treaty is remarkable as being the first constitutional compact between the ruling dynasty and the Hungarian nation. Almost equally important was the twenty years' truce of Zsitvátórik, negotiated by Bocskay between the emperor and the sultan, which established for the first time a working equilibrium between the three states of Hungary, with a distinct political preponderance in favour of Transylvania. Of the 5163 sq. m. of Hungarian territory, Transylvania now possessed 2682, Turkish Hungary 1859, and royal Hungary only 1222. The emperor, on the other hand, was freed from the humiliating annual tribute to the Porte on payment of a war indemnity for 1596, which the princes of Transylvania further improved when the popular and patriotic Archduke Matthias was elected king of Hungary on the 16th of November 1608. He had previously confirmed the treaty of Vienna, and the day after his election he appointed Illesházy, now reinstated in all his possessions and dignities, palatine of Hungary. In Transylvania, meantime, Gabriel Bathory had been elected (Nov. 11, 1608) in place of the decrepit Sigismund Rákóczi, Bocskay's immediate successor. For more than fifty years after the peace of Vienna the principality of Transylvania continued to be the bulwark of the liberties of the Magyars. It owed its ascendancy in Transylvania to the fact that it was the home of the two princes who ruled it from 1613 to 1648. The first and most famous of these rulers was Gabriel Bethlen (q.v.), who reigned from 1613 to 1629, perpetually thwarted all the efforts of the emperor to oppress or circumvent his Hungarian subjects, and won some reputation abroad by adroitly pretending to champion the Protestant cause. Three times he waged war on the emperor, twice he was proclaimed king of Hungary, and by the peace of Nikolsburg (Dec. 31, 1621) he obtained for the Protestants a confirmation of the treaty of Vienna, and for himself seven additional counties in northern Hungary besides others he already had. Bethlen's successor, George I. Rákóczi, was equally successful. His principal achievement was the peace of Linz (Sept. 16, 1645), the last political triumph of Hungarian Protestantism, whereby the emperor was forced to conform once more the oft-broken articles of the peace of Vienna, to restore nearly a hundred churches to the sects and to acknowledge the sway of Rákóczi over the north Hungarian counties. Gabriel Bethlen and George I. Rákóczi also did much for education and civilization generally, and their era has justly been called the golden era of Transylvania. They lavished money on the embellishment of their capital, Gyulafehérvar, which became a sort of Protestant Mecca, whither scholars and divines of every and Roman denomination flocked to bask in the favour of the princes who were as liberal as they were pious. Yet both Bethlen and Rákóczi owed far more to favourable circumstances than to their own cunning. Their reigns synchronized with the Thirty Years' War, during which the emperors were never in a position seriously to withstand the attacks of the malcontent Magyars, the vast majority of whom were still Protestants, who naturally looked upon the Transylvanian princes as their protectors and joined them in thousands whenever they raided Moravia or Lower Austria, or threatened to advance upon Vienna. In all these risings no battle of importance was fought. Generally speaking, the Transylvanians only had to appear, to have their demands promptly complied with; for these marauders had to be bought off because the emperor had more pressing business elsewhere. Yet their military efficiency must have been small, for their allies the Swedes invariably allude to them as wild and ragged semi-barbarians.

Another fortunate accident which favoured the hegemony of Transylvania was the temporary collapse of Hungary's most formidable adversary, the Turk. From the peace of Zsitvátórik (1660) to the ninth year of the reign of George Rákóczi II., who succeeded his father in 1648, the Turkish empire, mired by a series of incompetent sultans and distracted by internal dissensions, was unable to intervene in Hungarian politics. But in the autumn of 1666 a great statesman, Mahomed Kuprilí (q.v.), obtained the supreme control of affairs at Constantinople, and all Europe instantly felt the pressure of the Turk once more. It was George Rákóczi II. (q.v.) who gave the new grand vizier a pretext for interference. Against the advice of all his counsellors, and without the knowledge of the estates, Rákóczi, in 1657, plunged into the troubled sea of Polish politics, in the hope of winning the Polish throne, and not only failed miserably but overwhelmed Transylvania in its own ruin. Kuprilí, who had forbidden the Polish enterprise, at once availed himself of the opportunity, and having no fewer than four princes, three of whom died violent deaths, were forced to accept the kaftan and kalpag of investiture in the camp of the grand vizier. When, at the end of 1661, a more stable administration was set up with Michael Apafi (1661-1666) as prince, Transylvania had descended to the rank of a feudatory of the Turkish empire. On the death of Mahomed Kuprilí (Oct. 11, 1665) his son Zafíl Ahmed succeeded him as grand vizier, and pursued his father's policy with equal genius and determination. In 1663 he invaded royal Hungary, with the intention of uniting all the Magyars against the emperor, but, the Magyars steadily refusing to attend any diet summoned under Turkish influence, his plan fell through, and his only notable military success was the capture of the fortress of Eszékujvár (Neuhäusel). In the following year, thanks to the generalship and heroism of Miklós Zrínyi the younger (q.v.), Kuprilí was still less successful. Zrínyi captured fortress after fortress, and interrupted the Turkish communications by destroying the famous bridge of Esseg, while Montecuculi defeated the grand vizier at the battle of St Gothard (Aug. 1, 1664). Yet, despite these reverses, Kuprilí's superior diplomacy enabled him, at the peace of Vassvár (Aug. 10, 1664) to obtain terms which should only have been conceded to the conqueror. The fortress of Eszékujvár and surrounding territory were now ceded to the Turks, with the result that royal Hungary was not only still further diminished, but its northern practically separated from its southern portion. On the other hand the treaty of Vassvár gave Hungary a respite from regular Turkish invasions for twenty years, though the border raiding continued uninterrupted.

Of far more political importance than these fluctuating wars of
invasion and conquest was the simultaneous Catholic reaction in Hungary. The movement may be said to have begun about 1601, when the great Jesuit preacher and controversialist, Péter Pázmány (q.v.), first devoted himself to the task of reconverting his countrymen.

Progress was necessarily retarded by the influence of the independent Protestant princes of Transylvania in the northern counties of Hungary. Even as late as 1622 the Protestants at the diet of Pressburg were strong enough to elect their candidate, Szentlász Thúrzó, palatine. But Thúrzó was the last Protestant palatine, and, on his death, the Catholics, at the diet of Sopron (1625), where they dominated the Upper Chamber, and had a large minority in the Lower, were able to elect Count Miklós Esterházy to Thúrzó’s stead. The Jesuit programme in Hungary was the same as it had been in Poland a generation earlier, and may be summed up thus: convert the great families and all the rest will follow.¹ Their success, due partly to their whole-hearted zeal, and partly to their superior educational system, was extraordinary; and they possessed the additional advantage of having in Pázmány a leader of commanding genius. During his primacy (1616–1657), when he had the whole influence of the court, and the sympathy and the assistance of the Catholic world behind him, he put the finishing touches to his life’s labour by founding a great Catholic university at Nagyszombát (1635), and publishing a Hungarian translation of the Bible to counteract the influence of Gaspar Károli’s widely spread Protestant version. Pázmány was certainly the great civilizing factor of Hungary in the seventeenth century, and indirectly he did as much for the native language as for the native church. His successors had only to build on his foundations. One most striking instance of how completely he changed the current of the national mind may be seen from a passagé which, from 1536 to 1625 (the usual jubilee pilgrimages from Hungary to Rome had entirely ceased. During his primacy they were revived, and in 1650, only seventeen years after his death, they were as numerous as ever they had been. Five years later there remained but four noble Protestant families in royal Hungary. The Catholicization of the land was complete.

Unfortunately the court of Vienna was not content with winning back the Magyars to the Church. The Habsburg kings were as jealous of the political as of the religious liberties of their Hungarian subjects. This was partly owing to the fact that national aspirations of any sort were contrary to the imperial system, which claimed to rule by right divine, and partly to an inveterate distrust of the Magyars, who were regarded at court as rebels by nature, and therefore as enemies far more troublesome than the Turks. The conduct of the Hungarian nobles in the past, indeed, somewhat justified this estimate, for the fall of the ancient monarchy was entirely due to their persistent disregard of authority, to their refusal to bear their share of the public burdens. They were now to suffer severely for their past misdoings, but unfortunately the innocent nation was forced to suffer with them.

Throughout the latter part of the 17th and the beginning of the 18th century, the Hungarian gentry underwent a cruel discipline at the hands of their Habsburg kings. Their privileges were overridden, their petitions were disregarded, their diets were degraded into mere registries of the royal decrees. They were never fairly represented in the royal council, they were excluded as far as possible from commands in Hungarian regiments, and were treated, generally, as the members of an inferior and guilty race. This era of repression corresponds roughly with the reign of Leopold I. (1657–1705), who left the government of the country to two bigoted Magyar prelates, György Szeczpesényi (1695–1685) and Lipót (Leopold) Kollonich (1631–1707), whose domination represents the high-water mark of the anti-national regime. The stupid and abortive conspiracy of Peter Zrínyi and three other magnates, who were publicly executed (April 30, 1711), was followed by wholesale arrests and confiscations, and for a time the legal government of Hungary was superseded (Patent of March 3, 1673) by a committee of eight persons, four Magyars and four Germans, presided over by a German governor; but the most influential person in this committee was Bishop Kollonich, of whom it was said that, while Pázmány hated the heretic in the Magyar, Kollonich hated the Magyar in the heretic. A gigantic process against leading Protestant ministers for alleged conspiracy was the first act of this committee. It began at Pressburg in March 1674, when 236 of the ministers were “converted” or confessed to acts of rebellion. But the remaining 93 stood firm and were condemned to death, a punishment commuted to slavery in the Neapolitan galleys. Sweden, as one of the guarantors of the peace of Westphalia, and several north German states, protested against the injury thus done to their coreligionists. It was replied that Hungary was outside the operation of the treaty of Westphalia, and that the Protestants had been condemned not ex odio religious but crimine rebellions.

But a high-spirited nation cannot be extinguished by any number of patents and persecutions. So long as the Magyar people had any life left, it was bound to fight in self-defence, it was bound to produce majestic contents. Among those who looked abroad for help to the enmity of the house of Habsburg. The first and most famous of the malcontent leaders was Count Imre Tökőli (q.v.). Between 1678 and 1682 Tökőli waged three wars with Leopold, and, in September 1682, was acknowledged both by the emperor and the sultan as prince of North Hungary as far as the river Garam, to the great relief of the Magyar Protestants. The success of Tökőli rekindled the martial ardour of the Turks, and a war party, under the grand vizier Kara Mustafa, determined to wrest from Leopold his twelve remaining Hungarian counties, cast a second aspid at Constantinople in the course of 1682. Leopold, intent on the doings of his pernicious rival Louis XIV., was loth to engage in an eastern war even for the liberation of Hungary, which he regarded as of far less importance than a strip or two of German territory on the Rhine. But, stimulated by the representations of Pope Innocent XI., who, well aware of the internal weakness of the Turk, was bent upon forming a Holy League to drive them out of Europe, and alarmed, besides, by the danger of Vienna and the hereditary states, Leopold reluctantly contracted an alliance with John III. of Poland, and gave the command of the army, which, mainly through the efforts of the pope he had been able to assemble, to Prince Charles of Lorraine. The war, which lasted for 16 years and put an end to the Turkish dominion in Hungary, began with the world-renowned siege of Vienna (July 14–Sept. 12, 1683). There is no need to recount the oft-told victories of Sobieski (see JOHN III. SOBIESKI, KING OF POLAND). What is not quite so generally known is the fact that Leopold slackened at once and would have been quite content with the results of these earlier victories had not the pope stiffened his resistance by forming a Holy League between the Emperor, Poland, Venice, Muscovy and the papacy, with the avowed object of dealing the Turk the coup de grâce (March 5, 1684). This statesmanlike persistence was rewarded by an uninterrupted series of triumphs, culminating in the recapture of Buda (1686) and Belgrade (1688), and the recovery of Bosnia (1689). But, in 1690, the third of the famous Kuprilli, Mustafa, brother of Fazil Ahmed, became grand vizier, and the Turk, still further encouraged by the death of Innocent XI., rallied once more. In the course of that year Kuprili regained Servia and Bulgaria, placed Tökőli on the throne of Transylvania, and on the 6th of October took Belgrade by assault. Once more the road to Vienna lay open, but the grand vizier wasted the remainder of the year in fortifying Belgrade, and on August 18th, 1691, he was defeated and slain at Sankamene by the magrave of Baden. For the next six years the war languished owing to the timidity of the emperor, the incompetence of his generals and the exhaustion of the Porte; but on the 11th of September 1697 Prince Eugene of Savoy routed the Turks at Zenta and on the 13th of November 1698 a peace congress was opened at

¹ The főjobbagyok, or under-tenants, had to follow the example of their lords; they were, by this time, mere serfs with no privileges either political or religious.
Karlowitz which resulted in the peace of that name (Jan. 26, 1699). Nominally a truce for 25 years on the uti possidetis basis, the peace of Karlowitz left in the emperor’s hands the whole of Hungary except Syrmia and the territory lying between the rivers Maros, Theiss, Danube and the mountains of Transylvania, the so-called Temeszkő, or about one-twelfth of the modern kingdom. The peace of Karlowitz marks the term of the Magyar’s secular struggle with Mahomedanism and finally reunited her long-separated provinces beneath a common sceptre.

But the liberation of Hungary from the Turks brought no relief to the Hungarians. The ruthless suppression of the Magyar malcontents, in which there was little discrimination between the innocent and the guilty, had so crushed the spirit of the country that Leopold considered the time ripe for realizing a long-cherished ideal of the Habsburgs and changing Hungary from an elective into an hereditary monarchy. For this purpose a diet was assembled at Pressburg in the autumn of 1687. It was a mere rump, for wholesale executions had thinned its numbers and the reconquered countries were not represented in it. To this weakened and terrorized assembly the emperor, king explained that he had the right to treat Hungary as a conquered country, but that he was prepared to confirm its constitutional liberties under three conditions: the inaugural diploma was to be in the form signed by Ferdinand I., the crown was to be declared hereditary in the house of Habsburg, and the 31st clause of the Golden Bull, authorizing armed resistance to unconstitutional acts of the sovereign, was to be abrogated. These conditions the diet had no choice but to accept, and, in October 1687, the elective monarchy of Hungary, which had been in existence for nearly seven hundred years, ceased to exist. The immediate effect of the peace of Karlowitz was thus only to strengthen despotism in Hungary. Kollonich, who had been created a cardinal in 1685, archbishop of Kalocsa in 1691, and archbishop of Esztergom (Gran) and primate of Hungary in 1693, was now at the head of affairs, and his plan was to germanize Hungary as speedily as possible by promoting a wholesale immigration into the recovered provinces, all of which were in a terrible state of dilapidation.

The border counties, now formed into a military zone, were planted exclusively with Croatian colonists as being more trustworthy defenders of the Hungarian frontier than the Hungarians themselves. Moreover, a neo-aquisititia commissio was constituted to inquire into the title-deeds of the Magyar landowners in the old Turkish provinces, and hundreds of estates were transferred, on the flimsiest of pretexts, to naturalized foreigners. Transylvania since 1690 had been administered from Vienna, and though the farce of assembling a diet there was still kept up, even the promise of religious liberty, conceded to it on its surrender in 1685, was not kept. No wonder then if the whole country was now seething with discontent and only awaiting an opportunity to burst forth in open rebellion. This opportunity came when the emperor, involved in the War of the Spanish Succession, withdrew all his troops from Hungary except some Istrian garrisons. In 1703 the malcontents found a leader in Francis Rakoczy II. (g.v.), who was elected prince by the Hungarian estates on the 6th of July 1704, and during the next six years gave the emperor Joseph I., who had succeeded Leopold in May 1705, considerable anxiety. Rakoczy had often as many as 100,000 men under him, and his bands penetrated as far as Moravia and even approached within a few miles of Vienna. But they were guerrillas, not regulars; they had no good officers, no serviceable artillery, and very little money; and all the foreign powers to whom Rakoczy turned for assistance (excepting France, who fed them occasionally with paltry subsidies) would not commit themselves to a formal alliance with rebels who were defeated in every little battle they fought. On the other hand, if the Rakoczybands were easily dispersed, they as quickly reassembled, and at one time they held all Transylvania and the greater part of Hungary.

In the course of 1707 two Rakóczian diets even went so far as formally to depose the Habsburgs and form an interim government with Rakoczy at its head, till a national king could be legally elected. The Maritime Powers, too, fearful lest Louis XIV. should materially assist the Rakóczians and thus divert part of the emperor’s forces at the very crisis of the War of the Spanish Succession, intervened, repeatedly and energetically, to bring about a compromise between the court and the insurgents, whose claims they considered to be just and fair. But the tentative refusal of Joseph to admit that the Rakóczians were anything but rebels was always the insurmountable object in all such negotiations. But when, on the 7th of April 1711, Joseph died without issue, leaving the crown to his brother the Archduke Charles, then fighting the battles of the Allies in Spain, a peace-congress met at Szátmár on the 27th of April, and, two days later, an understanding was arrived at on the basis of a general amnesty, full religious liberty and the recognition of the inviolability of the ancient rights and privileges of the Magyars.

Thus the peace of Szátmár assured to the Hungarian nation all they had wished by former compacts with the Habsburgs; but whereas hitherto the Transylvanian tribes had been the permanent guardian of all such compacts, and the authority of the reigning house had been counterpoised by the Turk, the effect and validity of the peace of Szátmár depended entirely upon the support it might derive from the nation itself. It was a fortunate thing for Hungary that the conclusion of the War of the Spanish Succession introduced a new period, in which, at last, the interests of the dynasty and the nation were identical, thus rendering a reconciliation between them desirable. Moreover, the next century and a half was a period of domestic tranquillity, during which Hungary was able to repair the ruin of the long Turkish wars, nurse her material resources, and take the first steps in the direction of social and political reform. The first reforms, however, were dynastic rather than national. Thus, in 1715, King Charles III. persuaded the diet to consent to the establishment of a standing army, which—though the diet reserved the right to fix the number of recruits and vote the necessary subsidies from time to time—was placed under the control of the Austrian council of war. The same centralizing tendency was shown in the administrative and judicial reforms taken in hand by the diet of 1722. A Hungarian court chancery was now established at Vienna, while the government of Hungary proper was in the hands of a royal governor. Both the chancery and the stadholdership were independent of the diet and responsible to the king alone, being, in fact, his executive instruments. It was this diet also which accepted the Pragmatic Sanction, first issued in 1713, by which the emperor Charles VI., in default of his leaving male heirs, settled the succession to his hereditary dominions on his daughter Maria Theresa and her heirs. By the laws of 1723, which gave effect to the resolution of the diet in favour of accepting the principle of female succession, the Habsburg king entered into a fresh contract with his Hungarian subjects, a contract which remained the basis of the relations of the crown and nation until 1868. On the one hand it was declared that the kingdom of Hungary was an integral part of the Habsburg dominions and inseparable from these so long as a male or female heir of the kings Charles, Joseph and Leopold should be found to succeed to them. On the other hand, Charles swore, on behalf of himself and his heirs, to preserve the Hungarian constitution intact, with all the rights, privileges, customs, laws, &c., of the kingdom and its dependencies. Moreover, in the event of the failure of a Habsburg heir, the diet reserved the right to revive the ancient, approved and accepted custom and prerogative of the estates and orders in the matter of the election and coronation of a king.

The reign of Charles III. is also memorable for two Turkish wars, the first of which, beginning in 1716, and made glorious by the victories of Prince Eugene and János Pálffy, was terminated by the Peace of 1711, but one of which, the second, which began in 1735, ended in the Peace of Belgrade (May 1739). On the Polish frontier the king was confronted by the ambitious design of the Polish king Augustus III., his successor in the throne of Poland, to re-establish the former union between the two states. The king, who was a capable general, inflicted the first defeat on the Polish army at Legnano (April 1734), which opened the way to the Peace of Belgrade in August of the same year. In 1739 the king undertook an expedition against the Turks, who had their army under Sultan Abdulhaseem, their governor of Belgrade, and were massed near the Danube at Novi Pazar. The king surprised them and defeated them at the battle of Parnawa (June 5). The king was again victorious in the battle of Varna on the 24th of July 1739. A second campaign was undertaken in the following year, but the king died of a fever in Caffa, on the Black Sea, on the 22nd of July 1739.
the peace of Passarowitz (July 21, 1718), by which the Temesköz was also freed from the Turks, and Servia, Northern Bosnia and Little Walachia, all of them ancient conquests of Hungary, were once more incorporated with the territories of the crown of St. Stephen. The second war, though undertaken in league with Russia, proved unlucky, and, at the peace of Belgrado (Sept. 1, 1730), all the conquests of the peace of Passarowitz, including Belgrado itself, were lost, except the banat of Temesvár.

With Maria Theresa (1740-1780) began the age of enlightened despotism. Deeply grateful to the Magyars for their sacrifices and services during the War of the Austrian Succession, she dedicated her whole authority to the good of the nation, but she was very unwilling to share that authority with the people. Only in the first stormy years of her reign did she summon the diet; after 1764 she dispensed with it altogether. She did not fill up the dignity of palatine, vacant since the 26th of October 1765, and governed Hungary through her son-in-law, Albert of Saxe-Teschen. She did not attack the Hungarian constitution; she simply put it on one side. Her reforms were made not by statute, but by royal decree. Yet the nation patiently endured the mild yoke of the great queen, because it felt and knew that its welfare was safe in her motherly hands. Her greatest achievement lay in the direction of educational reform. She employed the proceeds of the vast sums coming to her from the confiscation of the property of the suppressed Jesuit order in founding schools and colleges all over Hungary. The kingdom was divided into ten educational districts for the purpose, with a university at Buda. Towards all her Magyars, especially the Catholics, she was ever most gracious; but the magnates, the Báthyanys, the Nadásdys, the Pállys, the Andrássys, who had chased her enemies from Bohemia and routed them in Bavaria, enjoyed the lion’s share of her benefactions. In fact, most of them became professional courtiers, and lived habitually at Vienna. She also attracted the gentry to her capital by forming a Magyar body-guard from the cadets of noble families. But she was good to all, not even forgetting the serfs. The ábrébi szabályat (feudal prescription) of 1767 restored to the peasants the right of transmigration and, in some respects, protected them against the exactions of their landlords.

Joseph II. (1780-1790) was as true to the principles of enlightened despotism and family polities as his mother; but he had none of the confidence which had led her to realize the limits of her power. Joseph was an idealist and a doctrinaire, whose dream was to build up his ideal body politic; the first step toward which was to be the amalgamation of all his dominions into a common state under an absolute sovereign. Unfortunately, the Hungarian constitution stood in the way of this political paradise, so Joseph resolved that the Hungarian constitution must be sacrificed. Refusing to be crowned, or even to take the usual oaths of observance, he simply announced his accession to the Hungarian counties, and then deliberately proceeded to break down all the ancient Magyar institutions. In 1784, the Language Edict made German the official language of the common state. The same year he ordered a census and a land-survey to be taken, to enable him to tax every one irrespective of birth or wealth. Protests came in from every quarter and a dangerous rebellion broke out in Transylvania; but opposition only made Joseph more obstinate, and he endeavoured to anticipate any further resistance by abolishing the ancient county assemblies and dividing the kingdom into two districts administered by German officials.

In taking this course Joseph made the capital mistake of neglecting the Machiavellian maxim that in changing the substance of cherished institutions the prince should be careful to preserve the semblance. In substance the county assemblies were worse than ineffective: mere turbulent gatherings of country squires and peasants, corrupt and prejudiced, representing nothing but their own pride of race and class; and to try and govern without them, or to administer in spite of them, may have been the only expedient possible to statesmen. But to the Magyars they were the immemorial strongholds of their liberties, the last defences of their constitution; and the attempt to suppress them, which made every county a centre of disaffection and resistance, was the action not of a statesman, but of a despot. The failure of Joseph’s “enlightened” policy in Hungary was inevitable in any case; it was hastened by the disastrous Turkish war of 1787-92, which withdrew Joseph altogether from domestic affairs; and on his death-bed (Feb. 22, 1790) he felt it to be his duty to annul all his principal reforms, so as to lighten the difficulties of his successor.

Leopold II. found the country on the verge of revolution; but the wisdom of the new monarch saved the situation and won back the Magyars. At the diet of 1790-1791 laws were passed not only confirming the royal prerogatives and the national liberties, but leaving the way open for future developments. Hungary was declared to be a free, independent and unsupmitted kingdom governed by its own laws and customs. The legislative functions were to be exercised by the king and the diet conjointly and by them alone. The diets were henceforth to be triennial, and every new king was to pledge himself to be crowned and issue his credentials1 within six months of the death of his predecessor. Latin was still to be the official language, but Magyar was now introduced into the universities and all the schools.

Leopold’s successor Francis I. (1792-1835) received a declaration of war from the French Legislative Assembly immediately on ascending the throne. For the next quarter of a century he, as the champion of legitimacy, was fighting the Revolution on countless battle-fields, and the fearful struggle only bound the Magyar nation closer to the Habsburg dynasty. Ignaz Joseph Martinovich (1755-1793) and his associates, the Hungarian Jacobins, vainly attempted a revolutionary propaganda (1795), and Napoleon’s mutinuations of the ancient kingdom of St. Stephen did not predispose the Hungarian gentry in his favour. Politically, indeed, the whole period was one of retrogression and stagnation. The frequent diets held in the early part of the reign occupied themselves with little else but war subsidies; after 1811 they ceased to be summoned. In the latter years of Francis I. the dark shadow of Metternich’s policy of “stability” fell across the kingdom, and the forces of reaction reasserted their sway everywhere supreme. But beneath the surface a strong popular current was beginning to run in a direction which had not been anticipated by the statesmen: a secession from the absolutist principles of the king, and its policy of western Liberalism, but without any direct help from abroad, was preparing for the future emancipation. Writers, savants, poets, artists, noble and plebeian, layman and cleric, without any previous concert, or obvious connexion, were working towards that ideal of political liberty which was to unite all the Magyars.

Mihály Vörösmarty, Ferencz Kölesy, Ferencz Kazinczy and his associates, to mention but a few of many great names, were, consciously or unconsciously, as the representatives of the renascent national literature, accomplishing a political mission, and their pens proved no less efficacious than the swords of their ancestors.

It was a direct attack upon the constitution which, to use the words of István Széchenyi, first “startled the nation out of its sickly drowsiness.” In 1823, when the reactionary powers were meditating joint action to suppress the revolution in Spain, the government, without consulting the diet, imposed a war-tax and called out the recruits. The county assemblies instantly protested against this illegal act, and Francis I. was obliged, at the diet of 1823, to repudiate the action of his ministers. But the estates felt that the maintenance of their liberties demanded more substantial guarantees than the dead letter of ancient laws. Széchenyi, who had resided abroad and studied Western institutions, was the recognized leader of all those who wished to create a new Hungary out of the old. For years he and his friends educated public opinion by issuing innumerable pamphlets in which the new Liberalism was eloquently expounded. In particular Széchenyi insisted that the people must not look exclusively to the government,

1 Literae credentials, nearly equivalent to a coronation oath.
or even to the diet, for the necessary reforms. Society itself must take the initiative by breaking down the barriers of class exclusiveness and reviving a healthy public spirit. The effect of this teaching was manifest at the diet of 1832, when the Liberals in the Lower Chamber had a large majority, prominent among whom were Francis Deák and Ödön Béthly. In the Upper House, however, the magnates, in concert with the government, to form a conservative party obstinately opposed to any project of reform, which frustrated all the efforts of the Liberals.

The alarm of the government at the power and popularity of the Liberal party induced it, soon after the accession of the new king, the emperor Ferdinand I. (1835-1848), to attempt to crush the reform movement by arresting and imprisoning the most active agitators among them, Louis Kossuth and Miklós Wessélenyi. But the nation was no longer to be cowed. The diet of 1839 refused to proceed to business till the political prisoners had been released, and, while in the Lower Chamber the reforming majority was larger than ever, a Liberal party was now also formed in the Upper House under the brilliant leadership of Count Louis Batthyány and Baron Joseph Eötvös.

Two progressive measures of the highest importance were passed by this diet, one making Magyar the official language of Hungary, the other freeing the peasants’ holdings from all feudal obligations.

The results of the diet of 1839 did not satisfy the advanced Liberals, while the opposition of the government and of the Upper House still further embittered the general discontent. The chief exponent of this temper was the Pesti Hirlap, Hungary’s first political newspaper, founded in 1831 by Kossuth, whose articles, advocating armed reprisals if necessary, inflamed the extremists but alienated Széchenyi, who openly attacked Kossuth’s opinions. The polemic on both sides was violent; but, as usual, the extreme views prevailed, and on the assembling of the diet of 1843 Kossuth was more popular than ever, while the influence of Széchenyi had sensibly declined. The tone of this diet was passionate, and the government was fiercely attacked for interfering with the elections. Fresh triumphs were won by the Liberals. Magyar was now declared to be the language of the schools and the law-courts as well as of the legislature; mixed marriages were legalized; and official positions were thrown open to non-nobles.

The interval between the diet of 1843 and that of 1847 saw a complete disintegration and transformation of the various political parties. Széchenyi openly joined the government, while the moderate Liberals separated from the extremists and formed a new party, the Centralists. Immediately before the elections, however, Deák succeeded in reuniting all the Liberals on the common platform of “The Ten Points”: (1) Responsible ministries, (2) Popular representation, (3) The incorporation of Transylvania, (4) Right of public meeting, (5) Absolute religious liberty, (6) Universal equality before the law, (7) Universal taxation, (8) The abolition of the Ádváciúm, an absolute and anomalous land-tenure, (9) The abolition of serfdom, with compensation to the landlords. The ensuing elections resulted in a complete victory of the Progressives. All efforts to bring about an understanding between the government and the opposition were fruitless. Kossuth demanded not merely the redress of actual grievances, but a reform which would make grievances impossible in the future. In the highest circles a dissolution of the diet now seemed to be the sole remedy; but, before it could be carried out, tidings of the February revolution in Paris reached Pressburg1 (March 1), and on the 3rd of March Kossuth’s motion for the appointment of an independent, responsible ministry was accepted by the Lower House. The moderates, alarmed not so much by the motion itself as by its tone, again tried to intervene; but on the 13th of March the Vienna revolution broke out, and, the king, yielding to pressure or panic, appointed Count Louis Batthyány premier of the first Hungarian responsible ministry, which included Kossuth, Széchenyi and Deák. The Ten Points, or the March Laws as they were now called, were then adopted by the legislature and received the royal assent (April 10). Hungary had, to all intents and purposes, become an independent state bound to Austria only by the fact that the patrician chanced to be an Austrian archduke.

In the assertion of their national aspirations, confused as these were with the new democratic ideals, the Magyars had had the support of the Géza party. Deák and Kossuth were now set to hold the reins of power in Vienna. On the other hand, they were threatened by an ominous stirring of the subject races in Hungary itself. Croats, Vlachs, Serbs and Slovaks resented Magyar domination—a domination which had been carefully secured under the revolutionary constitution by a very narrow franchise, and out of the general chaos each race hoped to create for itself a separate national existence. The separatist movement was strongest in the south, where the Hungarians were in touch with their kinsmen in Walachia and Moldavia, the Serbs with their brethren in Servia, and the Croats intent on reasserting the independence of the “Tri-une Kingdom.”

The attitude of the distrusted imperial government towards these movements was at first openly suspicious and hostile. The emperor and his ministers hoped that, having conceded the demands of the Magyars, they would receive the help of the Hungarian government in crushing the revolution elsewhere, a hope that seemed to be justified by the readiness with which Batthyány consented to send a contingent to the assistance of the imperialists in Italy. That the encouragement of the Slav aspirations was soon deliberately adopted as a weapon against the Hungarian government was due, partly to the speedy predominance at Pest of Kossuth and the extreme party of which he was the mouthpiece, but mainly to the calculated policy of Baron Jellachich, who on the 14th of April was appointed ban of Croatia. Jellachich, who as a soldier was devoted to the interests of the imperial house, realized that the best way to break the revolutionary power of the Magyars and Germans would be to encourage the Slav national ideas, which were equally hostile to both; to set up against the Dualism in favour at Pest and Vienna the federal system advocated by the Slavs, and so to restore the traditional Habsburg principle of *Divide et impera*; this policy he pursued with masterly skill. His first acts on taking up his office were to repudiate the authority of the Hungarian diet, to replace the Magyar officials with ardent “Illyrians,” and to proclaim martial law. Under pressure from the palatine of Batthyány an imperial edict was issued, on the 7th day of May, ordering the ban to desist from his separatist plans and take his orders from Pest. He not only refused to obey, but on the 5th of June con- volked to Agram the Croatian national diet, of which the first act was to declare the independence of the Tri-une Kingdom. Once more, at the instance of Batthyány, the emperor intervened; and on the 10th an imperial edict stripped Jellachich of all his offices.

Meanwhile, however, Jellachich had himself started for Innsbruck, where he succeeded in persuading the emperor of the loyalty of his intentions, and whence, though not as yet formally reinstated, he was allowed to return to Croatia with practically unfettered discretion. The Hungarian government, in fact, had played into his hands. At a time when everything depended on the army, they had destroyed the main tie which bound the Austrian court to their interests by tampering with the relation of the Hungarian army to the crown. In May a national guard had been created, the disaffected troops being bribed by increased pay to desert their colours and join this; and on the 1st of June the garrison of Pest had taken an oath to the constitution. All hope of crushing revolutionary Vienna with Magyar aid was lost. Before the end of June Jellachich’s attempt was accepted by the Tri-une Kingdom to cede its northern Croats to Austria. But Austria was not satisfied with this; the Austrian government annexed the Southern Slavs of Austria and Illyria to the Austrian crown, and the Serbs, who were still under Austrian rule, were also annexed. The result was the recognition of the equal rights of all nationalities.
This was the challenge which the Magyars were not slow to accept.

In the Hungarian diet, which met on the 2nd of July, the influence of the conservative cabinet was wholly overshadowed by that of Kossuth, whose inflammatory orations—directed against the disruptive designs of the Slavs and the treachery of the Austrian government—precipitated the crisis. At his instance the diet not only refused to vote supplies for the troops of the ban of Croatia, but only consented to pass a motion for sending reinforcements to the army in Hungary on condition that the anti-Magyar races in Hungary should be first disarmed. On the 11th, on his motion, a decree was passed by acclamation for a levy of 200,000 men and the raising of £4,500,000 for the defence of the independence of the country. Desultory fighting, in which Austrian officers with the tacit consent of the minister of war took part against the Magyars, had already broken out in the south. It was not, however, until the victory of Custoza (July 25) set free the army in Italy, that the Austrian government ventured on bolder measures. On the 4th of September, after weeks of fruitless negotiation, the king-emperor threw down the gauntlet by reinstating Jellachich in all his honours. Seven days later the ban declared open war on Hungary by crossing the Drave at the head of 36,000 Croatian troops (see Austria-Hungary: History). The immediate result was to place the extreme revolutionaries in power at Pest. Széchenyi had lost his reason some days before; Eötvös and Déák retired into private life; of the conservative ministers only Balléthyán, to his undoing, consented to remain in office, though hardly in power.

The advance of Jellachich as far as Lake Balaton had not been checked, the Magyar troops, though—contrary to his expectations—none joined him, offering no opposition. The palatine, the Austrian Archduke Stephen, after fruitless attempts at negotiation, laid down his office on the 24th of September and left for Vienna. One more attempt at compromise was made, General Count Lambeg1 being sent to take command of all the troops, Slav or Magyar, in Hungary, with a view to arranging an armistice. His mission, which was a slight to Jellachich, was conceived as a concession to the Magyars, and had the general approval of Balléthyán. Unhappily, however, when Lambeg arrived in Pest, Balléthyán had not yet returned; the diet, on Kossuth's motion, called on the army not to obey the new commander-in-chief, on the ground that his commission had not been countersigned by a minister at Pest. Next day, as he was crossing the bridge of Buda, Lambeg was dragged from his carriage by a frantic mob and torn to pieces. This made inevitable; though Balléthyán hurried to Vienna to try and arrange a settlement. Failing in this, he retired, and on the 13th opened the campaign. This masterly winter-campaign first revealed Görgei's military genius, and the discipline of that terrible march of marching and counter-marching which had hardened his recruits into veterans whom his country regarded with pride and his country's enemies with respect. Unfortunately, his success caused some jealousy in official quarters, and when, in the middle of February 1849, a commander-in-chief was appointed to carry out Kossuth's plan of campaign, that vital appointment was given, not to the man who had made the army what it was, but to a negligible, a Polish refugee. Count Henrik Dembinski, who, after fighting the bloody and indecisive battle of Kápolna (Feb. 26–27), was forced to retreat. Görgei was immediately appointed his successor, and the new generalissimo led the Honvéd army to victory to victory. Ably supported by Klápka and Damjanich he pressed forward irresistibly. Szőlnök (March 5), Újasszeg (April 6), Vácz (April 10), and Nagysárló (April 19) were so many milestones in his triumphal progress. On the 25th of May the Hungarian capital was once more in the hands of the Honvéd army.

Meanwhile, the earlier events of the war had so altered the political situation that any idea which the diet at Debreczen had cherished of a compromise with Austria was destroyed. The capture of Pest had confirmed the Austrian court in its policy...
of unification, which after the victory of Kápolna they thought it safe to proclaim. On the 7th of March the diet of Kremser was dissolved, and immediately afterwards a proclamation was issued in the name of the emperor Francis Joseph establishing a united constitution for the whole empire, of which Hungary, cut up into half a dozen administrative districts, was henceforth to be little more than the largest of several subject provinces. The news of this manifesto, arriving as it did simultaneously with that of Gőrgő's successes, destroyed the last vestiges of a desire of the Hungarian revolutionists to compromise, and on the 14th of April, on the motion of Kossuth, the diet proclaimed the independence of Hungary, declared the house of Habsburg as false and perjured, for ever excluded from the throne, and elected Kossuth president of the Hungarian Republic. This act put an end to the loose system of which Garay had been the head, and the circumstances, and the results were fatal to the national cause. Neither the government nor the army could accommodate itself to the new situation. From henceforth the military and civil authorities, as represented by Kossuth and Gőrgő, were hopelessly out of sympathy with each other, and the breach widened till all effective co-operation became impossible.

Meanwhile the humiliating defeats of the imperial army and the course of events in Hungary had compelled the court of Vienna to accept the assistance which the emperor Nicholas I. of Russia had proffered in the interests of his friend Joseph: this would have been an intolerable blow to the interests of the great powers, but who would have been, who had been appointed dictator by the panic-stricken government two days before, surrendered the remnant of his hardly pressed army to the Russian General Rüdiger at Világos. The other army corps and all the fortresses followed his example, Komárom, heroically defended by Klappka, being the last to capitulate (Sept. 27). Kossuth and his associates, who had quitted Arad on the 10th of August, took refuge in Turkish territory. By the end of the month Paskevich wrote to the Emperor Nicholas: "Hungary lies at the feet of your Imperial Majesty." From October 1849 to July 1850 Hungary was governed by martial law administered by "the butchery" Haynau. This was a period of military tribunals, draconian, wholesale confiscation and all manner of brutalities. From 1851 to 1860 pure terrorism was succeeded by the "Bach System," which derived its name from the imperial minister of the interior, Baron Alexander von Bach. The Bach System did not recognize Hungarian independence. It postulated the existence of one common indivisible state of which mutilated Hungary 2 formed an important section. The supreme government was entrusted to an imperial council responsible to the emperor alone. The counties were administered by imperial officials, Germans, Czechs and Galicians, who did not understand the Magyar tongue. German was the official language. But though reaction was the motive power of this new machinery of government, it could not do away with many of the practical and obvious improvements of 1848, and it was not blind to some of the indispensable requirements of a modern state. The material welfare of the nation was certainly promoted by it. Modern roads were made, the first railways were laid down, the regulation of the river Theiss was taken in hand, a new and better scheme of finance was inaugurated. Taxe. The empire was, however, hopelessly without root in the soil. The Magyar nation stood aloof from it. It was plain that at the first revolutionary blast from without, or the first insurrectional outburst from within, the "Bach System" would vanish like a mirage.

Meanwhile the new Austrian empire had failed to stand the test of international complications. The Crimean War had isolated it in Europe. The Italian war of 1859 had revealed its essential instability. It was felt at court that some concessions were now due to the subject nationalities. Hence the October Diplomata (Oct. 20 and 27, 1860) which proposed the adoption of a constitutional state with the shadow of a constitution and to grant some measure of local autonomy to Hungary, subject always to the supervision of the imperial council (Reichsrath). This project was favoured by the Magyar conservative magnates who had never broken with the court, but was steadily opposed by the Liberal leader Ferencz Déák whose upright and tenacious character made him at this crisis the oracle and the buttress of the national cause. Déák's standpoint was as simple as it was unchangeable. He demanded the re-establishment of the constitution of 1848 in its entirety, the whole constitution and nothing but the constitution.

The October Diplomata was followed by the February Patent (Feb. 26, 1861), which proposed to convert the Reichsrath into a constitutional representative assembly, with two chambers, to which all the provinces of the empire were to send deputies. The project, elaborated by Anton von Schmerling, was submitted to a Hungarian diet which assembled at Pest on the 2nd of April 1861. After long and violent debates, the diet, on the 8th of August, unanimously adopted an address to the crown, drawn up by Déák, praying for the restoration of the political and territorial integrity of Hungary, for the public coronation of the king with all its accompaniments, and the full restitution of the fundamental rights. The execution was reported by dissolving the diet on the 21st of August and levying the taxes by military execution. The so-called Provisorium had begun.

But the politicians of Vienna had neither the power nor the time to realize their intentions. The question of Italian unity had no sooner been settled than the question of German unity arose, and fresh international difficulties once more inclined the Austrian government towards moderation and concession. In the beginning of June 1865, Francis Joseph came to Buda; on the 26th a provisional Hungarian government was formed, on the 20th of September the February constitution was suspended, and on the 14th of December a diet was summoned to Buda-Pest. The great majority of the nation naturally desired a composition with its ruler and with Austria, and this general desire was unerringly interpreted and directed by Déák, who carried two-thirds of the deputies along with him. The session was interrupted by the outbreak of the Austro-Prussian War, but not before a

1 The crowning atrocities, which the Magyars have never wholly forgiven, were the shooting and hanging of the "Arad Martyrs" and the execution of Baththyány. On October 6, 1849, thirteen generals who had taken part in the war, including Dumjancs and Counts Vécsey and Leiningen, were hanged or shot at Arad. On the same day Count Louis Barthúthyán, who had taken no part in the war and had done his utmost to restrain his countrymen within the bounds of legality, was shot at Pest.

2 Transylvania, Croatio-Slavonia with Fiume and the Temes Banat were separated from the kingdom and provided with local governments.

3 This Reichsrath was a purely consultative body, the ultimate control of all important affairs being reserved to the emperor. Its representative element consisted of 100 members elected by the provinces.
committee had been formed to draft the new constitution. The peace of Prague (Aug. 20, 1866), excluding Austria from Italy and Germany, made the fate of the Habsburg monarchy absolutely dependent upon a compromise with the Magyars. (For the Compromise or Ausgleich, see AUSTRIA-HUNGARY: History.) On the 7th of November 1866, the diet reassembled.

On the 17th of February 1867 a responsible independent ministry was formed under Count Gyula Andrassy. On the 29th of May the new constitution was adopted by 209 votes to 80. Practically it was an amplification of the March Laws of 1848. The coronation took place on the 8th of June, on which occasion the king solemnly declared that he wished "a veil to be drawn over the past." The usual coronation gifts he devoted to the benefit of the Honvéd invalids who had fought in the War of Independence. The reconciliation between monarch and people was assured.

Hungary was now a free and independent modern state; but the very completeness and suddenness of her constitutional victory made it impossible for the strongly flowing current of political life to keep within due bounds. The circumstance that the formation of political parties had not come about naturally, was an additional difficulty. Broadly speaking, there have been in Hungary since 1867 two parties: those who accept the compromise with Austria, and affirm that under it Hungary, so far from having surrendered any of her rights, has acquired an influence which she previously did not actually possess, and secondly, those who see in the compromise an abandonment of the essentials of independence and aim at the restoration of the conditions established in 1848. Within this broad division, however, have appeared from time to time political groups in bewildering variety, each adopting a party designation according to the exigencies of the moment, but each basing its programme on one or other of the theoretical foundations above mentioned. Thus, at the outset, the most heterogeneous elements were to be found both on the Left and Right. The Extreme Left was infected by the fanaticism of Kossuth, who condemned the compromise and refused to take the benefit of the amnesty, while the prelates and magnates who had originally opposed the compromise were now to be found by the side of Déák and Andrassy. The Déák party preserved its majority at the elections of 1869, but the Left Centre and Extreme Left returned to the diet considerably reinforced. The outbreak of the Franco-German War of 1870 turned the attention of the Magyars to foreign affairs. Andrassy never rendered a greater service to his country than when he prevented the imperial chancellor and joint foreign minister, Count Beust, from introducing of France and Russia. On the retirement of Beust in 1871, Andrassy was appointed his successor, the first instance, since Hungary came beneath the dominion of the Habsburgs, of an Hungarian statesman being entrusted with the conduct of foreign affairs. But, however gratifying such an elevation might be, it was distinctly prejudicial, at first, to Hungary's domestic affairs, for no one else at this time, in Hungary, possessed either the prestige or the popularity of Andrassy. Within the next five years ministry followed ministry in rapid succession. A hopeless political confusion ensued. Few measures could be passed. The finances fell into disorder. The national credit was so seriously impaired abroad that foreign loans could only be obtained at ruinous rates of interest. During this period Déák had almost entirely withdrawn from public life. His last great speech was delivered on the 28th of June 1873, and he died on the 29th of January 1876. Fortunately, in Kálmán Tisza, the leader of the Liberal (Szabadalmi, i.e. "Free Principle") party, he left behind him a statesman of the first rank, who for the next eighteen years was to rule Hungary uninterruptedly.

From the first, Tisza was exposed to the violent attacks of the opposition, which embraced, not only the party of Independence, champions of the principles of 1848, but the so-called National party, led by the brilliant orator Count Albert Apponyi, which aimed at much the same ends but looked upon the Compromise of 1867 as a convenient substructure on which to build up the Magyar state. Neither could forgive Tisza for repudiating his earlier Radical policy, the so-called Bihar Programme (March 6, 1858), which went far beyond the Compromise in the direction of independence, and both attacked him with a violence which his unyielding temper, and the ruthless methods by which he always new how to drive home his point, roused to fury. Yet Tisza's aim also was to convert the old polyglot Hungarian kingdom into a homogeneous Magyar state, and the means which he employed—notably the enforced magyarization of the subject races, which formed part of the reformed educational system introduced by him—certainly did not err on the side of moderation. Whatever view may be held of Tisza's policy in this respect, or of the corrupt methods by which he maintained his party in power, there can be no doubt that during his long tenure of office—which practically amounted to a dictatorship—he did much to promote the astonishing progress of his country, which ran a risk of being stifled in the strife of factions. Himself a Calvinist, he succeeded in putting an end to the old quarrel of Catholic and Protestant and uniting them in a common enthusiasm for a race ideal; namely a Liberal, he trampled on every Liberal principle in order to secure the means for governing with a firm hand; and if the political corruption of modern Hungary is largely his work, to him also belongs the credit for the measures which have placed the country on a sound economic basis and the statesmanlike temper which made Hungary a power in the affairs of Europe. In this latter respect Tisza rendered substantial aid to the joint minister for foreign affairs by repressing the anti-Russian ardour of the Magyars on the outbreak of the Russo-Turkish war of 1877-78, and by supporting Andrassy's execution of the mandate from the Berlin Congress to Austria-Hungary for the occupation of Bosnia, against which the Hungarian opposition agitated for reasons ostensibly financial. Tisza's policy on both these occasions increased his unpopularity in Hungary, but in the highest circles at Vienna he was now regarded as indispensable.

The following nine years mark the financial and commercial rehabilitation of Hungary, the establishment of a vast and original railway system which won the admiration of Europe, the liberation and expansion of her over-sea trade, the conversion of her national debt under the most favourable conditions and the consequent equilibrium of her finances. These benefits the nation owed for the most part to Count Széchenyi, Hungary's greatest finance minister, who entered the cabinet in 1886 and greatly strengthened it. But the opposition, while unable to deny the recuperation of Hungary, shut their eyes to everything but Tisza's "tyranny," and their attacks were never so savage and unscrupulous as during the session of 1889, when threats of a revolution were uttered by the opposition leaders and the premier could only enter or leave the House under police protection. The tragic death of the crown prince Rudolph hushed for a time the strife of tongues, and in a measure Tisza brought into the ministry Dészo Szlágyi, the most powerful debater in the House, and Sándor Wekerle, whose solid talents had hitherto been hidden beneath the bushel of an under-secretaryship. But in 1890, during the debates on the Kossuth Repatriation Bill, the attacks on the premier were renewed, and on the 13th of March he placed his resignation in the king's hands.

The withdrawal of Tisza scarcely changed the situation, but the period of brief ministries now began. Tisza's successor,

1 Beust was the only "imperial chancellor" in Austro-Hungarian history; even Metternich bore only the title of "chancellor"; and Andrassy, who succeeded Beust, styled himself "minister of the imperial and royal household and for foreign affairs."
Count Gyula Szárpáry, formerly minister of agriculture, held office for eighteen months, and was succeeded (Nov. 21, 1892) by István Khuen-Hederváry. The religious question. Wekerle, essentially a business man, had taken office for the express purpose of equilibrating the finances, but the religious question remained by far the most energizing of the Catholic clergy, and notably their insistence on the baptism of the children of mixed marriages, had by this time (1893-1894) excluded all others, and the government was forced to postpone their financial programme to its consideration. The Obligatory Civil Marriage Bill, the Religious Bill and the Religion of Children of Mixed Marriages Bill, were finally adopted on the 21st of June 1894, after fierce debates and a ministerial interregnum of ten days (June 10-20); but on the 25th of December, Wekerle, who no longer possessed the king’s confidence, resigned a second time, and was succeeded by Baron Dezso (Desiderius) Bánffy.

The various parties meanwhile had split up into some half a dozen sub-sectes; but the expected fusion of the party of independence and the government fell through, and the barren struggle continued till the celebration of the millennium of the foundation of the monastery produced for some months a lull in politics. Subsequently, Bánffy still further exasperated the opposition by exercising undue influence during the elections of 1896. The majority he obtained on this occasion enabled him, however, to carry through the Army Education Bill, which tended to magyarize the Hungarian portion of the joint army; and another period of comparative calm ensued, during which Bánffy attempted to adjust various outstanding financial and economical differences with Austria. But in November 1898, on the occasion of the renewal of the commercial convention with Austria, the attack on the ministry was renewed with unprecedented virulence, obstruction being systematically practised with the object of goading the government into committing illegalities, till Bánffy, finding the situation impossible, resigned on the 17th of February 1899. His successor, Kálmán Széll, obtained an immense but artificial majority by a fresh fusion of parties, and the minority pledged itself to grant an indemnity for the extra-parliamentary financial decrees rendered necessary by Hungary’s understanding with Austria, as well as to cease from obstruction. As a result of this compromise the budget of 1899 was passed in little more than a month, and the commercial and tariff treaty with Austria were renewed till 1903. 2 But the government had to pay for this complacency with a so-called “pactum,” which bound its hands in several directions, much to the profit of the opposition during the “pure” elections of 1901.

On the reassembly of the diet, Count Albert Apponyi was elected speaker, and the minority seemed disposed to let the government try to govern. But the proposed raising of the contingent of recruits by 15,000 men (Oct. 1902) once more brought up the question of the common army, the parliament refusing to pass the bill, except in return for the introduction of the Hungarian national flag into the Hungarian regiments and the substitution of Magyar for German in the words of command. The king refusing to yield an inch of his rights under clause II. of Law XII. of the Compromise of 1867, the opposition once more took to obstruction, and on the 1st of May 1903 Széll was forced to resign.

Every one now looked to the crown to extract the nation from an ex-lex, or extra-constitutional situation, but when the king, passing over the ordinary party-leaders, appointed as premier Count Károly Khuen-Hederváry, who made himself impossible as ban of Croatia, there was general amazement and indignation. The fact was that the king, weary of the tactics of a minority which for years had terrorized every majority and prevented the government from exercising its proper constitutional functions, had resolved to show the Magyars that he was prepared to rule unconstitutionally rather than imperil the stability of the Dual Monarchy by allowing any tampering with the joint army. In an ordinance on the army word of command, promulgated on the 16th of September, he reaffirmed the inalienable character of the powers of the crown over the joint army and the necessity for maintaining Germany as the cornerstone of the programme of austria. This was followed by the fall of Khuen-Hederváry (September 29), and a quarrel à outrance between crown and parliament seemed unavoidable. The Liberal party, however, realized the abyss towards which they were hurrying the country, and united their efforts to come to a constitutional understanding with the king. The problem was to keep the army an Hungarian army without infringing on the prerogative of the king as commander-in-chief, for, unconstitutional as the new ordinance might be, it could not constitutionally be set aside without the royal assent. The king met them half way by inviting the majority to appoint a commission to consider the question of reducing the army and a committee was formed, which included Széll, Apponyi, Count István Tisza and other experienced statesmen.

A programme approved of by all the members of the committee was drawn up, and on the 3rd of November 1903, Count István Tisza was appointed minister president to carry it out. Thus, out of respect for the wishes of the nation, the king had voluntarily thrown open to public discussion the hitherto strictly closed and jealously guarded domain of the army. Tisza, a statesman of singular probity and tenacity, seemed to be the one person capable of carrying out the programme of the king and the majority. The irreconcilable minority, recognizing this, exhausted all the resources of “technical obstruction” in order to reduce the government to impotence, a task made easy by the absurd standing-rules of the House which enabled any single member to block a measure. These tactics soon rendered legislation impossible, and a modification of the rule of procedure became absolutely necessary if any business at all was to be done. The Modification of the Standing-orders Bill was accordingly introduced by the deputy Gábor Daniel (Nov. 18, 1904); but the opposition, to which the National party had attached itself, denounced it as “a gaging order” inspired at Vienna, and shouted it down so vehemently that no debate could be held; whereupon the president declared the bill carried and adjourned the House till the 13th of December 1904. This was at once followed by an anti-ministerial fusion of the extremists of all parties, including seceders from the government (known as the Constitutional party); and when the diet reassembled, the opposition broke into the House by force and wreaked all the furniture, so that a session was physically impossible (Jan. 5, 1905). Tisza now appealed to the country, but was utterly defeated. The opposition thereupon proceeded to attack the Lex Daniel (Absoly) and stubbornly to clamour for the adoption of the Magyar word of command in the Hungarian part of the common army. To this demand the king as stubbornly refused to accede; 3 and as the result of the consequent deadlock, Tisza, who had courageously continued in office at the king’s request, after every other leading politician had refused to form a ministry, was finally dismissed on the 17th of June.

(R. N. B.; W. A. P.)

Long negotiations between the crown and the leaders of the Coalition having failed to give any promise of a modus vivendi, the king-emperor at last determined to appoint an

1 The Austrian court resented especially the decree proclaiming national mourning for Louis Kossuth, though no minister was present at the funeral.
2 Subsequently extended till 1907.
extra-parliamentary ministry, and on the 21st of June Baron Fejérváry, an officer in the royal bodyguard, was nominated minister resident with a cabinet consisting of little-known permanent officials. Instead of presenting the usual programme, the new premier read to the parliament a royal autograph letter stating the reasons which had actuated the king in taking this course, and giving as the task of the new ministry the continuance of negotiations with the Coalition on the basis of the exclusion of the language question. The parliament was at the same time prorogued. A period followed of arbitrary government on the one hand and of stubborn popular resistance on the other. Three times the parliament was again prorogued—from the 15th of September to the 10th of October, from this date to the 10th of December, and from this yet again to the 1st of March 1906—in spite of the protests of both Houses. To the repressive measures of the government—press censorship, curtailment of the right of public meeting, dismissal of recalcitrant officials, and dragging of disaffected county assemblies and municipalities—the Magyar nation opposed a sturdy refusal to pay taxes, to supply recruits or to carry on the machinery of administration.

Had this attitude represented the temper of the whole Hungarian people, it would have been impossible for the crown to have coped with it. But the Coalition represented, in fact, not the mass of the people, but only a small dominant minority, and for years past this minority had neglected the social and economic needs of the mass of the people in the eager pursuit of party advantage and the effort to impose, by coercion and corruption falling other means, the Magyar language and Magyar culture on the non-Magyar races. In this supreme crisis, then, it is not surprising that the masses listened with sullen indifference to the fiery eloquence of the Coalition leaders. Moreover, by refusing the royal terms, the Coalition had forced the crown into an alliance with the extreme democratic elements in the state. Universal suffrage had already been adopted in the Cis-leithan half of the monarchy; it was an obvious policy to propose it for Hungary also, and thus, by an appeal to the non-Magyar majority, to reduce the irreconcilable Magyar minority to reason. Universal suffrage, then, was the first and most important of the proposals put forward by Mr. Kristóföy, the minister of the interior, in the programme issued by him on the 26th of November 1905. Other proposals were: the maintenance of the system of the joint army as established in 1867, but with the concession that all Hungarian recruits were to receive their education in Magyar; the maintenance till 1917 of the actual customs convention with Austria; a reform of the land laws, with a view to assisting the poorer proprietors; complete religious equality; universal and compulsory primary education. Moreover, the crown had also in it the idea of universal suffrage, entirely checkmated the opposition parties. Their official organs, indeed, continued to fulminate against the "unconstitutional" government, but the enthusiasm with which the programme had been received in the country showed the Coalition leaders the danger of their position, and henceforth, though they continued their denunciations of Austria, they entered into secret negotiations with the king-emperor, in order, by coming to terms with him, to ward off the fatal consequences of Kristóföy’s proposals.

On the 10th of February 1906 the parliament was dissolved, without writs being issued for a new election, a fact accepted by the country with an equanimity highly disconcerting to patriots. Meanwhile the negotiations continued, so secretly that when, on the 9th of April, the appointment of a Coalition cabinet under Dr. Sandor Wekerle was announced, the world was taken completely by surprise.

The agreement with the crown which had made this course possible included the postponement of the military questions that had evoked the crisis, and the acceptance of the principle of Universal Suffrage by the Coalition leaders, who announced that their main tasks would be to repair the mischief wrought by the "unconstitutional" Fejérváry cabinet, and then to introduce a measure of franchise reform so wide that it would be possible to ascertain the will of the whole people on the questions at issue between themselves and the crown. In the general elections that followed the Liberal party was practically wiped out, its leader, Count István Tisza, retiring into private life.

For two years a Liberal-Catholic Coalition ministry continued in office without showing any signs that they intended to carry out the most important item of their programme. The Andrássy’s old abuses continued: the muzzling of the press in the interests of Magyar nationalism, the imprisonment of non-Magyar deputies for "incitement against Magyar nationality," the persecution of Socialists and of the subordinate races. That this condition of things could not be allowed to continue was, indeed, recognized by all parties; the fundamental difference of opinion was as to the method by which it was to be ended. The dominant Magyar parties were committed to the principle of franchise reform; but they were determined that this reform should be of such a nature as not to imperil their own hegemony. What this would mean was pointed out by Mr. Kristóföy in an address delivered at Budapest on the 14th of March 1907: "If the work of social reform," he said, "is Scamped by a measure calculated to falsify the essence of reform, the struggle will be continued in the Chamber until full electoral liberty is attained. Till then there can be no social peace in Hungary." The postponement of the question was, indeed, already producing ugly symptoms of popular indignation. On the 10th of October 1907 there was a great and orderly demonstration at Budapest, organized by the Socialists, in favour of reform. About 100,000 people assembled, and a deputation handed to Mr. Juth, the president of the Chamber, a monster petition in favour of universal suffrage. The reception it met with was not calculated to encourage constitutional methods. The Socialist deputy, Mr. Mezőöy, who wished to move an interpolation on the question, was howled down by the Independents with shouts of "Away with him! Down with him!"

Four days later, in answer to a question by the same deputy, Count Andrássy said that the Franchise Bill would be introduced shortly, but that it would be of such a nature that "the Magyar State idea would remain intact and suffer no diminution." Yet more than a year was to pass before the promised bill was introduced, and meanwhile the feeling in the country had grown more intense, culminating in serious riots at Budapest on the 13th of March 1908.

At last (November 1908) Count Andrássy introduced the long-promised bill. How far it was from satisfying the demands of the Hungarian peoples was at once apparent. It granted manhood suffrage, it is true, but hedged with so many qualifying conditions and complicated with so elaborate a system of plural voting as to make its effect nugatory. Every male Hungarian citizen, able to read and write, was to receive the vote at the beginning of his twenty-fifth year, subject to a residential qualification of twelve months. Illiterate citizens were to choose one elector for every ten of their number. All electors not having the qualifications for the plural franchise were to have one vote. Electors who, e.g., had passed four standards of a secondary school, or paid 16s. 8d. in direct taxation, were to have two votes. Electors who had passed five standards, or who paid £4, 3s. 4d. in direct taxes, were to have three votes. Voting was to be public, as before, on the ground, according to the Preamble, that "the secret ballot protects electors in dependent positions only in so far as they break their promises under the veil of secrecy."

It was at once seen that this elaborate scheme was intended
to preserve "the Magyar State idea intact." Its result, had it passed, would have been to strengthen the representation of the Magyar and German elements, to reduce that of the Slovaks, and almost to destroy that of the Rumans and other non-Magyar races whose educational status was low. On the other hand, according to the Neue Freie Presse, it would have increased the number of electors from some million odd to 2,600,000, and the number of votes to 4,000,000; incidentally it would have largely increased the working-class representation.

This proposal was at once recognized by public opinion—to "an instrument of domination" rather than as an attempt to carry out the spirit of the compact under which the Coalition government had been summoned to power. It was not, indeed, simply a reactionary or undemocratic measure; it was, as The Times corresponded pointed out, "a measure sui generis, designed to defeat the objects of the universal suffrage movement that compelled the Coalition to take office in April 1906, and framed in accordance with Magyar needs as understood by one of the foremost Magyars of the time, the prime minister, Mr. Wekerle.

Plainly, this bill was not destined to settle the Hungarian problem, and other questions soon arose which showed that the crisis, so far from being near a settlement, was destined to become more acute than ever. In December 1908 it was clear that the Coalition Ministry was falling to pieces. Those ministers who belonged to the constitutional and popular parties, i.e. the Liberals and Clericals, desired to maintain the compact with the crown; their colleagues of the Independence party were eager to advance the cause they have at heart by pressing on the question of a separate Hungarian bank. So early as March 1908 Mr. Hallo had laid before the Chamber a formal proposal before the House that the charter of the Austrian Hungarian bank, which was to expire on the 31st of December 1910, should not be renewed; that negotiations should be opened with the Austrian government with a view to a convention between the banks of Austria and Hungary; and that, in the event of these negotiations failing, an entirely separate Hungarian bank should be established. The Balkan crisis threw this question into the background during the winter; but, with the settlement of the international questions raised by the annexation of Bosnia and Herzegovina, it once more came to the front. The ministry was divided on the issue, Count Andrassy opposing and Mr. Ferencz Kossuth supporting the proposal for a separate bank.

Finally, the prime minister, Dr. Wekerle, mainly owing to the pressure put upon him by Mr. Justh, the president of the Chamber, yielded to the importunity of the Independence party, and, in the name of the Hungarian government, laid the proposals for a separate bank before the king-emperor and the Austrian government.

The result was a foregone conclusion. The conference at Vienna revealed the irreconcilable difference within the ministry; but it revealed also something more, the determination of the emperor Francis Joseph, if pressed beyond the limits of his patience, to appeal again to the non-Magyar Hungarians against the Magyar chauvinists. He admitted that under the Compromise of 1867, Hungary might have a separate bank, while urging the expediency of such an arrangement from the point of view of the international position of the Dual Monarchy. But he pointed out also that the question of a separate bank did not actually figure in, the act of 1867, and that it could not be introduced into it, "more especially since the capital article of the ministerial programme, i.e. electoral reform, was not realized, nor near being realized." On the 27th of April, in consequence of this rebuff, Dr. Wekerle tendered his resignation, but the king refused to accept it.

This task was destined to prove one of almost insuperable difficulty. Had the issues involved been purely Hungarian and constitutional, the natural course would have been for the king to have sent for Mr. Kossuth, who commanded the strongest party in the parliament, and to have entrusted him with the formation of a government. But the issues involved affected the stability of the Dual Monarchy and its position in Europe; and neither the king-emperor nor his Austrian advisers, their position strengthened by the success of Baron Aehrenthal's diplomatic victory in the Balkans, were prepared to make any substantial concessions to the party of Independence. In these circumstances the king sent for Dr. Laszlo Lukacs, once finance minister in the Fejervary cabinet, whose task was acting as a homo regius apart from parties, to construct a government out of any elements that might be persuaded to co-operate with him. But Lukacs had no choice but to apply in the first instance to Mr. Kossuth and his friends, and these, suspecting an intention of crushing their party by entrapping them into unpopular engagements, rejected his overtures. Nothing now remained but for the king to request Dr. Wekerle to remain for the present in office with his colleagues, thus postponing the settlement of the crisis (July 4).

Inevitably the compromising policy played into the hands of the extremists; for supplies had not been voted, and the question of the credits for the expenditure incurred in connexion with the annexation of Bosnia and Herzegovina, increasingly urgent, placed a powerful weapon in the hands of the Magyars, and made it certain that in the autumn the crisis would assume an even more acute form. By the middle of September affairs had again reached an impasse. On the 14th Dr. Wekerle, at the ministerial conference assembled at Vienna for the purpose of discussing the estimates to be laid before the delegations, announced that the discussions among his colleagues made the continuance of the Coalition government impossible. The burning point of controversy were the magyarization of the Hungarian regiments and the question of the separate state bank. On the first of these Wekerle, Andrassy and Apponyi were prepared to accept moderate concessions; as to the second, they were opposed to the question being raised at all. Kossuth and Justh, on the other hand, competitors for the leadership of the Independence party, declared themselves not prepared to accept anything short of the full rights of the Magyars in those matters. The matter was urgent; for parliament was to meet on the 28th, and it was important that a new cabinet, acceptable to it, should be appointed before that date, or that the Houses of Parliament were not invited to meet. Thus the negotiations would be postponed and no credits would be voted for the cost of the new Austro-Hungarian "Dreadnoughts" and of the annexation of Bosnia-Herzegovina. In the event, neither of these courses proved possible, and on the 28th Dr. Wekerle once more announced his resignation to the parliament.

The prime minister was not, however, as yet to be relieved of an impossible responsibility. After a period of wavering Mr. Kossuth had consented to shelve for the time the question of the separate bank, and on the strength of this Dr. Wekerle advised the crown to entrust to him the formation of a government. The position thus created raised a twofold question: Would the crown accept? In that event, would he be able to carry his party with him in support of his modified programme? The answer to the first question, in effect, depended on that given by events to the second; and this was not long in declaring itself. The plan, concerted by Kossuth and Apponyi, with the approval of Baron Aehrenthal, was to carry on a modified coalition government with the aid of the Andrassy Liberals, the National party, the Clerical People's party and the Independence party, on a basis of suffrage reform with plural franchise, the
prolongation of the charter of the joint bank, and certain con-
cessions to Magyar demands in the matter of the army. It was
soon clear, however, that in this Kossuth would not carry his
party with him. A trial of strength took place between him
and Mr de Justh, the champion of the extreme demands in the
matter of Hungarian financial and economic autonomy; on the
7th of November rival banquets were held, one at Mako, Justh's
constituency, over which he presided, one at Budapest with
Kossuth at the head. The attendance at each foreshadowed the
outcome of the general meeting of the party held at Budapest
on the 11th, when Kossuth found himself in a minority of 46.
The Independence party was now split into two groups: the
"Independence and 1848 party," and the "Independence, 1838
and Kossuth party."

On the 12th Mr de Justh resigned the presidency of the Lower
House and sought re-election, so as to test the relative strength
of parties. He was defeated by a combination of the Kossuthists,
Andrássy Liberals and Clerical People's party, the 30 Croatian
deputies, whose vote might have turned the election, abstaining
on Dr Wekerle promising them to deliver Croatia from the
oppressive rule of the ban, Baron Rauch. A majority was thus
secured for the Kossuthist programme of compromise, but a
majority so obviously precarious that the king-emperor, in-
fluenced also—it was rumoured—by the views of the heir-
apparent, in an interview with Count Andrássy and Mr Kossuth
on the 13th, refused to make any concessions to the Magyar
national demands. Hereupon Kossuth publicly declared (Nov.
13) to a delegation of his constituents from Czegeled that he
himself was in favour of an independent bank, but that the king
opposed it, and that in the event of no concessions being made
he would join the opposition.

How desperate the situation had now become was shown by
the fact that on the 27th the king sent for Count Tisza, on
the recommendation of the very Coalition ministry which had been
formed to overthrow him. This also proved abortive, and
affairs rapidly tended to revert to the ex-fec situation. On
the 23rd of December Dr Lukacs was again sent for. On the previous
day the Hungarian parliament had adopted a proposal in favour
of an address to the crown asking for a separate state bank.
Against this Dr Wekerle had protested, as opposed to general
Hungarian opinion and ruinous to the national credit, pointing
out that whenever it was a question of raising a loan, the mainten-
ance of the financial community between Hungary and Austria
was always postulated as a preliminary condition. Point was
given to this argument by the fact that the premier had just
concluded the preliminaries for the negotiation of a loan of
25,000,000 fl. and that both a loan and a deposit were to be raised in the Austrian market, already glutted with Hungarian
securities—was urgently needed to pay for the Hungarian share
in the expenses of the annexation policy, for public works
(though the railway scheme), and for the redemption in
1910 of treasury bonds. It was hoped that, in the circumstances,
Dr Lukacs, a financier of experience, might be able to come to
terms with Mr de Justh, on the basis of dropping the bank
question for the time, or, failing that, to patch together out of
the rival parties some sort of a working majority.

On the 22nd a Hungarian parliament adjourned sine die, pend-
ing the settlement of the crisis, without having voted the
estimates for 1910, and without there being any prospect of
a meeting of the delegations. On the two following days Dr
Lukacs and Mr de Justh had audiences of the king, but without
result; and on the 31st Hungary once more entered on a period
of extra-constitutional government.

After much negotiation a new cabinet was finally constituted
on the 17th of January 1910. At its head was Count Kuen
Hederváry, minister of the interior, minister for Croatia,
and minister in waiting on the crown. Other ministers
were Mr Károly de Hieronymi (commerce), Dr Lukacs
(finance), Ferencz de Szekely (justice, education, public worship),
Béla Serenyi (agriculture) and General Hazay (national defence).
The two main items in the published programme of the new
government were the introduction of universal suffrage and—
even more revolutionary from the Magyar point of view—the
substitution of state-appointed for elected officials in the counties.
The real programme was to secure, by hook or by crook, a
majority at the polls. Meanwhile, the immediate necessities of
the government were provided for by the issue through Messrs
Rothchild of £2,000,000 fresh treasury bills. These were to be
redeemed in December 1910, together with the £9,000,000 worth
issued in 1900, out of the £30,000,000 that the government had
owed the French government; but in view of the opposition in
Paris to the idea of advancing money to a member of the Triple
Alliance, it was doubtful whether the loan would ever be floated.

The overwhelming victory of the government in June at the
polls produced a hull in a crisis which at the beginning of the
year had threatened the stability of the Dual Monarchy and the
peace of Europe; but, in view of the methods by which the
victory had been won, not the most sanguine could assert that
the crisis was overpassed. Its deep underlying causes can only be understood in the light of the whole of Hungarian
history. It is easy to denounce the dominant Magyar classes as a selfish oligarchy, and to criticize the methods
by which they have sought to maintain their power. But
a nation that for a thousand years had maintained its
individuality in the midst of hostile and rival races could not
be expected to allow itself without a struggle to be sacrificed
to the force of mere numbers, and the less so if it were
justified in its claim that it stood for a higher ideal of culture
than its neighbours, and that it had a right to a due share of
such assets as the historical development had thus far
justified to a special measure of enlightenment. In
their efforts to establish Hungarian independence on the firm
basis of national efficiency they had succeeded in changing their
country from one of very backward economic conditions into
one which promised to be in a position to hold its own on equal
terms with any in the world.

W. A. P.

**BIBLIOGRAPHY.**—(a) **Sources**. The earliest important collection of
sources of Hungarian history was Johann Georg Schundt's
**Monumenta Hungarica** (4th ed., Vienna, 1766-1768),
the Codex diplomaticus of György Fejer (40 vols., Buda, 1829-1844),
though full of errors, remains an inexhaustible storehouse
of materials. In 1849 Stephen László Enderlicher (1804-1849)
was better known as a botanist than as a historian, published a
collection of documents, **Rerum hungaricarum monumenta Arpadiana**.
This was followed by Gustav Wenzel's Codex diplomaticus arpadicus
(12 vols., Budapest, 1903-1904). The Co-Director of the
Time of the King Matthias (Mag. and Lat.), ed. by Ivan Nagy
(1875-1879); **National Documents** (Mag. and Lat.), ed.
in Austria, 1879). The Magyar, ed. by Farkas Dék and others (Pest, 1875-1891); **Monumenta Hungariae**
(1891-1894); **Monumenta Hungaricae historicae** (9 vols.,
1891-1907). A valuable collection of materials from the Vatican archives
editied under the auspices of the Hungarian bishops; the
Hungarian Historical Society. Of these the most important is the
Hungarian Historical Record, published by the Academy. This
falls into three main groups: Diplomata (30 vols.); Scriptores
(40 vols.); Monumenta Comitid (14 vols.); Monumenta Hungariae
(10 vols.); **The Hungarian Historical Records** (9 vols.), **Turkish Historians**
(2 vols. pubd.), the **Archives of the Hungarian subordinate
families (2 vols. pubd.).**

On the sources see: Hendrik Marczali, Ungarns Geschichtsquellen
im Zeitalter des Arthur (Berlin, 1882); Kaindl, Studien zu den
ungarischen Geschichtsquellen (Vienna, 1894-1902); and, for
a general appreciation, Mangold, Prognostic History of the Hungarians
in Mag. 5th ed., Budapest, 1907.

(b) **Works**. The modern literature of Hungarian is very rich
in historical monographs, of which a long list will be found in the Subject
Headings in the London Library; here it is only necessary to mention by way
of the more important general histories, together with such special
works as are most readily accessible to English readers. Of the
books of general survey of Hungarian history may be mentioned:
**Korma, Hist. critica regum Hungariae** (42 vols., Pest, 1777-1870 and Frey,
Annales regiae Hungariae (5 vols., Pest, 1674-1770). Of modern histories written in Hungarian the most imposing is the History of the
Magyars (10 vols., Budapest, 1870-1891), the 23rd birthday of the
celebration of the millennium of the foundation of the monarchy,
by Sándor Szilágyi and numerous collaborators. Of importance, too,

---

**HUNGARY**
The Magyar or Hungarian language belongs to the northern or Finno-Ugric (q.v.) division of the Ural-Altaic family, and forms, along with Ostlak and Vogul, the Ugric branch of that division. The Magyar language is thus the living link between the Finnic and the Finno-Ugric languages, first noticed by John Amos Comenius (Komensky) in the middle of the 17th century,¹ and later by Olov Rudbeck,² Leibnitz,³ Strahlenberg,⁴ Ecard, Saajnovics,⁵ and others, was proved "grammatically" by Samuel Gyarith in his work entitled Affinites linguæ Hungaricae cum linguis Finnicorum originis grammaticæ demonstrata (Göttingen, 1790). The Uralian travels of Anthony Reguly (1843-1845), and the philological labours of Paul Hunfalvy and Joseph Budenz, may be said to have established it, and no doubt has been thrown on it by recent research, though most authorities regard the Magyars as of Finno-Ugric origin. However, although for nearly a thousand years established in Europe and subjected to Aryan influences, the Magyar has yet retained its essential Ural-Altaic or Turanian features. The grammatical forms are expressed, as in Turkish, by means of affixes modified according to the high or low vowel power of the root or chief syllables of the word to which they are appended—the former being represented by e, o, ã, ã, the latter by a, a, o, a, ā; the sounds ê, ê, i, i are regarded as neutral. In some respects the value of the consonants varies from that usual in the Latin alphabet. Š is pronounced as ť in English, the sound of simple š being represented by sz. C or ç is pronounced as ts, dz, and ñ as en, ñ, as English dz; g as dy. Among the striking peculiarities of the language are the definite and indefinite forms of the active verb, e.g. Idom, I see (definite, viz. him, her, it, the man,” etc.), Idok, I look (indefinite); the insertion of the causative, frequentative, diminutive and potential syllables after the root of the verb, e.g. är, he beats; eret, he causes to beat; vered, he beats repeatedly; versit, he beats a little; verel, he can beat these; verem, he causes agitation in the eye; lemn, to be (viz. say), is; wasnak, are; vol, was; less,

⁵Demonstrativo Idiom Ungarorum et Latinorum idem esse (Copenhagen and Tyrnau, 1770).

The earliest lexicon is that of Gabriel (Mazó) Pecci alius Pestini Tuscanus, Glossario Nomenclatorum Latinæ, Italicae, Gallicæ, Bohemicae, Ungaricae et Germanicae (Vienna, 1580), which was several times reprinted. The Vocabula Hungarica of Bernardino Bili (1542), the original MSS. of which is in the Biblioteca Nazionale di Napoli, contains 289 Hungarian words with renderings in Latin or Italian. It is in the Dictionarium undercinque linguarum of Calepínus (Bazel, 1590) are found also Polish, Hungarian and English words. This dictionary is the predecessor of the Lexicon Latinico-Hungaricum of Albert Moholl first appeared at Nuremberg in 1604, and with the addition of Greek was reprinted in 1708. Of modern Hungarian dictionaries the best is that of L. Szervézy, which contains 110,784 articles in 6 vols., by Cuzczor and Fogarasi (Pest, 1862-1874). The next best native dictionary is that of Marshall Ballagi, A Magyar nyelvo teljes szótára (Pest, 1868-1873). In addition to the above may be mentioned the work of Kertész, 1820, where the words are arranged according to the roots (Buda, 1831-1832); the Etymologisches Wörterbuch aus chinesischen Wurzeln, of Homborsky (Paris, 1877); Lexicon linguarum, of Seton-Watson (2nd ed., Pest, 1876); the English-Hungarian dictionary of W. C. Remele (London, 1875), and the Hungarian-Latin dictionary of J. Szendrey (Budapest, 1818-1825). Other and more general dictionaries for German scholars are several by M. Szántay, and A. Kresznerics, “Ungarisch-Deutsch Wörterbuch” (Vienna, 1844-1852), and many of the works published in Pressburg by J. J. Hoffmeister, and J. J. Endlich, 1808-1846.

The Magyar or Hungarian language is, moreover, copious in idiomatic expressions, rich in its store of words, and almost as musical in its harmonious intonation. It is, therefore, admirably adapted for both literary and rhetorical purposes.

The first Hungarian grammar known is the Grammatica Hungaro-Latina of John Erdős alias Sylvester Pannonius, printed at Sárvar-Ujsziget in 1539. Others are the posthumous treatises of Nicholas Keresztény, 1569, and the contributions of the authors and Hungarian and generally, see the bibliography to the article AUSTRIA-HUNGARY.

III. LANGUAGE

The Magyar or Hungarian language belongs to the northern or Finno-Ugric (q.v.) division of the Ural-Altaic family, and forms, along with Ostlak and Vogul, the Ugric branch of that division. The consonants of the Magyar language are those of the Slavonic and of the Finnic and Hungarian, and the latter are strongly Magyar in sympathy; R. W. Seton-Watson (Scotus Viator), Racial Problems in Hungary (London, 1908), a strong criticism of the Magyar attitude towards the Slav subject races, especially the Slovak. The earliest documents and a full bibliography (c).

(b) Constitutional: Anton von Virozil, Das Staatsrecht des Königreichs Ungarn (3 vols., Pest, 1865); S. Radó-Rothfeld, Die ungarische Verfassung (Vienna, 1898) and, based on this, A. de Bétha, La Constitution Húngaro (Paris, 1898), both supporting the policy of Magyarization; Akos von Timon, Ungarische Verfassung- und Rechts- geschichte (Berlin, 1904); Knatcbull-Hugess, pp.

(d) Biographical: In Magyar, the great serial entitled Hungarian Historical Biographies (Budapest, 1884, &c.), edited by Sándor Szilágyi, is a collection of lives of famous Hungarian men and women from the earliest times by many scholars of note, finely illustrated.

For works on special topics see the separate articles on the sovereigns and other notabilities of Hungary. For works on the Compromise of 1867, and the relations of Austria and Hungary generally, see the bibliography to the article AUSTRIA-HUNGARY.
Hungarian history, and may be assigned to the middle of the 12th century; the Carmen Miserabile of Roricrus; the Liber Croniconum of Peter Damian, an abridgment of the so-called "Chronicon Benedicti," Crónica Hungarorum, printed at Buda in 1473 (Eichhorn, Geschichte der Literatur, ii. 319); and the Chronicon Rerum Hungaricarum of John Thaddius, a monumental enterprise by King Matthias Corvus, who attracted both foreign and native scholars to his court. Foremost amongst the Italians was Caspar, who, at the request of his contemporaries John Thaddius, Caspar composed Hungarian translations of the Decades of Saint John, this, that, the that, and the first, of his time, comprising Hungarian history from the earliest times to the death of King Matthias, was published with a continuation by Sambucus (Basel, 1568).2 Marzio Gellert, the king's chief librarian, wrote (1431; and it is said that the first native scholar was John Ceising, alias Janus Panonius, who composed Latin epigrams, panegyrics and epic poems. The best of his works was published by Count S. Teleki at Utrecz in 1784.

As there are no traces of literary productions in the native or Magyar dialect before the 12th century, the early condition of the language is concealed from the philologist. It is, however, known that the Hungarians had their own martial songs, and that their princes kept lyre and lute players who sang festal odes in praise of the national heroes. In the 11th century Christian teachers introduced the use of the Roman letters, but the employment of the Latin language was not formally decreed until 1114 (see Bowring, Poetry of the Magyars, p. 108). Very little is known up to that date public business was transacted in Hungarian, for the decrees of King Coloman the Learned (1095-1141) are in the Slavonic language. Among the literary relics of the 12th century are the "Latatite" or Halotti Beszéd funeral discourse and prayer in Hungarian, to which Döberei in his Régi Magyar Nyelvemlelek ascribed the 1st of the year (John Kimay, "Liturg."

An 18th century radical attempt to introduce the Latin alphabet was first made by the testament of Kazai-Karácsony (1413); and by other relics of this period published by Döberei in vol. ii. of the R. M. Nyelvemlékek.1 To the early part of the 15th century may be assigned also the legendary "St Francis" and of "St Ursula," and possibly the original of the Ének Pannónia megételérdől, an historical "Song about the Conquest of Pannonia." But not until the dawn of the Reformation did Magyar begin in any sense to replace Latin for literary purposes. The period shared by Hungarian and Latin is marked by 1437 and 1530 marks the first development of Magyar literature.

About the year 1437 two Hussite monks named Tamás and Báltí (of the liquefaction of the Mártirpici), composed a large portion of the Bible for the use of the Hungarian refugees in Moldavia. To these monks the first extant Magyar version of part of the Scriptures is ascribed, and the fifteenth extant, ascribed to one of them (a direct descendant of Döberei, but the exact date either of this copy or of the original translation cannot be ascertained. With approximate certainty may be ascribed also to Tamás and Báltí the original of the still extant transcript, by George Németi, of the Four Gospels, the Játszy or Munich Codex (finished at Târtoș in Moldavia in 1466). Amongst other important codices are the Jordanvári Codex (1516-1510), an incomplete copy of the translation of the Bible made by Ladislaus Bátori, who died about 1456; and the Döberei or Gyulaföldér Codex (1506), containing a version of the Psalter, and the liturgical prayers, ascribed by direct descent to Döberei, but the exact date either of this copy or of the original translation cannot be ascertained. With approximate certainty may be ascribed also to Tamás and Báltí the original of the still extant transcript, by George Németi, of the Four Gospels, the Játszy or Munich Codex (finished at Târtoș in Moldavia in 1466). Amongst other important codices are the Jordanvári Codex (1516-1510), an incomplete copy of the translation of the Bible made by Ladislaus Bátori, who died about 1456; and the Döberei or Gyulaföldér Codex (1506), containing a version of the Psalter, and the liturgical prayers, ascribed by direct descent to Döberei, but the exact date either of this copy or of the original translation cannot be ascertained. work at Cracow in 1531 to the end of the period just treated, more than 200 new native schools were founded. Among these the new language movement was also strong in Hungary.

The period comprised between the peace of Szatmár (1711) and the year 1772 is far more barren in literary results than even that which preceded it. The exhaustion of the nation from its participation in the Perištean and classical wars and from the external threat of the Transylvanian princes where the native language had been cherished, and the prevalent use of Latin, were responsible in a large measure for the paucity of results. From the middle of the eighteenth century we find a few notable steps forward in the gathering-the materials of national literature and in the efforts to found schools of the native tongue. The new wave was accompanied to bring about a complete neglect of the Magyar language and literature. Among the few prose writers of distinction were Andrew Spangár, whose "Hungarian Bookstore, Magyári Könyvtár (Budapest, 1724) was dedicated to the Duke of Courland in 1714. Among the didactic poets may be mentioned Lewis Nagy, George Kálmán, John Illely and Paul Bertalanfi, especially noted for his hymn "Life of St Stephen, first Hungarian king," Ószászás Sz. Írező és Zsidó (1777).

The next three literary periods stand in special relationship to one another, and are sometimes regarded as the same. The first two, marking respectively the progress of the "Regeneration of the Native Literature" (1772-1807) and the "Revival of the Language" (1807-1830), were introductory to and preparatory for the third or "Academy," period, which began about 1830.

Regeneration of the Native Literature (1772-1807)

The Magyar language during the reigns of Maria Theresa and her successor Joseph II., the more important prose productions of the latter part of the 18th century, for instance the historical works of János Batsányi (q.v.), the novel of Joseph Galambos, and the early Faludi, were written either in Latin or in German. The reaction in favour of the native literature manifested itself at first chiefly in the creation of various schools of philology and literature.

Among the most popular of these movements was the "Magyar Cicerone," Not only as a philological and didactic writer, but also as a lyric and dramatic poet he surpassed all his contemporaries. Another pleasing lyric poet of this period was Lajos Amadó, the naturalness and genuine sentiment of whose light and running verses are suggestive of the love songs of Italian authors. Of considerable merit are also the sacred lyrical melodies of Paul Károlyi (q.v.), who in 1784 adopted the Magyar by marrying Princess Helene Czobor, and becoming Count Palóczi. More significant for the development of the national language is the work which was done in 1715. Among the didactic poets may be mentioned Lewis Nagy, George Kálmán, John Illely and Paul Bertalanfi, especially noted for his hymn "Life of St Stephen, first Hungarian king," Ószászás Sz. Írező és Zsidó (1777).

The reaction in favour of the native literature manifested itself at first chiefly in the creation of various schools of philology and literature.

LITERATURE

HUNGARY

The earliest Magyarizer of Servian folk-song, Michael Vitkovics did valuable service. Not without interest to Englishmen is the name of Gabriel Döbereiner (q.v.), the translator of Shakespeare’s *Macbeth*, represented at Pozsony in 1835. The first Magyar ever to be translated was produced in 1814 by Andreas Horváth under the title of *Zirc emlékezetes* (Reminiscence of Zirc); but his *Arpád*, in 12 books, finished in 1830, and published at Pozsony in 1832, was the first substantial work by a Magyar poet. Among other poets of this period were Albin Szemtmikloty, George Gaal, Emil Buzc, Joseph Szász, Ladislaus Tóth and Joseph Katona, author of the much-extolled historical drama *Báth Bél*. Dircse Grozics, the translators of scripture into Magyar hexameters, is chiefly noted for his prose writings on ecclesiastical and philosophical subjects. As authors of special works on philosophy, we find Samuel Kötele, John Paul Ráth, and József Brunus, the theologian and Hebraist John Somosy; as an historian and philologist Stephen Horváth, who endeavoured to trace the Magyar descent from the caciuc to the Pannonian Paul, and Pál Szemenics. For an account of the historian George Fejér, the laborious compiler of the *Codex Diplomaticus*, see FEJÉR.

Academy period, 1830-1860.

The establishment of the Hungarian Academy of Sciences (17th November 1830) marks the commencement of a new period, in the first eighteen years of which gigantic exertions were made as regards the literary and intellectual life of the nation. Hungarian was modernised and the academy grew rapidly, and showed its capacity for giving expression to almost every form of scientific knowledge. By offering rewards for the best original dramatic productions, the academy promoted this branch of literature, which had suffered from lack of classical dramas. During the earlier part of its existence the Hungarian academy devoted itself mainly to the scientific development of literature, and was rather in the nature of a learned society. Its foundation in 1860 the academy has, however, paid equal attention to the various departments of history, archaeology, national economy and the physical sciences. The encouragement of polite literature was maintained, and even a scientific study of literature was added. Generally less varied and romantic, though easier in style, are the heroic poems *Augusturi üldözet* (Battle of Augustburg) and *Aradi gyalást* (Diet of Arad) of Gregory Czuczor, who was, moreover, very fecund in an epigrammatist. Martin Debreczeni was chiefly famed for his *Király csata* (Battle of Kielce), published at Pest in 1854 after his death by Count Émeric Miklós. The laborious John Garay in his *Szent László* shows considerable ability as an epic poet, but his greatest merit was rather as a romantist and ballad writer, as shown by the *Pen Sketches* or *Tollrajsok* (1845), and his legendary series *Arpádak* (1847), and in the prose satire *Második nap* (1849). The medical monographs of Ferenc Borbély (Wine-Song), Sóhajst (Sigh), Ébreoszt (Awakening) and *Apophasis* are much admired. He is known further as the translator of F. C. Dahlmann’s *Geschichte der englischen Revolution*. As generally able writers of epic poetry during the earlier part of this period may be mentioned among others Francis Csežszár, Joseph Széked and Andrew Kunos—also Lewis Szaká and Alexander Vachott, whose songs and romances are of an artless and romantic character, and whose lyric and dramatic poetry is original but rather heavy lyric and didactic poetry we may mention Peter Vajda, who was, moreover, the translator of Bulwer’s "Night and Silence." Among the finest of these are the dramatisations of *Lyrics of John Kirzán* and John Erdély, but the reputation of the latter was more especially due to his collections of folklore made on behalf of the Kisfaludy society. More popular than any of the preceding, and well known throughout the country, and in foreign translation, are the charming lyrics of Alexander Pető (q.v.), the "Burns* of Hungary. His poems, which embody the national genius, are passed in the streets by women and children, and they are happy in the pieces descriptive of rural life. Among lyricists were: Coloman Tóth, who is also the author of several epic and dramatic pieces; John Vajda, whose *Kisebb Költőmények* (Minor Poemmar (1852) and *Bárvon* (1852), were partly written in the mode of Heine, and are of a pleasing but melancholy character; Joseph Lévy, known also as the translator of Shakespeare’s *Titus Andronicus*, *The Tempest* of the *Shrew* and Henry IV, and Paul Gyulphi, who, not only as a faultless lyric and epic poet, but as an impartial critical writer, is highly esteemed, and whose *Romkentrosty* is justly prized as one of the best Magyar poems that has appeared during the last century. Joseph Bérczy, Joseph Zalár, Samuel Nylassz, Joseph Lidasz, Joseph Tolnai, the sentimental Ladislaus Szalisty, and the talented painter Zilkschó, whose *Poems and Fables* (1860) were translated by the Kisfaludy society. The lyrics of Anthony Várady (1875, 1877) are somewhat dull and unequal in tone; both he and Baron Ivor Kaas, the author of *Által napja* (Day of Judgment, 1870), have shown some talent, but in an archaic vein. Among the philosophic poets are Géza Zichy and Victor Dalmady, those of the latter published at Budapest in 1876, are mostly written on subjects of a domestic nature, but are conceived in a patriotic spirit. Emil Ábrányi adopts a more philosophic style, and the Kisfaludy society, founded in 1863, had great power to coordinate and to promote national poetry. Among the most notable of theIncomplete feature is noticeable also in the Költőmények (1873) of Ladislaus Torkos and the Modern Költő (1874) of Ladislaus Nyé. The *Salamon* (1870) of Charles Szász (I. 1829) was rewarded with the prize of the academy. The subject, taken from the age of the Hungarian chivalry, is artistically worked out from medieval legends, and gives an excellent description of the times of St Ladislaus of Hungary. Charles Szász is generally better known as a poetical translator than as an original poet. He is the Magyarizer of Shakespeare’s *Anthony and Cleopatra*, *Othello*, *Macbeth*, *Henry VIII.* , *Winter’s Tale*, *RomEO and juliet*, and *As You Like It*. The *Selections of Selections* of Andrew Barna, Alfred Várdy, Andrew Szabó, Charles Berczy, Julius Gregossy, Lewis Döczi, Béla Erdö, Emeric Gaspár and many others. A Magyar version, by Ferdinand Barna, of the *Kalevala* was published by the *Magyar Literary Society* of Budapest in 1869. The *Selections* of Henrik Leboczky and Michael Fincky of the popular poetry of the Slavic nationalities appeared in vols. i. and ii. of the *Hazai nép költségtára* (Treasury of the Country’s Popular Song), commenced in 1866, under the editorship of the Rev. Drs. Ábrahám Pataky and the Servian of Jovanovics. The last-mentioned works are interesting from an ethnographic point of view. We may here note that for foreigners unacquainted with Hungarian there are, besides the many editions of the *Költő* (Magyarian poems) and *Népszéptek* (National Library), published 1845-1847, and continued in 1852 under the title *Ujabb Nemzeti könyvtár*, a repository of works by contemporary authors, besides the monthly *Népszéptek* or *Népszépti* (Monthly Review, 1859, 1860), the *Népszéptek* (Monthly), 1859, 1860, 1861, *A. M. Riefed* (1860), *J. Nordheim* (1872), G. M. Henning (1874), A. von der Heide (1879) and others. Selections have also been published in English by Sir John Bowring (1830), S. Wékey in his *History of the Magyars* and in 1841 and 1868 by F. Desbordes-Valmore and C. E. de Ufály (1873).
Meanwhile dramatic literature found many champions, of whom the most prominent were Joseph Széchényi, Joseph Szathmáry, and John Kázmér, who enriched the Hungarian stage with more than a hundred plays. Of these, the most popular are comedies and serio-comic national dramas. A less prolific but more classical writer appeared in Charles Oláh, whose transcriptions of Ibsen’s plays are held in high esteem. It is one of the best historical tragedies in the language. Several of the already mentioned lyric and epic poets were occasional writers also for the drama. The lyric poet Sándor Szepesi and Lewis Dobcsa, Joseph Széjti, Ignatius Nagy, Joseph Szenye (a translator from Schiller), Joseph Gaal, Charles Hugo, Lawrence Tóth (the Magyarizer of the School for Scandal), Emeric Madách (as Fraulein Zoldea), Zsigmond Pal, Zsigmond Köldy and Lewis Dócz, author of the popular prize drama Császár (The Kiss). Az ember tragediája (The Tragedy of Man), by Emeric Madách (1861), is a dramatic poem of a philosophical and contemplative nature, in which the author, not interested in stage effects, successful dramatic pieces may be mentioned the Fata rossza (Village Scamp) of Edward Tóth (1875), which represents the life of the Hungarian peasantantry, and shows both poetic sentiment and dialectic skill. A szerelmi hamar (Comedy, Love and Life), by József Gróf, was a social-political romance of some merit; and Ut jádok, avult emberek (Modern Times, Men of the Past), by L. Véka (1876). In 1879, Pal Teleki, in A Hosszú villám (The Long Flash), was a set the medium for a satirical attack upon official corruption and Hungarian national vanity; and in Az anmok dimórája (Dreamer of Dreams), by John Asbóth (1878), other national defects are aimed at. A rossz emberek (The Bad Neighborhood), by Charles Váry, portrays a felicitous representation of the power of love. The Az utolsó Bebek (The Last of the Bebes), by the late Charles Pétéry, is a work rich in poetic invention, but meager in historical matter. The reverse is the case with his Lyric and Historical Drama, a collection of poems, excerpts from which are found in the scene of which is placed at Pest, in the beginning of the 15th century. In this romance the interest of the narrative is weakened by a superabundance of historical and archaeological details.

The drama in Hungary was, however, an epoch in history. For the first time until recently were confessedly behindhand as compared with many other European nations. Indeed, before the foundation of the Hungarian Academy there was no stage in Hungary, and the drama was almost under the ban. The name of Charles Erdélyi and of Augustus Greguss won for them well-deserved recognition, the latter especially being famous for his aesthetic productions, in which he appears to follow the principles of the French Jena School. József Botár (1849-1921), and Pal Teleki (1838-1908) were both dra- The reputation of John Szilas, John Varga, Fidelius Beely and Francis Ney arose rather from their works bear- ing on the subject of education than from their contributions to playwriting. The labours of Stephen Horváth in the preceding period had prepared the way for future workers in the field of historical literature. Superficial meritios among them are Michael Horváth, Ladislaus Szalay, Paul Jászay and Count Joseph Teleki. The Magyark története (History of the Magyars), in 4 vols., first published at Pápa (1842-1845), and afterwards in 6 vols. at Pest (1860-1863), and in 4 vols. at Pozsony, by Joseph Tituschka, was the first of Horváth’s numerous historical productions. Ladislaus Szalay’s Magyarország története (History of the Magyars), vols. i-v. (Leipzig, 1852-1854), vols. V-VI. (Pest, 1856-1861), 2nd ed., i-v. (1861-1866), is a work of the same kind, and was prepared from the last cursory reading of the Magyar historical literature. It is the work of a Hungarian legislative development in past times. His style is elevated and concise, but somewhat difficult. Magyar history is indebted to Paul Jászay for his careful working out of Charles Erde- gy’s História, by which he was inspired to write a history of Hungary in the style of the 18th century. His principal work is a History of the Magyars, published in 1848, x-xii. (1853-1857), the result of thirty years’ labour and research. In particular depart- ments of historical literature we find George Bartal, author of the History of the Magyars, (Vallardi, 1854), and Gustav Wenzel, Czech, Gustavus Wenzel, Frederick Pesty and Paul Szemling as writers on legal history; Joseph Bajza, who in 1845 commenced a History of the World; Alexander Szilagyi, some of whose works, like those of Ladislaus Kőváry, bear on the past of Hungar- ia; others on the Hungarian revolution of 1848-1849; Charles Lányi and John Pauer, authors of treatises on Roman Catholic
HUNGARY

ecclesiastical history; John Szombati, Emerich Révész and Balogh, writers on Protestant church history; William Frankó, bishop of the Hungarian Catholic Church; and Sajó Pál, bishop of the Hungarian Roman Catholic Church, have written important works on this subject. For the medieval history of Hungary, the first mention of the country in the historical sources is in the year 896, but the first written records date from the 11th century. The earliest known Hungarian literary writing, however, dates from the 12th century and is written in Latin, and the first known Hungarian poet was Szentgyörgyi Zsigmond, who lived in the 13th century. The first known Hungarian literary work in Hungarian is the poem "A gyönyörű tenger" ("The Beautiful Sea") by Szentgyörgyi Zsigmond, which was written in the 13th century.

The number of Hungarian writers has increased since 1880 to an extent hardly expected by the reading public in Hungary. There were only 10 Magyar periodical publications in 1880; in 1885, there were 27; in 1890, there were 42; and in 1895, there were 65. Among the most notable Hungarian literary journals of this period were the "Kulturális Élet" ("Cultural Life"), which was established in 1880, and the "Magyarország" ("Hungary"), which was established in 1882. The number of periodical publications in Hungary has increased steadily since 1880, and by 1895, there were over 100 periodical publications in Hungary. The increase in the number of periodical publications in Hungary has been accompanied by an increase in the number of books published, and by the end of the 19th century, there were over 100,000 books published in Hungary per year. The increase in the number of books published in Hungary has been accompanied by an increase in the number of libraries and bookstores, and by the end of the 19th century, there were over 100,000 libraries and bookstores in Hungary. The increase in the number of libraries and bookstores in Hungary has been accompanied by an increase in the number of readers, and by the end of the 19th century, there were over 10 million readers in Hungary. The increase in the number of readers in Hungary has been accompanied by an increase in the number of books read, and by the end of the 19th century, there were over 100 million books read in Hungary per year.
Hungarian literature is hardly less important than the unique esperi and charism of its writers.

Dramatic literature, liberally supported by the king and the government, produced splendid, solid and effective theatres in the capital, and also in the provinces (the finest provincial theatre is in Kolozsvár, in Transylvania), has developed remarkably. The Hungarians have produced many outstanding playwrights, including the following, actors and actresses of the first rank. In the modern drama three clearly differentiated groups may be distinguished. First the neo-romantic group, whose chief representatives are Eugen Rákos, József Naszályi, and Attila József, who have written splendid dramas, and also the following,
HUNGER and THIRST—HUNGERFORD

conservative school; younger critics, like Béla Lázár, Alexander Hevesi, H. Lenkei, Zoltán Ferenczy, Aladár Ballagi, Ladas Németh, sometimes seem to be somewhat too ready to follow the latest Norwegian or Parisian fashion.

AUTHORITIES.—The best authorities on Magyar literature are: F. Toldy, A Magyar nemzeti irodalom története a legrégibb időktől a jelenhez (1863); J. S. Imre, A Magyar irodalom és nyolc rövid története (Debrecen, 1865; 4th ed., 1878); J. Szvorényi, Magyar irodalmi személyek (Pest, 1867), and A Magyar irodalom története (Budapest, 1868); P. Balogh, A Magyar irodalom története (Pest, 1864); J. Környci, A Magyar nemzeti irodalmotörténet vázlata (Pest, 1861; 3rd ed., 1874); A. Lonkay, A Magyar irodalom ismertetése (Budán, 1855; 3rd ed., Pest, 1864); T. Herczeg, A Magyar irodalom és tudományos írások története (Pest, 1854); J. Ferencz and J. Danielik, Magyar Írók. Előtrajz- és Gyilkosmények (2 vols., Pest, 1856-1858); and the literary histories of L, Nýöy, Z. Bethy, and B. Eriki. One of the most useful monographs on "Magyar Literary History Writing" is that of J. Szinyei, junior, A Magyar Irodalmotörténet-Irás ismertetésének (Budapest, 1878).

For information as to the most recent literature see A. Dux, Aus Ungarn (Leipzig, 1880); C. Bethy, A Magy, nemz. irod. tör.; S. Bodnár, A magy. irod. tör.; B. Lázár, A tegnap, a ma, és a holnap (Budapest, 1896-1900); Joseph Szinnyel, Magy. írók élete és munkái (an extensive biographical dictionary of Hungarian authors). Irodalom történeti Közlemények (a periodical edited by Aro Szilády, for the history of literature); Emil Reich, Hungarian Literature (London, 1898).

HUNGER and THIRST. These terms are used to express peculiar sensations which are produced by and give expression to general wants of the system, satisfied respectively by the ingestion of organic solids containing substances capable of acting as food, and by water or liquids and solids containing water.

Hunger (a word common to Teutonic languages) is a peculiarly indefinite sensation of craving or want which is referred to the stomach, but with which is often combined, always indeed in its most pronounced stages, a general feeling of weakness or faintness. The earliest stages are unattended with suffering, and are characterized as "appetite for food." Hunger is normally appeased by the introduction of solid or semi-solid nutriment into the stomach, and it is probable that the almost immediate alleviation of the sensation in these circumstances is in part due to a local influence, perhaps connected with a free secretion of gastric juice. Essentially, however, the sensation of hunger is a mere local expression of a general want, and this local expression ceases when the want is satisfied, even though no food be introduced into the stomach, the needs of the economy being satisfied by the introduction of food through other channels, as, for example, when food which admits of being readily absorbed is injected into the large intestine.

Thirst is, like hunger, a Teutonic origin, Ger. Durst, Swed. and Dan. törst, akin to the Latin torgere, to parch) is a peculiar sensation of dryness and heat localized in the tongue and throat. Although thirst may be artificially produced by drying, as by the passage of a current of air over the mucous membrane of the above parts, normally it depends upon an impoverishment of the system in water. And, when this impoverishment ceases, in whichever way this be effected, the sensation likewise ceases. The injection of water into the blood, the stomach, or the large intestine appeases thirst, though no fluid is brought in contact with the part to which the sensation is referred.

The sensations of hunger and thirst lead us, or when urgent compel us, to take food and drink into the mouth. Once in the mouth, the entrance to the alimentary canal, the food begins to undergo a series of processes, the object of which is to extract from it as much as possible of its nutritive constituents. Food in the alimentary canal is, strictly speaking, outside the confines of the body; as much so as the fly grasped in the leaves of the insectivorous Dionaea is outside of the plant itself. The mechanical and chemical processes to which the food is subjected have their seat and conditions outside the body which it is destined to nourish, though unquestionably the body is no passive agent, and innumerable glands come into action to supply the chemical agents which dissolve and render assimilable those constituents of the food capable of being absorbed into the organism, and of forming part and parcel of its substance (see further under Nutrition).

HUNGERFORD, WALTER HUNGERFORD, BARON (d. 1449), English soldier, belonged to a Wiltshire family. His father, Sir Thomas Hungerford (d. 1398), was speaker of the House of Commons in 1377, a position which he owed to his friend John of Gaunt, and is the first person formally mentioned in the rolls of parliament as holding the office. Walter Hungerford also served as speaker, but he is more celebrated as a warrior and diplomatist, serving in the former capacity at Agincourt and in the latter at the council of Constance and the congress of Arras. An executor of Henry V.'s will and a member of the council under Henry VI., Hungerford became a baron in 1426, and he was lord treasurer from 1426 to 1431. Remains of his benefactions still exist at Heytesbury, long the principal residence of the family.

Hungerford's son Robert (c. 1400-1459) was also called to parliament as a baron; he was very wealthy, both his mother and his wife being heiresses. Like several other members of the family, Robert was buried in the cathedral at Salisbury.

Robert's son and heir, Robert, Lord Moleyns and Hungerford (c. 1420-1464), married Eleanor, daughter of Sir William de Moleyns, and was called to parliament as Lord de Moleyns in 1445. He is chiefly remembered through his dispute with John Paston over the possession of the Norfolk manor of Gresham. After losing this case he was taken prisoner in France in 1453, not securing his release until 1459. During the Wars of the Roses he fought for Henry VI., with whom he fled to Scotland; then he was attainted, was taken prisoner at the battle of Hexham, and was executed at Newcastle in May 1464.

His eldest son, Sir Thomas Hungerford (d. 1469), was attainted and executed for attempting the restoration of Henry VI.; a younger son, Sir Walter Hungerford (d. 1516), who fought for Henry VII. at Bosworth, received some of the estates forfeited by his ancestors. Sir Thomas, who had no sons, left an only daughter Mary (d. c. 1534). When the attainders of her father and grandfather were reversed in 1485 this lady became Baroness Hungerford and Baroness de Moleyns; she married into the Hastings family and was the mother of George Hastings, 1st earl of Huntingdon.

Sir Walter Hungerford's son Edward (d. 1522) was the father of Walter, Lord Hungerford of Heytesbury (1503-1540), who was created a baron in 1536, but was attainted for his alleged sympathy with the Pilgrimage of Grace; he was beheaded on the 28th of July 1540, the same day as his patron Thomas Cromwell. As his sons Sir Walter (1532-1590) and Sir Edward (d. 1607) both died without sons the estates passed to another branch of the family.

Sir Edward Hungerford (1596-1648), who inherited the estates of his kinsman Sir Edward in 1607, was the son of Sir Anthony (1564-1627) and a descendant of Walter, Lord Hungerford. He was a member of both the Short and Long Parliaments in 1640; during the Civil War he attached himself to the parliamentary party, fighting at Lansdowne and at Roundway Down. His half-brother Anthony (d. 1657) was also a member of both the Short and the Long Parliaments, but was on the royalist side during the war. This Anthony's son and heir was Sir Edward Hungerford (1652-1711), the founder of Hungerford market at Charing Cross, London. He was a member of parliament for over forty years, but was very extravagant and was obliged to sell much of his property; and little is known of the family after his death.

HUNGERFORD, a market town in the Newbury parliamentary division of Berkshire, England, extending into Wiltshire, 61 m. W. by S. of London by the Great Western railway. Pop. (1901) 4,047. It is beautifully situated in the narrow valley of the Kennet at the junction of tributary valleys from the south and south-west, the second of which is followed by the Bath road, an important highway from London to the west. The town, which lies on the Kennet and Avon canal, has agricultural trade. John of Gaunt, duke of Lancaster, presented to the citizens manorial rights, including common pasture and fishing. The fishing is valuable, for the trout of the Kennet and other streams.
The locality is numerous and carefully preserved. Hungerford is also a favourite hunting centre. A horn given to the town by John of Gaunt is preserved in the town hall, another horn dating from 1634 being used to summon the manorial court of twelve citizens called feefoes (the president being called the constable), at Hocktide, the Tuesday following Easter week. In 1774, when a number of towns had taken action against the imposition of a fee for the delivery of letters from their local post-offices, Hungerford was selected as a typical case, and was first relieved of the imposition.

**HÜNINGEN**, a town of Germany, in Alsace-Lorraine, situated on the left bank of the Rhine, on a branch of the Rhine-Rhone canal, and 3 m. N. of Basel by rail. Pop. (1905) 3304. The Rhine is here crossed by an iron railway bridge. The town boasts a handsome Roman Catholic church, and has manufactures of silk, watches, chemicals and cigars. Hünigen is an ancient place and grew up round a stronghold placed to guard the passage of the Rhine. It was wrested from the Imperialists by the duke of Lauenburg in 1634, and subsequently passed by purchase to Louis XIV. of France. It was fortified by Vauban (1670–1685) and a bridge was built across the Rhine. The town was captured by the French on the 26th of August 1815 and the works were shortly afterwards dismantled. In 1871, the town passed, with Alsace-Lorraine, to the German empire.

See Tschamber, Geschichte der Stadt und ehemaligen Festung Hünigen (St Ludwig, 1894); and Latruffe, Hünigne et Bâle devant les traités de 1870 (Paris, 1865).

**HUNNERIC** (d. 484), king of the Vandals, was a son of King Gaiseric, and was sent to Italy as a hostage in 435 when his father made a treaty with the emperor Valentinian III. After his return to the Vandal court at Carthage, he married a daughter of Theodoric I., king of the Visigoths; but when this princess was suspected of attempting to poison her father-in-law, she was mutilated and was sent back to Europe. Hunneric became king of the Vandals on his father’s death in 477. Like Gaiseric he was an Arian, and his reign is chiefly memorable for his cruel persecution of members of the orthodox Christian Church in his dominions. Hunneric’s second wife was Eudocia, a daughter of Valentinian III. and his wife Eudocia. (See VANDALS.)

**HUNNIS, WILLIAM** (d. 1597), English musician and poet, was as early as 1549 in the service of William Herbert, afterwards earl of Pembroke. His friend Thomas Newton, in a poem prefixed to The Histoire de Huuny (1578), says: "In prime of youth thy name was dear, thy sovresant Sonets sweete, and mentions his interludes, gallant laudas, rondells and songs, explaining that it was in the winter of his age that he turned to sacred lore and high philosophy. In 1550 he published Certain Psalme Poemes... in English metre, and shortly afterwards was made a gentleman of the Chapel Royal. At Mary’s accession he retained his appointment, but in 1555 he is said to have been one of a party of twelve conspirators who had determined to take Mary’s life. Nothing came of this plot, but shortly afterwards he was party to a conspiracy to dethrone Mary in favour of Elizabeth. Hunnis, having some knowledge of alchemy, was to go abroad to coin the necessary gold, but this doubtful mission was exchanged for the task of making false keys to the treasury in London, which he was able to do because of his friendship with Nicholas Brigham, the receiver of the exchequer. The conspirators were, however, betrayed by one of their number, Thomas Whyte. Some of them were executed, but Hunnis escaped with imprisonment. The death of Mary made him a free man, and in 1559 he married Margaret, Brigham’s widow, but she died within the year, and Hunnis married in 1560 the widow of a grocer. He himself became a grocer and freeman of the City of London, and supervisor of the Queen’s Gardens at Greenwich. In 1566 he was made Master of the Children of the Chapel Royal. No complete piece of his is extant, perhaps because of the rule that the plays acted by the Children’s Chapel should not have been previously printed. In his later years he purchased land at Barking, Essex. If the lines above his signature on a 1557 edition of Sir Thomas More’s works are genuine, he remained a poor man, for he refuses to make a will on the ground that "the good that I shall leave, will not pay all I owe.” In Harleian MS. 6403 is a story that one of his sons, in the capacity of page, drank the remainder of the poisoned cup supposed to have been provided by Leicester for Walter Devereux, 1st earl of Essex, but escaped with no injury beyond the loss of his hair.

Hunnis’s extant works include Certaine Psalms (1549). A Hymne ful of joy (1578), Sonnets hobbes of a sorrowfull Soule (1578), and Hunninges Recreations (1588), sixteen poems in the Paradise of Dainty Devices (1576), and two in England’s Helicon (1600). See Mrs C. Carmichael Stope’s tract on William Hunnis, reprinted (1892) from the Jahrbuch der deutschen Shakespeare-Gesellschaft.

**HUNS.** This or some similar name is given to at least four peoples, whose identity cannot be regarded as certain. (1) The Huns, who invaded the East Roman empire from about A.D. 372 to 453 and were most formidable under the leadership of Attila. (2) The Hungarians or Magyars. The Magyars crossed the Carpathians into Hungary in A.D. 898 and mingled with the races they found there. The modern Hungarians (excluding Slavonic elements) are probably a mixture of these Magyars with the remnant of older invaders such as Huns, Petchenegs and Kumans. (3) The White Huns (Ľuobi slavov or Ephthalites), a branch of the Scythians, who crossed the Ural about 1575 and were known by the Byzantines. (4) The Hûnas, who invaded India during the same period. There is not much doubt that the third and fourth of these tribes are the same, and it is quite likely that the Magyars are descended from the horde which sent forth the Huns in the 4th century, but it is not demonstrable. Neither can it be proved that the Huns and Magyars belonged either physically or linguistically to the same section as the Hûnas and Ephthalites. But the occurrence of the name in both India and Europe is prima facie evidence in favour of a connexion between those who bore it, for, though civilized races often lumped all their barbarian neighbours together under one general name, it would seem that, when the same name is applied independently to similar invaders in both India and eastern Europe, the only explanation can be that they gave themselves that name, and this fact probably indicates that they were members of the same tribe or group. What we know of the history and distribution of the Huns does not conflict with this idea. They appear in Europe towards the end of the 4th century and the Ephthalites and Hûnas in western Asia about fifty years later. It may be supposed that some defeat in China (and the Chinese were successful in driving back the Hûng-nu in the 1st century A.D.) had sent them westwards some time earlier. The body of Hûnas and Ephthalites, Transoxian and, after resting for a time, pushed their way through the mountains into Afghanistan and India, exactly as the Yié-Chi had done before them. Another division pressed farther westwards and probably made its headquarters near the northern end of the Caspian Sea and the southern part of the Ural Mountains. It was from here that the Huns invaded Europe, and when their power collapsed, after the death of Attila, many of them may have returned to their original haunts. Possibly the Bulgarians and Khazars were offshoots of the same horde. The Magyars may very well have gradually spread first to the Don and then beyond it, until in the 9th century they entered Hungary. This sketch of possible migrations from an imagined Transoxian, and authorities are shown to have been agreed as to the branch of the Turanians to which the Huns should be referred. The physical characteristics of these nomadic armies were very variable, since they continually increased their numbers by slaves, women and soldiers of fortune drawn from all the surrounding races. The language of the Magyars is Finno-Ugric and most nearly allied to the speech of the Ostiaks now found on the east of the Ural, but we have no warrant for assuming that the Huns, and still less that the Ephthalites and Hûnas, spoke the same language. Neither can we assume that the Huns and Hûnas are the same as the Hûng-nu of the Chinese. The names may be identical, but it is not certain, for in Hûnas may lurk some other name of a tribe. Also Hûng-nu seems to be the name of warlike nomads in general, not of a particular section. Again the Finnish languages spoken in various parts of Russia and more or less allied to Magyar must have spread gradually westwards from the Ural, and their
development and diffusion seem to postulate a long period (for the history of the Finns shows that they were not mobile like the Turks and Mongols), so that the ancestral language from which spring Finnish and Magyar can hardly have been brought across Asia after the Christian era. The warlike and vigorous temper of the Huns has led many writers to regard them as Turks. The Turks were perhaps not distinguished by name or institutions from other tribes before the 7th century, though they have been an earlier offshoot of the same stock. Apart from this the Hungarians may have received an infusion of Turkish blood not only from the Osmanis but from the Kuman and other tribes who settled in the country.

History.—The authentic history of the Huns in Europe practically begins about the year a.d. 372, when under a leader named Balamir (or, according to some MSS., Balamber) they began a westward movement from their settlements in the steppes lying to the north of the Caspian. After crushing, or compelling the alliance of, various nations unknown to fame (Alpizzuri, Aldzduri, Hilmai, Tuncarsi, Boishe), they at length reached the Alani, a powerful nation which had its seat between the Volga and the Don; these also, after a struggle, they defeated and finally enlisted in their service. They then proceeded, in 374, to invade the empire of the Ostrogoths (Greetungt), ruled over by the aged Ermanaric, or Heremanric, who died (perhaps by his own hand) while the critical attack was still impending. Under his son Hunimund a section of his subjects promptly made a humiliating peace; under Withemir (Winitheh), however, who succeeded him in the larger part of his dominions, an armed resistance was organized; but it resulted only in repeated defeat, and finally in the death of the king. The representatives of his son Witheric put an end to the conflict by accepting the condition of vassalage. Balamir now directed his victorious arms still farther westward against that portion of the Visigothic nation (or Tervingi) which acknowledged the authority of Athanaric. The latter entrenched himself on the frontier which had separated him from the Ostrogoths, behind the "Greetung-rampart" and the Dniester; but he was surprised by the enemy, who forced the river in the night, fell suddenly upon his camp, and compelled him to abandon his position. Athanaric next attempted to establish himself in the territory between the Pruth and the Danube, and with this object set about heightening the old Roman wall which Trajan had erected in north-eastern Dacia; before his fortifications, however, were complete, the Huns were again upon him, and without a battle he was forced to retreat to the Danube. The remainder of the Visigoths, under Alavivus and Fritigern, now began to seek, and ultimately were successful in obtaining (376), the permission of the emperor Valens to settle in Thrace; Athanaric meanwhile took refuge in Transylvania, thus abandoning the field without any serious struggle to the irresistible Huns. For more than fifty years the Roman world was undisturbed by any aggressive act on the part of the new invaders, who contented themselves with overpowering various tribes which lived to the north of the Danube. In some instances, in fact, the Huns lent their aid to the Romans against third parties; thus in 404-405 certain Hunnic tribes, under a chief or king named Uldin, assisted Honorius in the struggle against the Vandals (Bury, I. 20). The Huns also took a prominent part in the decisive battle fought in the neighbourhood of Florence. Once indeed, in 409, they are said to have crossed the Danube and invaded Bulgaria under perhaps the same chief (Uldin), but extensive desolations soon compelled a retreat.

About the year 432 a Hunnic king, Ruas or Rugulas, made himself of such importance that he received from Theodosius II. an annual stipend or tribute of 350 pounds of gold (1,400,000), and as a further reward the kingdom of the Quarrelers, partly out of the circumstance that the Romans had sought to make alliances with certain Danubian tribes which Ruas chose to regard as properly subject to himself, partly also because some of the undoubted subjects of the Hun had found refuge on Roman territory; and Theodosius, in reply to an indignant and insulting message which he had received about this cause of dispute, was preparing to send off a special embassy when tidings arrived that Ruas was dead and that he had been succeeded in his kingdom by Attila and Bleda, the two sons of his brother Mundzuk (433). Shortly afterwards the treaty of Margus (not far from the modern Belgrade), where both sides negotiated on horseback, was ratified. By its stipulations the yearly stipendium or tribute payable to Attila by the Romans was reduced; the fugitives were to be surrendered, or a fine of £50 to be paid for each of those who should be missing; all markets, open to Hun and Roman alike, were to be instituted; and any tribe with which Attila might be at any time at war was thereby to be held as excluded from alliance with Rome. For eight years afterwards there was peace so far as the Romans were concerned; and it was probably during this period that the Huns proceeded to the extensive conquests to which the contemporary historian Priscus so vaguely alludes in the words: "He (Attila) has made the whole of Scythia his own, he has laid the Roman empire under tribute, and he thinks of renewing his attacks upon Persia. The road to that eastern kingdom is not untrodden by the Huns; already they have marched fifteen days from a certain lake, and have ravaged Media." They also appear before the end of this interval to have pushed westward as far as to the Rhone, and to have come into conflict with the Burgundians. Over acts of hostility, however, occurred against the Eastern empire when the town of Margus (by the treachery of its bishop) was seized and sacked (441), and against the Western when Sirmium was invested and taken (442). In 445 Bleda died, and two years afterwards Attila, now sole ruler, undertook one of his most important expeditions against the Eastern empire; on this occasion he pushed southwards as far as Thermopyle, Gallipoli and the walls of Constantinople; peace was cheaply purchased by tripling the yearly tribute (which accordingly now stood at 2,000 pounds of gold, or £5,000 sterling) and by the payment of a heavy indemnity. In 448 again occurred various diplomatic negotiations, and especially the embassy of Maximinus, of which many various details have been recorded by Priscus his companion. Then followed, in 451, that westward movement across the Rhine which was only arrested at last, with terrible slaughter, on the Catalaunian plains (according to common belief, in the neighbourhood of the modern Châlons, but more probably at a point some 50 m. to the south-east, near Mery-sur-Seine). The following year (452), that of the Italian campaign, was marked by such events as the sack of Aquileia, the destruction of the cities of Venetia, and finally, on the banks of the Mincio, that historical interview with Theodoric I. which resulted in the return of Attila to the East, where in 453 he died (see ATILLA). Almost immediately afterwards the empire he had amassed rather than consolidated fell to pieces. His too numerous sons began to quarrel about their inheritance, while Ardarc, the king of the Gepidae, was placing himself at the head of a general revolt of the dependent nations. The inevitable struggle came to a crisis near the river Netad in Pannonia, in a battle in which 30,000 of the Huns and their confederates, including Ellak, Attila's eldest son, were slain. The nation, thus broken, rapidly dispersed, exactly as the White Huns did after a battle near Chalons in 376, etc. One horde settled under Roman protection in Little Scythia (the Dobrudzha), others in Dacia Ripensis (on the confines of Servia and Bulgaria) or on the southern borders of Pannonia. Many, however, appear to have returned to what is now South Russia, and may perhaps have taken part in the ethnical combinations which produced the Bulgarians.

The chief original authorities are Ammianus Marcellinus, Priscus, Jordanes (Getungt, ch. 44; Amelius, Querelle, ch. 13), Chavannes, 6, Franke, Stein and others in various learned periodicals. For the literature on the White Huns see Epithalites. (C. EL.)
HUNSDON—HUNT, LEIGH

HUNSDON, HENRY CAREY, 1ST BARON (C. 1524-1596), English soldier and courtier, was a son of William Carey (d. 1529); his mother was Mary (d. 1543), a sister of Anne Boleyn, and he was consequently cousin to Queen Elizabeth. Member of parliament for Buckingham under Edward VI. and Mary; he was knighted in 1558, was created Baron Hunsdon in 1559, and in 1561 became Lord Chamberlain and a knight of the Garter. In 1568 he became governor of Berwick and warden of the east Marches, and he was largely instrumental in quelling the rising in the north of England in 1569, gaining a decisive victory over Leonard Dacre near Carlisle in February 1570. Hunsdon received very little money to cover his expenses, but Elizabeth lavished honours upon him, although he did not always carry out her wishes. In 1583 he became Lord Chamberlain, but he did not relinquish his post at Berwick. Hunsdon was one of the commissioners appointed to try Mary Queen of Scots; after Mary's execution he went on a mission to James VI. of Scotland, and when the Spanish Armada was expected he commanded the queen's bodyguard. He died in London, at Somerset House, on the 23rd of July 1596.

His eldest son, George (1547-1603), 2nd Baron Hunsdon, was a member of parliament, a diplomatist, a soldier and Lord Chamberlain. He was also captain-general of the Isle of Wight during the time of the Spanish Armada. He was succeeded by his brother John (d. 1617). In 1628 John's son Henry, 4th Baron Hunsdon, was created Earl of Dover. This title became extinct on the death of the 2nd earl, John, in 1677, and a like fate befell the barony of Hunsdon on the death of the 8th Baron, William Ferdinand, in June 1765. Elizabeth, daughter of Sir John Spencer of Althorp, and wife of the 2nd Lord Hunsdon, is celebrated as the patroness of her kinship, the poet Spenser; and either this lady or her daughter Elizabeth was the author of the Tragedie of Marian (1613).

The 1st Lord's youngest son, Robert Carey (c. 1560-1639), was for a long time a member of the English parliament. He was frequently employed on the Scottish borders; he announced the death of Elizabeth to James VI. of Scotland; and he was created Earl of Monmouth in 1626. He wrote some interesting Memoirs, first published in 1759. His son and successor, Henry (1596-1661), is known as a translator of various French and Italian books. The title of Earl of Monmouth became extinct on his death in June 1661.

HUNSTANTON [commonly pronounced Hunston], a seaside resort in the north-western parliamentary division of Norfolk, England, on the east shore of the Wash, 112 m. N. by E. from London by the Great Eastern railway. Pop. of urban district of New Hunstanton (1901) 1893. The new watering-place is about 1 m. from the old village. It has a good beach, a golf course and a pier. The parish church of St Mary is a fine Decorated building, containing monuments of the L'Estrange family, whose mansion, Hunstanton Hall, is a picturesque Tudor building of brick in a well-wooded park. A convalescent hospital (1873) commemorates the recovery from illness of King Edward VII. when Prince of Wales. At Brancaster, 6 m. E., there is a Roman fort which formed part of the defences of the Litus Saxonum (4th century a.d.).

HUNT, ALFRED WILLIAM (1830-1896), English painter, son of Andrew Hunt, a landscape painter, was born at Liverpool in 1830. He began to paint while at the Liverpool Collegiate School; but as the idea of adopting the artist's profession was not favoured by his father, he went in 1848 to Corpus Christi College, Oxford. His career there was distinguished; he won the Newdigate Prize in 1851, and became a Fellow of Corpus in 1853. In 1859 he married Miss Severn, and became a Roman Catholic priest. By encouragement of Ruskin, he exhibited at the Royal Academy in 1854, and thenceforth regularly contributed landscapes in oil and water-colour to the London and provincial exhibitions. In 1861 he married, gave up his Fellowship, and was elected an Associate of the Royal Society of Painters in Water-Colours, receiving full membership three years later. His work is distinguished mainly by its exquisite quality and a poetic rendering of atmosphere. Hunt died on 3rd May 1896. Mrs A. W. Hunt (née Margaret Raine) wrote several works of fiction; and one of her daughters, Violet Hunt, is well known as a novelist.

HUNT, HENRY (1773-1835), English politician, commonly called "Orator Hunt," was born at Widdington Farm, Upavon, Wilts, on the 6th of November 1773. While following the vocation of a farmer he made the acquaintance of John Horne Tooke, with whose advanced views he soon began to sympathize. At the general election of 1806 he came into the Commons, and soon associated himself with William Cobbett, and in 1812 he was an unsuccessful candidate for Bristol. He was one of the speakers at the meeting held in Spa Fields, London, in November 1816; in 1818 he tried in vain to become member of parliament for Westminster, and in 1820 for Preston. In August 1819 Hunt presided over the great meeting in St Peter's Field, Manchester, which developed into a riot and was called the "Peterloo massacre." He was arrested and was tried for conspiracy, being sentenced to imprisonment for two years and a half. In August 1830 he was elected member of parliament for Cumberland, but his election was set aside. In 1833, when in parliament, Hunt presented a petition in favour of the people's right to vote, probably the first of this kind, and he moved for a repeal of the corn laws. He died on the 15th of February 1835. During his imprisonment Hunt wrote his Memoirs which were published in 1820. See R. Huish, Life of Hunt (1836); and S. Bamford, Passages in the Life of a Radical (2nd ed., 1883).

HUNT, HENRY JACKSON (1819-1886), American soldier, was born in Detroit, Michigan, on the 14th of September 1819, and graduated at the U. S. military academy in 1839. He served in the Mexican War under Scott, and was brevetted for gallantry at Contreras and Churubusco and at Chapultepec. He took part in the first battle of Bull Run in 1861, and soon afterwards became chief of artillery in the Washington defences. As a colonel on the staff of General McClellan he organized and trained the artillery reserve of the Army of the Potomac. Throughout the Civil War he contributed more than any officer to the effective employment of the artillery arm. With the artillery reserve he rendered the greatest assistance at the battle of Malvern Hill, and soon afterwards he became chief of artillery in the Army of the Potomac. On the day after the battle of South Mountain he was made brigadier-general of volunteers. At the Antietam, Fredericksburg and Chancellorsville, he rendered further good service, and at Gettysburg his handling of the artillery was conspicuous in the repulse of Pickett's charge, and he was rewarded with the brevet of colonel. He served in Virginia to the end of the war, attaining the brevet rank of major-general of volunteers and brigadier-general of regulars. When the U.S. army was reorganized in 1866 he became colonel of the 4th artillery and president of the permanent Artillery Board. He held various commands until 1885, when he retired to become governor of the Soldiers' Home, Washington, D.C. He died on the 11th of February 1889. He was the author of Instructions for Field Artillery (1860), and of papers on Gettysburg in the "Battles and Leaders" series.

His brother, Lewis Cass Hunt (1824-1886), served throughout the Civil War in the infantry arm, becoming brigadier-general of volunteers in 1862, and brevet brigadier-general U.S. in 1865.

HUNT, JAMES HENRY LEIGH (1784-1859), English essayist and miscellaneous writer, was born at Southgate, Middlesex, in 1784. His father, the Rev. Thomas Leigh, an Indian clergyman, had settled as a lawyer in Philadelphia, and his mother was the daughter of a merchant there. Having embraced the loyalist side, Leigh Hunt's father was compelled to fly to England, where he took orders, and acquired some reputation as a popular preacher, but was of steadiness, want of orthodoxy, and want of interest conspired to prevent his obtaining any preferment. He was engaged by James Brydges, 3rd duke of Chandos, as act to tutor to his nephew, James
Henry Leigh, after whom Leigh Hunt was called. The boy was educated at Christ's Hospital, of which school he has left a lively account in his autobiography. As a boy at school he was an ardent admirer of Gray and Collins, writing many verses in imitation of them. An impediment in his speech, afterwards removed, prevented his being sent to the university. "For some time after I left school," he says, "I did nothing but visit my school-fellows, haunt the book-stalls and write verses." These latter were published in 1801 under the title of Juvenilia, and contributed to introduce him into literary and theatrical society. He began to write for the newspapers, and in 1805, in the form of a volume of theatrical criticisms, and a series of Classic Tales with critical essays on the authors.

In 1808 he quitted the War Office, where he had for some time been a clerk, to become editor of the Examiner newspaper, a speculation of his brother John. The new journal with which Leigh Hunt was connected for thirteen years soon acquired a high reputation. It was perhaps the only newspaper of the time which owed no allegiance to any political party, but assailed whatever seemed amiss, "from a principle of taste," as Keats happily expressed it. The taste of the attack itself, indeed, was not always unexceptionable; and one upon the Prince Regent, the chief sting of which lay in its substantial truth, occasioned (1813) a prosecution and a sentence of two years' imprisonment for each of the brothers. The effect was to give a political direction to what should have been the career of a man of letters. But the cheerfulness and gaiety with which Leigh Hunt bore his imprisonment attracted general attention and sympathy, and brought him visits from Byron, Moore, Brougham and others, whose acquaintance exerted much influence on his future destiny.

In 1810–1811 he edited for his brother John a quarterly magazine, the Reflector, for which he wrote "The Feast of the Poets," a satire which gave offence to many contemporary poets, and particularly offended William Gifford of the Quarterly. The essays afterwards published under the title of the Round Table (2 vols., 1816–1817), conjointly with William Hazlitt, appeared in the Examiner. In 1816 he made a permanent mark in English literature by the publication of his Story of Rimini. There is perhaps no other instance of a poem short of the highest excellence having produced so important and durable an effect in modifying the accepted standards of literary composition. The secret of Hunt's success consists less in superiority of genius than of taste. His refined critical perception had detected the superiority of Chaucer's versification, as adapted to the present state of the language by Dryden, over the sententious epigrammatic couplet of Pope which had superseded it. By a simple return to the old manner he effected for English poetry in his "translation" of the comparatively restricted domain of metrical art what Wordsworth had already effected in the domain of nature; his is an achievement of the same class, though not of the same calibre. His poem is also a triumph in the art of poetical narrative, abounds with verbal felicities, and is pervaded throughout by a free, cheerful and animated spirit, notwithstanding the tragic nature of the subject. It has been remarked that it does not contain one hackneyed or conventional rhyme. But the writer's occasional flippancy and familiarity, not seldom degenerating into the ludicrous, made him a mark for ridicule and parody on the part of his opponents, whose animosity, however, was rather political than literary.

In 1818 a collection of poems entitled Foliage, followed in 1819 by Hero and Leander, and Bacchus and Ariadne. In the same year he reprinted these two works with The Story of Rimini and The Descent of Liberty with the title of Poetical Works, and started the Indicator, in which some of his best work appeared. Both Keats and Shelley belonged to the circle gathered around him at Hampstead, which also included William Hazlitt, Charles Lamb, Byron, Proctor, Benjamin Haydon, Cowden Clarke, C. W. Dilke, Walter Coulson, John Hamilton Reynolds, and in general almost all the rising young men of letters of liberal sympathies. He had now for some years been married to Marianne Kent, who seems to have been sincerely attached to him, but was not in every respect a desirable partner. His own affairs were by this time in the utmost confusion, and he was only saved from ruin by the romantic generosity of Shelley. In return he was lavish of sympathy to Shelley at the time of the latter's domestic distresses, and defended him with spirit in the Examiner, although he does not appear to have at this date appreciated his genius with either the discernment or the warmth of his generous adversary, Professor Wilson. Keats he welcomed with enthusiasm, and introduced to Shelley. He also wrote a very generous appreciation of him in the Indicator, and, before leaving for Italy, Keats stayed with Hunt at Hampstead. Keats seems, however, to have subsequently felt that Hunt's example as a poet had been in some respects detrimental to him. After Shelley's departure for Italy (1818) Leigh Hunt's affairs became still more embarrassed, and the prospects of political reform less and less satisfactory. His health and his wife's failed, and he was obliged to discontinue his charming series of essays entitled the Indica (1819–1821), having, he says, "almost died over the last numbers." These circumstances induced him to listen to a proposal, which seems to have originated with Shelley, that he should proceed to Italy and join Shelley and Byron in the establishment of a quarterly magazine in which Liberal opinions should be advocated with more freedom than was possible at home. The project was injudicious from every point of view; it would have done little for Hunt or the Liberal cause at the best, and depended entirely upon the co-operation of Byron, the most capricious of allies, and the most parsimonious of paymasters. Byron's principal motive for acceding to it appears to have been the expectation of acquiring influence over the Examiner, and he was exceedingly mortified on discovering when too late that Hunt had parted, or was considered to have parted, with his interest in the Journal. Leigh Hunt left England for Italy in November 1821, but storm, sickness and misadventure retarded his arrival until the 1st of July 1822, a rate of progress which T. L. Peacock appropriately compares to the navigation of Ulysses.

The tragic death of Shelley, a few weeks later, destroyed every prospect of success for the Liberal. Hunt was now virtuously a dependant upon Byron, whose least amiable qualities were called forth by the relation of patron to an unsympathetic dependant, burdened with a large and troublesome family. He was moreover incessantly wounded by the representations of his friends that he was losing caste by the connexion. The Liberal lived through four quarterly numbers, containing contributions no less memorable than Byron's "Vision of Judgment" and Shelley's translations of Partenope and Vincenzo, but in mid-1822 Byron sailed for Greece, leaving the coadjutor at Genoa to shift for himself. The Italian climate and manners, however, were entirely to Hunt's taste, and he protracted his residence until 1825, producing in the interim Ultime Crepidarius, a Satire on William Gifford (1823), and his matchless translation (1823) of Francesco Redi's Bacchus in Toscana.

In 1825 an unfortunate litigation with his brother brought him back to England, and in 1828 he committed his greatest mistake by the publication of his Lord Byron and some of his Contemporaries. The work is of considerable value as a corrective of many idealized estimates of Lord Byron. But such a corrective should not have come from one who had lain under obligations to Byron. British ideas of what was decent were shocked, and the author especially writhed under the withering satire of Moore. For many years ensuing the history of Hunt's life is that of a painful struggle with poverty and sickness. He worked unremittingly, but one effort failed after another. Two journalistic ventures, the Titular (1830–1832), a daily devoted to literary and dramatic criticism, and Leigh Hunt's London Journal (1834–1835),

1 Walter Coulson (1792–1860), lawyer and journalist, was at one time amanuensis to Jeremy Bentham, and became in 1823 editor of the Globe.

2 John Hamilton Reynolds (1796–1852), best known for his friendship and correspondence with Keats. His narrative verse founded on the tales of Boccaccio appeared in 1821 as The Garden of Florence and other Poems. He wrote some admirable sonnets, one of which is addressed to Keats.
HUNT, R.

were discontinued for want of subscribers, although in the latter Leigh Hunt had able coadjutors, and it contained some of his best writing. His editorship (1837-1838) of the *Monthly Repository*, in which he succeeded W. J. Fox, was also unsuccessful. The adventurous circumstances which followed for the proprietor of this magazine were no longer existed, and Hunt’s strength and weak points, his refinement and his affectations, were alike unsuited to the general body of readers.

In 1832 a collected edition of his poems was published by subscription, the list of subscribers including many of his opponents. In the same year was printed for private circulation *Christianism*, the work afterwards published (1833) as *The Religion of the Heart*. A copy sent to Carlyle secured his friendship, and Hunt went to live next door to him in Cheyne Row in 1833. *Sir Ralph Esher*, a romance of Charles II’s period, had a success, and *Captain Sword and Captain Pen* (1835), a spirited contrast between the victories of peace and the victories of war, deserves to be ranked among his best poems. In 1840 his circumstances were improved by the successful representation at Covent Garden of his *Legend of Florence*, a play of considerable merit. *Lover’s Amusements*, a comedy, was acted several years afterwards and was printed in *Leigh Hunt’s Journal* (1850-1851), and other plays remained in MS. In 1840 he wrote introductory notices to the work of R. B. Sheridan and to Moxon’s edition of the works of Wycherley, Congreve, Vanbrugh and Farquhar, a work which furnished the occasion of Macaulay’s essay on the *Dramatists of the Restoration*. The pretty narrative poem of the *Palfrey* (1842) was acted in 1843.

The time of Hunt’s greatest difficulties was between 1834 and 1839. He was at times in absolute want, and his distress was aggravated by domestic complications. By Macaulay’s recommendation he began to write for the *Edinburgh Review*. In 1844 he was further benefited by the generosity of Mrs Shelley and her son, who, on succeeding to the family estates, settled an annuity of £120 upon him; and in 1847 Lord John Russell procured him a civil list pension of £200. The fruits of the improved comfort and augmented leisure of these latter years were visible in the production of some charming volumes. Foremost among these are the companion books, *Imagination and Fancy* (1844), and *Wit and Humour* (1846), two volumes of selections from the English poets. In these Leigh Hunt shows himself within a certain range the most refined, appreciative and felicitous of critics. Homer and Milton may be upon the whole beyond his reach, though even here he is great in the detection of minor and unapprehended beauties; with Spencer and the old English dramatists he is perfectly at home, and his subtle and discriminating criticism upon them, as well as upon his own great contemporaries, is continually bringing to light unsuspected beauties. His companion volume on the pastoral poetry of Sicily, quaintly entitled *A Jar of Honey from Mount Hybla* (1848), is almost equally delightful. *The Town* (2 vols., 1848) and *Men, Women and Books* (2 vols., 1847) are partly made up from former material. *The Old Court Suburb* (2 vols., 1855; ed. A. Dobson, 1902) is an anecdotic sketch of Kensington, where he long resided before his final removal to Hammersmith. In 1850 he published his *Autobiography* (3 vols.), a naive and accurate piece of self-portraiture, full of affectations, but on that account free from the affectation of unreality. It contains very detailed accounts of some of the most interesting periods of the author’s life, his education at Christ’s Hospital, his imprisonment, and his residence in Italy. *A Book for a Corner* (2 vols.) was published in 1849, and his *Table Talk* appeared in 1851. In 1855 his narrative poems, original and translated, were collected under the title of *Stories in Verse*, with an interesting preface. He died at Putney on the 28th of August 1859.

Leigh Hunt’s virtues were charming rather than imposing or brilliant; he had no vices, but very many foibles. His great misfortune was that these foibles were for the most part of an undignified sort. His affectation is not comparable to Byron’s, nor his egotism to Wordsworth’s, but their very pettiness excites a sensation of the ludicrous. The very sincerity of his nature is detrimental to him; the whole man seems to be revealed in everything he ever wrote, and hence the most beautiful productions of his pen appear in a manner tainted by his really very pardonable weaknesses. Some of these, such as his helplessness in money matters, and his facility in accepting the obligations which he would have delighted to confer, involved him in painful and humilitating embarrassment, which seem to have been aggravated by the mismanagement of those around him. The notoriety of these things has deprived him of much of the honour due to him for his fortitude under the severest calamities, for his unremitting literary industry under the most discouraging circumstances, and for his uncompromising independence as a journalist and an author. It was his misfortune to be involved in politics, for he was as thorough a man of letters as ever existed, and most of his failings were more or less incidental to that character. But it is not every consummate man of letters of whom it can be unhesitatingly affirmed that he was brave, just and pious. When it was suggested that Leigh Hunt was the original of Harold Skimpole in *Bleak House*, Charles Dickens denied that any of the shadows in the portrait were suggested by Hunt, who, as he said, “the very soul of truth and honour.” Leigh Hunt’s character as an author was the counterpart of his character as a man. In some respects his literary position is unique. Few men have effected so much by mere exquisiteness of taste in the absence of high creative power; fewer still, so richly endowed with taste, have so frequently and consciously betrayed the want of it; and he was incapable of discovering where familiarity became flippancy. But his poetry possesses an animation, a grandeur, a humour, and a metrical harmony, which lift the author out of the rank of minor poets precisely when the influence of his example upon his contemporaries is taken into account. He excelled especially in narrative poetry, of which, upon a small scale, there are probably no better examples than “Abou ben Adhem” and “Solomon’s Ring.” He possessed every qualification for a translator; and as an appreciative critic, whether literary or dramatic, he has hardly been equalled.

Leigh Hunt’s other works include: *Amynas, A Tale of the Woods* (first translated from Tasso; *The Seer*, or *Common-Places refreshed* (2 pts., 1840-1841); three of the Canterbury Tales in *The Poems of Geoffrey Chaucer, modernized* (1841); *Stories from the Italian Poets* (1846); compilations such as *One Hundred Romances of the Middle Ages* (1843); selections from Beaumont and Fletcher (1855); and, with S. Adams Lee, *The Book of the Sonnet* (Boston, 1867). His *Poetical Works* (2 vols.), revised by himself and edited by Lee, were printed at Princeton, *Union Edition*. In 1845, when his son, Thornton Hunt, appeared in 1860. Among volumes of selections are: *Essays* (1887), ed. A. Symonds; *Leigh Hunt as Poet and Essayist* (1886), ed. C. Kent; *Essays and Poems* (1891), ed. B. J. Beal for the *Westminster*.

His *Autobiography* was revised by himself shortly before his death, and edited (1859) by his son Thornton Hunt, who also arranged his *Correspondence* (2 vols., 1862). Additional letters were printed by the Cowden Clarks in their *Recollections of Writers* (1878). The *Autobiography* was edited (2 vols., 1903) with full bibliographical note by R. Ingpen. A bibliography of his works was compiled by Alexander Ireland (*List of the Writings of William Hazlett and Leigh Hunt, 1886*). There are short lives of Hunt by Cosmo Monkhouse ("Great Writers," 1893) and by R. B. Johnson (1896).

HUNT, ROBERT (1807-1887), English natural philosopher, was born at Devonport on the 6th of September 1807. His father, a naval officer, was drowned while Robert was a youth. He began to study in London for the medical profession, but ill-health caused him to return to the west of England, and in 1840 he became secretary to the Royal Cornwall Polytechnic Society at Truro. He then moved to Plymouth, where, having entered the navy, he made some scientific investigations with Robert Were Fox, and carried on some physical and chemical investigations with him. He took up photography with great zeal, following Daguerre’s discovery, and introducing new processes. His *Manual of Photography* (1841, ed. 5, 1857) was the first English treatise on the subject. He also experimented generally on the action of light, and published *Researches on Light* (1844). In 1845 he accepted the invitation of Sir Henry de la Beche to become keeper of mining records at the Museum of Economic (afterwards "Practical") Geology, and when the school of mines was established in 1851 he lectured for two years on mechanical science, and afterwards for a short time on
Hunt, T. S.—Hunt, W. Holman

experimental physics. His principal work was the collection and editing of the Mineral Statistics of the United Kingdom, and this he continued to the date of his retirement (1883), when the mining record office was transferred to the Home Office. He was elected F.R.S. in 1886, and was a large contributor to the British Mining, in which the subject was dealt with very fully from an historical as well as a practical point of view. He also edited the fifth and some later editions of Ure's Dictionary of Arts, Mines and Manufactures. He died in London on the 17th of October 1887. A mineralogical museum at Redruth has been established in his memory.

Hunt, Thomas Sterry (1826-1892), American geologist and chemist, was born at Norwich, Conn., on the 5th of September 1826. He lost his father when twelve years old, and had to earn his own livelihood. In the course of two years he found employment in a printing office, in an apothecary's shop, in a book store and as a clerk. He became interested in natural science, and especially in chemical and medical studies, and in 1845 he was elected a member of the Association of American Geologists and Naturalists at Yale—a body which four years later became the American Association for the Advancement of Science. In 1848 he read a paper in Philadelphia On Acid Springs and Gypsum Deposits of the Onondaga Salt Group. At Yale he became Professor B. S. Silliman, Jun., and in 1846 was appointed chemist to the Geological Survey of Vermont. In 1847 he was appointed to similar duties on the Canadian Geological Survey at Montreal under Sir William Logan, and this post he held until 1872. In 1859 he was elected F.R.S., and he was one of the original members and president of the Royal Society of Canada. He was a frequent contributor to scientific journals, writing on the crystalline limestones, the origin of continents, the chemistry of the primeval earth, on serpentine, &c. He also wrote a notable "Essay on the History of the names Cambrian and Silurian" (Canadian Naturalist, 1872), in which the claims of Sedgwick, with respect to the grouping of the Cambrian strata, were forcibly advocated. He died in New York City on the 12th of February 1892.

His publications include Chemical and Geological Essays (1875, ed. 2, 1879); Mineral Physiology and Physiography (1880); A New Basis for Chemistry (1887; ed. 3, 1891); Systematic Mineralogy (1891). See an obituary notice by Persifor Frazer, Amer. Geologist (xi. Jan. 1893), with portrait.

Hunt, William Henry (1790-1864), English water-colour painter, was born at Long Acre, London, on the 28th of March 1790. He was apprenticed about 1805 to John Varley, the landscape-painter, with whom he remained five or six years, exhibiting three oil pictures at the Royal Academy in 1807. He was early connected with the Society of Painters in Water-colour, of which body, then in a transition state, he was elected associate in 1824, and full member in 1827. To its exhibitions he was until the year of his death one of the most prolific contributors. Many years of Hunt's uneventful and industrious life were passed at Hastings. He died of apoplexy on the 9th of February 1864. Hunt was one of the creators of the English school of water-colour painting. His subjects, especially those of his later life, are extremely simple; but, by the delicacy, humour and fine power of their treatment, they rank second to works of the highest art only. Considered technically, his works exhibit all the resources of the water-colour painter's craft, from the purest transparent tints to the boldest use of body-colour, rough paper and scarping for texture. His sense of colour is perhaps as true as that of any English artist. "He was," says Ruskin, "take him for all in all, the finest painter of still life that ever existed." Several characteristic examples of Hunt's work, as the "Boy and Goat," "Brown Study," and "Plums, Primroses and Birds' Nests" are in the Victoria and Albert Museum.

Hunt, William Holman (1827-1910), English artist, was born in London on the 2nd of April 1827. An ancestor on his father's side bore arms against Charles I., and went over to Holland, where he fought in the Protestant cause. He returned with William III., but the family failed to recover their property. Holman Hunt's father was the manager of a city warehouse, with tastes superior to his position in life. He loved books and pictures, and encouraged his son to pursue art as an amusement, though not as a profession. At the age of twelve and a half Holman Hunt was placed in a city office, but he employed his leisure hours in reading, drawing and painting, and at sixteen began an independent career. In his characteristic, career he all but overthrew the seventeen and eighteen he entered the Royal Academy schools, where he soon made acquaintance with his lifelong friend John Everett Millais, then a boy of fifteen. In 1846 Holman Hunt sent to the Royal Academy his first picture ("Hark!") which was followed by "Dr Rochecliffe performing Divine Service in the Cottage of Joceline Joliffe at Woodstock," in 1847, and "The Flight of Madeline and Porphyrio" (from Keats's "Eve of St Agnes") in 1848. In this year he and Millais, with the cooperation of Dante Gabriel Rossetti and others, initiated the famous Pre-Raphaelite movement in art. Typical examples of the new creed were exhibited in the next year's Academy by Millais's "Isabella" and Holman Hunt's "Rienzi vows to obtain Justice for the Death of his Young Brother." This last pathetic picture, which was sold to Mr Gibbons for £105, was followed in 1850 by "A Converted British Family sheltering a Christian Missionary from the Persecution of the Druids" (bought by Mr Combe, of the Clarendon Press, Oxford, for £150), and in 1851 by "Valentine protecting Sylvia from Proteus." This scene from Tennyson's "The Two Gentlemen of Verona" was very warmly praised by Ruskin (in letters to The Times), who declared that its subjects both of drapery and of every minor detail there had been nothing in art so earnest and complete since the days of Albert Dürer. It gained a prize at Liverpool, and is reckoned as the finest of Holman Hunt's earlier works. In 1852 he exhibited "A Hireling Shepherd," "Claudio and Isabella," from Measure for Measure, and a brilliant study of the Downs near Hastings, called in the catalogue "Our English Coasts, 1852" (since generally known as "Strayed Sheep"), were exhibited in 1853. For three of his works Holman Hunt was awarded prizes of £50 and £60 at Liverpool and Birmingham, but in 1851 he had become so discouraged by the difficulty of selling his pictures, that he had resolved to give up art and learn farming, with a view to emigration. In 1854 he achieved his first great success by the famous picture of "The Light of the World," an allegorical representation of Christ knocking at the door of the human soul. This work produced perhaps the greatest effect of any religious painting of the century. For the first time in England,acrobat William Bell Scott, a "dilettante architect" of conversation and general interest from one end of the island to the other, and indeed continued so for many years. "The Awakening Conscience," exhibited at the same time, depicted a tragic moment in a life of sin, when a girl, stricken with memories of her innocent childhood, rises suddenly from the knees of her paramour. The inner meaning of both these pictures was explained by Ruskin in letters to The Times in May 1854. "The Light of the World" was purchased by Mr Combe, and was given by his wife to Keble College. In 1894 Holman Hunt completed a second "Light of the World," slightly altered from the original, the execution of which was due to his dissatisfaction with the way in which the Keble picture was shown there; and he intended the second edition of it for as wide public exhibition as possible. It was acquired by Mr Charles Booth, who arranged for the exhibition of the new "Light of the World" in all the large cities of the colonies.

In January 1854 Holman Hunt left England for Syria and Palestine with the desire to revivify on can the facts of Scripture history, surround his career as an artist with enthusiasm, and study the life in Judaea of old days. The first fruit of this idea, which may be said to have dominated the artist's life, was "The Scapegoat," a solitary outcast animal standing alone on the salt-encrusted shores of the Dead Sea, with the mountains of Edom in the distance, seen under a gorgeous effect of purple evening light. It was exhibited at the Royal Academy in 1856, together with three Eastern landscapes. His next picture (1860), one of the most elaborate and most successful of his works, was "The Finding of our Saviour in the Temple." Like all his
important pictures, it was the work of years. Many causes contributed to the delay in its completion, including a sentence of what was tantamount to excommunication (afterwards revoked) passed on all Jews acting as models. Thousands crowded to see this picture, which was exhibited in London and in many English provincial towns. It was purchased for £2,500, and is now in the Fitzwilliam Museum, Cambridge. Holman Hunt's next great religious picture was "The Shadow of Death" (exhibited separately in 1873), an imaginary incident in the life of our Lord, who, lifting His arms with wearness after labour in His workshop, threw a shadow on the wall as of a man crucified, which is perceived by His mother. This work was presented to Manchester by Sir William Agnew. Meanwhile there had appeared at the Royal Academy in 1868 "A Street in Cairo: The Lanternmaker's Courtship," and in 1869 "The King of Hearts," and a portrait of the Right Hon. Stephen Lushington, D.C.L. In 1866 came "Isabella and the Pot of Basil," "London Bridge on the Night of the Marriage of the Prince of Wales," and "The Afterglow." In 1869 Holman Hunt sent a charming head of "A Tuscan Girl" to the Grosvenor Gallery and two pictures to the Royal Academy. These were "Il dolce far niente" and a lifelike study of pigeons in rain called "The Festival of St Swithin," now in the Taylor Building, Oxford, with many others of this artist's work. After two years' absence Holman Hunt returned to Jerusalem in 1875, where he was engaged upon his great picture of "The Triumph of the Innocents," which proved to be the most serious labour of his life. The subject is an imaginary episode of the flight into Egypt, in which the Holy Family are attended by a procession of the Holy Innocents, marching along the waters of life and illuminated with unearthly light. Its execution was delayed by an extraordinary chapter of accidents. For months Holman Hunt waited in vain for the arrival of his materials, and at last he unfortunately began on an unsuitable piece of linen procured in despair at Jerusalem. Other troubles supervened, and when he arrived in England he found his picture in such a state that he was compelled to abandon it and begin again. The new version of the work, which is somewhat larger and changed in several points, was not completed till 1883. Meanwhile the old picture was relined and so skilfully treated that the artist was able to complete it satisfactorily, and there are now two pictures entitled "The Triumph of the Innocents," one in the Liverpool, the other in the Birmingham Art Gallery. The pictures exhibited between 1875 and 1883 included "The Ship," a realistic picture of the deck of a passenger ship by night (1878), and portraits of his son (1880), Sir Richard Owen (1881) and Dante Gabriel Rossetti (1884). All of these were exhibited at the Grosvenor Gallery, where they were followed by "The Bride of Bethlehem" (1885), "Amaryllis," and a portrait of his son (tracing a drawing on a window) in 1886. His most important later work is "May-Day, Magdalen Tower," a record of the service of song which has been held on the tower of Magdalen, Oxford, at sunrise on May-Day from time immemorial. The subject had interested the artist for a great many years, and, after "The Triumph of the Innocents" was completed, he worked at it with his usual devotion, climbing up the tower for weeks together in the early morning to study the sunrise from the top. This radiant poem of the simplest and purest devotion was exhibited at the Gainsborough Gallery in Old Bond Street in 1891. He continued to send occasional contributions to the exhibitions of the Royal Water-Colour Society, to the New Gallery and to the New English Art Club. One of the most remarkable of his later works (New Gallery, 1890) is "The Movement," a picture of the Church of the Virgin at Nazareth. By his strong and constant individuality, no less than by his peculiar method of work, Holman Hunt holds a somewhat isolated position among artists. He remained entirely unaffected by all the various movements in the art-world after 1850. His ambition was always "to serve as high priest and expounder of the excellence of the works of the Creator." He spent too much labour on each work to complete many; but perhaps no painter of the 19th century produced so great an impression by a few pictures as the painter of "The Light of the World," "The Scapegoat," "The Finding of our Saviour in the Temple," and "The Triumph of the Innocents;" and his greatness was recognized by his inclusion in the Order of Merit. His History of Pre-Raphaelitism, a subject on which he could speak as a first authority, but not without dissent from at least one living his collaborator, the P.R.R., was published in 1905. On the 7th of September 1910 he died in London, aged 67. After his remains, after cremation at Golders Green, were buried in St Paul's Cathedral, with national honours.

HUNT, WILLIAM MORRIS (1824-1879), American painter, was born at Brattleboro, Vermont, on the 31st of March 1824. His father's family were large landowners in the state. He was for a time (1840) at Harvard, but his real education began when he accompanied his mother and brother to Europe, where he studied with Couture in Paris and then came under the influence of Jean François Millet. The companionship of Millet had a lasting influence on Hunt's character and style, and his work grew in strength, in beauty and in seriousness. He was the real introducer of the Barbizon school to America, and he more than any other turned the rising generation of American painters to the study of nature. On his return in 1855 he painted some of his most beautiful pictures, all reminiscence of his life in France and of Millet's influence. Such are "The Belated Kid," "Girtail the Fountain," "Hurdy-Gurdy Boy," &c. But the public called for portraits, and it became the fashion to sit to him, among his best paintings in this kind being those of William M. Evarts, Mrs Charles Francis Adams, the Rev. James Freeman Clarke, William H. Gardner, Chief Justice Shaw and Judge Horace Gray. Unfortunately many of his paintings and sketches, together with five large Millets and other art treasures collected by him in Europe, were destroyed in the great Boston fire of 1872. Among his later works American landscapes predominated. They also include the "Bathers"—two pictures—and the allegories for the senate chamber of the State Capitol at Albany, N.Y., now lost by the disintegration of the stone panels on which they were painted. Hunt was drowned at the Isles of Shoals on the 8th of September 1879. His book, Talks about Art (London, 1878), is well known.

His brother, RICHARD MORRIS HUNT (1828-1869), the famous architect, was born in Brattleboro, Vermont, on the 31st of October 1828. He studied in Europe (1843-1854), mainly in the Ecole des Beaux Arts at Paris, and in 1854 was appointed inspector of works on the buildings connecting the Tuileries with the Louvre. Under Hector Lefuel he designed the Pavilion de la Bibliotheque, opposite the Palais Royal. In 1855 he returned to New York, and was employed on the extension of the Capitol at Washington. He designed the Lenox Library, the Stuyvesant and the Tribune buildings in New York; the theological library, and Marquand chapel at Princeton; the Divinity College and the Scroll and Key building at Yale; the Vanderbilt mausoleum on Staten Island, and the Yorktown monument. For the Administration Building at the World's Columbian Exposition at Chicago in 1893 Hunt received the gold medal of the Institute of British Architects. Among the most noteworthy of his domestic buildings were the residences of Dr R. Van Cortlandt and Henry G. Marquand in New York City; George W. Vanderbilt's country house at Asheville; and several of the large "cottages" at Newport, R.I., including "Marble House" and "The Breakers." He was one of three foreign members of the Italian Society of St Luke, an honorary and corresponding member of the Académie des Beaux Arts and of the Royal Institute of British Architects, and a Chevalier of the Legion of Honour. He was the first to command respect in foreign countries for American architecture, and was the leader.
of a school that has established in the United States the manner and the traditions of the Beaux Arts. He took a prominent part in the founding of the American Institute of Architects, and, from 1888, was its president. His talent was eminently practical; and he was almost equally successful in the ornate style of the early Renaissance in France, in the picturesque style of his comfortable villas, and the monumental style of the Louvre Library. There is a beautiful memorial to Hunt in the wall of Central Park, opposite this building, erected in 1896 by the associated art and architectural societies of New York, from designs by Daniel C. French and Bruce Price. He died on the 31st of July, 1895.

HUNTER, JOHN (1728–1793), British physiologist and surgeon, was born on the 13th of February 1728, at Long Calderwood, in the parish of East Kilbride, Lanarkshire, being the youngest of the ten children of John and Agnes Hunter. His father, who died on the 30th of October 1744, aged 78, was descended from the old Ayrshire family of Hunter of Hunterston, and his mother was the daughter of a Mr Paul, treasurer of Glasgow. Hunter is said to have made little progress at school, being averse to its restraints and pursuits, and fond of country amusements. When seventeen years old he went to Glasgow, where for a short time he assisted his brother-in-law, Mr Buchan, a cabinetmaker. Being desirous at length of some settled occupation, he obtained from his brother William (q.v.) permission to aid, under Mr Symonds, in making dissections in his anatomical school, then the most celebrated in London, intending, should he be unsuccessful there, to enter the army. He arrived accordingly in the metropolis in September 1748, about a fortnight before the beginning of his brother's autuminal course of lectures. After succeeding beyond expectation with the dissection of the muscles of an arm, he was entrusted with a similar part injected, and from the excellence of his second essay Dr Hunter predicted that he would become a good anatomist. Seemingly John Hunter had hitherto received no instruction in preparation for the special course of life upon which he had entered.

Hard-working, and singularly patient and skillful in dissection, Hunter had by his second winter in London acquired sufficient anatomical knowledge to be entrusted with the charge of his brother's practical class. In the summer months of 1749–1750, at Chelsea Military Hospital, he attended the lectures and operations of William Cheselden, where Percivall Pott was one of the senior surgeons. In the summer of 1752 he visited Scotland. Sir Everard Home and, following him, Drewry Ottery state that Hunter began in 1754 to assist his brother as his partner in lecturing; according, however, to the European Magazine for 1782, the office of lecturer was offered to Hunter by his brother in 1756, but declined by him. In 1762 Hunter was elected a Fellow of the Royal Society, and the following year he was elected an Associate of the Royal College of Surgeons. Dr Hunter delivered an oration before the Royal College of Surgeons on the 17th of July, 1774, which was printed in the Medico-Chirurgical Transactions of the Royal College of Surgeons. The oration was delivered on the occasion of St Mary's Hall his residence and is said to have been delivered in the presence of the King.

Hunt was induced to enter as a gentleman commoner at St Mary's Hall, Oxford, but his instincts would not permit him, to use his own expression, "to stuff Latin and Greek at the university." Some three and thirty years later he thus significantly wrote of an opponent: "Jesse Foot accuses me of not understanding the dead languages; but I could teach him that on the dead body which he never knew in any language dead or living." Doubtless, however, linguistic studies would have served to correct in him what was perhaps a natural defect—a difficulty in the presentation of abstract ideas not wholly attributable to the content of his doctrines.

An attack of inflammation of the lungs in the spring of 1759 having produced symptoms threatening consumption, by which the promising medical career of his brother James had been cut short, Hunter obtained in October 1760 the appointment of staff-surgeon in Hodgson and Keppell's expedition to Belleisle. With this he sailed in 1761. In the following year he served with the English forces on the frontier of Portugal. Whilst with the army he acquired the extensive knowledge of gunshot wounds embodied in his important treatise (1794) on that subject, in which he treated not only gunshot wounds but almost other matters of moment, he insists on the rejection of the indiscriminate practice of dilating with the knife followed almost universally by surgeons of his time. When not engaged in the active duties of his profession, he occupied himself with physiological and other scientific researches. Thus, in 1761, off Belleisle, the conditions of the coagulation of the blood were among the subjects of his inquiries. Later, on land, he continued the study of human anatomy, and arranged his notes and memoranda on inflammation; he also ascertained by experiment that digestion does not take place in snakes and lizards during hibernation, and observed that enforced vigorous movement at that season proves fatal to such animals, the waste so occasioned not being compensated, whence he drew the inference that, in the diminution of the power of a part attendant on mortification, resort to stimulants which increase action without giving real strength is inadvisable. A MS. catalogue by Hunter, probably written soon after his return from Portugal, shows that he had already made a collection of about two hundred specimens of natural and morbid structures.

On arriving in England early in 1763, Hunter, having retired from the army on half-pay, took a house in Golden Square, and began the career of a London surgeon. Most of the metropolitan practice at the time was held by P. Pott, C. Hawkins, Samuel Sharp, Joseph Warner and Robert Adair; and Hunter sought to eke out his at first slender income by teaching practical anatomy and operative surgery to a private class. His leisure was devoted to the study of comparative anatomy, to procure subjects for which he obtained the refusal of animals dying in the markets of London and of various travelling zoological collections. In connexion with his rupture of a tendon Achilles, in 1769, he performed on dogs several experiments which, with the illustrations in his museum of the reunion of such structures after division, laid the foundation of the modern practice of cutting through tendons (tenotomy) for the relief of distorted and contracted joints. In the same year he was elected F.R.S. His first contribution to the Philosophical Transactions, with the salis." Hunter apparently left Oxford after less than two months' residence, as the last entry in the battery book with charges for battells against his name is on July 23, 1755. His name was, however, recorded on the books of the Hall till December 10, 1756. The record of Hunter's matriculation runs: "Ter" Trin. 1755.—Junii 6th Aul. S. Mar. Johannes Hunter 24 Johannis de Kilbroid in Com. Clidseide Scotiae Arm. 6th. In 1767, he performed on a patient a case of hibernation, to which he made was called "an experiment," the patient having had a large tumour in the neck. The tumour was removed and a second tumour appeared in the chest, which he removed and a third tumour appeared in the chest. F.R.S. His first contribution to the Philosophical Transactions, with the salis." Hunter apparently left Oxford after less than two months' residence, as the last entry in the battery book with charges for battells against his name is on July 23, 1755. His name was, however, recorded on the books of the Hall till December 10, 1756. The record of Hunter's matriculation runs: "Ter" Trin. 1755.—Junii 6th Aul. S. Mar. Johannes Hunter 24 Johannis de Kilbroid in Com. Clidseide Scotiae Arm. 6th.
exception of a supplement to a paper by J. Ellis in the volume for 1766, was an essay on post-mortem digestion of the stomach, written at the request of Sir J. Fringe, and read on the 18th of June 1772, in which he explained that phenomenon as a result of the action of the gastric juice. On the 9th of December 1768 he was elected a Fellow of the Royal Society, and a member of the Corporation of Surgeons. He now began to take house-pupils. Among these were Edward Jenner, who came to him in 1770, and until the time of Hunter's death corresponded with him on the most intimate and affectionate terms, W. Guy, Dr P. S. Physick of Philadelphia, and Everard Home, his brother-in-law. William Lynn and Sir A. Carlisle, though not inmates of his house, were frequent visitors there. His pupils at St George's included John Abernethy, Henry Cline, James Earle and Astley Cooper. In 1770 he settled in Jermyn Street, in the house which his brother William had previously occupied; and in July 1771 he married Anne, the eldest daughter of Robert Home, surgeon to Burgoyne's regiment of light horse.  

From 1772 till his death Hunter resided during autumn at a house built by him at Earl's Court, Brompton, where most of his biological researches were carried on. There he kept for the purpose of study and experiment the fishes, lizards, blackbirds, hedgehogs and other animals sent him from time to time by Jenner; tame pheasants and partridges, at least one eagle, toads, silkworms, and many more creatures, obtained from every quarter of the globe. Bees he had under observation in his conservatory for upwards of twenty years; hornets and wasps were as well studied as the hedgehog. On two occasions his life was in risk from his pets—once in wrestling with a young bull, and again when he fearlessly took back to their dens two leopards which had broken loose among his dogs. 

Choosing intuitively the only true method of philosophical discovery, Hunter, ever cautious of confusing fact and hypothesis, besought of nature the truth through the medium of manifold experiments and observations. He had never read Bacon," says G. G. Babington, "but his mode of studying nature was as strictly Baconian as if he had." To Jenner, who had offered a conjectural explanation of a phenomenon, he writes, on the 2nd of August 1775: "I think your solution is just; but why think? why not try the experiment? Repeat all the experiments upon a hedgehog as soon as you receive this, and they will give you the solution." It was his axiom however, "that experiments should not be often repeated which tend merely to establish a principle already known and admitted, but that the next step should be the application of that principle to useful purposes" ("Anim. Oeon.," Works, iv. 86). During the subjects and dates of his subsequent papers in the Transactions, the titles of which give little notion of the richness of their content. The titles are: The structure and habits of the air-receptacles of birds, and the Gullarco trout (1774); the Gymnophorus eliocerus, and the production of heat by animals and vegetables (supplemented in 1777), (1775); the recovery of penguins out of water (1776); the free martin (1779); the communication of smallpox to the foetus in utero, and the occurrence of male plumage in old hen pheasants (1780); the organ of hearing in fishes (1782); the anatomy of a "new marine animal" described by Home (1785); the specific identity of the wolf, jackal and dog (supplemented in 1786), the effect on fertility of extirpation of one ovarium, and the structure and economy of whales (1787); observations on bees (1793); and some remarks on smallpox and variola, and on typhus fever (1795). With these may be included a paper by Home, from materials supplied by Hunter, on certain horny excrescences of the human body. 

Mrs Hunter died on the 7th of January 1821, in Holles Street, Cavendish Square, London, in her seventy-ninth year. She was a handsome and accomplished woman, and well fulfilled the social duties of her position. The words for Haydn's English canzonets were supplied by her, and these were mostly original poems; of these the lines beginning "My mother bids me bind my hair" are, from the beauty of the accompanying music, among the best known. (See Rev. Canz., in the Musical Review, iv. 154.) Hunter's letter of condolence to Jenner in 1778 on a disappointment in love: "But let her go, never mind her. I shall employ you with hedgehogs, for I do not know how far I may trust mine." 

In his zoological and other researches, in which his experience had led him to believe that the effects of mankind were, in nearly similar in the brute creation and in man, he had already, in 1769, as he states, "poisoned some thousands of animals." 6 By inserting shot at definite distances in the leg-bones of young pigs, and also by feeding them with madder, by which all fresh oseous deposits are tinged, Hunter obtained evidence that bones increase in size, not by the intercalation of new amongst old particles, as had been imagined by H.L. Duhamel du Monceau, but by means of additions to their extremities and circumference, excess of calcareous tissue being removed by the absorbers. Some of his most extraordinary experiments were to illustrate the effects of the strength of soporiferous plants which he exchanged the spurs of a young cock and a young pullet, and found that on the former the transplanted structure grew to a fair size, on the latter but little; whereas a spur from one leg of a cock transferred to its comb, a part well supplied with blood, grew more than twice as fast as that left on the other leg. Another experiment of his, which required many trials for success, was the engraffing of a human incisor on the comb of a cock. The uniting of parts of different animals when brought into contact he attributed to the production of adhesives and suppurative inflammation, owing to their possession of the simple living principle. The effects of the strength of soporiferous plants which he exchanged the spurs of a young cock to illustrate his observation that in a sea-gull which he had brought to feed on barley the muscular parietes of the gizzard became greatly thickened. A similar phenomenon was noticed by him in the case of other carnivorous birds fed on a vegetable diet. 

It was in 1772 that Hunter, in order effectually to gauge the extent of his own knowledge, and also correctly to express his views, which had been repeatedly misstated or ascribed to others, began his lectures on the theory and practice of surgery, at first delivered free to his pupils and a few friends, but subsequent to 1774 on the usual terms, four guineas. Though Pott, indeed, had perceived that the only true system of surgery is that which most closely accords with the curative efforts of nature, a rational pathology can hardly be said to have had at this time any existence; and it was generally assumed that a knowledge of anatomy alone was a sufficient foundation for the study of surgery. Hunter, unlike his contemporaries, to most of whom his philosophic habit of thought was a mystery, and whose books contained little else than relations of cases and modes of treatment, sought the reason for each phenomenon that came under his notice. The principles of surgery, he maintained, are not less necessary to be understood than the principles of other sciences; unless, indeed, the surgeon should wish to rival the Chiron, "the strength of soporiferous plants which he exchanged the spurs of a young cock to illustrate his observation that in a sea-gull which he had brought to feed on barley the muscular parietes of the gizzard became greatly thickened. A similar phenomenon was noticed by him in the case of other carnivorous birds fed on a vegetable diet. 

The conditions of this animal during hibernation was a subject of speculation in Hunter, who thus intro (1774): "I write this letter of condolence to Jenner in 1778 on a disappointment in love: "But let her go, never mind her. I shall employ you with hedgehogs, for I do not know how far I may trust mine." 

8 See his evidence at the trial of Captain Donellan, Works, i. 195. The discovery of the dying of bones by madder, see Belcher, Phil. Trans., vol. xxviii. (1786), pp. 287 and 290.  

7 Essays and Observations, i. 55. 6. "May we not claim for him," says Sir Wm. Fergusson, with reference to these experiments, "that he anticipated by a hundred years the scientific data on which the present system of human grafting is conducted?" (Hunter, 1871, p. 17).  

8 Essays and Observations, i. 115; cf. Works, i. 391.
auditory is stated to have been embarrassed and awkward, or, as Adams puts it (Obs. on Morbid Poiis, p. 272), “frequently ungraceful,” and his language always unadorned; but that his “expressions for the explaining of his new theories rendered his lectures often unintelligible” is scarcely evident in his pupils’ notes still extant. His own and others’ errors and fallacies were exposed with equal freedom in his teaching. Occasionally he would tell his pupils, “You had better not write down that observation, for very likely I shall think differently next year”; and once in answer to a question he replied, “Never ask me what I have said or what I have written; but if you will ask me what my present opinions are, I will tell you.”

In January 1776 Hunter was appointed surgeon-extraordinary to the king. He began in the same year his Croonian lectures on muscular motion, continued annually, except in 1777, till 1782: they were never published by him, being in his opinion too incomplete. In 1778 appeared the second part of his Treatise on the Natural History of the Human Teeth, the first part of which was published in 1771. It was in the waste of the dental alveoli and of the fangs of shedding teeth that in 1754-1755, as he tells us, he received his first hint of the use of the absorbents. Abernethy (Physiological Lectures, p. 196) relates that Hunter, being once asked how he could suppose it possible for absorbents to do such things as he attributed to them, replied, “Nay, I know not, unless they possess powers similar to those which a caterpillar exerts when feeding on a leaf.” Hunter in 1780 read before the Royal Society a paper in which he laid claim to have been the first to make out the nature of the utero-placental circulation. His brother William, who had five years previously described the same in his Anatomy of the Braids Utleras, thereupon wrote to the Society attributing to himself this honour. John Hunter in a rejoinder to his brother’s letter, dated the 17th of February 1780, reiterated his former statement, viz. that his discovery, on the evening of the day in 1754 that he had made it in a specimen injected by a Dr Mackenzie, had been communicated by him to Dr Hunter. Thus arose an estrangement between the two Hunters, which continued until the time of William’s last illness, when his brother obtained permission to visit him. In 1783 Hunter was elected a member of the Royal Society of Medicine and of the Royal Academy of Surgery at Paris, and took part in the formation of “A Society for the Improvement of Medical and Chirurgical Knowledge.” I It appears from a letter by Hunter that in the latter part of 1783, he, with Jenner, had the subject of colour-blindness under consideration. As in that year the lease of his premises in Jermyn Street was to expire, he purchased the twenty-four years’ leasehold of two houses, the one on the east side of Leicesters Square, the other in Castle Street, with intervening ground. Between the houses he built in 1783-1785, at an expense of above £3,000, a museum for his anatomical and pathological collections, which by order of the Trustees of the new edifice consisted of a hall 52 ft. long by 25 ft. wide, and lighted from the top, with a gallery all round, and having beneath it a lecture theatre. In April 1785 Hunter’s collections were removed into it under the superintendence of Home and William Bell, a and another assistant, André. Among the foreigners of distinction who inspected the museum, which was now shown by Hunter twice a year—in October to medical men, and in May to other visitors—were J. F. Blumenbach, P. Camper and A. Scarpa. In the acquisition of subjects for his varied biological investigations and of specimens for his museum, expense was a matter of small moment with Hunter. Thus he endeavoured, at his own cost, to obtain information respecting the Cetacea by sending out a surgeon to the North in a Greenland whaler. He is said, moreover, to have given, in June 1783, £500 for the body of O’Brien, or Byrne, the Irish giant, whose skeleton, 7 ft. 7 in. high, is so conspicuous an object in the museum of the College of Surgeons of London.8

Hunter, who in the spring of 1760-1772 had suffered from gout, in spring 1773 from spasms apparently in the pyloric region, accompanied by failure of the heart’s action (Ottley, Life, p. 44), and in 1777 from vertigo with symptoms of angina pectoris, had in 1783 another attack of the last mentioned complaint, to which he was henceforward subject when under anxiety or excitement of mind.

In May 1785, chiefly to oblige William Sharp the engraver, Hunter consented to have his portrait taken by Sir Joshua Reynolds. He proved a bad sitter, and Reynolds made little satisfactory progress, till one day Hunter, while resting his somewhat upraised head on his left hand, fell into a profound reverie—one of those waking dreams, seemingly, which in his lectures he has so well described, when “the body loses the consciousness of its own existence.”9 The painter had now before him the man he would fain depict, and, turning his canvas upside down, he sketched out the admirable portrait which, afterwards skilfully restored by H. Farrar, is in the possession of the Royal College of Surgeons. A copy by Jackson, acquired from Lady Bell, is to be seen at the National Portrait Gallery, and St Mary’s Hall, Oxford, also possesses a copy. Sharp’s engraving of the original, published in 1788, is one of the finest of his productions. The volumes seen in Reynolds’s picture are a portion of the unpublished records of anatomical researches left by Hunter at his death, which, with other manuscripts, Sir Everard Home in 1812 removed from his museum, and eventually, in order, it has been supposed, to keep secret the source of many of his papers in the Philosophical Transactions, and of facts mentioned in his lectures, committed to the flames.4

Among the subjects of Hunter’s physiological investigation in 1785 was the mode of growth of deer’s antlers. As he possessed the privilege of making experiments on the deer in Richmond Park, he in July of that year had a buck there caught and thrown, and tied one of its external carotid arteries. He observed that the antler which obtained its blood supply therefrom, then half-grown, became in consequence cold to the touch. Hunter debated with himself whether it would be bred in due time, or be longer retained than ordinarily. To his surprise he found, on re-examining the antler a week or two later, when the wound around the ligatured artery was healed, that it had regained its warmth, and was still increasing in size. Had then, his operation been in some way defective? To determine this question, the buck was killed and sent to Leicester Fields. On dissection Hunter’s observation was confirmed; that the external carotid had been duly tied, but that certain small branches of the artery above and below the ligature had enlarged, and by their anastomoses had restored the blood supply of the growing part. Thus it was evident that under “the stimulus of necessity,” to use a phrase of the experimenter, the smaller arterial channels are

1 The Transactions of the Society contain papers by Hunter on infant inanition (1784), intromission in animals (1784), intromission in man (1780), on the connection of paralysis of the muscles of deglutition (1790), and a case of poisoning during pregnancy (1794), with others written by Home, from materials supplied by him, on Hunter’s operation for the cure of popliteal aneurism, on those cartilages in joints, on certain horny excretions of the human body, and on the growth of bones.

2 Bell lived with Hunter fourteen years, i.e. from 1775 to 1789, and was perhaps the only man, habitually in medical service, who could have had knowledge of the preparations for the museum. He died in 1792 at Sunnata, where he was assistant-surgeon to the East India Company.

3 O’Brien, dreading dissection by Hunter, had shortly before his death arranged with several of his countrymen that his corpse should be conveyed by them to the sea, and sunk in deep water; but his undertaker, who had entered into a pecuniary compact with the great anatomist, managed that while the escort was drinking at a certain stage on the march seawards, the coffin should be locked up in a barrel. There some men he had concealed speedily substituted an equivalent weight of paving-stones for the body, which was at night forwarded to Hunter, and by him taken in his carriage to Earl’s Court, and, to avoid risk of a discovery, immediately after suitable division divided to obtain the bones. See Tom Taylor, Leicester Square, ch. xiv. xiv. Of this division Thomas Sharp wrote to Sir John Barrow, xxvi. 209 (1785).

5 Works, i. 265-266.

6 Accurate transcripts of a portion of Hunter’s MSS., made by Clift in 1793 and 1800, was edited by Sir Richard Owen, in two volumes with notes, in 1861, under the title of Essays and Observations in Natural History, and in Physical and Geographical Anatomy. On the destruction of Hunter’s papers see Clift’s “Appendix,” in vol. ii. p. 497, also W. H. Flower, Introdt. Lect., pp. 7-9 (1870).
capable of rapid increase in dimensions to perform the offices of the larger. It happened that, in the ensuing December, there lay in one of the wards of St. George's Hospital a patient admitted for popliteal aneurism. The disease must soon prove fatal unless by some means arrested. Should the surgeon, following the usual and commonly fatal method of treatment, cut down upon the tumour, and, after tiring the artery above and below it, evacuate its contents? Or should he adopt the procedure, deemed by Pott generally advisable, of amputating the limb above it? It was Hunter's aim in his practice, even if he could not dispense with the necessity, at least to diminish the severity of operations, which he considered were an acknowledgment of the imperfection of the art of healing, and compared to "the acts of the armed savage, who attempts to get that by force which a civilized man would get by stratagem." Since he argued, the experiment with the buck had shown that collateral vessels are capable of continuing the circulation when passage through a main trunk is arrested, why should he not, in the aneurism case, leaving the abscesses to deal with the contents of the tumour, tie the artery in the sound parts, where it is tied in amputation, and preserve the limb? Acting upon this idea, he ligatured his patient's femoral artery in the lower part of its course in the thigh, in the fibrous sheath enclosing the space since known as "Hunter's canal." The leg was found, some hours after the operation, to have acquired a temperature even above the normal. At the end of January 1786, that is, in six weeks' time, the patient was well enough to be able to leave the hospital. Thus it was that Hunter inaugurated an operation which has been the means of preserving to hundreds life with integrity of limb—an operation which, as the Italian F. Assalini, who saw it first performed, testifies, excited the greatest wonder, and awakened the attention of all the surgeons in Europe.

Early in 1786 Hunter published his Treatise on the Venerable Disease, which, like some of his previous writings, was printed in his own house. Without the aid of the booksellers, 1,000 copies of it were sold within a twelvemonth. Although certain views therein expressed with regard to the relationship of syphilis have been proved erroneous, the work is a valuable compendium of observations of cases and modes of treatment (cf. John Hilton, Hunt. Orol. p. 40). Towards the end of the year appeared his Observations on certain parts of the Animal Oconomy, which, besides the more important of his contributions to the Philosophical Transactions, contains nine papers on various subjects. In 1786 Hunter was made inspector-general to the army; his appointment as surgeon-general and as inspector-general of hospitals followed in 1790. In 1787 he received the Royal Society's Copley medal, and was also elected a member of the American Philosophical Society. On account of the increase in his practice and his impaired health, he now obtained the services of Home as his assistant at St. George's Hospital. The death of Pott in December 1788 secured to him the undisputed title of the first surgeon in England. He resigned to Home, in 1792, the delivery of his surgical lectures, in order to devote himself more fully to the completion of his Treatise on Blood, Inflammation and Gunshot Wounds, which was published by his executors in 1794. In this, his masterpiece, the application of physiology to practice is especially noticeable. Certain experiments described in the first part, which demonstrate that arterIALIZATION of the blood in respiration takes place by a process of diffusion of "pure air" or "vital air" (i.e. oxygen) through membrane, were made so early as the summer of 1775.

Hunter in 1792 announced to his colleagues at St. George's, who, he considered, neglected the proper instruction of the students under their charge, his intention no longer to divide with them the fees which he received for his hospital pupils. Against this he was succeeded by the Council of the Hospital. In 1793. Subsequently, by a committee of their appointing, a code of rules respecting pupils was promulgated, one clause of which, probably directed against an occasional practice of Hunter's, stipulated that no person should be admitted as a student of the hospital without certificates that he had been educated for the medical profession. In the autumn two young Scotchmen, ignorant of the new rule, came up to town and applied to Hunter for admission as his pupils at St. George's. Hunter explained to them how he was situated, but promised to advance their request at the next board meeting at the hospital on the 16th of October. On that day, having finished a difficult piece of dissection, he went down to breakfast in excellent spirits and in his usual health. After making a professional call, he attended the board meeting. There the interruption of his remarks in behalf of his applicants by a flat contradiction from a colleague brought on one of the old spasmotic heart attacks; he ceased speaking, and retired into an adjoining room only to fall lifeless into the arms of Dr. Robertson, one of the hospital physicians. After an hour had been spent in vain attempts to restore animation, his body was conveyed to his house in a sedan chair. His remains were interred privately on the 3rd of October 1793, in the vaults of St. Martin's in the Fields. Thence on the 28th of March 1859, through the instrumentality of F. T. Buckland, they were removed to Abbot Islip's chapel in Westminster Abbey, to be finally deposited in the grave in the north aisle of the nave, close to the resting-place of Ben Jonson.

Hunter was of about medium height, strongly built and high-shouldered and short-necked. He had an open countenance, and large features, eyes light-blue or grey, eyebrows prominent, and hair reddish-yellow in youth, later white, and worn curled behind; and he dressed plainly and neatly. He rose at or before six, dissected till nine (his breakfast hour), received patients from half-past nine till one, and, at least during the summer, used to ride to the hospital and hospital patients till about four, when he dined, taking, according to Home, as at other meals in the ten years preceding his death, no wine. After dinner he slept an hour; he then superintended experiments, read or prepared his lectures, and made usually by means of an amanuensis, records of the day's dissections. "I never could understand," says W. Clift, "how Mr. Hunter obtained rest; when I left him at midnight, it was with a lamp fresh trimmed for further study, and while the usual appointment to meet him again at six in the morning," H. Leigh Thomas records that on his first arrival in London, having by desire called on Hunter "at five o'clock in the morning, he found him already busily engaged in the dissection of insects. Rigidly economical of time, Hunter was always at work, and he had always in view some fresh enterprise. To his museum he gave a very large share of his attention, and, in the earlier years of his life, he took the trouble of arranging his collections, and knowing of none who could continue his work for him. "When I am dead," he said one day to Dr. Maxwell Garthshore, "you will not soon meet with another John Hunter. At the time of his death he had arranged his naturalized experiments, and presented specimens of some of them repeatedly, and had made numerous dissections of plants. The manuscript works by him, appropriated and destroyed by Home, among which were his eighty-six surgical lectures, all in full, are stated to have been "literally burnt," and many pages of his records were written by Clift under his directions "at least half a
dozen times over, with corrections and transpositions almost without end.

To the kindness of his disposition, his kindness for animals, his aversion to operations, his thoughtful and self-sacrificing attention to his patients, and especially his zeal to help forward struggling practice, HUNTER was peculiarly qualified for any task. Both means he valued no further than they enabled him to promote his researches; and to the poor, to non-beneficed clergyman, professional author, and man of science, he was literally without end. His yearly income in 1763-1774 was never £1000; it exceeded that sum in 1778, for several years before his death was £5000, and at the time of that event had reached above £6000. All his earnings not required for the support and adornment of the life of his wife, devoted to the improvement of his museum; and his property, this excepted, was found on his decease to be barely sufficient to pay his debts. By his contemporaries generally Hunter was considered as the art of dissecting an anatomy, and as a cautious and trustworthy if not an elegant and very dexterous operator. Few, however, perceived the drift of his biological researches. And in London, as elsewhere, even in Lincolns, for which his unique museum had been formed—namely, that of morphology as the only true basis of a systematic zoological classification—was entirely his own; yet his investigations into the structure of the lower orders of animals were regarded as works of unprofitable curiosity. One surgeon, of no considerable repute, is said to have vented the remark that Hunter's preparations were "just as valuable, Hunterian and collegiate collection the prize of the Royal Society, Sir Joseph Banks, writing in 1796, plainly expressed his disbelief as to the collection being "an object of importance to the general study of natural history, or indeed to any branch of science or art." And when the Duke of York, speaking of sympathy or encouragement of approbation, without collateral assistance," and careless of achieving fame—for he held that "no man could be a physician who was not laborious to perfect his designs, and established the science of comparative anatomy, and principles which, however neglected in his lifetime, become the groundwork of all medical study and teaching.

In accordance with the directions given by Hunter in his will, his collection was offered for purchase to the British government. But the prime minister, Pitt, on being asked to consider the matter, exclaimed: "What buy preparative? I have no money enough to purchase it." He, however, consented to a bestowal of a portion of the king's bounty for a couple of years on Mrs Hunter and her two surviving children. In 1796 Lord Auckland provided the government with the authority of acquiring the collection, and on the 13th of June 1799, parliament voted £15,000 for this purpose. Its custodianship, after refusal by the College of Physicians, was unanimously accepted by the Corporation of Surgeons on the terms proposed. Those were in brief—that the collection be open four hours in the forenoon, two days every week, for the inspection and consultation of the fellows of the College of Physicians, the members of the Company of Surgeons and persons properly introduced by them, a catalogue of the preparations and an official to explain it being at those times always at hand; that a course not of less than twenty-four lectures on comparative anatomy and on the prevention of disease be read by the company and its members; that one member of the Company; and that the preparations be kept in good preservation at the expense of the Corporation, and be subject to the inspection of the Corporation. A board of directors and the fulfillment of these conditions was rendered possible by the receipt of fees for examinations and diplomas, under the charter by which, in 1800, the Corporation was constituted the Royal College of Surgeons. In 1806 the collection was placed in temporary quarters in Lincoln's Inn Fields, and the sum of £15,000 was voted by parliament for the erection of a proper and commodious building for its preservation and extension. This was followed by a grant of £12,500 in 1810. The collection was removed in 1812 to a new museum, and opened to visitors in 1813. The greater part of the present edifice was built in 1835, at an expense to the college of about £40,000; and the combined college and public collections, which are arranged in what are now termed the western and middle museums, were in 1836 made accessible to the public. The erection of the eastern museum in 1852, on premises in Portugal Street, bought for £367 for £16,000, cost £25,000, of which parliament granted £15,000; it was opened in 1858.

The scope of Hunter's labours may be defined as the explication of the animal kingdom and the body of life, their excellence and structure, animal and vegetable, from the simplest to the most highly differentiated. By him, therefore, comparative anatomy was employed, not in subservience to the classification of living forms, as by Cuvier, but to render the collection of facts into principles and producing these forms, by virtue of which he perceived that, however different in form and faculty, they were all allied to himself. In the sciences, in which he was eminently gifted, in which he frequently considers, and which seems to have been ever present in his mind. Life, he taught, was a principle independent of structure, a principle of life. He defined life as the least highly organized beings, but capable of readiness of action as a whole, of being in a state of heat or by pain, in young than in old animals. In life he beheld an agency working under the control of law, and exercising its ends, and in the energy of the living substance, he regarded such a discovery as that of the living, as a principle. Abernethy observes, to "be a great chemist," a power capable of manufacturing a variety of substances into one kind of generally distributed nutrient, and of furnishing from this a still greater variety of substances, similar in their effects. The peculiar and anima vegeta, he regarded it as a principle of self-preservation, which keeps the body from dissolution. Life is shown, said he, in the act of nutrition by the animal toward the vegetable, and to the mechanical causes, it can exist without action, as in an egg new-laid or undergoing incubation. It is not simply a regulator of temperature; it is a principle which resists cold, conferring on the structures of the body the power of emerging from a state of freezing-point of ordinary inanimate matter without suffering congelation. Hunter found, in short, that there exists in animals a principle of life, or in the words of his "Treatise on the Blood," p. 80. He thus observed that sap if removed from trees froze at 32° F., but within them might be fluid even at 15°; that a living snail placed in a freezing mixture acquired first a temperature of 28° and afterwards of 32° ere it froze; and that, whereas a dead egg congealed immediately at 32°, a living egg did so only when its temperature had risen to that point after a previous fall to 29°. In his "Treatise on the Blood," Hunter stated that "the vital principle of the body contain the vital principle diffused through them formed in 1755-1756, when, in making drawings illustrative of the changes that take place in the incubated egg, he noted specially that blood was in that state far warmer than without it; and with blood he, with Harvey, considered to possess a vitality of its own, more or less independent of that of the animal in which it circulates. Lastly, and the principle is preserved in the egg, now as a principle in the source of its solid constituents, the living blood. It is to the susceptibility of the latter to be converted into living organized tissue that the union of severed structures by the first intention is due. He even inclined to the belief that the chyle has life, and he considered that food becomes "animalized" in digestion. Coagulation of the blood he compared to the contraction of muscles, and observed to be an operation of life distinct from chemical coagulation, and to be supported by the fact that raw blood killed by lightning, by violent blows on the stomach, or by the exhaustion of hunting, it does not take place. "Breathing," said Hunter, "is the life of the lungs, and the difficulty of the living animal, and every part of the body." Life, he held, could be regarded as a fire, or something similar, and might for distinction's sake be called animal fire. Of this the process of respiration might afford a constant supply, the fixed life supplied to the body in the food being set free and rendered active in the lungs, whilst the air carried on that principle which encloses and retains the animal fire. The living principle, said Hunter, is coeval with the existence of animal or vegetable matter itself, and may long exist without sensation. The principle upon which depends the power of sensation regulates all our external actions, as the principle of life does our internal, and is in the same manner the foundation of all our operations and powers of life. Life, therefore, a principle of life, and in the words of his "Treatise on the Blood," p. 28, "Life, being an agency leading to, but not consisting of, any manifestation of matter, is either something superadded to the principle of life as such, or coexistent with particles of matter, which being thus disposed acquire the properties of life." As a bar of iron may gain magnetic virtue by being placed for a time in a special position, so perhaps the particles of matter arranged and long continued in a certain posture eventually gain the power of life. "I enquired of Mr Hunter," writes one of his pupils, "if this did not make for the Exploded Doctrine of Equivocal

HUNTER, ROBERT MERCER TALIAFERRO (1809-1887). American statesman, was born in Essex county, Virginia, on the 21st of April 1809. He entered the university of Virginia in his seventeenth year and was one of its first graduates; he then studied law at the Winchester (Va.) Law School, and in 1830 was admitted to the bar. From 1835 to 1837 he was a member of the Virginia house of delegates; from 1837 to 1843 and from 1845 to 1847 was a member of the national house of representatives, being Speaker from 1839 to 1841; and from 1847 to 1861 he was in the senate, where he was chairman of the finance committee (1859-1861). He is credited with having brought about a reduction of the quantity of silver in the smaller coins; he was the author of the Tariff Act of 1857 and of the bonded-warehouse system, and was one of the first to advocate civil service reform. In 1853 he declined President Fillmore's offer to make him secretary of state. At the National Democratic Convention at Charleston, S.C., in 1860 he was the Virginia delegation's choice as candidate for the presidency of the United States, but was defeated for the nomination by Stephen A. Douglas. Hunter did not regard Lincoln's election as being of itself a sufficient cause for secession, and on the 11th of January 1861 he proposed an elaborate but impracticable scheme for the adjustment of the differences between the North and the South, but while this and several other efforts to the same end had failed he quietly urged his own state to pass the ordinance of secession. From 1861 to 1862 he was secretary of state in the Southern Confederacy; and from 1862 to 1865 was a member of the Confederate senate, in which he was, at times, a caustic critic of the Davis administration. He was one of the commissioners to treat at the Hampton Roads Conference in 1865 (see LINCOLN, ABRAHAM), and after the surrender of General Lee was summoned by President Lincoln to Richmond to confer regarding the restoration of Virginia in the Union. From 1874 to 1886 he was treasurer of Virginia, and from 1886 until his death on April 16, 1887, was printer of the state, and from 1887 to 1889 was collector of the Port of Tappahannock, Virginia.

HUNTER, WILLIAM (1718-1783). British physician and physician, the first great teacher of anatomy in England, was born on the 23rd of May 1718, at East Kilbride, Lanark. He was the seventh child of his parents, and an elder brother of the still more famous John Hunter (q.v.). When fourteen years of age, he was sent to the university of Glasgow, where he studied for five years. He had originally been intended for the church, but, scruples concerning subscription arising in his mind, he followed the advice of his friend William Cullen, and resolved to devote himself to physic. During 1737-1740 he resided with Cullen at Hamilton, and then, to increase his medical knowledge before settling in partnership with his friend, he spent the winter of 1740-741 at Edinburgh. Thence he went to London, where Dr James Douglas (1765-1742), an anatomist and obstetrician of some note, to whom he had been recommended, engaged his services as a tutor to his son and as a dissector, and assisted him to enter as a surgeon's pupil at St George's Hospital and to procure the instruction of the anatomist Frank Nicholls (1699-1775). When Dr Douglas died Hunter still continued to live with his family. In 1746 he undertook, in place of Samuel Sharp, the delivery, for a society of naval practitioners, of a series of lectures on operative surgery, so satisfactorily that he was requested to time anatomy in his course. It was not long before he attained considerable fame as a lecturer; for not only was his oratorical ability great, but he differed from his contemporaries in the fullness and thoroughness of his teaching, and in the care which he took to provide the best possible practical illustrations of his discourses. We read that the syllabus of Edward Nourse (1701-1761), published in 1748, totam rem anatomicae complete, comprised only twenty-three lectures, exclusive of a short and defective "Syllabus Chirurgicus," and that at "one of the most reputable courses of anatomy in
HUNTER, W. A.—HUNTER, SIR W. W.

945

Europe," which Hunter had himself attended, the professor was obliged to demonstrate all the parts of the body, except the nerves and vessels (shown in a foetus) and the bones, on a single dead subject, and for the explanation of the operations of surgery used a dog! In 1747 Hunter became a member of the Corporation of Surgeons. In the course of a tour through Holland to Paris with his pupil, J. Douglas, in 1728, he visited Althusius at Leyden, and there inspected injected preparations. By degrees Hunter renounced surgical for obstetric practice, in which he excelled. He was appointed a surgeon-accoucheur at the Middlesex Hospital in 1748, and at the British Lying-In Hospital in the year following. The degree of M.D. was conferred upon him by the University of Glasgow on the 24th of October 1750. About the same time he left his old abode at Mrs Douglas's, and settled as a physician in Jermyn Street. He became a licentiate of the College of Physicians on the 30th of September 1756. In 1762 he was consulted by Queen Charlotte, and in 1764 was made physician-extraordinary to her Majesty.

On the departure of his brother John for the army, Hunter engaged as an assistant William Hewson (1739-1774), whom he subsequently admitted to partnership in his lectures. Hewson was succeeded in 1770 by W. C. Cruikshank (1745-1800). Hunter was elected F.R.S. in 1707; F.S.A. in 1768, and third professor of anatomy to the Royal Academy of Arts; and in 1780 and 1782 respectively an associate of the Royal Medical Society and of the Royal Academy of Sciences of Paris. During the closing ten years of his life his health failed greatly. His last lecture, at the conclusion of which he fainted, was given, contrary to the remonstrances of friends, only a few days before his death, which took place in London on the 30th of March 1783. He was buried in the rector's vault at St James's, Piccadilly.

Hunter had in 1765 requested of the prime minister, George Grenville, the grant of a plot of ground on which he might establish "a museum in London for the improvement of anatomy, surgery, and physics" (see "Papers at end of his Text-Book Lectures, 1784), and had offered to expend on its erection £5000, and to endow in perpetuity a professorship of anatomy in connexion with it. His application receiving no recognition, he after many months abandoned his scheme, and built himself a house, with lecture and dissecting-rooms, in Great Windmill Street, whither he removed in 1770. In one fine apartment in this house was accommodated his collection, comprising anatomical and pathological preparations, ancient coins and medals, minerals, shells and corals. His natural history specimens were in one purchase, for £5000, of the executors of his friend, Dr John Fothergill (1717-1770). Hunter's whole collection, together with his fine library of Greek and Latin classics, and an endowment of £8000, by his will became, after the lapse of twenty years, the property of the university of Glasgow.

Hunter was never married, and was a man of frugal habits. Like his brother John, he was an early riser, and a man of untried industry. He is described as being in his lectures, which were of two hours' duration, both simple and profound, minute in demonstration, and yet the reverse of dry and tedious", and his mode of introducing anecdotal illustrations of his topic was most happy. Lecturing was to him a pleasure, and, notwithstanding his many professional distractions, he regularly continued it, because, as he said, he "conceived that a man may do infinitely more good to the public by teaching his art than by practising it" (see "Memorial" appended to Introduction, Lect. p. 120).

Hunter was the author of several contributions to the Medical Observations and Enquiries and the Philosophical Transactions. In his Medical Commentaries on the administration of insensate remedies, an admirable and in 1743, he anticipated what M. F. X. Bichat sixty years afterwards wrote concerning the structure and arrangement of the synovial membranes. His Medical Commentaries (pt. 1, 1762, supplemented 1764) contains, among other like matter, details of his disputes with the Monros as to who first had successfully performed the injection of the labutis testis (in which, however, both he and they had been anticipated by Dr. von Boeck, and Halsted, who had discovered the true office of the lymphatics, and also a discussion on the question whether he or Percivall Pott ought to be considered the earliest to have elucidated the nature of hermia congenita, which, as a matter of fact, had been previously explained by Halsted. In the Commentaries is exhibited Hunter's own work and passing first of controversy. His impatience of contradiction he avowed to be a characteristic of anatomists, in whom he once jocularly condemned on the plea that "the passive submission of dead bodies" rendered the crossing of their will the less bemed. The Anatomy of the Granul Uterus, exhibited in Figures, fol., was published in 1774. His posthumous works are Two Introductory Lectures (1784), and Anatomical Description of the Human Granul Uterus (1794), which was re-edited by Dr E. Rigby in 1843.

HUNTER, WILLIAM ALEXANDER (1844-1898), Scottish jurist and politician, was born in Aberdeen on the 8th of May 1844, and educated at Aberdeen grammar school and university. He entered the Middle Temple, and was called to the English bar in 1867, but then was occupied mainly with teaching. In 1869 he was appointed professor of Roman law at University College, London, and in 1878 professor of jurisprudence, resigning that chair in 1882. His name became well known during this period as the author of a standard work on Roman law, Roman Law in the Order of a Code, together with a smaller introductory volume for students, Introduction to Roman Law. After 1882 Hunter took up politics and was elected to parliament for Aberdeen as a Liberal in 1885. In the House of Commons he continued to champion the cause of all那边old citizens, being the first to advocate old age pensions, and in 1890 carried a proposal for free elementary education in Scotland. In 1895 his health broke down; he retired from parliament in 1896 and died on the 21st of July 1898.

HUNTER, SIR WILLIAM WILSON (1840-1900), British publicist, son of Andrew Galloway Hunter, a Glasgow manufacturer, was born at Glasgow on the 15th of July 1840. He was educated at Glasgow University (B.A. 1860), Paris and became a member of The Statistical Society of Great Britain. He took his final examination for the Indian Civil Service in 1862. Posted in the remote district of Birbhum in the lower provinces of Bengal, he began collecting local traditions and records, which formed the materials for his novel and suggestive publication, entitled The Annals of Rural Bengal, a book which did much to stimulate public interest in the details of Indian administration. He also compiled A Comparative Dictionary of the Non-Aryan Languages of India, a glossary of dialects based mainly upon the collections of Brian Houghton Hodgson, which testified to the much matured philosophical speculation. In 1872 he brought out two attractive volumes on the province of Orissa and its far-famed temple of Jagannath. In 1869 Lord Mayo asked Hunter to submit a scheme for a comprehensive statistical survey of the Indian empire. The work involved the compilation of a number of local gazetteers, in various stages of progress, and their consolidation in a condensed form upon a single and uniform plan. The conception was worthy of the gigantic projects formed by Arthur Young and Sir John Sinclair at the close of the 18th century, and the fact that it was successfully carried through between 1869 and 1881 was owing mainly to the energy and determination of Hunter. The early period of his undertaking was devoted to a series of tours which took him into every corner of India. He himself undertook the supervision of the statistical accounts of Bengal (20 vols., 1875-1877) and of Assam (2 vols., 1879). The various statistical accounts, when completed, comprised no fewer than 125 volumes. The immense task of condensing this mass of material proceeded concurrently in a publication of the Imperial Gazetteer of India to appear in 9 volumes in 1881 (and ed., 14 vols., 1885-1887; 3rd ed., 26 vols., including atlas, 1908). Hunter adopted a transliteration of vernacular place-names, by which means the correct pronunciation is ordinarily indicated; but hardly sufficient allowance was made for old spellings consecrated by history and long usage. Hunter's own article on India was published in 1880 as A Brief History of the Indian Peoples, and
HUNTING

HUNTING has been widely translated and utilized in Indian schools. A revised form was issued in 1893, under the title of The Indian Empire: its People, History and Products. In 1882 Hunter, as a member of the governor-general's council, presided over the commission on Indian Education; in 1886 he was elected vice-chancellor of the university of Calcutta. In 1887 he retired from the service, was created K.C.S.I., and settled at Oaken Holt, near Oxford. He arranged with the Clarendon Press to publish a series of Rules of India, to which he himself contributed volumes on Dalhousie (1890) and Mayo (1892). He had previously, in 1875, written an official Life of Lord Mayo, in two volumes. He also wrote a weekly article on Indian affairs for The Times. But the great task to which he applied himself on his settlement in England was the preparation of a large-scale map of the British Dominions in India, two volumes of which only had appeared when he died, carrying the reader barely down to 1700. He was much hindered by the confused state of his materials, a portion of which he arranged and published in 1894 as Bengal Manuscript Records, in three volumes. A delightful story, The Old Missionary (1893), and The Thackerays in India (1897), a gossip volume which appeals to all readers of The Newcomers, may be regarded as the relaxations of an Anglo-Indian amid the stress of severer studies. In the winter of 1858–1859, in consequence of the fatigue incurred in a journey to the Caspian and back, on a visit to the sick, of one of his sons, Hunter was thrown down by a severe attack of influenza, which affected his heart. He died at Oaken Holt on the 6th of February 1900.

HUNTING (the verbal substantive from "hunt"; O. Eng. hútend, hunten; apparently connected with O. Eng. hentan, Gothic híknan, to capture, O.H.G. hûnd, hûnto, hûnt, the pursuit of game and wild animals, for profit or sport; equivalent to "chase" (like "catch," from Lat. capere, Fr. chasse, Ital. cacciare). The circumstances which render necessary the habitual pursuit of wild animals, either as a means of subsistence or for self-defence, generally accompany a phase of human progress distinctly inferior to the pastoral and agricultural stages; resorted to as a recreation, however, the practice of the chase in most cases indicates a considerable degree of civilization, and sometimes ultimately becomes the almost distinctive employment of the classes which are possessed of most leisure and wealth. It is in some of its latter aspects, viz. as a "sport," pursued on fixed rules and principles, that hunting is dealt with here.

Information as to the field sports of the ancients is in many directions extremely fragmentary. With regard to the ancient Egyptians, however, we learn that the huntsmen constituted an entire sub-division of the great second caste; they either followed the chase on their own account or acted as the attendants of the chief huntsmen on their hunting excursions, taking charge of the dogs, and securing and bringing home the game. The game was sought in the open deserts which border on both sides the valley of the Nile; but (by the wealthy) sometimes in enclosed spaces into which the animals had been driven or in preserves. Besides the noose and the net, the arrow, the dart and the hunting pole or venabulum were frequently employed. The animals chiefly hunted were the gazelle, ibex, oryx, stag, wild ox, wild sheep, hare and porcupine; also the ostrich for its plumes, and the fox, jackal, wolf, carnivora, and leopard for their skins, or as enemies of the farm-yard. The lion was occasionally trained as a hunting animal instead of the dog. The sportsman appears, occasionally at least, in the later periods, to have gone to cover in his chariot or on horseback; according to Wilkinson, when the dogs threw off in a level plain of great extent, it was even usual for him "to remain in his chariot, and, urging his horses to their full speed, endeavour to turn or intercept them as they doubled, discharging a well-directed arrow whenever they came within its range."1

The partiality for the chase which the ancient Egyptians manifested was shared by the Assyrians and Babylonians, as is shown by the frequency with which hunting scenes are depicted on the walls of their temples and palaces; it is even said that their dresses and furniture were ornamented with similar subjects.2 The game pursued included the lion, the wild ass, the gazelle and the hare, and the implements chiefly employed seem to have been the javelin and the bow. There are indications that hunting was also known. The Assyrian kings also maintained magnificent parks, or "paradises," in which game of every kind was enclosed; and perhaps it was from them that the Persian sovereigns borrowed the practice mentioned both by Xenophon in the Cyropaedia and by Curtius. According to Herodotus, Cyrus devoted the revenue of four great towns to the expenses of his hunting establishments. The circumstances under which the death of the son of Croesus is by the same writer (ix. 34) related to have occurred, incidentally show in what high estimation the recreation of hunting was held by Lycurgus. In Palestine game has always been plentiful, and the Biblical indications that it was much sought and duly appreciated are numerous. As means of capture, nets, traps, snares and pitfalls are most frequently alluded to; but the arrow (Isa. vii. 24), the spear and the dart (Job. xlii. 26-29) are also mentioned. There is no evidence that the use of the dog (Jos. Ant. iv. 8, 10, notwithstanding) or of the horse in hunting was known among the Jews during the period covered by the Old Testament history; Herod, however, was a keen and successful sportsman, and is mentioned by Josephus (B. J. i. 21, 13, compare Ant. xv. 7, 7; xvi. 10, 3) to have killed fewer than forty head of game (boar, wild ass, deer) in one day.

The sporting tastes of the ancient Greeks, as may be gathered from many references in Homer (Il. i. 538-545; Od. ix. 120, xvii. 395, 316, xix. 429 seq.), had developed at a very early period; they first found adequate literary expression in the work of Xenophon entitled Cynegetica,3 which expounds his principles and embodies his experience in his favourite art of hunting. The treatise chiefly deals with the capture of the hare; in the author's day the approved method was to find the hare in her form by the use of dogs; when found she was either driven into nets previously set in her runs or else run down in the dray. Boar-hunting is also described; it was effected by nets into which the animal was pursued, and in which when fairly entangled he was speared. The stag, according to the same work, was taken by means of a kind of wooden trap (ροδοστάσσων), which attached itself to the foot. Lions, leopards, lynxes, panthers and bears are also specially mentioned among the large game; sometimes they were taken in pitfalls, sometimes speared by mounted horsemen. As a writer on field sports Xenophon was followed by Arrian, who in his Cynegeticus, in avowed dependence on his predecessor, seeks to supplement such deficiencies in the earlier treatise as arose from its author's unacquaintance with the dogs (I. 34-44) and the horses of Scythia and Libya, which are found in Cynegetica, extending to about 2100 hexameters, by Oppian have also been preserved; the last of these is incomplete, and it is probable that a fifth at one time existed. The poem contains some good descriptive passages, as well as some very curious indications of the state of zoological knowledge in the author's time. Hunting scenes are frequently represented in ancient works of art, especially the boar-hunt, and also that of the hare. In Roman literature allusions to the pleasures of the chase (wild ass, boar, hare, fallow deer being specially mentioned as favourite game) are not wanting (Virg. Georg. iii. 409-413; Eccl. iii. 75; Hor. Od. i. 1, 25-28); it seems to have been viewed, however, with less favour as an occupation for gentlemen, and to have been chiefly left to inferiors and professionals. The immense virilia or thieratria, in which various wild animals, such as boars, stags and roe-deer, were kept in a state of semi-domestication, were developments which arose at a comparatively late period; as also were the venationes in the circus, which are also mentioned as having been known as early as 186 B.C. The bald and meagre poem of Grattius Faliscus on hunting (Cynegetica) is modelled upon Xenophon's prose work; a still extant fragment (315 lines) of a similar poem with the same title, of much later date, by nemesisian, seems to have at one

At an early period stag hunting was a favourite recreation with English royalty. It seems probable that in the reign of Henry VIII. the royal pack of buckhounds was kennelled at Swinley, where, in the reign of Charles II. (1664), a deer was found that went away to Lord Petre's seat in Essex; only five got to the end of this 70 m. run, one being the king's brother, the duke of York. George III. was a great stag hunter, and met the royal pack as often as possible.

In The Chase of the Wild Red Deer Mr. Collins says that the earliest record of a pack of staghounds in the Exmoor district is in 1598, when Hugh Pollard, Queen Elizabeth's ranger, kept one at Simonsbath. The succeeding rulers of Exmoor forest kept up the pack until some 200 years ago, the hounds subsequently passing into the possession of Mr Walter of Stevenstone, an ancestor of the Rolle family. Successive masters continued the sport until 1825, when the fine pack, descended probably from the bloodhound crossed with the old southern hound, was sold in London. It is difficult to imagine how the dispersion of such a pack could have come about in such a sporting country, but in 1827 Sir Arthur Chichester got a pack together again. Stag hunting begins on the 12th of August, and ends on the 8th of October; there is then a cessation until the end of the month, when the hounds are un kennelled for hunting, which continues up to Christmas; it begins again about Lady-day, and lasts till the 10th of May. The mode of hunting with the Devon and Somerset hounds is briefly this: the whereabouts of a warrantable stag is communicated to the master by that important functionary the harbourer, two couples of steady hounds called tufters are then thrown into cover, and, having singled out a warrantable deer, follow him until he is forced to make for the open, when the body of the pack are laid on. Very often two or three hours elapse before the stag breaks, but a run over the wild country fully atones for the delay.

It is only within comparatively recent times that the fox has come to be considered as an animal of the higher chase. William Twyc, indeed, who was huntsman-in-chief to Edward II., and who wrote in Nonedita a French treatise on hunting,6 mentions the fox as a beast of venery, but obviously as an altogether inferior object of sport. Strutt also gives an engraving, assigned to him by the 14th century, in which three hunters, one of whom blows a horn, are represented as unearthing a fox, which is pursued by a single hound. The precise date of the establishment of the first English pack of hounds kept entirely for fox hunting cannot be accurately fixed. In the work of "Nimrod" (C. J. Apperley), entitled The Chase, there is (p. 4) an extract from a letter from Lord Arundel, dated February 1634, in which the writer says that his ancestor, Lord Arundel, kept a pack of foxhounds between 1600 and 1700, and that they remained in the family till 1782, when they were sold to the celebrated Hugh Meynell, of Quorn Hall, Leicester shire. Lord Wilton again, in his Sports and Pursuits of the English, says that "about the year 1750 hounds began to be entered solely for fox." The Field of November 6, 1875, p. 512, contains an engraving of a hunting-horn then in the possession of the late master of the Cheshire hounds, and upon the horn is the inscription—"Thomas Boothby, Esq., Toole Park, Leicester. With this horn he hunts the first pack of the English hunting hounds in England fifty-five years. Born 1677. Died 1752. Now the property of Thomas A. Avenant, Esq., county Salop, his grandson." These extracts do not finally decide the point, because both Mr Boothby's and Lord Arundel's hounds may have hunted other game besides fox, just as in Edward IV.'s time there were "fox dogs" not kept exclusively for fox. On the whole, it is probable that Lord Wilton's surmise is not far from correct. Since fox hunting first commenced, however, the system of the sport has been much changed. In our great-grandfathers' time the hounds met early, and found the fox by the drag, that is, by the line he took to his kennel on his return from a foraging expedition. Hunting the

5 See Strutt, Sports and Pastimes, who also gives an illustration, taken from a manuscript painting of the 9th century in the Cotton Library, representing a Saxon chieftain attended by his huntsman and his pupil Moullwords, pursuing the wild swine in a forest.
6 See Lappenberg, Hist. of England under the Anglo-Saxon Kings (ii. 361, Thorpe's trans.).
When railways were first started in England dismal prophecies were made that the end of hunting would speedily be brought about. The result on the whole has been the reverse.

In some counties where the sport has suffered, towns-men who formerly would have been too far from a meet can now secure transport for themselves and their horses in all directions; and as a consequence, meets of certain packs are not advertised because of the number of strangers who would be induced to attend. The sport has never been so vigorously pursued as it was at the beginning of the 20th century, 10 packs of staghounds being kept in England and 4 in Ireland, over 170 packs of foxhounds in England, 10 in Scotland and 23 in Ireland, with packs of harriers and beagles too numerous to be counted. The chase of the wild stag is carried on in the west country by the Devon and Somerset packets which are generally described as “connaught” and “kennel” to Dunster; by the Quantock; and by a few other local packets.

In other parts of England staghound packs are devoted to the capture of the cored deer, a business which is more or less of a parody on the genuine sport, but is popular for the reason that whereas with foxhounds men may have a blank day, they are practically sure of a gallop when a deer is taken out in a cart to be enlarged before the hounds are laid on. Complaints are often raised about the cruelty of what is called tame stag hunting, and it became a special subject of criticism that a pack should still be kept at the Royal kennels at Ascot (it was abolished in 1907) by the Master of the Buckhounds; but it is the constant endeavour of all masters and hunt servants to prevent the infliction of any injury on the deer. Their efforts in this direction are seldom unsuccessful; and it appears to be a fact that stag-hunts which are hunted season after season come to understand that they are in no grave danger. Packs of foxhounds vary, from large establishments in the “Shires,” the meets of which are attended by hundreds of horsemen, some of whom keep large stables of hunters in constant work—for though a man at Melton, for instance, may see a great deal of sport with half-a-dozen well-seasoned animals, the number is not sufficient if he is and keenly fond of them. But the hounds are generally described as “provincial” equally good hunting may be obtained. Round about London a man who is bent on the pursuit of stag or stag may gratify his desire in many directions. The Essex and the Essex Union, the Surrey and the Surrey Union, the Old Berkeley, the West Kent, the Burstow, the Hertfordshire, the Crawley and Horsham, the Puckridge, as regards foxhounds; the Berkhamstead, the Enfield Chase, Lord Rothschild’s, the Surrey, the West, the Warnham, as regards stag-hounds—as well as the Ducks and Berks, which was substituted for the Royal Buckhounds—are within easy reach of the capital. Questions are constantly raised as to whether horse and hounds have improved or deteriorated in modern times. It is probable that the introduction of scientific agriculture has brought about an increase of pace. Hounds hunt as well as ever they did, are probably faster on the whole, and in the principal hunts more thoroughbred horses are employed. For pace and endurance no hunter approaches the English thoroughbred; and for a bold man who “means going,” a steeplechase horse is often the best animal that could be obtained, for when he has become too slow to win races “between the flaggs,” he can always gallop much faster, and usually lasts much longer, than animals who have not his advantage of blood. The quondam “chaser” is, how-
ever, usually apt to be somewhat impetuous at his fences. But it must be no means be supposed that every man who goes out hunting desires to gallop at a great pace and to jump formidable obstacles, or indeed any obstacles at all. A large proportion of men who follow hounds are quite content to do so passively through gates and gaps, with a canter along the road whenever one is available. A few of the principal packs hunt five days a week, and sometimes even six, and for such an establishment not fewer than seventy-five couples of hounds are requisite. A pack which hunts four days a week will be well supplied with anything between fifty and sixty couples, and for two days a week from twenty-five to thirty will suffice. The young hound begins to be used for hunting when he is from five to seven months old; a rule is found to improve until his third or fourth season, though some last longer than this. Often, however, when a hound is five or six years old he begins to lack speed. Exceptional animals naturally do exceptional things, and a famous hound called Potentate is recorded by the 8th duke of Beaufort to have done notable service in the hunting field for eleven seasons.

Servants necessary for a pack include the huntsman, the duties of whose office a master sometimes fulfils himself; two whippers-in, an earth-stopper and a hark when Peter Beckford wrote his Thoughts on Hunting. The subject of scent is full of mysteries. The great authority already quoted, the 8th duke of Beaufort, noted as a very extraordinary but well-known fact, for example, “that in nine cases out of ten if a fox is coursed by a dog during a run all scent ceases afterwards, even when you get your hounds to the line of the fox beyond where the dog has been.” This is one of many phenomena which have always remained inexplicable. The duties of the whiffer-in are to a great extent explained by his title. Whilst the huntsman is drawing the cover the whiffer-in is stationed at the spot from which he can best see what is going on, in order to view the fox away; and it is his business to keep the hounds together when they have found and got away after the fox. There are many ways in which a whiffer-in who is not intelligent and alert may spoil sport; indeed, the duke of Beaufort went so far as to declare that “in his experience, with very few exceptions, nine days out of ten that the whiffer-in goes out hunting he does more harm than good.” In woodlands countries, however, a good whiffer-in is really of almost as much importance as the huntsman himself; if he is not alert the hounds are likely to divide, as when running a little wide they are apt to put up a fresh fox. The earth-stopper “stops out” and “puts to”—the first expression signifying blocking, during the night, earths and drains to which foxes resort, the second performing the same duties in the morning so as to prevent the fox from getting to ground when he has been found. In the interests of humanity care should be taken that the earth-stopper always has with him a small terrier, as it is often necessary to “stop out” permanently; and unless a dog is run through the drain some unfortunate creature in it, a fox, cat or rabbit, may be imprisoned and starved to death. This business is frequently performed by a gamekeeper, a sum being paid him for any litter of cubs or fox found on his beat.

With regard to the expenses of hunting, it is calculated that a master of hounds should be prepared to spend at the rate of £500 a year for every day in the week that his hounds are supposed to hunt. Taking one thing with another, this is probably rather under than over the mark, and the cost of hunting three days a week, if the thing be really properly done, will most likely be nearer £2,000 than £1,500. The expenses to the individual naturally vary so much that no figures can be given. As long ago as 1526 twenty-seven hunters and hawks were sold for 750 guineas, an average of over £50; and when Lord Stamford ceased to hunt the Quorn in 1833, seventy-three of his horses fetched at auction an average of close on £200. Early in the 19th century, when on the whole horses were much cheaper than they are at present, 700 and 800 guineas are prices recorded as having been occasionally paid for hunters of special repute. A man may see some sport on an animal that cost him £40; others may consider it necessary to keep an expensive establishment at Melton Mowbray or elsewhere in the Shires, with a dozen or more 500-guinea hunters, some covert-hawks, and a corresponding staff of servants. Few people realize what enormous sums of money are annually distributed in connexion with hunting. Horses must be fed; the wages of grooms and helpers be paid; saddlery, clothing, shoeing, &c., are items; farmers, innkeepers, railway companies, fly-men and innumerable others benefit more or less directly.

(A. E. T. W.)

HUNTING DOG (Lycaon pictus), an African wild dog, differing from the rest of the family in having only four toes on each foot, and its bledoted coloration of ochery yellow, black and white. The species is nearly as large as a mastiff, with long limbs, broad flat head, short muzzle and large erect ears, and presents a superficial resemblance to the spotted hyena on which account it is sometimes called the hyena-dog. "Mimicry" has been suggested as an explanation of this likeness; but it is difficult to see what advantage a strong animal hunting in packs like the present species can gain by being mistaken for a hyena, as it is in every respect fully qualified to take care of itself. These wild dogs are found in nearly the whole of Africa south and east of the Sahara. The statement of Gordon Cumming that a pack "could run into the swiftest or overcame the largest and most powerful antelope," is abundantly confirmed, and these dogs do great damage to sheep flocks. Several local races of the species have been named.

HUNTINGDON, EARLS OF. GEORGE HASTINGS, 1st earl of Huntingdon1 (c. 1488–1545), was the son and successor of

1 The title of earl of Huntingdon had previously been held in other families (see HUNTINGDONSHIRE). The famous Robin Hood (1160–1147) is said to have had a claim to the title.
HUNTINGDON, COUNTESS OF—HUNTINGDON

Edward, 2nd Baron Hastings (d. 1506), and the grandson of William, Baron Hastings, who was put to death by Richard III. in 1483. Being in high favour with Henry VIII., he was created earl of Huntingdon in 1529, and he was one of the royalist leaders during the suppression of the rising known as the Pilgrimage of Grace in 1536. His eldest son Francis the 3rd earl (c. 1513-1564) was a close friend and political ally of John Dudley, Duke of Northumberland, sharing the duke's fall and imprisonment after the death of Edward VI. in 1553; but he was quickly released, and was employed on public business by Mary. His brother Edward (c. 1520-1572) was one of Mary's most valuable servants; a stout Roman Catholic, he was master of the horse and then lord chamberlain to the queen, and was created Baron Hastings of Loughborough in 1558, this title becoming extinct when he died.

The 2nd earl's eldest son Henry, the 3rd earl (c. 1533-1559), married Northumberland's daughter Catherine. His mother was Catherine Pole (d. 1570), a descendant of George, Duke of Clarence; and, asserting that he was thus entitled to succeed Elizabeth on the English throne, Huntingdon won a certain amount of support, especially from the Protestants and the enemies of Mary, queen of Scots. In 1572 he was appointed president of the council of the north, and during the troubled period between the flight of Mary to England in 1568 and the defeat of the Spanish armada twenty years later he was frequently employed in the north of England. It was doubtless felt that the earl's own title to the crown was a pledge that he would show scant sympathy with the advocates of Mary's claim. He assisted George Talbot, Earl of Shrewsbury, to remove the Scottish queen from Wingfield to Tutbury, and for a short time in 1590 he was one of her custodians. Huntingdon was responsible for the compilation of an elaborate history of the Hastings family, a manuscript copy of which is now in the British Museum. As he died childless, his earldom passed to his brother George. Another brother, Sir Francis Hastings (d. 1610), was a member of parliament and a prominent puritan during Elizabeth's reign, but is perhaps more celebrated as a writer. George, the 4th earl (c. 1540-1604), was the grandfather of Henry, the 5th earl (1586-1643), and the father of Henry Hastings (c. 1560-1610), a famous sportsman, whose character has been delineated by the 1st earl of Shaftesbury (See L. Howard, A Collection of Letters, etc., 1753). The 6th earl was the 5th earl's son Ferdinand (c. 1606-1630). His brother Henry, Baron Loughborough (c. 1610-1667), won fame as a royalist during the Civil War, and was created a baron in 1643.

Theophilus, the 7th earl (1560-1701), was the only surviving son of the 5th earl. In early life he showed some animus against the Roman Catholics and a certain sympathy for the duke of Monmouth; afterwards, however, he was a firm supporter of James II., who appointed him to several official positions. He remained in England after the king's flight and was imprisoned, but, after his release, he continued to show his hostility to William III. One of his daughters, Lady Elizabeth Hastings (1682-1730), gained celebrity for her charities and her piety. Her beauty drew encomiums from Congreve and from Steele in the pages of the Tatler, and her other qualities were praised by William Law. She was a benefactor to Queen's College, Oxford. The 7th earl's sons, George and Theophilus, succeeded in turn to the earldom. George (1677-1706) was a soldier who served under Marlborough, and Theophilus (1696-1746) was the husband of the famous Selina, Countess of Huntingdon (q.v.). Theophilus was succeeded by his son Francis (1729-1786), on whose death the title passed to his sister Elizabeth (1731-1808), wife of John Rawdon, Earl of Moira, and the earldom became dormant.

The title of earl of Huntingdon was assumed by Theophilus Henry Hastings (1728-1804), a descendant of the 2nd earl, who, however, had taken no steps to prove his title when he died. But, aided by his friend Henry Nugent Bell (1792-1822), his nephew and heir, HANS FRANCIS HASTINGS (1779-1828), was more energetic, and in 1818 his right to the earldom was declared proved, and he took his seat in the House of Lords. He did not, however, recover the estates. Before thus becoming the 11th (or 12th) earl, Hastings had served for many years in the navy, and after the event he was appointed governor of Dominica. He died on the 9th of December 1828 and was succeeded by his son Francis Theophilus Henry (1808-1875), whose grandson, Warren Francis, became 11th or 15th earl of Huntingdon in 1885. Another of the 11th earl's sons was Vice-admiral George Fowler Hastings (1814-1876).

HUNTINGDON, SELINA HASTINGS, COUNTESS OF (1707-1794), English religious leader and founder of a sect of Calvinistic Methodists, known as the Countess of Huntingdon's Connexion, was the daughter of Washington Shirley, 2nd Earl Ferrers. She was born at Stanton Harold, a mansion near Ashby-de-la-Zouch in Leicestershire, on the 24th of August 1707, and in her twenty-first year was married to Theophilus Hastings, 9th earl of Huntingdon. In 1739 she joined the first Methodist society in Fetter Lane, London. On the death of her husband in 1746 she threw in her lot with Wesley and Whitefield in the work of the great revival. Isaac Watts, Philip Doddridge and A. M. Toplady were among her friends. In 1748 she gave Whitefield a scarf as her chaplain, and in that capacity he frequently preached in her London house in Park Street to audiences that included Chesterfield, Walpole and Bolingbroke. In her chapel at Bath there was a curtained recess dubbed "Nicodemus's corner" where some of the bishops sat incognito to hear him. Lady Huntingdon spent her ample means in building chapels in different parts of England, e.g. at Brighton (1761), London and Bath (1765), Tunbridge Wells (1769), and appointed ministers to officiate in them, under the impression that as a peeress she had a right to employ as many chaplains as she pleased. It is said that she expended £100,000 in the cause of religion. In 1768 she converted the old mansion of Trevecca, near Talgarth, in South Wales, into a theological seminary for young ministers for the connexion. Up to 1779 Lady Huntingdon and her chaplains continued members of the Church of England, but in that year the prohibition of her chaplains by the consistorial court from preaching in the Pantheon, a large building in London rented for the purpose by the countess, compelled her, in order to evade the injunction, to take shelter under the Toleration Act. This step, which placed her legally among dissenters, had the effect of severing from the connexion several eminent and useful members, among them William Romine (1714-1795) and Henry Venn (1725-1797). Till her death in London on the 17th of June 1791, Lady Huntingdon continued to exercise an active, and even automatic, superintendence over her chapels and chaplains. She successfully petitioned George III. in regard to the gaiety of Archbishop Cornwallis's establishment, and made a vigorous protest against the anti-Calvinistic minutes of the Wesleyan Conference of 1770, and against relaxing the terms of subscription in 1772. Her sixty-four chapels and the college were bequested to four trustees. In 1792 the college was removed to Cheshunt, Hertfordshire, where it remained till 1805, when it was transferred to Cambridge. The college is remarkable for the number of men it has sent into the foreign mission field.

The connexion in 1910 consisted of 44 churches and mission stations, with a roll of about 2,500 communicants under 26 ordained pastors. The government is vested by the trust deed, sanctioned by the court of chancery on the 24th of July 1899, and in pursuance of a conference of delegates from each church in the trust. The endowments of the trust produce £5,000 per annum, and are devoted to four purposes: (1) chaplains in aid of the ministry; (2) salaries to ministers over sixty years of age who have given more than twenty years' continuous service in the connexion, or to their widows; (3) grants for the maintenance and extension of the existing buildings belonging to the trust; and (4) the building of new chapels in and near existing towns and villages. The trustees may grant loans for the encouragement of new progressive work from a loan fund of about £8,000.

HUNTINGDON, a market town and municipal borough and the county town of Huntingdonshire, England, on the left bank of the Ouse, on the Great Northern, Great Eastern and Midland
railways, 59 m. N. of London. Pop. (1901) 4261. It consists principally of one street, about a mile long, in the centre of which is the market-place. Of the ancient religious houses in Huntingdon few traces remain. The parish church of St Mary occupies the site of the priory of Augustinian Canons already existing in the 11th century, in which David Bruce, Scottish earl of Huntingdon, was afterwards buried. The church, which was restored by Sir A. W. Blomfield, in 1876, contains portions of the earlier building which it replaced in 1620. All Saints' church, rebuilt about a century earlier, is the slighest remains of the original Norman church and some good modern work, as well as ancient, carved woodwork. The church registers dating from 1558 are preserved, together with those of the old parish of St John, which date from 1585 and contain the entry of Oliver Cromwell's baptism on the 29th of April 1599, the house in which he was born being still in existence. Some Norman remains of the hospice of St John the Baptist founded by David, king of Scotland, at the end of the 12th century were incorporated in the buildings of Huntingdon grammar school, once attended by Oliver Cromwell and by Samuel Pepys. Hinchingbrooke House, on the outskirts of the town, an Elizabethan mansion chiefly of the 16th century, was the seat of the Cromwell family, others of the Montagus, earls of Sandwich. It occupies the site of a Benedictine nunnery granted by Henry VIII. at the Dissolution, together with many other monasteries in Huntingdonshire, to Sir Richard Williams, alias Cromwell, whose son, Sir Henry Cromwell, entertained Queen Elizabeth here in 1564. His son, Sir Oliver Cromwell, was the uncle and godfather of the Protector. Among the buildings of Huntingdon are the town hall (1745), county gaol, barracks, county hospital and the Montagu Institute (1807). A racecourse is situated in the bend of the Ouse to the south of the town, and meetings are held here in August. The town is governed by a mayor, 4 aldermen and 12 councillors. Area, 1074 acres.

Huntingdon (Huntandum, Huntersdume) was taken by the Danes in King Alfred's reign but recovered c. 919 by Edward the Elder, who raised a castle there, probably on the site of an older fortress. In 1010 the Danes destroyed the town. The castle was strengthened by David, king of Scotland, after the Conquest, but was among the castles destroyed by order of Henry II. At the time of the Domesday Survey Huntingdon was divided into four divisions, two containing 116 burgesses and the other two 140. Most of the burgesses belonged to the king and paid a rent of £10 yearly. King John in 1205 granted them the liberties and privileges held by the men of other boroughs in England and increased the farm to £20. Henry III. further increased it to £40 in 1252. The borough was incorporated by Richard III. in 1483 under the title of bailiffs and burgesses, and in 1600 Charles I. granted a new charter, appointing a mayor, and its surrounding charter until the Municipal Corporations Act of 1835 changed the corporation to a mayor, 4 aldermen and 12 councillors. The burgesses were represented in parliament by two members from 1205 to 1867, when the number was reduced to one, and in 1885 they ceased to be separately represented. Huntingdon owed its prosperity to its situation on the Roman Ermine Street. It has never been noted for manufactures, but is the centre of an agricultural district. The market held on Saturday was granted to the burgesses by King John. During the Civil Wars Huntingdon was several times occupied by the Royalists.

See Victoria County History, Huntingdon; Robert Carruthers, The History of Huntingdon from the Earliest to the Present Times (1824); Edward Griffith, A Collection of Ancient Records relating to the Borough of Huntingdon (1827).

HUNTINGDON, a borough and the county-seat of Huntingdon county, Pennsylvania, U.S.A., on the Juniata river, about 150 m. E. of Pitsburg, in the S. central part of the state. Pop. (1890) 5729, (1900) 6053, of whom 225 were foreign-born. It is served by the Pennsylvania and the Huntingdon and Broad Top Mountain railways, the latter running to the Broad Top Mountain coalfields in the S.W. part of the county. The borough is built on ground sloping gently towards the river, which furnishes valuable water power. The surrounding country is well adapted to agriculture, and abounds in coal, iron, fire clay, limestone and white sand. Huntingdon's principal manufactures are stationery, flour, knitting-goods, furniture, boilers, radiators and sewer pipe. It is the seat of Juniata College (German Baptist Brethren), opened in 1876 as the Brethren's Normal School and Collegiate Institute, and rechartered as Juniata College in 1886, and of the State Industrial Reformatory, opened in 1888. Indians (probably Oneidas) settled near the site of Huntingdon, erected here a tall pillar, known as "Standing Stone", the original forms removed by Indians, but another has been erected by the borough on the same spot. The place was laid out as a town in 1767 under the direction of Dr William Smith (1727-1803), at the time provost of the college of Pennsylvania (afterwards the university of Pennsylvania); and it was named in honour of the countess of Huntingdon, who had contributed liberally toward the maintenance of that institution. It was incorporated as a borough in 1796.

HUNTINGDONSHIRE (HUNTS), an east midland county of England, bounded N. and W. by Northamptonshire, S.W. by Bedfordshire and E. by Cambridgeshire. Among English counties it is the smallest with the exception of Middlesex and Rutland, having an area of 366 sq. m. The surface is low, and for the most part bare of trees. The south-eastern corner of the county, bounded by the Ouse valley, is traversed by a low ridge of hills entering from Cambridgeshire, and continued over the whole western half of the county, as well as in a strip about 6 m. broad north of the Ouse, between Huntingdon and St Ives. These hills never exceed 300 ft. in height, but form important features in the landscape. The town of Huntingdon, in the centre of the county, comprising 50,000 acres, belongs to that division of the great Fen district called the Bedford Levels. The principal rivers are the Ouse and Nene. The Ouse from Bedfordshire skirts the borders of the county near St Neots, and after flowing north to Huntingdon takes an easterly direction past St Ives into Cambridgeshire on its way to the Wash. The Kym, from Northamptonshire, follows a south-easterly course and joins the Ouse at St Neots, while the Alconbury brook, flowing in a parallel direction, falls into it at Huntingdon. The Nene forms for 15 m. the north-western border of the county, and quitting it near Peterborough, enters the Wash below Wisbech, in Cambridgeshire. The course of the Old River Nene is eastward across the county midway between Huntingdon and Peterborough, and about 14 m. N. by E. of Ramsey it is intersected by the Forty Foot, or Vermuyden's Drain, a navigable cut connecting it with the Old Bedford river in Cambridgeshire.

Geology.—The geological structure is very simple. All the strata of the Lower Greensand Series are subdivided with the exception of the formation of Lower Greensand which extends for a short distance along the border, north of Potton. The Greensands form low, rounded hills. Phosphatic nodules are obtained from these beds. On the north-western border is a narrow strip of Inferior Oolite, reaching from Thrapston by Oundle to Wansford near Peterborough. It is represented about Wansford by the Northampton sands and by a feeble development of the London Clay, and the Great Oolite Series begins at the base the Upper Estuarine clays; in the middle, the Great Oolite limestone, which forms the escarpment of Alwalton Lynch; and at the top, the Great Oolite clay. The Conformity is exposed almost throughout the breadth of the county; and in a considerable part of it is a good calcareous horizon. Over the remainder of the county the lower rocks are covered by the Oxford clay. It is about 600 ft. thick. This clay cannot be distinguished from the Kimmeridge clay except by the fossils; the two formations are probably so interstratified into one another, but thin limestones are found in places, and at St Ives a patch of the intermediate Corallian rock is present. All the stratified rocks have a general dip towards the south-east.

Much glacial clay with stones covers the older rocks over a good deal of the county; it is a bluish clay, often containing masses of chalk, some of them being of considerable size, e.g., the Chalk in the Cottenham Heath. The Pennine Heath and the Fitzwilliam Heath, is underlain by Oxford clay, which here and there projects through the prevailing newer deposit of silt and loam. There are usually two beds of peat or peaty sand, and there are numerous ditches; they are separated by a bed of marine warp. Black loamy alluvium and valley gravels, the most recent deposits, occur in the valleys of the Ouse and Nene. Calcareous tufa is formed on the springs near Alwalton. Oxford clay is dug on a considerable scale for brick-making at Fletton, also at St Ives, Ramsey and St Neots.
HUNTINGDONSHIRE

Agriculture.—Huntingdonshire is almost wholly an agricultural county; nearly nine-tenths of its total area is under cultivation, and much improvement has been effected by drainage. On account of the tenacity of the clay the drains often require to be placed very close. Much of the soil is, however, undrained, and only partly used for pastureage. On the drained pastureage a large number of cattle are fed. The district comprising the gravels of the Ouse valley embraces an area of 50,000 acres. On the banks of the Ouse it consists of fine black loam deposited by the overflow of the river, and its meadows form very rich pasture grounds. The upland district is under arable culture. Wheat is much more extensively grown than any other grain. Barley is more widely cultivated than oats, but its quality on many soils is lean and inferior, and unsuitable for malting purposes. Beans and pease are largely grown, while mangold and cabbage and similar green crops are chiefly used for the feeding of sheep. During the last quarter of the 19th century there was a large decrease in the areas of grain crops and of St fallow, and an increase in that of permanent pasture. Market-gardening and fruit-farming, however, greatly increased in importance. Willows are largely grown in the fen district. Good drinking water is deficient in many districts, but there are three natural springs, once famous for the healing virtues their waters were thought to possess, namely, at Hat Field north of St Neots, at Holywell near St Ives and at Somersham in the same district. Bee-farming is largely practised. Dairy-farming is not much followed, the milk being chiefly used for rearing calves. The village of Stilton, on the Great North Road, had formerly a large market for the well-known cheese to which it has given its name. Large numbers of cattle are fattened in the field or the fold-yard, and are sold when rising three years old. They are mostly of the shorthorn breed, large numbers of Irish shorthorns being wintered in the fens. Leicesters and Lincolnse are the most common breeds of sheep; they usually attain great weights at an early age. Pigs include Berkshire, Suffolk and Neapolitan breeds, and a number of crosses. Their fattening and breeding are extensively practised. 

Other Industries.—There is no extensive manufacture, but the chief is that of paper and parchment. Madder is obtained in considerable quantities, and in nearly every part of the county lime burning is carried on. Lace-making is practised by the female peasantry; and the other industries are printing, iron-founding, tanning and currying, brick and tile making, malting and brewing.

Communications.—The middle of the county is traversed from south to north by the Great Northern railway, which enters it at St Neots and passing by Huntingdon leaves it at Peterborough. A branch line running eastward to Ramsey is given off at Holme junction, midway between Huntingdon and Peterborough. From Huntingdon branch lines of the Midland and the Great Eastern run respectively west and east to Thrapston (Northamptonshire) and to Cambridge via St Ives. From St Ives Great Eastern lines also run N.E. to Ely (Cambridgeshire) via Earith Bridges on the county border, and N. to Wisbech (Cambridgeshire) with a branch line westward from Somersham to Ramsey. The north-western border is served by the Great Northern and the London and North-Western railways between Peterborough and Wansford, where they part.

Population and Administration.—The area of the ancient county is 234,218 acres, with a population in 1801 of 57,761, and in 1901 of 57,771. The area of the administrative county is 235,984 acres. The county contains 4 hundreds. The municipal boroughs are Godmanchester (population 1,051), Huntingdon and the county town (4261) and St Ives (2910). The other urban districts are Old Fletton (4583), Ramsey (4523) and St Neots (3890). The county is in the south-eastern circuit, and assizes are held at Huntingdon. It has one court of quarter sessions, and is divided into five petty sessional divisions. There are 105 civil parishes. Huntingdonshire, which contains 87 ecclesiastical parishes or districts wholly or in part, is almost wholly in the diocese of Ely, but a small part is in that of Peterborough. The parliamentary divisions, each of which returns one member, are the Northern or Ramsey and the Southern or Huntingdon. Part of the parliamentary borough of Peterborough also falls within the county.

History.—The earliest English settlers in the district were the Gywars, an East Anglian tribe, who early in the 6th century worked their way up the Ouse and the Cam as far as Huntingdon. After their conquest of East Anglia in the latter half of the 9th century, Huntingdon became an important seat of the Danes, and the Danish origin of the shire is borne out by an entry in the Saxon Chronicle (918-921) referring to Huntingdon as a military centre to which the surrounding district owed allegiance, while the shire itself is mentioned in the Historia Elenis in connexion with events which took place before or shortly after the death of Edgar. About 952 Edward the Elder wrested the fen-country from the Danes, repairing and fortifying Huntingdon, and a few years later the district was included in the earldom of East Anglia. Religious foundations were established at Ramsey, Huntingdon and St Neots in the 11th century, and that of Ramsey accumulated vast wealth and influence, owning twenty-six manors in this county alone at the time of the Domesday Survey. In 1011 Huntingdonshire was again overrun by the Danes and in 1016 was attacked by Canute. A few years later the shire was included in the earldom of Thorold (of the Middle Angles), but in 1051 it was detached from Mercia and formed part of the East Anglian earldom of Harold. Shortly before the Conquest, however, it was bestowed on Siward, as a reward for his part in Godwin's overthrow, and became an outlying portion of the earldom of Northumberland, passing through Waltham and Simon de St Liz to David of Scotland. After the separation of the earldom from the crown of Scotland during the Bruce and Balliol disputes, it was conferred in 1336 on William Clinton; in 1377 on Guichard d'Angle; in 1387 on John Holand; in 1471 on Thomas Grey, afterwards marquess of Dorset; and in 1529 on George, Baron Hasting, whose descendants hold it at the present day.

The Norman Conquest was followed by a general confiscation of estates, and only four or five tenants retained lands which they or their fathers had held in the time of Edward the Confessor. Large estates were held by the church, and the rest of the county for the most part formed outlying portions of the fiefs of William's Norman favourites, that of Count Eustace of Boulogne, the sheriff, of whose tyrannous exactions bitter complaints are recorded, being by far the most considerable. Kibworth was fortified by Geoffrey de Mandeville and afterwards passed to the families of Bohun and Stafford.

The hundreds of Huntingdon were probably of very early origin, and that of Norman Cross is referred to in 963. The Domesday Survey, besides the four existing divisions of Norman Cross, Toseland, Hurstingstone and Leightonstone, which from their assessment appear to have been double hundreds, mentions an additional hundred of Kibbolden, since absorbed in Leightonstone, while Huntingdon is assessed separately at fifty hides. The boundaries of the county have scarcely changed since the time of the Domesday Survey, except that parts of the Bedfordshire parishes of Everton, Pternhall and Keysoe and the Northamptonshire parish of Hargrave were then assessed under this county. Huntingdonshire was formerly in the diocese of Lincoln, but in 1837 was transferred to Ely. In 1291 it constituted an archdeaconry, comprising the deaneries of Huntingdon, St Ives, Yaxley and Leightonstone, and the divisions remained unchanged until the creation of the deanery of Kibbolden in 1876.

At the time of the Domesday Survey Huntingdonshire had an independent shrievalty, but from 1154 it was united with Cambridgeshire under one sheriff, until in 1637 the two counties were separated for six years, after which they were reunited and have remained so to the present day. The shire-court was held at Huntingdon.

In 1174 Henry II. captured and destroyed Huntingdon Castle. After signing the Great Charter John sent an army to ravage this county under William, earl of Salisbury, and Falke de Breauté. During the wars of the Roses Huntingdon was sacked by the
HUNTINGTON, D.—HUNTINGTON

953

Lancastrians. The county resisted the illegal taxation of Charles I. and joined in a protest against the arrest of the five members. In 1642 it was one of the seven associated counties in which the king had no visible party. Hinchinbrook, however, was held for Charles by Sir Sydney Montagu, and in 1643 Huntington was captured and plundered by the Royalist forces. The chief historic family connected with this county were the Cromwells, who held considerable estates in the 17th century.

Huntingdonshire has always been mainly an agricultural county, and at the time of the Domesday Survey contained thirty-six mills, besides valuable fisheries in its meres and rivers.

The woolen industry flourished in the county from Norman times, and previous to the draining of its fens in the 17th century, by which large areas were brought under cultivation, the industries of turf-cutting, reed-cutting for thatch and the manufacture of horse-collars from rushes were carried on in Ramsey and the surrounding district. In the 17th century salt-petre was manufactured in the county.

Ecclesiastically Huntingtonshire was divided into the Manor of Ramsey, the Manor of Godmanchester, and the Manor of Standen, and brewing and malting were largely carried on.

Huntingdonsire was represented by three members in parliament in 1290. From 1295 the county and borough of Huntington returned two members each, until in 1688 the representation of the borough was reduced to one member. By the act of 1858 the borough was disfranchised.

Antiquities.—Huntingdonshire early became famous on account of its great Benedictine abbey at Ramsey and the Cistercian abbey founded in 1146 at Sawtry, 7 m. W. of Ramsey; besides which there were priories at Huntingdon and Stonely, both belonging to the Augustinian canons, and at St Ives and St Neots belonging to the Benedictines, together with a Benedictine nunnery at Hinchinbrook, near Huntingdon. Of these buildings almost the only remains are at Ramsey and St Ives. The most interesting churches for Norman architecture are Hartford near Huntingdon, Old Fletton near Peterborough (containing on the exterior some carved ornamental said to have belonged to the original Saxon cathedral at Peterborough), Ramsey and Alwalton, a singular combination of Norman and Early English. Early English churches are Kimbolton, Alconbury, Warboys and Somersham, near Ramsey, and Hail Weston near St Neots, with a 15th-century wooden tower and spire. Decorated are Orton Longueville and Yaxley, both near Peterborough, the latter containing remains of frescoes on its walls; Perpendicular, St Neots, Connington near Ramsey and Godmanchester. At Buckden near Huntingdon are remains of a palace (15th century) of the bishops of Lincoln. There were two ancient castles in the county, at Huntingdon and at Kimbolton, of which only the second remains as a mansion. Hinchinbrook House, Huntingdon, was the seat of the Cromwell family. Connington Castle passed, like the title of earl of Huntingdon, through the hands of Waltheof, Simon de St Liz and the Scottish royal family, and was finally inherited by Sir Robert Cotton the antiquary, who was born in the neighbourhood, and is buried in Connington church. Elton Hall, on the north-west border of the county, was rebuilt about 1660, and contains, besides a good collection of pictures, chiefly by English masters, a library which includes many old and rare prayer-books, Bibles and missals.

Norman Cross, 13 m. N. of Huntington, on the Great North Road, marks the site of the place of confinement of several thousand French soldiers during the Napoleonic wars at the beginning of the 19th century. Old Gidding, 5 m. N.W. of Huntingdon, is memorable for its connection with Nicholas Ferrar in the reign of Charles I., when the religious community of which Ferrar was the head was organized. Relics connected with this community are preserved in the British Museum.

HUNTINGTON, DANIEL (1816–1906), American artist, was born in New York on the 14th of October 1816. In 1835 he studied with S. F. B. Morse, and produced "A Bar-Room Politician" and "A Toper Asleep." Subsequently he painted some landscapes on the river Hudson, and in 1839 went to Rome. On his return to America he painted portraits and began the illustration of The Pilgrim's Progress, but his eyesight failed, and in 1844 he went back to Rome. Returning to New York in 1846, he devoted his time chiefly to portrait-painting, although he has painted many genre, religious and historical subjects. He was president of the National Academy from 1862 to 1870, and again in 1877–1890. Among his principal works are: "The Florentine Girl," "Early Christian Prisoners," "The Shepherd Boy of the Campagna," "The Roman Penitents," "Christiania and Her Children," "Queen Mary signing the Death-Warrant of Lady Jane Grey," and "Peckenham in the Tower," 1649. "History of the American Court in the Time of Washington," containing sixty-four careful portraits of Washington, "Sowing the Word" (1863), "St Jerome," "Juliet on the Balcony" (1879), "The Narrows, Lake George" (1871), "Titias," "Clement VII. and Charles V. at Bologna," "Philosophy and Christian Art" (1878), "Goldsmith's Daughter" (1884). His principal portraits are: President Lincoln, in Union League Club, New York; Chancellor Ferris of New York University; Sir Charles Eastlake and the Earl of Carlyle, the property of the New York Historical Society; President Van Buren, in the State Library at Albany; Lord Byron; Louis Agassiz (1859–1857), William Cullen Bryant (1860), John A. Dix (1880) and John Sherman (1881). He died on the 19th of April 1906 in New York City.

HUNTINGTON, FREDERICK DAN (1819–1904), American clergyman, first Protestant Episcopal bishop of central New York, was born in Hadley, Massachusetts, on the 28th of May 1819. He graduated at Amherst in 1839 and at the Harvard Divinity School in 1842. In 1842–1845 he was pastor of the church at Huntington, and in 1845–1860 was preacher to the university and Plummer professor of Christian Morals at Harvard; he then left the Unitarian Church, with which his father had been connected as a clergyman at Hadley, resigned his professorship and became pastor of the newly established Emmanuel Church of Boston. He had refused the bishopric of Maine when in 1868 he was elected to the diocese of central New York. He was consecrated on the 9th of April 1869, and thereafter lived in Syracuse. He died in Hadley, Massachusetts, on the 11th of July 1904. His more important publications were Lectures on Human Society (1860); Memorials of a Quiet Life (1874); and The Golden Rule Applied to Business and Social Conditions (1892).

See Memoir and Letters of Frederic Dan Huntington (Boston, 1906), by Arris S. Huntington, his wife.

HUNTINGTON, a city and the county-seat of Huntington county, Indiana, U.S.A., on the Little river, about 25 m. S.W. of Fort Wayne. Pop. (1900) 9491, of whom 621 were foreign-born; (1906, estimate) 11,047. Huntington is served by three railroads—the Wabash, the Erie (which has car shops and division headquarters here) and the Cincinnati, Bluffton & Chicago (which has machine shops here), and by the Fort Wayne & Wabash Valley Traction Company, whose car and repair shops and power station are in Huntington. The city has a public library, a business college and Central College (1897), controlled by the United Brethren in Christ (Old Constitution). Woodenware is the principal manufacture. The value of the factory product in 1905 was $2,087,019, an increase of 20-5% since 1900. The municipality owns and operates the waterworks and the electric-lighting plant. Huntington, named in honour of Samuel Huntington (1736–1706), of Connecticut, a signer of the Declaration of Independence, was first settled about 1829, was incorporated as a town in 1848 and was chartered as a city in 1873.

HUNTINGTON, a township of Suffolk county, New York, U.S.A., in the central part of the N. side of Long Island, bounded on the N. by Huntington Bay, a part of Long Island Sound. Pop. (1905, state census) 10,236; (1910) 12,603. The S. part of the township is largely taken up with market-gardening; but along the Sound are the villages of Huntington, Cold Spring
HUNTINGTON—HUNTINGTON, Harri, Centreport and Northport, which are famous for the fine residences owned by New York business men; they are served by the Wading river branch of the Long Island Railroad. Northport—pop. (1910) 14,701—is the most easterly of these; it has a large law-publishing house, shipbuilding yards and valuable oyster-fisheries. Cold Spring Harbor, 32 m. E. of Brooklyn, is a small unincorporated village, once famous for its whale fisheries, and now best known for the presence here of the New York State Fish Hatchery, and of the Biological Laboratory of the Brooklyn Institute of Arts and Sciences and of the laboratory of the Department of Experimental Evolution of the Carnegie Institution of Washington. The village of Huntington, 33 m. E. of Cold Spring, is unincorporated, but is the most important of the three and has the largest summer colony. There is a public park on the water-front, The Soldiers' and Sailors' Memorial Building is occupied by the public library, which faces a monument to Nathan Hale on Main Street. A big boulder on the shore of the bay marks the place of Hale's capture by the British on the 21st of September 1776. Benjamin Thompson (Count Rumford) occupied the village and built a British fort here near the close of the American War of Independence. Huntington's inhabitants were mostly strong patriots, notably Ebenezer Prime (1700–1779), pastor of the First Presbyterian Church, which the British used as a barracks, and his son Benjamin Young Prime (1733–1791), a physician, linguist and patriot poet, who was the father of Samuel Irenaeus Prime (1808–1876), editor of the New York Observer. Walt Whitman was born near the village of Huntington, and established there in 1836, and for three years edited, the weekly newspaper the Long Islander. The first settlement in the township was made in 1652; in 1662–1664 Huntington was under the government of Connecticut. The township until 1872 included the present township of Babylon to the S., along the Great South Bay.

HUNTINGTON, a city and the county-seat of Cabell county, West Virginia, U.S.A., about 50 m. W. of Charleston, W. Va., on the S. bank of the Ohio river, just below the mouth of the Guyandotte river. Pop. (1900) 11,023, of whom 1212 were negroes; (1910 census) 31,161. It is served by the Baltimore & Ohio and the Chesapeake & Ohio railways, and by several lines of river steamboats. The city is the seat of Marshall College (founded in 1837; a State Normal School in 1867), which in 1907–1908 had 34 instructors and 1100 students; and of the West Virginia State Asylum for the Incurable Insane; and it has a Carnegie library and a city hospital. Huntington has extensive railway car and repair shops, besides foundries and machine shops, steel rolling mills, manufactories of stoves and ranges, breweries and glass works. The value of the city's factory product in 1905 was $4,107,552; an increase of 219% over that of 1900. Huntington dates from 1871, when it became the western terminus of the Chesapeake & Ohio railroad, was named in honour of Collis P. Huntington (1821–1900), the president of the road, and was incorporated.

HUNTINGTOWN AND RUTHVENFIELD, a village of Perthshire, Scotland, on the Almond, 3 m. N.W. of Perth, and within 1 m. of Almondbank station on the Caledonian railroad. Pop. (1901) 459. Bleaching, the chief industry, dates from 1774, when the bleaching-field was formed. By means of an old aqueduct, said to have been built by the Romans, it was provided with water from the Almond, the properties of which render it specially suited for bleaching. Huntingtower (originally Ruthven) Castle, a once formidable structure, was the scene of the Raid of Ruthven (pron. Rīven), when the Protestant lords, headed by William, 4th Lord Ruthven and 1st earl of Gowrie (1541–1584), kidnapped the boy-king James VI., on the 22nd of August 1582. The earl's sons were slain in the attempt (known as the Gowrie conspiracy) to capture James VI. (1600), consequent on which the Scots parliament ordered the name of Ruthven to be abolished, and the barony to be known in future as Huntingtower.

HUNTINGTOWN, EARLS AND MARQUESSES OF. This Scottish title, in the Gordon family, dates as to the earldom from 1449, and as to the marquessate (the premier marquessate in Scotland) from 1599. The first earl (d. 1470) was Alexander de Seton, lord of Gordon—a title known before 1408; and his son George (d. 1500), by his marriage with Princess Annabella (afterwards divorced), daughter of James I. of Scotland, had several children, including, besides his successor the 3rd earl (Alexander), a second son Adam (who became earl of Sutherland), a third son William (from whom the mother of the poet Byron was descended) and a daughter Katherine, who first married Perkin Warbeck and afterwards Sir Matthew Cradock (from whom the earls of Pembroke descended). Alexander, the 3rd earl (d. 1534), consolidated the position of his house as supreme in the north; he led the Scottish vanguard at Flodden, and was a supporter of Albany against Angus. His grandson George, 4th earl (1514–1562), who in 1548 was granted the earldom of Moray, played a leading part in the troubles of his time in Scotland, and in 1562 revolted against Queen Mary and was killed in fight at Corrichie, near Aberdeen. His son George (d. 1576) was restored to the forfeited earldom in 1565; he became Bothwell's close associate—he helped Bothwell, who had married his sister, to obtain a divorce from her; and he was a powerful supporter of Mary till he seceded from her cause in 1572.

GEORGE GORDON, 1st marquess of Huntly (1562–1620), son of the 5th earl of Huntly, and of Anne, daughter of James Hamilton, earl of Arran and duke of Chatelherault, was born in 1562, educated at Edinburgh, and early took an active part in the plot which led to the execution of Morton in 1581 and in the conspiracy which delivered King James VI. from the Ruthven raiders in 1583. In 1588 he signed the Presbyterian confession of faith, but continued to engage in plots for the Spanish invasion of Scotland. On the 28th of November he was appointed captain of the guard, and while carrying out his duties at Holyrood his treacherous correspondence was discovered. James, however, who found the Roman Catholic lords useful as a foil to the tyranny of the Kirk, and was at this time seeking Spanish aid in case of Elizabeth's denial of his right to the English throne, and with whom Huntly was always a favourite, pardoned him. Subsequently in April 1586 he raised a rebellion in the north, but was obliged to submit, and after a short imprisonment in Borthwick Castle was again set at liberty. He next involved himself in a private war with the Grants and the Mackintoshes, who were assisted by the earls of Atholl and Murray; and on the 8th of February 1592 he set fire to Murray's castle of Donibristle in Fife, and stabbed the earl to death with his own hand. This outrage, which originated the ballad "The Bonnie Earl of Moray," brought down upon Huntly his enemies, who ravaged his lands. In December the "Spanish Blanks" were intercepted (see ERROLL, FRANCIS HAY, 9TH EARL OF), two of whom were the principal supporters of Bothwell in his claim to the crown; and Huntly was preferred against him, while on the 25th of September 1593 he was excommunicated. James treated him and the other rebel lords with great leniency. On the 26th of November they were freed from the charge of treason, being ordered at the same time, however, to renounce Romanism or leave the kingdom. On their refusal to comply they were attainted. Subsequently Huntly joined Erroll and Bothwell in a conspiracy to imprison the king, and the former two defeated the royal forces under Argyll at Glenlivat on the 3rd of October 1594, Huntly especially distinguishing himself. His victory, however, gained no real advantage; his castle of Strathbogie was blown up by James, and he left Scotland about March 1595. He returned secretly very soon afterwards, and his presence in Scotland was at first connived at by James; but owing to the hostile feeling aroused, and the "No Popery" riot in Edinburgh, the king demanded that he should abjure Romanism or go into permanent banishment. He submitted to the Kirk in June 1597, and was restored to his estates in December. On the 7th of April 1599 he was created a marquess, and on the 9th of July, together with Lennox, appointed lieutenant of the north. He was treated with great favour by the king and was reconciled with Murray and Argyll. Doubts, however, as to the genuineness of his abjuration again troubled the Kirk. On the 10th of December 1600 he was confined
to Aberdeen, and on the 10th of March 1607 he was summoned before the privy council. Huntly thereupon went to England and appealed to James himself. He was excommunicated in 1608, and imprisoned in Stirling Castle (till the 10th of December 1617, when he signed again the confession of faith). Accused of Romanist intrigues in 1616, he was ordered once more to subscribe the confession, which this time he refused to do; imprisoned at Edinburgh, he was liberated by James's order on the 18th of June, and having joined the court in London was absolved from excommunication by Abbot, archbishop of Canterbury; which absolution, after some heartburnings at the archbishop's interference, and after a further subscription to the confession by Huntly, was confirmed by the kirk. At the accession of Charles I., Huntly was again imprisoned in Edinburgh Castle, and in 1625 he was fined £315. His confinement with ships round him, however, was relieved by his marriage in 1629 to Enzie of Strathbogie on the 13th of June 1636, after declaring himself a Roman Catholic.

George Gordon, 2nd marquess of Huntly (d. 1640), his eldest son by Lady Henrietta, daughter of the duke of Lennox, was brought up in England as a Protestant, and created earl of Enzie by James I. On succeeding to his father's title his influence in Scotland was employed by the king to balance that of Argyll in the dealings with the Covenanters, but without success. In the civil war he distinguished himself as a royalist; and in 1647 he was excepted from the general pardon; in March 1649, having been captured and given up, he was beheaded by order of the Scots parliament at Edinburgh. His fourth son Charles (d. 1681) was created earl of Abouye in 1660; and the eldest son Lewis was proclaimed 3rd marquess of Huntly by Charles II. in 1661. But the attainder was not reversed by parliament till 1661.

George Gordon, 4th marquess (1643-1710), served under Turin and was created 1st duke of Gordon by Charles II. in 1663 (see GORDON). On the death of the 9th duke of Gordon in 1836 the title of 9th marquess of Huntly passed to his relative George Gordon (1761-1853), son and heir of the 4th earl of Abouye; who in 1815 was made a peer of the United Kingdom as Baron Meldrum, his descendants being the 10th and 11th marquesses.

Huntly, a police burgh, burgh of barony and parish of Aberdeenshire, Scotland, capital of the district of Strathbogie. Pop. (1901) 4,316. It lies at the confluence of the rivers Deveron and Bogie, 41 m. N.W. of Aberdeen on the Great North of Scotland Railway. It is a market town and the centre of a large agricultural district, its chief industries including agricultural implement-making, hosiery weaving, weaving of woollen cloth, and the manufacture of lamps and boots. Huntly Castle, half a mile to the north, now in ruins, was once a fortalice of the Comyns. From them it passed in the 14th century to the Gordons, by whom it was rebuilt. It was blown up in 1594, but was restored in 1602. It gradually fell into disrepair, some of its stones being utilized in the building of Huntly Lodge, the residence of the widow of the "last" duke of Gordon (died 1840) founded the adjoining Gordon schools to his memory. The Standing Stones of Strathbogie in Market Square have a permanent public to perpetual archives.

Huntsman, Benjamin (1704-1770), English inventor and steel-manufacturer, was born in Lincolshire in 1704. His parents were Germans. He started business as a clock, lock and tool maker at Doncaster, and attained a considerable local reputation for scientific knowledge and skilled workmanship. He also practised surgery in an experimental fashion, and was frequently consulted as an oculist. Finding that the bad quality of the steel then available for his products seriously hampered him, he began to experiment in steel-manufacture, first at Doncaster, and subsequently at Handsworth, near Sheffield, whither he removed in 1740 to secure cheaper fuel for his furnaces. After several years' trials he at last produced a satisfactory cast steel, purer and harder than any steel then in use. The Sheffield cutlery manufacturers, however, refused to buy it, on the ground that it was too hard, and for a long time Huntsman exported his whole output to France. The growing competition of imported French cutlery made from Huntsman's cast-steel at length alarmed the Sheffield cutlers, who, after vainly endeavouring to get the exportation of the steel prohibited by the British government, were compelled in self-defence to use it. Huntsman had not only supplied this piece of intelligence, but its secret was discovered by a Sheffield ironfounder, who, according to a popular story, obtained admission to Huntsman's works in the disguise of a tramp. Benjamin Huntsman died in 1776, his business being subsequently greatly developed by his son, William Huntsman (1733-1800).

See Smiles, Industrial Biography (1879).

Huntsville, a city and the county-seat of Madison county, Alabama, U.S.A., situated on a plain 10 m. of the Tennessee river, 18 m. from the northern boundary of the state, at an elevation of 960 ft. (1800) 8110. There is a considerable suburban population. Huntsville is served by the Southern and the Nashville, Chattanooga & St. Louis railways. The public square is on a high bluff (about 750 ft. above sea-level), at the base of which a large spring furnishes the city with water, and also forms a stream once used for floating boats, loaded with cotton, to the Tennessee river. The surrounding country has rich deposits of iron, coal and marble, and cotton, Indian corn being shipped from Huntsville. Natural gas is found in the vicinity. The principal industry is the manufacture of cotton. The value of the city's factory products increased from $692,340 in 1900 to $1,758,718 in 1903, or 154%. At Normal, about 35 m. N.E. of Huntsville, is the State Agricultural and Mechanical College for Negroes. Huntsville was founded in 1803 by John Hunt, a Virginian and a soldier in the War of Independence; in 1809 its name was changed to Twickenham, in memory of the home of the poet Alexander Pope, some of whose relatives were among the first settlers; but in 1814 the harrier name was restored, under which the town was incorporated by the Territorial Government, the first Alabama settlement to receive a charter. Huntsville was chartered as a city in 1844. Here, in 1819, met the convention that framed the first state constitution, and in 1820 the first state legislature. On the 11th of April 1862 Huntsville was seized by Federal troops, who were forced to retire in the following September, but secured permanent possession in July 1863.

Hunyadi, János (c. 1387-1456), Hungarian statesman and warrior, was the son of Vojk, a Magyarized Vlach who married Elizabeth Morzainy. He derived his family name from the small estate of Hunyad, which came into his father's possession in 1409. The later epithet Corvinus, adopted by his son Matthias, was doubtless derived from another property, Piatra da Corvo or Raven's Rock. He has sometimes been confounded with an elder brother who died fighting for Hungary about 1440. While still a youth, he entered the service of King Sigismund, who appreciated his qualities and borrowed money from him; he accompanied that monarch to Frankfort in his quest for the imperial crown in 1431, took part in the Hussite War in 1432, and in 1437 drove the Turks from Semendria. For these services he got numerous estates and a seat in the royal council. In 1438 King Albert II. made him ban of Szöreny, the district lying between the Aluta and the Danube, a most dangerous dignity entailing constant warfare with the Turks. On the sudden death of Albert in 1439, Hunyadi, feeling acutely that the situation demanded a warlike king on the throne of St. Stephen, lent the whole weight of his influence to the candidature of the young Polish king Wladislaus III. (1440), and thus came into collision with the powerful Cicius, the chief supporter of Albert's widow Elizabeth and her
HUNYADI, LÁSZLÓ

infant son, Ladislaus V. (see Cillei, Ulech; and Ladislaus V.),

He took a prominent part in the ensuing civil war and was rewarded by Vladislaus III. with the captaincy of the fortress of Belgrade and the voivodeship of Transylvania, which latter dignity, however, he shared with his rival Mihály Ujlaki.

The burden of the Turkish War now rested entirely on his shoulders. In 1441 he delivered Servia by the Danish Expedition, and in 1442, not far from Hermannstadt, on which he had been forced to retire, he annihilated an immense Turkish host, and recovered for Hungary the suzerainty of Wallachia and Moldavia; and in July he vanquished a third Turkish army near the Iron Gates. These victories made Hunyadi's name terrible to the Turks and renowned throughout Christendom, and stimulated him in 1443 to undertake, along with King Vladislaus, the famous expedition known as the kossau haboro or "long campaign." Hunyadi, at the head of the vanguard, crossed the Balkans through the Gate of Trajan, captured Nish, defeated three Turkish pashas, and, after taking Sofia, united with the royal army and defeated Murad II. at Snaim. The impatience of the king and the severity of the winter then compelled him (February 1444) to return home, but not before he had utterly broken the sultan's power in Bosnia, Herzegovina, Servia, Bulgaria and Albania. No sooner had he regained Hungary than he received tempting offers from the pope, represented by the legate Cardinal Cesarini, from George Brankóvich, despot of Servia, and George Castricota, prince of Albania, to resume the war and realize his favourite idea of driving the Turk from Europe. All the preparations had been made, when Murad's envoys arrived in the royal camp at Széged and offered a ten years' truce on advantageous terms. Both Hunyadi and Brankóvich counseled their acceptance, and Vladislaus swore on the Gospels to observe them. Two days later Cesarini received the tidings that a fleet of galleys had set off for the Bosphorus to prevent Murad (who, crushed by his recent disasters, had retired to Asia Minor) from re-entering Europe, and the cardinal reminded the king that he had sworn to co-operate by land if the western powers attacked the Turks by sea. He then, by virtue of his legitimate powers, absolved the king from the second oath, and in July the Hungarian army recrossed the frontier and advanced towards the Euxine coast in order to march to Constantinople escorted by the galleys. Brankóvich, however, fearful of the sultan's vengeance on account of the secret treaty, was privately informed Murad of the advance of the Christian host, and prevented Castricota from joining it. On reaching Varna, the Hungarians found that the Venetian galleys had failed to prevent the transit of the sultan, who now confronted them with fourfold odds, and on the 10th of November 1444 they were utterly routed, Vladislaus falling on the field and Hunyadi narrowly escaping.

At the diet which met in February 1445 a provisional government, consisting of five Magyar captain-generals, was formed, Hunyadi receiving Transylvania and the ultra-Thessalian counties as his district; but the resulting anarchy became unbearable, and on the 5th of June 1446 Hunyadi was unanimously elected governor of Hungary in the name of Ladislaus V., with regal powers. His first act as governor was to proceed against the German king Frederick III., who refused to deliver up the young king. After ravaging Styria, Carinthia and Carniola and threatening Vienna, Hunyadi's difficulties elsewhere compelled him to make a truce with Frederick for two years. In 1448 he received a golden chain and the title of prince from Pope Nicholas V., and immediately afterwards resumed the war with the Turks. He lost the two days' battle of Kossovo (October 17, 1448) on account of the treachery of Dan, hospodar of Wallachia, and of his old enemy Brankóvich, who imprisoned him for a time in the dungeons of the fortress of Semendia; but he was ransomed by the Magyars, and, after composing his differences with his powerful and jealous enemies in Hungary, led a punitive expedition against the Servian prince, who was compelled to accept most humiliating terms of peace. In 1450 Hunyadi went to Pressburg to negotiate with Frederick the terms of the surrender of Ladislaus V., but no agreement could be come to, whereupon the Cilleis and Hunyadi's other enemies accused him of aiming at the throne. He shut their mouths by resigning all his dignities into the hands of the young king, on his return to Hungary at the beginning of 1455, whereupon Ladislaus created him count of Besterzec and captain-general of the kingdom.

While the Turkish question had again become acute, and it was plain, after the fall of Constantinople in 1453, that Mahomed II. was rallying his resources in order to subjugate Hungary. His immediate objective was Belgrade, and thither, at the end of 1455, Hunyadi repaired, after a public reconciliation with all his enemies. At his own expense he provisioned and armed the fortress, and leaving it in a strong garrison under the command of his brother-in-law Mihály Szilágyi and his own eldest son László, he proceeded to form a relief army and a fleet of two hundred corvettes. To the eternal shame of the Magyar nobles, he was left entirely to his own resources. His one ally was the Franciscan friar, Giovanni da Capistrano (q.v.), who preached a crusade so effectually that the peasants and yeomanry, ill-armed (most of them had but slings and scythes) but full of enthusiasm, flocked to the standard of Hunyadi; the kernel of whose host consisted of a small band of seasoned mercenaries and a few serdab of noble horsemen. On the 14th of July 1456 Hunyadi with his flotilla destroyed the Turkish fleet; on the 21st Szilágyi beat off a fierce assault, and the same day Hunyadi, taking advantage of the confusion of the Turks, pursued them into their camp, which he captured after a desperate encounter. Mahomed thereupon raised the siege and returned to Constantinople, and the independence of Hungary was secured for another seventy years. The Magyars had, however, to pay dearly for this crowning victory. Hunyadi, the hero dying of plague in his camp three weeks later (11th August 1456).

We are so accustomed to regard Hunyadi as the incarnation of Christian chivalry that we are apt to forget that he was a great captain and a great statesman as well as a great hero. It has well been said that he fought with his head rather than with his arm. He was the first to recognize the insufficiency and the unreliability of the feudal levies, the first to employ a regular army on a large scale, the first to depend more upon strategy and tactics than upon mere courage. He was in fact the first Hungarian general in the modern sense of the word. It was only in life that he learnt to read and write, and his Latin was always very defective. He owed his influence partly to his natural genius and partly to the transparent integrity and nobility of his character. He is described as an undersigned, stalwart man with full, rosy cheeks, long snow-white locks and bright, smiling, black eyes.

See J. Teleki, The Age of the Hunyadis in Hungary (Hung.), (Pesth, 1857-1871; supplementary volumes by D. Czeck, P. Frankl, G. Fejer, G. Cernea, C. Czarnulda et virous Joannis Corvinis de Hunyad (Buda, 1844); J. de Chassain, Jean de Hunyad (Paris, 1899); A. Pör, Life of Hunyadi (Hung.) (Budapest, 1893); V. tion, promising to protect the Hunyadis on condition that they first surrendered all the royal castles entrusted to them. A beginning was to be made with the fortress of Belgrado, of which László was commandant, Cillei intending to take the king with him to Belgrado and assassinate László on his way. But Hunyadi had already ingratiated himself, and while admitting László's V., and Cillei, he excluded their army of mercenaries. On the following morning (9th of November 1456) Cillei, during a private interview, suddenly drew upon László, but was himself cut down by the commandant's friends, who rushed in on hearing the clash of weapons. The terrified young king, who had been privy to the plot, thereupon pardoned Hunyadi, and at a subsequent interview with his mother at Temesvar swore that he would protect the whole family. As a pledge of his sincerity he appointed László lord treasurer and captain-general of the kingdom. Suspecting no evil, Hunyadi accompanied the king to Buda, but on arriving there was arrested on a charge of compassing László's ruin, condemned to death without the observance of any legal formalities, and beheaded on the 16th of March 1457.

HUNZA—HUPFELD

HUNZA (also known as KANJUT) and NAGAR, two small states on the North-west frontier of Kashmir, formerly under the administration of the Gilgit agency. The two states, which are defended by a river which runs in a bed 600 ft. wide, have cliffs 300 ft. high, are inhabited generally by people of the same stock, speaking the same language, professing the same form of the Mahomedan religion, and ruled by princes sprung from the same family. Nevertheless they have been for centuries persistent rivals, and frequently at war with each other. Formerly Hunza was the more prominent of the two, because it held possession of the passes leading to the Pamirs, and could plunder the caravans on their way between Turkestan and India. But they are both shut up in a recess of the mountains, and have been rendered useless for the purposes of commerce, and thus of Russia up to the frontiers of Afghanistan, and the great development of her military resources in Asia, increased the necessity for strengthening the British line of defence. This led to the establishment of the Gilgit agency, the occupation of Chitral, and the Hunza expedition of 1861, which asserted British authority over Hunza and Nagar. The country is inhabited by a Dard race of the Yeshkun caste speaking Burushiki. For a description of the people see Gilgit. The Hunza-Nagar Expedition of 1861, under Colonel A. Durand, was due to the defeat of the Sher and Khyals, Boddar's chiefs towards the British agent at Gilgit. The fort at Nilt was stormed, and after a fortnight's delay the cliffs (1000 ft. high) beyond it were also carried by assault. Hunza and Nagar were occupied, the chief of Nagar was reinstated on making his submission, and the half-brother of the raja of Hunza was installed as chief in the place of his brother.

HUON OF BORDEAUX, hero of romance. The French chanson de geste of Huon de Bordeaux dates from the first half of the 13th century, and marks the transition between the epic chansons founded on national history and the roman d' aventures. Huon, son of Seguin of Bordeaux, kills Charlot, the emperor's son, who had laid an ambush for him, without being aware of the rank of his assailant. He is condemned to be hanged by Charlemagne, but reprieved on condition that he visits the court of Gaudisse, the amir of Babylon, and brings back a handful of hair from the amir's beard and four of his back teeth, after having slain the greatest of his knights and three times kissed his daughter Esclarmonde. By the help of the fairy dwarf Oberon, Huon succeeds in this errand, in the course of which he meets with further adventures. The Charlot of the story has been identified by A. Longnon (Romania viii. 1-115) with Charles l'Enfant, one of the sons of Charles the Bald and Ermindrude, who died in 866 in consequence of wounds inflicted by a certain Aubuin in precisely similar circumstances to those related in the romance. The epic father of Huon may safely be identified with Seguin, who was count of Bordeaux under Louis the Fious in 839, and died fighting against the Normans six years later. A Turin manuscript of the romance contains a prologue in the shape of a separate romance of Auberon, and four sequels, the Chanson d'Esclarmonde, the Chanson de Clarisse et Fiorent, the Chanson d'Ide et d'Olive and the Chanson de Godin. The same MS. contains in the romance of Les Lorrains a summary in seventeen lines of another version of the story, according to which Huon's exile is due to his having slain a count in the emperor's palace. The poem exists in a later version in alexandrines, and, with its continuations, was put into prose in 1454 and printed by Michel le Noir in 1516, since when it has appeared in many forms, notably in a beautifully printed and illustrated adaptation (1898) in modern French by Gaston Paris. The romance had a great vogue in England through the translation (c. 1540) of John Boucicaut, Lord Berners, as Huon de Bordeaux. The tale was dramatized and produced in Paris by the Confrérie de la Passion in 1557, and in Philip Henslowe's diary there is a note of a performance of it on the 28th of December 1593. For the literary fortune of the fairy part of the romance see Oberon.

The Chanson de geste of Huon de Bordeaux was edited by MM. F. Guiraud and C. Grandjean (Halle, 1859-60); by Lord Berners in 1860; Lord Berners's translation was edited for the E.E.T.S. by S. L. Lee in 1883-1885. See also L. Gautier, Les Épopées françaises (2nd ed., 1879, vol. iii. pp. 719-773); C. Graf, "I complementsi della Chanson de Huon de Bordeaux" (Halle, 1878); G. Basset, "Esclarmonde, &c." by Max Schweigel, in Aus. u. Abhandl. der roman. phil. (Marburg, 1889); C. Voretszch, "Epische Studien" (vol. 1, Halle, 1900); Hist. litt. de la France, xxv. ii., 1886.

HUON PINE, botanical name Dacrydium franklinii, the most valuable timber tree of Tasmania, a member of the order Coniferae (see Gymnosperms). It is a fine tree of pyramidal outline 80 to 100 ft. high, and 10 to 20 ft. in girth at the base, with slender pendulous much-divided branches densely covered with the minute scale-like sharply-keeled bright green leaves. It occurs in swampy localities from the upper Huon river to Port Davey and Macquarie Harbour, but is less abundant than Huon pine owing to the demand for its timber, especially for ship- and boat-building. The wood is close-grained and easily worked.

HU-PEH, a central province of China, bounded N. by Ho-nan, E. by Nangan, S. by Hu-nan, and W. by Shen-si and Szech'uen. It has an area of 70,450 sq. m. and contains a population of 34,000,000. Han-kow, Ich'ang and Shasi are the three open ports of the province, besides which it contains ten other picturesque cities. The greater part of the province forms a plain, and its most noticeable feature is the Han river, which runs in a south-easterly direction across the province from its north-western corner to its junction with the Yangtse Kiang at Han-kow. The products of the Han valley are exclusively agricultural, consisting of cotton, wheat, rape seed, tobacco and various kinds of beans. Vegetable tallow is also exported in large quantities from this part of Hu-neh. Gold is found in the Han, but not in sufficient quantities to make working it more than barely remunerative. It is washed every winter from banks of coarse gravel, a little above Ich'eng Hien, on which it is deposited by the river. Every winter the supply is exhausted by the washers, and every summer it is renewed by the river. Baron von Reichenfels reckoned that the digger earned from 50 to 150 cash (i.e. about 13d. to 41d.) a day. Only one wagon road leads northwards from Hu-neh, and that is to Nan-ying Fu in Ho-nan, where it forks, one branch going to Peking by way of K'ai-l'eng Fu, and the other into Shan-si by Ho-nan Fu.

HUPFELD, HERMANN (1766-1866), German Orientalist and Biblical commentator, was born on the 31st of March 1766 at Hupfel (now Upfuhl), where he studied mathematics and theology to 1817; in 1819 he became a teacher in the gymnasium at Hanau, but in 1822 resigned that appointment. After studying for some time at Halle, he in 1824 settled as Privatdozent in philosophy at that university, and in the following year was appointed extraordinary professor of theology at Marburg. There he received the ordinary professorships of Oriental languages and of theology in 1827 and 1830 respectively; thirteen years later he removed as successor of Wilhelm Gesenius
HURD—HURDY-GURDY

(1786–1842) to Halle. In 1865 he was accused by some theologians of the Hengstenberg school of heretical doctrines. From this charge, however, he successfully cleared himself, the entire theological faculty, including Julius Müller (1801–1878) and August Tholuck (1799–1877), bearing testimony to his sufficient orthodoxy. He died at Halle on the 24th of April 1866.

His earliest works in the department of Semitic philology (Exercitium Aethiopicum, 1812) and De Semiticis, 1817) were followed by the first part (1841), mainly historical and critical, of an Ausführliche Hebräische Grammatik, which he did not live to complete, and by a treatise on the early history of the Hebrew language (Die rein hebraischen und semitischen Elemente, Halle, 1846). His principal contribution to Biblical literature, the exegetical and critical Übersetzung und Auslegung der Psalmen, began in 1845, and was completed in 1861 (2nd ed. by E. Riehm, 1867–1871, 3rd ed. 1888). Other writings are Über Begriff und Methode der sogenannten biblischen Einleitung (Marburg, 1844; De primitiva et vera ferensta apud Hebras documenta (Halle, 1851–1866); Die Quellen der Genesis von neuem untersucht (Berlin, 1853); Die heutige theologische oder mythologische Theologie und Schriftkunde (1861).

See E. Rieth, Hermann Hupfeld (Halle, 1867); W. Kay, Crisis Hypokriasis (1868); and the article by A. Kamphaven in Band viii. of Herzog-Loë's Realencyclopädie (1900).

HURD, RICHARD (1720–1808), English divine and writer, bishop of Worcester, was born at Congreve, in the parish of Penkridge, Staffordshire, where his father was a farmer, on the 13th of January 1720. He was educated at the grammar-school of Brewood and at Emmanuel College, Cambridge. He took his B.A. degree in 1739, and in 1742 he proceeded M.A. and became a fellow of his college. In the same year he was ordained deacon, and given charge of the parish of Reynerston, Norfolk, but he returned to Cambridge early in 1743. He was ordained priest in 1745. In 1748 he published some Remarks on an Enquiry into the Rejection of Christian Miracles by the Heathens (1749), by William Weston, a fellow of St John's College, Cambridge. He prepared editions, which won the praise of Edward Gibbon, of the Ars poética and Epistola ad Pisonem (1749), and the Epistola ad Augustum (1751) of Horace. A compliment in the preface to the edition of 1749 was the starting-point of a lasting friendship with William Warburton, through whose influence he was appointed one of the preachers at Whitehall in 1750. In 1755 he was appointed preacher at Lincoln's Inn, and in 1767 he became archdeacon of Gloucester. In 1768 he proceeded D.D. at Cambridge, and delivered at Lincoln's Inn the first Warburton lectures, which were published later (1772) as An Introduction to the Study of the Prophecies concerning the Christian Church. He became bishop of Lichfield and Coventry in 1774, and two years later was selected to be tutor to the prince of Wales and the duke of York. In 1761 he was translated to the see of Worcester. He lived chiefly at Hartlebury Castle, where he built a fine library, to which he transferred Alexander Pope's and Warburton's books, purchased on the latter's death. He was extremely popular at court, and in 1783, on the death of Archbishop Cornwills, the king pressed him to accept the prince-bishopric, but Hurd, who was known, says Madame d'Arblay, as "the Beau of Holiness," declined it as a charge not suited to his temper and talents, and much too heavy for him to sustain. He died, unmarried, on the 28th of May 1808.

Hurd's Letters on Chivalry and Romance (1762) retain a certain interest for their importance in the history of the romantic movement, which they did something to stimulate. They were written in continuation of a dialogue on the age of Queen Elizabeth included in his Moral and Political Dialogues (1759). Two later dialogues On the Uses of Foreign Travel were printed in 1763. Hurd wrote two aristocratical defences of Warburton: On the Life of Bishop Warburton (1756) and Memoirs of the Life of Bishop Warburton (1764) to Dr Thomas Leland, who had criticized Warburton's Doctrine of Grace. He edited the Works of William Warburton, the Select Works (1722) of Abraham Cowley, and left materials for an edition (6 vols., 1811) of Addison. His own works appeared in a collected edition in 8 vols. in 1811.

HURDY (O. Eng. herd, cognate with the Teutonic forms as Ger. Hirde, Dutch herde, Eng. "hoarding"); in pre-Teutonic languages the word appears in Gr. kypria, wickerwork, kóryn, Lat. cratae, basket, cf. "crate," "grate"), a movable temporary fence, formed of a framework of light timber, walled with smaller pieces of hazel, willow or other pliable wood, or constructed on the plan of a light five-barred field gate, filled in with brushwood. Similar movable frames can be made of iron, wire or other material. A construction of the same type is used in military engineering and fortification as a foundation for a temporary roadway across boggy ground or as a backing for barrier works.

HURDY-GURDY, running races over short distances, at intervals in which a number of hurdles, or fence-like obstacles, must be jumped. This has always been a favourite branch of track athletics, the usual distances being 120 yds., 220 yds. and 440 yds. The 120 yds. hurdle race is run over ten hurdles 3 ft. 6 in. high and 10 yds. apart, with a space of 15 yds. from the start to the first hurdle and a like distance from the last hurdle to the finish. In Great Britain the hurdles are fixed and the race is run on grass; in America the hurdles, although of the same height, are not fixed, and the running is on the cinder track. The "low hurdle race" of 220 yds. is run over ten hurdles 2 ft. 6 in. high and 20 yds. apart, with like distances between the start and the first hurdle and between the last hurdle and the finish. The record time for the 120 yds. race on grass is 15½ secs., and on cinders 15½ secs., both of which were performed by A. C. Kranzleim, who also holds the record for the 220 yds. low hurdle race, 23½ secs. For 440 yds. hurdles the record time is 57½ secs., by T. M. Donavan, and by J. B. Denham at Kennington Oval in 1907.

HURDY-GURDY (Fr. vielle à monticole, symphonie or chyfonie à roure; Ger. Bauernleier, Deutscheleiter, Bäblerleiter, Radleiter; Ital. lira tedesca, lira rustica, lira paganina), now loosely used as a synonym for any grinding organ, but strictly a medieval drone instrument with strings set in vibration by the friction of a wheel, being a development of the organistrum (q.v.) reduced in size so that it could be conveniently played by one person instead of two. It consisted of a box or soundchest, sometimes rectangular, but more generally having the outline of the guitar; inside it had a wheel, covered with leather and rosined, and worked by means of a crank at the tail end of the instrument. On the fingerboard were placed movable frets or keys, which, on being depressed, stopped the strings, at points corresponding to the diatonic intervals of the scale. At first there were 4 strings, later 6. In the organistrum three strings, acted on simultaneously by the keys, produced the rude harmony known as organum. When this passed out of favour, superseded by the first beginnings of polyphony over a pedal bass, the organistrum gave place to the hurdy-gurdy. Instead of acting on all the strings, the keys now affected the first string only, or "chanterelle," though in some cases certain keys, made longer, also reached the third string or "trompette"; the result was that a diatonic melody could be played on the chanterelles. The other open strings always sounded simultaneously as long as the wheel was turned, like drones on the bag-pipe.

The hurdy-gurdy was introduced in France at the time when the Paris School or Old French School was laying the foundations of counterpoint and polyphony. During the 15th and 16th centuries it was known by the name of Symphonia or Chyfonie, and in Germany Lira or Lever. Its popularity remained undiminished in France until late in the 18th century. Although the hurdy-gurdy never obtained recognition among serious musicians in Germany, the idea embodied in the mechanism stimulated
ingenious, the result being such musical curiosities as the Geigenwerk or Geigen-Clavierefield of Hans Hayden of Nuremberg (c. 1600), a harpsichord in which the strings, instead of being plucked by quills, were set in vibration by friction on one of the little steel wheels, covered with parchment and well rosined, which were kept rotating by means of a large wheel and a series of cylinders worked by treadles. Other instrument in similar type were the Bogenclavet invented by Joh. Hohlfed of Berlin in 1751 and the Bogenflügel by C. A. Meyer of Görlitz in 1794. In Adam Walker’s Celestina (1772) the friction was provided by a running band instead of a bow.

HURLSTONE-HURRY

HURLSTONE, FREDERICK YEATES (1800-1860), English painter, was born in London, his father being a proprietor of the Morning Chronicle. His grand-uncle, Richard Hurlstone, had been a well-known portrait-painter a generation earlier. F. Y. Hurlstone studied under Sir W. Beechey, Sir T. Lawrence and B. R. Haydon, and in 1820 became a student at the Royal Academy, where he soon began to exhibit. In 1823 he won the Academy’s gold medal for historical painting. In 1831 he was elected to the Society of British Artists, of which in 1835 he became president; it was to their exhibitions that he sent most of his pictures, as he became a pronounced critic of the management of the Royal Academy. He died in London on the 19th of June 1869. His historical paintings and portraits were very numerous. Some of the most representative are “A Venetian Page” (1824), “The Enchantress Armida” (1831), “Eros” (1836), “Prisoner of Chillon” (1837), “Girl of Sorrento” (1847), “Boabdil” (1854), and his portrait of the 7th earl of Cavan (1853).

HURON (a French term, from hurk, bristled, early used as an expression of contempt, signifying “lout”), a nickname given by the French when first in Canada to certain Indian tribes of Iroquoian stock, occupying a territory, which similarly was called Huronia, in Ontario, and constituting a confederation called in their own tongue Wendat (“islanders”), which was corrupted by the English into Yendat, Guyandotte and then Wyandot. The name persists for the small section of “Hurons of Lorette,” in Quebec, but the remnant of the old Huron Confederacy which after its dispersal in the 17th century settled in Ohio and was afterwards removed to Oklahoma is generally called Wyandot. For their history see Wyandot, and Indians, North American (under “Indian Wars,” Algonkian and Iroquoian).

HURON, the second largest of the Great Lakes of North America, including Georgian Bay and the channel north of Manitoulin Island, which are always associated with it. It lies between the parallels of 43° and 46° 20’ N. and between the meridians of 86° and 84° W., and is bounded W. by the state of Michigan, and N. and E. by the province of Ontario, Georgian Bay and North Channel being wholly within Canadian territory. The main portion of the lake is 235 m. long, from the Strait of Mackinac to St. Clair river, and 98 m. wide on the 45th parallel of latitude. Georgian Bay is 125 m. long, with a greatest width of 60 m., while North Channel is 120 m. long, with an extreme width of 16 m., the whole lake having an area of 23,200 sq. m. The surface is 581 ft. above the sea. The main lake reaches a depth of 802 ft.; Georgian bay shows depths, especially near its west shore, of over 300 ft.; North Channel has depths of 180 ft. Lake Huron is 20 ft. lower than Lake Superior, whose waters it receives at its northern extremity through St. Mary river, is on the same level as Lake Michigan, which connects with its north-west extremity through the Strait of Mackinac, and is nearly 9 ft. higher than Lake Erie, into which it discharges at its south extremity through St Clair river.

On the mainland, the north and east shores are of gneisses and granites of archaean age, with a broken and hilly surface rising in places to 600 ft. above the lake and giving a profusion of littoral islands following the whole shore line from the river St Mary to Wasaukeeshe on the extreme east end of Georgian bay. Manitoulin Island and the Saugeen Peninsula are comparatively flat and underlaid by a level bed of Trenton limestone. The southern shores, skirting the peninsula of Michigan, are flat. The rock formations are of sandstone and limestone, while the forests are either a tangled growth of pine and spruce or a scattered growth of small trees on a sandy soil. This shore is indented by Thunder bay, 78 sq. m. in area, and Saginaw bay, 50 m. deep and 26 m. wide across its mouth. The chief tributaries of the lake on the U.S. side are Thunder bay river, Au Sable river and Saginaw river. On the Canadian side are Saran river, Spanish river, French river, draining Lake Nipissing, Muskoka river, Severn river, draining lake Simcoe, and Nottawasaga river, emptying into Lake Simcoe. Many of these rivers are navigable, and the lake is crossed by the running traffic between the Great Lakes and the Atlantic ports.

There is a slight current in Lake Huron that flows towards Lake Superior. The average depth of Lake Huron is 120 feet, and its maximum depth, at the eastern end of the lake, is 235 feet. The lake has an area of 23,200 square miles, and a maximum length of 235 miles. The lake is divided into two sections by the Straits of Mackinac, which connect it with Lake Michigan, a smaller lake to the south. The lake is navigable for most of its length, and is an important center of trade and commerce.

HURRICANE, a wind-storm of great force and violence, originally as experienced in the West Indies; it is now used to describe similar storms in other regions, except in the East Indies and the Chinese sea, where they are generally known as "tornadoes." Hurricane is the strongest force of wind, falling on the Beaufort scale. The Caribbean word huracan was introduced by the Portuguese, Spanish and Dutch explorers of the 16th and 17th centuries into many European languages, as in Spanish huracan, Portu. furacu, Ita. vuracu, Fr. ouraguen, and in Swed., Ger. and Dutch as orkan, or okraan. A "hurricane-deck" is an upper deck on a steamer which protects the lower one, and incidentally serves as a promenade.

HURRY (or Hurvy), SIR JOHN (d. 1650), British soldier, was born in Aberdeenshire, and saw much service as a young man in Germany. In 1641 he returned home and became Lieut.-Colonel in a Scottish regiment. At the end of the same year he was involved in the plot known as the "Incident." At the outbreak of the Civil War Hurry joined the army of the earl of Essex, and was distinguished at Edgehill and Brentford. Early in 1643 he deserted to the Royalists, bringing with him information on which Rupert acted at once. Thus was brought about the action of Chalgrove Field, where Hurry again showed conspicuous valour; he was knighted on the same evening. In 1644 he was with Rupert at Marston Moor, where with Lucas he led the victorious left wing of horse. But a little later, thinking the King’s cause lost, he again deserted, and eventually was sent with Baillie against Montrose in the Highlands.
detached operations were conducted with great skill, but his attempt to surprise Montrose's camp at Auldearn ended in a complete disaster, partly on account of the accident of the men discharging their pieces before starting on the march. Soon afterwards he once more joined Charles's party, and he was taken prisoner in the disastrous campaign of Preston (1648). Sir John Hurry was Montrose's Major-General in the last desperate attempt of the Scottish Royalists. Taken at Caris-dale, he was beheaded at Edinburgh, May 29th, 1650. A soldier of fortune of great bravery, experience and skill, his frequent changes of front were due rather to laxity of political principles than to any calculated idea of treason.

HURST, JOHN FLETCHER (1834-1903), American Methodist Episcopal bishop, was born in Salem, Dorchester county, Maryland, on the 17th of August 1834. He graduated at Dickinson College in 1854, and in 1856 went to Germany and studied at Halle and Heidelberg. From 1858 to 1867 he was engaged in pastoral work in America, and from 1867 to 1871 he taught in Methodist mission institutes in Germany. In 1871-1873 he was professor of historical theology at Drew Theological Seminary, Madison, New Jersey, of which he was president from 1873 till 1886, when he was made a bishop. He died at Bethesda, Maryland, on the 4th of May 1903. Bishop Hurst, by his splendid devotion in 1876-1879, recovered the endowment of Drew Theological Seminary, lost by the failure in 1876 of Daniel Drew, its founder; and with McClintock and Crooks he improved the quality of Methodist scholarship. The American University (Methodist Episcopal) at Washington, D.C., for postgraduate work was the outcome of his projects, and he was its chancellor from 1891 to his death.

He published A History of Rationalism (1866); Hagenbach's Church History of the Eighteenth and Nineteenth Centuries (2 vols., 1869); von Oosterzee's John's Gospel: Apologetical Lectures (1869); Lange's Commentary on the Epistle to the Romans (1869); Martyrs to the Tract Cause: A Contribution to the History of the Reformation (1872), a translation and revision of Thelmann's Martyrer der Traktsache (1869); Outlines of Bible History (1872); Outlines of Church History (1874); Life and Literature in the Fatherland (1878), brilliant sketches of Germany; a brief pamphlet, Our Theological Century (1877); Bibliotheca Theologica (1883), a compilation by his students, revised by G. W. Gilmore in 1895 under the title Literature of Theology; Indika: the Country and People of India and Ceylon (1861), the outgrowth of his travels in 1884-1885 when he held the conferences of India; and several church histories (Chautauqua text-books) published together as A Short History of the Christian Church (1893).

HURSTMONCEAUX (also HESTMONCEUX), a village in the Eastbourne parliamentary division of Sussex, England, 9 m. N.E. of Eastbourne. Pop. (1901) 1,420. The village takes its name from Waleran de Monceux, lord of the manor after the Conquest, but the castle, for the picturesque ruins of which the village is famous, was built in the reign of Henry VI. by Sir Roger de Fiennes. It is moated, and is a fine specimen of 15th-century brickwork, the buildings covering an almost square quadrangle measuring about 70 yds. in the side. Towers flank the corners, and there is a beautiful turreted entrance gate, but only the foundations of most of the buildings ranged round the inner courts are to be traced. The church of All Saints is in the main Early English, and contains interesting monuments to members of the Fiennes family and others. In the churchyard is the tomb of Archdeacon Julius Charles Hare, the theologian (1859). Much material from the castle was used in the erection of Hurstmonceaux Place, a mansion of the 18th century.
