Under Augustus Helvetia (not so called till later times, earlier ater Helvetiorum) proper was included under Gallia Belgica. Two Roman colonies had previously been founded at Noviodunum (Colonia Julia Equestris, mod. Nyon) and at Colonia Raurecotum (afterwards Augusta Rauracorum, Augst near Basel) to keep watch over the inhabitants, who were treated with generosity by their conquerors, and only the name of foederati they retained their original constitution and division into four cantons. They were under an obligation to furnish a contingent to the Roman army for foreign service, but were allowed to maintain garrisons of their own, and their magistrates had the right to call out a militia. Their religion was not interfered with; they managed their own local affairs and kept their own language, although Latin was used officially. Their chief town was Aventicum (Avenches) and Vindonissa (Windisch). Under Tiberius the Helvetii were separated from Gallia Belgica and made part of Germania Superior. After the death of Galba (A.D. 69), having refused submission to Vitellius, their land was devastated by Allobroges, and only the colony now named after the invaders was named Claudius Cossus saved them from annihilation. Under Vespasian they attained the height of their prosperity. He greatly increased the importance of Aventicum, where his father had carried on business. Its inhabitants, with those of other towns, probably obtained the jus Latinum, had a senate, a council of decuriones, a prefect of public works and flamens of Augustus. After the extension of the eastern frontier, the troops were withdrawn from the garrisons and fortresses, and Helvetia, free from warlike disturbances, gradually became completely romanized. Aventicum had an amphitheatre, a public gymnasium and an academy with Roman professors. Roads were made wherever possible, and commerce rapidly developed. The old Celtic religion was also supplanted by the Roman. The west of the country, however, was more susceptible to Roman influence, and hence preserved its independence against barbarian invaders longer than its eastern portion. During the reign of Gallienus (260–268) the Alamanni overran the country; and although Probus, Constantius Chlorus, Julian, Valentinian I. and Gratian to some extent checked the inroads of the barbarians, it never regained its former prosperity. In the subdivision of Gaul in the 4th century, Helvetia, with the territory of the Sequani and Rauraci, formed the Provincia Maxima Sequanorum, the chief town of which was Vesontio (Besançon). Under Honorius (395–423) it was probably definitely occupied by the Alamanni, except in the west, where the small portion remaining to the Romans was ceded in 436 by Attius to the Burgundians.

HELVÉTIUS, CLAUDE ADRIEN (1757–1772), French philosopher and littérateur, was born in Paris in January 1757. He was descended from a family of physicians, whose original name was Schweitzer (Latinized as Helvetius). His grandfather introduced the use of ipecacuanha; his father was first physician to Queen Marie Leczinska of France. Claude Adrien was trained for a financial career, but he occupied his spare time with writing verses. At the age of twenty-three, at the queen's request, he was appointed farmer-general, a post of great responsibility and dignity worth a 100,000 crowns a year. Thus provided for, he proceeded to enjoy life to the utmost, with the help of his wealth and liberality, his literary and artistic tastes. As he grew older, however, his social successes ceased, and he began to dream of more lasting distinctions, stimulated by the success of Maupertuis as a mathematician, of Voltaire as a poet, of Montesquieu as a philosopher. The mathematical dream seems to have produced nothing; his poetical ambitions resulted in the poem called Le Bonheur (published posthumously, with an account of Helvétius's life and works, by C. F. de Saint-Lambert, 1773), in which he develops the idea that true happiness is only to be found in making the interest of one that of all; his philosophical studies ended in the production of his famous De l'Esprit. It was characteristic of the man that, as soon as he thought his fortune sufficient, he gave up his legal career, after-gener, and retired to an estate in the country, where he employed his large means in the relief of the poor, the encouragement of agriculture and the development of industries. De l'Esprit (Eng. trans., by W. Mudford, 1809), intended to be the rival of Montesquieu's L'Esprit des lois, appeared in 1758. It attracted immediate attention and aroused the most formidable opposition, especially from the dauphin, son of Louis XV. The Sorbonne condemned the book, the priests persuaded the court that it was full of the most dangerous doctrines, and the author, terrified at the storm he had raised, wrote three separate replies to it; yet, in spite of his protestations of orthodoxy, he had to leave his official station. The book was publicly burned by the hangman. The virulence of the attacks upon the work, as much as its intrinsic merit, caused it to be widely read; it was translated into almost all the languages of Europe. Voltaire said that it was full of commonplaces, and that what was original was false or problematical; Rousseau declared that the very benevolence of the author gave the lie to his principles; Grimm thought that all the ideas in the book were borrowed from Diderot; according to Madame de Delalande, Helvétius had raised such a storm by saying openly what every one thought in secret; Madame de Graffigny averred that all the good things in the book had been picked up in her own salon. In 1764 Helvétius visited England, and the next year, on the invitation of Frederick II., he went to Berlin, where the king paid him marked attention. He then returned to his country estate and passed the remainder of his life in perfect tranquillity. He died on the 26th of December 1772.

His philosophy belongs to the utilitarian school. The four discussions of which his book consists have been thus summed up: (1) All man's faculties may be reduced to physical sensation, even memory, comparison, judgment; our only difference from the lower animals lies in our external organization. (2) Self-interest, founded on the love of pleasure and the fear of pain, is the sole spring of judgment, action, affection; self-sacrifice is prompted by the fact that the sensation of pleasure out weighs the accompanying pain; it is thus the result of deliberate calculation; we have no liberty of choice between good and evil; there is no such thing as absolute right—ideas of justice and injustice change according to customs. (3) All intellects are equal; their apparent inequalities do not depend on a more or less perfect organization, but have their cause in the unequal desire for instruction, and this desire springs from passions, of which all men commonly well organized are susceptible to the same degree; and we can, therefore, all love glory with the same enthusiasm and we owe all to education. (4) In this discourse the author treats of the ideas which are attached to such words as genius, imagination, talent, taste, good sense, &c. The only original lines in his system are those of the natural equality of intelligences and the omnipotence of education, neither of which, however, is generally accepted, though both were prominent in the system of J. S. Mill. There is no doubt that his thinking was unsystematic; but many of his critics have entirely misrepresented him (e.g. Cairns in his Unbelief in the Eighteenth Century). As J. M. Robertson (Short History of Free Thought) points out, he had great influence upon Bentham, and C. Beccaria states that he himself was largely inspired by Helvétius in his attempt to modify penal laws. The keynote of his thought was
that public ethics has a utilitarian basis, and he insisted strongly on the importance of culture in national development. He wrote the De l'homme, de ses facultes intellectuelles et de son education (Eng. trans. by W. Hooper, 1777), found among his manuscripts, was published after his death, but created little interest. There is a notable position of the History of the Scottish Philosophy, Edinburgh, 1835. For an estimate of his work and his place among the philosophers of the 18th century see Victor Cousin’s Philosophie sensualiste (1865); P. L. Lezaud, Resume philosophique (1853); M. F. G. Diderot and the Encyclopedist (London, 1878); D. G. Mostratos, Die Pädagogik des Herodes (Berlin, 1891); A. Guillou, Le Salon de Madame Helvetius (1894), and finally L. A. J. Herodotus, Historia, 5th ed. by A. Heil (Miami, 1889); G. Plehakoff, Beiträge zur Geschichte des Materialismus (Stuttgart, 1896); L. Lamentani, Le Teoré psicologique de C. A. Helvetius (Verona, 1902); A. Kein, Helvetius, so vie et son œuvre (1897).

HELVIDIUS PRISCUS. Stoic philosopher and statesman, lived during the reigns of Nero, Galba, Otho, Vitellius and Vespasian. Like his father’s request by Herennius Puteius, he was distinguished for his ardent and courageous republicanism. Although he repeatedly defended his rulers, he held several high offices. During Nero’s reign he was quaestor of Achaean and tribune of the plebs (A.D. 56); he restored peace and order in Armenia, and gained the respect and confidence of the provincials. His declared sympathy with Brutus and Cassius occasioned his banishment in 66. Having been recalled to Rome by Galba in 68, he attacked the praetor C. Piso Marcellus, the accuser of Thrasea Paetus, but dropped the charge, as the condemnation of Marcellus would have involved a number of senators. As praetor elect he ventured to oppose Vitellius in the senate (Tacitus, Hist. ii. 91), and as praetor (20) he maintained, in opposition to Vespasian, that the management of the finances ought to be left to the discretion of the senate; he proposed that the capital, which had been destroyed in the Neronian conflagration, should be restored at the public expense; he saluted Vespasian by his private name, and did not recognize him as emperor in his praetorian edicts. At length he was banished a second time, and shortly afterwards was executed by Vespasian’s order. His life, in the form of a warm panegyric, written at his widow’s request by Herennius Senecio, caused its author’s death in the reign of Domitian.

HELY-HUTCHINSON, JOHN (1724–1794), Irish lawyer, statesman, and provost of Trinity College, Dublin, son of Francis Hely, a gentleman of County Cork, was educated at Trinity College, Dublin, and was called to the Irish bar in 1748. He took the additional name of Hutchinson on his marriage in 1751 with Christiana Nixon, heiress of his uncle, Richard Hutchinson. He was elected member of the Irish House of Commons for the borough of Lanesborough in 1759, but after 1761 he represented the city of Cork. He first attached himself to the “patriotic” party in opposition to the government, and although he afterwards joined the administration he never abandoned his advocacy of popular measures. He was a man of brilliant and versatile ability, whom Lord Townshend, the lord lieutenant, described as “by far the most powerful man in parliament.” William Gerard Hamilton said of him that “Ireland never bred a more able, nor any country a more honest man.” Hely-Hutchinson was, however, an inveterate place-hunter, and there was point in Lord North’s vitriolism that “if you were to give him the whole of Great Britain and Ireland for an estate, he would ask the Isle of Man for a potato garden.” After a session or two in parliament he was made a judge of the Exchequer and in 1768, at this time he gave a general, though by no means invincible, support to the government. In 1769 the ministry contemplated an increase of the army establishment in Ireland from 12,000 to 15,000 men, but the Augmentation Bill met with strenuous opposition, not only from Flood, Ponsonby and the habitual opponents of the government, but from the Under-takers, or priebritors of boroughs, on whom the government had hitherto relied to secure them a majority in the House of Commons. It therefore became necessary for Lord Townshend to turn to other methods for procuring support. Early in 1768 an English act was passed for the increase of the army, and a message from the king setting forth the necessity for the measure was laid before the House of Commons in Dublin. An address favourable to the government policy was, however, rejected; and Hely-Hutchinson, together with the speaker and the attorney-general, did their utmost both in public and private to obstruct the bill. Parliament was dissolved in May 1768, and the lord lieutenant set about the task of purchasing or otherwise securing a majority in the new parliament. Peerages, pensions and places were bestowed lavishly on those whose support could be thereby obtained. Hely-Hutchinson was won over; and although the Irish army should be established by the authority of an Irish act of parliament instead of an English one. The Augmentation Bill was carried in the session of 1769 by a large majority. Hely-Hutchinson’s support had been so valuable that he received as reward an addition of £1,000 a year to the salary of his sinecure of Alnagar, a major’s commission in a cavalry regiment, and a promise of the secretarieship of state. He was at this time one of the most brilliant debaters in the Irish parliament, and he was enjoying an exceedingly lucrative practice at the bar. This increased power, together with his wealth and his station as a member of parliament, caused him to be called upon to fill the place as prime minister, he surrendered in 1774, to become provost of Trinity College, although the statute requiring the provost to be in holy orders had to be dispensed with in his favour.

For this great academic position Hely-Hutchinson was in no way qualified, and his appointment to it for purely political service to the government was justly criticized with much asperity. His conduct in using his position as provost to secure the parliamentary representation of the university for his eldest son brought him into conflict with Dulugenon, who attacked him in Lacaemae academicae, and involved him in a duel with Mr. Doyle; while a similar attempt on behalf of his second son in 1790 led to his being accused before a select committee of the House of Commons of impropriety as returning officer. But although without scholarship Hely-Hutchinson was an efficient provost, during whose rule material benefits were conferred on Trinity College. He continued to occupy a prominent place in parliament, where he advocated free trade, the relief of the Catholics from penal legislation, and the reform of parliament. He was one of the very earliest politicians to recognize the necessity of Adam Smith’s views on free trade; and he quoted from the Wealth of Nations, adopting some of its principles, in his Commercial Restraints of Ireland, published in 1779, which Lecky pronounces “one of the best specimens of political literature produced in Ireland in the latter half of the 18th century.” In the same year, the economic condition of Ireland being the cause of great anxiety, the government solicited from several leading politicians their opinion on the state of the country with suggestions for a remedy. Hely-Hutchinson’s response was a remarkably able state paper (MS. in the Record Office), which also showed clear traces of the influence of Adam Smith. The Commercial Restraints, condemned by the authorities as seditious, went far to restore Hely-Hutchinson’s popularity which had been damaged by his greed of office. Not less enlightened were his views on the Catholic question. In a speech in parliament on Catholic education in 1782 the provost declared that Catholic students were in fact to be found at Trinity College, but that he desired their presence there to be legalized on the largest scale. “My opinion,” he said, “is strongly against sending Roman Catholics abroad for education, nor would I establish Popish colleges at home. The advantage of being admitted into the university of Dublin will be very great at present; and if they need not be obliged to attend the Divinity professor, they may have one of their own; and I would have a part of the public money applied to their use, to the support of a number of poor lads as sizars, and to provide premiums for persons of merit, for I would have them go into examinations and make no distinction between them and the Protestants but such as merit might claim.” And after sketching a scheme for increasing the number of diocesan schools where Roman Catholics might receive free education, he went on to
urge that "it is certainly a matter of importance that the education of their priests should be as perfect as possible, and that if they have any prejudices they should be prejudices in favour of their own country. The Roman Catholics should receive the best education in the established university at the public expense; but by no means should Popish colleges be allowed, for by them we should again have the press groaning with themes of controversy, and subjects of religious disputation that have long slept in oblivion would again awake, and awaken with them all the worst passions of the human mind."  

In 1777 Hely-Hutchinson became secretary of state. When Grattan in 1782 moved an address to the king containing a declaration of Irish legislative independence, Hely-Hutchinson supported the attorney-general's motion postponing the question; but on the 16th of April, after the Easter recess, he read a message from the lord lieutenant, the duke of Portland, giving the king's permission for the House to take the matter into consideration, and he expressed his personal sympathy with the popular cause which Grattan on the same day brought to a triumphant issue (see Grattan, Henry). Hely-Hutchinson supported the opposition on the regency question in 1788, and one of his last votes in the House was in favour of parliamentary reform. In 1790 he exchanged the constituency of Cork for that of Waterford in County Wexford, for which borough he remained member till his death at Buxton on the 4th of September 1794.

In 1785 his wife had been created Baroness Donoughmore and on her death in 1788, his eldest son Richard (1756–1825) succeeded to the title. Lord Donoughmore was an ardent advocate of Catholic emancipation. In 1797 he was created Viscount Donoughmore, and in 1800 (having voted for the Union, hoping to secure Catholic emancipation from the united parliament) he was further created earl of Donoughmore of Knocklofty, being succeeded first by his brother John Hely-Hutchinson (1757–1832) and then by his nephew John, 3rd earl (1785–1851), from whom the title descended.

(R. J. M.)

HELYOT, PIERRE (1660–1716), Franciscan friar and historian, was born at Paris in January 1660, of supposed English parentage, by a Creole mother. After spending his youth in Paris, he entered the twenty-fourth year of the third order of St Francis, founded at Picpus, near Paris, by his uncle Jérôme Helyot, canon of St Sepulchre. There he took the name of Père Hippolyte. Two journeys to Rome on monastic business afforded him the opportunity of travelling over most of Italy; and after his final return he saw much of France, while acting as secretary to various provincials of his order there. Both in Italy and France he was engaged in collecting materials for his great work, which occupied him about twenty-five years, L'Histoire des ordres monastiques, religieux, et militaires, et des congrégations séculières, de l'un et de l'autre sexe, qui ont été établies jusqu'à présent, published in 8 volumes in 1714–1721. Helyot died on the 5th of January 1716, before the fifth volume appeared, but his works were afterwards edited. His other noteworthy work is Le Chrétien mourant (1695). The Histoire is a work of first importance, being the great repository of information for the general history of the religious orders up to the end of the 17th century. It is profusely illustrated by large plates.
HEMEL HEMPSTEAD—HEMICHORDA

which appeared a year later with the "Lays of Many Lands" and miscellaneous pieces collected from the New Monthly Magazine and other periodicals.

In the spring of 1825 Mrs Hemans removed from Bronwylla, which had been purchased by her brother, to Ryhallon, a house on an opposite height across the river Clywd. The contrast between the two houses suggested her Dramatic Scene between Bronwylla and Ryhallon. The house itself was bare and un Picturesque, but the beauty of its surroundings has been celebrated in "The Hour of Romance," "To the River Clywd in North Wales," "Our Lady's Well," and "To a Distant Scene." This time seems to have been the most tranquil in Mrs Hemans's life. But the death of her mother in January 1827 was a second great breaking-point in her life. Her heart was affected, and she was from this time an acknowledged invalid. In the summer of 1828 the Records of Woman was published by Blackwood, and in the same year the home in Wales was finally broken up by the marriage of Mrs Hemans's sister and the departure of her two elder boys to their father in Rome. Mrs Hemans removed to Wavertree, near Liverpool. But, although she had a few intimate friends there—among them her two subsequent biographers, Henry F. Chorley and Mrs Lawrence of Wavertree Hall—she was disappointed in her new home. She thought the people of Liverpool stupid and provincial; and they, on the other hand, found her uncommunicative and eccentric. In the following January she sailed by sea to Scotland with two of her boys, to visit the Hamiltons of Chiefphaw.

Here she enjoyed "constant, almost daily, intercourse" with Sir Walter Scott, with whom she and her boys afterwards stayed some time at Abbotsford. "There are some whom we meet, and should like ever after to claim as kith and kin; and you are one of those," was Scott's compliment to her at parting. One of the results of her Edinburgh visit was an article, full of praise, judiciously tempered with criticism, by Jeffrey himself for the Edinburgh Review. Mrs Hemans returned to Wavertree to write her Songs of the Afflicted, which were published early in 1830. In the following June, however, she again left home, this time to visit Wordsworth and the Lake country; and in August she paid a second visit to Scotland. In 1831 she removed to Dublin. Her poetry of this date is chiefly religious. Early in 1834 her Hymns for Childhood, which had appeared some years before in America, were published in Dublin. At the same time appeared her collection of National Lyrics, and shortly afterwards Scenes and Hymns of Life. She was planning also a series of German studies, one of which, on Goethe's Tasso, was completed and published in the New Monthly Magazine for January 1834. In the interval she added to her Lyric Dependency and Aspiration, and dictated a series of sonnets called Thoughts during Sickness, the last of which, "Recovery," was written when she fancied she was getting well. After three months spent at Redesdale, Archbishop Whately's county seat, she was again brought into Dublin, where she lingered till spring. Her last poem, the Sabbath Sonnet, was dedicated to her brother on Sunday April 26th, and she died in Dublin on the 16th of May 1835 at the age of forty-one.

Mrs Hemans's poetry is the production of a fine imaginative and intense temperament, not of a commonplace intellect or very complex or subtle nature. It is the outcome of a beautiful but singularly circumscribed life, a life spent in romantic seclusion, without much worldly experience, and warped and saddened by domestic unhappiness and physical suffering. An undue preponderance of the emotional is its prevailing characteristic. Scott complained that it was "too poetical," that it contained "too many flowers" and "too little fruit." Many of her short poems, such as "The Treasures of the Deep," "The Better Land," "The Homes of England," "Cassadine," "The Palm Tree," "The Graves of a Household," "The Wreck," "The Dying Improbator," and "The Lost Pleiad," have become standard English lyrics. It is on the strength of these that her reputation must rest.

Mrs Hemans's Poetical Works were collected in 1832; her Memorials &c., by H. F. Chorley (1836).

HEMEL HEMPSTEAD, a market-town and municipal borough in the Watford parliamentary division of Hertfordshire, England, 25 m. N.W. from London, with a station on a branch of the Midland railway from Harpenden, and near Boxmoor station on the London and North Western main line. Pop. (1891) 6078; (1901) 11,264. It is pleasantly situated in the steep-sided valley of the river Gade, immediately above its junction with the Bulbourne, near the Grand Junction canal. The church of St Mary is a very fine Norman building with Decorated additions. Industries include the manufacture of paper, iron foundling, brewing and tanning. Boxmoor, within the parish, is a considerable township of modern growth. Hemel Hempstead is governed by a mayor, 6 aldermen and 15 councillors. Area, 7184 acres.

The elements in the neighbourhood of Hemel Hempstead (Hamalomatude, Hemel Hempested) date from pre-Roman times, and a Roman villa has been discovered at Boxmoor. The manor, royal demesne in 886, was granted by Edmund Plantagenet in 1285 to the house of Ashridge, and the town developed under monastic protection. In 1359 a charter incorporated the bailiff and inhabitants. A mayor, aldermen and councillors received governing power by a charter of 1898. The town has never had parliamentary representation. A market on Thursday and a fair on the feast of Corpus Christi were conferred in 1359. A statute fair, long for licensing hiring fairs, originated in 1803.

HEMEROBAPTISTS. An agricultural community, Jews, formed from their observing a practice of daily ablution as an essential part of religion. Epiphanius (Panarion, i. 17), who mentions their doctrine as the fourth heresy among the Jews, classes the Hemerobaptists doctrinally with the Pharisaeus (v. 26) from whom they differed only in, like the Sadducees, denying the resurrection of the dead. The name has been sometimes given to the Mandaeans on account of their frequent ablutions; and in the Clementine Homilies (ii. 23) St John the Baptist is spoken of as a Hemero- baptist. Mention of the sect is made by Hegesippus (see Euseb. Hist. Eccl. iv. 22) and by Justin Martyr in the Dialogue with Trypho, § 80. They were probably a division of the Essenes.

HEMICHORDA, or Hemichordata, a zoological term introduced by W. Bateson in 1884, without special definition, as equivalent to Enteropneusta, which then included the single genus Balanoglossus, and now generally employed to cover a group of marine worm-like animals believed by many zoologists to be related to the lower vertebrates and so to represent the invertebrate stock from which Vertebrates have been derived. Vertebrates, or as they are sometimes termed Chordates, are distinguished from other animals by several important features. The first feature of significance is the presence of an elastic rod, the notochord, which forms the longitudinal axis of the body, and which persists throughout life in some of the lowest forms, but which appears only in the embryo of the higher forms, being replaced by the jointed backbone or vertebral column. A second feature is the development of outgrowths of the pharynx which unite with the skin of the neck and form a series of perforations leading to the exterior. These structures are the gill-slits, which in fishes are lined with vascular tufts, but which in terrestrial breathing animals appear only in the embryo. The third feature of significance is the reduction of the central nervous system, which in all the Chordates lies dorsally to the alimentary canal and is formed by the sinking in of a longitudinal media dorsal groove. Of these structures the Vertebrata or Craneiata possess all three in a typical form; the Cephalochordata (see Amphioxus) also possess them, but the notochord extends throughout the whole length of the body to the extreme tip of the snout; the Urochordata (see Tunicata) possess them in a larval condition, but the notochord is present only in the tail, whilst in the adult the notochord disappears and the nervous system becomes profoundly modified; in the Hemichorda, the respiratory organs occupy the closely resemble gill-slits, and structures comparable with the notochord and the tubular dorsal nervous system are present.

The Hemichorda include three orders, the Phoronidea (g.v.), the Pterobranchia (g.v.) and the Enteropneusta (see Balano-
Hemicycle—Hemiptera

closus), but the relationship to the Chordata expressed in the designation Hemichordata cannot be regarded as more than an attractive theory with certain arguments in its favour. (P. C. M.)

Hemicycle (Gr. ἡμίκύκλος, half, and κύκλος, circle), a semi-
circular recess of considerable size which formed one of the most
conspicuous features in the Roman Thermæ, where it was
always covered with a hemispherical vault. A small example
exists in Pompeii, in the street of tombs, with a seat round inside,
where those who came to pay their respects to the departed
could rest. An immense hemicycle was designed by Bramante
for the Vatican, where it constitutes a fine architectural effect
at the end of the great court.

Hemimerus, an Orthopterous or Dermapterous insect, the
sole representative of the family Hemimeridae, which has affinities
with both the Forficulidae (earwigs) and the Blattidae (cock-
rcoaches). Only two species have been discovered, both from
West Africa. The better known of these (H. hanseni) lives upon
a large rat-like rodent (Cricetomys gambianus) feeding perhaps
upon its external parasites, perhaps upon scurf and other dermal
products. Like many epizooic or parasitic insects, Hemimerus
is wingless, eyeless and has relatively short and strong legs.
Correlated also with a mode of life is the viviparous, ovipara,
and viviparous, the young being born in an advanced stage of
growth.

Hemimorphite, a mineral consisting of hydrous zinc
silicate, HZnSiO₄, of importance as an ore of the metal, of
which it contains 54.4%.

It is interesting crystallographically by reason of the hemimorphic
development of its orthorhombic crystals; these are prismatic in habit and are
differently terminated at the two ends. In

The figure, the faces at the upper end of the
-crystal are the basal plane $k$ and the domes $a, \ p, \ i, \ m,$ whilst at the lower end there are
-only the four faces of the pyramid $p$. Con-

nected with this polarity of the crystals is

their pyroelectric character—when a crystal

is subjected to changes of temperature it

becomes positively electrified at one end and

negatively at the opposite end. There are per-
fet cleavages parallel to the prism faces $d$ (in the

figure). Crystals are usually colourless, some-
times yellowish or greenish, and transparent;

they have vitreous lustre. The hardness is 5, and the specific

gravity 3.45. The mineral also occurs as stalactitic or botryoidal

masses with a fibrous structure, or in a massive, cellular or

granular condition intermixed with calamine and clay. It is
decomposed by hydrochloric acid with gelatinization; this

property affords a ready means of distinguishing hemimorphite

from calamine (zinc carbonate); these two minerals being

nearly not crystallized, very like each other in appearance.

The water contained in hemimorphite is expelled only at a red heat, and the

mineral must therefore be considered as a basic metasilicate, (ZnOH)₂SiO₄.

The name hemimorphite was given by G. A. Kennett in 1853

because of the typical hemimorphic development of the crystals.

The mineral had long been confused with calamine (q.v.) and
even now this name is often applied to it. On account of its

pyroelectric properties, it was called electric calamine by J. Smithson

in 1803.

Hemimorphite occurs with other ores of zinc (calamine and
blende), forming veins and beds in sedimentary limestones.

British localities are Matlock, Alston, Mendip Hills and Lead-
hills; at Roughten Gill, Caldbec Fells, Cumberland, it occurs as

mрамировано incrustedations of a sky-blue colour. Well-crystallized

specimens have been found in the zinc mines at Altenberg near

Aachen in Rhenish Prussia, Nerchinsk mining district in Siberia,

and Elkhorn in Montana.

(L. J. S.)

Hemimorphite, Walter of, also commonly, but errone-
ously, called Walter Hemingham, a Latin chronicler of the
14th century, was a canon regular of the Austin priory of Gisburn
in Yorkshire. Hence he is sometimes known as Walter of Gisburn
(Walterus Gisburnensis). Bale seems to have been the first to
give the name by which he became more commonly known.

His chronicle embraces the period of English history from the
Conquest (1066) to the nineteenth year of Edward III., with
the exception of the years 1316–1326. It ends with the title of a
chapter in which it was proposed to describe the battle of Crecy
(1346); but the chronicler seems to have died before the required
information reached him. There is, however, some controversy
as to whether the later portions which are lacking in some of the
 MSS. are by him. In compiling the first part, Hemingburgh
apparently used the histories of Etalmer, Hoveden, Henry of
Huntingdon, and William of Newburgh; but the reigns of the
three Edwards are original, composed from personal observation
and information. There are several manuscripts of the history
extent—the best perhaps being that presented to the College of
Arms by the earl of Arundel. The work is correct and judicious,
and written in a pleasing style. One of its special features is the
preservation in its pages of copies of the great charters, and
Hemingburgh's versions have more than once supplied deficiencies
and cleared up obscurities in copies from other sources.

The first three books were published by Thomas Gale in 1687, in
his Historiae Anglicanae scripturese quinta, and the remainder by
Thomas Hearne in 1731. The first portion was again published in
1818 by the English Historical Society, under the title Chronicle
Writings of the British Monarchs, from the Time of Edward
nuncupata, de gestis regum Angliae, edited by H. C. Hamilton.

Hemiptera (Gr. ἡμιπτέρα, half and πτέρων, a wing), the name
applied in zoological classification to that order of the class
Hexapoda (q.v.) which includes bugs, cicadas, aphids and scale-

insects. The name was first used by Linnæus (1735), who
derived it from the half-coriaceous and half-membranous con
dition of the forewing in many members of the order. But the
wings vary considerably in different families, and the most dis-
tinctive feature is the structure of the jaws, which form a beak-
like organ with stylets adapted for piercing and sucking. Hence
the name Rhyngota (or Rynkotha), proposed by J. C. Fabricius
(1775), is used by many writers in preference to Hemiptera.

Structure. The head varies greatly in shape, and the feelers
have usually but few segments—often only four or five. The
arrangement of the jaws is remarkably constant throughout
the order, if we exclude from it the lice (Anopluæ). Taking as
our type the head of a cicada, we find a jointed rostrum or beak
(figs. 1 and 2, IV, b, c) with a deep groove on its anterior face;

this organ is formed by the second pair of maxillae and
corresponds therefore to the labium or 'lower lip of biting insects.

Within the groove of the rostrum two pairs of slender piercers
are often barbed at the tip—work to and fro. One of these
pairs (fig. 2, II, a, b, c) represents the mandibles, the other
(fig. 2, III, a, b, c) the first maxillae. The piercing portions of the
latter—representing their inner lobes or laciniae—lie median to the man-

dible piercers in the natural position of the organs. These homologies
of the hemipterous jaws IV. Second maxillae forming rostrum.
were determined by J. C. V., Pronotum.

Savigny in 1816, and though disputed by various subsequent
writers, they have been lately confirmed by the embryological
researches of R. Heymons (1899). Vestigial palps have been
described in various species of Hemiptera, but the true nature
of these structures is doubtful. In front of the rostrum and the
piercers lies the pointed flexible labrum and within its base a
small hypopharynx (fig. 2, IV, d) consisting of paired conical
processes which lie dorsal to the 'syringe' of the salivary

glands. This latter organ injects a secretion into the plant or

animal tissue from which the insect is sucking. The point of the rostrum is pressed against the surface to be pierced; then the stylets come into play and the fluid food is believed to pass into the mouth by capillary attraction.

The prothorax (Figs. 1 and 2, V.) in HEMIPTERA is large and free, and the mesothoracic scutellum is usually extensive. The number of tarsal segments is reduced; often three, two or only one may be present instead of the typical insectan number five. The wings will be described in connexion with the various sub-orders, but an interesting peculiarity of the HEMIPTERA is the occasional presence of winged and wingless races of the same species. Eleven abdominal segments can be recognized, at least in the early stages; as the adult condition is reached, the hinder segments become reduced or modified in connexion with the external reproductive organs, and show, in some male HEMIPTERA, a marked asymmetry. The typical insectan ovipositor with its three pairs of processes, one pair belonging to the eighth and two pairs to the ninth abdominal segment, can be distinguished in the female.

In the nervous system the concentration of the trunk ganglia in many HEMIPTERA. In the adult there is a pair of such glands opening ventrally on the hindmost thoracic segment, and at the base of the abdomen; but in the young insect the glands are situated dorsally and open to the exterior on a variable number of the abdominal terga.

Development.—In most HEMIPTERA the young insect (Fig. 3) resembles its parents except for the absence of wings, and is active through all stages of its growth. In all HEMIPTERA the wing-rudiments develop externally on the nymphal cuticle, but in some families—the cicads for example—the young insect (Fig. 10) is a larva differing markedly in form from its parent, and adapted for a different mode of life, while the nymph before the final moult is sluggish and inactive. In the male Cicadae (Scale-insects) the nymph (Fig. 4) remains passive and takes no food. The order of the HEMIPTERA affords, therefore, some interesting transition stages towards the complete metamorphosis of the higher insects.

Distribution and Habits.—HEMIPTERA are widely distributed, and are plentiful in most quarters of the globe, though they probably have not penetrated as far into remote and inhospitable regions as have the Coleoptera, Diptera and Aptera. They feed entirely by suction, and the majority of the species pierce plant tissues and suck sap. The leaves of plants are for the most part the objects of attack, but many aphids and scale-insects pierce stems, and some go underground and feed on roots. The enormous rate at which aphids multiply under favourable conditions makes them of the greatest economic importance, since the growth of immense numbers of the same kind of plant in close proximity—as in ordinary farm-crops—is especially advantageous to the insects that feed on them. Several families of bugs are pre-
daceous in habit, attacking other insects—often members of their own order—and sucking their juices. Others are scavengers feeding on decaying organic matter; the pond skaters, for example, live mostly on the juices of dead floating insects. And some, like the bed-bugs, are parasites of vertebrate animals, on whose bodies they live temporarily or permanently, and whose blood they suck.

The HEMIPTERA are especially interesting as an order from the variety of aquatic insects included therein. Some of these—the Hydrometridae or pond-skaters, for example—move over the surface-film, on which they are supported by their elongated, slender legs, the body of the insect being raised clear of the water. They are covered with short hairs which form a velvet-like pile, so dense that water cannot penetrate. Consequently when the insect dives, an air-bubble forms around it, a supply of oxygen is thus secured for breathing and the water is kept away from the spiracles. In many of these insects, while most individuals of the species are wingless, winged specimens are now and then met with. The occasional development of wings is probably of service to the species in enabling the insects to reach new freshwater-breeding-grounds. This family of HEMIPTERA (the Hydrometridae) and the Saldidae contain several insects that are marine, haunting the tidal margin. One genus of Hydrometridae (Halobates) is even oceanic in its habit, the species being met with in skimming over the surface of the seas hundreds of miles from land. Probably they dive when the surface becomes ruffled. In these marine genera the abdomen often undergoes excessive reduction (Fig. 5).

Other families of HEMIPTERA—such as the “Boatmen” (Notonectidae) and the “Water-scorpions” (Fig. 6) and their allies (Neptiidae) dive and swim through the water. They obtain their supply of air from the surface. The Neptiidae breathe by means of a pair of long, grooved tail processes (realy out-growths
of the abdominal pleura) which when pressed together form a tube whose point can pierce the surface film and convey air to the hindmost spiracles which are alone functional in the adult. The Notonectidae breathe mostly through the thoracic spiracles; the air is conveyed to these from the tail-end, which is brought to the surface, along a kind of tunnel formed by overlapping hairs.

**Sound-producing Organs.**—The Hemiptera are remarkable for the variety of their stridulating organs. In many genera of the Pentatomidae, bristle-bearing tubercles on the legs are scraped across a set of fine striations on the abdominal sterna. In Halobates a comb-like series of sharp spines on the fore-shin can be drawn across a set of blunt processes on the shin of the opposite leg. Males of the little water-bugs of the genus Corixa make a shrill chirping note by drawing a row of teeth on the flattened fore-foot across a group of spines on the haunch of the opposite leg. But the loudest and most remarkable vocal organs of all insects are those of the male cicadas, which "sing" by the rapid vibration of a pair of "drums" or membranes within the metastomorax. These drums are worked by special muscles, and the cavities in which they lie are protected by conspicuous plates visible beneath the base of the abdomen (see fig. 7).

**Fossil History.**—The Heteroptera can be traced back farther than any other winged insects if the fossil Protocixus silurica Moberg, from the Ordovician slates of Sweden is rightly regarded as the wing of a bug. But according to the recent researches of A. Handlirsch it is not insectan at all. Both Heteropterous and Homopterous genera have been described from the Carboniferous, but the true nature of some of these is doubtful. Eugeerobius is a remarkable Permian fossil, with jaws that are typically hemipterous except that the second maxillae are not fused and with cockroach-like wings. In the Jurassic period many of the existing families, such as the Cicadidae, Fulgoridae, Aphidae, Nipidae, Reduviidae, Hydrometridae, Lygaeidae and Coreidae, had already become differentiated.

**Classification.**—The number of described species of Hemiptera must now be nearly 20,000. The order is divided into two sub-orders, the Heteroptera and the Homoptera. The Anoplura or lice should not be included among the Hemiptera, but it has been thought convenient to refer briefly to them at the close of this article.

**Heteroptera.**

In this sub-order are included the various families of bugs and their aquatic relations. The front of the head is not in contact with the haunches of the fore-legs. There is usually a marked difference between the wings of the two pairs. The fore-wing is generally divided into a firm coriaceous basal region, occupying most of the area, and a membranous terminal portion, while the hind-wing is delicate and entirely membranous (see fig. 6). In the firm portion of the fore-wing two distinct regions can usually be distinguished: most of the area is formed by the corium (fig. 6, 6), which is separated by a longitudinal suture from the clavus (fig. 6, 6), on its hinder edge, and in some families there is also a cuneus (fig. 9 c) external to and an embolium in front of the corium.

Most Heteroptera are flattened in form, and the wings lie flat, or nearly so, when closed. The young Heteropteron is hatched from the egg in a form not markedly different from that of its parent; it is active and takes food through all the stages of its growth. It is usual to divide the Heteroptera into two tribes—the Gymnocerata and the Cryptocerata.

**Gymnocerata.**—This tribe includes some eighteen families of terrestrial, arboreal and marsh-haunting bugs, as well as those aquatic Heteroptera that live on the surface-film of water. The feelers are elongate and conspicuous. The Pentatomidae (shield-bugs), some of which are metallic or otherwise brightly coloured, are easily recognised by the great development of the scutellum, which reaches at least half-way back towards the tip of the abdomen, and in some genera covers the whole of the hind body, and also the wings when these are closed. The Coreidae have a smaller scutellum, and the feelers are inserted high on the head, while in the Lygaeidae they are inserted lower down. These three families have the foot with three segments. In the curious little Tingidae, whose integuments exhibit a pattern of network-like ridges, the feet are two-segmented and the scutellum is hidden by the pronotum. The Aradidae have two-segmented feet, and a large visible scutellum. The Hydrometridae are a large family including the pond-skaters and other dwellers on the surface-film of fresh water, as well as the remarkable oceanic genus Halobates already referred to. The Reduviidae are...
a family of predaceous bugs that attack other insects and suck their juices; the beak is short, and carried under the head in a hand-like curve, not—as in the preceding families—lying close against the breast. The Cimicidae have the feet three-segmented and the forewings greatly reduced; most of the species are parasites on birds and bats, but one—Cimex lectularius (fig. 7)—is the well-known "bed-bug" which abounds in unclean dwellings and sucks human blood (see Bed-bug). The Anthocoridae are nearly related to the Cimicidae, but the wings are usually well developed and the forewings possess cuneus and embolium as well as corium and clavus. The Capsidae are a large family of rather soft-skinned bugs mostly elongate in form with the two basal segments of the feelers stouter than the two terminal. The forewing in this family has a cuneus (fig. 9 c), but not an embolium. These insects are often found in large numbers on plants whose juices they suck.

_Cryptocercida_—In this tribe are included five or six families of aquatic Heteroptera which spend the greater part of their lives submerged, diving and swimming through the water. The feelers are very small and are often hidden in cavities beneath the head. The _Nasocoridae_ and _Belostomatidae_ are flattened insects, with four-segmented feelers and fore-legs inserted at the front of the pronotum. Two species of the former family inhabit our islands, but the _Belostomatidae_ are found only in the warmer regions of the globe; some of them, attaining a length of 4 to 5 in., are giants among insects. The _Nepidae_ (fig. 6) or water-scorpions are distinguished by their three-segmented feelers, their raptorial fore-legs, and their long slender hind-legs. These insects are admirably adapted for aquatic life. By means of the ear-like hind-legs they swim actively through the water with the ventral surface upwards; the fore-legs are inserted at the hinder edge of the prothorax. The _Corixidae_ are small flattened water-bugs, with a short unjointed beak, the labrum being enclosed within the second maxillae, and the foot in the fore and intermediate leg having but a single segment. The hinder abdominal segments in the male show a curious asymmetrical arrangement, the sixth segment bearing on its upper side a small stalked plate (stigil) of unknown function, furnished with rows of teeth. On account of the reduction and modification of the jaws in the _Corixidae_, C. Börner has lately suggested that they should form a special sub-order of Hemiptera—the Sandaliorrhyncha.

**HEMIPTERA**

This sub-order includes the cicadas, lantern-flies, froghoppers, aphids and scale-insects. The face has such a marked backward slope (see fig. 1) as to bring the beak into close contact with the haunches of the fore-legs. The feelers have one or more thickened basal segments, while the remaining segments are slender and thread-like. The fore-wings are sometimes membranous like the hind-wings, usually they are firmer in texture, but they never show the distinct areas that characterize the wings of Heteroptera. When at rest the wings of Homoptera slope roof-wise across the back of the insect. In their life-history the Homoptera are more specialized than the Heteroptera; the young insect often differs markedly from its parent and does not live in the same situations; while in some families there is a passive stage before the last moult.

The Cicadidae are for the most part large insects with ample wings; they are distinguished from other Homoptera by the front thighs being thickened and toothed beneath. The broad head carries, in addition to the prominent compound eyes, three simple eyes (ocelli) on the crown, while the feeler consists of a stout basal segment, followed by five slender segments. The female, by means of her serrated ovipositor, lays her eggs in slits cut in the twigs of plants. The young have simple feelers and stout fore-legs (fig. 10) adapted for digging; they live underground and feed on the roots of plants.

**Homoptera**

This sub-order includes the cicadas, lantern-flies, froghoppers, aphids and scale-insects. The face has such a marked backward slope (see fig. 1) as to bring the beak into close contact with the haunches of the fore-legs. The feelers have one or more thickened basal segments, while the remaining segments are slender and thread-like. The fore-wings are sometimes membranous like the hind-wings, usually they are firmer in texture, but they never show the distinct areas that characterize the wings of Heteroptera. When at rest the wings of Homoptera slope roof-wise across the back of the insect. In their life-history the Homoptera are more specialized than the Heteroptera; the young insect often differs markedly from its parent and does not live in the same situations; while in some families there is a passive stage before the last moult.

The Cicadidae are for the most part large insects with ample wings; they are distinguished from other Homoptera by the front thighs being thickened and toothed beneath. The broad head carries, in addition to the prominent compound eyes, three simple eyes (ocelli) on the crown, while the feeler consists of a stout basal segment, followed by five slender segments. The young have simple feelers and stout fore-legs (fig. 10) adapted for digging; they live underground and feed on the roots of plants.

**Fig. 11.—Cabbage Aphid (Aphis brassicae), a, Male; c, female (wingless). Magnified. b and d, Head and feelers of male and female, more highly magnified.**

**Fig. 12.—Apple Scale Insect (Mytilaspís pomorum), a, Male; e, female; c, larva, magnified 20 times; b, foot of male; d, feeler of larva, more highly magnified.**

In the case of a North American species it is known that this larval life lasts for seventeen years. The "song" of the male cicads is notorious and the structures by which it is produced have already been described (see also Cicada). There are about 900 known species, but the family is mostly confined to warm countries; only a single cicad is found in England, and that is restricted to the south. The Fulgoridae and Membracidae are two allied families most of whose members are also natives of hot regions. The Fulgoridae...
The Anoplura or lice (see LOUSE) are wingless parasitic insects (fig. 14) forming an order distinct from the Hemiptera, their sucking and piercing mouth-organs being apparently formed on quite a different plan from those of the Homoptera or Homoptera. In front of the head is a short tubule armed with strong teeth which can be fixed into the skin of the host, and from the tube an elongate, more slender sucking-trunk can be protruded (fig. 15). Each foot is provided with a single strong claw-like organ, opposed to a process on the shin, serves to grasp a hair of the host, all these organs being parasites on different mammals. Although G. Enderlein has recently shown that the jaws of the Hemiptera can be recognized in the lice, and some authors have been led to suppose that the lice were evolved from the Hemiptera, the modification is so excessive that the group certainly deserves ordinal separation.

HEMLOCK (in O. Eng. hematic or hydraulic; no cognate is found in any other language, and the origin is unknown), the Conium maculatum of botanists, a biennial umbelliferous plant, found wild in many parts of Great Britain and Ireland, where it occurs in waste places on hedge-banks, and by the borders of fields, and also widely spread over Europe and temperate Asia, and naturalized in the cultivated districts of North and South America. It is an erect, strong, and annual plant, with a well-marked, very high, and emitting a disagreeable smell, like that of mice. The stems are hollow, smooth, somewhat glaucous green, spotted with dull dark purple, as alluded to in the specific name, maculatum. The root-leaves have long furrowed footstalks, sheathing the stem at the base, and are large, triangular in outline, and repeatedly divided or compound, the ultimate and very numerous segments being small, ovate, and deeply incised at the edge. These leaves generally persist after the growth of the flowering stem, which takes place in the second year, while the leaves
produced on the stem became gradually smaller upwards. The branches are all terminated by compound many-rayed umbels of small white flowers, the general involucres consisting of several, the partial ones of about three short lanceolate bracts, the latter being usually turned towards the outside of the umbel. The flowers are succeeded by broadly ovate fruits, the mercarcaps (half-fruits) having five ribs which, when mature, are waved or crenated; and when cut across the albumen is seen to be deeply furrowed on the inner face, so as to exhibit in section a reiform outline. The fruits when triturated with a solution of caustic potash evolve a most unpleasant odour. Hemlock is not often employed, but it is much in potency according to the conditions under which it has grown, and the season or stage of growth at which it is gathered. In the first year the leaves have little power, nor in the second are their properties developed until the flowering period, at which time, or later on when the fruits are fully grown, the plant should be gathered. The wild plant growing in exposed situations is to be preferred to garden-grown samples, and is more potent in dry warm summers than in those which are dull and moist.

The poisonous property of hemlock resides chiefly in the aerial parts, especially the leaves; in which is the linear toxalbumen, called conlydrine, which may be converted into conine by the abstraction of the elements of water. When collected for medicinal purposes, for which both leaves and fruits are used, the former should be gathered at the time the plant is in full blossom, while the latter are said to possess the greatest degree of energy just before they ripen. The fruits are the chief source when the stock is prepared. The principal forms in which hemlock is employed are the extract and juice of hemlock, hemlock poultice, and the tincture of hemlock fruits. Large doses produce vertigo, nausea and paralysis, but in smaller quantities, administered by skilful hands, it has a sedative action on the nerves. It has also some reputation as an alterative and resolvent, and as an anodyne.

The acrid narcotic properties of the plant render it of some importance that one should be able to identify it, the more so as some of the compound-leaved umbrellifers, which have a general similarity (New Zealand salsify, which is neither flax nor hemp) are found for man and animals. Not only is this knowledge desirable to prevent the poisonous plant being detrimentally used in place of the wholesome one; it is equally important in the opposite case, namely, to prevent the inert being substituted for the remedial agent. The plant with which hemlock is most likely to be confounded is Anthriscus sylvestris, or cow-parsley, the leaves of which are freely eaten by cattle and rabbits; this plant, like the hemlock, has spotted stems but they are hairy, not hairless; it has much-divided leaves of the same general form, but they are downy and aromatic, not smooth and nauseous when bruised; and the fruit of Anthriscus is linear-oblong and not ovate.

HEMP (in O. Eng. henequin, cf. Dutch hennep, Ger. Hanf, cognate with Gr. κάνναβις, Lat. cannabis), an annual herb (Cannabis sativa) having angular rough stems and alternate deeply lobed leaves. The bast fibres of Cannabis are the hemp of commerce but, unfortunately, the products from many totally different plants are often included under the general name of hemp. In some cases the fibre is obtained from the stem, while in others it comes from the leaf. Sunn hemp, Manila hemp, Sisal hemp, and Phormium (New Zealand flax), which is neither flax nor hemp) are treated separately. All these, however, are often classed under the above general name, and so are the following—Deccan or Ambari hemp, Hibiscus cannabinus, an Indian and East Indian malicious plant, the fibre from which is often known as brown hemp or Bombay hemp; Piñé hemp, which is obtained from the American aloe, Agave americana; and Moorva or bowstring-hemp, Sansevieria zeylanica, which is obtained from an aloe-like plant, and is a native of India and Ceylon. Then there are Canada hemp, Apocynum cannabinum, Kentucky hemp, Urtica cannabina, and others.

The hemp plant, like the hop, which is of the same natural order, Cannabinaeae, is dioecious, i.e. the male and female flowers are borne on separate plants. The female plant grows to a greater height than the male, and its foliage is darker and more luxuriant, but the plant takes from five to six weeks longer to ripen. When the male plants are ripe they are pulled, put up into bundles, and steeped in a similar manner to flax, but the female plants are allowed to remain until the seed is perfectly ripe. They are then pulled, and after the seed has been removed segregated in the ordinary way. The seed is also a valuable product; the finest is kept for sowing, a large quantity is sold for the food of cage birds, while the remainder is sent to the oil mills to be crushed. The extracted oil is used in the manufacture of soap; while the solid remains, known as oil-cake, are valuable as a food for cattle. The leaves of hemp have five to seven leaflets, the form of which is lanceolate-acuminate, with a serrate margin. The loose panicles of male flowers, and the short spikes of female flowers, arise from the axils of the upper leaves. The height of the plant varies greatly with season, soil and other conditions, but it is commonly about 10 ft. high, and in the Piedmont province it is not unusual to see them from 8 to 16 ft. in height, whilst a variety (Cannabis setiva, variety gigantea) has produced specimens over 17 ft. in height.

All cultivated hemp belongs to the same species, Cannabis sativa; the special varieties such as Cannabis indica, Cannabis chinensis, &c., owe their differences to climate and soil, and they lose many of their peculiarities when cultivated in temperate regions. Rumplius (in the 17th century) had noticed these differences between Indian and European hemp.

Wild hemp still grows on the banks of the lower Ural, and the Volga, near the Caspian Sea. It extends to Persia, the Altai range and northern and western China. The authors of the Pharmacographia say:—"It is found in Kashmir and the Himalaya, growing 10 to 12 ft. high, and thriving vigorously at an elevation of 6000 to 10,000 ft." Wild hemp is, however, of very little use as a fibre producer, although a drug is obtained from it.

It would appear that the native country of the hemp plant is in some part of temperate Asia, probably near the Caspian Sea. It has spread westwards throughout Europe, and southward through the Indian peninsula.

The names given to the plant and to its products in different countries are of interest in connexion with the utilization of the fibre and resin. In Sans. it is called goni, sana, sanaāpasa, bang and ganjika; in Bengali, ganga; Pers. bang and canna; Arabic. kinnub or canna; Gr. κάνναβις; Lat. cannabis; Italian canapa; Fr. chanvre; Spanish cánamo; Portuguese, cânamo; Russian konopel; Lettsich and Lithuanian, kannapes; Slav. konopi; Erse, canaib and canaib; A. Sax. hoven; Dutch, hennep; Ger. Hanf; Eng. hemp; Danish and Norwegian, hemp; Icelandic, hampir; and in Swed. kampa. The English word cannabis sufficiently reveals its derivation from cannabis.

Very little hemp is now grown in the British Isles, although this variety was considered to be of very good quality, and to possess great strength. The chief continental hemp-producing countries are Italy, Russia and France; it is also grown in several parts of Canada and the United States and India. The Central Provinces, Bengal and Bombay are the chief centres of hemp cultivation in India, where the plant is of most use for narcotics. The satisfactory growth of hemp demands a light, rich and fertile soil, but, unlike most substances, it may be reared for a few years in succession. The time of sowing, the quantity of seed per acre (about three bushels) and the method of gathering and retting are very similar to those of flax; but, as a rule, it is a harder plant than flax, does not possess the same pliability, is much coarser and more brittle, and does not require the same amount of attention during the first few weeks of its growth.

The very finest hemp, that grown in the province of Piedmont,
HEMSTERHUIS, F.

Italy, is, however, very similar to flax, and in many cases the two fibres are mixed in the same material. The hemp fibre has always been valuable for the rope industry, and it was at one time very extensively used in the production of sails for vessels, covering, bagging, sacking, &e. Much of the finer quality is still made into cloth, but almost all the coarser quality finds its way into ropes and similar material.

A large quantity of hemp cloth is still made for the British navy. The cloth, when finished, is cut up into lengths, made into bags and tarred. They are then used as coal sacks. There is also a quantity made into sacks which are intended to hold very heavy material. Hemp yarns are also used in certain classes of carpets, for special bags for use in cop dyes and for similar special purposes, but for the ordinary bagging and sacking the employment of hemp yarns has been almost entirely supplanted by yarns made from the jute fibre.

Hemp is grown for three products—(1) the fibre of its stem; (2) the resinous secretion which is developed in hot countries upon its leaves and flowering heads; (3) its oily seeds.

Hemp has been employed for its fibre from ancient times. Herodotus (iv. 74) mentions the wild and cultivated hemp of Scythia, and describes the hemp garments made by the Thracians as equal to linen in fineness. Hesychius says the Thracian women made sheets of hemp. Moschion (about 200 B.C.) records the use of hempen ropes for rigging the ship "Syracusa" built for Hiero II. The hemp plant has been cultivated in northern India from a considerable antiquity, not only as a drug but for its fibre. The Anglo-Saxons were well acquainted with the mode of preparing hemp. Hempen cloth became common in central and southern Europe in the 13th century.

Hemp-resin.—Hemp as a drug or intoxicant for smoking and chewing occurs in the three forms of bhang, ganja and charas.

1. Bhang, the Hindustani siddhi or salai, consists of the dried leaves and small stalks of the hemp; a few fruits occur in it. It is of a dark brownish-green colour, and has a faint peculiar odour and but a slight taste. It is smoked with or without tobacco; or it is made into a sweetmeat with honey, sugar and aromatic spices; or it is powdered and infused in cold water, yielding a turbid drink, sabdah. Hashish is one of the Arabic names given to the Syrian and Turkish preparations of the resinous hemp leaves. One of the commonest of these prepara-
tions is made by heating the bhang with water and butter, the butter becoming thus charged with the resinous and active substances of the plant.

2. Ganja, the guaza of the London brokers, consists of the flowering and fruiting heads of the female plant. It is brownish-green, and otherwise resembles bhang, as in odour and taste. Some of the more esteemed kinds of hashish are prepared from this ganja. Ganja is met with in the Indian bazaars in dense bundles of 24 plants or heads apiece. The hashish in such extensive use in Central Asia is often seen in the bazaars of large cities in the form of cakes, 1 to 3 in. thick, 5 to 10 in. broad and 10 to 15 in. long.

3. Charas, or chaurus, is the resin itself collected, as it exudes naturally from the plant, in different ways. The best sort is gathered by the hand like opium; sometimes the resinous exudation of the plant is made to stick first of all to cloths, or to the leather garments of men, or even to their skin, and is then removed by scraping, and afterwards consolidated by kneading, pressing and rolling. It contains about one-third or one-fourth its weight of the resin. But the chaurus prepared by different methods and in different countries differs greatly in appearance and purity. Sometimes it takes the form of egg-like masses of greyish-brown colour, having when of high quality a shining resinous fracture. Often it occurs in the form of irregular friable lumps, like pieces of impure linseed oil-cake. The medicinal and intoxicating properties of hemp have probably been known in Oriental countries from a very early period. An ancient Chinese herbal, part of which was written about the 5th century A.D., while the remainder is of still earlier date, notices the seed and flower-bearing kinds of hemp. Other early writers refer to hemp as a remedy. The medicinal and dietic use of hemp spread through India, Persia and Arabia in the early middle ages. The use of hemp (bhang) in India was noticed by García d'Orta in 1563. Berlu in his Treasury of Drugs (1566) describes it as of "an infatuating quality and pernicious use." Attention was recalled to this drug, in consequence of Napoleon's Egyptian expedition, by de Sacy (1809) and Rouger (1810). Its modern medicinal use is chiefly due to trials by Dr. O'Shaughnessy in Calcutta (1838-1842). The plant is grown partly and often mainly for the sake of its resin in Persia, northern India and Arabia, in many parts of Africa and in Brazil.

Pharmacology and Therapeutics.—The composition of this drug is still extremely obscure; partly, perhaps, because it varies so much in individual specimens. It appears to contain at least two alkaloids—cannabinine and tetano-cannabinine—of which the former is volatile. The chief active principle may possibly be neither of these, but the substance cannabinin. There are also resins, a volatile oil and several other constituents. Cannabis indica—as the drug is termed in the pharmacopoeias—may be given as an extract (dose 2-1 gr.) or tincture (dose 5-15 minims).

The drug has no external action. The effects of its absorption, whether it be swallowed or smoked, vary within wide limits in different individuals and races. So great is this variation as to be inexplicable except on the view that the nature and proportions of the active principles vary greatly in different specimens. But typically the drug in an intoxicant, resembling alcohol in many features of its action, but differing in others. The early symptoms are highly pleasurable, and it is for these, as in the case of other stimulants, that the drug is so largely consumed in the East. There is a subjective sensation of mental brilliance, but, as in other cases, this is not born out by the objective results. It has been suggested that the incoordination of nervous action under the influence of Indian hemp may be due to independent and non-concerted action on the part of the two halves of the cerebrum. Following on a decided lowering of the pain and touch senses, which may even lead to complete loss of cutaneous sensation, there comes a sleep which is often accompanied by pleasant dreams. There appears to be no evidence in the case of either the lower animals or the human subject that the drug is an aphrodisiac. Excessive indulgence in cannabis indica is very rare, but may lead to general ill-health and occasionally to death. So great is the apparent impossibility of obtaining pure and trustworthy samples of the drug that it has led to its entire abandonment in therapeutics. When a good sample is obtained it is a safe and efficient hypnotic, at any rate in the case of a European. The tincture should not be prescribed unless precautions are taken to avoid the precipitation of the resin which follows its dilution with water.

See Watt, Dictionary of the Economic Products of India.

HEMSTERHUIS, FRANÇOIS (1721-1790), Dutch writer on aesthetics and moral philosophy, son of Tiberius Hemsterhuis, was born at Franeker in Holland, on the 27th of December 1721. He was educated at the university of Leiden, where he studied Plato. Failing to obtain a professorship, he entered the service of the state, and for many years acted as secretary to the state council of the United Provinces of the Netherlands on the 7th of July 1790. Through his philosophical writings he became acquainted with many distinguished persons—Goethe, Herder, Princess Amalia of Gallitzin, and especially Jacobi, with whom he had much in common. Both were idealists, and their works suffer from a similar lack of arrangement, although distinguished by elegance of form and refined sentiment. His most valuable contributions are in the department of aesthetics or the general analysis of feeling. His philosophy has been characterized as Socratic in content and Platonic in form. Its foundation was the desire for self knowledge and truth, untrammelled by the rigid bonds of any particular system.

His most important works, all of which were written in French, are: Lettre sur la sculpture (1769), in which occurs the well-known definition of the Beautiful as "that which gives us the greatest number of
HESPERHUIS, T.—HENbane

Henbane, also known in Greece and Vo-Vo-Kafios, was represented in two faculties at Oxford which are the will, the imagination, the moral principle (which is both passive and active); Alexis (1787), an attempt to prove that chemistry is the last being the life beyond the grave; Lettre sur l'ethme (1787).

The best collected edition of his works is by P. S. Meijboom (1845-1890); see also A. Gnomen, F. Hemsterhuis, de Nederlandse Historiograaf, (1896) for the development and history of Hemsterhuis, sa vie et ses a ouvres (Paris, 1866); E. Meyer, Der Philosoph Franz Hemsterhuis (Breslau, 1893), with bibliographical notice.

Hemsterhuis, Tiberius (1685-1766), Dutch philologist and critic, was born on the 9th of January 1685 at Groningen in Holland. His father, a learned physician, gave him so good an early education that, when he entered the university of his native town in his fifteenth year, he speedily proved himself to be the best student of mathematics. After a year or two at Groningen, he was attracted to the university of Leiden by the fame of Petzianus; and while there he was entrusted with the duty of arranging the manuscripts in the library. Though he accepted an appointment as professor of mathematics and philosophy at Amsterdam in his twentieth year, he had already directed his attention to the study of the ancient languages. In 1706 he completed the edition of Pollux's Onomasticon begun by Lederlin; but the praise he received from his countrymen was more than counterbalanced by two letters of criticism from Bentley, which mortified him so keenly that for two months he refused to open a Greek book. In 1717 Hemsterhuis was appointed professor of Greek at Franeker, but he did not enter on his duties there till 1720. In 1738 he became professor of national history also. Two years afterwards he was called to teach the same subjects at Leiden, where he died on the 7th of April 1766. Hemsterhuis was the founder of a laborious and useful Dutch school of criticism, which had famous disciples, in Valkenaer, Lennep and Ruhnken.

His chief works are the following: Luciani colloqui et Timon (1705); Aristophanis Pintus (1754); Notae, &c., ad Xenophontem Ephesum in the Miscellanea critica of Amsterdam, vols. iii. and iv.; Observationes ad Chrysostomii homilias: Orationes (1784); a Latin translation of the Birds of Aristophanes, in Küster's edition; notes to Bernard's Thomas Magister, to Alberti's Heresiar, to Erasmus's Pseudolus, and to Horatii Opera Minora. These were published in 1789, with the letters of Bentley (with Bentley's letters) by Ruhnken (1789), and Supplementa annotationibus ad elegionem T. Hemsterhussi, &c. (Leiden, 1784); also J. E. Sandys' Hist. Class. Scholarship, ii. (1908).

HEMY, CHARLES NAPIER (1841— ), British painter, born at Newcastle-on-Tyne, was trained in the Newcastle school of art, in the Antwerp academy and in the studio of Baron Leyss. He has produced some figure subjects and landscapes, but is best known by his admirable marine paintings. He was elected an associate of the Royal Academy in 1888, associate of the Royal Society of Painters in Water Colours in 1890 and member in 1897. Of his two paintings, "Pilchards" (1897) and "London River" (1904), are in the National Gallery of British Art.

HEN, a female bird, especially the female of the common fowl (Gallus domesticus). The O. Eng. hen is the feminine form of hane, the male bird, a correlation of words which is represented in other Teutonic languages, cf. Ger. Hahn, Henne, Dutch haan, hen, Swed. hane, häne, llc. The O. Eng. name for the male bird has disappeared, its place being taken by " cock," a term borrowed probably from the Latin cognomen, name for a poetic origin, being from a base kük- or kik-, seen also in " chicken." This word also appears in Fr. coq, and medieval Lat. coecus.

HÉNault, Charles Jean François (1685-1770), French historian, was born in Paris on the 8th of February 1685. His father, a farmer-general of taxes, was a man of literary tastes, and young Hénault obtained a good education at the Jesuit college. Captivated by the eloquence of Massillon, in his fifteenth year he entered the Oratory with the view of becoming a preacher, but in two years' residence he changed his intention, and, inheriting a position which secured him access to the most select society of Paris, he achieved distinction at an early period by his gay, witty and graceful manners. His literary talent, manifested in the composition of various light poetical pieces, an opera, a tragedy (Cornélée vestite, 1710), &c., obtained his entrance to the Academy (1723). Petit-maitre as he was, he had also serious capacity, for he became councillor of the parlement of Paris (1709), and in 1710 he was chosen president of the court of enquêtes. After the death of the count de Rieux (son of the famous financier, Samuel Bernard) he became (1753) superintendent of the household, and in the death of the inopportune father of the state, the intimate friendship he had previously enjoyed. On his recovery in his eightieth year from a dangerous malady (1765) he professed to have undergone religious conversion and retired into private life, devoting the remainder of his days to study and devotion. His religion was, however, according to the marquis d'Argenson, " exempt from fanaticism, persecution, bitterness and intrigue"; and it did not prevent him from continuing his friendship with Voltaire, to whom it is said he had formerly rendered the service of saving the manuscript of La Henriade, which was published in 1744 without the author's name. In the compass of two volumes he comprised the whole history of France from the earliest times to the death of Louis XIV. The work has no originality. Hénault had kept his note-books of the history lectures at the Jesuit college, of which the substance was taken from Mazarin and P. Daniel. He revised them first in 1723, and later put them in the form of question and answer on the advice of le Rageux and by following Dubos and Boulainvilliers and with the aid of the abbé Boudot he compiled his Abrégé. The research is all on the surface and is only borrowed. But the work had a prodigious success, and was translated into several languages, even into Chinese. This was due partly to Hénault's popularity and position, partly to the agreeable style which made the history readable. He inserted, according to the fashion of the period, moral and political reflections, which are always brief and generally as fresh and pleasing as they are just. A few masterly strokes reproduced the leading features of each age and the characters of its illustrious men; accurate chronological tables set forth the most interesting events in the history of each sovereign and the names of the great men who flourished during his reign; and interspersed throughout the work are occasional chapters on the social and civil state of the country at the close of each era in its history. Continuations of the work have been made at separate periods by Fantin des Odoards, by Angius with notes by Walkenaer, and by Michaud. He died at Paris on the 24th of November 1770.

BIBLIOGRAPHY.—Hénault's Mémoires have come down to us in two volumes forming a verison of the proceedings of the Academy. One was published in 1855 by M. du Vigan; the other was owned by the Comte de Coutades, who permitted Lucien Perrey to give long extracts in his work on President Hénault (Paris, 1893). The memoirs are fragmentary and disconnected, but contain interesting anecdotes and details concerning persons of note. See the Correspondance de Grimm, of Madame du Delfand and of Voltaire; the notice by Walkenaer in the edition of the Abrégé Sainte-Beuve, Converses du boude, vol. i. and the Origines de l'abregé (Ann. Bulletin de la Société de l'histoire de France, 1901). Also H. Lion, Le Président Hénault (Paris, 1903).

HENBANE (Fr. jusquiaume, from the Gr. bouswouos, or hog's-bean; Ital. iusquiole; Ger. Schwarze Bilsenbrant, Hühnerblut, Sowsehne und Zinger-Korn or " pigeons' corn"), the dried and powdered leaves of henbane, a plant belonging to the natural order Solanaceae, indigenous to Britain, found wild in waste places, on rubbish about villages and old castles, and cultivated for medicinal use in various counties in the south and east of England. It occurs also in central and southern Europe and in western Asia extending to India and Siberia, and has long been naturalized in the United States. There are two forms of the plant, an annual and a biennial, which spring indifferently from the same crop of seed—the one growing on during summer to a height of from 1 to 2 ft., and flowering and perfecting seed; the other producing the first season only a tuft of radicle leaves, which disappear in winter, leaving un-
ground a thick fleshy root, from the crown of which arises in spring a branched flowering stem, usually much taller and more vigorous than the flowering stems of the annual plants. The biennial form is that which is considered official. The radical leaves of this biennial plant spread out flat on all sides from the crown of the root; they are ovate-oblong, acute, stalked, and more or less incised-toothed, of a greyish-green colour, and covered with viscid hairs; these leaves perish at the approach of winter. The flowering stem pushes up from the root-crown in spring, ultimately reaching from 3 to 4 ft. in height, and as it grows becoming branched, and furnished with alternate sessile leaves, which are stem-clasping, oblong, unequally-lobed, clothed with glandular clammy hairs, and of a dull grey-green, the whole plant having a powerful nauseous-odour. The flowers are shortly-stalked, the lower ones growing in the fork of the branches, the upper ones sessile in one-sided leafy spikes which are rolled back at the top before flowering, the leaves becoming smaller upwards and taking the place of bracts. The flowers have an urn-shaped calyx which persists around the fruit and is strongly veined, with five stiff, broad, almost prickly lobes; these, when the soft matter is removed by maceration, form very elegant specimens when associated with leaves prepared in a similar way. The corollas are obliquely funnel-shaped, of a dirty yellow or buff, marked with a close reticulation of purple veins.

The capsule opens transversely by a convex lid and contains numerous seeds. Both the leaves and the seeds are employed in pharmacy. The Mahomedan traders of India are stated to have found the plant in Persia. Henbane yields a poisonous alkaloid, hyoscyamine, which is stated to have properties almost identical with those of atropine, from which it differs in being far more soluble in water. It is usually obtained in an amorphous, scarcely ever in a crystalline state. Its properties have been investigated in Germany by T. Husemann, Schroth, Höhn, &c. Höhn finds its chemical composition expressed by C_{15}H_{25}N_{2}O_{3}.

(Compare Hellmann, Beiträge zur Kenntniss der physiolog. Wirkung des Hyoscyaminis, &c., Jena, 1874.) In small and repeated doses henbane has been found to have a tranquilizing effect upon persons affected by severe nervous irritability. In poisonous doses it causes loss of speech, distortion and paralysis. In the form of extract or tincture it is a valuable remedy in the hands of a medical man, either as an anodyne, a hypnotic or a sedative. The extract of henbane is rich in nitrate of potassium and other inorganic salts. The smoking of the seeds and capsules of henbane is noted in books as a somewhat dangerous remedy adopted by country people for toothache. Accidental poisoning from henbane occasionally occurs, owing sometimes to the apparent edible and wholesomeness of the root.

See Bentley and Trunen, *Medicinal Plants*, 194 (1880).

**Henchman, Alexander**

(1583–1646) Scottish ecclesiastic, was born in 1583 at Criech, Fifeshire. He graduated from the university of St Andrews in 1603, and in 1610 was appointed professor of rhetoric and philosophy and questor of the faculty of arts. Shortly after this he was presented to the living of Leuchars. As Henderson was forced upon his parish by Archbishop George Gladstanes, and was known to sympathize with episcopacy, his settlement was at first extremely unpopular; but he subsequently changed his views and became a Presbyterian in doctrine and church government, and one of the most esteemed ministers in Scotland. He early made his mark as a church leader, and took an active part in petitioning against the "five acts" and later against the introduction of a service-book and canons drawn up on the model of the English prayer-book. On the 1st of March 1638 the public signing of the "National Covenant" began in Greyfriars Church, Edinburgh. Henderson was mainly responsible for the final form of this document, which consisted of (1) the "king's confession" drawn up in 1581 by John Craig, (2) a recital of the acts of parliament against "superstitious and papistical rites," and (3) an elaborate oath to maintain the true reformed religion. Owing to the skill shown on this occasion he seems to have been applied to when any manifesto of unusual ability was required. In July of the same year he proceeded to the north to debate on the "Covenant" with the famous Aberdeen doctors; but he was not well received by them. "The voved church was made fast, and the keys kept by the magistrate," says Baillie. Henderson's next great public opponent was the Most Rev. John Leuchars, Archbishop of Glasgow on the 21st of November 1638. He was chosen moderator by acclamation, being, as Baillie says, "incomparable the ablest man of us all for all things." James Hamilton, 3rd marquess of Hamilton, was the king's commissioner; and when the Assembly insisted on proceeding with the trial of the bishops, he formally dissolved the meeting under pain of treason. Acting on the constitutional principle that the king's right to convene did not interfere with the church's independent right to hold assemblies, they sat till the 20th of December, deposed all the Scottish bishops, excommunicated a number of them, repealed all acts favouring episcopacy, and reconstituted the Scottish Kirk on thorough Presbyterian principles. During the sitting of this Assembly it was carried by a majority of seventy-five votes that Henderson should be transferred to Edinburgh. He had been at Leuchars for about twenty-three years, and was extremely reluctant to leave it.

While Scotland and England were preparing for the "First Bishops' War," Henderson drew up two papers, entitled respectively *The Remonstrance of the Nobility and Instructions for Defensive Arms*. The first of these documents he published himself; the second was published against his will by John Corbet (1603–1641), a deposed minister. The "First Bishops' War" did not last long. At the Pacification of Birks the king virtually granted all the demands of the Scots. In the negotiations for peace Henderson was one of the Scottish commissioners, and his name appears in the treaty. In 1642 Henderson was elected by the town council rector of Edinburgh University—an office to which he was annually re-elected till his death. The Pacification of Birks had been wrung from the king; and the Scots, seeing that he was preparing for the "Second Bishops' War," took the initiative, and pressed into England so vigorously that Charles had again to yield everything. The maturing of the treaty of peace took a considerable time, and Henderson was again active in the negotiations, first at Ripon (October 1st) and afterwards in London. While he was in London he had a personal interview with the king, with the view of obtaining assistance for the Scottish universities from the money formerly applied to the support of the bishops. On Henderson's return to Edinburgh in July 1645 the Assembly was sitting at St Andrews. To suit the convenience of the parliament, however, it removed to Edinburgh; Henderson was elected moderator of the Edinburgh meeting. In this Assembly he proposed that "a confession of faith, a catechism, a directory for all the parts of the public worship, and a platform
HENDERSON, E.—HENDERSON, G. F. R.

of government, wherein possibly England and we might agree," should be drawn up. This was unanimously approved of, and the laborious undertaking was left in Henderson's hands; but the "notable motion" did not lead to any immediate results.

During Charles's second state-visit to Scotland, in the autumn of 1641, Henderson acted as foremost chaplain, and managed to get the lands, merely belonging to the bishopric of Edinburgh, applied to the metropolitan university. In 1642 Henderson, whose policy was to keep Scotland neutral in the war which had now broken out between the king and the parliament, was engaged in corresponding with England on ecclesiastical topics; and, shortly afterwards, he was sent to Oxford to mediate between the king and his parliament; but his mission proved a failure.

A memorable meeting of the General Assembly was held in August 1643. Henderson was elected moderator for the third time. He presented a draft of the famous "Solemn League and Covenant," which was received with great enthusiasm. Unlike the "National Covenant" of 1638, which applied to Scotland only, this document was common to the two kingdoms. Henderson, Baillie, Rutherford and others were sent up to London to represent Scotland in the Assembly at Westminster. The "Solemn League and Covenant," which pledged both countries to the extirpation of prelacy, leaving further decision as to church government to be decided by the "example of the best reformed churches," after undergoing some slight alterations, passed the two houses of Parliament, and managed to get the King's assent, and thus became law for the two kingdoms. By means of it Henderson has had considerable influence on the history of Great Britain. As Scottish commissioner to the Westminster Assembly, he was in England from August 1643 till August 1646; his principal work was the drafting of the directory for public worship. Early in 1645 Henderson was sent to Uxbridge to aid the commissioners of the two parliaments in negotiating with the king; but nothing came of the conference. In 1646 the king joined the Scottish army; and, after retir ing with them to Newcastle, he sent for Henderson, and discussed with him the two systems of church government in a number of papers. Meanwhile Henderson was falling in health. He sailed to Scotland, and eight days after his arrival died, on the 10th of August 1646. He was buried in Greyfriars churchyard, Edinburgh; and his death was the occasion of national mourning in Scotland. On the 7th of August Baillie had written that he had heard that Henderson was dying "most of heart-break." A document was published in London purporting to be a "Declaration of Mr Alexander Henderson made upon his Death-bed"; and, although two papers of this kind, denounced and shown to be false, were in the General Assembly of August 1648, the document was used by Clarendon as giving the impression that Henderson had recanted. Its foundation was probably certain expressions lamenting Scottish interference in English affairs.

Henderson is one of the greatest men in the history of Scotland and, next to Knox, is certainly the most famous of Scottish ecclesiastics. He had great political genius; and his statesmanship was so influential that "he was," as Masson well observes, "a cabinet minister without office." He has made a deep mark on the history, not only of Scotland, but of England; and the existence of his "History of the Church of Scotland" is a vital document to him for the forms of their dogmas and their ecclesiastical organization. He is thus justly considered the second founder of the Reformed Church in Scotland.

HENDERSON, EBENEZER (1784–1838), a Scottish divine, was born at the Linn near Dunfermline on the 17th of November 1784, and died at Mortlake on the 17th of May 1838. He was the youngest son of an agricultural labourer, and after three years' schooling spent some time at watchmaking and as a shoemaker's apprentice. In 1803 he joined Robert Haldane's theological seminary, and in 1805 was selected to accompany the Rev. John Paterson to India; but as the East India Company would not allow British vessels to convey missionaries to India, Hendersoneland. His other principal works are: "A Voyage to the Passage to Serampur, then a Danish port. Being unexpectedly delayed, and having begun to preach in Copenhagen, they ultimately decided to settle in Denmark, and in 1806 Henderson became pastor at Elnorine. From this time till about 1817 he was engaged in encouraging the distribution of Bibles in the Scandinavian countries, and in the course of his labours he visited Sweden and Lapland (1807–1808), Iceland (1814–1815) and the mainland of Denmark and part of Germany (1816).

During most of this time he was an agent of the British and Foreign Bible Society. On 6th of October 1811 he formed the first Congregational church in Sweden. In 1818, after a visit to England, he travelled in company with Paterson through Russia as far south as Tiflis, but, instead of settling as was proposed at Astrakhan, he retraced his steps, having resigned his connexion with the Bible Society owing to his disapproval of a translation of the Scriptures which had been made in Turkish. In 1822 he was invited by Prince Alexander (Galtzin) to assist the Russian Bible Society in translating the Scriptures into various languages spoken in the Russian empire. After twenty years of foreign labour Henderson returned to England, and in 1845 was appointed itinerant and his colleague in Sweden. He was elected an honorary member of the Russian Oriental Society in 1828.

In 1830, on the amalgamation of the colleges of Homerton, Coward and Highbury, he retired on a pension. In 1832–1833 he was pastor of Sheen Vale chapel at Mortlake. His last work was a translation of the book of Ezekiel. Henderson was a man of great linguistic attain ment. He made himself more or less acquainted, not only with the ordinary languages of scholarly accomplishment and the various members of the Scandinavian group, but also with Hebrew, Syriac, Ethiopian, Russian, Arabic, Tatar, Persian, Turkish, Armenian, Manchu, Mongolian and Coptic. He organized the first Bible Society in Denmark (1814), and paved the way for several others. In 1817 he was nominated by the Scandinavian Literary Society a corresponding member; and in 1840 he was made D.D. by the university of Copenhagen. He was honorary secretary for life of the Religious Tract Society, and one of the first promoters of the British Society for the Propagation of the Gospel among the Jews. The records of his travels in Iceland (1818) were valuable contributions to our knowledge of that island and of its mission (1818). He was also a contributor to "Iceland, or the Journal of a Residence in that Island" (2 vols., 1818); "Biblical Researches and Travels in Russia" (1825); "Elements of Biblical Criticism and Interpretation" (1838); "The Vaugeois, a Tour of the Valleys of Piedmont" (1843).

See Memoirs of Ebenezer Henderson, by Thulia S. Henderson (his daughter) (London, 1899); Congregational Year Book (1899).

HENDERSON, GEORGE FRANCIS ROBERT (1854–1903), British soldier and military writer, was born in Jersey in 1854. Educated at Leeds Grammar School, of which his father, afterwards Dean of Carlisle, was headmaster, he was early attached to the staff of the 35th (Northumberland Fusiliers) at Harrow, and afterwards to the staff of the 4th (Durham Light Infantry) at Sandhurst. He obtained a commission in the Rifle Brigade in 1873, and was sent to India as a private soldier. In 1879 he received a commission in the 1st Grenadier Guards, and was sent to Egypt as an ensign in 1882. He was also a member of the 4th Battalion of the Royal Fusiliers. He retired from the British army in 1888, and was appointed a judge of the Indian Army. He was the author of several books, including "The History of the Indian Army," "The History of the Indian Army," "The History of the Indian Army," and "The History of the Indian Army." He was also a member of the Indian Army. He was the author of several books, including "The History of the Indian Army," "The History of the Indian Army," "The History of the Indian Army," and "The History of the Indian Army." He was also a member of the Indian Army. He was the author of several books, including "The History of the Indian Army," "The History of the Indian Army," "The History of the Indian Army," and "The History of the Indian Army." He was also a member of the Indian Army. He was the author of several books, including "The History of the Indian Army," "The History of the Indian Army," and "The History of the Indian Army." He was also a member of the Indian Army.
HENDERSON, J.—HENGEST and HORSÁ

(anonymous) his first work, *The Campaign of Fredericksburg.*

In the same year he became Instructor in Tactics, Military Law and Administration at Sandhurst. From this post he proceeded as Professor of Military Art and History to the Staff College (1892–1899), and there exercised a profound influence on the younger generation of officers. His study on *Sphicron* had been begun some years before, and in 1898 appeared, as the result of eight years’ work, his masterpiece, *Stonewall Jackson and the American Civil War.* In the South African War Lieutenant-Colonel Henderson served with distinction on the staff of Lord Roberts as Director of Intelligence. But overwork and malaria broke his health, and he had to return home, being eventually selected to write the official history of the war. But failing health obliged him to go to Egypt, where he died at Assuan on the 3rd of March 1903. He had completed the portion of the history of the South African War dealing with the events up to the commencement of hostilities, amounting to about a volume, but the War Office decided to suppress this, and the work was begun *de novo* and carried out by Sir F. Maurice.

Various lectures and papers by Henderson were collected and published in 1905 by Captain Malcolm, D.S.O., under the title *The Science of War,* to which a memoir was contributed by Lord Roberts in the *Journal of the Royal United Service Institution,* vol. xlvii. No. 302.

HENDerson, John (1747–1785), English actor, of Scottish descent, was born in London. He made his first appearance on the stage at Bath on the 6th of October 1772 as Hamlet. His success in this and other Shakespearian parts led to his being called the "Bath Roscius." He had great difficulty in getting a London engagement, but finally appeared at the Haymarket in 1776 as Othello, and his success was a source of considerable profit to Colman, the manager. Sheridan then engaged him to play at Drury Lane, where he remained for two years. When the companies joined forces he went to Covent Garden, appearing as Richard III. in 1778, and creating original parts in many of the plays of Cumberland, Shirley, Jephson and others. His last appearance was in 1785 as Horatius in *The Roman Father,* and he died on the 25th of November of that year and was buried in Westminster Abbey. Garrick was very jealous of Henderson, and the latter’s power of mimicry separated him also from Colman, but he was always gratefully remembered by Mrs. Siddons and others of his profession whom he had encouraged. He was a close friend of Gainsborough, the painter, and came to the birthday of Sir Walter Scott and Romney. He was co-author of Sheridan and Henderson’s *Practical Method of Reading and Writing English Poetry.*

Henderson, a city and the county-seat of Henderson county, Kentucky, U.S.A., on the S. bank of the Ohio river, about 142 m. W.S.W. of Louisville. Pop. (1890), 8355; (1900), 10,272, of whom 4029 were negroes; (1910 census) 11,452. It is served by the Illinois Central, the Louisville & Nashville, and the Louisville, Henderson & St. Louis railways, and has direct communication by steamboat with Louisville, Evansville, Cairo, Memphis and New Orleans. Henderson is built on the high bank of the river, above the flood level; the river is spanned here by a fine steel bridge, designed by George W. G. Ferris (1865–1936), and the truss, of the design partly, Henderson, named in honour of Richard Henderson (1734–1785), was settled as early as 1784, was first known as Red Banks, was laid out as a town by Henderson’s company in 1797, was incorporated as a town in 1810, and was first chartered as a city in 1834. The city boundary lines were extended in 1895 by the annexation of Audubon and Edgewood. Henderson was for some time the home of John James Audubon, the ornithologist.

HENDRiDiUs, the name adopted from the Gr. ὁ ἄνθρωπος (“one by means of two hands”) as a rhetorical figure, in which two words connected by a copulative conjunction are used of a single idea; usually the figure takes the form of two substantives instead of a substantive and adjective, as in the classical example *pateris libamus et auro* (Virgil, *Georgics,* ii. 192), “we pour libations in cups and gold” for “cups of gold.”

Hendon, an urban district in the Harrow parliamentary division of Middlesex, England, on the river Brent, 8 m. N.W. of St. Paul’s Cathedral, London, served by the Midland railway. Pop. (1891), 15,643; (1901), 22,450. The nucleus of the township lies on high ground to the east of the Edgware road, which crosses the Welsh Harp reservoir of Regent’s Canal, a favourite fishing and skating resort. The church of St Mary is mainly Perpendicular, and contains a Norman font and monuments of the 18th century. To the north of the village, which has extended greatly as a residential suburb of the metropolis, is Mill Hill, with a Roman Catholic Missionary College, opened in 1871, with branches at Rosendaal, Holland and Brixen, Austria, and a preparatory school at Freshfield near Liverpool; and a large grammar school founded by Nonconformists in 1807. The manor belonged at an early date to the abbots of Westminster.

Hendricks, Thomas Andrews (1819–1883), American political leader, vice-president of the United States in 1885, was born near Zanesville, Ohio, on the 7th of September 1819. He graduated at Hanover College, Hanover, Indiana, in 1841, and began in 1843 a successful career at the bar. Identifying himself with the Democratic party, he served in the state House of Representatives in 1848, and was a prominent member of the convention for the revision of the state constitution in 1850–1851, a representative in Congress (1851–1853), commissioner of the United States General Land Office (1855–1859), a United States senator (1863–1866), and governor of Indiana (1873–1877). From 1888 until his death he was put forward for nomination for the presidency at every national Democratic Convention save in 1872. Both in 1876 and 1884, after his failure to receive the nomination for the presidency, he was nominated by the Democratic National Convention for vice-president. His nomination in each of these conventions being made partly, it seems, with the hope of gaining “greenback” votes—Hendricks had opposed the immediate resumption of specie payments. In 1876, with S. J. Tilden, he lost the disputed election by the decision of the electoral commission, but he was elected with Grover Cleveland in 1884. He died at Indianapolis on the 25th of November 1885.

Hengelo, or Hengelo, a town in the province of Overijssel, Holland, and a junction station 5 m. by rail N.W. of Enschede. Pop. (1900), 14,068. The castle belonging to the ancient territorial lords of Hengelo has long since disappeared, and the only interest the town now possesses is as the centre of the flourishing industries of the Twente district. The manufactures of cotton in all its branches is very actively carried on, and there are dye-works and breweries, besides the engineering works of the state railway company.

Hengest and Horsa, the brother chieftains who led the first Saxon bands which settled in England. They were apparently called in by the British king Vortigern (q.v.) to defend him against the Picts. The place of their landing is said to have been Ebbsfleet in Kent. Its date is not certainly known, 450–455 being given by the English authorities, 428 by the Welsh (see Kent). The settlers of Kent are described by Bede as Jutes (q.v.), and there are traces in Kentish custom of differences from the other Anglo-Saxon kingdoms. Hengest and Horsa were given the island of Thanet as a home, but soon quarrelled with their British allies, and gradually possessed themselves of what became the kingdom of Kent. In 455 the Saxon Chronicle records a battle between Hengest and Horsa and Vortigan at a place called Aegaels threip, in which Horsa
was slain. Thenceforward Hengest reigned in Kent, together
with his son Aesc (Oisc). Both the Saxon Chronicle and the
Historia Britonum record three subsequent battles, though
the two authorities disagree as to their issue. There is no doubt,
however, that the net result was the expulsion of the Britons
from Kent. According to the Chronicle, which probably
derived its information from a lost list of Kentish kings, Hengest
died in 488, while his son Aesc continued to reign until 522.

J. A. L. Wegscheider with infidelity and profanity, and on

the ground of these accusations advocated the interposition

of the civil power, thus giving rise to the prolonged Halische

Strel.

In 1828 the first volume of Hengstenberg's Christologie
des Alien Testaments passed through the press; in the autumn
of that year he became professor ordinarius in theology, and
in 1829 doctor of theology. He died on the 28th of May 1869.

The following is a list of his principal works: Christologie des

Alien Testaments (1829-1835; 2nd ed., 1854-1857; Eng. trans. by

R. Keith, 1835-1839, also in Clark's "Foreign Theological Library," by T. Meyer and J. Martin, 1854-1858), a work of much learning,
estimate of which varies according to the hermeneutical principles
of the individual critic; Beiträge zur Einleitung in das Alien Testament (1851-1859); Eng. trans., Dissertations on the genuineness of Daniel

and Zechariah (1848), and Dissertations on the Genuineness of the

Pentaloche (Edin., 1847), in which traditional view on each question is strongly upheld, and much capital is made of the absence of harmony among the negative
critics; Die Bücher Mose and Agypten (1841); Die Geschichte Bileams u. seiner Weissagungen (1842; translated along with the Dissertations on Daniel and Zechariah); Commentar über die Psalmen (1842-1847; 2nd ed., 1849-1852; Eng. trans. by P. Fairbairn and K. R. Fairbairn, 1854-1858); a work of weighty learning and defects of the Christologie; Die Offenbarung Johannis erwährt (1849-1851; 2nd ed., 1861-1862; Eng. trans. by P. Fairbairn, and Sir L. W. Fairbairn, 1859); Die Geschichte des Daniel (1848); Die

Hohe Lied ausgelegt (1853); Der Prediger Salomo ausgelegt (1856); Das Evangelium Johannis erwährt (1861-1863; 2nd ed., 1867-1871; Eng. trans., 1863) and Die Weissagungen des Propheten Ezekiel engelegt (1861-1871). The editor of Der theologische Commentar

hochacademica (1825); Über den Tag des Herrn (1852); Das Passa, ein Vortrag (1853); and Die Opfer der heiligen Schrift (1859).

Several papers of series also, as, for example, on, "The Retention of the Apocrypha," "Frememasonry" (1854), "Duelling" (1856) and

"The Relation between the Jews and the Christian Church" (1857; 2nd ed., 1859), which originally appeared in the Kirchenzeitung, were
afterwards printed in a separate form. Geschichte des Reiches Gottes
(1871); Das Buch Ierusalem (1875) and Vorlesungen über die Leidensgeschichte (1875) were published posthumously.

J. Bachmann's Ernst Wilhelm Hengstenberg (1876-1879),
also his article in Herzog-Hauck, Realencyclopadie (1890), and the article in the Allgemeine deutsche Biographie. Also F. Lichtenberg,
History of German Theology in the Nineteenth Century (1889), pp.
212-217; J. Schach, Germany; its Universities, Theology and
Religion (1857), pp. 300-319.

HENKE, HEINRICH PHILIPP KONRAD (1752-1809),
German theologian, best known as a writer on church history,
was born at Hehlen, Brunswick, on the 3rd of July 1752. He
was educated at the gymnasium of Brunswick and the university
of Helmstädt, and from 1778 to 1809 he was professor, first of
philosophy, then of theology, in that university. In 1803 he
was appointed principal of the Carolinum in Brunswick as well.

He died on the 2nd May 1809. Henke belonged to the
rationalistic school. His principal work (Allegemeine Geschichte
der christl. Kirche, 6 vols., 1788-1804; 2nd ed., 1795-1806)
was commended by F. C. Baur for fullness, accuracy and artistic
composition. His other works are Lineamenta institutionum fidei Christianae historico-criticarum (1783), Opuscula academica
(1802) and two volumes of Predigten. He was also editor of
the Magazin für die Religionsphilosophie, Exegese und Kirchengeschichte (1793-1802) and the Archiv für die neuesten Kirchengeschichte (1794-1799).

His son, ERNST LUDWIG THEODOR HENKE (1804-1872), after studying medicine at Heidelberg and at Bonn, where he took his doctor's degree in 1832, he became professor extraordinarius there in 1833, and professor ordinarius of Marburg in 1839. He is known as the author of monographs upon
Geo Calixt u. seine Zeil (1836-1860), Papst Pius VII. (1890),

HENLE, FRIEDRICH GUSTAV JAKOB (1800-1883),
German pathologist and anatomist, was born on the 9th of
July 1800 at Fürth, in Franconia. After studying medicine
at Heidelberg and at Bonn, where he took his doctor's degree
in 1833, he became professor of anatomy (1832-1835) at Berlin.

During the six years he spent in that position he published
a large amount of work, including three anatomical
monographs on new species of animals, and papers on the
structure of the lenticular system, the distribution of epithelium
in the human body, the structure and development of the hair,
the formation of mucus and pus, &c. In 1840 he accepted the
chair of anatomy at Zürich, and in 1844 he was called to
Heidelberg, where he taught not only anatomy, but physiology
and pathology. About this period he was engaged on his complete
systematic general anatomy, which formed the sixth volume
of the new edition of S. T. von Sömmering's treatise, published
at Leipzig between 1841 and 1844. While at Heidelberg he published
a zoological monograph on the sharks and rays, in conjunction
with his master Müller, and in 1846 his famous Manual of Rational Pathology began to appear; this marked the
beginning of a new era in pathological study, since in it
physiology and pathology were treated, in Henle's own words,
as "branches of one science," and the facts of disease were
systematically considered with reference to their physiological
cause. In 1848 he moved to Göttingen, whence he issued
three years later the first installment of his great Handbook of
Systematic Human Anatomy, the last volume of which was not
published till 1873. This work was perhaps the most complete
and comprehensive of its kind that had so far appeared, and
it was remarkable not only for the fullness and minuteness of the
anatomical descriptions, but also for the number and excellence
of the illustrations with which they were elucidated.

During the latter half of his life Henle's researches were mainly
histological in character, his investigations embracing the
minute anatomy of the blood vessels, serous membranes, kidney,
eye, the central nervous system, &c. He died at Göttingen
on the 13th of May 1882.
HENLEY, JOHN (1692–1759), English clergyman, commonly known as “Orator Henley,” was born on the 3rd of August 1692 at Melch–Mowbray, where his father was rector. After attending the grammar schools of Melton and Oakham, he entered St John’s College, Cambridge, and while still an undergraduate he addressed in February 1712, under the pseudonym of Peter de Quir, a letter to the Spectator displaying no small wit and humour. After graduating B.A., he became assistant and then headmaster of the grammar school of his native town, uniting to these duties those of assistant curate. His abundant energy found still further expression in a poem entitled Esther, Queen of Persia (1714), and in the compilation of a grammar of ten languages entitled The Complete Linguist (2 vols., London, 1719–1721). He then decided to go to London, where he obtained the appointment of assistant preacher in the chapels of Ormond Street and Bloomsbury. In 1729 he was presented to the rectory of Chelmondston in Suffolk; but residence being insisted on, he resigned both his appointments, and on the 3rd of July 1726 opened what he called an “oratory” in Newport Market, which he licensed under the Toleration Act. In 1729 he transferred the scene of his operations to Lincoln’s Inn Fields. Into his services he introduced many peculiar alterations: he drew up a “Primitive Liturgy,” in which he substituted for the Nicene and Athanasian creeds two creeds taken from the Apostolical Constitutions; for his “Primitive Eucharist” he made use of unleavened bread and mixed wine; he distributed at the price of one shilling medals of admission to his oratory, with the device of a sun rising to the meridian, with the motto Ad summum, and thereon the title of the oratory. But the most original element in the services was Henley himself, who is described by Pope in the Dunciad as

“Preacher at once and zany of his age.”

He possessed some oratorical ability and adopted a very theatrical style of elocution, “tuning his voice and balancing his hands”; and his addresses were a strange medley of solemnity and buffoonery, of clever wit and the wildest absurdity, of able and original disquisition and the worst artifices of the oratorical charlatan. His services were much frequented by the “free-thinkers,” and he himself expressed his determination “to die a rational.” Besides his Sunday sermons, he delivered Wednesday lectures on social and political subjects; and he also projected a scheme for connecting with the “oratory” a university on quite a utopian plan. For some time he edited the Dublin Observer, a weekly newspaper, of which he was the editor, and the Craftsman, and for this service he enjoyed a pension of £100 a year from Sir Robert Walpole. At first the orations of Henley drew great crowds, but, although he never discontinued his services, his audience latterly dwindled almost entirely away. He died on the 13th of October 1759.

Henley is the subject of several of Hogarth’s prints. His life, professedly written by A. Welsteed, but in all probability by himself, was inserted by him in his Oratory Transactions. See J. B. Nichols, History of Leicestershire: I. Darnall, Calamities of Authors.

HENLEY, WILLIAM ERNEST (1849–1903), British poet, critic and editor, was born on the 23rd of August 1849 at Gloucester, and was educated at the Crypt Grammar School in that city. The school was a sort of Cinderella sister to the Cathedral School, and Henley indicated its shortcomings in his article (Pall Mall Magazine, Nov. 1900) on T. E. Brown the poet, who was headmaster there for a brief period. Brown’s appointment, uncongenial to himself, was a stroke of luck for Henley, for whom, as he said, it represented a first acquaintance with a man of genius. “He was singularly kind to me at a moment when I needed kindness even more than I needed encouragement.” Among other kindnesses Brown did him the essential service of lending him books. To the end Henley was no classical scholar, but his knowledge and love of literature were vital. Afflicted with a physical infirmity, he found himself in 1874, at the age of twenty-five, an inmate of the hospital at Edinburgh. From there he sent to the Cornhill Magazine poems in irregular rhythms, describing with poignant force his experiences in hospital. Leslie Stephen, then editor, being in Edinburgh, visited his contributor in hospital and took Robert Louis Stevenson, another recruit of the Cornhill, with him. The meeting between Stevenson and Henley, and the friendship of which it was the beginning, forms one of the best-known episodes in recent literature (see especially Stevenson’s letter to Mrs. Sitwell, Jan. 1875, and Henley’s poems “An Apparition” and “Envoy to Charles Baxter”). In 1877 Henley went to London and began his editorial career by editing London, a journal of a type more usual in Paris than London, written for the sake of its contributors rather than of the public. Among other distinctions it first gave to the world The New Arabian Nights of Stevenson. Henley himself contributed to his journal a series of verses chiefly in old French forms. He had been writing poetry since 1872, but (so he told the world in his “advertisement” to his collected Poems, 1890) he “found himself about 1877 so utterly unketabat that he had to own himself beaten in art and to add himself to journalism for the next ten years.” After the decease of London, he edited the Magazine of Art from 1882 to 1886. At the end of that period he came before the public as a poet. In 1887 Mr. Glessen White made for the popular series of Canterbury Poets (edited by Mr. William Sharp) a selection of poems in old French forms. In his selection Mr. Glessen White included a considerable number of pieces from London, and only after he had completed the selection did he discover that the verses were all by one hand, that of Henley. In the following year, Mr. H. B. Donkin in his volume Voluntaries of an East End hospital, included Henley’s unrhymed rhythms quintessentializing the poet’s memories of the old Edinburgh Inn, Mr. Alfred Nott read these, and asked for more; and in 1888 his firm published A Book of Voluntaries below. This was by this time well known in a restricted literary circle, and the publication of this volume determined for them his fame as a poet, which rapidly outgrew these limits, two new editions of this volume being called for within three years. In this same year (1888) Mr. Fitzroy Bell started the Scots Observer in Edinburgh, with Henley as literary editor, and early in 1889 Mr. Bell left the conduct of the paper to him. It was a weekly review somewhat on the lines of the old Saturday Review, but inspired in every paragraph by the vigorous and combative personality of the editor. It was transferred soon after to London as the National Observer, and remained under Henley’s editorship until 1894. Two years later he was resigned in the Vanguard. Many writers and readers, and the name was mainly confined to the literary class, it was a lively and not influential feature of the literary life of its time. Henley had the editor’s great gift of discerning promise, and in the “Men of the Scots Observer” as Henley affectionately and characteristically called his band of contributors, in most instances justified his insight. The paper found utterance for the growing imperialism of its day, and among other services to literature gave to the world Mr. Kipling’s Barrack–Room Ballads. In 1890 Henley published Views and Reviews, a volume of notable criticisms, described by himself as “less a book than a mosaic of scraps and shreds recovered from the shot rubbish of some fourteen years of journalism.” The criticisms, covering a wide range of authors (except Heine and Tolstoy, all English and French), though wilful and often one-sided were terse, trenchant and picturesque, and remarkable for insight and gusto. In 1892 he published a second volume of poetry, named after the first poem, The Song of the Sword, but on the issue of the second edition (1893) re-christened London Voluntaries after another section. Stevenson wrote that he had not received the same thrill of poetry since Mr. Meredith’s “Joy of Earth” and “Love in the Valley,” and he did not know that that was so intimate and so deep. “I did not guess you were so great a magician. These are new tunes; this is an undertone of the true Apollo. These are not verse; they are poetry.” In 1892 Henley published also three plays written with Stevenson and Asa Clift: Beau Austin, Deacon Brodie and Admiral Guinevere. In 1895 followed Macaire, afterwards published in a volume with the other plays. Deacon Brodie was produced in Edinburgh in 1884 and later in London. Beerbohm Tree produced Beau Austin at the Haymarket on the 3rd of November 1890.
HENLEY-ON-THAMES—HENNA

and Macaire at His Majesty’s on the 2nd of May 1901. Admiral Guineas also achieved stage performance. In the meantime Henley was active in the magazines and did notable editorial work for the publishers: the Lyra Herica, 1891; A Book of English Verse (with Mr Charles Whibley), 1894; the centenary Book (with Mr T.F. Henderson) in 1896-1897, in which Henley’s Essay (published separately in 1887) roused considerable controversy. In 1892 he undertook for Mr Nutt the general editorship of the Tudor Translations; and in 1897 began for Mr Heinemann an edition of Byron, which did not proceed beyond one volume of letters. In 1898 he published a collection of his Poems in one volume, with the autobiographical “advertisement” above quoted; in 1890 London Types, Quatorzains to accompany Mr William Nicolson’s designs; and in 1900 during the Boer War, a patriotic poetical brochure, Patroits. In 1901 he published a second volume of collected poetry with the title Hawthorn and Lavender, uniform with the volume of 1898. In 1902 he collected his various articles on painters and artists and published them as a companion volume of Views and Reviews: Art. These with “A Song of Speed” printed in May 1903 within two months of his death make up his tale of work. At the close of his life he was engaged upon his edition of the Authorized Version of the Bible for his series of Tudor Translations. There remained uncataloged some of his scattered articles in periodicals and reviews, especially the series of literary articles contributed by his name to The Pall Mall Magazine in 1899, the year of his death. These contain the most outspoken utterances of a critic never mealy-mouthed, and include the spleenetic attack on the memory of his dead friend R. L. Stevenson, which aroused deep regret and resentment. In 1894 Henley lost his little six-year-old daughter Margaret; he had borne the “bludgeonings of chance” with “the unconquerable soul” of which he boasted, not unjustifiably, in a well-known poem; but this blow broke his heart. With the knowledge of this fact, some of these outbursts may be better understood; yet we have the evidence of a clear-eyed critic who knew Henley well, that he found him more generous, more sympathetic at the close of his life than he had been before. He died on the 11th of July 1903. In spite of his too boisterous mannerism and prejudices, he exercised by his originality, independence and fearlessness an inspiring and inspiring influence on the higher class of journalism. This influence he exercised by word of mouth as well as by his pen, for he was a famous talker, and figures as “Burlby” in Stevenson’s essay on Talk and Talkers. As critic he was a good hater and a good fighter. His virtue lay in his vital and vitalizing love of good literature, and the vivid and pictorial phrases he found to give it expression. His name was the best known of English critics, and many of his book reviews published in the two or three weeks before his death. For these, and for his paintings and watercolours, as well as for the many of his impressions of his world, his contemporaries, and his friends, he is known. He was an author of a great name, a man of education, a statesman, a man of letters, a collector of books and a critic of books, a man of the people, and a man of the world. He was a man of the church, a man of the state, a man of the press, and a man of the world. He was a man of the people, a man of the press, and a man of the world. He was a man of the church, a man of the state, a man of the press, and a man of the world. He was a man of the church, a man of the state, a man of the press, and a man of the world.
HENNEBONT—HENRIETTA MARIA

in a pulverized state being sometimes mixed with them. When required for use; the powder is made into a pasty mass with hot water, and is then spread upon the part to be dyed, where it is generally allowed to remain for one night. According to Lady Calcott, the flowers are often used by the Eastern women to adorn their hair. The distilled water from the flowers is used as a perfume.

HENNEBONT, a town of western France, in the department of Morbihan, 6m. N.E. of Lorient by road. Pop. (1906) 7250. It is situated about 10 m. from the mouth of the Blavet, which divides it into two parts—the Ville Close, the medieval military town, and the Ville Neuve on the left bank and the Vieille Ville on the right bank. The Ville Close, surrounded by ramparts and entered by a massive gateway flanked by machicolated towers, consists of narrow quiet streets bordered by houses of the 16th and 17th centuries. The Ville Neuve, which lies nearer the river, developed during the 17th century and later than the Ville Close, while the Vieille Ville is older than either. The only building of architectural importance is the church of Notre-Dame de Paradis (16th century) preceded by a tower with an ornamented stone spire. There are scanty remains of the old fortress. Hennebont has a small but busy river-port accessible to vessels of 200 to 500 tons. An important foundry in the environs of the town employs 1500 work-peole in the manufacture of tinplate for sanitary boxes and other purposes. Boat-building, tanning, distilling and the manufacture of earthenware, white lead and chemical manures are also carried on. Granite is worked in the neighbourhood. Hennebont is famed for the resistance which it made, under the widow of Jean de Montfort, when besieged in 1342 by the armies of Philip of Valois and Charles of Blois during the War of the Succession in Brittany (see BRITTANY).

HENNEQUIN, PHILIPPE AUGUSTE (1763–1833), French painter, was a pupil of David. He was born at Lyons in 1763, distinguished himself early by winning the "Grand Prix," and left France for Italy. The disturbances at Rome, during the course of the Revolution, obliged him to return to Paris, where he executed the Federation of the 14th of July, and he was at work on a large design commissioned for the town-hall of Lyons, when in July 1794 he was accused before the revolutionary tribunal and thrown into prison. Hennequin escaped, only to be anew accused and imprisoned in Paris, and after running great danger of death, seems to have devoted himself thenceforth wholly to his profession. At Paris he finished the picture ordered for the municipality of Lyons, and in 1801 produced his chief work, "Orestes pursued by the Furies" (Louvre, engraved by Landon, Annales du Musée, v. i. p. 105). He was one of the four painters who competed when in 1802 Gros carried off the official prize for a picture of the Battle of Nazareth, and in 1808 Napoleon himself ordered Hennequin to illustrate a series of scenes from his German campaigns, and commanded that his picture of the "Death of General Salomon" should be engraved. After 1815 Hennequin retired to Liège, and there, aided by subventions from the Government, carried out a large historical picture of the "Death of the Three Hundred in defence of Liège"—a sketch of which he himself engraved. In 1824 Hennequin settled at Tournay, and became director of the academy; he exhibited various works at Lille in the following year, and continued to produce actively up to the day of his death in May 1833.

HENNER, JEAN JACQUES (1809–1905), French painter, was born on the 5th of March 1829 at Dornach (Alsace). At first a pupil of Drolling and of Picot, he entered the École des Beaux-Arts in 1848, and took the Prix de Rome with a painting of "Adam and Eve finding the Body of Abel," (1854). In 1855 he was guided by Flandrin, and, among other works, painted four pictures for the gallery at Colmar. He first exhibited at the Salon in 1853 in "A Bather Asleep," and subsequently contributed "Chaste Susanna" (1856); "Byblis turned into a Spring" (1857); "The Magdalene" (1878); "Portrait of M. Hayem" (1875); "Christ Entombed" (1879); "Saint Jerome" (1881); "Herodias" (1887); "A Study" (1881); "Christ in His Shroud," and a "Portrait of Carolus-Duran" (1896); a "Portrait of Mlle Fouquier" (1897); "The Levite of the Tribe of Ephraim" (1898), for which a first-class medal was awarded to him; and "The Dream" (1900). Among other professional distinctions Henner also took a Grand Prix for painting at the Paris International Exhibition of 1890. He was made Knight of the Legion of Honour in 1873, Officer in 1878 and Commander in 1886. In 1889 he succeeded Cabanel in the Institut de France.

See E. Bricon, Psychologie d'art (Paris, 1900); C. Phillips, Art Journal (1888); F. Wedmore, Magazine of Art (1888).

HENRIETTA MARIA (1600–1666), queen of Charles I. of England, born on the 25th of November 1609, was the daughter of Henry IV. of France. When the first serious overtures for her hand were made on behalf of Charles, prince of Wales, in the spring of 1624, she was little more than fourteen years of age. Her brother, Louis XIII., only consented to the marriage on the condition that the English Roman Catholics were relieved from the operation of the penal laws. When therefore she set out for her new home in June 1625, she had already pledged the husband to whom she had been married by proxy on the 1st of May to a course of action which was certain to bring unpopularity on him as well as upon herself.

That husband was now king of England. The early years of the married life of Charles I. were most unhappy. He soon found an excuse for breaking his promise to relieve the English Catholics, and he married his young wife deeply offended by treatment which she naturally regarded as unhandsome. The favourite Buckingham stirred the flames of his master's discontent. Charles in vain strove to reduce her to tame submission. After the assassination of Buckingham in 1628 the barrier between the married pair was broken down, and the bond of affection which from that moment united them was never loosened. The children of the marriage were Charles II. (b. 1630), Mary, princess of Orange (b. 1631), James II. (b. 1633), Elizabeth (b. 1636), Henry, duke of Gloucester (b. 1640), and Henrietta, duchess of Orleans (b. 1644).

For some years Henrietta Maria's chief interests lay in her young family, and in the amusements of a gay and brilliant court. She loved to be present at dramatic entertainments, and her participation in the private rehearsals of the Shepherd's Pastoral, written by her favourite Walter Montague, probably drew down upon her the savage attack of Fryrne. With political matters she hardly meddled as yet. Even her co-religionists found little aid from her till the summer of 1637. She had then recently opened a diplomatic communication with the see of Rome. She appointed an agent to reside at Rome, and a papal agent, a Scotsman named George Conn, accredited to her, was soon engaged in effecting conversions amongst the English gentry and nobility. Henrietta Maria was well pleased to become a patroness of so holy a work, especially as she was not afraid to take any personal trouble in the matter. Protestant England took alarm at the proceedings of a queen who associated herself so closely with the doings of "the grim wolf with pryvy paw."

When the Scottish troubles broke out, she raised money from her fellow-Catholics to support the king's army on the borders in 1639. During the session of the Short Parliament in the spring of 1640, the queen urged the king to oppose himself to the House of Commons in defence of the Catholics. When the Long Parliament met, the Catholics were believed to be the authors and agents of every arbitrary scheme which was supposed to have entered into the plans of Strafford or Laud. Before the Long Parliament had sat for two months, the queen was urgeing upon the pope the duty of lending money to enable her to restore her husband's authority. She threw herself heart and soul into the scheme for rescuing Strafford and coercion the parliament. The army plot, the scheme for using Scotland against England, and the attempt upon the five members were the fruits of her political activity.

In the next year the queen effected her passage to the Continent. In February 1643 she landed at Burlington Quay, placed herself at the head of a force of loyalists, and marched through England to join the king near Oxford. After little more than a year's residence there, on the 3rd of April 1644, she left her husband,
HENRY—HENRY II.

273
to see his face no more. Henrietta Maria found a refuge in France. Richelieu was dead, and Anne of Austria was compassionate. As long as her husband was alive the queen never ceased to encourage him to resistance.

During her exile in France she had much to suffer. Her husband's execution in 1649 was a terrible blow. She brought up with sensible success her young son, the duke of Gloucester, to take the same course only produced discomfort in the exiled family. The story of her marriage with her attached servant Lord Jermyn needs more confirmation than it has yet received to be accepted, but all the information which has reached us of her relations with her children points to the estrangement which had grown up between them. When after the Restoration she returned to England, she found—that she had no place in the world. She received from parliament a grant of £30,000 a year in compensation for the loss of her dower-lands, and the king added a similar sum as a pension from himself. In January 1661 she returned to France to be present at the marriage of her daughter Henrietta to the duke of Orleans. In July 1662 she set out again for England, and took up her residence once more at Somerset House. Her health failed her, and on the 24th of June 1665, she departed in search of the clearer air of her native country. She died on the 31st of August 1666, at Coblemes, not far from Paris. See J. A. Taylor, The Life of Queen Henrietta Maria (1906).

HENRY (Tr. Henri, Span. Enrique; Ger. Heinrich; Mid. Fr. Herneke; Lat. Henricus; O.H.G. Haimi-
heim, i.e. "prince, or chief of the house," from O.H.G. heim, the Eng. home, and rith, Germ. reich; compare Lat. rex "king"—"rich," therefore "mighty," and so "a ruler." Compare Sans. rādās "to shine forth, rule, &c." and mod. rāj "rule" and raja, "king"), the name of many European sovereigns, the more important of whom are noticed below in the following order: (1) Emperors and German kings; (2) Kings of England; (3) Other kings in the alphabetical order of their states; (4) Other reigning princes in the same order; (5) Non-reigning princes; (6) Bishops, nobles, chroniclers, &c.

HENRY I (c. 875–936) surnamed the " Fowler," German king, son of Otto the Illustrious, duke of Saxony, grew to manhood amid the disorders which witnessed to the decay of the Carolingian empire, and in early life shared in various campaigns for the defence of Saxony. He married Hatburg, a daughter of Irwin, count of Mercersburg, but as she had taken the veil on the death of a former husband this union was declared illegal by the church, and in 909 he married Matilda, daughter of a Saxon count named Thiederich, and a reputed descendant of the hero Widukind. On his father's death in 912 he became duke of Saxony, which he inherited also; on the death of June 919 he was chosen king of the Slavs and resisting the claims of the German king Conrad I. (see SAXONY). He afterwards won the esteem of Conrad to such an extent that in 918 the king advised the nobles to make the Saxon duke his successor. After Conrad's death the Franks and the Saxons met at Fritzlar in May 919 and chose Henry as German king, after which the new king refused to allow his election to be sanctioned by the church. His authority, save in Saxony, was merely nominal; but by negotiation rather than by warfare he secured a recognition of his sovereignty from the Bavarians and the Swabians. A struggle soon took place between Henry and Charles III., the Simple, king of France, for the possession of Lorraine. In 921 Charles recognized Henry as king of the East Franks, and when in 923 the French king was taken prisoner by Herbert, count of Vermandois, Lorraine came under Henry's authority, and Gisela, who married his daughter Gerberga, was recognized as duke. Turning his attention to the east, Henry reduced various Slavonic tribes to subjection, took Bennibrow, the modern Brandenburg, from the Hevelli, and secured both banks of the Elbe for Saxony. In 923 he had bought a truce for ten years with the Hungarians, by a promise of tribute, but on its expiring he gained a great victory over these formidable foes in March 933. The Danes were defeated, and territory as far as the Eider secured for Germany; and the king sought further to extend his influence by entering into relations with the kings of England, France and Burgundy. He is said to have contemplated a journey to Rome, where he died at Meleben on the 2nd of July 936, and was buried at Quedlinburg. By his first wife, Hatburg, he left a son, Theckmar, who was excluded from the succession as illegitimate; and by Matilda he left three sons, of whom, Otto (afterwards the emperor Otto the Great), succeeded him. Henry's grandson Henry II., a spirited ruler, probably because he was careful to undertake only such enterprises as he was able to carry through. Laying more stress on his position as duke of Saxony than king of Germany, he conferred great benefits on his duchy. The founder of her town life and the creator of her army, he ruled in harmony with her nobles and secured her frontiers from attack. The story that he received the surname of " Fowler " because the nobles, sent to inform him of his election to the throne, found engaged in laying snares for the birds, appears to be mythical.

HENRY II. (973–1034), surnamed the "Saint," Roman emperor, son of Henry I., the Quarrelsome, duke of Bavaria, and the eldest daughter of Conrad, king of Burgundy, or Arles (d. 993), and great-grandson of the German king, surnamed the " Fowler," was born on the 6th of May 973. When his father was driven from his duchy in 976 it was intended that Henry should take holy orders, and he received the earlier part of a good education at Hildesheim. This idea, however, was abandoned when his father was restored to Bavaria in 985; but young Henry, whose education was completed at Regensburg, retained a lively interest in ecclesiastical affairs. He became duke of Bavaria on his father's death in 995, and appears to have governed his duchy quietly and successfully for seven years. He showed a special regard for monastic reform and church government, accomplished his kinsman, the emperor Otto III., on two occasions to Italy, and about 1001 married Kunigunde (d. 1037), daughter of Siegfried, count of Luxemburg. When Otto III. died childless in 1002, Henry sought to secure the German throne, and seizing the imperial insignia made an arrangement with Otto I., duke of Carinthia. There was considerable opposition to his claim; but one rival, Eckhard I., margrave of Meissen, was murdered, and, hurrying to Mainz, Henry was chosen German king by the Franks and Bavarians on the death of June 1002. Henry's archbishopric of Augsburg, where his father was bishop, was conferred on him at Mainz, which had been largely instrumental in securing his election. Having ravaged the lands of another rival, Hermann II., duke of Swabia, Henry purchased the allegiance of the Thuringians and the Saxons; and when shortly afterwards the nobles of Lorraine did homage and Hermann of Swabia submitted, he was generally recognized as king. Danger soon arose from Boleslaus I., the Great, king of Poland, who had extended his authority over Meissen and Lusatia, seized Bohemia, and allied himself with some discontented German nobles, including the king's brother, Bruno, bishop of Augsburg. Henry easily subdued his domestic foes; but the incipient war with Boleslaus was abandoned in favour of an expedition into Italy, where Arduin, margrave of Ivrea, had been elected king. Crossing the Alps Henry met with no resistance from Arduin, and in May 1004 he was chosen and crowned king of the Lombards at Pavia; but a tumult caused by the presence of the Germans soon arose in the city, and having received the homage of several cities of Lombardy the king returned to Germany. He then freed Bohemia from the rule of the Poles, led an expedition into Friesland, and was successful in compelling Boleslaus I. to sue for peace; and added to his dominion by the marriage of his son with Bertha, countess of Flanders, in 1006 and 1007 was followed by trouble with the king's brothers-in-law, Dietrich and Adalbero of Luxemburg, who had seized respectively the bishopric of Metz and the
archbishopric of Trier (Treves). Henry sought to dislodge them, but aided by their elder brother Henry, who had been made duke of Bavaria in 1004, they held their own in a desultory warfare in Lorraine. In 1009, however, the eldest of the three brothers was deprived of Bavaria, while Adalbero had in the previous year given up his claim to Trier, but Dietrich retained the bishopric of Metz. The Polish war had been renewed in 1007, but it was not until 1010 that the king was able to take a personal part in these campaigns. Meeting with indifferent success, he made peace with Boleslaus early in 1013, when the duke retained Lusatia, but did homage to Henry at Merseburg.

In 1013 the king made a second journey to Italy where two popes were contending for the papal chair, and meeting none opposition was received with great honour at Rome. Having recognized Benedict VIII. as the rightful pope, he was crowned emperor on the 14th of February 1014, and soon returned to Germany laden with treasures from Italian cities. But the struggle with the Poles now broke out afresh, and in 1015 and 1017 the king, having obtained assistance from the heathen Liutici, led formidable armies against Boleslaus. During the campaign of 1017 he had as an ally the grand duke of Russia, but his troops suffered considerable loss, and on the 30th of January 1018 he made peace at Bautzen with Boleslaus, who again retained Lusatia. As early as 1006 Henry had concluded a similar treaty with his uncle Rudolf III., the childless king of Burgundy, or Arles; but when Rudolf desired to abdicate in 1016 Henry's efforts to secure possession of the territory were foiled by the resistance of the nobles. In 1020 the emperor was visited at Bamberg by Pope Benedict, in response to whose entreaty for assistance against the Greeks of southern Italy he crossed the Alps in 1021 for the third and last time. With the aid of the Normans he captured many fortresses and seriously crippled the power of the Greeks, but was compelled by the ravages of pestilence among his troops to return to Germany in 1022. It was probably about this time that Henry gave Benedict the diploma which ratified the gifts made by his predecessors to the papacy. Spending his concluding years in preparation for his abdication he died on the 13th of July 1024 at Grona near Göttingen, and was buried at Bamberg, where he had founded and richly endowed a bishopric.

Henry was an enthusiast for church reform, and under the influence of his friend Odilo, abbot of Cluny, sought to further the principles of the Cluniacs, and seconded the efforts of Benedict VIII. to prevent the marriage of the clergy and the sale of spiritual dignities. He was energetic and capable, but except in his relations with the church was not a strong ruler. But though devoted to the church and a strict observer of religious rites, he was by no means the slave of the clergy. He appointed bishops without the formality of an election, and attacked clerical privileges although he made clerics the representatives of the imperial power. He held numerous diets and issued frequent ordinances for peace, but feuds among the nobles were common, and the frontier of the empire were insecure. Henry, who was the last emperor of the Saxon house, was the first to use the title "King of the Romans." He died childless, and a tradition of the 12th century says he and his wife took vows of chastity. He was canonized in 1146 by Pope Eugenius III.

HENRY III. (1017–1056), surnamed the "Black," Roman emperor, only son of the emperor Conrad II., and Gisela, widow of Ernest I., duke of Swabia, was born on the 28th of October 1017, designated as his father's successor in 1026, and crowned German king at Aix-la-Chapelle by Pilgrim, archbishop of Cologne, on the 14th of April 1028. In 1027 he was appointed duke of Bavaria, and his early years were mainly spent in this country, where he received an excellent education under the care of Bruno, bishop of Augsburg and, afterwards, of Egilbert, bishop of Freising. He soon began to take part in the business of the empire. In 1032 he took part in a campaign in Burgundy; in 1033 led an expedition against Ulrich, prince of the Bohemians; and in June 1036 was married at Nijmegen to Gunhilda, afterwards called Kunigunde, daughter of Canute, king of Denmark and England. In 1038 he followed his father to Italy, and in the same year the emperor formally handed over to him the kingdom of Burgundy, or Arles, and appointed him duke of Swabia. In spite of the honours which Conrad showed him Henry the relations between father and son were not uniformly friendly, as Henry disapproved of the emperor's harsh treatment of some of his allies and adherents. When Conrad died in June 1039, Henry became sole ruler of the empire, and his authority was at once recognized in all parts of his dominions. Three of the duchies were under his direct rule, and no rival appeared to contest his claim, and the outlying parts of the empire, as well as Germany, were practically free from disorder. This peaceful state of affairs was, however, soon broken by the ambition of Bretislaus, prince of the Bohemians, who revived the idea of an independent Slavonic state, and conquered various Polish towns. Henry took up arms, and after a fierce struggle with a stronger force in the following year, when he compelled Bretislaus to sue for peace and to do homage for Bohemia at Regensburg. In 1042 he received the homage of the Burgundians and his attention was then turned to the Hungarians, who had driven out their king Peter, and set up in his stead one Aba Samuel, or Ovo, who attacked the eastern border of Bavaria.

In 1043 and the following years Henry crushed the Hungarians, restored Peter, and brought Hungary completely under the power of the German king. In 1048 Queen Kunigunde had died in Italy, and in 1043 the king was married at Ingelheim to Agnes, daughter of William V., duke of Guise, a union which drew him nearer to the Bentinck party in the church. In 1044 Gothelon (Gozelio), duke of Lorraine, died, and some disturbance arose over Henry's refusal to grant the whole of the duchy to his son Godfrey, called the Bearded. Godfrey took up arms, but after a short imprisonment was released and confirmed in the possession of Upper Lorraine in 1046 which, however, he failed to secure. About this time Henry was invited to Italy where three popes were contending for power, and, crossing the Alps with a large army he marched to Rome. Councils held at Sutri and at Rome having declared the popes deposed, the king secured the election of Suidger, bishop of Bamberg, who took the name of Clement II., and by this pontiff Henry was crowned as emperor on the 25th of December 1046. He was immediately recognized by the Romans as "Patricius," an office which carried with it at this time the right to appoint the pope. Supreme in church and state alike, ruler of Germany, Italy and Burgundy, overlord of Hungary and Bohemia, Henry occupied a commanding position, and this time may be regarded as marking the apogee of the power of the Roman empire of the Germans. The emperor assisted Pope Clement in his efforts to banish simony. He made a victorious progress in southern Italy, where he restored Pandolph IV. to the principality of Capua, and asserted his authority over the Normans in Apulia and Aversa. Returning to Germany in 1047 he appointed two popes, Damasus II. and Leo IX., in quick succession, and turned to face a threatening combination in the west of the empire, where Godfrey of Lorraine was again in revolt, and with the help of Baldwin V., count of Flanders and Dirk IV., count of Holland, who had previously caused trouble to Henry, was ravaging the lands of the emperor's representatives in Lorraine. Assisted by the kings of England and Denmark, Henry succeeded with some difficulty in bringing the rebels to submission in 1050. Godfrey was deposed; but Baldwin soon found an opportunity for a further revolt, which an expedition undertaken by the emperor in 1054 was unable to crush.
HENRY IV.

Meanwhile a reaction against German influence had taken place in Hungary. King Peter had been driven out in 1046 and his place taken by Andreas I. Inroads into Bavaria followed, and in 1051 and 1052 Henry led his forces against the Hungarians, and after the pope had vainly attempted to mediate, peace was made in 1053. It was quickly broken, however, and the emperor, occupied elsewhere, soon lost most of his authority in the east; and in 1055 the rebellious Bohemian prince, Bretislaus, with the help of Bidegis, count of Bohemia, and Casimir I, duke of the Poles. Henry had not lost sight of affairs in Italy during these years, and had received several visits from the pope, whose aim was to bring southern Italy under his own dominion. Henry had sent military assistance to Leo, and had handed over to him the government of the principality of Benevento in return for the bishopric of Bamberg. But the pope's defeat by the Normans was followed by his death. Henry then nominated Gebhard, bishop of Eichstätt, who took the name of Victor II., to the vacant chair, and promised his assistance to the reluctant candidate. In 1055 the emperor went a second time to Italy, where his authority was threatened by Godfrey of Lorraine, who had married Beatrice, widow of Boniface III., margrave of Tuscany, and was ruling her vast estates. Godfrey fled, however, on the appearance of Henry, who only remained a short time in Italy, during which he granted the duchy of Spoleto to Pope Victor, and negotiated for an attack upon the Normans. Before the journey to Italy, Henry had found it necessary to depose Conrad III., duke of Bavaria, and to suppress a rising in southern Germany. During his absence, Conrad formed an alliance with Wolf, duke of Frankfurt, and Gebhard III., bishop of Regensburg. A conspiracy to depose the emperor, support for which was found in Lorraine, was quickly discovered, and Henry, leaving Victor as his representative in Italy, returned in 1055 to Germany to receive the submission of his foes. In 1056, the emperor was visited by the pope; and on the 9th of October in the same year he died at Bollfeld and was buried at Spire. Henry was a pious and peace-loving prince, who favoured church reform, sought earnestly to suppress private warfare, and alone among the early emperors is said to have been innocent of simony. Although under his rule Germany enjoyed considerable tranquillity, and a period of wealth and progress set in for the towns, yet his secular and ecclesiastical policy showed signs of weakness. Unable, or unwilling, to curb the increasing power of the church, he alienated the sympathies of the nobles as a class, and by allowing the southern duchies to pass into other hands restored a power which true to its traditions was not always friendly to the royal house. Henry was a patron of learning, a founder of schools, and built or completed cathedrals at Spire, Worms, and Mainz.

The chief original authorities for the life and reign of Henry III. are the Chronicon of Herrmann von Reichenau, the Annales Sangelenses maior, the Annales Hildeshiemenses, all in the Monumenta Germaniae historica. Scriptores (Hanover and Berlin, 1826 fdl.); The best modern authorities, are W. W. von Giesebrecht, Geschichte der deutschen Kaiserzeit, Band ii. (Leipzig, 1888); M. Perlich, "Die Kriege Heinrichs III. gegen Böhmen," in the Forschungen zur deutschen Geschichte, Band x. (Götttingen, 1862-1866); E. Steinhof, Jahrbücher des deutschen Reichs unter Heinrich III. (Leipzig, 1874-1881); and F. Steinhoff, Das Königthum und Kaiserthum Heinrichs III. (Göttingen, 1865).

HENRY IV. (1050-1106), Roman emperor, son of the emperor Henry III. and Agnes, daughter of William V., duke of Guiseux, was born on the 11th of November 1050, chosen German king at Tribur in 1053, and crowned at Aix-la-Chapelle on the 17th of July 1054. In 1055 he was appointed duke of Bavaria, and on his father's death in October 1056 inherited the kingdoms of Germany, Italy and Burgundy. These territories were governed in his name by his mother, who was unable to repress the internal disorder or to take adequate measures for their defence. Some opposition was soon aroused, and in 1063 Anno, his archbishop of Cologne, and others planned to seize the person of the young king and to deprive Agnes of power. This plot met with complete success. Henry, who was at Kaiserwerth, was persuaded to board a boat lying in the Rhine; it was immediately unmoored and the king sprang into the stream, but was rescued by one of the conspirators and carried to Cologne. Agnes made no serious effort to regain her control, and the chief authority was exercised for a time by Anno; but his rule proved unpopular, and he was soon compelled to share his power with Adalbert, archbishop of Bremen. The education and training of Henry were supervised by Anno, who was called his magister, while Adalbert was styled paterculus; but Anno was disliked by Henry, and during his absence in Italy the chief power passed into the hands of Adalbert. Henry's education seems to have been neglected, and his wilful and headstrong nature was developed by the conditions under which his early years were passed. In March 1065 he was declared of age, and in the following year a powerful coalition of ecclesiastical and lay nobles brought about the banishment of Adalbert from court and the return of Anno to power. In 1066 Henry was persuaded to marry Bertha, daughter of Otto, count of Savoy, to whom he had been betrothed since 1055. For some time he regarded his wife with strong dislike and sought in vain for a divorce, but after she had borne him a son in 1071 she gained his affection, and became his most trusted friend and companion.

In 1069 the king took the reins of government into his own hands. He recalled Adalbert to court; led expeditions against the Liutici, and against Dedo or Dedi II., margrave of a district east of Saxony; and soon afterwards quarrelled with Rudolph, duke of Swabia, and Berthold, duke of Carinthia. Much more serious was Henry's struggle with Otto of Nordheim, duke of Bavaria, who was the only prince in Germany, was accused in 1070 by a certain Egino of being privy to a plot to murder the king. It was decided that a trial by battle should take place at Goslar, but when the demand of Otto for a safe conduct for himself and his followers, and from the place of meeting, was refused, he declined to appear. He was thereupon declared deposed in Bavaria, and his Saxon estates were plundered. He obtained sufficient support, however, to carry on a struggle with the king in Saxony and Thuringia until 1071, when he submitted at Halberstadt. Henry aroused the hostility of the Thuringians by supporting Siegfried, archbishop of Mainz, in his efforts to exact tithes from them; but still more formidable was the enmity of the Saxons, who had several causes of complaint against the king. He was the son of one enemy, Henry III., and the friend of another, Adalbert of Bremen. He had ordered a restoration of all crown lands in Saxony and had built forts among this people, while the country was ravaged to supply the needs of his courtiers, and its duke Magnus was a prisoner in his hands. All classes were united against him, and when the struggle broke out in 1073 the Saxons joined the Germans, and the war, which lasted with slight interruptions until 1086, exploded in an attempt to wrest the potent influence upon Henry's fortunes elsewhere (see SAXONY).

Henry soon found himself confronted by an able and more stubborn antagonist than either Thuringian or Saxon. In 1073 Hildebrand became pope as Gregory VII. Two years later this great ecclesiastical issued his memorable prohibition of lay investiture, and the blow then struck at the secular power by the papacy threatened seriously to undermine the imperial authority. Spurred on by his advisers, Henry did not refuse the challenge, but determined to attack the pope; the synod of German bishops which met at Worms in January 1076 and declared Gregory deposed; and he wrote his famous letter to the pope, in which he referred to him as "not pope, but false monk." The king was at once excommunicated. His adherents gradually fell away, the Saxons were again in arms, and Otto of Nordheim succeeded in uniting the malcontents of north and south Germany. In October 1076 an important diet met at Tribur, and after discussing the deposition of the king, decided that he should be judged by an assembly to be held at Augsburg in the following February under the presidency of the pope. This union of the temporal and spiritual forces was too strong for the king, and he decided to submit.

Crossing the Alps, Henry appeared in January 1077 as a penitent before the castle of Canossa, where Gregory had taken
HENRY IV.

Successor, Urban II. Among them was Welf, son of Welf I., the deposed duke of Bavaria, whose marriage with Matilda of Tuscany rendered him too formidable to be neglected. The emperor accordingly returned to Italy in 1090, where Mantua and Milan were taken, and Pope Clement was restored to Rome. Henry's communications with Germany were, however, threatened by a league of the Lombard cities, and his anxieties were soon augmented by domestic troubles.

Henry's first wife had died in 1087, and in 1089 he had married a Russian princess, Praxedis, afterwards called Adelaide. Her conduct soon aroused his suspicions, and his own eldest son, Conrad, who had been crowned German king in 1087, was thought to be a partner in her guilt. Escaping from prison, Adelaide fled to Henry's enemies and brought grave charges against her husband; while the papal party induced Conrad to desert his father and to be crowned king of Italy at Monza in 1093. Crushed by this blow, Henry remained almost inactive in northern Italy for five years, until 1097, when having lost every shred of authority in that country, he returned to Germany, where his position was stronger than ever. Welf had submitted, had forsaken the cause of Matilda and had been restored to Bavaria, and in 1098 the diet assembled at Mainz declared Conrad deposed, and chose the emperor's second son, Henry, afterwards the emperor Henry V., as German king. The crusade of 1096 had freed Germany from many turbulent spirits, and the emperor, meeting with some success in his efforts to restore order, could afford to ignore his repeated excommunication. A successful campaign in Flanders was followed in 1103 by a diet at Mainz, which confirmed Henry's title of King of the Romans. From then on Henry was for a time secure, but without any serious effect on the fortunes of the king. At Henry's initiative, Gregory was declared deposed on three occasions, and an anti-pope was elected in the person of Wibert, archbishop of Ravenna, who took the name of Clement III.

The death of Rudolph in October 1080, and a consequent lull in the war, enabled the king to go to Italy early in 1081. He found considerable support in Lombardy; placed Matilda, marchioness of Tuscany, the faithful friend of Gregory, under the imperial ban; took the Lombard crown at Pavia; and secured the recognition of Clement by a council. Marching to Rome, he undertook the siege of the city, but was soon compelled to retire to Tuscany, where he granted privileges to various cities, and obtained monastic admission from a new ally, the eastern emperor, Alexius I. A second and equally unsuccessful attack on Rome was followed by a war of devastation in northern Italy with the adherents of Matilda; and towards the end of 1082 the king made a third attack on Rome. After a siege of seven months the Leonine city fell into his hands. A treaty was concluded with the Romans, who agreed that the quarrel between king and pope should be decided by a synod, and secretly bound themselves to induce Gregory to crown Henry as emperor, or to choose another pope. Gregory, however, shut up in the castle of St Angelo, would hear of no compromise; the synod was a failure, as Henry prevented the attendance of many of the pope's supporters; and the king, in pursuance of his treaty with Alexius, marched against the Normans. The Romans soon fell away from their allegiance to the pope; and, recalled to the city, Henry entered Rome in March 1084, after which Gregory was declared deposed and Clement recognized by the Romans. On the 31st of March 1084 Henry was crowned emperor by Clement, and received the patrician authority. His next step was to attack the fortresses still in the hands of Gregory. The pope was saved by the advance of Robert Guiscard, duke of Apulia, with a large force, which compelled Henry to return to Germany.

Meanwhile the German rebels had chosen a fresh anti-king, Hermann, count of Luxemburg, whom Henry's supporters had already driven to his last line of defence in Saxony. During the campaign of 1086 Henry was defeated near Würzburg, but in 1088 Hermann abandoned the struggle and the emperor was generally recognized in Saxony, to which country he showed considerable clemency. Although Henry's power was in the ascendant, a few powerful nobles adhered to the cause of Gregory's
HENRY V. (1081–1125), Roman emperor, son of the emperor Henry IV., was born on the 8th of January 1081, and after the revolt and deposition of his elder brother, the German king Conrad (d. 1101), was chosen as his successor in 1088. He promised to take no part in the business of the Empire during his father’s lifetime, and was crowned at Aix-la-Chapelle on the 6th of January 1099. In spite of his oath Henry was induced by his father’s enemies to revolt in 1104, and some of the princes did homage to him at Mainz in January 1106. In August of the same year the elder Henry died, when his son became sole ruler of Germany. Order was soon restored in Germany, the citizens of Cologne were punished by a fine, and an expedition against Robert II., count of Flanders, brought this rebel to his knees. In 1107 a campaign, which was only partially successful, was undertaken to restore Bo孚woj II. to the dukedom of Bohemia, and in the year following the king led his forces into Hungary, where he failed to takePressburg. In 1109 he was unable to compel the Poles to renew their accustomed tribute, but in 1110 he succeeded in securing the dukedom of Bohemia for Ladislaus I.

The chief interest of Henry’s reign centres in the controversy over lay investiture, which had caused a serious dispute during the previous reign. The papal party who had supported Henry in his resistance to his father hoped he would assent to the decrees of the pope, which had been renewed by Paschal II. at the synod of Guastalla in 1106. The king, however, continued to invest the bishops, but wished the pope to hold a council in Germany to settle the question. Paschal after some hesitation preferred France to Germany, and, after holding a council at Troyes, renewed his prohibition of lay investiture. The matter slumbered until 1116, when, negotiations between King and pope having failed, Paschal renewed his decrees and Henry went to Italy with a large army. The strength of his forces helped him to secure general recognition in Lombardy, and at Sutri he concluded an arrangement with Paschal by which he renounced the right of investiture in return for a promise of coronation, and the restoration to the Empire of all lands given by kings, or emperors, to the German church since the time of Charlemagne. It was a treaty impossible to execute, and Henry, whose consent to it is said to have been conditional on its acceptance by the princes and bishops of Germany, probably foresaw that it would occasion a breach between the German clergy and the pope. Having entered Rome and sworn the usual oaths, the king presented himself at St. Peter’s on the 22d of February 1117 for his coronation and the ratification of the treaty. The words commanding the clergy to restore the fiefs of the crown to Henry were read amid a tumult of indignation, whereupon the pope refused to crown the king, who in return declined to hand over his renunciation of the right of investiture. Paschal was seized by Henry’s soldiers and, in the general disorder into which the city was thrown, an attempt to liberate the pontiff was thwarted in a mob action during which the king was wounded. Henry then led the city carrying the pope with him; and Paschal’s failure to obtain assistance drew from him a confirmation of the king’s right of investiture and a promise to crown him emperor. The coronation ceremony accordingly took place on the 13th of April 1117, after which the emperor returned to Germany, where he sought to strengthen his power by granting privileges to the inhabitants of the region of the upper Rhine.

In 1112 Lothair, duke of Saxony, rose in arms against Henry, but was easily quelled. In 1113, however, a quarrel over the succession to the counties of Weimar and Orlamünde gave occasion for a fresh outbreak on the part of Lothair, whose troops were defeated at Warnstadt, after which the duke was pardoned. Having been married at Mainz on the 7th of January 1114 to Matilda, or Maud, daughter of Henry I., king of England, the emperor was confronted with a further rising, initiated by the citizens of Cologne, who were soon joined by the Saxons and others. Henry failed to take Cologne, his forces were defeated at Wellescholz on the 11th of February 1115, and complications in Italy compelled him to leave Germany to the care of Frederick II. of Hohenstaufen, duke of Swabia, and his brother Conrad, duke of Swabia. In the Investiturstreit of 1117 Henry from Rome in 1113 a council had declared the privilege of lay investiture, which had been extorted from Paschal, to be invalid, and Guido, archbishop of Vienne, excommunicated the emperor and called upon the pope to ratify this sentence. Paschal, however, refused to take so extreme a step; and the quarrel entered upon a new stage in 1115 when Matilda, daughter and heiress of Boniface, margrave of Tuscany, died leaving her vast estates to the papacy. Crossing the Alps in 1116 Henry won the support of town and noble by privileges to the one and restitution to the other, and supported by the lort, bishop was gladly received in Rome. By this time Paschal had withdrawn his consent to lay investiture and the excommunication had been published in Rome; but the pope was compelled to fly from the city. Some of the cardinals withstood the emperor, but by means of bribes he broke down the opposition, and was crowned a second time by Burdinus, archbishop of Braga. Meanwhile the defeat at Wellescholz had given heart to Henry’s enemies; many of his supporters, especially among the bishops, fell away; the excommunication was published at Cologne, and the pope, with the assistance of the Normans, began to plot against Henry. In 1118 Paschal was succeeded by Gelasius II. The emperor immediately returned from northern Italy to Rome. But as the new pope escaped from the city, Henry, despairing of making a treaty, secured the election of an antipope who took the name of Gregory VIII., and who was left in possession of Rome when the emperor returned across the Alps in 1118. The opposition in Germany was gradually crushed and a general peace declared at Tribur, while the desire for a settlement of the investiture dispute was growing. Negotiations, begun at Würzburg, were continued at Worms, where the new pope, Calixtus II., was represented by Cardinal Lambert, bishop of Osilo. In the concordat of Worms, signed in September 1122, Henry renounced the right of investiture with ring and crosier, recognized the freedom of election of the clergy and promised to restore all church property. The pope agreed to allow elections to take place in presence of the imperial envoys, and the investiture with the sceptre to be granted by the emperor as a symbol that the estates of the church were held under the crown. Henry, who had been solemly excommunicated at Reims by Calixtus in October 1116, was received again into the communion of the church, after he had abandoned his nominee, Gregory, to the emperor. The emperor’s concluding years were occupied with a campaign in Holland, and with a quarrel over the succession to the margravate of Meissen, two disputes in which his enemies were aided by Lothair of Saxony. In 1124 he led an expedition against King Louis VI. of France, turned his arms against the citizens of Worms, and on the 23rd of May 1125 died at Utrecht and was buried at Spire. Having no children, he left his possessions to his nephew, Frederick II. of Hohenstaufen, duke of Swabia, and on his death the line of Franconian, or Salian, emperors became extinct.

Henry’s character was reactionary. His love of power was inordinate; he was wanting in generosity, and he did not retract from treachery in pursuing his ends.

HENRY VI. (1165-1197), Roman emperor, son of the emperor Frederick I. and Beatrix, daughter of Renaud III., count of upper Burgundy, was born at Nijmegen, and educated under the care of Conrad of Querfurt, afterwards bishop of Hildesheim and Würzburg. Chosen German king, or king of the Romans, at Bamberg in June 1169, he was crowned at Aix-la-Chapelle on the 15th of August 1169, invested with lands in Germany in 1179, and at Whitsun 1184 his knighthood was celebrated in the most magnificent manner at Mainz. Frederick was anxious to associate his son with himself in the government of the empire, and when he left Germany in 1184 Henry remained behind as regent, while his father sought to procure his coronation from Pope Lucius III. The pope was hesitating when he heard that the emperor had arranged a marriage between Henry and Constance, daughter of the late king of Sicily, Roger II., and aunt and heiress of the reigning king, William II.; and this step, which threatened to unite Sicily with Germany, decided him to refuse the proposal. This marriage took place at Milan on the 27th of January 1186, and soon afterwards Henry was crowned king of Italy. The claim of Henry and his wife on Sicily was recognized by the barons of that kingdom; and having been recognized by the pope as Roman emperor-elect, easterners were received to Germany, and was again appointed regent when Frederick set out on crusade in May 1189. His attempts to bring peace to Germany were interrupted by the return of Henry the Lion, duke of Saxony, in October 1189, and a campaign against him was followed by a peace made at Fulda in July 1190.

Henry's desire to make this peace was due to the death of William of Sicily, which was soon followed by that of the emperor Frederick. Germany and Italy alike seemed to need the king's presence, but for him, like all the Hohenstaufen, Italy had the greater charm, and having obtained a promise of his coronation from Pope Clement III. he crossed the Alps in the winter of 1190. He purchased the support of the cities of northern Italy, but on reaching Rome he found Clement was dead and his successor, Celestine III., disinclined to carry out the engagement of his predecessor. The strength of the German army and a treaty made between the king and the Romans induced him, however, to crown Henry as emperor on the 14th of April 1191. The aid of the Romans had been purchased by the king's promise to place in their possession the city of Tusculum, which they had attacked in vain for three years. After the ceremony the emperor fulfilled this contract, when the city was destroyed and many of the inhabitants massacred. Meanwhile a party in Sicily had chosen Tancred, an illegitimate son of Roger, son of King Roger II., as their king, and he had already won considerable authority and was favoured by the pope. Leaving Rome Henry met with no resistance until he reached Naples, which he was unable to take, as the ravages of fever and threatening news from Germany, where his death was reported, compelled him to raise the siege. In December 1191 he returned to Germany. Disorder was general and a variety of reasons induced both the Welfs and their earlier opponents to join in a general league against the emperor. Vacancies in various bishoprics added to the confusion, and Henry's enemies gained in numbers and strength when it was suspected that he was implicated in the murder of Albert, bishop of Liège. Henry acted energetically in fighting this formidable combination, but his salvation came from the captivity of Richard I., king of England, and the skill with which his brother John conducted his event to make peace with his foe; and, when Henry the Lion came to terms in March 1194, order was restored to Germany.

In the following May, Henry made his second expedition to Italy, where Pope Celestine had definitely espoused the cause of Tancred. The ransom received from Richard enabled him to equip a large army, and aided by a fleet fitted out by Genoa and Pisa, be soon secured a complete mastery over the Italian main-land. When he reached Sicily he found Tancred dead, and, meeting with very little resistance, he entered Palermo, where he was crowned king on Christmas day 1194. A stay of a few months' duration enabled Henry to settle the affairs of the kingdom; and leaving his wife, Constance, as regent, and appointing many Germans to positions of influence, he returned to Germany in June 1195.

Having established his position in Germany and Italy, Henry began to cherish ideas of universal empire. Richard of England had already owned his supremacy, and declaring he would compel the king of France to do the same Henry sought to stir up strife between France and England. Nor did the Spanish kingdoms escape his notice. Tunis and Tripoli were claimed, but not kept, by the eastern emperor, Isaac Angelus, asked his help, he demanded in return the cession of the Balkan peninsula. The kings of Cyprus and Armenia asked for investiture at his hands; and in general Henry, in the words of a Byzantine chronicler, put forward his demands as "the lord of all lords, the king of all kings." To complete this scheme two steps were necessary, a reconciliation with the pope and the recognition of his young son, Frederick, as his successor in the Empire. The first was easily accomplished; the second was more difficult. After attempting to suppress the renewed disorder in Germany, Henry met the princes at Worms in December 1195 and put his proposal before them. In spite of promises they disliked the suggestion of giving to them into Sicilian troubles, and declined the emperor's displeasure by postponing their answer. By threats or negotiations, however, Henry won the consent of about fifty princes; but though the diet which met at Würzburg in April 1196 agreed to the scheme, the vigorous opposition of Adolph, archbishop of Cologne, and others rendered it inoperative. In June 1196 Henry went again to Italy, sought vainly to restore order in the north, and tried to persuade the pope to crown his son who had been chosen king of the Romans at Frankfort Celestine, who had many causes of complaint against the emperor and his vassals, refused. The emperor then went to the south, where the oppression of his German officials had caused an insurrection, which was put down with terrible cruelty. At Messina on the 28th of September 1197 Henry died from a cold caught whilst hunting, and was buried at Palermo. He was a man of small frame and delicate constitution, but possessed considerable mental gifts and was skilled in knightly exercises. His ambition was immense, and to attain his ends he often resorted deliberately to cruelty and treachery. His chief recreation was hunting, and he also found pleasure in the society of the Minnesingers and in writing poems, which appear in F. von der Hagen's Minnesinger (Leipzig, 1838). He left an only son Frederick, afterwards the emperor Frederick II.

The chief authorities for the life and reign of Henry VI. are Otto of Freising, Chronicon, continued by Otto of St Blasius; Godfrey of Viterbo, Gesta Frederici I. and Gesta Henrici VI.; Giselbert of Mons, Chronicon Hanoiensis, all of which appear in the Monumenta Germaniae historica. Scriptores, Bände xx., xx., xxii. (Hanover and Berlin, 1826-1892), and the various annals of the time. The best modern authorities are: W. von Giesebrecht, Geschichte der deutschen Kaiserzeit, Band iv. (Brunswick, 1877); T. Toech, Kaiser Heinrich VI. (Leipzig, 1867); H. Bloch, Forschungen zur Politik Kaiser Heinrich VI. (Berlin, 1892), and K. A. Kneeler, Des Richard Löwenherz deutsche Gefangenschaft (Freiburg, 1893).

HENRY VII. (c. 1260-1313), Roman emperor, son of Henry III., count of Luxemburg, was knighted by Philip IV., king of France, and passed his early days under French influences, while the French language was his mother-tongue. His father was killed in battle in 1288, and Henry ruled the kingdom with prudence, but came into collision with the citizens of Trier over a question of tolls. In 1292 he married Margaret (d. 1311), daughter of John I., duke of Brabant, and after the death of the German king, Albert II., he was elected to the vacant throne on the 27th of November 1308. Recognized at once by the German princes and by Pope Clement V., the aspirations of the new king turned to Italy, where he hoped to restore the imperial authority to prepare the way for the conquest of
the Holy Land. Meanwhile he strove to secure his position in Germany. The Rhenish archbishops were pacified by the restoration of the Rhine tolls, negotiations were begun with Philip IV., king of France, and with Robert, king of Naples, and the Habsburgs were confirmed in their possessions. But at this time Bohemia was ruled-probably by V. of Luxemburg, who wished to offer the crown, together with the hand of Elizabeth, daughter of the late king Wenceslas II., to John, the son of the German king. Henry accepted the offer, and in August 1310 John was invested with Bohemia and his marriage was celebrated. Before John's coronation at Prague, however, in February 1311, Henry had crossed the Alps. His hopes of reuniting Germany and Italy and of restoring the empire of the Hohenstaufen were flattered by an appeal from the Ghibellines to come to their assistance, and Henry, in the spirit of the time, sharing the sentiments expressed by Dante in his De Monarchia, looked eagerly for a restoration of the imperial authority. In October 1310 he reached Turin where, on receiving the homage of the Lombard cities, he declared that he favoured neither Guelphs nor Ghibellines, but only sought to impose peace. Having entered Milan he placed the Lombard crown upon his head on the 6th of January 1311. But trouble soon showed itself. His poverty compelled him to exact money from the citizens; the peaceable professions of the Guelphs were insincere, and Robert, king of Naples, watched the Emperor with disinterest. The Florentines, in particular, and the mutual hatred of Guelph and Ghibelline was easily renewed. risings took place in various places and, after the capture of Brescia, Henry marched to Rome only to find the city in the hands of the Guelphs and the troops of King Robert. Some street fighting ensued, and the king, unable to obtain possession of St Peter's, was crowned emperor on the 29th of June 1312 in the church of St John Lateran by some cardinals who declared they only acted under compulsion. Failing to subdue Florence, the emperor from his headquarters at Pisa prepared to attack Robert of Naples, for which purpose he had allied himself with Frederick III., king of Sicily. But Clement, anxious to protect Robert, threatened Henry with excommunication. Undeterred by the threat the emperor collected fresh forces, made an alliance with the Venetians, and set out for Naples. On the march he was, however, taken ill, and died at Buonconvento near Siena on the 24th of August 1313, and was buried at Pisa. His death was attributed, probably without reason, to poison given him by a Dominican friar in the sacramental wine. Henry is described by his contemporary Albertino Mussato, in the Historia, as a handsome man, of great presence, with reddish hair and beard, but disfigured by a squint. He adds, among other details, that he was slow and laconic in his speech, magnanimous and devout, but impatient of any Compact with his subjects, loathing the mention of the Guelph and Ghibelline factions, and insisting on the absolute authority of the Empire over all (cuncta absoluto complecium Imperio). He was, however, a lover of justice, and as a knight both bold and skilful. He was hailed by Dante as the deliverer of Italy, and in the Paradiso the poet reserved for him a place marked by a crown.

The contemporary documents for the life and reign of Henry VII. are very numerous. Many of them are found in the Rerum Italicarum scriptores, edited by L. A. Muratori (Milan, 1723-1751), others in Fontes rerum Germanicarum, edited by J. F. Böhmer (Stuttgart, 1843-1868), and in Die Geschichtsschreiber der deutschen Vorsell, Bände 79 and 80 (Leipzig, 1884). The following modern works may also be consulted: Acta Henrici VII. imperatoris Romanorum, edited by G. Dönniges (Berlin, 1839); F. Bonamini, Acta Henrici VII. Romanae imperatoris (Florence, 1871); Lendemmann, Geschichte der Denkmalen des Habsburger und Luxemburger (Stuttgart, 1888-1893); J. Heidemann, Die Königswahl Heinrichs von Luxemburg, in the Forschungen zur deutschen Geschichte, Band 22 (1883); B. Thomas, Die Königszeit des Grafen Heinrich von Luxemburg (Strassburg, 1875); D. König, Kritische Erörterungen zu einigen italienischen Quellen für die Geschichte des Römervogtes König Heinrich VII. (Göttingen, 1873); K. Wenck, Clemens V. und Heinrich VII. (Hr. Im, 1882); H. W. Barthold, Der Römervogt König Heinrichs von Lützelburg (Königsberg, 1820-1831); E. Rehm, Der Römervogt König Heinrichs VII. und die Politik der des Nebenländer (Nuremberg, 1884); F. G. Dönniges, Kritik der Quellen für die Geschichte Heinrichs VII. des Luxemburgers (Berlin, 1841), and G. Sommerfeld, Die Römische Kaiser Heinrichs VII. (Königsberg, 1888).

HENRY VII. (1211-1243), German king, son of the emperor Frederick II. and his first wife Constance, daughter of Alphonso III., king of Aragon, was crowned at Magdeburg in 1212, and made duke of Swabia in 1216. Pope Innocent III. had favoured his coronation as king of Sicily in the hope that the union of this island with the Empire would be dissolved, and had obtained a promise from Frederick to this effect. In spite of this, however, Henry was chosen king of the Romans, or German king, at Frankfurt in April 1220, and crowned at Aix-la-Chapelle on the 8th of May 1222 by his guardian Engelbert, archbishop of Cologne. He appears to have spent most of his youth in Germany, and on the 18th of November 1225 was married at Nuremberg to Margaret (d. 1267), daughter of Leopold VI., duke of Austria. Henry's marriage was the occasion of some difference of opinion, as Engelbert wished him to marry an English princess, and the name of a Bohemian princess was also mentioned in this connexion, but Frederick insisted upon the union with Margaret. The murder of Engelbert in 1225 was followed by an increase of disorder in Germany in which Henry soon began to participate, and in 1227 he took part in a quarrel which had arisen on the death of Henry V., the childless count palatine of the Rhine. About this time the relations between Frederick and his sons began to be somewhat strained. The emperor had favoured the marriage between his brother, Duke Frederick II., was childless; but Henry took up a hostile attitude towards his brother-in-law and wished to put away his wife and marry Agnes, daughter of Wenceslaus I., king of Bohemia. Other causes of trouble probably existed, for in 1231 Henry not only refused to appear at the diet at Ravenna, but opposed the privileges granted by Frederick to the princes at Worms. In 1234, however, he submitted to his father, promising to adopt the emperor's policy and to obey his commands. He did not long keep his word and was soon engaged in thwarting Frederick's wishes in several directions, until in 1233 he took the decisive step of issuing a manifesto to the princes, and the following year raised the standard of revolt at Boppard. He obtained very little support in Germany, however, while the suspicion that he favoured heresy deprived him of encouragement from the pope. On the other hand, he succeeded in forming an alliance with the Lombards in December 1234, but his few supporters fell away when the emperor reached Germany in 1235, and, after a vain attack on Worms, Henry submitted and was kept for some time as a prisoner in Germany, though his formal deposition as German emperor was not pronounced until May 1237, as he had broken the oath taken in 1232. He was soon removed to San Felice in Apulia, and afterwards to Martinano in Calabria, where he died, probably by his own hand, on the 12th of February 1242, and was buried at Cosenza. He left two sons, Frederick and Henry, both of whom died in Italy about 1251.

See J. Rohden, Der Sturz Heinrichs VII. (Göttingen, 1883); F. W. Schirrmacher, Die letzten Hohenstaufen (Göttingen, 1871), and E. Zimmermann, Keine Schrift der Welt (Göttingen, 1884).
HENRY I.

expedition, for he did not appear at the diet of Verona in 1238; and it is not improbable that he disliked the betrothal of his nephew Hermann to the emperor's daughter Margaret. At all events, when the projected marriage had been broken off the landgrave publicly showed his loyalty to the emperor in 1239 in opposition to a plan formed by various princes to elect an anti-king. Henry, whose attitude at this time was very important to Frederick, was probably kept loyal by the influence which his brother Conrad, grand-master of the Teutonic Order, exercised over him, for after the death of this brother in 1244 Henry's loyalty again wavered, and he was himself mentioned as a possible anti-king. Frederick's visit to Germany in 1245 was partly successful in preventing this step for a time, and in May of that year the landgrave was appointed administrator of Germany for King Conrad; and by the death of his nephew in this year he became the nominal, as well as the actual, ruler of Thuringia. Again he contemplated deserting the cause of Frederick, and in April 1246 Pope Innocent IV. wrote to the German princes advising them to choose Henry as their king in place of Frederick who had just been declared deposed. Acting on these instructions, Henry was elected at Veitschötzheim on the 22nd of May 1246, and owing to the part played by the spiritual princes in this election was called the Pfaffenkönig, or parsons' king. Collecting an army, he defeated King Conrad near Frankfort on the 5th of August 1246, and then, after holding a diet at Nuremberg, undertook the siege of Ulm. But he was soon compelled to give up this enterprise, and returning to Thuringia died at the Wartburg on the 17th of February 1247.

HENRY (c. 1174-1216), emperor of Romania, or Constantinople, was the younger son of Baldwin, count of Flanders and Hainault (d. 1195). Having joined the Fourth Crusade about 1202, he distinguished himself at the siege of Constantinople in 1204 and elsewhere, and soon became prominent among the princes of the new Latin empire of Constantinople. When his brother, the emperor Baldwin I., was captured at the battle of Adrianople in April 1205, Henry was chosen regent of the empire, succeeding to the throne when the news of Baldwin's death arrived. He was crowned on the 20th of August 1205. Henry was a wise ruler, whose reign was largely passed in successful struggles with the Bulgarians and with his rival, Theodore Lascaris I., emperor of Nicea. Henry appears to have been brave but not cruel, and tolerant but not weak; possessing "the superior courage to oppose, in a superstitious age, the pride and avarice of the clergy."

The emperor died, poisoned, it is said, by his Greek wife, on the 11th of June 1216.

See Gibbon's Decline and Fall of the Roman Empire, vol. vi. (ed. J. B. Burry, 1898).

HENRY I. (1068-1135), king of England, nicknamed Beauclerk, the fourth and youngest son of William I. by his queen Matilda of Flanders, was born in 1068 on English soil. Of his life before 1086, when he was solemnly knighted by his father at Westminster, we know little. He was his mother's favourite, and she bequeathed to him her English estates, which, however, he was not permitted to hold in his father's lifetime. Henry received a good education, of which in later life he professed he was credited with the saying that an unlettered king is only a crowned ass. His attainments included Latin, which he could both read and write; he knew something of the English laws and language, and it may have been from an interest in natural history that he collected, during his reign, the Woodstock menagerie which was the admiration of his subjects. But from 1087 his life was one of action and vicissitudes which left him little leisure. Receiving, under the Conqueror's last dispositions, a legacy of five thousand pounds of silver, but no land, he traded upon the pecuniary needs of Duke Robert of Normandy, from whom he purchased, for the small sum of £3000, the district of the Cotentin. He negotiated with Rufus to obtain the possession of their mother's inheritance, but only incurred thereby the suspicions of the duke, who threw him into prison.

In 1090 the prince vindicated his loyalty by suppressing, on Robert's behalf, a revolt of the citizens of Rouen which Rufus had fomented. But when his elder brothers were reconciled in the next year they combined to evict Henry from the Cotentin. He dissembled his resentment for a time, and lived for nearly two years in the French Vexin in great poverty. He then accepted from the citizens of Domfront an invitation to defend them against Robert of Bellême, and subsequently, coming to an agreement with Rufus, assisted the king in the war on their elder brother Robert. When Robert's departure for the First Crusade left Normandy in the hands of Rufus (1096) Henry took service under the latter, and he was in the royal hunting train on the day of Rufus's death (August 2nd, 1100). Had Robert been in Normandy the claim of Henry to the English crown might have been effectually opposed. But Robert only returned to the duchy a month after Henry's coronation. In the meantime the new king, by issuing his famous charter, by recalling Anselm, and by choosing the Anglo-Scottish princess Edith-Matilda, daughter of Malcolm III., king of Scotland, to his future queen, had cemented that alliance with the church and with the northern English which was the foundation of his greatness. Anselm preached in his favour, English levies marched under the royal banner both to repel Robert's invasion (1101) and to crush the revolt of the Montgomerie headed by Robert of Bellême (1102). The alliance of crown and church was subsequently imperilled by the question of Investitures (1103-1106). Henry was sharply criticized for his ingratitude to Anselm (q.v.), in spite of the marked respect which he showed to the archbishop. At this juncture a sentence of excommunication would have been a dangerous blow to Henry's power in England. But the king's diplomatic skill enabled him to satisfy the church without surrendering any rights of consequence (1106); and he skilfully threw the blame of his previous conduct upon his counsellor, Robert of Meulan. Although the Peterborough Chronicle accuses Henry of oppression in his early years, the nation soon learned to regard him with respect. William of Malmesbury, about 1155, already treats Tinchebrai (1106) as an English victory and the revenge for Hastings. Henry was disliked but feared by the baronage, towards whom he showed gross bad faith in disregard of his coronation promises. In 1110 he banished the more conspicuous malcontents, and from that date was safe against the plots of his English feudatories.

With Normandy he had more trouble, and the military skill which he had displayed at Tinchebrai was more than once put to the test against Norman rebels. His Norman, like his English administration, was popular with the non-feudal classes, but doubtless oppressive towards the barons. The latter had abandoned the cause of Duke Robert, who remained a prisoner in England till his death (1134); but they embraced that of Robert's son William the Clito, whom Henry in a fit of generosity had allowed to go free after Tinchebrai. The Norman conspiracies of 1122, 1128, and 1123-24 were all formed in the Clito's interest. Both France and Anjou supported this pretender's cause from time to time; he was always a thorn in Henry's side till his untimely death at Alost (1128), but more especially after the catastrophe of the White Ship (1120) deprived the king of his only lawful son. But Henry emerged from all these complications with enhanced prestige. His campaigns had been uneventful, his chief victory (Brémaud, 1119) was little more than a skirmish. But he had held his own as a general, and as a diplomatist he had shown surpassing skill. The chief triumphs of his foreign policy were the marriage of his daughter Matilda to the emperor Henry V. (1114) which saved Normandy in 1124; the detachment of the pope, Calixtus II., from the side of France and the Clito (1119), and the Angevin marriages which he arranged for his son William Aetheling (1119) and for
HENRY II. (1133-1189), king of England, son of Geoffrey Plantagenet, count of Anjou, by Matilda, daughter of Henry I., was born at Le Mans on the 25th of March 1133. He was brought to England during his mother's conflict with Stephen (1142), and was placed under the charge of a tutor at Bristol. He returned to Normandy in 1146. He next appeared on English soil in 1149 when he came to court the help of Scotland and the English baronage against King Stephen. The second visit was of short duration he returned to the lands promised him by his father, whose death in the next year made him also count of Anjou. In 1152 by a marriage with Eleanor of Aquitaine, the divorced wife of the French king Louis VII., he acquired Poitou, Guienne and Gascoy but in doing so incurred the ill-will of his suzerain from which he suffered not a little in the future. Lastly in 1153 he was able, through the aid of the Church and his mother's partisans, to extort from Stephen the recognition of his claim to the English succession; and this claim was asserted without opposition immediately after Stephen's death (25th of October 1154). Matilda retired into seclusion, although she possessed, until her death (1167), great influence with her son.

The first years of the reign were largely spent in restoring the public peace and recovering for the crown the lands and prerogatives which Stephen had bartered away. Amongst the older partisans of the Angevin house the most influential were Archbishop Theobald, whose good will guaranteed to Henry the support of the Church, and Nigel, bishop of Ely, who presided at the exchequer. But Thomas Becket, archdeacon of Canterbury, a younger statesman whom Theobald had discovered and promoted, soon became all-powerful.

Becket, well pleased with himself entirely to his master's ambitions, which at this time centred round schemes of territorial aggrandizement. In 1155 Henry asked and obtained from Adrian IV. a licence to invade Ireland, which the king contemplated bestowing upon his brother, William of Anjou. This plan was dropped; but Malcolm of Scotland was forced to restore the northern counties which had been ceded to David; North Wales was invaded in 1157; and in 1159 Henry made an attempt, which was foiled by the intervention of Louis VII., to assert his wife's claims upon Toulouse. After vainly involving the heir of the emperor Frederick I., the young king came to terms with Louis (1160), whose daughter was betrothed to Henry's namesake and heir. The peace proved unstable, and there was desultory skirmishing in 1161. The following year was chiefly spent in reforming the government of the continental provinces. In 1163 Henry returned to England, and almost immediately embarked on that quarrel with the Church which is the keynote to the middle period of the reign.

Henry had good cause to complain of the ecclesiastical courts, and had only awaited a convenient season to correct them. He was admitted to all reasonable demands; but he raised the question to be complicated by personal intrigue. He was bitterly disappointed that Becket, on whom he bestowed the primacy, left vacant by the death of Theobald (1162), at once became the champion of clerical privilege; he and the archbishop were no longer on speaking terms when the Constitutions of Clarendon came up for debate. The king's demands were not intrinsically irreconcilable with the canon law, and the papacy would probably have allowed them to take effect sub silencio, if Becket (q.v.) had not been goaded to extremity by persecution in the forms of law. After Becket's flight (1164), the king put furthering the impounding of the revenues of Canterbury and banning at one stroke a number of the archbishop's friends and connexions. He showed, however, considerable dexterity in playing off the emperor against Alexander III. and Louis VII., and contrived for five years, partly by these means, partly by insinicate negotiations with Becket, to stave off a papal interdict upon his dominions. When, in July 1170, he was forced by Alexander's threats to make terms with Becket, the king contrived that not a word should be said of the Constitutions. He undoubtedly hoped that in this matter he would have his way when Becket should be recovered in England and within his grasp. For the murder of Becket (Dec. 29, 1170) the king cannot be held responsible, though the
deed was suggested by his impertinent words. It was a misfortune to the royal cause; and Henry was compelled to purchase the papal absolution by a complete surrender on the question of criminal clerks (1172). When he heard of the murder he was panic-stricken; and his expedition to Ireland (1171), although so momentous for the future, was originally a mere pretext for placing himself beyond the reach of Alexander's censes.

Becket's fate, though it supplied an excuse, was certainly not the real cause of the troubles with his sons which disturbed the king's later years (1173-1189). But Henry's misfortunes were largely of his own making. Queen Eleanor, whom he alienated by his faithlessness, stirred up her sons to rebellion; and they had grievances enough to be easily persuaded. Henry was an affectionate but a suspicious and close-handed father. The titles which he bestowed on them carried little power, and served chiefly to denote the shares of the paternal inheritance which were to be theirs after his death. The excessive favour which he showed to John, his youngest-born, was another cause of heart-burning; and Louis, the old enemy, did his utmost to foment all discord.

It must, however, be remembered in Henry's favour, that the supporters of the princes, both in England and in the foreign provinces, were animated by resentment against the soundest features of the king's administration; and that, in the rebellion of 1173, he received from the English commons such hearty support that any further attempt to raise a rebellion in England was considered hopeless. Henry, like his grandfather, gained in popularity with every year of his reign. In 1183 the death of Prince Henry, the heir-apparent, while engaged in a war against his brother Richard and their father, secured a short interval of peace. But in 1184 Geoffrey of Brittany and John combined with their father's leave to make war upon Richard, now the heir-apparent. After Geoffrey's death in 1186 the mood between John and Richard was so openly hostile, that the latter was forced to make an alliance with Philip Augustus of France. The ill-success of the old king in this war aggravated the disease from which he was suffering; and his heart was broken by the discovery that John, for whose sake he had alienated Richard, was in secret league with the victorious allies. Henry died at Chinon on the 6th of July 1189, and was buried at Fontevrault. By Eleanor of Aquitaine the king had five sons and three daughters. His eldest son, William, died young; his other sons, Henry, Richard, Geoffrey and John, are all mentioned above. His daughters were: Matilda (1156-1186), who became the wife of Henry the Lion, duke of Saxony; Eleanor (1162-1214), who married Alphonso III, king of Castile; and Joanna, who, after the death of her husband in 1185, married Louis VI, count of Toulouse, having previously accompanied her brother, Richard, to Palestine. He had also three illegitimate sons: Geoffrey, archbishop of York; Morgan; and William Longsword, earl of Salisbury.

Henry's power impressed the imagination of his contemporaries, who credited him with aiming at the conquest of France and the acquisition of the imperial title. But his ambitions of conquest were comparatively moderate in his later years. He attempted to secure Maurienne and Savoy for John by a marriage-alliance, for which a treaty was signed in 1173. But the project failed through the death of the intended bride; nor did the marriage of his third daughter, the princess Joanna (1165-1199), with William II, king of Sicily (1177), lead to English intervention in Italian politics. Henry once declined an offer of the Empire, made by the opponents of Frederick Barbarossa; and he steadily supported the young Philip Augustus against the intrigues of French feudatories. The conquest of Ireland was carried out independently of his assistance, and perhaps against his wishes. He asserted his suzerainty over Scotland by the treaty of Falaise (1175), but not so stringently as to provoke Scottish hostility. This moderation was partly due to the embarrassments produced by the ecclesiastical question and the rebellions of the princes. But Henry, despite a violent and capricious temper, had a strong taste for the work of a legislator and administrator. He devoted infinite pains and thought to the reform of government both in England and Normandy.

The legislation of his reign was probably in great part of his own contriving. His supervision of the law courts was close and jealous; he transacted a great amount of judicial business in his own person, even after he had formed a high court of justice which might sit without his personal presence. To these activities he devoted his scanty intervals of leisure. His government was stern; he over-ruled the privileges of the baronage with a rigor which, however, he tempered with the establishment of districts under the arbitrary and vexatious jurisdiction of the forest-courts. But it is the general opinion of historians that he had a high sense of his responsibilities and a strong love of justice; despite the looseness of his personal morals, he commanded the affection and respect of Gilbert Foliot and Hugh of Lincoln, the most upright of the English bishops.

Original Authorities.—Henry's laws are printed in W. Stubbs' Select Charters (Oxford, 1895). The chief chroniclers of his reign are William of Newburgh, Ralph de Diceto, the so-called Benedict of Peterborough, Roger of Hoveden, Robert de Torigni (or de Monte), Jordan Fantosme, Giraldus Cambrensis, Gervase of Canterbury; all printed in the Rolls Series. The biographies and letters contained in the 7 vols. of Materials for the History of Thomas Becket (ed. J. C. Robertson, Rolls Series, 1875-1885) are valuable for the early and middle part of the reign. For Irish affairs the Song of Dermot (ed. 1892) is indispensable, and the Insular Rebellions of the princes the metrical Historie de Guillaume le Maréchal (ed. C. R. Petrie, 1891, &c.) are of importance. Henry's legal and administrative reforms are illustrated by the Traictatus de legibus attributed to Peter Foliot (ed. 1880), and the De Vilain Milieu (ed. W. H. S. Jones, 1868), by the Dialogus de scaccario of Richard fitz Nigel (Oxford, 1882), and the Pipe Rolls, printed by J. Hunter for the Record Commission (1844) and by the Pipe-Roll Society (London, 1854, &c.) supply valuable details. The works of John of Salisbury (J. A. Giles, 1882, 3 vols.; Peter of Blois (ed. Migne), Walter Map (Cameren Society, 1841, 1850) and the letters of Gilbert Foliot (ed. J. A. Giles, Oxford, 1845) are useful for the social and Church history of the reign.

HENRY III. (1207-1272), king of England, was the eldest son of King John by Isabella of Angoulême. Born on the 1st of October 1207, the prince was but nine years old at the time of his father's death. The greater part of eastern England being kept in subjection by the former, the crown was under the prince's rule, supported by the barons and burghers, and later by the various ecclesiastics. The young Henry, however, could not long remain under the insubordination of the royal partisans. Henry remained a passive spectator of the measures by which William Marshal (d. 1219), and his successor, the justiciar Hubert de Burgh, asserted the royal prerogative against native barons and foreign mercenaries. In 1223 Honourus III. declared the king of age, but this was a mere formality, intended to justify the resumption of the royal castles and demesnes which had passed into private hands during the commotions of the civil war.

The personal rule of Henry III. began in 1227, when he was again proclaimed of age. Even then he remained for some time under the influence of Hubert de Burgh, whose chief rival, Peter des Roches, found it expedient to quit the kingdom for four years. But Henry was ambitious to recover the continental

283

possessions which his father had lost. Against the wishes of the justiciar he planned and carried out an expedition to the west of France (1230); when it failed he laid the blame upon his minister. Other differences arose soon afterwards. Hubert was accused, with some reason, of enriching himself at the expense of the crown, and of encouraging popular riots against the alien clerks for whom the papacy was providing at the expense of the English Church. He was disgraced in 1232; and power passed for a time into the hands of Peter des Roches, who filled the administration with Poitevins. So began the period of injustice by which Henry III. is chiefly remembered in history. The Poitevins fell in 1234; they were removed at the demand of the barons and the primate Edmund Rich, who held them responsible for the tragic fate of the rebellious Richard Marshal. But the king replaced them with a new clique of servile and rapacious favourites. Disregarding the wishes of the Great Council, and excluding all the more important of the barons and bishops from office, he acted as his own chief minister and never condescended to justify his policy except when he stood in need of subsidies. When these were refused, he extorted aids from the towns, the Jews or the clergy, the three most defenceless interests in the kingdom. Always in pecuniary straits through his extravagance, he pursued a foreign policy which would have been expensive under the most careful management. He hoped not only to regain the French possessions but to establish members of his own family as sovereigns in Italy and the Empire. These plans were artfully fostered by the Savoyard kinsmen of Eleanor, daughter of Raymond Berenger, count of Provence, who, while in Rome, was the infatuated and ill-considered half-brothers, the sons of Queen Isabella and Hugo, count of la Marche. These favourites, not content with pushing their fortunes in the English court, encouraged the king in the wildest designs. In 1242 he led an expedition to Gascony which terminated disastrously with the defeat of Taillebourg; and hostilities with France were intermittently continued for seventeen years. The Savoyards encouraged his natural tendency to support the papacy against the Empire; at an early date in the period of injustice he entered into a close alliance with Rome, while, at the same time, he was in the hands of the French. Although he had been called to the barony by the cardinal-legate, he was soon in England and at Henry's request, and during four years (1237-1241) administered the English Church in a manner equally profitable to the king and to the pope. After the recall of the legate Otho the alliance was less open and less cordial. Still the pope continued to share the spoils of the English clergy with the king, and the king to enforce the demands of Roman tax-collectors.

Circumstances favoured Henry's schemes. Archbishop Edmund Rich was timid and inexperienced; his successor, Boniface of Savoy, was a kinsman of the queen; Groseteste, the most eminent of the bishops, died in 1233, when he was at the point of becoming a popular hero. Among the lay barons, the first place naturally belonged to Richard of Cornwall who, as the king's brother, was unwilling to take any steps which might impair the royal prerogative; while Simon de Montfort, earl of Leicester, the ablest man of his order, was regarded with suspicion as a foreigner, and linked to Henry's cause by his marriage with the princess Eleanor. Although the Great Council repeatedly protested against the king's injustice and extravagance, their remonstrances came to nothing for want of leaders and a clear-cut policy. But between 1241 and 1259 Henry alienated Montfort from his cause by taking the side of the Gascons, whom the earl had provoked to rebellion through his rigorous administration of their duchy. A little later, when Montfort was committed to opposition, Henry foolishly accepted from Innocent IV. the crown of Sicily for his second son Edmund Crouchback (1253). Sicily was to be conquered from the Hohenstaufen at the expense of England; and Henry pledged his credit to the papacy for enormous subsidies, although years of comparative inactivity had already overwhelmed him with debts. On the public account he managed to bargain the subsidy on long length took vigorous action. They forced upon the king the Provisions of Oxford (1258), which placed the government in the hands of a feudal oligarchy; they reduced expenditure, expelled the alien favourites from the kingdom, and insisted upon a final renunciation of the French claims. The king submitted for the moment, but at the first opportunity endeavoured to cancel his concessions. He obtained a papal absolution from his promises; and he tricked the opposition into accepting the arbitration of the French king, Louis IX., who had intrusted the matter to the king the project of excluding the French from the English throne. But Henry was incapable of protecting with a stubborn hand the rights which he had recovered by his double-dealing. Ignominiously defeated by Montfort at Lewes (1264) he fell into the position of a cipher, equally despised by his opponents and supporters. He acquiesced in the earl's dictatorship; left to his eldest son, Edward, the difficult task of reorganizing the royal party; marched with the Montfortians to Evesham; and narrowly escaped sharing the fate of his gaoler. After Evesham he is hardly mentioned by the chroniclers. The compromise with the surviving rebels was arranged by his son in concert with the Cornwalls and the legate Ottobuono; the statute of Marlborough (1267), which purchased a lasting peace by judicious concessions, was similarly arranged between Edward and the earl of Gloucester. Edward was king in all but name for some years before the death of his father, by whom he was alternately suspected and adored.

Henry had in him some of the elements of a fine character. His mind was cultivated; he was a discriminating patron of literature, and Westminster Abbey is an abiding memorial of his artistic taste. His personal morality was irreproachable, and he was true to the Plantagenet taste for crooked courses and dissimulation in political affairs; even in this respect the king's reputation has suffered unduly at the hands of Matthew Paris, whose literary skill is only equalled by his malice. The ambitions which Henry cherished, if extravagant, were never sordid; his patriotism, though seldom attested by practical measures, was thoroughly sincere. Some of his worst actions as a politician were due to a sincere, though exaggerated, gratitude for the support which the Papacy had given him during his minority. But he had neither the training nor the temper of a statesman. His dreams of autocracy at home and far-reaching dominion abroad were anachronisms in a century of constitutional ideas and national differentiation. Above all he earned the contempt of Englishmen and foreigners alike by the instability of his purpose. Matthew Paris said that he had a heart of wax; Dante relegated him to the limbo of ineffectual souls; and later generations have endorsed these scathing judgments.

Henry died at Westminster on the 16th of November 1272; his widow, Eleanor, took the veil in 1276 and died at Amersbury on the 25th of June 1291. Their children were: the future king Edward L.; Edmund, earl of Lancaster; Margaret (1240-1275), the wife of Alexander III., King of Scotland; Beatrice; and Katherine.

Original Authorities.—Roger of Wendover, Flores historiarum (ed. H. O. Cole, 4 vols., 1841-1844); and Matthew of Paris, Chronica majora (ed. H. R. Luard, Rolls Series 7 vols., 1872-1885) and the chief narrative sources. See also the Annales monacitici (ed. H. R. Luard, Rolls Series 5 vols., 1864-1866); the collection of Royal and other Historical Letters edited by W. Shirley (Rolls Series 2 vols., 1867-1868); the Close Rolls for the years 1296 to 1301 inclusive; the Master of the Rolls; the Eppolii Roberti Grosseteste (ed. H. R. Luard, Rolls Series 1861); and the Monimenta Francisci, vol. i. (ed. J. S. Brewer, Rolls Series 1868), the documents in the new Foederum, vol. i. (1864).

HENRY IV. (1367-1413), king of England, son of John of Gaunt, by Blanche, daughter of Henry, duke of Lancaster, was born on the 3rd of April 1367, at Bolingbroke in Lincolnshire. As early as 1377 he was styled earl of Derby, and in 1380 he married
Mary de Bohun (d. 1394) one of the co-heiresses of the last earl of Hereford. In 1387 he supported his uncle Thomas, duke of Gloucester, in his armed opposition to Richard II. and his favorites. Afterwards, probably through his father's influence he changed sides. He was already distinguished for his knightly prowess, and for some years devoted himself to adventure. He thought of going on the crusade to Barbary; but instead, in July 1390, went to serve with the Teutonic knights in Lithuania. He came home in the following spring, but next year went again to Prussia, whence he journeyed by way of Venice to Cyprus and Jerusalem. After his return to England he sided with his father and the king against Gloucester, and in 1397 was made duke of Hereford. In January 1398 he quarrelled with the duke of Norfolk, who charged him with treason. The dispute was to have been decided in the lists at Coventry in September; but at the last moment Richard intervened and banished them both.

When John of Gaunt died in February 1399 Richard, contrary to his promise, confiscated the estates of Lancaster. Henry then felt himself free, and made friends with the exiled Arundels. Early in July, whilst Richard was absent in Ireland, he landed at Ravenspur in Yorkshire. He was at once joined by the Percies; and Richard, abandoned by his friends, surrendered at Flint on the 10th of August. In the parliament, which assembled on the 30th of September, Richard was forced to abdicate. Henry then made his claim as coming by right line of blood from King Henry III., and through his right to recover the realm which was in point to be undone for default of governance and good law. Parliament formally accepted him, and thus Henry became king, "not so much by title of blood as by popular election" (Capgrave). The new dynasty had consequently a constitutional basis. With this Henry's own political sympathies well accorded. But though the revolution of 1399 was popular in form, its success was due to an oligarchical faction. From the start Henry was embarrassed by the power and pretensions of the Percys. Nor was his hereditary title so good as that of the Mortimers. To domestic troubles was added the complication of disputes with Scotland and France. The first danger came from the friends of Richard, who plotted prematurely, and were crushed in January 1400. During the summer of 1400 Henry made a not over-successful expedition to Scotland. The French court was not satisfied with this, and it was only in the summer of 1401 that a truce was patched up by the restoration of Richard's child-queen, Isabella of Valois. Meantime a more serious trouble had arisen through the outbreak of the Welsh revolt under Owen Glendower (p.285). In 1400 and again in each of the two following autums Henry invaded Wales in vain. The success of the Percys over the Scots at Homildon Hill (Sept. 1402) was no advantage. Henry Percy (Hotspur) and his father, the earl of Northumberland, thought their services ill-requited, and finally made common cause with the partisans of Mortimer and the Welsh. The plot was frustrated by Hotspur's defeat at Shrewsbury (21st of July 1403); and Northumberland for the time submitted. Henry had, however, no one on whom he could rely outside his own family, except Archbishop Arundel. The Welsh were unsubdued; the French were plundering the southern coast; Northumberland was fomenting trouble in the north. The crisis came in 1405. A plot to carry off the young Mortimers was defeated; but Mowbray, the earl marshal, who had been privy to it, raised a rebellion in the north supported by Archbishop Scope of York. Mowbray and Scope were taken and beheaded; Northumberland escaped into Scotland. For the execution of the archbishop Henry was personally responsible, and he could never free himself from its odium. Popular belief regarded his subsequent illness as a judgment for his impiety. Apart from ill-health and unpopularity Henry had succeeded — relations with Scotland were secured by the capture of James, the heir to the crown; Northumberland was at last crushed at Bramhall Moor (Feb. 1408); and a little later the Welsh revolt was mastered.

Henry, stricken with sore disease, was unable to reap the advantage. His necessities had all along enabled the Commons to extort concessions in parliament, until in 1406 he was forced to nominate a council and govern by its advice. However, with Archbishop Arundel as his chancellor, Henry still controlled the government. But in January 1410 Arundel had to give way to the king's half-brother, Thomas Beaufort. Beaufort and his brother Henry, bishop of Winchester, were opposed to Arundel and supported by the prince of Wales. For two years the real government rested with the prince and the council. Under the prince's influence the English intervened in France in 1411 on the side of Burgundy. In this, and in some matters of home politics, the king disagreed with his ministers. There is good reason to suppose that the Beauforts had gone so far as to contemplate a forced abdication on the score of the king's ill-health. However, in November 1411 Henry showed that he was still capable of vigorous action by discharging the prince and his supporters. Arundel again became chancellor, and the king's second son, Thomas, took his brother's place. The change was further marked by the sending of an expedition to France in support of Orleans. But Henry's health was failing steadily. On the 20th of March 1413, whilst praying in Westminster Abbey he was seized with a fainting fit, and died that same evening in the Jerusalem Chamber. At the time he was believed to have been a leper, but as it would appear without sufficient reason.

As a young man Henry had been chivalrous and adventurous, and in politics anxious for good government and justice. As king the loss and failure of friends made him cautious, suspicious and cruel. The persecution of the Lollards, which began with it, was partly due to the absence of a bishop and partly by the new king's own orthodoxy, or by the influence of Archbishop Arundel, his one faithful friend. But that political Lollardry was strong is shown by the proposal in the parliament of 1410 for a wholesome confiscation of ecclesiastical property. Henry's faults may be excused by his difficulties. Throughout he was practical and steadfast, and he deserved credit for maintaining his principles as a constitutional ruler. So after all his troubles he founded his dynasty firmly, and passed on the crown to his son with a better title. He is buried under a fine tomb at Canterbury.

By Mary Bohun Henry had four sons: his successor Henry V., Thomas, duke of Clarence, John, duke of Bedford, and Humphrey, duke of Gloucester; and two daughters, Blanche, who married Louis III., elector palatine of the Rhine, and Philippa, who married Eric XIII., king of Sweden. Henry's second wife was Joan, or Joanna, (c. 1370-1437), daughter of Charles the Bad, king of Navarre, and widow of John IV. or V., duke of Brittany, who survived until July 1437. By her he had no children.

HENRY V. (1387-1422), king of England, son of Henry IV. by Mary de Bohun, was born at Monmouth, in August 1387. On his father's exile in 1398 Richard II. took the boy into his own charge, and treated him kindly. Next year the Lancastrian revolution forced Bobergh to make overtures (April) to the young prince. From October 1400 the administration of Wales was conducted in his name; less than three years later he was in actual command of the English forces and fought against the Percys at Shrewsbury. The Welsh revolt absorbed his energies till 1408. Then through the king's ill-health he began to take a wider share in politics. From January 1410, helped by his uncles Henry and Thomas Beaufort, he had practical control of the government. Both in foreign and domestic policy he
differed from the king, who in November 1411 discharged the prince from the council. The quarrel of father and son was political only, though it is probable that the Beauforts had discussed the abdication of Henry IV., and their opponents certainly endeavoured to advance the prince. It may be that to political eminence the tradition of Henry's riotous youth, immortalized by Shakespeare, is partly due. To that tradition Henry's strenuous life in war and politics is a sufficient general contradiction. The most famous incident, his quarrel with the chief justice, has no contemporary authority and was first related by Sir Thomas Elyot in 1531. The story of Falstaff originated partly in Henry's early friendship for Oldcastle (q.v.). That friendship, and the prince's political opposition to Archbishop Arundel, perhaps encouraged Lollard hopes. If so, their disappointment may account for the statements of ecclesiastical writers, like Walsingham, that Henry on becoming king was changed suddenly into a new man.

Henry succeeded his father on the 20th of March 1413. With no past to embarrass him, and with no dangerous rivals, his practical experience had full scope. He had to deal with three main problems—the restoration of domestic peace, the healing of schism in the Church and the recovery of English prestige in Europe. Henry grasped them all together, and gradually built upon them a yet wider policy. From the first he made it clear that he would rule England as the head of a united nation, and war his chief instrument. If the rebellious barons were a threat, the king was honourably reinterred; the young Mortimer was taken into favour; the heirs of those who had suffered in the last reign were restored gradually to their titles and estates. With Oldcastle Henry used his personal influence in vain, and the gravest domestic danger was Lollard discontent. But the king's firmness nipped the movement in the bud (Jan. 1414), and made his own position as ruler secure. Save for the abortive Scrope and Cambridge plot in favour of Mortimer in July 1415, the rest of his reign was free from serious trouble at home. Henry could now turn his attention to foreign affairs. A foreign war was the first to allege that Henry was encouraged by ecclesiastical statesmen to enter on the French war as a means of diverting attention from home troubles. For this story there is no foundation. The restoration of domestic peace was the king's first care, and until it was assured he could not embark on any wider enterprise abroad. Nor was that enterprise one of idle conquest. Old commercial disputes and the support which the French had lent to Glendower gave a sufficient excuse for war, whilst the disordered state of France afforded no security for peace. Henry may have regarded the assertion of his own claims as part of his kingly duty, but in any case a peaceful settlement of the national quarrel was essential to the success of his world policy. The campaign of 1415, with its brilliant conclusion at Agincourt (October 25), was only the first step. Two years of patient preparation followed. The command of the sea was secured by driving the Genoese allies of the French out of the Channel. A successful diplomacy detached the emperor Sigismund from France, and by the Treaty of Canterbury paved the way to end the schism in the Church. So in 1417 the war was renewed on a larger scale. Lower Normandy was quickly conquered, Rouen taken, and France pacified. The first harvest, were paralyzed by the disputes of Burgundians and Armagnacs. Henry skilfully played them off one against the other, without relaxing his warlike energy. In January 1419 Rouen fell. By August the English were outside the walls of Paris. The intrigues of the French parties culminated in the assassination of John of Burgundy by the dauphin's partisans at Montereau (September 10, 1419). Philip, the new duke, and the French court threw themselves into Henry's arms. After six months' negotiation Henry was by the Treaty of Troyes recognized as heir and regent of France, and on the 2nd of June 1420 married Catherine, the king's daughter. He was now at the height of his power. His eventual success in France seemed certain. He shared with Sigismund the credit of having ended the Great Schism by obtaining the election of Pope Martin V. All the states of western Europe were being brought within the web of his diplomacy. The headship of Christendom was in his grasp, and schemes for a new crusade began to take shape. He actually sent out an envoy to collect information in the East; but his plans were cut short by death. A visit to England in 1421 was interrupted by the defeat of France at Bauge. The hardships of the longer winter siege of Meaux broke down his health, and he died at Bois de Vincennes on the 21st of August 1422.

Henry's last words were a wish that he might live to rebuild the walls of Jerusalem. They are significant. His ideal was founded consciously on the models of Arthur and Godfrey as national king and leader of Christendom. So he is the typical medieval hero. For that very reason his schemes were doomed to fail in disaster, since the time was come for a new departure. Yet he was not reactionary. His policy was constructive: a firm central government supported by parliament; church reform on conservative lines; commercial development; and the maintenance of national prestige. His aims in some respects anticipated those of his Tudor successors, but he would have accomplished them on medieval lines as a constitutional ruler. His success was due to the power of his personality. He could train able lieutenants, but at his death there was no one who could take his place as leader. War, diplomacy and civil administration were all dependent on his guidance. His dazzling achievements as a general have obscured his more sober qualities as a ruler, and even the sound strategy, with which he aimed to be master of the situation. If the king of England was the founder of the English navy he was one of the first to realize its true importance. Henry had so high a sense of his own rights that he was merciless to disloyalty. But he was scrupulous of the rights of others, and it was his eager desire to further the cause of justice that impressed his French contemporaries. He has been charged with cruelty as a religious persecutor; but in fact he had as prince opposed the harsh policy of Archbishop Arundel, and as king sanctioned a more moderate course. Lollard executions during his reign had more often a political than a religious reason. To be just with sternness, but not with vengeance. So in the political sphere, though he kept strict discipline and allowed no wanton violence, he treated everybody as if he had in his opinion transgressed. In his personal conduct he was chaste, temperate and sincerely pious. He delighted in sport and all manly exercises. At the same time he was cultured, with a taste for literature, art and music. Henry lies buried in Westminster Abbey. His tomb was stripped of its splendid adornment during the Reformation. The shield, helm and saddle, which formed part of the original funeral equipment, still hang above it.

Of original authorities the best on the English side is the Gesta Henrici Quinti (down to 1419), printed anonymously for the English Historical Society, but probably written by Thomas Hearne, one of Henry's chaplains. Two lives edited by Thomas Hearne under the names of Elmham and Titus Livius Forjuliensis come from a common source; the longer, which Hearne ascribed incorrectly to Elmham, is perhaps the original work of Livius, who was an Italian in the service of Humphrey of Gloucester, and wrote about 1440. Other authorities are the Chronicles of Walsingham and Otterbourne, the English Chronicle or Brut, and the various London Chronicles. On the French side the most valuable are Chronicles of Monstrelet and St Rémy (both Burgundian) and the Chronique du religieux de S. Denis (the official view of the French court). For documents and miscellaneous works J. H. Round's Annals of the Hundred Years' War and Monstrelet, Hist. of the Battle of Agincourt and the Expedition of 1415 (London, 1853); C. L. Kingsford, Henry V., the Typical Medieval Hero (New York, 1901), where a fuller bibliography will be found. (C. L. R.)

HENRY VI. (1421-1471), king of England, son of Henry V. and Catherine of Valois, was born at Windsor on the 6th of December 1421. He became king of England in the 1st of September 1422, and a few weeks later, on the death of his grandfather Charles VI., was proclaimed king of France also. Henry V. had directed that Richard Beauchamp, earl of Warwick (q.v.), should be his son's successor; Warwick took up his charge in 1426; he trained his pupil to be a good man and reformed gentleman, but he could not teach him kingship. As early as 1423 the baby king was made to appear at public functions and take his place in parliament. He was knighted by his uncle Bedford at Leicester in May 1426, and on the 6th of November 1429 was crowned at Westminster.
HENRY VII.

Early in the next year he was taken over to France, and after long delay crowned in Paris on the 16th of December 1431. His return to London on the 14th of February 1432 was celebrated with a great pageant devised by Lydgate.

During these early years Bedford ruled France wisely and at first with success, but he could not prevent the mischief which Humphrey of Gloucester (q.v.) caused both at home and abroad. Even in France the English lost ground steadily after the victory of Joan of Arc before Orleans in 1429. The climax came with the death of Bedford, and defection of Philip of Burgundy in 1435. This closed the first phase of Henry's reign. There followed fifteen years of vain struggle in France, and growing disorder at home. The determining factor in politics was the conduct of the war. Cardinal Beaufort, and after him Suffolk, sought by working for peace to secure at least Guienne and Normandy. Gloucester court popularity by alluring them throughout; with him was Richard of York, who stood next in succession to the crown. Beaufort controlled the council, and it was under his guidance that the king began to take part in the government. Thus it was natural that as Henry grew to manhood he seconded heartily the peace policy. That policy was wise, but national pride made it unpopular and difficult. Henry himself had not the strength or knowledge to direct it, and was unfortunate in his advisers. The cardinal was old, his nephews John and Edmund Beaufort were incompetent, Suffolk, though a man of noble character, was tactless. Suffolk, however, achieved a great success by negotiating the marriage of Henry to Margaret of Anjou (q.v.) in 1445. Humphrey of Gloucester and Cardinal Beaufort both died in 1447. Beaufort, as protector, with the queen regnant, was the king and queen. But his home administration was unpopular, whilst the incapacity of Edmund Beaufort ended in the loss of all Normandy and Guienne. Suffolk's fall in 1450 left Richard of York the foremost man in England. Henry's reign then entered on its last phase of dynamic struggle. Cade's rebellion suggested first that popular discontent might result in a change of rulers. But York, as heir to the throne, could abide his time. The situation was altered by the mental derangement of the king, and the birth of his son in 1453. York after a struggle secured the protectorship, and for the next year ruled England. Then Henry was restored to sanity, and the queen and Edmund Beaufort, now Duke of Somerset, to power. Open war followed, with the lieutenant of York, Pembroke, against the queen's and Beaufort's forces. Henry's chief rivals were the Duke of Suffolk, who was fired by the ambition for the reign are scantly; the best are the Chronicles of London (ed. C. L. Kingsford), with the analogous Gregory's Chronicle (ed. J. Gairdner for Camden Soc.) and Chronicle of London (ed. Sir H. N. Bacon). For the reigns of Henry VII. and Henry VIII., the reigns of Henry V., the works of T. Bekynton (in both "Rolls Series"). Other useful authorities are Joseph Stevenson's Letters and Papers Illustrative of the Wars of the Roses, and the History of the Reign of Henry VI., and Correspondence of T. Bekynton (in both "Rolls Series"). Other useful authorities are the Chronicles of Monstrelet, D'Escoysh and T. Basin. For other documents and modern authorities see under Henry IV. For Henry's foundations see Sir H. C. Maxwell-Lyte, History of Eton College (London, 1899), and J. B. Mullinger, History of the University of Cambridge (London, 1888).

C. L. K.

HENRY VII. (1457-1509), king of England, was the first of the Tudor dynasty. His claim to the throne was through his mother from John of Gaunt and Catherine Swynford, whose issue born before their marriage had been legitimated by parliament. This, of course, was only a Lancastrian claim, nayer valid, even as such, till the direct male line of John of Gaunt had become extinct. By his father the genealogists traced his pedigree to Cadwallader, but this only endeared him to the Welsh, who made him a hero. His elder brother, Edmund, was never acknowledged his father, Owen Tudor, however, had married Catherine, the widow of Henry V. and daughter to Charles VI. of France. Their son Edmund, being half brother of Henry VI., was created by that king earl of Richmond, and having married Margaret Beaufort, only daughter of John, Duke of Somerset, died more than two months before their only child, Henry, was born in Pembroke Castle in January 1457. The fatherless child had sore trials. Edward IV. won the crown when he was four years old, and while Wales partly held out against the conqueror, he was carried for safety from one castle to another. Then for a time he was made a prisoner; but ultimately he was taken abroad by his uncle Jasper, who found refuge in Brittany. At one time the duke of Brittany was nearly induced to surrender him to Edward IV.; but he remained safe in the duchy till the cruelties of Richard III. drove more and more Englishmen abroad to join him. An invasion of England was planned in 1483 in concert with the duke of Buckingham's rising; but stormy weather at sea and an inundation in the Severn defeated the two movements. A second expedition, two years later, aimed this time by France, was more successful. Henry landed at Milford Haven among his Welsh allies and defeated Richard at the battle of Bosworth (August 22, 1485). He was crowned at Westminster on the 30th of October following. Then, in fulfilment of pledges by which he had procured the adhesion of many Yorkist supporters, he was married at Westminster to Catherine of Aragon (q. v.). The marriage was without issue. With the death of Edward IV. (Jan. 18, 1486), whose two brothers had both been murdered by Richard III. Thus the Red and White Roses were united and the pretenses for civil war done away with.

Nevertheless, Henry's reign was much disturbed by a succession
of Yorkist conspiracies and pretenders. Of the two most notable impostors, the first, Lambert Simnel, personated the earl of Warwick, son of the duke of Clarence, a youth of seventeen whom Henry had at his accession taken care to imprison in the Tower. Simnel, who was but a boy, was taken over to Ireland to perform his part, and the farce was wonderfully successful. He was crowned and felled invected in Christchurch Cathedral, Dublin, and received the allegiance of every one—bishops, nobles and judges, alike with others. From Ireland, accompanied by some bands of German mercenaries procured for him in the Low Countries, he invaded England; but the rising was put down at Stoke near Newark in Nottinghamshire, and, Simnel being captured, the king made him a menial of his kitchen.

This movement had been greatly assisted by Margaret, duchess dowager of Burgundy, sister of Edward IV., who could not endure to see the House of York supplant her by Tudor. The second pretender, Perkin Warbeck, was also much indebted to her support; but he seems to have entered on his career at first without it. And his story, which was more prolonged, had to do with the attitude of many countries towards England. Anxious as Henry was to avoid being involved in foreign wars, it was not many years before he was committed to a war with France, partly by his desire of an alliance with Spain, and partly by the indignation of his own subjects at the way in which the French were undermining the independence of Brittany. Henry gave Brittany defensive aid; but after the death of Charles VIII. of France, he felt himself involved in obligations to Ferdinand and Isabella of Spain, and also to the German king Maximilian, by an invasion of France in 1492. His allies, however, were not equally scrupulous or equally able to fulfil their obligations to him; and after besieging Boulogne for some little time, he received very advantageous offers from the French king and made peace with him.

Now Perkin Warbeck had first appeared in Ireland in 1491, and had somehow been persuaded there to personate Richard, duke of York, the younger of the two princes murdered in the Tower, pretending that he had escaped, though his brother had been killed. Charles VIII., then expecting war with England, called him to France, recognized his pretensions and gave him a retinue; but after the peace he dismissed him. Then Margaret of Burgundy received him as her nephew, and Maximilian, now estranged from Henry, recognized him as king of England. With a fleet given him by Maximilian he attempted to land at Deal, but sailed away to Ireland and, not succeeding very well there either, sailed farther to Scotland, where James IV. received him with open arms, married him to an earl's daughter and supplied him with an army to invade England along with him. But in 1497 he thought best to dismiss him, and Perkin, after attempting something again in Ireland, landed in Cornwall with a small body of men.

Already Cornwall had risen in insurrection that year, not liking the taxation imposed for the purpose of repelling the Scottish invasion. A host of the country people, led first by a blacksmith, but afterwards by a nobleman, marched up towards London and were only defeated at Blackheath. But the Cornishmen were quite ready for another revolt, and indeed had invited Perkin to their shores. He had little fight in him, however, and after a futile siege of Exeter an advance to Southampton he stole away and took sanctuary at Beaulieu in Hampshire. But, being assured of his life, he surrendered, was brought to London, and was only executed two years later, when, being imprisoned near the earl of Warwick in the Tower, he inveigled that simple-minded youth into a project of escape. For this Warwick, too, was tried, condemned and executed—no doubt to deliver Henry from repeated conspiracies in his favour.

Henry had by this time several children, of whom the eldest, Arthur, had been proposed in infancy for a bridegroom to Catherine, daughter of Ferdinand of Aragon. The match had always been kept in view, but its completion depended greatly on the assurance Ferdinand and Isabella could feel of Henry's secure position upon the throne. At last Catherine was brought to England and was married to Prince Arthur at St Paul's on the 14th of November 1501. The lad was just over fifteen and the co-habitation of the couple was wisely delayed; but he died on the 2nd of April following. Another match was presently proposed for Catherine with the king's second son, Henry, which only took effect when the latter had become king himself. Meanwhile Henry's eldest son, Perkin, was married to Isabella of Scotland—a match distinctly intended for national peace, and made possible that ultimate union which actually resulted from it. The espousals had taken place at Richmond in 1502, and the marriage was celebrated in Scotland the year after. In the interval between these two events Henry lost his queen, who died on the 11th of February 1503, and during the remainder of his reign he made proposals in various quarters for a second marriage—proposals in which political objects were always the chief consideration; but none of them led to any result. In his latter years he became unpopular from the exertions practised by his two instruments, Empson and Dudley, under the authority of antiquated statutes. From the beginning of his reign he had been accumulating money, mainly for his own security against intrigues and conspiracies, and avarice had grown upon him with success. He died in April 1509, undoubtedly the richest man in Christendom. He was not only a niggard, however, in his expenditure. Before his death he had finished the hospital of the Savoy and made provision for the magnificent chapel at Westminster which bears his name. His money-getting was but part of his statesmanship, and for his statesmanship his country could hardly thank him, not a little gratitude. He not only terminated a disastrous civil war and brought under control the spirit of ancient feudalism, but with a clear survey of the conditions of foreign powers he secured England in almost uninterrupted peace while he developed her commerce, strengthened her slender navy and built, apparently for the first time, a naval dock at Portsmouth.

In addition to his sons Arthur and Henry, Henry VII. had several daughters, one of whom, Margaret, married James IV., king of Scotland, and another, Mary, became the wife of Louis XII. of France, and afterwards of Charles Brandon, duke of Suffolk. The popular view of Henry VII.'s reign has always been derived from Bacon's History of that king. This has been edited by J. R. Lumby (Cambridge, 1881). But during the last half century large accessions to our knowledge have been made from foreign and domestic archives, and the sources of Bacon's work have been more critically examined. For a complete account of those sources the reader may be referred to W. Busch's England under the Tudors, the first German, and then an English translation in 1895. Some further information of a special character was found in M. Oppenheim's Naval Accounts and Inventories, published by the Navy-Records Society in 1896. See also J. Gardiner's Henry VII. and Henry VIII. (G. B.).
completed in the first few months of his reign. This step was largely due to the pressure brought to bear by Catherine's father, Ferdinand upon Henry's council; he regarded England as a tool in his hands and Catherine as his resident ambassador. The young king himself at first took little interest in politics, and for two years affairs were managed by the pacific Richard Fox (p. 288) and Warham. Then Warham was superseded while Henry was immersed in the pursuit of sport and other amusements. He took, however, the keenest interest from the first in learning and in the navy, and his inborn pride easily led him to support Wolsey's and Ferdinand's war-like designs on France. He followed an English army across the Channel in 1513, and personally took part in the successful sieges of Theroanne and Tournay and the battle of Guinegate which led to the peace of 1514. Ferdinand, however, deserted the English alliance, and amid the consequent irritation against everything Spanish, there was talk of a divorce between Henry and Catherine (1514), whose issue had hitherto been attended with fatal misfortune. But the new antagonism between England and France which followed the accession of Francis I. (1515) led to a rapprochement with Ferdinand; the birth of the lady Mary (1516) held out hopes of the male issue which Henry so much desired; and the question of a divorce was postponed. Ferdinand died in that year (1516) and the emperor Maximilian in 1519. Their grandson Charles V. succeeded them both in all their realms and dignities in spite of Henry's hardly serious candidature for the empire; and a lifelong rivalry broke out between him and Francis I. Wolsey used this antagonism to make England arbiter between them; and both monarchs sought England's favor in 1520, Francis at the Field of Cloth of Gold and Charles V. more quietly in Kent. At the conference of Calais in English presence reached its zenith; but the alliance with Charles destroyed the balance on which that influence depended. Francis was overweighted, and his defeat at Pavia in 1525 made the emperor supreme. Feeble efforts to challenge his power in Italy provoked the sack of Rome in 1527; and the peace of Cambrai in 1529 was made without any reference to Wolsey or England's interests.

Meanwhile Henry had been developing a serious interest in politics, and he could brook no superior in whatever sphere he wished to shine. He began to adopt a more critical attitude towards Wolsey's policy, foreign and domestic; and to give ear to the murmurs against the cardinal and his ecclesiastical rule. Parliament had been kept at arm's length since 1515 lest it should attack the church; but Wolsey's expensive foreign policy rendered recourse to parliamentary subsidies indispensable. When it met in 1523 it refused Wolsey's demands, and forced loans were the result which increased the cardinal's unpopularity. Nor did success abroad now blunt the edge of domestic discontent. His fate, however, was sealed by his failure to obtain a divorce for Henry from the papal court. The king's hopes of male issue had been disappointed, and by 1526 it was fairly certain that Henry could have no male heir to the throne while Catherine remained his wife. There was Mary, but no queen regnant had yet ruled in England; Margaret Beaufort had been passed over in favor of her son in 1485, and there was a popular impression that women from the lower social classes, than those of the upper, have succeeded the succession without a recurrence of civil war. Moreover the unexampled fatality which had attended Henry's issue revived the theological scruples which had always existed about the marriage; and the breach with Charles V. in 1527 provoked a renewal of the design of 1514. All these considerations were magnified by Henry's passion for Anne Boleyn, though she certainly was not the sole or the main cause of the divorce. That the succession was the main point is proved by the fact that Henry's efforts were all directed to securing a wife and not a mistress. Wolsey persuaded him that the necessary divorce could be obtained from Rome, as it had been in the case of Louis XII. of France and Margaret of Scotland. For a time Clement VII. was inclined to concede the demand, and Campeggio in 1528 was given ample powers. But the prospect of French success in Italy which had encouraged the pope proved delusive, and in 1529 he had to submit to the yoke of Charles V. This involved a rejection of Henry's suit, not because Charles cared anything for his aunt, but because a divorce would mean disinheriting Charles's cousin Mary, and perhaps the eventual succession of the son of a French princess to the English throne.

But in 1532, when Campeggio was recalled, and his fall involved the triumph of the anti-ecclesiastical party in England. Loy- men who had resented their exclusion from power were now promoted to offices such as those of lord chancellor and lord privy seal which they had rarely held before; and parliament was encouraged to propound lay grievances against the church. On the support of the laity Henry relied to abolish papal jurisdiction and reduce clerical privilege and property in England; and by a close alliance with Francis I. he insured himself against the enmity of Charles V. But it was only gradually that the breach was completed with Rome. Henry had defended the papacy against Luther in 1521 and had received in return the title "defender of the faith." He never liked Protestantism, and he was prepared for peace with Rome on his own terms. Those terms were impossible of acceptance by a papal pontiff VII.'s position; but before Clement had made up his mind to reject them, Henry had discovered that the papacy was hardly worth conciliating. His eyes were opened to the extent of his own power as the exponent of national antipathy to papal jurisdiction and ecclesiastical privilege; and his appetite for power grew. With Cromwell's help he secured parliamentary support, and its usefulness led him to extend parliamentary representation to Wales and Calais, to defend the privileges of Parliament, and to yield rather than forfeit its confidence. He had little difficulty in securing the Acts of Annates, Appeals and Supremacy which completed the separation from Rome, and dissolved the monasteries which, by transferring enormous wealth from the church to the crown, really, in Cecily's opinion, ensured the reformation.

The abolition of the papal jurisdiction removed all obstacles to the divorce from Catherine and to the legalization of Henry's marriage with Anne Boleyn (1533). But the recognition of the royal supremacy could only be enforced at the cost of the heads of Sir Thomas More, Bishop Fisher and a number of monks and others among whom the Carthusians signalized themselves by their devotion (1533-1536). Anne Boleyn fared no better than the Catholic martyrs; she failed to produce a male heir to the throne, and her conduct afforded a jury of peers, over which her uncle, the duke of Norfolk, presided, sufficient excuse for condemning her to death on a charge of adultery (1536). Henry then married Jane Seymour, who was obnoxious to no one, gave birth to Edward VI., and then died (1537). The dissolution of the monasteries had meanwhile evoked a popular protest in the north, and it was only by skilful and unscrupulous diplomacy that Henry was enabled to suppress so easily the Pilgrimage of Grace. Foreign intervention was avoided through the renewal of war between Francis and Charles; and the insurgents were hampered by having no rival candidate for the throne and no means of securing the execution of their programme.

As the years passed their rising hatred Henry against further doctrinal change. He had authorized the English Bible and some approach towards Protestant doctrine in the Ten Articles. He also considered the possibility of a political and theological alliance with the Lutheran princes of Germany. But in 1538 he definitely rejected their theological terms, while in 1539-1540 they rejected his political proposals. By the statute of Six Articles (1539) he took his stand on Catholic doctrine; and when the Luthers had rejected his alliance, and Cromwell's nominee, Anne of Cleves, had proved both distasteful on personal grounds and unnecessary because Charles and Francis were not really projecting a Catholic crusade against England, Anne was divorced and Cromwell beheaded. The new queen Catherine Howard represented the triumph of the reactionary party under Gardiner and Norfolk; but there was no idea of returning to the papal obedience, and even Catholic orthodoxy was represented
by the Six Articles was only enforced by spasmodic outbursts of persecution and vain attempts to get rid of Cranmer. Nevertheless, Henry's activity has been somewhat obscured by his achievements in the sphere of ecclesiastical politics; but no small part of his energies was devoted to the task of expanding the royal authority at the expense of temporal conquerors. Feudalism was not yet dead, and in the north and west there were medieval fiefdoms in which the royal will and common law hardly ran at all. Wales and its marches were brought into legal union with the rest of England by the statutes of Wales (1534-1536); and after the Pilgrimage of Grace the Council of the North was set up to bring into subjection the extensive jurisdictions of the northern earls. Neither they nor the lesser chiefs who flourished on the lack of common law and order could be reduced by ordinary methods, and the Councils of Wales and of the North were given summary powers derived from the Roman civil law similar to those exercised by the Star Chamber at Westminster and the court of Castle Chamber at Dublin. Ireland had been left by Wolsey to wallow in its own disorder; but disorder was anathema to Henry's mind, and in 1535 Sir William Skeffington was sent to apply English methods and artillery to the government of Ireland. Sir Anthony St Leger continued his policy from 1540; Henry, instead of being merely lord of Ireland dependent on the pope, was made by an Irish act of parliament king, and supreme head of the Irish church. Conciliation was also tried with some success; plantation schemes were rejected in favour of an attempt to Anglicize the Irish; their chieftains were created earls and endowed with monastic lands; and so peaceful was Ireland in 1542 that the lord-deputy could send Irish kerns and gallowglasses to fight against the Scots.

Henry, however, seems to have believed as much in the coercion of Scotland as in the conciliation of Ireland. Margaret Tudor's marriage had not reconciled the realms; and as soon as James V. became a possible pawn in the hands of Charles V., Henry betook himself of his old claims to suzerainty over Scotland. At first he was willing to subordinate them to an attempt to win over Scotland to his anti-papal policy, and he made various efforts to bring about an interview with his nephew. But James V. was held aloof by Beaton and two French marriages; and France was alarmed by Henry's growing friendliness with Charles V., who was mollified by his cousin Mary's restoration to her place in the succession to the throne. In 1542 James madly sent a Scottish army to ruin at Solway Moss; his death a few weeks later left the Scottish throne to his infant daughter Mary Stuart, and Henry set to work to secure her hand for his son Edward and the recognition of his own suzerainty. A treaty was signed with the Scottish estates; but the marriage was set up a few months later under the influence of Beaton and the queen-dowager Mary of Guise, and Herford was sent in 1544 to punish this breach of promise by sacking Edinburgh.

Perhaps to prevent French intervention in Scotland Henry joined Charles V. in invading France, and captured Boulogne (Sept. 1544). But Charles left his ally in the lurch and concluded the peace of Crépy that same month; and in 1545 Henry had to face alone a French invasion of the Isle of Wight. This attack proved abortive, and peace between England and France was made in 1546. Charles V.'s desertion inclined Henry to listen to the proposals of the threatened Lutheran princes, and the last two years of his reign were marked by a renewed tendency to advance in a Protestant direction. Catherine Howard had been brought to the block (1542) on charges in which there was probably a good deal of truth, and her successor, Catherine Parr, was a patroness of the new learning. An act of 1545 dissolved chantries, colleges and other religious foundations; and in the autumn of 1546 the Spanish ambassador was anticipating further anti-ecclesiastical measures. Gardiner had almost been sent to the Tower, and Norfolk and Surrey were condemned to death, while Cranmer intimated that it was Henry's intention to convert the mass into a communion service. An opportunist to the last, he would readily have sacrificed any theological convictions he may have had in the interests of national uniformity. He died on the 28th of January 1547, and was buried in St. George's Chapel, Windsor.

The atrocity of many of Henry's acts, the novelty and success of his religious policy, the apparent despotism of his methods, or all combined, have made it difficult to estimate calmly the importance of Henry's work or the conditions which made it possible. Henry's egotism was profound, and personal motives underlay his public action. While political and ecclesiastical conditions made the breach with Rome possible—and in the view of most Englishmen desirable—Henry VIII. was led to adopt the policy by private considerations. He worked for the good of the state because he thought his interests were bound up with those of the nation; and it was the real coincidence of this private and public point of view that made it possible for so selfish a man to achieve so much for his country. The royal supremacy over the church and the means by which it was enforced were harsh and violent expedients; but it was of the highest importance that England should be saved from religious civil war, and it could only be saved by a despotic government. It was necessary for the future development of England that its governmental system should be centralized and unified, that the authority of the monarchy should be more firmly extended over Wales and the western and northern borders, and that the still existing feudal franchises should be crushed; and these objects were worth the price paid in the methods of the Star Chamber and of the Councils of the North and of Wales. Henry's work on the navy requires no apology; without it Elizabeth's victory over the Spanish Armada would have been impossible; and "of all others the year 1545 best marks the birth of the English naval power" (Corbett, Drake, i. 59). His judgment was more at fault when he conquered Boulogne and sought by violence to bring Scotland into union with England. But at least Henry appreciated the necessity of union within the British Isles; and his work in Ireland laid the foundations of English rule. No less important was his development of the parliamentary system. Representation was extended to Wales, Cheshire, Berwick and Caisia; and parliamentary authority was enhanced, largely that it might deal with the church, until men began to complain of this new parliamentary infallibility. The privileges of the two Houses were encouraged and expanded, and parliament was led to exercise ever wider powers. This policy was not due to any belief on Henry's part in parliamentary government, but to opportunism, to the circumstance that parliament was willing to do most of the things which Henry desired, while competing authorities, the church and the old nobility, were not. Nevertheless, to the encouragement given by Henry VIII. parliament owed not a little of its future growth, and to the aid rendered by parliament Henry owed his successes.

He has been described as a "despot under the forms of law"; and it is apparently true that he committed no illegal act. His despotism consists not in any attempt to rule unconstitutionally, but in the extraordinary degree to which he was able to use constitutional means in the furtherance of his own personal ends. His industry, his remarkable political insight, his lack of scruple, and his combined strength of will and subtlety of intellect enabled him to utilize all the forces which tended at that time towards strong government throughout western Europe. In Michelot's words, "le nouveau Messie est le roi", and the monarchy alone seemed capable of guiding the state through the social and political anarchy which threatened all nations in their transition from medieval to modern organization. The king was the emblem, the focus and the bond of national unity; and to preserve it men were ready to put up with vagaries which to other ages seem intolerable. Henry could thus behead ministers and divorce wives with comparative impunity, because the individual appeared to be of little importance compared with the state. This impunity provoked a licence which is responsible for the unlovely features of Henry's reign and character. The elevation and the isolation of his position fostered a detachment from ordinary virtues and compassion,
and he was a remorseless incarnation of Machiavelli’s Prince.
He had an elastic conscience which was always at the beck and
call of his desire, and he cared little for principle. But he had a
passion for efficiency, and for the greatness of England and
himself. His mind, in spite of its clinging to the outward forms
of the old faith, was intensely secular; and he was devoid of
a moral sense as he was of a genuine religious temperament.
His greatness consists in his practical aptitude, in his political
perception, and in the self-restraint which enabled him to
confine within limits tolerable to his people an insatiable appetite
for power.

The original materials for Henry VIII’s biography are practically
all incorporated in the monumental Letters and Papers of the Reign of
His Majesty King Henry VIII, first published in 1616 and edited
and completed after fifty years’ labour in 1910. A few further details may
be gleaned from such contemporary sources as Hall’s Chronicle,
Cavendish’s Life of Wolsey, W. Thomas’s The Pilgrims and others;
and communications have been made to the documentary sources
contained in the Letters and Papers by recent works, such as Eheses
Römische Dometente, and Herriman’s Life and Letters of Thomas
Cromwell.

Henry II. (1214-1270), king of Castile, son of Alphonso VIII.
II. of Castile, and his wife Eleanor of Aquitaine, daughter of Henry
II. of England, after whom he was named, was born about
1207. He was killed, while still a boy, by the fall of a tile from a
roof.

Henry II. of Trastamara (1360-1379), king of Castile, founder of the
dynasty known as the new kings, was the eldest son
of Alphonso XI. and of his mistress Leonora de Guzman.
He was born in 1233. His father endowed him with great lordships
in northern Spain, and made him count of Trastamara.
After the death of Alphonso XI. in 1350, Leonora was murdered in
order to satisfy the revenge of the king’s neglected wife. Several of
the numerous children she had borne to Alphonso were slain at
different times by Peter the Cruel, the king’s legitimate son
and successor. Henry preserved his life by submissions and by
keeping out of the king’s way. At last, after taking part in
several internal commotions, he fled to France in 1356. In 1360
he entered into a treaty with his opponent, the king of
England, and France to accompany him on an expedition to
upset Peter, who was driven out. The Black Prince having
intervened on behalf of Peter, Henry was defeated at Najera
(3rd of April 1367) and had again to flee to Aragon. When the
Black Prince was told that “the Bastard” had neither been
slain nor taken, he said that nothing had been done.
And so it turned out; for, when the Black Prince had left Spain, Henry
came back with a body of French soldiers of fortune under du
Guesclin, and drove his brother into the castle of Montiel in La
Mancha. Peter was tempted out by du Guesclin, and the half
brothers met in the Frenchman’s tent. They rushed at one another,
and Peter, the stronger man, threw Henry down, and fell on
him. One of Henry’s pages seized the king by the leg and
threw him on his back. Henry then pulled up Peter’s hauberk
and stabbing him mortally in the stomach, on the 23rd of March
1360. He reigned for ten years, with some success both in
pacifying the kingdom and in war with Portugal. But as his
title was disputed he was compelled to purchase support by vast
grants to the nobles and concessions to the cities, by which he
gained the title of El de las Mercedes—he of the largesse.
Henry was a strong ally of the French king in his wars with the English,
who supported the claims of Peter’s natural daughters. He
died on the 30th of May 1379.

Henry III. (1390-1460) king of Castile, called El Doliente,
the Sufferer, was the son of John I. of Castile and Leon, and
of his wife Beatrice, daughter of Ferdinand of Portugal. He
was born in 1379. The period of minority was exceptionally anarchi-
cal, even for Castile, but as the cities, always the best supporters
of the royal authority, were growing in strength, Henry was able
to reduce his kingdom to obedience, and, when he took
the government into his own hands after 1393, to compel his nobles
with comparative ease to surrender the crown lands they had
seized. The feeing of the Cortes summoned by him at Madrid
in 1394 marked a great epoch in the establishment of a practically
despotical royal authority, based on the consent of the commons,
who looked to the crown to protect them against the excesses
of the nobles. Henry strengthened his position still further
by his marriage with Catherine, daughter of John of Gaunt and
of Constance, elder daughter of Peter the Cruel and Maria de
Padilla. This union combined the rival claims of the descendants
of Peter and of Henry of Trastamara. The king’s bodily
weakness limited his real capacity, and his early death on the 25th
of December 1406 cut short the promise of his reign.

Henry IV. (1452-1474), king of Castile, named the Impotent,
or the Spendthrift, was the son of John II. of Castile and Leon,
and of his wife, Mary, daughter of Ferdinand I. of Aragon
and Sicily. He was born at Valladolid on the 6th of January 1452.
The surname given to this king by his subjects are of much more
than usual accuracy. His personal character was one of mere
weakness, bodily and mental. Henry was an undutiful son, and
his reign was one long period of confusion, marked by incidents
of the most ignominious kind. He divorced his first wife Blanche
of Navarre in 1453 on the ground of “mutual impotence.”
Yet in 1468 he married Joan of Portugal, and when she bore a
dughter, first repudiated her as adulterine, and then claimed
her for his own. In 1468 he was solemnly deposed in favour
of his brother Alphonso, on whose death in the same year his
authority was again recognised. The last years of his life were
spent in civil war, in the first of which he was defeated at La
Rugata, afterwards queen, to marry his favourite, the Master of Santiago,
and then to exclude her from the throne. Henry died at Madrid
on the 12th of December 1474.

Henry V. (1490-1504), son of King Robert and his queen,
Constance of Aquitaine, and grandson of Hugh Capet,
came to the throne upon the death of his father in 1314, although
in 1297 he had been appointed king at Reims and associated
in the government with his father. His mother, who favoured
her younger son Robert, and had retired from court upon
Henry’s coronation, formed a powerful league against him, and
he was forced to take refuge with Robert II., duke of Normandy.
In the civil war which resulted Henry played his masterpiece,
and he speedily became master of the situation. Constance
died in 1344, and the rebel brother Robert was given the duchy of Burgundy,
thus founding that great collateral line which was to rival the
kings of France for three centuries. Henry atoned for this by
a reign marked by unceasing struggle against the great barons.
From 1343 to 1342 he was involved in a life and death contest
with those nobles whose territory adjoined the royal domains,
especially with the great house of Blois, whose count, Odo II.,
had been the centre of the league of Constance, and with the
counts of Champagne. Henry’s success in these wars was largely
due to the help given him by Robert of Normandy, but upon the
accession of Robert’s son William (the Conqueror), Normandy
itself became the chief danger. From 1347 to the year of his
death, Henry was almost constantly at war with William, who
held his own against the king’s formidable leagues and beat back
two royal invasions, in 1055 and 1058. Henry’s reign
HENRY II.—HENRY III.

291

marks the height of feudalism. The Normans were independent of him, with their frontier barely 25 m. west of Paris; to the south his authority was really bounded by the Loire; in the east the count of Champagne was little more than nominally his subject, and the duchy of Burgundy was almost entirely cut off from the king. Yet Henry maintained the independence of the clergy against the pope Leo IX., and claimed to derive from the emperor Frederick I. alone the right to intercede at Ivos, he reproached the French with the violation of promises, and Henry III. challenged him to a single combat. According to the German chronicler—which French historians doubt—the king of France, declined the combat and fled from Ivos during the night. In 1059 he had his eldest son Philip crowned as joint king, and died the following year. Henry's first wife was Maud, niece of the emperor Henry III., whom he married in 1043. She died childless in 1044. Historians have sometimes confused her with Maud (or Matilda), the emperor Conrad II.'s daughter, to whom Henry was allied in 1053, but who died before the marriage. In 1057 Henry married the Russian princess Anna, daughter of Yaroslav I., grand duke of Kiev. She bore him two sons, Philip, his successor, and Hugh the great, count of Vermandois.

See the Historiae of Rudolph Glaber, edited by M. Prou (Paris, 1886); F. Soehnle, Catalogue des actes d'Henri Ier (1907); de Caiz de Saint Aymourn, Anne de Russie, reine de France (1866); E. Lavisse, Histoire de France, tome ii. (1901), and the article on Henry I. in La Grande Encyclopédie by M. Prou.

HENRY II. (1550-1559), king of France, the second son of Francis I. and Claude, succeeded to the throne in 1547. When only seven years old he was sent by his father, with his brother the dauphin Francis, as a hostage to Spain in 1528, whence they returned after the conclusion of the peace of Cambrai in 1530. Henry was too young to have carried away any abiding impressions, yet throughout his life his character, dress and bearing were far more Spanish than French. In 1533 his father married him to Catherine de' Medici, from which match, as he said, Francis hoped to gain great advantage, even though it might be somewhat of a misalliance. In 1536 Henry, hitherto duke of Orleans, became dauphin by the death of his elder brother Francis. From that time he was under the influence of two personages, who dominated him completely for the remainder of his life—Diane de Poitiers, his mistress, and Anne de Montmorency, his mentor. Moreover, his younger brother, Charles of Orleans, who was of a more sprightly temperament, was his father's favourite; and the rivalry of Diane and the duchesse d'Étampes helped to make still wider the breach between the king and the dauphin. Henry supported the constable Montmorency when he was disgraced in 1541; protested against the treaty of Crépy in 1544; and at the end of the reign he was more than once brought near to a revolt at the court. Diane, Montmorency and the Guises were all-powerful, and dismissed Cardinal de Tournon, de Longueval, the duchesse d'Étampes and all the late king's friends and officials. At that time Henry was twenty-eight years old. He was a robust man, and inherited his father's love of violent exercise; but his character was weak and his intelligence mediocre, and he had none of the superficial and brilliant gifts of Francis I. He was cold, haughty, melancholy and dull. He was a bigoted Catholic, and showed to the Protestants and their adherents less mercy than his father. During his reign his authority became more severe and more absolute than ever. Resistance to the financial extortions of the government was cruelly chastised, and the "Chambre Ardent" was instituted against the Reformed. Abroad, the struggle was continued against Charles V. and Philip II., which ended in the much-discussed treaty of Cateau-Cambrésis. Some weeks afterwards vital fees was held on the occasion of the double marriage of the king's daughter Elizabeth with the king of Spain, and of his sister Margaret with the duke of Savoy. On the 30th of June 1559, when the count of Montgomery, Henry was wounded in the temple by a lance. In spite of the attentions of Ambroise Paré he died on the 10th of July. By his wife Catherine de' Medici he had seven children living; Elizabeth, queen of Spain; Claude, duchess of Lorraine; Francis II. (Charles IX.) and Henry (III.), all of whom came to the throne; Marguerite, who became queen of Navarre in 1572; and Francis, duke of Alençon and afterwards of Anjou, who died in 1584.

The bulk of the documents for the reign of Henry II. are unpublished, and are scattered in the Bibliothèque Nationale, Paris. Of the published documents, see especially the correspondence of Catherine de' Medici (ed. de la Ferrière, Paris, 1880), of Diane de Poitiers (ed. by Guiffrey, Paris, 1866), of Antoine de Bourbon and Jeanne d'Albret (ed. by Bossuau, Paris, 1877), of Odet de Selve, ambassador to England (ed. by Lefèvre-Pontalis, Paris, 1888) and of Dominique de Gabre, ambassador to Venice (ed. by Vitalis, Paris, 1903); Ribier, Lettres et mémoires d'État (Paris, 1865); Robiquet, Mémoires des ambassadeurs réunis, &c. Of the contemporary memoirs and histories, see Brantôme (ed. by Lalanne, Paris, 1864—1882), François de Lorraine (ed. by Michaud and Poujoulat, Paris, 1839), Montuc (ed. by Aimealle, Paris, 1820), F. d'Albret (ed. by Poujoulat), F. de Rubutin (Pantheon littéraire, Paris, 1836). See also de Thou, Histoire sui tempori... (London, 1732); Decrue, Anna de Montmorency (Paris, 1888); H. Fournier, Les Duc de Guise et leur époque, vol. i. (Paris, 1877); and H. Lemomier, "La France sous Henri II" (Paris, 1904), in the Histoire de France, by E. Lavisse, which contains a fuller bibliography of the subject.

HENRY III. (1551-1559), king of France, third son of Henry II. and Catherine de' Medici, was born at Fontainebleau on the 19th of September 1551, and succeeded to the throne of France on the death of his brother Charles IX. in 1574. In his youth, as duke of Anjou, he was warmly attached to the Huguenot opinions, as we learn from his sister Marguerite de Valois; but his unstable character soon gave way before his mother's will, and both Henry and Marguerite remained unchanged in sympathy. When, in 1575, he was seventeen years old, he was hand in hand with the princess of Condé, and set out reluctantly to Warsaw, but, on the death of his brother Charles IX. in 1574, he escaped from his Polish subjects, who endeavoured to retain him by force, came back to France and assumed the crown. He returned to a wretched kingdom, torn by civil war. Because of his good intentions, he was incapable of governing, and abandoned the power to his brother and his favourites. Yet he was no dullard. He was a man of keen intelligence and cultivated mind, and deserves as much as Francis I. the title of patron of letters and art. But his incredible indulgence and love of pleasure prevented him from taking any active part in affairs. Surrounded by his mignons, he scandalized the people by his effeminate manners. He dressed himself in women's clothes, made a collection of little dogs and hid in the cellars when it thundered. The disgust aroused by the vices and effeminacy of the king increased the popularity of the Huguenots. The "day of the barricades" (12th of May 1558), the king, perceiving that his influence was lost, resolved to rid himself of Guise by assassination; and on the 23rd of December 1558 his faithful bodyguard, the "forty-five," carried out his design at the château of Blois. But the fanatical preachers of the League clamoured furiously for vengeance, and on the 1st of August 1559, while Henry III. was investing Paris with Henry of Navarre, Jacques Clement, a Dominican friar, was introduced into his presence on false letters of recommendation, and plunged a knife into the lower part of his body. He died a few hours afterwards with great pain. By his wife Louise de Lorraine, daughter of the count of Vaudémont, he had no children, and on his deathbed he recognized Henry of Navarre as his successor.

HENRY IV. (1553–1610), king of France, the son of Antoine de Bourbon, duke of Vendôme, head of the younger branch of the Bourbons, descendant of Robert of Clermont, sixth son of St Louis and of Jeanne d’Albret, queen of Navarre, was born at Pau (Basses Pyrénées) on the 14th of December 1553. He was educated as a Protestant, and in 1559 was sent to the court at Amiens. In 1561 he entered the Collège de Navarre at Paris, returning in 1565 to Béarn. During the third war of religion in France (1568–1570) he was taken by his mother to Gaspard de Coligny, leader of the Protestant forces since the death of Louis I., prince of Condé, at Jarnac, and distinguished himself at the battle of Armagnac in Burgundy in 1569. On the 9th of June 1572, Jeanne d’Albret died and Henry became king of Navarre, marrying Margaret of Valois, sister of Charles IX. of France, on the 18th of August of that year. He escaped the massacre of St Bartholomew on the 24th of August by a feigned abjuration. On the 2nd of February 1576, after several vain attempts, he escaped from the castle, joined the combined forces of Protestants and of opponents of the king, and obtained by the treaty of Beaulieu (1576) the government of Guinée. In 1577 he secured the treaty of Bergerac, which foreshadowed the edict of Nantes. As a result of quarrels with his unworthy wife, and the unwelcome intervention of Henry III., he undertook the seventh war of religion, known as the “war of the lovers” (des amoureux), seized Cahors on the 5th of May 1580, and signed the treaty of Fleix on the 26th of November 1580. On the 10th of June 1584 the death of Monsieur, the duke of Anjou, brother of King Henry III., made Henry of Navarre heir presumptive to the throne of France. Excluded from it by the treaty of Nemours (1585) he began the “war of the three Henrys” by a campaign in Guienne (1586) and defeated in Inte (1587)—an event of political wisdom, since it brought about the collapse of all opposition. Paris gave in to him on the 22nd of March 1594 and province by province yielded to arms or negotiations; while the victory of Fontaine-Française (1595) and the capture of Amiens foreshadowed the death of Philip II. of Spain to sign the peace of Vervins on the 2nd of May 1598. On the 13th of April of that year Henry IV. had promulgated the Edict of Nantes.

Then Henry set to work to pacify and restore prosperity to his kingdom. Convinced by the experience of the wars that France needed an energetic central power, he pushed at times his royal prerogatives to excess, raising taxes in spite of the Estates, interfering in the adoptions of his eldest children, holding himself free to reject the advice of the notables if he consulted them. Aided by his faithful friend Maximilien de Béthune, baron de Rosny and duc de Sully (q.v.), he reformed the finances, repressed abuses, suppressed useless offices, extinguished the formidable debt and realized a reserve of eighteen millions. To alleviate the distress of the people he undertook to develop both agriculture and industry: planting colonies of Dutch and Flemish settlers to drain the marshes of Saintonge, issuing prohibitive measures against the importation of foreign goods (1597), introducing the silk industry, encouraging the manufacture of cloth, of glass-ware, of tapestries (Gobelins), and under the direction of Sully—named grand-royer des manufactures—improving and increasing the royal factories for commerce. A complete system of canals was planned, that of Briare partly dug. New capitulations were concluded with the sultan Ahmed I. (1604) and treaties of commerce with England (1606), with Spain and Holland. Attempts were made in 1604 and 1608 to colonize Canada (see CHAMPLAIN, SAMUEL DE). The army was reorganized, its pay raised and assured, a school of cadets formed to supply it with officers, artillery constituted and strongholds on the frontier fortified. While lacking the artistic tastes of the Valois, Henry beautified Paris, adding the great gallery of the Louvre, finishing the Tulleries, building the Pont Neuf, the Hôtel-de-Ville and the Place Royale.

The foreign policy of Henry IV. was directed against the Habsburgs. Without declaring war, he did all possible harm to them by alliances and diplomacy. In Italy he gained the grand duke of Tuscany—marrying his niece Marie de’ Medici in 1600—the duke of Mantua, the republic of Venice and Pope Paul V. The duke of Savoy, who held back from the treaty of Vervins in 1598, signed the treaty of Lyons in 1601; in exchange for the marquisate of Saluzzo, France acquired Bresse, Bugey, Valromey and the bailliage of Gex. In the Low Countries, Henry undertook subsidies to the Dutch in their struggle against Spain. He concluded alliances with the Protestant princes in Germany, with the duke of Lorraine, the Swiss cantons (treaty of Soleure, 1602) and with Sweden.

The opening on the 25th of March 1609 of the question of the succession of John William the Good, duke of Cleves, of Jülich and of Berg, led Henry, in spite of his own hesitations and those of his German allies, to declare war on the emperor Rudolph II. But he was assassinated by Ravaillac (q.v.) on the 14th of May 1610, upon the eve of his great enterprise, leaving his policy to be followed up later by Richelieu. Sully in his Économies royales attributes to his master the “great design” of constituting, after having defeated Austria, a vast European confederation of fifteen states of the Christian Republic”—directed by a general council of sixty deputies reappointed every three years. But this “design” has been attributed rather to the imagination of Sully himself than to the more practical policy of the king.

No figure in France has been more popular than that of “Henry the Great.” He was affable to the point of familiarity, quick-witted like a true Gascon, good-hearted, indulgent, yet skilled in reading the character of those around him, and he could at times show himself severe and unyielding. His courage amounted almost to recklessness. He was a better soldier than strategist. Although at bottom authoritative he surrounded himself with admirable advisers (Sully, Sillery, Villeroi, Jeannin) and profited from their co-operation. His love affairs, unusually too, caused no scandal (with Gabrielle d’Estrees and Henriette d’Entragues), if they injure his personal reputation, had no bad effect on his policy as king, in which he was guided only by an exalted ideal of his royal office, and by a sympathy for the common people, his reputation for which has perhaps been exaggerated somewhat in popular tradition by the circumstances of his reign.

Henry IV. had no children by his first wife, Margaret of Valois. By Marie de’ Medici he had Louis, later Louis XIII.; Gaston, duke of Orleans; Elizabeth, who married Philip IV. of Spain; Christine, duchess of Savoy; and Henrietta, wife of Charles I. of England. Among his bastards the most famous was that of Gabrielle d’Estrees—Caesar, duc de Vendôme, Alexander of Vendôme, and Catherine Henriette, duchess of Elbeuf.

Several portraits of Henry are preserved at Paris, in the Bibliothèque Nationale (cf. Bouchot, Portraits au crayon, p. 189), at the Louvre (by Probus, bust by Barthélemy Prieur) at Versailles, Geneva (Henry at the age of fifty), at Hampton Court, at Munich and at Florence.

The works dealing with Henry IV. and his reign are too numerous to be enumerated here. For sources, see the Recueil des lettres publiées de Henri IV. (1558–1610), in the Collection de documents intérieurs relatifs à l'histoire de France, and the various researches of Galtzins, Bautiott, Halphen, Dussieux and others. Besides their historic interest, the letters written by Henry, whether love notes or letters to state, reveal a charming writer. Mention should be made of Auguste Poiron’s Histoire du règne de Henri IV (2nd ed. 4 vols., Paris, 1862–1867) and of J. H. Mariéjol’s volume (vi.) in the Histoire de France, edited by Ernest Lavisse (Paris, 1909), where main sources and literature
HENRY I.—HENRY THE PROUD

are given with each chapter. A Reine Henri IV has been founded at Paris (1908). Finally, a complete survey of the sources for the period 1494-1616 is given by Henri Hauser in vol. vii. of Sources de l'histoire de France (Paris, 1906) in continuation of A. Molinier's collection of the sources for French history during the middle ages.

HENRY I. (c. 1270-1274), surnamed le Gros, king of Navarre and count of Champagne, as the youngest son of Theobald II, king of Navarre, by Margaret of Foix, and succeeded his eldest brother Theobald III. as king of Navarre and count of Champagne in December 1270. His proclamation at Pamplona, however, did not take place till March of the following year, and his coronation was delayed until May 1273. After a brief reign, characterized, it is said, by dignity and talent, he died in July 1274, suffocated, according to the generally received accounts, by his own fat. In him the male line of the counts of Champagne and kings of Navarre, became extinct. He married in 1269 Blanche, daughter of Robert, count of Artois, and niece of King Louis IX., and was succeeded by his only legitimate child, Jeanne or Joanna, by whose marriage to Philip IV. afterwards king of France in 1284, the crown of Navarre became united to that of France.

HENRY II. (1293-1255), titular king of Navarre, was the eldest son of Jean d'Albret (d. 1251) by his wife Catherine de Foix, sister and heiress of Francis Phoebus, king of Navarre, and was born at Sanguesa in April 1203. When Catherine died in exile in 1247 Henry succeeded her in claim on Navarre, which was disputed by Ferdinand I. king of Spain; and under the protection of Francis I. of France, he added to the title of king. After ineffective conferences at Noyon in 1251 and at Montpellier in 1258, an active effort was made in 1253 to establish him in the de facto sovereignty; but the French troops which had seized the country were ultimately expelled by the Spaniards. In 1253 Henry was taken prisoner at the battle of Pavia, but he contrived to escape, and in 1256 married Margaret, the sister of Francis I. and widow of Charles, duke of Alençon. By her he was the father of Jeanne d'Albret (d. 1272), and was consequently the grandfather of Henry IV. of France. Henry, who had some sympathy with the Huguenots, died at Pau on the 29th of May 1255.

HENRY I. (1352-1380), king of Portugal, third son of Emanuel the Fortunate, was born in Lisbon, on the 31st of January 1352. He was destined for the church, and in 1352 was raised to the archiepiscopal see of Braga. In 1342 he received the cardinal's hat, and in 1368 when he was called to succeed his grandnephew Sebastian on the throne, he held the archbishoprics of Lisbon and Coimbra as well as that of Braga, in addition to the wealthy abbacy of Aizobazar. As an ecclesiastic he was pious, pure, simple in his mode of life, charitable, and a learned and liberal patron of letters. But his administrative power proved strong, vigilant, but incapable. On his death in 1380, after a brief reign of seventeen months, the male line of the royal family which traced its descent from Henry, first count of Portugal (c. 1100), came to an end; and all attempts to fix the succession during his lifetime having ignominiously failed, Portugal became an easy prey to Philip II. of Spain.

HENRY II. (1489-1508), duke of Brunswick-Wolfenbüttel, was a son of Duke Henry I., and was born on the 10th of November 1489. He began to reign in 1514, but his brother William objected to the indivisibility of the duchy which had been decreed by the elder Henry, and it was only in 1535, after an imprisonment of eleven years, that William recognized his brother's title. Sharing in an attack on John, bishop of Hildesheim, Henry was defeated at the battle of Soltau in June 1519, but afterwards he was more successful, and when peace was made received some lands from the bishop. In 1525 he assisted Philip, landgrave of Hesse, to crush the rising of the peasants in north Germany, and in 1528 took help to Charles V. in Italy, where he narrowly escaped capture. As a pronounced opponent of the reformed doctrines, he joined the Catholic princes in concerting measures for their defence, and collections on the other hand promised Philip of Hesse to aid him in restoring his own brother-in-law Ulrich, duke of Württemberg, to his duchy. However he gave no assistance when this enterprise was undertaken in 1534, and subsequently the hostility between Philip and himself was very marked. Henry was attacked by Luther with unmeasured violence in a writing Wider Hans Worst; but more serious was his isolation in north Germany. The duke soon came into collision with the Protestant towns of Goslar and Brunswick, against the former of which a sentence of restitution had been pronounced by the imperial court of justice (Reichskammergericht). To conciliate the Protestants Charles V. had suspended the execution of this sentence, a proceeding which Henry declared was ultra vires. The league of Schmalkalden, led by Philip of Hesse and John Frederick, elector of Saxony, then took up arms to defend the towns; and in 1542 Brunswick was overrun and the duke forced to flee. In September 1545 he made an attempt to regain his duchy, but was taken prisoner by Philip, and only released after the victory of Charles V. at Mühlberg in April 1547. Returning to Brunswick, where he was very unpopular, he soon quarrelled with his subjects both on political and religious questions, while his duchy was ravaged by Albert Alcibiades, prince of Bayreuth. Henry was among the princes who banded themselves together to crush Albert, and after the death of Maurice, elector of Saxony, at Sievershausen in July 1553, he took command of the allied troops and defeated Albert in two engagements. In his later years he became more tolerant, and was reconciled with his Protestant subjects. He died at Wolfenbüttel on the 11th of June 1568. The duke was twice married, firstly in 1515 to Maria (d. 1541), daughter of James I., king of Portugal, and secondly in 1556 to Marie (d. 1575), daughter of Sigismund I., king of Poland. He attained some notoriety through his romantic attachment to Eva von Trott, whom he represented as dead and afterwards kept concealed at Staufenburg. Henry was succeeded by his only surviving son, Julius (1528-1589).

HENRY (c. 1105-1139), surnamed the "Proud," duke of Saxony and Bavaria, second son of Henry the Black, duke of Brabant, and Wulhild, daughter of Magnus Billung, duke of Saxony, was a member of the Welf family. His father and mother both died in 1126, and as his elder brother Conrad had entered the church, Henry became duke of Bavaria and shared the family possessions in Saxony, Bavaria and Swabia with his younger brother, Welf. At Whitinsunde 1127 he was married to Gertrude, the only child of the German king, Lothair the Saxon, and at once took part in the warfare between the king and the Hohenstaufen brothers, Frederick II., duke of Swabia, and Conrad, afterwards the German king Conrad III. While fighting in this struggle Henry was also one of the princes who, in 1137, rose in Bavaria, led by Frederick, count of Bogen, during which both duke and count sought to establish their own candidates in the bishopric of Regensburg. After a war of devastation, Frederick submitted in 1133, and two years later the Hohenstaufen brothers made their peace with Lothair. In 1136 Henry accompanied his father-in-law to Italy, and taking command of one division of the German army marched into southern Italy, devastating the land as he went. It was probably about this time that he was invested with the margraviate of Tuscany and the lands of Matilda, the late margrave. Having distinguished himself by his military genius during this campaign, Henry left Italy with the German troops, and was appointed by the emperor as his successor in the dukedom of Saxony. When Lothair died in December 1137 Henry's wealth and position made him a formidable candidate for the German throne; but the same qualities which earned him the surname of "Proud," aroused the jealousy of the princes, and so prevented his election. The new king, Conrad III., demanded the imperial insignia which were in Henry's possession, and the duke in return asked for his investiture with the Saxon duchy. But, Conrad, who was somewhat over-reaching in the project, was so impressed by the fact that it was unlawful for two duchies to be in one hand. Attempts at a settlement failed, and in July 1138 the duke was placed
under the ban, and Saxony was given to Albert the Bear, afterwards margrave of Brandenburg. War broke out in Saxony and Bavaria, but was cut short by Henry's sudden death at Quedlinburg on the 20th of October 1139. He was buried at Königslutter. Henry was a man of great ability, and his early death alone prevented him from playing an important part in Germany. Indeed, the author of the Rollenspiegel, which was in Henry's service, and probably wrote this poem at the request of the duchess, Gertrude.

See S. Kießler, Geschichte Bayerns, Band i. (Gotha, 1878); W. Bernhardi, Lotar von Supplinburg (Leipzig, 1879); W. von Giesebrecht, Geschichte der deutschen Kaiserzeit, Band iv. (Brunswick, 1877).

HENRY (1112-1195), surnamed the "Lion," duke of Saxony and Bavaria, only son of Henry the Proud, duke of Saxony and Bavaria, and Gertrude, daughter of the emperor Lothair the Saxo, was born at Ravensburg, and was a member of the family of Welf. In 1138 the German king Conrad III. had sought to deprive Henry the Proud of his duchies, and when the duke died in the following year the interests of his young son were maintained in Saxony by his mother, and his grandmother Richenza, widow of Lothair, and in Bavaria by his uncle, Count Welf VI. This struggle ended in May 1142 when Henry was invested as duke of Saxony at Frankfurt, and Bavaria was given to Henry II., Jasomirgott, margrave of Austria, who married his mother Gertrude. In 1147 he married Clementia, daughter of Conrad, duke of Zähringen (d. 1152), and began to take an active part in administering his dukedom and extending its area. He engaged in a successful expedition against the Abotrites, or Obotrites, in 1147, and won a considerable tract of land beyond the Elbe, in which were re-established the bishoprics of Mecklenburg, Oldenburg, and Ratzeburg. Hartwig, archbishop of Bremen, wished these to be under his authority, but Henry contested this claim, and won the right to invest these bishoprics himself, a privilege afterwards confirmed by the emperor Frederick I. Henry, meanwhile, had not forgotten Bavaria. In 1147 he made a formal claim on this duchy, and in 1151 sought to take possession, but failing to obtain the aid of his uncle Welf, did not effect his purpose. The situation was changed in his favour when Frederick I., who was anxious to count the duke among his supporters, succeeded Conrad as German king in February 1152. Frederick was unable at first to persuade Henry Jasomirgott to abandon Bavaria, but in June 1154 he recognized the claim of Henry the Lion, who accompanied him on his first Italian campaign and distinguished himself in suppressing revolts at Piacenza, Henry's formal investiture as duke of Bavaria taking place in September 1156 on the emperor's return to Germany. Henry soon returned to Saxony, where he found full scope for his untiring energy. Adolph II., count of Holstein, was compelled to cede Lübeck to him in 1158; campaigns in 1163 and 1164 beat down further resistance of the Abotrites; and Saxon garrisons were established in the conquered lands. The duke was aided in this work by the alliance of Valdemar I., king of Denmark, and, it is said, by engines of war brought from Italy. During these years he had also helped Frederick I. in his expedition of 1157 against the Poles, and in July 1159 had gone to his assistance in Italy, where he remained for about two years.

The vigorous measures taken by Henry to increase his power aroused considerable opposition. In 1166 a coalition was formed against him a. Merseburg under the leadership of Albert the Bear, margrave of Brandenburg, and Archbishop Hartwig. Neither side met with much success in the desultory warfare that ensued, and Frederick made peace between the combatants at Würzburg in June 1168. Having obtained a divorce from his first wife in 1162, Henry was married at Minden in February 1168 to Matilda (1156-1189), daughter of Henry II., king of England, and was soon afterwards sent by the emperor Frederick I. on an embassy to the kings of England and France. A war with Valdemar of Denmark, caused by a quarrel over the booty obtained from the conquest of Rügen, engaged Henry's activity until June 1171, when, in pursuance of a treaty which restored peace, Henry's daughter, Gertrude, married the Danish prince, Canute. Henry, whose position was now very strong, made a pilgrimage to Jerusalem in 1172, was received with great respect by the eastern emperor Manuel Comnenus at Constantinople, and returned to Saxony in 1173.

A variety of measures leading to a rupture in the harmonious relations between Frederick and Henry, whose increasing power could not escape the emperor's notice, and who showed little inclination to sacrifice his interests in Germany in order to help the imperial cause in Italy. He was not pleased when he heard that his uncle, Welf, had bequeathed his Italian and Swabian lands to the emperor, and the crisis came after Frederick's check before Alessandria in 1175. The emperor appealed personally to Henry for help in February, or March 1176, but Henry made no move in response, and his defection contributed in some measure to the emperor's defeat at Legnano. The peace of Venice provided for the restoration of Ulrich to his see of Halberstadt. Henry, however, refused to give up the lands which he held over it, and this conduct provoked a war in which Ulrich was soon joined by Philip, archbishop of Cologne. No attack on Henry appears to have been contemplated by Frederick to whom both parties carried their complaints, and a day was fixed for the settlement of the dispute at Worms. But neither then, nor on two further occasions, did Henry appear to answer the charges preferred against him; accordingly in January 1180 he was placed under the imperial ban at Würzburg, and was declared deprived of all his lands.

Meanwhile the war with Ulrich continued, but after his victory at Weissensee Henry's allies began to fall away, and his cause to decline. When Frederick took the field in June 1181 the struggle was soon over. Henry sought for peace, and the conditions were settled at Erfurt in November 1181, when he was granted the counties of Lüneburg and Brunswick, but was banished under oath not to return without the emperor's permission. In July 1182 he went to his father-in-law's court in Normandy, and afterwards to England, returning to Germany with Frederick's permission in 1185. He was soon regarded once more as a menace to the peace of Germany, and of the three alternatives presented to him by the emperor in 1188 he rejected the idea of making a formal renunciation of his claim, or of participating in the crusade, and chose exile, going again to England in 1189. In October of the same year, however, he returned to Saxony, excusing himself on the plea that his lands had not been defended according to the emperor's promise. He found many allies, took Lübeck, and soon almost the whole of Saxony was in his power. King Henry VI. was obliged to take the field against him, after which the duke's cause declined, and in July 1190 a peace was arranged at Fulda, by which he retained Brunswick and Lüneburg, received half the revenues of Lübeck, and gave two of his sons as hostages. Still hoping to regain his former position, he took advantage of a league against Henry VI. in 1193 to engage in a further revolt; but the captivity of his brother-in-law Richard I., king of England, led to a reconciliation. Henry passed his later years mainly at his residences in Saxony, and died on the 6th of August 1195, and was buried in the church of St Blasius which he had founded in the town. He had by his first wife a son and a daughter, and by his second wife five sons and a daughter. One of his sons was Otto, afterwards the emperor Otto IV., and another was Henry (d. 1227) count palatine of the Rhine.

Henry was a man of great ambition, and won his surname of "Lion" by his personal bravery. His influence on the fortunes of Saxony and northern Germany was very considerable. He planted Flemish and Dutch settlers in the land between the Elbe and the Oder, fostered the growth and trade of Lübeck, and in other ways encouraged trade and agriculture. He sought to spread Christianity by introducing the Cistercians, founding bishoprics, and building churches and monasteries. In 1184 a colossal statue was erected to his memory at Brunswick.

1 The see was transferred to Schwerin by Henry in 1167.  
2 Transferred to Lübeck in 1163.
HENRY OF BATTENBERG—HENRY STUART

The authorities for the life of Henry the Lion are those dealing with the reign of the emperor Frederick I, and the early years of his brother Henry the Lion, with the chronicles of Germany and France. The chief modern works are H. Prutz, "Heinrich der Löwe" (Leipzig, 1865); M. Philippson, Geschichte Heinrichs des Löwen (Leipzig, 1867); and L. Welland, Das sächsische Herzogtum unter Lothar und Heinrich dem Löwen (Göschen, 1866).

HENRY, PRINCE OF BATTENBERG (1858-1896), was the third son of Prince Alexander of Hesse and his morganatic wife, the beautiful Countess Julia von Hauke, to whom was granted in 1884, the title of Prince of Battenberg, which her children inherited. He was born at Milian on the 5th of October 1858, was educated with a special view to military service, and in due time became a lieutenant in the first regiment of Rhinen Hussars. By their relationship to the grand dukes of Hesse the princes of Battenberg were brought into close contact with the English court, and Prince Henry paid several visits to England, where he soon became popular both in public and in private circles. It therefore created but little surprise when, towards the close of 1884, it was announced that Queen Victoria had sanctioned his engagement to a daughter of Prince Alfred, Duke of Edinburgh.

The wedding took place at Whippingham on the 23rd of July 1885, and after the honeymoon the prince and princess settled down to a quiet home life with the queen, being seldom absent from the court, and accompanying her majesty in her annual visits to the continent. Three sons and a daughter were the issue of the marriage. On the 31st of July 1885 a bill to naturalize Prince Henry was passed by the House of Lords, and he received the title of royal highness. He was made a Knight of the Garter and a member of the Privy Council, and also appointed a colonel in the army, and afterward a captain-general in the government and governor of Carisbrooke Castle. He adapted himself very readily to English country life, for he was an excellent shot and an enthusiastic yachtsman. Coming of a martial race, the prince would gladly have embraced an active military career, and when the Ashanti expedition was organized in November 1895 he volunteered to join it. But when the expedition reached Prahus, about 30 m. from Kumasi, he was struck down by fever, and being promptly conveyed back to the coast, was placed on board H.M.S. "Blonde." On the 17th of January he seemed to recover slightly, but a relapse occurred on the 19th, and he died on the evening of the 20th of the coast Beacarina.

HENRY FITZ HENRY (1155-1183), second son of Henry II., king of England, by Eleanor of Aquitaine, became heir to the throne on the death of his brother William (1156), and at the age of five was married to Marguerite, the infant daughter of Louis VII. In 1170 he was crowned at Westminster by Roger of York. The protests of Becket against this usurpation of the rights of Canterbury were the ultimate cause of the primate's murder. The young king soon quarrelled with his father, who allowed him no power and a wholly inadequate revenue, and he led the great baronial revolt of 1173. He was assisted by his father-in-law, to whose court he had repaired; but, failing to shake the old king's power either in Normandy or England, made peace in 1174. Despite the generous terms which he received, he continued to intrigue with Louis VII., and was in consequence jealously watched by his father. In 1182 he and his younger brother Geoffrey took up arms, on the side of the Poitevin rebels, against Richard Coeur de Lion; apparently from resentment at the favour which Henry II. had shown to Richard in giving him the government of Poitou while they were virtually landless. Henry II. took the 10th, and he died on the evening of the 20th of the coast Isiera Leone.

Hippisley, d. 1825), who had formerly acted semi-officially on behalf of the British government at the court of Pius VI. Sir John Hippisley appealed to George III., who on the warm recommendation of Prince Augustus Frederick, duke of Sussex, gave orders for the annual payment of a pension of £4000 to the last of the Royal Stuarts. Henry received the proffered assistance gratefully, and in return for the king's kindness subsequently left by his will certain British crown jewels in his possession to the prince regent. In 1800 Henry was able to return to Rome, and in 1803, being now senior cardinal bishop, he became 1st dean of the Sacred College and bishop of Ostia and Velletri. He died at Frascati on the 13th of July 1807, and was buried in the Grotte Vaticane of St Peter's in an urn bearing the title of "Henry IX."); he is also commemorated in Canova's well-known monument to the Royal Stuarts (see JAMES). The Stuart archives, once the property of Cardinal York, were subsequently presented by Pope Pius VII. to the prince regent, who placed them in the royal library at Windsor Castle.

See B. W. Kelly, Life of Cardinal York; H. M. Vaughan, Last of the Royal Stuarts; and A. Shield, Henry Stuart, Cardinal York, and his Times (1868).
HENRY OF PORTUGAL, surnamed the “Navigator” (1394-1460), duke of Viseu, governor of the Algarve, was born at Oporto on the 4th of March 1394. He was the third (or, counting children who died in infancy, the fifth) son of John (João) I., the founder of the Aviz dynasty, under whom Portugal, victorious against Castile and against the Moors of Morocco, began to take a prominent place among European nations; his mother was Philippa, daughter of John of Gaunt. When Ceuta, the “African Gibraltar,” was taken in 1443, Prince Henry performed the most distinguished service of any Portuguese leader, and received knighthood; he was now created duke of Viseu and lord of Covilham, and about the same time began his explorations, which, however, limited in their original conception, certainly developed into a search for a better knowledge of the western ocean and for a sea-way along the unknown coast of Africa to the supposed western Nile (our Senegal), to the rich negro lands beyond the Sahara desert, to the half-true, half-fabled realm of Prester John, and so ultimately to the Indies.

Disregarding the traditions which assign 1412 or even 1410 as the commencement of these explorations, it is certain that in 1415, the year of Ceuta, the prince sent out his “Duque de Trastamara” on a voyage which brought the Portuguese to Grand Canary. There was no discovery here, for the whole Canarian archipelago was now pretty well known to French and Spanish mariners, especially since the conquest of 1402-06 by French adventurers under Castilian overlordship; but in 1418 Henry’s captain, João Gonçalves Zarco rediscovered Porto Santo, and in 1420 Madeira, the chief members of an island group which had originally been discovered (probably by Genoese pioneers) before 1351 or perhaps even before 1339, but had rather faded from Christian knowledge since. The story of the rediscovery of Madeira by the Englishman Robert Machim or Machin, eluding from Bristol with his subjects in the reign of Edward III. (about 1370), has been the subject of much controversy; in any case it does not affect the original Italian discovery, nor the first sighting of Porto Santo by Zarco, who, while exploring the west African mainland coast, was driven by storms to this island. In 1424-25 Prince Henry attempted to purchase the Canaries, and began the colonization of the Madeira group, both in Madeira itself and in Porto Santo; to aid this latter movement he procured the famous charters of 1430 and 1433 from the Portuguese crown. In 1427, again, with the co-operation of his father King John, he seems to have sent out the royal pilot Diogo de Sevilh, followed in 1427 by Gonçalo Velho Cabral, to explore the Azores, first mentioned in a description in the school books of Joao I. (1355), and in an Italian map of 1351 (the Laurentian Portolano, also the first cartographical work to give us the Madeiras with modern names), but probably almost unvisited from that time to the advent of Sevilh. This rediscovery of the far western archipelago, and the expeditions which, even within Prince Henry’s life (as in 1452) pushed still deeper into the Atlantic, seem to show that the infante was not entirely forgetful of the possibility of such a western route to Asia as Columbus attempted in 1492, only to find America across his path. Meanwhile, in 1418, Henry had gone in person to relieve Ceuta from an attack of Morocco and Granada Musulmans; had accomplished his task, and had planned, though he did not carry out, a seizure of Gibraltar. About this time, moreover, it is probable that he had begun to gather information from the Moors with regard to the coast of “Guinea” and the interior of Africa. In 1419, after his return to Portugal, he was created governor of the “kingdom” of Algarve, the southernmost province of Portugal; and his connexion now appears to have begun with what afterwards became known as the “Infante’s Town” (“Villa do Infante”) at Sagres, close to Cape St Vincent; where, before 1438, a Tercena Naval or naval arsenal grew up; where, from 1438, after the Tangier expedition, the prince certainly resided for a great part of his later life; and where he died in 1460.

In 1433 died King John, exhibiting his son not to abandon those schemes which were now, in the long-continued failure to round Cape Bojador, ridiculed by many as costly absurdities; and in 1434 one of the prince’s ships, commanded by Gil Eannes, at length doubled the cape. In 1435 Affonso Gonçalvez Baldy, the prince’s cup-bearer, passed fifty leagues beyond; and before the close of 1436 the Portuguese had almost reached Cape Blanco. Plans of further conquest in Morocco, resulting in 1437 in the disastrous attack upon Tangier, and followed in 1438 by the death of King Edward (Duarte) and the domestic troubles of the earlier minority of Affonso V., now interrupted Atlantic and African exploration down to 1441, except only in the Azores. Here rediscovery and colonization both progressed, as is shown by the royal licence of the 2nd of July 1439, to people “the seven islands” of the group then known. In 1441 exploration began again in earnest with the venture of Antam Gonçalvez, who brought to Portugal the first slaves and gold-dust from the Guinea coasts beyond Bojador; while Nuno Tristam in the same year pushed on to Cape Blanco. These successes produced a great effect; the cause of discovery, now connected with boundless hopes of profit, became popular; and many volunteers, especially merchants and seamen from Lisbon and Lagos, came forward. In 1442 Nuno Tristam reached the Bay or Bight of Arguin, which the Portuguese called “el Congo,” which was, however, thereafter to Portuguese carried on vigorous slave-raiding. Meantime the prince, who had now, in 1443, been created by Henry VI. a knight of the Garter of England, proceeded with his Sagres buildings, especially the palace, church and observatory (the first in Portugal) which formed the nucleus of the “Infante’s Town,” and which were certainly commenced soon after the Tangier fiasco (1437), if not earlier. In 1444-46 there was an immense burst of maritime and exploring activity; more than 30 ships sailed with Henry’s licence to Guinea; and several of their commanders achieved notable success. Thus Diniz Diaz, Nuno Tristam, and others reached the Senegal in 1445; Diaz rounded Cape Verde in the same year; and in 1446 Alvar Fernandez pushed on almost to our Sierra Leone, to a point 110 leagues beyond Cape Verde. This was perhaps the most distant point reached before 1461. In 1444, moreover, the island of St Michael in the Azores was sighted (May 8), and in 1445 its colonization was begun. During this latter year also John Fernandez (q.v.) spent seven months among the natives of the Arguin coast, and brought back the first trustworthy first-hand European account of the Sahara hinterland. Slave-raiding continued ceaselessly; by 1446 the Portuguese had carried off nearly a thousand captives from the newly surveyed coasts; but between this time and the voyages of Cadamosto (q.v.) in 1455-56, the prince altered his policy, forbade the kidnapping of captives (which had brought about fierce reprisals after the death of Nuno Tristam in 1446, and of other pioneers in 1445, 1448, &c.), and endeavoured to promote their peaceful intercourse with his men. In 1445-46, again, Dom Henrique renewed his earlier attempts (which had failed in 1424-1425) to purchase or seize the Canaries for Portugal; by these he brought his country to the verge of war with Castile; but the home government refused to support him, and the project was again abandoned. After 1446 our most voluminous authority, Azurara, records but little; his narrative ceases altogether in 1448; one of the latest expeditions noticed by him is that of a foreigner in the prince’s service, “Vallarte the Dane,” which ended in utter destruction on the coast of the Gambia, after 1447-48. After this the chief matters worth notice in Dom Henry’s life are, first, the progress of discovery and colonization in the Azores—where Terceira was discovered before 1450, perhaps in 1445, and apparently by a Fleming, called “Jacques de Bruges” in the prince’s charter of the 2nd of March 1450 (by this charter Jacques receives the captnacy of this isle as its intending colonizer); secondly, the rapid progress of civilization in Madeira, evidenced by its timber trade to Portugal, by its sugar, corn and honey, and above all by its wine, produced from the Malvoisie or Malmsye grape, introduced from Crète; and thirdly, the explorations of Cadamosto and Diogo Gomez (q.v.). Of these the former, in his two voyages of 1445 and 1446, explored part of the coasts of the Senegal and the Gambia, discovered the Cape Verde Islands (1446), named and mapped more carefully than
HENRY OF ALMAIN—HENRY OF BLOIS

before a considerable section of the African littoral beyond Cape Verde, and gave much new information on the trade-routes of north-west Africa and on the native races; while Gomez, in his first important venture (after 1448 and before 1458), though not accomplishing the full Indian purpose of his voyage (he took a native interpreter with him for use "in the event of reaching India"), explored and observed in the Gambia valley and along the adjacent coasts with fully as much care and profit. As a result of these expeditions the infante seems to have sent out in 1458 a mission to convert the Gambia negroes. Gomez' second voyage, resulting in another "discovery" of the Cape Verde Islands, was probably in 1462, after the death of Prince Henry. The infante's last occupations were the necessary measures for the equipment and despatch of this venture, as well as of Pedro de Sintra's important expedition of 1461.

The infante's share in home politics was considerable, especially in the years of Afonso V.'s minority (1438, &c.) when he helped to make his elder brother Pedro regent, reconciled him with the queen-mother, and worked together with them both in a council of regency. But when Dom Pedro rose in revolt (1447), Henry stood by the king and allowed his brother to be crushed. In the Moroccan campaigns of his last years, especially at the capture of Alcazar the Little (1458), he restored the military fame which he had founded at Ceuta and compromised at Tangier, and which brought him invitations to the pope, the emperor and the kings of Castile and England, to take command of their armies. The prince was also grand master of the Order of Christ, the successor of the Templars in Portugal; and most of his Atlantic and African expeditions sailed under the flag of his order, whose revenues were at the service of his explorations, in whose name he asked and obtained the official recognition of Pope Eugenius IV for his work, and on which he bestowed many privileges in the new- won lands—the tithes of St Michael in the Azores and one- half of its sugar revenues, the tithes of all merchandise from Guinea, the ecclesiastical dues of Madeira, &c. As "protector of Portuguese studies," Dom Henry is credited with having founded a professorship of theology, and perhaps also chairs of mathematics and medicine, in Lisbon—where also, in 1431, he is said to have provided house-room for the university teachers and students. To instruct his captains, pilots and other pioneers more fully in the art of navigation and the making of maps and instruments he procured, says Barros, the aid of one Master Jacome from Majorca, together with several other mathematicians. We hear also of one Master Peter, who inscribed and illuminated maps for the infante; the mathematician Pedro Nunes declares that the prince's mariners were well taught and provided with instruments and rules of astronomy and geometry "which all map-makers should know"; Cadamosto tells us that the Portuguese caravels in his day were the best sailing ships afloat; while, from several matters recorded by Henry's biographers, it is clear that he devoted great attention to the study of earlier charts and of any available information he could gain upon the trade-routes of north-west Africa. Thus we find an Arab merchant corresponding with him about events happening in the negro-world of the Gambia basin in 1438. Even if there were never a formal "geographical school" at Sagres, or elsewhere in Portugal, founded by Prince Henry, it appears certain that his court was the centre of active and useful geographical study, as well as the source of the best practical exploration of the time.

The prince died on the 13th of November 1460, in his town near Cape St Vincent, and was buried in the church of St Mary in Lagos, but a year later his body was removed to the superb monastery of Batalha. His great-nephew, King Dom Manuel, had a statue of him placed over the central column of the side gate of the church of Belem. On the 24th of July 1840, a monument was erected to him at Sagres at the instance of the marquis de Sá da Bandeira.

The glory attaching to the name of Prince Henry does not rest merely on the achievements effected during his own lifetime, but on the subsequent results to which his genius and perseverance had lent the primary inspiration. To him the human race is indebted, in large measure, for the maritime exploration, within one century (1420-1522), of more than half the globe, and especially of the great waterways from Europe to Asia both by east and by west. His own life only sufficed for the accomplishment of a small portion of his task. The complete opening out of the African or south-east route to the Indies needed nearly forty years of somewhat intermittent labour after his death (1460-1468), and the prince's share has often been forgotten in that of pioneers who were really his executors—Diogo Cam, Bartholomew Diaz or Vasco da Gama. Less directly, other sides of his activity may be considered as fulfilled by the Portuguese penetration of Asia, especially beyond Abyssinia, the land of the "great Pasha John" for whom Dom Henry sought, and even by the finding of a western route to Asia through the discoveries of Columbus, Balboa and Magellan.

HENRY OF ALMAIN (1325-1271), so called from his father's German connections, was the son of Richard, earl of Cornwall and king of the Romans. As a nephew of both Henry III. and Simon de Montfort he wavered between the two at the beginning of the Barons' War, but finally took the royalist side and was among the prisoners taken by Montfort at Lewes (1264). In 1268 he took the cross with his cousin Edward, who, however, sent him back from Sicily to pacify the unruly province of Gascony.Henry took the master of the Church in England. He was educated at Cluny, and consistently exerted himself for the principles of Cluniac reform. If these involved high claims of independence and power for the Church, they also rested on a high standard of devotion and discipline. Henry was brought to England by Henry I. and made abbot of Glastonbury. In 1129 he was given the bishopric of Winchester and allowed to hold his abbey in conjunction with it. His hopes of the see of Canterbury were disappointed, but he obtained in 1139 a legatine commission which gave him a higher rank than the primate. In fact as well as in theory he took the master of the Church in England. He was succeeded by his nephew, Henry de Blois, son of Earl Simon, and foully murdered. This revenge was the more outrageous since Henry had personally exerted himself on behalf of the Montforts after Evesham. The deed is mentioned by Dante, who put Guy de Montfort in the seventh circle of hell.

See W. H. Bluauw's The Barons' War (ed. 1871); Ch. Bémont's Simon de Montfort (1884).

HENRY OF BLOIS, bishop of Winchester (1100-1171), was the son of Stephen, count of Blois, by Adela, daughter of William I., and brother of King Stephen. He was educated at Cluny, and consistently exerted himself for the principles of Cluniac reform. If these involved high claims of independence and power for the Church, they also rested on a high standard of devotion and discipline. Henry was brought to England by Henry I. and made abbot of Glastonbury. In 1129 he was given the bishopric of Winchester and allowed to hold his abbey in conjunction with it. His hopes of the see of Canterbury were disappointed, but he obtained in 1139 a legatine commission which gave him a higher rank than the primate. In fact as well as in theory he took the master of the Church in England. He was succeeded by his nephew, Henry de Blois, son of Earl Simon, and foully murdered. This revenge was the more outrageous since Henry had personally exerted himself on behalf of the Montforts after Evesham. The deed is mentioned by Dante, who put Guy de Montfort in the seventh circle of hell.
HENRY OF GENT—HENRY OF LAUSANNE

clergy. Stephen owed his crown to Henry (1135), but they quarrelled when Stephen refused to give Henry the primacy; and the bishop took up the cause of Roger of Salisbury (1130). After the battle of Lincoln (1141) Henry declared for Matilda; but finding his advice treated with contempt, rejoined his brother's side, and his successful defence of Winchester against the empress (Aug.–Sept. 1141) was the turning-point of the civil war. The expiration of his legatine commission of 1144 deprived him of most of his power. He spent the rest of Stephen's reign in trying to procure its renewal. But his efforts were unsuccessful, though he made a personal visit to Rome. At the accession of Henry II. (1154) he retired from the world and spent the rest of his life in works of charity and penitence. He died in 1171. Henry seems to have been a man of high character, great courage, resolution and ability. Like most great bishops of his age he had a passion for architecture. He built, among other castles, that of Farnham; and he began the hospital of St Cross at Winchester.

HENRY OF GHENT [Henricus a Gandavo] (c. 1217–1293), scholastic philosopher, known as “Doctor Solennis,” was born in the district of Mude, near Ghent, and died at Tournai (or Paris). He is said to have belonged to an Italian family named Bonicolli, in Flemish Gothaels, but the question of his name has been much discussed (see authorities below). He studied at Ghent and then at Cologne under Albertus Magnus. After obtaining the degree of doctor he returned to Ghent, and is said to have been the first to lecture there publicly on philosophy and theology. Attracted to Paris by the fame of the university, he took part in the many disputes between the orders and the secular priests, and warmly defended the latter. A contemporary of Aquinas, he opposed several of the dominant theories of the time, and at times he was the centre of violent controversy in defence of Platonism. He distinguished between knowledge of actual objects and the divine inspiration by which we cognize the being and existence of God. The first throws no light upon the second. Individuals are constituted not by the material element but by their independent existence, i.e. ultimately by the fact that they are created as separate entities. Universals must be distinguished according as they have reference to our minds or to the divine mind. In the divine intelligence exist exemplars of the genera and species of natural objects. On this subject Henry is far from clear; but he defends Plato against the current Aristotelian criticism, and endeavours to show that the two views are in harmony. In psychology, his view is little in harmony with that of the body of school. The body he regards as forming part of the substance of the soul, which through this union is more perfect and complete.

WORKS.—Quodlibeta theologica (Paris, 1518; Venice, 1608 and 1613); Summa theologica (Paris, 1520; Ferrara, 1646); De scriptoribus ecclesiasticis (Cologne, 1580).

AUTHORITIES.—F. Hart's Recherches histo. et crit. de H. de G. (Paris, 1838) has been superseded by F. Ehrle's monograph in Archiv für Lit. u. Kirchengeschichte des Mitteleuropa, i. (1885); see also A. Wauters and N. de Paw in the Bull. de l'Académie royale d'histoire de Belgique, ser. x. (1887–1888); H. Delechaye, Nouvelles Recherches sur H. de Gand (1886); C. Werner, Heinrich von Gent als Repräsentant des christlichen Platonismus im 13ten Jahrh. (Vienna, 1876); A. Stöckl, Phil. d. Mitteleuropa in der zweiten Hälfte des 13. Jahrh. (1892); W. C. Bézout, Annales de la Bibliothèque National de Belgique, vii. (Brussels, 1880); and article SCHOLASTICISCH.

HENRY OF HUNTINGDON, English chronicler of the 12th century, was born, apparently, between the years 1080 and 1090. His father, by name Nicholas, was a clerk, who became archdeacon of Cambridge, Hertford and Huntingdon, in the time of Remigius, bishop of Lincoln (d. 1092). The celibacy of the clergy was not strictly enforced there before 1102. Hence the chronicler makes no secret of his antecedents, nor did they interfere with his career. At an early age Henry entered the household of Bishop Robert Bloe, who appointed him, immediately after the death of Nicholas (1110), archdeacon of Hertford and Huntingdon. Henry was on familiar terms with his patron; and also, it would seem, with Bloe's successor, by whom he was encouraged to undertake the writing of an English history from the time of Julius Caesar. This work, undertaken before 1130, was first published in that year; the author subsequently published in succession four more editions, of which the last ends in 1154 with the accession of Henry II. The only recorded fact of the chronicler's later life is that he went with Archbishop Theobald to Rome in 1139. On the way Henry halted at Bec, and there made the acquaintance of Robert de Torigni, who mentions their encounter in the preface to his Chronicle. The Historia Anglorum was first printed in Savile, Rerum Anglicarum scriptores post Bedam (London, 1596). The first six books, excepting the last two, are quoted or transcribed, and are given in Monumenta historiae Britanniæ, vol. i. (ed. H. Petrie and J. Sharpe, London, 1848). The standard edition is that of T. Arnold in the Rolls Series (London, 1837–42). The text is that of F. T. Forester in Bohn's Antiquarian Library (London, 1853). The Historia is of little independent value before 1126. Up to that point the author compiles from Eutropius, Aurelius Victor, Nennius, Bede and the English chronicles, particularly that of Peterborough; in some cases he professes to supply these sources from oral tradition: but most of his amplifications are pure rhetoric (see F. Liebermann in Forschungen zur deutschen Geschichte for 1878, pp. 42–80). Also appended, a minute from Henry's pen, the Epistolæ ad Walleram de contemptu mundi, which was written in 1135. It is a moralizing tract, but contains some interesting anecdotes about contemporaries. Henry also wrote episcopal letters to Henry II. and Louis VII. and both monarchs of the world) and to "Warinus, a Briton" (on the early British kings, after Geoffrey of Monmouth). A book, De miraculis, composed of extracts from Bede, was appended along with the Life of the Virgin. The last volume of the Historia was published in 1183. Henry composed eight books of Latin epigrams; two books survive in the Lambeth MS., No. 118. His value as a historian, formerly much overrated, is discussed at length by Liebermann and in T. Arnold's introduction to the Rolls edition of the Historia.

HENRY OF LAUSANNE [variously known as of Brûys, of Cluny, of Toulouse, and as the Deacon], French heresiarach of the first half of the 12th century. Practically nothing is known of his origin or early life. He may have been one of those hermits who at that time swarmed in the forests of western Europe, and particularly in France, always surrounded by popular veneration, and sometimes the founders of monasteries or religious orders, such as those of Prémontré or Fontevrault. If St Bernard's reproach (Ep. 241) be well founded, Henry was an apostate monk—a "black monk" (Benedictine) according to the chronicler Alberic de Trois Fontaines. The information we possess as to his degree of instruction is scarcely more precise or less conflicting. When he arrived at Le Mans in 1101, his terminus a quo was probably Lausanne. At that moment Hildebert, the bishop of Le Mans, was absent from his episcopal town, and this is one of the reasons why Henry was granted permission to preach (March to July 1101), a function jealously guarded by the regular clergy. Whether by his prestige as a hermit and ascetic or by his personal charm, he soon acquired enormous influence over the people. His doctrine at that date and thereafter has been variously rejected and the invocation of saints and also second marriages, and preached penitence. Women, inflamed by his words, gave up their jewels and luxurious apparel, and young men married cousins in the hope of reclaiming them. Henry was peculiarly fitted for a popular preacher. In person he was tall and had a long beard; his voice was sonorous, and his eyes flashed fire. He went bare-footed, preceded by a man carrying a staff surmounted with an iron cross; he slept on the bare ground, and lived by alms. At his instigation the inhabitants of Le Mans soon began to slight the clergy of their town and to reject all ecclesiastical authority. On his return from Rome, Hildebert had a public disputation with Henry, in which, according to the chronicler's account, Henry was shown to be less guilty of heresy than of ignorance. He, however, was forced to leave Le Mans, and went probably to Poitiers and afterwards to Bordeaux. Later we find him in the diocese of Arles, where the archbishop arrested him and had his case referred to the tribunal of the pope. In 1134 Henry appeared before Pope Innocent III. at the council of Pisa, where he was compelled
HENRY, E. L.—HENRY, J.

1876. As a commentator on Virgil Henry will always deserve to be remembered, notwithstanding the occasional eccentricity of his notes and remarks. The first fruits of his researches were published at Dresden in 1853 under the quaint title Notes of a Twelve Years' Voyage of Discovery in the first six Books of the Enéids. These were embodied, with alterations and additions, in the Aeneida, or Critical, Exegetical and Aesthetic Remarks on the Aeneis (1873-1892), of which only the notes on the first book were published during the author's lifetime. As a textual critic, Henry was exceedingly conservative. His notes, written in a rigorously literal style, are especially valuable for the wealth of illustration and references to the less-known classical authors. Henry was also the author of several poems, some of them descriptive accounts of his travels, and of various pamphlets of a satirical nature.

See obituary notice by J. P. Mahaffy in the Academy of the 12th of August 1876, where a list of his works, nearly all of which were privately printed, is given.

HENRY, JOSEPH (1799-1878), American physicist, was born in Albany, N.Y., on the 17th of December 1797. He received his education at the ordinary school, and afterwards at the Albany Academy, which enjoyed considerable reputation for the thoroughness of its classical and mathematical courses. On finishing his academic studies he contemplated adopting the medical profession, and prosecuted his studies in chemistry, anatomy and physiology with that view. He occasionally contributed papers to the Albany Institute, in the years 1824 and 1825, on chemical and mechanical subjects; and in the latter year, having been unexpectedly appointed assistant engineer on the survey of a route for a state road from the Hudson river to Lake Erie, a distance somewhat over 300 miles, he at once embarked with zeal and success in the new enterprise. This diversion from his original bent gave him an inclination to the career of civil and mechanical engineering; and in the spring of 1826 he was elected by the trustees of the Albany Academy to the chair of mathematics and natural philosophy in that institution. In the latter part of 1827 he read before the Albany Institute his first important contribution, "On Some Modifications of the Electro-Magnetic Apparatus." Struck with the great improvements then recently introduced into such apparatus by William Sturgeon of Woolwich, he had still further extended their efficiency, with considerable reduction of battery-power, by adopting in all the experimental circuits (where applicable) the principle of J. C. Schweigger's "multiplier," that is, by substituting for single wire circuits, voluminous coils (Trans. Albany Institute, 1827, 1, p. 22). In June 1828 and in March 1829 he exhibited before the institute small electromagnets closely and repeatedly wound with silk-covered wire, which had a far greater lifting power than any then known.

Henry appears to have been the first to adopt insulated or silk-covered wire for the magnetic coil; and also the first to employ what may be called the "spool" winding for the limbs of the magnet. He was also the first to demonstrate experimentally the difference of action between what he called a "quantity" magnet excited by a "quantity" battery of a single pair, and an "intensity" magnet with long fine wire coil excited by an "intensity" battery of many elements, having their resistances suitably proportioned. He pointed out that the latter form alone was applicable to telegraphic purposes. A detailed account of these experiments and exhibitions was not, however, published till 1851 (Sill. Journ., 10, p. 400). Henry's "quantity" magnets were the first, from their unprecedented attractive power—one (August 1830) lifting 75 lb., another (March 1831) 2500, and a third (1834) 3500.

Early in 1831 he arranged a small office-bell to be tapped by the polarized armature of an "intensity" magnet, whose coil was in continuation of a mile of insulated copper wire, suspended about one of the rooms of his academy. This was the first instance of magnetizing iron at a distance, or of a suitable combination of magnet and battery being so arranged as to be capable of such action. It was, therefore, the earliest example of a true "magnetic" telegraph, all preceding experiments to
HENRY, M.—HENRY, P.

this end having been on the galvanometer or needle principle. About the same time he devised and constructed the first electromagnetic engine with automatic polechanger (Sill. Journ., 1831, p. 340; and Surgeon’s Annals Electr., 1839, 3, p. 554). Early in 1832 he discovered the induction of a current on itself, in a long helical wire, giving greatly increased intensity of discharge (Sill. Annals, 1833, 22, p. 406). In 1832 he was elected to the chair of natural philosophy in the New Jersey College at Princeton. In 1834 he continued and extended his researches “On the Influence of a Spiral Conductor in increasing the Intensity of Electricity from a Galvanic Arrangement of a Single Pair,” a memoir of which was read before the American Philosophical Society on the 5th of February 1835. In 1835 he combined the short circuit of his monster magnet (of 1834) with the small “intensity” magnet of an experimental telegraph wire, thereby establishing the fact that very powerful mechanical effects could be produced at a great distance by the agency of a very feeble magnet used as a circuit maker and breaker, or as a “trigger”—the precursor of later forms of relay and receiving magnets. In 1837 he paid his first visit to England and Ireland for 181 interesting papers by means of electrical experiments on the conditions and range of induction from electrical currents—showing that induced currents, although merely momentary, produce still other or tertiary currents, and thus on through successive orders of induction, with alternating signs, and with reversed initial and terminal signs. He also discovered similar successive orders of induction in the case of the passage of frictional electricity (Trans. Am. Phil. Soc., 6, pp. 303-337). Among many minor observations, he discovered in 1842 the oscilatory nature of the electrical discharge, magnetizing a thousand needles in the course of his experiments (Proc. Am. Phil. Soc., 1, p. 301). He traced the influence of induction to surprising distances, magnetizing needles in the lower story of a house through several intervening floors by means of electrical discharges in the upper story, and also by the secondary current in a wire 220 ft. distant from the wire of the primary circuit. The five numbers of his Contributions to Electricity and Magnetism (1833-1842) were separately republished from the Transactions. In 1843 he made some interesting original observations on “Phosphorescence” (Proc. Am. Phil. Soc., 3, pp. 35-44). In 1844, by experiments on the tenacity of soap-bubbles, he showed that the molecular cohesion of water is equal (if not superior) to that of ice, and hence, generally, that solids and their liquids have practically the same amount of cohesion (Proc. Am. Phil. Soc., 4, pp. 56 and 84). In 1845 he showed, by means of a thermo-galvano-meter, that the solar spots radiate less heat than the general surface of the sun (Phil. Soc., Philadelphia, 173, 18, May 1845).

In December 1846 Henry was elected secretary and director of the Smithsonian Institution, then just established. While closely occupied with the exacting duties of that office, he still found time to prosecute many original inquiries—as into the application of acoustics to public buildings, and the best construction and arrangement of lecture-rooms, into the strength of various building materials, &c. Having early devoted much attention to meteorology, both in observing and in reducing and discussing observations, he (among his, first administrative acts) organized a large and widespread corps of observers, and made arrangements for simultaneous reports by means of the electric telegraph, which was yet in its infancy (Smithson. Report for 1847, pp. 146, 147). He was the first to apply the telegraph to meteorological research, to have the atmospheric conditions daily indicated on a large map, to utilize the generalizations made in weather forecasts, and to embrace a continent under a single system—British America and Mexico being included in the field of observation. In 1852, on the reorganization of the American lighthouse system, he was appointed a member of the new board; and in 1871 he became the presiding officer of the establishment—a position he continued to hold during the rest of his life. His diligent investigations into the efficiency of various illuminants in differing circumstances, and into the best conditions for developing their several maximum powers of brilliancy, while greatly improving the usefulness of the line of beacons along the extensive coast of the United States, effected at the same time a great economy of administration. His equally careful experiments on various acoustic instruments also resulted in giving to his country the most serviceable system of fog-signals known to maritime powers. In the course of these varied and prolonged researches from 1865 to 1877, he also made important contributions to the science of acoustics; and he established by several series of laborious observations, extending over many years and along a wide coast range, the correctness of G. G. Stokes’s hypothesis (Report Brit. Assoc., 1837, part ii. 27) that the wind exerts a very marked influence in refracting sound-beams. From 1868 Henry continued to be annually chosen as president of the National Academy of Sciences; and he was also president of the Philosophical Society of Washington from the date of its organization in 1871.

Henry was by general concession the foremost of American physicists. He was a man of varied culture, of large breadth and liberality of views, of generous impulses, of great gentleness and courtesy of manner, combined with equal firmness of purpose and energy of action. He died at Washington on the 15th of May 1877. (S. F. B.)

HENRY, MATTHEW (1662-1714), English nonconformist divine, was born at Broad Oak, a farm-house on the confines of Flintsfiith and Shropshire, on the 18th of October 1662. He was the son of Philip Henry, who had, two months earlier, been ejected by the Act of Uniformity. Unlike most of his fellow-sufferers, Philip Henry possessed some private means, and was thus enabled to give a good education to his son, who went first to a school at Islington, and then to Gray’s Inn. He soon relinquished his legal studies for theology, and in 1687 became minister of a Presbyterian congregation at Chester, removing in 1712 to Mare Street, Hackney. Two years later (22nd of June 1714), he died suddenly of apoplexy at Nantwich while on a journey from Chester to London. Henry’s well-known Exposition of the Old and New Testaments (1708-1710) is a commentary of a practical and devotional rather than of a critical kind, covering the whole of the Old Testament, and the Gospels and Acts in the New. Here it was broken off by the author’s death, but the work was finished by a number of ministers, and edited by G. Burder and John Hughes in 1811. Of no value as criticism, its unfailing good sense, its discriminating thought, its high moral tone, its simple piety and its singular felicity of practical application, combine with the well-sustained flow of its racy English style to secure for it the foremost place among works of its class.

His Miscellaneous Writings, including a Life of Mr Philip Henry, The Communicant’s Companion, Directions for Daily Communion with God, A Method for Prayer, A Scriptural Catechism, and numerous sermons, were edited in 1809 and in 1830. See biographies by W. Tong (1816), C. Chapman (1859), J. B. Williams (1828, new ed. 1865); and M. H. Lee’s Diaries and Letters of Philip Henry (1883).

HENRY, PATRICK (1736-1799), American statesman and orator, was born at Studley, Hanover county, Virginia, on the 29th of May 1736. He was the son of John Henry, a well-educated Scotman, among whose relatives was the historian William Robertson, and who served in Virginia as county surveyor, colonel and judge of a county court. His mother was one of a family named Winston, of Welsh descent, noted for conversational and musical talent. At the age of ten Patrick was making slow progress in the study of reading, writing and arithmetic at a small country school, when his father became his tutor and taught him Latin, Greek and mathematics for five years, but with limited success. His school days being then terminated, he was employed as a store-clerk for one year. Within the seven years next following he failed twice as a storekeeper and once as a farmer; but in the meantime acquired a taste for reading, of history especially, and read and re-read the history of Greece and Rome,—of England, and of her American colonies. Then, poor but not discouraged, he resolved to be a lawyer, and after reading Coke upon Littleton and the Virginia laws for a few weeks only, he strongly impressed one of his
HENRY, R.—HENRY, V.

examiners, and was admitted to the bar at the age of twenty-four, on condition that he spend more time in study before beginning to practise. He rapidly acquired a considerable practice, his fee books shewing that for the first three years he charged fees in 1185 cases. Then in 1763 was delivered his speech in "The Parson's Cause"—a suit brought by a clergyman, Rev. James Maury, from the Hanover County court, to secure restitution for money considered by him to be due on account of his salary ($16,000 pounds of tobacco by law) having been paid in money calculated at a rate less than the current market price of tobacco. This speech, which, according to reports, was extremely radical and denied the right of the king to disallow acts of the colonial legislature, made Henry the idol of the common people of Virginia and procured for him an enormous practice. In 1765 he was elected a member of the Virginia legislature, where he became in the same year the author of the "Virginia Resolutions," which were no less than a declaration of resistance to the Stamp Act and an assertion of the right of the colonies to legislate for themselves independently of the control of the British parliament, and gave a most powerful impetus to the movement resulting in the War of Independence.

In a speech urging their adoption appear the often-quoted words: "Tarquin and Caesar had each his Brutus, Charles the First his Cromwell, and George the Third [here he was interrupted by cries of "Treason!"] and George the Third may profit by their example! If this be treason, make the most of it." Until 1775 he continued to sit in the House of Burgesses, as a leader during that critical period. He was unceasing in all measures in opposition to the British government, and was a member of the first Virginia committee of correspondence. In 1774 and 1775 he was a delegate to the Continental Congress and served on three of its most important committees: that on colonial trade and manufactures, that for drawing up an address to the king, and that for stating the rights of the colonies. In 1775, in the second revolutionary convention of Virginia, Henry, regarding war as inevitable, presented resolutions for arming the Virginia militia. The more conservative members strongly opposed them as premature, whereas Henry supported them in a speech familiar to the American school-boy for several generations following, closing with the words, "Is life so dear or peace so sweet as to be purchased at the price of chains and slavery? Forbid it, Almighty God! I know not what course others may take, but as for me, give me liberty or give me death!" The resolutions were passed and their author was made chairman of the committee for which they provided. The chief command of the newly organized army was also given to him, but previously, at the head of a body of militia, he had demanded satisfaction for powder removed from the public store by order of Lord Dunmore, the royal governor, with the result that £1300 was paid in compensation. But his military appointment required obedience to the Committee of Public Safety, and this body, largely dominated by Edmund Pendleton, so restrained him from active service that he resigned on the 28th of February 1776. In the Virginia convention of 1776 he favoured the postponement of a declaration of independence, until a firm union of the colonies and the friendship of France and Spain had been secured. In the same convention he served on the committee which drafted the first constitution for Virginia, and was elected to its first legislature. He was re-elected in 1777 and 1778, thus serving as long as the new constitution allowed any man to serve continuously. As governor he gave Washington able support and sent out the expedition under George Rogers Clark (q.v.) into the Illinois country. In 1778 he was chosen a delegate to Congress, but declined to serve. From 1780 to 1784 and from 1787 to 1790 he was again a member of his State legislature; and from 1784 to 1786 was again governor. Until 1786 he was a leading advocate of a stronger central government but when chosen a delegate to the Philadelphia constitutional convention of 1787 he had become convinced in the cause and declined to serve. Moreover, in the state convention called to decide whether Virginia should ratify the Federal Constitution he led the opposition, contending that the proposed Constitution, because of its centralizing character, was dangerous to the liberties of the country. This change of attitude is thought to have been due chiefly to his suspicion of the North aroused by John Jay's proposal to surrender to Spain for twenty-five or thirty years the navigation of the Mississippi. From 1794 until his death he declined in succession the following offices: United States senator (1794), secretary of state in Washington's cabinet (1795-1797), member of the Supreme Court (1795), governor of Virginia (1796), to which office he had been elected by the Assembly, and envoy to France (1799).

In 1799, however, he consented to serve again in his State legislature, where he wished to combat the Virginia Resolutions; he never took his seat, since he died, on his Red Hill estate in Charlotte county, Virginia, on the 6th of June that year. Henry was twice married, first to Sarah Skelton, and second to Dorothea Spotswood Dandridge, a grand-daughter of Governor Alexander Spotswood.

See Moses Coit Tyler, Patrick Henry (Boston, 1887; new ed., 1899), and William Wirt Henry (Patrick Henry's grandson), Patrick Henry: Life, Correspondence and Speeches (New York, 1860-1881); these supersede the very unsatisfactory biography by William Wirt, Sketches of the Life and Character of Patrick Henry (Philadelphia, 1817). See also George Morgan, The True Patrick Henry (Philadelphia, 1907).

HENRY, ROBERT (1718-1790), British historian, was the son of James Henry, a farmer of Muirton, near Stirling. Born on the 18th of February 1718 he was educated at the parish school of St Ninians, and at the grammar school of Stirling, and, after receiving his education, went to Edinburgh University, where he became master of the grammar school at Dunbar, and in 1746 he was licensed to preach, and in 1748 was chosen minister of a Presbyterian congregation at Carlisle, where he remained until 1760, when he removed to a similar charge at Berwick-on-Tweed. In 1768 he became minister of the New Greyfriars' Church, Edinburgh, and having received the degree of D.D. from Edinburgh University in 1771, and served as moderator of the general assembly of the church of Scotland in 1774, he was appointed one of the ministers of the Old Greyfriars' Church, Edinburgh, in 1776, remaining in this charge until his death on the 24th of November 1790. During his residence in Berwick, Henry commenced his History of Great Britain, written on a new plan; but, owing to the difficulty of consulting the original authorities, he did not make much progress with the work until his removal to Edinburgh in 1768. The first five volumes appeared between 1771 and 1785, and the sixth, edited and completed by Malcolm Laing, was published three years after the author's death. A life of Henry was prefixed to this volume. The History covers the years between the Roman invasion and the death of Henry VIII., and the "new plan" is the combination of an account of the events of each reign, with the progress of the people with the narrative of the political events of each period. The work was virulently assailed by Dr Gilbert Stuart (1742-1786), who appeared anxious to damage the sale of the book; but the injury thus effected was only slight, as Henry received £300 for the volumes published during his lifetime. In 1781, through the influence of the earl of Mansfield, he obtained a pension of £500 a year from the British government.

The History of Great Britain has been translated into French, and has passed into several English editions. An account of Stuart's attack on Henry is given in Isaac D'Israeli's Curiosities of Authors.

HENRY, VICTOR (1850— ), French philologist, was born at Colmar in Alsace. Having held appointments at Douai and Lille, he was appointed professor of Sanskrit and comparative grammar in the university of Paris. A prolific and versatile writer, he is probably best known by the English translations of his Précis de Grammaire comparée de l'anglais et de l'allemand et Précis du Greco et du Latin. Important works by him on Indian and Indian languages are: Manuel pour étudier le Sanscrit (with A. Bergaigne, 1880); Éléments de grammaire classique (1902); Dictionnaire de grammaire Pâli (1904); Les Littératures de l'Inde: Sanscrit, Pâli, Prâkrit (1904); La Magie dans l'Inde antique (1904); Le Parisime (1905); L'Agniphitu (1906).
Obscure languages (such as Innok, Quichua, Greenland) and local dialects (Lexique étymologique du Breton moderne; Le Diácte Alaman de Colmar) also claimed his attention. Le Langage Martiens is a curious book. It contains a discussion of some 40 phrases (amounting to about 300 words), which a certain Mademoiselle Hélène Smith (a well-known spiritualist medium of Geneva), while on a hypnotic visit to the planet Mars, learnt and repeated and even wrote down during her trance as specimens of a language spoken there, explained to her by a disembodied interpreter.

HENRY, WILLIAM (1775-1836), English chemist, son of Thomas Henry (1734-1816), an apothecary and writer on chemistry, was born at Manchester on the 12th of December 1775. He began to study medicine at Edinburgh in 1795, taking his doctor's degree in 1807, but ill-health interrupted his practice as a physician, and he devoted his time mainly to chemical research, especially in regard to gases. One of his best-known papers (Phil. Trans., 1803) describes experiments on the quantity of gases absorbed by water at different temperatures and under different pressures, the conclusion he reached ("Henry's law") being that "water takes up of gas condensed by one, two or more additional atmospheres, a quantity which, ordinarily compressed, would be equal to twice, thrice, &c. the volume absorbed under the common pressure of the atmosphere." Others of his papers deal with gas-analysis, fire-damp, illuminating gas, the composition of hydrochloric acid and of ammonia, urinary and other morbid concretions, and the disinfecting powers of heat. His Elements of Experimental Chemistry (1799) enjoyed considerable vogue in its day, going through 11 editions in 35 years. He died at Pendlebury, near Manchester, on the 2nd of September 1836.

HENRYSON, ROBERT (c. 1425-c. 1500), Scottish poet, was born about 1425. It has been surmised that he was connected with the family of Henderson of Fordell, but of this there is no evidence. He is described, on the title-page of the 1570 edition of his Fables, as "scholemaister of Dunfermeling," probably of the grammar-school of the Benedictine Abbey there. There is no record of his having studied at St Andrews, the only Scottish university at this time; but in 1462 a "Master Robert Henryson" is named among those incorporated in the recently founded university of Glasgow. It is therefore likely that his first studies were completed abroad, at Paris or Louvain. He would appear to have been in lower orders, if, in addition to being master of the grammar-school, he is the notary Robert Henryson who subscribes certain deeds in 1478. As Dunbar (q.v.) refers to him as deceased in his Lament for the Makaris, his death may be dated about 1500.

Efforts have been made to draw up a chronology of his poems; but every scheme of this kind, is, in a stronger sense than in the case of Dunbar, mere guess-work. There are no biographical or bibliographical facts to guide us, and the "internal evidence" is inconclusive.

Henryson's longest, and in many respects his most original and effective work, is his Morall Fabillis of Esopo, a collection of thirteen fables, chiefly based on the versions of Aesop, Lydgate and Caxton. The outstanding merit of the work is its freshness of treatment. The old themes are retold with such vivacity, such fresh lights on human character, and with so much local "atmosphere," that they deserve the credit of original productions. They are certainly unrivalled in English fabulistic literature. The earliest available texts are the Charteris text printed by Lepkepiuk in Edinburgh in 1570 and the Harleian MS. No. 3865 in the British Museum.

In the Testament of Cresseid Henryson supplements Chaucer's tale of Troilus with the story of the tragedy of Cresseid. Here again his literary craftsmanship saves him from the disaster which must have overcome another poet in undertaking to continue the part of the story which Chaucer had intentionally left untold. The description of Cresseid's leprosy, of her meeting with Troilus, of his sorrow and charity, and of her death, give the poem a high place in writings of this genre.

The poem entitled Orpheus and Eurydice, which is drawn from Bothius, contains some good passages, especially the lyrical lament of Orpheus, with the refrain "Qahar thow gane, my luf Erudices!" and "My lady quene and luf, Erudices!" It is followed by a long moralitas, in the manner of the Fables.

Thirteen short dialogues have been ascribed to Henryson. Of these the pastoral dialogue "Robene and Makyne," perhaps the best known of his work, is the most successful. Its model may perhaps be found in the pastorelles, but it stands safely on its own merits. Unlike most of the minor poems it is independent of Chaucerian tradition. The other pieces deal with the conventional 15th-century topics, Age: Death, Hasty Credence, Want of Wise Men and the like. The verses entitled "Sum Pracysis of Medecyne," in which some have failed to see Henryson's hand, is an example of that boisterous alliterative burlesque which is represented by a single specimen in the work of the greatest makers, Dunbar, Douglas and Lyndsay. For this reason, if not for others, the difference of its manner is no argument against its authenticity.

The MS. authorities for the text are the Asloa, Bannatyne, Maitland Folio, Mackulloch, Gray and Riddell. Chapman and Myllar's Prints (1508) have preserved two of the minor poems and a fragment of Orpheus and Eurydice. The first complete edition was published by F. S. Pendlebury, in Edinburgh, 1860. A second, much more extensive edition in three volumes, containing all the texts, was undertaken by the Scottish Text Society (ed. G. Gregory Smith), the first volume of the text (vol. ii. of the work) appearing in 1907. For a convenient account of Henryson, see Henderson's Elements of Scottish Poetry, Henderson's Vernacular Scottish Literature, Gregory Smith's Transition Period, J. H. Miller's Literary History of Scotland, and the second volume of the Cambridge History of English Literature (1908).

HENSCHEL, GEORGE [ISIDOR GEORG] (1820—1903), English musician (naturalized 1890), of German family, was born at Breslau, and educated as a pianist, making his first public appearance in Berlin in 1862. He subsequently, however, took up singing, having developed a fine baritone voice; and in 1868 he sang the part of Hans Sachs in Meistersinger at Munich. In 1877 he began a successful career in England, singing at the principal concerts; and in 1881 he married the American soprano, Lilian Bailey (d. 1901), who was associated with him in a number of vocal recitals. He was also prominent as a conductor, starting the London symphony concerts in 1886, and both in England and America (where he was the first conductor of the Boston symphony concerts), 1888. He took a leading part in advancing his art. He composed a number of instrumental works, a fine Stabat Mater (Birmingham festival, 1894), &c., and an opera, Nubia (Dresden, 1890).

HENSEL'T, ADOLF VON (1814-1888), German composer, was born at Schwabach, in Bavaria, on the 12th of May 1814. At three years old he began to learn the violin, and at five the pianoforte under Frau v. Fldt. On obtaining financial help from King Louis I. he went to study under Hummel in Weimar, and thence in 1832 to Vienna, where, besides studying composition under Simon Sechter, he made a great success as a concert pianist. In order to recruit his health he made a prolonged tour in 1836 through the chief German towns. In 1837 he settled at Breslau, where he had married, but in the following year he migrated to St Petersburg, where previous visits had made him persona grata at Court. He then became court pianist and inspector of musical studies in the Imperial Institute of Female Education, and was ennobled. In 1852 and again in 1856 he visited England, though in the latter year he made no public appearance. St Petersburg was his home practically until his death, which took place at Warmbrun on the 10th of October 1888. The characteristic of Henselt's playing was a combination of Liszt's sonority with Hummel's smoothness. It was full of poetry, remarkable for the great use he made of extended chords, and for his perfect technique. He excelled in his own works and in those of Weber and Chopin. His concerto in F for a critical account of Henryson, see Irving's 1814-1889, and a number of his many valuable studies, Si ossos f'teias is very familiar. His A minor trio deserves to be better known. At one time Henselt was second to Rubinstein in the direction of the St Petersburg Conservatorium.
HENSLOW, JOHN STEVENS (1796-1861), English botanist and geologist, was born at Rochester on the 6th of February 1796. From his father, who was a solicitor in that city, he imbibed a love of natural history which largely influenced his career. He was educated at Sandhurst College, Cambridge, where he graduated as sixteenth wrangler in 1818, the year in which Sedgwick became Woodwardian professor of geology. He accompanied Sedgwick in 1819 during a tour in the Isle of Wight, and there he learned his first lessons in geology. He also studied chemistry under Professor James Cumming and mineralogy under E. D. Clarke. In the autumn of 1819 he made some valuable observations on the geology of the Isle of Man (Trans. Geol. Soc., 1821), and in 1821 he investigated the geology of parts of Anglesey, the results being printed in the first volume of the Transactions of the Cambridge Philosophical Society (1823), the foundation of which society was originated by Sedgwick and Henslow. Meanwhile, Henslow had studied mineralogy with considerable zeal, so that on the death of Clarke he was in 1822 appointed professor of mineralogy in the university at Cambridge. Two years later he took holy orders. Botany, however, had claimed much of his attention, and to this science he became more and more attached, so that he gladly resigned the chair of mineralogy in 1825, to succeed to that of botany. As a teacher both in the class-room and in the field he was eminently successful. To him Darwin largely owed his attachment to the study of natural history, and he was responsible for the publication of the phosphate industry in Suffolk and Cambridgeshire, and the works proved lucrative until the introduction of foreign phosphates. The museum at Ipswich, which was established in 1847, owed much to Henslow, who was elected president in 1850, and then superintended the arrangement of the collections. He died at Hitcham on the 16th of May 1861. His publications included A Catalogue of British Plants (1829; ed. 2, 1832); Principles of Descriptive and Physiological Botany (1835); Flora of Suffolk (with E. Skepper) (1860). Memorial tablet by the Rev. Leonard Jenyns (1862).

HENSLOWE, PHILIP (d. 1616), English theatrical manager, was the son of Edmund Henslowe of Lindfield, Sussex, master of the game in Ashdown Forest and Bril Park. He was originally a servant in the employment of the bailiff to Viscount Montague, whose property included Montague House in Southwark, and his duties led him to settle there before 1577. He subsequently married the bailiff's widow, and, with the fortune he got with her, he developed into a clever business man and became a considerable owner of Southwark property. He started his connexion with the stage when, on the 24th of March 1584, he bought land near the houses of the Earl of Kent at the end of Southwark Bridge, on which stood the Little Rose playhouse; afterwards rebuilt as the Rose. Successive companies played in it under Henslowe's financial management between 1592 and 1603. The theatre at Newington Butts was also under him in 1594. A share of the control in the Swan theatre, which like the Rose was on the Bankside, fell to Henslowe before the close of the 16th century. With the actor Edward Alleyne, who married his step-daughter Joan Woodward, he built in Golden Lane, Cripplegate Without, the Fortune Playhouse, opened in November 1600. In December of 1594, he had secured the Paradise Garden, a place for bear-baiting, on the Bankside, and in 1604 they bought the office of master of the royal game of bears, bulls and mastiffs from the holder, and obtained a patent. Alleyne sold his share to Henslowe in February 1610, and three years later Henslowe formed a new partnership with Jacob Meade and built the Hope playhouse, designed for stage performances as well as bull and bear-baiting, and managed by Meade.

In Henslowe's theatre were first produced many plays by the famous Elizabethan dramatists. What is known as 'Henslowe's Diary' contains some of his vocation in his Ashfle. Invited between 1576 and 1581, entered by John Henslowe, while the later entries by Philip Henslowe from 1592 to 1609 are those which throw light on the theatrical matters of the time, and which have been subjected to much controversial criticism as a result of injuries done to the manuscript. "Henslowe's Diary" passed into the hands of Edward Alleyn, and thence into the Library of Dulwich College, where the manuscript remained intact for more than a hundred and fifty years. In 1780 Malone tried to borrow it, but it had been mislaid; in 1790 it was discovered and given into his charge. He was then at work on his Variarum Shakespeare. Malone had a transcript made of certain portions in Brains and collated it with the original; and this transcript, with various notes and corrections by Malone, is now in the Dulwich Library. An abstract of this transcript he also published with his Variorum Shakespeare. The MS. of the diary was eventually returned to the library in 1812 by Malone's executor. In 1840 it was lent to J. P. Collier, who in 1845 printed for the Shakespeare Society what purported to be a full edition, but it was afterwards shown by G. F. Warner (Catalogue of the Dulwich Library, 1881) that a number of forged interpolations had been made, the responsibility for which rests on Collen.

The complicated history of the forgeries and their detection has been exhaustively treated in Walter W. Greg's edition of Henslowe's Diary (London, 1904; enlarged 1908).

HENTY, GEORGE ALFRED (1832-1902), English war-correspondent and author, was born at Trumpington, near Cambridge, in December 1832, and educated at Westminster School and Caius College, Cambridge. He served in the Crimean in the Purveyor's department, and after the peace filled various posts in the department in England and Ireland, but he found the work too dull and drifted into journalism for the London Standard. He volunteered as Special Correspondent for the Austro-Italian War of 1866, accompanied Garibaldi in his Tirrolese Campaign, followed Lord Napier through the mountain gorges to Magdala, and Lord Wolseley across bush and swamp to Kumassi. Next he reported the Franco-German War, starred in Paris through the siege of the Commune, and then turned south to rough it in the Pyrenees during the Carlist insurrection. He was in Asiatic Russia at the time of the Khiva expedition, and later saw the desperate hand-to-hand fighting of the Turks in the Serbs. He wrote the report of the affair as an eye-witness, and went on to edit a magazine for boys called the Union Jack, he became the mainstay of the new periodical, to which he contributed several serials in succession. The stories pleased their public, and had ever increasing circulation in book form, until Henty became a name to conjure with in juvenile circles. Altogether he wrote about eighty of these books. Henty was an enthusiastic yachtsman, having spent at least six months afloat each year, and he died on board his yacht in Weymouth Harbour on the 16th of November 1902.

HENWOOD, WILLIAM JORY (1805-1872), English mining geologist, was born at Perron Wharf, Cornwall, on the 16th of January 1805. In 1822 he commenced work as a clerk in a mining office, and soon took an active interest in the working of mines and in the metalliferous deposits. In 1835 he was appointed to the office of assay-master and supervisor of tin in the duchy of Cornwall, a post from which he retired in 1838. Meanwhile he had commenced in 1836 to communicate papers on mining subjects to the Royal Geological Society of Cornwall, and the Geological Society of London, and in 1840 he was elected F.R.S. In 1843 he went to take charge of the Gogo-Soco mines which afterwards he proceeded to India to report on certain metalliferous deposits for the Indian government; and in 1858, impaired in health, he retired and settled at Penzance. His most important memoirs on the metalliferous deposits of Cornwall and Devon were published in 1843 by the Royal Geological Society of Cornwall. At a much later date he communicated with enlarged
HENZADA—HEPHAESTUS

HENZADA, a district of Lower Burma, formerly in the Plegu, but now in the Irrawaddy division. Area, 2870 sq. m. Pop. (1901) 484,558. It stretches from north to south in one vast plain, forming the valley of the Irrawaddy, and is divided by that river into two nearly equal portions. This country is protected from inundation by immense embankments, so that almost the whole area is suitable for rice cultivation. The chief mountains are the Arakan and Pegu Yoma ranges. The greatest elevation of the Arakan Yomas in Henzada, attained in the latitude of Myan-aung, is 4003 ft. above sea-level. Numerous torrents pour down from the two boundary ranges, and unite in the plains to form large streams, which fall into the chief streams of the district, which are the Irrawaddy, Haing and Bassein, all of them branches of the Irrawaddy. The forests comprise almost every variety of timber found in Burma. The bulk of the cultivation is rice, but a number of acres are under tobacco. The chief town of the district is Henzada, which had in 1901 a population of 24,736. It is a municipal town, with ten elective and three ex-officio members. Other municipal towns in the district are Zalan, with a population of 5645; Myan-aung, with a population of 7183, according to the 1901 census. The town of Lemyethna had a population of 5831. The steamers of the Irrawaddy Flotilla Company call at Henzada and Myan-aung.

The district was once a portion of the Talaing kingdom of Pegu, afterwards annexed to the Burmese empire in 1753, and has no history of its own. During the second Burmese war, after Prome had been seized, the Burmese on the right bank of the Irrawaddy crossed the river and offered resistance to the British, but were completely routed. Meanwhile, in Tharawaddy, or the country east of the Irrawaddy, and in the south of Henzada, much disorder was caused by a revolt, the leaders of which were, however, defeated by the British and their gangs dispersed.

HEPBURN, SIR JOHN (c. 1598-1636), Scotch soldier in the Thirty Years' War, was a son of George Hepburn of Athelstaneford near Haddington. In 1620 and in the following years he served in Bohemia, on the lower Rhine and in the Netherlands, and in 1623 he entered the service of Gustavus Adolphus, who, two years later, appointed him colonel of a Scottish regiment of his army. He took part with his regiment in Gustavus's Polish wars, and in 1631, a few months before the battle of Breitenfeld he was placed in command of the "Scots" or "Green" brigade of the Swedish army. At Breitenfeld it was Hepburn's brigade which delivered the decisive stroke, and after this he remained with the king, who placed the fullest reliance on his skill and courage, till the battle of the Alte Veste near Zürichberg. He then entered the French service, and raised two thousand men in Scotland for the French army, to which force was added in France the historic Scottish archer bodyguard of the French kings. The existing Royal Scots (Lothian) regiment (late 1st Foot) represents in the British army of to-day Hepburn's French regiment, and indirectly, through the amalgamation referred to, the Scottish contingent of the Hundred Years' War. Hepburn's claim to the right of the line of battle was bitterly resented by the senior French regiments. Shortly after this, in 1633, Hepburn was under a marché de camp, and he took part in the campaigns in Alsace and Lorraine (1634–35). In 1635 Bernhard of Saxe-Weimar, on entering the French service, brought with him Hepburn's former Scottish regiment, which was an once more, as "régiment d'Hébron," the latter thus attaining the unusual strength of 8300 men. Sir John Hepburn was killed shortly afterwards during the siege of Saverne (Zabern) on the 8th of July 1636. He was buried in Toul cathedral. With his friend Sir Robert Monro, Hepburn was the foremost of the Scottish soldiers of fortune who bore so conspicuous a part in the Thirty Years' War. He was a sincere Roman Catholic. It is stated that he left Gustavus owing to a jest about his religion, and at any rate he found in the French service, in which he died on this days, the opportunity of reconciling his beliefs with the desire of military glory which had led him into the Swedish army, and with the patriotic feeling which had first brought him out to the wars to fight for the Stuart princess, Queen Elizabeth of Bohemia. See James Grant, Memoirs of Sir John Hepburn.

HEPHAESTION, a Macedonian general, celebrated as the friend of Alexander the Great, who, comparing himself with Achilles, called Hephastion his Patroclus. In the later campaigns in Bactria and India, he was entrusted with the task of founding cities and colonies, and built the fleet intended to sail down the Indus. He was rewarded with a golden crown and the hand of Drypetis, the sister of Alexander's wife Stateira (324). In the same year he died suddenly at Ecbatana. A general mourning was ordered throughout Asia; at Babylon a funeral pile was erected at enormous cost, and temples were built in his honour (see Alexander the Great).

HEPHAESTION, a grammarian of Alexandria, who flourished in the age of the Antonines. He was the author of a manual (abridged from a larger work in 48 books) of Greek metres ("Εγχειρίδιον πεπληροφόρον") which is most valuable as the only complete treatise on the subject that has been preserved. The concluding chapter ("Ειδοπόρεος") discusses the various kinds of poetic composition, and is written in a clear and simple style, and was much used as a school-book.

Editions by T. Gaisford (1855, with the valuable scholia), R. Westphal (1886, in Scriptores metrici Graeci) and M. Conbruch (1906); translation by T. F. Barham (1845); see also W. Christ, Gesch. der griech. Litt. (1869); M. Conbruch, De veterum Hephasteioun doctrina (1890); J. E. Sandys, Hist. Class. Schol. i. (1906).

HEPHAESTUS, in Greek mythology, the god of fire, analogous to, and by the ancients often confused with, the Roman god Vulcan (q.v.); the derivation of the name is uncertain, but it may well be of Greek origin. The elemental character of Hephastus is far more apparent than is the case with the majority of the Olympian gods; the word Hephastus was used as a synonym for fire not only in poetry (Homer, II. i. 426 and later), but also in common speech ( Dios. v. 74). It is doubtful whether the origin of the god can be traced to any specific form of fire. As all earthly fire was thought to have come from heaven, Hephastus has been identified with the lightning. This is supported by the myth of his fall from heaven, and by the fact that, according to the Homeric tradition, his father was Zeus, the heaven-god. On the other hand, the lightning is not associated with him in literature or cult, and his connexion with volcanic fires is so close as to suggest that he was originally a volcano-god. The connexion, however, though it may be early, is probably not primitive, and it seems reasonable to conclude that Hephastus was a general fire-god, though some of his characteristics were due to particular manifestations of the element.

In Homer the fire-god was the son of Zeus and Hera, and found a place in the Olympian system as the divine smith. The Ηλιδ contains two versions of his fall from heaven. In one account (i. 590) he was cast out by Zeus and fell on Lemnos; in the other, Hera threw him down immediately after his birth in disgust at his lameness, and he was received by the sea-goddesses Eurynome and Thetis. The Lemnian version is due to the prominence of his cult at Lemnos in very early times; and his fall into the sea may have been suggested by volcanic activity in Mediterranean islands, as at Lipara and Thera. The subsequent return of Hephastus to Olympus is a favourite theme in early art. His wife was Charys, one of the Graces (in the Hesp. Aphr. or the Odyssey). His graces were the only ones of the Graces who came to Olympus, and the reason why was curious; it may be due to the beautiful works of the smith-god (Χαΐρετα θυρώς), but it is possibly derived from the supposed fertilizing and productive power of fire, in which case Hephastus is a natural mate of Charis, a goddess of spring, and Aphrodite the goddess
of love. In Homer, the skill of Hephaestus in metallurgy is often mentioned; his forge was on Olympus, where he was served by images of golden handmaids which he had animated. Similar myths are found in relation to the Finnish smith-god Ilmarinen, who made a golden woman, and the Teutonic Wieland, a belief in the non-passibility of man's creation being a common survival from an age in which their art was new and mysterious. In epic poetry Hephaestus is rather a comic figure, and his limping gait provokes "Homeric laughter" among the gods. In Vedic poetry Agni, the fire-god, is footless; and the ancients themselves attributed this lameness to the crooked appearance of flame (Servius on Aen. viii. 814), and possibly no better explanation can be found, though it has been suggested that in an early stage of society the trade of a smith would be suitable for the lame; Hephaestus and the lame Wieland would thus conform to the type of their human counterparts.

Except in Lemnos and Attica, there are few indications of any cult of Hephaestus. His association with Lemnos can be traced from Homer to the Roman age. A town in the island was called Hephaestia, and the functions of the god must have been wide, as we are told that his Lemnian priests could cure snake-bites. Once a year every fire was extinguished on the island for nine days, during which period sacrifice was offered to the gods of the underworld and the dead. After the nine days were passed, new fire was brought from the sacred hearth at Delos. The significance of this, and its origin, is unknown. But if the Lemnian fire was identified, not improbably, with the fire god, and if it continued a custom of predecessor ages, then a Lemnian fire—presumably a fairly large fire—would have been kept in the island, while the volcanic nature of the soil, and the primitive religious state of the islanders, would both tend to render it plausible. The island was known to Homer as the island of Hephaestus, and it is probable that the Lemnian fire is the same as that which Plato mentions as being kept at Lemnos.

Hephaestus is mentioned in Homer as the god of fire and metals, and as the smith of the gods. He is also associated with the art of metallurgy and with the crafts of the metalworkers. His cult is found in various parts of the ancient world, and is particularly significant in the islands of the Aegean Sea, where he was the patron of the art of metalworking. The volcanic nature of the Lemnian fire and the Lemnian priesthood of Hephaestus suggest that the Lemnian fire may have been a symbol of the god's association with fire and metals.

In art he appears as a bearded, muscular man, holding a hammer and a sickle, and sometimes a hammer and a sickle. His cult is also associated with the art of metalworking, and he is often depicted with a workshop tools such as hammers, chisels, and pliers. The art of metalworking was highly developed in ancient Greece, and the craftsmen who worked in this field were highly esteemed. Hephaestus was often depicted as the patron of these craftsmen, and his cult was particularly strong in Athens, where he was worshiped as the god of the artisans.

Hephaestus is also associated with the art of metalworking, and is often depicted with a workshop tools such as hammers, chisels, and pliers. The art of metalworking was highly developed in ancient Greece, and the craftsmen who worked in this field were highly esteemed. Hephaestus was often depicted as the patron of these craftsmen, and his cult was particularly strong in Athens, where he was worshiped as the god of the artisans.
a spade foot which often became the “spider leg” that characterized much of the late 18th-century furniture, this form of leg was indeed not confined to chairs but was used also for tables and sideboards. Of the dainty drawing-room grace of the style there can be no question. The great majority of modern chairs are of Hepplewhite inspiration, while he, or those who worked with him, appears to have a clear claim to have originated, or at all events popularized, the winged easy-chair, in which the sides are continued to the same height as the back. This is probably the most comfortable type of chair that has ever been made. The backs of Hepplewhite chairs were often adorned with galleries and festoons of wheat-ears or pointed fern leaves, and not infrequently with the prince of Wales’s feathers in some more medieval form. The frequency with which this badge was used has led to the suggestion either that A. Hepplewhite & Co. were employed by George IV, when prince of Wales, or that the feathers were used as a political emblem. The former suggestion is obviously the more feasible, but there is little doubt that the feathers were used by other makers working in the same style. It has been objected as an artistic flaw in Hepplewhite’s chairs that they have the appearance of fragility. They are, however, constructionally sound as a rule. The painted and japanned work has been criticized on safer grounds. This delicate type of furniture, often made of satinwood, and painted with wreaths and festoons, with amorini and musical instruments or floral motives, is the most elegant and pleasing that can be imagined. It has, however, no elements of decorative permanence. With comparatively little use the paintings wear off and have to be renewed. A piece of untouched painted satinwood is almost unknown, and one of the essential charms of old furniture as of all other antiques is that it should retain the patina of time. A large proportion of Hepplewhite furniture is inlaid with the exotic woods which had come into high favour by the third quarter of the 18th century. While the decorative use upon furniture of so evanescent a medium as paint is always open to criticism, any form of marquetry is obviously legitimate, and, if inlaid furniture be less ravishing to the eye, its beauty is but enhanced by time. It was not in chairs alone that the Hepplewhite manner excelled. It acquired, for instance, a speciality of seats for the tall, narrow Georgian sash windows, which in the Hepplewhite period had almost entirely superseded the more picturesque forms of an earlier time. These windowseats had ends rolling over outwards, and no backs, and despite their skimpiness their elegant simplicity is decidedly pleasing. Elegance, in fact, was the note of a style which on the whole was more distinctly English than that which preceded or immediately followed it. The smaller Hepplewhite pieces are much prized by collectors. Among these may be included urn-shaped knife-boxes in mahogany and satinwood, charming in form and decorative in the extreme; inlaid tea-caddies, varying greatly in shape and material, but always appropriate and coquet; delicate little fire-screens with shaped poles; painted worktables, and inlaid stands. Hepplewhite’s delicate carving, and fluted pillars were very handsome and attractive. The evolution of the dining-room sideboard made rapid progress towards the end of the 18th century, but neither Hepplewhite nor those who worked in his style did much to advance it. Indeed they somewhat retarded its development by causing it to revert to little more than that side-table which had been its original form. It was, however, a very delightful table with its undulating front, its many elegant spade-footed legs and its delicate carving. If we were dealing with a less elusive personality it would be just to say that Hepplewhite’s work varies from the extreme of elegance and the most delicious simplicity to an unimaginative commonplace, and sometimes to actual ugliness. As it is, this summary may well be applied to the style as a whole—a style which was assuredly not the creation of any one man, but owed much alike of excellence and of defect to a school of cabinet-makers who were under the influence of conflicting tastes and changing ideals. At its best the taste was so fine and so full of distinction, so simple, modest and sufficient, that it amounted to genius. On its lower planes it was clearly influenced by commercialism and the desire to make what tasteless people preferred. Yet this is no more than to say that the Hepplewhite style succumbed sometimes, perhaps very often, to the eternal enemy of all art—the uninspired banality of the average man. (J. P.-B.)

HEPTARCHY (Gr. ἑπτάρχης, seven, and ἄρχης, rule), a word which is frequently used to designate the period of English history between the coming of the Anglo-Saxons in 449 and the union of the kingdoms under Egbert in 828. It was first used during the 16th century because of the belief held by Camden and other older historians, that during this period there were exactly seven kingdoms in England, these being Northumbria, Mercia, East Anglia, Essex, Kent, Sussex and Wessex. This belief is erroneous, as the number of kingdoms varied considerably from time to time; nevertheless the word still serves a useful purpose to denote the period.

HERA, in Greek mythology, the sister and wife of Zeus and queen of the Olympian gods; she was identified by the Romans with Juno. The derivation of the name is obscure, but there is no reason to doubt that she was a genuine Greek deity. There are no signs of Oriental influence in her cults, except at Corinth, where she seems to have been identified with Astarte. It is probable that she was originally a personification of some department of nature; but the traces of her primitive significance are vague, and have been interpreted to suit various theories. Some of the ancients connected her with the earth; Plato, followed by the Stoics, derived her name from ἐδάφος, the air. Both theories are derived from her having been worshiped, the former notably by F. G. Welcker, the latter by L. Preller. A third view, that Hera is the moon, is held by W. H. Roscher and others. Of these explanations, that advanced by Preller has little to commend it, even if, with O. Gruppe, we understand the air-goddess as a storm deity; some of the arguments in support of the two other theories will be examined in this article.

Whatever may have been the origin of Hera, to the historic Greeks (except a few poets or philosophers) she was a purely anthropomorphic goddess, and had no close relation to any province of nature. In literature, from the times of Homer and Hesiod, she played an important part, appearing most frequently as the jealous and resentful wife of Zeus. In this character she pursues with vindictive hatred her enemies, such as Alcmene, Leto and Semele, who were beloved by Zeus. She visits his sins upon the children born of his intrigues, and is thus the constant enemy of Heracles and Dionysus. This character of the offended wife was borrowed by later poets from the Greek epic; but it belongs to literature rather than to cult, in which the dignity and power of the goddess is naturally more emphasized.

The worship of Hera is found, in different degrees of prominence, throughout the Greek world. It was especially important in the ancient Achaean centres, Argos, Mycenae and Sparta, which it claims in the Iliad (iv. 51) as her three dearest cities. Whether Hera was also worshipped by the early Dorians is uncertain; after the Dorian invasion she remained the chief deity of Argos, but her cult at Sparta was not so conspicuous. She received honour, however, in other parts of the Peloponnese, particularly in Olympia, where her temple was the oldest, and in Arcadia. In several Boeotian cities she seems to have been one of the principal objects of worship, while the neighbouring island of Euboea probably derived its name from a title of Hera, who was “rich in cows” (Ephesos). Among the islands of the Aegean, Samos was celebrated for the cult of Hera; according to the local tradition, she was born in the island. As Hera Lacinia (from her Lacinian temple near Croton) she was extensively worshipped in Magna Graecia. The connexion of Zeus and Hera was probably not primitive, since Dion seems to have preceded Hera as the wife of Zeus at Dodona. The origin of the connexion may possibly be due to the fusion of two “Pelasgic” tribes, worshipping Zeus and Hera respectively; but speculation on the earliest cult of the goddess, before she became the wife of Zeus, must be largely conjectural. The close relation of the two deities appears in a
frequent community of altars and sacrifices, and also in the _lepos yámos_, a dramatic representation of their sacred marriage. The festival, which was certainly ancient, was held not only in Argos, Samos, Euboea and other centres of Hera-worship, but also in Athens, where the goddess was obscured by the predominance of Athena. The details of the _lepos yámos _may have varied locally, but the main idea of the ritual was the same. In the Daedala, as the festival was called at Platea, an effigy was made from an oak-tree, dressed in bridal attire, and carried in a cart with a woman who acted as bridesmaid. The image was called Daedala, and the ritual was explained by a myth; Hera had left Zeus in her anger; in order to win her back, Zeus announced that he was about to marry, and dressed up a puppet to imitate a bride; Hera met the procession, tore the veil from the false bride, and, on discovering the ruse, became reconciled to her husband. The image was put away after each occasion; every sixty years a large number of such images, which had served in previous celebrations, were carried in procession to the top of Mount Cithaeron, and burned on an altar together with animals and the altar itself. As Frazer notes (Golden Bough, ii. 227), this festival appears to belong to the large class of mimetic charms designed to quicken the growth of vegetation; the marriage of Zeus and Hera would in this case represent the union of the king and queen of May. But it by no means follows that Hera was therefore originally a goddess of vegetation. When the real nature of the ritual had become lost or obscured, it was natural to explain it by the help of an aetiological myth; in European folklore, images, corresponding to these burnt at the Daedala, were sometimes called Judas Iscariot or Luther (Golden Bough, iii. 315). At Samos the _lepos yámos_ was celebrated annually; the image of Hera was concealed on the sea-shore and solemnly discovered. This rite seems to reflect an actual custom of abduction; or it may rather refer to the practice of intercourse between the betrothed before marriage. Such intercourse was sanctioned by the Samians, who excused it by the example of Zeus and Hera (schol. on H. ii. 216). There is nothing in the Samian _lepos yámos_ to suggest a marriage of heaven and earth, or of two vegetation-spirits; as Dr Farnell points out, the ritual appears to explain the custom of human nuptials. The sacred marriage, therefore, though connected with vegetation at the Daedala, was not necessarily a vegetation-charm in origin; consequently, it does not prove that Hera was an earth-goddess or tree-spirit. It is at least remarkable that, except at Argos, Hera had little to do with agriculture, and was not closely associated with such deities as Cybele, Demeter, Persephone, Bacchus, Ceres, Minerva, etc., whose occupations were largely agricultural. So, although the warlike character of Hera was not elsewhere prominent, she assumed a militant aspect in her two chief cities; a festival called the Shield (Heris, in Pindar's _αγια χάλακες_ was part of the Argive cult, and there was an armed procession in her honour at Samos. The city-goddess, whether Hera or Athena, must be chief alike in peace and war.

The cow was the animal specially sacred to Hera both in ritual and in mythology. The story of Io, metamorphosed into a cow, is familiar; she was priestess to her original home, the goddess Hera. She was the maiden. Her name means "cow-faced." The flowers of Hera. She was worshipped as the goddess of flowers (_argìa_); girls served in her temple under the name of "flower-bearers," and a flower festival (_Προσφήλα_ is celebrated by Peloponnesian women in spring. These rites recall our May day observance, and give colour to the earth-goddess theory. On the other hand it must be remembered that the patron deity of a Greek state had very wide functions; and it is not surprising to find that Hera (whatever her origin may have been) assumed an agricultural character among her own people whose occupations were largely agricultural. So, although the warlike character of Hera was not elsewhere prominent, she assumed a militant aspect in her two chief cities; a festival called the Shield (Heris, in Pindar's _αγια χάλακες_ was part of the Argive cult, and there was an armed procession in her honour at Samos. The city-goddess, whether Hera or Athena, must be chief alike in peace and war.

The earliest recorded images of Hera preceded the rise of Greek sculpture; a log at Theopseia, a plank at Samos, a pillar at Argos served to represent the goddess. In the archaic period of sculpture the _ξανά_ or wooden statue of the Samian Hera by Sminis was famous. In the first half of the 5th century the sacred marriage was represented on an extant metope from a temple at Seilinus. The most celebrated statue of Hera was the one of Polyclitus, made for the Heraeum at Argos soon after 423 B.C., and widely celebrated. This was the one who says that Hera was seated on a throne, wearing a crown (στέφανος), and carrying a sceptre in one hand and a pomegranate in the other. Various ancient writers testify to the beauty and dignity of the statue, which was considered equal to the Zeus of Phidias. Polyclitus seems to have fixed the type of Hera as a youthful matron, but unfortunately the exact character of her head cannot be determined. A majestic and rather severe beauty marks the conception of Hera in later art, of which the Farnese bust at Naples and the Ludovisi Hera are the most conspicuous examples.

Mythologie u. Religionsgesch. p. 1121 f. (Munich, 1903). In the article Greek Art, fig. 24, will be found a roughly executed head of Hera, from the pediment of the treasury of the Megarians. (E. E. S.)

HERACLEA, the name of a large number of ancient cities founded by the Greeks.

1. HERACLEA (Gr. Ἡρακλεα), an ancient city of Lucania, situated near the modern Policoro, 3 m. from the coast of the gulf of Tarentum, between the rivers Aciris (Agri) and Siris (Sinni) about 13 m. S.S.W. of Metapontum. It was a Greek colony founded by the Tarentines and Thurians in 432 B.C., the former being predominant. It was chosen as the meeting-place of the general assembly of the Italiot Greeks, which Alexander of Epirus, after his alienation from Tarentum, tried to detach from Thurii. Here Pyrrhus, king of Epirus, defeated the consuls Laevius in 280 B.C., after he had crossed the river Siris. In 278 B.C., or possibly in 282 B.C., probably in order to detach it from Tarentum, the Romans made a special treaty with Heraclea, on such favourable terms that in 89 B.C. the Roman citizenship given to the inhabitants by the Lex Plautia Papiria was only accepted after considerable hesitation. We hear that Heraclea surrendered under compulsion to Hannibal in 212 B.C. and that in the Social war the public records were destroyed by fire. Cicero in his defence of the poet Archias, an adopted citizen of Heraclea, speaks of it as a flourishing town. As a consequence of its having accepted Roman citizenship, it became a municiplium; part of a copy of the Lex Iulia Municipalis of 46 B.C. (engraved on the back of two bronze tablets, on the front of which is a Greek inscription of the 3rd century B.C. defining the boundaries of later belonging to various temples), which was found between Heraclea and Metapontum, is of the highest importance for our knowledge of that law. It was still a place of some importance under the empire; a branch road from Venusia joined the coast road here. The circumstances of its destruction and abandonment was unknown; the site is now marked by a few heaps of ruins. Its medieval representative was Angiona, once a bishopric, but now itself a heap of ruins, among which are those of an 11th-century church.

2. HERACLEA MINOA, an ancient town on the south coast of Sicily, at the mouth of the river Halycus, near the modern Montalegro, some 20 m. N.W. of Girgenti. It was at first an outpost of Sicily (478 B.C.); later, this town was connected with Carthage, being the headquarters of Agrigentum. It passed into Carthaginian hands by the treaty of 463 B.C., was won back by Dionysius in his first Piraeus war, but recovered by Carthage in 353. From this date onwards coins bearing its Semitic name, Ras Melkarti, become common, and it was obviously an important border fortress. It was here that Dion landed in 357 B.C., when he attacked Syracuse. The Agrigentines won it back in 309 B.C., but it soon fell under the power of Agathocles. It was temporarily recovered for Greece by Pyrrhus. (T. As.)

3. HERACLEA PONTICA (mod. Bender Ereğli), an ancient city on the coast of Bithynia in Asia Minor, at the mouth of the Kiliju. It was founded by a Megarian colony, which soon subjugated the Carian king, Perinthus, and extended its power over considerable territory. The prosperity of the city, rudely shaken by the Galatians and the Bithynians, was utterly destroyed in the Mithradatic war. It was the birthplace of Heracles Ponticus. The modern town is best known for its lignite coal-mines, from which Constantinople receives a good part of its supply.

4. HERACLEA SINTICA, a town in Thracian Macedonia, to the south of the Strymon, the site of which is marked by the village of Zervokhori, and identified by the discovery of local coins.

5. HERACLEA, a town on the borders of Caria and Ionia, near the foot of Mount Latmus. In its neighbourhood was the burial cave of Endymion. (E. E. S.)

HERACLEA—CYUSTRA (mod. Ereğli) in the vilayet of Konia, under the name Cybistra, had some importance in Hellenistic times owing to its position near the point where the road to the Cilician Gates enters the hills. It lay in the way of armies and was more than once sacked by the Arab invaders of Asia Minor (A.D. 805 and 832). It became Turkish (Seljuk) in the 11th century. Modern Ereğli had grown from a large village to a town since the railway reached it from Konia and Karaman in 1904; and it has now an hotel and good shops. Three hours’ ride S. is the famous “Hittite” rock-relief of Ivriz, representing a king (probably of neighbouring Tyana) adoring a god (see HITTITES). This was the first “Hittite” monument discovered in modern times (early 19th century, by the Swede Otter, an emissary of Louis XIV.).

For Heraclea Trachinia see TRACHIS, and for Heraclea Perinthus see PERNITHUS.

HERACLEON, a Gnostic who flourished about A.D. 125, probably in the south of Italy or in Sicily, and is generally classed by the early heresiologists with the Valentinian school of heresy. In his system he appears to have regarded the divine nature as a vast abyss in whose pleroma were aeons of different orders and degrees,—emanations from the source of being. Midway between the supreme God and the material world was the Demiurgus, who created the latter, and under whose jurisdiction the lower, animal soul of man proceeded after death, while his higher, celestial soul returned to the pleroma whence at first it issued. Though consciously uniting faith in Christ with spiritual maturity, there are evidences that, like other Valentinians, Heracleon did not sufficiently emphasize abstinence from the moral laxity and worldliness into which his followers fell. He seems to have received the ordinary Christian scriptures; and Origen, who treats him as a notable exegete, has preserved fragments of a commentary by him on the fourth gospel (brought together by Grabe in the second volume of his Spicilegium), while Clement of Alexandria quotes from him what appears to be a passage from a commentary on Luke. These writings are remarkable for their intensely mystical and allegorical interpretations of the text.

HERACLEONAS, east-Roman emperor (Feb.–Sept. 641), was the son of Heracleus (q.v.) and Martina. At the end of Heracleus’ reign he obtained through his mother’s influence the title of Augustus (638), and after his father’s death was proclaimed emperor. After the death of Constantine III. the premature death of Constantine, in May 641, left Heracleonas sole ruler. But a suspicion that he and Martina had murdered Constantine led soon after to a revolt, and to the mutiny and banishment of the supposed offenders. Nothing further is known about Heracleonas subsequent to 641.

HERACLIDAE, the general name for the numerous descendants of Heracles (Hercules), and specially applied in a narrower sense to the descendants of Hyllus, the eldest of his four sons by Deaneira, conquerors of Peloponnesus. Heracles, whom Zeus had originally intended to be ruler of Argos, Lacedaemon and Messenian Pylos, had been supplanted by the cunning of Hera, and his intended possessions had fallen into the hands of Eurystheus. After the death of Achilles, his children, after many wanderings, found refuge from Eurystheus at Athens. Eurystheus, on his demand for their surrender being refused, attacked Athens, but was defeated and slain. Hyllus and his brothers then invaded Peloponnesus, but after a year’s stay were forced by a pestilence to quit. They withdrew to Thessaly, where Aegimius, the mythical ancestor of the Doriains, whom Heracles had assisted in war against the Lapithae, adopted Hyllus and made over to him a third part of his territory. After the death of Aegimius, his two sons, Pamphilus and Dymas, voluntarily submitted to Hyllus (who was, according to the Dorian tradition in Herodotus v. 72, really an Achaean), who thus became ruler of the Dorians, the three branches of that race being named after these three heroes. Being desirous of reconquering his paternal inheritance, Hyllus consulted the Delphic oracle, which told him to wait for “the third fruit,” and then enter Peloponnesus by “a narrow passage by sea.”
HERACLIDES—HERACLITUS

Accordingly, after three years, Hyllus marched across the isthmus of Corinth to attack Ateus, the successor of Eurystheus, but was slain in single combat by Echemus, king of Tegea. This second attempt was followed by a third under Cleodaeus and a fourth under Aristomachus, both of which were equally unsuccessful. At last, Temenus, C Cresphontes and Aristodemus, the sons of Aristomachus, complained to the oracle that their instructions had proved fatal to those who had followed them. They received the answer that by the "third fruit" the "third generation" was meant, and that the "narrow passage" was not the isthmus of Corinth, but the straits of Rhium. They accordingly built a fleet at Naupactus, but before they set sail, Aristodemus was struck by lightning (or shot by Apollo) and the fleet destroyed, because one of the Heraclidæ had slain an Acanian soothsayer. The oracle, being again consulted by Temenus, bade him offer an expiatory sacrifice and banish the murderer for ten years, and look out for a man with three eyes to act as guide. On his way back to Naupactus, Temenus fell in with Oxylus, an Aetolian, who had lost one eye, riding on a horse (thus making up the three eyes) and immediately pressed him into his service. According to another account, a mule on which Oxylus rode had lost an eye. The Heraclidæ repaired their ships, sailed from Naupactus to Antirrhum, and thence to Rhium in Peloponnesus. A decisive battle was fought with Tisamenus, son of Orestes, the chief ruler in the peninsula, who was defeated and slain. The Heraclidæ, who thus became practically masters of Peloponnesus, proceeded to distribute its territory among themselves by lot. Argos fell to Tesenus, Larissa to Procles and Eurystheus, the sons of Aristodemus; and Messene to Cresphontes. The fertile district of Elis had been reserved by agreement for Oxylus. The Heraclidæ ruled in Lacedaemon till 221 B.C., but disappeared much earlier in the other countries. This conquest of Peloponnesus by the Dorians, commonly called the "Return of the Heraclidæ," is represented as the recovery by the descendants of Heracles of the rightful inheritance of their hero ancestor and his sons. The Dorians followed the custom of other Greek tribes in claiming as ancestor for their ruling families one of the legendary heroes, but the traditions must not on that account be regarded as entirely mythical. They represent a joint invasion of Peloponnesus by Aetolians and Dorians, the latter having been driven southward from their original native home under pressure from the Thessalians. It is noticeable that there is no mention of these Heraclidæ or their invasion in Homer or Hesiod. Herodotus (vi. 52) speaks of poets who had celebrated their deeds, but these were limited to events immediately succeeding the death of Heracles. The story was first amplified by the Greek tragedians, who probably drew their inspiration from local legends, and finally glorified the services rendered by Athens to the rulers of Peloponnesus.

Apollodorus ii. 8; Diod. Sic. iv. 57, 58; Pausanias i. 32, 41, ii. 13, 18, iii. 1, iv. 3, v. 3; Euripides, Heraclidae; Pindar, Pythias, ix. 137; Herodotus ii. 78. See Müller's Dorians, i. ch. 31; Thirlwall, History of Greece, ch. vii.; Grote, Hist. of Greece, pt. i. ch. xvii.; Busolt, Griechische Geschichte, i. ch. ii. sec. 7, where a list of modern authorities is given.

HERACLIDES PONTICUS, Greek philosopher and miscellaneous writer, born at Heraclea in Pontus, flourished in the 4th century B.C. He studied philosophy at Athens under Socrates, Plato and Aristotle. According to Suidas, Plato, on his departure for Sicily, handed over the schools in charge of Heraclides. The latter part of his life was spent at Hermaclea. He is said to have been vain and fat, and to have been so fond of display that he was nicknamed Pompicus, or the Showy (unless the epithet refers to his literary style). Various idle stories are related about him. On one occasion, for instance, Heraclea was afflicted with famine, and the Pythian priestess at Delphi, bribed by Heracleides, assured his inquiring townsmen that the dearth would be stayed if they granted a golden crown to that philosopher. This was done; but just as Heracleides was receiving his honour in a crowned assembly, he was seized with apoplexy, while the dishonest priestess perished at the same moment from the bite of a serpent. On his death-bed he is said to have requested a friend to hide his body as soon as life was extinct, and, by putting a serpent in its place, induce his townsmen to suppose that he had been carried up to heaven. The trick was discovered, and Heracleides received only ridicule instead of divine honours (Diogenes Laërtius vi. 6). Whatever may be the truth about these stories, Heracleides seems to have been a versatile and prolific writer on philosophy, mathematics, music, grammar, rhetoric and rhetoric. Many of the works attributed to him, however, are probably by one or more persons of the same name.

The extant fragment of a treatise On Constitutions (C.W. Müller, F.H.G. ii. 197-207) is probably a compilation from the Politics of Aristotle by Heracleides Longus, who lived in the time of Tokomy VI. Philomor (181-186). See also Von, De Heracleidii Politics vita et scripta (1896).

HERACLITUS (Ἡρακλῆτος; c. 540-475 B.C.), Greek philosopher, was born at Ephesus of distinguished parentage. Of his early life and education we know nothing; but his teacher, at which he spoke of all his fellow-philosophers and of his fellow-countrymen as a whole we may gather that he regarded himself as self-taught and a pioneer of wisdom. So intensely aristocratic (hence his nickname ὁ ἄρσιτος, "he who rules at the people") was his temperament that he declined to exercise the regal-hieratic office of βασιλεύς which was hereditary in his family, and presented it to his brother. It is probable, however, that he did occasionally intervene in the affairs of the city at the period when the rule of Persia had given place to autonomy; it is said that he compelled the usurper Macedonius to abdicate. From the lonely life he led, and still more from the extreme simplicity of his poverty and his contempt for the general, he was called the "Dark Philosopher" (ὁ ακορώνος), or the "Weeping Philosopher," in contrast to Democritus, the "Laughing Philosopher."

Heracleit in is a real sense the founder of metaphysics. Starting from the physical standpoint of the Ionian physicists, he accepted their general idea of the unity of nature, but entirely denied their theory of being. The fundamental uniform fact in nature is constant change (ἵνα γίνεται καθ' ἑαυτὸν μείζον;); everything both is and is not at the same time. He thus arrives at the principle of Relativity; harmony and unity consist in diversity and multiplicity. The senses are "bad witnesses" (κακοὶ μάταιοι;); only the wise man can obtain knowledge.

To appreciate the significance of the doctrines of Heracleitus, it must be borne in mind that to Greek philosophy the sharp distinction between subject and object which pervades modern thought was foreign, a consideration which suggests the conclusion that, while it is a great mistake to reckon Heracleitus with the materialistic cosmologists of the Ionic schools, it is, on the other hand, going too far to treat his theory, with Hegel and Lassalle, as one of pure Panegogism. Accordingly, when he denies the permanence of being, and declares Becoming, or eternal flux and change, to be the sole actuality, Heracleitus must be understood to enunciate not only the unreality of the abstract notion of being, except as the correlative of that of not-being, but also the physical doctrine that all phenomena are in a state of continuous transition from non-existence to existence, and vice versa, without either distinguishing these propositions or qualifying them by any reference to the relation of thought to experience. "Every thing is and is not;" all things are, and nothing remains. So far he is in general agreement with Anaximander (q.v.), but he differs from him in his solution of the problem, distinguishing a poet and a mystic, the primary matter which satisfied the patient researcher, and demanding a more vivid and picturesque element. Naturally he selects fire, according to him the most complete embodiment of the process of Becoming, as the principle of empirical existence, out of which all things, including even the soul, grow by way of a quasi condensation, and into which all things must in course of time be again resolved. But this primordial fire is in itself that divine rational process, the harmony of which constitutes the law of the universe (See Lékos). Real knowledge consists in apprehending this all-pervading harmony as embodied in the manifold of perception, and the senses are "bad witnesses," because they apprehend phenomena,
not as its manifestation, but as "stiff and dead." In like manner real virtue consists in the subordination of the individual to the laws of this harmony as the universal reason wherein alone true freedom is to be found. 'The law of things is a law of Reason Universal (Nýgos), but most men live as though they had none or its name.' Edward Burney, in a close relation, similar, in many respects, to that which we find in Hegel and in Comte. For Heraclitus the soul approaches most nearly to perfection when it is most akin to the fiery vapour out of which it was originally created, and as this is most so in death, "while we live our souls are dead in us, but when we die our souls are restored to life." The doctrine of immortality comes prominently forward in his ethics, but whether this must not be reckoned with the figurative accommodation to the popular theology of Greece which pervades his ethical teaching, is very doubtful.

The school of disciples founded by Heraclitus flourished for long after his death, the chief exponent of his teaching being Cratylus. A good deal of the information in regard to his doctrines has been gathered from the later Greek philosophy, which was deeply influenced by it.

**HERACLITUS** (Ἡρακλῆτης) (c. 575-545), East Roman emperor, was born in Cappadocia. His father held high military command under the emperor Maurice, and as governor of Africa maintained his independence against the usurper Phocas (q.v.). When invited to head a rebellion against the latter, he sent his son with a fleet which reached Constantinople unopposed, and precipitated the dethronement of Phocas. Proclaiming himself emperor, Heraclius set himself to reorganize the utterly disordered administration. At first he found himself helpless before the Persian armies (see PERSIA: Ancient History; and CHOSROES II. of CHOSROES II.), which conquered Syria and Egypt and since 616 had encamped opposite Constantinople; in 618 he even proposed in despair to abandon his capital and seek a refuge in Carthage, but at the entreaty of the patriarch he took courage. By securing a loan from the Church and suspending the corn-distribution at Constantinople, he raised sufficient funds for war, and after making a treaty with the Avars, who had nearly surprised the capital during an incursion in 619, he was at last able to take the field. At the beginning of the war the capital was besieged by A. Westermann (Leipzig, 1857). See also in A. H. Ritter and L. Reller's *Historia philosophiae Graecae* (8th ed. by E. Wellmann, 1898); F. W. Eth.* vii. 3; Clement of Alexandria, *Stromata*, v. 599, 603 (ed. Paris). (J. M. M.)

**HERALD** (Fr. heral, herault; the origin is uncertain, but O.H.G. heren, to call, or heraldus, leader of an army, have been proposed; the Gr. equivalent is ἵρων: Lat. francus, cædaceator, soldier). In Greek and Roman antiquities, the term for the officials described below: in modern usage, in the sense "herald" is often used generally in a sense analogous to that of the ancients, it is more specially restricted to that dealt with in the article HERALDRY.

The Greek heralds, who claimed descent from Hermes, the messenger of the gods, through his son Keryx, were public functionaries of high importance in early times. Like Hermes, they carried a staff of olive or laurel wood surrounded by two snakes (or with wool as messengers of peace); their persons were inviolable; and they formed a kind of priesthood or corporation. In the Homeric age, they summoned the assemblies of the people, at which they preserved order and saved; proclaimed war; arranged the cessation of hostilities and the conclusion of peace; and assisted at public sacrifices and banquets. They also performed certain menial offices for the kings (mixing and pouring out the wine for the guests), by whom they were treated as confidential servants. In later times,
their position was a less honourable one; they were recruited from the poorer classes, and were mostly paid servants of the various officials. Pollux in his Onomasticon distinguishes four classes of heralds: (1) the sacred heralds at the Eleusinian mysteries; (2) the heralds at the public games, who announced the which was ascribed to one of the kings. They those who who proclaimed goods for sale in the market (for which purpose they mounted a stone), and gave notice of lost children and runaway slaves. To these should be added (5) the heralds of the boule and demos, who summoned the members of the council and the ecclesia, recited the solemn formula of prayer before the opening of the meeting, called upon the orators to speak, counted the votes and announced the results; (6) the heralds of the law courts, who gave notice of the time of trials and summoned the parties. They also served together with the officials to whom they were attached. Their appointment was subject to some kind of examination, probably of the quality of their voice. Like the earlier heralds, they were also employed in negotiations connected with war and peace.

Among the Romans the praecores or "criers" exercised their profession both in private and official business. As private criers they were especially concerned with auctions; they advertised the time, place and conditions of sale, called out the various bids, and like the modern auctioneer varied the proceedings with jokes. They gave notice in the streets of things that had been lost, and took part in funeral processions, such as funerary arrangements. Although the calling was held in little estimation, some of these criers amassed great wealth. The state criers, who were mostly freedmen and well paid, formed the lowest class of apparitores (attendants on various magistrates). On the whole, their functions resembled those of the Greek heralds. They called the popular assemblies together, proclaimed silence and made known the result of the voting; in judicial cases, they summoned the plaintiff, defendant, advocates and witnesses; in criminal executions they gave out the reasons for the punishment and called on the executed to perform his duty; they invited the people to the games and announced the names of the victors. Public criers were also employed at state auctions in the municipia and colonies, but, according to the lex Julia municipalis of Caesar, they were prohibited from holding office.

Among the Romans the settlement of matters relating to war and peace was entrusted to a special class of heralds called Fetiales (not Feciales), a word of uncertain etymology, possibly connected with fater, fari, and meaning the speakers. They formed a priestly college of 20 (or 15) members, the institution of whose origin is uncertain. The office came to be held by the most distinguished families, held office for life, and filled up vacancies in their number by co-optation. Their duties were to demand redress for insult or injury to the state, to declare war unless satisfaction was obtained within a certain number of days and to conclude treaties of peace. A deputation of four (or two), one of whom was called pater patratus, wearing priestly garments, with sacred herbs plucked from the Capitoline hill borne in front, proceeded to the frontier of the enemy's territory and demanded the surrender of the guilty party. This demand was called clariatio (perhaps from its being made in a loud, clear voice, with the criers). If refusal was given within five days, the deputation returned to Rome and made a report. If war was decided upon, the deputation again repaired to the frontier, pronounced a solemn formula, and hurls a charred and blood-stained javelin across the frontier, in the presence of three witnesses, which was tantamount to a declaration of war (Livy i. 24, 32). With the extension of the Roman empire, it became impossible to carry out this ceremonial, for which was substituted the hurling of a javelin over a column near the temple of Bellona in the direction of the enemy's territory. When the termination of the war was decided upon, the fetiales either made an arrangement for the surrender of the prisoners of war, or, if this was not forthcoming, called the会议, after which the war recommenced automatically or they concluded a solemn treaty with the enemy. Conditions of peace or alliance proposed by the general on his own responsibility (sponsio) were not binding upon the people, and in case of rejection the general, with hands bound, was delivered by the fetiales to the enemy (Livy ix. 10). But if the terms were agreed to, a deputation carrying the sacred herbs and the flint stones, kept in the temple of Jupiter Feretrius for sacrificial purposes, met a deputation of fetiales from the other side. After the conditions of the treaty had been read, the sacrificial formula was pronounced and the victims slain by a blow from a stone (hence the expression foedus ferire). The treaty was then signed and handed over to the keeping of the fetial college. These ceremonies usually took place in Rome, but in 201 a deputation of fetiales went to Africa to ratify the conclusion of peace with Carthage. From that time little is heard of the fetiales, although they appear to have existed till the end of the 4th century A.D. The caduceator (from caduceus, the latinized form of ὑποκράτων) was the name of a person who was sent to treat for peace. His person was considered sacred; and like the fetiales he carried the sacred herbs, instead of the caduceus, which was not in use amongst the Romans.

Ostermann, De praecoresibus Graecorum (1845); for the Roman Praecores, Mommsen, Römisches Staatsrecht, i. 363 (3rd ed., 1887); also article Praecores in Pauly’s Realencyklopädie (1892 edition); for the Fetiales, monographs by F. C. Conrad (1734, containing all the necessary material), and G. Fusinato (1884, from Atti della R. Accad. dei Lincei, series iii. vol. 13); also Marquardt, Römische Staatsverwaltung, ii. 415 (3rd ed., 1885), and A. Weiss in Darmerein and Saglio’s Dizionario dei costumi antichi.

HERALDRY. Although the word Heraldry properly belongs to all the business of the herald (g.n.), it has long attached itself to that which in earlier times was known as armory, the science of armorial bearings.

History of Armorial Bearings.—In all ages and in all quarters of the world distinguishing symbols have been adopted by tribes or nations, by families or by chieftains. Greek and Roman poets describe the devices borne on the shields of heroes, and many such painted shields are pictured on antique vases. Rubblisthical writers have supported the fancy that the standards of the tribes set up by the ancient Romans were borne as follows: the eagle for Jupiter, the raven Jacob, the ravening wolf for Benjamin, the lion’s whelp for Judah and the ship of Zebulon. In the East we have such ancient symbols as the five-clawed dragon of the Chinese empire and the chrysanthemum of the emperor of Japan. In Japan, indeed, the systematized badges borne by the noble clans may be regarded as akin to the heraldry of the West, and the circle with the three asarum leaves of the Tokugawa shoguns has been made as familiar to us by Japanese lacquer and porcelain as the red pellets of the Medici by old Italian fabrics. Before the landing of the Spanish invaders in Mexico in 1519, the Mexicans carried many of their devices after the fashion of a painted writing the names of their bears; and the eagle on the new banner of Mexico may be traced to the eagle that was once carved over the palace of Montezuma. That mysterious business of totemism, which students of folk-lore have discovered among most primitive peoples, must be regarded as another of the forerunners of true heraldry, the totem of a tribe supplying a badge which was sometimes displayed on the body of the tribesman in paint, scars or tattooing. Totemism so far touching the heraldry that some would trace it to its symbols the white horse of Wattle, the bull head of the Mecklenburgers and many other ancient armories

When true heraldy begins in Western Europe nothing is more remarkable than the suddenness of its development, once the idea of hereditary armorial symbols was taken by the nobles and
HERALDRY

His earliest examples are probably still to be discovered by research, but certain notes may be made which narrow the dates between which we must seek its origin. The older writers on heraldry, lacking exact archaeology, were wont to carry back the beginnings to the dark ages, even if they lacked the assurance of those who distributed blazons among the angelic host before the Creation. Even in our own times old misconceptions give ground slowly. Georg Rüxner's Thaurnier Buch of 1522 is still cited for its evidence of the tournament laws of Henry the Fowler, by which those who would contend in tournaments were forced to show four generations of arms-bearing ancestors. Yet modern criticism has shattered the elaborated fiction of Rüxner. In England many legends survive of arms borne by the Conqueror and his companions. But nothing is more certain than that neither armorial banners nor shields of arms were borne on either side at Hastings. The famous record of the Bayeux tapestry shows shields which in some cases suggest rudely devised armorial bearings, but in no case can a shield be identified as one which is recognized in the generations after the Conquest. So far is the idea of personal arms from the artist, that the same warrior, seen in different parts of the tapestry's history, has his shield with differing devices. A generation later, Anna Commena, the daughter of the Byzantine emperor, describing the shields of the French knights who came to Constantinople, tells us that their polished faces were plain.

Of all men, kings and princes might be the first to be found bearing arms. Yet the first English sovereign who appears on his great seal with arms on his shield is Richard I. His seal of 1189 shows his shield charged with a lion ramping towards the sinister side. Since one half only is seen of the rounded face of the shield, English antiquaries have perhaps too hastily suggested that the whole bearing was two lions face to face. But the mounted figure of Philip of Alsace, count of Flanders, on his seal of 1164 bears a like shield charged with a like lion, and in this case another shield on the counterseal makes it clear that this is the single lion of Flanders. Therefore we may take it that, in 1189, King Richard bore arms of a lion rampant, while, nine years later, another seal shows him with a shield of the familiar bearings which have been borne as the arms of England by each one of his successors. That seal of Philip of Alsace is the earliest known example of the arms of the great counts of Flanders. The ancient arms of the kings of France, the blue shield powdered with half-moon shaped charges, a device famous even later. Louis le Jeune, on the crowning of his son Philip Augustus, ordered that the young prince should be clad in a blue dalmatic and blue shoes, sewn with gold fleurs-de-lys, a flower whose name, as "Fleur de Loys," played upon that of his own, and possibly upon his epithet name of Florus. A seal of the same king has the device of a single lily. But the first French royal seal with the shield of the lilies is that of Louis VIII. (1223-1226). The eagle of the emperors may well be as ancient a bearing as any in Europe, seeing that Charlemagne is said, as the successor of the Caesars, to have used the eagle as his badge. The emperor Henry III. (1259-1296) has the sceptre on his seal surmounted by an eagle; in the 12th century the eagle was used by the imperial household. The imperial shield of the emperor's banner is said by William of Tyre to have borne the eagle, and with the beginning of regular heraldry this imperial badge would soon be displayed on a shield. The double-headed eagle is not seen on an imperial seal until after 1414, when the bird with one neck becomes the recognized arms of the king of the Romans.

There are, however, earlier examples of shields of arms than any of these. A document of the first importance is the description by John of Marmouster of the marriage of Geoffrey of Anjou with Maude the empress, daughter of Henry I., in the year which is said to have hung round the neck of his son-in-law a shield with golden "lions." Afterwards the monk speaks of Geoffrey in fight, "pictos leones preferebat in clypeo." Two notes may be added to this account. The first is that the enamelled plate now in the museum at Le Mans, which is said to have been placed over the tomb of Geoffrey after his death in 1154, shows him bearing a long shield of azure with six golden lions, thus confirming the monk's story. The second is the well-known fact that Geoffrey's bastard grandson, William with the Long Sword, undoubtedly bore these same arms of the six lions of gold in a blue field, even as they are still to be seen upon his tomb at Salisbury. Some ten years later Richard I. is with the three leopards, his brother John, count of Mortain, is found using the three lions and two leopards, arms which later tradition assigns to the ancient dukes of Normandy and to their descendants the kings of England before Henry II., who is said to have added the third leopard in right of his wife, a legend of no value. Mr Round has pointed out that Gilbert of Clare, earl of Hertford, who died in 1152, bears on his seal to a document sealed after 1138 and not later than 1146, the three chevrons afterwards so well known in England as the bearings of his successors. An old drawing of the seal of his uncle Gilbert, earl of Pembroke (Lansdowne MS. 203), shows a chevron-nyon shield used between 1138 and 1148. At some date between 1144 and 1150, Waleran, count of Meulan, shows on his seal a pennon and saddle-cloth with a checkered pattern: the house of Warenne, sprung from his mother's son, bore shields checky of gold and azure. If we may trust the inventory of Norman seals made by M. Demay, a careful antiquary, there is among the archives of the Manche a grant by Eudes, seigneur du Punt, sealed with a seal and counterseal of arms, to which M. Demay gives a date as early as 1128. The writer has not examined this seal, the earliest armorial evidence of which he has any knowledge, but it may be remarked that the arms are described as varying on the seal and counterseal, a significant touch of primitive armorial. Another type of seal common in this 12th century shows the personal device which had not yet developed into an armorial charge. A good example is that of Enguerrand de Candavède, count of St Pol, where, although the shield of the horseman is uncharged, sheaves of oats, playing on his name, are strewn at the foot of the seal. Five of these sheaves were the arms of Candavède when the house came to display arms. In the same fashion three different members of the family of Armentières in England show one, two or three swords upon their seals, but here the writer has no evidence of a coat of arms derived from these devices.

From the beginning of the 13th century arms upon shields increase in number. Soon the most of the great houses of the west display them with pride. Leaders in the field, whether popes or kings, carry their shields, as did Charlemagne, before his shield on his war-horse. French history, having adopted this device from the custom of the time, carried it forward. One of the earliest usages was that of a custom which made shield and banner things that might be recognized in the press. Although it is probable that armorial bearings have their first place upon the shield, the charges of the shield are found displayed on the knight's long surcoat, his "coat of arms," on his banner or pennon, on the trappers of his horse and even upon the peaks of his saddle. An attempt has been made to connect the rise of armorial with the adoption of the barrel-shaped close helm; but even when wearing the earlier Norman helmet with its long nasal the knight's face was not to be recognized. The Conqueror, as we know, had to bare his head before he could persuade his men at Hastings that he still lived. Armoried a heraldic device which had long been used for personal use, and the knight's helm was said to hide the face that his friend and foe soon learned that the gold and blue checkers meant that Warne was in the field and that the gold and red war were for Ferrers. Earl Simon at Evesham sent up his barber to a spaying place and, as the barber named in turn the banners which had come up against him, he knew that his last fight was at hand. In spite of these things the growth of the custom of sealing deeds and charters had at least as much influence in the development of armorial as any military need. By this way, women and clerks, citizens and men of peace, corporations and colleges, came to share with the fighting man in the use of armorial bearings. Arms in stone, wood and brass decorated the tombs of the dead and the houses of the living; they were brodered in bed-curtains, coverlets and copes, painted on the sails of ships and enamelled upon all manner of goldsmiths' and silversmiths' work. And, even by warriors, the full splendour of armorial was at all times displayed more fully.
PART OF A ROLL OF ARMS PAINTED IN ENGLAND AT THE BEGINNING OF THE 14TH CENTURY. THE NAMES HAVE BEEN ADDRESSED BY A SOMEWHAT LATER HAND, AND ARE IN MANY CASES MISTAKEN AND MIS-SPOTTED.

in the fantastic magnificence of the tournament than in the rougher business of war.

There can be little doubt that ancient armorial bearings were chosen at will by the man who bore them, many reasons guiding his choice. Crosses in plenty were taken. Old writers have asserted that these crosses commemorate the badge of the crusaders, yet the fact that the cross was the symbol of the faith was reason enough. No symbolism can be found in such charges as bends and fessies; they are on the shield because a broad band, aslant or athwart, is a charge easily recognized.

Medieval wisdom gave every noble and magnanimous quality to the lion, and therefore this beast is chosen by hundreds of knights. We see the white lion of a Candavene play upon his name. Such an example was imitated on all sides. Salle of Bedfordshire has two salamanders saltirewise; Belet has his namesake the weasel. In ancient shields almost all beasts and birds other than the lion and the eagle play upon the bearer's name. No object is so humble that it is unwelcome to the knight seeking a pun for his shield. Trivet has a three-legged trivet; Trumpington two trumps; and Montbocher three pots. The legends which assert that certain arms were "won in the Holy Land" or granted by ancient kings are all fanciful in the field are for the most part worthless fancies.

Tenants or neighbours of the great feudal lords were wont to make their arms by differencing the lord's shield or by bringing some charge of it into their own bearings. Thus a group of Kentish shields borrow lions from that of Leyborne, which is azure with six lions of silver. Shirland of Minster bore the same arms, but with an ermine argent. Detling had the silver lions in a sable field. Rokesle's lions are azure in a golden field with a fesse of gules between them; while Wateringbury has six sable lions in a field of silver, and Timlanstone six ermine lions in a field of azure. The sinister bend or annulet is in several shields of Westmorland knights, and the chevron of Clare, the cinquefoil badge of Beaumont and the sheaves of Chester can be traced in the coats of many of the followers of those houses. Sometimes the lord himself set forth such arms in a formal grant, as when the baron of Gresley grants to Adam of Blencowe a shield in which his own three chaplets are charges. The Whigtree family of Staffordshire still show a shield granted to their ancestor in 1442 by the earl of Stafford, in which the Stafford red chevron on a golden field is four times repeated.

Differences.—By the custom of the middle ages the "whole coat," which is the undifferenced arms, belonged to one man only and was inherited whole only by his heirs. Younger branches differed in many ways, following no rule. In modern armorial the label is reckoned a difference proper only to an eldest son. But in older times, although the label was very commonly used by the son and heir apparent, he often chose another distinction during his father's lifetime, while the label is sometimes found upon the shields of younger sons. Changing the colours or varying the number of charges, drawing a bend or bastard on the shield or adding a border are common differences of coat-armories. Beauchamp, earl of Warwick, bore "Gules with a fesse and six crosses golde." His cousins are seen changing the crosses for martlets or for billets. Bastards difference their father's arms, as a rule, in no more striking manner than the legitimate cadets. Towards the end of the 14th century we have the beginning of the custom whereby certain bastards of princely houses differenced the paternal arms by charging them upon a bend, a fesse or a chief, a chevron or a quarter. Before his legitimation the eldest son of John of Gaunt by Katherine Swinford is said to have borne a shield party silver and azure with the arms of Lancaster on a bend. After his legitimation in 1397 he charged his bearings to the royal arms of France and England within a border goryony of silver and azure. Warren of Poynton, descended from the last earl Warenne and his concubine, Maud of Neirford, bore the checkered shield of Warenne with a quarter charged with the ermine lion of Neirford. By the end of the middle ages the bastard under continental influence tended to become a bastard's difference in England and the jingle of the two words may have helped to support this custom. About the same time the border gobony began to acquire unity of character. The "bar sinister" of the novelists is probably the baston sinister, with the ends cupped, which has since the time of Charles II. been familiar on the arms of certain descendants of the royal house. But it has rarely been seen in England over other shields; and, although the border gobony surrounds the arms granted to a peer of Victorian creation, the modern heralds have fallen into the habit of assigning, in nineteen cases out of twenty, a wavy border as the standard difference for illegitimacy.

Although no general register of arms was maintained it is remarkable that there was no conflict between persons who had charged to assume the same arms. The famous suit in which Scrope, Grosvenor and Carminow all claimed the blue shield with the golden bend is well known, and there are a few cases in the 14th century of like disputes which were never carried to the courts. But the men of the middle ages would seem to have had marvellous memories for blazonry; and we know that rolls of arms for reference, some of them the records of tournaments, existed in great numbers. A few examples of these remain to us, with painted shields or descriptions in French bastard, some of them containing many hundreds of names and arms.

To women were assigned, as a rule, the undifferenced arms of their fathers. In the early days of armory married women—well-born spinsters of full age were all but unknown outside the walls of religious houses—have seals on which appear the shield of the husband or the father or both shields side by side. But we have some instances of the shield in which two coats of arms are parted or, to use the modern phrase, "impaled." Early in the reign of King John, Robert de Pinkney seals with a parted shield. On the right or dexter side—the right hand of a shield is at the right hand of the person covered by it—are two fusils of an indented fesse: on the left or sinister side are three waves. The arms of Pinkney being an indented fesse, we may see in this shield the parted arms of husband and wife—the latter being probably a Basset. In many of the earliest examples, as in this, the dexter half of the husband's shield was used with the sinister half of that of the wife, both coats being, as modern antiquaries have it, dimidiated. This "dimidiation," however, had its inconvenience. With some coats it was impossible. If the wife bore arms with a quarter for the only charge, her half of the shield would be blank. Therefore the practice was early abandoned by the majority of bearers of parted shields although there is a survival of it in the fact that borders and tressures continue to be "dimidiated" in order that the charges within them shall not be crampet. Parted shields came into common use from the reign of Edward II., and the rule is established that the husband's arms should take the dexter side. There are, however, several instances of the contrary practice. On the seal (1370) of Maude, wife of John Boutetort of Halstead, the engrailed saltire of the Boutetorts takes the sinister place. A twice-married woman would sometimes show a shield charged with her paternal arms between those of both of her husbands, as did Beatrice Stafford in 1404, while in 1417 Elizabeth, Lady of Clinton, seals with a shield paled with five coats—her arms
of la Plaunche between those of four husbands. In most cases the parted shield is shown on the wife's seal alone. Even in our own time it is recognized that the wife's arms should not appear upon the husband's official seal, upon his banner or surcoat or upon his shield when it is surrounded by the collar of an order. Parted arms, it may be noted, do not always represent a husband and wife. Richard II. parted with his quartered arms of France and England those ascribed to Edward the Confessor, and parting is often used on the continent where quartering would serve in England. In 1497 the seal of Giles Daubeney and Reynold Bray, fellow justices in eyre, shows their arms parted in one shield. English bishops, by a custom begun late in the 14th century, part the see's arms with their own. By modern English custom a husband and wife, where the wife is not an heir, use the parted coat on a shield, a widow bearing the same upon the lozenge on which, when a spinster, she displayed her father's coat alone. When the wife is an heir, her arms are now borne in a little scocheon above those of her husband. If the husband's arms be in an unquartered shield the central charge is often hidden away by this scocheon.

The practice of marshalling arms by quartering spread in England by reason of the example given by Eleanor, wife of Edward I., who displayed the castle of Castile quartered with the lion of Leon. Isabel of France, wife of Edward II., seals with a shield in whose four quarters are the arms of England, France, Navarre and Champagne. Early in the 14th century Simon de Montagu, an ancestor of the earls of Salisbury, quartered with his own arms a coat of azure with a golden griffin. In 1340 we have Laurence Hastings, earl of Pembroke, quartering with the Hastings arms the arms of Valence, as heir of his great-uncle Aymer, earl of Pembroke. In the preceding year the king had already asserted his claim to another kingdom by quartering France with England, and after this quartered seal became customary in the great houses where some were carefully matched with heirs female. When the wife was an heir the husband would quarter her arms with his own, displaying, as a rule, the more important coat in the first quarter. Marshalling becomes more elaborate with shields showing both quarterings and partings, as in the seal (1368) of Sibil Arundel, where Arundel (Fitzalan) is quartered with Warenne and parted with the arms of Montagu. In all, save one, of these examples the quartering is in its simplest form, with one coat repeated in the first and fourth quarters of the shield and another in the second and third. But to a charter of 1434 Sir Henry Bromflete sets a seal upon which Bromflete quarters Vesci in the second quarter, Aton in the third and St John in the fourth, after the fashion of the much earlier seal of Edward II.'s queen. Another development is that of what armorists style the "grand quarter," a quarter which is itself quartered, as in the shield of Reynold Grey of Ruthyn, which bears Grey in the first and fourth quarters and Hastings quartered with Valentine in the third and fourth. Humphrey Bourchier, Lord Cromwell, in 1460, bears one grand quarter quartered with another, the first having Bourchier and Lovaine, the second Tattershall and Cromwell.

The last detail to be noted in medieval marshalling is the introduction into the shield of another surmounting shield called by old armorists the "innersccheon" and by modern blazoners the "inescutcheon." John the Fearless, count of Flanders, marshalled his arms in 1409 as a quartered shield of the new and old coats of Burgundy. Above these coats a little scocheon, borne over the crossing of the quartering lines, had the black lion of Flanders, the arms of his mother. Richard Beauchamp, the adventurous earl of Warwick, who had seen most European courts during his wanderings, may have had this shield in mind when, over his arms of Beauchamp quartering Newburgh, he set a scocheon of Clare quartering Despenser, the arms of his wife Isabel Despenser, co-heir of the earls of Gloucester. The seal of his son-in-law, the King-Maker, shows four quarters—Beauchamp quartering Clare, Montagu quartering Montnermer, Nevill alone, and Newburgh quartering Despenser. An interesting use of the scocheon en surtout is that made by Richard Wydville, Lord Rivers, whose garter stall-plate has a grand quarter of Wydville and Prouz quartering Beauchamp of Hache, the whole surmounted by a scocheon with the arms of Reviers or Rivers, the house from which he took the title of his barony. On the continent the common use of the scocheon is to bear the paternal arms of a sovereign or noble, surmounting the quarterings of his kingdoms, principalities, fiefs or seignories. Our own prince of Wales bears the arms of Saxony above those of the United Kingdom differentiated with his silver label. Marshalling takes its most elaborate form, the most removed from the graceful simplicity of the middle ages, in such shields as the "Great Arms" of the Austrian empire, wherein are nine grand quarters each marshalling in various fashions from three to eleven coats, six of the grand-quarters bearing scocheons en surtout, each escutcheon elaborately charged with a different crown.

Crests.—The most important accessory of the arms is the crested helm. Like the arms it has its pre-heraldic history in the crests of the Greek helmets, the wings, the wild boar's and bull's heads of Viking headpieces. A little roundel of the arms of a Japanese house was often borne as a crest in the Japanese helmet, stepped in a socket above the middle of the brim. The 17th-century seal of Philip of Alsace, count of Flanders, shows a demi-lion painted or beaten on the side of the upper part of his helm, and on his seal of 1198 our own Richard Cour de Lion's barrel-helm has a leopard upon the semicircular combridge, the edge of which is set off with feathers arranged as two wings. Crests, however, came slowly into use in England, although before 1290 Roger de Quincy, earl of Winchester, bore on his seal with a wyver upon his helm. Of the long roll of ears and barons sealing the famous letter to the pope in 1301 only five show true crests on their seals. Two of them are the earl of Lancaster and his brother, each with a wyver crest like that of Quincy. One, and the most remarkable, is John St John of Halkamer, whose crest is a leopard standing between two upright palm branches. Ralph de Montmerker has an eagle crest, while Walter de Moncy's helm is surmounted by a fox-like beast. In three of these instances the crest is borne, as was often the case, by the horse as well as the rider. Others of these seals to the barons' letter have the fan-shaped crest without any decoration upon it. But as the furniture of tournaments grew more magnificent the crest gave a new field for display, and many strange shapes appear in painted and gilded wood.

Shield of Beatrice Stafford from her seal (1404), showing her arms of Stafford between those of her husbands—Thomas, Lord Roos, and Sir Richard Burley.

Shield of John Talbot, first earl of Shrewsbury (d. 1453), showing four coats quartered.

Shield of Richard Beauchamp, earl of Warwick, from his garter stall-plate (after 1423). The arms are Beauchamp quartering Newburgh, with a scocheon of Clare quartering Despenser.
HERALDRY

metal, leather or parchment above the helms of the jousters.
The Berkeleys, great patrons of abbeys, bore a mitre as their crest painted with their arms, like crests being sometimes seen on the continent where the wearer was advocatus of a bishopric or abbey. The whole or half figures of the heads and necks of beasts and birds were employed by other families. Saracens' heads topped many helms, that of the great Chandos among them. Astley bore for his crest a silver harpy standing in marsh-sedge, a golden chain fastened to a crown about her neck. Dymoke played pleasantly on his name with a long-eared moke's scalp. Stanley took the eagle's nest in which the eagle is lighting down with a swaddled babe in his claws. Burnell had a burdock bush, la Vache a cow's leg, and Lisle's strange fancy was to perch a huge millstone on edge above his head. Many early helms, as that of Sir John Lotereil, painted in the Lotereil pastel, repeat the arms on the sides of a fan-crest. Howard bore for a crest his arms painted on a pair of wings, while simple "bushes" or feathers are seen in great plenty. The crest of a cadet is often differentiated like the arms, and thus a wyver or a leopard will have a label about its neck. The Montagu griffon on the helm of John, marquess of Montagu, holds in its beak the gimel ring with which he differentiated his father's shield. His brother, juncture of crest and helm was commonly covered, especially after the beginning of the 15th century, by a torse or "wreath" of silk, twisted with one, two or three colours. Coronets or crowns and "hats of estate" often take the place of the wreath as a badge for the crest, and there are other curious variants. With the wreath may be considered the mantle, a hanging cloth which, in its earliest form, is seen as two strips of silk or sendal attached to the top of the helm below the crest and streaming like pennants as the rider bent his head and charged. Such strips are often displayed from the conical top of an uncrested helm, and some ancient examples have the air of the two ends of a stole or of the infilade of a bishop's mitre. The general opinion of antiquaries has been that the mantle originated among the crusaders as a protection for the steel helm from the rays of an Eastern sun; but the fact that mantles take in England their fuller form after our crusading days were over seems against this theory. When the fashion for slittering the edges of clothing came in, the edges of the mantle were slittered like the edge of the sleeve or skirt, and, flourished out on either side of the helm, it became the delight of the painter of armories and the seal engraver. A worthless tale, repeated by popular manuals, makes the slittered edge represent the shearing work of the enemy's sword, a fancy which takes no account of the like developments in civil dress. Modern heraldry in England paints the mantle with the principal colour of the shield, lining it with the principal metal. This in cases where two old graces of arms cited as evidence of another usage. The mantles of the king and of the prince of Wales are, however, of gold lined with ermine and those of other members of the royal house of gold lined with silver. In ancient examples there is great variety and freedom. Where the crest is the head of a griffon or bird the feathering of the neck will be carried on to cover the mantle. Other mantles will be powdered with badges or with charges from the shield, others checkered, barred or paled. More than thirty of the mantles enamelled on the stall-plates of the medieval Garter-knights are of red with an ermine lining, tinctures which in most cases have no reference to the shields below them.

Supporters.—Shields of arms, especially upon seals, are sometimes figured as hung round the necks of eagles, lions, swans and griffins, as strapped between the horns of a hart or to the boughs of a tree. Badges may fill in the blank spaces at the sides between the shield and the inscription on the rim, but in the later 13th and early 14th centuries the commonest objects so serving are sprigs of plants, lions, leopards, or, still more frequently, boar's- or lion's-head wyverns. John of Segrave in 1301 flanks his shields with two of the sheaves of the older coat of Segrave: William Marshal of Hingham does the like with his two marshal's staves. Henry of Lancaster at the same time shows on his seal a shield and a helm crested with a wyver, with two like wyvers ranged on either side of the shield as "supporters." It is uncertain at what time in the 14th century these various fashions crystallize into the recognized use of beasts, birds, reptiles, men or inanimate objects, definitely chosen as "supporters" of the shield, and not to be taken as the ornaments suggested by the fancy of the seal engraver. That supporters originate in the decoration of the seal there can be little doubt. Some writers, the learned Memfrier among them, will have it that they were first the fantastically clad fellows who supported and displayed the knight's shield at the opening of the tournament. If the earliest supporters were wild men, angels or Saracens, this theory might be defended; but lions, boars and talbots, dogs and trees are guises into which a man would put himself with difficulty.

Ralph de Monthermer (1301), showing shield of arms, helm with crest and mantle, horse-crest and armorial trappers.
By the middle of the 14th century we find what are clearly recognizable as supporters. These, as in a lesser degree the crest, are often personal rather than hereditary, being changed generation by generation. The same person is found using more than one pair of them. The kings of France have had angels as supporters of the shield of the fleurs de lys since the 15th century, but the angels have only taken their place as the sole royal supporters since the time of Louis XIV. Sovereigns of England from Henry IV. to Elizabeth changed about between supporters of harts, leopards, antelopes, bulls, greyhounds, boars and dragons. James I. at his accession to the English throne brought the Scottish unicorn to face the English leopard rampant across his shield, and, ever since, the "lion and unicorn" have been the royal supporters.

An old herald wrote as his opinion that "there is little or nothing in precedent to direct the use of supporters." Modern custom gives them, as a rule, only to peers, to knights of the Garter, the Thistle and St Patrick, and to knights who are "Grand Crosses" or Grand Commanders of other orders. Royal warrants are sometimes issued for the granting of supporters to baronets, and, in rare cases, they have been assigned to untitiled persons. But in spite of the jealousy with which official heraldry hedges about the display of these supporters once assumed so freely, a few old English families still assert their right by hereditary prescription to use these ornaments as their forefathers were wont to use them.

**Badges.**—The badge may claim a greater antiquity and a wider use than armorial bearings. The "Plantagenet" broom is an early example in England, sprigs of it being figured on the seal of Richard I. In the 14th and 15th centuries every magnate had his badge, which he displayed on his horse-furniture, on the hangings of his bed, his wall and his chair of state, besides giving it as a "livery" to his servants and followers. Such were the knots of Stafford, Bourchier and Wake, the scabbard-crampet of La Warr, the sickle of Hungerford, the swan of Tosny, Bohun and Lancaster, the dun-bull of Nevill, the blue boar of Vere and the bear and ragged staff of Beauchamp, Nevill of Warwick and Dudley of Northumberland. So well known of all were these symbols that a political ballad of 1449 sings of the misfortunes of the great lords without naming one of them, all men understanding what signified the Falcon, the Water Bowge and the Cresset and the other badges of the doggerel. More famous still were the White Hart, the Red Rose, the White Rose, the Sun, the Falcon and Fetterlock, the Portcullis and the many other badges of the royal house. We still call those wars that blotted out the old baronage the Wars of the Roses, and the Prince of Wales's feathers are as well known to-day as the royal arms. The Flint and Steel of Burgundy make a collar for the order of the Golden Fleece.

**Mottoes.**—The motto now accompanies every coat of arms in these islands. Few of these Latin aphorisms, these bald assertions of virtue, high courage, sieges endured, loyalty have any antiquity. Some few, however, like the "Espérance" of Percy, were the war-cries of remote ancestors. "I mak' sicker" of Kirkpatrick recalls pridefully a bloody deed done on a wounded man, and the "Dieu Ayde," "Agincourt" and "D'Accomplir Agincourt" of the Irish "Montmorencys" and the English Wodehouses and Dalisons, glorious traditions based upon untrustworthy genealogy. The often-quoted running mottoes may be illustrated by that of Cust, who says "Qui Cust-odit caveat," a modern example and a fair one. Ancient mottoes as distinct from the war or gathering cry of a house are often cryptic sentences whose meaning might be known to the user and perchant to his mistress. Such are the "Plus est en vous" of Louis de Bruges, the Flemish earl of Winchester, and the "So have I cause" and "Till then thus" of two Englishmen. The word motto is of modern use, our forefathers speaking rather of their "word" or of their "reason."

**Coronets of Rank.**—Among accessories of the shield may now be counted the coronets of peers, whose present form is post-medieval. When Edward III. made dukes of his sons, gold circlets were set upon their heads in token of their new dignity. In 1385 John de Vere, marquis of Dublin, was created in the same fashion. Edward VI. extended the honour of the gold circle to earls. Caps of honour were worn with these circles or coronets, and viscounts wore the cap by appointment of James I., Vincent the herald stating that "a verge of pearls on top of the circlet of gold" was added at the creation of Robert Cecil as Viscount Cranborne. At the coronation of Charles I., the viscounts walked in procession with their caps and coronets. A few days before the coronation of Charles II. the privilege...
SIXTEEN SHIELDS FROM A ROLL OF ARMS OF ENGLISH KNIGHTS AND BARONS MADE BY AN ENGLISH PAINTER EARLY IN THE REIGN OF EDWARD III.

Drawn by William Gibb
of the cap of honour was given to the lowest rank of the peerage, and letters patent of January 1661 assign to them both cap and crown. The caps of velvet turned up with miniver, which are now always worn with the peer's coronet, are therefore the ancient caps of honour, akin to that "cap of maintenance." Worn by English sovereigns on their coronation days when walking to the Abbey Church, and borne before them on occasions of royal state.

The ancient circles were enriched according to the taste of the bearer, and, although used at creations as symbols of the rank conferred, were worn in the 14th and 15th centuries by men and women of rank without the use signifying a rank in the peerage. Edmund, earl of March, in his will of 1380, named his seal "or roses, emeraudes et rubies liliis indentes," and his descendant bequeathed it to his daughter. Modern coronets are of silver-gilt, without jewels, set upon caps of crimson velvet turned up with ermine, with a gold tassel at the top. A duke's coronet has the circle decorated with eight gold "strawberry leaves"; that of a marquess has four gold strawberry leaves and four silver balls. The coronet of an earl has eight silver balls, raised upon points, with gold strawberry leaves between the points. A viscount's coronet has on the circle sixteen silver balls, and a baron's coronet six silver balls. On the continent the modern use of coronets is regulated by the precise English fashion, men of gentile birth displaying coronets which afford but slight indication of the bearer's rank.

Lines.—Eleven varieties of lines, other than straight lines, which divide the shield, or edge our chevrons, pales, bars and the like, are pictured in the heraldry books and named as engrailed, embattled, indented, invected, wavy or undy, nebuly, dancetty, raguly, potenté, dovetailed and urdy. As in the case of many other such lists of the later armorists these eleven varieties need some pruning and a new explanation.

The most commonly found is the line engrailed, which for the student of heraldry must be associated with the line indented. In its earliest form the line which a roll of arms would describe indifferently as indented or engrailed takes almost invariably the form to which the name indented is restricted by modern armorists.

The cross may serve as our first example. A cross, engraved or indented, the words being used indifferently, is a cross so deeply notched at the edges that it seems made up of so many lozenge-shaped wedges or fusils. About the middle of the 14th century begins a tendency, resisted in practice by many conservative families, to draw the engrailed lines with a slight gap or rise between the teeth, or what modern armorists restrict the word "engrailed," making shallower indentures in the form of lines of half circles. Thus the engrailed cross of the Mohuns takes either of the two forms which we illustrate. Bends follow the same fashion, early bends engraved or indented being some four or more fusils joined bendwise by their blunt sides, bends of less than four fusils being very rare. Thus also the engraved or indented saltires, pales or chevrons, the exact number of the fusils which go to the making of these being unconsidered. For the fesse there is another law. The fesse indented or engraved is made up of fusils as is the engraved bend. But although early rolls of arms sometimes neglect this detail in their blazon, the fusils making a fesse must always be of an ascertained number. Montagu, earl of Salisbury, bore a fesse engraved or indented of three fusils only, very few shields having with this Medieval armorists will describe his arms as a fesse indented of three indentures, as a fesse fusilie of three pieces, or as a fesse engraved of three points or pieces, all of these blazons having the same value. The indented fesse on the red shield of the Dynhams has four such fusils of ermine. Four, however, is almost as rare a number as three, the normal form of a fesse indented being that of five fusils as borne by Percys, Pinkneys, Newmarches and many other ancient houses. Indeed, accuracy of blazon is served if the number of fusils in a fesse be named in the cases of threes and fours. Fusses of six fusils are not to be found. Note that bars indented or engrailed are, for a reason which will be evident, never subject to this curving of fusils. Fauconberg, for example, bore "Silver with two bars engrailed, or indented, sable." Displayed on a shield of the flat-iron outline, the lower bar would show fewer fusils than the upper, while on a square banner each bar would have an equal number—usually five or six.

While bends, cheverons, crosses, saltieres and pales often follow, especially in the 15th century, the tendency towards the round "engrailing" fusses keep, as a rule, their bold indentures—neither Percy nor Montagu nor any other family being ever found with his bearings in aught but their ancient form. Borders take the newer fashion as leaving more room for the charges of the field. But indented chiefs do not change their fashion, although many saw-teeth sometimes take the place of the three or four strong points of early arms, and parti-coloured shields whose party line is indented never lose the bold zig-zag.

While bearing in mind that the two words have no distinctive force in ancient armorry, the student and the herald of modern times may conveniently allow himself to blazon the sharp and saw-toothed line as "indented" and the scolloped line as "engrailed," especially when dealing with the debased armorry in which the distinction is held to be a true one and one of the first importance. One error at least he must avoid, and that is the following of the heraldry-book compilers in their use of the word "dancyet." A "dancyet" line, we are told, is a line having fewer and deeper indentures than the line indented. But no dancyet line could make a bolder dash across the shield than do the lines which the old armorists recognized as "indented." In old armorry we have fessy dancy—commonly called "dances"—bends dancy, or cheverons dancy, or fesse dancy; there are no chiefs dancy nor bordures dancy, nor are there shields blazoned as parted with a dancyet line. Waved lines, battled lines and ragged lines need little explanation that a picture cannot give. The word invecked or invected is sometimes applied by old-fashioned heraldic pedants to engraved lines; later pedants have given it to a line found in modern grants of arms, an engraved line reversed. Dove-tailed and urdy lines are mere modernisms. Of the very rare nebuly or clouded line we can only say that the ancient form, which imitated the conventional cloud-bank of the old painters, is now almost forgotten, while the bold "wavy" lines of early armorry have the word "nebuly" misapplied to them.

The Ordinary Charges.—The writers upon armorry have given the name of Ordinaries to certain conventional figures commonly charged upon shields. Also they affect to divide these into Honourable Ordinaries and Sub-Ordinaries without explaining the reason for the superior honour of the Saltire or for the subordination of the Quarter. Disregarding such distinctions, we may begin with the description of the "Ordinaries" most commonly to be found.

From the first the Cross was a common bearing on English shields, "Silver a cross gules" being given early to St George, patron of knights and of England, for his arms; and under St George's red cross the English were wont to fight. Our armorial crosses took many shapes, but the "crosses innumerabilis" of the Book of St Albans and its successors may be left to the heraldic dictionary makers who have devised them. It is more
important to define those forms in use during the middle ages, and to name them accurately after the custom of those who bore them in war, a task which the heraldry books have never as yet attempted with success.

The cross in its simple form needs no definition, but it will be noted that it is sometimes borne “voided” and that in a very few cases it appears as a lesser charge with its ends cut off square, in which case it must be clearly blazoned as “a plain Cross.”

Andrew Harcla, the march-warden, whom Edward II. made an earl and executed as a traitor, bore the arms of St George with a martlet sable in the quarter.

Crevequer of Kent bore “Gold a voided cross gules.”

Newcom (14th century) bore “Azure a fesse silver with three plain crosses gules.”

Next to the plain Cross may be taken the Cross paty, the cross pâle or pale of old rolls of arms. It has several forms, according to the taste of the artist and the age. So, in the 13th and early 14th centuries, its limbs curve out broadly, while at a later date the limbs become more slender and of even breadth, the ends somewhat resembling fleurs-de-lys. Each of these forms has been seized by the heraldic writers as the type of a distinct cross for which a name must be found, none of them, as a rule, being recognized as a cross paty, a word which has its misappli-

![Diagram of Heraldry Symbols]

tion elsewhere. Thus the books have “cross patonce” for the earlier ones, while “cross clecheé” and “cross fleury” serve for the others. But the true identification of the various crosses is of the first importance in the antiquity, since without it descriptions of the arms on early seals or monuments must needs be valueless. Many instances of this need might be cited from the British Museum catalogue of seals, where, for example, the cross paty of Latimer is described twice as a “cross floré,” six times as a “cross patonce,” but not once by its own name, although there is no better known example of this bearing in England.

Latimer bore “Gules a cross paty gold.”

The cross formy follows the lines of the cross paty save that its broadening ends are cut off squarely.

Chetwode bore “Quarterly silver and gules with four crosses formy countercolored.” That is to say, the two crosses in the gules are of silver and the two in the silver of gules.

The cross flory or flowered cross, the “cross with the ends flowered”—_ad les boutes florées_ as some of the old rolls have it—is, like the cross paty, a mark for the misapprehension of writers on armory, who describe some shapes of the cross paty by its name. Playing upon discovered or fancied variants of the word, they bid us mark the distinctions between crosses “fleur-de-lisée,” “fleurée” and “fleurtée,” although each author has his own version of the value which must be given these precious words. But the facts of the medieval practice are clear to those who take their armory from ancient examples and not from phrases plagiarized from the hundredth plagiator. The flowered cross is one whose limbs end in fleur-de-lys, which spring sometimes from a knob or bud but more frequently issue from the square ends of a cross of the “formy” type.

Mill-rinds.

Mill-rind for a charge having the same origin but of somewhat differing form. Since this charge became common in Tudor armory it is perhaps better that the original mill-rind should be called for distinction a mill-rind cross.

Willoughby bore “Gules a mill-rind cross silver.”

The crosslet, cross bottony or cross crosetted, is a cross whose limbs, of even breadth, end as trefoils or treble buds. It is rarely found in medieval examples in the shape—that of a cross with limbs ending in squarely cut plain crosses—which it took during the 16th-century decadence. As the sole charge of a shield it is very rare; otherwise it is one of the commonest of charges.

Brerelegh bore “Silver a crosslet gules.”

Within these modest limits we have brought the greater part of that monstrous host of crosses which cumber the dictionaries. A few rare varieties may be noticed.

Dukinfield bore “Silver a voided cross with sharpened ends.”

Skirlaw, bishop of Durham (d. 1406), the son of a basket-weaver, bore “Silver a cross of three upright wattles sable, crossed and interwoven by three more.”

Drury bore “Silver a chief vert with a St Anthony’s cross gold between two golden molets, pierced gules.”

Bryton bore “Gold a patriarch’s cross set upon three degrees or steps of gules.”

Hurlestone of Cheshire bore “Silver a cross of four ermine tails sable.”

Melton bore “Silver a Toulouse cross gules.” By giving this cross a name from the counts of Toulouse, its best-known bearers, some elaborate blazonry is spared.

The crosses paty and formy and, more especially the crosslets, are often borne fitchy, that is to say, with the lower limb somewhat lengthened and ending in a point, for which reason the 15th-century writers call these “crosses fixabil.” In the 14th-century rolls the word “potent” is sometimes used for these crosses fitchy, the long foot suggesting a potent or staff. From this source modern English armoryists derive many of their “crosses potent,” whose four arms have the T heads of old-fashioned walking staves.

Howard bore “Silver a bend between six crosslets fitchy gules.”

Scott of Congerhurst in Kent bore “Silver a crosslet fitchy sable.”

The Saltire is the cross in the form of that on which St Andrew suffered, whence it is borne on the banner of Scotland, and by the Andrew family of Northamptonshire.

Nevile of Raby bore “Gules a saltire silver.”

Nicholas Upton, the 15th-century writer on armory, bore “Silver a saltire sable with the ends couped and five golden rings thereon.”
HERALDRY

Aynho bore "Sable a saltries silver having the ends flowered between four leopards gold."

"Mayster Elwett of Yorke chyre" in a 15th-century roll bears "Silver a saltries of chains sable with a crescent in the chief."

Restwalde bore "Party saltirewise of gules and ermine."

The chief is the upper part of the shield and, marked out by a line of division, it is taken as one of the Ordinaries. Shields with a plain chief and no more are rare in England, but Tichborne of Tichborne has borne since the 13th century "Vair a chief gold." According to the heraldry books the chief should be marked off as a third part of the shield, but its depth varies, being broader when charged with devices and narrower when, itself uncharged, it surmounts a charged field. Fenwick bore "Silver a chief gules with six martlets countercoloured," and in this case the chief would be the half of the shield. Clinging to the belief that the chief must not fill more than a third of the shield, the heraldry books abandon the word in such cases, blazoning them as "party per fesse."

Hastang bore "Azure a chief gules and a lion with a forked tail over all."

Walter Kingston seals in the 13th century with a shield of "Two rings or annulets in the chief."

Hilton of Westmorland bore "Sable three rings gold and two saltries silver in the chief."

With the chief may be named the Foot, the nether part of the shield marked off as an Ordinary. So rare is this charge that we can cite but one example of it, that of the shield of John of Skipton, who in the 14th century bore "Silver with the foot indented purple and a lion purple." The foot, however, is a recognized bearing in France, whose heralds gave it the name of chamfron.

The Pale is a broad stripe running the length of the shield. Of a single pale and of three pales there are several old examples. Four red pales in a golden shield were borne by Eleanor of Provence, queen of Henry III.; but the number did not come itself to English armorists. When the field is divided evenly into six pales it is said to be paly; if into four or eight pales, it is blazoned as paly of that number of pieces. But paly of more or less than six pieces is rarely found.

The Yorkshire house of Gascoigne bore "Silver a pale sable with a golden conger’s head thereon, cut off at the shoulder."

Ferlington bore "Gules three pales vair and a chief gold."

Strelley bore "Paly silver and azure."

Rothinge bore "Paly silver and gules of eight pieces."

When the shield or charge is divided palewise down the middle into two tinctures it is said to be "party." "Party silver and gules" are the arms of the Waldegraves. Bermingham bore "Party silver and sable indented." Caldecote bore "Party silver and azure with a chief gules." Such partings of the field often cut through charges whose colours change about on either side of the parting line. Thus Chaucer the poet bore "Party silver and gules with a bend countercoloured."

The Fesse is a band athwart the shield, filling, according to the rules of the heraldic writers, a third part of it. By ancient use, however, as in the case of the chief and pale, its width varies with the taste of the painter, narrowing when set in a field full of charges and broadening when charges are displayed on itself.

When two or three fesses are borne they are commonly called Bars. "Ermine four bars gules" is given as the shield of Sir John Sully, a 14th-century Garter knight, on his stall-plate at Windsor: but the plate belongs to a later generation, and should probably have three bars only. Little bars borne in couples are styled Gules (twins). The field divided into an even number of bars of alternate colours is said to be barry,

barry of six pieces being the normal number. If four or eight divisions be found the number of pieces must be named; but with ten or more divisions the number is reckoned and "barely" is the word.

Colevile of Bitham bore "Gold a fesse gules." West bore "Silver a dancette (or fesse dancy) sable." Fauconberg bore "Gold a fesse azure with three pales gules in the chief.

Cayvile bore "Silver a fesse gules, flowered on both sides."

Devereux bore "Gules a fesse silver with three roundels silver in the chief."

Chamberlayne of Northamptonshire bore "Gules a fesse and three scallop gold."

Harcourt bore "Gules two bars gold."

Manners bore "Gold two bars azure and a chief gules."

Wake bore "Gold two bars gules with three roundels gules in the chief."

Bussy bore "Silver three bars sable."

Badlesmere of Kent bore "Silver a fesse between two gules gules."

Melsanby bore "Sable two gules and a chief silver."

Grey bore "Barry of silver and azure."

Fitzalan of Bedale bore "Barry of eight pieces gold and gules."

Stuteville bore "Barely of silver and gules."
The Bend is a band traversing the shield aslant, arms with one, two or three bends being common during the middle ages in England. Bendy shields follow the rule of shields paly and harry, but as many as ten pieces have been counted in them. The bend is often accompanied by a narrow bend on either side, these companions being called Cotises. A single narrow bend, struck over all other charges, is the Baston, which during the 13th and 14th centuries was a common difference for the shields of the younger branches of a family, coming in later times to suggest itself as a difference for bastards.

The Bend Sinister, the bend drawn from right to left beginning at the "sinister" corner of the shield, is reckoned in the heraldry books as a separate Ordinary, and has a peculiar significance accorded to it by novelists. Medieval English seals afford a group of examples of Bends Sinister and Bastons Sinister, but there seems no reason for taking them as anything more than cases in which the artist has neglected the common rule.

Manley bore "Gold a bend sable."
Harley bore "Gold a bend with two cotices sable."
Wallop bore "Silver a bend wavy sable."
Ralegh bore "Gules a bend indented, or engrailed, sable."

Bodrugan bore "Gules three bends sable."
St Philibert bore "Bendy of six pieces, silver and azure."
Basset bore "Bendy of six pieces, gold and azure, with a quarter ermine."
Montfort of Whitchurch bore "Bendy of ten pieces gold and azure."

Henry of Lancaster, second son of Edmund Crouchback, bore the arms of his cousin, the king of England, with the difference of "a baston azure."

Adam Fraunceys (14th century) bore "Party gold and sable bendwise with a lion countercoloured." The parting line is here commonly shown as "sinister."

The Cheveron, a word found in medieval building accounts for the barge-boards of a gable, is an Ordinary whose form is explained by its name. Perhaps the very earliest of English armorial charges, and familiarized by the shield of the great house of Clare, it became exceedingly popular in England. Like the bend and the chief, its width varies in different examples. Likewise its angle varies, being sometimes so acute as to touch the top of the shield, while in post-medieval armorry the point is often blunted beyond the right angle. One, two or three chevrons occur in numberless shields, and five chevrons have been found. Also there are some examples of the bearing of cheveronny.

The earls of Gloucester of the house of Clare bore "Gold three cheverons gules." and the Staffords derived from them their shield of "Gold a chevron gules."
Chaworth bore "Azure two chevronny of ermine and gules."
Peytevyn bore "Chevronny of ermine and gules."
St Quintin of Yorkshire bore "Gold two chevronny of ermine and a chief vair."
Sheffield bore "Ermine a chevronny of ermine and gules between two sheaves gulf."
Cobham of Kent bore "Gules a chevron gold with three fleurs-de-lys azure thereon."
Fitzwalter bore "Gold a fesse between two chevronny of gules."

Shields parted chevronny are common in the 15th century, when they are often blazoned as having chiefs "enty" or "ete," or "be," or "fe," or "e," or "e." When the case or stave (estache) is a wedge-shaped figure jutting from the chief to the foot of the shield, it name allied to the pile of the bridge-builder. A single pile is found in the notable arms of Chandas, and the black piles in the ermine shield of Hollis are seen as an example of the bearing of two piles. Three piles are more easily found, and when more than one is represented the points are brought together at the foot. In ancient armoury piles in a shield are sometimes reckoned as a variety of pales, and a Basset with three piles on his shield is seen with three pales on his square banner.

Tuchin bore "Gold a pile gules."
Cobham bore "Gold three piles azure."

The Quarter is the space of the first quarter of the shield divided crosswise into four parts. As an Ordinary it is an ancient charge and a common one in medieval England, although it has all but disappeared from modern heraldry books, the "Canton," an alleged "diminutive," unknown to early armorry, taking its place. Like the other Ordinaries, its size is found to vary with the scheme of the shield's charges, and this has persuaded those armorists who must needs call a narrow bend a "bendlet," to the invention of the "Canton," a word which in the sense of a quarter or small quarter appears for the first time in the latter part of the 15th century. Writers of the 14th century sometimes give it the name of the Cantel, but this word is also applied to the void space on the opposite side of the chief, seen above a bend.

SHIELDS OF ARMS OF "LE ROY DARRABE," "LE ROY DE TARSSE," AND OTHER SOVEREIGNS, MOSTLY MYTHICAL, TAKEN FROM A ROLL OF ARMS MADE BY AN ENGLISH PAINTER IN THE TIME OF HENRY VI.

Drawn by William Gibb.
Heraldry

addition of "a bend sable with three silver scallops thereon." Philp, Lord Bardolf, bore "Quarterly gules and silver with an eagle gold in the quarter."

With the 15th century came a fashion of dividing the shield into more than four squares, six and nine divisions being often found in arms of that age. The heraldry books, eager to work out problems of blazonry, decide that a shield divided into six squares should be described as "Party per fesse with a pale counterchanged," and one divided into nine squares as bearing "a cross quarter-pierced." It seems a simpler business to follow a 15th-century fashion and to blazon such shields as being of six or nine "pieces." Thus John Garth (15th century) bore "Nine pieces ermine and ermine," and Whitgreave of Staffordshire "Nine pieces of azure and of Stafford's arms, which are gold with a chevron gules." The Tallow Chandlers of London had a grant in 1456 of "Six pieces azure and silver with three doves in the azure, each with an olive sprig in her bezel."

Squared into more than nine squares the shield becomes checky or checkered and the number is not reckoned. Warene's checker of gold and azure is one of the most ancient coats in England and checkered fields and charges follow in great numbers. Even lions have been borne checkered.

Warene bore "Checky gold and azure." Clifford bore the like with "a fesse gules." Cobham bore "Silver a lion checky gold and sable." Arderne bore "Ermine a fesse checky gold and gules."

Such charges as this fesse of Arderne's and other checkered fesses, bars, bends, borders and the like, will commonly bear but two rows of squares, or three at the most. The heraldry writers are ready to note that when two rows are used "counter-compy" is the word in place of checky, and "compy-counter-compy" in the case of three rows. It is needless to say that these words have neither practical value nor antiquity to commend them. But bends and bastons, labels, borders and the rest are often coloured with a single row of alternating tinctures. In this case the pieces are said to be "gobony." Thus John Cromwell (14th century) bore "Silver a chief gules with a bastard gobony of gold and azure."

The scocheon or shield used as a charge is found among the earliest arms. Itself charged with arms, it served to indicate alliance by blood or by tenure with another house, as in the bearings of St Owen whose shield of "Gules with a cross silver" has a scocheon of Clare in the quarter. In the latter half of the 15th century it plays an important part in the curious marshalling of the arms of great houses and lordships.

Erpingham bore "Vert a scocheon silver with an orle (or border) of silver martlets." Davillers bore at the battle of Boroughbridge "Silver three scocheons gules."

The scocheon was often borne voided or pierced, its field cut away to a narrow border. Especially this was the case in the far North, where the Balliols, who bore such a voided scocheon, were powerful. The voided scocheon is wrongly named in all the heraldry books as an orle, a term which belongs to a number of small charges set round a central charge. Thus the martlets in the shield of Erpingham, already described, may be called an orle of martlets or a border of martlets. This misnaming of the voided scocheon has caused a curious misapprehension of its form, even Dr Woodward, in his Heraldry, British and Foreign, describing the "orle" as "a narrow border detached from the edge of the shield." Following this definition modern armorial artists will, in the case of quartered arms, draw the "orle" in a first or second quarter of a quartered shield as a rectangular figure and in a third or fourth quarter as a scalene triangle with one arcaded side. Thereby the original voided scocheon changes into forms without meaning.

Balliol bore "Gules a voided scocheon silver." Surtees bore "Ermine with a quarter of the arms of Balliol."

The Treasure or flowered treasure is a figure which is correctly described by Woodward's incorrect description of the orle as cited above, being a narrow inner border of the shield. It is distinguished, however, by the fleurs-de-lys which decorate it, setting off its edges. The double treasure which surrounds the lion in the royal shield of Scotland, and which is borne by many Scottish houses who have served their kings well or mated with their daughters, is carefully described by Scottish heralds as "flowered and counter-flowered," a blazon which is held to mean that the fleurs-de-lys show head and tail in turn from the outer rim of the outer treasure and from the inner rim of the innermost. But this seems to have been no essential matter with medieval armorists and a curious 15th-century enamelled roundel of the arms of Vampage shows that in this English case the flowering takes the more convenient form of allowing all the lily heads to sprout from the outer rim.

Vampage bore "Azure an eagle silver within a flowered treasure silver." The king of Scots bore "Gules a lion within a double treasure flowered and counterflowered gules."

Felton bore "Gules two lions passant within a double treasure florid silver."

The Border of the shield when marked out in its own tincture is counted as an Ordinary. Plain or charged, it was commonly used as a difference. As the principal charge of a shield it is very rare, so rare that in most cases where it apparently occurs we may, perhaps, be following medieval custom in blazoning the shield as one charged with a scocheon and not with a border. Thus Hondecote bore "Ermine a border gules" or "Gules a scocheon ermine."

Somerville bore "Barely silver and gules and a border azure with golden martlets."

Paynel bore "Silver two bars sable with a border, or, of martlets gules."

The Flaunches are the flanks of the shield which, cut off by rounded lines, are borne in pairs as Ordinaries. These charges are found in many coats devised by 15th-century armorists.
"Ermine two flaunches azure with six golden wheat-ears" was borne by John Greyby of Oxfordershire (15th century).

The Label is a narrow fillet across the upper part of the chief, from which hang three, four, five or more pendants, the pendants being, in most old examples, broader than the fillet. Reckoned with the Ordinarys, it was commonly used as a means of differentiating a cadet's shield, and in the heraldry books it has become the accepted difference for an eldest son, although the cadets often bore it in the middle ages. John of Hastings bore in 1300 before Carlaverock "Gold a sleeve (or maunch) gules," while Edmund his brother bore the same arms with a sable label. In modern armory the pendants are all but invariably reduced to three, which, in debased examples, are given a dovetailed form while the ends of the fillet are cut off.

The Fret, drawn as a voided lozenge interlaced by a slender saltire, is counted an Ordinary. A charge in such a shape is extremely rare in medieval armory, its ancient form when the field is covered by it being a number of bastons—three being the customary number—interlaced by as many more from the sinister side. Although the whole is described as a fret in certain English blazons of the 15th century, the adjective "fretty" is more commonly used. Trussel's fret is remarkable for its bezants at the joints, which stand, doubtless, for the golden nail-heads of the "trellis" suggested by his name. Curwen, Wyville and other northern houses bearing a fret and a chief have, owing to their fashion of drawing their frets, often seen them changed by the heraldry books into "three chevronettes or interlaced."

Huddleston bore "Gules fretty silver."

Trussel bore "Silver fretty gules, the joints bezants."

Hugh Giffard (14th century) bore "Gules with an engrafted fret of ermine."

Wyville bore "Gules fretty vair with a chief gold."

Boxhill bore "Gold a lion azure fretty silver."

Another Ordinary is the Giron or Gyron—a word now commonly mispronounced with a hard "g." It may be defined as the lower half of a quarter which has been divided bendwise. No old example of a single giron can be found to match the figure in the heraldry books. Gironny, or grymonny, is a manner of dividing the field into sections, by lines radiating from a centre point, of which many instances may be given. Most of the earlier examples have some twelve divisions although later armory gives eight as the normal number, as Campbell bears them.

Bassingbourne bore "Gironny of gold and azure of twelve pieces."

William Stoker, who died Lord Mayor of London in 1484, bore "Gironny of six pieces azure and silver with three poppies in the silver pieces."

A pair of gironys on either side of a chief were borne in the strange shield of Mortimer, commonly blazoned as "Barry azure and gold of six pieces, the chief azure with two pales and two gironys gold, a scocheon silver over all." An early example shows that this shield began as a plain field with a gobony border.

With the Ordinaries we may take the Roundels or Pellets, disks or balls of various colours. Ancient custom gives the name of a bezant to the golden roundel, and the folly of the heraldic writers has found names for all the others, names which may be disregarded together with the belief that, while bezants and silver roundels, as representing coins, must be pictured with a flat surface, roundels of other hues must needs be shaded by the painter to represent rounded balls. Rings or Annelets were common charges in the North, where Lowthers, Musgraves and many more, differed the six rings of Vipont by bearing them in various colours.

Burlay of Wharfside bore "Gules a bezant."

Caraunt bore, "Silver three roundels azure, each with three chevronettes gules."

Vipont bore "Gules six annels gules."

Avenel bore "Silver a fesse and six annelets (annelets) gules."

Hawberke of Stapleford bore "Silver a bend sable charged with three pieces of a mail hauberk, each of three linked rings of gold."

Stouton bore "Sable a bend gold between six fountains.

The Lozenge is linked in the heraldry book with the Fusil. This Fusil is described as a lengthened and sharper lozenge. But it will be understood that the Fusil, other than as part of an engrafted or indented bend, pale or fesse, is not known to true armory. Also it is one of the notable achievements of the English writers on heraldry that they should have allotted to the lozenge, when borne voided, the name of Mascel. This "mascel" is the word of the oldest armorists for the unvoided charge, the voided being sometimes described by them as a lozenge, without further qualifications. Fortunately the difficulty can be solved by following the late 14th-century custom in distinguishing between "lozenges" and "voided lozenges" and by abandoning altogether this misleading word Mascel.

Thomas of Merstone, a clerk, bore on his seal in 1359 "Ermine a lozenge with a pierced molet thereon."

Braybrooke bore "Silver seven voided lozenges gules."

Charles bore "Ermine a chief gules with five golden lozenges thereon."

Fitzwilliam bore "Lozengy silver and gules."

Billots are oblong figures set upright. Black billots in the arms of Delves of Cheshire stand for "delves" of earth and the gads of steel in the arms of the London Ironmongers' Company took a somewhat similar form.
Sir Ralph Mounchensy bore in the 14th century "Silver a chevron between three billets sable.

Haggerston bore "Azure a bend with cotises silver and three billets sable on the bend."

With the Billet, the Ordinaries, uncertain as they are in number, may be said to end. But we may here add certain armorial charges which might well have been counted with them.

First of these is the Molet, a word corrupted in modern heraldry to Mullet, a fish-like change with nothing to commend it. This figure is as a star of five or six points, six points being perhaps the commonest form in old examples, although the sixth point is, as a rule, lost during the later period. Medieval armorists are not, it seems, inclined to make any distinction between molets of five and six points, but some families, such as the Harpedens and Ashethons, remained constant to the five-pointed form. It was generally borne pierced with a round hole, and then represents, as its name implies, the rowel of a spur. In ancient rolls of arms the word Rowel is often used, and probably indicated the pierced molet. That the piercing was reckoned an essential difference is shown by a roll of the time of Edward II., in which Sir John of Pabenham bears "Barry azure and silver, with a bend gules and three molets gold thereon," arms which Sir John his son differs by piercing the molets. Beside these names is that of Sir Walter Baa with "Guules a chevron and three rowels silver," which are shown on seals of the family bears, probably an older bearing than the molet, which would be popularized when the rowelled spur began to take the place of the prick-spur, is the Star or Estolte, differing from the molet in that its five or six points are wavy. It is possible that several star bearings of the 13th century were changed in the 14th for molets. The star is not pierced in the fashion of the molet; but, like the molet, it tends to lose its sixth point in armory of the decadence. Suns, sometimes blazoned in old rolls as Sunnis—rayes de soleil—are pictured as unpierced molets of many points, which in rare cases are waved.

Harpeden bore "Silver a pierced molet gules."

Pabenham bore "Gold a chief sable with two molets pierced gules."

Grimston bore "Silver a sable and thereon three molets silver pierced gules."

Ingleby of Yorkshire bore "Sable a star silver.

Sir John de la Haye of Lincolnshire bore "Silver a sun gules."

The Crescent is a charge which has to answer for many idle tales concerning the crusading ancestors of families who bear it. It is commonly borne with both points uppermost, but when representing the waning or the waxing moon—decrescent or increcent—its horns are turned to the sinister or dexter side of the shield.

Peter de Marines (13th century) bore on his seal a shield charged with a crescent in the chief.

William Cobion (14th century) bore "A bend between two waxing moons."

Longchamp bore "Ermine three crescents gules, pierced silver."

Tinctures.—The tinctures or hues of the shield and its charges are seven in number—gold or yellow, silver or white, red, blue, black, green and purple. Medieval custom gave, according to a rule often broken, "gules," "azure" and "sable" as more high-sounding names for the red, blue and black. Green was often named as "vert," and sometimes as "gynobill," a word which as "sinepl" is used to this day by French armorists. The song of the siege of Carlavocker and other early documents have red, gules or "vermeele," sable or black, azure or blue, but gules, azure, sable and vert came to be recognized as armorists' adjectives, and an early 15th-century romance discards the simple words deliberately, telling us of its hero that "His shield was black and blue, sans fable. Barred of azure and of sable."

But gold and silver served as the armorists' words for yellows and whites until late in the 16th century, when, gold and silver made way for "or" and "argent," words which those for whom the interest of armory lies in its liveliest days will not be eager to accept. Likewise the colours of "sanguine" and "tennè" brought in by the pedants to bring the tinctures to the mystical number of nine may be disregarded.

A certain armorial chart of the duchy of Brabant, published in 1600, is the earliest example of the practice whereby later engravers have indicated colours in uncoloured plates by the use of lines and dots. Gold is indicated by a poudering of dots; silver is left plain. Azure is shown by horizontal shading lines; gules by upright lines; sable by cross-hatching of upright and horizontal lines. Diagonal lines from sinister to dexter indicate purple; vert is marked with diagonal lines from dexter to sinister. The practice, in spite of a certain convenience, has been disastrous in its cramping effects on armorial art, especially when applied to seals and coins.

Besides the two "metals" and five "colours," fields and charges are varied by the use of the furs ermine and vair. Ermine is shown by a white field flecked with black ermine tails, and vair by a conventional representation of a fur of small skins sewn in rows, white and blue skins alternately. In the 15th century there was a popular variant of ermine, white tails upon a black field. To this fur the books now give the name of "ermynes"—a most unfortunate choice, since ermines is a name used in old documents for the original ermine. "Ermines," which has at least a 13th-century authority, will serve for those who are not content to speak of "sable ermined with silver." Vair, although silver and blue be its normal form, may be made up of gold, silver or ermine, with sable gules or vert, but in these latter cases the colours must be named in the blazon. To the vairs and ermines of old use the heraldry books have added "erminois," which is a gold field with black ermine tails, "pean," which is "erminois" reversed, and "erminites," which is ermine with a single red hair on either side of each black tail. The vairs, mainly by misunderstanding of the various patterns found in old paintings, have been amplified with "countervair," "potent," "counter-potent" and "vair-en-point," no one of which merits description.

No shield of a plain metal or colour has ever been borne by an Englishman, although the knights at Carlavocker and Falkirk saw Amianu d'Albret with his banner all of red having no charge thereon. Plain ermine was the shield of the duke of Brittany and no Englishman challenged the bearing. But Beauchamp of Hatch bore simple vair, Ferrers of Derby "Vairy gold and gules," and Ward "Vairy silver and sable." Gresley had "Vairy ermine and gules," and Beche "Vairy silver and gules."

Only one English example has hitherto been discovered of a field covered not with a fur but with overlapping feathers. A 15th-century book of arms gives "Plumetti of gold and purple" for "Myldam in Coverdale."

Drope of various colours which variegate certain fields and charges are often mistaken for ermine tails when ancient seals are deciphered. A simple example of such spattering is in the shield of Grayndore, who bore "Party ermine and vert, the vert
dropped with gold.” Sir Richard le Brun (14th century) bore “Azure a silver lion dropped with gules.”

A very common variant of charges and fields is the sowing or “powdering” them with a small charge repeated many times. Mortimer of Norfolk bore “gold powdered with fleurs-de-lys sable” and Edward III. quartered for the old arms of France “Azure powdered with fleurs-de-lys gold,” such fields being often described as flowered or flory. Golden billets were scattered in Cowdray’s red shield, which is blazoned as “Gules billety gold,” and bezants in that of Zouche, which is “Gules bezanty with a quarter ermine.” The disposition of such charges varied with the users. Zouche as a rule shows ten bezants placed four, three, two and one on his shield, while the old arms of France in the royal coat allows the pattern of flowers to run over the edge, the shield border thus showing halves and tops and stalk ends of the fleurs-de-lys. But the commonest of these powderings is that with crosses, as in the arms of John la Warr “Gules crusily silver with a silver lion.”

Trees, Leaves and Flowers.—Sir Stephen Cheyndut, a 13th-century knight, bore an oak tree, the cheyne of his first syllable, while for like reasons a Fitzjon had a pear on his shield. Three pears were borne (temp. Edward III.) by Nicholas Stivecle of Huntingtonshire, and about the same date is Applegarth’s shield of three red apples in a silver field. Leaves of burdock are in the arms (14th century) of Sir John de Lisle and mulberry leaves in those of Sir Hugh de Morieux. Three roots of trees are given to one Richard Rotour in a 14th-century roll. Malherbe (13th century) bore the “evil herb”—a leatly bush. Pineapples are borne here and there, and it will be noted that armorists have not surrendered this, our ancient word for the “fir-cone,” to the foreign ananas. Out of the cornfield English armory took the sheaf, three sheaves being on the shield of an earl of Chester early in the 13th century and Sheffield bearing sheaves for a play on his name. For a like reason Peverel’s sheaves were sheaves of pepper. Rye bore three ears of rye on a bend, and Grindorge had barley-ears. Flowers are few in this field of armory, although lilies with their stalks and leaves are in the grant of arms to Eton College. Ossethorpe has water flowers, and now and again we find some such strange charges as those in the 13th-century shield of Thomas Porthelyne who bore “Sable a chevron gules between three poppycobles, or poppy-heads vert.”

The fleur-de-lys, a conventional form from the beginnings of armory, might well be taken amongst the “ordinaries.” In England as in France it is found in great plenty. Aguylon bore “Gules a fleur-de-lys silver.” Peyféré bore “Silver three fleur-de-lys sable.”

Trefoils are very rarely seen until the 15th century, although Hervey has them, and Gausill, and a Bosville coat seems to have borne them. They have always their stalk left hanging to them. Vincent, Hatfield and Massingberd all bore the quatrefoil, while the Bardolfs, and the Quincys, earls of Winchester, had cinquefoils. The old rolls of arms made much confusion between cinquefoils and sixfoils (quietafoiles e sixfoiles) and the rose. It is still uncertain how far that confusion extended amongst the families which bore these charges. The cinquefoil and sixfoil, however, are all but invariably pierced in the middle like the spur rowel, and the rose’s blunt-edged petals give it definite shape soon after the decorative movement of the Edwardian age began to carve natural buds and flowers in stone and wood.

Hervey bore “Gules a bend silver with three trefoils vert thereon.” Vincent bore “Azure three quatrefoils silver.”

Beasts and Birds.—The book of natural history as studied in the middle ages lay open at the chapter of the lion, to which royal beast all the noble virtues were set down. What is the oldest armorial seal of a sovereign prince as yet discovered bears the rampant lion of Flanders. In England we know of no royal shield earlier than that first seal of Richard I. which has a like device. A long roll of our old earls, barons and knights wore the lion on their coats—Lacy, Marshal, Fitzalan and Montfort, Percy, Mowbray and Talbot. By custom the royal beast is shown as rampant, touching the ground with but one foot and clawing at the air in noble rage. So far is this the normal attitude of a lion that the adjective “rampant” was often dropped, and we have leave and good authority for blazoning the rampant beast simply as “a lion,” leave which a writer on armory may take gladly to the saving of much repetition. In France and Germany this licence has always been the rule, and the modern English herald’s blazon of “Gules a lion rampant or” for the arms of Fitzalan, becomes in French de gueules au lion d’or and in German in Rot ein goldener Loewe. Other positions must be named with care and the prowling “lion passant” distinguished from the rampant beast, as well as from such rarer shapes as the crouching lion, the lion sleeping, sitting or leaping. Of these the lion passant is the only one commonly encountered. The lion standing with his forepaws together is not a figure for the shield, but for the crest, where he takes this position for greater staleness upon the helm, and the sitting lion is also found rather upon helms than in shields. For a
HERALDRY

325
couchant lion or a dormant lion one must search far afield, although there are some medieval instances. The leaping lion is in so few shields that no maker of a heraldry book has it, would appear, discovered an example. In the books this "lion salient" is described as with the hind paws together on the ground and the fore paws together in the air, somewhat after a fashion of a diver's first movement. But examples from seals and monuments of the Felbrigg and the Merks show that the leaping lion differed only from the rampant in that he leans somewhat forward in his eager spring. The compiler of the British Museum catalogue of medieval armorial shields, and others equally unfamiliar with medieval armory, invariably describe this position as "rampant," seeing no distinction from other rampings. As rare as the leaping lion is the lion who looks backward over his shoulder. This position is called "regardant" by modern armorists. The old French blazon calls it "rere regardant or tournoy au visage aore, "regardant" alone meaning simply "looking," and therefore we shall describe it more reasonably in plain English as "looking backward." The twoheaded lion occurs in a 15th-century coat of Mason, and at the same period a monstrous lion of three bodies and one head is borne, apparently, by a Sheringbury.

The lion’s companion is the leopard. What might be the true form of this beast was a dark thing to the old armorist, yet knowing from the report of grave travellers that the leopard was regarded in some branch of the lion and thepard, it was felt that his shape would favour his sire’s. But nice distinctions of outline, even were they ascertainable, are not to be marked on the tiny seal, or easily expressed by the broad strokes of the shield painter. The leopard was indeed lesser than the lion, but in armory, as in the Noah’s arks launched by the old yards, the bear is no bigger than the badder. Then a happy device came to the armorist. He would paint the leopard like the lion at all points. But as the lion looks forward the leopard should look sidelong, showing his whole face. The matter was arranged, and until the end of the middle ages the distinction held and served. The disregarded writers on armory, Nicholas Upton, and his fellows, protested that a lion did not become a leopard by turning his face sidelong, but none who fought in the field under lion and leopard banners heeded this pedantry from cathedral closers. The English king’s beasts were leopards in blazon, in ballad and chronicle, and in the mouths of liegemen and enemy. Henry V’s herald, named from his master’s coat, was Leopard Herald; and Napoleon’s gazettes never fail to speak of the English leopards. In our own days, those who deal with armory as antiquaries and students of the past will observe the old custom for convenience’ sake. Those for whom the interest of heraldry lies in the nonsense-language brewed during post-medieval years may correct the medieval ignorance at their pleasure. The knight who saw the king’s banner fly at Falkirk or Crécy tells us that it bore "Gules with three leopards of gold." The modern armorist will shame the uninstructed warrior with "Gules three lions passant gardant in pale or."

As the lion rampant is the normal lion, so the normal leopard is the leopard passant, the adjective being needless. In a few cases only the leopard rises up to ramp in the lion’s fashion, and here he must be blazoned without fail as a leopard rampant.

Parts of the lion and the leopard are common charges. Chief of these are the demi-lion and the demi-leopard, beasts complete above their slender middles, even to the upper parts of their lashing tails. Rampant or passant, they follow the customs of the untaimed brute. Also the heads of lion and leopard are in many shields, and here the armorist of the modern handbooks stumbles by reason of his refusal to regard clearly marked medieval distinctions. The instructed will know a lion’s head because it shows but half the face and a leopard’s head because it is seen full-face. But the handbooks of heraldry, knowing naught of leopards, must judge by absence or presence of a mane, speaking uncertainly of leopards’ faces and lions’ heads and faces. Here again the old path is the straighter. The head of a lion, or indeed of any beast, bird or monster, is generally painted as “razed,” or torn away with a ragged edge which is pleasantly conventionalized. Less often it is found “couped” or cut off with a sheer line. But the leopard’s head is neither razed nor couped, for no neck is shown below it. Likewise the lion’s fore leg or paw—“gamb” is the book word—may be borne, razed or coupled. Its normal position is raised upright, although Newdgate seems to have borne “Gules three lions’ legs razed silver, the paws downward.” With the strange bearing of the lion’s whip-like tail cut off at the rump, we may end the list of these oddments.

Fitzalan, earl of Arundel, bore "Gules a lion gold.”
Simon de Montfort bore "Gules a silver lion with a forked tail."
Segrave bore "Sable a lion silver crowned gold."
Haverin bore "Silver a lion rampant gules with a forked tail, having a collar azure."
Felbrigge of Felbrigg bore "Gold a leaping lion gules."
Esturny bore "Silver a lion salde (or purple) looking backward."
Marmon bore "Gules a lion vair."
Mason bore "Silver a two-headed lion gules."
Lovelot bore "Silver a lion parted at the hinder parts of sable and gules."
Richard le Jen bore "Vert a lion gold—"the arms of Wakelin of Ardorne—" with a fesse gules on the lion."
Fiennes bore "Azure three lions gold."
Leyburne of Kent bore "Azure six lions silver."

Carew bore "Gold three lions passant sable."
Fotheringhay bore "Silver two lions passant sable, looking backward."
Richard Norton of Waddeworth (1357) sealed with arms of "A lion dormant."
Lisle bore "Gules a leopard silver crowned gold."
Ludlowe bore "Azure three leopards silver."
Brocas bore "Sable a leopard rampant gold."

John Hardry of Kent seals in 1372 with arms of "a sitting leopard."
John Northampton, Lord Mayor of London in 1381, bore "Azure a crowned leopard gold with two bodies rampant against each other."
Novenham bore "Azure three demi-lions silver."
A deed delivered at Lapworth in Warwickshire in 1466 is sealed with arms of "a molet between three demi-leopards."
Kenton bore "Gules three lions’ heads razed sable."

Pole, earl and duke of Suffolk, bore "Azure a fesse between three leopards’ heads gold."
Cantelu bore "Azure three leopards’ heads silver with silver fleurs-de-lys issuing from them."
Wenterton bore "Gules a chevron between three lions’ legs razed silver."
Pynebek bore "silver three forked tails of lions sable."

The tiger is rarely named in collections of medieval arms. Deep mystery wrapped the shape of him, which was never during
the middle ages standardized by artists. A crest upon a 15th-century brass shows him as a lean wolf-like figure, with a dash of the boar, gazing after his vain went into a looking-glass; and the 16th-century heralds gave him the body of a lion with the head of a wolf, head and body being tufted here and there with thick tufts of hair. But it is noteworthy that the arms of Sir John Norwich, a well-known knight of the 14th century, are blazoned in a roll of that age as “party azure and gules with a tiger rampant.” Now this beast in the arms of Norwich has been commonly taken for a lion, and the Norwich family seem in later times to have accepted the lion as their bearing. But a portion of a painted roll of Sir John’s day shows on careful examination that his lion has been given two moustache-like tufts to the nose. A copy made about 1600 of another roll gives the same decoration to the Norwich lion, and it is at least possible we have here evidence that the economy of the medieval armorist allowed him to make at small cost his lion, his leopard and his tiger out of a single beaust form.

Take away the lions and the leopards, and the other beasts upon medieval shields are a little herd. In most cases they are here to play upon the names of their bearers. Thus Swinburne of Northumberland has the heads of swine in his coat and Bacon has his own pigs. Three white beasts were borne by Bartlingham, and a bear ramping on his hind legs is for Barnard. Lovett of Astwel has three running wolves, Vide lou three wolves’ heads, Colfox three foxes’ heads.

Three hedgehogs were in the arms of Heriz. Barnewall reminds us of extinct natives of England by bearing two beavers, and Otter of Yorkshire had otters. Farewell had hares’ heads, Lovett. Talbot. Saunders.

Cunliffe conies, Mitford moles or moldiwarps. A Talbot of Lancashire had three purple squirrels in a silver shield. An elephant was brought to England as early as the days of Henry III, but he had no immediate armorial progeny, although Saunder of Northall has his arms here borne before the end of the middle ages the elephants’ heads, which speak of his ownership of the Great, patron of all Saunderse. Bevil of the west had a red bull, and Bulkley bore three silver bulls’ heads. The heads in Netheam’s 14th-century shield are neat’s heads, ox heads are for Oxwys. Calves are for Veel, and the same mild beasts are in the arms of that fierce knight Hugh Calveley. Stansfield bore three rams with bells at their necks, and a 14th-century Lecheford thought no shame to bear the head of the ram who is the symbol of lechery. Lambton had lambs. Goats were borne by Chevercourt to play on his name, a leaping goat by Bardwell, and goats’ heads by Gatesheal. Of the race of dogs the greyhound and the talbot, or mastiff, are found most often. Thus Talbot of Cumberland had talbots, and Mauleverer, running greyhounds or “leverers” for his name’s sake. A small, a big, a crop-haired dog, is in the 15th-century shield of John Wood of Kent, and “kenets,” or little tracking dogs, in a 13th-century coat of Kenet. The horse is not easily found as an English charge, but Moyle’s white mule seems an old coat; horses’ heads are in Horsley’s shield, and ass heads make crests for more than one noble house. Askew has three asses in his arms. Three bats or flittermice are in the shield of Burningham and in that of Heyworth of Whetstomet.

As it might be looked for in a land where forest and greenwood once linked from sea to sea, the wild deer is a common charge in the shield. Downes of Cheshire bore a hart “lodged” or lying down. Hertford had harts’ heads, Malebis, fawns’ heads (testes de bis), Bukiingham, heads of bucks. The harts in Rotherham’s arms are the rose of his name’s first syllable. Reindeer heads were borne by Bowet in the 14th century. Antelopes, fierce beasts with horns that have something of the ibex, show by their great claws, their lion tails, and their boar muzzles and tusks that they are midway between the hart and the monster.

Of the outlandish monsters the griffon is the oldest and the chief. With the hinder parts of a lion, the rest of him is eagle, head and shoulders, wings and fore legs. The long tuft under the beak and his pointed ears mark him out from the eagle when his head alone is borne. At an early date a griffon rampant, his normal position, was borne by the great house of Montagu as a quartering, and another griffon played upon Griffin’s name.

The wyver, who becomes wyvern in the 16th century, and takes a new form under the care of inventive heralds, was in the middle ages a lizard-like dragon, generally with small wings. Sir Edmund Mauley in the 14th century is found differenc- ing the black bend of his elder brother by charging it with three wyvers of silver. During the middle ages there seems small distinction between the wyver and the still rarer dragon, which, with the coming of the Tudors, who bore their wyver as their badge, is seen as a four-legged monster with wings and a tail that ends like a broad arrow. The monster in the arms of Drake, blazoned by Tudor heralds as a wyvern, is clearly a fire-drake or dragon in his origin.

The unicorn rampant was borne by Harlyn of Norfolk, unicorn’s heads by the Cambridgeshire family of Paris. The mermaid with her comb and looking-glass makes a 14th-century crest for Byron, while “Silver a bend gules with three silver harpies thereon” is found in the 15th century for Entyrdene.

Concerning beasts and monsters the heraldry books have many adjectives of blazonry which sometimes gives a separate colour to the tongue and claws of the lion, but even this may be set aside. Though a black lion in a silver field may be armed with red claws, and a golden leopard in a red field given blue claws and tongues, these tritiles would be changed to white for the lion and the leopards. When the beak and claws of the eagle are common painted a second colour in all but very small representations. Thus the golden eagle of Lymesey in a red field may have blue beak and claws, and golden beak and claws will be given to Joyce’s silver eagle on red. A lure, or two wings joined and spread like those of an eagle, is a rare charge sometimes found. When fitted with the cord by which a falconer’s lure is swung, the cord must be named. Monthermer bore “Gold an eagle vert.” Sigggeston bore “Silver a two-headed eagle sable.” Gavaston, earl of Cornwall, bore “Vert six eagles gold.” Baforde of Foremore (in 13th century) has arms of “An eagle bendwise, with a border engrafted and a baston.” Graunson bore “Paly silver and azure with a bend gules and three golden eagles thereon.” Seymor bore “Gules a lure of two golden wings.”

Commoner than the eagle as a charge is the martlet, a humbler bird which is never found as the sole charge. In all
but a few early representations the feathers of the legs are seen without the legs or claws. The martlet indicates both swallow and martin, and in the arms of the Cornish Arundels the martlets must stand for "hirundels" or swallows.

The falcon or hawk is borne as a rule with close wings, so that he may not be taken for the eagle. In most cases he is there to play on the bearer's name, and this may be said of most of the flight of lesser birds.

Nauton bore "Sable three martlets silver."
Heron bore "Azure three herons silver."
Fauconer bore "Silver three falcons gules."
Hauville bore "Azure a dance between three hawks gold."
Twenge bore "Silver a fesse gules between three popinjays (or parrots) vert."
Cranesley bore "Silver a chevron gules between three cranes azure."

Arundel bore "Gules a swan silver."
Dalston bore "Silver a chevron ensigned between three daws' heads razed sable."
Corbet bore "Gold two courbies sable."

Cockfield bore "Silver three cocks gules."
Burton bore "Sable a chevron sable between three silver owls."
Rokey bore "Silver a chevron sable between three rooks."
Duffyfele bore "Sable a chevron sable between three doves."
Pelham bore "Azure three pelicans silver."

Sumcri (13th century) sealed with arms of "A peacock with his tail spread."

John Pyskale of Suffolk (14th century) sealed with arms of "Three magpies."  

Fishes, Reptiles and Insects.—Like the birds, the fishes are borne for the most part to call to mind their bearers' names. Unless their position be otherwise named, they are painted as upright in the shield, as though rising towards the water surface. The dolphin is known by his bowed back, old artists making him a grotesquely decorative figure.

Lucy bore "Gules three lutes (or pipe) silver."
Heringaude bore "Azure, crusily gold, with six golden herrings."
Fishacre bore "Gules a dolphin silver."
La Roche bore "Three roach swimming."
John Simon (14th century) sealed with arms of "Three salmon swimming."
Sturgeon bore "Azure three sturgeon swimming gold, with a frer gules over all."
Whalley bore "Silver three whales' heads razed sable."

Shell-fish would hardly have place in English armory were it not for the abundance of scallops which have followed their appearance in the banners of Dacre and Scales. The crest of the Yorkshire Scrupes, playing upon their name, was a pair of crabs' claws.

Dacre bore "Gules three scallops silver."
Shelley bore "Sable a fesse ensigned between three wheel-shells gold."

Reptiles and insects are barely represented. The lizards in the crest and supporters of the Ironmongers of London belong to the 15th century. Gawdy of Norfolk may have borne the tortoise in his shield in the same age. "Silver three toads sable" was quartered as a second coat for Botreaux of Cornwall in the 16th century—Botereau or Botere signifying a little toad in the old French tongue—but the arms do not appear on the old Botreaux seals beside their ancient bearing of the griffon. Boten bore "Silver a bend between six bees sable" and a 15th-century Harbottle seems to have sealed with arms of three bluebottle flies. Three butterflies are in the shield of Preslen of Lancashire in 1415, while the winged insect shown on the seal of John Mayre, a King's Lynn burgess of the age of Edward I., is probably a mayfly.

Human Charges.—Man and the parts of him play but a small part in English shields, and we have nothing to put beside such a coat as that of the German Manessen, on which two armed knights attack each other's haubers with their teeth. But certain arms of religious houses and the like have the whole figure, the see of Salisbury bearing the Virgin and Child in a blue field. And old crests have demi-Saracens and falconer men, coal-miners, monks and blackamoors. Sowden bore in his shield a turbaned soldier's head; Eady, three old men's "eads"! Heads of maidens, the "winsome marrows " of the ballad, are in the arms of Marow. The Stanleys, as kings of Man, quartered the famous three-armed legs whirling mill-sail fashion, and Tremayne of the west bore three men's arms in like wise. "Gules three hands silver" was for Malmeysn as early as the 15th century, and Tynye of Colchester displayed hearts.

Miscellaneous Charges.—Other charges of the shield are less frequent but are found in great variety, the reason for most of them being the desire to play upon the bearer's name. Weapons and the like are rare, having regard to the military associations of armory. Dauneney bore three helms; Philip Marmion took with his wife, the coheir of Kilpeck, the Kilpeck shield of a sword (espe). Tuck had a stabbing sword or "tuck." Bent bows were borne by Bowes, an arblaster by Arblaster, arrows by Archer, birding-bolts or bosouns by Bosun, the mangelon by Mangnall. The three lances of Amberst is probably a medicinal coat; Leweston had battle-axes.

A scythe was in the shield of Praers; Picot had picks; Bilsby a hammer or "beal"; Malet showed mallets. The chamberlain's key is in the shield of a Chamberlain, and the spenser's key in that of a Spenser. Porter bore the porter's bell, Boteler the butter's cup. Three-legged pots were borne by Monbocher.
Crows are for Coroum. Yarde had yard-wands; Bordou a burden or pilgrim's staff.

Of horse-furniture we have the stirrups of Scudamore and Giffard, the horse-barnacles of Bernake, and the horse-shoes borne by many branches and tenants of the house of Ferrers.

Of musical instruments there are pipes, trumps and harps for Pipe, Trumpington and Harpsfield. Hunting horns are common among families bearing such names as Forester or Horne. Remarkable charges are the three organs of Grenville, who held of the house of Clare, the lords of Glamorgan.

Combs play on the name of Tunstall, and gloves (wounns or gauns) on that of Waunyc. Hose were borne by Iose; buckles by a long list of families. But the most notable of the charges derived from clothing is the hanging sleeve familiar in the arms of Hastings, Conyers and Mansel.

Chess-rooks, hardly to be distinguished from the roe or roquet at the head of a jousting-lance, were borne by Rokewode and by many more. Topcliffe had pegtops in his shield, while Ambassas had a cast of three dice which should each show the point of one, for "to throw ambasace" is an ancient phrase-used of those who throw three aces.

Although we are a sea-going people, there are few ships in our armory, most of these in the arms of sea-ports. Anchors are commoner.

Castles and towers, bridges, portcullises and gates have all examples, and a minster-church was the curious charge borne by the ancient house of Musters of Kirklington.

Letters of the alphabet are very rarely found in ancient armory; but three capital 't's, in old English script, were borne by Toft of Cheshire in the 14th century. In the period of decadence whole words or sentences, commonly the names of military or naval victories, are often seen.

Blazonry.—An ill-service has been done to the students of armory by those who have pretended that the phrases in which the shields and their charges are described or blazoned must follow arbitrary laws devised by writers of the period of armorial decadence. One of these laws, and a mischievous one, asserts that no tincture should be named a second time in the blazon of one coat. Thus if gules be the hue of the field any charge of that colour must thereafter be styled "of the first." Obeying this law the blazoner of a shield of arms elaborately charged may find himself sadly involved among "of the first," "of the second," and "of the third." It is needless to say that no such law obtained among armorists of the middle ages. The only rule that demands obedience is that the brief description should convey to the reader a true knowledge of the arms described.

The examples of blazonry given in that part of this article which deals with armorial charges will be more instructive to the student than any elaborated code of directions. It will be observed that the description of the field is first set down, the blazoner giving its plain tincture or describing it as bare, party, paly or Barry, as powdered or sown with roses, croslets or fleurs-de-lys. Then should follow the main or central charges, the lion or griffin dominating the field, the chevron or the pale, the fesse, bend or bars, and next the subsidiary charges in the field beside the "ordinary" and those set upon it. Chiefs and quarters are blazoned after the field and its contents, and the border, commonly an added difference, is taken last of all. Where there are charges both upon and beside a bend, fesse or the like, a curious inversion is used by pedantic blazoners.

The arms of Mr Samuel Pepys of the Admiralty Office would have been described in earlier times as "Sable a bend between two horses' heads rased silver, with three fleurs-de-lys sable on the bend." Modern heraldic writers would give the sentence as "Sable, on a bend between two horses' heads erazed argent, three fleurs-de-lys of the first." Nothing is gained by this inversion but the precious advantage of naming the bend but once. On the other side it may be said that, while the newer blazon couches itself in a form that seems to prepare for the naming of the fleurs-de-lys as the important element of the shield, the older form gives the fleurs-de-lys as a mere postscript, and rightly, seeing that charges in such a position are very commonly the last additions to a shield by way of difference. In like manner when a crest is described it is better to say "a lion's head out of a crown" than "out of a crown a lion's head." The first and last necessity in blazonry is lucidity, which is cheaply gained at the price of a few syllables repeated.

Modern Heraldry.—With the accession of the Tudors armory began a rapid decadence. Heraldry ceased to play its part in military affairs, the badges and banners under which the medieval nobleman's retinue came into the field were banished, and even the tournament in its later days became a renascence pageant which did not need the painted shield and armorial trappers. Treatises on armory had been rare in the days before the printing press, but even so early a writer as Nicholas Upton had shown himself as a writer on armorial matters and had been quoted in the bombast sleeve familiar in the arms of Hastings, Conyers and Mansel.

Chess-rooks, hardly to be distinguished from the roe or roquet at the head of a jousting-lance, were borne by Rokewode and by many more. Topcliffe had pegtops in his shield, while Ambassas had a cast of three dice which should each show the point of one, for "to throw ambasace" is an ancient phrase-used of those who throw three aces.

Although we are a sea-going people, there are few ships in our armory, most of these in the arms of sea-ports. Anchors are commoner.

Castles and towers, bridges, portcullises and gates have all examples, and a minster-church was the curious charge borne by the ancient house of Musters of Kirklington.

Letters of the alphabet are very rarely found in ancient armory; but three capital 't's, in old English script, were borne by Toft of Cheshire in the 14th century. In the period of decadence whole words or sentences, commonly the names of military or naval victories, are often seen.

Blazonry.—An ill-service has been done to the students of armory by those who have pretended that the phrases in which the shields and their charges are described or blazoned must follow arbitrary laws devised by writers of the period of armorial decadence. One of these laws, and a mischievous one, asserts that no tincture should be named a second time in the blazon of one coat. Thus if gules be the hue of the field any charge of that colour must thereafter be styled "of the first." Obeying this law the blazoner of a shield of arms elaborately charged may find himself sadly involved among "of the first," "of the second," and "of the third." It is needless to say that no such law obtained among armorists of the middle ages. The only rule that demands obedience is that the brief description should convey to the reader a true knowledge of the arms described.

The examples of blazonry given in that part of this article which deals with armorial charges will be more instructive to the student than any elaborated code of directions. It will be observed that the description of the field is first set down, the blazoner giving its plain tincture or describing it as bare, party, paly or Barry, as powdered or sown with roses, croslets or fleurs-de-lys. Then should follow the main or central charges, the lion or griffin dominating the field, the chevron or the pale, the fesse, bend or bars, and next the subsidiary charges in the field beside the "ordinary" and those set upon it. Chiefs and quarters are blazoned after the field and its contents, and the border, commonly an added difference, is taken last of all. Where there are charges both upon and beside a bend, fesse or the like, a curious inversion is used by pedantic blazoners.

The arms of Mr Samuel Pepys of the Admiralty Office would have been described in earlier times as "Sable a bend between two horses' heads rased silver, with three fleurs-de-lys sable on the bend." Modern heraldic writers would give the sentence as "Sable, on a bend between two horses' heads erazed argent, three fleurs-de-lys of the first." Nothing is gained by this inversion but the precious advantage of naming the bend but once. On the other side it may be said that, while the newer blazon couches itself in a form that seems to prepare for the naming of the fleurs-de-lys as the important element of the shield, the older form gives the fleurs-de-lys as a mere postscript, and rightly, seeing that charges in such a position are very commonly
Armorial de Gêre. The title of Blue Mantle pursuivant, as old as the reign of Edward III., suggests a like usage in England. When the tight-laced coat of arms went out of fashion among the knighthood the loose tabard of arms with its wide sleeves was at once taken in England as the armorial dress of both herald and cavalier, and the fashion of it has changed but little since those days. Clad in such a coat the herald was the image of his master, and, although he himself was never chosen from any rank above that of the lesser gentry, his person, as a messenger, acquired an almost priestly sacredness. To injure or to insult him was to affront the coat that he wore.

We hear of kings of arms in the royal household of the 13th century, and we may compare their title with those of such officers as the King of the Ribalds and the King of the Minstrels; but it is noteworthy that, even in modern warrants for heralds' patents, the custom of the reign of Edward III. is still cited as giving the necessary precedents for the officers' liveryes. Officers of arms took their titles from their provinces or from the titles and badges of their masters. Thus we have Garter, Norroy and Clarenceux, March, Lancaster, Windsor, Leicester, Leopard, Falcon and Blant Sanglier as officers attached to the royal house; Chandos, the herald of the great Sir John Chandos; Vert Eagle of the Nevill earls of Salisbury, Esperance and Crescent of the Percy of Northumberland. The spirit of Henry VII.'s legislation was against such usages in baronial houses, and in the age of the Tudors the last of the private heralds disappears.

In England the royal officers of arms were made a corporation by Richard III. He was the member of this corporation, known as the College of Arms or heralds' College, are Garter, Principal King of Arms, Clarenceux King of Arms South of Trent, Norroy King of Arms North of the Trent, heralds Windsor, Chester, Richmond, Somerset, York and Lancaster, and the pursuivants Rouge Croix, Bluemante, Rouge Dragon and Portcullis. Another knight of arms, not a member of this corporation, has been attached to the order of the Bath since the reign of George I., and an officer of arms, without a title, attends the order of St Michael and St George.

There are no common officers of heralds in Scotland or Ireland. In Scotland "Lyon-king-of-arms," "Lyon rex armorum," or "Leo feclatis," so called from the lion on the royal shield, is the head of the office of arms. When first the dignity was constituted is not known, but Lyon was a prominent figure in the coronation of Robert II. in 1317. The office was at first, as in England, attached to the earl marshal, but it has long been conferred by patent under the great seal, and is held direct from the crown. Lyon is also king-of-arms for the national order of the Thistle. He is styled "Lord Lyon," and the office has always been held by men of family, and frequently by a person of the royal blood. In the old books it is found in all matters of heraldry in Scotland. Besides the "Lyon depute," there are the Scottish heralds, Albany, Ross and Rothesay, with precedence according to date of appointment; and the pursuivants, Carrick, March and Unicorn. Herald and pursuivants are appointed by Lyon.

In Ireland also there is but one king-of-arms, Ulster. The office was instituted by Edward VI. in 1553. The patent is given by Rymer, and refers to certain emoluments as "praedico officio suo... ab antiquo spectantibus." The allusion is to an Irish king of arms appointed in the reign of Richard II. and superseded by Ulster. Ulster holds office by patent, during pleasure; under him the Irish office of arms consists of two heralds, Cork and Dublin; and a pursuivant, Athlone. Ulster is king-of-arms to the order of St Patrick. He held visitations in parts of Ireland from 1568 to 1620, and these and other records, including all grants of arms from the institution of the office, are kept in the Birmingham Tower, Dublin.

The armorial duties of the ancient heralds are not clearly defined. The patent of Edward IV., creating John Wrythe king of arms, says nothing of the style of Garter, speaks vaguely of the care of the office of arms and whose thing it is being at that office. We know that the heralds had their part in the ordering of tournaments, wherein armory played its greatest part, and that their expert knowledge of arms gave them such duties as reckoning the noble slain on a battlefield. But it is not until the 15th century that we find the heralds following a recognized practice of granting or assigning arms, a practice on which John of Guildford comments, saying that such arms given by a herald are not of greater authority than those which a man has taken for himself. The Book of St Albans, put forth in 1386, speaks of arms granted by princes and lords, is careful to add that "arms bi a manus proper actortie take, if an other man have not borne them afore, be of strength enou," repeating, as it seems, Nicholas Upton's opinion which, in this matter, does not conflict with the practice of his day. It is probable that the earlier grants of arms by heralds were made by reason of persons uncoming in armorial lore applying for a suitable device to experts in such matters—and that such setting forth of arms may have been practised even in the 14th century.

The earliest known grants of arms in England by sovereigns or private persons are, as a rule, the conveyance of a right in a coat of arms already existing or of a differentiated version of it. Thus in 1301 Thomas Grendale, a squire who had inherited through his grandmother the right in the shield of Beaumys, granted his right in it to Sir William Moigne, a knight who seems to have acquired the whole or part of the Beaumys manor in Sawtry. Under Henry VI. we have certain rare and curious letters of the crown granting nobility with arms "in sigillum hujusmodi nobilitatis" to certain individuals, some, and perhaps all of whom, were foreigners who may have asked for letters which in nobility, a continental usage. After this the heralds of England began to assert that new arms, to be valid, must necessarily be derived from their assignments, although ancient use continued to be recognized.

An account of the genealogical function of the heralds, so closely connected with their armorial duties will be found in the article Genealogy. In spite of the work of such distinguished men as Camden and Dugdale they gradually fell in public estimation until Blackstone could write of them that the marshalling of coat-armour had fallen into the hands of certain holders called heralds, who had allowed for such falsity and confusion to creep into their records that even their common seal could no longer be received as evidence in any court of justice. From this low estate they rose again when the new archaeology included heraldry in its interests, and several antiquaries of repute have of late years worn the herald's tabard.

In spite of the vast amount of material which the libraries catalogue under the head of "Heraldry," the subject has as yet received little attention from antiquaries working in the modern sense. Perhaps the most remarkable for their detachment from the facts as for their folly. The work of Sir Thomas Pope, De studio militari, although written in the first half of the 19th century, shows, as has been already remarked, no attempt to reconcile the conceptions of the author with the armorial practice which he must have seen about him on every side. Gerard Leigh, Bossewell, Ferne and Morgan carry on this bad tradition, each adding his own extravagances. The Display of Heraldry, first published in 1803 under the name of John Gillium, is more remarkable for not more learned, and in its various editions gives a valuable view of the decadent heraldry of the 17th century. In the 19th century many important essays on the subject are to be found in such magazines as the Genealogist, the Herald and Genealogist and the Ancestor, while Planché's Pursuivant of Arms contains some slight but suggestive work which attempts original enquiry. But Dr Woodward's Treatise on Heraldry, British and Foreign (1856), in spite of many errors arising from the author's reliance upon unchecked material, must be counted the only scholarly book in English upon a matter which has engaged so many pens. Among foreign volumes may be cited those of Menestrier and Spener, and the vast compendium of the Genoese, Bochart, as notable ordinaries of arms are those of Papworth and Renesse, companions to the armorial halls of Burke and Rietstap. The student may be advised to turn his attention to
all works dealing with the effigies, brasses and other monuments of the middle ages, to the ancient heraldic seals and to the heraldry of medieval architecture and ornament. (O. Ba.)

**HERAT.** a city and province of Afghanistan. The city of Herat lies in 34° 20' 30" N., and 62° 11' 0" E., at an altitude of 2500 ft. above sea-level. Estimated pop. about 10,000. It is a city of great interest historically, geographically, politically and strategically, but in modern days it has quite lost its ancient commercial importance. From this central point great lines of communication radiate in all directions to Russian, British, Persian and Afghan territory. Sixty-six miles to the north lies the terminus of the Russian railway system; to the south-east is Kandahar (360 m.) and about 70 m. beyond that, New Chaman, the terminus of the British Southern Railway, lies Scistan (200 m.), and eastward Kabul (550 m.); while on the west four routes lead into Persia by Turbet to Meshed (215 m.), and by Birjend to Kerman (400 m.), to Yazd (500 m.), or to Isfahan (600 m.). The city forms a quadrangle of nearly 1 m. square (more accurately about 1600 yds. by 1500 yds.); on the western, southern and eastern faces the line of defence is almost straight, the only projecting points being the gateways, but on the northern face the contour is broken by a double outpost, consisting of the Ark or citadel, which is built of sun-dried brick on a high artificial mound within the enceinte, and a lower work at its foot, called the Ark-i-n ao, or "new citadel," which extends 100 yds. beyond the line of the city wall. That which distinguishes Herat from all other Oriental cities, and at the same time constitutes its main defence, is the stupendous character of the earthwork upon which the city wall is built. This earthwork averages 250 ft. in width at the base and about 50 ft. in height, and as it is crowned by a wall 25 ft. high and 14 ft. thick at the base, supported by about 150 semi-circular towers, and is further protected by a ditch 45 ft. in width and 16 in depth, it presents an appearance of imposing strength. When the royal engineers of the Russo-Afghan Boundary Commission entered Herat in 1883 they found its defences in various stages of disrepair. The gigantic rampart was unflanked, and the covered ways in the face of it subenfe from end to end. The ditch was choked, the gates were unprotected; the tumbled mass of irregular mud buildings which constituted the city clung tightly to the walls; there were no gun emplacements. Outside, matters were almost worse than inside. To the north of the walls the site of old Herat was indicated by a vast mass of débris—mounds of bricks and pottery intersected by a network of shallow trenches, where the only semblance of a protective wall was the irregular line of the Tal-i-Bangi. South of the city was a vast area filled in with the graveyards of centuries. Here the trenches dug by the Persians during the last siege were still in a fair state of preservation; they were within a stone's-throw of the walls. Round about the city on all sides were similar opportunities for close approach; even the villages stretched out long irregular streets towards the city gates. To the north-west, beyond the Tal-i-Bangi, the magnificent outlines of the Mosalla filled a wide space with the glorious curves of dome and gateway and the statly grace of tapering minars, but the impressive beauty of this, by far the finest architectural structure in all Afghanistan, could not be permitted to weigh against the fact that the position occupied by this pile of solid buildings was fatal to the interests of effective defence. By the end of August 1885, when a political crisis had supervened between Great Britain and Russia, under the orders of the Amir the Mosalla was destroyed; but four minars standing at the corners of the wide plinth still remain to attest to the glorious proportions of the ancient structure, and to exhibit samples of that decorative tilework, which for intricate beauty of design and exquisite taste in the blending of colour still appeals to the memory as unique. At the same time the ancient graveyards round the city were swept smooth and levelled; obstructions were demolished, outworks constructed, and the defences generally renovated. Whether or no the strength of this bulwark of North-Western Afghanistan should ever be practically tested, the general result of the most recent in-vestigations into the value of Herat as a strategic centre has been largely to modify the once widely-accepted view that the key to India lies with it. Abdur Rahman's successor Habibullah steadfastly refused the offer of British assistance to strengthen its defences; and though the Afghans themselves have occasionally undertaken repairs, it is doubtful whether the old walls of Herat are maintained in a state of efficiency.

The exact position of Herat, with reference to the Russian station of Kushk (now the terminus of a branch railway from Merv), is as follows: From Herat, a gentle ascent northwards for 3 m. reaches to the foot of the Koh-i-Mulla Khwaja, crossing the Jul Nao or "new" canal, which here divides the gravel-covered foot hills from the alluvial flats of the Hari Rud plain. The crest of the outer ridges of this subsidiary range is about 700 ft. above the city, at a distance of 4 m. from it. Beyond it farther the wind roads first amongst the broken ridges of the Koh-i-Mulla Khwaja, then over the intervening dasht into the southern spurs of the Paropamisus to the Ardekan pass. This is the highest point it attains, and it has risen about 2150 ft. from Herat. From the pass it drops over the gradually decreasing grades of a wide sweep of Chol which here happens to be locally free from the intersecting network of narrow ravines which is generally a distinguishing feature of Turkestan loess formations) for a distance of 35 m. into the Russian railway station, falling some 2700 ft. from the crest of the Paropamisus. To the south the road from Herat to India through Kandahar lies across an open plain, which presents no major engineering difficulties, but is of a somewhat waterless and barren character.

The city possesses five gates, two on the northern face, the Kutab-chak near the north-east angle of the wall, and the Malik at the re-entering angle of the Ark-i-nao; and three others in the centres of the remaining faces, the Irak gate on the west, the Kandahar gate on the south and the Kushk gate on the east face. Four streets called the Chahar-sük, running from the centre of each face, meet in the centre of the town in a small domed quadrangle. The principal street runs from the south or Kandahar gate to the market in front of the citadel, and is covered in with a vaulted roof through its entire length, the shops and buildings of this bazaar being much superior to those of the other streets, and the merchants' caravanserais, several of which are spacious and well built, all opening out on this great thoroughfare. Near the central quadrangle of the city is a vast reservoir of water, the dome of which is of bold and excellent proportions. The only other public building of any consequence in Herat is the great mosque or Masjid-i-Jama, which comprises an area of 800 yds. square, and must have been a most magnificent structure. It was erected towards the close of the 15th century, during the reign of Shah Sultan Hussein of the family of Timur, and is said when perfect to have been 465 ft. long by 275 ft. wide, to have had 406 cupolas, 130 windows, 444 pillars and 6 entrances, and to have been adorned in the most magnificent manner with gilding, carving, precious mosaics and other elaborate and costly embellishments. Now, however, it is falling rapidly into ruin, the ever-changing provincial governors who administer Herat having neither the means nor the inclination to undertake the necessary repairs. Neither the palace of the Charbagh within the city wall, which was the residence of the British mission in 1840-1841, nor the royal quarters in the citadel deserve any special notice. At the present day, with the exception of the Chahar-sük, where there is always a certain amount of traffic, and where the great diversity of race and costume imparts much liveliness to the scene, Herat presents a very melancholy and desolate appearance. The mud houses which appear to be now the only buildings left intact in the ruins, and even the burnt brick buildings are becoming everywhere dilapidated. The city is also one of the filthiest in the East, as there are no means of drainage or sewerage, and garbage of every description lies in heaps in the open streets.

Along the slopes of the northern hills there is a space of some 4 m. in length by 3 m. in breadth, the surface of the plain, strewn over its whole extent with pieces of pottery and crumbling bricks, and also broken here and there by earthen mounds and
ruined walls, the débris of palatial structures which at one time were the glory and wonder of the East. Of these structures indeed some have survived to the present day in a sufficiently perfect state to bear witness to the grandeur and beauty of the old architecture of Herat. Such was the mosque of the Mosalla before its destruction. Scarcely inferior in beauty of design and execution, though of more moderate dimensions, is the tomb of the saint Abdullah Ansari, in the same neighbourhood. This building, which was erected by Shah Rukh Mirza, the grandson of Timur, over 500 years ago, contains some exquisite specimens of sculpture in the best style of Oriental art. Adjoining the tomb also are numerous marble mausoleums, the sepulchres of princes of the house of Timur; and especially deserving of notice is a royal building tastefully decorated by an Italian artist named Geraldii, who was in the service of Shah Abbas the Great. The locality, which is further enlivened by gardens and running streams, is named Gazar-gah, and is a favourite resort of the Heratis. It is held indeed in high veneration by all classes, and the famous Dost Mahomed Khan is himself buried at the foot of the tomb of the saint. Two other royal palaces named respectively Bagh-i-Shah and Tablat-i-Tefer, are situated on the same rising ground somewhat further to the west. The buildings are now in ruins, but the view from the pavilions, shaded by splendid plane trees on the terraced gardens formed on the slope of the mountain, is said to be very beautiful.

The population of Herat and the neighbourhood is of a very mixed character. The original inhabitants of Ariana were no doubt of the Aryan family, and immediately cognate with the Persian race, but they were probably internecinated at a very early period with the Thracian and Massagetae, whose stream to have held the mountains from Kabul to Herat from the first dawn of history, and to whom must be ascribed—rather than to an infusion of Turco-Tartaric blood introduced by the armies of Jenghiz and Timur—the peculiar broad features and flattened countenance which distinguish the inhabitants of Herat, Seistan and the eastern provinces of Persia from their countrymen farther to the west. Under the government of Herat, however, there are a very large number of tribes, ruled over by separate and semi-independent chiefs, and belonging probably to different nationalities. The principal group of tribes is called the Ghurak-Aimak, or "four races," the constituent parts of which, however, are variously stated by different authorities both as to strength and nomenclature. The Heratis are an agricultural race, and are not nearly so warlike as the Pathans from the neighbourhood of Kabul or Kandahar.

The long narrow valley of the Hari Rud, starting from the western slopes of the Koh-i-Baba, extends almost due west for 350 m. before it takes its great northern bend at Kulsan, and passes northwards through the broken ridges of the midst of the valley to a turbid red stream (the now called Paropamisus) towards Sarakhs. For the greater part of its length it drains the southern slopes only of the Paropamisus and the northern slopes of a parallel range called Koh-i-Safed. The Paropamisus forms the southern face of the Turkestan plateau, which contains the sources of the Murghab river; the northern face of the same plateau is defined by the Band-i-Turkestan. On the south of the plateau we find a similar succession of narrow valleys dividing parallel flexures, or anticlinals, formed under similar geological conditions to those which appear to be universally applicable to the Himalaya, the Hindo Kosh, and the Indus frontier mountain systems. From one of these long lateral valleys the Hari Rud receives its principal tributary, which joins the main river below Obeh, 180 m. from its source; and it is this tributary (separated from the Hari Rud by the narrow ridges of the Koh-i-Safed and Band-i-Balan) that offers the high road from Herat to Kabul, and not the Hari Rud itself. From its source to Obeh the Hari Rud is a valley of sandy desolation. There are no glaciers near its sources, although they must have existed there in geologically recent times, but massive, melting snows annually give rise to floods, which rush through the midst of the valley in a turbid red stream, frequently rendering the river impassable and cutting off the crazy brick bridges at Herat and Tirpal. It is impossible, whilst watching the rolling, scething volume of flood-water which swirls westwards in April, to imagine the waste stretches of dry river-bed which in a few months' time (when every available drop of water is carried off for irrigation) will represent the Hari Rud. The soft shales or clays of the hills bounding the valley render these hills especially subject to the action of denudation, and the result, in rounded slopes and easily accessible crests, determines the nature of the easy tracks and passes which intersect them. At the same time, any excessive local rainfall is productive of difficulty and danger from the floods of liquid mud and loose boulders which sweep like an avalanche down the hill sides. The intense cold which usually accompanies these sudden northern blizzards of Herat and Turkestan is a further source of danger.

From Obeh, 50 m. east of Herat, the cultivated portion of the valley commences, and it extends, with a width which varies from 8 to 10 m., to Kulsan, 60 m. west of the city. But the great stretch of highly irrigated and valuable fruit-growing land, which appears to spread from the walls of Herat east and west as far as the eye can reach, and to sweep to the foot of the hills north and south with an endless array of vineyards and melon-beds, orchards and villages, varied with a brilliant patchwork of poppy growth brightening the width of green wheat-fields with splashes of scarlet and purple—all this is really comprised within a narrow area which does not extend beyond a ten-miles' radius from the city. The system of irrigation by which these agricultural results are attained is most elaborate. The despatched Herati Tajik, in blue shirt and skull-cap, and with no instrument better than a three-cornered spade, is as the Ghilzai engineer, though he cannot effect more than the limits of his water-supply will permit. He adopts the karez (or, Persia, kandil) system of underground irrigation, as does the Ghilzai, and brings every drop of water that he can find to the surface; but it cannot be said that he is more successful than the Ghilzai. It is the startling contrast of the Herati oasis with the vast expanse of comparative sterility that encloses it which has given such a fictitious value to the estimates of the material wealth of the valley of the Hari Rud.

The valley about Herat includes a flat alluvial plain which might, for some miles on any side except the north, be speedily reduced to an impassable swamp by means of flood-water from the surrounding canals. Three miles to the south of the city the river flows from east to west, spanned by the Pal-i-Malan, a bridge possessing grand proportions, but which was in 1885 in a state of grievous disrepair and practically useless. East and west stretches the long vista of the Hari Rud. Due north the hills called the Koh-i-Mullah Khwaja appear to be close and dominating, but the foot of these hills is really about 5 m. distant from the river. These hills, once, broken sandstone, are now geographically no part of the Paropamisus range, from which it is separated by a stretch of sandy upland about 20 m. in width, called the Dashit-i-Hamdamoi, or Dashit-i-Ardewân, formed by the talus or drift of the higher mountains, which, washed down through centuries of denudation, now forms long sweeping spurts of gravel and sand, scantily clothed with wormwood scrub and almost destitute of water. Through this stretch of dashit the drainage from the main water-divide breaks downwards to the plains of Herat, where it is arrested and utilized for irrigation purposes. To the north-east of the city a very considerable valley has been opened between the Paropamisus and the subsidiary Koh-i-Mullah Khwaja range, called Korokh. Here there are one or two important villages and a well-known shrine marked by a group of pine trees which is unique in this part of Afghanistan. The valley leads to a group of passes across the Paropamisus into Turkestan, of which the Zirmast is perhaps the best known. The main water-divide between Herat and the Turkestan Chol (the loess district) has been called Paropamisus for want of any well-recognized general name. To the north of the Korokh valley it exhibits something of the formation of the Hindu Kush (of which it is apparently a geological extension), but as it passes westwards it becomes broken.

Environs of Herat.
into fragments by processes of denudation, until it is hardly recognizable as a distinct range at all. The direct passes across it from Herat (the Baba and the Ardeawan) wind amongst masses of disintegrating sandstone for some miles on each side of the divided watershed, but farther west the rounded knolls of the rain-washed Downs from time immemorial have stood out pathless without difficulty. The names applied to this débris of a once formidable mountain system are essentially local and hardly distinctive. Beyond this range the sand and clay loess formation spreads downwards like a tumbled sea, hiding within the folds of its many-crested hills the twisting course of the Kusheh and its tributaries.

**History.**—The origin of Herat is lost in antiquity. The name first appears in the list of primitive Zoroastrian settlements contained in the Vendidad Satdeh, where, however, like most of the names in the same list,—such as Sughuud (Sogdiana), Mevar (Merv or Margus), Haragwiti (Arachotus or Arghand-ab), Hatemsh (Feymander or Helmond), and Roghe (or Argha-stan),—it seems to apply to the river or river-basin, which was the special centre of population. This name of Harowy, as it is written in the Vendidad, or Harwivus, as it appears in the inscriptions of Darius, is a cognate form with the Sanskrit Sarasye, which signifies "a river," and its resemblance to the ethnic title of Aryan (Sansk. Arya) is purely fortuitous; though from the circumstance of the city being named " Aria Metropolis " by the Greeks, and being also recognized as the capital of Ariana, " the country of the Arians," the two forms have been frequently confounded. Of the foundation of Herat (or Heri, as it is still often called) nothing is known. We can only infer from the colossal character of the earth-works which surround the modern town, that, like the similar remains at Bost on the Helmund and at Ulun Robat, of Arachosia, they belong to that period of Central-Asian history which preceded the rise of Achaemenian power, and which in Grecian romance is illustrated by the names of Bacchus, of Hercules, and of Semiramis. To trace in any detail the fortunes of Herat would be to write the modern history of the East, for there has hardly been a dynastic revolution, or a foreign invasion, or a great civil war in Central Asia since the time of the prophet, in which Herat has not played a conspicuous part and suffered accordingly. Under the Tahirsid of Khorasan, the Sassarids of Seistan and the Samanids of Bokhara, it flourished for some centuries in peace and progressive prosperity; but during the succeeding rule of the Ghuzz, Ghorids, and Ghilzais, of Khurasan, the metropolis was for a time obscured by the celebrity of the neighbouring capital of Ghazni, until finally in the reign of Sultan Sanjar of Merv about 1157 the city was entirely destroyed by an irruption of the Ghuzz, the predecessors, in race as well as in habitat, of the modern Turkmans. Herat gradually recovered under the enlightened Ghordk kings, who were indeed natives of the province, though they preferred to hold their court amid their ancestral fortresses in the mountains of Ghor, so that at the time of Jenghiz Khan's invasion it equalled or even exceeded in populousness and wealth its sister capitals of Balkh, Merv and Nishapur, the united strength of the four cities being estimated at three millions of inhabitants. But this Mogul was not a lasting power. The Ghurids were succeeded by the Najrains, and from them the Ghilzais, who claimed sovereignty of Herat, were expelled in 1398, when the local dynasty of Kurb, which had succeeded the Ghorides in eastern Khurasan, was put an end to, it is astonishing to find that early in the 16th century Herat was again flourishing and populous, and the favoured seat of the art and literature of the East. It was indeed under the princes of the house of Timur that most of the noble buildings were erected, of which the remains still excite our admiration at Herat, while all the great historical works relate to Asia, such as the Rosett-es-Sefâ, the Habib-es-seir, HâFF 8 Abû's-Târikh, the Matta'e-es-Sa'odin, &c., date from the same place and the same age. Four times was Herat sacked by Turkmans and Usbegs during the centuries which intervened between the Timuride princes and the rise of the Afghan power, and it has never in modern times attained to anything like its old importance. Afghan tribes, who had originally dwelt far to the east, were first settled at Herat by Nadir Shah, and from that time they have monopolized the government and formed the dominant element in the population. It will be needless to trace the revolutions and counter-revolutions which have followed each other in quick succession at Herat since Ahmad Shah Durani founded the Afghan khanate in the 18th century. Let it suffice to say that Herat has been throughout the seat of an Afghan government, sometimes in subordination to Kabul and sometimes independent. Persia indeed for many years showed a strong disposition to reassert the supremacy over Herat which was exercised by the Safavid kings, but great Britain, disapproving of the advance of Persia towards the Indian frontier, steadily resisted the encroachment; and, indeed, after helping the Heratis to beat off the attack of the Persian army in 1838, the British at length compelled the shah in 1857 at the close of his war with them to sign a treaty recognizing the further independence of the place, and pledging Persia against any further interference with the Afghans. In 1893 Herat, which for fifty years previously had been independent of Kabul, was incorporated by Dost Mahomed Khan in the Afghan monarchy, and the Amir, Habibullah of Afghanistan, like his father Abdur Rahman before him, remained Amir of Herat and Kandahar, as well as Kabul.

See Holdich, *Indian Borderland* (1901); C. E. Yate, *Northern Afghanistan* (1888).

**HéraULT,** a department in the south of France, formed from Lower Languedoc. Pop. (1906) 483,779. Area, 2,403 sq. m. It is bounded N.E. by Gard, N.W. by Aveyron and Tarn, and S. by Aude and the Golfe du Lion. The southern prolongation of the Cevennes mountains occupies the north-western zone of the department, the highest point being about 4,250 ft. above the sea-level. South-east of this range comes a region of hills and plateaus decreasing in height as they approach the sea, from which they are separated by the rich plains at the mouth of the Orb and the Hérault and, farther to the north-east, by the line of intercommunicating salt lagoons (Etang de Thau, &c.) which fringes the coast. The region to the north-west of Montpellier comprises an extensive tract of country known as the Garrigues, a district of dry limestone plateaus and hills, which stretches into the neighbouring department of Gard. The mountains of the north-west form the watershed between the Atlantic and Mediterranean basins. From these slopes of Hérault, its tributary the Lergue, and more to the south-west the Livron and the Orb, which are the main rivers of the department. Dry summers, varied by occasional violent storms, are characteristic of Hérault. The climate is naturally colder and more rainy in the mountains.

A third of the surface of Hérault is planted with vines, which are the chief source of agricultural wealth, the department ranking first in France with respect to the area of its vineyards; the red wines of St Georges, Cazouls-lès-Béziers, Picpoul and Maransan, and the white wines of Frontignan and Lunel (pop. in 1906, 6,769) are held in high estimation. The area given over to arable land and pasture is small in extent. Fruit trees and olive trees are plentiful, but especially mulberries, olives and chestnuts flourish. The rearing of silk-worms is largely carried on. Considerable numbers of sheep are raised, their milk being utilized for the preparation of Roquefort cheeses. The mineral wealth of the department is considerable. There are mines of lignite, coal in the vicinity of Graissac, iron, calamine and copper, and quarries of building-stone, limestone, gypsum, &c.; the marshes supply salt. Mineral springs are numerous, the most important being those of Lamalon-lès-Bains and Balaruc-lès-Bains. The chief manufactures are woolen and cotton cloth, especially for military use, silk (Ganges), casks, soap and fertilizing stuffs. There are also oil-works, distilleries (Béziers) and tanneries (Béziers). Fishing is an important industry. Cette and Méze (pop. in 1906, 5,574) are the chief ports. Hérault exports salt fish, wine, liqueurs, timber, salt, building-material, &c. It imports cattle, skins, wool, cereals, vegetables, coal and other commodities. The railway lines belong chiefly to the
HÉRAULT DE SÉCHELLES, MARIE JEAN (1750-1794). French politician, was born at Paris on the 20th of September 1750, of a noble family connected with those of Contades and Polignac. He made his début as a lawyer at the Châtelet, and delivered some very successful speeches; later he was avocat général to the parlement of Paris. His legal occupations did not prevent him from devoting himself also to literature, and after 1780 he published an account of a visit he had made to the comte de Buffon at Montbard. Hérald's account is marked by a delicate irony, and it has with some justice been called a masterpiece of interviewing, before the day of journalists. Hérald, who was an ardent champion of the Revolution, took part in the taking of the Bastille, and on the 8th of December 1789 was appointed judge of the court of the first arrondissement in the department of Paris. From the end of January to April 1791 Hérald was absent on a mission in Alsace, where he had been sent to restore order. On his return he was appointed commissaire du roi in the court of cassation. He was elected as a deputy for Paris to the Legislative Assembly, where he became more and more towards the extreme left; he was a member of several committees, and, when a member of the diplomatic committee, presented a famous report demanding that the nation should be declared to be in danger (11th June 1793). After the revolution of the 10th of August 1792 (see French Revolution), he co-operated with Danton, one of the organizers of this rising, and on the 2nd of September was appointed president of the Legislative Assembly. He was a deputy to the National Convention for the department of Seine-et-Oise, and was sent on a mission to organize the new department of Mont Blanc. Hérald was thus absent during the trial of Louis XVI., but he made it known that he approved of the condemnation of the King, and would probably have voted for the death penalty. On his return to Paris, Hérald was several times president of the Convention, notably on the 2nd of June 1793, the occasion of the attack on the Girondins, and on the 10th of August 1793, on which the passing of the new constitution was celebrated. On this occasion Hérald, as president of the Convention, had to make several speeches. It was he, moreover, who, on the rejection of the projected constitution drawn up by Condorcet, was entrusted with the task of preparing a fresh one; this work he performed within a few days, and his plan, which, however, differed very little from that of Condorcet, became the Constitution of 1793, which was passed, but never applied. As a member of the Committee of Public Safety, it was with diplomacy that Hérald was chiefly concerned, and from October to December 1793 he was employed on a diplomatic and military mission in Alsace. But this mission helped to make him an object of suspicion to the other members of the Committee of Public Safety, and especially to Robespierre, who as a deist and a fanatical follower of the ideas of Rousseau, hated Hérald, the follower of the naturalism of Diderot. He was accused of treason, and after being tried before the revolutionary tribunal, was condemned at the same time as Danton, and executed on the 16th Germinal in the year II. (5th April 1794). He was handsome, elegant and a lover of pleasure, and was one of the most individual figures of the Revolution.

Clément, Condorcet... étude sur les Dantonistes (Paris, 1875); Dr Robinet, Le Procès des Dantonistes (Paris, 1879); "Hérald de Séchelles, sa première mission en Alsace" in the review La Révolution Française, tome 22; E. Dauzat, Le jacobin... Hérald de Séchelles et le procès de Bellegarde (1904). His Œuvres littéraires were edited (Paris, 1907) by E. Dard.

HERB (Lat. herba, grass, food for cattle, generally taken to represent the Old Lat. forca, Gr. φοιβίς, pasture, φιδέον, to feed, Sans. bharb, to eat), in botany, the name given to those plants whose stem or stalk dies entirely or down to the root each year, and does not become, as in shrubs or trees, woody or permanent, such plants are also called "herbae annuae," or "perennials." The herbaceous plants are of two sorts, those which possess certain properties, and are used for medicinal purposes, for flavouring or garnishing in cooking, and also for perfumes (see Horticulture and Pharmacology).

HERBARIUM, or Hortus Siccus, a collection of plants so dried and preserved as to illustrate as far as possible their characters. Since the same plant, owing to peculiarities of climate, soil and situation, degree of exposure to light and other influences may vary greatly according to the locality in which it occurs, it is only by gathering together for study a large series of examples of each species that the flora of different regions can be satisfactorily represented. Even in the best equipped botanical garden it is impossible to have, at one and the same time, more than a very small percentage of the representatives of the flora of any given region or of any large group of plants. Hence a good herbarium forms an indispensable part of a botanical museum or institution. There are large herbaria at the British Museum and at the Royal Gardens, Kew, and smaller collections at the botanical institutions at the principal British universities. The original herbarium of Linnaeus is in large herbarium of the Linnean Society of London, which was purchased from the widow of Linnaeus by Dr (afterwards Sir) J. E. Smith, one of the founders of the Linnean Society, and after his death was purchased by the society. Herbaria are also associated with the more important botanic gardens and museums in other countries. The value of a herbarium is much enhanced by the possession of "types," that is, the original specimens on the study of which a species was founded. Thus the herbarium at the British Museum, which is especially rich in the earlier collections made in the 18th and early 19th centuries, contains the types of many species founded by the earlier workers in botany. It is also rich in the types of Australian plants in the collections of Sir Joseph Banks and Robert Brown, and contains in addition many valuable modern collections. The Kew herbarium, founded by Sir William Hooker and greatly increased by his son Sir Joseph Hooker, is also very rich in types, especially those of plants described in the Flora of British India and various colonial floras. The collection of Dillenius is deposited at Oxford, and that of Professor W. H. Harvey at Trinity College, Dublin. The collections of Antoine Laurent de Jussieu, his son Adrien, and Sir Auguste de St Hilaire, are included in the large herbarium of the Jardin des Plantes at Paris, and in the same city is the extensive private collection of Dr Ernest Cosson. At Geneva are three large collections—Augustin Pyrame de Candolle's, containing the typical specimens of the Prodrumus, a large series of monographs of the families of flowering plants, Benjamin Delessert's fine series at the Botanic Garden, and the Boissier Herbarium, which is rich in Mediterranean and Oriental plants. The university of Göttingen has had bequeathed to it the largest collection (exceeding 40,000 specimens) ever made by a single individual—that of Professor Grisebach. At the
The specimen of the genus Bignonia, as well as those of other plants, is preserved in a glass-covered case of what is called a herbarium. It is a document which contains the permanent form of the plant as it is to be studied by botanists for future generations. The herbarium is a valuable resource that helps in understanding the diverse species of plants and their characteristics. The herbarium serves as a repository of plants that have been collected and preserved for future research and study. It is a vital tool for botanists and researchers to conduct comparative studies and assess the distribution and diversity of plant species. The herbarium thus plays a crucial role in the field of botany, providing a permanent record of the plant kingdom.
bipapular paper. It offers the advantage of fitting closely to thin specimens, for it is composed of rapidly spreading few plants. A Gracefully cut, but strong portfolio, to which pressure by means of straps can be applied, and a few quirles of this paper, if the paper be changed night and morning, will be usually sufficient to dry all except very succulent plants. When forming the herbarium, the specimens are laid out in order to show its habit, &c., to dry the whole of it, it may be divided into two or three portions, and each placed on a separate sheet for drying. This judgment, however, depends, naturally, on how hot the air is — for, should it cause a cold sensation when applied to the cheek, or assume a rigidity not evident in the earlier stages of preparation. Each class of flowerless or cryptogamic plants requires special treatment for its preservation.

Marine algae are usually mounted on tough smooth white cartridge paper in the following manner. Growing specimens of good colour and in fruit are if possible selected, and cleansed as much as practicable from any sand or pebbles. They are next laid on the smooth sea or under water in a pool. Some species rapidly change colour, and cause the decay of any others with which they come in contact. This is especially the case with the red and green algae, so that the whole operation is done with care and skill. The paper is cut to a suitable size and a camel's hair pencil for the more delicate ones. The paper with the specimen is then carefully removed from the water by sliding it over the edge of the dish so as to drain it as much as possible, and then the specimen is pressed between two sheets of paper placed side by side. Together, the beauty of the specimen may be restored by dipping the edge into water, so as to float out the part and allow it to subside naturally on the paper. The paper, with the specimen upwards, is then pressed between the moistened sheets of paper to absorb any possible of the superficial moisture. When freed from excess of water it is laid on a sheet of thick white blotting-paper, and a piece of greaseproof paper is placed between this, the paper being pressed down, in the use of its "facing," adheres to the sea-weed. Another sheet of blotting-paper is then laid over it; and, a number of similar specimens being formed into a pile, the whole is submitted to pressure, the paper being changed every hour or two at first. The pressure and the papers are changed less frequently as the specimens become dry, which usually takes place in thirty-six hours. Some species, especially those of a thick or leathery texture, contract so much in dryness that without the aid of the paper they would be puckered. Other species of a gelatious nature, like Nemalion and Didymos, may be allowed to dry on the paper, and need not be submitted to pressure until they no longer present a gelatinous appearance. Large coarse algae, such, for instance, as the Fucus and Laminariae, do not readily adhere to paper, and require soaking for some time in fresh water before being pressed. The less robust species of the Fucus, Ascophyllum, etc., are pressed for a week, and the paper, may be made to do so by brushing them over either with milk, carefully skimmed, or with a liquid formed by placing isinglass (1 oz. and water (1 oz) in a bottle, and shaking them for half an hour in a saucepan containing cold water, heating until solution is effected, and then adding 1 oz. of rectified spirits of wine; the whole is next stirred together, and when cold is kept in a stoppered bottle. For the purpose of pressing the bladders, or bladder-worts, the means of a camel's hair brush to the underside of the specimen, which is then laid neatly on paper. For the more delicate species, such as the Callithamnia and Ectocarpus, it is an excellent plan to place a small fruting fragment, carefully floated out in water, on a slip of mica of the size of an ordinary microscopic slide, and allow it to dry. The plant can then be at any time examined under the microscope without injuring the mounted specimen. Many of the small water alge which form a mere crust, such as Palmella cruenta, may be placed in a vessel of water, where after a time they float like a scum, the earthy matter settling down to the bottom, and may then be mounted. The same piece of paper may then be used, and the slide with the big片子 can be laid in a suitable vessel to dry. Oscillatoriae may be mounted by laying a portion on a silver coin placed on a piece of paper in a plate, and pouring in water until the edge of the coin is just covered, the paper being then peeled off from the specimen, enclosed for safety in a small envelope fastened at one corner of the sheet of paper. Filamentous diatoms may be mounted like ordinary seaweeds, and, as well as all parasitic algae, should when pressed be allowed to remain immersed in a vessel of water on which they grow, some species being almost always found parasitical on particular plants. Ordinary diatoms and desmids may be mounted by using the glycerine jelly, Canada balsam or some other suitable medium.
HERBART

33^

many distinct forms of elaboration. Logic, which stands first, has
to render our conceptions and the judgments and reasonings arising
from them clear and distinct. But some conceptions are such that
the more distinct they are made the more contradictory their elements
become; so to change and supplement these as to make them

at

length thinkable is the problem of the second part of philosophy,
or metaphysics. There is still a class of conceptions requiring more
than a logical treatment, but differing from the last in not involving
latent contradictions, and in being independent of the reality of their
objects, the conceptions, viz. that embody our judgments of approval
and disapproval; the philosophic treatment of these conceptions
falls to Aesthetic.

In Herbart's writings logic receives comparatively meagre notice;
he insisted strongly on its purely formal character, and expressed
himself in the main at one with Kantians such as Fries and Krug.
As a metaphysician he starts from what he terms " the higher
"

of the Hume-Kantian sphere of thought, the beginnings
scepticism
of which he discerns in Locke's perplexity about the idea of substance.
By this scepticism the real validity of even the forms of experience
is called in question on account of the contradictions they are found
"
"
to involve. And yet that these forms are
to us, as truly as
given
sensations are, follows beyond doubt when we consider that we are
as little able to control the one as the other. To attempt at this stage
a psychological inquiry into the origin of these conceptions would be
doubly a mistake; for we should nave to use these unlegitimated
conceptions in the course of it, and the task of clearing up their
contradictions would still remain, whether we succeeded in our enquiry
or not. But how are we to set about this task? We have given to us
a conception A uniting among its constituent marks two that prove
to be contradictory, say
and N and we can neither deny the unity
nor reject one of the contradictory members. For to do either is
forbidden by experience and yet to do nothing is forbidden by logic.
We are thus driven to the assumption that the conception is contradictory because incomplete; but how are we to supplement it?
What we have must point the way to what we want, or our procedure
will be arbitrary. Experience asserts that
is the same (i.e. a mark
of the same concept) as N, while logic denies it; and so it being
to sustain these contradictory
impossible for one and the same
positions there is but one way open to us; we must posit several
Ms. But even now we cannot say one of these Ms is the same as N,
another is not for every
must be both thinkable and valid. We
may, however, take the Ms not singly but together; and again, no
other course being open to us, this is what we must dp; we must
assume that N results from a combination of Ms. This is Herbart's
method of relations, the counterpart in his system of the Hegelian

dialectic.

In the Ontology this method is employed to determine what in
reality corresponds to the empirical conceptions of substance and
cause, or rather of inherence and change. But first we must analyse
this notion of reality itself, to which our scepticism had already led
"

"

is what it
the given
though we could doubt whether
appears, we cannot doubt that it is something; the conception of the
real thus consists of the two conceptions of being and quality. That
"
which we are compelled to
posit," which cannot be sublated, is
that which is, and in the recognition of this lies the simple conception
of -being.
But when is a thing thus posited? When it is posited

us, for,

posit the things we see and taste and handle.
sensations, i.e. were never bound against our will
to endure the persistence of a presentation, we should never know
what being is. Keeping fast hold of this idea of absolute position,
Herbart leads us next to the quality of the real, (i) This must
exclude everything negative; for non-A sublates instead of positing,
and is not absolute, but relative to A. (2) The real must be absolutely
and B, then either
simple; for if it contain two determinations,
these are reducible to one, which is the true quality, or they are not,
when each is conditioned by the other and their position is no longer
absolute. (3) All quantitative conceptions are excluded, for quantity

as
If

we are wont to
we were without

A

with simplicity. (4) But
implies parts, and these are incompatible
"
there may be a plurality of
reals," albeit the mere conception of
being can tell us nothing as to this. The doctrine here developed
is the first cardinal point of Herbart's system, and has obtained
"
for it the name of
pluralistic realism."
The contradictions he finds in the common-sense conception of
"
a thing with several attributes," will now become
inherence, or of
obvious. Let us take some thing, say A, having
attributes, a, b,
c
.: we are forced to posit each of these because each is presented
in intuition. But in conceiving
we make, not n positions, still less
n l positions, but one position simply; for common sense removes
the absolute position from its original source, sensation. So when we
the possessor of a, b, c
ask, What is the one posited? we are told
. .
or in other words, their seat or substance. But if so, then
,
A, as a real, being simple, must=a; similarly it must"= 6; and so
on. Now this would be possible if a, 6, c ... were but
contingent
"
of A, as e.g. 2',V64, 4+3
1 are contingent aspects of 8.
aspects
Such, of course, is not the case, and so we have as many contradictions as there are attributes; for we must say A is a, is not a, is b,
is not 6, &c.
There must then, according to the method of relations,
for b,
be several As. For o let us assume Ai+Ai+Ai . . .
A2 2 2 .; and so on for the rest. But now what relation
can there be among these several As, which will restore to us

the common observation that the
properties of things exist only under external conditions. Bodies, we
say, are coloured, but colour is nothing without light, and nothing
without eyes. They sound, but only in a vibrating medium, and
for healthy ears.
Colour and tone present the appearance of inherence, but on looking closer we find they are not really immanent
in things but rather presuppose a communion
among several."
The result then is briefly thus: In place of the one absolute
position,
which in some unthinkable way the common understanding substitutes for the absolute positions of the n attributes, we have really
a series of two or more positions for each attribute, every series,
however, beginning with the same (as it were, central) real (hence
the unity of substance in a group of attributes), but each being
continued by different reals (hence the plurality and difference of
attributes in unity of substance). Where there is the appearance of
inherence, therefore, there is always a plurality of reals; no such
correlative to substance as attribute or accident can be admitted
at all. Substantiality is impossible without causality, and to this
as its true correlative we now turn.
The common-sense conception of change involves at bottom the
same contradiction of opposing qualities in one real. The same A
that was a, b, c
becomes a, b, d
and this, which experience thrusts upon us, proves on reflection unthinkable. The metaSince c

no longer in connexion with A 3 &c.
But to think a number of reals " in connexion " (Zusammensein)
will not suffice as an explanation of phenomena something or other
must happen when they are in connexion; what is it? The answer
to this question is the second hinge-point of Herbart's theoretical
"
"
as distinct from all that
actually happens
philosophy. What
seems to happen, when two reals A and B are together is that,
assuming them to differ in quality, they tend to disturb each other
to the extent of that difference, at the same time that each preserves
itself intact by resisting, as it were, the other's disturbance.
And
"
so by coming into connexion with different reals the
self-preserva"
ticns
of A will vary accordingly, A remaining the same through
all; just as, by way of illustration, hydrogen remains the same in
water and in ammonia, or as the same line may be now a normal
and now a tangent. But to indicate this opposition in the qualities
of the reals A+B, we must substitute for these symbols others,
"
"
of A and B, i.e. reprewhich, though only
contingent aspects
senting their relations, not themselves, yet like similar devices in
mathematics enable thought to advance. Thus we may put A =
0+/3 7, B=TO+n+-x; -y then represents the character of the selfpreservations in this case, and a+/3+i+n represents all that could
be observed by a spectator who did not know the simple qualities,
but was himself involved in the relations of A to B; and such is
exactly our position.
Having thus determined what really is and what actually happens,
our philosopher proceeds next to explain synthetically the objective
semblance (der objective Schein) that results from these. But if
this construction is to be truly objective, i.e. valid for all intelligences,
ontology must furnish us with a clue. This we have in the forms of
Space, Time and Motion which are involved whenever we think the
reals as being in, or coming into, connexion and the opposite.
These forms then cannot be merely the products of our psychological

Hence Herbart gave the name Synechology to this branch of
metaphysics, instead of the usual one, Cosmology.


I would actually have happened, nothing would appear. As it is, which cannot so continue are very speedily driven down by the law according to which a presentation is freed from inhibition and rising anew into consciousness tends to lose its force as an external hindrance. Suppose two presentations $p$ and $\rho$ united by the residual force $\pi$, and the amount of $p^b$ "help" to $\pi$ is $r$, the portion of which appropriated by $\pi$ is given by the ratio $\rho / \pi$; and thus the initial help is $\frac{\rho}{\pi}$.

But after a time $t$, when a portion of $\rho$ represented by $\omega$ has been actually brought into consciousness, the help afforded in the next instant will be found by the equation

$$
\frac{d}{dt} = \omega \frac{d}{dt}
$$

from which by integration we have the value of $\omega$.

So that if there are several $\omega$ connected with $\rho$ and smaller parts, there will be a definite "serial" order in which they will be revived by $\rho$; and on this fact Herbart rests all the phenomena of the so-called faculty of memory, the development of spatial and temporal forms and much besides. Emotions and volitions, the self-preservation and mechanical faculties as one by his metaphysics, and tries to show that all psychical phenomena whatever result from the action and interaction of elementary ideas or presentations (Verstrendungen). The soul being one and simple, its separate acts of self-preservation or primary presentations must be simple too, and its several presentations must become united together. And this they can do at once and completely when, as is the case, with the several attributes of an object, they are not of opposite quality. But otherwise there ensues a conflict in which the opposed presentations comport themselves like forces and mutually suppress or obscure each other, and thus the soul is divided against itself. When this is the case, and partly transformed into an effort, and its product, the idea, becomes in the same proportion less and less intense till a position of equilibrium is reached, (though it may be arrived at only in the most attenuated form). We have thus a statics and a mechanics of mind which investigate respectively the conditions of equilibrium and of movement among presentations. In the statics two magnitudes have to be determined: (1) the amount of the suppression or inhibition (Hemmungsumme), and (2) the ratio in which this is shared among the opposing presentations. The first must obviously be as small as possible; thus for two totally-opposed presentations $a$ and $b$, of which $a$ is the greater, the inihibendum $= b$.

For a given degree of opposition this will be shared between the conflicting presentations in the inverse ratio of their strength. When its remainder after inhibition = $0$, a presentation is said to be on the threshold of consciousness for it; and a small diminution of the inhibition the "effort" will become actual presentation in the same proportion. Such total exclusion from consciousness is, however, manifestly impossible with only two presentations, though in the case of more parts of our knowledge, when we have the equation $(S - a) dV = dV$, where $S$ is the total inhibendum, and $dV$ the intensity actually inhibited after the time $t$. Hence

$$
\log (S - \omega) = (t - \omega)
$$

From this law it follows, for example, that equilibrium is never quite obtained for those presentations which continue above the threshold of consciousness, while the rest

which shall find a continuous molecule manifesting attractive and repulsive forces; attraction corresponding to the tendency of the soul to self-preservation and mechanical faculties as one by his metaphysics, and tries to show that all psychical phenomena whatever result from the action and interaction of elementary ideas or presentations (Verstrendungen). The soul being one and simple, its separate acts of self-preservation or primary presentations must be simple too, and its several presentations must become united together. And this they can do at once and completely when, as is the case, with the several attributes of an object, they are not of opposite quality. But otherwise there ensues a conflict in which the opposed presentations comport themselves like forces and mutually suppress or obscure each other, and thus the soul is divided against itself. When this is the case, and partly transformed into an effort, and its product, the idea, becomes in the same proportion less and less intense till a position of equilibrium is reached, (though it may be arrived at only in the most attenuated form). We have thus a statics and a mechanics of mind which investigate respectively the conditions of equilibrium and of movement among presentations. In the statics two magnitudes have to be determined: (1) the amount of the suppression or inhibition (Hemmungsumme), and (2) the ratio in which this is shared among the opposing presentations. The first must obviously be as small as possible; thus for two totally-opposed presentations $a$ and $b$, of which $a$ is the greater, the inihibendum $= b$.

For a given degree of opposition this will be shared between the conflicting presentations in the inverse ratio of their strength. When its remainder after inhibition = $0$, a presentation is said to be on the threshold of consciousness for it; and a small diminution of the inhibition the "effort" will become actual presentation in the same proportion. Such total exclusion from consciousness is, however, manifestly impossible with only two presentations, though in the case of more parts of our knowledge, when we have the equation $(S - a) dV = dV$, where $S$ is the total inhibendum, and $dV$ the intensity actually inhibited after the time $t$. Hence

$$
\log (S - \omega) = (t - \omega)
$$

From this law it follows, for example, that equilibrium is never quite obtained for those presentations which continue above the threshold of consciousness, while the rest

1 Thus, taking the case above supposed, the share of the inhibendum falling to the smaller presentation $b$ is the fourth term of the proportion $a+b:b:a:ab$; and so $b$'s remainder is $b = ab = b(1 - \frac{a}{a+b})$ which only $= 0$ when $a = 1$.

In Theology Herbart held the argument from design to be as valid for divine activity for Herbart, to justify the belief in a superhuman, real, concerning which however, that knowledge is neither attainable nor on practical grounds desirable.

Among the post-Kantian philosophers Herbart doubtless ranks next to Hegel in importance, and this with good reason. With his very great contributions to the science of education. His disciples speak of theirs as the "exact philosophy," and the term well expresses their master's chief excellence and the character of
HERBELOT DE MOLAINVILLE—HERBERT

the chief influence he has exerted upon succeeding thinkers of his own and other schools. His criticisms are worth more than his constructions; indeed for exactness and penetration of thought he is quite on a level with Hume and Kant. His merits in this respect, however, can only be appraised by the study of his works at first hand. But the whole enterprise of this author is of enormous advance psychology has been enabled to make, thanks to his fruitful treatment of it, albeit as yet few among the many who have appropriated and improved his method, by the great and heretofore unventured paths he has traversed in his metaphysical foundations. (J. W. *)

BIBLIOGRAPHY.—Herbarts works were collected and published by his disciple G. Hartenstein (Leipzig, 1850–1852; reprinted at Hamburg, with supplementary volume, 1883–1893); another edition by K. Kehrbruch (Leipzig, 1882, and Langensalza, 1887). The following are also to be mentioned: Allgemeine Pädagogik (1806; new ed., 1894); Hauptpunkte der Metaphysik (1808); Allgemeine praktische Philosophie (1808); Lehrbuch zur Einleitung in die Philosophie (1813; new ed. by Hartenstein, 1860); Grundriss der Philosophie (1887); Psychologie als Wissenschaft (1824–1825); Allgemeine Metaphysik (1828–1829); Encyclopädie der Philosophie (2nd ed., 1841); Umriss pädagogischer Vorlesungen (2nd ed., 1841); Psychologische Untersuchungen (1839–1840).

Some of his works have been translated into English under the following titles: Textbook in Psychology, by M. K. Smith (1891); The Science of Education and the Aesthetic Revelation of the World (1850); Die Erziehungsgesetze der Pädagogik (1898), by D. H. M. and E. Felkin; A B C of Sense Perception and minor pedagogical works (New York, 1896), by W. J. Eckhoff and others; Applications of Psychology to the Science of Education (1898), by B. C. Mulliner; Oriental Psychology, by H. D. G. (Leipzig, 1890). There is a life of Herbert in Hartenstein’s introduction to his Kleinere philosophische Schriften und Abhandlungen (1842–1843) and by F. H. T. Allihn in Zeitschrift für exacte Psychologie (1895). The English edition of Herbert’s Educational Philosophy and Historical and Biographical Sketches of Herbert’s Works and his Life is published (Guterath, 1910); L. Strümpell, Das System der Pädagogik Herberts (Leipzig, 1894); J. Christinger, Herberts Erziehungsliteratur und ihre Fortbildung (Zurich, 1913); O. H. L. Davidson, Éléments de l’Histoire de l’Éducation (Paris, 1899), and The Herbartian Psychology applied to Education (1897); F. H. Hayward, The Student’s Herbert (1902), The Critics of Herbartianism (1903), Three Historical Educators: Pestalozzi, Herbart, and Comenius (New York, 1906); and W. Kinkel, Herbert the German Educator as interpreted by Herbert (1907); W. Kinkel, J. F. Herbert: sein Leben und seine Philosophie (1903); A. Darroch, Herbert and the Herbertian Theory of Education (1907); G. W. Dorr, Herbert’s Interpretation of Psychology (1904); J. Davidson, A New Interpretation of Herbert’s Psychology and Educational Theory through the Psychological of Lebens (1906); see also J. M. Baldwin, Dictionary of Psychology and Philosophy (1901–1905).

HERBELOT DE MOLAINVILLE, BAILLIÉRE ÉDOUARD D’ (1625–1695), French orientalist, was born on the 14th of December 1625 at Paris. He was educated at the university of Paris, and devoted himself to the study of oriental languages, going to Italy to perfect himself in them by converse with the orientals who frequented its sea-ports. There he also made the acquaintance of Holstenius, the Dutch humanist (1596–1661), and Leo Allatius, the Greek scholar (1586–1660). On his return to France after a year and a half, he was received into the house of Fouquet, superintendent of finance, who gave him a pension of 1500 livres. Losing this on the disgrace of Fouquet in 1661, he was appointed secretary and interpreter of Eastern languages to the king. A few years later he again visited Italy, when the grand-duke Ferdinand II. of Tuscany presented him with a large amount of oriental literature, and even allowed him to visit the Orient, if he cared to go to court. Herbert, however, was recalled to France by Colbert, and received from the king a pension equal to the one he had lost. In 1692 he succeeded D’Auvergne in the chair of Syriac, in the Collège de France. He died in Paris on the 8th of December 1695. His great work is the Bibliothèque orientale, ou dictionnaire universel contenant tout ce qui regarde la connaissance des peuples de l’Orient, which occupied him nearly all his life, and was completed in 1697 by A. Galland. It is based on the immense Arabic dictionary of Hadj Khalfa, of which some translations, but it also contains the substance of a vast number of other Arabic and Turkish compilations and manuscripts.

The Bibliothèque was reprinted at Maestricht (fol. 1776), and at the Hague (4 vols. 4to. 1777–1799). The latter edition is enriched with the contributions of the Dutch orientalist Schultens, Johan Jakob Becker (1745–1811), and an able supplement provided by Visdelow and Galland. Herbelot’s other works, none of which have been published, comprise an Oriental Anthology, and an Arabic, Persian, Turkish and Latin Dictionary.

HERBERAY DES ESSARTS, NICOLAS DE (d. about 1557), French translator, was born in Picardy. He served in the artillery, and at the expressed desire of Francis I. he translated into French the first eight books of Amadis de Gaul (1540–1549). The remaining books were translated by other authors. His other translations from the Spanish include L’Amant maltraité de sa mye (1530); Le Premier Livre de la chronique de don Flors de Grèce (1552); and L’Horloge des princes (1585) from Guevara. He also translated the works of Josephus (1557). He died about 1557. The Amadis de Gaul was translated into English by Anthony Munday in 1609.

HERBERT (FAMILY). The sudden rising of this English family to great wealth and high place is the more remarkable in that its elevation belongs to the 15th century and not to that age of the Tudors when many new men made their way upwards into the ranks of the nobility. Earlier generations of the family, which carried the common name of Herbart, were none of them distinguished. The Herbert of the Chamberlain, a Domesday tenant, being disregarded, their patriarch may be taken to be one Jenkin ap Adam (Temp. Edward III.), who had a small Monmouthshire estate at Llanvapley and the office of master sergeant of the lordship of Abergavenny, a place which gave him precedence after the steward of that lordship. Jenkin’s son, Gwili ap Jenkin, who followed his father as master sergeant, is given six sons by the border genealogists, no less than six score pedgreees finding their origin in these six brothers. Their order is uncertain, although the Progers of Wennerde, the last of whom sold his ancestral estate in 1786, are reckoned as the senior line of Gwili’s brothers. But the eldest of his sons, William ap Gwili, is ancestor of all those who bore the surname of Herbert.

Thomas’s fifth son, William or Gwili ap Thomas, who died in 1446, was the first man of the family to make any figure in history. This Gwili ap Thomas was steward of the lordships of Usk and Caerleon under Richard, duke of York. Legend makes him a knight on the field of Agincourt, but his knighthood belongs to the year 1426. He appears to have married twice, his first wife being Elizabeth Bluet of Raglan, widow of Sir James Berkeley, and his second a daughter of David Gam, a valiant Welsh squire slain at Agincourt. Royal favour enriched Sir William, and he was able to buy Raglan Castle from the Lord Berkeley, his first wife’s son, the deed, which remains among the Beaufort muniments, refuting the pedigree-maker’s statement that he inherited the castle as heir of his mother “Maude, daughter of Sir John Morley.” His sons William and Richard, both partisans of the White Rose, took the surname of Herbert in or before 1461. Playing a part in English affairs remote from the Welsh Marches, their lack of a surname may well have inconveniented them, and their choice of the name Herbert can only be explained by the suggestion that their long pedigree from Herbert the Chamberlain, absurdly represented as a bastard son of Henry I., must already have been discovered for them. Copies exist of an alleged commission issued by Edward IV. to a commission of bargains for the ascertaining of the true descendents of William Herbert, earl of Pembroke, whom “the chiefest men of skill” in the province of South Wales declare to be the descendant of “Herbert, a noble lord, natural son to King Henry the first,” and it is recited that King Edward, after the creation of the earldom, commanded the earl and Sir Richard his brother to “take their surnames after their first progenitor
Herbert, George

Herbert fitz Roy and to forgo the British order and manner." But this commission, whose date anticipates by some years the true date of the creation of the earldom, is the work of one of the many genealogical forgers who flourished under the Tudors.

Sir William Herbert, called by the Welsh Gwylim Ddu or Black William, was a baron in 1461 and a Knight of the Garter in the following year. With many manors and castles on the marches he had the castle, town and lordship of Pembroke, and after the attainder of Jasper Tudor in 1468 was created earl of Pembroke. When in July 1460 he was taken by Sir John Conyers and the northern Lancastrians on Hedgecote, he was beheaded with his brother Sir Richard Herbert of Coldbrook. The second earl while still a minor exchanged at the king's desire in 1470 his earldom of Pembroke for that of Huntingdon. In 1494 this son of one whom Hall not unjustly describes as born "a mean gentleman" contracted to marry Katharine the daughter of King Richard III., but her death annulled the contract and the earl married Mary, daughter of the Earl Rivers, by whom he had a daughter Elizabeth, whose descendants, the Somersets, lived in the Herbert's castle of Raglan until the cannon of the Parliament broke it in ruins. With the second earl's death in 1497 the first Herbert earldom became extinct. No claim being set up among the other descendants of the first earl, it may be taken that their lines were illegitimate. One of the chief difficulties which beset the genealogist of the Herberts lies in their Cambrian disregard of the marriage tie, bastards and legitimate issue growing up, apparently, at will, in the Herbert family. Thus the ancestor of the present earls of Pembroke and Carnarvon and of the Herbert who was created marquess of Powis was a natural son of the first earl, one Richard Herbert, whom the restored inscription on his tomb at Aberavon incorrectly describes as a knight. He was constable and porter of Aberavon Castle, and his son William, "a mad fighting fellow" in his youth, married a sister of Catherine Parr and thus in 1543 became nearly allied to the king, who made him one of the executors of his will. The earldom of Pembroke was revived for him in 1551. It is worthy of note that all traces of illegitimacy have disappeared since they have been removed from the arms of the Herberts from the noble descendents of Richard Herbert.

The honors and titles of this clan of marchmen make a long list. They include the marquessate of Powis, two earldoms with the title of Pembroke, two with that of Powis, and the earldoms of Huntingdon and Montgomery, Torrington and Carnarvon, the viscounts of Montgomery and Ludlow, fourteen baronies and seven baronetcies. Seven Herberts have worn the Garter. The knights and rich squires of the stock can hardly be reckoned, more especially as they must be so, that there is beside Richard Herbert, the poet, and John Donne, Sir Henry Wotton, Izaak Walton, Bishop Andrews and Francis Bacon, who dedicated to him his translation of the Psalms. Walton tells us that "the love of a court conversation, mixed with a laudable ambition to be something more than he was, drew him often from Cambridge to attend the king wheresoever the court was," and James I. gave him in 1623 the sinecure day rectory of Whipton, Shropshire, worth £120 a year. The death of his patrons, the duke of Richmond and the marquess of Hamilton, and of King James put an end to his hopes of political preferment; moreover he probably distrusted the conduct of affairs under the new reign. Largely influenced by his mother, he decided to take holy orders, and in July 1626 he was appointed prebendary of Layton Ecclesia (Leighton Bromswold), Huntingdon. Here he was within two miles of Little Gidding, and came under the influence of Nicholas Ferrar. It was at Ferrar's suggestion that he undertook to rebuild the church of Layton, an undertaking carried through by his own gifts and the generosity of his friends. There is little doubt that the close friendship with Ferrar had a large share in Herbert's adoption of the religious life. In 1630 Charles I., at the instance of the earl of Pembroke, whose kinsman Herbert was, presented him to the living of Fugglestone with Bemerton, near Salisbury, and he was ordained priest in September. A year before, after three days' acquaintance, he had married Jane Danvers, whose father had been set on the marriage for a long time. He had often spoken of his daughter Jane to Herbert, and it so much commended Mr Herbert to her, that Jane became so much a Platonian as to fall in love with Mr Herbert, and accepted of the poet's life at Bemerton, as told by Walton, is one of the most exquisite pictures in literary biography. He devoted much time to explaining the meaning of the various parts of the Prayer-Book, and held services twice every day, at which many of the parishioners attended, and some "let their plough rest when Mr Herbert's saints-bell rung to prayers, that they might also offer their devotions to God with him." Next to Christianity itself he loved the English Church. He was passionately fond of music, and his own hymns were written to the accompaniment of his lute or viol. He usually walked twice a week to attend the cathedral at Salisbury, and before returning home, would sing and play his part at a meeting of music lovers. Walton illustrates Herbert's kindness to the poor by many touching anecdotes, but he had not been three years in Bemerton when he succumbed to consumption. He was buried beneath the altar of his church on the 3rd of March 1633.

None of Herbert's English poems was published during his lifetime. On his death-bed he gave to Nicholas Ferrar a manuscript with the title The Temple: Sacred Poems and Private Thoughts. This Herbert wrote at Cambridge, apparently for private circulation, almost immediately after Herbert's Englishman, and a second imprint followed in the same year. On the title-page of both is the quotation "In his Temple doth every man speak of his honour." The Temple is a collection of religious poems connected by unity of sentiment and inspiration. Herbert tried to interpret his own devout meditations by applying images of all kinds to the ritual and beliefs of the Church. Nothing in his own church at Bemerton was too common-place to serve as a starting-point for the epigrammatic expression of his piety. The church key reminds him that "it is my sin that locks hinder hopeful meditation."

The English Church, with its great sense of balance, of humility, while the cement that binds them together is love and charity. The chief faults of the book are obscurity, verbal conceits and a forced ingenuity which shows itself in grotesque puns, odd metres and occasional want of taste. But the quaint beauty of Herbert's style and its musical quality give The Temple a high place. "The Church Porch," "The Agony," "Sin," "Sunday," "Vertue," "Man," "The British Church," "The Quip," "The Collar," "The Pulley," "The Flower," "Aaron" and "The Elixir" are among the best known of the poems. Herbert was not merely the poet of Anglican theology. No book is fuller of devotion to the Church of England than The Temple, and no poems in our language exhibit more of the spirit of true Christianity. Every page is marked by

1 Printed in 1662 as an appendix to J. Vivian's Ecclesiastes Solomonis.

O. Ba.
HERBERT, H. W.—HERBERT OF CHERUBY

Herbert, Sir Thomas (1606-1652), English traveller and author, was born at York in 1606. Several of his ancestors were aldermen and merchants in that city—e.g. his grandfather and benefactor, Alderman Herbert (d. 1614)—and they traced a connexion with the earls of Pembroke. Thomas became a commoner of Jesus College, Oxford, in 1621, but afterwards removed to Cambridge, through the influence of his uncle Dr Ambrose Akroyd. In 1627 the earl of Pembroke procured his appointment in the suite of Sir Dodmore Cotton, then starting as ambassador for Persia with Sir Robert Shirley. Sailing in March they visited the Cape, Madagascar, Goa and Surat; landing at Gambrum (10th of January 1627-1628), they travelled by sea to Ashraf and thence to Kavzin, where both Cotton and Shirley died, and whence Herbert made extensive travels in the Persian Hinterland, visiting Kashan, Bagdad, &c. On his return voyage he touched at Ceylon, the Coromandel coast, Mauritius and St Helena. He reached England in 1629, travelled in Europe in 1630-1631, married in 1632 and retired from court in 1634 (his prospects perhaps blighted by Pembroke's death in 1630); after this he resided on his Tintern estate and elsewhere till the Civil War, siding with the parliament till his appointment to attend on the king in 1646. Becoming a devoted royalist, he was rewarded with a baronetcy at the Restoration (1660). He resided mainly in York Street, Westminster, till the Great Plague (1666), when he retired to York, where he died (at Petergate House) on the 1st of March 1662.

Herbert's chief work is the Description of the Persian Monarchy now beinge: the Orientall Inydes, Iles and other parts of the Greater Asia and Africke (1634), reissued with additions, &c., in 1638 as Some Years Travels into Africa and Asia the Great (al. into divers parts of Asia and Africque); a third edition followed in 1664, and a fourth in 1677. This collection of letters is remarkable for its curious canonical inscriptions and Persepolis. Herbert's Threnodia Carolina; or, Memoirs of the two last years of the reign of that unparalleled prince Charles the First, was published in 1672, and contained a facsimile of the inscription on Herbert's tomb; Wood's Athenae, iv. 15-41; and Fasti, ii. 26, 131, 138, 143-144, 150.

HERBERT OF CHERUBY, EDWARD HERBERT, BARON (1583-1649), English soldier, diplomatist, historian and religious philosopher, eldest son of Richard Herbert of Montgomery Castle (a member of a collateral branch of the family of the earls of Pembroke) and of Magdalen, daughter of Sir Richard Newport, was born at Eynon-on-Severn near Wroxeter on the 3rd of March 1634. After careful private tuition he matriculated at University College, Oxford, as a gentleman commoner, in May 1596. On the 28th of February 1599 he married his cousin Mary, daughter and heiress of Sir William Herbert (d. 1593). He returned to Oxford with his wife and mother, continued his studies, and obtained proficiency in modern languages as well as in music, riding and fencing. On the accession of James I. he presented himself at court and was created a knight of the Bath on the 24th of July 1603. In 1608 he went to Paris, enjoying the friendship and hospitality of the old constable de Montmorency, and being entertained by Henry IV. On his return, as he says himself with naive vanity, he was "in great esteem both in court and city, many of the greatest desiring my company." In 1610 he served as a volunteer in the Low Countries under the prince of Orange, whose intimate friend he became, and distinguished himself at the capture of Juliers from the emperor. He offered to decide the war by engaging in single combat with a champion chosen from among the enemy, but his challenge was declined. During an interval in the fighting he paid a visit to Spinola, in the Spanish camp near Wezel, and afterwards to the elector palatine at Heidelberg, subsequently travelling in Italy. At the instance of the duke of Mantua he was engaged as counsellor and mentor of 4000 Huguenots from Languedoc into Piedmont to help the Sobrayers against the Turks; after nearly losing his life in the journey to Lyons he was imprisoned on his arrival there, and the enterprise came to nothing. Thence he returned to the Netherlands and the prince of Orange, arriving in England in 1617. In 1619 he was made by Buckingham ambassador at Paris, but a quarrel with de Luyres and a challenge sent by him to the latter occasioned his recall in 1621. After the death of de Luyres Herbert resumed his post in February 1622. He was very popular at the French court and showed considerable diplomatic ability. His chief objects being to accomplish the union between Charles and Henrietta Maria and secure the assistance of Louis XIII. For the unfortunate election of his brother as prince palatine he could not obtain, and he was dismissed in April 1623. He returned to England in debt and received little reward for his services beyond the Irish peerage of Castle island in 1624 and the English barony of Cherbury, or Chisbury, on the 7th of May 1629. In 1632 he was appointed a member of the council of war. He attended the king at York in 1639, and in May 1642 was imprisoned by the parliament for urging the addition of the words "without cause" to the resolution that the king violated his oath by making war on parliament. He determined after this to take no further part in the struggle, retired to Montgomery Castle, and declined the king's summons. On the 5th of September 1644 he surrendered the castle to the parliamentary forces, returned to London, submitted, and was granted a pension of £20 a week. In 1647 he paid a visit to Gassendi at Paris, and died in London on the 20th of August 1648, being buried in the church of St Giles's in the Fields.
HERBERT OF LEA

Lord Herbert left two sons, Richard (c. 1600–1655), who succeeded him as 2nd Lord Herbert of Cherbury, and Edward, the title becoming extinct in the person of Henry Herbert, the 4th baron, grandson of the 1st Lord Herbert in 1607. In 1646, however, his name was revived in favour of Henry Herbert (1645–1724), son of Sir Henry Herbert (1595–1673), brother of the 1st Lord Herbert of Cherbury. Sir Henry was master of the revels to Charles I. and Charles II., being busily employed in reading and licensing plays and in supervising all kinds of public entertainments. He died in April 1673; his son Henry died in January 1700, when the latter’s son Henry became 2nd Lord Herbert of Cherbury of the second creation. He died without issue in April 1738, and again the barony became extinct. In 1743 it was revived for Henry Arthur Herbert (c. 1703–1772), who is most probably the son of Henry Herbert who was a great-grandson of the 2nd Lord Herbert of Cherbury of the first creation, and since his time the barony has been held by the earls of Powis.

Lord Herbert’s cousin, Sir Edward Herbert (c. 1591–1657), was a member of parliament under James I. and Charles I. Having become attorney-general he was instructed by Charles to take proceedings against some members of parliament who had been concerned in the passing of the Grand Remonstrance; the only result, however, was Herbert’s own impeachment by the House of Commons, and his banishment. It is hard to convey the impression which he made of life when he was with the exiled royal family in Holland and in France, becoming lord keeper of the great seal to Charles II., an office which he had refused in 1645. He died in Paris in December 1657. One of Herbert’s sons was Arthur Herbert, earl of Torrington, and another was Sir Edward Herbert (c. 1648–1698), titular earl of Portland, who was made chief justice of the king’s bench in 1685 in succession to Lord Jeffreys. It was Sir Edward who declared for the royal prerogative in the case of Godden v. Hales, asserting that the kings of England, being sovereign polity, are the only persons with peculiar laws in particular cases. After the escape of James II. to France, Sir Edward was his lord chancellor and created him earl of Portland, although he was a Protestant and had exhibited a certain amount of independence during 1687.

The first Lord Herbert’s real claim to fame and remembrance is derived from his writings. Herbert’s first and most important work is the De causis errorum, a philosophical poem, a De causis, et a falsa (Paris, 1624; London, 1633; translated into French 1639, but never into English; a MS., in add. MSS. 7081. And the second edition is translation into Latin: the Dieresis, or Brother George in his own hand, dated 1620). It combines a theory of knowledge with a partial psychology, a methodology for the investigation of truth, and a scheme of natural religion. The author’s methodology is what the book is about. The book is a part of the system, but it contains the skeleton and much of the soul of a complete philosophy. Giving up all past theories as useless, Herbert postulates four factors to constitute a new and true system. Truth, which he defines as a just conjunctive of the faculties with one another and with their objects, he distributed into four classes or stages: (1) truth in the thing or the truth of the object; (2) truth of the appearance; (3) truth of the apprehension (conceptus); (4) truth of the intellect. The faculties of the mind are as numerous as the differences of their objects, and are accordingly innumerable; but they may be arranged in four groups. The first and fundamental and most correlative pair is the Natural intellect, which contains the nostrum, the notitia communes, which are innate, of divine origin and indisputable. The second group, the next in certainty, is the sense of inference (on which he feels Herbert discusses amongst others love, hate, fear, conscience with its communis natura, and (free will); the third is the sensus externus; and the fourth is discursus, reasoning, to which, as being the least certain, we have recourse when the other faculties fail. The reflexive faculties proceed by division and analysis, by questioning, and are slow and gradual in their movement; they take aid from the other faculties. Those of the instinctus naturalis are always the final test. Herbert’s categories of questions and questions on whether (a thing is), what, of what sort, how much, in what relation, how, when, where, whence, wherefore. No faculty, rightly used, can err. But as faculties reasoning becomes the source of almost all our errors. The discussion of the notion est nomen is the most characteristic part of the book. The exposition of them, though highly dogmatic, is at times strikingly Kantian in substance. For example, Berkeley’s arguments for the existence of things are to be found here. The same is true of some details from the evidence of experience or observation that without some of them, or at least some one of them, we can never experience even observe. Unless we feel driven by them to explore the nature of things, “it is impossible for us to perceive anything from another.” It cannot be said that Herbert proves the existence of the common notions; he does not deduce them or even give any list of them. But each faculty has its common notion; no faculty may be emptied of its six marks, their priority, independence, universality, certainty, necessity (for the well-being of man), and immediacy. Law is based on certain common notions; so is religion. Herbert’s attitude towards the Church’s doctrine is distinctly negative, and he denies revelation except as a result of the dominant social order. The De religionis gentilium (completed 1645, published Amsterdam, 1663, translated into English by W. Lewis, London, 1705) he gives what may be called, in Hume’s words, “a natural history of religion.” By explaining the heathen religions Herbert finds, to his great delight, the universality of his five great articles, and that these are clearly recognizable under their absurdities as they are under the rites, ceremonies and polytheism invented by sacrificial superstition. To these is maintained in the tract De causis errorum, an unfinished work on logical fallacies, Religio laici, and Ad sacerdotes de religione Christiana (Paris, 1637). In this work he produced the first purely metaphysical treatise written by an Englishman and in which the word De religionis gentilium one of the earliest studies extant in comparative theology; while both his metaphysical speculations and his critical works brought him into considerable and provoked considerable controversy. His achievements in historical writing are vastly inferior, and vitiated by personal aims and his preoccupation to gain the royal favour. Herbert’s first historical work is the Exsiccatio Buckinghamiana ductis (published in 1634). A translation in 1656 and in the original English by the earl of Powis for the Philobiblon Society in 1880, a defence of Buckingham’s conduct of the ill-fated expedition of 1627, The Life and Reign of King Henry VIII. (1649) derives his chief value from his composition from original documents, but is ill-proportioned, and the author judges the character and statesmanship of Henry with too obtrusive partiality.

His poems, published in 1665 (reprinted and edited by J. Churton Collins in 1881), show him in general a faithful disciple of Donne, obscure and uncouth. His sates are miserable compositions, but a few of his lyrical works, such as The De cause of War and The inspiration, while his use of the metre afterwards employed by Tennyson in his “In Memoriam” is particularly happy and effective. His Latin poems are evidence of his scholarship. Three of these had appeared together with the De causis errorum in 1642. These works must be added A Dialogue between a Tutor and a Pupil (1765; a treatise on education, MS. in the Bodleian Library); a few of his lyrical works in the Collected Poems of Sir John Walpole (1764), a naive and amusing narrative, too much occupied, however, with his duels and duelling Custom, the Oratio in J. W. Warner’s Ebelishy Curiosities, i. ser. 1874. Reid’s works, edited by Sir William Hamilton; National Review, xxxiv. 661 (Leslie Stephen); Locke’s Essay on Human Understanding (1870); Ath. Oeconomia (Bliss), ii. 235; Gentleman’s Magazine (1816), i. 201 (print of remains of hisrellidex); Lord Herbert of Poems, ed. by J. Churton Collins (1881); Aubrey’s Lives of Eminent Men; also works quoted under Deism.

BIBLIOGRAPHY.—The autobiography edited by Sidney Lee with correspondence from add. MSS. 7062 (1886); article in the Dict. of Nat. Biog. by the same writer and the list of authorities there collected; Hist. MSS. Com., rep. x. app. iv. 375; Lord Herbert de Cherbury, by Charles de Romain; (1747); Edard, Lord Herbert von Cherbury, by C. Gatter (a criticism of his philosophy; 1897); Collections Historical and Archaeological relating to Montgomeryshire, vol. vii., by L. R. Warner’s Ebelishy Curiosities, i. ser. Reid’s works, edited by Sir William Hamilton; National Review, xxxiv. 661 (Leslie Stephen); Locke’s Essay on Human Understanding (1870); Ath. Oeconomia (Bliss), ii. 235; Gentleman’s Magazine (1816), i. 201 (print of remains of his rellidex); Lord Herbert of Poems, ed. by J. Churton Collins (1881); Aubrey’s Lives of Eminent Men; also works quoted under Deism.

HERBERT OF LEA, SYDNEY HERBERT, 1st BARON (1860–1861), English statesman, was the younger son of the 11th earl of Pembroke. Educated at Harrow and Oriel, Oxford, he made a reputation at the Oxford Union as a speaker, and entered the House of Commons as Conservative member for a division of Wiltshire in 1835. On 23 May 1841, he was appointed a judge of the Common Pleas, and on 1845 was included in the cabinet as secretary at war, and again held this office in 1852–1855, being responsible for the War Office during the Crimean difficulties, and in 1859. It was Sidney Herbert who sent Florence Nightingale out to the Crimea, and he led the movement for War Office reform after the war,
HERCULETÓN—HERCULANEUM

The family of Calpurnius Piso. By means of the Via Appia it had easy communication north-westward with Neapolis, Puteoli and Capua, and thence by the Via Appia with Rome; and southwards with Pompeii and Nuceria, and thence with Lucania and the Bruttii. In the year a.D. 63 it suffered terribly from the earthquake which, according to Seneca, "Campaniam nunquam securam hulas nullam, indemnem tamen, et toties defunctum metu magna strage vastavit. Nam et Herculaneensis oppidi pars ruit dubieque statt etiam quae relicta sunt." (Nat. quaest. vi. 1). Hardly had Herculaneum completed the restoration of some of its principal buildings (cf. Mommsen, I.N. n. 2583; Catalogo del Museo Nazionale di Napoli, n. 1151) when it fell beneath the great eruption of the year 79, described by Pliny the younger (Ep. vi. 16, 20), in which Pompeii also was destroyed, with other flourishing cities of Campania. According to the commonest account, on the 23rd of August of that year Pliny the elder, who had command of the Roman fleet at Misenum, set out to render assistance to a young lady of noble family named Rectina and others dwelling on that coast, but, as there was no escape by sea, the little harbour having been on a sudden filled up so as to be inaccessible, he was obliged to abandon to their fate the whole body of people of Herculaneum who had managed to flee from their houses, and which they might have preserved by the simple passage of a hill. The text of Pliny the younger, where this account is given, has been subjected to various interpretations; and from the comparison of other classical testimonies and the study of the excavations it has been concluded that it is impossible to determine the date of the catastrophe, though there are satisfactory arguments to justify the statement that the event took place in the autumn. The opinion that immediately after the first outbreak of Vesuvius a torrent of lava was ejected over Herculaneum was refuted by the scholars of the 18th century, and their refutation is confirmed by Beulé (Le Drame du Vésuve, p. 240 seq.). And the last recensions of P. R. Coltman (Antiquity, iv. 15) have found in the Plinyan report of the destruction that Rectina cannot have been the name of the harbour described by Beulé (ib. pp. 122, 247), but that the name of a lady who had implored succour, the wife of Caecius Bassus, or rather Tascius (cf. Pliny, ed. Keil, Leipzig, 1870; Aulus Persius, ed. Jahn, Sat. vi). The shore, moreover, according to the accurate studies of the engineer Michele Ruggiero, director of the excavations, was not altered by the changes adduced by Beulé (p. 125), but by a simpler event. "It is certain," he says (Pompeii e la regione sotterrata del Vesuvio l'anno 79, Naples, 1875, p. 21 seq.), "that the districts between the south and west, and those between the south and east, were overwhelmed in two quite different ways. From Torre Annunziata (which is believed to be the site of the ancient Minti) to San Severino di Tuccito (i.e. Tufa) - a distance of about 9 m., there flowed a muddy eruption which in Herculaneum and the neighbouring places, where it was most abundant, raised the level of the country more than 65 ft. The matter transported consisted of soil of various kinds—sand, ashes, fragments of lava, pozzolana and whitish pumice, enclosing grains of uncalcined lime, similar in every respect to those of Pompeii. In the part of Herculaneum already excavated the corridors in the upper portions of the theatre are compactly filled, up to the head of the arches, with pozzolana and pumice transformed into tufa (which proves that the formation of this stone may take place in a comparatively short time). Tufa is also found in the lowest part of the city towards the sea in front of the few houses that have been discovered; and in the very high banks that surround them, as also in the lowest part of the theatre, there are plainly to be seen earth, sand, ashes, fragments quartz..." 3

1 A fragment of L. Sisenna calls it "Oppidum tumulo in excelsis loco proprium inter parvius moenia, inter duas fluvas, infra Vesuvium collocatum" (lib. iv., fragm. 53, Peters). Of one of these rivers this historian again makes mention in the passage where probably he related the capture of Herculaneum by Minatius Magius and T. Didius (Velleius Paterculus ii. 16). Further topographical details are supplied by an inscription of B.C. 465 (88 v. c.), it appears to have been less severely treated than Pompeii, and to have escaped the imposition of a colony of Sulla's veterans, although Zumpt has suspected the contrary (Comm. epigr. i. 259). It afterwards became a municipium, and enjoyed great prosperity towards the close of the republic and in the earlier times of the empire, since many noble families of Rome selected this pleasant spot for the construction of splendid villas, one of which indeed belonged to the imperial house (Seneca, De ira, iii.), and another to the family of Calpurnius Piso.

2 See also Niebuhr, Hist. of Rome, i. 76, and Mommsen, Die unteritalischen Dialekte (1850), p. 314: for later discussions see Osca Lingua, Pelasgiens.

3 C.I.L. ii. No. 3866. This Spanish inscription refers to a Rectina who died at the age of 18 and was the wife of Voconius Romanus, an intimate friend of Pliny the younger. The latter addressed to her in a very affectionate letter a few lines of comfort, which in another letter commended him to the emperor Trajan (x. 3), and in another (ii. 13) says of him: "Hunc ego cum simul studierimus arte familiariterque dileximus; ille meus in urbe, ille in secessu contubernialibus; cum hoc seriat et jocos misc likeness.
of lava and pumice, with little distinction of strata, almost always confused and mingled together, and varying from spot to spot in degree of compactness. It is clear that this immense congeries of earth and stones could not flow in a dry state or through regular channels (in the beds of the Tiber, Patarna, and at intervals almost level), where certainly it would have been arrested and all accumulated in a mound; but it must have been borne along by a great quantity of water, the effects of which may be distinctly recognized, not only in the filling and choking up even of the most narrow, intricate and remote parts of the buildings, but also in the formation of the tufa, in which water has so great a share; for it cannot be supposed that enough of it has filtered through so great a depth of earth. The torrent ran in a few hours to the sea, and formed that shallow or deeper furrow, which at present is the only trace which remains of playing the lyre (ibid. No. 1201), and Hercules finding Telephus who is being sucked by the hind (ibid. No. 1143).

Notwithstanding subsequent discoveries of stupendous paintings in the gardens of the Villa Farnesina on the banks of the Tiber, the monochromes of Herculanenum remain among the finest specimens of the exquisite taste and consummate skill displayed by the ancient painter, and which had been afterwards lost until the middle of the 18th century (i.e. the 18th) form a collection of the highest scientific and artistic value. They come partly from the buildings of the ancient city (theatre, basilicas, houses and forum), and partly from the country (the Villa Farnesina, La Villa Ercolanesi dei Pisoni, Turin, 1883). From the city come, that is, many of the other objects, the two equestrian statues of the Emperor Tiberius (ibid. vii. pl. xxxvii., xxxviii.), the great imperial and municipal bronze statues. In the country, extraordinary beauty were also discovered here, such as those that represent Theseus after the slaughter of the Minotaur (Herwig. Wandreise nach Herculanenum, 1878). Comparetti, in his Chalcis (the art of playing the lyre (ibid. No. 1201), and Hercules finding Telephus who is being sucked by the hind (ibid. No. 1143).
villa, giving the plan executed by Weber and recovered by chance by the director of excavations, Michele Ruggiero. This plan, which is here reproduced from de Petra, is the only satisfactory document for the topography of Herculaneum; for the plan of the theatre published in the *Bollettino archeologico italiano* (Naples, 1861, i. p. 53, tav. III) was executed in 1747, when the excavations were not completed. And even for the history of the "finds," made in the Villa Suburbana, the necessity for further studies makes itself felt, since there is a lack of agreement between the accounts given by Alcubierre and that communicated to the *Philosophical Transactions* (London, vol. x.) by Camillo Paderini, conservator of the Portici Museum.

The most important reference work is C. Waldstein and L. Shorebridge, *Herculaneum, Past, Present and Future* (London, 1908); it contains full references to the history and the explorations, and to the buildings and objects found (with illustrations). Miss E. R. Barker's *Buried Herculaneum* (1908) is exceedingly useful.

In 1904 Professor Waldstein expounded both in Europe and in America an international scheme for thorough investigation of the site. Negotiations of a highly complex character existed with the Italian government, which ultimately in 1908 decided that the work should be undertaken by Italian scholars with Italian funds. The work was begun in the autumn of 1908, but financial difficulties with property owners in Resina immediately arose with the result that progress was practically stopped.

F. B.

**HERCULANO DE CARVALHO E ARAUJO, ALEXANDRE** (1810-1877), Portuguese historian, was born in Lisbon of humble stock, his grandfather having been a foreman stonemason in the royal employ. He received his early education, comprising Latin, logic and rhetoric, at the Necessidades Monastery, and spent a year at the Royal Marine Academy studying mathematics with the intention of entering on a commercial career. In 1828 Portugal fell under the absolute rule of D. Miguel, and Herculano, becoming involved in the unsuccessful military *pronunciamento* of August 1831, had to leave Portugal clandestinely and take refuge in England and France. In 1832 he accompanied the Liberal expedition to Terceira as a volunteer, and was one of D. Pedro's famous army of 7500 men who landed at the Mindello and occupied Oporto. He took part in all the actions of the great siege, and at the same time served as a librarian in the city archives. He published his first volume of verses, *A Voz de Propheta*, in 1832, and two years later another entitled *A Harpa do Crente*. Privation had made a man of him, and in these little books he proves himself a poet of deep feeling and considerable power of expression. The stirring incidents in the political emancipation of Portugal inspired his muse, and he describes the bitterness of exile, the adventurous expedition to Terceira, the heroic defence of Oporto, and the final conquests of Portugal. In 1837 he founded the *Panorama* in imitation of the *English Penny Magazine*, and there and in *Ilustração* he published the historical tales which were afterwards collected into *Lendas e Narratives*; in the same year he became royal librarian at the Ajuda Palace, which enabled him to continue his studies of the past. The *Panorama* had a large circulation and influence, and Herculano's biographical sketches of great men and his articles of literary and historical criticism did much to educate the middle class by acquainting them with the history of their nation, and with the progress of knowledge and the state of letters in foreign countries. On entering parliament in 1840 he resigned the editorship to devote himself to history, but he still remained its most important contributor.

Up to the age of twenty-five Herculano had been a poet, but he then abandoned poetry to Garrett, and after several essays in that direction he definitely introduced the historical novel into Portugal in 1844 by a book written in imitation of Walter Scott, *Eurico*; treatments of the fall of the Visigothic monarchy and the beginnings of resistance in the Asturias which gave

HERCULES

345

birth to the Christian kingdoms of the Peninsula, while the
Monge de Cister, published in 1848, describes the time of King
John I., when the middle class and the municipalities first
asserted their power and elected a king in opposition to the
nobility. From an artistic standpoint, these stories are rather
labored productions, besides being ultra-romantic in tone;
but it must be remembered that they were written mainly
with an educational object, and, moreover, they deserve high praise
for their style. The composition have made it a Portuguese classic,
but lacked descriptive talent and skill in dialogue. His
touch is heavy, and these novels show no dramatic power, which
accounts for his failure as a playwright, but their influence was
as great as their followers were many, and they still find readers.

These and editions of two old chronicles, the Chronicas de D.
Sebastiao (1839) and the Annaes do rei D. Joao III (1844),
prepared Herculado for his life's work, and the year 1846 saw
the first volume of his History of Portugal from the Beginning
of the Monarchy to the end of the Reign of Afonso III., a book
written on critical lines and based on documents. The success
he experienced in presenting it was very great, for the founda-
tions had been ill-prepared by his predecessors, and he was
obliged to be artisan and architect at the same time. He had

to collect MSS. from all parts of Portugal, decipher, classify and
weigh them before he could begin work, and then he found it
necessary to break with precedents and destroy traditions.
Serious students in Portugal and abroad welcomed the book
as an historical work of the first rank, for its evidence of careful
research, its able marshalling of facts, its learning and its painful
accuracy, while the sculptural simplicity of the style and the
correctness of the execution have made it a Portuguese classic.
The first volume, however, gave rise to a celebrated controversy,
because Herculado had reduced the famous battle of Ourique,
which was supposed to have seen the birth of the Portuguese
monarchy, to the dimensions of a mere skirmish, and denied the
apparition of Christ to King Afonso, a fable first circulated in the
17th century. Herculado was denounced from the pulpit
and the press for his lack of patriotism and piety, and after
bearing the attack for some time his pride drove him to reply.
In a letter to the cardinal patriarch of Lisbon entitled Em e o
Clero (1850), he denounced the fanaticism and ignorance of the
clergy in plain terms, and this provoked a fierce pamphlet war
marked by much personal abuse. The professor of Arabic in
Lisbon intervened to sustain the accepted view of the battle,
and charged Herculado and his supporter Gayangos with
ignorance of the Arab historians and of their language.
The conduct of the controversy, which lasted some years, did credit
to none of the contending parties, but Herculado's statement
of the facts is now universally accepted as correct. The second
volume of his history appeared in 1847, the third in 1849 and the
fourth in 1853. In his youth, the excesses of absolutism had
made Herculf the Liberal, and the attacks on his history turned
this man, full of sentiment and deep religious conviction, into an
anti-clerical who began to distinguish between political Catho-
licism and Christianity. His History of the Origin and Establish-
ment of the Inquisition (1844-1855), relating the thirty years'
struggle between King John III. and the Jews—he to establish
the tribunal and they to prevent him—was compiled, as the
preface showed, to stem the Ultramontane reaction, but none
the less carried weight because it was a recital of events with
little or no comment or evidence of passion in its author. Next
to these two books his study, De Estado das cousas sertao na
Peninsula desde o VIII. até o XII. seculo, is Herculado's most
valuable contribution to history. In 1856 he began editing a
series of Portualliae monumenta historia, but personal differ-
ences between him and the keeper of the Archive office, which
he was forced to frequent, caused him to interrupt his historical
studies, and on the death of his friend King Pedro V. he left
the Ajuda and retired to a country house near Santarem.

Disillusioned with men and despairing of the future of his
country, he spent the rest of his life devoted to agricultural
pursuits, and rarely emerged from his retirement; when he
did so, it was to fight political and religious reaction. Once he
had defended the monastic orders, advocating their reform and
not their suppression, supported the rural clergy and idealized
the village priest in his Paroche da Aldeia, after the manner of
Goldsmith in the Vicar of Wakefield. Unfortunately, however,
the brilliant epoch of the alliance of Liberalism and Catholicism,
represented on its literary side by Chateaubriand and by Lamar-
tine, to whose poetic school Herculado had belonged, was past,
and fanatical teachings, and the progress of events drove the
former champion of the Church into conflict with the ecclesiastical
authorities. His protest against the Concordat of the 21st of
February 1857 between Portugal and the Holy See, regulating
the Portuguese Padroado in the East, his successful opposition
to the entry of foreign religious orders, and his advocacy of civil
marriage, were the chief landmarks in his battle with Ultra-
monatism, and his Estudos sobre a Casaimento Civil were put
on the Index. Finally in 1871 he attacked the dogmas of the
Immaculate Conception and papal infallibility, and fell into
line with the Old Catholics. In the domain of letters he remained
his death a veritable pontiff, and an article or book of his
was an event celebrated from one end of Portugal to the other.
The nation continued to look up to him for mental leadership,
but, in his later years, lacking hope himself, he could not stimulate
others or use to advantage the powers conferred upon him.
In politics he remained a constitutional Liberal of the old type,
and for him the people were the middle classes in opposition to
the lower, which he saw to have been the supporters of tyranny
in all ages, while he considered Radicvalism to mean a return
via anarchy to absolutism. However, though he conducted a political
propaganda in the newspapers, and in his early years, Herculado
exercised much influence in politics. Grave as most of his writings are, they include a short description of a crossing
from Jersey to Granville, in which he satirizes English character
and customs, and reveals an unexpected sense of humour.
A rare capacity for tedious work, a devout Catonian rectitude,
a passion for truth, pride, irribatiliy at criticism and independence
of character, are the marks of Herculado as a man. He could
be broken but never bent, and his rude frankness accorded
with his hard, sombre face, and alienated men's sympathies
though it did not lose him their respect. His lyricism is
vigorous, feeling, austere, yet almost entirely subjective and personal,
while his pamphlets are distinguished by energy of conviction,
strength of affirmation, and contempt for weaker and more
ignorant opponents. His History of Portugal is a great but
incomplete monument. A lack of imagination and of the
philosophic spirit prevented him from penetrating or drawing
characters, but his analytical gift, joined to persevering toil
and honesty of purpose enabled him to present a faithful account
of ascertained facts and a satisfactory and lucid explanation
of political and economic events. His remains lie in a majestic
tomb in the Jeronymo's College, Lisbon, his house was rented
by public subscription to the greatest modern historian of
Portugal and of the Peninsula. His more important works have
gone through many editions and his name is still one to conjure
with.

HERCULES. (O. Lat. Hercules, Hercules), the latinized form of the mythical Heracles, the chief native hero of Hellas.

Heracles (Heros, and Alexander—glory) is explained as "re-
nowned through Hera" (i.e. in consequence of her persecution) or "the glory of Hera" "i.e. of Argos. The thoroughly national character of Heracles is shown by his being the mythical ancestor of the Dorian dynastic tribe, while revered by Ionian Athens, Lelegian Opus and Aeolian-Phoenician Thebes, and closely
associated with the Achaean heroes Peleus and Telamon. The
Perseid Alcmena, wife of Amphithryon of Tiryns, was Hercules' mother, Zeus his father. After his father he is often called
Amphitryoniades, and also Alcides, after the Perseid Alcme,
father of Amphithryon. His mother and his husband lived at
Thebes in exile as guests of King Creon. By the craft of Hera,
HERCULES

his foes through life, his birth was delayed, and that of Eurytheus, son of Sthenelus of Argos, hastened; Zeus having in effect sworn that the elder of the two should rule the realm of Perseus. Hera sent two serpents to destroy the new-born Hercules, but he strangled them. He was trained in all many accomplishments by heroes of the highest renown in each, until in a transport of anger at a reprimand he slew Linus, his instructor in music, with the lyre. Thereupon he was sent to tend Amphitrion’s oxen, and at this period slew the lion of Mount Cithaeron. By freeing Thebes from paying tribute to the Minyans of Orchomenus he won Creon’s daughter, Megara, to wife. Her children by him he killed in a frenzy induced by Hera. After purification he was sent by the Pythia to serve Eurytheus. Thus began the cycle of the twelve labours.

1. Wrestling with the Nemean lion.
2. Destruction of the Lernean Hydra.
3. Capture of the Arcadian hind (a stag in art).
4. Capture of the boar of Erymanthus, while chasing which he fought the Centaurs and killed his friends Chiron and Pholus, this homicide leading to Demeter’s institution of mysteries.
5. Cleansing of the stables of Augeas.
6. Shooting the Stymphalian birds.
7. Capture of the Cretan bull subsequently slain by Theseus at Marathon.
8. Capture of the man-eating mares of the Thracian Diomedes.
10. Bringing home to Greece the golden fleece of Phaethon in the far west, which errand involved many adventures in the coast lands of the Mediterranean, and the setting up of the “Pillars of Hercules” at the Straits of Gibraltar.
11. Bringing the golden apples from the garden of the Hesperides.
12. Carrying Cerberus from Hades to the upper world.

Most of the labours lead to various adventures called πάλαιρα. On Hercules’ return to Thebes he gave his wife Megara to his friend and charioteer Iolaus, son of Iphicles, and by beating Eurytus of Oechalia and his sons in a shooting match won a claim to the hand of his daughter Iole, whose family, however, except her brother Iphitus, withheld their consent to the union. Iphitus persuaded Hercules to search for Eurytus’ lost oxen, but was killed by him at Tiryas in a frenzy. He consulted the Pythia about a cure for the consequent madness, but she declined to answer him. Whereupon he seized the oracular tripod, and so entered upon a contest with Apollo, which Zeus stopped by sending a flash of lightning between the combatants. The Pythia foretold that he should serve the Lydian queen Omphale. He then, with Telamon, Peleus and Theseus, took Troy. He next helped the gods in the great battle against the giants. He destroyed sundry sea-monsters, set free the bound Prometheus, took part in the Argonautic voyage and the Calydonian boar hunt, made war against Augeas, and against Nestor and the Pylians, and restored Tyndareus to the sovereignty of Lacedaemon. He sustained many single combats, one very famous struggle being the wrestling with the Libyan Antaeus, son of Poseidon and Ge (Earth), who had to be held in the air, as he grew stronger every time he touched his mother, Earth. Hercules withstood Ares, Poseidon and Hera, as well as Apollo. The cause of his career is assigned to Actaea and Trachis. He wrestles with Aecholus for Delainea (“destructive to husband”), daughter of Oeneus, king of Calydon, vanquishes the river god, and breaks off one of his horns, which as a horn of plenty is found as an attribute of Hercules in art. Driven from Calydon for homicide, he goes with Delainea to Trachis. On the way he slays the centaur Nessus, who persuades Delainea that his blood is a love-charm. From Trachis he wages successful war against the Dryopes and Lapithae as ally of Aeginiunus, king of the Dorian, who promised him a third of his realm, and after his death adopted Hylus, his son by Delainea. Finally Hercules attacks Eurytus, takes Oechalia and carries off Iola. Thereupon Delainea, prompted by love and jealousy, sends him a tunic dipped in the blood of Nessus, and the unsuspecting hero dresses in it on just before sacrificing at the headland of Cenacum in Euboea. (So far the dithyramb of Bacchylides xv. [xvil], agrees with Sophocles’ Trachiniae as to the hero’s end.) Mad with pain, he seizes Lichas, the messenger who had brought the fatal garment, and buries him on the rocks; and then he wanders in agony to Mount Oeta, where he mounts a pyre, which, however, no one will kindle. At last Poes, father of Philoctetes, takes pity on him, and is rewarded with the gift of his bow and arrows. The immortal part of Hercules passes to Olympus, where he is reconciled to Hera and weds her daughter Hebe. This account of the hero’s principal labours, exploits and crimes is derived from the mythologists Apollodorus and Diodorus, who probably followed the Heracles by Pheidias of Rhodes as to the twelve labours or that of Panyasis of Halicarnassus, but sundry variations of order and incident are found in classical literature.

In one aspect Hercules is clearly a sun-god, being identified, especially in Cyprus and in Thasos (as Makar), with the Tyrian Melkart. The third and twelfth labours may be solar, the horned hind representing the moon, and the carrying of Cerberus to the upper world an eclipse, while the last episode of the hero’s tragedy is possibly a complete solar myth developed at Trachis. The winter sun is seen rising over the Cenaean promontory to toll across to Mount Oeta and disappear over it in a bank of fiery cloud. But more important and less speculative is the hero’s aspect as a national type or an amalgamation of tribal types of physical force, of dauntless effort and endurance, of militant civilization, and of Hellenic enterprise, “stronger than everything except his own passions,” and “at once above and below the noblest type of man” (Jebb). The fifth labour seems to symbolize some great improvement in the drainage of Elis. Strenuous devotion to the deliverance of mankind from dangers and pests is the “virtue” which, in Proclus’ famous apologue on the Chains of Hercules, the hero preferred to an easy and happy life. Ethically, Hercules symbolizes the attainment of glory and immortality by toil and suffering.

The Old-Dorian Hercules is represented in three cycles of myth, the Argive, the Boeotian and the Thessalian; the legends of Arcadia, Aetolia, Lydia, &c., and Italy are either local or symbolical and comparatively late. The fatality by which Hercules kills so many friends as well as foes recalls the destroying Apollo; while his career frequently illustrates the Delphic views on blood-guiltiness and expiation. As Apollo’s champion Hercules is Daphnephoros, and fights Cynicus and Amyntor to keep open the sacred way from Tempe to Delphi. As the Latin tutelar he aids Tyndareus and Aegimius. As patron of many adversaries he is the Roman Augustus and Troubador; he slays Bellerophon and Triton, slays Eryx and Busiris, and perhaps captures the wild horses and oxen, which may stand for pirates. As a god of athletes he is often a wrestler (παλαιωρως), and founds the Olympic games. In comedy and occasionally in myths he is depicted as voracious (βαυβαςχοι). He is also represented as the companion of Dionysus, especially in Asia Minor. The “Resting” (αναπαυμενος) Hercules is, as at Thermopylae and near Himera, the natural tutelar of hot springs in conjunction with his protectress Athena, who is usually depicted attending him on ancient vases. The glorified Hercules was worshipped both as a god and a hero. In the Attic deme Melita he was invoked as Δίξωκας (“Helper in ills”), at Olympia as σαλώκας (“Nobly-victorious”), in the rustic worship of the Oetaeans as κορφαλιος (“corker”), by the Erythraeans of Ionia as ἀπτερος (“Canker-worm-slayer”). He was σατυρ (“Saviour”), i.e. a protector of voyagers, at Thasos and Smyrna. Games in his honour were held at Thebes and Marathon and annual festivals in every deme of Attica, in Sicyon and Agyrium (Sicily). His guardian goddess was Athena (Homer, Η. vii. 638; Bacchylides v. 91). In early poetry, as often in art, he is an archer, afterwards a club-wielder and fully armed warrior. In early art the adult Hercules, is bearded, but not long-haired. Later he is sometimes youthful and beardless, always with short curly hair and thick neck, the lower half of the brow prominent. A lion’s skin is generally worn or carried. Lyssippus worked out the finest type of sculptured Hercules, of which the Farnese by Glycon is a grand specimen. The infantine struggle with serpents was a favourite subject.

Quite distinct was the Idaean Hercules, a Cretan Dactyl connected with the cult of Rhea or Cybele. The Greeks recognized
Hercules—HERDER

Hercules in an Egyptian deity Chons and an Indian Dorsanes, not to mention personages of other mythologies.

Hercules is supposed to have visited Italy on his return from Erythia, when he slew Cacus, son of Vulcan, the giant of the Aventine mount of Rome, who had stolen his oxen. To this victory was assigned the founding of the Ara maxima by Evander. His worship, introduced from the Greek colonies in Etruria and in the south of Italy, seems to have been established in Rome from the earliest times, as two old Patrician genes were associated with Hercules in the Senate. The titles vowed to him by Romans and men of Sora and Reate, for safety on journeys and voyages, furnished sacrifices and (in Rome) public entertainment (pollinium). Tibur was a special seat of his cult. In Rome he was patron of gladiators, as of athletes in Greece. With respect to the Roman relations of the hero, it is manifest that the native myths of Recaranes, or Sancus, or Dius Fidius, were transferred to the Hellenic Hercules.

In the article GREEK ART, fig. 16 represents Heracles wrestling with the river-god Achelous; fig. 20 (from a small pediment, possibly of a temple at Ephesus) is of an Anaximander playing of the Hydra; fig. 35 Hercules holding up the sky on a cushion.

Hercules was a favourite figure in French medieval literature. In the romance of Alexander the tent of the hero is decorated with images from Heracles. The romance La Rose des Trois vertus et vaillances du preux Hercule (Paris, 1500), the hero's labours are represented as having been performed in honour of a Boeotian princess; Pluto is a king dwelling in a dismal castle; the Fates are duennas watching Proserpine; the entrance to Pluto's castle is watched by the giant Cerberus. Heracles conquers Spain and takes Merida from Geryon. The book is translated into English as Hercules of Olympos (p. d.). Fragments of a French, poem on the subject will be found in the Bulletin de la soc. des ancients textes français (1877). Den Enrique de Villena took from Les Prusses his prose Los Dones Trabajos de Hercule (Madrid, 1621): and Ferencz Heredia wrote Trabajos y aforismos de Hercules (Madrid, 1682), which belies its title, being a collection of adages and allegories.

La Pathe de Erode (1747) is a romance in poetic prose by Pietro Bassi, and the Deduci Trabijes di Erode (1544) a poem by J. Perillos.

HERCULES, in astronomy, a constellation of the northern hemisphere, mentioned by Eudoxus (4th century B.C.) and Aratus (3rd century B.C.) and catalogued by Ptolemy (20 stars) and Tycho Brahe (28 stars). Represented by a man kneeling, this constellation was first known as "the man on his knees," and was afterwards called Cetheus, Theseus and Hercules by the ancient Greeks. Interesting objects in this constellation are: α Herculis, a fine coloured double star, composed of an orange star of magnitude 2½, and a blue star of magnitude 6; ι Herculis, a binary star, discovered by Sir William Herschel in 1782; one component of this is a yellow star of the third magnitude, the other a bluish, which appears to vary from red to blue, of magnitude 6; g and u Herculis, irregularly variable stars; and the cluster M. 13 Herculis, the finest globular cluster in the northern hemisphere, containing at least 5000 stars and of the roo determined only 2 are variable.

HERD (a word common to Teutonic languages; the O. Eng. form was herd; cf. Ger. Herde, Swed. and Dan. hjord; the Sans. ca'dhas, which shows the pre-Teutonic form, means a troop), a number of animals of one kind driven or fed together, usually applied to cattle as "flock" is to sheep, but used also of wild animals, such as deer, porpoises, etc., and of birds, as swans, cranes and curlews. A "herd-book" is a book containing the pedigree and other information of any breed of cattle or pigs, like the "flock-book" for sheep or "stud-book" for horses. Formerly the word "herdwick" was applied to the pasture ground under the care of a shepherd, and it is now used of a special hardy breed of sheep in Cumberland and Westmorland. The word "herd" is also applied in a disparaging sense to a company of people, a mob or rabble, as "the vulgar herd." As the name for a keeper of a herd or flock of domestic animals, the herdsman, it is usually qualified to denote the kind of animal under his protection, as swine-herd, shepherd, etc., but in Ireland, Scotland and the north of England, "herd" alone is commonly used.

HERDER, JOHANN GOTTFRIED VON (1744—1803), one of the most prolific and influential writers that Germany has produced, was born in Mohrungen, a small town in East Prussia, on the 25th of August 1744. Like his contemporary Lessing, Herder had throughout his life to struggle against adverse circumstances. His father was poor, having to put together a livelihood by washing and as a schoolmaster. Herder was therefore stimulated to poetry and petty schoolmaster. After receiving some rudimentary instruction from his father, the boy was sent to the grammar school of his native town. The mode of discipline practised by the pedantic and irritable old man who stood at the head of this institution was not at all to the young student's liking, and the impression made upon him stimulated him later on to work out his projects of school reform. The hardships of his early years drove him to introspection and to solitary communion with nature, and thus favoured a more than proportionate development of the sentimental and poetic side of his mind. When quite young he expressed a wish to become a minister of the gospel, but his aspirations were discouraged by the local clergyman. In 1762, at the age of eighteen, he went up to Königsberg with the intention of studying medicine, but finding himself unequal to the operations of dissecting-room, he abandoned this object, and, by the help of one or two friends and his own self-supporting labours, followed out his earlier idea of the clerical profession by joining the university. There he came under the influence of Kant, who was just then passing from physical to metaphysical problems. Without becoming a disciple of this great philosopher, he was stimulated to a life of critical inquiry by that thinker's revolutionary ideas in philosophy. To Kant's lectures and conversations he further owed something of his large interest in cosmological and anthropological problems. Among the writers whom he most carefully read were Plato, Hume, Shaftesbury, Leibnitz, Diderot and Rousseau. Another personal influence under which he fell at Königsberg, and which was destined to be far more permanent, was that of J. G. Hamann, "the northern Magie." This writer had already won a name, and in young Herder he found a mind well fitted to be the receptacle and vehicle of his new ideas on literature. From this vague, incoherent, yet gifted writer our author acquired some of his strong feeling for the naïve element in poetry, and for the earliest developments of national literature. Even before he went to Königsberg he had begun to compose verses, and at the age of twenty he took up the pen as a chief occupation. His first published writings were occasional poems and reviews contributed to the Königsbergerische Zeitung. Soon after this he got an appointment at Riga, as assistant master at the cathedral school, and a few years later, became assistant pastor. In this busy commercial town, in somewhat improved pecuniary and social circumstances, he developed the main ideas of his writings. In the year 1767 he published his first considerable work Fragmente über die neuere deutsche Literatur, which at once made him widely known and secured for him the favourable interest of Lessing. From this time he continued to pour forth a number of critical writings on literature, art, &c. His bold ideas on these subjects, which were a great advance even on Lessing's doctrines, naturally excited hostile criticism, and in consequence of this opposition, which took the form of aspersions on his religious orthodoxy, he resolved to leave Riga. He was much carried away at this time by the idea of a radical reform of social life in Livonia, which (after the example of Rousseau) he thought to effect by means of a better method of school-training. With this plan in view he began (1769) a tour through France, England, Holland, &c., for the purpose of collecting information respecting their systems of education. It was during the solitude of his voyage to France, when on deck at night, that he first shaped his idea of the genesis of primitive poetry, and of the gradual evolution of humanity. Having received an offer of an appointment as travelling tutor and chaplain to the young prince of Eutin-Holstein, he abandoned his somewhat visionary scheme of a social reconstruction of a
Russian province. He has, however, left a curious sketch of his projected school reforms. His new duties led him to Strassburg, where he met the young Goethe, on whose poetical development he exercised so potent an influence. At Darmstadt he made the acquaintance of Caroline Flachsland, to whom he soon became betrothed, and who for the rest of his life supplied him with that abundance of consolatory sympathy which his sensitive and rather querulous nature appeared to require. The engagement as tutor did not prove an agreeable one, and he soon threw it up (1771) in favour of an appointment as court preacher and member of the consistory at Bückeburg. Here he had to encounter bitter opposition from the orthodox clergy and their followers, among whom he was regarded as a freethinker. His health continued poor, and a fistula in the eye, from which he had suffered from early childhood, and to cure which he had undergone a number of painful operations, continued to trouble him. Further, pecuniary difficulties, from which he never long managed to keep himself free, by delaying his marriage, added to his depression. Notwithstanding these trying circumstances he resumed literary work, which his travels had interrupted. For some time he had been greatly interested by the poetry of the north, more particularly Percy’s Reliques, the poems of “Ossian” (in the genuineness of which he like many others believed) and the works of Shakespeare. Under the influence of this reading he now finally broke with classicism and became the first exponent of the new German romantic movement. He co-operated with a band of young writers at Darmstadt and Frankfort, including Goethe, who in a journal of their own sought to diffuse the new ideas. His marriage took place in 1773. In 1776 he obtained through Goethe’s influence the post of general superintendent and court preacher at Weimar, where he passed the rest of his life. There he enjoyed the society of Goethe, Wieland, Jean Paul (who came to Weimar in order to be near Herder), and others, the patronage of the court, with whom as a preacher he was very popular, and an opportunity of carrying out some of his ideas of school reform. Yet the social atmosphere of the place did not suit him. His personal relations with Goethe waned and again became ambivalent. This, added to ill-health, served to intensify a natural irritability of temperament, and the history of his later Weimar days is a rather dreary page in the chronicles of literary life. He had valued more than anything else a teacher’s influence over other minds, and as he began to feel that he was losing it he grew jealous of the success of those who had outgrown this influence. Yet while presenting these unhappy traits, Herder’s character was on the whole a worthy and attractive one. This seems to be sufficiently attested by the fact that he was greatly liked and esteemed, not only in the pulpit but in private intercourse, by cultivated women like the countess of Bückeburg, the duchess of Weimar and Frau von Stein, and, what perhaps is more, was exceedingly popular among the gymnasium pupils, in whose education he took so lively an interest. While much that Herder produced after settling in Weimar has little value, he wrote also some of his best works, among others his collection of popular poetry on which he had been engaged for many years, Stimmen der Völker in Liedern (1778–1779); his translation of the Spanish romances of the Cid (1803); his celebrated work on Hebrew poetry, Vom Geist der hebräischen Poesie (1782–1783); and his opus magnum, the Ideen zur Philosophie der Geschichte der Menschheit (1784–1791). Towards the close of his life he occupied himself, like Lessing, with speculative questions in philosophy and theology. The boldness of some of his ideas cost him some valuable friendships, as that of Jacoby, Lavater and even of his most devoted pupil, Goethe. On the 29th of December 1803, full of new literary plans up to the very last.

Herder’s writings were for a long time regarded as of temporary value only, and fell into neglect. Recent criticism, however, has tended very much to raise their value by tracing out their wide and far-reaching influence. His works are very voluminous, and to a large extent fragmentary and devoid of artistic finish; nevertheless they are nearly always worth investigating for the brilliant suggestions in which they abound. His place in German literature has already been indicated in tracing his mental development. Like Lessing, whose work he immediately continued, he was a pioneer of the golden age of this literature. Lessing had given the first impetus to the formation of a national literature by exposing the folly of the current imitation of French writers. But in doing this he did not so much call his fellow-countrymen to develop freely their own national sentiments and ideas as send them back to classical example and principle. Lessing was the exponent of German classicism; Herder, on the contrary, was a pioneer of the romantic movement. He fought against all imitation as such, and bade German writers be true to themselves and their national antecedents. As a sort of theoretic basis for this adhesion to national type in literature, he moulded the national spirit, together with language and national culture as a whole, are evolved by a natural process, and that the intellectual and emotional life of each people is correlated with peculiarities of physical temperament and of material environment. In this way he became the originator of that genetic or historical method which has since been applied to all human ideas and institutions. Herder was thus an evolutionist, but an evolutionist still under the influence of Rousseau. That is to say, in tracing back the later acquisitions of civilization to impulses which are as old as the dawn of primitive culture, he did not, as the modern evolutionist does, lay stress on the superiority of the later to the earlier, he sought for a development, but rather became enamoured of the simplicity and spontaneity of early impulses which, since they are the oldest, easily come to look like the most real and precious. Yet even in this way he helped to found the historical school in literature and science, for it was only after an excessive and sentimental interest in primitive human culture had been awakened that this subject would receive the amount of attention which was requisite for the genetic explanation of later developments. This historical idea was carried by Herder into the regions of poetry, art, religion, language, and finally into human culture as a whole. It colours all his writings, and is intimately connected with some of the most characteristic attributes of his mind, a quick sympathetic imagination, a fine feeling for local differences, and a scientific instinct for seizing the sequences of cause and effect.

Herder’s works may be arranged in an ascending series, corresponding to the various phases of the poetical life of Germany which had developed and extended. First come the works on poetic literature, art, language and religion as special regions of development. Secondly, we have in the Ideen a general account of the process of development. Thirdly, we find the Fragmente, which, though inferior in interest to the others, may be said to supply the philosophic basis of his leading ideas.

1. In the region of poetry Herder sought to persuade his countrymen, both by example and precept, to return to a natural and spontaneous form of utterance. His own poetry has but little value; Herder was a skilful verse-maker but hardly a creative poet. He was most successful in his translation of popular song, in which he shows a rare sympathetic insight into the various feelings and ideas of peoples as unlike as Greenlanders and Spaniards, Indians and Scots. In the Fragmente he aims at nationalizing German poetry and freeing it from all extraneous influence. He ridicules the ambition of German writers to be classic, as Lessing had ridiculed their eagerness to be French. He looked at poetry as a kind of "proteus among the people, which changes its form according to language, manners and customs, and which has as little to do with the national spirit as the idiom according to the accent of different nations." This fact of the idiosyncrasy of national poetry he illustrated with great fulness and richness in the case of Homer, the nature of whose works he was one of the first to elucidate, the Hebrew poets, and the poetry of the north as typified in "Ossian." This same idea of necessary relation to national character and circumstance is also applied to dramatic poetry, and more especially to Shakespeare. Lessing had done much for the reformation of dramatic poetry and correctly regarded him in contrast to the French dramatists with whom he also contrasted the Greek dramatic poets, and accordingly did not bring out his essentially modern and Teutonic character. Herder does this, and has shown a true understanding of Shakespeare’s genius than his predecessor had shown.

2. The views on art contained in Herder’s Kritische Wälder (1786), Plastik (1778), &c., are chiefly valuable as a correction of the historic, and Lessing, by help of his fundamental idea of national idiosyncrasy. He argues against the setting up of classic art as an unchanging type,
valid for all peoples and all times. He was one of the first to bring to light the characteristic excellences of Gothic art. Beyond this, he eloquently pleaded the cause of painting as a distinct art, which Lessing in his desire to mark off the formative arts from poetry and music, might have neglected, even while he was painting himself the sculptured eye of Ceres, the dimension three of the eye, while sculpture was rather the art of the organ of touch. Painting being less real than sculpture, because lacking the third dimension of space, and a kind of dream, admitted of much greater freedom of expression than the postures and situations for early German painters, and helped to awaken the modern interest in Albrecht Dürer.

3. In seinem Über den Ursprung der Sprache (1772), Herder may be said to have laid the first rude foundations of the science of comparative philology and that deeper science of the ultimate nature and origin of language. It was specially directed against the then popular view of the complete endowment of man at birth. Its main argument is that speech is a necessary outcome of that special arrangement of mental forces which distinguishes man, and manifests itself in the way he endows his body and the moral element in art. Thus his theoretical opposition to the Kantian aesthetics is but the reflection of his practical opposition to the form-idolatry (see van der Weyden, J. S.)

Bibliography—An edition of Herder's Sämtliche Werke of 45 vols. was published after his death by his widow (1805-1820); a second in 60 vols. followed in 1827-1830; a third in 40 vols. in 1852-1854. There is also an edition by H. Dünitzer (24 vols., 1869-1870). But these have all been superseded by the monumental critical edition by B. Suphan (32 vols., 1877 sqq.). Of the many "selected works," mention may be made of those by B. Suphan (4 vols., 1884) and M. Nicolai (2 vols., 1889). By far the best introduction is Kürschner's Deutsche Nationalliteratur (10 vols., 1885-1894). For Herder's correspondence, see Aus Herders Nachlass (3 vols., 1869-1879-1880) Von und an Herder: Ungerdruckte Briefe (3 vols., 1861-1862)—all thorough and readable work by H. Dünitzer and F. G. von Herder. Herder's Briefwechsel mit Nicolai and his Briefe an Humann have been edited by O. Hofmann (1887), his Correspondence by von Nicolai, his Vorlesungen über das Leben Herders, by his wife, edited by J. G. Müller (2 vols., 1820); J. G. von Herders Lebensbild (with his correspondence), by his son, E. von Herder (6 vols., 1840); C. Joret, Herder et l'âge romantique en Allemagne au XVIIIe siècle (1878); F. von Bärenback, Herder als Vorgänger Darwins (1877); R. Haym, Herder nach seinem Leben und seinen Werken (2 vols., 1880-1885); H. Nevinson, A Sketch of Herder and his Times (1884); M. Kronenberg, Herders Philosophie nach ihrem Entwicklungs gang (1880); E. Kühnbeck, Herders Leben (1895); R. Bürkner, Herder, sein Leben und Wirken (1904).

HEREDIA, JOSÉ MARIA DE (1842-1905), French poet, the modern master of the French sonnet, was born at Fortuna Cafayere, near Santiago de Cuba, on the 22nd of November 1842, being in blood part Spanish Creole and part French. At the age of eight he came from the West Indies to France, returning thence to Havana at seventeen, and finally making France his home not long afterwards. He received his classical education with the priests of Saint Vincent at Senlis, and after a visit to Havana he studied at the École des Chartes at Paris. In the 'sixties, with François Coppee, Sully-Prudhomme, Paul Verlaine, and others, he took part in the circle of poets who gathered round Leconte de Lisle, and received the name of Parnassians. To this new school, form—the technical side of their art—was of supreme importance, and, in reaction against the influence of Musset, they rigorously repressed in their work the expression of personal feeling and emotion. "True poetry," said M. de Heredia in his discourse on entering the Academy—"true poetry dwells in nature and in humanity, which are eternal, and not in the heart of the creature of a day, however great." M. de Heredia's place in the movement was so small he was little heard of, but his sonnets circulated in MS., and gave him a reputation before they appeared in 1893, together with a few longer poems, as a volume, under the title of Les Trophées. He was elected to the Academy on the 22nd of February 1894, in the place of Louis de Mazade-Percin the publicist. Few purely literary men can have entered the Academy with credentials so small in quantity. A small volume of verse—a translation, with introduction, of Díaz del Castillo's History of the Conquest of New Spain (1878-1881)—a translation of the life of the nun Alférez (1894), de Quincey's "Spanish Military Nun"—and one or two other pieces is but small literary baggage, to use the French expression. But the sonnets are of their kind among the most superb in modern literature. "A Légende des siècles in sonnets" M. François Coppee called them. Each presents a picture, striking, brilliant, drawn with unfaltering hand—the picture of some
characteristic scene in man’s long history. The verse is flawless, polished like a gem; and its sound has distinction and fine harmony. If one may suggest a fault, it is that each picture is sometimes too much of a picture only, and that the poetical line, like that of M. de Heredia’s master, Leconte de Lisle himself, is occasionally overcrowded. M. de Heredia was none the less one of the most skilful craftsmen who ever practised the art of verse. In 1905 he became librarian of the Bibliothèque de l’Arsenal at Paris. He died at the Château de Bourdonné (Seine-et-Oise) on the 3rd of October 1905, having completed his critical edition of André Chénier’s works.

HEREDIA Y CAMPUZANO, JOSÉ MARIA (1823-1839), Cuban poet, was born at Santiago de Cuba on the 31st of December 1823, and was called to the bar in 1823. In the autumn of 1823 he was arrested on a charge of conspiracy against the Spanish government, and was sentenced to banishment for life. He took refuge in the United States, published a volume of verses at New York in 1825, and then went to Mexico, where, becoming naturalized, he obtained a post as magistrate. In 1832 a collection of his poems was issued at Toluca, and in 1836 he obtained permission to visit Cuba for two months. Disappointed in his political ambitions, and broken in health, Heredia returned to Mexico in January 1837, and died at Toluca on the 21st of May 1839. Many of his earlier pieces are merely clever translations from French, English and Italian; but his originality is placed beyond doubt by such poems as the "Epístola del desdichado", the epistle to Familia, Desencadenados, and the celebrated ode to Niagra. Bello may be thought to excel Heredia in execution, and a few lines of Olmedo’s Canto a Junípero vibrate with a virile passion to which the Cuban poet rarely attained; but the sincerity of his patriotism and the sublimity of his imagination have secured for Heredia a real supremacy among Spanish-American poets.

The best edition of his works is that published at Paris in 1893 with a preface by Elías Zerolo.

HEREDITAMENT (from Lat. hereditāre, to inherit, heres, heir), in law, every kind of property that can be inherited. Hereditaments are divided into corporeal and incorporeal; corporeal hereditaments are "such as affect the senses, and may be seen and handled by the body; incorporeal are not the subject of sensation, can neither be seen nor handled, are creatures of the mind, and exist only in contemplation" (Blackstone, Commentaries). An example of a corporeal hereditament is land held in freehold, of incorporeal heirships, tithes, advowsons, pensions, annuities, rents, franchises, &c. It is still used in the phrase "lands, tenements and hereditaments" to describe property in land, as distinguished from goods and chattels or movable property.

HEREDITY, in biological science, the name given to the generalization, drawn from the observed facts, that animals and plants closely resemble their progenitors. (That the resemblance is not complete involves in the first place the subject of variation (see Variation and Selection); but it must be clearly stated that there is no adequate ground for the current loose statements as to the existence of opposing "laws" or "forces" of heredity and variation.) In the simplest cases there seems to be no separate problem of heredity. When a creeping plant propagates itself by runners, when a Naís or Myrianida breaks up into a series of similar segments, each of which becomes a worm like the parent, we have to do with the general fact that growing organisms tend to display a symmetrical repetition of equivalent parts, and that reproduction by fission is simply a special case of metamerism. When we try to answer the question why the segments of an organism resemble one another, whether they remain in association to form a segmented animal, or break into different animals, we come to the conclusion, which at least is on the way to an answer, that it is because they are formed from pieces of the same protoplasm, growing under similar conditions. It is apparently a fundamental property of protoplasm to be able to multiply by division into parts, the properties of which are similar to each other and to those of the parent.

This leads us directly to the cases of reproduction where there is an obvious problem of heredity. In the majority of cases among animals and plants the new individual arises as a portion of living matter, separated from the parents, but different from the parents in size and structure. These germs of the new organisms may be spores, reproductive cells, fused reproductive cells or cellular masses (see Reproduction). For the present purpose it is enough to state that they consist of portions of the parental protoplasm. These pass through an embryological history, in which by growth, multiplication and specialization they form structures closely resembling the parents. Now, if it could be shown that these reproductive masses arose directly from the reproductive masses which formed the parent body, the problem of heredity would be extremely simplified. If the first division of a reproductive cell set apart one mass to lie dormant for a time and ultimately to form the reproductive cells of the new generation, while the other mass, exactly of the same kind, developed directly into the new organism, then heredity would simply be a delayed case of what is called organic symmetry, the tendency of similar living material to develop in similar ways under the stimulus of similar external conditions. The cases in which this happens are very rare. In the Diptera the first division of the egg-cell separates the nuclear material of the subsequent reproductive cells from the material that is elaborated into the new organism to contain these cells. In the Daphnia and in Sagitta a similar separation occurs at slightly later stages; in vertebrates it occurs much later; while in some hydroids the germ-cells do not arise in the individual which is developed from the egg-cell at all, but in a much later generation, which is produced from the first by budding. However, it is not necessary to dismiss the fertile idea of what Moritz Nussbaum and August Weismann, who drew attention to it, called "continuity of the germ-plasm." Weismann has shown that an actual series of organic forms might be drawn up in which the formation of germ-cells begins at stages successively more remote from the first division of the egg-cell. He has also shown evidence, singularly complete in the case of the hydroids, for the existence of an actual migration of the place of formation of the germ-cells, the migration reaching farther and farther away from the egg-cell. He has elaborated the conception of the germ-track, a chain of cell generations in the development of any creature along which the reproductive material saved over from the development of one generation for the germ-cells of the next generation is handed on in a latent condition to its ultimate position. And thus he supposes a real continuity of the germ-plasm, extending from generation to generation in spite of the apparent discontinuity in the observed cases. The conception certainly ranks among the most luminous and most fertile contributions of the 19th century to biological thought, and it is necessary to examine at greater length the superstructure which Weismann has raised upon it.

Weismann’s Theory of the Germ-plasm.—A living being takes its individual origin only where there is separated from the stock of the parent a little piece of the peculiar reproductive plasm, the so-called germ-plasm. In sexless reproduction one parent is enough; in sexual reproduction equivalent masses of germ-plasm from each parent combine to form the new individual. The germ-plasm resides in the nucleus of cells, and Weismann identifies it with the nuclear material named chromatin. Like ordinary protoplasm, of which the bulk of cell bodies is composed, germ-plasm is a living material, capable of growing in bulk without alteration of structure when it is supplied with appropriate food. But it is a living material much more complex than protoplasm. In the first place, the mass of germ-plasm is the starting-point of the new individual consists of several different pieces named "idians," which are either the chromosomes into a definite number of which the nuclear material of a dividing cell breaks up, or possibly smaller units named chromosome. These idians are a collection of "ids" which Weismann tentatively identifies with the microsomata contained in the chromosomes, which are visible after treatment with certain reagents. Each id contains all the possibilities—
generic, specific, individual — of a new organism, or rather the directing substance which in appropriate surroundings of food, &c., forms a new organism. Each id is a veritable microcosm, possessed of an historic architecture that has been elaborated slowly through the multitudinous series of generations that stretch backwards in time from every living individual. This microcosm, again, consists of a number of minor vital units called "determinants," which cohere according to the architecture of the whole id. The determinants are hypothetical units corresponding to the number of parts of the organism independently variable. Lastly, each determinant consists of a number of chemical units which are called "biophores." These are adaptations of a conception of H. de Vries, and are supposed to become active by leaving the nucleus of the cell in which they lie, passing out into the general protoplasm of the cell and ruling its activities. Each new individual begins life as a nucleated cell, the nucleus of which contains germ-plasm of this complex structure derived from the parent. The reproductive cell gives rise to the new individual by continued absorption of food, by growth, cell-divisions and cell-specializations. The theory supposes that the first divisions of the nucleus are "doubling," or homogeneous divisions. The germ-plasm has grown in bulk without altering its character in any respect, and, when it divides, each resulting mass is precisely alike. From these first divisions a chain of similar doubling divisions stretches along the "germ-tracks," so marshalling unaltered germ-plasm to the generative organs of the new individual, to be ready to form the germ-cells of the next generation. In this mode the continuity of the germ-plasm from individual to individual is maintained. This also is the immortality of the germ-cells, or rather of the germ-plasm, the part of the theory which has laid so large a hold on the popular imagination, although it is really no more than a reassertion in new terms of biogenesis. With this also is connected the celebrated denial of the inheritance of acquired characters. It seemed a clear inference that, if the hereditary mass for the daughters were separated off from the hereditary mass that was to form the mother, at the very first, before the body of the mother was formed, the daughters were in all essentials the sisters of their mother, and could take from her nothing of any characters that might be impressed on her body in subsequent development. In the later elaboration of his theory Weismann has admitted the possibility of some direct modification of the germ-plasm within the body of the individual and heating its body.

The mass of germ-plasm which is not retained in unaltered form to provide for the generative cells is supposed to be employed for the elaboration of the individual body. It grows, dividing and multiplying, and forms the nuclear matter of the tissues of the individual, but the theory supposes this process to occur in a peculiar fashion. The nuclear divisions are what Weismann calls "differentiating" or heterogeneous divisions. In them the microcosms of the germ-plasm are not doubled, but slowly disintegrated in accordance with the historical architecture of the plasm, each division differentiating among the determinants and forming another portion out of another portion. There are differences in the observed facts of nuclear division which tend to support the theoretical possibility of two sorts of division, but as yet these have not been correlated definitely with the divisions along the germ-tracks and the ordinary divisions of embryological organogeny. The theoretical conception is, that when the whole body is formed, the cells contain only their own kind of determinants, and it would follow from this that the cells of the tissues cannot give rise to structures containing germ-plasm less disintegrated than their own nuclear material, and least of all to reproductive cells which must contain the undissociated microcosms of the germ-plasm. Cases of bud-formation and of reconstructions of lost parts (see regeneration of lost parts) are regarded as special adaptations made possible by the provision of latent groups of accessory determinants, to become active only on emergency.

It is to be noticed that Weismann's conception of the processes of ontogeny is strictly evolutionary, and in so far is a reversion to the general opinion of biologists of the 17th and 18th centuries. These supposed that the germ-cell contained an image-in-little of the adult, and that the process of development was a mere unfolding or evolution of this, under the influence of favouring and nutrient forces. Hartsoeker, indeed, went so far as to figure the human spermatoozon with a mannikin seated within the "head," and similar extremes of imagination were indulged in by other writers for the spermatoozon or ovum, according to the view they took of the relative importance of these two bodies. C. F. Wolff, in his Theoria generationis (1759), was the first distinguished anatomist to make assertions of these evolutionary views, but his direct observation on the process of development were not sufficiently in bulk nor in clarity of interpretation to convince his contemporaries. Naturally the improved methods and vastly greater knowledge of modern days have made evolution in the old sense an impossible conception; we know that the egg is morphologically unlike the adult, that various external conditions are necessary for its subsequent progress through a slow series of stages, each of which is unlike the adult, but gradually approaching it until the final condition is reached. None the less, Weismann's theory does suggest that the important division of the cell into parts, the transformation of parts into other parts, is connected with the development of the germ-plasm, and from the theoretical point of view his theory remains strictly an unfolding, a becoming manifest of hidden complexity.

Hertwig's View.—The chief modern holder of the rival view, and the writer who has put together in most cogent form the objections to Weismann's theory, is Oscar Hertwig. He points out that there is no direct evidence for the existence of differentiating as opposed to doubling divisions of the nuclear matter, and, moreover, he thinks that there is very generally diffused evidence as to the universality of doubling division. In the first place, there is the fundamental fact that single-celled organisms exhibit only doubling division, as by that the persistence of species which actually occurs alone is possible. In the case of higher plants, the widespread occurrence of tissues with power of reproduction, the occurrence of budding in almost any part of the body in lower animals and in plants, and the widespread powers of regeneration of lost parts, are easily intelligible if every cell like the egg-cell has been formed by doubling division, and so contains the germinal material for every part of the organism, and thus, on the call of special conditions, can become a germ-cell again. Hertwig's most important determining factor in this process of development has been interfered with in various ways at various stages, as showing that the cells which arise from the division of the egg-cell were not predestined unalterably for a particular role, according to a predetermined plan. He dismisses Weismann's suggestion of the presence of accessory determinants which remain latent unless they happen to be required, as being too complicated a supposition to be supported without exact evidence, a view in which he has received strong support from those who have worked most at the experimental side of the question. From consideration of a large number of physiological facts, such as the results of grafting, transplantations of tissues and transfusions of blood, he concludes that the cells of an organism possess, in addition to their patent microscopical characters, latent characters peculiar to the species, and pointing towards a fundamental identity of the germinal substance in every cell.

The Nuclear Matter.—Apart from these two characteristic protagonists of extreme and opposing views, the general consensus of biological opinion does not take us very far beyond the plainest facts of observation. The resemblances of heredity are due to the fact that the new organism takes its origin from a definite piece of the substance of its parent or parents. This piece always contains protoplasm, and as the protoplasm of every animal and plant appears to have its own specific reactions, we cannot exclude this factor; indeed many, following the views of M. Verworn, and seeing in the specific metabolisms of protoplasm a large part of the meaning of life, attach an increasing importance to the protoplasm in the hereditary mass. Next, it always contains nuclear matter, and, in view of the extreme
specialization of the nuclear changes in the process of maturation and fertilization of the generative cells, there is more than sufficient reason for believing that the nuclear substance, if not actually the specific germ-plasm, is of vast importance in heredity. The theory of its absolute dominance depends on a number of experiments, the interpretation of which is doubtful. Moritz Nussbaum showed that in Isolates, non-nucleated fragments of a cell always died, while nucleated fragments were able to complete themselves; but it may be said with almost equal confidence that nuclei separated from protoplasm also invariably die—at least, all attempts to preserve them have failed. Hertwig and others, in their brilliant work on the nature of fertilization, showed that the process always involved the entrance into the female cell of the nucleus of the male cell, but we now know that part of the protoplasm of the spermatozoon also enters.

T. Boveri made experiments on the cross-fertilization of non-nucleated fragments of the eggs of *Sphaerechinus granularis* with spermatozoa of *Echinus microtuberculatus*, and obtained dwarf larvae with only the paternal characters; but the nature of his experiments was such as absolutely to exclude doubt. Finally, in addition to the nucleated and the protoplasmic portions of the organism, the centrosome, is a part of the hereditary mass. In sum, while most of the evidence points to a preponderating importance of the nuclear matter, it cannot be said to be an established proposition that the nuclear matter is the germ-plasm. Nor are we yet definitely in a position to say that the germinal mass (nuclear matter, protoplasm, &c., of the reproductive cells) differs essentially from the general substance of the organism—whether, in fact, there is continuity of germ-plasm as opposed to continuity of living material from individual to individual. The origin of sexual cells from only definite places, in the vast majority of cases, and such phenomena as the phylogenetic migration of their germinal elements from the Hydro- medusae, tell strongly in favour of Weismann’s conception. Early experiments in dividing eggs, in which, by separation or transposition, cells were made to give rise to tissues and parts of the organism which in the natural order they would not have produced, tell strongly against any profound separation between germ-plasm and body-plasm. It is also to be noticed that the failure of germ-cells to arise except in specific places may be only part of the specialized ordering of the whole body, and does not necessarily involve the interpretation that reproductive material is absolutely different in kind.

**Amphimixis.**—Hitherto we have considered the material bearer of heredity apart from the question of sexual union, and we have seen that the germinal mass is produced from a portion of living material, forming a material which may be called germ-plasm, in which resides the capacity to correspond to the same kind of surrounding forces as stimulated the parent germ-plasm by growth of the same fashion. In many cases (e.g., asexual spores) the piece of germ-plasm comes from one parent, and from an organ or tissue not associated with sexual reproduction; in other cases (parthenogenetic eggs) it comes from the ovary of a female, and may have the apparent characters of a sexual egg, except that it develops without fertilization; here also are to be included the cases where normal female ova have been induced to develop, not by the entrance of a spermatozoon, but by artificial chemical stimulation. In such cases the problem of heredity does not differ fundamentally from the symmetrical repetition of parts. In most of the higher plants and animals, however, sexual reproduction is the normal process, and from our present point of view the essential feature of this is that the germ-plasm which starts the new individual (the fertilized egg) is derived from the male (the spermatozoon) and from the female parent (the ovum). Although it cannot yet be set down sharply as a general proposition, there is considerable evidence to show that in the preparation of the ovum and spermatozoon for fertilization the nuclear matter of each is reduced by half (reducing division of the chromosomes), and that fertilization means the restoration of the normal bulk in the fertilized cell by equal contributions from male and female. So far as the known facts of this process of union of germ-plasms go, they take us no farther than to establish such a relation between the offspring and two parents as exists between the offspring and one parent in the other cases. Amphimixis has a vast importance in the theory of evolution (Weismann, for instance, regards it as the chief factor in the production of variations); for its relation to heredity we are as yet dependent on empirical observations.

**Heredity and Development.**—The actual process by which the germinal mass slowly assumes the characters of the adult that is, becomes like the parent—depends on the interaction of two sets of factors: the properties of the germinal material itself, and the influences of substances and conditions external to the germinal material. Naturally, as K. W. von Nägeli and Hertwig in particular have pointed out, there is no perpetual sharp contrast between the two sets of factors, for, as growth proceeds, the external is constantly becoming the internal; the results of influences, which were in one stage part of the environment, are in the next and subsequent stages part of the embryo. The differences between the exponents of evolution and epigenesis offer practical problems to be decided by experiment. Every phenomenon in development that is proved the direct result of inductive factors can be disconnected from the complexity of the germinal mass. If, for instance, as H. Driesch and Hertwig have argued, much of the differentiation of cells and tissues is a function of locality and is due to the action of different external forces on similar material, then just so much burden is removed from what evolutionists have to explain. That much remains cannot be doubted. Two eggs similar in appearance develop side by side in the same sea-water, one becoming a mollusc, the other an Amphioxus. Hertwig would say that the slight differences in the original eggs would determine slight differences in metabolism and so forth, with the result that the segmentation of the two is slightly different; in the next stage the differences in metabolism and other relations will be increased, and so on indefinitely. But this is c’est le premier pas qui coûte, and the absolute cost in theoretical complexity of the germinal material can be estimated only after a prolonged course of experimental work in a field which is as yet hardly touched.

**Empirical Study of Heredity.**—The fundamental basis of heredity is the separation of a mass from the parent (germ-plasm) which under certain conditions grows into an individual resembling the parent. The goal of the study of heredity will be reached only when all the phenomena can be referred to the nature of the germ-plasm and of its relations to the conditions under which it grows, but we have seen how far our knowledge is from any attempt at such references. In the meantime, the empirical facts, the actual relations of the characters to the characters of the parents and ancestors, are being collected and grouped. In this inquiry it at once becomes obvious that every character found in a parent may or may not be present in the offspring. When any character occurs in both, it is generally spoken of as transmissible and of having been transmitted. In this broad sense there is no character that is not transmissible. In all kinds of reproduction, the characters of the class, family, genus, species, variety or race, and of the actual individual, are transmissible, the certainty with which any character appears being almost in direct proportion to its rank in the descending scale from order to individual. The transmitted characters are anatomical, down to the most minute detail; physiological, including such phenomena as distheses, timbre of voice and even compound phenomena, such as gauchette and peculiarity of handwriting; psychological; pathological; teratological, such as syndactyism and all kinds of individual variations. Either sex may transmit characters which in themselves are necessarily latent, as, for instance, a bull may transmit a good milking strain. In forms of asexual reproduction, such as division, budding, propagation by slips and so forth, every character of the parent may appear in the descendant, and apparently even in the descendants produced from that descendant by the ordinary sexual processes. In reproduction by spore formation, in parthenogenesis and in ordinary sexual modes, where there is an embryological history between the separated mass and the new adult, it is necessary
to attempt a difficult discrimination between acquired and innate
characters.

Acquired Characters.—Every character is the result of two
sets of factors, those resident in the germinal material and those
imposed from without. Our knowledge has taken us far beyond
any such rôle as this to the concept of a germ-plasm, the living
matter of the collection of particles from the adult organs and tissues
gamules of C. Darwin). The inheritance of any character means
the transmission in the germinal material of matter which,
brought under the necessary external conditions, develops into
the character of the parent. There is necessarily an acquired
or epigenetic side to every character; but there is nothing in
our knowledge of the actual processes to make necessary or
even probable the supposition that the result of that factor in
one generation appears in the germ-plasm of the subsequent
generation. In those cases where an embryological development
separates parent and offspring. The development of any normal,
so-called "innate," character, such as, say, the assumption of
the normal human shape and relations of the frontal bone,
requires the co-operation of many factors external to the develop-
ment embryo, and the absence of abnormal distorting factors.
When we say that such an innate character is transmitted, we
mean only that the germ-plasm has such a constitution that,
in the presence of the epigenetic factors and the absence of
abnormal epigenetic factors, the bone will appear in due course
and in due form. If an abnormal epigenetic factor be applied
during a way to a certain external stimulus, the living matter of
the developing child, or in after life, abnormality of some kind will
appear in the bone, and such an abnormality is a good type of
what is spoken of as an "acquired" character. Naturally such
character varies with the external stimulus and the nature of
the material to which the stimulus is applied, and probability
and observation lead us to suppose that as the germ-plasm of
the offspring is similar to that of the parent, being a mass
separated from the parent, abnormal epigenetic influences
would produce results on the offspring similar to those which
they produced on the parent. Scrutiny of very many cases of
the supposed inheritance of acquired characters shows that
they may be explained in this fashion—that is to say, that they
do not necessarily involve any feature different in kind from
what we understand to occur in normal development. The
effects of increased use or of disuse on organs or tissues, the
reactions of living tissues to various external influences, to
bacteria, to bacterial or other toxins, or to different conditions
of respiration, nutrition and so forth, we know empirically to
be different in the case of different individuals, and we may
expect that when the living matter of a parent responds in a
different way to a certain external stimulus, the living matter of
the descendant will respond to similar circumstances in a similar
fashion. The operation of similar influences on similar material
accounts for a large proportion of the facts. In the important
case of the transmission of disease from parent to offspring it is
plain that there are some sets of normal factors may operate, and other
cases of transmission must be subjected to similar scrutiny:
(1) a child may inherit the anatomical and physiological con-
stitution of either parent, and with that a special liability of
failure to resist the attacks of a wide-spread disease; (2) the
activity of the germ-plasm, or that of the ovum or ovum in the
spermatozoon; (3) the toxins of the disease may have affected
the ovum, or the spermatozoon, or through the placenta
the growing embryo. Obviously in the first two cases the offspring
cannot be said in any strict sense to have inherited the disease;
in the last case, the theoretical nomenclature is more doubtful,
but it is at least plain that no inexplicable factor is involved.

It is to be noticed, however, that "Lamarckians" and "Neo-
Lamarckians" in their advocacy of an inheritance of "acquired
characters" make a theoretical assumption of a different kind,
which develops equally to "acquired" and to "innate" char-
acters. They suppose that the result of the epigenetic factors
is reflected on the germ-plasm in such a mode that in develop-
ment the products would display the same or a similar character
without the co-operation of the epigenetic factors on the new

individual, or would display the result in an accentuated form
if with the renewed co-operation of the external factors. Such
an assumption presents its greatest theoretical difficulty if, with
Weismann, we suppose the germ-plasm to be different in kind
from the general soma-plasm, and its least theoretical difficulty
in the view, for instance, of Hertwig, we suppose that the ger-
plasm to be equivalent to the soma-plasm, the exter-
ductive cells to be similar in kind to the essential substance of
the general body cells. But, apart from the differences between
such theories, it supposes, in all cases where an embryological development lies between parent and descendant, the existence of a factor towards which our present knowledge of the actual
processes gives us no assistance. The separated hereditary
mass does not contain the organs of the adult; the Lamarckian
factor would involve the translation of the characters of the adult
back into the characters of the germ-cell in such a fashion that
when the germ-cell developed these characters would be
translated again into those which originally had been produced
by co-operation between germ-plasm characters and epigenetic
factors. In the present state of our knowledge the theoretical
difficulty is not fatal to the Lamarckian supposition; it does
now no more than demand a much more careful scrutiny of the
supposed cases. Such a scrutiny has been going on since Weismann
first raised the difficulty, and the present result is that no known
case has appeared which cannot be explained without the
Lamarckian factor, and the vast majority of cases have been
resolved without any difficulty into the ordinary events of which
we have full experience. Taking the experimental evidence as
it would appear first that the effects of single mutilations are
not inherited. The effects of long-continued mutilations are
not inherited, but Darwin cites as a possible case the Mahom-
edans of Celebes, in whom the prepuce is very small. C. E.
Brown-Séquard thought that he had shown in the case of guinea-
pigs the inheritance of the results of nervous lesions, but analyses
of his results leave the question extremely doubtful. The
inheritance of the effects of use and disuse is not proved. The
inheritance of the effects of changed conditions of life is quite
uncertain. Nagel grew Alpinch plants at Munich, but found
that the change was produced at once and was not increased
in a period of thirteen years. Alphonse de Candolle starved
plants, with the result of producing better blooms, and found
that seedlings from these were also above the average in luxuri-
ance of blossom, but in these experiments the effects of selection
during the starvation, and of direct effect on the nutrition of the
seeds, were not eliminated. Such results are typical of the vast
number of experiments and observations recorded. The
empirical issue is doubtful, with a considerable balance against
the supposed inheritance of acquired characters. Biological Study
of Effects of Amphibian.—Inheritance is theoretically possible from each parent and from the ancestry
of each. In considering the total effect it is becoming customary
to distinguish between "blended" inheritance, where the off-
spring appears in respect of any character to be intermediate
between the conditions in the parents; "prepotent" inheritance,
where one parent is supposed to be more effective than the other
in stamping the offspring (thus, for instance, Negroes, Jews and
Chinese are stated to be prepotent in crosses); "exclusive"
inheritance, where the character of the offspring is definitely
inherited from one of the parents; "emergent" inheritance, in which the interpretation of the word character, and rests on no certain
grounds. An apparently blended character or a prepotent
character may on analysis turn out to be due to the inheritance
of a certain proportion of minuter characters derived exclusively
from either parent. H. de Vries and later on a number of other
biologists have advanced the knowledge of heredity in crosses
by carrying out further the experimental and theoretical work
of Gregor Mendel (see MENDELISM and HYBRIDISM), and results of
great practical importance to breeders have already been
obtained. These experimental results, however, appear to relate exclusively to sexual reproduction and almost entirely
to the crossing of artificial varieties of animals and plants. So
far as they go, they point strongly to the occurrence of alternate
inheritance instead of blended inheritance in the case of artificial
varieties. On the other hand, in the case of natural varieties it appears that blended inheritance predominates. The difficulty of the interpretation of the word "character" still remains and the Mendelian interpretation cannot be dismissed with regard to the behaviour of any "character" in inheritance until it is certain that it is a unit and not a composite. There is another fundamental difficulty in making empirical comparisons between the characters of parents and offspring. At first sight it seems as if this mode of work were sufficiently direct and simple, and involved no more than a mere collection of sufficient data. The cranial index, or the height of a human being and of so many of his ancestors being given, it would seem easy to draw an inference as to whether or no in these cases brachycphaly or stature were inherited. But our modern conceptions of the individual and the race make it plain that the problems are not so simple. With regard to any character, the type is not a particular measurement, but a curve of variations derived from statistics, and any individual with regard to the particular character may be referable to any point of the curve. A tall race like the modern Scots may contain individuals of any height within the human limits; a dolichocephalic race like the modern Spaniards may contain extremely round-headed individuals. What is meant by saying that one race is tall or the other dolichocephalic, is merely that if a sufficiently large number be chosen at random, the average height of the one race will be great, the cranial index of the other low. It follows that the study of variation must be associated with, or rather must precede, the empirical study of heredity, and we are beginning to know enough now to be certain that in both cases the results be obtained are practically useless for the individual case, and of value only when large masses of statistics are collected. No doubt, when general conclusions have been established, they must be acted on for individual cases, but the results can be predicted not for the individual case, but only for the average of a mass of individual cases. It is impossible within the limits of this article to discuss the mathematical conceptions involved in the formation and applications of the method, but it is necessary to insist on the fact that these form an indispensable part of any valuable study of empirical data. One interesting conclusion, which may be called the "ancestral law" of heredity, with regard to any character, such as height, which appears to be a blend of the height of related characters, is that any apparent blend is really due to an exclusive inheritance of separate components, which may be given from the work of F. Galton and K. Pearson. Each parent, on the average, contributes 1/2 or (c-5)a, each grandparent 1/4 or (c-5)b, and each ancestor of nth place (c-5)ma. But this, like all other deductions, is applicable only to the mass of cases and not to any individual case.

Regression.—An important result of quantitative work brings into prominence the steady tendency to maintain the type which appears to be one of the most important results of amphimixis. In the tenth generation a man has 1024 tenth grandparents, and is thus the product of an enormous population, the mean of which can hardly differ from that of the general population. Hence this heavy weight of mediocritv produces regression or progression to type. Thus in the case of height, a large number of cases being examined, it was found that fathers of a stature of 72 in. had sons with a mean stature of 70-8 in., a regression towards the normal stature of the race. Fathers with a stature of 66 in. had sons with a mean of 68-3 in., a progression towards the normal. It follows from this that where there is much in-and-in breeding the weight of mediocrity will be less, and the peculiarities of the breed will be accentuated.

Atavism.—Under this name a large number of ordinary cases of variation are included. A tall man with very short parents would probably be set down as a case of atavism if the existence of a very tall ancestor were known. He would, however, simply be a case of normal variation, the probability of which may be calculated from a table of stature variations in his race. Less marked cases set down to atavism may be instances merely of normal regression. Many cases of more abnormal structure, which are really due to abnormal embryonic or post-embryonic development, are set down to atavism, as, for instance, the cervical fistulae, which have been regarded as atavistic persistences of the gill clefts. It is also used to imply the reversion that takes place when domestic varieties are set free. Many species or varieties are crossed (see HYBRIDISM). Atavism is, in fact, a misleading name covering a number of very different phenomena.

Teleonomy is the name given to the supposed fact that offspring of a mother to one sire may inherit characters from a sire with which the mother had previously bred. Although breeders of stock have a strong belief in the existence of this, there are no certain facts to support it, the supposed cases being more readily explained as individual variations of the kind generally referred to as "atavism." None the less, two theoretical explanations have been suggested: (1) that spermatozoa, or portions of spermatozoa, from the first sire may occasionally survive within the mother for an abnormally long period; (2) that the body, or the reproductive cells of the mother, may be influenced by the growth of the embryo within her, so that she acquires something of the character of the sire. The first supposition has no direct evidence to support it, and is made highly improbable from the fact that a second impregnation is always necessary. Against the second supposition Pearson brings the cogent empirical evidence that the younger children of the same sire show no increased tendency to resemble him. (See TELEONY.)

Authorities.—The following books contain a fair proportion of the best and old knowledge on this subject:—W Bateson, Materials for the Study of Variation (1894); Y. Delage, La Structure du proto-plasme et les théories sur l'éphérédie (a very full discussion and list of literature); G. H. D. Eimer, Organic Evolution, Eng. trans. by Cunningham (1890); J. C. Ewart, The Pycnch Experiments (1890); F. Galton, Natural Inheritance (1885); O. Hertwig, Evolution or Epigenesis? Eng. trans. by P. C. Mitchell (1896); K. Pearson, The Grammar of Science, 3d ed. (1896). Eng.; W. A. Steinmann, The Germ Plasm, Eng. trans. by Parker (1893). Lists of separate papers are given in the annual volumes of the Zoological Record under heading "General Subject." (P.C.M.)

HEREFORD, a city and municipal and parliamentary borough, and the county town of Herefordshire, England, on the river Wye, 144 m. W.N.W. of London, on the Worcester-Cadilly line of the Great Western railway and on the west-and-north joint line of that company and the North-Western. It is connected with Ross and Gloucester by a branch of the Great Western, and is the terminus of a line from the west worked by the Midland and Neath & Brecon companies. Pop. (1901) 21,382. It is mainly on the left bank of the river, which here traverses a broad valley, well wooded and pleasant. The cathedral of St Etchelbert exemplifies all styles from Norman to Perpendicular. The site was detached from Lichfield in 676, Puut being its first bishop; and the modern diocese covers most of Herefordshire, a considerable part of Shropshire, and small portions of Worcester- shire, Staffordshire and Monmouthshire; extending also a short distance across the Welsh border. The removal of murdered Aethelbert's body from Marden to Hereford led to the foundation of a superior church, reconstructed by Bishop Athelstane, and burnt by the Welsh in 1055. Begun again in 1079 by Bishop Robert Losinga, it was carried on by Bishop Reynelm and completed in 1148 by Bishop R. de Betun. In 1786 the great western tower fell and carried with it the west front and the first bay of the nave, when the church suffered much from unhappy restoration by James Wyatt, but his errors were partly corrected by the further work of Lewis Cottingham and Sir Gilbert Scott in 1841 and 1863 respectively, while the present west front is a reconstruction completed in 1905. The total length of the cathedral outside is 342 ft., inside 327 ft. 5 in., the nave being 158 ft. 6 in., the choir from screen to reredos 75 ft. 6 in. and the lady chapel 93 ft. 6 in. Without the principal tower of Decorated work with ball-flower ornament, formerly surmounted by a timber spire; and the north porch, rich Perpendicular with parvise. The lady chapel has a bold east end with five narrow lancet windows. The bishop's clietsiers, of which only two walks remain, are Perpendicular of curious design, with heavy tracery in the bays. A picturesque tower
at the south-east corner, in the same style, is called the "Lady Arbour," but the origin of the name is unknown. Of the former fine decagonal Decorated chapter-house, only the doorway and slight traces remain. Within, the nave has Norman arcades, showing the wealth of ornament commensurate with the work of this part of the building. The altar is set on a pulpit by the lady, and the clerestory is his work. There is a fine late Norman font, springing from a base with the rare design of four lions at the corners. The south transept is also Norman, but largely altered by the introduction of Perpendicular work. The north transept was wholly rebuilt in 1287 to contain the shrine of St Thomas de Cantilupe, bishop of Hereford, of which there remains the magnificent marble pedestal surmounted by an ornate arcade. The fine lantern, with its many shafts and vauling, was thrown open to the floor of the bell-chamber by Cottingham. The choir screen is a florid design by Sir Gilbert Scott, in light wrought iron, with a wealth of ornament in copper, brass, mosaic and polished stones. The dark choir is Norman in the arcades and the stage above, with Early English clerestory and vauling. At the east end is a fine Norman arch, blocked until 1841 by a Grecian screen erected in 1717. The choir stalls are largely Decorated. The organ contains original work by the famous builder Renatus Harris, and was the gift of Charles II. to the cathedral. The small north-east and south-east transepts are Decorated but retain traces of the Norman spindal terminations eastward. The earliest as yet discovered, dating by a crypt in the choir, is the elaborate Early English work. On the south side opens the little Perpendicular chantry of Bishop Audley (1492-1502). In the north choir aisle is the beautiful fan-vaulted chantry of Bishop Stanbury (1470). The crypt is remarkable as being, like the lady chapel, Early English, and is thus the only cathedral crypt in England of a later date than the 11th century. The ancient monastic library remains in the archive room, with its heavy oak cupboards. Deeds, documents and several rare manuscripts and relics are preserved, and several of the precious books are among the library's treasures. The chapter house, is in the south choir aisle. This is the Map of the World, dating from about 1314, the work of a Lincolnshire monk, Richard of Haldingham. It represents the world as surrounded by ocean, and embodies many ideas taken from Herodotus, Pliny and other writers, being filled with grotesque figures of men, beasts, birds, and fishes, together with representations of famous cities and scenes of scriptural classical story, such as the Labyrinth of Crete, the Egyptian pyramids, Mount Sinai and the journeyings of the Israelites. The map is surmounted by representations of Paradise and the Day of Judgement.

From the south-east transept of the cathedral a cloister leads to the quadrangle college of the Vicars-Choral, a beautiful Perpendicular building. On this side of the cathedral, too, the bishop's palace, originally a Norman hall, overlooks the Wye, and near it lies the castle green, the site of the historic castle, which is utterly effaced. There is here a column (1809) commemorating the victories of Nelson. The church of All Saints is Early English and Decorated, and has a lofty spire. Both this St Peter's (originally Norman) have good carved stalls, but the fabric of both churches is greatly restored. One only of the great arches of the transepts of the old walls are seen, but there are ruins of the Black Friars' Monastery in Widemarsh, and a mile out of Hereford on the Brecowan, the White Cross, erected in 1347 by Bishop Louis Charlton, and restored by Archbishop Lord Saye and Sele, commemorates the departure of the Black Plague. Of domestic buildings the "Old House" is a good example of the picturesque half-timbered style, dating from 1521, and the Coningsby Hospital (almshouses) date from 1614. The inmates wear a remarkable uniform of red, designed by the founder, Sir T. Coningsby. St Ethelbert's hospital is an eastern English lady chantry, dated about 1380, and the schools are the Cathedral school (1384) and the Blue Coat school (1570). There is also the County College (1886). The public buildings are the shire hall in St Peter's Street, in the Grecian Doric style, with a statue in front of it of Sir George Cornwall Lewis, who represented the county in parliament from 1847 to 1852, the town hall (1904), the corn-exchange (1858), the free library and museum in Broad Street; the guildhall and mansion house. A musical festival of the choirs of Hereford, Gloucester and Worcester cathedrals is held annually in rotation at these cities.

The government is in the hands of a municipal council consisting of a mayor, 6 aldermen and 18 councillors. Area, 5041 acres.

Hereford (Hereford) founded after the crossing of the Severn by the West Saxons early in the 7th century, had a strategic importance due to its proximity to the Welsh March. The foundation of the city is ascribed to Earl Harold, afterwards Harold II. The castle was successfully besieged by Stephen, and was the prison of Prince Edward during the Barons' Wars. The pacification of Wales deprived Hereford of military significance until it became a Royalist stronghold during the Civil Wars. It surrendered easily to Waller in 1643, but was relieved by the king's troops and received Rupert on his march to Wales after Naseby. It was besieged by the Scots during August 1645 and relieved by the king. It fell to the Parliamentarians in this year. In 1806 the town included fees of the bishop, the dean and chapter, and the Knights Hospitalers, but was otherwise royal demesne. Richard I. in 1189 sold their town to the citizens at a fee farm rent, which grant was confirmed by John, Henry III., Edward II., Edward III., Richard II., Henry IV. and Edward IV. Incorporation was granted to the mayor, Aldermen and citizens in 1597, and confirmed in 1620 and 1697-1698. Hereford returned two members to parliament from 1295 until 1885, when the Redistribution Act deprived it of one representative. In 1116-1117 a fair beginning on St Ethelbert's day was conferred on the bishop, the antecedent of the modern fair in the beginning of May. A fair beginning on St Denis' day, granted to the citizens in 1226-1227, is represented by that held in October. The fair of Easter Wednesday was granted in 1482. In 1792 the existing fairs of Candlemas week and the beginning of July were held. Market days were, under Edward I., and in 1792, Wednesday, Friday and Saturday; the Friday market was discontinued before 1815. Hereford was the site of a provincial mint in 1086 and later. A grant of an exclusive merchant gild, in 1275-1216, was several times confirmed. The trade in wool was important in 1202, and eventually responsible for gilds of tailors, drapers, mercers, dyers, fullers, cloth workers, weavers and haberdashers; it brought into the market Welsh friers and white cloth; but declined in the 14th century, although it existed in 1385. The leather trade was considerable in the 13th century. In 1385 the glove trade had declined. The city anciently had an extensive trade in bread to Wales. It was the birthplace of David Garrick, the actor, in 1716, and probably of Nell Gwyn, mistress of Charles II., to whose memory a tablet was erected in 1883, marking the supposed site of her house.

HEREFORDSHIRE, an inland county of England on the south Welsh border, bounded N. by Shropshire, E. by Worcestershire, S. by Monmouthshire and Gloucestershire, and W. by Radnorshire. The area is 1953-5 sq. m. The county is almost wholly drained by the Wye and its tributaries, but on the north and east includes a small portion of the Severn. The Wye enters Herefordshire from Wales at Hay, and with a sinuous and very beautiful course crosses the south-western part of the county, leaving it close above the town of Monmouth. Of its tributaries, the Lugg enters the north-west near Presteigne, and has a course generally easterly to Leominster, where it turns south, receives the Arrow from the west, and joins the Wye 6 m. below Hereford, the Frome flowing in from the east immediately above the junction. The Monnow rising in the mountains of Breconshire forms the boundary between Herefordshire and Monmouthshire over one-half of its course (about 20 m.), but it joins the main river at Monmouth. Its principal tributary in Herefordshire is the Dore, which traverses the picturesque Golden Valley. The Wye is celebrated for its...
salmon fishing, which is carefully preserved, while the Lug, Arrow and Frome abound in trout and grayling, as does the Teme. This last is a tributary of the Severn, and at two points reaches lie within this county in the north, while it also forms parts of the northern and eastern boundary. The Leddon, also flowing to the Severn, rises in the east of the county and leaves it in the south-east, passing the town of Ledbury. High ground, of an elevation from 500 to 800 ft, separates the various valleys, while on the eastern boundary rise the Malvern Hills, reaching 1104 ft. in the Herefordshire Beacon, and 1305 ft. in the Worcestershire Beacon, and on the boundary with Brecknockshire the Black Mountains exceed 2000 ft. The scenery of the Wye, with its wooded and often precipitous banks, is famous, the most noteworthy point in this county being Symond’s Yat, on the Herefordshire border, 4 miles N.W. of Ross.

Geology.—The Archean or Pre-Cambrian rocks, the most ancient in the county, emerge from beneath the newer deposits in three small isolated areas. On the western border, Stanner Rock, a picturesque craggy hill near Kington, consists of igneous materials (granitoid rock, felsite, dolerite and gabbro), apparently of intrusive origin and possibly of Uriconian age. In Brampton Bryan Park, a few miles to the north-east, some ancient conglomerates emerge and may be a continuation of the earlier rocks. On the southern boundary the Hereford Beacon in the Malvern chain consists of gneisses and schists and Uriconian volcanic rocks; these have been thrust over various members of the Cambrian and Silurian systems, and owing to their harder nature they form the existing higher grounds. The Cambrian rocks (Tremadoc Beds) come next in order of age and consist of quartzites, sandstones, and shales, well exposed at the southern end of the Malvern chain and also at Pedwarline near Brecon, where they form part of the Great Malvern oolite. The Warnford Rock consists of north-west of the county, between Presteign and Ludlow; also along the western flanks of the Malvern Hills and in the eroded domes of Woolhope. Smaller patches come to light at Westhide east of Hereford. Near the Severn they consist of highly fossiliferous sandstones, mudstones, shales and limestones, known as the Llandovery, Wenlock and Ludlow Series; the Woolhope, Wenlock and Aymestry Limestone sections are faulted for the most part.

The remainder and by far the greater part of the county is occupied by the Old Red Sandstone, through which the rocks above described project in detached areas. The Old Red Sandstone consists of a great thickness of red sandstones and marls, with imperceptible bands of impure concretionary limestone known as cornstones, which by their superior hardness give rise to scarp and rounded ridges; they have yielded remains of fishes and crustaceans. Some of the upper beds are conglomeratic. On its south-eastern margin the county just reaches the Carboniferous Limestone cliffs of the Wye Valley near Ross. Glacial deposits, chiefly sand and gravel, are found in the lower ground along the river-courses, while cavelion, rhinoceros, mammoth and reindeer. The apple crop, generally large, is enormous one year out of four. Twenty hogsheads of cider have been made from an acre of orchard, twelve being the ordinary yield. Cider is the staple beverage of the county, and the trade in cider and perry is large. Hops are another staple of the county, the vines of which are planted in rows on ploughed land. As early as Camden’s day a Herefordshire adage coupled Weobley ale with Leominster bread, indicating the county’s capacity to produce fine wheat and barley, as well as hops.

Herefordshire is also famous as a breeding county for its cattle of bright red hue, with mottled or white faces and sleek silvery coats. Herefords are famous throughout the world, though not good milkers, put up more meat and fat at an early age, in proportion to food consumed, than almost any other variety. They produce the finest beef, and are more cheaply fed than Devons or Durhams, with which they are advantageously crossed. As a dairy county Herefordshire does not rank high.

Its small, white-faced, hornless, symmetrical breed of sheep known as “the Ryelands,” from the district near Ross, where it was bred in most perfection, made the county long famous both for the flavour of its meat and the merino-like texture of its wool. Fuller says of this that it was best known as “Lemster ore,” and the finest in all England. In its original form the breed is extinct, crossing with the Leicester having improved size and stamina at the cost of the fleece, and the chief breeds of sheep on Herefordshire farms at present are Shropshire Downs, Cotswolds and Radnors, with their crosses. Agricultural horses of good quality are bred in the north, and saddle and coach horses may be met with at the fairs. Breeders’ names from the county are famous at the national cattle shows, and the number, size and quality of the stock are seen in their supply of the metropolitan and other markets. Prize Herefords are constant, and to a large extent, the service of the county.

Manufacuring enterprise is small. There are some iron foundries and factories for agricultural implements, and some paper is made. There are considerable limestone quarries, as near Ledbury.

Communications.—Hereford is an important railway centre. The Worcester and Cardif line of the Great Western railway, entering on the east, runs to Hereford by Ledbury and then southward. The joint line of the Great Western and North-Western companies runs north from Hereford by Leominster, proceeding to Shrewsbury and Crewe. At Leominster a Great Western branch crosses, connecting Worcester, Bromyard and New Radnor. From Hereford a Great Western branch follows the valley of the Wye, passing through Hereford to Gloucester; a branch connects Ledbury with Gloucester, and the Golden Valley is traversed by a branch from Pontrilas on the Worcester-Cardiff line. From Hereford the Midland and Neath and Brecon line follows the Wye valley westward. None of the rivers is commercially navigable and the canals are out of use.

Population and Administration.—The area of the ancient county is 537,363 acres, with a population in 1891 of 115,949 and in 1901 of 114,380. The area of the administrative county is 538,921 acres. The county contains 12 hundreds. It is divided into two parliamentary divisions, Leominster (N.) and Ross (S.), and it also includes the parliamentary borough of Hereford, which returns one member. There are two municipal boroughs—Hereford (pop. 21,382) and Leominster (5826). The other urban districts are Bromyard (1665), Kington (1944), Ledbury (3259) and Ross (3303). The county is in the Oxford circuit, and assizes are held at Hereford. It has one court of quarter sessions and is divided into 11 petty sessional divisions. The boroughs of Hereford and Leominster have separate commissions of the peace, and the borough of Hereford has in addition a separate court of quarter sessions. There are 260 civil parishes. The ancient county, which is almost entirely in the diocese of Hereford, with small parts in those of Gloucester, Worcester and Llandaff, contains 222 ecclesiastical parishes or districts, wholly or in part.

History.—At some time in the 7th century the West Saxons pushed their way across the Severn and established themselves in the territory between Wales and Mercia, with which kingdom they soon became incorporated. The district which is now Herefordshire was occupied by a tribe the Hecanas, who congregated chiefly in the fertile area about Hereford and in the mining districts round Ross. In the 8th century Offa extended the Mercian frontier to the Wye, securing it by the earthwork known as Offa’s dyke, portions of which are visible at Knighton and Moorhampton in this county. In 915 the Danes made their way up the Severn to the district of Archensfield, where they took prisoner Cyfellawg bishop of Llandaff, and in 1067 they besieged Wigmore, which had been rebuilt in that year by Edward. From the time of its first settlement the district was the scene of constant border warfare with the Welsh, and Harold, whose earldom included this county, ordered that any Welshman caught trespassing over the border should lose his right hand. In the period preceding the Conquest much disturbance was
caused by the outrages of the Norman colony planted in this county by Edward the Confessor. Richard's castle in the north of the county was the first Norman fortress erected on English soil, and was Wroxeter, Ewyas, Hereford, Bromfield, Hereford, Donnington, and Caldecot were all the sites of Norman strongholds. The conqueror entrusted the subjugation of Herefordshire to William FitzOsbern, but Edric the Wild in conjunction with the Welsh prolonged resistance against him for two years.

In the wars of Stephen's reign Hereford and Wobceley castles were held against the king, but were captured in 1138. Edward, afterwards Edward I., was imprisoned in Hereford Castle, and made his famous escape thence in 1265. In 1326 the parliament assembled at Hereford which deposed Edward II. In the 14th and 15th centuries the forest of Deaneld was held by the Mortimer family of Clif ford. During the Wars of the Roses the influence of the Mortimers led the county to support the Yorkist cause, and Edward, afterwards Edward IV., raised 23,000 men in this neighbourhood. The battle of Mortimer's Cross was fought in 1461 near Wigmore. Before the outbreak of the civil war of the 17th century, complaints of illegal taxation were rife in Herefordshire, but a strong anti-puritan feeling induced the county to support the royalist cause. Hereford, Goodrich and Ledbury all endured sieges.

The earldom of Hereford was granted by William I. to William FitzOsbern, and afterwards on the death of his son Roger in 1074 the title lapsed until conferred on Henry de Bohun about 1199. It remained in the possession of the Bohuns until the death of Humphrey de Bohun in 1373; in 1397 Henry, earl of Derby, afterwards King Henry IV., who had married Mary Bohun, was created duke of Hereford. Edward VI. created Walter Devereux, a descendant of the Bohun family, Viscount Hereford, in 1550, and his grandson, the famous earl of Essex, was born in this county. Since this date the viscountcy has been held by the Devereux family, and the holder ranks as Viscount of Hereford. In the middle of the 15th century Giffard and Mortimer figured prominently in the warfare on the Welsh border, and the Talbots, Lacy, Crofts and Scudamores also had important seats in the county, Sir James Scudamore of Holme Lacy being the original of the Sir Scudamore of Spenser's Faery Queen. Sir John Oldcastle, the leader of the Lollards, was sheriff of Herefordshire in 1406.

Herefordshire Probably originated as a shire in the time of Æthelstan, and is mentioned in the Saxon Chronicle in 957. In the Domesday Survey parts of Monmouthshire and Radnorshire are about, about 1086, but on the outlying south and southern borders remained debatable ground until with the incorporation of the Welsh marches in 1535 considerable territory was restored to Herefordshire and formed into the hundreds of Wigmore, Ewys Lacy and Huntingdon, while Ewys Harold was united to Wickeb. At the time of the Domesday Survey the divisions of the county were very unsettled. As many as nineteen hundreds are mentioned, but these were of varying extent, some containing only one manor, some from twenty to thirty. Of the twelve modern hundreds, only Greetree, Radlow, Stretford, Wobceley and Wormelow retain Domesday names. Herefordshire has been included in the diocese of Hereford since its foundation in 676. In 1291 it comprised the deaneries of Hereford, Weston, Leominster, Wobceley, Frome, Archenfield and Ross in the archdeaconry of Hereford, and the deaneries of Burford, Stottesdon, Ludlow, Pontesbury, Clun and Wenlock, in the archdeaconry of Shropshire. In 1877 the name of the archdeaconry of Shropshire was changed to Ludlow, and in 1899 the deaneries of Abbey Dore, Bromyard, Kingsland, Kington and Ledbury were created in the archdeaconry of Hereford.

Herefordshire was governed by a sheriff as early as the reign of Edward the Confessor, the shire-court meeting at Hereford where later the assizes and quarter sessions were also held. In 1066 an act was passed declaring Hereford free from the jurisdiction of the council of Wales, but the county was not finally relieved from the interference of the Lords Marchers until the reign of William and Mary.

Herefordshire has always been esteemed an exceptionally rich agricultural area, the manufactures being unimportant, with the sole exception of the woollen and the cloth trade which flourished soon after the Conquest. Iron was smelted in the Golden hundred in Roman times, and the Domesday Survey mentions iron workers in Marche. At the time of Henry VIII. the towns had become much impoverished, and Elizabeth in order to encourage local industries, insisted on her subjects wearing English-made caps from the factory of Hereford. Hops were grown in the county soon after their introduction into England in 1524. In 1650 and again in 1697 the county was severely visited by the plague, but in the 17th century it had a flourishing timber trade and was noted for its orchards and cider.

Herefordshire was first represented in parliament in 1295, when it returned two members, the boroughs of Ledbury, Hereford, Leominster and Wobceley being also represented. Hereford was again represented in 1299, and Bromyard and Ross in 1304, but the boroughs made very irregular returns, and from 1306 until Wobceley regained representation in 1627, only Hereford and Leominster were represented. Under the act of 1832 the county returned three members and Wobceley was disfranchised.

The act of 1868 deprived Leominster of one member, and under the act of 1885 Leominster was disfranchised, and Hereford lost one member.

Architecture.—There are remains of several of the strongholds which Herefordshire possessed as a march county, some of which were maintained and enlarged, after the settlement of the border, to serve in later wars. To the south of Ross are those of Wilton and Goodrich, commanding the Wye on the right bank, the latter a ruin of peculiar magnificence, and both gaining picturesqueness from their beautiful situations. Of the several castles in the valleys of the boundary-river Monnow and its tributaries, those in this county include Pembriode, Kilpeck and Longtown; of which the last shows extensive remains of the strong keep and towers of the earlier castle. In the region of Wigmore, consisting of a keep on an artificial mound without walls, the seat of the powerful family of Mortimer.

Beside the cathedral of Hereford, and the fine churches of Ledbury, Leominster and Ross, described under separate headings, the county contains some churches of almost unique interest. In that of Kilpeck remarkable and unusual Norman work is seen. It consists of the three divisions of nave, choir and chancel, divided by ornate arches, the chancel ending in an apse, with a beautiful and elaborate west end and south doorway. The columns of the choir arch are composed of slender pillars, the central plan is seen in Peterchurch in the Wye Valley, and in Moccas church, on the Wye above Hereford. Among the large number of churches exhibiting Norman details that at Bromyard is noteworthy. At Abbey Dore, the Cistercian abbey church, still in use, is a large and beautiful specimen of Early English work, and there are slight remains of the monastic buildings. At Madley, south of the Wye 5 m. W. of Hereford, is a fine Decorated church (with earlier portions), with the rare feature of a Decorated apsidal chancel over an octagonal crypt. Of the churches in mixed styles those in the larger towns are the most noteworthy, together with that of Wigmore.

The half-timbered style of domestic architecture, common in the west and midlands of England in the 16th and 17th centuries, beautifies many of the towns and villages. Among country houses, that of Tregoes, 9 m. W. of Ross, is a remarkable example of a fortified mansion of the 15th century, in a condition little altered. Redhill and Sutton Court, between Ross and Hereford, are good specimens of 15th-century work, and portions of Hampton Court, 8 m. N. of Hereford, are of the same period, built by Sir Rowland Lenthall, a favourite of Henry IV. Holme Lacy, 5 m. S.E. of Hereford, is a fine mansion of the latter part of the 17th century, with picturesque Dutch gardens, and much wood-carving by Grining Gibbons within. This was formerly the seat of the Scudamores, from whom it was inherited by the Stanhope, earls of Chesterfield, the 6th earl of Chesterfield taking the name of Scudamore-Stanhope. His son, the 10th earl, has recently (1909) sold Holme Lacy to Sir Robert
HERERO—HERESY

Lucas-Tooth, Bart. Downton Castle possesses historical interest in having been designed in 1726 in a strange mixture of Gothic and Greek styles, by Richard Payne Knight (1720-1824), a famous scholar, numismatist and member of parliament for Lich-

HERERO, or Ovaherero ("merry people"), a Bantu people of German South-West Africa, living in the region known as Damaraland or Hereroland. They call themselves Ovaherero and their language Otshiherero. Sometimes they are described as Cattle Damara or "Damara of the Plains" in distinction from the Hill Damara who are of mixed blood and Hottentots in language. The Herero, whose main occupation is that of cattle-rearing, are a warlike race, possessed of considerable mili-

HERESY, the English equivalent of the Greek word ἁδερσ which is used in the Septuagint for "free choice," in later classical literature for a philosophical school or sect as "chosen" by those who believe in it, in Philo for religion, in Josephus for a religious party (the Sadducees, the Pharisees and the Essenes). It is in this last sense that the term is used in the New Testa-

Christianity is itself so described (Acts xxiv. 14, xxviii. 22): "In the Pauline Epistles it is used with severe condemnation of the divisions within the Christian Church itself. Heresies with "enmities, strife, jealousies, wraths, factions, divisions, envyings" are reckoned among "the works of the flesh" (Gal. v. 20). Such divisions, proofs of a carnal mind, are censured in the church of Corinth (1 Cor. iii. 3, 4); and the church of Rome, where the apostles had laboured and implored (Rom. xvi. 17). The term "schism," afterwirds distinguished from "heresy," is also used of these divisions (1 Cor. i. 10). The estrangements of the rich and the poor in the church at Corinth, leading to a lack of Christian fellowship even at the Lord's Supper, is described as "heresy" (1 Cor. xi. 19). Breaches of the law of love, not errors about the truth of the Gospel, are referred to in these passages. But the first step towards the ecclesiastical use of the term is found already in 2 Peter ii. 1, "Among you also there shall be false teachers who shall privily bring in destructive heresies (R.V. margin "sects of perdition"), denying even the Master that bought them, bringing upon themselves swift destruction." The meaning here suggested is "falsely chosen ones," warned against those who deny the apostles (Acts i. 13). This is very far from persons and their temper to mental products—from the sphere of sympathetic love to that of objective truth" (Bartlet, art. "Heresy," Hastings' Bible Dictionary). As the parallel passage in Jude, verse 4, shows, however, that these errors had immoral consequences, the moral reference is not absent even from this passage. The first employment of the term outside the New Testament is also its first use for theological error. Ignatius applies it to Docetism (Ad Trall. 6). As doctrine came to be made more important, heresy was restricted to any de-

Christian Church, even in the Apostolic age, towards errors in belief. The Apostolic writings show a vehement antagonism towards all teaching opposed to the Gospel. Paul declares anathema the Judaizer, who required the circumcision of the Gentiles (Gal. i. 8), and even calls them the "dogs of the covenant" and "evil workers" (Phil. iii. 2). The elders of Ephesus are warned against the false teachers who would appear in the church after the apostle's death as "grievous wolves not sparing the flock" (Acts xx. 29); and the speculations of the Gnostics are denounced as "seducing spirits and doctrines of devils" (1 Tim. iv. 1), as "profane babblings and oppositions of the knowledge which is falsely so called" (vi. 20). John's warnings are as earnest and severe. Those who deny the fact of the Incarnation are described as "antichrist," and as "deceivers" (1 John iv. 3; 2 John 7). The references to heretics in 2 Peter and Jude have already been dealt with. This antagonism is explicable by the character of the heresies that threatened the Christian Church in the Apostolic age. Each of these heresies involved such a blending of the Gospel with either Jewish or pagan elements, as would not only pollute its purity, but destroy its power. In each of these the Gospel was in danger of being made of none effect by the environ-

The church, even in the Apostolic age, towards errors in belief. The Apostolic writings show a vehement antagonism towards all teaching opposed to the Gospel. The Heresies, which threatened to paganize the Christian Church, were condemned in no measured terms by the fathers. These false teachers are denounced as "servants of Satan, beasts in human shape, dealers in deadly poison, robbers and pirates." Polycarp, Ignatius, Justin, Irenaeus, Hippolytus, Tertullian and even Clement of Alexandria and Origen are as severe in condemnation as the later fathers (cf. Matt. xiii. 35-43; Tertullian, Prosecc. 31). While the necessity of the heresies is admitted in accordance with 1 Cor. xi. 19, yet woe is pronounced on those who have introduced them, according to Matt. xviii. 7. (This application of these passages, however, is of altogether doubtful validity.) "It was necessary," says Tertullian (ibid. 30), to the Lord should be betrayed; but woe to the traitor." The very worst motives, pride, disappointed ambition, sensual lust, and avarice," are recklessly imputed to the heretics; and no possibility of morally innocent doubt, difficulty or difference in thought is admitted. Origen and Augustine do, however, recognize the error of these teachers, but deny that they are false teachers with good motives. While we must admit that there was a very serious peril to the thought and life of the Christian Church in the teaching thus denounced, yet we must not forget that for the most part these teachers are known to us only in the ex parte representation that their opponents have given of them; and we must not assume that even their doctrines, still less their characters, were so bad as they are described.

The attitude of the church in the post-Nicene period differs from that in the ante-Nicene in two important respects. (1) As has already been indicated, the earlier heresies threatened to introduce Jewish or pagan elements into the faith of the church, and it was necessary that they should be vigorously resisted if the church was to retain its distinctive character. Many of the later heresies were differences in the interpretation of Christian truth, which did not in the same way threaten the very life of the church. No vital interest of Christian faith justified the extravagant denunciations in which theological partisanship so recklessly and ruthlessly indulged. (2) In the ante-Nicene period only ecclesiastical penalties, such as reproof, deposition or excommunication, could be imposed. In the post-Nicene the union of church and state transformed theological error into legal offence (see below).

We must now consider the definition of heresy which was gradually reached in the Christian Church. It is a "religious error held in wilful and persistent opposition to the truth after it has been defined and declared to be the will of the church in an authoritative manner," or "pertinax defensio dogmatis ecclesiae universalis judicio condemnati" (Schaff's Ante-Nicene Christianity, ii. 512-516). (i) It "denotes an opinion antagonistic to a fundamental
article of the Christian faith," due to the introduction of "foreign elements" and resulting in a perversion of Christianity, and an amalgamation with it of ideas discordant with its nature (Fisher's History of Christian Doctrine, i. 61). It has hitherto generally assumed that the ecclesiastical authority was always competent to determine what are the fundamental articles of the Christian faith, and to detect any departures from them; but it is necessary to admit the possibility that the error was in the church, and the truth was with the heresy. (ii.) There cannot be any heresy where there is no orthodoxy, and, therefore, in the definition it is assumed that the church has declared what is the truth or the error in any matter. Accordingly "heresy is to be distinguished from defective stages of Christian knowledge. For example, the Jewish believers, including the Apostles themselves, at the outset required the Gentile believers to be circumcised. They were not on this account chargeable with heresy. Additional light must first come in, and be rejected, before that earlier opinion could be thus stigmatized. Moreover, heresies are not to be confounded with tentative and faulty hypotheses broached in a period prior to the scrutiny of a topic of Christian doctrine, and before that scrutiny has led the general mind to an assured conclusion. Such hypotheses—for example, the idea that in the person of Christ the Logos is substituted for a rational human spirit—are to be met with in certain early fathers (ibid. p. 9). There are many more examples which were afterwards condemned, but, as these matters were still open questions in his day, he was not reckoned a heretic. (iii.) In accordance with the New Testament use of the term heresy, it is assumed that moral defect accompanies the intellectual error, that the false view is held pertinaciously, in spite of warning, remonstrance and rebuke; aggressively to win over others, and so factiously, to cause division in the church, a breach in its unity.

A distinction is made between "heresy" and "schism" (from Gr. ἡρεσις, ἱσχισμός, rend. asunder, divide). "The fathers commonly use 'heresy' of false teaching in opposition to Catholic doctrine, and 'schism' of a breach of discipline, in opposition to Catholic government" (Schaff). But as the claims of the church to be the guardian through its episcopate of the apostolic tradition, of the Christian faith itself, were magnified, and unity in practice as well as in doctrine came to be regarded as essential, this distinction became a theoretical rather than a practical one. While severely condemning, both Irenaeus and Tertullian distinguished schismatics from heretics. "Though we are by no means bound to say that they acknowledged orthodox schismatics they did not venture to reckon them simply as heretics. If it was desired to get rid of these, an effort was made to impute to them some deviation from the rule of faith; and under this pretext the church freed herself from the Montanists and the Monarchians. Cyprian was the first to proclaim the identity of heretics and schismatics by making a man's Christianity depend on his belonging to the great episcopal church confederation. But in both East and West, this theory of his became established only by very imperceptible degrees, and indeed, strictly speaking, the process was never completed. The distinction between heretics and schismatics was preserved because it prevented a public denial of the old principles, because it was advisable on political grounds to treat certain schismatic communities with indulgence, and because it was always possible in case of need to prove heresy against the schismatics." (Harnack's History of Dogma, ii. 92-93).

There was considerable controversy in the early church as to the validity of heretical baptism. As even "the Christian virtues of the heretics were described as hypocrisies and lies of distortion, p. 90. Origen indulged in this whenever attached by the orthodox party to the sacraments performed by heretics. Tertullian declares that the church can have no communion with the heretics, for there is nothing common; as they have not the same God, and the same Christ, so they have not the same baptism (De bapt. 15). Cyprian agreed with him. The validity of heretical baptism was denied by the church of Asia Minor as well as of Africa; but the practice of the Roman Church was to admit without second baptism heretics who had been baptized with the name of Christ, or of the Holy Trinity. Stephen of Rome attempted to fore the Roman practice on the whole church in 253. The controversy his intolerance provoked was closed by Augustine's controversial treatise De Baptismo, in which the validity of baptism administered by heretics is based on the objectivity of the sacrament. Whenever the name of the three-one God is used, the sacrament is declared valid by whomsoever it may be performed. This was a triumph of sacramentarianism, not of charity.

Three types of heresy have appeared in the history of the Christian Church. The earliest may be called the 'sacramental,' such as the adoption of Pagan elements. Ebionitism asserted "the continual obligation to observe the whole of the Mosaic law," and "outran the Old Testament monothelitism by a barren monacharianism that denied the divinity of Christ" (Kurtz, Church History, i. 120). Gnosticism was the result of the attempt to blend with Christianity the religious notions of pagan mythology, mysteroLOGY, theosophy and philosophy" (p. 98). The Judaizing and the paganizing tendency were combined in Gnostic Ebionitism which was prepared for in Jewish Essenism. In the later heresy of Manichaeism there were affinities to Gnosticism, but it was a philosophy in itself, and combined theosophy, Persian dualism and even Buddhist ethics (p. 126).

The next type of heresy may be called evolutionary or formatory. When the Christian faith is being formulated, undue emphasis may be put on one aspect, and thus so partial a statement of truth may result in error. Thus when in the ante-Nicene age the doctrine of the Trinity was under discussion, dynamic Monarchianism "regarded Christ as a mere man, who, like the prophets, though in a much higher measure, had been endowed with divine wisdom and power"; modal Monarchianism saw in the Logos a dweller within Christ "only a delicate manifestation of the Father"; Patristicism identified the Logos with the Father; and Sabellianism regarded Father, Son and Spirit as "the rôles which the God who manifests Himself in the world assumes in succession" (Kurtz, Church History, i. 175-181). When Arius asserted the subordination of the Son to the Father, and denied the eternal generation, Athanasius and his party asserted the Homoousia, the oneness of substance of the Father and the Son. This assertion of the divinity of Christ triumphed, but other problems at once emerged. How was the relation of the humanity to the divinity in the incarnate Christ conceived? The whole question of the nature of the person of Christ. Nestorius held the two natures so far apart as to appear to sacrifice the unity of the person of Christ. Eutyches on the contrary "taught not only that after His incarnation Christ had only one nature, but also that the body of Christ as the body of God is not of like substance with our own" (Kurtz, Church History, i. 330-334). The Church in the Creed of Chalcedon in A.D. 451 affirmed "that Christ is true God and true man, according to His Godhead begotten from eternity and like the Father in everything, only without sin; and that after His incarnation the unity of the person consists in two natures which are conjoined without confusion, and without change, but also without rending and without separation." The problem was not solved, but the inadequate solutions were excluded, and the data to be considered in any adequate solution were affirmed. After this decision the controversies about the Person of Christ degenerated into mere hair-splitting; and the interference of the imperial authority from time to time in the dispute was not conducive to the settlement of the questions in the interests of truth alone. This problem interested not only the Christians of the Eastern churches but the Western as well. The West there was waged a theological warfare around the nature of man and the work of Christ. To Augustine's doctrine of man's total depravity, his incapacity for any good, and the absolute sovereignty of the divine grace in salvation according to the divine election, Pelagius opposed the view that "God's grace..."
is destined for all men, but man must make himself worthy of it by honest striving after virtue" (Kurtz, Church History, i. 348). While Pelagius was condemned, it was only a modified Augustinianism which became the doctrine of the church. It is not necessary in illustration of the second type of heresy to point out that which arises when the contents of the Christian faith are beclouded—to refer to the doctrinal controversies of the middle ages. It may be added that after the Reformation Arianism was revived in Socinianism, and Pelagianism in Arminianism; but the conception of heresy in Protestantism demands subsequent notice.

The third type of heresy is the revolutionary or reformatory. This is not directed against doctrine as such, but against the church, its theory and its practice. Such movements of antagonism to the errors or abuses of ecclesiastical authority may be so permeated by defective conceptions and injurious influences as by their own character to deserve condemnation. But on the other hand the church in maintaining its place and power may condemn as heretical genuine efforts at reform by a return, though partial, to the standard set by the Holy Scriptures or the Apostolic Church. On the one hand there were during the middle ages sects, like the Catharists and Albigenses, whose "opposition as a rule developed itself from dualistic or pantheistic premises (surviving effects of old Gnostic or Manichaean views)" and who "stood outside of ordinary Christendom, and while no doubt affecting many individual members within it, had no influence on church doctrine." On the other hand there were movements, such as the Waldensian, the Wycliffite and Hussite, which are often described as "reformations anticipating the Reformation" which "set out from the Augustinian conception of the Church, but took exception to the development of the conception," and were pronounced by the medieval church as heretical for (1) "contesting the hierarchic gradation of the priestly order; or (2) giving to the religious idea of the Church implied in the thought of predestination a place superior to the conception of the empirical Church; or (3) applying to the priests, and thereby to the authorities of the Church, the test of the law of God, before admitting their right to exercise, as holding the keys, the power of binding and loosing" (Harnack's History of Dogma, vi. 136-137). The Reformation itself was from the standpoint of the Roman Catholic Church heresy and schism.

"In the present divided state of Christendom," says Schaff (Augsburg Confession, i. 513-514), "there are different kinds of orthodoxy and heresy. Orthodoxy is conformity to the recognized creed or standard of public doctrine; heresy is a wilful departure from it. The Greek church rejects as heretical, because contrary to the teaching of the first seven ecumenical councils, the Roman dogmas of the papacy, of the double procession of the Holy Ghost, the immaculate conception of the Virgin Mary, and the infallibility of the Pope. The Roman Church anathematized, in the council of Trent, all the distinctive doctrines of the Protestant Reformation. Among Protestant churches again there are minor doctrinal differences, which are held with various degrees of exclusiveness or liberality according to the degree of departure from the Roman Catholic Church. Luther, for instance, would not tolerate Zwingli's view on the Lord's Supper, while Zwingli was willing to fraternize with him notwithstanding this difference." At the colloquy of Marburg "Zwingli offered his hand to Luther with the entreaty that they be at least Christian brethren, but Luther refused it and declared that the Swiss were of another spirit. He expressed surprise that a man of such views as Zwingli should wish brotherly relations with the Wittenberg reformers" (Walker, The Reformation, p. 174). A difference of opinion on the question of the presence of Christ in the elements at the Lord's Supper was thus allowed to divide and to weaken the forces of the Reformation. On the problem of divine election Lutheranism and Calvinism remained divided. 'The Formula of Concord (1557), which gave to the whole Lutheran Church of Germany a common doctrinal system, declined to accept the Calvinistic position that man's condemnation as well as his salvation is an object of divine predestination. Within Calvinism itself Pelagianism was revived in Arminianism, which denied the irresistible, and affirmed the universality of grace. This heresy was condemned by the synod of Dort (1610). The standpoint of the Reformed churches was the sentence of the authority of the Scriptures for the authority of the church. Whatever was conceived in this context, the teaching of the Bible was regarded as heresy. The position is well expressed in the Scotch Confession (1559). "Protesting, that if any man will note in this our Confession any article or sentence repugning to God's Holy Word, that it would please him, of his gentleness, and for Christian charity's sake, to admonish us of the same in writ, and we of our honour and fidelity do promise unto him satisfaction from the mouth of God; that is, from His Holy Scripture, or else reformation of that which he shall prove to be amiss. In God we take to record in our consciences that from our hearts we abhor all sects of heresy, and all teachers of erroneous doctrines; and that with all humility we embrace purity of Christ's evangel, which is the only food of our souls" (Preface).

Although subsequently to the Reformation period the Protestant churches for the most part relapsed into the dogmatism of the Roman Catholic Church, and were ever ready with censure for every departure from orthodoxy—yet to-day a spirit of diffidence in regard to one's own beliefs, and of tolerance towards the beliefs of others, is abroad. The enlargement of the horizon of knowledge by the advance of science, the recognition of the only relative validity of human opinions and beliefs as determined by and adapted to each stage of human development, which is due to the growing historical sense, the alteration of view regarding the nature of inspiration, and the purpose of the Holy Scriptures, the revolt against all ecclesiastical authority, and the acceptance of reason and conscience as alone authoritative, the growth of the spirit of Christian charity, the clamorous demand of the social problem for immediate attention, all combine in making the Christian churches less anxious about the danger, and less zealous in the discovery and condemnation of heresy.

Having traced the history of opinion in the Christian churches on the subject of heresy, we must now return to a subject already mentioned, the persecution of heretics. According to the Canon Law, which "was the ecclesiastical law of medieval Europe, and is still the law of the Roman Catholic Church," heresy was defined as "error which is voluntarily held in contradiction to a doctrine which has been clearly stated in the creed, and has become part of the defined faith of the church," and which is "persisted in by a member of the church." It was regarded not only as an error, but also as a crime to be detected and punished. As it belongs, however, to a man's thoughts and not his deeds, it often can be proved only from suspicions. The canonists define the degrees of suspicion as "light" calling for vigilance, "vehement" demanding denunciation, and "violent" requiring punishment. The grounds of suspicion are held to have been formulated "Pope Innocent III. declared that to lead a solitary life, to refuse to accommodate oneself to the prevailing manners of society, and to frequent unauthorized religious meetings were abundant grounds of suspicion; while later canonists were accustomed to give lists of deeds which made the doers suspect: a priest who did not celebrate mass, a layman who was seen in clerical robes, those who favoured heretics, received them as guests, gave them safe conduct, tolerated them, trusted them, defended them, fought under them or read their books were all to be suspect" (T.M. Lindsay in article "Heresy," Ency. Brit., 9th edition). That the dangers of heresy might be avoided, laymen were forbidden to argue about matters of faith by Pope Alexander IV., an oath "to abjure every heresy and to maintain in its completeness the Catholic faith" was required by the council of Toledo (1129). The reading of the Scriptures in the vulgar tongue was not allowed to the laity by Pope Pius IV. The reading of books was restricted and certain books were prohibited. Regarding heresy as a crime, the church was not content with inflicting its spiritual penalties,
such as excommunication and such civil disabilities as its own organization allowed it to impose (e.g. the heretics were forbidden to give evidence in ecclesiastical courts, fathers were forbidden to allow a son or a daughter to marry a heretic, and to hold social intercourse with a heretic was an offense). It regarded itself as justified in invoking the power of the state to suppress heresy by civil pains and penalties, including even torture and death. The story of the persecution of heretics by the state must be briefly sketched. As long as the Christian Church was itself persecuted by the pagan empire, it advocated freedom of conscience, and insisted that religion could be promoted only by instruction and persuasion (Justin Martyr, Tertullian, Lactantius); but almost immediately after Christianity was adopted as the religion of the Roman empire the persecution of men for religious opinions began. While Constantine at the beginning of his reign (313) declared complete religious liberty, and kept on the whole to this declaration, yet he confined his favours to the orthodox hierarchical church, and even by an edict of the year 326 formally asserted the exclusion from these of heretics and schismatics. Arianism, when favoured by the reigning emperor, showed itself even more intolerant than Catholic Orthodoxy. Theodosius the Great, in 380, soon after his baptism, issued, with his co-emperors, the following edict: “We, the three emperors, will that all our subjects steadfastly adhere to the religion which was taught by St Peter to the Romans, which has been faithfully preserved by tradition, and which is now professed by the pontiffs Damasus of Rome, and Peter, bishop of Alexandria, a man of apostolic holiness. According to the institution of the Apostles, and the doctrine of the Gospel, let us believe in the one Godhead of the Father, the Son, and the Holy Ghost, of equal majesty in the Holy Trinity. We order that the adherents of this faith be called Catholic Christians; we brand all the senseless followers of the other religions with the infamous name of heretics, and forbid their conventicles assuming the name of churches. Besides the condemnation of divine justice, they must expect the heavy penalties which our authority, guided by heavenly wisdom, shall think fit to inflict.” (Theod. Cod. i. 142.) The fifteen penal laws which this emperor issued in as many years deprived them of all right to the exercise of their religion, “excluded them from all civil offices, and threatened them with fines, confiscation, banishment and even in some cases with death.” In 385 Maximus, his rival and colleague, caused seven heretics to be put to death at Trelves (Trier). Many bishops approved the act, but Ambrose of Milan and Martin of Tours condemned it. While Chrysostom disapproved of the execution of heretics, he approved the prohibition of their assemblies and the confiscation of their churches. Jerome by an appeal to Deut. xii. 6-10 appears to defend even the execution of heretics. Augustine found a justification for these penal measures in the “compel them to come in” of Luke xiv. 23, although his personal leanings were towards clemency. Only the persecuted themselves insisted on toleration as a Christian duty. In the middle ages the church showed no hesitation about persecuting unto death all who dared to contradict her doctrine, or challenge her practice, or question her authority. The instruction and persuasion which St Bernard favored found little imitation. Even the Dominicans, who began as a preaching order to convert heretics, soon became persecutors. In the Albigensian Crusade (A.D. 1209-1229) thousands were slaughtered. As the bishops were not zealous enough in enforcing penal laws against heretics, the Tribunal of the Inquisition was founded in 1232 by Gregory IX., and was entrusted to the Dominicans who “as Dominici canes subjected to the most cruel tortures all on whom the suspicion of heresy fell, and all the residue were handed over to the civil authorities, who readily undertook their execution” (Kurtz, Church History, ii. 166). At the Reformation Luther laid down the principle that the civil government is concerned with the province of the external and temporal life, and has nothing to do with faith and conscience. “How could the emperor gain the right,” he asks, “to rule my faith?” With that only the Word of God is concerned. “Heresy is a spiritual thing,” he says, “which one cannot hew with any iron, burn with any fire, drown with any water. The Word of God alone is there to do it.” Nevertheless Luther assigned to the state, which he assumes to be Christian, the function of maintaining the Gospel and the Word of God in public life. He was not quite consistent in carrying out his principle (see Luthard’s Geschichte der christlichen Ethik, ii. 33). In the Religious Peace of Augsburg the principle “cujus regio ejus religio” was accepted; by it a ruler’s choice between Catholicism and Lutheranism bound his subjects, but any subject unwilling to accept the decision might emigrate without hindrance. In Geneva under Calvin, while the Consistoire, or ecclesiastical court, could inflict only spiritual penalties, yet the medieval idea of the duty of the state to co-operate with the church to maintain the religious purity of the community in matters of belief as well as of conduct so far survived that the civil authority was sure to punish those whom the ecclesiastical had censured. Calvin consented to the death of Servetus, whose views on the Trinity he regarded as most dangerous heresy, and whose denial of the full authority of the Scriptures he dreaded as overthrowing the foundations of all religious authority. Protestantism generally, it is to be observed, quite approved the execution of the heretic. The Synod of Dort (1619) not only condemned Arminianism, but its defenders were expelled from the Netherlands. In 1635 they were tried at The Hague, and their在家 were they allowed to erect schools and churches. In modern Protestantism there is a growing disinclination to deal with even errors of belief by ecclesiastical censure; the appeal to the civil authority to inflict any penalty is abandoned. During the course of the 19th century in Scottish Presbyterianism the affirmation of Christ’s atoning death for all men, the denial of eternal punishment, the modification of the doctrine of the inspiration of the Scriptures by acceptance of the results of the Higher Criticism, were all censured as perilous errors. The subject cannot be left without a brief reference to the persecution of witches. To the beginning of the 15th century the popular superstitions regarding sorcery, witchcraft, and compacts with the devil were condemned by the ecclesiastical authorities as heathenish, sinful and heretical. But after the establishment of the Inquisition “heresy and sorcery were regarded as correlates, like two agencies resting on and serviceable to the demonical powers, and were therefore treated in the same way as offences to be punished with torture and the stake” (Kurtz, Church History, ii. 193). While the Franciscans rejected the belief in witchcraft, the Dominicans were most zealous in persecuting witches. In the 17th century this delusion, fostered by the ecclesiastical authorities, took possession of the mind of the people, and thousands, mostly old women, but also a number of girls, were tortured and burned as witches. Protestantism took over the superstition from Catholicism. It was defended by James I. of England. As late as the 18th century death was inflicted in Germany and Switzerland on men, women and even children accused of this crime. This superstition dominated Scotland. Not till 1756 were the statutes against witchcraft repealed; an act which the Associate Presbytery at Edinburgh in 1743 declared to be “contrary to the express law of God, for which a holy God may be provoked in a way of righteous judgment.”

The recognition and condemnation of errors in religious belief is by no means confined to the Christian Church. Only a few instances of heresy in other religions can be given. In regard to the fetishism of the Gold Coast of Africa, Jevons (Introduction to the History of Religion, pp. 165-166) maintains that “public opinion does not approve of the worship by an individual of a suhman, or private tutelary deity, and that his dealings with it are merely in the nature of 'black art,' as it is in a god of the community.” In China there is a “classical or canonical, primitive and therefore alone orthodox (ts'ching) and true
religion," Confucianism and Taoism, while the "heterodox (sio)," Buddhism especially, is "partly tolerated, but generally forbidden, and even cruelly persecuted" (Chantepie de la Saussaye, Religionsgeschichte, i. 57). In Islam "according to an unconfirmed tradition Mahomet is said to have foretold that his community would split into seventy-three sects (see MAHOMMEDAN RELIGION, § Sects.), of which only one would escape the flames of hell." The first split was due to uncertainty regarding the principle of which should rule the succession to the Caliphate. The Arabic and orthodox party (i.e. the Sunnites, who held by the Koran and tradition) maintained that this should be determined by the choice of the community. The Persian and heterodox party (the Shiites) insisted on heredity. But this political difference was connected with theological differences. The sect of the Mu'tazilites which affirmed that the Koran had been created, and denied predetermination, began to be persecuted by the government in the 9th century, and discussion of religious questions was forbidden (see CAILHAT, sections B and C). The mystical tendency in Islam, Sufism, is also regarded as heretical (see Kuenen's Hibbert Lecture, pp. 45-50). But Buddhism was generally approved of by the orthodox party against Brahmanism, and hence after a swift unfolding and quick spread it was driven out of India and had to find a home in other lands. Esessen from the standpoint of Judaism was heterodox in two respects, the abandonment of animal sacrifices and the adoration of the sun.

Although in Greece there was generally wide tolerance, yet in 399 B.C. Socrates was "indicted as an irreligious man, a corrupted of youth, and an innovator in worship."

Besides the works quoted above, see Gottfried Arnoldi's Unpar.

deitatische Kirchen- und Ketzer-Historie (1699-1700; ed. Schaffhausen, 1740). A very good list of writers on heresy, ancient and medieval, is given in Rümker, Geschichte der Auserwählten des Menschen (1836). The various Trinitarian and Christological heresies may be studied in Dorner's History of the Doctrine of the Person of Christ (1845-1856; Eng. trans., 1861-1862); the Gnostic and Manichean heresies in the lives of Maximus Duraeus and the matter and method there presented; in Hahn's Geschichte der Ketzer im Mittelalter (1840-1850), and Pegler's Geschichte der deutschen Mystik (1875). Quietism in Huppe's Geschichte der quietistischen Mönche und Prediger in der letzten Zeit (1873). Apostolic Secten in Palmer's Geschichte der Ketzer und Sekten Württembergs (1875): the Reformist and 17th-century heresies and sects in the Anabaptistische en enthusiastiam Pantheon und geistliche Rüst-Haus (1702). Böhmen in L. E. von Brünn, Zu vorgnaden und pestilenten (1726), and Böhmische Lebensgeschichte (1790). Eschenheim's 'Hats ecclesiasticum' (1712) detail at great length the relations of heresy to canon and civil law. On the question of the baptism of heretics see Smith and Cheetham's Dict. of Eccl. Antiquities, s. v. "Baptism of Heretics." On the condition in which a heretic is received into the church, compare Marteno, De ritibus, and Morinus, De poeniendiis.

A. E. G.*

Heresy according to the Law of England.—The highest point reached by the English law in regard to heresy was the Act of 1520 called "Comburus" (2 Henry IV. c. 15). Some have supposed that a writ of that name is as old as the common law, but its execution might be arrested by a pardon from the crown. The Act of Henry IV. enabled the diocesan alone, without the co-operation of a synod, to pronounce sentence of heresy, and required the sheriff to execute it by burning the offender, without waiting for the consent of the crown. 1 A large number of penal statutes were enacted in the following reigns, and the statute 4 Eliz. 1 is regarded by lawyers as limiting for the first time the description of heresy to tenets declared heretical either by the canonical Scripture or by the first four general councils, or such subordinate councils as the king or Convocation might authorize. The writ was abolished by 29 Car. II. c. 9, which reserved to the ecclesiastical courts their jurisdiction over heresy and similar offences, and their power of awarding punishments not exceeding fines. Heresy became henceforward a purely ecclesiastical offence, although disabling laws of various kinds continued to be enforced against Jews, Catholics and other dissenters. The temporal courts have no knowledge of any offence known as heresy, and the punishment of heretics (e.g. hereticae et sacrilegiarum), in 1540, it would be a violation of the law, subjecting those concerned in it to the penalties of a praemunire, but that the sentence in question was "simply nothing, literally nothing." With the Act of 1520, at least, was the right of the crown to pass a law" intended to express an opinion unless specially authorized to do so by the crown, and it is certain that it cannot do anything more. Heresy no more, in the last resort, like the other ecclesiastical questions, is decided by the judicial committees of the council.

The English lawyers, following the Roman law, distinguish between heresy and apostasy. The latter offence is dealt with by an act which still stands on the statute book, although it has long been

HEREWARD.—HERIOT, G. 363

virtually obsolete—the 8 & 10 Will. III. c. 35. If any person who has been educated in or has professed the Christian religion shall at any time, during his lifetime, publicly speak or maintain that there are more gods than one, or shall deny any of the persons of the Holy Trinity to be God, or shall deny the Christian religion to be true or the Holy Scriptures of the Old and New Testament to be the only infallible authority, he shall for the first offence be declared incapable of holding any ecclesiastical, civil, or military office or employment, and for the second incapable of bringing any action, judgment, suit, or proceeding. He shall suffer three years' imprisonment without bail. Unitarians were saved from these atrocity judgments by a later act (53 Geo. III. c. 160), which permits Christians to deny any of the persons of the Trinity without penal consequences.

HEREWARD, usually but erroneously styled "the Wake" (an addition of later days), an Englishman famous for his resistance to William the Conqueror. It is now established that he was a tenant of Peterborough Abbey, from which he held lands at Witham-on-the-Hill and Barholm with Stow in the south-western corner of Lincolnshire, and of Crowland Abbey at Rippingale in the neighbouring fenland. His first authentic act is the storm and sacking of Peterborough in 1070, in company with outlaws and Danish invaders. The next year he took part in the desperate stand against the Conqueror's rule made in the isle of Ely, and, on its capture by the Normans, escaped with his followers through the fens. That his exploits made an exceptional impression on the popular mind is certain from the mass of legendary history that clustered round his name; he became, says Mr. Davis, "in popular eyes the champion of the English national cause." The Hereward legend has been fully dealt with by him and by Professor Freeman, who observed that "with no name has fiction been more busy."

HERFORD, a town in the Prussian province of Westphalia, situated at the confluence of the Werre and Aa, on the Minden & Cologne railway, 9 m. N.E. of Bielefeld, and at the junction of the railway to Detmold and Altenbeken. Pop. (1885) 3,852; (1909) 24,931. It possesses six Evangelical churches, notably the Marienkirche, a Romanesque building with a Gothic apse of the 15th century; the Marienkirche, in the Gothic style; and the Johanniskirche, with a steeple 280 ft. high. The other principal buildings are the Roman Catholic church, the synagoge, the gymnasium founded in 1540, the agricultural school and the theatre. There is a statue of Frederick William of Brandenburg. The industries include cotton and flax-spinning, and the manufacture of linen cloth, carpets, furniture, machinery, sugar, tobacco and leather.

Herford owes its origin to a Benedictine nunnery which is said to have been founded in 832, and was confirmed by the emperor Louis IV. in 839. From the emperor Frederick I. the abbess obtained princely rank and a seat in the imperial diet. Among the abbesses was the celebrated Elizabeth (1618–1680), eldest daughter of the elector palatine Frederick V., who was a philosophical princess, and a pupil of Descartes. Under her rule the sect of the Labadists settled for some time in Herford. The foundation was secularized in 1803. Herford was a member of the Hanseatic League, and its suzerainty passed in 1547 from the abbesses to the dukes of Juliers. In 1631 it became a free imperial town, but in 1649 it was subjugated by the elector of Brandenburg and joined to Old and New Testament of Westphalia in 1807, and in 1813 into that of Prussia. See L. Hölscher, Reformationgeschichte der Stadt Herford (Gütersloh, 1888).

HERGENRÖTHER, JOSEPH VON (1824–1890), German theologian, was born at Würzburg in Bavaria on the 15th of September 1824. He studied at Würzburg and at Rome. After spending a year as parish priest at Zellingen, near his native city, he went, in 1859, to his bishop's command, to the university of Munich, where he took his degree of doctor of theology the same year, becoming in 1851 Privatdozent, and in 1855 professor of ecclesiastical law and history. At Munich he gained the reputation of being one of the most learned theologians on the Ultramontane side of the Infallibility question, which had begun to be discussed; and in 1868 he was sent to Rome to arrange the proceedings of the Vatican Council. He was a staunch supporter of the infallibility dogma, and in 1870 he published Anti-Jansen (Der Papst und die Katholiken), in answer to The Pope and the Council, by "J. T. M." (Dellinger and J. Friedrich), which made a great sensation at the time. In 1877 he was made prelate of the papal household; he became cardinal deacon in 1879, and was afterwards made curator of the Vatican archives. He died in Rome on the 3rd of October 1890.

Hergenröther's first published work was a dissertation on the doctrine of the Trinity according to Gregory Nazianzen (Regensburg, 1850), and from this time onward his literary activity was immense. After several articles and brochures on Hippolytus and the question of the authorship of the Philosophumena, he turned to the study of Photius, patriarch of Constantinople, and the history of the Greek scholia. In twelve years he engaged in the study of the latter, the result being his monumental Photius, Patriarch von Constantinopel. Sein Leben, seine Schriften und das griechische Schisma (3 vols., Regensburg, 1867–1868); an additional volume (1869) gave, under the title Monumenta Graecod Photii... pertinentia, a collection of the unpublished documents on which the work was largely based. Of Hergenröther's other works, the most important are his history of the Papal States since the Revolution (Der Kirchenstaat seit der französischen Revolution, Freiburg i. B., 1860; Fr. trans., Leipzig, 1860), his great work on the relations of church and state (Katholische Kirche und christlicher Staat in ihrer geschichtlichen Entwicklung und gegenwärtiger Beziehung, 2 vols., 1st ed. Stuttgart, 1872; 2nd ed. expanded, 1876; Eng. trans., London, 1876, Baltimore, 1889), and his universal church history (Handbuch der allgemeinen Kirchengeschichte, 3 vols., Freiburg i. B., 1870, 1872, 1875; 3rd ed., 1886; 4th ed., 1897; 5th ed., Peter Kirsch, 1902, &c.; French trans., Paris, 1880, &c.). He also found time for a while to edit the new edition of Wetzler and Welte's Kirchenwaerter and to supply the historical introduction of the Regesta Pontificum (Freiburg i. B., 1884–1885), and to add two volumes to Hede's Concilienhistorie (ib., 1887 and 1890).

HERINGSDORF, a seaside resort of Germany, in the Prussian province of Pomerania, on the north coast of the island of Usedom, 5 m. by rail N.W. of Swinemünde. It is surrounded by beech woods, and is perhaps the most popular seaside resort on the German shore of the Baltic, being frequented by some 12,000 visitors annually.

HERIOT, GEORGE (1565–1652) was the founder of Heriot's Hospital, Edinburgh, who was descended from an old Haddington family; his father, a goldsmith in Edinburgh, represented the city in the Scottish parliament. George was born in 1565, and after receiving a good education was apprenticed to his father's trade. In 1586 he married the daughters of a deceased Edinburgh merchant, and with the assistance of her patrimony set up in business on his own account. At first he occupied a small "buit" at the north-east corner of St Giles's church, and afterwards a more pretentious shop at the west end of the building. To the business of a goldsmith he joined that of a money-lender, and in 1597 he had acquired such a reputation that he was appointed goldsmith to Queen Anne, consort of James VI. In 1601 he became jeweller to the king, and followed him to London, occupying a shop opposite the Exchange. Heriot was largely indebted for his fortune to the extravagance of the queen, and the imitation of this extravagance by the nobility. Latterly he had such an extensive business as a jeweller as to be one of the most popular names in the city; his name was sometimes engraved on all the magistrates of the kingdom to aid him in securing the workmen he required. He died in London on the 10th of February 1623. In 1608, having some time previously lost his first wife, he married his second cousin, Ann Primrose, daughter of James Primrose, grandfather of the first earl of Rosebery, but she died in 1612; by neither marriage had he any issue. The surplus of his estate, after deducting legacies to his nearest relations and some of his more intimate friends, was bequeathed to found a hospital for the education of freemen's sons of the town of Edinburgh; and its value afterwards increased so greatly as to supply funds for the erection of several Heriot foundation schools in different parts of the city.

Heriot takes a leading part in Scott's novel, The Fortunes of Nigel (see also the Introduction). A History of Heriot's Hospital, with a Memoir of the Founder, by William Steven, D.D., appeared in 1827; 2nd ed. 1859.
HERIOT, by derivation the arms and equipment (geatou) of a soldier or army (here); the O. Eng. word is thus here-geatou. The lord of a fee provided his tenant with arms and a horse, either as a gift or loan, which he was to use in the military service paid by him. On the death of the tenant the lord claimed the return of the equipment. At the beginning of the 16th century heriot was being given instead of arms, the heriot was still paid, but more in the nature of a “relief” (q.v.). There seems to have been some connexion between the payment of the heriot and the power of making a will (F. W. Maitland, Domesday Book and Beyond, p. 298). By the 13th century the payment was made either in money or in kind by the handing over of the best beast or of the best other chattel of the tenant (see Pollock and Maitland, History of English Law, i. 270 sq.). For the manifold law relating to heriots, see Copyhold.

HERISAU, the largest town in the entire Swiss canton of Appenzell, built on the Glatt torrent, and by light railway 7 m. south-west of St. Gall or 13½ m. north of Appenzell. In 1900 it had 13,497 inhabitants, mainly Protestant and German-speaking. The lower portion of the massive tower of the parish church (Protestant) dates from the 11th century or even earlier. It is a prosperous little industrial town in the Auser Rhoden half of the canton, especially busied with the manufacture of embroidery by machinery, and of muslins. Near it is the goat’s whey cure establishment of Heinrichsad, and the two castles of Rosenberg and Rosenburg, ruined in 1403 when the land rose against its lord, the abbot of St. Gall. About 5 m. to the south-east is Hundwil, a village of 1523 inhabitants, where the Landsgemeinde of Auser Rhoden meets in the odd years (in other years at Trogen) on the last Sunday in April.

RECOGNIZABLE JURISDICTIONS, in the law of Scotland, grants of jurisdiction made to a man and his heirs. They were a usual accompaniment to feudal tenures, and the power which they conferred on great families, being recognized as a source of danger to the state, led to frequent attempts being made by statute to restrict them, both before and after the Union. They were all abolished in 1746.

HERKIMER, a village and the county-seat of Herkimer county, New York, U.S.A., in the township of the same name, on the Mohawk river, about 15 m. S.E. of Utica. Pop. (1900) 5335 (744 being foreign-born); (1905, state census) 6596; (1910) 7580. It is served by the New York Central & Hudson River railway (which in the village extended through the Adirondacks to Malone, N.Y.; by interurban electric railway to Little Falls, Syracuse, Richfield Springs, Cooperstown and Oneonta, and by the Erie canal. The village has a public library, and is the seat of the Folts Mission Institute (opened 1893), a training school for young women, controlled by the Women’s Foreign Missionary Society of the Methodist Episcopal Church. Herkimer is situated in a rich dairying region, and has various manufactures. The municipal owns and operates its water-supply system and electric-lighting plant. Herkimer, named in honour of General Nicholas Herkimer (c. 1728-1777), who was mortally wounded in the Battle of Oriskany, and in whose memory there is a monument (unveiled on 29 July 1873) in the village, was settled about 1787 by Palatine Germans, who bought from the Mohawk Indians a large tract of land including the present site of the village and established thereon several settlements which became known collectively as the “German Flats.” In 1756 a stone house, built in 1740 by General Herkimer’s father, John Joseph Herkimer (d. 1775)—apparently one of the original group of settlers—a stone church, and other buildings, standing within what is now Herkimer village, were enclosed in a stockade and ditch fortifications by Sir William Johnson, and this post, at first known as Fort Kouari (the Indian name), was subsequently called Fort Herkimer. Another fort ( Ft. Dayton) was built within the limits of the present village in 1776 by Colonel Elias Dayton (1737-1807), who later became a brigadier-general (1783) and served in the Confederation Congress in 1787-1788. During the French and Indian War the settlement was attacked (12th November 1757) and practically destroyed, many of the settlers being killed or taken prisoners; and it was again attacked on the 30th of April 1758. In the War of Independence General Herkimer assembled here the force which on the 6th of August 1777 was ambushed near Oriskany on its march from Ft. Dayton to the relief of Ft. Schuyler (see Oriskany); and the settlement was attacked by the British and Indians in September 1778 and in June 1782. The township of Herkimer was organized in 1788, and in 1807 the village was incorporated.

KERKOMER, SIR HUBERT VON (1840— ), British painter, was born at Waal, in Bavaria, and eight years later was brought to England by his father, a wood-carver of great ability. He lived for some time at Southampton and in the school of art there began his art training; but in 1866 he entered upon a more serious course of study at the South Kensington Schools, and in 1869 exhibited for the first time at the Royal Academy. By his picture, “The Last Muster,” at the Academy in 1875, he definitely established his position as an artist of high distinction. He was elected an associate of the Academy in 1879, and academi- cin 1880; an associate of the Royal Society of Painters in Water Colours in 1883, and a full member in 1884; and in 1885 he was appointed Slade professor at Oxford. He exhibited a very large number of memorable portraits, figure subjects and landscapes, in oil and water colour; he achieved marked success as a worker in enamel, as an etcher, mezzotint engraver and illustrative draughtsman; and he exercised wide influence upon art education by means of the Herkomer School (incorporated), at Bushey, which he founded in 1883 and directed gratuitously until 1904, when he retired. It was then voluntarily wound up, and conducted privately. Two of his pictures, “Found” (1886) and “The Chapel of the Charterhouse” (1889), are in the National Gallery of British Art. In the year 1907 he received the honorary degree of D.C.L. at Oxford, and a knighthood was conferred upon him by the king in addition to the commandership of the Royal Victorian Order with which he was already decorated.

HERLEN (or HERLIN), FRITZ, of Nördlingen, German artist of the early Swabian school, in the 15th century. The date and place of his birth are unknown, but his name is on the roll of the tax-gatherers of Ulm in 1440; and in 1467 he was made citizen and conducted business in Nördlingen, “with a house of his own” and with Flemish methods of painting.” One of the first of his acknowledged productions is a shrine on one of the altars of the church of Rothenburg on the Tauber, the wings of which were finished in 1466, with seven scenes from the lives of Christ and the Virgin Mary. In the town-hall of Rothenburg is a Madonna and St. Catherine of 1467; and in the choir of Nördlingen cathedral a triptych of 1488, representing the “Nativity” and “Christ amidst the Doctors,” at the side of a votive Madonna attended by St. Joseph and St. Margaret as patrons of a family. In each of these works the painter’s name certifies the picture, and the manner is truly that of an artist “acquainted with the development of art in Swabia. By general consent critics have assigned to him a large altar-piece, with scenes from the gospels and figures of St. Florian and St. Floriana, and a Crucifixion, the principal figure of which is carved in high relief on the surface of
HERMAE—HEMAN DE VALENCIENNES

See the article with bibliography by Pierre Paris in Daremberg and Saglio's Dictionnaire des antiquités; for the mutilation of the Hermæ, Thucydides vi. 27; Andocides, De mysteriis; Grote, Hist. of Greece, ch. 58; H. Weil, Études sur l'antiquité grecque (1900); J. Bureau, Greece, Gesch. (ed. 1909). III. p. 257.

HERMAGORAS, of Temnos, Greek rhetorician of the Rhodian school and teacher of oratory in Rome, flourished during the first half of the 1st century B.C. He obtained a great reputation among a certain section and founded a special school, the members of which called themselves Hermagorei. His chief opponent was Posidonius of Rhodes, who is said to have contended with him in argument in the presence of Pompey (Plutarch, Pompey, 42). Hermagoras devoted himself particularly to the branch of rhetoric known as ὄσωστα (inventio), and is said to have written a doctrine against the doctrine of Simonides. He also arranged the parts of an oration differently from his predecessors. Cicero held an unavourable opinion of his methods, which were approved by Quintilian, although he considers that Hermagoras neglected the practical side of rhetoric for the theoretical. According to Suidas and Strabo, he was the author of ῥήματα ἐπίροπτακαλ (rhetorical manuals) and of other works, which should perhaps be attributed to his younger namesake, surnamed Carion, the pupil of Theodorus of Gadara.

The first recorded case of the occurrence of an hermard occurred in the 12th century when the towns and the peasantry of the north united to police the pilgrim road to Santiago in Galicia and protect the pilgrims against robber knights. Throughout the middle ages such alliances were frequently formed by combinations of towns to protect the roads connecting them, and were occasionally extended to political purposes. They acted to some extent like the Flemic courts of Germany. The Catholic sovereigns, Ferdinand and Isabella, adapted an existing hermard to the purpose of a general police acting under officials appointed by themselves, and endowed with large powers of summary jurisdiction even in capital cases. The hermard became known as a hermardus, a juridical which, however, fell gradually into neglect. In Catalonia and Valencia the "germanias" were combinations of the peasantry to resist the exactions of the feudal lords.

HERMAN DE VALENCIENNES, 12th-century French poet, was born at Valenciennes, of good parentage. His father and mother, Robert and Hérémour, belonged to Hainault, and gave him for god-parents Count Baldwin and Countess Yolande—doubtless Baldwin IV, of Hainault and his mother Yolanda. Herman was a priest and the author of a verse Histoire de la Virgin, which includes the following translation of the Virgin's poem: The work is generally known as Le Roman de sappience, the name arising from a copyist's error in the first line of the poem: ""Comens de sapiencie, ce est la cremon de Deu"", the first word being misswritten in one MS. Romans, and in another Romans. His work has, indeed, the form of an ordinary romance, and cannot be regarded as a translation. He selects such stories from the Bible as suit his purpose, and adds freely from legendary sources, displaying considerable art in the selection and use of his materials. This scriptural poem, very popular in its day, mentions Henry II. of England as already dead, and must therefore be assigned to a date posterior to 1189. See the dictionnaires et extraits des manuscrits (Paris, vol. 34), and Jean Bonnaud, Les Traductions de la Bible en vers français au moyen âge (1884).
HERMANN I.—HERMANN, F. B. W. VON

HERMANN I. (d. 1217), landgrave of Thuringia and count palatine of Saxony, was the second son of Louis II. the Hard, landgrave of Thuringia, and Judith of Hohenstaufen, sister of the emperor Frederick I. Little is known of his early years, but in 1180 he joined a coalition against Henry the Lion, duke of Saxony, and with his brother, the landgrave Louis III., suffered a short imprisonment after his defeat at Weissensee by Henry. About this time he received from his brother Louis the Saxon palatinate, over which he strengthened his authority by marrying Sophia, sister of Adalbert, count of Sommersenbarg, a former count palatine. In 1190 Louis died and Hermann by his energetic measures frustrated the attempt of the emperor Henry VI. to seize Thuringia as a vacant fief of the Empire, and established himself as landgrave. Having joined a league against the emperor he was accused, probably wrongly, of an attempt to murder him. Henry was not only successful in detaching Hermann from the hostile combination, but gained his support for the scheme to unite Sicily with the Empire. In 1197 Hermann went on crusade. When Henry VI. died in 1198 Hermann's support was purchased by the late emperor's brother Philip, duke of Swabia, but as soon as Philip's cause appeared to be weakening he transferred his allegiance to Otto of Bruns- wig, who had married Hermann's sister. His coalition against Philip was speedily invaded by Thuringia in 1204 and compelled Hermann to come to terms by which he surrendered the lands he had obtained in 1198. After the death of Philip and the recognition of Otto he was among the princes who invited Frederick of Hohenstaufen, afterwards the emperor Frederick II., to come to Germany and assume the crown. In consequence of this step the Saxons attacked Thuringia, but the landgrave was saved by Frederick's arrival in Germany in 1212. After the death of his first wife in 1195 Hermann married Sophia, daughter of Otto I., duke of Bavaria. By her he had four sons, two of whom, Louis and Henry Raspe, succeeded their father in turn as landgrave. Hermann died at Gotta on the 25th of April 1217, and was buried in the abbey of Kehl in Württemberg. For a long time after his death letters of, and Walther von der Vogelweide and other Minnesingers were welcomed to his castle of the Wartburg. In this connexion he figures in Wagner's Tannhäuser.

See E. Winkelmann, Philipp von Schauen und Otto IV. von Braunschweig (Leipzig, 1873-1878); T. Knochenhauer, Geschichte Thüringens (Gottha, 1871); and F. Rüchte, Thüringische und ober- sächsische Geschichte (Leipzig, 1826).

HERMANN OF REICHENAU (HERMANNUS AUGENISI), commonly distinguished as Hermannus Contractus, i.e. the Lame (1013-1054), German scholar and chronicler, was the son of Count Wolferd of Alshausen in Swabia. Hermann, who became a monk of the famous abbey of Reichenaus, is at once one of the most attractive and one of the most pathetic figures of medieval monasticism. Crippled and distorted by gout from his childhood, he was deprived of the use of his legs; but, in spite of this, he became one of the most learned men of his time, and exercised a great personal and intellectual influence on the numerous band of scholars he gathered round him. He died on the 24th of September 1054, at the small castle of Alshausen near Biberach. Besides the ordinary studies of the monastic scholar, he devoted himself to mathematics, astronomy and music, and constructed watches and instruments of various kinds.

His chief work is a Chronicon ad annum 1054, which furnishes important and original material for the history of the emperor Henry III. The first edition, from a MS., no longer extant, was printed by J. Sichard at Basel in 1529, and reprinted by Heinrich Felten in 1540; another edition appeared at St Blaise in 1790 under the supervision of Usener; and a third, as a result of the collation of numerous MSS., forms part of vol. v. of Pertz's Monumenta Germaniae historica. A Latin translation was last published (1852) by R. F. von Willebrand, of Die Geschichtsschreiber der deutschen Vorsehung (1st ed., Berlin, 1831; 2nd ed., Leipzig, 1843). The separate lives of Conrad II. and Henry III., often ascribed to Hermann, appear to have been written by Heinrich von Freese, in De anatomia astralium (to be found, on the authority of Salzburg MSS., in Pcz, Theaurus anecdotorum nostrissimus, iil.) being the first contributions of moment furnished by a European. The name of this work was wrongly considered the inventor of the astrolobe. A didactic poem from his pen, De octo viitis principalibus, is printed in Haas's Zeitschrift für deutsches Alterthum (vol. xi.); and he is sometimes credited with the composition of the Latin hymns Veni Sancte Spiritus, Salve Regina, and Alma Redemptoris. A martyrology by Hermann was discovered by E. Dümmler in a MS. at Stuttgart, and was published in Das Martyropolion Notkeris und seine Verwandten in Forschungen zur deutschen Geschichte, xxv. (Göttingen, 1886).

See H. Hansjakob, Hermann der Lahme (Mainz, 1875); Potthast, Bibliotheca med. aen. s. "Hermannus Augenisi."

HERMANN OF WIED (1477-1552), elector and archbishop of Cologne, was the fourth son of Frederick, count of Wied (d. 1587), and was born on the 14th of January 1477. Educated for the Church, he became elector and archbishop in 1515, and ruled his electorate with vigour and intelligence, taking up at first an attitude of hostility towards the reformers and their teaching. A quarrel with the papacy turned, or helped to turn, his thoughts in the direction of Church reform, but he hoped this would come from within rather than from without, and with the aid of his friend John Gropper (1503-1550), began, about 1536, to institute certain reforms in his own diocese. Onestepped to another, and as all efforts at union failed the elector invited Martin Bucer to Cologne in 1542. Supported by the estates of the electorate, and relying upon the recess of the diet of Regensburg in 1541, he encouraged Bucer to press on with the work of reform, and in 1543 invited Melanchthon to his court. Hermann was the first to hail the new movement with great joy by the Protestants, and the league of Schalkalder was soon resolved to defend him; but the Reformotion in the electorate received checks from the victory of Charles V. over William, duke of Cleves, and the hostility of the citizens of Cologne. Summoned both before the emperor and the pope, the elector was deposed and excommunicated by Paul III. in 1546. He resigned his office in February 1547, and retired to Wied. Hermann, who was also a bishop of Paderborn from 1532 to 1547, died on the 15th of August 1552.

See C. Varentrapp, Hermann von Wied (Leipzig, 1878).

HERMANN, FRIEDRICH BENEDICT WILHELM VON (1795-1868), German economist, was born on the 5th of December 1795. From his youth he showed a taste for science and mathematics. The education he was for some time employed in a draughtsman's office. He then resumed his studies, partly at the gymnasium in his native town, partly at the universities of Erlangen and Würzburg. In 1817 he took up a private school at Nuremberg, where he remained for four years. After filling an appointment as teacher of mathematics at the gymnasium of Erlangen, he became in 1823 Privatdozent at the university in that town. His inaugural dissertation was on the notions of political economy among the Romans (Dissertatio exhibens sententias Romanaorum ad economiam politicam pertinentes, Erlangen, 1823). He afterwards acted as professor of mathematics at the gymnasium and polytechnic school in Nuremberg, where he continued till 1832, and during his stay there he published an elementary treatise on arithmetic and algebra (Lehrbuch der Arith. u. Algeb., 1826), and made a journey to France to inspect the organization and conduct of technical schools in that country. The results of his investigation were published in 1826 and 1828 (Über technische Unterrichts-Anstalten). Soon after his return from France he was made professor extraordinarius of political science of the university of Munich, and in 1823 he was advanced to the rank of ordinary professor. In 1832 appeared the first edition of his great work on political economy, Staatswirtschaftliche Untersuchungen. In 1835 he was made member of the Royal Bavarian Academy of Sciences. From the year 1836 he acted as inspector of technical instruction in Bavaria, and made frequent journeys to Berlin and Paris in order to study the methods there pursued. In the state service of Bavaria, to which he devoted himself, he rose rapidly. In 1837 he was placed on the council for supervision of church and school work; in 1839 he was entrusted with the direction of the bureau of statistics; in 1845 he was one of the councillors for the interior; in 1848 he sat as member for Munich in the national assembly at Frankfurt. In this assembly Hermann, with Johann Heckscher and others, was mainly instrumental in organizing the so-called "Great German" party, and was selected as one of the representatives of their views at Vienna. Warmly supporting the customs
Hermann, J. J. — Hermas, Shepherd of

union (Zollverein), he acted in 1837 as one of its commissioners at the great industrial exhibition at London, and published an elaborate work upon it on the woolen goods. Three years later he was president of the committee of judges at the similar exhibition at Munich, and the report of its proceedings was drawn up by him. In 1835 he became councillor of state, the highest honour in the service. From 1835 to 1847 he contributed a long series of reviews, mainly of works on economical subjects, to the Münchener gelehrte Anzeigen and also wrote for Rau’s Archiv der politischen Ökonomie and the Augsburger allgemeine Zeitung. As head of the bureau of statistics he published a series of valuable special reports (Beiträge zur Statistik des Königreichs Bayern, Heft 1-17, 1856-1867). He was engaged at the time of his death, on the 23rd of November 1868, upon a second edition of his Staatswirtschaftliche Untersuchungen, which was published in 1870.

Hermann's rare technological knowledge gave him a great advantage in dealing with some economic questions. He reviewed the principal fundamental ideas of the science with great thoroughness and acuteness. "His strength," says Roscher, "lies in his clear, sharp, exhaustive distinction between the several elements of a complex conception, or the several stages in the gradual, "nascent" act." For keen analytical power his German brethren compare him with Ricardo. But he avoids several one-sided views of the English economist. Thus he places public spirit beside egoism as an economic motor, regards price as not measured by labour only but as a product of several factors, and habitually contemplates the consumption of the labourer, not as a part of the cost of production to the capitalist, but as the main practical end of economies.

Hermann Johann Gottfried Jakob (1772-1848), German classical scholar and philologist, was born at Leipzig on the 28th of November 1772. Entering the university of his native city at the age of fourteen, Hermann at first studied law, which he soon abandoned for the classics. After a session at Jena in 1793-1794, he became a lecturer on classical literature in Leipzig, in 1798 professor extraordinarius of philosophy in the university, and in 1803 professor of eloquence (and poetry, 1809). He died on the 31st of December 1848. Hermann maintained that an accurate knowledge of the Greek and Latin languages was the only road to a clear understanding of the intellectual life of the ancient people. His aim, if not the only aim, of philosophy as the leader of this grammatico-critical school, he came into collision with A. Böckh and Otfried Müller, the representatives of the historico-antiquarian school, which regarded Hermann of view of philology as inadequate and one-sided.

Hermann devoted his early attention to the classical poetical metres, and published several works on that subject, the most important being Elementa doctrinae metrice (1816), in which he set forth a scientific theory based on the Kantian categories. His writings on Greek grammar are also valuable, especially De emendanda ratione Graecae grammaticae (1801), and notes and excurses on Vigier's treatise on Greek idioms. His editions of the classics include several of the plays of Euripides; the Clouds of Aristophanes (1790); Trinummus of Plautus (1800); Poetica of Aristotle (1802); Orphica (1805); the Homeric Hymns (1806); and the Lexicon of Photius (1808). In 1825 Hermann finished the edition of Sophocles begun by Erhardt. His edition of Aeschylus was published after his death in 1852. The Opera sua, a collection of his smaller writings in Latin, appeared in seven volumes between 1827 and 1839.

Hermann Karl Friedrich (1804-1850), German classical scholar and antiquary, was born on the 4th of August 1804, at Frankfurt-on-Main. Having studied at the universities of Heidelberg and Leipzig, he went for a tour in Italy, on his return from which he lectured as Privatdozent in Heidelberg. In 1832 he was called to Marburg as professor ordinarius of classical literature; and in 1842 he was transferred to Göttingen to the chair of philology and archaeology, vacant by the death of Otfrid Müller. He died at Göttingen on the 31st of December 1855. His knowledge of all branches of classical learning was profound, but he was chiefly distinguished for his works on Greek antiquities and ancient philosophy. Among these may be mentioned the Lehrbuch der griechischen Antiquitäten (new ed., 1886) dealing with political, religious and domestic antiquities; the Geschichte und System der Platonischen Philosophie (1839), unfinished; an edition of the Platonic Dialogues (6 vols., 1851-1853); and Culturgegeschichte der Griechen und Römer (1857-1862) by C. G. Schmidt. He also edited the text of Juvenal and Persius (1854) and Lucian's De conscribenda historia (1828). A collection of Abhandlungen und Beiträge appeared in 1849.

See M. Lechner, Zur Erinnerung an K. F. Hermann (1864), and article by C. Halm in Allgemeine deutsche Biographie, xli. (1880).

Hermaphroditus, in Greek mythology, a being partly male, partly female, originally worshipped as a divinity. The conception undoubtedly had its origin in the East, where deities of a similar dual nature frequently occur. The oldest traces of the cult in Greek antiquity appear in Egypt, in Cyprus. Here, according to Macrobius (Saturnalia, iii. 8) there was a bearded statue of a male aphroditus, called Aphroditos by Aristophanes (probably in his Niçois, a similar variant). Philochorus in his Athêis (ap. Macrobius loc. cit.) further identified this divinity, at whose sacrifices men and women exchanged garments, with the moon. This double sex also attributed to Dionysus and Priapus—the union in one being of the two principles of generation and conception—denotes extensive fertilizing and productive powers. This Cyprian Aphroditus is the same as the later Hermaphroditos, which simply means Aphroditos in the form of a herm (see Hermakos), and first occurs in the Characterer (10) of Theophrastus. After its introduction at Athens (probably in the 5th century B.C.), the importance of this object has seemed to have declined. It appears no longer as the object of a special cult, but limited to the homage of certain sects, expressed by superstitious rites of obscure significance. The still later form of the legend, a product of the Hellenistic period, is due to a mistaken etymology of the name. In accordance with this, Hermaphroditus is the son of Hermes and Aphroditos, of whom the nymph of the fountain of Salmakis in Caria became enamoured while he was bathing. When her overtures were rejected, she enchanted him and entrapped the gods that she might be for ever united with him. The result was the formation of a being, half man, half woman. This story is told by Ovid (Metam. iv. 285) to explain the peculiarly enervating qualities of the water of the fountain. Strabo (xiv. p. 636) attributes its bad repute to the attempt of the inhabitants of the country to find some excuse for the demoralization caused by their own luxurious and effeminate habits of life. There was a famous statue of Hermaphroditus by Polyclees of Athens, probably the younger of the two statues of that name. In later Greek art he was a favourite subject.

See articles in Daremberg and Saglio, Dictionnaire des antiquités, and Roscher's Lexicon der Mythologie; and for art., A. Baumeister, Denkmäler des klassischen Altertums (1884-1888).

Hermas, Shepherd of, one of the works representing the Apostolic Fathers (q.v.), a homitatory writing which "holds the mirror up" to the Church in Rome during the 3rd Christian generation. This is the period indicated by the evidence of the Muratorian Canon, which assigns it to the brother of Pius, Roman bishop c. 130-134. Probably it was not the fruit of a single effort of its author. Rather its contents came to him piecemeal and at various stages in his ministry as a Christian "prophet," extending over a period of years; and, like certain Old Testament prophets, he shows us how by his own experiences he became the medium of a divine message to his church and to God's "elect" people at large.

In its present form it falls under three heads: Visions, Mandates, Similitudes. But these divisions are misleading. The personal and preliminary revelation embodied in Vision i. brings the prophet a new sense of sin as essentially a matter of the heart,
Hermas, Shepherd of

and an awakened conscience as before the "glory of God," the Creator and Upholder of all things. His responsibility also for the sad state of religion at home is emphasized, and he is given a mission of repentance to his erring children. How far in all this and in the next vision the author is describing facts, and how far transforming his personal history into a type (after the manner of Bunyan's Pilgrim's Progress), the better to impress his moral upon his readers, is uncertain. But the whole style of the work, with its use of conventional apocalyptic forms, favours the more symbolic view. Vision II. records his call proper, through revelation of his essential message, to be delivered both to his wife and children and to "all the saints who have sinned unto this day" (2. 4). It contains the assurances of forgiveness even for the gravest sins after baptism (save blasphemy of the Name and betrayal of the brethren, Sim. ix. 19), "if they repent with their whole heart and remove doubts from their minds. For the Master hath sworn by His glory ('His Son,' below) touching His elect, that if there be more sinning after this day which He hath limited, they shall not obtain salvation. For the repentance of the righteous hath an end; the days of repentance for all saints are fulfilled. . . . Stand fast, then, ye that work righteously and be not of doubtful mind. . . . Happy are all ye that endure the temptation, for the Lord God, who made heaven and earth, gave unto them that turn to Him, as it is written in the book of Eldad and Modad, who prophesied to the people in the wilderness."

Here, in the gist of the "booklet" received from the hand of a female figure representing the Church, we have in germ the message of The Shepherd. But before Hermas announces it to the Roman Church, and through "Clement" to the churches abroad, there are added two Visions (iii. iv.) tending to heighten its impressiveness. He is shown the "Holy Church" under the similitude of a tower in building, and the great and final tribulation (already alluded to as near at hand) under that of a devouring beast, which yet is innocuous to undoing faith. Hermas begins to deliver the message of Viz. i.-iv., as bidden. But this section is perhaps not to be included as a part of the whole teaching, for it is, as it were, a parenthesis, inserted by way of introduction, by a fresh series of revelations through an angel in the guise of a Shepherd, who in a preliminary interview announces himself as the Angel of Repentance, sent to administer the special "repentance" which it was Hermas's mission to declare. This interview appears in our MSS. as Viz. v., but is really a prelude to the Mandates and Similitudes which form the bulk of the whole work, hence known as "The Shepherd." The relation of this second part to Viz. i.-iv. is set forth by the Shepherd himself. "I was sent, quoth he, to show thee again all that thou wast before, to wit the sum of the things profitable for thee. First of all write thou my mandates and similitudes; and the rest, as I will show thee, so shalt thou write." This programme is fulfilled in the v. Mandates and Similitudes, which are perhaps the most striking of the 'Teaching of the Twelve Apostles' (see DODDICE), which Hermas knows—and Similitudes i.-viii., while Simul. ix. is "the rest" and constitutes a distinct "book" (Sim. iii. 1, x. 1). In this latter the building of the Tower, already shown in outline in Viz. iii., is shown "more carefully" in an elaborate section dealing with the same themes. One may infer that Sim. ix. represents a distinctly later stage in Hermas's ministry—during the whole of which he seems to have committed to writing what he received on each occasion, possibly for recital to the church (cf. Viz. ii. ft.). Finally came Sim. x., really an epilogue in which Hermas is "delivered" afresh to the Shepherd, for the rest of his days. He is "to continue in this ministry" of proclaiming the Shepherd's teaching, "so that they who have repented or are about to repent may have the same mind with thee," and so receive a good report before God (Sim. x. 2-4). Only they must "make haste to do aright," lest while they delay the tower be finished (4. 4), and the new aeon dawn (after the final tribulation: cf. Viz. iv. 3). The relation here indicated between the Shepherd's instruction and the initial message of one definitive repentance, open to those believers who have already "broken" their "scal" of baptism by deadly sins, as announced in Visions i.-iv. is made yet plainer by Sim. vi. 1. 3 f. "These mandates are profitable to such as are about to repent; for except they walk in them their repentance is in vain." Hermas sees that mere repentance is not enough to meet the backsliding condition in which so many Christians then were, owing to the recoil of invertebrate habits of worldliness entrenched in society around and within. It is, after all, too negative a thing to stand by itself or to satisfy God. "Cease, Hermas," says the Church, "to pray all about thy sins. Ask for righteousness also" (Vis. iii. 1. 6). The positive Christian ideal which "the saints" should attain, "the Lord enabling," it is the business of the Shepherd to set forth.

Here lies a great merit of Hermas's book, his insight into experimental religion and the secret of failure in Christians about him, to many of whom Christianity had come by birth rather than faith. He shows that the worldliness in various forms, particularly the desire for wealth and the luxuries it affords, and for a place in "good society"—which meant a pagan atmosphere. Thus they were divided in soul between spiritual goods and worldly pleasures, and were apt to doubt whether the rewards promised by God to the life of "simplicity" (all Christ meant by the childlike spirit, including generosity in giving and forgiving) and self-restraint, were real or not. For while the expected "end of the age" delayed, persecutions abounded. "Such "doubled-souled" persons, like Mr Facing-both-ways, inclined to say, "the Christian ideal may be glorious, but is it practicable?" It is this most fatal doubt which engenders the Shepherd's sternest rebuke; and he states it with the utmost vehemence of religious appeal, viz. 10. 3 "the glory of God." He will have a man "to rule over all things under heaven," could He have given behests beyond man's ability? If only a man "hath the Lord in his heart," he shall know that there is nothing easier nor sweeter nor gentler than these mandates (Mand. xii. 3-4). So in the forefront of the Mandates stands the secret of all: "First of all believe that there is one God. . . . Believe therefore in Him, and fear Him, and fearing Him have self-mastery. For the fear of the Lord dwelleth in the good desire," and to "put on" this master-desire is to possess power to curb "evil desire" in all its shapes (Mand. xii. 1-2). Elsewhere "good desire" is analysed into the "spirits" of the several virtues, which yet are organically related to the Self-mastery of her daughter, and so on (Viz. iii. 3. 3 sq.; cf. Sim. ix. 15). These are the specific forms of the Holy Spirit power, without whose indwelling the mandates cannot be kept (Sim. x. 3; cf. ix. 13. 2, 24. 2). Thus the "morality" sometimes traced in Hermas is apparent rather than real, for he has a deep sense of the enabling grace of God. His defect lies rather in not presenting the historic Christ as the Christian's chief inspiration, a fact which connects itself with the strange absence of the names "Jesus" and "Christ." He uses rather the "Son of God," in a peculiar Adoptianist sense, which, as taken for granted in a work by the bishop's own brother, must be held typical of the Roman Church of his day. But as it is implicit and not part of his distinctive message, it did not hinder his book from enjoying wide quasi-canonical honour during most of the Anti-Nicene period. The absence of the historic names, "Jesus" and "Christ," may be due to the form of the book as purporting to quote angelic communications. This would also explain the absence of explicit scriptural citations generally, though knowledge both of the Old Testament and of several New Testament books—including the congenially symbolic Gospel of John—is clear (cf. The New Testament in the Apostolic Fathers, Oxford, 1905, p. 105 seq.). The one exception is the pathetic wish, "let the Book of Eldad and Modad, 4 A careful study of practical Christian ethics at Rome as implied in the Shepherd, will be found in E. von Dobschütz, Christian Life in the Primitive Church (1904).
which is cited apparently as being similar in the scope of its message. Among its non-scriptural sources may be named the allegorical picture of human life known as *Tabula Cerberis* (cf. C. Taylor, as below), the *Didaché* (see p. 530) and *Sibylla Arabiae*.

Hermas regarded Christians as "justified by the most revered Angel" (i.e. the pre-existent Holy Spirit or Son, who dwelt in Christ's "flesh"), in baptism, the "seed" which even Old Testament saints had waiting for in the "hosanna" (Is. 62:11) and may be "life". Yet the degree of "honour" (e.g. that of martyrs, *Viz.* ii. 2; *Simp. i*., 28), the exact place in the kingdom or consummated church, may often be reserved as regards the "Kingdom of Hades" (see above); and even this, in doing *inunda* and "apocrypta" in later Catholicism. Again his doctrine of fasting is a spiritualizing of a current *opus operatum* conception on Jewish lines as though an essential part of the "Kingdom of Hades". The Shepherd enjoins, first, as a "perfect fast," a "fast from every word, every evil desire, from all the vanities of this world-age" (3. 6; cf. *Barn.* iii. and the Oxyrhynchus Saying, "except what is fast from the world"); and next, as a course of perfection, a fast to yield somewhat for the relief of the widow and orphan, that this extra "service" may be to God for a "sacrifice.

Generally speaking, Hermas's piety, especially in its language, adheres closely to Old Testament forms. But it is doubtful (pace Spitta and Völter, who assume a Jewish or a proselyte basis) whether the book was written as a whole in the time of the Old Testament; it is the Old Testament still in use in the Church. In this respect, too, Hermas faithfully reflects the Roman Church of the early 2nd century (cf. the language of 1 Clem., esp. the liturgical parts, and even the Roman Mass). Indeed the parts which are most Roman is the Hermas's vision on life in the "Kingdom of Hades" (or Rome in the otherwise obscure period c. 110-140, when it had as yet hardly felt the influences converging on it from other centres of tradition and thought. Thus Hermas's comparatively mildcons of Gnostic teachers in *Simp.* suggests that the greater systems, like the Valentinian and Marcionite, had not yet made an impression there, as Hermas argues that they must have done by c. 145. This date, then, is a likely lower limit for Hermas's revision of his earlier prophetic memoranda, and their publication in a single homogeneous work, such as the *Shepherd* appears to be. Its wider historic significance—it was felt by its author to be adapted to the new situation, and welcomed—its form, it is great but hard to determine in detail. What is certain is its influence on the development of the Church's policy as to discipline in grave cases, like apostasy and adultery—"a burning question for some generations from the end of the 2nd century, particularly in Rome and North Africa. Indirectly, too, Hermas tended to keep alive the idea of the Christian prophet, even after Montanism had helped to discredit it.

**LITERATURE.**—The chief modern edition is by O. von Gebhardt and A. Harnack, in Fasc. iii. of their *Patr. apoct. opera* (Leipzig, 1877); it is edited less fully by F. X. Funk, *Pátr. apoct.* (Tübingen 1913). The *Shepherd* has been translated into English, with an English commentary, notes, by Dr C. Taylor (S.P.C.K., 2 vols, 1903-1906). For the wide literature of the subject, see the two former editions, also Harnack's *Christliche Schriften*, iii. 1, 357 seq., and O. Bardenhewer, *Gesch. der altkirchl.* Lit. i. 557 seq. For the authorship see _A. B. LIT._ *LITURTRE*, sect. III.

*HERMENEUTICS*.—(See *ermwnevtikan*, sc. *fýrkn*, Lat. *art hermeneutica*, from *ermwneuein*, to interpret, from Hermes, the messenger of the gods), the science or art of interpretation or explanation, especially of the Holy Scriptures (see _THIELOLOGY_).

*HERMES*, a Greek god, identified by the Romans with Mercury. The derivation of his name and his primitive character are very uncertain. The earliest centres of his cult were Arcadia, where Mt. Cyllene was reputed to be his birthplace, the islands of Lemnos, Imbros and Samothrace, in which he was associated with the Cabeiri and Attica. In Arcadia he was specially worshipped as the god of fertility, and his images were ithyphallic as also were the "Hermes" at Athens. Herodotus (ii. 51) states that the Athenians borrowed this type from the Pelasgians, thus testifying to the great antiquity of the phallic Hermes. At Cyllene in Elis a mere phalus served as his emblem, and was highly venerated in the time of Pausanias (vi. 20. 3). Both in literature and image, as also in the symbol of a ram or a ram-shaped trophy, he was the god of protection of cattle and sheep; at Tanagra and elsewhere his title was *kávdpofuros*, the ram-bearer. As a pastoral god he was often closely connected with deities of vegetation, especially Pan and the nymphs. His pastoral character is recognized in the *Iliad* (xiv. 490) and the later epic hymn to Hermes; and his Homeric titles *δακρυα* and *κρονων, διορω* ταυ-, probably refer to him as the giver of fertility. In the Odyssey, however, he appears mainly as the messenger of the gods, and the conductor of the dead to Hades. Hence in later times he is often represented in art and mythology as a herald. The conductor of souls was naturally a chthonian god; at Athens there was a festival in honour of Hermes and the souls of the dead, and Aeschylus (Perse, 628) invokes Hermes, with Earth and Hades, in summoning a spirit from the underworld. The function of a messenger-guardian is also described of Montanism (see *Montanism*, v. 163), and perhaps the Romans, with their birthright concept of Hermes as a dream-god; he is called the "conductor of dreams" (φύρθνων τύχης), and the Greeks offered to him the last Eutation before sleep. As a messenger he may also have become the god of roads and doorways; he was the protector of travellers and his images were used for boundary-marks (see *Hermes*). It was a custom to make a cairn of stones near the waysides statues of Hermes, each passer-by adding a stone; the significance of the practice, which is found in many countries, is discussed by Frazier (Golden Bough, 2nd ed., iii. 10 f.) and Hartland (Legends of Perseus, ii. 228).

The *Tandare* of Greek education on the "musical" side he was the special patron of eloquence (μύρων), in conjunction with the giver of grace rather than of strength, which was the province of Heracles. Though athletic, he was one of the least militant of the gods; a title *πρόμαχος*, the Defender, is found only in connexion with a victory of young men ("ephebes") in a battle at Tanagra. A further point of contact between Hermes and Apollo may here be noted: both had prophetic powers, although Hermes held a place far inferior to that of the Pythian god, and possessed no famous oracle. Certain forms of popular divination were, however, under his patronage, notably the world-wide process of divination by pebbles (θορια); the "Homer's Hymn" to Hermes explains these minor gifts of prophecy as delegated by Apollo, who alone knew the mind of Zeus. Only a single oracle is recorded for Hermes, in the market-place of Phaë in Achaia, and here the procedure was akin to popular divination. An altar, furnished with lamps, was placed before the statue; the inquirer, after lighting the lamps and offering incense, placed a coin in the right hand of the god; he then whispered his question into the ear of the statue, and, stopping his own ears, left the market place. The first sound which it he be heard outside was an omen form the foregoing account it will be seen that it is difficult to derive the many-sided character of Hermes from a single elemental conception. The various theories which identified him with the sun, the moon or the dawn, may be dismissed, as they do not rest on evidence to which value would now be attached. The Arcadian or "Pelasgic" Hermes may have been an earth-deity, as his connexion with fertility suggests; but his symbol at Cyllene

---

1 *Note* the prestige of martyrs and confessors, the ways of true and false prophets in *Mand.* xi., and the different and good "walk" among Christians, e.g. in *Viss.* iii. 57; *Mand.* viii.; *Simp.* viii.

2 We only hear of a Hermes *dolos* at Pellene (Paus. vii. 27. 1) and of the custom of allowing promiscuous thriving during the festival of Hermes at Samos (Plut. *Quaest. Græc.* 55).
rather points to a mere personification of reproductive powers. According to Plutarch the ancients "set Hermes by the side of Aphrodite," i.e., the male and female principles of generation; and the two deities were worshipped together in Argos and elsewhere. But this phallic character does not explain other aspects of Hermes, as the messenger-god, the master-thief or the ideal Greek ephebe. It is impossible to adopt the view that the Homeric poets turned the rude shepherd-god of Arcadia into a messenger, in order to provide him with a place in the Olympian circle. To their Achaeian audience Hermes must have been more than a phallic god. It is more probable that the Olympian Hermes represents the fusion of several distinct deities. Some scholars hold that the various functions of Hermes may have originated from the idea of good luck which is so closely bound up with his character. As a pastoral god he would give luck to the flocks and herds; when worshiped by victorious athletes (κορινθιακός), which give luck to the merchant, the orator, the traveller and the athlete. But though the notion of luck plays an important part in early thought, it seems improbable that the primitive Greeks would have personified a mere abstraction. Another theory, which has much to commend it, has been advanced by Roscher, who sees in Hermes a wind-god. His strongest arguments are that the wind would easily develop into the messenger of the gods (Δίος θύρας), and that it was often thought to promote fertility in crops and cattle. Thus the two aspects of Hermes which seem most discordant are referred to a single origin. The Homeric epithet ἀργόμαρτυρ, which the Greeks interpreted as "the slayer of Argus," inventing a myth to account for Argus, is explained by the epithet of wind (πνεύματος), which clears away the mists (ἐργός, φάλαινα). The uncertainty of the wind might well suggest the trickery of a thief, and its whistling might contain the germ from which a god of music should be developed. But many of Roscher's arguments are forced, and his method of interpretation is not altogether sound. For example, the last argument would equally apply to Apollo, and would lead to the improbable conclusion that Apollo was a wind-god. It must, in fact, be remembered that men make their gods after their own likeness; and, whatever his origin, Hermes in particular was endowed with many of the qualities and habits of the Greek race. If he was evolved from the wind, his character had become so anthropomorphic that the Greeks had practically lost the knowledge of his primitive significance; nor did Greek cult ever associate him with the wind.

The oldest form under which Hermes was represented was that of the Hermae mentioned above. Alcmeones, the rival or pupil of Pheidias, was the sculptor of a herm at Athens, a copy of which, dating from Roman times, was discovered at Pergamum in 1903. But side by side with the Hermes there grew up a more anthropomorphic conception of the god. In archaic art he was portrayed as a full-grown and bearded man, clothed in a long chiton, and often wearing a cap (καστόρ or a broad-brimmed hat (κέρασος), and winged boots. Sometimes he was represented in his pastoral character, as when he bears a sheep on his shoulders; at other times he appears as the messenger or herald of the gods with the κρηκώνιον, or herald's staff, which is his most frequent attribute. From the latter part of the 5th century his art-type was changed in conformity with the general development of Greek sculpture. He now became a nude and beardless youth, the type of the young athlete. In the 4th century this type was probably fixed by Praxiteles in his statue of Hermes at Olympia. Authorities.—F. G. Welcker, Griech. Göttler, i. 342 f. (Göttingen, 1835-1863); L. Pfeiffer, ed. C. Ritter, Geschichte der griechischen Mythologie, ii (Berlin, 1894); W. H. Roscher, Lex. der griech. u. röm. Mythologie, s.v. (Leipzig, 1884-1886); A. Lang, Myth, Ritual and Religion, ii. 225 sq. (London, 1887); C. Darenberg and E. Saglio, Dic. des ant. et préc. des anciens peuples et des villes des Gr. et des Rom. (Paris, 1855-1862, O. Gruppe, Griech. Mythologie und religiöse Gesch., p. 531 sq. (Munich, 1896). In the article GREEK ART, figs. 43 and 82 (Plate VI) represent the Hermes of Praxiteles; fig. 57 (Plate II), a professed copy of the Hermes of Alcamenes.

HERMES, GEORG (1775-1831), German Roman Catholic theologian, was born on the 22d of April 1775, at Dreyerwaalde, in Westphalia, and was educated at the gymnasium and university of Münster, in both of which institutions he afterwards taught. In 1820 he was appointed professor of theology at Bonn, where he died on the 20th of May 1831. Hermes had a devoted band of adherents, of whom the most notable was Peter Josef Elvenich (1797-1886), who became professor at Breslau in 1839, and in 1870 threw in his lot with the Old Catholic movement. His works were Untersuchungen über die innere Wahrheit des Christenthums (Münster, 1856), and Einleitung in die christkatholische Theologie, of which the first part, a philosophical introduction, was published in 1819, the second part, on positive theology, in 1829. The Einleitung was never completed. His Christkatholische Dogmatik was published, from his lectures, after his death by two of his students, Achatfeld and Braun (3 vols., 1831—1834).

The Einleitung is a remarkable work, both in itself and in its effect upon Catholic theology in Germany. Few works of modern days have excited a more keen and bitter controversy. Hermes himself was very largely under the influence of the Kantian and Fichtean ideas, and though in the philosophical portion of his Einleitung he criticizes both these thinkers severely, rejects their doctrine of the moral law as the sole guarantee for the existence of God, and confines their restricted view of the possibility and nature of revelation, enough remained of purely speculative material to render his system obnoxious to his church. After his death, the controversies between his followers and their opponents grew so bitter that the dispute was referred to the papal see. The judgment was adverse, and on the 29th of September 1835 a papal bull condemned both parts of the Einleitung and the first volume of the Dogmatik. Two months later the remaining volumes of the Dogmatik were likewise condemned. The controversy did not cease, and in 1845 a systematic attempt was made by W. H. Werner to examine and refute the Hermetic doctrines, as contrasted with the orthodox Catholic faith (Der Hermesianismus, 1845). In 1847 the condemnation of 1835 was confirmed by Pius IX.

See K. Werner, Geschichte der katholischen Theologie (1866), pp. 405 sqq.

HERMES TRISMEGISTUS ("the thrice greatest Hermes"), an honorific designation of the Egyptian Hermes, i.e. Thoth (Θότ), the god of wisdom. In late hieroglyphic the name of Thoth often has the epithet "the twice very great," sometimes "the thrice very great"; in the popular language (demotic) the corresponding epithet is "the five times very great," found as early as the 3rd century B.C. Greek translations give ὁ μέγας καὶ μεγάτους: ἡμέραμεσις occurs in a late magical text. ὁ τρεμφάγος has not yet been found earlier than the 2nd century A.D., but there can now be no doubt of its origin in the above Egyptian epithets.

Thoth was "the scribe of the gods," "Lord of divine words," and to Hermes was attributed the authorship of all the strictly sacred books generally called by Greek authors Hermetic. These, according to Clemens Alexandrinus, our sole ancient authority (Strom. vi. p. 268 et seq.), were forty-two in number, and were subdivided into six divisions, of which the first, containing ten books, was in charge of the "prophet and" dealt with laws, deities and the education of priests; the second, consisting of the ten books of the statiles, the official whose duty it was to dress and ornament the statues of the gods, treated of sacrifices and offerings, prayers, hymns, festive processions; the third, of the "hierogrammatist," also in ten books, was called "hieroglyphics," and was a repertory of cosmographical, geographical and topographical information; the four books of the "horoscope" were devoted to astronomy and astrology; the two books of the "chanter" contained respectively a collection of songs in honour of the gods and a description of the royal life and its duties; while the sixth and last division, containing the six books of the "Old Testament," was medical. Clemens's statement cannot be contradicted. Works are extant in papyri and on temple walls, treating of geography, astronomy, myths, medicine, &c. It is probable that the native priests would have been ready to ascribe the authorship or inspiration, as well as the care and protection of all their books of sacred lore to Thoth, although
there was a goddess of writing (Sphinx), and the ancient deities inscribes Inuithes and Amenophis, and later inspired doctors Petosiris, Nechepso, etc., to be reckoned with; there are indeed some deities in Horus, and an attribution in poetry to an individual canoes. Whether a canon of such books was ever established, even in the latest times, may be seriously doubted. We know, however, that the vizier of Upper Egypt (at Thebes) in the eighteenth dynasty, had 40 (not 42) parchment rolls laid before him as he sat in the hall of audience. Unfortunately we have no hint of their contents. Forty-two was the number of divine assessors at the judgment of the dead before Osiris, and was the standard number of the names or counties in Egypt.

The name of Hermes seems during the 3rd and following centuries to have been regarded (as it had been by Plutarch) with the numerous syncretistic writings in which it was sought to combine Neo-Platonic philosophy, Philonic Judaism and cabalistic theosophy, and so provide the world with some acceptable substitute for the Christianity which had even at that time began to give indications of the ascendency it was destined afterwards to attain. Of these pseudepigraphic Hermetic writings some have come down to us in the original Greek; others survive in Latin or Arabic translations; but the majority appear to have perished. That which is best known and has been most frequently discussed is the "De potestate et sapientia divinae" (Hermes, between the Divine Intelligence, ποιητὴν ἀριστεύοντος περιεργετικόν. 'Εκ τῆς μαθηματικῆς ἐπιστήμης πρὸς Λυκαμώνα: (in Latin) Aphorismi sine Ceniloquium, Cyranides; (in Arabic, but doubtless from a Greek original) an address to the human soul, which has been translated by H. L. Fleischer (As die menschliche Seele, 1870).

The connexion of the name of Hermes with alchemy will explain what is meant by hermetic sealing, and will account for the use of the phrase "hermetic medicine by Paracelsus, as also for the so-called "hermetic freemasonry" of the middle ages. Besides Thoth, Anubis (αύξαι) was constantly identified with Hermes; also See Ursinus, De Zoroastrae, Hermete, &c. (Nuremberg, 1661); Nicolaus Lenglet-Dufresnoy, L'Histoire de la philosophie hermétique (Paris, 1742); Baumgarten-Crusius, De librorum hermeticorum originali plenitudine (1779); B. I. Hilgers, De Hermetis Ermetistis (Jena, 1866), which consists of fifteen chapters treating of such subjects as the nature of God, the origin of the world, the creation and fall of man, and the divine illumination which is the sole means of his deliverance. The editio princeps appeared in Paris in 1554; there is also an edition by G. Parthey (1834); the work has also been translated into German by D. Tiedemann (1781). Other Hermetic writings which have been preserved, and which have been for the most part collected by Patricius in the Nova de universis philosophia (1558), consist of solitiously-written "Aphorismi, de vi et virtute, Περὶ κατακλῶνος νοσοῦντων περιεργετικῶν."

The word "hermit" is an adaptation through the O. F. ermite or eremite, from the Lat. form, eremita, of the Gr. ἔρημιτας, a solitary, from ἄρημα, a desert. The English form "cremite," which was used, according to the New English Dictionary, quite indiscriminately with hermit " till the middle of the 17th century, is now chiefly used in a metaphorical sense, except when the early hermits of the Libyan desert, or sometimes to such particular orders as the eremites of St Augustine (see AUGUSTINIAN HERMITS). Another synonym is "anchoress" or "anchorite." This comes through the French and Latin forms from the Gr. ἄναχωρησία, from ἄναχωρέω, to withdraw. A form nearer to the Greek original, "anarchite," is sometimes used of the early Christian recluses in the East.

HERMOGENES, of Tarsus, Greek rhetorician, surnamed ξύρτος (the polisher), flourished in the reign of Marcus Aurelius (a.d. 161-180). His precocious ability secured him a public appointment as teacher of his art while as yet he was only a boy; but at the age of twenty-five his faculties gave way, and he spent the remainder of his long life in a state of intellectual impotence. During his early years, however, he had composed a series of rhetorical treatises, which became popular text-books, and the subject of subsequent commentaries. Of his Τέχνη ἁγική we still possess the sections Περὶ τῶν στάσεως (on legal issues), Περὶ εὐθέως (on the invention of arguments), Περὶ τῆς (on the various kinds of style), Περὶ μεθὸς διδασκάλου (on the method of speaking effectively), and Περὶ γνωσμοῦ θεωρητικοῦ (on the theoretical evidence). Editions by C. Walz (1831) and by L. Spergel (1854), in their Rhetores Graeci; bibliographical note on the commentaries in W. Christ, Geschichte der griechischen Literatur (1898).

HERMON, the highest mountain in Syria (estimated at 9050 to 9200 ft.), an outlier of the Anti-Lebanon. As the Hebrew name (1970, "belonging to a sanctuary, " separate") shows, it was always a sacred mountain. The Sidonians called it Sirion, and the
HERMSDORF

Amorites Shenir (Deut. iii.9). According to one theory it is the "high mountain" near Caesarea Philippi, which was the scene of the Transfiguration (Mark ix. 2). A curious reference in Enoch vi. 6, says that in the days of Jared the wicked angels descended on the summit of the mountain and named it Hermon. The modern name is Jebel es-Sheikh, or "mountain of the chief or elder." It is also called Jebel el-Thulij, "snowy mountain." The ridge of Hermon, rising into a dome-shaped summit, is 20 m. long, extending north-east and south-west. The formation of the lower part is Nubian sandstone, that of the upper part is a hard grey-crystalline limestone belonging to the Neocomian period, and full of fossils. The spurs consist in some cases of white chalk covering the limestone, and on the south there are several basaltic outbreaks. The view from Hermon is very extensive, embracing all Lebanon and the plains east of Damascus, with Palestine as far as Carmel and Tabor. On a clear day Jaffa may also be seen. The mountain in spring is covered with snow, but in autumn there is occasionally none left, even in the ravines. To the height of 500 ft. it is clothed with oaks, poplars and brush, while luxuriant vineyards abound. Foxes, wolves and Syrian bears are not infrequently met with, and there is a heavy dew or night mist. Above the snow-limit the mountain is bare and covered with fine limestone shingle. The summit, is a plateau from which three rocky knobs rise up, that on the west being the lowest, that on the south-east the highest. On the south slope of the latter are remains of a small temple or sacellum described by St Jerome. A semicircular dwarf wall of good masonry and about 5 ft. in height. The base of the peak excavated in the rock may perhaps indicate the site of an altar. On the plateau is a cave about 25 ft. sq. with the entrance on the east. A rock column supports the roof, and a building (possibly a Mithraeum) once stood above. Other small temples are found on the sides of Hermon, of which twelve in all have been explored. They face the east and are dated by architects about A.D. 200. The most remarkable are those of Deir el 'Ashaiyir, Hlibbariye, Hosn Niha and Tell Thatha. At the ruined town called Rukleh on the northern slopes are remains of a temple, the stones of which have been built into a church. A large medallion, 5 ft. in diameter, with a head supposed to represent the sun-god, is built into the wall. Several Greek inscriptions occur among these ruins. In the 12th century Psalm 114:12 was supposed to indicate the proximity of Hermon to Tabor. The conical hill immediately south of Tabor was thus named Little Hermon, and is still so called by some of the inhabitants of the district.

HERMSDORF, a village of Germany, in the Prussian province of Silesia. Pop. (1900) 10,975. There are coal and iron mines and lime quarries in the vicinity, and in the town there are large iron-works. Hermsdorf is known as Niederhermsdorf to distinguish it from other places of the same name. Perhaps the most noteworthy of these is a village in Silesia at the foot of the Riesengebirge, chiefly famous for the ruins of the castle of Kynast. This castle, formerly the seat of the Schaffgotsch family, was destroyed by lightning in 1675. A third Hermsdorf is a village in Saxo-Altefries, where porcelain is made.

HERNE, JAMES A. [originally HERNE] (1840-1901), American actor and playwright, was born in Troy, New York, and after theatrical experiences in various companies produced his own first play, Hearts of Oak, in 1878, and his great success Shore Acres in 1882. It was in rural drama that his humour and pathos found their proper setting, and Shore Acres was seen throughout the United States almost continuously for six seasons, being followed by the less successful Sag Harbor, 1900.

HERNE, a town of Germany, in the Prussian province of Westphalia, 15 m. by rail N.W. of Dortmund. Pop. (1905) 33,738. It has coal mines, boiler-works, gunpowder mills, &c. Herne was made a town in 1897.

HERNE BAY, a seaside resort in The St Augustine's parliamen-
tary division of Kent, England, 8 m. N. by E. of Canterbury, on the South Eastern and Chatham railway. Pop. of urban district (1901) 6726. It has grown up since 1830, above a sandy and pebbly shore, and has a pier 4 m. long. The church of St Martin in the village of Herne, 1/2 m. inland, is Early English and later; the building was held by Nicholas Ridley (1538), afterwards Bishop of London. At Reculver, m. E. of Herne Bay on the coast, is the site of the Roman station of Reculbium. The fortress occupied about 8 acres, but only traces of the south and east walls remain. In Saxon times it was converted into a palace by King Ethelbert, and in 669 a monastery was founded here by Egbert. The Early English church was taken down early in the 19th century owing to the encroachment of the sea, and parts of its fabric were preserved in the modern church of St Mary. But its twin towers, known as the Sistren from the tradition that they were built by a Benedictine abbess of Faversham in memory of her sister, were preserved by Trinity House as a conspicuous landmark.

HERNE THE HUNTER, a legendary huntsman who was alleged to haunt Windsor Great Park at night, especially around an aged tree, long known as Herne's oak, said to be 900 years old. This was blown down in 1863, and a young oak was planted by Queen Victoria on the spot. Herne has his French counterpart in the Grand Veneur of Fontainebleau. Mention is made of Herne in The Merry Wives of Windsor and in Harrison Ainsworth's Windsor Castle. Nothing definite is known of the Herne legend. It is suggested that it originated in the life-story of some keeper of the forest; but more probably it is only a variant of the "Wild Huntsman" myth common to folk-lore, which (E. B. Tylor, Primitive Culture, 4th ed. pp. 361-362) is almost certainly the modern form of a prehistoric storm-myth.

HERNIA (Lat. hernis, perhaps from Gr. ὑφος, a sprout), in medicine, the protrusion of a part of a viscous, from its normal cavity; thus, hernia cerebri is a protrusion of some of the brain through an aperture in the cornea. But, used by itself, hernia implies a protrusion from the abdominal cavity, or, in common language, a "rupture." A rupture may occur at any weak point in the abdominal wall. The common situations are the groin (inguinal hernia), the upper part of the thigh (femoral hernia), and the navel (umbilical hernia). The more movable the viscus the greater the liability to protrusion, and therefore one commonly finds some of the small intestine, or of the fatty apron (omentum), in the hernia. The tumour may contain intestine alone (enterocele), omentum alone (epi-epilecule), or both intestine and omentum (entero-epilecule). The predisposing cause of rupture is abnormal length of the suspensory membrane of the bowel (the mesentery), or of the omentum, in conjunction with some weak spot in the abdominal wall, as in an inguinal hernia, which descends along the canal in which the peritoneal cord lies in the male and the round ligament of the womb in the female. A femoral hernia comes through a weak spot in the abdomen to the inner side of the great femoral vessels; a ventral hernia takes place by the yielding of the scar tissue left after an operation for appendicitis or ovarian disease. The exciting cause of hernia is generally some over-exertion, as in lifting a heavy weight, jumping off a high wall, straining (as in difficult micturition), copulation or excessive coughing. The pressure of the diaphragm above and the abdominal wall in front acting on the abdominal viscera causes a protrusion at the weakest point.

Rupture is either congenital or acquired. A child may be born with a hernia in the inguinal or umbilical region, the result of an arrest of development in these parts; or the rupture may be acquired, first appearing, perhaps, in adult life as the result of a strain or burst. Men suffer more frequently than women, because of their physical labours, because they are more liable to accidents, and because of the passage for the spermatic cord out of the abdomen being more spacious than that for the round ligament of the womb.

At first the rupture is small, and it gradually increases in bulk. It varies from the size of a marble to a child's head. The swelling consists of three parts—the coverings, sac and contents. The "coverings" are the structures which form the abdominal wall at the part where the rupture occurs. In femoral hernia the coverings are the structures at the upper part of the thigh which are stretched, thinned and matted together as the result of
pressure; in other cases there is an increase in their thickness, the result of repeated attacks of inflammation. The "sac" is composed of the peritoneum or membrane lining the abdominal cavity; in some rare cases the sac is wanting. The neck of the sac is the narrowed portion where the peritoneum forming the sac becomes taut to form a ridge of bone in the peritoneal cavity.

The neck of the sac is often thickened, indurated and adherent to surrounding parts, the result of chronic inflammation. The "contents" are bowel, omental fat, or, in children, an ovary.

The hernia may be reducible, irreducible or strangulated. A "reducible" hernia is one in which the contents can be pushed back into the abdomen. In some cases this reduction is effected with ease, in others it is a matter of great difficulty. At any moment a reducible hernia may become "irreducible," that is to say, it cannot be pushed back into the abdominal cavity, perhaps because of inflammatory adhesions in and around the fatty contents, or because of extra fullness of the bowel in the sac. A "strangulated" hernia is one in which the circulation of the blood through the hernial contents is interfered with, by the pinching at the narrowest part of the passage. The interference is at first slight, but it quickly becomes more pronounced; the pinched bowel in the hernial sac swells as a finger does when a string is tightly wound round its base. At first there is congestion, and this may go on to inflammation, to infection by micro-organisms and to mortification. The rapidity with which the changes take place varies, depending on the size of the hernial sac. The time at which this occurs, which takes place depends on the tightness of the constriction, and on the virulence of the bacterial infection from the bowel. As a rule, the more rapidly a hernia forms the greater the rapidity of serious change in the conditions of the bowel or omentum, and the more urgent are the symptoms. The constricting band may be one of the structures which form the boundaries of the openings through which the hernia has travelled, or it may be the neck of the sac, which has become thickened in consequence of inflammation—especially is this the case in an inguinal hernia.

Reducible Hernia.—A "reducible" hernia may have the appearance of a compressible tumour (elastic when it contains intestine, doughy when it contains omentum), its size increasing in the erect, and diminishing in the horizontal posture. As a rule, it causes no trouble during the night. It gives an impulse on coughing, and when the intestinal contents are pushed back into the abdomen a gurgling sensation is perceptible by the fingers. Such a tumour may be met with in any part of the abdominal wall, but the chief situations are as follows. The inguinal region, in which the neck of the tumour lies immediately above Poupart's ligament (a cord-like ligamentous structure which can be felt stretching from the front of the hip bone to the pubic arch immediately above the genital organs); the femoral region, in the upper part of the thigh, in which the neck of the sac lies immediately below the inner end of Poupart's ligament; the umbilical region, in which the tumour appears at or near the navel. As the inguinal hernial increases in size it passes into the scrotum in the male, into the labium in the female; while the femoral hernia gradually pushes upwards towards the abdomen.

The palliative treatment of a reducible hernia consists in pushing back the contents of the tumour into the abdomen and keeping them there. Elastic bandages are used for this purpose. It is sometimes found impossible to keep up a hernia by means of a truss, and an operation becomes necessary. The operation is spoken of as "the radical treatment of hernia," in contrast to the so-called "palliative treatment" by means of a truss. It should not be spoken of as the radical cure, for skilfully as the operation may have been performed it is not always a cure. The principles involved in the operation are the emptying of the sac and its entire removal, and the closure of the opening into the abdomen by strong sutures: and, in this way, great advance has been made by modern surgery. Without tiresome delay, and the tedious and sometimes disappointing application of trusses, the weak spot in the abdominal wall is exposed, the sac of the hernia is tied and removed, and the canal by which the rupture descended is blockaded by buried sutures, and with no material risk to life. Thus the patient's worries become a thing of the past, and he is rendered a fit and normal member of society. Experience has shown that very few ruptures are unsuited for successful treatment by operation. No boy should now be sent to school compelled to wear a truss, and so hindered in his games and rendered an object of remark.

Irreducible Hernia.—The main symptom in a tumour in one of the situations already referred to, of long standing and perhaps of large size, in which the contents of the tumour, in whole or in part, cannot be pushed back into the abdomen. The irreducibility is due either to its large size or to changes which have taken place by indurations or adhesions. Such a tumour is a constant source of danger: its contents are liable, from their exposed situation, to injury from external violence; it has a constant risk of increase; it may at any time become strangulated, or the contents may inflame, and strangulation may either lead to the inflammatory destruction of the contents, or give rise to dragging sensations (referred to the abdomen), colic, dyspepsia and constipation, which may lead to obstruction, that is to say, a stoppage may occur of the passage of the contents of that portion of the intestinal canal which lies in the hernia. When an irreducible hernia becomes painful and tender, a local peritonitis has occurred, which resembles in many of its symptoms a case of strangulation, and must be regarded with suspicion and anxiety. Indeed, the only safe treatment is by operation.

The treatment of irreducible hernia may be palliative; a "cushion" may be applied; a "waist belt" may be strapped around the hernia, so as to make it getting larger; the bowels must be kept open, and all irregularities of diet avoided. A person with such a hernia is in constant danger, and if his general condition does not contra-indicate it he should be submitted to operative treatment. That is to say, the surgeon should cut down on the hernia, open the sac, divide any omental adhesions, tie and cut away indurated omentum, return the bowel, and complete the radical operation by closing the aperture by strong sutures.

In Strangulated Hernia the bowel or omentum is being nipped at the neck of the sac, and the flow of blood into and from the bowel is stopped, so that it is deprived of its normal blood supply. Such a tumour may have the appearance of a swelling, hard to the touch and tender, with a region of redness and heat, and sometimes of dull pain below the navel. Sometimes there is complete absence of pain and tenderness in the hernia itself, and in an aged person all the symptoms may be very slight. Sometimes the tumour may be eight hours or even longer in the hernial sac; and, if that is not relieved, the tumour becomes livid, cracking with gas, mortification of the bowel at the neck of the sac takes place, followed by extravasation of the intestinal contents into the abdominal cavity; the patient has hiccup; he becomes collapsed; and dies comatose from blood-poisoning.

The treatment of a strangulated hernia admits of no delay; if the hernia does not "go back" on the surgeon trying to reduce it, it must be operated on at once, the constricting being relieved, the bowel returned and the opening closed. There should be no treatment by hot-bath or ice-bag; operation is urgently needed. An anaesthetic should be administered, and perhaps one gentle attempt to return the contents by pressure (termed "taxis") may be made, but no prolonged attempts are justified, because the condition of the hernial contents may be such that they cannot bear the pressure of the fingers. "Think
well of the herma," says the aphorism, "which has been little handled."

The taxis to be successful should be made in a direction opposite to the one in which the herma has come down. The inguinal herma should be pressed upwards, outwards and backwards, the femoral herma downwards, backwards and upwards. The larger the herma the greater is the chance of success by taxis, and the smaller the herma the greater the risk of its being injured by manipulation and delay. In every case the handling must be absolutely gentle. If taxis does not succeed the surgeon must at once cut down on the tumour, carefully dividing the different coverings until he reaches the sac. The sac is then opened, the constriction divided, care being taken not to injure the bowel. The bowel must be examined before it is returned into the abdomen, and if its lustreless appearance, its dusky colour, or fulness, suggests that it is mortified, or is on the point of mortifying, it must not be put back or perforation would give rise to septic peritonitis which would probably have a fatal ending. In such a case the damaged piece of bowel must be resected and the healthy ends of the bowel joined together by suturing. Matted or diseased omentum must be tied off and removed. Should peritonitis supervene after the operation on account of bacillary infection, the bowels should be quickly made to act by repeated doses of Epsom salts in hot water.

A person who is the subject of a reducible herma should take great care to obtain an accurately fitting truss, and should remember that whenever symptoms resembling in any degree those of strangulation occur, delay in treatment may be fatal. Attempts to reduce it once once communicated with, and he should come prepared to operate.

(E. O.*

HERNICI, an ancient people of Italy, whose territory was in Latium between the Fucine Lake and the Trebius, bounded by the Volscian on the S., and by the Aeuvian and the Marsian on the N. They long maintained their independence, and in 486 B.C. were still strong enough to conclude an equal treaty with the Latins (Dion. Hal. viii. 64 and 65). They broke away from Rome in 362 (Livy vii. 6 ff.) and in 306 (Livy ix. 42), when their chief town Anagnia (q.v.) was taken and reduced to a praefecture, but Ferentium, Aleturn and Verulam were rewarded for their fidelity by being allowed to remain free municipia, a position which at that time they preferred to the citatus. The name of the Hernici, like that of the Volsci, is missing from the list of Italian peoples whom Polybius (ii. 24) describes as able to furnish troops in 225 B.C.; by that date, therefore, their territory cannot have been distinguished from Latium generally, and it seems probable (Beloch, Ital. Bund, p. 123) that they had then received the full Roman citizenship. The oldest Latin inscriptions of the district (from Ferentum, C.I.L. x. 5837-5840) are earlier than the Social War, and present no local characteristic.

For further details of their history see C.I.L. x. 572.

There is no evidence to show that the Hernici ever spoke a really different dialect from the Latins; but one or two glosses indicate that they had certain peculiarities of vocabulary, such as might be expected among folk who clung to their local customs. Their name, however, with its Co-termination, class them along with the Co-tribes, like the Volsci, who would seem to have been earlier inhabitants of the west coast of Italy, rather than with the tribes whose names were formed with the No-suffix. On this question see Volsci and Sabini.

See Conway's Italic Dialects (Camb. Univ. Press, 1897), p. 360 ff., on the glosses and the local and personal names of the district will be found.

(R. S. C.)

HERNOSAND, a seaport of Sweden, chief town of the district (län) of Westermörland on the Gulf of Bothnia. Pop. (1900) 7,890. It stands on the island of Hernö (which is connected with the mainland by bridges) near the mouth of the Ångerman river, 423 m. N. of Stockholm by rail. It is the seat of a bishop and possesses a fine cathedral. There are engine-works and saw-mills. The herring and salmon are generally ice-bound from December to May. Timber, iron and wood-pulp are exported. There are a school of navigation and an institute for pisciculture. Hernösand was founded in 1584, and received its first town-privileges from John III. in 1587. It was the first town in Europe to be lighted by electricity (1882). The poet Framström (1797), Bishop of Hernösand, is buried here.

HERO (Gr. Ἥρως), a term specially applied to warriors of extraordinary strength and courage, and generally to all who were distinguished from their fellows by superior moral, physical or intellectual qualities. No satisfactory derivation of the word has been suggested.

Ancient Greek Heroes.

In ancient Greece, the heroes were the object of a special cult, and as such were intimately connected with its religious life. Various theories have been put forward as to the nature of these heroes. According to some authorities, they were idealized historical personages; according to others, symbolical representations of the forces of nature. The view most commonly held is that they were degraded or "depotentiated" gods, occupying a position intermediate between gods and men. According to E. Rohde (in Psyche) they are souls of the dead, which after separation from the body enter upon a higher, eternal existence. But it is only a select minority who attain to the rank of heroes after death, only the distinguished men of the past. The worship of these heroes is in reality an ancestor worship, which existed in pre-Homeric times, and was preserved in local cults. Instances no doubt occur of gods being degraded to the ranks of heroes, but these are not the real heroes, the heroes who are the object of a cult. The cult-heroes were all persons who had lived the life of man on earth, and it was necessary for the degraded gods to pass through this stage. They did not at once become cult-heroes, but only after they had undergone death like other mortals. Only one who has been a man can become a hero. The heroes are spirits of the dead, not demi-gods; their position is not intermediate between gods and men, but by the side of these they exist as a separate class.

In Homer the term is applied especially to warrior princes, to kings and kings' sons, even to distinguished persons of lower rank, and free men generally. In Hesiod it is chiefly confined to those who fought before Troy and Thesus; in view of their supposed divine origin, he calls them demi-gods (μισθωτοί). This name is also given them in an interpolated passage in the Hid (xii. 23), which is quite at variance with the general Homeric idea of the heroes, who are no more than men, the children of divine origin and of superior strength and prowess. But neither in Homer nor in Hesiod is there any trace of the idea that the heroes after death had any power for good or evil over the lives of those who survived them; and consequently, no cult. Nevertheless, traces of an earlier ancestor worship appear, e.g. in funeral games in honour of Patroclus and other heroes, while the Hesiodic account of the five ages of man is a reminiscence of the belief in the continued existence of souls in a higher life. This pre-historic worship and belief, for a time obscure, were subsequently revived. According to Porphyry (De abstinentia, iv. 22), Draco ordered the inhabitants of Attica to honour the gods and heroes of their country "in accordance with the usage of their fathers" with offerings of first fruits and ceremonial cakes every year, thereby clearly pointing to a custom of high antiquity. Solon also ordered that the tombs of the heroes should be treated with the greatest respect, and Cleisthenes (q.v.) sought to create a pan-Athenian enthusiasm by calling his new tribes after Attic heroes and setting up their statues in the Agora. Heroic honours were at first bestowed upon the founders of a colony or city, and the ancestors of families; if their name was not known, one was adopted from legend. In many cases these heroes were purely fictitious; such were the supposed ancestors of the noble and priestly families of Attica and elsewhere (Butades at Athens, Branchidæ at Milæus Ceryces at Eleusis), of the eponyms of the tribes and demes. Again, side by side with heroes of superior rank, certain heroes were worshipped as protecting spirits of the country or state; such were the Aeacidae amongst the Aeginetans, Ajax son of Oileus amongst the Epizephyrians Locrians and Hector at Thebes. Neglect of the worship of these heroes was held to be
responsible for pestilence, bad crops and other misfortunes, while, on the other hand, if duly honoured, their influence was equally beneficent. This belief was supported by the Delphic oracle, which was largely instrumental in promoting hero-worship and keeping alive its due observance. Special importance was attached to the grave of the hero and to his bodily remains, with which the spirit of the departed was inseparably connected. The grave was regarded as his place of abode, from which he could only be absent for a brief period; hence his bones were fetched from abroad (e.g. Cimon brought those of Theseus from Scyros), or if they could not be procured, at least a cenotaph was erected in his honour. Their relics also were carefully preserved: the house of Cadmus at Thebes, the huts of Orestes at Tegea, the stone of the Agora at Athens, the altar at Syracuse, and the shrine of Aesilaus (Ἀείλαος) were also erected in their honour, usually over their graves. In these shrines a complete set of armour was kept, in accordance with the idea that the hero was essentially a warrior, who on occasion came forth from his grave and fought at the head of his countrymen, putting the enemy to flight as during his lifetime. Like the gods, the cult heroes were supposed to exercise an influence on human affairs, though not to the same extent, their sphere of action being confined to their own localities. Amongst the earliest known historical examples of the elevation of the dead to the rank of heroes are Timesius the founder of Abydos, Miltiades the son of Cyzicus and the dead, but differs from that of the ordinary gods, a further indication that they were not "depotentiated" gods. Thus, sacrifice was offered to them at night or in the evening; not on a high, but on a low altar (εὐχήρα), surrounded by a trench to receive the blood of the victim, which was supposed to make its way through the ground to the occupant of the grave; the victims were black male animals, whose heads were turned downwards, not upwards; their blood was allowed to trickle on the ground to appease the departed (ἀλαιμναω); the body was entirely consumed by fire and no sacrifice was allowed to eat of it; the technical expression for the sacrifice was not θῦμον but εὐχήρια (less commonly εὐχήρια). The chthonian aspect of the hero is further shown by his attribute, the snake, and in many cases he appears under that form himself. On special occasions a sacrificial meal of cooked food was set out for the heroes, of which they were solemnly invited to partake. The fullest description of such a festival is the account given by Plutarch (Aristides, 21) of the festival celebrated by the Plataneans in honour of their countrymen whom he had fallen at the battle of Plataea. On the 16th of the month Maimacterion, a long procession, headed by a trumpeter playing a warlike air, set out for the graves; wagons decked with myrtle and garlands of flowers followed, young men (who must be of free birth) carried jars of wine, milk, oil and perfumes; next came the black bull destined for the sacrifice, the rear being brought up by the archon, who wore the purple robe of the general, a naked sword in one hand, in the other an urn. When he came near the tombs, he drew some water with which he washed the gravestones, afterwards anointing them with perfume; he then sacrificed the bull on the altar calling upon Zeus Chthoni奥斯 and Hermes Psychopompus, and inviting them in company with the heroes to the festival of blood. Finally, he poured into the trench of the sacrificer, "I drink to those who died for the freedom of the Hellenes,"

(1897); J. Wassner, De heroem apud Gracces cultu (Kiel, 1883); article by F. Deneken in Roscher’s Lexicon der Mythologie, in which a large amount of material is accumulated; J. A. Hild, Entlaufl des dimon (1881) and article in Duremberg and Saggio’s Dictionnaire de l antiquites.

Teutonic Legend.

Many of the chief characteristics of the ancient Greek heroes are reproduced in those of the Teutonic North, the parallel being in some cases very striking; Siegfried, for instance, like Achilles, is vulnerable only in one spot, and Wayland Smith, like Hephaestus, is lame. Superhuman qualities and powers, too, are commonly ascribed to both, an important difference, however, being that whatever worship may have been paid to the Teutonic heroes never crystallized into a cult. This applies equally to those who have a recognized historical origin and to those who are regarded as purely mythical. Of the latter the number has tended to diminish in the light of modern scholarship. The fashion during the 19th century set strongly in the other direction, and the "degraded gods" theory was applied not only to such conspicuous heroes as Siegfried, Dietrich and Beowulf, but to a host of minor characters, such as the good marquis Rüdiger of the Nibelungeni and our own Robin Hood (both identified with Woden Hrudpurahet). The reaction from one extreme has, indeed, tended to lead to another, until not only the heroes, but the very gods themselves, are being traced to very human, not to say commonplace, origins. Thus H. Strebel, Tournouer (1902); and F. H. Anrein, "The idea of the hero in mediaeval German literature" (1903), basing his argument on the Ynglinga Saga, interpreted in the light of "Social Science," reveals Odin, "the traveller," as a great "caravan-leader" and warrior, who, driven from Asgard—a trading city on the borders of the steppes east of the Don— by "the blows that Pompey aimed at Mithridates," brought to the north the arts and industries of the East. The argument is developed with convincing ingenuity, but it may be doubted whether it has permanently "rescued Odin from the misty dreamland of mythology and restored him to history." It has not, however, admitted that, whatever influence the one deity may have from time to time exerted, myth and Teutonic heroic legend were developed on independent lines. The Teutonic heroes are, in the main, historical personages, never gods; though, like the Greek heroes, they are sometimes endowed with semi-divine attributes or interpreted as symbolic representations of natural forces.

The origin of Teutonic heroic saga, which may be regarded as including that of the Germans, Goths, Anglo-Saxons and Scandinavians, is to be looked for in the period of the so-called migration of nations (A.D. 350-560). It consequently rests upon a distinct basis of facts. The saga (in the older and wider sense of any story said or sung) being the oldest form of historical tradition; though this of course does not exclude the probability of the accretion of mythical elements round persons and episodes from the very first. As to the origin of the heroic sagas as we now have them, Tacitus tells us that the deeds of Arminius were still celebrated in song a hundred years after his death (Annales, ii. 88) and in the Germania he speaks of "old songs" as the only kind of "annals" which the ancient Germans possessed; but, whatever relics of the old songs may be embedded in the Teutonic sagas, they have left no recognizable mark on the heroic poetry of the German peoples. The attempt to identify Arminius with Siegfried is now generally abandoned. Teutonic heroic saga, properly so-called, consists of the traditions connected with the migration period, the earliest traces of which are found in the works of historical writers such as Ammianus Marcellinus and Cassiodorus. According to Jordanes (the epitomator of
HERO

Cassiodorus's History of the Goths) at the funeral of Attila his vassals, as they rode round the corpse, sang of his glorious deeds. The next step in the development of epic narrative was the single lay of an episodic character, sung by a single individual, who was frequently a member of a distinguished family, not merely a professional minstrel. Then, as different stories grew up round the person of a particular hero, they formed a connected cycle of legend, the centre of which was the person of the hero (e.g. Dietrich of Bern). The most important figures of these cycles are the following.

(1) Beowulf, king of the Geatas (Jutland), whose story in its present form was probably brought from the continent by the Angles. It is an amalgamation of the myth of Beowa, the slayer of the water-demon and the dragon, with the historical legend of Beowulf, nephew and successor of Hygelac (Chohil-ainus), king of the Geatas, who was defeated and slain (c. 529) while ravaging the Frisian coast. The water-demon Grendel and the dragon (probably, by whom Beowulf is mortally wounded, have been supposed to represent the powers of autumn and darkness, the floods which at certain seasons overflow the low-lying countries on the coast of the North Sea and sweep away all human habitations; Beowulf is the hero of spring and light who, after overcoming the spirit of the raging waters, finally succumbs to the dragon of approaching winter. Others regard him as a wind-hero, who disperses the pestilential vapours of the fens. Beowulf is also a culture-hero. His father Sceaf-Soyld (E. Sveivel Scealing, "the protector with the shield") lands on the Angloian or Scandinavian coast when a child, in a rudderless ship, asleep on a sheaf of grain, symbolical of the means whereby his kingdom shall become great; the son indicates the blessings of a fixed habitation, secured against the attacks of the sea. (2) Hildebrand, the hero of the oldest German epic. A loyal supporter of Theodoric, he follows his master, when threatened by Odoacer, to the court of Attila. After thirty years' absence, he returns to his home in Italy; his son Hadu-brand, believing his father to be dead, suspects treachery and refuses to accept presents offered by the father in token of good-will. A fight takes place, in which the son is slain by the father. In a later version, recognition and reconciliation take place.

Well-known parallels are Odysseus and Teleconis, Rustem and Sobhab. (3) Ermanaric, the king of the East Goths, who according to Ammianus Marcellinus slew himself (c. 375) in terror at the invasion of the Huns. With him is connected the old German Dioscuri myth of the Harlungen. (4) Dietrich of Bern (Verona), the legendary name of Theodoric the Great. Contrary to historical tradition, Italy is supposed to have been his ancestral inheritance, of which he has been deprived by Odoacer, or by Ermanaric, who in his altered character of a typical tyrant appears as his uncle and contemporary. He takes refuge in Hungary with Etzel (Attila), by whose aid he finally recovers his kingdom. In the later middle ages he is represented as fighting with giants, dragons and dwarfs, and finally disappears on a black horse. Some attempts have been made to identify him as a kind of Donar or god of thunder. (5) Siegfried (M.H. Ger. Svarit), the hero of the Niebelungenlied, the Sigurd of the related northern sagas, is usually regarded as a purely mythical figure, a hero of light who is ultimately overcome by the powers of darkness, the mist-people (Niebelungen). He is, however, closely associated with historical characters and events, e.g. with the Burgundian king Gundahari (Gunther, Gunnar) and the overthrow of his house and nation by the Huns; the scholars have exercised considerable ingenuity in attempting to identify him with various historical figures. Theodor Abelung (Das Niebelungenlied, Leipz., 1907) traces the Niebelung sagas to three groups of Burgundian legends, each based on fact: the Frankish-Burgundian tradition of the murder of Segeric, son of the Burgundian king Sigimund, who was slain by his father at the instigation of his stepmother; the Frankish-Burgundian story, as told by Gregory of Tours (iii. 11), of the defeat of the Burgundian kings Sigimund and Godomar, and the captivity and murder of Sigimund, by the sons of Clovis, at the instigation of their mother Chrothildis, in revenge for the murder of her father Chilperich and of her mother, by Godomar; the Rhenish-Burgundian story of the ruin of Gundahari's kingdom by Attila's Huns. Herr Abelung identifies Tegried (Sigfried) with Segeric, while—according to him—the heroine of the Nibelungenlied, Kriemhild (Gudrun), represents a confusion of two historical persons: Chrothildis, the wife of Clovis, and Ildico (Hilde), the wife of Attila. (See also the articles KRIEMHILD, NIEBELUNGENLIED.

(6) Hugdietrich, Wolddietrich and Ortnit, whose legend, like that of Siegfried, is of Frankish origin. It is preserved in four versions, the best of which is the oldest, and has an historical foundation. Hugdietrich is the "Frankish Dietrich." (= Hugo Theodoric), king of Austrasia (d. 534), who like his son and successor Theodbert, was illegitimate; both had to fight for their inheritance with relatives. The transference of the scene to Constantinople is a reminiscence of the events of the Crusades and Theodbert's projected campaign against that city. The version in which Hugdietrich gains access to his future wife by disguising himself as a woman has also a foundation in fact. As the myth of the Harlungen is connected with Ermanaric, so another Dioscuri myth (of the Harlungen) is combined with the Ortnit-Wolddietrich legend. The Harlungen are probably identical with the divine youths (mentioned in Tacitus as worshipped by the Vandal Naharvall or Naharavvall), from whom the Vandal royal family, the Asdingi, claimed descent. Asdingi ("Aesvingos") would be represented in Gothic by Hadzigos, "men with women's hair." (cf. mullebr kenves in Tacitus), and in middle high German by Hartungen. (7) Rother, king of Lombardy. Desiring to wed the daughter of Constantine, king of Constantinople, he sends twelve envoys to ask her in marriage. They are arrested and thrown into prison by the king. Rother, who appears under the name of Dietrich, sets out with an army, liberates the envoy and carries off the princess. One version places the scene in the land of the Huns. The character of Constantine in many respects resembles that of Alexius Comnenus; the slaying of a tame lion by one of the gigantic followers of Rother is founded on an incident which actually took place at the court of Alexius during the crusade of 1101 under duke Welf of Bavaria, when King Rother was composed about 1160 by a Rhenish minstrel. Rother may be the Lombard king Rothari (636-650), transferred to the period of the Crusades. (8) Walther of Aquitaine, chiefly known from the Latin poem Waltherius, written by Ekkehard of St Gall at the beginning of the 10th century, and fragments of an 8th-century Anglo-Saxon Epic Waldere. Walther is not an historical figure, although the legend undoubtedly represents typical occurrences of the migration period, such as the detention and flight of hostages of noble family from the court of the Huns, and the rescue of captive maidens by abduction. (9) Wieland (Vulcan), Wayland the Smith, the only Teutonic hero (his original home was lower Saxony) who firmly established himself in England. There is absolutely no historical background for his legend. He is a fire-hero, who is pressed into man's service, and typifies the advance from the stone age to a higher stage of civilization (working in metals). As the lame smith he reminds us of Hephaestus, and in his flight with wings of Daedalus escaping from Minos. (10) Högni (Hagen) and Hedin (Helot), whose personalities are overshadowed by the heroine Hilde and Gudrum (Kudrun, Kutrun). In one version occurs the incident of the never-ending battle between the forces of Hagen and Hedin. Every night Hilde revives the fallen, and "so will it continue till the twilight of the gods." The battle represents the eternal conflict between light and darkness, the alternation of day and night. Hilde here figures as a typical Valkyr delighting in battle and bloodshed, who frustrates a reconciliation. Hedin has been described as "the reverse Hagen," but Hilde persuades her father that it is only a ruse. This necklace occurs in the story of the goddess Freya (Frieg), who is said to have caused the battle to conciliate the wrath of Odin at her infidelity, the price paid by her for the possession of the necklace Brisingamen; again, the light god Heimdall is said to have fought with Loki for the necklace (the sun) stolen by the latter. Hence the battle has been explained as the necklace
HERO

myth in epic form. The historical background is the raids of the Teutonic maritime tribes on the coasts of England and Ireland:

Famous heroes who are specially connected with England are Alfred the Great, Richard of Cour-der-Lion, King Horn, Havelok the Dane, Guy of Warwick, Sir Bevis of Hampton (or Southamptoon), Robin Hood and his companions.

Celtic Heroes.

The Celtic heroic saga in the British islands may be divided into the two principal groups of Gaelic (Irish) and Brython (Welsh), the first, excluding the purely mythological, into the Ulotian (connected with Ulster) and the Oslian. The Ulotionians grouped round the names of King Conchobar and the hero Cuchulainn, "the Irish Achilles," the defender of Ulster against all Ireland, regarded by some as a solar hero. The second cycle contains the epics of Finn (Fionn, Fingal) mac Cumhail, and his son Osian (Ossian), the bard and warrior, chiefly known from the supposed Osianic poems of Macpherson.

(See Celt, sec. Celtic Literature.)

Of Brython origin is the cycle of King Arthur (Artus), the adopted national hero of the mixed nationalities of whom the "English" people was composed. Here he appears as a chiefly mythical personality, who slays monsters, such as the giant of St Michel, the boar Troit, the demon cat, and goes down to the underworld. The original Welsh legend was spread by British refugee Celtic settlers in Brittany, and was brought to the fore by their sons and French Celts. From a literary point of view, however, it is chiefly French and forms "the matter of Brittany." Arthur, the leader (comes Britanniae, dux bellorum) of the Siluri or Dumononi against the Saxons, flourished at the beginning of the 6th century. He is first spoken of in Nennius's History of the Britons (6th century), and at greater length in Geoffrey of Monmouth's History of the Kings of Britain (12th century), at the end of which the French Breton cycle attained its fullest development in the poems of Chrétiens de Troyes and others.

Speaking generally, the Celtic heroes are differentiated from the Teutonic by their sense of the supernatural and their weird acts, their superhuman, or rather extra-human, qualities. Teutonic legend does not lightly exaggerate, and what to us seems incredible in it may be easily conceived as credible to those by whom and for whom the tales were told; that Sigmund and his son Sinfliot turned themselves into wolves would be but a sign of exceptional powers to those who believed in werewolves; Finn assuming the form of a serpent would be no more incredible to the barbarous Teuton than the similar transformation of Proteus to the Greek. But in the characterization of their heroes the Celtic imagination runs riot, and their qualities and their acts become exaggerated beyond the bounds of any conceivable probability. Take, for instance, the description of some of Arthur's knights in the Welsh tale of Kilhivch and Olwen (in the Mabinogion). Along with Kai and Bedwyr (Bedivere), Peredur (Perceval), Gwalchmai (Gawain), and many others, we have such figures as Siglith Yscundroed, whose way through the wood lay along the tops of the trees, and whose tread was so light that no blade of grass bent beneath his weight; Sol, who could stand all day upon one leg; Sugyn the son of Sugneddyw, who was "breast-chested" to such a degree that he could suck up the sea on which were three hundred and thirty ships; the son of Gweswred, the son of Gwestad, who when he was sad would let one of his lips drop beneath his waist and turn up the other like a cap over his head; and Uchtry Varyl Draws, who spread his red untrimmed beard over the eight-and-forty rafters of Arthur's hall.

Such figures as these make no human impression, and criticism has busied itself in tracing them to one or other of the shadowy divinities of the Celtic pantheon. However this may be, remnants of their primitive superhuman qualities cling to the Celtic heroes long after they have been transfused, under the influence of Christianity and chivalry, into the heroes of the medieval Arthurian romance, types—for the most part—of the knightly virtues as these were conceived by the middle ages; while shadowy memories of early myths live on, strangely disguised, in certain of the episodes repeated uncritically by the medieval poets. So Merlin preserves his diabolic origin; Arthur his mystic coming and his mystic passing; while Gawain, and after him Lancelot, journey across the river, as the Irish hero Bran had done before them to the island of fair women—the Celtic vision of the realm of death.

The chief heroes of these medieval Arthurian romances are the following. Arthur himself, who tends however to become completely overshadowed by his knights, who make his court the starting-point of their adventures. Merlin (Myrddin), the famous wizard, bard and warrior, perhaps an historical figure, first introduced by Geoffrey of Monmouth, originally called Ambrose from the British leader Ambrosius Aurelianus, under whom he is said to have first served. Perceval (Parzival, Parsialf), the Welsh Peredur, "the seeker of the basin," the most intimately connected with the quest of the Grail (q.v.). Tristan of Brittany, whose adventures with Iseult and Iskander, are inseparably associated with that of Iscyle. Lancelot, son of Ban king of Brittany, a creation of chivalrous romance, who only appears in Arthurian literature under French influence, known chiefly from his amour with Guinevere, perhaps in imitation of the story of Tristan and Iscyle. Gawain (Welwain, Welsh Gwalchmal), Arthur's nephew, who in medieval romance remains the type of knightly courage and chivalry, until his character is degraded in order to exalt that of Lancelot. Among less important, but still conspicuous, figures may be mentioned Kay (the Kay of the Mabinogion), Arthur's foster-brother and vassal, the type of the bluff and brawny warrior and lover (Bedwyr), the type of brave knight and faithful retainer, who alone is with Arthur at his passing, and afterwards becomes "a hermit and a holy man." (See Arthur, Merlin, Perceval, Tristan, Lancelot, Gawain.)

Heroes of Romance.

Another series of heroes, forming the central figures of stories variously derived but developed in Europe by the Latin-speaking peoples, may be conveniently grouped under the heading of "Germanic." Of these the most typical are Alexander of Macedon and Charlemagne, while alongside of them Triam and other heroes of the Trojan war appear during the middle ages in strangely altered guise. Of all heroes of romance Alexander has been the most widely celebrated. His name, in the form of Iskander, is familiar in legend and story all over the East to this day; to the West he was introduced through a Latin translation of the original Greek romance (by the pseudo-Callisthenes) to which the innumerable Oriental versions are likewise traceable (see Alexander III., King of Macedon; sec. The Romance of Alexander). More important in the West, however, was the cycle of legends gathering round the figure of Charlemagne, formed what was known as "the matter of France." The romances of this cycle, of Germanic (Frankish) origin and developed probably in the north of France by the French (probably in the north of France) contain reminiscences of the heroes of the Merovingian period, and in their later development were influenced by the Arthurian cycle. Just as Arthur was eclipsed by his companions, so Charlemagne's vassal nobles, except in the Chanson de Roland, are exalted at the expense of the emperor, probably the result of the changed relations between the later emperors and their barons. The character of Charlemagne himself undergoes a change; in the Chanson de Roland he is a venerable figure, mild and dignified, while later he appears as a cruel and typical tyrant (as is also the case with Ermanaric). The basis of his legend is mainly historical, although the story of his journey to Constantinople and the East is mythical, and incidents have been transferred from the reign of Charles Martel to his. Charlemagne is chiefly venerated as the champion of Christianity against the heathen and the Saracens. (See Charlemagne, ad fin. "The Charlemagne Legends.")

The most famous heroes who are associated with him are Roland, preeft of the marches of Brittany, the Orlando of Ariosto, slain at Roncevaux (Roncevalles) in the Pyrenees, and his friend and rival Olivier (Oliver); Ogier the Dane, the Holger Danske of Hans Andersen, and Huon of Bordeaux, probably both introduced from the Arthurian cycle; Renaud (Rinaldo) of Montauban, one of the four sons of Aymon, to
whom the wonderful horse Bayard was presented by Charlemagne; the traitor Doon of Mayence; Ganelon, responsible for the treachery that led to the death of Roland; Archbishop Turpin, a typical specimen of Carolingian piety; Philostratus, William Fierensbrts, William de Orange (all probably identical), and Vivien, the nephew of the latter and the hero of Alisancs. The late Charlemagne romances originated the legends, in English form, of Sazonof of Babylone, Sir Othen, Sir Firumbras and Hsson of Bordeaux (in which Oberon, the king of the fairies, the son of Julius Caesar and Morgan the Fay, was first made known to England).

The chief remains of the Spanish heroic epic are some poems on the Cid, on the seven Infantes of Lara, and on Fernán González, count of Castile. The legend of Charlemagne as told in the Crónica general of Alfonso X. created the desire for a national hero distinguished for his exploits against the Moors, and Roland was thus supplantè by Bernardo del Carpio.

Another famous hero and centre of a 14th century cycle of romance was Amadis of Gaul; its earliest form is Spanish, although the Portuguese have claimed it as a translation from their own language. There is no trace of a French original.

Slavonic Heroes.—The Slavonic heroic saga of Russia centres round Vladimir of Kiev (980-1015), the first Christian ruler of that country, whose personality is eclipsed by that of Ilya (Elias) of Mouroum, the son of a peasant, who was said to have saved the empire from the Tatars at the urgent request of his emperor. It is not known whether he was an historical personage; many of the achievements attributed to him border on the miraculous. A much-discussed work is the Tale of Igor, the oldest specimens of which are copies of a text of the 13th century against the heathen Polovtsi in 1185; at first successful, he was afterwards defeated and taken prisoner, but finally managed to escape. Although the Finns are not Slavs, on topographical grounds mention may here be made of Waimanomien, the great magician and hero of the Finnish epic Kalevala ("land of heroes"). The popular hero of the Servians and Bulgarians is Marko Kraljevich (q.v.), son of Vukashin, characterized by Goethe as a counterpart of the Greek Heracles and the Persian Rustem. For the Persian, Indian, &c., heroes see the articles on the literature and religions of the various countries.

Authorities.—On the subject generally, see J. G. T. Gräcke, Die grossen Sagenkreise der Mitteleuropa (Dresden, 1842), forming part of his Gesammelte Abhandlungen über die slavische Geschichts- und Literaturgeschichte; W. P. Ker, Epic and Romance (2nd ed., 1908). TEU- TONIC.—B. Symons, "Germanische Heldensage" in H. Paul's Grundriss der deutschen Philologie (Berlin, 1894); E. Križek, Deutsche Heldensagen, 1. (Strassburg, 1845); 2. (Strassburg, 1848); 3. (Strassburg, 1849). For fuller information, see the following: The Religion of the Teutons (Eng. tr., Boston, U.S.A., 1902); J. G. Robertson, History of German Literature (1902). See also HELDEN- BUCH.

CELTIC.—M. H. d'Arbois de Jubainville, Cours de littérature celtique (12 vols., 1883-1902), one vol. trans. into English by R. L. Best, The Irish Mythological Cycle and Celtic Mythology (1903); L. Petit de Julleville, Histori, de la langue et de la litt. francaise, i. Moyen âge (1896); C. Squire, The Mythology of the British Isles, an English and American Supplement (1903); J. R. R. Tolkien, History of Middle-Earth (1893); SLAVONIC.—A. N. Rambaud, La Russie épique (1876); W. Wollner, Untersuchungen über die Volkslieder der Grossrussen (1879); W. R. Morfill, Slavonic Literature (1883).

HERO AND LEANDER.—two lovers celebrated in antiquity. Hero, the beautiful priestess of Aphrodite at Sestos, was seen by Leander, a youth of Byblos, at the celebration of the festival of Aphrodite and Adonis. He became deeply enamoured of her; but, as her position as priestess and the opposition of her parents rendered their marriage impossible they agreed to carry on a clandestine intercourse. Every night Hero placed a lamp in the top of the tower she dwelt in, the sea the Leanders guided by it, swam across the dangerous Hellespont. One stormy night the lamp was blown out and Leander perished. On finding his body next morning on the shore, Hero plunged herself into the waves. The story is referred to by Virgil (Georg. iii. 258), Statius (Theb. vi. 533) and Ovid (Her. xviii. and xix.). The beautiful little epic of Musaeus has been frequently translated, and is expanded in the Hero and Leander of C. Marlowe and G. Chapman. It is also the subject of a ballad by Schiller and a drama by F. Grillparzer.

See M. H. Jellinek, Die Sage von Hero und Leander in der Dichtung (1890), and G. Knack, "Hero and Leander" in Festgabe für Franz Sasemthi (1889). A careful collection of materials will be found in F. von der Gathen, Die Sage von Hero und Leander in der Literatur und Kunst des Altertums (1894).

HERO OF ALEXANDRIA. Greek geometer and writer on mechanical and physical subjects, probably flourished in the second half of the 1st century. This is the more modern view, in contrast to the earlier theory most generally accepted, according to which he flourished about 100 B.C. The earlier theory started from the superscription of one of his works, Περὶ τῶν εἰδῶν τῶν οἰκοδομικῶν "On the Building of Things," from which it was inferred that Hero was a pupil of Ctesibius. Martin, Hultsch and Cantor took this Ctesibius to be a barber of that name who lived in the reign of Ptolemy Euergete II. (d. 117 B.C.) and is credited with having invented an improved water-organ. But this identification is far from certain, as a Ctesibius mechanicalus is mentioned by Athenaeus as having lived under Ptolemy II. Philadelphus (285-247 B.C.). Nor can the relation of master and pupil be certainly inferred from the superscription quoted (observe the omission of any article), which really asserts more than that Hero re-edited an earlier treatise by Ctesibius, and implies nothing about his being an immediate predecessor. Further, it is certain that Hero used physical and mathematical writings by Posidonius, the Stoic, of Apamea, who lived about the middle of the 1st century B.C. The positive arguments for the more modern view of Hero's date are (1) the use by him of Latinisms from which Diels concluded that the 1st century A.D. was the earliest possible date, (2) the description in Hero's Mechanicorum iii. of a small olive-press with one screw which is alluded to by Pliny (Nat. Hist. viii.) as having been introduced since A.D. 55, (3) an allusion by Plutarch (who died A.D. 120) to the proposition that light is reflected from a surface at an angle equal to the angle of incidence, which Hero proved in his Catoptrica, the words used by Plutarch fitting well with the corresponding passage of that work (as to which see below). Thus we arrive at the latter half of the 1st century A.D. as the approximate date of Hero's activity. Which his work (which has been lost and only interpolated in Greek) are entitled respectively Definitiones, Geometria, Geodaesia, Stereometria (i. and ii.), Mensurae, Libri Geoponici, to which must now be added the Metroi recently discovered by R. Schöne in a MS. at Constantinople. These books, except the Definitiones, mostly consist of directions for obtaining, from given parts, the areas or volumes, and other parts, of plane or solid figures. A remarkable feature is the bare statement of a number of very close approximations to the square roots of numbers which are not complete squares. Others occur in the Metroi where also a method of finding such approximate square, and even approximate cube, roots is shown. Hero's expressions for the areas of regular polygons of from 5 to 12 sides in terms of the radius of the circumscribed circle are remarkable for their accuracy, even when the values of trigonometrical ratios. Akin to the geometrical works is that On the Dioptra, a remarkable book on land-surveying, so called from the instrument described in it, which was used for the same purposes as the modern theodolite. It is in this book that Hero proves the expression for the area of a triangle in terms of its sides. The Pneumatics in two books is also extant in Greek as is also the Automatotheodosia. In the former will be found such things as siphons, "Hero's fountain," "penny-in-the-slot" machines, a fire-engine, a water-organ, and arrangements employing the force of steam. Pappus quotes from three books of Mechanica and from a work called Barulcus, both by Hero. The three books on Mechanica survive in an Arabic translation which, however, bears a title "On the lifting of heavy objects." This corresponds exactly to Barulcus, and it is probable that Barulcus and Mechanica were only alternative titles for one and the same work. It is indeed not credible that Hero wrote two
separate treatises on the subject of the mechanical powers, which are fully discussed in the *Mechanics*, ii. iii. The *Belopotica* (on engines of war) is extant in Greek, and both this and the *Mechanica* contain Hero's solution of the problem of the two mean proportionals. Hero also wrote *Colopotica* (on reflecting surfaces), a certain portion of which was translated into Latin, work, probably translated from the Greek by Wilhelm van Moerebeck, which was long thought to be a fragment of Ptolemy's *Optics*, because it bore the title *Ptolemaei de speculis* in the MS. But the attribution to Ptolemy was shown to be wrong as soon as it was made clear (especially by Martin) that another translation by an Admiral Eugenius Siculus (12th century) of an optical work from the Arabic was Ptolemy's *Optics*. Of other treatises by Hero only fragments remain. One was a four books on *Water Clocks* (Πηγινι ισωπολειων), of which Proclus (Hypotyp. astron. ed. Halma) has preserved a fragment, and to which Pappus also refers. Another work was a commentary on Euclid (referred to by the Arabs as "the book of the resolution of doubts in Euclid") from which quotations have survived in an-Nairīzī's commentary.

The *Pneumatica*, *Automatopoiētica*, *Belopotica* and *Chetorvolastria* of Hero were published in Greek and Latin in Thévenot's *Veterum mathematicorum copiae et historiae nec praemio edita* (Paris, 1653); the first important critical researches on Hero were G. B. Venturi's *Commentarii sopra la storia e la teoria dell'Optica* (Bologna, 1813) and H. Martin's "Recherches sur la vie et les ouvrages de l'architecte et théoricien des machines et des récréations et sur tous les ouvrages mathématiques grecs conservés ou perdus, publiés ou inédits, qui ont été attribués à un auteur nommé Héron" (Mém. présentés à l'Académie des Inscriptions et Belles-Lettres, i. sér., iv., 1854). The geometrical work of Hero, at least of the *Metrica*, were published (Greek only) by F. Hultsch (Heronis Alexandrini geometricorum et stereometricorum opera, 1864), the *Dioptra* by Vincent (Extraits des manuscrits de l'Académie des Inscriptions et Belles-Lettres de Lyon, 2nd ser., 1869), and the *De ingeniorum spiritualibus* of Philon of Byzantium and extracts on Pneumatics by Vitruvius. Vol. ii. pt. i., by L. Nix and W. Schmidt, contain the *Mechanica* in Arabic, Greek fragments of the same, the *Colopotica* in Latin with appendices of extracts from Olympiodorus, Vitruvius, Pliny, &c. Vol. iii. (by Hermann Schöne) contains the *Metrica* (in three books) and the *Dioptra*. A German translation is added throughout. The approximation to square roots in Hero has been used as a basis of comparison to make reference should be made to the exhaustive studies on Hero's arithmetic by Paul Tannery, "L'Arithmétique des Grecs dans Héron d'Alexandrie," in Recueil des travaux philologiques et historiques de l'Association de France d'Études Grecques, vol. v., sér. ii., 1881. The "La Stéréométrie d'Hérô de Alexëndrie" and "Études Héroniennes (ibid., v., 1883), "Questions Héroniennes" (Bulletin des sciences math., ii. sér., 1885), "Un Fragment des Mathematica d'Héro d'Alexandrie," (Zeitschrift der math. und physischen Klasse der königl. bayerischen Akademie der Wissenschaften, 1894). A good account of Hero's works will be found in M. Cantor's *Geschichte der Mathematik*, 2 (1874), chapters 18 and 19, and in G. Loria's studies, *Le Scienze esatte nell'antica Grecia*, especially book iii. (Modena, 1900), pp. 103-128.

HERO, THE YOUNGER, the name given without any sufficient reason to a Byzantine land-surveyor who wrote (about a.d. 938) a treatise on land-surveying modelled on the works of Hero of Alexandria, especially the *Dioptra*.

HEROD, the name borne by the princes of a dynasty which reigned in Judaea from 40 B.C.

Herod (surnamed the Great), the son of Antipater, who supported Hyrcanus II. against Aristobulus II. with the aid first of the Nabataean Arabs and then of Rome. The family seems to have had its origin in Phoenicia, so that its members were liable to the reproach of being half-Jews of foreign blood. Herod has a tradition that they were originally Philistines of Ascalon (Dial. c. 52), and on the other hand Nicholas of Damascus (apud Jos. Ant. xiv. 3) asserted that Herod, his royal patron, was descended from the Jews who first returned from the Babylonian Captivity. The tradition and the assertion are in all probability equally fictitious and proceed respectively from the foes and the friends of the Herodian dynasty.

Antipas (or Antipater), the father of Antipater, had been governor of Idumaea under Alexander Janneaus. His son allied himself by marriage with the Arabian nobility and claimed to be the real ruler of Palestine under Hyrcanus II. When Rome intervened in Asia in the person of Pompey, the younger Antipater realized her inevitable predominance and secured the friendship of her representative. After the capture of Jerusalem in 63 B.C. Pompey installed Hyrcanus, who was little better than a figurehead, in the high-priesthood; and when in 55 B.C. the son of Aristobulus renewed the civil war in Palestine, the Roman governor of Syria in the exercise of his jurisdiction arranged a settlement "in accordance with the wishes of Antipater" (Jos. Anti. xiv. 6, 4). To this policy of dependence upon Rome the Antipater adhered, and he succeeded in commending himself to Mark Antony and Caesar in turn. After the battle of Pharsalia Caesar made him procurator and a Roman citizen.

At this point Herod appears on the scene as ruler of Galilee (Jos. Anti. xiv. 2) appointed by his father at the age of fifteen or, since he died at seventy, twenty-five. In spite of his youth he soon found an opportunity of displaying his mettle; for he arrested Hezekiah the arch-brigand, who had overrun the Syrian border, and put him to death. The Jewish nobility at Jerusalem was satisfied with this high-handed action as a pretext for satisfying their jealousy of the Idumenean rulers. Herod was cited in the name of Hyrcanus to appear before the Sanhedrin, whose prerogative he had usurped in executing Hezekiah. He appeared with a bodyguard, and the Sanhedrin was overridden. Only Samaea, a Pharisian, dared to insist upon the legal verdict of condemnation. But the governor of Syria had sent a demand for Herod's acquittal, and so Hyrcanus adjourned the trial and persuaded the accused to abscond. Herod returned with an army, but his father prevailed upon him to depart to Galilee without wreaking his vengeance upon his enemies. About this time (47-46 B.C.) he was created strategos of Coelesyria under the provincial governor. The episode is important for the light which it throws upon Herod's relations with Rome and with the Jews.

In 44 B.C. Cassius arrived in Syria for the purpose of filling his war-chest: Antipater and Herod collected the sum of money at which the Jews of Palestine had been assessed. In 43 B.C. Antipater was poisoned at the instigation of one Malichus, who was perhaps a Jewish patriot animated by hatred of the Herods and their Roman patrons.

The nominative for Herod Herod Had Malichus assassinated; but the country was in a state of anarchy, thanks to the extortions of Cassius and the encroachments of neighbouring powers. Antony, who became master of the East after Philippus, was ready to support the sons of his friend Antipater; but he was absent in Egypt when the Parthians invaded Palestine to restore Antigonus to the throne of his father Aristobulus (40 B.C.). Herod escaped to Rome: the Arabsians, his mother's people, had repudiated him. Antony had made him tetrarch, and now with the assent of Octavian persuaded the Senate to declare him king of Judaea (37-36 B.C.). Herod returned to Palestine and, when the presence of Antony put the reluctant Roman troops entirely at his disposal, he was able to lay siege to Jerusalem two years later. Secure of the support of Rome he was concerned also to legitimate his position in the eyes of the Jews by taking, for love as well as policy, the Hasmonaean princess Mariamne to be his second wife. Jerusalem was taken by storm; the Roman troops withdrew to behead Antigonus the usurper at Antioch. In 37 B.C. Herod was king of Judaea, being the client of Antony and the husband of Mariamne.

The Hasmonaean rulers, who dominated the bulk of the Jews, were content to accept Herod's rule as a judgment of God. Hyrcanus returned from his prison; mutilated, he could no longer hold office as high-priest; but his mutilation probably gave him the prestige of a martyr, and his influence—whatever it was worth—
seems to have been favourable to the new dynasty. On the other hand Herod's marriage with Mariamne brought some of his enemies into his own household. He had orchestrated the faction of Hasmonaean sympathizers by killing forty-five members of the Sanhedrin and confiscating their possessions. But so long as there were representatives of the family alive, there was always a pretender to the throne which he occupied; and the people had not lost their affection for their former deliverers. Mariamne's mother used her position to further her plots for the overthrow of her son-in-law; and she found an ally in Cleopatra of Egypt, who was unwilling to be spurned by him, even if she was not weary of his patron, Antony.

The events of Herod's reign indicate the temporary triumphs of his different adversaries. His high-priest, a Babylonian, was deposed in order that Aristobulus III., Mariamne's brother, might hold the place to which he had some ancestral right. But the enthusiasm with which the people received him at the Feast of Tabernacles convinced Herod of the danger; and the youth was drowned by order of the king at Jericho. Cleopatra had obtained from Antony a grant of territory adjacent to Herod's domain and even part of it. She required Herod to collect arrears of tribute. So it fell out that, when Octavian and the Senate declared war against Antony and Cleopatra, Herod was preoccupied in obedience to her commands and was thus prevented from fighting against the future emperor of Rome.

After the battle of Actium (31 B.C.) Herod executed Hyrcanus and proceeded to wait upon the victorious Octavian at Rhodes. His position was considered safe and his territories were restored. On his return he took in hand to deal with the Hasmonaean, and in 25 B.C. the old intriguing, their victims like Mariamne, and all pretenders were dead. From this time onwards Herod was free to govern Palestine, as a client-prince of the Roman Empire should govern his kingdom. In order to put down the brigands who still infested the country and to check the raids of the Arabs on the frontier, he built or rebuilt fortresses, which were of material assistance to the Jews in the great revolt against Rome. Within and without Judaea he erected magnificent buildings and founded cities. He established games in honour of the emperor after the ancient Greek model in Caesarea and Jerusalem and revived the splendour of the Olympic games. At Athens and elsewhere he was commemorated as a benefactor; and as Jew and king of the Jews he restored the temple at Jerusalem. The emperor recognized his successful government by putting the districts of Ulatha and Pania under him in 20 B.C.

But Herod found new enemies among the members of his household. His brother Pheroras and sister Salome plotted for their own advantage and against the two sons of Mariamne. The people still cherished a loyalty to the Hasmonaean lineage, although the young princes were also the sons of Herod. The enthusiasm with which they were received fed the suspicion, which their uncle instilled into their father's mind, and they were strangled at Sebaste. On his deathbed Herod discovered that his eldest son, Antipater, whom Josephus calls a "monstrosity of iniquity," had been plotting against him. He proceeded to accuse him before the governor of Syria and obtained leave from Augustus to put him to death. The father died five days after his son in 4 B.C. He had done much for the Jews, thanks to the favour he had won and kept in spite of all from the success of the two sons of Mariamne. He had observed the Law publicly—in fact, as the traditional epigram of Augustus says, "it was better to be Herod's slave than a son of Herod." 

**Herod Antipas**, son of Herod the Great by the Samaritan Malchace, and full brother of Archelaus, received as his share of his father's dominions the provinces of Galilee and Perea, with the title of tetrarch. Like his father, Antipas had no architect; he rebuilt and fortified the town of Sepphoris in Galilee; he also fortified Betharamphath in Perea, and called it Julias after the wife of the emperor. Above all he founded the important town of Tiberias on the west shore of the Sea of Galilee, with institutions of a distinctly Greek character. He reigned 4 B.C.—A.D. 39. In the gospels he is mentioned as Herod. He was the son of a deceased "fox" by Christ (Luke xiii. 32). He is erroneously spoken of as a king in Mark vi. 14. It was to him that Jesus was sent by Pilate to be tried. But it is in connexion with his wife Herodias that he is best known, and it was through her that his misfortunes arose. He was married first of all to a daughter of Aretas, the Arabian king; but, making the acquaintance of Herodias, the wife of his brother Philip (not the tetrarch), during a visit to Rome, he was fascinated by her and arranged to marry her. Meantime his Arabian wife discovered the plan and escaped to her father, who made war on Herod, and completely defeated his army. John the Baptist condemned his marriage with Herodias, and in consequence was put to death in the way described in the gospels and in Josephus. When Herodias's brother Agrippa was appointed king by Caligula, she was determined to see her husband placed to an equal eminence, and persuaded him, though naturally of a quiet and unambitious temperament, to make the journey to Rome to crave a crown from the emperor. Agrippa, however, managed to influence Caligula against him. Antipas was deprived of his dominions and banished to Lyons, Herodias voluntarily sharing his exile.

**Herod Philip**, son of Herod the Great by Cleopatra of Jerusalem, received the tetrarchate of Iturea and other districts to E. and N.E. of the Lake of Galilee, the poorest part of his father's kingdom. His subjects were mainly Greeks or Syrians, and his coins bear the image of Augustus or Tiberius. He is described as an excellent ruler, who loved peace and was careful to maintain justice, and spent his time in his own territories. Herod Philip built the Temple at Sepphoris, and another was Bethesda, which he called Julias. He died after a reign of thirty-seven years (A.D. 34); and his dominions were incorporated in the province of Syria.

**Herodas** (Gr. Ἡροδας), or **Herodas** (the name is spelt differently in the few places where he is mentioned), Greek poet, the author of short humorous dramatic scenes in verse, written under the Alexandrian empire in the 3rd century B.C. Apart from the intrinsic merit of these pieces, they are interesting in the history of Greek literature as being a new species, illustrating Alexandrian methods. They are called μιμεικάβικα, "Mime-iambics." Mimes were the Dorian product of South Italy and Sicily, and the most famous of them—from which Plato is said to have studied the drawing of character—were the work of Sophron. These were scenes in popular life, written in the language of the people, vigorous with racy proverbs such as we get in other reflections of that region—in Petronius and the Pentamerone. Two of the best known and the most vital among the Idyls of Theocritus, the 2nd and the 15th, we know to have been derived from mimes of Sophron. What Theocritus is doing there, Herodas, his younger contemporary, is doing in another manner—casting old material into novel form, upon a small scale, under strict conditions of technique. The method is entirely Alexandrian: Sophron had written in a peculiar kind of rhythmical prose; Theocritus uses the hexameter and Doric, Herodas the σκαῦνον or "lame" iambic (with a dragging spondee at the end) and the old Ionic dialect with which that curious metre was associated. That, however, hardly goes beyond the choice and form of words; the structure of the sentences is close-knit Attic. But the grumbling metre and quaint language suit the tone of common life which Herodas aims at realizing; for, as Theocritus may be called idealist, Herodas is a realist unfinishing. His persons talk in vehement exclamations and emphatic turns of speech, with proverbs and fixed phrases; and occasionally, where it is designed as proper to the part, with the most naked coarseness of expression.

The scene of the second and the fourth is laid at Cos, and the speaking characters in each are never more than three. In Mimes I. the old nurse, now the professional go-between or bawd, calls on Metrice, whose husband has been long away in Egypt, and endeavours to excite her interest in a most desirable young man, fallen deeply in love with her at first sight. After hearing all the arguments Metrice declines with dignity, but consoles the old woman with an ample glass of wine, this kind being always...
represented with the taste of Mrs Camp. II. is a monologue by the Περὶ θινηδοτικὸς ("Whoremonger") prosecuting a merchant-trader for breaking into his establishment at night and attempting to carry off one of the inmates, who is produced in court. The vulgar blackguard, who is a stranger to any sort of shame, remarking that he has no evidence to call, proceeds to a peroration in the regular oratorical style, appealing to the Coan judges not to be unworthy of their traditional glory. In fact, the whole oration is also a burlesque in every detail of an Attic speech at law; and in this case we have the material from which to estimate the excellence of the parody. In III. a desperate mother brings to the schoolmaster a truant urchin, with whom neither she nor his incapable old father can do anything. In a voluble stream of interminable sentences she narrates the boy's offences and implores the schoolmaster to flog him. The boy accordingly is boistered on another's back and flogged; but his spirit does not appear to be subdued, and the mother retorts to the old man after all. IV. is a visit of two poor women with an offering to the temple of Asclepius at Cos. While the humble cock is being sacrificed, they turn, like the women in the Ιων of Euripides, to admire the works of art; among them a small boy strangling a volupser—doubtless the work of Boethus that we know—and a sacrificial procession by Apelles, "the Ephesian," of whom we have an interesting piece of contemporary eulogy. The oil seller is admirably painted in a few slight strokes. V. brings us very close to some unpleasant facts of ancient life. The jealous woman accuses one of her slaves, whom she has made her favourite, of infidelity; has him bound and sent degraded through the town to receive 2000 lashes; no sooner is he out of sight than she recalls him to be branded "at one job." The only pleasing person in the piece is the little maidservant—permitted liberties as a verna brought up in the house—whose ready tact suggests to her mistress an excuse for postponing execution of a threat made in ungovernable fury. VI is a free execution, but the comedy is confined to a single person, but the dialogue is as clever and amusing as the rest, with some delicious touches. Our interest is engaged here in a certain Kerdon, the artistic shoemaker, to whom we are introduced in VII. (the name had already become generic for the shoemaker as the typical representative of retail trade), a little bald man with a fluent tongue, complaining of hard times, who bluffs and wheelies by turns. VII opens with a mistress waking up her maids to listen to her dream; but we have only the beginning, and the other fragments are very short.

Within the limits of two lines or less Herodas presents us with a highly entertaining scene and with characters definitely drawn. Some of these had been perfected no doubt upon the Attic stage, where the tendency in the 4th century had been gradually to resolve accepted types—not individuals, but generalizations from a class, an art in which Menander's was esteemed the master-hand. The Περὶ θινηδοτικὸς and the Μαστροτικὸς we can piece together from succeeding literature, and see how skilfully the established traits are indicated here. This is achieved by true dramatic means, with touches never wasted and the more delightful often because they do not clamour for attention. The execution has the qualities of first-rate Alexandrian work in miniature, such as the epigrams of Asclepiades possess, the finish and fine outlines; and these little pictures bear the test of all artistic work—they do not lose their freshness with familiarity, and gain in interest as one learns to appreciate their subtle points.

The papyrus MS., obtained from the Fayum, is in the possession of the British Museum, and was first printed by F. G. Kenyon in 1891. Editions by O. Crussius (1905, text only, in Teubner series) and J. A. Nairn (1904), with introduction, notes and bibliography. There is an English version of translation of the mimes by Dr. G. R. S. Mead (1906) under the title A Realist of the Athenaeum.

HERODIANS—HERODOTUS

soldiers of Herod Antipas ("Milites Herodis," Jerome) are intended; but more probably the Herodians were a public political party, who distinguished themselves from the two great historical parties of post-tilian Judaism by the fact that they were and had been sincerely friendly to Herod the Great and to his dynasty (cf. such formations as "Caesarian," "Pompeian"). It is possible that, to gain adherents, the Herodian party may have been in the habit of representing that the establishment of a Herodian dynasty would be favourable to the realization of the theocracy; and this in turn may account for Tertullian's (De praescr.) allegation that the Herodians regarded Herod himself as the Messiah. The sect was called by the Rabbis Boethusians as being friendly to the family of the Emperor, and whose daughter Mariamne was one of Herod the Great's wives. (J. H. A. H.)

HERODIANUS, Greek historian, flourished during the third century A.D. He is supposed to have been a Syrian Greek. In 203 he was in Rome, where he held some minor posts. He does not appear to have attained high official rank; the statement that he was imperial procurator and legate of the Sicilian provinces rests upon conjecture only. His historical work (Περὶ θινηδοτίνη τῆς μετὰ Μάκρου βασιλείας ἱστορίας βιβλία ἕξα) narrates the events of the fifty-eight years between the death of Marcus Aurelius and the proclamation of Gordianus III, (180–238). The narrative is of special value for its supplemental historical Cassian whose history ends with Alexander Severus. His work has the value that attaches to a record written by one chronicling the events of his own times, gifted with ordinary powers of observation, indubitable candour and independence of view. But while he gives a lively account of external events—such as the death of Commodus and the assassination of Pertinax—the barbarian invasions, the spread of Christianity, the extension of the franchise by Caracalla are unnoticed. The dates are often wrong, and little attention is paid to geographical details, which general historical works do not make up for. But it is a work essential for a generalist to grasp the history of the empire difficult to understand. Herodian has been accused of prejudice against Alexander Severus. His style, modelled on that of Thucydides and unreservedly praised by Photius, is on the whole pure, though somewhat rhetorical and showing a fondness for Latinisms.

Extensive use has been made of Herodianus by later chroniclers, especially the "Scriptores historiae Augustae" and John of Antioch. The best edition is by Uhlig's (1867–70); a supplementary volume is included in Uhlig's Corpus inscriptionum graecarum. Further bibliographical information see W. Christ, Geschichte der griechischen Literatur (1898).

HERODOTUS (c. 484–425 B.C.), Greek historian, called the Father of History, was born at Halicarnassus in Asia Minor, then dependent upon the Persians, in or about the year 484 B.C. Herodotus was thus born a Persian subject, and such he continued until he was thirty or five-and-thirty years of age. At the time of his birth Halicarnassus was under the rule of a queen.
Artemisia (g.v.). The year of her death is unknown; but she left her crown to her son Pisindelus (born about 498 B.C.), who was succeeded upon the throne by his son Lygdamis about the time that Herodotus grew to manhood. The family of Herodotus belonged to the upper rank of the citizens. His father was named Lyxes, and his mother Rhaeo, or Dryo. He had a brother Theodore, and an uncle or cousin Panyasis (g.v.), the epic poet, a personage of so much importance that the tyrant Lygdamis, suspecting him of treasonable projects, put him to death. It is probable that Herodotus shared his relative's political opinions, and either was exiled by Halicarnassus or quitted it voluntarily at the time of his execution.

The education of Herodotus no more can be said than that it was thoroughly Greek, and embraced no doubt the three subjects essential to a Greek liberal education—grammar, gymnastic training and music. His studies would be regarded as completed when he attained the age of eighteen, and took rank among the *ephebi* or *eiron* of his native city. In a free Greek state he would at once have begun his duties as a citizen, and found therein sufficient employment for his growing energies. But in a city ruled by a tyrant this outlet was wanting; no political life worthy of the name existed. Herodotus may thus have had his thoughts turned to literature as furnishing a not unsatisfactory career, and may well have been encouraged in his choice by the example of Panyasis, who had already gained a reputation by his writings when Herodotus was still an infant. At any rate it is clear from the extant work of Herodotus that he must have devoted himself early to the literary life, and commenced that extensive course of reading which renders him one of the most instructed men of his age, as we suppose that he of all ancient writers. The poetical literature of Greece was already large; the prose literature was more extensive than is generally supposed; yet Herodotus shows an intimate acquaintance with the whole of it. The *Iliad* and the *Odyssey* are as familiar to him as Shakespeare to the educated Englishman. He is acquainted with the poems of the epic cycle, the *Cypris*, the *Epigoni*, &c. He quotes or other- wise shows familiarity with the writings of Hesiod, Olen, Musaeus, Bacis, Lyssistratus, Archilochus of Paros, Alcaeus, Sappho, Solon, Aesop, Aristaeas of Proconnesus, Simonides of Ceos, Phrynichus, Aeschylus and Pindar. He quotes and criticizes Hecataeus, the best of the prose writers who had preceded him, and makes numerous allusions to other authors of the same class. It is impossible to say at any time a mere student. It is probable that from an early age his inquiring disposition led him to engage in travels, both in Greece and in foreign countries. He traversed Asia Minor and European Greece probably more than once; he visited all the most important islands of the Archipelago—Rhodes, Cyprus, Delos, Paros, Thasos, Samothrace, Crete, Cyprus, Cythera and Aegina. He undertook the long and perilous journey from Sardis to the Persian capital Susa, visited Babylon, Colchis, and the western shores of the Black Sea as far as the estuary of the Dnieper; he travelled in Scythia and in Thrace, visited Zante and Magna Graecia, explored the antiquities of Tyre, coasted along the shores of Palestine, saw Gaza, and made a long stay in Egypt. At the most remote ages his travels covered a space of thirty-one degrees of longitude, or 1700 miles, and twenty-four of latitude, or nearly the same distance. At all the more interesting sites he took up his abode for a time; he examined, he inquired, he made measurements, he accumulated materials. Having in his mind the scheme of his great work, he gave ample time to the elaboration of all its parts, and took care to obtain by personal observation a full knowledge of the various countries.

The travels of Herodotus seem to have been chiefly accomplished between his twentieth and his thirty-seventh year (464-447 B.C.). 1 It was probably in his early manhood that as a Persian subject he visited Susa and Babylon, taking advantage of the Persian system of posts which he describes in his fifth book. His residence in Egypt must, on the other hand, have been subsequent to 466 B.C., since he saw the skulls of the Persians slain by Inarus in that year. Skulls are rarely visible on a battlefield for more than two or three seasons after the fight, and we may therefore presume that it was during the reign of Inarus (460-455 B.C.), 2 when the Athenians had great authority in Egypt, that he visited the country, making himself known as a learned Greek, and therefore receiving favour and attention on the part of the Egyptians, who were so much beholden to his countrymen (see Athens, Cimon, Pericles). On his return from Egypt, as he proceeded along the Syrian shore, he seems to have landed at Tyre, and from thence to have gone to Thasos. His Scythian travels are thought to have taken place prior to 450 B.C.

It is a question of some interest from what centre or centres these various expeditions were made. Up to the time of the execution of Panayasis, which is placed by chronologists in or about the year 457 B.C., there is every reason to believe that Herodotus lived at Halicarnassus. His travels in Asia Minor, in European Greece, and among the islands of the Aegean, probably belong to this period, as also his journey to Susa and Babylon. We are told that when he quitted Halicarnassus on account of the tyranny of Lygdamis, in or about the year 457 B.C., he took up his abode in Samos. That island was an important member of the Athenian confederacy, and in making it his home Herodotus would have put himself under the protection of Athens. The fact that Egypt was then largely under Athenian influence (see Cimon, Pericles) may have induced him to proceed, in 457 or 456 B.C., to that country. The stories that he had heard in Egypt of Sesostris may then have stimulated him to make voyages from Samos to Colchis, Scythia and Thrace. He was thus acquainted with almost all the regions which were to be the scene of his projected history.

After Herodotus had resided for some seven or eight years in Samos, events occurred in his native city which induced him to return thither. The tyranny of Lygdamis had gone from bad to worse, and at last he was expelled. According to Suidas, Herodotus was himself an actor, and indeed the chief actor, in the rebellion against him; but no other author confirms this statement, which is intrinsically improbable. It is certain, however, that Halicarnassus became henceforward a voluntary member of the Athenian confederacy. Herodotus would now naturally retire to his native city, and enter upon the enjoyment of those rights of free citizenship on which every Greek set a high value. He would also, if he had by this time composed his history, or any considerable portion of it, begin to make it known by recitation among his friends. There is reason to believe that these first attempts were not received with much favour, and that it was in chagrin at his failure that he precipitately withdrew from his native town, and sought a refuge in Greece proper (about 447 B.C.). 3 We learn that Athens was the place to which he went, and that he appealed from the verdict of his countrymen to Athenian taste and judgment. His work won such approval that in the year 445 B.C., on the proposition of a certain Anytus, he was voted a sum of ten talents (£2400) by decree of the people. At one of the recitations, it was said, the future historian Thucydides was present with his father, Olorus, and was so moved that he burst into tears, whereupon Herodotus remarked to the father—"Olorus, your son has a natural enthusiasm for letters." 4

Athens was at this time the centre of intellectual life, and could boast an almost unique galaxy of talent—Pericles, Thucydides the son of Melesias, Aspasia, Antiphon, the musician Damon, Pheidias, Protagoras, Zeno, Cratinus, Crates, Euripides and Sophocles. Accepted into this brilliant society, on familiar terms with all probably, as he certainly was with Olorus, 5

---

1 The date of his travels is difficult to determine. E. Meyer inclines to put all the longer journeys, except the Scythian, between 440 and 450 B.C. The journey to Susa and Babylon is put by C. F. Lehmann c. 450 B.C., and by H. Scholz before 450 B.C.

2 Most recent critics (e.g. Stein, Meyer, Busolt) put the visit to Egypt after the suppression of the revolt under Inarus and Amyrtaeus (i.e. after 449 B.C.), on the strength of Herod. 2. 30, which implies the destruction of Persia in 449 B.C., at which time Herodotus, according to Busolt, had already quitted the country.

3 Stein, Meyer, Busolt, and other recent writers attribute his departure from Halicarnassus to political causes, e.g. the ascendancy of the anti-Athenian party in the state.

4 This story is on chronological grounds rejected by all recent critics.
Thucydides and Sophocles, he must have been tempted, like many another foreigner, to make Athens his permanent home. It is to his credit that he did not yield to this temptation. At Athens he must have been a dilettante, an idler, without political rights or duties. As a universal he would have soon ceased to be respected in a society where literature was not recognized as a separate profession, where a Socrates served in the infantry, a Sophocles commanded fleets, a Thucydides was general of an army, and an Antiphan was for a time at the head of the state. Men were not men according to Greek notions unless they were citizens; and Herodotus, aware of this, probably sharing in the feeling, was anxious, having lost his political status at Halicarnassus, to obtain such status elsewhere. At Athens the franchise, jealously guarded at this period, was not to be obtained without expense and difficulty. Accordingly, in the spring of the following year he sailed from Athens with the colonists who went out to found the colony of Thurii (see PERICLES), and became a citizen of the new town.

From this point of his career, when he had reached the age of forty, we lose sight of him almost wholly. He seems to have made but few journeys, one to Crotona, one to Metapontum, and one to Athens (about 430 B.C.) being all that his work indicates.1 No doubt he was employed mainly, as Pliny testifies, in retouching and elaborating his general history. He may have had a hand in the making of the History of Assyria to which he twice refers in his first book, and which is quoted by Aristotle. It has been supposed by many that he lived to a great age, and argued that "the never-to-be-mistaken fundamental tone of his performance is the quiet talkativeness of a highly cultivated, tolerant, intelligent, old man" (Dahllman). But the indications derived from the later touches added to his work, which form the sole evidence on the subject, would rather lead to the conclusion that his life was not very prolonged. There is nothing in the nine books which may not have been written as early as 450 B.C.; there is no touch which, even probably, points to a later date than 424 B.C. As the author was evidently engaged in polishing his work to the last, and even promises touches which he does not give, we may assume that he did not much outlive the date last mentioned, or in other words, that he died at about the age of sixty. The predominant voice of antiquity tells us that he died at Thurii, where his tomb was shown in later ages.

The History.—In estimating the great work of Herodotus, and his genius as its author, it is above all things necessary to conceive right what that work was intended to be. Thus it begins as "a universal history," "a history of the wars between the Greeks and the barbarians," and "a history of the struggle between Greece and Persia." But these titles are all of them too comprehensive. Herodotus, who omits wholly the histories of Phoenicia, Carthage and Ethiopia, three of the most important among the states existing in his day, cannot have intended to compose a "universal history," the very idea of which belongs to a later age. He speaks in places as if his object was to record the wars between the Greeks and the barbarians; but as he omits the Trojan war, in which he fully believes, the expedition of the "Toungers and Myanians against Thrace and Thessaly, the wars connected with the Ionian colonization of Asia Minor and others, it is evident that he does not really aim at embracing in his narrative all the wars between Greeks and barbarians with which he was acquainted. Nor does it even seem to have been his object to give an account of the entire struggle between Greece and Persia. That struggle was not terminated by the battle of Mycale and the capture of Sestos in 479 B.C. It continued for thirty years longer, to the peace of Callias (but see CALLIAS and CTMOS). The fact that Herodotus ends his history at Thurii does not imply that his intention was, not to give an account of the entire long contest between the two countries, but to write the history of a particular war—the Persian war of invasion. His aim was as definite as that of Thucydides, or Schiller, or Napoleon, to write a history of a certain world, and to treat it in a certain way. Every partial history requires an "introduction"; Herodotus, untrammeled by examples, resolved to give his history a magnificent introduction. Thucydides is content with a single introductory book, forming little more than one-eighth of his work; Herodotus has six such books, forming two-thirds of the entire composition.

By this arrangement he is enabled to treat his subject in the grand way, which is so characteristic of him. Making it his business to tell us the stories by which the characters of the two nations who were the actors in the great war, he is able in tracing their history to bring into his narrative some account of almost all the nations of the known world, and has room to expatiate freely upon their geography, antiquities, manners and customs and the like, thus giving his work a "universal" character, and securing for it, without treading upon unity, that variety, richness and fulness which are a principal charm of the best histories, and of none more than his. In tracing the growth of Persia from a petty subject to a vast empire, he has also a great deal to say on the history of Lydia, Media, Assyria, Babylon, Egypt, Scythia, Thrace, and to describe the countries and the peoples inhabiting them, their natural productions, climate, geographical position, monuments, &c.; while, in noting the contemporaneous changes in Greece, he is led to tell of the various migrations of the Greek race, their colonies, commerce, progress in the arts, revolutions, internal struggles, wars with one another, legislation, religious tenets and the like. The greatest variety of episodical matter is thus introduced; but the propriety of the occasion and the mode of introduction are such that no complaint can be made; the digressions never entangle, encumber or even unpleasantly interrupt the main narrative.

It has been questioned, both in ancient and in modern times, whether the history of Herodotus possesses the essential requisite of trustworthiness. Several ancient writers accuse him of intentional untruthfulness. Moderns generally acquit him of this charge; but his severer critics still urge that, from the inherent defects of his character, his credulity, his love of effect and his loose and inaccurate habits of thought, he was unfit for the historian's office, and has produced a work of but small historical value. This is certainly the case; the real interconnection of the events which he describes. He belongs distinctly to the romantic school; his forte is vivid and picturesque description, the lively presentation of scenes and actions, characters and states of society, not the subtle analysis of motives, the power of detecting the undercurrents or the generalizing faculty.

But it is as a writer that the merits of Herodotus are most...
conspicuous. "O that I were in a condition," says Lucian, "to resemble Herodotus, if only in some measure! I by no means say in all his gifts, but only in some time, for instance, the beauty of his language, or its harmony, or the natural and peculiar grace of the Ionic dialect, or his fulness of thought, or by whatever name those thousand beauties are called which to the despair of his imitator are united in him." Cicero calls his style "copious and polished," Quintillian, "sweet, pure and flowing"; Longinus says he was "the most Homeric of historians"; Dionysius, his countryman, prefers him to Thucy- dides, and regards him as combining in an extraordinary degree the excellences of sublimity, beauty and the true historical method of composition. Modern writers are almost equally enthusiastic. The style of Herodotus," says one, "is universally allowed to be rich, harmonious and sweet," "The charm of his style," argues another, "so dazzled men as to make them blind to his defects." Various attempts have been made to analyse the charm which is so universally felt; but it may be doubted whether any of them are very successful. All, however, seem to agree that among the qualities for which the style of Herodotus is to be admired are simplicity, freshness, naturalness and harmony of rhythm. Master of a form of language peculiarly sweet and euphonial, and possessed of a delicate ear which instinctively suggested the most musical arrangement possible, he gives it, without art or effort, the most agreeable flow, is never abrupt, never tedious, never commonplace, and scarce, and being himself simple, fresh, naïf (if we may use the word), somewhat quaint, he delights us by combining with this melody of sound simple, clear and fresh thoughts, perspicuously expressed, often accompanied by happy turns of phrase, and always manifestly the spontaneous growth of his own fresh and un- sophisti cated mind. Reminding us in some respects of the quaint medieval writers, Froissart and Philippe de Comines, he greatly excels them, at once in the beauty of his language and the art with which he has combined his heterogeneous materials into a single perfect harmonious whole. See also Greece, section History, "Authorities.

Bibliography.—The history of Herodotus has been translated by many persons and into many languages. About 1450, at the time of the revival of learning, a Latin version was made and published by Laurentius Valla. This was revised in 1537 by Heubach, and accompanies the Greek text of Herodotus in many editions. The first complete translation into a modern language was that of the first three books, made by one of Littlebury, published in 1737. This was followed in 1786 by the French translation of Larcher, a valuable work, accompanied by copious notes and essays. Below, the second English translator, besides the author of the above edition, the edition of Grundy (2nd ed.), 1864, is confessedly very defective; the second, in 1806, still left much to be desired. A good German translation, but without note or comment, was brought out by Friedrich Lange at Berlin in 1811. Andrea Miot, a native of Genoa, published an Italian version in 1802. In 1822 Auguste Miot endeavoured to improve on Larcher; and in 1828-1832 Dr Adolph Scholl brought out a German translation with copious notes (new ed., 1853), which has to some extent superseded the work of Lange. About the same time a new English version was made by Isaac Taylor (London, 1829). In 1858-1860, the history of Herodotus was translated by Canon G. Rawlinson, assisted in the second and subsequent volumes by the work of Sir Gardner Wilkinson and Sir Henry Rawlinson; Miot, to whom we have translations in English by C. C. Macaulay (2 vols., 1800), in German by Bahr (Stuttgart, 1867) and Stein (Oldenburg, 1875); in French by Glatigny (1857) and Talon (1860); in Italian by Turin, 1871-1876), Grandi (Asti, 1872) and Bertini (Naples, 1871- 1872). A Swedish translation by F. Carlsatd was published at Stockholm in 1871.

The best of the older editions of the Greek text are the following:—Herodotii historiarum ed. Schweighäuser (5 vols., Strassburg, 1816); Herodoti Halicarnassense historiarum libri IX. (ed. Gaisford, Oxford, 1816); Herodotus, with a Commentary, by J. W. Blakney (2 vols., London, 1838); Herodotus, a new English translation, with a commentary by Sir Gardiner Wilkinson and Sir Henry Rawlinson, Miot, to whom we have translations in English by C. C. Macaulay (2 vols., 1800); in German by Bahr (Stuttgart, 1867) and Stein (Oldenburg, 1875); in French by Glatigny (1857) and Talon (1860); in Italian by Turin, 1871-1876, Grandi (Asti, 1872) and Bertini (Naples, 1871-1872). A Swedish translation by F. Carlsatd was published at Stockholm in 1871.

impossible vaour devoted to a pursuit of the impossible beauty, but the whole clothed in the language and feeling and atmosphere of the age in which the book was written. In a Calprenède we are given a picture of the chivalous actions of the heroes, it was always hinted that they were well-known public characters of the day in a romantic disguise.

In the *Astrée* of Honoré d'Urfé, which was a pure pastoral, in the religious romances of Pierre Camus (1582–1653), in the comic *Franchise* of Charles Sorel, piquancy had been given to the recital by this belief that real personages could be recognized under the disguises. But in the *Carlihde* of Gomberville (1621) we have a pastoral which is already beginning to be a heroic romance, and a book in which, under a traveesty of Roman history, the hero is depicted as a man made to seem chivalous enthusiasm. A further development was seen in the *Polynéx* (1623) of François de Molière, and the *Endymion* (1624) of Gombault; in the latter the elderly queen, Marie de' Medici, was celebrated under the disguise of Diana, for whom a beautiful shepherd of Caria (the author himself) nourishes a hopeless passion. The earliest of the Heroic Romances, pure and simple, is, however, the celebrated *PolaXandre* (1639) of Gomberville. The author began by intending his hero to represent Louis XIII., but he changed his mind, and drew a portrait of Cardinal Richelieu. The latter, for the character proper to this class of books is seen undiluted; there is no intrusion of a personage who is not celebrated for his birth, his beauty or his exploits. The story deals with the adventures of a hero who visits all the sea-coasts of the world, the most remote as well as the most fabulous, in search of an ineffable princess, Alciane. This absurd and pretentious, yet very original piece of invention enjoyed an immense success, and historical romances of a similar class competed for the favour of the public. There was an equal amount of geography and more of ancient history in the *Artiane* (1632) of Desmarets de Saint-Sorlin (1595-1676), a book which, long neglected, has in late years been rediscovered, and which has been greeted by M. Paul Morillo as the most readable and the least tiresome of all the Heroic Romances. The type of that class of literature, however, has always been found in the highly elaborate writings of Gauthier de Coste de la Calprenède (1600–1663), which enjoyed for a time a prodigious celebrity, and were read and imitated all over Europe. La Calprenède was a Gascon soldier, imbued with all the extravagance of his race, and in full sympathy with the audacity and vast projects of some of the most notable of French statesmen. The *Gonde de Cassandre*, which appeared in ten volumes between 1642 and 1645, is perhaps the most characteristic of all the Heroic Romances. It deals with a highly romantic epoch of ancient history, the decline of the empire of Alexander the Great. The wars of the Persians and of the Scythians are introduced, and among the characters are discovered such personages as Artaxerxes, Roxana and Ephestion. It must not be supposed, however, that la Calprenède makes the smallest effort to deal with the subject accurately or realistically. The figures are those of his own day; they are seigneurs and great ladies of the court of Louis XIII., masquerading in Macedonian raiment. The passion of love is dominant throughout, and it is treated in the most exalted and hyperbolic spirit. The central heroes of the story, Oronondate and Lysimachus, are dignified, eloquent and amorous; they undergo unexampled privations in the quest of incomparable ladies whose beauty and whose nobility is only equalled by their magnificent loyalty. These books were written with an aim that was partly didactic. Their object was to entertain the ladies and to gratify a taste for endlessly wire-drawn sentimentality, but it was also to teach fortitude and grandeur of soul and to inculcate lessons of practical charity. La Calprenède followed up the success of his Cassandre with a *Cloptère* (1647) in twelve volumes, and a *Faramond* (1661) which he did not live to finish. He became more extravagant, more rhetorical as he proceeded, and he lost all the little hold on history which he had ever held. *Clöptère*, nevertheless, enjoyed a prodigious popularity, and it became the fashion to emulate as far as possible the prowess of its magnificent hero, the proud Artaban.

It should be said that la Calprenède objected to his books being styled romances, and insisted that they were specimens of "histoire embellie avec certain inventions." He may, in opposition to his wishes, claim the doubtful praise of being, in reality, the creator of the modern historical novel. He was immediately imitated or accompanied by a large number of authors, of whom two have achieved a certain immortality, which, unhappily, must be confessed to be partly of ridicule.

The vogue of the historical romance was carried to its height by a brother and a sister, Georges de Scudéry (1601–1667) and Madeleine de Scudéry (1608–1701), who represented in their own persons all the extravagant, tempestuous and absurd idea that the books entertained. The chalpenhite romances remain as portraits in the history of literature. There are five of them—were signed by Georges de Scudéry, but it is believed that all were in the main written by Madeleine. The earliest was *Ibrahim, ou l'Illustre Bassa* (1641); it was followed by *Le Grand Cyrus* (1648–1653) and the final, and most post-vergerous member of the series was *Clélie* (1649–1654). The romances of Mlle de Scudéry (for to her we may safely attribute them) are much inferior in style to those of la Calprenède. They are pretentious, affected and sickly. The author abuses the element of analysis, and pushes a psychology, which was beyond her, towards sublimation of the Book of Proverbs. Nothing, it is probable, in the whole evolution of the Historical Romances has attracted so much attention as the "Carte de Tendre" which occurs in the opening book of *Clélie*. This celebrated map, drawn by the heroine in order to show the route from New Friendship to Tender, and a geographical symbol, therefore, of the progress of love, with its city of Tender-upon-Esteeim, its sea of Enmity, its river of Inclination, its rock-built citadel of Pride, its cold lake of Indifference, is a miracle of elaborate and incongruous ingenuity. But, amusing as it is, it shows into what depths of puerility the amorous fancy of these romances had fallen. These novels formed the chief topic of conversation and of correspondence in the literary society which gathered at and around the Hotel de Rambouillet, and in the personages of Mlle de Scudéry's romances could be recognized all the famous leaders of that society. The mawkish love-making and the false heroism of these monstrous novels went rapidly out of fashion in France soon after 1650, when the epoch of the Heroic Romance came to an end. In England the Heroic Romance had a period of flourishing popularity. All manner of books were very promptly translated, and "he was not to be admitted into the academy of authors if he had not read *Astrée* and *The Grand Cyrus*." The great vogue of these books in England lasted from about 1645 to 1660. It led, of course, to the composition of original works in imitation of the French. The most remarkable and successful of these was *Parthenissa*, published in 1654 by Roger Boyle, Lord Broghill and afterwards Earl of Orrery (1621–1679), which was greatly admired by Dorothy Osborne and her correspondents. Addison speaks in the "Spectator" of the popularity of all these huge books, "the *Grand Cyrus*, with a pin stuck in one of the middle leaves, *Clélie*, which opened of itself in the place that describes two lovers in a bower." When the drama, and in particular tragedy, was reinstated in England, sentimental readers found a field for their emotions on the stage, and the heroic romances immediately began to go out of fashion. They lingered, however, for a quarter of a century more, and M. Jusserrand has analysed what may be considered the very latest of the race, *Pandion and Amphigone*, published in 1665 by the dramatist, John Crowne.

were written. In English, however, it was not enough to designate a single iambic line of five beats as heroic verse, because it was necessary to distinguish blank verse from the distich, which was formed by the heroic couplet. This had escaped the notice of Dryden, when he wrote "The English Verse, which we call Heroic, consists of no more than ten syllables." If that were the case, then Paradise Lost would be written in heroic verse, which is not true. What Dryden should have said is "consists of two rhymed lines, each of ten syllables." In French the alexandrine has always been regarded as the heroic measure of that language. The dactylic movement of the heroic line in ancient Greek, the famous ἄρθρον τοῦ Αμφιπόλος of Homer, is expressed in modern Europe by the iambic movement. The consequence is that much of the rush and energy of the antique verse, which at vigorous moments was like the charge of a battalion, is lost. It is owing to this, in part, that the heroic couplet is so often required to give, in translation, the full value of a single Homeric hexameter. It is important to insist that it is the couplet, not the single line, which constitutes heroic verse. It is interesting to note that the Latin poet Ennius, as reported by Cicero, called the heroic metre of one line versum longum, to distinguish it from the brevity of lyrical measures. The current form of English heroic verse appears to be the invention of Chaucer, who used it in his Legend of Good Women and afterwards, with still greater freedom, in the Canterbury Tales. Here is an example of it in its earliest development:—

"And thus the longè day in fight they spend,
Till, at the last, as everything holds end,
Anton is shent, and put him to the flight,
And all his folk to go, as best go might."

This way of writing was misunderstood and neglected by Chaucer's English disciples, but was followed nearly a century later by the Scottish poet, called Blind Harry (c. 1473), whose Wallace holds an important place in the history of versification as having passed on the tradition of the heroic couplet. Another Scottish poet, Gavin Douglas, selected heroic verse for his translation of the Iliad (1513), and displayed, in such examples as the following, a skill which left little room for improvement at the hands of later poets:—

"One sang, 'The ship sails over the salt foam,
Will bring the merchants and my leman home';
Some other sings, 'I will be thine, and light,
Mine heart is set upon so goodly a sight.'"

The verse so successfully mastered was, however, not very generally used for heroic purposes in Tudor literature. The early poets of the revival, and Spenser and Shakespeare after them, greatly preferred stanzaic forms. For dramatic purposes blank verse was almost exclusively used, although the French had adopted the rhymed alexandrine for their plays. In the earlier half of the 17th century, heroic verse was often put to somewhat unheroic purposes, mainly in prologues and epilogues, or other short poems of occasion; but it was nobly redeemed by Marlowe in his Hero and Leander and especially by Browne in his Britannia's Pastoral. It is to be noted, however, that those Elizabethans who, like Chapman, Warner and Drayton, aimed at producing a warlike and Homeric effect, did so in champing fourteen-syllable couplets. The one heroic poem of that age written at considerable length in the appropriate national metre is the Basworth Field of Sir John Beaumont (1582-1628). Since the middle of the 17th century, when heroic verse became the typical and for a while almost the solitary form in which serious English poetry was written, its history has known many vicissitudes. After having been the principal instrument of Dryden and Pope, it was almost entirely rejected by Wordsworth and Coleridge, but revived, with various modifications, by Byron, Shelley (in Julian and Maddalo) and Keats (in Lamia). In the second half of the 19th century its prestige was restored by the brilliant work of Swinburne in Tristram and elsewhere.

HÉROLD, LOUIS JOSEPH FERDINAND (1791-1833). French musician, the son of François Joseph Hérod, an accomplished pianist, was born in Paris, on the 28th of January 1791. It was not till after his father's death that Hérod in 1806 entered the Paris conservatoire, where he studied under Catal and Méhul. In 1812 he gained the grand prix de Rome with the cantata La Duchesse de Valéry, and started for Italy, where he remained till 1815 and composed a symphony, a cantata and several pieces of chamber music. During his stay in Italy also Hérod for the first time ventured on the stage with the opera La Gioventù di Enrico V., first performed at Naples in 1815 with moderate success. During a short stay in Vienna he was much in the society of Salieri. Returning to Paris he was invited by Boieldieu to collaborate with him on an opera called Charles de France, performed in 1816, and soon followed by Hérod's first French opera, Les Rosières (1817), which was received very favourably. Hérod produced numerous dramatic works for the next fifteen years in rapid succession. Only the names of some of the more important need here be mentioned:—La Clochette (1817), L'Auteur mort et vivant (1820), Moris (1826), and the ballets La Fille mal gardée (1828) and La Belle au bois dormant (1829). Hérod also wrote a vast quantity of pianoforte music, in spite of his time being much occupied by his duties as accompanist at the Italian opera in Paris. In 1831 he produced the romantic opera Zampa, and in the following year Le Pré aux clerks (first performance December 15, 1832), in which French esprit and French chivalry find their most perfect embodiment. These two operas secured immortality for the name of the composer, who died on the 18th of January 1833, of the lung disease from which he had suffered for many years, and the effects of which he had accelerated by incessant work. Hérod's incomplete opera Ludovic was afterwards printed by J. F. Halévy.

HERON (Fr. héron; Ital. aghire, ai Iron; Lat. ardea; Gr. ἀρεία). In the family Ardeidae, the night-herons, which (in 1863) contained in the collection at Leyden (Mus. des Pays-Bas, Ardeae, 64 pp.),—on the other hand, G. R. Gray in 1871 (Handlist, &c. iii. 26-34) admitted above 90, while Dr Anton Reinchenow (Journ. für Ornithologie, 1877, pp. 232-275) recognizes 67 as known, besides 15 "subspecies" and 3 varieties, arranging them in 3 genera, Nycticorax, Botaurus and Ardea, with 17 subgenera. But it is difficult to separate the family, with any satisfactory result, into genera, if structural characters have to be found for these groups, for in many cases they run almost insensibly into each other—though in common language it is easy to speak of herons, egrets, bitterns, night-herons and

![Fig. 1.—Heron.](image-url)
boathills. With the exception of the last, Professor Schlegel retains all in the genus Ardea, dividing it into eight sections, the names of which may perhaps be Englished—great herons, small herons, egrets, semi-egrets, rail-like herons, little bitterns, bitterns and night-herons.

The common heron of Europe, Ardea cinerea of Linnaeus, is universally allowed to be the type of the family, and it may also be regarded as that of Professor Schlegel's first section. The species inhabits suitable localities throughout the whole of Europe, Africa and Asia, reaching Japan, many of the islands of the Indian Archipelago and even Australia. Though by no means so numerous as formerly in Britain, it is still sufficiently common,¹ and there must be few persons who have not seen it rising slowly from some river-side or marshy flat, or passing overhead in its lofty and leisurely flight on its way to or from its daily haunts; while they are many who have been entertained by watching it as it sought its food, consisting chiefly of fishes (especially eels and flounders) and amphibians—though young birds and small mammals come not amiss—wading midleg in the shallows, swimming occasionally when out of its depth, or standing motionless to strike its prey with its formidable and sure beak. When sufficiently numerous the heron breeds in societies, known as heronries, which of old were protected both by law and custom in nearly all European countries, on account of the sport their tenants accorded to the falconer. At late periods, partly owing to the withdrawal of the protection they had enjoyed, and still more, it would seem, from agricultural improvement, which, by draining meres, fens and marshes, has abolished the feeding-places of a great population of herons, many of the larger heronries have broken up—the birds combining those dispersing to neighbouring localities and forming smaller settlements, most of which are hardly to be dignified by the name of herony, though commonly accounted such. Thus the number of so-called heronries in the United Kingdom, and especially in England and Wales, has become far greater than formerly, but no one can deny that the number of herons has dwindled. The sites chosen by the heron for its nest vary greatly. It is generally built in the top of a lofty tree, but not infrequently (and this seems to have been much more usual in former days) near or on the ground among rough vegetation, on an island in a lake, or again on a rocky cliff of the coast. It commonly consists of a huge mass of sticks, often the accumulation of years, lined with twigs, and in it are laid from four to six sea-green eggs. The young are clothed in soft flax-coloured down, and remain in the nest for a considerable time, therein differing remarkably from the "pipers" of the quails, which are able to run almost as soon as they are hatched. The first feathers assumed by young herons in a general way resemble those of the adult, but the pure white breast, the black throat-streaks and especially the long pendent plumage, which characterize only the very old birds, and are most beautiful in the cocks, are subsequently acquired. The heron measures about 3 ft. from the bill to the tail, and the expanse of its wings is sometimes not less than 6 ft., yet it weighs only between 3 and 4 lb.

Large as is the common heron of Europe, it is exceeded in size by the great blue heron of America (Ardea herodias), which greatly resembles it in appearance and habits, and both are smaller than the A. sumatrana or A. typhon of India and the Malay Archipelago, while the A. goliath, of wide distribution in Africa and Asia, is the largest of all. The purple heron, A. purpurea, as a well-known European species having a great range over the Old World, also deserves mention here. The species included in Professor Schlegel's second section inhabit the tropical parts of Africa, Australasia and America. The egrets, forming his third group, require more notice, distinguished as they are by their pure white plumage, and, when in breeding-dress, by the beautiful dorsal tufts of decomposed feathers that ordinarily droop over the tail, and are so highly esteemed as ornaments by Oriental magnates. The largest species is A. occidentalis, only known apparently from Florida and Cuba; but one not much less, the great egret (A. alba), belongs to the Old World, breeding regularly in south-eastern Europe, and occasionally straying to Britain. A third, A. egretta, represents it in America, while much the same may be said of two smaller species, A. garzetta, the little egret of English authors, and A. candidissima; and a sixth, A. intermedia, is common in India, China and Japan, besides occurring in Australia. The group of semi-egrets, containing some nine or ten forms, among which the buff-backed heron (A. bubulcus), is the only species that is known to have occurred in Europe, is hardly to be distinguished from the last section except by their plumage being at certain seasons varied in some species with slaty-blue and in others with rufous. The rail-like herons form Professor Schlegel's next section, but it can scarcely be satisfactorily differentiated, and the epithet is misleading, for its members have no rail-like affinities, though the typical species, A. ralloides, which inhabits the south of Europe, and occasionally finds its way to England, has long been known as A. ralloides.² Nearly all these birds are tropical or subtropical. There is then the somewhat better defined group of little bitterns, containing about a dozen species—the smallest of the whole family. One of them, A. minuta, though very local in its distribution, is a native of the greater part of Europe, and has bred in England. It has a close counterpart in the A. celts of North America, and is represented by three or four forms in other parts of the world, the A. pusilla of Australia especially differing very slightly from it. Ranged by Professor Schlegel with these birds, which are all remarkable for their skulking habits, but more resembling the true herons in their nature, are the common green bittern of America (A. viridescens) and its very near ally the African A. atreicapilla, from which last it is almost impossible to distinguish the A. javonica, of wide range throughout Asia and its islands, while other species, less closely related, occur elsewhere as A. flavicollis—one form of which, A. gouldi, inhabits Australia.

The true bitterns, forming the genus Botaurus of most authors, seem to be fairly separable, but more perhaps on account of their wholly nocturnal habits and correspondingly adapted plumage than on strictly structural grounds, though some differences of proportion are observable. The common bittern (q.v.) of modern British authors—the distinctive name, given "Squacco" by Willughby and Ray from Aldrovandus, having been misspelt by Latham.

Fig. 2.—Bittern.
HERPES—HERRERA

Europe (B. stellaris), is widely distributed over the eastern hemisphere.1 Australia and New Zealand have a kindred species, B. poecilepis, and North America a third, B. magnians2 or B. lentiginosus. Nine other species from various parts of the world are admitted by Professor Schlegel, but some of them should perhaps be excluded from the genus Botaurus.

Of the night-herons the same author recognizes six species, all of which may be reasonably placed in the genus Nycticorax, characterized by a shorter beak and a few other peculiarities, among which the large eyes deserve mention. The first is N. griseus, a bird widely spread over the Old World, and not unfrequently visiting England, where it would undoubtedly breed if permitted. Professor Schlegel unites it with the common night-heron of America; but this, though very closely allied, is generally deemed distinct, and is the N. nasicus or N. gardeni of most writers. A clearly different American species, with a more southern habitat, is the N. violaceus or N. cayennensis, while others are found in South America, Australia, some of the Asiatic Islands and in West Africa. The Galapagos have a peculiar species, N. pauper, and another, so far as is known, peculiar to Rodriguez, N. megacephalus, existed in that island at the time of its being first colonized, but is now extinct.

The boatbill, of which only one species is known, seems to be merely a night-heron with an exaggerated bill,—so much wider and as to suggest its English name,—but has always been allowed generic rank. This curious bird, the Cancroco cockerla of most authors, is a native of tropical America, and what is known of its habits shows that they are essentially those of a Nycticorax.3

Bones of the common heron and bittern are not uncommon in the peat of the East-Anglian fens. Remains from Sansan and Langy in France have been referred by Alphonse Milne-Edwards to herons under the names of Ardea perpleca and A. formosa; a tibia from the Miocene of Steinheim am Albuch by Dr Fras to an A. similis, while Sir R. Owen recognized a portion of a sternum from the London Clay as most nearly approaching this family.

It remains to say that the herons form part of Huxley's section Pelargomorphae, belonging to his larger group Desmognathae, and to draw attention to the singular development of the patches of "powder-down" in which the family Ardeidae attain a magnitude hardly to be found elsewhere. Their use is utterly unknown.

HERPES (from the Gr. herpes, to creep), an inflammation of the true skin resulting from a lesion of the underlying nerve or its ganglion, attended with the formation of isolated or grouped vesicles of various sizes upon a reddened base. They contain a clear fluid, and either rupture or dry up a short time after their appearance. Two well-marked varieties of herpes are frequently met with. (a) In herpes labialis et nasalis the eruption occurs about the lips and nose. It is seen in cases of certain acute febrile ailments, such as fevers, inflammation of the lungs or even in a severe cold. It soon passes off. (b) In the herpes soster, sora or "shingles" the eruption occurs in the course of one or more cutaneous nerves, often on one side of the trunk, but it may be on the face, limbs or other parts. It may occur at any age, but is probably more frequently met with in elderly people. The appearance of the eruption is usually preceded by severe stinging neuralgic pains for several days, and, not only during the continuance of the herpetic spots, but long after they have dried up and disappeared, these pains sometimes continue and give rise to great suffering. The disease seldom recurs.

The most that can be done for its relief is to protect the parts with cotton wool or some dusting powder, while the pain may be allayed by opiates or bromide of potassium. Quinine internally is often of service.

HERRERA, FERNANDO DE (c. 1534—1597), Spanish lyric poet, was born at Seville. Although in minor orders, he addressed many impassioned poems to the countless of Gelves, wife of Alvaro Colon de Portugal; but it is suggested that these should be regarded as Platonic literary exercises in the manner of Petrarch. As is shown by his Anotaciones a las obras de Garcilaso de la Vega (1586), Herrera had a boundless admiration for the Italian poets, and continued the work of Boscán in naturalizing the Italian metrical system in Spain. His commentary on Garcilaso involved him in a series of literary polemics, and his verbal innovations laid him open to attack. But, even if his amatory sonnets are condemned as insincere in sentiment, their workmanship is admirable, while his odes on the battle of Lepanto, on Don John of Austria, and the elegy on King Sebastian of Portugal entitle him to rank as the greatest of Andalusian poets and as the most important of the followers of Garcilaso de la Vega (see VEGA).

His poems were published in 1582, and reprinted with additions in 1619; they are reissued in the Bibliotheca de auctores hispanici, vol. xxii. Of Herrera's prose works only the Vida y Muerte de Tomás Muñoz (1585) survives; it is a translation of the life in Thomas Stapleton's Tres Thomae (1588).

BIBLIOGRAPHY.—E. Bourciez, "Les Sonnets de Fernando de Herrera," Annales de la Faculté des Lettres de Bordeaux (1894); Fernando de Herrera, controversia sobre sus anotaciones a las obras de Garcilaso de la Vega (Seville, 1870); A. Morel-Fatio, L'Hymne sur Lépante (Paris, 1893).

HERRERA, FRANCISCO (1576—1656), surnamed el Viejo (the old), Spanish historical and fresco painter, studied under Luis Fernandez in Seville, his native city, where he spent most of his life. Although so rough and coarse in manners that neither scholar nor child could remain with him, the great talents of Herrera, and the promptitude with which he used them, brought him abundant commissions. He was also a skillful worker in bronze, an accomplishment that led to his being charged with coinage base money. From this accusation, whether true or false, he sought sanctuary in the Jesuit college of San Hermengildo, which he adorned with a fine picture of its patron saint. Philip IV., on his visit to Seville in 1624, having seen this picture, and learned the position of the artist, pardoned him at once, warning him, however, that such powers as his should not be degraded. In 1630 Herrera removed to Madrid, where he lived in great honour till his death in 1656. Herrera was the first to relinquish the timid Italian manner of the old Spanish school of painting, and to initiate the free, vigorous touch and style which reached such perfection in Velazquez, who had seen for a short time his pupil. His pictures are marked by an energy of design and freedom of execution quite in keeping with his bold, rough character. He is said to have used very long brushes in his painting; and it is also said that, when pupils failed, his servant used to dash the colours on the canvas with a broom under his directions, and that he worked them up into his designs before they dried.
HERRERA Y TORDESILLAS—HERRICK

in his pictures is correct, and the colouring original and skilfully managed, so that the figures stand out in striking relief. What has been considered his best easel-work, the "Last Judgment," in the church of San Bernardo at Seville, is an original and striking composition, shrewdly arranged, as analytic and ill-founded as the common belief was that Spanish painters, through ignorance of anatomy, understood only the draped figure. Perhaps his best fresco is that on the dome of the church of San Buenaventura; but many of his frescoes have perished, some by the effects of the weather and others by the artist's own carelessness in preparing his surfaces. He has, however, preserved several of his own designs in etchings. For his easel works Herrera often chose such humble subjects as fairs, carnivals, ale-houses and the like.

His son Francisco Herrera (1622–1653), surnamed el Mozo (the young), was also an historical and fresco painter. Unable to endure his father's cruelty, the younger Herrera, seizing what money he could find, fled from Seville to Rome. There, instead of devoting himself to the antiquities and the works of the old Italian masters, he gave himself up to the study of architecture and perspective, with the view of becoming a fresco-painter. He did not altogether neglect easel-work, but became renowned for his pictures of still-life, flowers and fruit, and from his skill in painting fish was called by the Italians Lo Spagnuolo degli Pesci. In later life he painted portraits with great success. He returned to author's young age but devoted his first years to travel, and in 1653 was appointed subdirector of the new academy there under Murillo. His vanity, however, brooked the superiority of no one; and throwing up his appointment he went to Madrid. There he was employed to paint a San Hermenegildo for the barefooted Carmelites, and to decorate in fresco the roof of the church of San Felipe el Real. The success of this last work procured for him a commission from Philip IV. to paint in fresco the roof of the Atocha church. He chose as his subject for this the Assumption of the Virgin. Soon afterwards he was rewarded with the title of painter to the king, and was made superintendent of the royal buildings. He died at Madrid in 1685. Herrera was of a somewhat similar temperament to his father, and offended many people by his inordinate vanity and suspicious jealousy. His pictures are inferior to the older Herrera's both in design and in execution; but in some of them traces of the vigour of his father, who was his first teacher, are visible. He was by no means an unskilful colourist, and was especially master of the effects of chiaroscuro. As his best picture Sir Edmund Head in his 

HERRERA Y TORDESILLAS, ANTONIO DE (1540–1625),
Spanish historian, was born at Cuellar, in the province of Segovia in Spain. His father, Rodrigo de Tordesillas, and his mother, Agnes de Herrera, were both of good family. After studying for some time in his native country, Herrera proceeded to Italy, and there became secretary to Vespasian Gonzalo, with whom, on his appointment as viceroys of Navarre, he returned to Spain. Gonzalo, sensible of his secretary's abilities, commended him to Philip II. of Spain; and that monarch appointed Herrera first historiographer of the Indies, and one of the historiographers of Castile. Placed thus in the enjoyment of an ample salary, Herrera devoted the rest of his life to the pursuit of literature, retaining his offices until the reign of Philip IV., by whom he was appointed secretary of state very shortly before his death, which took place at Madrid on the 20th of March 1625. Of Herrera's writings, the most valuable is his Historia general de los hechos de los Castellanos en las islas y tierra firme del Mar Oceano (Madrid, 1601–1615, 4 vols.), a work which relates the history of the Spanish-American colonies from 1492 to 1554. The author's official position gave him access to the most secret and to other authentic sources not attainable by other writers, while he did not scruple to borrow largely from other MSS., especially from that of Bartolomé de Las Casas. He used his facilities carefully and judiciously; and the result is a work on the whole accurate and unprejudiced, and quite indispensable to the student either of the history of the early colonies, or of the institutions and customs of the aboriginal American peoples. Although it is written in the form of annals, mistakes are not wanting, and several glaring anachronisms have been pointed out by M. J. C. van Heurkom (Histoire de l'Amérique, 1823). In the words of another writer "by attempting to relate the various occurrences in the New World in a strict chronological order, the arrangement of events in his work had not been rendered so perplexed, disconnected and obscure that it is an unpleasant task to collect from different parts of his book and piece together the detached shreds of a story, he might justly have been ranked among the most eminent historians of his country." This work was republished in 1730, and has been translated into English by J. Stevens (London, 1740), and into other European languages.

HERRICK, ROBERT (1591–1674), English poet, was born at Cheapside, London, and baptized on the 24th of August 1591. His father, John Herrick, was a rich goldsmith, and settled in London. He was the seventh child of Nicholas Herrick, goldsmith, of the city of London, who died in 1602, under suspicion of suicide. The children were brought up by their uncle, Sir William Herrick, one of the richest goldsmiths of the day, to whom in 1607 Robert was bound apprentice. He had probably been educated at Westminster school, and in 1614 he proceeded to Cambridge; and it was no doubt during his apprenticeship that the young poet was introduced to that circle of wits which he was afterwards to adorn. He seems to have been present at the first performance of The Alchemist in 1610, and it was probably about that time that Ben Jonson adopted him as his poetical disciple. He entered the university as fellow-commoner of St John's College, and he remained there until, in 1616, upon taking his degree, he removed to Trinity Hall. A lively series of fourteen letters to his uncle, mainly begging for money, exists at Beau- manoir, and shows that Herrick suffered much from poverty at the university. He took his B.A. in 1617, and in 1620 he became master of arts. From this date until 1627 we entirely lose sight of him; it has been variously conjectured that he spent these years preparing for the ministry at Cambridge, or in much looser connexion with London. In the latter year he married a lady of the name of Jones, of whom he became the estranged husband by the king to the vicarage of Dean Prior, not far from Totnes in Devonshire. At Dean Prior he resided quietly until 1648, when he was ejected by the Puritans. The solitude there oppressed him at first; the village was dull and remote, and he felt very bitterly that he was cut off from all literary and social associations; but soon the quiet existence in Devonshire soothed and delighted him. He was pleased with the rural and semi-pagan customs that survived in the village, and in some of his most charming verses he has immortalized the Morris-dances, wakes and quantsins, the Christmas mummers and the Twelfth Night revellings, that date from a period when the genius of Prior. Herrick never married, but lived at the vicarage surrounded by a happy family of pets, and tended by an excellent old servant named Prudence Baldwin. His first appearance in print was in some verses he contributed to A Description of the King and Queen of Fairies, in 1635. In 1650 a volume of Wit's Recreations contained sixty-two small poems afterwards acknowledged by Herrick in the Hesperides, and one not reprinted until our own day. These partial appearances make it probable that he visited the banks of his native stream from time to time. We have few hints of his life as a clergyman. Anthony Wood says that Herrick's sermons were florid and witty, and that he was "beloved by the neighbouring gentry." A very aged woman, one Dorothy King, stated that the poet once threw his sermon at his congregation, cursing them for their inattention. The same old woman recollected his favourite pig, which he taught to drink out of a tankard. He
HERRIES, J. C.—HERRING

was a devotedly loyal supporter of the king during the Civil War, and immediately upon his ejection in 1648 he published his celebrated collection of lyrical poems, entitled Hesperides; or the Works both Human and Divine of Robert Herrick. The "divine works" bore the title of Noble Numbers and the date 1647. Though he was reduced to great poverty, and was forced to turn from poetry to subject-matter where the money could be had, but there is no evidence of the fact. In August 1662 Herrick returned to Dean Prior, supplanting his own supplanter, Dr John Syms. He died in his eighty-fourth year, and was buried at Dean Prior, October 15, 1674. A monument was erected to his memory in the parish church in 1857, by Mr Perry Herrick, a descendant of a collateral branch of the family. The Hesperides (and Noble Numbers) is the only volume which Herrick published, but he contributed poems to Lachrymae Musarum (1649) and to Wit's Recreations.

As a pastoral lyrist Herrick stands first among English poets. His genius is limited in scope, and comparatively unambitious, but in its own field it is unrivalled. His tiny poems—and of the thirteen hundred that he has left behind him not one is long—are like jewels of various value, heaped together in a casket. Some are of the purest water, radiant with light and colour, some were originally set in false metal that has tarnished, some were rude and repulsive from the first. Out of the unarranged, heterogeneous mass the student has to select what is not worth reading, but, after he has cast aside all the rubbish, he is astonished at the amount of excellent and exquisite work that remains. Herrick has himself summed up, very correctly, the themes of his sylvan muse when he says:

"I sing of brooks, of blossoms, birds and bowers,
Of April, May, of June and July flowers,
Of old heritages, book-carts, wassail, wakes,
Of bridgrooms, brides and of their bridal-cakes."

He saw the picturesqueness of English homely life as no one before him had seen it, and he described it in his verse with a certain purple glow of Arcadian romance over it, in tones of immortal vigour and freshness. His love poems are still more beautiful; the best of them have an ardour and tender sweetness which give them a place in the forefront of modern lyrical poetry, and remind us of what was best in Horace and in the poets of the Greek anthology.

After suffering complete extinction for more than a century, the fame of Herrick was revived by John Nichols, who introduced his poems to the readers of the Gentleman's Magazine of 1796 and 1797. Dr Drake followed in 1798 with considerable enthusiasm. By 1810 interest had so far revived the forgotten poet that Dr Nott ventured to print a selection from his poems, which attracted the favourable notice of the Quarterly Review. In 1823 the Hesperides and the Noble Numbers were for the first time edited by Mr T. Maitland, and the work was thus continued and improved. Since then the reprints of Herrick's works have been too numerous to be mentioned here; there are few English poets of the 17th century whose writings are now more accessible. See F. W. Moorman, Robert Herrick (1910). (E. G.)

HERRIES, JOHN CHARLES (1778–1839), English politician, son of a London merchant, began his career as a junior clerk in the treasury, and became known for his financial abilities as private secretary to successive ministers. He was appointed commissioner-in-chief (1811), and, on the abolition of that office (1816), auditor of the civil list. In 1823 he entered parliament as secretary to the treasury, and in 1827 became chancellor of the exchequer under Lord Goderich; but in consequence of internal differences, arising partly out of a slight put upon Herries, the ministry was broken up, and in 1828 he was appointed master of the mint. In 1832 he became president of the board of trade, and for the earlier months of 1835 he was secretary at war. From 1841 to 1847 he was out of parliament, but during 1852 he was president of the board of control under Lord Derby. He was a consistent and upright Tory of the old school, who carried weight as an authority on financial subjects. His eldest son was judge. See Life by his younger son, Edward Herries (1880).

HERRIES, JOHN MAXWELL, 4th Lord (c. 1512–1583), Scottish politician, was the second son of Robert Maxwell, 4th Lord Maxwell (d. 1546). In 1547 he married Agnes (d. 1594), daughter of William Herries, 3rd Lord Herries (d. 1543), a grandson of Herbert Herries (d. c. 1500) of Terregles, Kirkcudbrightshire, who was created a lord of the Scottish parliament about 1496, and in 1567 he obtained the title of Lord Herries. But before this event Maxwell had become prominent among the men who rallied to Mary queen of Scots, although during the earlier part of his public life he had been closely aligned with the religious reformers and had been imprisoned by the regent, Mary of Lorraine. He was, moreover—at least until 1563—very friendly with John Knox, who calls him "a man zealous and stout in God's cause." But the transition from one party to the other was gradually accomplished, and from March 1566, when Maxwell joined Mary at Dunbar after the murder of David Rizzio and her escape from Holyrood, he remained one of her staunchest friends, although he disliked her marriage with Bothwell. He led her cavalry at Langside, and after this battle she committed herself to his care. Herries rode with the queen into England in May 1568, and he and John Lesley, bishop of Ross, were her chief commissioners at the conferences at York. He continued to labour in Mary's cause after returning to Scotland, and was imprisoned by the regent Murray; he also incurred Elizabeth's displeasure by harbouring the rebel Leonard Dacres, but he soon made his peace with the English queen. He showed himself in general hostile to the regent Morton, but he was among the supporters of the regent Lennox until his death on the 20th of January 1583. His son William, 5th Lord Herries (d. 1604), was, like his father, warden of the west marches. William's grandson John, 7th Lord Herries (d. 1677), became 3rd earl of Nithsdale in succession to his cousin Robert Maxwell, the 2nd earl, in 1667. John's grandson was William, 5th earl of Nithsdale, the Jacobite (see NITHSDAER). William was deprived of his honours in 1716, but in 1758 the House of Lords decided that his descendant William Constable-Maxwell (1824–1876) was rightly Lord Herries of Terregles. In 1876 William's son Marmaduke Constable-Maxwell (b. 1837) became 12th Lord Herries, and in 1884 he was created a baron of the United Kingdom.

HERRING (Clupea harengus, Häring in German, le hareng in French, sill in Swedish), a fish belonging to the genus Clupea, of which more than sixty different species are known in various parts of the globe. The sprat, pilchard or sardine and shad are species of the same genus. Of all sea-fishes Clupea are the most abundant; for although other genera may comprise a greater variety of species they are far surpassed by Clupea in the number of individuals. The majority of the species of Clupea are of greater or less utility to man; it is only a few tropical species that acquire, probably from their food, highly poisonous properties, so as to be dangerous to persons eating them. But no other species equals the common herring in importance as an article of food or commerce. It inhabits in incredible numbers the North Sea, the northern parts of the Atlantic and the seas north of Asia. The herring inhabiting the corresponding latitudes of the North Pacific is another species, but most closely allied to that of the eastern hemisphere. Formerly it was the general belief that the herring inhabits the open ocean close to the Arctic Circle, and that it migrates with the seasons towards the coasts of Europe and America. This view has been proved to be erroneous, and we know now that this fish lives throughout the year in the vicinity of our shores, but at a greater depth, and at a greater distance from the coast, than at the time when it approaches land for the purpose of spawning.

Herrings are readily recognized and distinguished from the other species of Clupea by having an ovate patch of very small teeth on the vomer (that is, the centre of the palate). In the dorsal fin they have from 17 to 20 rays, and in the anal fin from 16 to 18; there are from 53 to 59 scales in the lateral line and 54 to 56 vertebrae in the vertebral column. They have a smooth gill-cover, without those radiating ridges of bone which are so conspicuous in the pilchard and other Clupea. The sprat cannot be confounded with the herring, as it has no teeth on the vomer and only 47 or 48 scales in the lateral line.

The spawn of the herring is adhesive, and is deposited on
HERRING-BONE—HERSCHEL, SIR F. W.

rough gravelly ground at varying distances from the coast and always in comparatively shallow water. The season of spawning is different in different places, and even in the same district, e.g. the east coast of Scotland, there are herrings spawning in spring and others in autumn. These are not the same fish but different although it is only occasionally found in spring buildings, if they spawn near the coast at the mouths of estuaries, and ascend the estuaries to a considerable distance at certain times, as in the Firths of Forth and Clyde, while those which spawn in summer or autumn belong more to the open sea, e.g. the great shoals that visit the North Sea annually.

Herrings grow very rapidly; according to H. A. Moyer's observations, they attain a length of from 17 to 18 mm. during the first month after hatching, 34 to 36 mm. during the second, 45 to 50 mm. during the third, 55 to 61 mm. during the fourth, and several eyecells, during the fifth. The size which they finally attain and their general condition depend chiefly on the abundance of food (which consists of crustaceans and other small marine animals), on the temperature of the water, on the season at which they have been hatched, &c. Their usual size is about 12 in., but in some particularly suitable localities they grow to a length of 15 in., and instances of specimens measuring 17 in. are on record. In the Baltic, where the water is gradually losing its saline constituents, thus becoming less adapted for the development of marine species, the herring continues to exist in large numbers, but as a dwarf form, not growing either as quickly or to such a considerable length as in the North Atlantic. The herring of the American side of the Atlantic is specifically identical with that of Europe. A second species (Clupea leachi) has been supposed to exist on the British coast; but it comprises only individuals of a smaller size, the produce of an early or late spawn. Also the so-called "white-bait" is not a distinct species, but consists chiefly of the fry or the young of herrings and sprats, and is obtained in perfection at localities where these small fishes find an abundance of food, as in the estuary of the Thames.

Several excellent accounts of the herring have been published, as by Valenciennes in the 20th vol. of the Histoire naturelle des poissons, and more especially by Mr J. M. Mitchell, The Herring, its Natural History and National Importance (Edinburgh, 1864). Recent investigations are described in the Reports of the Fishery Board for Scotland, and in the reports of the German Kommission zur Untersuchung der Deutschen Meere (published at Kiel). (J. T. C.)

HERRING-BONE, a term in architecture applied to alternate courses of bricks or stone, which are laid diagonally with binding courses above and below: this is said to give a better bond to the wall, especially when the stone employed is stratified, such as Stonefield stone, and too thin to be laid in horizontal courses. Another term to which it is sometimes applied is the herring-bone pattern in which the courses of the masonry were laid at right angles, and included a form of construction constantly employed in Roman, Byzantine and Romanesque work, and in the latter is regarded as a test of very early date. It is frequently found in the Byzantine walls in Asia Minor, and in Byzantine churches was employed decoratively to give variety to the wall surface. Sometimes the diagonal courses are reversed one above the other. Examples in France exist in the churches at Querqueville in Normandy and St Christophe at Suèvres (Loir et Cher), both dating from the 10th century, and in England herring-bone masonry is found in small buildings, such as at Guildford, Colchester and Tamworth. The term is also applied to the paving of stable yards with bricks laid flat diagonally and alternating so that the head of one brick butts against the side of another; and the effect is more pleasing than when laid in parallel courses.

HERRINGS, BATTLE OF THE, the name applied to the action of Rouvray, fought in 1429 between the French (and Scots) and the English, who, under Sir John Falstolfe (or Falstaff), were conveying Lenthal provisions, chiefly herrings, to the besiegers of Orleans. (See Orleans and Hundred Years War.)

HERRHUT, a town of Germany, in the kingdom of Saxony, 18 m. S.E. of Bautzen, and situated on the Löbau-Zittau railroad. Pop. 1200. It is chiefly known as the principal seat of the Moravian or Bohemian brotherhood, the members of which are called Herrnhuter. A colony of these people, fleeing from persecution in Moravia, settled at Herrnhut in 1722 on a site presented by Count Zinzendorf. The buildings of the society include a church, a school and houses for the brethren, the sisters and the widowed of both sexes, while it possesses an ethnographical museum and other collections. Its sense of the benefit is remarkable for its ordered, regular life and its scrupulous cleanliness. Linen, paper (to varieties of which Herrnhut gives its name), tobacco and various minor articles are manufactured. The Hutberg, at the foot of which the town lies, commands a pleasant view. Berthelsdorf, a village about a mile distant, has been the seat of the directorate of the community since about 1780.

HERSCHEL, CAROLINE LUCRETTA (1750-1848), English astronomer, sister of Sir William Herschel, the eighth child and fourth daughter of Isaac Newton, was born at Bath, on 16th of March 1750. On account of the prejudices of her mother, who did not desire her to know more than was necessary for being useful in the family, she received in youth only the first elements of education. After the death of her father in 1767 she obtained permission to learn millinery and dressmaking with a view to earning her bread, but continued to assist her mother in the management of the household until the autumn of 1772, when she joined her brother William, who had established himself as a teacher of music at Bath. At once she became a valuable co-operator with him both in his professional duties and in the chemical researches to which he had already begun to devote all his spare time. She was the principal singer at his oratorio concerts, and acquired such a reputation as a vocalist that she was offered an engagement for the Birmingham festival, which, however, she declined. When her brother accepted the office of astronomer to George III., she became his constant assistant in his observations, and also executed the laborious calculations which were connected with them. For these services she received from the king in 1787 a salary of £30 a year. Her chief amusement during her leisure hours was sweeping the heavens with a small Newtonian telescope. By this means she detected in 1783 three remarkable nebulae, and during the eleven years 1786-1797 eight comets, five of them with unquestioned priority. In 1797 she presented to the Royal Society an Index to Flamsteed's observations, together with a catalogue of 561 stars accidentally omitted from the "British Catalogue," and a list of the errata in that publication. Though she returned to Hanover in 1822 she did not abandon her astronomical studies, and in 1828 she completed the reduction, to January 1800, of 2500 nebulae discovered by her brother. In 1828 the Astronomical Society of London was founded, and Herschel was its first president. She devoted herself to science by such a series of laborious exertions, unanimously resolved to present her with their gold medal, and in 1835 elected her an honorary member of the society. In 1846 she received a gold medal from the king of Prussia. She died on the 9th of January 1848. See The Memoir and Correspondence of Caroline Herschel, by Mrs John Herschel (1876).

HERSCHEL, SIR FREDERICK WILLIAM (1738-1822), generally known as Sir William Herschel, English astronomer, was born at Hanover on the 15th of November 1738. His parents were a small Neapolitan couple, who had emigrated to the Hanoverian guard. The family had quitted Moravia for Saxony in the early part of the 17th century on account of religious troubles, they themselves being Protestants. Herschel's earlier education was necessarily of a very limited character, chiefly owing to the warlike commotions of his country; but being at all times an indomitable student, he, by his own exertions, more than repaired this deficiency. He became a very skilful musician, both theoretical and practical; while his attainments as a self-taught mathematician were fully adequate to the prosecution of the three branches of astronomy, which he so eminently advanced and adorned. Whatever he did he did methodically and thoroughly; and in this methodical thoroughness lay the secret of what Arago very properly termed his astonishing scientific success.
In 1752, at the age of fourteen, he joined the band of the Hanoverian guard, and with his detachment visited England in 1755, accompanied by his father and eldest brother; in the following year he returned to his native country; but the hardships of campaigning during the Seven Years' War imperilling his health, his parents privately removed him from the regiment, and on the 26th of July 1757 despatched him to England. There, as might have been expected, the earlier part of his career was attended with formidable difficulties and much privation. We find him engaged in several towns in the north of England as organist and teacher of music, which were not lucrative occupations. But the tide of his fortunes began to flow when he obtained in 1766 the appointment of organist to the Octagon chapel in Bath, at that time the resort of the wealth and fashion of the city.

During the next five or six years he became the leading musical authority, and the director of all the chief public musical entertainments at Bath. His circumstances having thus become easier, he revisited Hanover for the purpose of bringing back with him his sister Caroline, whose services he much needed in his multifarious undertakings. She arrived in Bath in August 1772, being at that time in her twenty-third year. She thus obtained her brother's consent to an arrangement whereby "fate" determined it should be his lot to retire to bed with a bason of milk or a glass of water, with Smith's Harmonies and Ferguson's Astronomy, &c., and so went to sleep buried under his favourite authors; and his first thoughts on waking were how to obtain instruments for viewing those objects himself of which he had been reading. "It is not without significance that we find him thus reading Smith's Harmonies; to that study loyalty to his profession would impel him; as a reward for his thoroughness this led him to Smith's Optics, and this, by a natural sequence, again led him to astronomy, for the purposes of which the chief optical instruments were devised. It was in this way that he was introduced to the works of Fresnel and Keill, and subsequently to those of Lalande, whereby he educated himself to become an astronomer of undying fame. In those days telescopes were very rare, very expensive and not very efficient, for the Dollond's had not as yet perfected even their beautiful little achromatics of 2½ in. aperture. So Herschel was obliged to content himself with hiring a small Gregorian reflector of about 2 in. aperture, which he had seen exposed for loan in a tradesman's shop. Not satisfied with this implement, he procured a small lens of about 18 ft. focal length, and set his sister to work on a pasteboard tube to match it, so as to make him a telescope. This unsatisfactory material was soon replaced by tin, and thus a sorry sort of vision was obtained of Jupiter, Saturn and the moon. He then sought in London for a reflector of which he had learned dimensions; but no such instrument was on sale; and the project was abandoned for the construction of a reflecting telescope of 5 or 6 ft. focal length he regarded as too exorbitant even for the gratification of such desires as his own. So he was driven to the only alternative that remained; he must himself build a large telescope. His first step in this direction was to purchase the debris of an amateur's implements for grinding and polishing small mirrors; and thus, by slow degrees, and by indomitable perseverance, he in 1774 had, as he says, the satisfaction of viewing the heavens with a Newtonian telescope of 6 ft. focal length made by his own hands. But he was not contented to be a mere star-gazer; on the contrary, he had from the very first conceived the gigantic project of surveying the entire heavens, and, if possible, of ascertaining the plan of the general structure by a settled mode of procedure, if only he could provide himself with adequate instrumental means. For this purpose he, his brother and his sister toiled for many years at the grinding and polishing of hundreds of specula, always retaining the best and recasting the others, until the most perfect of the earlier products had been surpassed. This was the work of the daylight in those seasons of the year when the fashionable visitors of Bath had quitted the place, and had thus freed the family from professional duties. After 1774 every available hour of the night was devoted to the long-hoped-for scrutiny of the skies. In those days no machinery had been invented for the construction of telescopic mirrors; the man who had the hardihood to undertake polishing them doomed himself to walk leisurely and uniformly round an upright post for many hours, without removing his hands from the mirror, until his work was done. On these occasions Herschel received his food from the hands of his faithful sister. But his reward was nigh.

In May 1780 his first two papers containing some results of his observations on the variable star "Mira" and the mountains of the moon were communicated to the Royal Society through the influential introduction of Dr William Watson. Herschel had made his acquaintance in a characteristic manner. In order to obtain a sight of the moon, the astronomer had taken his telescope into the street opposite his house; the celebrated physician happening to pass at the time, and seeing his eye removed for a moment from the instrument, requested permission to take his place. The mutual courtesies and intelligent conversation which ensued soon ripened this casual acquaintance into a solid and enduring regard.

The phenomena of variable stars were examined by Herschel as a guide to what might be occurring in our own sun. The sun, he knew, rotated on its axis, and he knew that dark spots often exist on its photosphere; the questions that he put to himself were: Are there dark spots also on variable stars? Do the stars also rotate on their axes? or are they sometimes partially eclipsed by the intervention of opaque bodies? And he went on to enquire, What are these singular spots upon the sun? and have they any practical relation to the inhabitants of this planet? To these questions he applied his telescopes and his thoughts; and he communicated the results to the Royal Society in no less than six memoirs, occupying very many pages in the Philosophical Transactions, and extending in date from 1780 to 1801. It was in the latter year that these remarkable papers culminated in the inquiry whether any relation could be traced in the recurrence of sun-spots, regarded as evidences of solar activity, and the varying seasons of our planet, as exhibited by the varying price of corn. Herschel's reply was indefinite; nor has a final solution of the related problems yet been obtained.

In 1781 he communicated to the Royal Society the first of a series of papers on the rotation of the planets and of their several satellites. The object which he had in view was not so much to ascertain the times of their rotation as to discover whether those rotations are strictly uniform. From the result he expected to gather, by analogy, the probability of an alteration in the length of our own day. These inquiries occupy the greater part of seven memoirs extending from 1781 to 1797. While engaged on them he noticed the curious appearance of a white spot near to each of the poles of the planet Mars. On investigating the inclination of its axis to the plane of its orbit, and finding that it differed little from that of the earth, he concluded that its changes of climate also would resemble our own, and that these white patches were probably polar snow. Modern researches have confirmed his conclusion. He also discovered that, as far as his observations extended, the times of the rotations of the various satellites round their axes conformed to the analogy of our moon by equalising the times of their revolution round their primaries. Here again we perceive that his discoveries arose out of the systematic and comprehensive nature of his investigation. Nothing with such a man is accidental.

In the same year (1781) Herschel made a discovery which completely altered the character of his professional life. In the course of a methodical review of the heavens he lighted on an object which at first he supposed to be a comet, but which, by its subsequent motions and appearance, averted itself to be a new planet, moving outside the orbit of Saturn. The name of Georgium Sidus was by him assigned to it, but has by general consent been laid aside in favour of Uranus. The object was detected with a 7-ft. reflector having an aperture of 6½ in.; subsequently, when he had provided himself with a much more powerful telescope, of 20 ft. focal length, he discovered, as he believed, no less than six Uranian satellites. Modern observations, while abolishing four of these supposed attendants, have added two others apparently not observed by Herschel. Seven memoirs
on the subject were communicated by him to the Royal Society, extending from the date of the discovery in 1781 to 1815. A noteworthy peculiarity in Herschel's mode of observation led to the discovery of this planet. He had observed that the spurious diameters of stars are not much affected by increasing the magnifying powers, but that the case is different with other celestial objects; hence if anything in his telescopic field struck him as unusual in aspect, he immediately varied the magnifying power in order to decide its nature. Thus Uranus was discovered; and had a similar method been applied to Neptune, that planet would have been found at Cambridge some months before it was recognized at Berlin.

We now come to the beginning of Herschel's most important series of observations, culminating in what ought probably to be regarded as his capital discovery. A material part of the task which he had set himself embraced the determination of the relative distances of the stars from our sun and from each other. Now, in the course of his scrutiny of the heavens, he had observed many stars in apparently very close contiguity, but often differing greatly in relative brightness. He concluded that, on the average, the brighter star would be the nearer, and thus demonstrated the smaller enormously more distant; and considering that an astronomer on the earth, in consequence of its immense orbital displacement of some 180 millions of miles every six months, would see such a pair of stars under different perspective aspects, he perceived that the measurement of these changes should lead to an approximate determination of the stars' relative distances. He therefore mapped down the places and aspects of all the double stars that he met with, and communicated in 1782 and 1785 very extensive catalogues of the results. Indeed, his very letter in 1781, sent to the Royal Astronomical Society in the year 1822, when he was its first president and already in the eighty-fourth year of his age, related to these investigations. In the memoir of 1782 he threw out the hint that these apparently contiguous stars might be genuine pairs in mutual revolution; but he significantly added that the time had not yet arrived for settling the question. Eleven years afterwards (1793), he re-measured the relative positions of many such couples, and we may conceive what his feelings must have been at finding his prediction verified. For he ascertained that some of these stars circulated round each other, after the manner required by the laws of science, and thus demonstrated among the distant members of the starry firmament of the same mechanical laws which bind together the harmonious motions of our solar system. This sublime discovery, announced in 1802, would of itself suffice to immortalize his memory. If only he had lived long enough to learn the approximate distances of some of these binary combinations, he would at once have been able to calculate their masses relative to that of our own sun; and the quantities being, as we now know, strictly comparable, he would have found another of his analogical conjectures realized.

In the year 1782 Herschel was invited to Windsor by George III, and accepted the king's offer to become his private astronomer, and henceforth devote himself wholly to a scientific career. His salary was fixed at £200 per annum, to which an addition of £50 per annum was subsequently made for the astronomical assistance of his sister. Dr Watson, to whom alone the amount was mentioned, made the natural remark, "Never before was honour purchased by a monarch at so cheap a rate."

In this way the great astronomer removed from Bath, first to Datchet and soon afterwards permanently to Slough, within easy access of his royal patron at Windsor.

The old pursuits at Bath were soon resumed at Slough, but with renewed vigour and without the former professional interruptions. The greater part, in fact, of the papers already referred to are dated from Datchet and Slough; for the magnific- ent astronomical speculations in which he was engaged, though for the most part conceived in the earlier portion of his philosophical career, required years of patient observation before they could be fully examined and realized.

It was at Slough in 1783 that he wrote his first memorable paper on the "Motion of the Solar System in Space,"—a sublime speculation, yet through his genius realized by considerations of the utmost simplicity. He returned to the same subject with fuller details in 1805. It was also after his removal to Slough that he published his first memoir on the construction of the heavens, which from the first had been the inspiring idea of his varied toils. In a long series of remarkable papers, addressed as usual to the Royal Society, and extending from the year 1784 to 1818, when he was eighty years of age, he demonstrated the fact that our sun is a star situated not far from the bifurcation of the Milky Way, and that all the stars visible to us are not necessarily less than our own in mass, but, in the sun itself, that it is surrounded by an immensely extended stratum. At one time he imagined that his powerful instruments had pierced through this stellar stratum, and that he had approximately determined the form of some of its boundaries. In the last of his memoirs, having convinced himself of his error, he admitted that to his telescopes the Milky Way was "fathomless." On either side of this assemblage of stars, presumably in ceaseless motion round their common centre of gravity, Herschel discovered a canopy of discrete nebulous masses, such as those from the condensation of which he supposed the whole stellar universe to have been formed,—a magnificent conception, pursued with a force of genius and put to the practical test of observation with an industry almost incredible.

Hitherto we have said nothing about the great reflecting telescope, of 40 ft. focal length and 4 ft. aperture, the construction of which is often, though mistakenly, regarded as his chief performance. The full description of this celebrated instrument will be found in the 53rd volume of the Transactions of the Royal Society. On the day that it was finished (August 28, 1789), Herschel saw in the first view, in a grandeur not witnessed before, the Saturnian system with six satellites, five of which had been discovered long before by C. Huygens and G. D. Cassini, while the sixth, subsequently named Enceladus, he had, two years before, sighted by glimpses in his exquisite little telescope of 6½ in. aperture, but now saw in unmistakable brightness with the towering giant he had just completed. On the 17th of September he discovered a seventh, which proved to be the nearest to the globe of Saturn. It has since received the name of Mimas. It is somewhat remarkable that, notwithstanding his long and repeated scrutinies of this planet, the discovery of Rhea, Hyperion, and the crape ring should have escaped him.

Herschel married, on the 8th of May 1788, the widow of Mr John Pitt, a wealthy London merchant, by whom he had an only son, John Frederick William. The prince regent conferred a Hanoverian knighthood upon him in 1816. But a far more valued and less tardy distinction was the Copley medal assigned to him by his associates in the Royal Society in 1781.

He died at Slough on the 25th of August 1822, in the eighty-fourth year of his age, and was buried under the tower of St Laurence's Church, Upton, within a few hundred yards of the old site of the 40-ft. telescope. A mural tablet on the wall of the church bears a Latin inscription from the pen of the late Dr Goodall, provost of Eton College.

Sme, William Herschel and his Work (1900), and various papers in this volume, were discussed and reduced by E. C. Pickering in Harvard Annals, vols. xiv. p. 345, xxiii. p. 185, and xxiv.

C. P.; A. M. C.)

HERSCHEL, SIR JOHN FREDERICK WILLIAM, BART. (1792-1871), English astronomer, the only son of Sir William Herschel, was born at Slough, Bucks, on the 7th of March 1792. His scholastic education commenced at Eton, but maternal fears or prejudices soon removed him to the house of a private tutor. Thence, at the early age of seventeen, he was sent to St John's College, Cambridge, and the form and method of the
mathematical instruction he there received exercised a material influence on the whole complexion of his scientific career. In due time the young student won the highest academical distinction of his year, graduating as senior wrangler in 1813. It was during his undergraduate ship that he and two of his fellow-students who subsequently attained to very high eminence, Dean Peacock and Charles Babbage, entered into a compact that they would "do their best to leave the world wiser than they found it;"—a compact loyally and successfully carried out by all three to the end. As a commencement of this laudable attempt we find Herschel associated with these two friends in the production of a work on the differential calculus, and on cognate branches of mathematical science, which changed the style and aspect of mathematical learning in England, and brought it up to the level of the Continental maths. He experimental memoirs communicated to the Royal Society on new applications of mathematical analysis at once placed him in the front rank of the cultivators of this branch of knowledge. Of these his father had the gratification of introducing the first, but the others were presented in his own right as a fellow.

With the intention of being called to the bar, he entered his name at Lincoln's Inn on the 24th of January 1814, and placed himself under the guidance of an eminent special pleader. Probably this temporary choice of a profession was inspired by the extraordinary success in legal pursuits which had attended the efforts of some noted Cambridge mathematicians. Be that as it may, an early acquaintance with Mr Wollaston in London soon changed the direction of his studies. He entered the physical society, took up astronomy in 1816; and in 1820, assisted by his father, he completed for a reflecting telescope a mirror of 18 in. diameter and 20 ft. focal length. This, subsequently improved by his own hands, became the instrument which enabled him to effect the astronomical observations forming the chief basis of his fame. In 1821-22 we find him associated with Sir James South in the re-examination of his father's double stars, by the aid of two excellent refractors, of 7 and 5 ft. focal length respectively. For this work he was presented in 1826 with the Astronomical Society's gold medal; and with the Lalande medal of the French Institute in 1825; while the Royal Society had in 1821 bestowed upon him the Copley medal for his mathematical contributions to their Transactions. From 1824 to 1827 he held the responsible post of secretary to that society; and was in 1827 elected to the chair of the Astronomical Society, which office he also filled on two subsequent occasions. In the discharge of his duties to the last-named society he delivered presidential addresses and wrote oratory notices of deceased fellows, memorable for their combination of eloquence and wisdom. In 1831 the honour of knighthood was conferred on him by William IV., and two years later he again received the recognition of the Royal Society by the award of one of their medals for his memoir "On the Investigation of the Orbits of Revolving Double Stars." The award significantly commemorated his completion of his father's discovery of gravitational stellar systems. In the investigation of a gravitational system he could as it were see the two component stars of the binary system revolving under the prescription of the Newtonian law.

Before the end of the year 1833, being then about forty years of age, Sir John Herschel had re-examined all his father's double stars and nebulae, and had added many similar bodies to his own lists; thus accomplishing, under the conditions then prevailing, the full work of a lifetime. For it should be remembered that astronomers were not as yet provided with those valuable automatic contrivances which at present materially abridge the labour and increase the accuracy of their determinations. Equatorially mounted instruments actuated by clockwork, electrical chronographs for recording the times of the planets observed, were not available to Sir John Herschel; and he had no assistant.

His scientific life now entered upon another and very characteristic phase. The bias of his mind, as he subsequently was wont to declare, was towards chemistry and the phenomena of light, rather than towards astronomy. Indeed, very shortly after taking his degree at Cambridge, he proposed himself as a candidate for the vacant chair of chemistry in that university; but, as he said with some humour, the result of the election was to leave him in a glorious minority of one. In fact Herschel had become an astronomer from a sense of duty, and it was by filial loyalty to his father's memory that he was now impelled to undertake the completion of the work nobly begun at Slough. William Herschel had searched the northern heavens; John Herschel determined to explore the southern, besides re-exploring northern skies. "I resolved," he said, "to attempt the completion of a survey of the whole surface of the heavens; and for this purpose to transport into the other hemisphere the same instrument which had been employed in this, so as to give a unity to the results of both portions of the survey, and to render them comparable with each other." In accordance with this resolution, he and his family embarked for the Cape on the 13th November 1833; they arrived in Table Bay on the 15th January 1834; and proceedings, he says, "were pushed forward with such effect that on the 22nd of February I was enabled to gratify my curiosity by a view of [k] Cruxis, the nebula about [n] Argus, and some other remarkable objects in the 20-ft. reflector, and on the night of the 4th of March to commence a regular course of sweeping.

To give an adequate description of the mass of work completed by the means of four years of his life at the Cape would require the transcription of a considerable portion of the Cape Observations, a volume of unsurpassed interest and importance; although it might perhaps be equalled by a judicious selection from Sir William's 'Two Volumes of the Philosophical Transactions.' It was published, at the sole expense of the late Duke of Northumberland, but not till 1847, nine years after the author's return to England, for the cogent reason that he said, 'The book of the observations, as well as the entire work of reducing, arranging and preparing them for the press, have been executed by myself.' There are 104 pages of catalogues of southern stars, with a complete list of the principal and elaborate drawings of the great nebula in Orion, and of the stars surrounding the remarkable star in Argo. The labour and the thought bestowed upon some of these objects are almost Herculean. Several months were spent upon a minute spot in the heavens containing 1216 stars, but which an ordinary spangle, held at a distance of an arm's length, would eclipse. These catalogues and charts being completed, he proceeded to discuss their significance, and then to make this his father's hypothesis that our solar system is not the centre of the universe, but suspended, at a depth not greater than that of the average distance from us of an eleventh magnitude star. Then follows his catalogue of the relative positions and magnitudes of the southern double stars, to one of which, [v] Virginis, he applied the beautiful name of 'well-known double.' Initially discovered by himself, it impelled the satisfaction of witnessing the fulfilment of his prediction that the components would, in the course of their revolution, appear to close up into a single star, inseparable by any telescopic power. In the next chapter he proceeded to describe his observations on the varying and relative brightness of the stars. It has been already detailed how his father began his scientific career by similar observations on stellar light-fluctuations, and how his remarks culminated years afterwards in the question whether the radiative changes of our sun, due to the presence or absence of sun-spots, affected our harvests and the price of corn. Sir John carried speculation still farther, perceiving that what was the variation to the extent of half a degree in the sun's brightness would account for those strange alternations of semi-arctic and semi-tropical climates which geological researches show to have occurred in various regions of our globe.

Herschel returned to his English home in the spring of 1838. As was natural and right, he was welcomed with an enthusiastic greeting. By the queen at her coronation he was created a baronet; and, what to him was better than all such rewards, other men caught the contagion of his example, and laboured in fields similar to his own. Herschel was a highly accomplished chemist. His discovery in 1819 of the solvent power of hyposulphite of soda on the otherwise insoluble salts of silver was the prelude to its use as a fixing agent in photography; and he invented in 1839, independently of Fox Talbot, the process of photography on sensitized paper. He was the first person to apply the now well-known terms positive and negative to photographic images.
and to imprint them upon glass prepared by the deposit of a sensitive film. He also paved the way for Sir George Stokes's discovery of fluorescence, by his addition of the lavender rays to the spectrum, and by his announcement in 1845 of "epipelic dispersion," as exhibited by sulphate of quinine. Several other important researches connected with the undulatory theory of light are embodied in his treatise on "Light," published in the Encyclopaedia metropolitana.

Perhaps no man can become a truly great mathematician or philosopher, who does not have a strong imagination. John Herschel possessed this endowment to a large extent; and he solved his declining years with the translation of the Hliad into verse, having earlier executed a similar version of Schiller's 'Walk.' But the main work of his later life was the collection of all his father's catalogues of nebulae and double stars combined with his own observations and those of other astronomers each into a single volume. He lived to complete the former, to present it to the Royal Society, and to see it published in a separate form in the Philosophical Transactions, vol. cliv. The latter work he left unfinished, bequeathing it, in its imperfect form, to the Astronomer Royal; Sir John Herschell, by means of a trust to which he had been made legal governor, and which serves as an index to the observations of various astronomers on double stars up to the year 1866.

A complete list of his contributions to learned societies will be found in the Royal Society's great catalogues, and from them may be gathered most of the records of his busy scientific life. Sir John Herschel met with an amount of public recognition which was unusual in the time of his illustrious father. Naturally he was a member of almost every important learned society in both hemispheres. For five years he held the same office of master of the mint, which more than a century before had belonged to Sir Isaac Newton; his friends also offered to propose him as president of the Royal Society and again as member of parliament for the university of Cambridge, but neither position was desired by him.

In private life Sir John Herschel was a firm and most active friend; he had no jealousies; he avoided all scientific feuds; he gladly lent a helping hand to those who consulted him in scientific difficulties; he never discouraged, and still less disparaged, men younger than or inferior to himself; he was pleased by appreciation of his work without being solicitous for applause; he was said of him by a distinguished critic, and without extravagance, that "his was a life full of serenity of the sage and the docile innocence of a child."

He died at Collingwood, his residence near Hawkhurst in Kent, on the 11th of May 1871, in the seventy-ninth year of his age, and his remains are interred in Westminster Abbey close to the grave of Sir Isaac Newton.

Besides the laborious Cape Observations, Sir John Herschel was the author of several books, one of which at least, On the Study of Natural Philosophy (1830), possesses an interest which no future advances of the subjects on which he wrote can obliterate. In 1849 came the Outlines of Astronomy, a volume stillplete with charm and instruction. His articles, "Meteorology," "Physical Geography," and "Telescope," contributed to the 8th edition of the Encyclopaedia Britannica, were afterwards published separately. When he was at Krape he was more than once assisted in the attempts there to diffuse a love of knowledge among men not engaged in literary pursuits; and with the same purpose he, on his return to England, published, in Good Words and elsewhere, a series of papers on interesting points of natural philosophy, subsequently collected in a volume called Familiar Lectures on Scientific Subjects. Another less widely known volume is his Collected Addresses, in which he was in his happiest and most instructive mood.

great efforts sufficed in his case to gain him a reputation as a debater. The best examples of his style as a private member will be found in Hansard under the dates 18th February 1876, 23rd May 1878, 6th May 1879. On the last occasion he carried a resolution in favour of abolishing actions for breach of promise of marriage except when actual pecuniary loss had ensued, the damages in such cases to be measured by the amount of such loss. The grace of manner and solid reasoning with which he acquainted himself during these displays obtained for him the notice of Gladstone, who in 1880 appointed Herschell solicitor-general.

Herschell's public services from 1880 to 1885 were of great value, particularly in dealing with the "cases for opinion" submitted by the Foreign Office and other departments. He was also very helpful in speeding government measures through the House, notably the Irish Land Act 1881, the Corrupt Practices and Bankruptcy Acts 1883, the County Franchise Act 1884 and the Redistribution of Seats Act 1885. This last was a bitter pill for Herschell, since it halved the representation of Durham city, and so gave him statutory notice to quit. Reckoning on the local support of the Cavendish family, he contested the North Londesdale division of Lancashire; but in spite of the powerful influence of Lord Hartington, he was badly beaten at the poll, though Mr Gladstone again obtained a majority in the country. Herschell now thought he saw the solicitor-generalship slipping away from him, and along with it all prospect of high promotion.

Lord Selborne and Sir Henry James, however, successively declined Gladstone's offer of the Woolsack, and in 1886 Herschell, by a sudden turn of fortune's wheel, found himself in his forty-ninth year lord chancellor.

Herschell's chancellorship lasted barely six months, for in August 1886 Gladstone's Home Rule Bill was rejected in the Commons and his administration fell. In August 1892, when Gladstone returned to power, Herschell again became lord chancellor.

In September 1892, when the second Home Rule Bill came on for second reading in the House of Lords, Herschell took advantage of the opportunity to justify the "sudden conversion" to Home Rule of himself and his colleagues in 1885 by comparing it to the duke of Wellington's conversion to Catholic Emancipation in 1829 and to that of Sir Robert Peel to Free Trade in 1846. In 1895, however, his second chancellorship came to an end with the defeat of the Rosebery ministry.

Whether sitting at the royal courts in the Strand, on the judicial committee of the privy council, or in the House of Lords, Lord Herschell's judgments were distinguished for their acute and subtle reasoning, for their grasp of legal principles, and, what is not less marked, for his breadth of aspect on broad institutional and social questions. He was not a profound lawyer, but his quickness of apprehension was such that it was an excellent substitute for great learning. In construing a real property will or any other document, his first impulse was to read it by the light of nature, and to decline to be influenced by the construction put by the judges on similar phrases occurring elsewhere. But when he discovered that certain expressions had acquired a technical meaning which could not be disturbed without flustering the dovecotes of the conveyancers, he would yield to the established rule, even though he did not agree with it. He was perhaps seen at his judicial best in Vaglano v. Bank of England (1861) and Allen v. Flood (1898). Latterly he showed a tendency, which seems to grow on some judges, to interrupt counsel overmuch. The case last mentioned furnishes an example of this. The question involved was what constituted a molestation of a man in the pursuit of his lawful calling. At the close of the argument of counsel, whom he had frequently interrupted, one of their lordships, noted for his pretty wit, observed that although there might be a doubt as to what amounted to such molestation in point of law, the House could well understand, after that day's proceedings, what it was in actual practice. In addition to his political and judicial work, Herschell rendered many public services. In 1888 he presided over an inquiry directed by the House of Commons with regard to the Metropolitan Board of Works. He acted as chairman of two royal commissions, one on Indian currency, the other on vaccination. He took a great interest in the National Society for the Prevention of Cruelty to Children, not only promoting the acts of 1889 and 1894, but also bestowing a good deal of time in sifting the truth of certain allegations which had been brought against the management of that society. In June 1893 he was appointed chancellor of the university of London in succession to the earl of Derby, and he entered on his new duties with the usual thoroughness. "His views of reform," according to Victor Duxons, the accomplished registrar of the university, "were always most liberal and most frankly stated, though at first they were not altogether popular with an important section of university opinion. He disarmed opposition by his intellectual power, rather than conciliated it by compromise, and sometimes was perhaps a little masterful, after a fashion of his own, in his treatment of the various burning questions that agitated the university during his tenure of office. His characteristic power of detachment was well illustrated by his treatment of the proposal to remove the university to the site of the Imperial Institute at South Kensington. Although he was at that time chairman of the Institute, the most irremovable opponent of the removal never questioned his absolute impartiality. With the Imperial Institute Herschell had been officially connected from its inception. He was chairman of the provisional committee appointed by the prince of Wales to formulate a scheme for its organization, and he took an active part in the preparation of its charter and constitution in conjunction with Lord Thring, Lord James, Sir Frederick Abel and Mr John Hollams. He was the first chairman of its council, and, except during his tour in India in 1888, when he brought the Institute under the notice of the Indian authorities, he was hardly absent from a single meeting. For his special services in this connexion he was made G.C.B. In 1893, this being the only instance of a lord chancellor being decorated with an order. In 1897 he was appointed, jointly with Lord Justice Collins, to represent Great Britain on the Venezuela Boundary Commission, which assembled in Paris in the spring of 1899. So complicated a business involved a great deal of preparation and a careful study of maps and historic documents. Not content with this, he accepted in 1898 a seat on the joint high commission appointed to adjust certain boundary and other important questions pending between Great Britain and Canada on the one hand and the United States on the other hand. He started for America in July of that year, and was received most cordially at Washington. His fellow commissioners elected him their president. In February 1899, while the commission was in full swing, he had the misfortune to slip on the street and in falling to fracture a bone. His constitution, which at one time was a robust one, had been undermined by constant hard work, and proved unequal to sustaining the shock. On the 1st of March, only a fortnight after the accident, he died at the Shoreham Hotel, Washington, a post-mortem examination revealing disease of the heart. Mr Hay, secretary of state, at once telegraphed to Mr Choate, the United States ambassador in London, the "deep sorrow" felt by President McKinley; and Sir Wilfred Laurier said the next day, in the parliament chamber at Ottawa, that he regarded Herschell's death "as a misfortune to Canada and to the British Empire." A funeral service held in St John's Episcopal Church, Washington, was attended by the president and vice-president of the United States, by the cabinet ministers, the judges of the Supreme Court, the members of the joint high commission, and a large number of senators and other representative men. The body was brought to London in a British man-of-war, and a second funeral service was held in Westminster Abbey before it was conveyed to its final resting-place at Tincleton, Dorset, in the parish church of which he had been married. Herschell left a widow, granddaughter of Vice-Chancellor Kindersley; a son, Richard Farrer (b. 1878), who succeeded him as second baron; and two daughters.

A "reminiscence" of Herschell by Mr Speaker Gully (Lord Selby) will be found in The Law Quarterly Review for April 1899. The Journal of the Society of Comparative Legislation (of which he had been
HERSENT—HERTFORD, EARS OF

397

president from its formation in 1893) contains, in its part for July of the same year, notices of him by Lord James of Hereford, Lord Davie, Mr. Victor Williamson (his executor), and intimate friends, and also by Mr. J. D. Brewster and Senator C. W. Fairbanks (both of the United States).

HERSENT, LOUIS (1777-1860), French painter, was born at Paris on the 10th of March 1777, and becoming a pupil of David, obtained the Prix de Rome in 1797; in the Salon of 1802 he exhibited "Metamorphosis of Narcissus," a work continued to exhibit with rare intervals up to 1810. His most considerable works under the Empire were "Achilles paring from Brissée," and "Atala dying in the arms of Chaetac" (both engraved in Landon's "Annales du Musée"); "Incident of the life of Fénelon," painted in 1810, found a place at Malmaison, and "Passage of the Bridge at Landshut," which belongs to the same date, is now at Versailles. Herent's typical works, however, belong to the period of the Restoration; "Louis XVI. relieving the Afflicted" (Versailles), and "Daphnis and Chloé," "engraved by Langier and by Géléto" were both in the Salon of 1817; at that of 1819, the "Abduction of Gustave Vasa" brought to Herent his first honour, but the picture, purchased by the duke of Orleans, was destroyed at the Palais Royal in 1848, and the engraving by Henriquel-Dupont is now its sole record. "Ruth," produced in 1822, became the property of Louis XVIII, whom, from the moment that Herent rallied to the Restoration jealously patronized him, made him officer of the legion of honour, and pressed his claims at the Institute, where he replaced van Spaendonck. He continued in favour under Charles X., for whom he executed "Monk's of Mount St. Gotthard," exhibited in 1824. In 1831 Herent made his last appearance at the Salon with portraits of Louis Philippe and his ancestors. That of the king though good, is not equal to the portrait of Spontini (Berlin), which is probably Herent's "chef-d'œuvre." After this date Herent ceased to exhibit at the yearly salons. Although in 1836 he sent an excellent likeness of Delphine Gay and one or two other works to the rooms of the Sociétée d'Artists, he could not be tempted from his usual reserve even by the international contest of 1855. He died on the 2nd of October 1860.

HERSFELD, a town of Germany, in the Prussian province of Hesse-Nassau, is pleasantly situated at the confluence of the Geis and Hau rivers, in the county of Main, near Behra, 24 m. N.E. of Fulda. Pop. (1905) 8688. Some of the old fortifications of the town remain, but the ramparts and ditches have been laid out as promenades. The principal buildings are the Stadt Kirche, a beautiful Gothic building, erected about 1320 and restored in 1899, with a fine tower and a large bell; the old and interesting town hall (Rathaus) and the ruins of the abbey church. This church was erected on the site of the cathedral in the beginning of the 12th century; it was built in the Byzantine style and was burnt down by the French in 1761. Outside the town are the Frauenberg and the Johannesberg, on both of which are monastic ruins. Among the public institutions are a gymnasium and a military school. The town has important manufactures of cloth, leather and machinery; it also has dye-works, worsted mills and soap-boiling works.

Hersfeld owes its existence to the Benedictine abbey (see below). It became a town in the 12th century and in 1370 the burgurers, having meanwhile shaken off the authority of the abbots, placed themselves under the protection of the landgraves of Hesse. It was taken and retaken during the Thirty Years' War and later it suffered from the attacks of the French. The town of Hersfeld was founded by Lullus, afterwards archbishop of Mainz, about 760. It was richly endowed by Charlemagne and became an ecclesiastical principality in the 12th century, passing under the protection of the landgraves of Hesse in 1423. It was secularized in 1648, having been previously administered for some years by a member of the ruling family of Hesse. As a secular principality Hersfeld passed to Hesse, and with electoral Hesse was united with Prussia in 1866. In the middle ages the abbey was famous for its library. See Vögelius, "Denkmäler von Hersfeld" (Hersfeld, 1881-1891); Deems, "Nachrichten und Urkunden zur Chronik von Hersfeld" (Hersfeld, 1897-1901); and P. Hafner, "Die Reichskabinette Hersfeld bis zur Mitte des 13. Jahrhunderts" (Hersfeld, 1899).

HERSTAL, or Herstal, a town of Belgium, less than 2 m. N. of Liège and practically one of its suburbs. The name is supposed to be derived from 'Heerstelle, i.e. "Permanant Camp."' The second Pippin was born here, and this mayor of the palace acquired the control of the kingdom of the Franks. His grandson, Pippin the Short, died at Herstal in A.D. 708, and it disputes with Aix la Chapelle the honour of being the birthplace of Charlemagne. It is now a very active centre of iron and steel manufactu.
Hertford, a market-town and municipal borough, and the county town of Hertfordshire, England, in the Hertford parliamentary division of the county, 44 m. N. from London, the terminus of branch lines of the Great Eastern and Great Northern railways. Pop. (1901) 9322. It is pleasantly situated in the valley of the river Lea. The chief buildings are the modern churches of St Andrew and of All Saints, on the sites of old ones; a town hall, corn exchange, public library, school of art and the old castle, which retains the wall and part of a tower dating from the Norman period, and is represented by a picturesque Jacobean building of brick, largely modernized. There are several educational establishments, including the preparatory school for Christ's Hospital, a picturesqule building (in great part, however, rebuilt) at the east end of the town, Hale's grammar school, the Cowper Testimonial school, and a Green-coat school for boy soldiers. Two miles N.E. is Haileybury College, one of the principal public schools of England, founded in 1865 by the East India Company for their civil service students, who were then temporarily housed in Hertford Castle. The school lies high above the Lea valley, towards Hoddesdon, in the midst of a stretch of finely-wooded country. Hertford has a considerable agricultural trade, and there are maltings, breweries, ironfoundries, and oriental printing works. The town is governed by a mayor, 5 aldermen and 15 councillors. Area, 1354 acres.

Hertford (Hertford, Herford, Hertford) was the scene of a synod in 673. Its communication with London by way of the Lea and the Thames gave it strategic importance during the Danish occupation of the country. In 1066 and later it was a royal garrison and burgh. It made separate payments for aids to the Norman and Angevin kings; and in 1331 was governed by a bailiff annually elected by the commonalty. A charter incorporated the bailiffs and burgesses in 1555, and was confirmed under Elizabeth and in 1606. A charter of 1868 to the mayor, aldermen and commonalty was effective until the Municipal Corporation Act. Hertford returned two burgesses to the parliament of 1298, and to others until, after 1375/6, such right became abeyant, to be restored by order of parliament in 1623/4. One representative was lost by the Representation Act in 1868, and separate representation by the Redistribution Act in 1885. A grant of fairs in 1226 probably originated or confirmed this privilege, and was confirmed in 1246 and of St Simon and St Jude, their vicars and mourners, which fairs were confirmed by Elizabeth and Charles II. Another on the vigil, morrow and feast of the Nativity of the Virgin was granted by Elizabeth: its date was changed to May-day under James I. Modern fairs are on the third Saturday before Easter, the 12th of May, the 5th of July and the 8th of November. Markets were held in 1331 on Wednesday and Saturday; after 1368 on Thursday and Saturday; and they returned to Wednesdays and Saturdays in 1668.

Hertfordshire [Hearts], a county of England, bounded N. by Cambridgeshire, N.W. by Bedfordshire, E. by Essex, S. by Middlesex, and S.W. by Buckinghamshire. The area is 634½ sq. m., making it the sixth smallest in England. Its aspect is always pleasant, the surface generally undulating, while in some parts, where these undulations form a quick succession of hills and valleys, the woodland scenery becomes very beautiful, as in the upper Lea valley, in the neighbourhood of Tewin near Hertford, and elsewhere. To the north-west and north considerable elevations are reached, a line of hills, facing north-westward with a sharp descent, crossing this portion of the county, and overlooking the flat lands of Bedfordshire and Cambridgeshire. They continue the line of the Chiltern Hills under the name of the East Anglian Ridge. They exceed 800 ft. near Dunstable, sinking gradually north-eastward. These uplands are generally bare, and in parts remarkably sparsely populated compared with the county boundaries at large. In the greater part of the county, however, rich arable lands are intermingled with the parks and woodlands of numerous fine country seats, which impart to the county a peculiar luxuriance. Of the principal rivers, the Lea, rising beyond Luton in Bedfordshire, enters Hertfordshire near East Hyde, flows S.E. to near Hatfield, then E. by. N. to Hertford and Ware, whence it bends S. and passing along the eastern boundary of the county falls into the Thames below London. It receives in its course the Maran, or Mirrorn, the Beamer, the Rib and the Stort, all joining on the north side; the Stort for some distance; and the River Lea forms the eastern boundary with Essex. The Colne flows through the south-western part of the county, to fall into the Thames at Staines. It receives the Ver, the Bulborne and the Chess. The Ivel, rising in the N.W. soon passes into Bedfordshire to join the Great Ouse. To the south of Hatfield, near North Mimms, two streams of moderate size are lost in pot-holes, except in the highest floods. The New River, one of the water supplies of London, has its source near Ware, and runs roughly parallel with the Lea. Most of the rivers are full of fish, including trout in the upper parts of the Lea and Colne especially, which are carefully preserved.

Geology.—The rocks of Hertfordshire belong to the shallow syncline known as the London basin, the beds dipping in a south-easterly direction. The two most important formations are the Chalk, which forms the high ground in the north and west; and the Eocene beds which form the clay lands near the boundary of the county. The London clay has a southern continuation in the Lea valley. On the northern boundary, at the foot of the chalk hills, a small strip of Gault Clay and the Upper Greensand outcrop. The lowest subdivision of the chalk is the Chalk Marl, which with the Torrington Stone above it, lies at the base of the Chalk escarpment, by Ashwell, Pirton and Miswell to Toring. Above these beds, the Lower Chalk, without any sharp boundary, is formed of the Reading beds. The Upper Chalk slopes southward towards the Thames, a geographical boundary previously mentioned. The Reading beds consist of mottled and yellow clays and sands, the latter are frequently hardened into masses made up of pebbles in a siliceous cement, known locally as Hertfordshire puddingstone. The London Clay, a still blue clay which weathers brown, rests nearly everywhere upon the Reading beds. Outliers of Eocene rocks rest on the chalk at Micklefield Green, Sarratt, Bedfont, &c. The chalk is often covered by the Clay-with-flints, a detrital deposit, formed of the remnants of Tertiary rocks and Chalk. Glacial gravels, clays and loams cover a great deal of the whole area, and the Upper Chalk itself has been disturbed at Reed and Barley by the same agency. Chalk was formerly used for building purposes; it is now burned for lime. Reading beds and London clay are dug for brickmaking at Watford, Hertford and Hatfield. Phosphatic nodules have been excavated from the base of the Chalk Marl at several places along the outcrop; these are worked commercially.

Climate and Agriculture.—The climate is mild, dry and generally healthy. On this account London physicians were formerly accustomed to recommend the county to persons in weak health, and it was so much coveted by the noble and wealthy as a place of residence that it was a common saying that "he who buys a home in Hertfordshire pays two years' purchase for the air." Of the total area about four-fifths is under cultivation, and of this more than one-third is in permanent pasture. The principal grain crop is wheat, occupying about two-fifths of the area under corn, but gradually decreasing. The varieties mostly grown are white, and they are unsurpassed by those of any English county. Wheatmashstead on the upper Lea receives its name from the fine quality of the wheat grown in that part. Barley is extensively grown, chiefly for malting purposes. Vetches are grown for the London stables, and the greater part of the permanent grass is used for hay. There are some very rich pastures on the banks of the Stort, and also near Rickmansworth on the Colne. Some two-thirds of the area occupied by green crops is under turnips, swedes and mangolds, many cows being kept for the supply of milk and butter to London. The quantity of stock is generally small, but increasing except in the case of sheep, of which the numbers have greatly decreased. Of cows the most common breed is the Suffolk variety; of sheep, Southdowns, Wiltshires and a cross between Cotteswolds and Leicesters. In the south-west quantities of cherries, apples and pears are grown. The London market maintains its supremacy on the best soils near London, vegetables are forced by the aid of manure, and more than one crop is sometimes obtained in a year. A considerable industry lies in the growth of watercresses in the pure water of the upper parts of the rivers and...
the smaller streams. There are a number of rose-gardens and nurseries.

Other Industries.—The manufacturing industries are slight; though at Great and driving establishments at Watford may be mentioned, and straw-plaiting, paper-making, coach-building, tanning and brick-making are carried on in various towns.

Communications.—Owing to its proximity to the metropolis, Hertfordshire is particularly well served by railways. On the eastern border there is the Great Eastern (Cambridge line) with branches to Hertford and to Buntingford. The main line of the Great Northern passes through the centre by Hatfield, Stevenage and Hitchin, with branches from Hatfield to Hertford, to St Albans and to Luton and Dunstable, and from Hitchin to Baldock. The Midland passes through St Albans and Harpenden, with a branch to Hemel Hempstead. The London & North-Western traverses the south-west by Watford, Berkhamsted, and Tring, with branches to Rickmansworth and to St Albans. The Metropolitan & Great Central joint line serves Rickmansworth, and suburban lines of the Great Northern the Barnet district. The existence of these communications has combined with the natural attractions of the county to cause many villages to become large residential centres. Water communications are supplied from Hertford, Ware and Bishop Stortford, southward to the Thames by the Lee (at 1235), Hitchin (1077), and the Grand Union; and canals, from London to the north-west traverse the south-western corner of the county by Rickmansworth and Berkhamsted. Three great highways from London to the north traverse the county. The Holyhead Road passes Chipping Barnet, South Mimms and St Albans, quitting the county near Dunstable. The Great North Road branches from the Holyhead Road at Barnet, and passes Potter's Bar, Hatfield, Stevenage and Baldock, with a branch from Welwyn to Hitchin and beyond. Another road follows the Lea valley to Ware, whence it runs to Royston, being continued in the Roman Ermine Street and known as the Old North Road.

Population and Administration.—The area of the ancient county is 406,157 acres with a population in 1801 of 220,162, and in 1901 of 250,152. The area of the administrative county is 404,518 acres. The county comprises eighty hundreds. The municipal boroughs are: Hemel Hempstead (11,264), Hertford (9,322), St Albans, a city (16,010). The other urban districts are: Baldock (20,297), Barnet (7,670), Berkhamsted (Great Berkhamsted, 3,140), Bishop Stortford (7,143), Bushey (4,564), Cheshunt (12,302), East Barnet Valley (10,094), Harpenden (4,732), Hoddesdon (4,714), Rickmansworth (5,627), Royston (3,537), Sawbridgeworth (2,085), Stevenage (9,507), Tring (4,440), Ware (5,752) and Watford (29,327). The county is in the home circuit, and assizes are held at Hertford. It has two courts of quarter-sessions, and is divided into 15 petty-sessional districts. The boroughs of Hertford and St Albans have separate commissions of the peace. The total number of civil parishes is 528. All the civil parishes within 12 m. of, or in which no portion is more than 15 m. from, Charing Cross, London, are included in the metropolitan police district. The county contains 170 ecclesiastical parishes or districts, wholly or in part; it is nearly all in the diocese of St Albans, but small parts are in the dioceses of Ely, Oxford and London. It is divided into four parliamentary divisions—Northern or Hitchin, Eastern or Hertford, Mid or St Albans, Western or Watford, each returning one member. There is no parliamentary borough within the county.

History.—Relics of Saxon occupation have been found in Hertfordshire for the most part near St Albans and Hitchin. The diocesan limits show that part of the shire was included in the West Saxon kingdom. The East Saxons, as early as the 6th century, were settled about Hertford, which in 673 was sufficiently important to be the meeting-place of a synod convened by Theodore, archbishop of Canterbury, while in 675 the Witenagemot assembled at a place which has been identified with Hatfield. In the 9th century the district was frequently visited by the Danes; and after the peace of Wedmore the country east of the Lea was included in the Danelaw; in 911 Edward the Elder erected forts on both sides of the river at Hertford.

After the battle of Hastings William advanced into Hertfordshire and ravaged as far as Berkhamsted, where the Conquest received its formal ratification. In the sweeping confiscation of estates which followed, the church was generously endowed, the abbey of St Albans alone holding 172 hides, while Count Uustace of Boulogne, the chief lay tenant, held a vast fief in the north-east of the county. Large estates were held by Geoffrey de Mandeville, and the barony of Peter de Valoges, sheriff of the county in 1086, though extending over six counties in the east of England, was returned in 1166 as a Hertfordshire barony. Berkhamsted was the head of an honour carved from the old borough of Hertford. In the course of time Hertfordshire had been divided; for the most part changed hands very frequently and the county is noticeably lacking in historic families. Edmund Langley, fifth son of Edward III., was born at King's Lungeley in this county.

During the war between John and his barons, William, earl of Salisbury and Falke de Brouete had the king's orders to ravage Hertfordshire, and in 1216 Hertford Castle was captured and Berkhamsted Castle besieged by Louis of France, who had come over by invitation of the barons. At the time of the rising of 1381 the abbey's charter was broken into the abbey of St Albans and forced the abbott to grant them charters. During the Wars of the Roses, Henry VI. was defeated at St Albans in 1455; at the second battle of St Albans the earl of Warwick was defeated by Queen Margaret; and in 1471 Edward IV. again defeated the earl at Barnet. On the outbreak of the Civil War of the 17th century, Hertfordshire joined with Bedfordshire and Essex in petitioning for peace, and St Albans again played an important part in the struggle, being at different times the headquarters of Essex and Fairfax.

As a shire Hertfordshire is of purely military origin, being the county to which Edward the Elder retreated at Hertford. It is first mentioned in the Saxon Chronicle in 1011. At the time of the Domesday Survey the boundaries were approximately those of the present day, but part of Meppershall in Bedfordshire formed a detached portion of the shire and is still assessed for land and income tax in Hertfordshire. Of the nine Domesday hundreds, those of Danais and Tring were consolidated about 1200 under the name of Dacorum; the modern hundred of Cashio, from being held by the abbeys of St Albans, was known as Albaneston, while the remaining six hundreds correspond approximately both in name and extent with those of the present

Hertfordshire was originally divided between the dioceses of London and Lincoln. In 1291 that part included in the Lincoln diocese formed part of the archdeaconry of Huntingdon and comprised the deaneries of Berkhamsted, Hitchin, Hertford and Baldock, and the archdeaconry and deanery of St Albans; while that part within the London diocese formed the deanery of Braughing within the archdeaconry of Middlesex. In 1535 the jurisdiction of St Albans had been transferred to the London diocese, the division being otherwise unchanged. In 1846 the whole county was placed within the diocese of Rochester and archdeaconry of St Albans, and in the next year the deaneries of Welwyn, Bennington, Buntingford, Bishop Stortford and Ware were created, and that of Braughing abolished. In 1864 the archdeaconries of Rochester and St Albans were united under the name of the archdeaconry of Rochester and St Albans. In 1878 the county was placed in the newly created diocese of St Albans, and formed the archdeaconry of St Albans, the deaneries being unchanged.

Hertfordshire was closely associated with Essex from the time of its first settlement, and the counties had a joint fief and were united under one sheriff until 1365, the shire-court being held at Hertford. The hundred of St Albans was at an early date constituted a separate liberty, with independent courts and coroners under the control of the abbott; it preserved a separate commission of the peace until 1874, when by act of parliament the county was arranged in two divisions, the eastern division
being named Hertford, and the western the liberty of St Albans. These divisions have since been abolished.

Hertfordshire has always been an agricultural county, with few manufactures, and at the time of the Domesday Survey its wealth was derived almost entirely from its rural manors, with their water meadows, woodlands, fisheries paying rent in eels, and water-mills, the shire on its eastern side being noticeably free from waste land. In Norman times the woolen trade was considerable, and the great corn market at Royston has been famous since the reign of Elizabeth. At the time of the Civil War the malting industry was largely carried on, and saltpetre was produced in the county. In the 17th century Hertfordshire was famous for its horses, and the 18th century saw the introduction of several minor industries, such as straw-plaiting, paper-making and silk weaving.

In 1290 Hertfordshire returned two members to parliament, and in 1308 the borough of Hertford was represented. St Albans, Bishop Stortford and Berkhamstead acquired representation in the 14th century, but from 1375 to 1553 no returns were made for the boroughs. St Albans regained representation in 1553 and Hertford in 1623. Under the Reform Act of 1832 the county returned three members. St Albans was disfranchised on account of bribery in 1852. Hertford lost one member in 1868, and was disfranchised by the act of 1885.

Antiquities.—Among the objects of antiquarian interest may be mentioned the cave of Royston, doubtless once used as a hermitage; Waltham Cross, erected to mark the spot where rested the body of Eleanor, queen of Edward I., on its way to Westminster for interment; and the Great Bed of Ware referred to in Shakespeare’s Twelfth Night and preserved at Rye House. The principal monastic buildings are the noble pile of St Albans abbey; the remains of Sopwell Benedictine nunnerie near St Albans, founded in 1140; the remains of the priory of Ware, dedicated to St Francis, and originally a cell to the monastery of St Edburgh at Utica in Normandy; and the remains of the priory at Hitchin built by Edward II. for the Carmelites. Among the more interesting churches may be mentioned those of Abbots Langley and Hemel Hempstead, both of Late Norman architecture; Baldock, a handsome mixed Gothic building supposed to have been erected by the Knights Templars in the reign of Stephen; Royston, formerly connected with the priory of canons regular; Hitchin of the 13th century; Hatfield, dating from the 15th century; Sandridge church shows good Norman work with the use of Roman bricks; Wheathamstead church, mainly very fine Decorated, and that at St Albans, where the stonework of the monastic buildings of importance are those of Berkhamstead castle, Hertford castle, Hatfield palace of the bishops of Ely, the slight traces at Bishop Stortford, and the earthworks at Anstey. Among the numerous mansions of interest, Rye House, erected in the reign of Henry VI., was tenanted by Rumbold, one of the principal agents in the plot to assassinate Charles II. Moor Park, Rickmansworth, once the property of St Albans abbey, was granted by Henry VII. to John de Vere, earl of Oxford, and was afterwards the property of the duke of Monmouth, who built the present mansion, which, however, was subsequently cased with Portland stone and received various other additions. Knowle, the seat of the Lyttles, was originally a Norman fortress, rebuilt in the time of Elizabeth in the Tudor style and restored in the 19th century. Hatfield House is the seat of the marquis of Salisbury; but its earlier history is of great interest, as is that of Theobalds near Cheshunt. Panshanger House, until recently the principal seat of the Cowpers, is a splendid mansion in Gothic style erected at the beginning of the 19th century. The manor of Cashiobury House, the seat of the earls of Essex, was formerly held by the abbot of St Albans, but the mansion was rebuilt in the beginning of the 19th century from designs by Wyatt. Gorhambury House, near St Albans, the seat of the earl of Verulam, formerly the seat of the Bacoons, and the residence of the great chancellor, was rebuilt at the close of the 18th century. At Kings Langley and Hunsdon were also former royal residences.
ordinary light consists of electrical vibrations in an all-pervading ether which possesses the properties of an insulator and of a magnet, and in 1854 Hertz himself gave an admirable account of the significance of his discoveries in a lecture on the relations between light and electricity, delivered before the German Society for the Advancement of Natural Science and Medicine at Heidelberg in September 1889. Since the time of these early experiments, various other modes of detecting the existence of electric waves have been found out in addition to the spark-gap which he first employed, and the results of his observations, the earliest interest of which was simply that they afforded a confirmation of an abstruse mathematical theory, have been applied practically for the transmission of signals over long distances (see Telegraphy, Wireless).

In 1889 Hertz was appointed to succeed R. J. E. Clausius as ordinary professor of physics in the university of Bonn. There he continued his researches on the discharge of electricity in rarefied gases, only just missing the discovery of the X-rays described by W. C. Röntgen a few years later, and produced his treatise on the Principles of Mechanics. This was his last work, for after a long illness he died at Bonn on the 1st of January 1894. By his premature death death science lost one of her most promising disciples. Helmholtz thought him the one of all his pupils who had realized his own scientific thought and looked to him with the greatest confidence for the further extension and development of his work.

Hertz’s scientific papers were translated into English by Professor D. E. Jones, and published in three volumes: Electric Waves (1893), Miscellaneous Papers (1896), and Principles of Mechanics (1899). The preface contributed to the first of these by Lord Kelvin, and the introductions to the second and third by Professors P. E. A. Lenard and Helmholtz, contain many biographical details, together with statements of the scope and significance of his investigations.

HERZ, HENRIK (1797–1870), Danish poet, was born of Jewish parents in Copenhagen on the 25th of August, 1798. In 1826 he was sent to a university, and there, as his father died in infancy, and the family property was destroyed in the bombardment of 1807, The boy was brought up by his relative, M. L. Nathanson, a well-known newspaper editor. Young Hertz passed his examination in law 1825. But his taste was all for polite literature, and in 1826–1831 two plays of his were produced, Mr Burchardt and his Family and Love and Policy; in 1838 followed the comedy of Flitteden. In 1830 he brought out what was a complete novelty in Danish literature, a comedy in rhymed verse, Amor’s Strokes of Genius. In the same year Hertz published his translation of letters from a Genius which he pretended were written by Baggesen, who had died in 1826. The book was written in defence of J. L. Heiberg, and was full of satirical humour and fine critical insight. Its success was overwhelming; but Hertz preserved his anonymity, and the secret was not known until many years later. In 1832 he published a didactic poem, Nature and Art, and Four Poetical Epistles. A Day on the Island of Als was his next comedy, followed in 1835 by The Only Fault. Hertz passed through Germany and Switzerland into Italy in 1833; he spent the winter there, and returned the following autumn through France to Denmark. In 1836 his comedy of The Savings Bank enjoyed a great success. But it was not till 1837 that he gave the full measure of his genius in the romantic national drama of Svend Dyrings Hus, a beautiful and original piece. His historical tragedy Valdemar Atterdag was not so well received in 1839; but in 1845 he achieved an immense success with his lyrical drama Kong René’s Daughter (King René’s Daughter), which has been translated into almost every European language. To this succeeded the tragedy of Nimon in 1848, the romantic comedy of Tenietta in 1849, A Sacrifice in 1853, The Youngest in 1854. His lyrical poems appeared in collections, dated 1832, 1840 and 1844. From 1858 to 1859 he edited a literary journal entitled Weekly Leaves. His last drama, Three Days in Padua, was produced in 1869, and he died on the 29th of February of the next year.

Hertz is one of the first of Danish lyrical poets. His poems are full of colour and passion, his versification has more witchcraft in it than any other poet’s of his age, and his style is grace itself. He has all the sensuous fire of Keats without his prolixity to the antique. As a romantic dramatist he is scarcely less original. He has bequeathed to the Danish theatre, in Svend Dyrings Hus and King René’s Daughter, two pieces which have become classic. He is a troubadour by instinct; he has little or nothing of Scandinavian local colouring, and succeeds best when he is describing the scenery or the emotions of the glowing south.

His Dramatic Works (18 vols.) were published at Copenhagen in 1854–1873; and his Poems (4 vols.) in 1851–1862.

HERZBERG, EWALD FRIEDRICH, Count von (1725–1795), Prussian statesman, who came of a noble family which had been ennobled in 1689, was born in Lottin, in that province, on the 2nd of September 1725. After 1739 he studied, chiefly classics and history at the gymnasia at Stettin, and in 1742 entered the university of Halle as a student of jurisprudence, becoming in due course a doctor of laws in 1745. In addition to this principal study, he was also interested while at the university in historical and philosophical (Christian Wolff) studies. A first thesis for his doctorate, entitled Jus publicum Brandenburgicum, was not printed, because it contained a criticism of the existing condition of the state. Shortly afterwards Hertzberg entered the government service, in which he remained for the whole of his career, having been appointed at the age of 20 (1745) to the office of Judge in the government of the 'Rhenish-Prussian' (in which he became director in 1750), soon after in the foreign office, and finally in 1763 as chief minister (Cabinetminister). In 1753 he married Baroness Marie von Knyphausen, a marriage which was happy, but childless.

For more than forty years Hertzberg played an active part in the Prussian foreign office. In this capacity he had a decisive influence on Prussian policy, both under Frederick the Great and Frederick William II. At the beginning of the Seven Years’ War (1756) he took part as a political writer in the Hohenzollern-Habburg quarrel, both in his Ursachen, die S.K.M. in Preussen bewogen haben, sich weder die Absichten des Wienerischen Hofes zu setzen und deren Ausführung zuworsukommen ("Motives which have induced the king of Prussia to oppose the intentions of the court of Vienna, and to prevent them from being carried into effect"), and in his Memoire raossd on la conduite des cours de Vienne et de Saxe, based on the secret papers taken by Frederick the Great from the archives of Dresden. After the defeat at Kolin (1757) he hastened to Pomerania in order to organize the national defence there and collect the necessary troops for the protection of the kingdom (Erklärung der Ursachen, welche S.M. in Preussen bewogen haben, ihren hohen Mützstunden des Reiches eine Association zur Erhaltung des Reichssysten anzuwenden). By upholding the Fürstenbund Hertzberg made many enemies, prominent among whom was the king’s brother, Prince Henry. Though the Fürstenbund failed to effect a reform of the empire, it at any rate prevented the fulfilment of Joseph II.’s old desire for the incorporation of Bavaria with Austria. The last act of state in which Hertzberg took part occurred under Frederick the Great.
Hertzberg's political system remained on the whole the same under Frederick William II. as it had been under his predecessor. It was mainly characterized by a sharp opposition to the house of Habsburg and by a desire to win for Prussia the support of England, a policy supported by him in important memoirs of the years 1786 and 1787. His diplomacy was directed also against Austria's old ally, France. Hence it was chiefly owing to Hertzberg that in 1787, in spite of the king's unwillingness at first, Prussia intervened in Holland in support of the stadtholder William V. against the democratic states of Holland. Hertzberg forebore, however, to take this intervention, which was the practical realization of a plan very characteristic of Hertzberg, marks the culminating point in his career.

But the opposition between him and the new king, which had already appeared at the time of the conclusion of the triple alliance between Holland, England and Prussia, became more marked in the following years, when Hertzberg, relying upon this alliance, and in conscious imitation of Frederick II.'s policy at the time of the first partition of Poland, sought to take advantage of the entanglement of Austria with Russia in the war with Turkey to secure for Prussia an extension of territory by diplomatic intervention. According to his plan, Prussia was to offer her mediation at the proper moment, and in the territorial readjustments that the peace would bring, was to receive Danzig and Thorn as her portion. Beyond this he aimed at preventing the restoration of the hegemony of Austria in the Empire, and secretly cherished the hope of restoring Frederick the Great's Russian alliance.

With a curious obstinacy he continued to pursue these aims even when, owing to military and diplomatic events, they were already partly out of date. His personal position became increasingly difficult, as deep-rooted differences between him and the king were revealed during these diplomatic campaigns. Hertzberg wished to effect everything by peaceful means, while Frederick II. foresaw nothing but the expedient which would suit his plans. As regards Polish policy, too, their ideas came into conflict, Hertzberg having always been openly opposed to the total annihilation of the Polish kingdom. The same is true of the attitude of king and minister towards Great Britain. At the conferences at Reichenbach in the summer of 1790, this opposition became more and more acute, and Hertzberg was only with difficulty persuaded to come to an agreement merely on the basis of the status quo, as demanded by Pitt. The king's renunciation of any extension of territory was in Hertzberg's eyes impolitic, and this view of his was later endorsed by Bismarck.

A letter which came to the eyes of the king, in which Hertzberg severely criticized the king's foreign policy, and especially his plans for attacking Russia, led to his dismissal on the 29th of July 1791. He afterwards made several attempts to exert an influence over foreign affairs, but in vain. The king showed himself more and more personally hostile to the ex-minister, and in later years pursued Hertzberg, now quite embittered, with every kind of petty persecution, even ordering his letters to be opened.

Even in his literary interests Hertzberg found an adversary in the ungrateful king, for Frederick William, to give one instance, made it so difficult for him to use the archives that in the end Hertzberg entirely gave up the attempt. He found, however, some recompense for all his disillusionment and discouragement in learning, and, Wilhelm von Humboldt excepted, he was the most learned of all the Prussian ministers. As a member of the Berlin Academy especially, and, from 1786 onwards, as its curator, Hertzberg carried on a great and valuable activity in the world of learning. His yearly reports dealt with history, statistics and political science. The most interesting is that of 1784: Sur la forme des gouvernements, et quelle est la meilleure. This is directed exclusively against the absolute system (following Montesquieu), upholds a limited monarchy, and is in favour of extending to the peasants the right to be represented in the diet. He spoke for the last time in 1793 on Frederick the Great and the advantages of monarchy. After 1785 these discourses caused a great sensation, since Hertzberg introduced into them a review of the financial situation, which in the days of absolutism seemed an unprecedented innovation. Besides this, Hertzberg exerted himself as an academician to change the strongly French character of the Academy and make it into a truly German institution. He showed a keen interest in the old German language and literature. A special "German deputation " was set aside at the Academy and entrusted with the drawing up of a German grammar and dictionary. He also stood in very close relations with many of the German poets of the time, and especially with Daniel von Klopstock and Friedrich von Schiller, to whom he paid the highest interest, he had the greatest esteem for Pufendorf. He was equally concerned in the improvement of the state of education. In 1780 he boldly took up the defence of German literature, which had been disparaged by Frederick the Great in his famous writing De la littérature allemande.

Hertzberg's frank and honourable nature little fitted him to be a successful diplomatist; but the course of history has justified some of his aims and ideals, and in Prussia his memory is honoured. He died at Berlin on the 22nd of May 1795.

HERTZEN, ALEXANDER (1812-1879), Russian author, was born in Moscow, a very short time before the occupation of that city by the French. His father, Ivan Yakovlev, after a personal interview with Napoleon, was allowed to leave, when the invaders arrived, as the bearer of a letter from the French to the Russian emperor. His family attended him to the Russian lines. Then the mother of the infant Alexander (a young German Protestant of Jewish extraction from Stuttgart, according to A. von Wurzbach), only seventeen years old, and quite unable to speak Russian, was forced to seek shelter for some time in a peasant's hut. A year later the family returned to Moscow, where Hertzen passed his youth—remaining there, after completing his studies at the university, till 1834, when he was arrested and tried on a
charge of having assisted, with some other youths, at a festival during which verses by Sokolovsky, of a nature uncomplimentary to the emperor, were sung. The special commission appointed to try the youthful culprits found him guilty, and in 1835 he was banished to Viatka. There he remained till the visit to that city of the hereditary grand-duke (afterwards Alexander II.), accompanied by the poet Joukowsky, who led him being allowed to quit Viatka for Vladimir, where he was appointed editor of the official gazette of that city. In 1840 he obtained a post in the ministry of the interior at St. Petersburgh; but in consequence of having spoken too frankly about a death due to a police officer's violence, he was sent to Novgorod, where he led an official life, with the title of "state councillor," till 1842. In 1846 his father died, leaving him by his will a very large property. Early in 1847 he left Russia, never to return. From Italy, on hearing of the revolution of 1848, he hastened to Paris, whence he afterwards went to Switzerland. In 1852 he quitted Geneva for London, where he settled for some years. In 1864 he returned to Geneva, and after some time went to Paris, where he died on the 23rd of January 1870.

His literary career began in 1842 with the publication of an essay, in Russian, on Dilatantism in Science, under the pseudonym of "Iskander," the Turkish form of his Christian name—con-

victs, even when pardoned, not being allowed in those days to publish under their own names. His second work, also in Russian, was his Letters on the Study of Nature (1845-1846). In 1847 appeared his novel Kto Vinovat? (Whose Fault?), and about the same time were published in Russian periodicals the stories which were afterwards collected and printed in London in 1854, under the title of Prezrasnie Rashkazhi (Interrupted Tales). In 1850 two works appeared, translated from the Russian manuscript, Vom anderen Ufer (From another shore) and Lettres de France et d'Italie. In French appeared also his essay Du Développement des idées révolutionnaires en Russie, and his Memoirs, which, after being printed in Russian, were translated under the title of Le Monde russe et la Révolution (3 vols., 1860-
1862), and were in part translated into English as My Exile to Siberia (2 vols., 1855). From a literary point of view his most important work is Kto Vinovat? a story describing how the domestic happiness of a young tutor, who marries the unacknow-

ledged daughter of a Russian sensualist of the old type, dull, ignorant and sensual, is troubled by a Russian sensualist of the new school, intelligent, accomplished and callous, without there being any possibility of saying who is most to be blamed for the tragic termination. But it was as a political writer that Hertzen gained the vast reputation which he at one time enjoyed. Having founded in London his Free Russian Press," of the fortunes of which, during ten years of its existence, he gave an interesting account in a book published (in Russian) in 1863, he issued from it a great number of Russian works, all levelled against the system of government prevailing in Russia. Some of these were essays, such as his Baptized Property, an attack on serfdom; others were periodical publications, the Polyarnaya Zvezda (or Polar Star), the Kolokol (or Bell), and the Golosa in Rossii (or Voices from Russia). The Kolokol soon obtained an immense circulation, and exercised an extraordinary influence. For three years, it is true, during part of the time Free Press took on properties, but for the most part without selling a single copy, but scarcely being able to get a single copy introduced into Russia; so that when at last a bookseller bought ten shillings' worth of Baptized Property, the half-sovereign was set aside by the surprised editors in a special place of honour. But the death of the emperor Nicholas in 1855 produced an entire change. Hertzen's writings, and the journals he edited, were smuggled wholesale into Russia, and their words resounded throughout that country, as well as all over Europe. Their influence, therefore, became overwhelming. Evil deeds long hidden, evil-doers who had long prospered, were suddenly dragged into light and disgrace. His bold and vigorous language aptly expressed the thoughts which had long been secretly stirring Russian minds, and were now beginning to find a timid utterance at home. For some years his influence in Russia was a living force, the circulation of his writings was a vocation zealously pursued. Stories tell how on one occasion a merchant, who had bought several cases of sardines at Nijni-Novgorod, found that they contained forbidden print instead of fish, and at another time a supposititious copy of the Kolokol was printed for the emperor's special use, in which a telling attack upon a leading statesman, which had appeared in the genuine number, was omitted. At length the sweeping changes introduced by Alexander II. greatly diminished the need for and appreciation of Hertzen's assistance in the work of reform. The freedom he had demanded for the serfs was granted, the law-courts he had so long denounced were remodelled, trial by jury was established, liberty was to a great extent conceded to the press. It became clear that Hertzen's occupation was gone. When the Polish insurrection of 1863 broke out, and he pleaded the insurgents' cause, his reputation in Russia received its death-blow. From that time it was only with the revolutionary party that he was in full accord.

In 1873 a collection of his works in French was commenced in Paris. A volume of posthumous works, in Russian, was published at Geneva in 1876. His Memoirs supply the principal information about his life, a sketch of which appears also in A. von Wurzbach's Die Revolutionäre (Vienna, 1877). See also the Revue des deux mondes for July 15 and August 15, 1864. Kto Vinovat? was translated into German under the title Von ist Schuld? in Wolzogen's Russlands Neuenländhicher, vol. iii. The title of My Exile in Siberia is rendering; he was never in that country. (W. R. S.-R.)

HERULI, a Teutonic tribe which figures prominently in the history of the migration period. The name does not occur in the first two centuries A.D. Where the original home of the Heruli was situated is never clearly stated. Josephus says that they had been expelled from their territories by the Danes, from which it may be inferred that they belonged either to what is now the kingdom of Denmark, or the southern portion of the Jutish peninsula. They are mentioned first in the reign of Gallienus (260-268), when we find them together with the Goths ravaging the coasts of the Black Sea and the Aegean. Shortly afterwards, in A.D. 289, they appear in the region about the mouth of the Rhine. During the 4th century they frequently served together with the Batavii in the Roman armies. In the 5th century we again hear of piratical incursions by the Heruli in the western seas. At the same time they had a kingdom in central Europe, apparently in or round the basin of the Elbe. Together with the Thuringi and Wurms they were called upon by Theodoric the Ostrogoth about the beginning of the 6th century to form an alliance with him against the Frankish king Clovis, but very shortly afterwards they were completely overthrown in war by the Langobardi. A portion of them migrated to Sweden, where there are yet a number of their temples among the heathen, and entered the Roman service, where they are frequently mentioned later in connexion with the Gothic wars. After the middle of the 6th century, however, their name completely disappears. It is curious that in English, Frankish and Scandinavian works they are never mentioned, and there can be little doubt that they were known, especially among the western Teutonic peoples, by some other name. Probably they are identical either with the North Sutbi or with the Iutii. The Heruli itself is identified by many with the A.S. erl (nobles), O.S. erlas (men), the singular of which (erlaz) frequently occurs in the earliest Northern inscriptions, apparently as a title of honour. The Heruli remained heathen until the overthrow of their kingdom, and retained many striking primitive customs. When threatened with death by disease or old age, they were required to call in an executioner, who stabbed them on the pyre. Suttee was also customary. They were entirely devoted to warfare and served not only in the Roman armies, but also in those of all the surrounding nations. They disdained the use of helmets and coats of mail, and protected themselves only with shields.

HERVÁS Y PANDURO—HERVEY OF ICKWORTH

HERVÁS Y PANDURO, LORENZO (1735-1809), Spanish philologist, was born at Harcojo (Cuenca) on the 10th of May 1735. He joined the Jesuits on the 29th of September 1745 and in course of time became successively professor of philosophy and humanities at the seminaries of Madrid and Murcia. When the Jesuit order was banished from Spain in 1767, Hervás settled at Foé, and devoted himself to the first part of his Idea del P' Universo (22 vols., 1778-1792). Returning to Spain in 1798, he published his famous Cateálogo de las lenguas de las naciones conocidas (6 vols., 1800-1801), in which he collected the philo-

cological peculiarities of three hundred languages and drew up grammars of forty languages. In 1802 he was appointed librarian of the Quirinal Palace in Rome, where he died on the 24th of August 1809. Max Müller credits him with having anticipated Humboldt, and with making “one of the most brilliant discoveries in the history of the science of language” by establishing the relation between the Malay and Polynesian family of speech.

HERVEY, JAMES (1714-1738), English divine, was born at Hardingham, near Northampton, on the 26th of February 1714, and was educated at the grammar school of Northampton, and at Lincoln College, Oxford. Here he came under the influence of John Wesley and the Oxford methodists; ultimately, however, while retaining his regard for the men and his sympathy with their religious views, he adopted a thoroughly Calvinistic creed, and resolved to remain in the Anglican Church. Having taken orders in 1737, he held several curacies, and in 1738 succeeded his father in the family livings of Weston Favel and Collingtree. He was never robust, but was a good parish priest and a zealous writer. His style is often bombastic, but he displays a rare appreciation of natural beauty, and his simple piety made him many friends. His earliest work, Meditationes et Contemplations, said to have been modelled on Robert Boyle’s Occasional Reflections on various Subjects, within fourteen years passed through as many editions. Theron and Aspasia, or a series of Letters upon the most important and interesting Subjects, which appeared in 1755, and was equally well received, called forth some adverse criticism even from Calvinists, on account of tendencies which were considered to lead to antinomianism, and was strongly objected to by Wesley in his Preservative against unsetled Notions in Religion. Besides carrying into England the theological disputes to which the Marrow of Modern Divinity had given rise in Scotland, it also led to what is known as the Sandemanian controversy as to the nature of saving faith. Hervèy died on the 25th of December 1738.

A “new and complete” edition of his Works, with a memoir, appeared in 1797. See also Collection of the Letters of James Hervey, to which is prefixed an account of his Life and Death, by Dr Borch (1760).

HERVEY DE SAINT DENYS, MARIE JEAN LÉON, MARQUIS DE’ (1823-1892), French Orientalist and man of letters, was born in Paris in 1823. He devoted himself to the study of Chinese, and in 1851 published his Recherches sur l’agriculture et l’horticulture des Chinois, in which he dealt with the plants and animals that might be acclimatized in the West. At the Paris Exhibition of 1867 he acted as commissioner for the Chinese exhibits; in 1874 he succeeded Stanislas Julien in the chair of Chinese at the Collège de France; and in 1878 he was elected a member of the Académie des Inscriptions et de Belles-Lettres. His works include: Poétés de l’époque des T’ang (1869), translated from the Chinese; Ethnographie des peuples étrangers à la Chine, translated from M.-Touan-Lin (1876-1883); Li-Sao (1870), from the Chinese; Mémoires sur les drames religieux; de Convulsifs et de l’école des lettres (1887); and translations of some Chinese stories not of classical interest but valuable for the light they throw on oriental custom. Hervey de Saint Denys also translated some works from the Spanish, and wrote a history of the Spanish drama. He died in Paris on the 2nd of November 1892.

HERVEY OF ICKWORTH, JOHN HERVEY, BARON (1666-1743), English statesman and writer, eldest son of John, 1st earl of Bristol, by his second marriage, was born on the 13th of October 1666. He was educated at Westminster school and at Clare Hall, Cambridge, where he took his M.A. degree in 1715.

In 1716 his father sent him to Paris, and thence to Hanover to pay his court to George I. He was a frequent visitor at the court of the prince and princess of Wales at Richmond, and in 1720 he married Mary Lepell, who was one of the princess’s ladies-in-waiting, and a great court beauty. In 1723 he received the courtesy title of Lord Hervey on the death of his half-brother Carr, and in 1725 he was elected M.P. for Bury St Edmunds. He had been at one time on very friendly terms with Frederick, prince of Wales, but from 1731 he quarrelled with him, apparently because they were rivals in the favour of Anne Vane. These differences probably account for the scathing picture he draws of the prince’s calumnious conduct. Hervey had been hesitating between Pulteney and Shelburne (one of whose sons was his rival for the princess’s favour), but in 1730 he definitely took sides with Walpole, of whom he was thenceforward a faithful adherent. He was assumed by Pulteney to be the author of Sedition and Delegation display’d with a Dedication to the patrons of The Craftsman (1731). Pulteney, who, up to this time, had been a firm friend of Hervey, replied with A Proper Reply to a late Scurrilous Libel, and the quarrel resulted in a duel from which Hervey narrowly escaped with his life. Hervey is said to have denied the Smith of both the pamphlet and its dedication, but a note on the MS. at Ickworth, apparently in his own hand, states that he wrote the latter. He was able to render valuable service to Walpole from his influence over the queen. Through him the English government appointed Queen Caroline and indirectly George II. Hervey was vice-chamberlain in the royal household and a member of the privy council. In 1733 he was called to the House of Lords by writ in virtue of his father’s barony. In spite of repeated requests he received no further preternum until after 1740, when he became lord privy seal. After the fall of Sir Robert Walpole he was dismissed (July 1742) from his office. An excellent political pamphlet, Miscellaneous Thoughts on the present Posture of Foreign and Domestic Affairs, shows that he still retained his mental vigour, but he was liable to epilepsy, and his weak appearance and rigid diet were a constant source of ridicule to his enemies. He died on the 5th of August 1743. He predeceased his father, but three of his sons became successively earls of Bristol.

Hervey wrote detailed and brutally frank memoirs of the court of George II. from 1727 to 1737. He gave a most unflattering account of the king, and of Frederick, prince of Wales, and their family squabbles. For the queen and her daughter, Princess Caroline, he had a genuine respect and attachment, and the princess’s affection for him was commonly said to be the reason for the close retirement in which she lived after his death. The MS. of Hervey’s memoirs was preserved by the family, but his son, Augustus John, 3rd earl of Bristol, left strict injunctions that they should not be published until after the death of George III. In 1848 they were published under the editorship of J. W. Crossley, but the MS. had been subjected to a certain amount of mutilation before it came into his hands. Croker also softened in some cases the plain spokenness of the original. Hervey’s bitter account of court life and intrigues resembles in many points the memoirs of Horace Walpole, and the two books corroborate one another in many statements that might otherwise have been received with suspicion.

Until the publication of the Memoirs Hervey was chiefly known as the object of savage satire on the part of Pope, in whose works he figured as Lord Fanny, Sporus, Adonis and Narcissus. The quarrel is generally put down to Pope’s jealousy of Hervey’s friendship with Lady Mary Wortley Montagu. In the first of the Imitations of Horace, addressed to William Fortescue, “Lord Fanny” and “Sappho” were generally identified with Hervey and Lady Mary, although Pope denied the personal intention. Hervey had already been attacked in the Duniad and the Bathos, and he now retaliated. There is no doubt that he had a share in the Verses to the Imitator of Horace (1732) and it is possible that he was the sole author. In the Letter from a nobleman at Hampton Court to a Doctor of Divinity (1733), he scoffed at Pope’s deformity and humble birth. Pope’s reply was a Letter to a Noble Lord, dated November 1733, and the portrait of Sporus in the Epistle to Dr Arbuthnot (1733), which forms the prelude to
HERNIEU—HERZL

the satires. Many of the insinuations and insults contained in it are borrowed from Pulceny's libel. The malicious caricature of Sporus does Hervey great injustice, and he is not much better treated by Horace Walpole, who, in reporting his death in a letter (14th of August 1743) to Horace Mann, said he had outlived his last inch of character. Nevertheless his writings prove him to have been a man of real ability, competent the task Walpole's satires demanded, and distrust of able men to spend his life in court intrigue, the weapons of which, it must be owned, he used with the utmost adroitness. His wife Lady Hervey [Molly Lepell] (1700-1768), of whom an account is to be found in Lady Louisa Stuart's Anecdotes, was a warm partisan of the Stuarts. She retained her wit and charm throughout her life, and has the distinction of being the recipient of English verses by Voltaire.

HERVEY, PAUL (1857—), French dramatic and novelist, was born at Neufly (Seine) on the 23rd of November 1857. He was called to the bar in 1877, and, after serving some time in the office of the president of the council, he qualified for the diplomatic service, but resigned on his nomination in 1881 to a secretariatship in the French legation in Mexico. He contributed novels, tales and essays to the chief Parisian papers and reviews, and published a series of clever novels, including L'Iscene (1887), Flirt (1890), L'Excès (1891), Points par eux-mêmes (1893), an ironical study written in the form of letters, and L'Armée (1895), dramatized in 1896. But his work consists of a series of plays: Les Parades restent (Vaudeville, 17th of November 1893); Les Tendailles (Théâtre Français, 28th of September 1895); La Loi de l'homme (Théâtre Français, 15th of February 1897); La Course du flambeau (Vaudeville, 17th of April 1901); Point de lendemain (Odéon, 18th of October 1901), a dramatic version of a story by Vivant Denon; L'Enigme (Théâtre Français, 5th of November 1901); Théorème de Méricourt (Théâtre Sarah Bernhardt, 23rd of September 1902); Le Délire (Théâtre Français, 19th of December 1902), and Le Rêve (Théâtre Français, 18th of December 1902). These plays are built upon a severely logical method, the mechanism of which is sometimes so evident as to destroy the necessary illusion. The closing words of La Course du flambeau—"Pour ma fille, j'ai tenu ma mère"—are an example of his selection of a plot representing an extreme theory. The riddle in L'Enigme (staged at Wyndham's Theatre, London, March 1st 1902, as Caesar's Wife) is, however, worked out with great art, and Le Délire, dealing with the obstacles to the remarriage of a divorced woman, is reckoned among the masterpieces of the modern French stage. He was elected to the French Academy in 1900.

See A. Binet, in L'Armée psychologique, vol. x. Hervey's Théâtre was published by Lemerre (3 vols., 1900-1904).

HERWARTH VON BITTENFELD, KARL EBERHARD (1796-1884), Prussian general field-marshal, came of an aristocratic family which had supplied many distinguished officers to the Prussian army. He entered the Guard infantry in 1811, and served through the War of Liberation (1813-15), distinguishing himself at Lützen and Paris. During the years of peace he rose slowly to high command. In the Berlin revolution of 1848 he was on duty at the royal palace as colonel of the 1st Guards. Major-general in 1852, and lieutenant-general in 1856, he received the grade of general of infantry and the command of the VIIth (Westphalian) Army Corps in 1866. In the Danish War of 1864 he succeeded to the command of the Prussians when Prince Frederick Charles became commander-in-chief of the Allies, and in 1866 he commanded the army that was driven back to Alten on the 29th of June. In the war of 1866 Herwarth commanded the "Army of the Elbe" which overran Saxony and invaded Bohemia by the valley of the Elbe and Iser. His troops won the actions of Hünnerwasser and Münchgrätz, and at Königgrätz formed the right wing of the Prussian army. Herwarth himself directed the battle against the Austrian left flank. In 1870 he was not employed in the field, but was in charge of the scarcely less important business of organizing and forwarding all the reserves and material required for the armies in France. In 1871 his great services were recognized by promotion to the rank of field-marshal. The rest of his life was spent in retirement at Bonn, where he died in 1884. Since 1850 the 13th (1st Westphalian) Infantry has borne his name.

See G. F. M. Herwarth von Bittenfeld (München, 1883). HERWEGH, GEORG (1817-1872), German political poet, was born at Stuttgart on the 3ist of May 1817, the son of a restaurant keeper. He was educated at the gymnasium of his native city, and in 1833 proceeded to the university of Tübingen as a theological student, where, with a view to entering the ministry, he entered the protestant theological seminary. But the strict discipline was distasteful; he broke the rules and was expelled in 1836. He next studied law, but having gained the interest of August Lewald (1793-1871) by his literary ability, he returned to Stuttgart, where Lewald obtained for him a journalistic post. Called out for military service, he had hardly joined his regiment when he committed an act of flagrant insubordination, and fled to Switzerland to avoid punishment. Here he published his Gedichte eines Lebendigen (1841), a volume of political poems, which gave expression to the fervent aspirations of the German youth of the day. The work immediately rendered him famous, and although confiscated, it soon raff through several editions. The idea of the book was a refutation of the opinions of Prince Württemberg-Muskau (q.v.) in his Briefe eines Verstörten. He next proceeded to Paris and in 1842 returned to Germany, visiting Jena, Leipzig, Dresden and Berlin—a journey which was described as being a "veritable triumphal progress." His military insubordination appears to have been forgotten, and, for in Berlin King Frederick William IV, had introduced to him and used the memorable words: "ich liebe eine gesammelte Opposition" ("I admire an opposition, when dictated by principle."). Herwegh next returned to Paris, where he remained in 1844 the second volume of his Gedichte eines Lebendigen, which, like the first volume, was confiscated by the German police. At the head of a revolutionary column of German working men, recruited in Paris, Herwegh took an active part in the South German rising in 1848; but his raw troops were defeated on the 27th of April at Schopfheim in Baden, and, after a very feeble display of heroism, he just managed to escape to Switzerland, where he lived for many years on the proceeds of his literary productions. He was later (1866) permitted to return to Germany, and died at Ludwigsburg near Baden-Baden on the 7th of April 1875. A monument was erected to his memory there in 1904. Besides the above-mentioned works, Herwegh published Einandzwanzig Bogen aus der Schwere (1843), and translations into German of A. de Lamartine's works and of seven of Shakespeare's plays. Posthumously appeared Neue Gedichte (1877).

Herwegh's correspondence was published by his son Marcel in 1898. See also Johannes Scherr, Georg Herwegh (literarische und politische Blätter (1843); and the article by Franz Muncker in the Allgemeine deutsche Biographie.

HERZBERG, a town of Germany, in the Prussian province of Hanover, situated under the south-western declivity of the Harz, on the Sieber, 25 m. N.W. from Nordhausen by the railway to Osterode-Hildesheim. Pop. (1905) 586. It contains an Evangelical and a Roman Catholic church, and a botanical garden, and has manufactures of cloth and cigars, and weaving and dyeing works. The breeding of canaries is extensively carried on here and in the district. On a hill to the south-west of the town lies the castle of Herzberg, which in 1157 came into the possession of Henry the Lion, duke of Saxony, and afterwards was one of the residences of a branch of the house of Brunswick.

HERZBERG, a town of Prussia, in the Prussian province of Saxony, on the Schwarze Elster, 25 m. S. from Jüterbog by the railway Berlin-Röderau-Dresden. It has a church (Evangelical) dating from the 13th century and a medieval town hall. Its industries include the founding and turning of metal, agricultural machinery and boat-making. Pop. (1905) 4043.

HERZL, THEODOR (1860-1904), founder of modern political Zionism (q.v.), was born in Budapest on the 2nd of May 1860,
and died at Edlach on the 3rd of July 1904. The greater part of his career was associated with Vienna, where he acquired high repute as a literary journalist. He was also a dramatist, and apart from his prominence as a Jewish Nationalist would have found a niche in the temple of fame. All his other claims to renown, however, sink into insignificance when compared with his work as the reviver of Jewish hopes for a restoration to political autonomy. Herzl was stirred by sympathy for the misery of Jews under persecution, but he was even more powerfully moved by the difficulties experienced under conditions of assimilation. Modern anti-Semitism, he felt, was both like and unlike the medieval. The old physical attacks on the Jews continued in Russia, but there was added the reluctance of several national groups in Europe to admit the Jews to social equality. Herzl believed that the humanitarian hopes which inspired men at the end of the 18th and during the larger part of the 19th centuries had failed. The walls of the ghettoes had been cast down, but the Jews could find no entry into the comity of nations. The new nationalism of 1848 did not deprive the Jews of political rights, but it denied them both the amenities of friendly intercourse and the opportunity of distinction in the university, the army and the professions. Many Jews questioned this diagnosis, and refused to see in the new anti-Semitism (as) which spread over Europe something more than an expression of the cosmopolitanism of the French Revolution. In 1896 Herzl published his famous pamphlet "Der Judenstaat." Holding that the only alternatives for the Jews were complete merging by intermarriage or self-preservation by a national re-union, he boldly advocated the second course. He did not at first insist on Palestine as the new Jewish home, nor did he attach himself to religious sentiment. The expectation of a Messianic restoration to the Holy Land has always been strong, if often latent, in the Jewish consciousness. But Herzl approached the subject entirely on its secular side, and his solution was economic and political rather than sentimental. He was a strong advocate for the complete separation of Church and State. The existence of Zionism for him was an attempt at a new solution of the problem of the Jewish question. In 1896 he was an ex-officio member of the Congress of Berlin. In the following years Herzl devoted himself with unflagging energy to the promotion of Zionism, and the subsequent modifications of his plans, are told at length in the article ZIONISM.

His proposals undoubtedly roused an extraordinary enthusiasm, and though he almost completely failed to win to his cause the classes, he rallied the masses with sensational success. He unexpectedly gained the accession of many Jews by race who were indifferent to the religious aspect of Judaism, but he quite failed to convince the leaders of Jewish thought, who from first to last remained (with such conspicuous exceptions as Nordau and Zangwill) deaf to his pleading. The orthodox were at first cool because they had always dreamed of a nationalism inspired by messianic ideals, while the liberals had long since dissociated those universalistic ideals from all national limitations. Herzl, however, succeeded in assembling several congresses at Basel (beginning in 1897), and at these congresses were enacted remarkable scenes of enthusiasm for the cause and devotion to its leader. At all these assemblies the same ideal was formulated: "the establishing for the Jewish people a publicly and legally assured home in Palestine." Herzl's personal charm was irresistible. Among his political opponents he had some close personal friends. His sincerity, his eloquence, his tact, his devotion, his power, were recognized on all hands. He spent his whole strength in the furtherance of his ideas. Diplomatic interviews, exhausting journeys, impressive mass meetings, brilliant literary propaganda—all these methods were employed by him until the utmost limits of self-denial. But he also roused by his influence the pope and many European statesmen gave him audiences. The British government was ready to grant land for an autonomous settlement in East Africa. This last scheme was fatal to Herzl's peace of mind. Even as a temporary measure, the choice of an extra-Palestinian site for the Jewish state was bitterly opposed by many Zionists; others (with whom Herzl appears to have sympathized) thought that as Palestine was, at all events momentarily, inaccessible, it was expedient to form a settlement elsewhere. Herzl's health had been failing and he did not long survive the initiation of the somewhat embittered "terритори" controversy. He died in the summer of 1904, amid the consternation of supporters and the deep grief of opponents of his Zionist aims.

Herzl was beyond question the most influential Jewish leader of the 19th century. He had no profound insight into the problem of Judaism, and there was no lasting validity in his view that the problem—the thousands of years' old mystery—could be solved by a retrogression to local nationality. But he brought home to Jews the perils that confronted them; he compelled many a "semi-detached" son of Israel to rejoin the camp; he forced the "assimilationists" to realize their position and to define it; his scheme gave a new impulse to "Jewish culture," including the popularization of Hebrew as a living speech; and he effectively roused Jews all the world over to an earnest and vital interest in their present and their future. Herzl thus left an indelible mark on his time, and his renown is assured whatever be the fate in store for the political Zionism which he founded and for which he gave his life.

I. A.)

HERZOG, HANS (1819-1894), Swiss general, was born at Aarau. He became a Swiss artillery lieutenant in 1840, and then spent six years in travelling (visiting England among other countries), before he became a partner in his father's business in 1846. In 1847 he saw his first active service (as artillery captain) in the short Swiss Sonderbund war, and in 1851-1854 he adventured in mercantile pursuits for a purely military career, becoming colonel and inspector-general of the Swiss artillery. In 1870 he was commander-in-chief of the Swiss army, which guarded the Swiss frontier, in the Jura, during the Franco-German War, and in February 1871, as such, concluded the Convention of Verrières with General Clinchant for the disarming and the interning of the remains of Bourbaki's army, when it took refuge in Switzerland. In 1873 he became the commander-in-chief of the Swiss artillery, which he did much to reorganize, helping also in the reorganization of the other branches of the Swiss army. He died in 1894 at his native town of Aarau.

W. A. B. C.)

HERZOG, JOHANN JAKOB (1805-1888), German Protestant theologian, was born at Basel on the 12th of September 1805. He studied at Basel and Berlin, and eventually (1834) settled at Erlangen as professor of church history. He died there on the 30th of September 1882, having retired in 1877. His most noteworthy achievement was the publication of the Realencyklopfied für protestantische Theologie und Kirche (1853-1868, 22 vols.), of which he undertook a new edition with G. L. Plitt (1836-1880) in 1877, and after Plitt's death with Albert Hauck (b. 1843). Hauck began the publication of the third edition in 1896 (completed in 22 vols., 1909).

HESEKIEL, JOHANN GEORG LUDWIG (1819-1874), German author, was born on the 12th of August 1819 in Halle, where his father, distinguished as a writer of sacred poetry, was a Lutheran pastor. Hesekiel studied history and philosophy in Halle, Jena and Berlin, and devoted himself in early life to journalism and literature. In 1848 he settled in Berlin, where he lived until his death on the 26th of February 1874, achieving a considerable reputation as a writer and as editor of the Neue Preussische Zeitung. He attempted many different kinds of literary work, the most ambitious being perhaps his patriotic songs Preußenlieder, of which he published a volume during the revolutionary excitement of 1848 and another collection—Neue Preußenlieder—appeared in 1864 after the Danish War, and a third in 1870—Gegen die Franzosen, Preussische Kriegs- und Königslieder. Among his novels may be mentioned Untem Eisenbahn (1864) and Der Schulmeister vom Zeyes (1875). The best known of his works is his biography of Prince Bismarck (Das Buch vom Fürsten Bismarck) (3rd ed., 1873; English trans. by R. H. Mackenzie).

HESILRIGE (or HESELRIGE), SIR ARTHUR, 2nd Bart. (d. 1661), English parliamentary, was the eldest son of Sir Thomas Hesilrige, 1st baronet (c. 1622), of Noseley, Leicestershire, a
member of a very ancient family settled in Northumberland and Leicestershire, and of Frances, daughter of Sir William Gorges of Alderton, Northamptonshire. He early imbibed strong puritanical principles, and showed a special antagonism to Laud. He sat for Leicestershire in the Short and Long Parliaments in 1640, and took a principal part in Strafford’s attainder, the Root and Branch Bill and the Militia Bill of the 7th of December 1641, and was one of the five members impeached on the 3rd of January 1642. He showed much activity in the Great Rebellion, raised a troop of horse for Essex, fought at Edgehill, commanded in the West under Waller, being nick-
named his judas Achates, and distinguished himself particularly on the 2nd of September. The Cromwellians surrendered on the 5th of July 1643, at Roundway Down on the 13th of July, at both of which battles he was wounded, and at Cheriton, March 29th 1644. On the occasion of the breach between the army and the parliament, Hesilrige supported the former, took Cromwell’s part in his dispute with Manchester and Essex, and on the passing of the Self-denying Ordinance gave up his commission and became one of the leaders of the Independent party in parliament. On the 30th of December 1647 he was appointed governor of Newcastle, which he successfully defended, besides doing much good and much harm, and was raised to the bench and returned to Tynemouth. In October he accompanied Cromwell to Scotland, and gave him valuable support in the Scottish expedition in 1650. Hesilrige, though he approved of the king’s execution, had declined to act as judge on his trial. He was one of the leading men in the Commonwealth, but Cromwell’s expulsion of the Long Parliament threw him into antagonism, and he opposed the Protectorate and refused to pay taxes. He was returned for Leicester to the parliaments of 1654, 1656 and 1659, but was excluded from the two former. He refused a seat in the Long Parliament, accepted the act of succession, and succeeded in again obtaining admission to the Commons in January 1658. On Cromwell’s death Hesilrige refused support to Richard, and was instrumental in effecting his downfall. He was now one of the most influential men in the council and in parliament. He attempted to maintain a republican parliamentary administration, “to keep the sword subservient to the civil magistrate,” and opposed Lambert’s schemes. On the latter succeeding in expelling the parliament, Hesilrige turned to Monk for support, and assisted his movements by securing Portsmouth on the 3rd of December 1658. He was appointed to the council of state on the 2nd of January 1660, and on the 11th of February a commissioner for the army. He was completely deceived by Monk, and trusting to his assurance of fidelity to “the good old cause” consented to the retirement of his regiment from London. At the Restoration his life was saved by Monk’s intervention, but he was imprisoned in the Tower, where he died on the 7th of January 1661. Clarendon describes Hesilrige as “an absurd, bold man.” He was rash, “hairy-brained,” devoid of tact and had little claim to the title of a statesman, but his energy in the field and in parliament was often of great value to the parliamentary cause. He exposed himself to considerable obloquy by his exactions and appropriations of confiscated landed property, though the accusation brought against him by John Lilburne was examined by a parliamentary committee and adjudged to be false. Hesilrige married (1) Frances, daughter of Thomas Elmes of Lilford, Northamptonshire, by whom he had two sons and two daughters, and (2) Dorothy, sister of Robert Greville, 2nd Lord Brooke, by whom he had three sons and five daughters.

The family was represented in 1907 by his descendant Sir Arthur Green, a member of the Royal Commonwealth Society.

AUTHORITIES.—Article on Hesilrige by C. H. Firth in the Dict. of Nat. Biography, and authorities there quoted: Early History of the Family of Hesilrige, by W. G. D. Fletcher; Col. of State Papers, Domestic, 1631–1664, where there are a large number of important references, as also in Hist., M.S.S., Comm. Series, M.S.S. of Earl Cooper, Duke of Leeds and Duke of Portland; Egerton M.S. 2618, Harleian 700 i. 198, and in the Sloane, Satire and Addit. Rec. in the British Museum: also S. R. Gardiner, Hist. of England, Hist. of the Great Civil War and Commonwealth; Clarendon’s History, State Papers and Col. of State Papers, J. L. Sanford’s Studies of the Great Rebellion. His life is written by Noble in the House of Cromwell, i. 493. For his public letters and speeches in parliament see the catalogue of the British Museum.

HESIOD, the father of Greek didactic poetry, probably flourished during the 8th century b.c. His father had migrated from the Aeolic Cyme in Asia Minor to Boeotia; and Hesiod and his brother Perses were born at Asca, near mount Helicon (Works and Days, 633). Here, as he fed his father’s flocks, he received his commission from the Muses to be their prophet and poet—a commission which he recognized by dedicating to them a tripod won by him in a contest of song (see below) at the Delphic tripod games. In 681 B.C. Hesiod was banished by the Phocians, and the Spartan king Clytemnestra, of the race of the Boeotians, banished him. In this he followed the advice of the poet, who had been compelled to leave his native land in disgust at the result of a law-suit with his brother and to renounce his profession of baseball. There was a tradition that he was murdered by the sons of his host in the sacred enclosure of the Nemean Zeus at Oenoe in Locris (Thucydides iii. 96; Pausanias ix. 31); his remains were removed for burial by command of the Delphic oracle to Orchomenus in Boeotia, where the Ascaeans settled after the destruction of their temples. Clastrodix, and where, according to Pausanias, his grave was to be seen.

Hesiod’s earliest poem, the famous Works and Days, and according to Boeotian testimony the only genuine one, embodies the experiences of his daily life and work, and, interwoven with episodes of fable, allegory, and personal history, forms a sort of Boeotian shepherd’s calendar. The first portion is an ethical enforcement of honest labour and dissuasive of strife and idleness (1-383); the second consists of hints and rules as to husbandry (384-764); and the third is a religious calendar of the months, with remarks on the days most lucky or the contrary for rural or nautical employments. The connecting link of the whole poem is the author’s advice to his brother, who appears to have bribed the corrupt judges to deprive Hesiod of his already scanty inheritance, and to whom, as he wasted his substance lounging in the agora, the poet more than once returned good for evil, though he tells him there will be a limit to this unmerited kindness. In the Works and Days the episodes which rise above an even didactic level are the “Creation and Equipment of Pandora,” the “Five Ages of the World” and the much-admired “Description of Winter” (by some critics judged post- by Hesiod) with the poet’s personal reminiscences of the life of the poet in Greek literature, that of “The Hawk and the Nightingale.” It is in the Works and Days especially that we glean indications of Hesiod’s rank and condition in life, that of a stay-at-home farmer of the lower class, whose sole experience of the sea was a single voyage of 40 yrs. across the Eurius, and an old-fashioned bachelor whose misogynistic views and prejudice against matrimony have been conjecturally traced to his brother Perses having a wife as extravagant as himself.

The other poem attributed to Hesiod or his school which has come down in great part to modern times is The Theogony, a work of grander scope, inspired alike by older divinities and abundant local associations. It is an attempt to work into system, as none had essayed to do before, the floating legends of the gods and goddesses and their offspring. This task Herodotus (ii. 53) attributes to Hesiod, and he is quoted by Plato in the Symposium (178 b) as the author of the Theogony. The first to question his claim to this distinction was Pausanias, the geographer (A.D. 200). The Alexandrian grammarians had no doubt on the subject; and indications of the hand that wrote the Works and Days may be found in the severe strictures on women, in the high esteem for the artful toad Plutos, and in coincidences of verbal expression. Although, no doubt, of Hesiodic origin, in its present form it is composed of different recensions and numerous later additions and interpolations. The Theogony consists of three divisions—(1) a cosmogony, or creation; (2) a theogony proper, recounting the history of the dynasties of Zeus and Cronus; and (3) a brief and abruptly terminated heroïdogy, the starting-point not improbable of the supplementary poem, the karkhόyos, or “Lists of Women”
HESPERIDES—HESS

who wedded immortals, of which all but a few fragments are lost.1 The poem (1-116) addressed to the Heliconian and Pierian muses, is considered to have been variously enlarged, altered and arranged by successive rhapsodists. The poet has interwoven several episodes of rare merit, such as the contest of Zeus and the Olympian gods with the Titans, and the description of the prison-house in which the vanquished Titans are confined, with the Giants for keepers and Day and Night for janitors (735 seq.).

The only other poem which has come down to us under Hesiod's name is the Shield of Heracles, the opening verses of which are attributed by a nameless grammarian to the fourth book of Iliad. The theme of the piece is the expedition to the island of Lemnos, where the gods and Iolaus against the robber Cynicus; but its main object apparently is to describe the shield of Heracles (141-217). It is clearly an imitation of the Homeric account of the shield of Achilles (IIiad, xviii. 479) and is now generally considered spurious. Titles and fragments of other lost poems of Hesiod have come down to us: didactic, as the Maximis of Cleonides; genealogical, as the Aegimis, describing the contest of that mythical ancestor of the Dorian with the Lapithae; and mythological, as the Marriage of Ceyx and the Descent of Theseus to Elysium.

Recent editions of Hesiod include the 'Ayōv 'Ophgyov xal Ησθόλον, the contest of song between Homer and Hesiod at the funeral games held in honour of King Amphidamas at Chalcis. This little tract belongs to the time of Hadrian, who is actually mentioned as having been present during its recitation, but is founded on an earlier account by the sophist Alcidamas (q.t.). Quotations (old and new) are made from the works of both poets, and, in spite of the sympathies of the audience, the judge decides in favour of Hesiod. Certain biographical details of Homer and Hesiod are also given.

A strong characteristic of Hesiod's style is his sententious and trenchant language (as in Works and Days, 22-24, 215, 345, 370). There is naturally less of this in the Theogony, yet there too not a few sentiments take the form of the saw or adage. He is having fame as the first of didactic poets (see Didactic Poetry), the accredited systematizer of Greek mythology and the rough but unpoetical sketcher of the lines on which Virgil wrought out his exquisitely finished Georgics.

BIBLIOGRAPHY.—Complete works: Edito princeps (Milan, 1943); Carls-Buch (1879), with full bibliography up to date of publication; C. Sitt (1886), with introduction and critical and explanatory notes in Greek; F. A. Paley (1883): A. Rzach (1902), including the fragments; W. H. Davis (1874); W. Davis and D. Day (1847); A. Kirchhoff (1889); A. Stotz, Die Werke und Tage des Hesiodos (1884), dealing chiefly with the composition and arrangement of the poem; G. Wastoff, Prométhée, Pandore, et la légende des stèles (1883). Theogony: Van Lennep (1843); F. G. Weckler (1865), valuable edition; G. F. Schömann (1868), with text, critical notes and exhaustive commentary; H. Flach, Die hesiodeische Theogonie (1879), with prolegomena dealing chiefly with the digamma in Hesiod, System der hesioidischen Kosmogonie (1874), and Glossen und Scholia zur Theogonie (1876); Meyer, De compositione Theogonie (1887). Shield of Heracles: Wolf-Ranke (1840); Van Lennep-Hullemann (1854); P. Stegemann, De scult Hareolii Hesiodos poëtis (with illustrations) (1879). The fragments were published by W. Marschkeffel in 1840; for the 'Ayōv 'Ophgyov (ed. A. Rzach, 1908) see F. Nietzsche in Rheinisches Museum (new series) p. 706. For papyri fragments of the 'Apygmyov ('Ophgyov (150), some 50 lines on the wooring of Helen, and a shorter fragment in praise of Peleus, see Wilamowitz-Möllendorff in Sitzungsber. der königl. preuss. Akad. der Wissenschaften, for 26th of July 1900; for fragments relating to Meleager and the suitors of Helen, Berlin, Klassiker texte, v. (1907); of the Theogonie, Oxyrh. Pap. vi. (1908).

On the subject generally, consult G. F. Schömann, Opuscula, ii. (1857); H. Flach, Die hesioidischen Gedichte (1874); A. Rzach, Der Titel der Hesiodes (1870); P. O. Gruppe, Die griechischen Kulte und Mythen, i. (1887); O. Friedel, Die Sage vom Tode Hesiodes (1879), from Jahrbücher für klassische Philologie (10th suppl. Band, 1879); J. Adam, Religious Teachers of Greece (1905). There is a full bibliography of the excavations in southern Italy by A. Rzach in Bursian's Jahresbericht über die Fortschritte der klassischen Altertumswissenschaft, xxv. (1900).

There are translations of the Hesioid poems in English by Cooke (1728), C. A. Elton (1815), J. Banks (1856), and especially by A. W. Mair, with introduction and appendices (Oxford Library of Translations, 1908); in German (metrical version) with valuable introductions and notes by K. Pompeino (1896) and in other modern languages. (J. D.A.; J. H. F.)

HESPERIDES, in Greek mythology, maidens who guarded the golden apples which Earth gave Hera on her marriage to Zeus. According to Hesiod (Theogony, 273) they were the daughters of Erebus and Night; in later accounts, of Atlas and Hesperis, or of Phorcys and Ceto (schol. on Apoll. Rhod. iv. 1399; Diod. Sic. iv. 27) They were usually supposed to be three in number—Aegle, Erytheia, Hesperis (or Hesperethusa); according to some, four, or even seven. They lived far away in the west at the borders of Ocean, where the sun sets. Hence the sun (according to Mimmermus Ἄρα, Athenaeum xi. p. 470) sails in the golden bowl made by Hephaestus from the abode of the Hesperides to the land where he rises again. According to other accounts their home was among the Hyperboreans. The golden apples grew on a tree guarded by Ladon, the ever-watchful dragon. The sun is often in German and Lithuanian legends described as the apple that hangs on the tree of the nightly heaven, while the dragon, the envious power, keeps the light back from men till some beneficent power takes it from him. Hesperides are the hero who brings back the golden apples to mankind again. Like Perseus, he first applies to the nymphs, who help him to learn where the garden is. Arrived there he slays the dragon and carries the apples to Argos; and finally, like Perseus, he gives them to Athena. The Hesperides are, like the Sirens, possessed of the gift of delightful song. The apples appear to have been the symbol of love and fruitfulness, and are introduced at the marriages of Cadmus and Harmonia and Peleus and Thetis. The golden apples, the gift of Aphrodite to Hippomenes before his race with Atalanta, were also plucked from the garden of the Hesperides.

HESPERUS (Gr. *Eρθρους, Lat. Vesper), the evening star, son or brother of Atlas. According to Diodorus Siculus (iii. 60, iv. 27), he ascended Mount Atlas to observe the motions of the stars, and was suddenly swept away by a whirlwind. Ever afterwards he was honoured as a god, and the most brilliant star in the heavens was called by his name. Although as a mythological personality he is regarded as distinct from Phorbas or Hesperos (Lat. Lucifer, the morning star or bringer of light, the son of Astraus (or Cephalus) and Eos, the two stars were early identified by the Greeks.

HESS, the name of a family of German artists.

HEINRICH MARIA HESS (1798-1863)—von Hess, after he received a patent of personal nobility—was born at Düsseldorf and brought up to the profession of art by his father, the engraver Karl Ernst Christoph Hess (1755-1828). Karl Hess had already acquired a name when in 1806 the elector of Bavaria, having been raised to a kingship by Napoleon, transferred the Düsseldorf academy and gallery to Munich. Karl Hess accompanied the academy to its new home, and there continued the education of his son. Heinrich Hess became sufficiently master of his art to attract the attention of King Maximilian. He was sent with a stipend to Rome, where a copy which he made of Raphael's Panassus, and the study of great examples of monumental design, probably caused him to become a painter of ecclesiastical subjects on a large scale. In 1828 he was made professor of painting and director of all the art collections at Munich. He decorated the Aukirche, the Glyptothek and the Allerheiligenkapelle at Munich with frescoes; and his cartoons were selected for glass windows in the cathedrals of Cologne and Regensburg. Then came the great cycle of frescoes in the basilica of St Boniface at Munich, and the monumental attempts of the Vatican and Child enthroned between the four doctors, and receiving the homage of the four patrons of the Munich churches (now in the Pinakothek). His last work, the “Lord's Supper,” was found unfinished in his atelier after his death in 1863. Before testing his strength as a composer Heinrich Hess

1 Part of the poem was called Eoiai, because the description of each heroine began with η οἶα, "or like as." (See Bibliography.)
tried genre, an example of which is the Pilgrims entering Rome, now in the Munich gallery. He also painted portraits, and
had satistings from Thornwalden (Pinakothek and Schack
collections). But his fame rests on the frescoes representing
scenes from the Old and New Testaments in the Allerheiligen-
capelle, and the episodes from the life of St Boniface and other
German apostles in the basilica of Munich. Here he holds
rank second to none but Overbeck in monumental painting,
being always true to nature though mindful of the traditions
of Christian art, earnest and simple in feeling, yet lifelike and
powerful in expression. Through him and his pupils the sentiment
of religious art was preserved and extended in the Munich
school. Hess—was born
at Düsseldorf and accompanied his younger brother Maria in
1806. Being of an age to receive vivid
impressions, he felt the stirring impulses of the time and became
a painter of skirmishes and battles. In 1813-1815 he was allowed to
join the staff of General Wrede, who commanded the Bavarians in
the military operations which led to the abdication of Napoleon;
and there he gained novel experiences of war and a taste for
extensive travel. In the course of years he successively visited
Austria, Switzerland, France, Italy (on the Czar's army's
expedition), the northern arcades of the Hofgarten at Munich. King
Otto's entrance into Nauplia was the subject of a large and crowded canvas now in the
Pinakothek, which Hess executed in person. From that day, and from battlepieces on a scale of great size in the Royal
Palace, as well as from military episodes executed for the earl
Nicholas, and the battle of Waterloo now in the Munich Gallery,
we gather that Hess was a clever painter of horses. His
conception of subject was lifelike, and his drawing invariably correct,
but his style is not so congenial to modern taste as that of
the painters of touch. He finished almost too carefully with thin
medium and pointed tools; and on that account he lacked to a
certain extent the boldness of Horace Vernet, to whom he was
not unaptly compared. He died suddenly, full of honours,
at Munich, in April 1871. Several of his genre pictures, horse
hunts, and brigand scenes may be found in the Pinakothek and gallery of Munich.

Karl Hess (1801-1874), the third son of Karl Christopher Hess,
born at Düsseldorf, was also taught by his father, who hoped
that he would obtain distinction as an engraver. Karl, however,
after engraving one plate after Adrian Ostade, turned to painting
under the guidance of Wagenbauer of Munich, and then studied
under his elder brother Peter. But historical composition proved to be contrary to his taste as engraving, and he gave
himself exclusively at last to illustrations of peasant life in the
hill country of Bavaria. He became clever alike in representing
the people, the animals and the landscape of the Alps, and with
constant means of reference to nature in the neighbourhood
of Reichenhall, where he at last resided, he never produced
anything that was not impressed with the true stamp of a kindly
realism. Some of his pictures in the museum of Munich will
serve as examples of his manner. He died at Reichenhall on
16th of November 1874.

**HESS, HEINRICH HERMANN JOSEF, FREIHERR VON**
(1758-1870), Austrian soldier, entered the army in 1759 and was
soon employed as a staff officer on survey work. He distinguished
himself as a subaltern at Aspern and Wagram, and in 1813, as
a captain, again served on the staff. In 1815 he was with Schwarzen-
berg. He had in the interval between the two wars been employed as a military commissioner in Piedmont, and at the
peace resumed this post, gaining knowledge which later proved
invaluable to the Austrian army. In 1831, when Radetzky
became commander-in-chief in Austrian Italy, he took Hess as
his chief-of-staff, and thus began the connexion between two
famous soldiers which, like that of Kscherf and Gneisenau, is a
classical example of harmonious co-operation of commander and
chief-of-staff. Hess put into shape Radetzky's military ideas, in

the form of new drill for each arm, and, under their guidance,
the Austrian army in North Italy, always on a war footing,
became the best in Europe. From 1834 to 1848 Hess was
employed in Moravia, at Vienna, &c., but, on the outbreak of
revolution and war in the latter year, was at once sent out to
Radetzky as chief-of-staff. In the two campaigns against King
Charles Albert which followed, culminating in the victory
of Novara, Hess's assistance to his chief was made still more
valuable by his knowledge of the enemy, and the field-marshals
acknowledged his services in general orders. Lieut.-Fieldmarshaal
Hess was at once promoted Feldzeugmeister, made a member of
the emperor's council, and Freiherr, assuming at the same time
the duties of the quarter-master-general. Next year he became
chief of the staff to the emperor. He was often employed in
missions to various capitals, and he appeared in the field in 1854
at the head of the Austrian army which intervened so effectually
in the Crimean war. In 1859 he was sent to Italy after the early
defeats. He became field-marshall in 1860, and a year later, on
resigning his position as chief-of-staff, he was made captain of
the Trabant guard. He died in Vienna in 1870.

See "General Hess" in Lebensgeschichtlichen Hirnsissen (Vienna, 1855).

**HESSE** (Lat. Hesiaia, Ger. Hessen), a grand duchy forming a
state of the German empire. It was known until 1866 as Hesse-
Darmstadt, the history of which is given under a separate heading
below. It consists of two main parts, separated from each other
by a narrow strip of Prussian territory. The northern part is
the province of Oberhessen; the southern consists of the contiguous
provinces of Starkenburg and Rheinhessen. There are also
eleven very small exclaves, mostly grouped about Homburg to the
south-west of Oberhessen; but the largest is Wimpfen on the
north-west frontier of Württemberg. Oberhessen is hilly
though of no great elevation it extends over the water-parting
between the basins of the Rhine and the Weser, and in the
Vogelsberg it has as its culmination point the Taufstein (2533 ft.).
The north-west it includes spurs of the Taunus. Between
these two systems of hills lies the fertile undulating tract known as
the Wetteran, watered by the Wetter, a tributary of the Main.
Starkenburg occupies the angle between the Main and
the Rhine, and in its south-eastern part includes some of
the ranges of the Odenwald, the highest part being the Seidenbucher
Höhe (1065 ft.). Rheinhessen is separated from Starkenburg by
the Rhine, and has that river as its northern as well as its eastern
frontier, though it extends across it at the north-east corner,
where the Rhine, on receiving the Main, changes its course
abruptly from south to west. The territory consists of a fertile
tract of low hills, rising towards the south-west into the northern
extremity of the Hardt range, but at no point reaching a height of
more than 1030 ft.

The area and population of the three provinces of Hesse are
as follow:

The chief towns of the grand duchy are Darmstadt (the
capital) and Offenbach in Starkenburg, Mainz and Worms in
Rheinhessen and Giessen in Oberhessen. More than two-thirds of
the inhabitants are Protestants; the majority of the remainder
are Roman Catholics, and there are about 25,000 Jews. The
grand duke is head of the Protestant church. Education
is compulsory, the elementary schools being communal, assisted
by state grants. There are a university at Giessen and a technical
high school at Darmstadt. Agriculture is important, more than
three-fifths of the total area being under cultivation. The
largest grain crops are rye and barley, and nearly 40,000 acres
are under vines. Minerals, in which Oberhessen is much richer
than the two other provinces, include iron, manganese, salt and some coal.

The constitution dates from 1820, but was modified in 1856, 1862, 1872 and 1900. There are two legislative chambers. The upper consists of princes of the grand-ducal family, heads of mediatized houses, the head of the Roman Catholic and the superintendent of the Protestant church, the chancellor of the university, two elected representatives of the land-owning nobility, and twelve members nominated by the grand duke. The lower chamber consists of ten deputies from large towns and forty from small towns and rural districts. They are indirectly elected, by deputy electors (Wahlmänner) nominated by the electors, who must be Hessian over twenty-five years old, paying direct taxes. The executive ministry of state is divided into the departments of the interior, justice and finance. The three provinces are divided for local administration into 18 circles and 980 communes. The ordinary revenue and expenditure amount each to about £4,000,000 annually, the chief taxes being an income-tax, succession duties and stamp tax. The public debt, practically the whole of which is on railways, amounted to £10,000,000 in 1907.

History.—The name of Hesse, now used principally for the grand duchy formerly known as Hesse-Darmstadt, refers to a country which has had different boundaries and areas at different times. The name is derived from that of a Frankish tribe, the Hessi. The earliest known inhabitants of the country were the Chatti, who lived here during the 1st century A.D. (Tacitus, Germania, c. 30), and whose capital, Mattium on the Eder, was burned by the Romans about a.d. 15. "Alike both in race and language," says Walther Schultz, "the Chatti and the Hessi are identical." During the period of the Völkerwanderung many of these people moved westward, but some remained behind to give the name of Fulda and Herleshausen to parts of that country, although it was not until the 8th century that the word Hesse came into use. Early Hesse was the district around the Fulda, the Werra, the Eder and the Lahn, and was part of the Frankish kingdom both during Merovingian and during Carolingian times. Soon Hessegau is mentioned, and this district was the headquarters of Charlemagne during his campaigns against the Saxons. By the treaty of Verdun in 843 it fell to Louis the German, and later it seems to have been partly in the duchy of Saxony and partly in that of Franconia. The Hessian were converted to Christianity mainly through the efforts of St Boniface; their land was included in the archbishopric of Mainz; and religion and culture were kept alive among them largely owing to the foundation of the Benedictine abbeys of Fulda and Hersfeld. In the course of the 9th century Hesse felt the absence of a strong central power, and, before the time of the emperor Otto the Great, several counts, among whom were Giso and Werner, had made themselves practically independent; but after the accession of Otto in 936 the land quietly accepted the yoke of the medieval emperors. About 1120 another Giso, count of Gudensberg, secured possession of the lands of the Werners; on his death in 1137 his daughter and heiress, Hedwig, married Louis, landgrave of Thuringia; and from this date until 1247, when the Thuringian ruling family became extinct, Hesse formed part of Thuringia. The death of Henry Raspe, the last landgrave of Thuringia, in 1247, caused a long war over the disposal of his lands, and this dispute was not settled until 1264 when Hesse, separated again from Thuringia, was secured by his niece Sophia (d. 1284), widow of Henry II., duke of Brabant. In the following year Sophia handed over Hesse to her son Henry (1244-1308), who, remembering the connexion of Hesse and Thuringia, took the title of landgrave, and is the ancestor of all the subsequent rulers of the country. In 1292 Henry was made a prince of the Empire, and with him the history of Hesse properly begins.

For nearly 300 years the history of Hesse is comparatively uneventful. The land, which fell into two main portions, upper Hesse round Marburg, and lower Hesse round Cassel, was twice divided between two members of the ruling family, but no permanent partition took place before the Reformation. A Landtag was first called together in 1387, and the landgraves were constantly at variance with the electors of Mainz, who had large temporal possessions in the country. They found time, however, to increase the area of Hesse. Giessen, part of Schmalkalden, Ziegenhain, Nidda and, after a long struggle, Kassel in Hessen-Wetzlar, were acquired, while in 1432 the abbey of Hersfeld placed itself under the protection of Hesse. The most noteworthy of the landgraves was perhaps Louis I. (d. 1458), a candidate for the empire in 1440, and William II. (d. 1509), a comrade of the German king, Maximilian I. The title of Hesse-Rheinfels, held by Philip (1492-1522), became landgrave, and by his vigorous personality brought his country into prominence during the religious troubles of the 16th century. Following the example of his ancestors, Philip cared for education and the general welfare of his land, and the Protestant university of Marburg, founded in 1527, owed to him its origin. When he died in 1567 Hesse was divided between his four sons into Hesse-Cassel, Hesse-Darmstadt, Hesse-Marburg and Hesse-Rheinfels. The lines ruling in Hesse-Rheinfels and Hesse-Marburg, or upper Hesse, became extinct in 1585 and 1604 respectively, and these lands passed to the two remaining branches of the family. The small landgrave of Hesse-Darmstadt was formed in 1622 from Hesse-Darmstadt. After the annexation of Hesse-Cassel and Hesse-Homburg by Prussia in 1866 Hesse-Darmstadt remained the only independent part of Hesse, and it generally receives the common name.

Hesse-Philippsthal is an offshoot of Hesse-Cassel, and was founded in 1685 by Philip (d. 1721), son of the Landgrave William VI. In 1699 the representative of this family was the Landgrave Ernest (b. 1646). Hesse-Barchfeld was founded in 1721 by Philip's son, William (d. 1761), and in 1709 its representative was the Landgrave Clovis (b. 1756). The lands of both these princes are now mediatized. Hesse-Nassau is a province of Prussia formed in 1866 from part of Hesse-Cassel and part of the duchy of Nassau.

**HESSE-CASSL** (in German Kurhessen, i.e. Electoral Hesse), now the government district of Cassel in the Prussian province of Hesse-Nassau. It was till 1866 a landgravate and electorate of Germany, consisting of several detached masses of territory, some of which were entitled to a separate diet of electors, but in other ways, as a province of the Hesse-Cassel, subject to the over-lordship of the king of Hanover. The greatest part of the territory is within a triangular area of about 300 by 100 miles, and the population of 1866 was 543,780.

History.—The line of Hesse-Cassel was founded by William IV., surnamed the Wise, eldest son of Philip the Magnanimous. On his father's death in 1567 he received one half of Hesse, with Cassel as his capital; and this formed the landgrave of Hesse-Cassel. Additions were made to it by inheritance from his brother's possessions. His son, Maurice the Learned (1592-1627), turned Protestant in 1605, became involved later in the Thirty Years' War, and, after being forced to cede some of his territories to the Darmstadt line, abdicated in favour of his son William V. (1627-1657), his younger sons receiving appanages which created the cartels of the house, of which that of Hesse-Rheinfels obtained the largest. When William V., the territories which had been conquered by the Imperialists, his widow Amalie Elizabeth, as regent for her son William VI. (1637-1663), reconquered the country and, with the aid of the French and Swedes, held it, together with part of Westphalia. At the peace of Westphalia (1648), accordingly, Hesse-Cassel was augmented by the larger part of the countship of Schaumburg and by the abbey of Hersfeld, secularized as a principality of the Empire. The Landgrave Amalie Elizabeth introduced the rule of primogeniture. William VI., who came of age in 1650, was an enlightened patron of learning and the arts. He was succeeded by his son William VII., an infant, who died in 1679, and was succeeded by his brother Charles (1670-1739). Charles' chief claim to remembrance is that he was the first ruler to adopt...
the system of hiring his soldiers out to foreign powers as mercenaries, as a means of improving the national finances. Frederick I., the next landgrave (1730-1751), had become by marriage king of Sweden, and on his death was succeeded in the landgraviate by his brother William VIII. (1751-1760), who fought as an ally of England during the Seven Years' War. From his successor Frederick II. (1760-1785), who had become a Roman Catholic, 22,000 Hessian troops were hired by England for about £3,191,000, to assist in the war against the North German confederacy. This action, often bitterly criticized, has of late years found apologists (cf. v. Werthern, *Die hessischen Hilfstruppen im nordamerikanischen Unabhängigkeitskrieg*, Cassel, 1895). It is argued that the troops were in any case mercenaries, and that the practice was quite common. Whatever opinion may be held as to this, it is certain that Frederick spent the money well: he did much for the development of the economic and intellectual improvement of the country. The reign of the next landgrave, William IX. (1785-1821), was an important epoch in the history of Hesse-Cassel. Ascending the throne in 1785, he took part in the war against France a few years later, and in 1795 peace was arranged by the treaty of Basel. For the loss in 1801 of his possessions on the left bank of the Rhine he was in 1803 compensated by some of the former French territory round Mainz, and at the same time was raised to the dignity of Elector (*Kurfürst*) as William I. In 1806 he made a treaty of neutrality with Napoleon, but after the battle of Jena, the latter, suspecting William's designs, occupied his country, and expelled him. Hesse-Cassel was then added to Jerome Bonaparte's new kingdom of Westphalia; but after the battle of Leipzig in 1813 the French withdrew the occupation, and Hesse-Cassel was restored to its former dignity. The elector returned in triumph to his capital. A treaty concluded by him with the Allies (Dec. 2) stipulated that he was to receive back all his former territories, or their equivalent, and at the same time to restore the ancient constitution of his country. This treaty, so far as the territories were concerned, was carried out by the powers at the congress of Vienna. They refused, however, the elector's request to be recognized as "King of the Chatti" (*König der Katten*), a request which was again rejected at the conference of Aix-la-Chapelle (1818). He therefore retained the now meaningless title of elector, with the predicate of "royal highness." The elector had signalized his restoration by abolishing with a stroke of the pen all the reforms introduced under the French régime, repudiating the Westphalian debt and declaring null and void the sale of the crown domains. Everything was set back to its condition on the 1st of November 1806; even the officials had to descend to their former rank, and the army to revert to the old uniforms and powdered pigs tails. The estates, indeed, were summoned in March 1815, but the attempt to devise a constitution hinged on; their appeal to a federal diet at Frankfurt to call the elector to order in the matter of the debt and the domains came to nothing owing to the intervention of Metternich; and in May 1816 they were dissolved, never to meet again. William I. died on the 27th of February 1821, and was succeeded by his son, William II. Under him the constitutional crisis in Hesse-Cassel came to a head. He was arbitrary and avaricious like his father, and moreover shocked public sentiment by his treatment of his wife, a popular Prussian princess, and his relations with his mistress, one Emilie Ortloff, created countess of Reichenbach, whom he loaded with wealth. The full revolution in Paris gave the signal for disturbances; the elector was forced to summon the estates; and on the 5th of January 1831 a constitution on the ordinary Liberal basis was signed. The elector now retired to Hanau, appointed his son Frederick William regent, and took no further part in public affairs. The regent, without his father's coarseness, had a full share of his arbitrary and avaricious temper. Constitutional restrictions were intolerable to him; and the consequent friction with the diet was aggravated when, in 1832, Hassenzell (g.n.) was placed at the head of the administration. The whole efforts of the elector and his minister were directed to nullifying the constitutional control vested in the diet; and the Opposition was fought by manipulating the elections, packing the judicial bench, and a vexatious and petty persecution of political "suspects," and this policy continued after the retirement of Hassenzell in 1837. The situation that resulted issued in the revolutionary year 1848 in a general manifestation of public discontent; and Frederick William, who had become elector on his father's death (November 20, 1847), was forced to dismiss through Hessische Stämme and to agree to a comprehensive programme of democratic reform. This, however, was but short-lived. After the breakdown of the Frankfort National Parliament, Frederick William joined the Prussian Northern Union, and deputies from Hesse-Cassel were sent to the Erfurt parliament. But as Austria recovered strength, the elector's policy changed. On the 23rd of February 1850 Hassenzell was again placed at the head of the administration and threw himself with renewed zeal into the struggle against the constitution and into opposition to Prussia. On the 2nd of September the diet was dissolved; the taxes were continued by electoral order, and the country was placed under martial law. It was at once clear, however, that the elector could not depend on his officers or troops, who remained faithful to their oath to the constitution. Hassenzell persuaded the elector to leave Cassel secretly with him, and on the 15th of October appealed for aid to the reconstituted federal diet, which willingly passed a decree of "intervention." On the 1st of November an Austrian and Bavarian force marched into the electorate. This was a direct challenge to Prussia, which under conventions with the elector had the right to the use of the military forces. Whatever seemed imminent; Prussian troops also entered the country, and shots were actually exchanged between the outposts. But Prussia was in no condition to take up the challenge; and the diplomatic contest that followed issued in the Austrian triumph at Olmütz (1851). Hesse was surrendered to the federal diet; the taxes were collected by the federal forces, and all officials who refused to recognize the new order were dismissed. In March 1852 the federal diet abolished the constitution of 1831, together with the reforms of 1848, and in April issued a new provisional constitution. The new diet had, under this, very narrow powers; and the elector was free to carry out his policy of amassing money, forbidding the construction of railways and manufactories, and imposing strict orthodoxy on churches and schools. In 1855, however, Hassenzell—who had returned with the elector—was dismissed; and five years later, after a period of growing agitation, a new constitution was granted with the consent of the federal diet (May 30, 1866). The new chambers, however, demanded the constitution of 1831; and, after several dissolutions which always resulted in the return of the same members, the federal diet decided to restore the constitution of 1831 (May 24, 1862). This had been due to a threat of Prussian occupation; and it needed another such threat to persuade the elector to reassemble the chambers, which he had dismissed at the first sign of opposition; and he re-engaged himself by refusing to transact any public business. In 1866 the end came. The elector, full of grievances against Prussia, threw in his lot with Austria; the electorate was at once overrun with Prussian troops; Cassel was occupied (June 20); and the elector was carried a prisoner to Stettin. By the treaty of Prague Hesse-Cassel was annexed to Prussia. The elector Frederick William (d. 1873) had been, by the terms of the treaty of cession, guaranteed the entail property of his house. This was, however, sequestered in 1868 owing to his intrigues against Prussia; part of the income was paid, however, to the eldest agnate, the landgrave Frederick (d. 1884), and part, together with certain castles and palaces, was assigned to the cadet lines of Philippsthal and Philippsthal-Barchfeld.
HESSE-DARMSTADT, a grand-duchy in Germany; the history of which begins with the partition of Hesse in 1567. George I. (1547-1597), the youngest son of the landgrave Philip, received the upper country of Kassel and Wetterau, and, selecting Darmstadt as his residence, became the founder of the Hesse-Darmstadt line. Additions to the landgravate were made both in the reigns of George and of his son and successor, Louis V. (1577-1626), but in 1621 Hesse-Homburg was cut off to form an appanage for George's youngest son, Frederick (d. 1638). Although Louis V., who founded the university of Giessen in 1607, was a Lutherian, he and his son, George II. (1605-1661), sided with the imperialists in the Thirty Years' War, during which Hesse-Darmstadt suffered very severely from the ravages of the Swedes. In this struggle Hesse-Cassel took the other side, and the rivalry between the two landgravates was increased by a dispute over Hesse-Marburg, the ruling family of which had become extinct in 1604. This quarrel was interwoven with the general thread of the Thirty Years' War, and was not finally settled until 1648, when the disputed territory was divided between the two claimants. Louis VI. (d. 1678), a careful and patriotic prince, followed the policy of the three previous landgraves, but the anxiety of his son, Ernest Louis (d. 1730), to emulate the French court under Louis XIV. led his country into debt. Under Ernest Louis and his son and successor, Louis VIII. (d. 1768), another dispute occurred between Darmstadt and Cassel; this time it was over the succession to the county of Hanau, which was eventually divided, Hesse-Darmstadt receiving Lichtenberg. During the 18th century the War of the Austrian Succession and the Seven Years' War dealt heavy blows at the prosperity of the landgraviate, which was a result of the happy reign of Louis IX. (1719-1790), who served in the Prussian army under Frederick the Great, is chiefly famous as the husband of Caroline (1721-1774), "the great landgravine," who counted Goethe, Herder and Grimm among her friends and was described by Frederick the Great as feminia saxi, ingenio vir. In April 1790, just after the outbreak of the French Revolution, Louis X. (1753-1830), an educated prince who shared the tastes and friendships of his mother, Caroline, became landgrave. In 1792 he joined the allies against France, but in 1796 he was compelled to sign a treaty of neutrality. In 1803, having formally surrendered the part of Hesse on the left bank of the Rhine which had been taken from him in the early days of the Revolution, Louis X. transferred much of his territory which had hitherto belonged to the duchy of Westphalia, to the elector of Mainz and the bishop of Worms. In 1806, being a member of the confederation of the Rhine, he took the title of Louis I., grand-duke of Hesse; he supported Napoleon with troops from 1805 to 1813, but after the battle of Leipzig he joined the allies. In 1813 the congress of Vienna made another change in the area and boundaries of Hesse-Darmstadt. Louis secured again a district on the left bank of the Rhine, including the cities of Mainz and Worms, but he made cessions of territory to Prussia and to Bavaria and he recognized the independence of Hesse-Homburg, which had recently been incorporated with his lands. However, his title of grand-duke was confirmed, and as grand-duke of Hesse and by the right of the people he entered the German Confederation. Soon the growing desire for liberty made itself felt in Hesse, and in 1820 Louis gave a constitution to the land; various forms were carried through; the system of government was reorganized, and in 1828 Hesse-Darmstadt joined the Prussian Zollverein. Louis I., who did a great deal for the welfare of his country, died on the 6th of April 1830, and was followed on the throne by his son, Louis II. (1777-1848). This grand-duke had some trouble with his Landtag, but, dying on the 16th of June 1848, he left his son, Louis III. (1806-1877), to meet the fury of the revolutionary year 1848. Many concessions were made to the popular will, but during the subsequent reaction these were withdrawn, and the period between 1850 and 1871, when Karl Friedrich Reinhard, Freiherr von Dalwigk (1822-1886), was chiefly responsible for the government of Hesse-Darmstadt, was one of repression, although some benefits were conferred upon the people. Dalwigk was one of Prussia's enemies, and during the war of 1866 the grand-duke fought on the Austrian side, the result being that he was compelled to pay a heavy indemnity and to cede certain districts, including Hanau, which had just acquired, to Prussia. In 1867 Louis entered the North German Confederation, but only for his lands north of the Main, and in 1871 Hesse-Darmstadt became one of the states of the new German empire. After the withdrawal of Dalwigk from public life at this time a more liberal policy was adopted in Hesse. Many reforms in ecclesiastical, educational, financial and administrative matters were introduced, and in general the grand-duchy may be said to have passed largely under the influence of Prussia, which, by an arrangement made in 1866, controls the Hessian railway system. The constitution of 1870, subject to four subsequent modifications, is still the law of the land, the legislative power being vested in two chambers and the executive power being exercised by the three departments of the ministry of state. Since the annexation of Hesse-Cassel by Prussia in 1866 the grand-duchy has been known simply as Hesse. Louis III. died on the 13th of June 1877, and was succeeded by his nephew, Louis IV. (1837-1892), a son-in-law of Queen Victoria; he died on the 13th of March 1892, and was succeeded by his son, Ernest Louis (b. 1868). This grand-duke's marriage with Victoria (b. 1876), daughter of Alfred, duke of Saxe-Coburg and Gotha, was dissolved in 1901. The union was childless, and consequently in 1902 a law regulating the succession was passed. By this the landgrave Alexander Frederick (b. 1863), the representative of the family which ruled Hesse-Cassel until 1866, was declared the heir to Hesse in case the grand-duke died without sons. In 1905 Ernest Louis married Eleonore, princess of Solms-Hohensolms-Lichtenberg (b. 1874), by whom he had a son George (b. 1906).

HESE-HOMBURG, formerly a small landgraviate in Germany. It consisted of two parts, the district of Homburg on the right side of the Rhine, and the district of Meisenheim, which was added in 1815, on the left side of the same river. Its area was about 100 sq. m., and its population in 1864 was 27,374. Homburg now forms part of the Prussian province of Hesse-Nassau, and Meisenheim of the province of the Rhine. Hesse-Homburg was formed into a separate landgraviate in 1622 by Frederick I. (d. 1638), son of George I., landgrave of Hesse-Darmstadt, although it did not become independent of Hesse-Darmstadt until 1802. In 1806 it was made a part of Hesse-Darmstadt and named Hanau-Meisenheim. In 1815 by the congress of Vienna Hesse-Homburg was incorporated into Hesse-Homburg-Bingenheim; but these parts were again united in 1868 under the rule of Frederick's third son, Frederick II. (d. 1780). In 1866, during the long reign of the landgrave Frederick V., which extended from 1751 to 1820, Hesse-Homburg was mediatized, and incorporated with Hesse-Darmstadt; but in 1815 by the congress of Vienna the latter state was compelled to recognize the independence of Hesse-Homburg, which was increased by the addition of Meisenheim. Frederick V. joined the German confederation as a sovereign prince in 1817, and after his death his five sons in succession filled the throne. The last of these, Ferdinand, who succeeded in 1838, granted a liberal constitution to his people, but cancelled it during the reaction of 1848. After he died on the 24th of March 1866, Hesse-Homburg was inherited by Louis III., grand-duke of Hesse-Darmstadt, while Meisenheim fell to Prussia. In the following September, however, Louis
was forced to cede his new possession to Prussia, as he had supported Austria during the war between these two powers.

**HESSE-NAASSAUX** (Ger. *Hessen-Nassau*), a province of Prussia, bounded, from N. E., S., and W., successively by Westphalia, Waldeck, Hanover, the province of Saxony, the Thuringian States, Bavaria, Hesse, and the Rhine Province. There are small detached portions in Waldeck, Thuringia, &c.; on the other hand the province encloses the province of Oberhessen belonging to the sovereignty of Hesse, and the circle of Wetzlar belonging to the Rhine Province. Hesse-NAASSAUX was formed in 1867–1868 out of the territories which accrued to Prussia after the war of 1866, namely, the landgraviate of Hesse-Cassel and the duchy of Nassau, in addition to the greater part of the territory of Frankfort-on-Main, parts of the grand-duchy of Hesse, the territory of Homburg and the countship of Hesse-Homburg, together with certain small districts which belonged to Bavaria. It is now divided into the governments of Cassel and Wiesbaden, the second of which consists mainly of the former territories of NAASSAUX.

The province has an area of 6062 sq. m., and had a population in 1905 of 2,070,052, being the fourth most densely populated province in Prussia, after Berlin, the Rhine Province and Westphalia. The east and north parts lie in the basin of the river Fulda, which near the north-eastern boundary joins with the Werra to form the Weser. The Main forms part of the southern boundary, and the Rhine the south-western; the western part of the province lies mostly in the basin of the Lahn, a tributary of the Rhine. The province is generally hilly, the highest hills occurring in the east and west. The Fulda rises in the Wasserkuppe (3,117 ft.), an eminence of the Rhöngebirge, the highest in the province. In the south-west are the Taunus, bordering the Main, and the Westerwald, west of the Lahn, in which the highest points respectively are the Grosser Feldberg (2,887 ft.) and the Fuchskauten (2,155 ft.).

The congeries of small groups of lower hills in the north are known as the Hessische Bergland.

The province is not notably well suited to agriculture, but in forests it is the richest in Prussia, and the timber trade is large. The chief crop is wheat, and the growing of hops is extensively practised. The vine is cultivated chiefly on the slopes of the Taunus, in the south-west, where the names of several towns are well known for their wines—Schierstein, Erbach (Marcobrunner), Johannisburg, Geisenheim, Rüdesheim, Assmannshausen. Iron, coal, copper and manganese are mined. The mineral springs are important, including those at Wiesbaden, Homburg, Langenschwalbach, Nennsdorf, Schlangenbad and Soden. The chief manufacturing centres are Cassel, Diez, Eschwege, Frankfurt, Fulda, Gross Almerode, Hanau and Hirschfeld. The province is divided for administration into 42 districts (*Kreise*), 24 in the government of east and west; and 18 in that of Wiesbaden. It returns 14 representatives to the Reichstag. Marburg is the seat of a university.

**HESSE-ROTENBURG**, a German landgraviate which was broken up in 1834. In 1627 Ernest (1623–1693), a younger son of Maurice, landgrave of Hesse-Cassel (d. 1632), received Rhinefsels and lower Katzelnalbogen as his inheritance, and some years later, on the deaths of two of his brothers, he added Eschwege, Rotenburg, Wahnfried and other districts to his possessions. Ernest, who was a convert to the Roman Catholic Church, was a great traveller and a voluminous writer. About 1700 his two sons, William (d. 1725) and Charles (d. 1712), divided their territories, and founded the families of Hesse-Rotenburg and Hesse-Wansfried. The latter family died out in 1755, when William's grandson, Constantine (d. 1778), reunited the lands except Rheinsfeld, which had been acquired by Hesse-Cassel in 1735, and ruled them as landgrave of Hesse-Rotenburg. At the peace of Lunéville in 1801 the part of the landgraviate on the left bank of the Rhine was surrendered to France, and in 1815 other parts were ceded to Prussia, the landgraves Victor Amadeus being compensated by the abbey of Corvey and the Silesian duchy of Ratibor. Victor was the last male member of his family, so, with the consent of Prussia, he bequeathed his alodial estates to his nephews the princes Victor and Chlodwig of Hohenlohe-Waldenburg-Schillingsfürst (see Hohenlohe). When the landgrave died on the 12th of November 1834 the remaining parts of Hesse-Rotenburg were united with Hesse-Cassel according to the arrangement of 1627. It may be noted that Hesse-Rotenburg was never completely independent of Hesse-Cassel. Perhaps the most celebrated member of this Hesse-Rotenburg line was Charles Constantine (1752–1821), a younger son of the landgrave Constantine, who was called "citoyen Hesse," and who took part in the French Revolution.

**HESSIAN**, the name of a jute fabric made as a plain cloth, in various degrees of fineness, width and quality. The common, or standard, hessian is 40 in. wide, weighs 10½ oz. per yd., and in the finished state contains about 12 threads and 1½ picks per in. The name is probably of German origin, and the fabric was originally made from flax and tow. Small quantities of cloth are still made from yarns of these fibres, but the jute fibre is generally supplanted by its comparative cheapness, has now almost

This useful cloth is employed in countless ways, especially for packing all kinds of dry goods, while large quantities, of different qualities, are made up into bags for sugar, flour, coffee, grain, ore, manure, sand, potatoes, onions, &c. Indeed, bags made from one or other quality of this cloth, or from sacking, bagging or tarpaulin, form the most convenient, and at the same time the cheapest covering for any kind of goods which are not damaged by being crushed. Certain types are specially treated, dyed black, tan or other colour, or dyed in their natural colour, stiffened and used for padding and linings for cheap clothing, boots, shoes, bags and other articles. When dyed in art shades the cloth forms an attractive decoration for stages and platforms, and generally for any temporary erection, and in many cases it is stencilled and then used for wall decoration.

The great linoleum industry depends upon certain types of this fabric for the foundation of its products, while large quantities are used for the backs of fringe rugs, spring mattresses and the upholstery of furniture. The great centres for the manufacture of this fabric are Dundee and Calcutta, and every variety of the cloth, and all kinds of hand- and machine-sewn, as well as seamless bags, are made in the former city. The American name for hessian is burlap; this particular kind is 40 in. wide, and is now largely made in Calcutta as well as in Dundee and other places.

**HESSUS, HELIUS EOBANUS** (1488–1540), German Latin poet, was born at Halgehausen in Hesse-Cassel, on the 6th of January 1488. His family name is said to have been Koch; Eoban was the name of a local saint; Hessus indicates the land of his birth, Helius the fact that he was born on Sunday. In 1504 he entered the university of Erfurt, and soon after his graduation was appointed rector of the school of St Severus. This post he soon lost, and spent the years 1509–1513 at the court of the bishop of Riesenburg. Returning to Erfurt, he was reduced to great straits owing to his drunken and irregular habits. At length (in 1517) he was appointed professor of Latin in the university. He was prominently associated with the distinguished men of the time (Johann Reuchlin, Conrad Peutinger, Ulrich von Hutten, Conrad Mutianus), and took part in the political, religious and literary quarrels of the period, finally declining in favour of Luther and the Reformation, although his subsequent conduct showed that he was actuated by selfish motives. The university was seriously weakened by the growing popularity of the new university of Wittenberg, and Hessus endeavoured (but without success) to gain a living by the practice of medicine. Through the influence of Camerarius and Melanchthon, he obtained a post at Nuremberg (1526), but, finding a regular life distasteful, he again went back to Erfurt (1533). But it was not the Erfurt he had known; his old friends were dead or had left the place; the university was deserted. A lengthy poem gained him the favour
of the landgrave of Hesse, by whom he was summoned in 1536 as professor of poetry and history to Marburg, where he died on the 5th of October 1540. Hessus, who was considered the foremost Latin poet of his age, was a facile verse-maker, but his natural prolixity of style was thought less likely to pay or secure him the favour of some important person. He wrote local, historical and military poems, idyls, epigrams and occasional pieces, collected under the title of Sytæae. His most popular works were translations of the Psalms into Latin distichs (which reached forty editions) and of the Ἠλίαδ into hexameters. His most original poem was the Heroides in imitation of Ovid, consisting of forty letters from holy women, from the Virgin Mary down to Konigunde, wife of the emperor Henry II.

His Epistolae were edited by his friend Camerarius, who also wrote his life (1583). There are later accounts of him by M. Hertz (1800), G. Schwerzelt (1874) and C. Krause (1879); see also D. F. Strauss, **Ulrich von Huttten** (Eng. trans., 1874). His poems on Nuremberg and other towns have been edited with commentaries and 16th-century illustrations by J. Neff and V. von Loga in M. H. Hamburger, in **S. Szamotolski's Lateinische Literaturdenkmäler des XVI. u. XVII. Jahrhunderts** (Berlin, 1869).

**HESTIA**, in Greek mythology, the "fire-goddess," daughter of Cronus and Rhea, the goddess of hearth and home. She is not mentioned in Homer, although the hearth is recognized as a place of refuge for suppliants; this seems to show that her worship was not universally acknowledged at the time of the Homeric poems. In post-Homeric religion she is one of the twelve Olympian deities, but her abiding goddess of the home and hearth, wherever it leaves Olympus. When Apollo and Poseidon became suitors for her hand, she swore to remain a maid for ever; whereupon Zeus bestowed upon her the honour of presiding over all sacrifices. To her the opening sacrifice was offered; to her at the sacrificial meal the first and last libations were poured. The fire of Hestia was always kept burning, and, if by any accident it became extinct, only sacred fire produced by friction, or by burning glasses drawing fire from the sun, might be used to rekindle it. Hestia is the goddess of the family union, the personification of the idea of home; and as the city union is only the family union on a large scale, she was regarded as the goddess of the state. In this character her special sanctuary was in the pnyxæan, where the common hearth-fire round which the magistrates meet is ever burning, and where the sacred rites that sanctify the concord of city life are performed. From this fire, as the representative of the life of the city, intending colonists took the fire which was to be kindled on the hearth of the new colony. Hestia was closely connected with Zeus, the god of the family both in its external relation of hospitality and its internal unity round its own hearth; in the **Odyssey** a form of oath is by Zeus, the table and the hearth. Again, Hestia is often associated with Hermes, the two representing home and domestic life on the one hand, and business and outdoor life on the other; or, according to others, the association is local—that of the god of boundaries with the goddess of the house. In later philosophy Hestia became the heart of the universe—the personification of the earth as the centre of the universe, identified with Cybele and Demeter. As Hestia had her home in the pnyxæan, special temples dedicated to her are of rare occurrence. She is seldom represented in works of art, and plays no important part in legend. It is not certain that any really Greek statues of Hestia are in existence, although the Giustiniani Vesta in the Torlonia Museum is usually accepted as such. In this she is represented standing upright, simply robed, a hood over her head, the left hand raised and pointing upwards. The Roman deity corresponding to the Greek Hestia is **Vesta** (q.v.).

See A. Peucker, **Hestia-Vesta** (1864), the standard work on the subject. See also F. Roehl in **Röse's **Lexicon Thür.** (1874), E. G. Schwerzelt, *Italien* (1887); G. Hagemann, *De Graecorum pnyxæan* (1881), with bibliography and notes; Homerisches Hymnen, xxiii., ed. T. Allen and E. E. Sikes (1893); F. Rinnell, *Callis, the Greek States*, v. (1906).

**HESYCHASTS** (ἡσυχαστῖς, ἡσυχᾶστοι, from ἡσυχία, quiet, also called ἀμφισιγγχοι, Umbilicanimians, and sometimes referred to as Euchites, Massalians or Palamites), a quietistic sect which arose, during the later period of the Byzantine empire, among the monks of the Greek church, especially at Mount Athos, then at the height of its fame and influence under the reign of Andronicus the younger and the abbot of Symeon. Owing to various adventitious circumstances the sect came into great prominence politically and ecclesiastically for a few years about the middle of the 14th century. Their opinion and practice will be best represented in the words of a few of their early teachers (quoted by Gibbon, **Decline and Fall**, c. 63): "When thou art alone in thy cell shut thy door, and set thyself in a corner; raise thy mind above all things vain and transitory; recline thy head and chin on thy breast; turn thine eyes and thy thought towards the middle of thy belly, the region of the navel (ὑμακαρία); and, search the place of the heart, the seat of the soul. At first all will be dark and comfortless; but if thou persevere day and night, thou wilt feel an ineffable joy; and no sooner has he discovered the p unto of the heart than it is involved in a mystic and ethereal light." About the year 1335 this hesychasm, which is obviously related to certain well-known forms of Oriental mysticism, attracted the attention of the learned and versatile Barlaam, a Calabrian monk, who at that time held the office of abbot in the Basilian monastery of St. Saviour's in Constantinople, and who had visited the fraternities of Mount Athos on a tour of inspection. Amid much that he disapproved; what he specially took exception to as heretical and blasphemous was the doctrine entertained as to the nature of this divine light, the fruition of which was the supposed reward of hesychastic contemplation. It was maintained to be the pure and perfect essence of God Himself, that eternal light which by the declaration on Mount Tabor, to the transfiguration. This Barlaam held to be polytheistic, inasmuch as it postulated two eternal substances, a visible and an invisible God. On the hesychastic side the controversy was taken up by Gregory Palamas, afterwards archbishop of Thessalonica, who laboured to establish a distinction between eternal *ὁμολογία* and eternal *βιβρύγμα*. In 1341 the dispute came before a synod held at Constantinople and presided over by the emperor Andronicus; the assembly, influenced by the veneration in which the writings of the pseudo-Dionysius were held in the Eastern Church, overruled Barlaam, who recanted and returned to Calabria, afterwards becoming bishop of Hierace in the Latin communion. One of his friends, Gregory Aelidynus, continued the controversy, and three other synods on the subject were held, at the second of which the Barlaamites gained a brief victory. But in 1351 under the presidency of the emperor John Cantacuzenus, the uncreated light of Mount Tabor was established as an article of faith for the Greeks, who ever since have been ready to recognize it as an additional ground of separation from the Roman Church. The contemporary historians Cantacuzenus and Nicephorus Gregoras deal very copiously with this subject, taking the Hesychast and Barlaamite sides respectively. It may be mentioned that in the time of Justinian the word hesychast was applied to monks in general simply as descriptive of the quiet and contemplative character of their pursuits.

See article "Hesychastics" in Herzog-Hauck, **Realencyklopädie** (3rd ed., 1900), where further references are given.

**HESYCHIUS**, grammarian of Alexandria, probably flourished in the 5th century A.D. He was probably a pagan; and the explanations of words from Gregory of Nazianzus and other Christian writers (glossae sacrae) are interpolations of a later time. He has left a Greek dictionary, containing a copious list of peculiar words, forms and phrases, with an explanation of their meaning, and often with a reference to the author who used them or to the district of Greece where they were current. Hence the book is of great value to the student of the Greek dialects; while in the restoration of the text of the classical authors generally, and particularly of such writers as Aeschylus and Theocritus, who used many unusual words, its value can hardly be exaggerated. The explanations of many epithets and phrases reveal many important facts about the religion and social life of the ancients. In a prefatory letter Hesychius mentions that his lexicon is based on that of Diogenianus (itself extracted from an earlier work by Pamphilus),
but that he has also used similar works by Aristarchus, Apion, Heliodorus and others.

The text is very corrupt, and the order of the words has often been disturbed. There is no doubt that many interpolations, besides the Christian glosses, have been made. The work has been worked up from a single copy in the library at Venice, from which the edicto princeps was published. The best edition is by M. Schmiëd (1858–1868); in a smaller edition (1867) he attempts to distinguish the additions made by Photius to the work of Diogenes.

HEUSYCIUS OF MILETUS, German chronicler and biographer, named Hugullis, son of an advocate, flourished at Constantinople in the 5th century A.D. during the reign of Justinian. According to Photius (cod. 69) he was the author of three important works. (1) A Compendium of Universal History in six books, from Belus, the reputed founder of the Assyrian empire, to Anastasius I. (d. 518). A considerable fragment has been preserved from the sixth book, entitled Παράγενσις τῶν Μεγαλούχων, a history of Byzantium from its earliest beginnings till the time of Constantine the Great. (2) A Biographical Dictionary (Ονοματολογός or Πίναξ) of Learned Men, arranged according to classes (poets, philosophers), the chief sources of which were the Μουσαία τοπολογία of Aelius Dionysius and the works of Herennius Philo. Much of it has been incor- porated in the lexicon of Suzias, as we learn from that author. It is disputed, however, whether the words in Suzias ("of which this book is an epitome") mean that Suzias himself epitomized the work of Heusyclus, or whether they are part of the title of an already epitomized Heusyclus used by Suzias. The second view is more generally held. The epitome referred to, in which alphabetical order was substituted for arrangement in classes and some articles on Christian writers added as a concession to the times, is assigned from internal indications to the years 829–837. Both it and the original work are lost, with the exception of excerpts in Photius and Suzias. A smaller compilation, chiefly from Diogenes Laërtius and Suzias, with a similar title, is the work of an unknown author of the 11th or 12th century. (3) A History of the Reign of Justin I. (518–527) and the early years of Justinian, completely lost. Photius praises the style of Heusyclus, and credits him with being a veracious historian.

Editions: J. C. Orielli (1829) and J. Flach (1882); fragments in C. W. Müller, Frag. hist. Graec. iv. 143 and in T. Preger's Scriptores originis Constantinopolitanae, i. (1901); Pseudo-Heusyclus, by J. Flach (1880); see generally C. Krumbacher, Geschichle der byzant- nischen Literatur, 4th ed. (1904).

HETEROISM (Gr. ἑτερος a mistress), the term employed by anthropologists to express the primitive condition of man in his sexual relations. The earliest social organization of the human race was characterized by the absence of the institution of marriage in any form. Women were the common property of their tribe, and the children never knew their fathers.

HETEROOKARYOTA, a zoological name proposed by S. J. Hickson for the Infusoria (q.v.) on the ground of the differentiation of their nuclear apparatus into meganucleus and micro- nucleus (of nucleus).

See Lankester's Treatise of Zoology, vol. i. fasc. 1 (1903).

HETERONYMOS (from Gr. ἑτερος and ὑμιος, the rule of another), the state of being under the rule of another person. In ethics the term is specially used as the antithesis of "autonomy," which, especially in Kantian terminology, treats of the true self as will, determining itself by its own law, the moral law. "Heteronomy" is therefore applied by Kant to all other ethical systems, inasmuch as they place the individual in subjection to external laws of conduct.

HETMAN (from Slav. hétman, proper name derived from the Ger. Hauptmann, head-man or captain; the Russian form is átaman), a military title formerly in use in Poland; the Hetman Wielki, or Great Hetman, was the chief of the armed forces of the nation, and commanded in the field, except when the king was present in person. The office was abolished in 1792. From Poland the word was introduced into Russia, in the form átaman, and was adopted by the Cossacks, as a title for their head, who was practically an independent prince, when under the suzerainty of Poland. After the acceptance of Russian rule by the Cossacks in 1654, the post was shorn of its power. The title of "átaman" or "hetman of all the Cossacks" is held by the Cesarевич. "Átaman" or "hetman" is also the name of the elected elder of the stanitsa, the unit of Cossack administration. (See Cossacks.)

HETTNER, HERMANN THEODORE (1827–1882), German literary historian and writer on the history of art, was born at Leisersdorf, near Goldberg, in Silesia, on the 12th of March 1821. At the universities of Berlin, Halle and Heidelberg he since himself chiefly in a fine and poetic strain, and at last turned his attention to aesthetics, art and literature. With a view to furthering these studies, he spent three years in Italy, and, on his return, published a Vorschule zur bildenden Kunst der Alten (1848) and an essay on Die neapolitanischen Malerschulen. He became Privatdozent for aesthetics and the history of art at Heidelberg and, after the publication of his suggestive volume on Die romantische Schule in ihrem Zusammenhang mit Goethe und Schiller (1850), accepted a call as professor to Jena where he lectured on the history of both art and literature. In 1855 he was appointed director of the royal collections of the Prussian court at Berlin and the director of the plaster casts at Dresden, to which posts were subsequently added that of director of the historical museum and a professorship at the royal Polytechnikum. He died in Dresden on the 20th of May 1882. Hettner's chief work is his Literaturgeschichte des 18ten Jahrhunderts, which appeared in three parts, devoted respectively to English, French and German literature, between 1856 and 1870 (5th ed. of i. and ii., revised by A. Brandl and H. Morf, 1894; 4th of iii., revised by O. Harnack, 1894). Although to some extent influenced by the political and literary theories of the Hegelian school, which, since Hettner's day has fallen into disrepute, and to losing sight of the main issues of literary development over questions of social evolution, this work belongs to the best histories that the 19th century produced. Hettner's judgment is sound and his point of view always original and stimulating. His other works include Griechische Reiseskizzen (1853), Das moderne Drama (1852)—a book that arose from a correspondence with Gottfried Keller—Italienische Studien (1879), and several works descriptive of the Dresden art collections. His Kleine Schriften were collected and published in 1884.

HETTSTEDT, a town of Germany, in Prussian Saxony, on the Wipper, and at the junction of the railways Berlin-Blankenheim and Hettstedt-Halle, 23 m. N.W. of the last town. Pop. (1905), 9230. It has a Roman Catholic and four Evangelical churches, and has manufactures of machinery, pianofortes and artificial manure. In the neighbourhood are mines of argentiferous copper, and the surrounding district and villages are occupied with smelting and similar works. Silver and sulphuric acid are the other chief products; nickel and gold are also found in small quantities. In the Kaiser Friedrich mine close by, the first steam-engine in Germany was erected on the 23rd of August 1785. Hettstedt is mentioned as early as 1046; in 1220 it possessed a castle; and in 1380 it received civic privileges. When the countship of Mansfeld was sequestered, Hettstedt came into the possession of Saxony, passing to Prussia in 1815.

HEUGLIN, THEODOR VON (1824–1870), German traveller in north-east Africa, was born on the 20th of March 1824 at Hirschlanden near Leonberg in Württemberg. His father was a Protestant pastor, and he was trained to be a mining engineer. He was ambitious, however, to become a scientific investigator of unknown regions, and with that object studied the natural sciences, especially zoology. In 1850 he went to Egypt where he learnt Arabic, afterwards visiting Arabia Petraea. In 1852 he accompanied Dr Reitz, Austrian consul at Khartum, on a journey to Abyssinia, and in the next year was appointed Dr Reitz's successor in the consulate. While he held this post he travelled in Abyssinia and Kordofan, making a valuable collection of natural history specimens. In 1857 he journeyed through the coast lands of the African side of the Red Sea, and along the Somali coast. In 1860 he was chosen
HEULANDITE

leader of an expedition to search for Eduard Vogel, his companions including Werner Munzinger, Gottlob Kinzelbach, and Dr Hermann Steudner. In June 1661 the party landed at Massawa, having instructions to go direct to Khartum and thence to Wadai, where Vogel was thought to be detained. Heuglin, accompanied by Dr Steudner, turned aside and made a wide detour through Abyssinia and the Galla country, and in consequence the leadership of the expedition was taken from him. He and his brother returned to Khartum in 1862 and the above-mentioned party organized by Miss Timné. With her or on their own account, they travelled up the White Nile to Gondokoro and explored a great part of the Baher-el-Ghazal, where Steudner died of fever on the 10th of April 1863. Heuglin returned to Europe at the end of 1864. In 1870 and 1871 he made a valuable series of explorations in Spitsbergen and Novaya Zemlya; but 1875 found him again in north-east Africa, in the country of the Beni Amer and northern Abyssinia. He was preparing for an exploration of the island of Sokota, when he died, at Stuttgart, on the 5th of November 1876. It is principally by his zoological, and more especially his ornithological, labours that Heuglin has taken rank as an independent authority.

His chief works are Systematische Übersicht der Vögel Nordost-Africas (1855); Reisen in Nordost-Afrika, 1852–1853 (Gotha, 1857); Syst. Übersicht der Säugetiere Nordost-Africas (Vienna, 1866); Reise in Nordost-Afrika, 1867 (Jena, 1868); Reise in das Gebiet des Weissen Nil, &c., 1862–1864 (Leipzig, 1869); Reisen nach Nordpolarmeere, 1870–1871 (Brunswick, 1872–1874); Ornithologie von Nordost-Africa (Cassell, 1869–1875); Reise in Nordost-Afrika (Brunswick, 1877, 2 vols.). A list of the more important of his numerous contributions to Petermann's Mitteilungen will be found in that serial for 1877 at the close of the zoological notice.

HEULANDITE, a mineral of the zeolite group, consisting of hydrous calcium and aluminium silicate, \( \text{H}_2\text{CaAl}_2\text{(SiO}_4\text{)}_2 + 3\text{H}_2\text{O} \). Small amounts of sodium and potassium are usually present replacing part of the calcium. Crystals are monoclinic, and have a characteristic convex-shaped habit. They have a perfect cleavage parallel to the plane of symmetry \( (M \text{ in the figure}) \), on which the lustre is markedly pearly; on other faces the lustre is of the vitreous type. The mineral is usually colourless or white, sometimes brick-red, and varies from transparent to translucent. The hardness is 3.5–4, and the specific gravity 2.1.

Heulandite closely resembles stilbite (q.c.) in appearance, and differs from it chemically only in containing rather less water of crystallization. The two minerals may, however, be readily distinguished by the fact that in heulandite the acute positive bisectrix of the optic axes emerges perpendicular to the cleavage. Heulandite was first separated from stilbite by A. Breithaupt in 1818, and named by him euzeolite (meaning beautiful zoelite); independently, in 1822, H. J. Brooke arrived at the same result, giving the name heulandite, after the mineral collector, Henry Heuland.

Heulandite occurs with stilbite and other zeolites in the amygdaloidal cavities of basaltic volcanic rocks, and occasionally in gneiss and metallingenous veins. The best specimens are from the basaltus of Beruffjord, near Djuipvog, in Iceland and the area of the Tarn and the Lake District, and of the mountains near Bombay. Crystals of a brick-red colour are from Campsie Falls in Stirlingshire and the Fassathal in Tirol. A variety known as beaumontite occurs as small yellow crystals on syenitic schist near Baltimore in Maryland.

Isomorphous with heulandite is the strontium and barium zoelite brewsterite, named after Sir David Brewster. The greyish monochinic crystals have the composition \( \text{H}_4\text{(Sr, Ba, Ca)}\text{Al}_4\text{(SiO}_4\text{)}_2 + 3\text{H}_2\text{O} \), and are found in the basalt of the Giant's Causeway in Co. Antrim, and with harmotome in the lead mines at Strontian in Argyllshire. (L. J. S.)

HEUSCH, WILLEM, or GUILLIM de, a Dutch landscape painter in the 17th century at Utrecht. The dates of this artist's birth and death are not known. Nothing is known of him except that he presided over the gild of Utrecht, whilst Cornelis Poelengb, Jan Both and Jan Weenix formed the council of that body, in 1649. According to the majority of historians, Heusch was born in 1638, and was taught by Jan Both. But each of these statements seems open to doubt; and although it is obvious that the style of Heusch is identical with that of Both, it may be that the two masters during their travels in Italy fell under the influence of Claude Lorrain, whose "Arcadian" art they imitated. Heusch certainly painted the same effects of evening in wide expanses of country varied by rocky scenery and country deltaX-sclated. There is little to distinguish one master from the other, except that of the two Both is perhaps the more delicate colourist. The gild of Utrecht in the middle of the 17th century was composed of artists who clung faithfully to each other. Poelengb, who painted figures for Jan Both, did the same duty for Heusch. Sometimes Heusch sketched landscapes for the battlepieces of Molenaer. The most important examples of Heusch are in the galleries of the Hague and Rotterdam, in the Belvedere at Vienna, the Städel at Frankfurt and the Louvre. His pictures are signed with the full name, beginning with a monogram combining a G (for Guillaume), D and H. Heusch's etchings, of which thirteen are known, are also in the character of those of Both.

After Guillaume there also flourished at Utrecht his nephew, Jacob de Heusch, who signs like his uncle, substituting an initial J for the initial G. He was born at Utrecht in 1657, learnt drawing from his uncle, and travelled early to Rome, where he acquired friends and patrons for whom he executed pictures after his return. He settled for a time at Berlin, but finally retired to Utrecht, where he died in 1701. Jacob was an "Arcadian," like his relative, and an imitator of Both, and he chiefly painted Italian harbour views. But his pictures are now scarce. Two of his canvases, the "Ponte Rotto" at Rome, in the Brunswick Gallery, and a lake harbour with shipping in the Lichtenstein collection at Vienna, are dated 1660. A harbour with a tower and distant mountains, in the Belvedere at Vienna, was executed in 1669. Other examples may be found in English private galleries, in the Hermitage of St Petersburg and the museums of Rouen and Montpellier.

HEVELIUS [HEVEL or Hövelcke], JOHANN (1611–1687), German astronomer, was born at Danzig on the 28th of January 1611. He studied jurisprudence at Leiden in 1639; travelled in England and France; and in 1634 settled in his native town as a brewer and town councillor. From 1639 his chief interest became centred in astronomy; though he took, throughout his life, a liberal part in public and private affairs. In 1641 he built an observatory in his house, provided with a splendid instrumental outfit, including ultimately a tubeless telescope of 150 ft. focal length, constructed by himself. It was visited, on the 29th of January 1660, by John II. and Maria Gonzaga, king and queen of Poland. Hevelius made observations of sunspots, 1642–1645, devoted four years to charting the lunar surface, discovered the moon's libration in longitude, and published his results in Selenographia (1647), a work which entitles him to be called the founder of lunar topography. He discovered four comets in the several years 1653, 1651, 1672 and 1677, and suggested the revolution of such bodies in parabolic tracks round the sun. On the 26th of September 1679, his observatory, instruments and buildings were partly destroyed by fire; the catastrophe being described in the preface to his Annus climaetaricus (1685). He promptly repaired the damage, so far as to enable him to observe the great comet of December 1680; but his health suffered from the shock, and he died on the 28th of January 1687.

Among his works were: Promorus cometicus (1663); Cometographia (1668); Machina coelestis (first part, 1673), containing a description of his instruments; the second part (1679) is extremely rare, nearly the whole issue having perished in the conflagration of 1679. The observations made by Hevelius on the variable star named by him "Mira " are included in Annus climaetaricus. His catalogue of 1664 stars appeared at Odense in 1664 and Newport in 1666. The star was much impaired by his preference of the antique "pinnules " to telescopie sights on quadrants. This led to an acrimonious
controversy with Robert Hooke. In *An Atlas of 56 sheets, corresponding to his catalogue, and entitled Firmamentum Sobiescianum* (1690), he delineated seven new constellations, still in use. Hevelius had his book printed in his own house, at his own expense, and himself not only designed but engraved many of the plates.

HEWITT, SIR PRESCOTT GARDNER, Bart. (1812–1891), British surgeon, was born on the 3rd of July 1812, being the son of a Yorkshire gentleman. He lived for some years in early life in Paris, and started on a career as an artist, but abandoned it for surgery. He entered St George's Hospital, London (where his half-brother, Dr Cornwallis Hewitt, was physician from 1825 to 1833) becoming demonstrator of anatomy and curator of the museum. He was the pupil and intimate friend of Sir B. C. Brodie, and helped him in much of his work. Eventually he became anatomist of St George's Hospital, and surgeon to the hospital. In 1876 he was president of the College of Surgeons; in 1877 he was made serjeant-surgeon extraordinary to Queen Victoria, in 1883 serjeant-surgeon, and in 1883 he was created a baronet. He was a very good lecturer, but shrank from authorship; his lectures on *Surgical Affections of the Head* were, however, embodied in his treatise on the subject in Holmes's *System of Surgery*. As a surgeon he was always extremely conservative, but hesitated at no operation, however severe, when convinced of its expediency. He was a perfect operator, and one of the most trustworthy of counsellors. He died on the 10th of June 1891.

HEWITT, ABRAM STEVENS (1822–1903), American manufacturer and political leader, was born in Haverstraw, New York, on the 31st of July 1822. His father, John, a Staffordshire man, was one of a party of four mechanics who were sent by Boulton and Watt to Philadelphia about 1790 to set up a steam engine for the city water-works and who in 1793–1794 built at Belleville, N.J., the first steam engine constructed wholly in America; he made a fortune in the manufacture of furniture, but lost it by the burning of his factories. The boy's mother was of Huguenot descent. He was educated with his eldest brother at Columbia College, and in 1842, having supported himself through his course. He taught mathematics at Columbia, and in 1845 was admitted to the bar, but, owing to defective eyesight, never practised. With Edward Cooper (son of Peter Cooper, whom Hewitt greatly assisted in organizing Cooper Union, and whose daughter he married) he went into the manufacture of iron girders and beams under the firm name of Cooper, Hewitt & Co. His study of the making of gun-barrel iron in England enabled him to be of great assistance to the United States government during the Civil War, when he refused any profit on such orders. The men in his works never struck—indeed in 1877–1878 his plant was run at an annual loss of $100,000. In politics he was a Democrat. In 1871 he was prominent in the re-organization of Tammany after the fall of the "Tweed Ring"; from 1875 until the end of 1886 (except in 1879–1881) he was a representative in Congress; in 1876 he left Tammany for the County Democracy; in the Hayes–Tilden campaign of that year he was chairman of the Democratic National Committee, and in Congress he was one of the House members of the joint committee which drew up the famous Electoral Count Act, providing for the Electoral Commission. In 1886 he was elected mayor of New York City, his nomination having been forced upon the Democratic Party by the strength of the other nominees, Henry George and Theodore Roosevelt; his administration (1887–1888) was thoroughly efficient and creditable, but he broke with Tammany, was not renominated, ran independently for re-election, and was defeated. In 1890 and 1900 he voted the Republican ticket, but did not ally himself with the organization. He died in New York City on the 18th of January 1903. In Congress he was a consistent defender of sound money and civil service reform; in municipal politics he was in favour of business administrations and opposed to partisan nominations. He was a leader of those who proposed for reform in municipal government, was conspicuous for his public spirit, and exerted a great influence for good not only in New York City but in the state and nation. His most famous speech was that made at the opening of the Brooklyn Bridge in 1883. He was a terse, able and lucid speaker, master of wit and sarcasm, and a fearless critic. He gave liberally to Cooper Union, of which he was trustee and secretary, and which owes much of its success to him; was a trustee of Columbia University from 1875 until his death; chairman of the board of trustees of Barnard College, and was one of the original trustees, first chairman of the board of trustees, and a member of the executive committee of the Carnegie Institution.

HEWLETT, MAURICE HENRY (1861–), English novelist, was born on the 22nd of January 1861, the eldest son of Henry Gay Hewlett, of Shaw Hall, Addington, Kent. He was educated at the London International College, Spring Grove, Isleworth, and was called to the bar in 1891. From 1896 to 1900 he was keeper of the land revenue records and enrolments. He published in 1847–1882: *Italy, Two Months in Italy, and Italy again*; or: *Italy, Inland and Out of Tuscany*, and (in verse) *The Masque of Dead Poets*; *The Wander Meditations* followed in 1897, and in 1898 he won an immediate reputation by his *Forest Lovers*, a romance of medieval England, full of rapid movement and passion. In the same year he printed the pastoral and pagan drama of *Pon and the Young Shepherd*, shortened for purposes of representation and produced at the Court Theatre in March 1905, when it was followed by the *Youngest of the Angels*, dramatized from a chapter in his *Fool Errant*. In *Little Novels of Italy* (1899), a collection of brilliant short stories, he showed again his power of literary expression together with a close knowledge of medieval Italy. The new and vivid portraits of Richard Ceur de Lion in his *Richard Yea-and-Nay* (1900), and of Mary, queen of Scots, in *The Queen's Quair* (1904) showed the combination of fiction with real history at its best. The *New Canterbury Tales* (1901) was another volume of stories of English life, but he returned to Italian subjects with *The Road in Tuscany* (1904); in *Fond Adventures, Tales of the Youth of the World* (1905), two are Italian tales, and *The Fool Errant* (1905) purports to be the memoirs of Francis Antony Stretley, citizen of Lucca. Later works were the novel *The Moving Lady* (1907), and a volume of poems, *Artemion* (1900).

HEXAMETER, the name of the earliest and most important form of classical verse in dactylic rhythm. The word is due to each line containing six feet or measures (µέτρα), the last of which must be a spondee and the penultimate a dactyl, though occasionally, for some special effect, a spondee may be allowed in the fifth foot, when the line is said to be spondaic. The four other feet may be either spondees or dactyls. All the great heroic and epic verse of the Greek and Roman poets is in this metre, of which the finest examples are to be found in Homer and in Virgil. Varied cadences and a variety of feet are possible to this form of verse, otherwise the monody is wearring to the ear. The most usual places for the caesura are at the middle of the third, or the middle of the fourth foot: the former is known as the penthemimeral and the latter as heptameter caesura. There are several more or less successful examples of English poems in this metre, for example Longfellow's *Evangeline*, Kingsley's *Andromeda* and Clough's *Booth to Tober-na-Vuolich*, but it does not really suit the genius of the English language. In English the lack of true spondees is severely felt, even though the English metre depends, not, as in Greek and Latin, on the distinction between long and short syllables, but on that between accented and unaccented syllables. The accent must always (or it sounds very ugly) fall on the first syllable, whatever may have been the case in Greek and Latin—Voss, Kloppstock and Goethe have written hexameter poems.
of varying merit and the metre suits the German language distinctly better than the English. The customary form of hexameter in English verse is exemplified by Coleridge's descriptive line:

“\[In the hex\] ameter \[rises the\] fountain's \[silver\] column.”

Several modern poets, and in particular Robert Browning, and Lord Bowen (1835-1894) have used with effect a truncated hexameter consisting of the usual verse deprived of its last syllable. Thus Browning:

“Well, it is \[gone at\] last, the \[palace of\] music \[I \reared.\]

It is not sufficiently observed that even the classic Greek poets introduced considerable variations into their treatment of the hexameter. These have been, treated with erudition in G. Hermann's De \textit{aceate scriptoris Argonauticorum}. The differences in the hexameters of the Latin poets were not so remarkable, but even these varied, in various epochs, their treatment of the separate feet, and the position of the caesura. The satirists in particular allowed themselves an extraordinary licence: these hexameters, from Persius, are as far removed from the rhythm of Homer, or even of Virgil, as possible, if they are to remain hexameters:

\begin{itemize}
  \item \textit{Mane piger stertis. \ Surge! \ inquit Avaritia, \ hea. \ Surge! \ iugeas; instat \ Surge! \ iquit \ Non queo. \ Surge!}
  \item \textit{Et quid again? \ Rogitas \ e nesperdam advehe Ponto.}
\end{itemize}

It is also to be noted that various prosodical liberties, due originally to the extreme antiquity of the hexameter, and long reformed and repressed by the culture of poets, were apt to be revived in later ages, by writers who slavishly copied the most antique examples of the art of verse.

See Wilhelm Christ, \textit{Matrik der Griechen und Römer}, 2te Aufl. (1879).

**HEXAPLA** (Gr. for “sixfold”), the term for an edition of the Bible in six versions, and especially the edition of the Old Testament compiled by Origen, which place side by side (1) Hebrew, (2) Hebrew in Greek character, (3) Aquila, (4) Symmachus, (5) Septuagint, (6) Theodotion. See Bible: \textit{Old Testament, Texts and Versions}.

**HEXAPODA** (Gr. ἕξ, six, and πτέρυς, foot), a term used in systematic zoology for that class of the \textit{Arthropoda}, popularly known as insects. Linnaeus in his \textit{Systema naturae} (1735) grouped under the class \textit{Insecta} all segmented animals with firm and jointed limbs—that is to say, the insects, centipedes, millipedes, crustaceans, spiders, scorpions and their allies. This assemblage is now generally regarded as a great division (phylum or sub-phylum) of the animal kingdom and known by K. T. E. von Siebold's (1848) name of Arthropoda. For the class of the true insects included in this phylum, Linnaeus's old term \textit{Insecta}, first used in a limited sense by M. J. Brisson (1736), is still adopted by many zoologists, while others prefer the name \textit{Hexapoda}, first used systematically in its modern sense by P. A. Latreille in 1825 (\textit{Familles naturelles du règne animal}), since it has the advantage of expressing, in a single word, an important characteristic of the group. The terms \textit{Hexapoda} from \textit{“hexaped”} had already been used by F. Wollhugby, J. Ray and others in the late 17th century to include the active larvae of beetles, as well as bugs, lice, fleas and other insects with undeveloped wings.

**Characters.**

A true insect, or member of the class \textit{Hexapoda}, may be known by the grouping of its body-segments in three distinct regions—a head, a thorax and an abdomen—each of which consists of a definite number of segments. In the terminology proposed by E. R. Lankester the arrangement is homomeristic and "homotomastic." The head of an insect carries usually four pairs of conspicuous appendages—feelers, mandibles and two pairs of maxillae, so that the presence of four primitive somites is immediately evident. The compound eyes of insects resemble so closely the similar organs in Crustaceans that there can hardly be reasonable doubt of their homology, and the primitive appendicular nature of the eyes in the latter class suggests that in the \textit{Hexapoda} also they represent the appendages of an anterior (protocerebral) segment. Behind the antennal (or deutocerebral) segment an "intercalary" or tritocerebral segment has been demonstrated by W. M. Wheeler (1893). The head of an insect embryo, or the primitive maxillulae—in close association with the tongue are present, as has been shown by H. J. Hansen (1893) and J. W. Folsom (1900). Distinct vestiges of the maxillulae exist also in the earwigs and booklice, according to G. Enderlein and C. Börner (1904), and they are very evident in larval may-flies. The number of limb-bearing somites in the insectan head is thus seen to be seven. All of these are to be regarded as primitively post-oral, but in the course of development the mouth moves back to the mandibular segment, so that the first three somites—occipital, antennal and intercalary—lie in front of it. In Lankester's terminology, therefore, the head of an insect is "triprostomomerous." The maxillula of the head may be mere or less fused together to form a "lower lip" or labium, and the segment of these appendages is, in some insects, only imperfectly united with the head-capulse.

The thorax is composed of three segments; each bears a pair of jointed legs, and in the vast majority of insects the two hindmost bear each a pair of wings. From these three pairs of thoracic legs comes the name—\textit{Hexapoda}—which distinguishes the class. And the wings, though not always present, are highly characteristic of the \textit{Hexapoda}, since no other group of the \textit{Arthropoda} has acquired the power of flight. In the more generalised insects, the thorax is evidently composed of ten segments, the hindmost of which offer to the wings a pair of tail-feathers, (cerci or cercopods) and a terminal anal segment. In some cases, however, it can be shown that the cerci really belong to an eleventh abdominal segment which usually becomes fused with the tenth. With very few exceptions the abdomen is without locomotor limbs. Paired processes on the eighth and ninth abdominal segments may be specialized as external organs of reproduction, but these are probably not appendages. The female genital opening usually lies in front of the eighth abdominal segment, the male duct opens on the ninth.

In all main points of their internal structure the \textit{Hexapoda} agree with other \textit{Arthropoda}. Specially characteristic of the class, however, is the presence of a complex system of air-tubes (tracheae) for respiration, usually opening to the exterior by a series of paired spiracles on certain of the body segments. The possession of a variable number of excretory tubes (Malpighian tubes), which are developed as outgrowths of the hind-gut and pour their excretion into the intestine, is also a distinctive character of the \textit{Hexapoda}.

The wings of insects are, in all cases, developed after hatching, the younger stages being wingless, and often unlike the parent in other respects. In such cases the development of wings and the attainment of the adult form depend upon a more or less profound transformation or metamorphosis.

In this brief summary of the essential characters of the \textit{Hexapoda}, we may pass to a more detailed account of their structure.

**Exoskeleton.**

The outer cellular layer (ectoderm or "hylodermis") of insects as of other \textit{Arthropoda}, secretes a chitinous cuticle which has to be periodically shed and renewed during the growth of the animal. The regions of this cuticle have a markedly segmental arrangement, and the definite hardened pieces (sclerites) of the exoskeleton are closely confined within lines of suture (sutures) which are marked by regions of the cuticle which are less chitinous and more membranous, so as to permit freedom of movement.

**Head.**—The head-capule of an insect (figs. 1, 2) is composed of a number of segments firmly sutured together, so that the primitive segmentation is masked. Above is the crown (vertex or epicranium), on which or on the "front" may be seated three simple eyes (ocelli). Below this comes the front, and then the face orclypeus, to which a pair of antennae (labrum) is usually joined. Behind the labrum arises a process—the \textit{epipharynx}—which in some blood-sucking insects becomes a formidable piercing-organ. On either side a variable amount of convex area is occupied by the compound eye; in many insects of acute sense and accurate flight these are very large and sub-globular, almost meeting on the middle line of the
head. Below each eye is a cheek area (gena), often divided into an anterior and a posterior part, while a distinct chin-sclerite (gula) is often developed behind the mouth.

Feet.—Most conspicuous among the appendages of the head are the feelers or antennae, which correspond to the anterior feelers (antennules) of Crustacea. In their simpler condition they are long and many-jointed, the segments bearing numerous ocelliferous and tactile nerve-endings. Elaboration in the form of the feelers, often a secondary sexual character in male insects, may result from a distal broadening of the segments, so that the appendage becomes serrate, or from the development of processes bearing sensory organs, so that the structure is pinnate or feather-like. On the other hand, the number of segments may be reduced, certain of them often becoming highly modified in form.

Jaws.—The mandibles of the Hexapoda are usually strong jaws with one or more teeth at the apex (fig. 1, A, B, mn), articulating at their bases with the head-capulse by sub-globular condyles, and provided with adductor and abductor muscles by means of which they can be separated or drawn together so as to bite solid food, or seize objects which have to be carried about. They never bear segmented limbs (palps) and only exceptionally (as in the chafers) is the skeleton composed of more than one sclerite. The mandibles often furnish a good example of "secondary sexual characters," being more strongly developed in the male than in the female of the same species. In most insects that feed by suction the mandibles are modified. In bugs (Heteroptera) and many flies, for example, they are changed into needle-like piercers (fig. 2, II), while in moths and caddis-flies they are reduced to mere vestiges or altogether suppressed.

As previously mentioned, a pair of minute jaws—the maxillae—are present in the lowest order of insects, between the mandibles and the first maxillae. They usually consist of an inner and an outer lobe (lacinia and galea, fig. 1, C, la, ga) and externally a jointed limb or palp (fig. 1, C, pa). Such maxillae are found in many biting insects. In insects whose mouths are adapted for sucking and piercing, remarkable modifications may occur. In many blood-sucking flies, for example, the lacinia becomes a strong knife-like piercer and the palp is well developed. In bugs and aphids the lacinia is a slender needle-like piercer (fig. 2, III), while the palp is wanting. In butterflies and moths the lacinia is absent while the galea becomes a flexible process, grooved on its inner face, so as to make with its fellow a hollow sucking-trumpet, and the palp is usually very small.

The second pair of maxillae are more or less completely fused to form what is known as the labrum or "lower lip." In generalized biting insects, such as cockroaches and locusts (Orthoptera), the maxilla can be easily recognized in the labium. The fused cardines form a broad basal plate (sub-mentum) and the stipes a smaller plate (mentum)—see fig. 1, C, sm, m—jointed on to the submentum, while the galeae, laciniae and palps remain distinct. In specialized biting insects, such as beetles (Coleoptera), the labium tends to become a hard transverse plate bearing the pair of palps, a maxilla, the labrum, which is often called the "paraglossa," a term better avoided since it has been applied also to the maxillae of Aptera, entirely different structures. The long sucking "tongue" of beetles (fig. 1, IV) is formed from the labrum, while the mandibles and first maxillae lie on either side of it. A median process, the hypopharynx or tongue, arises from the side of the mouth in front of the labium, and becomes most variously developed or specialized in different insects. The salivary duct opens on its hinder surface. It does not appear to represent a pair of appendages, but the maxillae of the Aptera become closely associated with it. According to the view of R. Heymons, the hypopharynx represents the sternum of all the jaw-bearing somites, but other students consider that it belongs to the mandibular and first maxillary segments, or entirely to the segment of the first maxillae.

Neck.—The head is usually connected with the thorax by a distinct membranous neck, strengthened in the more generalized orders with small chitinous plates (cervical sclerites). These have been interpreted as indicating one or more primitive segments between the head and thorax. Probably, however, as suggested by T. H. Hobson (1904), they belong to the third thoracic segment which has not become completely fused with the head-capulse. It has been shown by C. Jane (1886), from careful studies of the musculature, that the greater part of the head-capulse is built up from the four anterior head-segments, the hindmost of which has the mandibles for its appendages, and this conclusion is in the main supported by the recent work on the head skeleton of J. H. Comstock and C. Koch (1902) and W. A. Riley (1904).

Thorax.—The three segments which make up the thorax or fore-trunk are known as the prothorax, mesothorax and metathorax (see fig. 3). The dorsal area of the prothorax is occupied by a single sclerite, the prothorax (fig. 1, a, d), which is the pair and consipicuous in those insects, such as cockroaches, bugs (Heteroptera) and beetles, which have the prothorax free—i.e. readily movable on the segment (mesothorax) immediately behind—smaller and of less importance where the prothorax is fixed to the mesothorax (fig. 2, x).

The dorsal area of the mesothorax, and also of the metathorax, may be made up of a series of sclerites arranged one behind the other —prescutum, scutum, scutellum and post-scutellum (fig. 3, e, f, g, h), the scutellum of the mesothorax being often especially conspicuous. Ventrally, each segment of the thorax has a sternum with which a median pres-ternum and paired episterna and epimeras are often associated (see figs. 3, 4). Janet (1904) that the hexapodian thorax in reality contains six primitive segments is entirely without embryological support.

Legs.—Each segment of the thorax carries a pair of legs. In most insects the leg is built up of nine segments: (1) a broad triangular, sub-globular, conical or cylindrical haunch (coxa); (2) a small trochanter; (3) an elongate stout thigh (femur); (4) a more slender shin (tibia); and (5-9) a foot consisting of five tarsal segments. The fifth (distal) tarsal segment carries a median adhesion—

probably to be regarded as a true terminal (tenth) segment of the leg, while the claws are highly modified bristles. Numerous bristles are

usually present on the thighs, shins and feet of insects, some of them so delicate as to be termed "hairs." Others so stout and hard that

variety, dependent on the order to which the insect belongs, and the special functions—walking, running, climbing, digging or swimming—for which the limb is adapted. The walking of insects has been carefully studied by V. Graber (1877) and J. Demoor (1890), who find that the legs are usually moved in two sets of three, the first and third legs of one side moving with the second leg of the other. One tripod thus affords a firm base of support while the legs of the other tripod are brought forward to their new positions.

Wings.—Two pairs of wings are present in the vast majority of insects, borne respectively on the mesothorax and metathorax. At the base of the wing, i.e., its attachment to the trunk, we find a highly complex series of small sclerites adapted for the varied movements necessary for flight. Those of the dragon-flies (Odonata) have been described in detail by R. von Lendenfeld (1881). The long axis of the wings, when at rest, lies parallel to the body axis. In this position the outer margin of the wing is the costa, the inner the dorum, and the hind-margin the termen. The angle between the costa and the termen is the apex. When the wing is spread, its long axis is more or less at a right angle to the body axis. A wing is an outgrowth from the dorsal and pleural regions of the thoracic segment that bears it, and microscopic examination shows it to consist of a double layer of cuticularized skin, the two layers being in contact except where they are thickened and folded to form the firm tubular nervures, which serve as a supporting framework for the wing membrane, enclose air-tubes, and convey blood. These nervures consist of a series of trunks radiating from the wing-base and usually branching as they approach the wing-margins, the branches being often connected by short transverse nervures, so that the wing-area is marked off into a number of "cells" or nervures.

The details of the nervuration vary greatly in the different orders, but J. H. Comstock and J. G. Needham have lately (1868-1890) shown that a common arrangement underlies all, six series of longitudinal radiating nervures being present in the typical wing (see fig. 5). Along the costa runs a costal nervure. This is followed by a sub-costal which sometimes forms two main branches. Then comes the radial—usually the most important nervure of the wing—typically with five branches, and the median with four. These sets arise from a main trunk towards the front region of the wing-base. From another hinder trunk arise the two-branched cubital nervure and three separate anal nervures. In the hind-wing of many insects the number of radial branches becomes reduced, while the anal area is especially well developed and undergoes a fan-like folding when the wings are closed. Great diversity exists in the texture and functions of fore- and hind-wing in different insects; these differences are discussed in the descriptions of the various orders. The wings often affect secondary sexual characters, being not infrequently absent or reduced in the female when well developed in the male (see fig. 6). Rarely the male is the wingless sex.

In addition to the wings there are smaller dorsal outgrowths of the thorax in many insects. Paired erectile plates (patagia) are borne on the prothorax in moths, while in moths, sawflies, wasps, bees and other insects there are small plates ( tegulae) —see fig. 3, i—on the mesothorax at the base of the fore-wings.

Abdomen.—In the abdominal exoskeleton the segmental structure is very clearly marked, a series of sclerites—dorsal terga and abdominal sterna—being connected by pale, feebly chitinized cuticle, so that considerable freedom of movement of the segments is possible. The first and second abdominal sternae are often suppressed or reduced, on account of the strong development of the hind-legs. In many insects too, and in a few ele-ven, abdominal segments can be clearly distinguished in addition to a small terminal anal segment. The female genital opening usually lies between the seventh and eighth segments, the male on the ninth. Prominent paired limbs are often borne on the tenth segment, the elongate tarsus—often curled or fringed—on the hind-legs, while the fore-wings of earwigs, for example, In the Embildae, a family of Isoptera, it has been shown by G. Enderlein (1901) that these ceci clearly belong to a partially suppressed eleventh segment, and R. 1866] has proved by embryological facts that in all cases they really belong to this eleventh segment, which in the course of development becomes fused with the tenth. Smaller appendages (such as the stylets of male cockroaches) may be carried on the ninth segment. Pairs of processes carried on the eighth and ninth segments often become specialized to form the ovipositor of the female (see fig. 14) and the genital armature of the male. A marked modification of the hinder abdominal segments may be noticed in most insects,
the sclerites of the eighth and ninth being frequently hidden by those of the seventh. In the higher orders several of the hinder segments may be altogether suppressed.

**HEXAPODA**

**INTERNAL ORGANS**

**Nervous System.**—The nervous system in the Hexapoda is built up on the typical arthropodan plan of a double ventral nerve-cord with a pair of ganglia in each segment, the cords passing on either side of the gullet and connecting with an anterior nerve-centre or brain (fig. 7) in the head. The brain innervates the eyes and feelers, and must be regarded as a 'syncerebrum' representing the ganglia of the three foremost limb-bear- ing somites united with the primitive cephalic lobes. Behind the gullet lies the sub-oesophageal nerve-centre (fig. 7, ab), composed of the ganglia of the four hinder head-somites and sending nerves to the jaws. A pair of ganglia in each thoracic segment is usual (fig. 8), and as many as eight distinct pairs of abdominal ganglia may often be distinguished, the hindmost of which represents the fused ganglia of the last four segments. But in many highly organized insects a remarkable concentration of the trunk-ganglia takes place, all the nerve-centres of the thorax and abdomen in the chelicerates (fig. 7) are represented by a single mass situated in the sub-oesophageal portion of the head. Such a 'sympathetic' system arises by paired nerves from the cephalic connectives; these nerves unite, and send back a median recurrent nerve associated with ganglia in the gullet and crop, whence proceed cords to various parts of the digestive system.

In connection with the central nervous system there are usually numerous organs of special sense. Most insects possess a pair of compound eyes, and many have, in addition, three simple eyes or ocelli on the vertex. The nature of these organs is described in the article ARTHROPODA. The surface of a compound eye is seen to be covered with a large number of hexagonal corneal facets, each of which overlaps an ommatidium or series of cell elements (fig. 9, A, B). There are over 25,000 ommatidia in the eye of a hawk-moth. Auditory organs of a simple type are present in most insects. These consist of fine rods suspended between two points of the cuticle, and connected with nerve-fibres; they are known as chordotonal organs. In many cases a more complex ear is developed, which may be situated in strangely diverse regions of the insect's body. In locusts (Astrididae) the large ovate, tympanic membrane (fig. 9, G) is conspicuous on either side of the first abdominal segment; on the inner surface of this membrane are two horn-like processes in contact with a delicate sac containing fluid, connected with which are the actual nerve-endings. In the nearly-related crickets and long-horned grasshoppers (Locustidae) the ears are situated in the shins of the fore-legs (see fig. 9, F). Just below the knee-joint there is a swelling, along which two narrow slit-like extensions run lengthwise. They lead into chambers, formed by pushing of the cuticle, whose delicate inner walls are in contact with air-tubes; on the outer surface of these latter are ridges, along which the special nerve-endings are arranged. An ear of another type is found in the swollen second segment of the feeler in many male gnats and midges, the cuticle between this segment and the third forming an annular drum which is connected with numerous nerve-endings, while the fine bristles on the more distal segments vibrate in response to the note produced by the humming of the female. Many of the numerous hairs (fig. 9, E) that cover the body of an insect have a tactile function. The sense of smell resides chiefly in the feelers, on whose segments occur tiny pits, often guarded by peg-like or tooth-like structures and containing rod-like cells (fig. 9, C) in connexion with large nerve-cells. It is said that 15,000 such olfactory organs are present on the feeler of a wasp, and 40,000 on the complex antennae of a male cockchafer. Organs of similar type on the maxillae and epipharynx appear to exercise the function of taste.
Hexapoda

**Muscular System.**—The muscles in the Hexapoda are striated, as in Arthropods generally, the large fibres being associated in bundles which are attached from point to point of the cuticle, so as to move adjacent sclerites with respect to one another (see fig. 8, 10). For example, the contraction of the tergo-sternal muscles, connecting the dorsal with the ventral sclerites of the abdomen, lessens the capacity of the abdominal region, while the contraction of other powerful muscles arising from the thoracic walls, and inserted into the proximal ends of the thighs, flexes or extends the legs.

**Circulatory System.**—Insects afford an excellent illustration of the remarkable type of blood-system characterizing the Arthropoda. The dorsal vessel is an elongate tube, whose abdominal portion is usually chambered, forming a contractile heart (fig. 10). At the constrictions between the chambers are paired slits, through which the blood passes from the surrounding pericardial sinuses. The dorsal vessel is prolonged anteriorly into an aorta, through which the blood is propelled into the great body-cavity or haemocoel. After bathing the various tissues and organs, the blood returns ventrally, and is again contracted in a cardiac sinus through fine perforations of its floor, and so makes its way into the heart again. Some water-bugs, e.g., of the families Belostomatidae, Nepidae, Coenagrionidae, and Hydometridae have a pulsating sac at each knee-joint to assist the flow of blood through the legs, while in dragon-flies and lacewings (Hesperioidea) there is a ventral pulsating diaphragm, which forms the roof of a sinus enclosing the heart. The anterior ends of the veins are often modified for silk-producing glands in caterpillars or as "scales" on the wings in the Malpighian tubes of water-bugs.

**Respiratory System.**—As mentioned above, respiration by means of air-tubes (tracheae) is a most characteristic feature of the Hexapoda. An air-tube consists of an epithelium of large polygonal cells with a thin basement-membrane externally and a chitinous layer internally, the latter being continuous with the outer cuticle. The chitinous layer is usually strengthened by thread-like chitinized filaments, in the region close to the outer opening of the tube, form a network enclosing polygonal areas, but which, through most of the tracheal system, are arranged spirally, the strengthening thread not forming a continuous spiral, but being interrupted after a few turns around the tube. The tracheal system in Hexapods is very complex, forming a series of longitudinal trunks with transverse Anastomosing connections (fig. 11), and extending by the finest sub-division and by repeated branching into all parts of the body. From each trachea the tubes swell out into numerous air-sacs, by which the breathing capacity is much increased. The air passes in to the air-tubes through paired spiracles or stigmas, which usually occur laterally on most of the body-segments. These spiracles have firm chitinous edges, and can be closed by valves moved by special muscles. When the spiracles are open and the body contracts, air is expired. The subsequent expansion of the body causes fresh air to enter the tracheal system, and if the spiracles are closed the air is driven to the finest branches of the air-tubes, where a direct re-oxidation of the tissues takes place. The physiology of respiration has been carefully studied by F. Plateau (1884). In aquatic insects air is obtained from a tube carried down as a wing 

**Digestive System.**—A striking feature in the food-duct of the Hexapoda, as in other Arthropods, is the great extent of the "fore-gut," or mouth part. The pharynx is lined with a chitinous cuticle, continuous with the exoskeleton and passing forwards part of the fore-gut is composed of a tubular gullet, a large sac-like crop (fig. 12, e) and a proventriculus or "gizzard," whose function is to strain the food-substances before they pass on into the tubular gut, the stomach, which has no chitinous lining. This organ, usually regarded as a "hind-gut," gives off a number of secretory caecal tubes (fig. 12, c), which, together with the hind-gut itself, is continuous with the hind-gut, which is usually differentiated into a tubular coiled intestine (fig. 12, f) and a swollen rectum (fig. 12, r). From the fore-end of the hind-gut the slender Malpighian tubes (fig. 12, k), having a renal function, take off. On the other side of the gullet the tubes are joined and again contracted into pairs of salivary glands (fig. 12, x) whose ducts open into the mouth. Some of these glands may be modified for special purposes—silkworm-mulberry feeding among caterpillars or as silk glands in blood-sucking flies and bugs. The food passing into the nerve-cords is there acted on by the saliva and also by an acid gastric juice which passes forwards from the stomach through the proventriculus. As the various portions of the food undergo digestion, they are allowed to pass through the proventriculus into the stomach, where the nutrient substances are absorbed.

**Excretory System.**—Nitrogenous waste-matter is removed from the body by the Malpighian tubes which open into the food-duct, usually where the hind-gut joins the stomach. These tubes vary in number from four to over a hundred in different orders of insects. The cells which line them and also the small sinuses or urates, which are excreted from the blood in the surrounding body-cavity. This cavity contains an irregular mass of whitish tissue, the fat-body, consisting of fat-cells which undergo degradation and become filled with urates. When the fat-cells are broken down, the urates are carried dissolved in the blood to the Malpighian tubes for excretion. The fat-body is therefore the seat of important metabolic processes in the hexapod body.

**Reproductive System.**—The eggs (fig. 13) in the female are paired, each ovary consisting of a variable number of tubes (one in the bristle-tail Campodea and fifteen hundred in a queen termite) in which the eggs are developed. From each ovary of a female insect (fig. 13, a) lead, and in some of the more primitive insects (bristle-tails, earwigs, may-flies) the two ovipords open separately to the exterior. Usually they open into a median vagina, formed by an ectodermal pouching and lined with chitin. The vagina usually opens in front of the eighth abdominal sternite. Behind it is situated a spermatheca (fig. 14, s).
and the ovipositor previously mentioned, with its three pairs of processes (Fig. 14, G, g).

The paired testes of the male consist of a variable number of seminal tubes, those of each testis opening into a vas deferens. In some bristle-tails and may-flies, the two vasa deferentia open separately, but usually they lead into a sperm-reservoir, whence issues a median ejaculatory duct. The male opening is on the ninth abdominal segment, to which belong the processes that form the claspers or genital armature. Accessory glands are commonly present in connection both with the male and the female reproductive organs. The poison-glands of the sting in wasps and bees are well-known examples of these.

**EMBRYOLOGY**

**The Egg.**—Among the Hexapoda, as in Arthropoda generally, the egg is large, containing an accumulation of yolk. **Layers.**

Most insect eggs are of an elongate oval shape; some are globular, others flattened, while others again are flask-shaped, and the outer envelope (chorion) is often beautifully sculptured (figs. 20, d; 27, a, b). Various devices are adopted for the protection of the eggs from mechanical injury or from the attacks of enemies, and for fixing them in appropriate situations. For example, the egg may be raised above the surface on which it is laid by an elongate stalk; the eggs may be protected by a secretion, which in some cases forms a hard protective capsule or "par"; or they may be covered with shed hairs of the mother, while among water-insects a gelatinous envelope is present.

In various groups of the Hexapoda—aphids and some flesh-flies (Sarcophaga), for example—the egg undergoes development within the body of the mother, and the young insect is born in an active state; such insects are said to be "viviparous."

**Parthenogenesis.**—A number of cases are known among the Hexapoda of the development of young from the eggs of virgin females. In insects so widely separated as bristle-tails and moths this occurs occasionally. In certain gall-flies (Cymipidae) no males are known to exist at all, and the species seems to be preserved entirely by successive parthenogenetic generations. In other gall-flies and in aphids we find that a sexual generation alternates with one or with many virgin generations. The offspring of the virgin females are in most of these instances females; but among the bees and wasps parthenogenesis occurs normally and always results in the development of males, the "queen" insect laying either a fertilized or unfertilized egg at will.

**Fertilization, Fertilisation and Segmentation.**—Polar bodies were first observed in the eggs of Hexapoda by F. Blockmann in 1887. The two nuclei are successively divided from the egg nucleus in the usual way, but they frequently become absorbed in the peripheral protoplasm instead of being extruded from the egg-cell altogether. It appears that in parthenogenetic eggs two polar nuclei are formed. According to A. Petrunkevitch (1901–1902), the second polar nucleus uniting with one daughter-nucleus of the first polar body gives rise to the germ-cells of the parthenogenetically-produced male. There is no reunion of the second polar nucleus with the female pronucleus, but, according to the recent work of L. Doncaster (1905–1907) on the eggs of sawflies, the number of chromosomes is not reduced in parthenogenetic egg-nuclei, while, in eggs capable of fertilization, the usual reduction-divisions occur. Fertilization takes place as the egg is laid, the spermatozoa being ejected from the spermatheca of the female and making their way to the protoplasm of the egg through openings (micropyles) in its firm envelope. The formation of the fertilized nuclei results in the formation of a number of nuclei which arrange themselves around the periphery of the egg and, the protoplasm surrounding them becoming thickened, the blastoderm or layer of cells, enclosing the central yolk, is formed. Within the yolk the nuclei of some "yolk cells" can be distinguished.

**Germinal Layers and Food-Canal.**—The embryo begins to develop as an elongate, thickened, ventral region of the blastoderm which is known as the ventral plate or germ band. Along this band a median furrow appears, and a mass of cells sinks within, the one-layered germ band thus becoming transformed into a band of two cell-layers (Fig. 15). In some cases the inner layer is formed not by invagination but by proliferation or by delamination. The outer of these two layers (Fig. 15, E) is the ectoderm. With regard to the inner layer (endoblast or germ-sphere, Fig. 15, M) much difference of opinion has prevailed. It has usually been regarded as representing both endoderm and mesoderm, and the groove which usually leads to its formation has been compared to the abnormally elongated blastopore of a typical gastrula. No doubt can be entertained that the greater part of the inner layer corresponds to the mesoderm of more ordinary embryos, for the coelomic pouches, the germ-cells, the musculature and the vascular system all arise from it. Further form, is common agreement, that the chitin-lined fore-gut and hind-gut, which form
HEXAPODA

The greater part of the digestive tract, arise from ectodermal invaginations ( stomodeum and proctodeum respectively) at the positions of the future mouth and anus. The origin of the mid-gut (mesenteron) that has no chitinous lining in the developing insect, is the disputed point. According to the classical researches of A. Kowalevsky (1871 and 1887) on the embryology of the water-beetle Hydrophilus and of the muscid flies, antennal and a posterior endodermal rudiment both derived from the "endoderm" become apparent at an early stage, in close association with the stomodeum and the proctodeum respectively. These two endodermal rudiments ultimately grow together and give rise to the epithelium of the mid-gut. These results were confirmed by the observations of K. Heider and W. M. Wheeler (1889) on the embryos of two beetles—Hydrophilus and Doryphora respectively. V. Graber, however (1889), stated that in the Muscidae, while the anterior endodermal rudiment as Kowalevsky had observed, the posterior part of the "mid-gut" has its origin as a direct outgrowth from the proctodeum. The recent researches of R. Heymons (1895) on the Orthoptera, and of A. Lécampion (1898) on various leaf beetles, tend to show that the whole of the "mid-gut" arises from the proliferation of cells at the extremity of the stomodeum and of the proctodeum. On this view the entire food-canal in most Hexapoda must be regarded as of ectodermal origin, the "endoderm" represents mesoderm only, and the median furrow whence it arises can be no longer compared with the blastopore. According to Heymons, the yolk-cells must be regarded as the true endolymph in the hexapod embryo, for he states (1897) that in the bristle-tail Lepistis and in dragon-flies they give rise to the mid-gut. These views are not, however, supported by other recent observers. J. Carrière's researches (1897) on the embryology of the mussel Diptera, claims that the fore and hind endodermal rudiments arise from the blastoderm by invagination, and are from their origin distinct from the mesoderm. On the whole it seems likely that the endoderm in both insects is represented in part by the yolk, and in part by those anterior and posterior rudiments which usually form the mesenteron, but that in some Hexapoda the whole digestive tract may be ectodermal. It must be admitted that some of the later work on insect embryology has justified the growing scepticism in the universal applicability of the "germ-layer theory." Heider has suggested, however, that the apparent origin of the mid-gut from the stomodeum and proctodeum may be explained by the presence of a "latent endodermal group" in those invaginations.

Embryonic Membranes.—A remarkable feature in the embryonic development of most Hexapoda is the formation of a protective membrane analogous to the amnion of higher Vertibrates and known by the same term. Usually there arises around the edge of the germ band a double fold in the undifferentiated blastoderm, which grows over the surface of the embryo, so that its inner and outer surfaces are thus separated from one another. The amnion represents this piece; the amnion, and the serosa (fig. 16, A, S). The embryo of a moth, a dragon-fly or a bug is invaginated into the yolk at the head end, the portion of the blastoderm necessarily pushed in with it forming the amnion. The mesothorax thus is represented by the hypopharynx, the embryonic membranes are vestigial or entirely wanting. In the bristle-tails Lepistis and Machilus, an interesting transitional condition occurs, a bristle-tail-like amnion has been delayed to the late larval stage. The embryo is invaginated into the yolk, but the surface edges of the blastoderm do not close over, so that a groove or pore puts the insunk space that represents the amniotic cavity into connection with the larval exterior. In the latter stages the larval organ in the embryos of the lower Arthropoda corresponds with the region invaginated to form the serosa of the hexapod embryo. Wheeler, however, compares with the "dorsal organ" the peculiar ectodermal cavities that have been observed between serosa and amnion in the embryo of the grasshopper Xiphidium.

Metameric Segmentation.—The segments are perceptible at a very early stage of the development as a number of transverse bands arranged in a linear sequence. The first segment of the ventral plate is not, however, very definite, and the segmentation does not become perceptible throughout the length of the plate; the anterior parts are segmented before the posterior. In Orthoptera and Thysanura, as well as some of the lower insects, twenty-one of these divisions—not, however, all—carefully distinguishable, five on each side of the embryo over the formation of the head, three going to the thorax and twelve to the abdomen. In Hemiptera only eleven and in Colembola only six abdominal segments have been detected. The first and last of these twenty-one divisions are so different from the others that they can scarcely be considered true segments.

Head Segments.—In the adult insect the head is insignificant in size compared with the thorax or abdomen, but in the embryo it forms a much larger portion of the body, and the greater part of it is occupied by the eyes. Its composition has been the subject of prolonged difference of opinion. Formerly it was said that the head consisted of four divisions, viz. three segments and the prosophage or praoral lobes. This was not certain, and it was often held that the head consisted of but three divisions, so that the head must certainly be formed from at least six segments. The first of these, according to the nomenclature of Heymons (see fig. 17), forms the piece of the head, the anterior segment; the second, the intercalary or pra-maxillary segment; the third, the intercalary or pro-maxillary segment; while the fourth, fifth, and sixth are respectively the segments of the mandibles and of the first and second maxillae. The divisions of the head are so formed that these appendages become the parts of the mouth. The appendages of the two maxillary segments arise as treble instead of single projections, thus giving rise from other appendages. From these facts it is evident that the anterior three, or four, segments of the head differ strongly from the posterior three, which greatly resemble thoracic segments; hence it has been thought possible to distinguish the head region accurately, and to which three segments and their leg-like appendages were subsequently added to form the head as it now exists. This is, however, very doubtful, and an entirely different inference is possible. Indeed, the five pairs of segmental somites just enumerated, and others must now be recognized in the head. One of these is the ocular segment, in front of the antennal, and behind the primitive preoral segment. The other is the segment of the maxillae (see also p. 173). Kowalevsky has suggested the occurrence of this in the embryos of the colembolan Anurida has been lately shown (1900) by J. W. Folsom (fig. 18, v, §), who terms the maxillipeds superiusque 1 on account of their close association with the hypopharynx. The leg-like rudiments of the head capsule in the imagos, it appears that the eyes and labrum represent, as already said, an unpaired median outgrowth of the oral piece. According to W. A. Riley (1904) the episternal or 'vertex,' the compound eyes and the front divisions of the gene are formed by the cephalic lobes of the embryo (belonging to the ocular segment), while the mandibular and maxillary segments form the hinder parts of the gene and the hypopharynx.
Great difference of opinion exists as to the hypopharynx, which has even been thought to represent a distinct segment, or the pair of appendages of a distinct segment. Heymons considers that it represents the sternites of the three thoracic segments, and that the hypopharynx belongs to the head. Riley holds that the hypopharynx belongs to the mandibular and maxillary segments, while the cervical sclerites of the embryos represent the sternum of the labial segment. The ganglia of the nervous system offer some important evidence as to the morphological head, and are alluded to below.

Thoracic Segments. These are always three in number. The three pairs of legs appear very early as rudiments; the thoracic segments bear the wings, no trace of these appendages exists till the close of the embryonic life; and each pair, even in many cases, till much later. The thoracic segments, as seen in an early stage of the ventral plate, display in a well-marked manner the essential elements of the insect segment. These elements are a central piece or sternite, and a lateral field on each side consisting of the leg segment. The external part of the lateral field subsequently grows up, and by coalescence with its fellow forms either the tergite or dorsal part of the segment.

Abdominal Segments and Appendages.—We have already seen that in numerous lower insects the abdomen is formed from twelve divisions placed in linear fashion. Eleven of these may perhaps be considered as true segments, but the twelfth or terminal one is different, and is called by Heymons a tail-segment. In it is situated the anal orifice, and the mass subsequently becomes the upper and lower laminae of the ovipositor. In those insects this telson is absent, and the anal orifice is placed quite at the termination of the eleventh segment. Moreover, in this order the abdomen shows at first a division into only nine segments, and a terminal mass, which last subsequently becomes divided into two. These divisions are all numbered, and the nine segments are called cerci, styli, and gonopophyses. They differ much according to the kind of insect, and in the adult according to sex. Difference of opinion exists as to the nature of the abdominal appendages. There are divided, or terminal appendages, which, when present, appear in the mature insect to be attached to the tenth segment, but according to Heymons they are really appendages of the eleventh segment, their connexion with the tenth being secondary and the result of considerable changes that take place later. It has been disputed whether any true cerci exist in the higher insects, but they are probably represented in the Diptera and in the scorpion-flies (Mecoptera). In those insects in which a median terminal appendage exists between the two cerci this is considered to be a prolongation of the eleventh tergite. The styli, when present, are placed on the ninth segment, and in some Thysanura exist also on the eighth segment; their development takes place later in life than that of the cerci. The gonopophyses are the projections near the hinder extremity of the temporary pseudopods, the male is formed to a considerable extent by modifications of the segments themselves. The development of the armature has been little studied, and the question whether there may be present gonopophyses homologous with those of the abdomen opens.

In the adult state no insect possesses more than six legs, and they are always attached to the thorax; in many Thysanura there are, however, processes on the abdomen that, as to their position are similar to legs. In the embryos of many insects there are projections from the segments of the abdomen similar, to a considerable extent, to the rudimentary thoracic legs. Whether these projections can be considered an indication of former polypody in insects has been raised. They do not long persist in the embryo, but disappear, and the thorax of the mature insect occupies part of the sternite. In some embryos there is but a single pair of these rudiments (or vestigial appendages), and never, as to their development considerably later than cerci and styli only after the apparently complete disappearance of the temporary pseudopods, it is probable that there are two pairs of gonopophyses on the ninth abdominal segment, and in some cases they become invaginations of a glandular nature. Whether cerci and styli also develop from these rudiments has been much debated. It appears that it is possible to accept cerci and styli as appendages of the sexual organs, that their development considerably later than cerci and styli only after the apparently complete disappearance of the temporary pseudopods, but it is more difficult to believe that this is the case with the gonopophyses. They are of great importance, and afford evidence as to the homologous parts of the body of insects. In Embryology [diagrammatic]. After Heymons.

**Fig. 17.**—Morphology of an Insect: the embryo of Gryllotalpa, somewhat diagrammatic. The longitudinal segmentation is based along the middle line and presents the early segmentation of the nervous system and the subsequent median field of each sternite; the lateral transverse unshaded bands are the lateral fields of each segment; the shaded areas indicate the more internally placed mesodermal layer. The segments are numbered 1-21; 1-6 will form the head, 7-9 the thorax, 10-21 the abdomen. A., antennae; Ab., Abx., appendages of 1st and 11th abdominal segments; Anx., anal piece = telson or 12th abdominal segment; Anl., antenna; Deut., deuterecapsopholon; Md., malpighian tubules; Mx., maxilla; Mx., maxilla, or labium; O., mouth; Obel., rudimentary labrum and clypeus; Pre., protecapsoplon; St., stoma, stigma 1 and 10; Tr., tergite; Tvx., appendage of first thoracic segment; U., tritocapsopholon; U1, an thickening at inner margin of the mouth.

The nervous system is ectodermal in origin, and is developed and supported by a plate of ectoderm, the outer layer of the body, in such a manner as to be of great importance to the segment therefrom. The continuous layer of cells from which the nervous system is developed undergoes a segmentation analogous with that we have described as occurring in the abdominal plate; there is thus formed a pair of contiguous ganglia for each segment of the body, and but there is no ganglion for the telson. The ganglia become greatly changed in position during the later life, and the nervous system is formed ten times as its forming ganglia in the embryo. In Orthoptera, Heymons has demonstrated the existence of eleven pairs, the terminal pair becoming, however, united with the tenth. The nervous system is formed from one ganglion, the head exhibits three ganglionic masses, anterior to the thoracic ganglionic masses; these three masses subsequently amalgamate and form the sub-oesophageal ganglion, which supplies the sensory appendages. Another pair, arising from the sub-oesophageal ganglion the mass of cells that is to form the nervous system is very large, and projects on each side of the anterior or "brain" mass consists of three lobes (the prot-, deut-, and tritocapsopholon), a number of which might be thought to represent a segmental ganglion. But the protocerebrum contains the ganglia of the ocular segment in addition to those of the prothoracic lobes, and three disjunct forms of ganglion or brain proper. There are other ganglia in addition to those of the ventral chain, and Janet supposes that the ganglia of the sympathetic system indicate the existence of three additional ganglia, the remains of the segments of the paecophila are, in accordance with this view, to be sought in the
stomodaeum. Folsom has detected in the embryo of Anurida a pair of ganglia (fig. 18, s) belonging to the maxillar (or superlingual) segment, thus establishing seven sets of cephalic ganglia, and supporting his view as to the composition of the head.

Air-tubes.—The air-tubes, like the food-canals, are formed by invaginations of the ectoderm, which arise close to the developing appendages, the rudimentary spiracles appearing as rudimentary budding limbs. The pits leading from these lengths into tubes, and undergo repeated branching as development proceeds.

The germ band evidently marks the ventral aspect of the developing insect, whose body must be completed by the extension of the embryo so as to enclose the yolk dorsally. The method of this dorsal closure varies in different insects. In the Colorado beetle (Dorophora), whose development has been studied by W. M. Wheeler, the amnion is ruptured and turned back from covering the germ band, enclosing the yolk dorsally and becoming finally absorbed, as the ectoderm of the germ band itself spreads to form the dorsal wall. In some midges and in caddis-flies the serosa becomes ruptured and absorbed, while the germ band, still clothed with the amnion, grows around the yolk. In moths and certain saw-flies there is no rupture of the membranes; the Russian zoologists Tichomirov and Kovalevsky have described the growth of both amnion and embryonic ectoderm around the yolk, the embryo being thus completely enclosed until hatching time by both amnion and serosa. V. Graber has described a similar method of dorsal closure in the saw-fly Hylotoma.

Mesoderm, Coelom and Blood-System.—From the mesoderm most of the organs of the body—muscular, circulatory, reproductive—take their origin. The mass of cells undergoes segmentation corresponding with the outer segmentation of the embryo, and a pair of cavities—the coelomic pouches (fig. 16, M)—are formed in each segment. Each coelomic pouch—as traced by Heymons in his study on the development of the cockroach (Phyllodroma)—divides into three parts, of which the most dorsal contains the primitive germ-cells, the median disappears, and the ventral loses its boundaries as it becomes filled up with the growing fat body (fig. 19).

This latter, as well as the heart and the walls of the blood spaces, arises by the mitotic divisions of mesodermal cells, and the body cavity is formed by the enlargement and coalescence of the blood channels and by the splitting of the fat body. It is therefore a haemocele, the coelom of the developed insect being represented only by the cavities of the genital glands and their ducts.

Reproductive Organs.—In the cockroach embryo, before the segmentation of the germ-band has begun, the primitive germ-cells can be recognized at the hinder end of the mesoderm, from whose ordinary surface they can be distinguished by their larger size. At a later stage further germ-cells arise from the epithelium of the coelomic pouches from the second to the seventh abdominal segments, and become surrounded by other mesoderm cells which form the ovarian and abdominal ducts and tubes (fig. 19, q). In the male of Phyllophora the rudiment of a vestigial ovary becomes separated from the developing testes, indicating perhaps an originally hermaphrodite condition. An exceedingly early differentiation of the primitive germ-cells occurs in certain Diptera. E. Metchnikoff observed (1866) in the development of the parthenogenetic eggs produced by the precocious larva of the gall-midge Cecidomyia that a large 'polar-cell' appeared at one extremity during the development of the seromere. This by successive divisions forms a group of four to eight cells, which subsequently pass through the blastoderm, and dividing into two groups become symmetrically arranged and surrounded by the rudiments of the ovarian tubes. E. G. Balbiani and R. Ritter (1890) have since observed a similar early origin for the germ-cells in the nudge Chironomus and in the Aphidae.

The paired oviducts and vasa deferentia are, as we have seen, mesodermal in origin. The median vagina, spermatheca and ejaculatory duct are, on the other hand, formed by ectodermal inpushings. The classical researches of J. A. Palmén (1884) on these ducts have shown that in may-flies and in female earwigs the paired mesodermal ducts open directly to the exterior, while in male earwigs there is a single mesodermal duct, due either to the coalescence of the two or to the suppression of one. In the absence of the external ectodermal ducts usual in winged insects, these two groups resemble therefore the primitive Aptera. The presence of rudiments of the genital ducts of both sexes in the embryo of either sex is interesting and suggestive. The ejaculatory duct which opens on the ninth abdominal sternum in the adult male arises in the tenth abdominal embryonic segment and subsequently moves forward.

GROWTH AND METAMORPHOSIS

After hatching or birth an insect undergoes a process of growth and change until the adult condition is reached. The varied details of this post-embryonic development furnish some of the most interesting facts and problems to the students of the Hexapoda. Wingless insects, such as spring-tails and lice, make their appearance in the form of miniature adults. Some winged insects—cockroaches, bugs (fig. 20) and earwigs, for example—when young closely resemble their parents, except for the absence of wings. On the other hand, we find in the vast majority of the Hexapoda a very marked difference between the perfect insect (imagio) and the young animal when newly hatched and for some time after hatching. From the moth's egg comes a crawling caterpillar (fig. 21, c), from the fly's a legless maggot (fig. 25, d).

From Mally, Ent. Bull. 24 (U.S. Dept. Agr.).

HEXAPODA

The study of the physiology of ecdysis in its simpler forms has unfortunately been somewhat neglected, investigators having directed their attention chiefly to the cases that are most striking, such as the transformation of a maggot into a fly, or of a caterpillar into a butterfly. The process of formation of the changes must be made up of certain processes: histolysis, by which the whole or part of a structure disappears; and histogenesis, or the formation of the new structure. Moreover, in certain cases the hypodermis are destroyed, while other portions of it develop in the new structures. The hypodermis is composed of parts of two different kinds, viz. (1) the larger part of the hypodermis that exists in the larva or caterpillar is dissolved at the metamorphosis; (2) parts that remain comparatively quiescent previously, and that grow and develop when the other parts are cast off. The centres of renovation are called imaginal disks or folds. The adult caterpillar may be described as a creature in which the hypodermis of which is studded with buds that expand and form the butterfly, while the parts around them degenerate. In some insects (e.g. the maggots of the blowfly, Calliphora vomitoria) the imaginal disks are all appearance completely separated from the organism, with the exception of the legs in some, however, really organically connected by strings or pedicels. This connexion was not at first recognized and the true nature of its basis not at first perceived, even by Weismann, to whom their discovery in Diptera is due. In other insects the imaginal disks are less completely disconnected from the superficies of the larval hypodermis, and may include in more patches thereof. The number of these disks in an individual is large, upwards of sixty having been discovered to take part in the formation of the outer body of a fly. With regard to the formation of organs, we need only say that transformation occurs in an essentially similar manner, by means of a development of two sets of centres distributed in the various organs. The imaginal disks for the outer wall of the body, some of them, at any rate, include mesodermal remnants (from which segments are developed) as well as hypodermis. The imaginal disks make their appearance (that is, have been first detected) at very different epochs in the life; their absolute origin has been but little investigated. Pratt has traced them in the sheep-tick (Melophagus) to an early stage of the embryonic life.

Histolysis and Histogenesis.—The process of destruction of the larval tissues was first studied in the forms where metamorphosis is greatest and most abrupt, viz. in the Muscid Diptera. It was found that the tissues were attacked by phagocytic cells that became enlarged and carried away fragments of the tissue; the cells were subsequently identified as leucocytes or blood cells. Histolysis is in the opinion of many an agent of histolysis is a process of phagocytosis. It has, however, since been found that in other kinds of insects the tissues degenerate and break down without the intervention of phagocytes. It has, moreover, been noticed that even in those phagocytes exist a greater or less extent of degeneration of the tissue may be observed before phagocytosis occurs. This process can therefore only be looked upon as secondary and accessory, and affects the destruction necessary to permit of the accompanying histogenesis. This view is confirmed by the fate of the phagocytic cells. These do not take a direct part in the formation of the new tissue, but it is believed merely yield their surplus acquisitions, becoming ordinary blood-cells or disappearing altogether. As to the nature of histogenesis, nothing more can be said than that it appears to be a phenomenon similar to embryonic growth, though limited to certain spots. Hence we are inclined to look on the imaginal disks as cellular areas that possess in a latent condition the powers of growth and development that exist in the embryo, powers that only become evident in certain special conditions of the organism. While the more essential of these conditions may be a question on which very little light has been thrown, though it has been widely discussed.

Much consideration has been given to the nature of metamorphosis in insects, to its value to the creatures and to the mode of its origin. Insect metamorphosis may be briefly described as phenomena of development characterized by abrupt changes of appearance and of structure, occurring during the latter part of embryonic development and amounting to the reproductive state. It is, in short, a peculiar mode of growth and adolescence. The differences in appearance between the caterpillar and the butterfly, striking as they are to the eye, do not sufficiently represent the phenomena of metamorphosis to the intelligence. The changes that take place involve a revolution in the being, and may be summarized under three headings: (1) The food-relations of the individual are profoundly changed, an entirely different set of mouth-organs appears and the kind and

GROWTH AND CHANGE
quantity of the food taken is often radically different. (2) A wingless, sedentary creature is turned into a winged one with superlative powers of aerial movement. (3) An individual in which the reproductive organs and powers are functionally absent becomes one in which these structures and powers are the only reason for existence, for the great majority of insects die after a brief period of reproduction. These changes are in the higher insects so extreme that it is difficult to imagine how they could be increased. In the case of the common drone-fly, Erastilia tenax, the individual, from a sedentary maggot living in filth, without any relations of sex, and with only unimportant organs for the ingestion of its foul nutriment, changes to a creature of extreme alertness, with magnificent powers of flight, living on the products of the flowers it frequents, and endowed with highly complex sexual structures.

Forms of Larva.—The unlikeliness of the young insect to its parent is one of the factors that necessitates metamorphosis. It is instructive, further, to trace among metabolic insects an increase in the degree of this dissimilarity. An adult Hexapoda is provided with a firm, well-chitinized cuticle and six conspicuous jointed legs. Many larval Hexapods might be defined in similar general terms, unlike as they are to their parents in most points of detail. Examples of such are to be seen in the grubs of may-flies, dragon-flies, lace-wing-flies and ground-beetles (fig. 24). This type of active, armoured larval grub, bearing conspicuous feelers on the head and long jointed cercopods on the tenth abdominal segment—was styled campodeiform by F. Brauer (1860), on account of its likeness in shape to the bristle-tail Campodea. As an extreme contrast to this campodeiform type, we take the maggot of the house-fly (fig. 25)—a veriform larva, with soft, white, feebly-chitinized cuticle and without either head-capulse or legs. Between these two extremes, numerous intermediate forms can be traced: the grub (wireworm) of a click-beetle, with narrow elongate well-armoured body, but with the legs very short; the grub of a chafier, with the legs fairly developed, but with the cuticle of all the trunk-segments soft and feebly chitinized; the well-known caterpillar of a moth (fig. 27, a) or saw-fly, with its long cylindrical body, bearing the six shortened thoracic legs and a variable number of pairs of “pro-legs” on the abdomen (this being the eruciform type of larva); the soft, white, wood-boring grub of a longhorn-beetle or of the saw-fly Sirex, with its stumpy vestiges of thoracic legs; the large-headed but entirely legless, flabby grub of a weevil; and the legless larva, with greatly reduced head, of a bee. The various larvae of the above series, however, have all a distinct head-capulse, which is altogether wanting in the degraded fly maggot. These differences in larval form depend in part on the surroundings among which the larva finds itself after hatching; the active, armoured grub has to seek food for itself and to fight its own battles, while the soft, defenceless maggot is provided with abundant nourishment. But in general we find that elaboration of imago-natal structure is associated with degradation in the nature of the larva, eruciform and veriform larvae being characteristic of the highest orders of the Hexapoda, so that unlikeliness between parent and offspring has increased with the evolution of the class.

Hypermetamorphosis.—Among a few of the beetles or Coleoptera (q.v.), and also in the neuropterous genus Mantidpia, are found life-histories in which the earliest instar is campodeiform and the succeeding larval stages eruciform. These later stages, comprising the greater part of the larval history, are adapted for an inquiline or a parasitic life, where shelter is assured and food abundant, while the short-lived, active condition enables the newly-hatched insect to make its way to the spot favourable for its future development, clinging, for example, in the case of an oil-beetle’s larva, to the hairs of a bee as she flies towards her nest. The presence of the two successive larval forms in the life-history constitutes what is called hypermetamorphosis. Most significant is the precedence of the eruciform by the campodeiform type. In conjunction with the association mentioned above of the most highly developed imaginal with the most degraded larval structure, it indicates clearly that the active, armoured grub preceded the sluggish soft-skinned caterpillar or maggot in the evolution of the Hexapoda.

Nymph.—The term nymph is applied by many writers on the Hexapoda to all young forms of insects that are not sufficiently unlike their parents to be called larvae. Other writers apply the term to a “free” pupa (see infra). It is in well-nigh universal use for those instars of ametabolous and hemimetabolous insects in which the external wing-rudiments have become conspicuous (fig. 27). The mature dragon-fly nymph, for example, makes its way out of the water in which the early stages have been passed and, clinging to some water-plant, undergoes the final ecdysis that the imago may emerge into the air. Like most ametabolous and hemimetabolous Hexapoda, such nymphs continue to move and feed throughout their lives. But examples are not wanting of a more or less complete resting habit during the latest nymphal instar. In some cicadas the mature nymph ceases to feed and remains quiescent within a pillar-shaped earthen chamber. The nymph of a thrips-insect (Thysanoptera) is sluggish, its legs and wings being sheathed by a delicate membrane, while the nymph of the male scale-insect rests enclosed beneath a waxy covering.

Sub-imago.—Among the Hexapoda generally there is no subsequent ecysis nor any further growth after the assumption of the winged state. The may-flies, however, offer a remarkable exception to this rule. After a prolonged aquatic larval and nymphal life-history, the winged insect appears as a sub-imago, whence, after the casting of a delicate cuticle, the true imago emerges.

Pupa.—In the metamorphic Hexapoda the resting pupal instar shows externally the wings and other characteristic imaginal organs which have been gradually elaborated beneath the larval cuticle. It is usual to distinguish between the free pupae (fig. 26, b)—of Coleoptera and Hymenoptera, for example—in which the wings, legs and other appendages are not fixed to the trunk, and the obect pupae (fig. 21, d)—such as may be noticed in the majority of the Lepidoptera—whose appendages are closely and immovably pressed to the body by a general hardening and fusion of the cuticle. In the degree of mobility there is great diversity among pupae. A gnat pupa swims through the water by powerful strokes of its abdomen, while the caddis-fly pupa, in preparation for its final ecdysis, bides its way out of its subaqueous protective case and rises through the water, so that the fly may emerge into the air. Some pupae are thus more active than some nymphs; the essential character of a pupa is not therefore its passivity, but that it is the instar in which the wings first become evident externally.
The division of the winged Hexapoda into Exopterygota and Endopterygota is thus again justified. If we admit that the larva has, in the phylogeny of insects, gradually diverged from the imago, and if we recollect that in the ontogeny the larva has always become the imago (and of course still does so) notwithstanding the increased difficulty of the transformation, we cannot but recognize that a period of holometabolosis in which the transformation may take place is to be expected. It is generally considered that this is sufficient as an explanation of the existence of the pupa. This, however, is not the case, because the greater part of the transformation precedes the disclosure of the pupa, which, as L. C. Miall remarks, is structurally little other "than the fly enclosed in a temporary skin." Moreover, in many insects, with imperfect metamorphosis the change from larva or (as the later stage of the larva is called in these cases) nymph to imago is about as great as the corresponding change in the Holometabola, as the student will recognize if he recalls the histories of Ephemeridae, Odonata and male Coccidae. But in some of these latter cases have the wings to be changed from a position inside the body to become external and actively functionally organs. The difference between the nymph or false pupa and the true pupa is that in the latter a whole stage is devoted to the perfecting of the wings and body-wall after the wings have become external organs; the stage is one in which no food is or can be taken, however prolonged may be its existence. Amongst insects with imperfect metamorphosis the nearest approximations to the true pupa of the Holometabola are to be found in the subimagines of Ephemeridae and in the quiescent or resting stages of Thyssanoptera, Neuroptera and Coccidae. A much more thorough appreciation than we yet possess of the phenomena in these cases is necessary in order completely to demonstrate the special characteristics of the holometabolous transformation. But even at present we can correctly state that the true pupa is invariably connected with the transference of the wings from the interior to the exterior of the body. It cannot but suggest itself that this transference was induced by some peculiarity as to formation of cuticle, causing the growth of the wings to be directed towards instead of outwards. We may remark that flies possess no wings, but are understood to possess a true pupa. This is a most remarkable case, but unfortunately very little information exists as to the details of metamorphosis in this group.

Life-Relations.—Only a brief reference can be made here to the fascinating subject of the life-relations of the larva, nymph and pupa, as compared with those of the imago. For details, the reader may consult the special articles on the various orders and groups of insects. A common result of metamorphosis is that the larva and imago differ markedly in their habitat and mode of feeding. The larva may be aquatic, or subterranean, or a burrower in wood, while the imago is aerial. It may bite and devour solid food, while the imago sucks liquids. It may eat roots or refuse, while the imago lives on leaves and flowers. The aquatic habit of many larvae is associated with endless beneficial adaptations for respiration. The series of paired spiracles on most of the trunk-segments is well displayed, as a rule, in terrestrial larvae—caterpillars and the grubs of most beetles, for example. In many aquatic larvae we find that all the spiracles are closed up, or become functionless, except a pair at the hinder end which are associated with some arrangement—such as the valvular flaps of the gnat larva or the telescopic "tail" of the drone-fly larva—for piercing the surface film and drawing periodical supplies of atmospheric air. A similar restriction of the functional spiracles to the tail-end (fig. 25, d) is seen in many larvae of flies (Diptera) that live and feed buried in carrion or excrement. Other aquatic larvae have the tracheal system entirely closed, and are able to breathe dissolved air by means of tubular or leaf-like gills. Such are the grubs of stone-flies, may-flies (fig. 27) and some dragon-flies and midges. An interesting feature in the difference often to be observed between an aquatic larva and pupa of the same insect in the matter of breathing. The gnat larva, for example, breathes at the tail-end, hanging head-downwards from the surface-film. But the pupa hangs from the surface by means of paired respiratory trumpets on the prothorax, the dorsal thoracic surface, where the cuticle splits to allow the emergence of the fly, being thus directed towards the upper air. A marked disproportion between the life-term of larva and imago is common; the former often lives for months or years, while the latter only survives for weeks or days or hours. Generally the larval is the feeding, the imaginal the breeding, stage of the life-cycle. The extreme of this "division of labour" is seen in those insects whose jaws are vestigial in the whole animal, the need for feeding all being, them, they have but to pair, to lay eggs and to die. The acquisition of wings is the sign of developed reproductive power. Pupa.—Nevertheless, the function of reproduction is occasionally exercised by larvae. In 1865 N. Wagner made his classical observations on the production of larvae from unfertilized eggs developed in the precociously formed ovariates of a larval gall-midge (Cecidomyiidae), and subsequent observers have confirmed his results by studies on insects of the same family and of the related Chironomidae. The larvae produced by this remarkable method (papagenosis) of virgin-reproduction are hatched within the parent larva, and in some cases escape by the rupture of its body.

Polyembryony.—Occasionally the power of reproduction is thrown still farther back in the life-history, and it is found that from a single egg a large number of embryos may be formed. Thus a mass or chain of embryos is produced, lying in a common cyst, and developing as their larval host develops. In this P. Marchal has (1901) described this power in two small parasitic Hymenoptera—a Chalcid (Encyrtus) which lays eggs in the developing eggs of the small moth Hyponomeuta, and a Proctotrupid (Polygnotus) which infests a gall-midge (Cecidomyiidae) larva. In the egg of these insects a small number of nuclei are formed by the division of the nucleus, and each of these nuclei originates by division the cell-layers of a separate embryo. Thus a mass or chain of embryos is produced, lying in a common cyst, and developing as their larval host develops. In this P. Marchal has (1901) described this power in two small parasitic Hymenoptera—a Chalcid (Encyrtus) which lays eggs in the developing eggs of the small moth Hyponomeuta, and a Proctotrupid (Polygnotus) which infests a gall-midge (Cecidomyiidae) larva. In the egg of these insects a small number of nuclei are formed by the division of the nucleus, and each of these nuclei originates by division the cell-layers of a separate embryo. Thus a mass or chain of embryos is produced, lying in a common cyst, and developing as their larval host develops.

Duration of Life.—The flour-moth (Ephestia kuehniella) sometimes passes through five or six generations in a single year. Although one of the characteristics of insects is the brevity of their adult lives, a considerable number of exceptions to the general rule have been discovered. These exceptions may be briefly summarized as follows: (1) Certain larvae, provided with food that may be adequate in quantity but deficient in nutrient, may live and go on feeding for many

From Miall and Denny (after Vayssiaux), The Cockroach, Lovel Kieve & Co.

HEXAPODA

[CLASSIFICATION]

years; (2) certain stages of the life that are naturally "resting stages" may be in exceptional cases prolonged, and that to a very great extent; in this case no food is taken, and the activity of the individual is almost nil; (3) the life of certain insects in the adult stage may be much prolonged if celibacy be maintained; a female of Cybister roeseli (a large water-beetle) has lived five and a half years in the adult stage in captivity. In addition to these abnormal cases, the life of certain insects is naturally more prolonged than usual. The females of some social insects have been known to live for many years. In Tibicen septendecim the life of the larva extends over from thirteen to seventeen years. The eggs of locusts may remain for years in the ground before hatching; and there may thus arise the peculiar phenomenon of some species of insect appearing in vast numbers in a locality where it has not been seen for several years.

Classification

Number of Species.—It is now considered that 2,000,000 is a moderate estimate of the species of insects actually existing. Some authorities consider this total to be too small, and extend the number to 10,000,000. Upwards of 300,000 species have been collected and described, and at present the number of named forms increases at a rate of about 8000 species per annum. The greater part by far of these forms existing in the world is still quite unknown to science. Many of the species are in process of extinction, owing to the extensive changes that are taking place in the natural conditions of the world by the extension of human population and of cultivation, and by the destruction of forests; hence it is probable that a considerable proportion of the species at present existing will disappear from the face of the earth before we have discovered or preserved any specimens of them. Nevertheless, the constant increase of our knowledge of insect forms renders classification increasingly difficult, for gaps in the series become filled, and while the number of genera and families increases, the distinctions between these groups become dependent on characters that must seem trivial to the naturalist who is not a specialist.

Orders of Hexapoda.—In the present article it is only possible to treat of the division of the Hexapoda into orders and sub-orders and of the relations of these orders to each other. For further classificatory details, reference must be made to the special articles on the various orders. As regards the vast majority of insects, the orders proposed by Linnaeus are acknowledged by modern zoologists. His classification was founded mainly on the nature of the wings, and of five of his orders—the Hymenoptera (bees, ants, wasps, &c.), Coleoptera (beetles), Diptera (two-winged flies), Lepidoptera (moths and butterflies), and Heteroptera (bugs, cicadas, &c.)—are recognized to-day with nearly the same limits as he laid down. His order of wingless insects (Aptera) included Crustacea, spiders, centipedes and other creatures that now form classes of the Arthropoda distinct from the Hexapoda; it also included Hexapoda of parasitic and evidently degraded structure, that are now regarded as allied more or less closely to various winged insects. Consequently the modern order Aptera comprises only a very small proportion of Linnaeus’s "Aptera"—the spring-tails and bristle-tails, wingless Hexapoda that stand evidently at a lower grade of development than the bulk of the class. The earwigs, cockroaches and locusts, which Linnaeus included among the Coleoptera, were early grouped into a distinct order, the Orthoptera. The great advance in modern zoology as regards the classification of the Hexapoda lies in the treatment of a heterogeneous assembly which formed Linnaeus’s order Neuroptera. The characters of the wings are doubtless important as indications of relationship, but the nature of the jaws and the course of the life-history must be considered of greater value. Linnaeus’s Neuroptera exhibit great diversity in these respects, and the insects included in it are now therefore distributed into a number of distinct orders. The many different arrangements that have been proposed can hardly be referred to in this article. Of special importance in the history of systematic entomology was the scheme of F. Brauer (1885), who separated the springtails and bristle-tails as a sub-class Apterygogenea from all the other Hexapoda, these forming the sub-class Pterygogenea distributed into sixteen orders. Brauer in his arrangement of these orders laid special stress on the nature of the metamorphosis, and was the first to draw attention to the number of Malpighian tubes as of importance in classification. Subsequent writers have, for the most part, increased the number of recognized orders; and during the last few years several schemes of classification have been published, in the most revolutionary of which—that of A. Handlirsch (1903-1904)—the Hexapoda are divided into four classes and thirty-four orders! Such excessive multiplicity of the larger taxonomic divisions shows an imperfect sense of proportion, for if the term "class" be allowed its usual zoological value, no student can fail to recognize that the Hexapoda form a single well-defined class, from which few entomologists would wish to exclude even the Apterygogenea. In several recent attempts to group the orders into sub-clases, stress has been laid upon a few characters in the imago. C. Börner (1904), for example, considers the presence or absence of cerci of great importance, while F. Klapaek (1904) lays stress on a supposed distinction between appendicular and non-appendicular genital processes. As a natural system must take into account the nature of the larva also, in conjunction with the general characters of the imago. Hence the orders of winged Hexapoda into the divisions Exopterygota and Endopterygota, as suggested by D. Sharp, is unlikely to be superseded by the result of any researches into minute imaginal structure. Sharp’s proposed association of the parasitic wingless insects in a group Anapterygota cannot, however, be defended as natural; and recent researches into the structure of these forms enables us to associate them confidently with related winged orders. The classification here adopted is based on Sharp’s scheme, with the addition of suggestions from some of the most recent authors—especially Börner and Enderlein.

Class: HEXAPODA

Sub-class: APTERYGOTA

Primarily (2) wingless to (3) winged, with cunnacean mandibles, distinct maxillulae, and locomotor abdominal appendages. Without ectodermal genital ducts. Young closely resemble adults.

The sub-class contains a single order:

Order: APTERA

which is divided into two sub-orders:—

1. Thyssanura (Bristle-tails); with ten abdominal segments; number of abdominal appendages variable. Cerci prominent. Developed tracheal system.

2. Pterygota (Spring-tails); with six abdominal segments; appendages of the first forming an adherent ventral tube, those of the third a minute "catch," those of the fourth (fused basally) a "spring." Tracheal system reduced or absent.

Sub-class: EXOPTERYGOTA

Hexapoda mostly with wings, the wingless forms clearly degraded. Maxillulae rarely distinct. No locomotor abdominal appendages. The wing-rudiments develop visibly outside the cuticle. Young like or unlike parents.

Order: DERMAPTERA

Biting mandibles; minute but distinct maxillulae; second maxillae incompletely fused. When wings are present, the fore-wings are small firm elytra, beneath which the delicate hind-wings are complexly folded. Many forms wingless. Genital ducts entirely exposed. Cerci always present; usually modified into unjointed forceps. Numerous (30 or more) Malpighian tubes. Young resembling parents.

Includes two families—the Forficulidae or earwigs (q.v.) and the Hemiptera.

Order: ORTHOPTERA

Biting mandibles; vestigial maxillulae; second maxillae incompletely fused. Wings usually well developed, net-veined; the fore-wings of firmer texture than the hind-wings, whose anal area folds fanwise beneath them. Cerci always present; ovipositor well developed. Malpighian tubes numerous (100-150). Young resemble parents.

Includes stick and leaf insects, cockroaches, mantids, grasshoppers, locusts and crickets (see ORTHOPTERA).

Order: PLECOPTERA

Young resembling parents, but aquatic in habit, breathing dissolved air by thoracic tracheal gills.
Includes the single family of the Perilidae (Stone-flies), formerly grouped with the Neuroptera.

**Order:** Isoptera.
Biting mandibles; second maxillae incompletely fused. Fore-wings similar in shape and texture to hind-wings, which do not fold. In most species the majority of individuals are winged. Short, jointed cerci. Six or eight Malpighian tubes. Young resembling adults; terrestrial throughout life.
Includes two families, formerly reckoned among the Neuroptera—the Embiidae and the Termitidae or "White Ants" (see Termite).

**Order:** Corrodentia.
Biting mandibles; second maxillae incompletely fused; maxilulae of distinct form. Cerci absent. Four Malpighian tubes. Includes two sub-orders, formerly regarded as Neuroptera—

- **Coptophasa:** Corrodentia with delicate cuticle. Wings usually developed; the fore-wings much larger than the hind-wings. One family, the Protocladidae (Book-llice). These minute insects are found amongst old books and furniture.

- **Mallolophus:** Parasitic wingless Corrodentia (Bird-llice).

**Order:** Ephemeroptera.
Jaws vestigial. Fore-wings much larger than hind-wings. Elongate, jointed cerci. Genital ducts paired and entirely mesodermal. Malpighian tubes numerous (40-80 in aquatic larvae with distinct mandibles). Breeding dissolved air by abdominal tracheal gills. Penultimate instar a flying sub-imago. [Includes the single family of the Ephemeridae or may-flies. See also Neuroptera, in which this order was formerly comprised.]

**Order:** Odonata.
Biting mandibles. Wings of both pairs closely alike; firm and gauzy in texture. Protrusive, unjointed cerci, male with genital armature on second abdominal segment. Malpighian tubes numerous (20-60) Aquatic larvae with caudal leaf-gills or with retinal tracheal system.
Includes the three families of dragon-flies. Formerly comprised among the Neuroptera.

**Order:** Thysanoptera.
Piercing mandibles, retracted within the head-capsule. First maxillae also modified as piercing; maxillae of both pairs with distinct palps. Both pairs of wings similar, narrow and fringed. Four Malpighian tubes. Cerci absent. Ovipositor usually present. Young resembling parents, but penultimate instar passive and enclosed in a filmy pellicle.
Includes three families of Thrips (see Thysanoptera).

**Order:** Hemiptera.
Mandibles and first maxillae modified as piercing; second maxillae fused to form a jointed, grooved rostrum. Wings usually present. Four Malpighian tubes. Cerci absent. Ovipositor developed.
Includes two sub-orders:

1. **Aleyrodidae:** Rostrum in contact with haunches of fore-legs.
Fore-wings partly coscious. Young resembling adults.
Includes the bugs, terrestrial and aquatic.

2. **Homoptera:** Rostrum in contact with haunches of fore-legs. Fore-wings united in texture. Young often larviform. Penultimate instar passive in some cases.
Includes the cicadas, aphides and scale-insects (see Hemiptera).

**Order:** Anoplura.
Piercing jaws modified and reduced, a tubular, protrusible sucking-trunk being developed; mouth with hooks. Wingless, parasitic forms. Cerci absent. Four Malpighian tubes. Young resembling adults.
Includes the family of the Lice (Pediculidae), often reckoned as Hemiptera (q.v.). See also Louse.
Sub-class: Endopterygota.
Hexapoda mostly with wings; the wingless forms clearly degraded or modified. Maxillulae vestigial or absent. No locomotor abdominal appendages (except in certain larvae). Young animals always unlike parents, the wing-nimture developing beneath the larval cuticle and only appearing in a penultimate pupal instar, which takes no food and is usually passive.

**Order:** Neuroptera.

**Order:** Coleoptera.
Biting mandibles; second maxillae very intimately fused. Prothorax large and free. Fore-wings modified into firm elytra, beneath which the membranous hind-wings (when present) can be folded. Cerci absent. Four or six Malpighian tubes. Larva campodeiform or eruciform. Pupa free. Includes the beetles and the parasitic Stylipodidae, often regarded as a distinct order (Sireripilopera). (See Coleoptera.)

**Order:** Megapodoptera.

**Order:** Panorpidae (scorpion-flies), often comprised among the Neuroptera.

**Order:** Trichoptera.
Mandibles present in pupa, vestigial in imago; maxillae sectorial without specialization; first maxillae with lacina, galea and palp. Two pairs of membranous hair-covered wings, with predominantly longitudinal neurulation. Larvae aquatic and eruciform. Pupa free. Six Malpighian tubes. Cerci absent.
Includes the caddis-flies. See Neuroptera, among which these insects were formerly comprised.

**Order:** Lepidoptera.
Mandibles absent in imago, very exceptionally present in pupa; first maxillae nearly always without lacinae and often without palps, or only with vestigial palps, their galeae elongated and grooved inwardly so as to form a sucking trunk. Prothorax small. Wings with predominantly longitudinally neurulated, covered with flattened scales. Fore-wings larger than hind-wings. Cerci absent. Four (usually 6) Malpighian tubes. Larvae eruciform, with rarely more than five pairs of abdominal prolegs. Pupa free in the lowest families, in most cases incompletely or completely oburtect.
Includes the moths and butterflies. See Lepidoptera.

**Order:** Diptera.
Mandibles rarely present; adapted for piercing; first maxillae with palps; second maxillae forming with hypopharynx a sectorial proboscis. Prothorax small, intimately united to mesothorax. Fore-wings well developed; hind-wings reduced to stalked knobs ("halteres"). Cerci present but usually reduced. Four Malpighian tubes. Larvae eruciform without thoracic legs, or vermiciform without head-capsule. Pupa incompletely oburtect or free, and enclosed in the hardened cuticle of the last larval instar (puparium). Includes the two-winged flies (see Diptera), which may be divided into two sub-orders:

1. **Ostreorrhapha:** Larvae eruciform. Cuticle of pupa or puparium stipitate, longitudinal. Fore-wings united to mesothorax. Larvae eruciform, with seven or 20 pairs of abdominal prolegs, or entirely legless. Pupa free.
Includes two sub-orders:

- **Aphylly:** Abdomen not basally constricted. Larvae caterpillars with thoracic legs and abdominal prolegs.

- **Cyclorrhapha:** Larva vermiciform (no head-capsule). Puparium opening by an anterior "lid.
Comprises the hover-flies, flesh-flies, hot-flies, &c.

**Order:** Siphonaptera.
Mandibles fused into a piercer; first maxillae developed as piercers; palps of both pairs of maxillae present; hypopharynx wanting. Prothorax large. Wings absent or vestigial. Larva eruciform, limbless.
Includes the fleas. See Hymenoptera.

**Order:** Hymenoptera.
Biting mandibles; second maxillae incompletely or completely fused. Exoskeleton forming a complete rigid cuticle. Prothorax small and united to mesothorax. First abdominal segment united to metathorax. Wings membranous, fore-wings larger than hind-wings. Ovipositor always well developed, and often modified into a sting.
Includes the Polyzoa (10-60 Malpighian tubes, 6-12 only). Larva eruciform, with seven or eight pairs of abdominal prolegs, or entirely legless. Pupa free.
Includes two sub-orders:

1. **Symphyta:** Abdomen not basally constricted. Larvae caterpillars with thoracic legs and abdominal prolegs.

- **Apoidea:** Abdomen markedly constricted at second segment. Larvae legless grubs.

- **Apocrita:** Larva uriniform, stabilized as insects, including a Thyssanuran from North America, but upon these considerable doubt has been cast.

**Geological History**

The classification just given has been drawn up with reference to existing insects, but the great majority of the extinct forms that have been discovered can be referred with some confidence to the same orders, and in many cases to recent families. The Hexapoda, being aerial, terrestrial and fresh-water animals, are but occasionally preserved in stratiographically strata, and our knowledge of extinct members of the class is therefore fragmentary, while the description, as insects, of various obscure fossils, which are perhaps not even Arthropods, has not tended to the advancement of this branch of zoology. Nevertheless, much progress has been made. Several Silurian fossils have been identified as insects, including a Thyssanuran from North America, but upon these considerable doubt has been cast.
The Devonian rocks of Canada (New Brunswick) have yielded several fossils which are undoubtedly wings of Hexapods. These have been described by S. H. Scudder, and include gigantic forms related to the Ephemeroptera.

In the Carboniferous strata (Coal measures) remains of Hexapods become numerous and quite indiscernible. Many European forms of this age have been described by C. Brongniart, and American by S. H. Scudder. The latter has established, for all the Palaeozoic insects, an order Palaeodictyoptera, there being a closer similarity between the fore-wings and the hind-wings than is to be seen in most living orders of Hexapoda, while affinities are shown to several of these orders—notably the Orthoptera, Ephemeroptera, Odonata and Hemiptera. It is probable that many of these Carboniferous insects might be referred to the Isoptera, while others would fall into the existing orders to which they are allied, with some modification of our present diagnoses. Of special interest are cockroach-like forms, with two pairs of similar membranous wings and a long ovipositor, and gigantic insects allied to the Odonata, that measured 2 ft. across the outspread wings. A remarkable fossil from the Scottish Coal-measures (Lithomanitis) had apparently small wing-like structures on the prothorax, and in allied genera small veined outgrowths—like tracheal gills—occurred on the abdominal segments. To the Permian period belongs a remarkable genus Eugeron, that combines hemipteroid jaws with orthopteroid wing-nourishment. With the dawn of the Mesozoic epoch we reach Hexapods that can be unhesitatingly referred to the existing orders. From the Solenhofen limestones, Scudder has described cockroaches intermediate between their Carboniferous precursors and their present-day descendants, while the existence of endopterygoteous Hexapods is shown by the remains of Coleoptera of several families. In the Jurassic rocks are found Ephemeroptera and Odonata, as well as Hemiptera, referable to existing families, some representatives of which had already appeared in the oldest of the Jurassic ages—the Liassic. To the Liassic also can be traced back the Neuroptera, the Trichoptera, the orthorrhaphous Diptera and, according to the determination of certain obscure fossils, also the Hymenoptera (ants). The Lithographic stone of Kimmeridgian age, at Solenhofen in Bavaria, is especially rich in insect remains, cyclorrhaphous Diptera appearing here for the first time. In Tertiary times the higher Diptera, besides Lepidoptera and Hymenoptera, referable to existing families, become fairly abundant. Numerous fossil insects preserved in the amber of the Baltic Oligocene have been described by G. L. Mayr and others, while Scudder has studied the rich Oligocene faunas of Colorado (Florissant) and Wyoming (Green River). The Oeningen beds of Baden, of Miocene age, have also yielded an extensive insect fauna, described fifty years ago by O. Heer. Further details of the geological history of the Hexapoda will be found in the special articles on the various orders. Fragmentary as the records are, they show that the Exopterygota preceded the Endopterygota in the evolution of the class, and that among the Endopterygota those orders in which the greatest difference exists between imago and larva—the Lepidoptera, Diptera and Hymenoptera—were the latest to take their rise.

Geographical Distribution

The class Hexapoda has a world-wide range, and so have most of its component orders. The Aptera have perhaps the most extensive distribution of all animals, being found in Franz Josef Land and South Victoria Land, on the snows of Alpine glaciers, and in the depths of the most extensive caves. Most of the families and a large proportion of the genera of insects are exceedingly widespread, but a study of the genera and species in any of the more important families shows that faunas can be distinguished whose hemipterous parts are quite flowing with each other that have been proposed to express the distribution of the higher vertebrates. Many insects, however, can readily extend their range, and a careful study of their distribution leads us to discriminate between faunas rather than definitely to map regions.

A large and dominant Holarctic fauna, with numerous subdivisions, ranges over the great northern continents, and is characterized by the abundance of certain families like the Carabidae and Staphylinidae among the Coleoptera and the Tenebrionidae among the Hymenoptera. The southern territory held by this fauna is invaded by genera and species distinctly tropical. Oriental types range far northwards into China and Japan. Ethiopian forms invade the Mediterranean area. Neotropical and distinctively Sonoran insects mingle with members of the Holarctic fauna across a wide "transition zone" in North America. "Wallace's line" dividing the Indo-Malayan and Austro-Malayan sub-regions is frequently transgressed in the range of Malayan insects. The Australian fauna is rich in characteristic and peculiar genera, and New Zealand, while possessing some remarkable insects of its own, lacks entirely several families with an almost world-wide range—forexample, the Notodontidae, Lascicampidae, and other families of Lepidoptera. Interesting relationships between the Ethiopian and Oriental, the Neotropical and West African, the Patagonian and New Zealand faunas suggest great changes in the distribution of land and water, and throw doubt on the doctrine of the permanence of continental areas and oceanic basins. Holarctic types reappear on the Andes and in South Africa, and even in New Zealand. The study of the Hexapoda of oceanic islands is full of interest. After the determination of a number of cosmopolitan insects that may well have been artificially introduced, there remains a large proportion of endemic species—sometimes referable to distinct genera—which suggest a high antiquity for the truly insular faunas.

Relationships and Phylogeny

The Hexapoda form a very clearly defined class of the Arthropoda, and many recent writers have suggested that they must have arisen independently of other Arthropods from annelid worms, and that the Arthropoda must, therefore, be regarded as an "unnatural," polyphyletic assemblage. The cogent arguments against this view are set forth in the article on Arthropoda. A near relationship between the Apterygota and the Crustacea has been ably advocated by H. J. Hansen (1885). It is admitted on all hands that the Hexapoda are akin to the Chilopoda. Verhoeff has lately (1904) put forward the view that there are really six segments to the abdomen—three of which are distinct in the abdomen—the cerci belonging to the seventeenth abdominal segment thus showing a close agreement with the centipede Scolopendra. On the other hand, G. H. Carpenter (1899, 1902-1904) has lately endeavoured to show an exact numerical correspondence in segmentation between the Hexapoda, the Crustacea, the Arachnida, and the most primitive of the Diplopoda. On either view it may be believed that the Hexapoda arose with the allied classes from a primitive arthropod stock, while the relationships of the class are with the Crustacea, the Chilopoda and the Diplopoda, rather than with the Arachnida.

Nature of Primitive Hexapoda.—Two divergent views have been held as to the nature of the original hexapod stock. Some of those zoologists who look to Peripatus, or a similar worm-like form, as representing the direct ancestors of the Hexapoda have laid stress on a larva like the caterpillar of a moth or saw-fly as representing a primitive stage. On the other hand, the view of F. Müller and F. Brauer, that the Thyasura represent more nearly than any other existing insects the ancestors of the class, has been accepted by the great majority of students. And there can be little doubt that this belief is justified. The caterpillar, or the maggot, is a specialized larval form characteristic of the most highly developed orders, while the campodeiform larva is the starting-point for the more primitive insects. The occurrence in the hypermetamorphic Coleoptera (see supra) of a campodeiform preceding an eruciform stage in the life-history is most suggestive. Taken in connection with the likeness of the young among the more generalized orders to the adults, it indicates clearly a thyasuronid starting-point for the evolution of the hexapod orders. And we must infer further that the specialization of the higher orders has been accompanied by an increase in
the extent of the metamorphosis—a very exceptional condition among animals generally, as has been ably pointed out by L. C. Miall (1895).

**Origin of Wings.**—The post-embryonic growth of Hexapoda with or without metamorphosis is accompanied in most cases by the appearance of wings. Stages in this growth during the lifetime of the individual, must have been in some way acquired during the evolution of the class. Many students of the group, following Brauer, have regarded the Aptygyna as representing the original wingless progenitors of the Pterygota, and the many primitive characters shown by the former group lend support to this view. On the other hand, it has been argued that the presence of wings in a vast majority of the Hexapoda suggests their presence in the ancestors of the whole class. It is most unlikely that wings have been acquired independently by various orders of Hexapoda, and if we regard the Thysanura as the slightly modified representatives of a primitively wingless stock, we must postulate the acquisition of wings by some early offshoot of that stock, an offshoot whence the whole group of the Pterygota took its rise. How wings were acquired by these primitive Pterygota must remain for the present a subject for speculation. Insect wings are specialized outgrowths of certain thoracic segments, and are quite unrepresented in any other class of Arthropods. They are not, therefore, like the wings of birds, modified from some pre-existing structures (the fore-limbs) common to their phylum; they are new and peculiar structures. Comparison of the tracheal systems in that Endoterpota in which outgrowths on the abdominal segments of the aquatic campodeiform larva of may-flies (see fig. 27) led C. Gegenbaur to the brilliant suggestion that wings might be regarded as specialized and transformed gills. But a survey of the Hexapoda as a whole, and especially a comparative study of the tracheal system, can hardly leave room for doubt that this system is primitively adapted for atmospheric breathing, and that the presence of tracheal gills in larvac must be regarded as a special adaptation for temporary aquatic life. The origin of insect wings remains, therefore, a mystery, deepened by the difficulty of imagining any probable use for thoracic outgrowths, comparable to the wing-rudiments of the Exopterygota, in the early stages of their evolution.

**Origin of Metamorphosis.**—In connexion with the question whether metamorphosis has been gradually acquired, we have to consider two aspects, viz. the bionomic nature of metamorphosis, and to what extent it existed in primitive insects. Bionomically, metamorphosis may be defined as the sum of adaptations that have gradually tilted the larva (caterpillar or maggot) for one kind of life, the fly for another. So that we may conclude that the larval stage is a stage of development. With regard to its occurrence in primitive insects, our knowledge of the geological record is most imperfect, but so far as it goes it supports the conclusion that holometabolism (i.e. extreme metamorphosis) is a comparatively recent phenomenon of insect life. None of the groups of existing Endopterygota have been traced with certainty farther back than the Mesozoic epoch, and all the numerous Palaeozoic insect-fossils seem to belong to forms that possessed only imperfect metamorphosis. The only doubt arises from the existence of insect remains, referred to the order Coleoptera, in the Silurian Culm of Steinkonsendorf near Reichenbach. The oldest larva known, Mormolocoides articipalus, is from the New Red Sandstone of Connecticut; it belongs to the Sialidae, one of the lowest forms of Holometabola. It is now, in fact, generally admitted that metamorphosis has been acquired comparatively recently, and Scudder in his review of the earliest fossil insects states that "their metamorphoses were simple and incomplete, the young leaving the egg with the form of the parent, but without wings, the assumption of which required no quiescent stage before maturity."

It has been previously remarked that the phenomena of holometabolism are connected with the development of wings inside the body (except in the case of the flies, where there are no wings in the perfect insect). Of existing insects 90% belong to the Endopterygota. At the same time we have no evidence that any Endopterygota existed amongst Palaeozoic insects, so that the phenomena of endopterygotism are comparatively recent, and we are led to infer that the Endopterygota owe their origin to the older Exopterygota. In Endopterygota the wings commence their development as invaginations of the hypoderm, while in Exopterygota they exist as external folds or evaginations. The two modes of growth are directly opposed, and at first sight it appears that this fact negatives the view that Endopterygota have been derived from Exopterygota. Only three hypotheses as to the origin of Endopterygota can be suggested as possible, viz.:

1. That some of the Palaeozoic insects, though we infer them to have been exopterygotous, were really endopterygotous, and were the actual ancestors of the existing Endopterygota; (2) that Endopterygota are are descended from Exopterygota, and we are led directly from ancestors that were never winged; (3) that the predominant division—i.e. Endopterygota—of insects of the present epoch are descended from the predominant—if not the sole—group that existed in the Palaeozoic epoch, viz. the Exopterygota. The first hypothesis is not negatived by direct evidence, for we do not actually know the ontogeny of any of the Palaeozoic insects; it is, however, rendered highly improbable by the modern views as to the nature and origin of wings in insects, and by the fact that the Endopterygota include none of the lower existing forms of insects. The second hypothesis—i.e. that the Endopterygota have been derived from the wingless forms of exopterygotous insects that had never possessed wings (i.e. the Apterogyna of Brauer and others, though we prefer the shorter term Apterygota)—is rendered improbable from the fact that existing Apterygota are related to Exopterygota, not to Endopterygota, and by the knowledge that has been gained as to the morphology and development of wings, which suggest that—if we may so phrase it—were an apterygotous insect gradually to develop wings, it would be on the exopterygotous system. From all points of view it appears, therefore, probable that Endopterygota are descended from Exopterygota, and we are brought to the question as to the way in which this has occurred.

It is almost impossible to believe that any species of insect that has for a long period developed the wings outside the body could change this mode of growth suddenly for an internal mode of development of the organs in question, for, as we have already explained, the two modes of growth are directly opposed. The explanation has to be sought in another direction. Now there are many forms of Exopterygota in which the creatures are almost or quite destitute of wings. This phenomenon occurs among species living at high elevations, among others found in arid or desert regions, and in some cases in the female sex only, the male being winged and the female wingless. This last state is very frequent in Blattidae, which were amongst the most abundant of Palaeozoic insects. The wingless forms in question are always allied to winged forms, and there is every reason to believe that they have been really derived from winged forms. There are also insects (flies, &c.) in which metamorphosis of a "complete" character exists, though the insects never develop wings. These cases render it highly probable that insects may in some circumstances become wingless. Such insects have been styled anapterygotous. In these facts we have one possible clue to the change from exopterygotism to endopterygotism, namely, by an intermediate period of anapterygotism.

Although we cannot yet define the conditions under which exopterygotous wings are suppressed or unusually developed, yet we know that such fluctuations occur. There are, in fact, existing forms of Exopterygota that are usually wingless, and that nevertheless appear in certain seasons or localities with wings. We are therefore entitled to assume that the suppressed wings of Exopterygota tend to reappear; and, speaking of the past, we may say that if after a period of suppression the wings began to reappear as hypodermal buds while a more rigid pressure was exerted by the cuticle, the growth of the buds would necessarily be inwards, and we should have incipient endopterygotism.
The change that is required to transform Exopterygota into Endopterygota is merely that a cell of hypodeimis should proliferate inwards instead of outwards, or that a minute hypodeimis-evaginated bud should be forced to the interior of the body by the pressure of a contracted cuticle.

If it should be objected that the wings so developed would be rudimentary, and that there would be nothing to encourage their development into perfect functional organs, we may remind the reader that we have already pointed out that imperfect wings of Exopterygota do, even at the present time under certain conditions, become perfect organs; and we may also add that there are, even among existing Endopterygota, species in which the wings are usually vestiges and yet sometimes become perfectly developed. In fact, almost every condition that is required for the change from exopterygotism to endopterygotism is among the insects that surround us.

But it may perhaps be considered improbable that organs like the wings, having once been lost, should have been re-acquired on the large scale suggested by the theory just put forward. If so, there is an alternative method by which the endopterygotous may have arisen from the exopterygotous condition. The sub-imago of the Ephemeroptera suggests that a molt, after the wings had become functional, was at one time general among the Hexapoda, and that the resting nymph of the Thysanoptera or the pupa of the Endopterygota represents a formerly active stage in the life-history. Further, although the wing-rudiments appear externally in an early instar of an exopterygote insect, the earliest instars are wingless and wing-rudiments have been previously developing beneath the cuticle, growing however outwards, not inwards as in the larva of an endopterygote. The change from an exopterygote to an endopterygote development could, therefore, be brought about by the gradual postponement to a later and later instar of the appearance of the wing-rudiments outside the body, and their correlated growth inwards as imaginal disks. For in the post-embryonic development of the ancestors of the Endopterygota we may imagine two or three instars with wing-rudiments to have existed, the last represented by the sub-imago of the may-flies. As the life-conditions and feeding-habits of the larva and imago become constantly more divergent, the appearance of the wing-rudiments would be postponed to the preceding instar, and that instar would become pre-dominantly passive.

Relationships of the Orders.—Reasons have been given for regarding the Thysanura as representing, more nearly than any other living group, the primitive stock of the Hexapoda. It is believed that insects of this group are represented among Silurian fossils. We may conclude, therefore, that they were preceded, in Cambrian times or earlier, by Arthropods possessing well-developed appendages on all the trunk-segments. Of such Arthropods the living Symphyla—of which the delicate little Serratigrella is a fairly well-known example—give us some representation.

No indications beyond those furnished by comparative anatomy help us to unravel the phylogeny of the Colembola. In most respects, the shortened abdomen, for example, they are more specialized than the Thysanura, and most of the features in which they appear to be simple, such as the absence of a tracheal system and of compound eyes, can be explained as the result of degradation. In their insunken mouth and their jaws retracted within the head-capule, the Collembola resemble the entotrophous division of the Thysanura (see Aptera), from which they are probably descended.

From the thysanuroid stock of the Apterygota, the Exopterygota took their rise. We have undoubtedly fossil evidence that winged insects lived in the Devonian and became numerous in the Carboniferous period. These ancient Exopterygota were synthetic in type, and included insects that may, with probability, be regarded as ancestral to most of the existing orders. It is hard to arrange the Exopterygota in a linear series, for some of the orders that are remarkably primitive in some respects are rather highly specialized in others. As regards wing-structure, the Isoptera with the two pairs closely similar are the most primitive of all winged insects; while in the paired mesodermal genital ducts, the elongate cerci and the conspicuous maxillulae of their larvae the Ephemeroptera retain notable ancestral characters. But the vestigial jaws, numerous Malpighian tubes, and specialized wings of may-flies forbid us to consider the hindwings as their primitive. So the Dermaptera, which retain distinct maxillulae and have no ectodermal genital ducts, have either specialized or aborted wings and a large number of Malpighian tubes. The Corrodentia retain vestigial maxillulae and two pairs of Malpighian tubes, but the wings are somewhat specialized in the Copeognatha and absent in the degraded and parasitic Mallophaga. The Plecoptera and Orthoptera agree in their numerous Malpighian tubes and in the development of a folding anal area in the hind-wing. As shown by the number and variety of species, the Orthoptera are the most dominant order of this group. Eminently terrestrial in habit, the differentiation of their fore-wings and hind-wings can be traced from Carboniferous, isopteroid ancestors through intermediate Mesoformic forms. The Plecoptera resemble the Ephemeroptera and Odonata in the aquatic habits of their larvae, and by the occasional presence of tufted thoracic gills in the imago exhibit an aquatic character unknown in any other winged insects. The Odonata are in many imaginal and larval characters highly specialized; yet they probably arose with the Ephemeroptera as a divergent offshoot of the same primitive isopteroid stock which developed more directly into the living Isopetera, Plecoptera, Dermaptera and Orthoptera.

All these orders agree in the possession of biting mandibles, while their second maxillae have the inner and outer lobes usually distinct. The Hemiptera, with their piercing mandibles and first maxillae and with their second maxillae fused to form a jointed beak, stand far apart from them. This order can be traced with certainty back to the early Jurassic epoch, while the Permian fossil Eugereon, and the living order—specially modified in many respects—of the Thysanoptera indicate steps by which the aberrant sectorial and piercing mouth of the Hemiptera may have been developed from the biting mouth of primitive isopteroids, by the elongation of some parts and the suppression of others. The Anoplura may probably be regarded as a degraded offshoot of the Hemiptera.

The importance of great cardinal features of the life-history as the clue of action leads us to consider the Exopterygota as a natural assembly of orders. The occurrence of weevils—among the most specialized of the Coleoptera—in Triassic rocks shows us that this great order of metamorphic insects had become differentiated into its leading families at the dawn of the Mesozoic era, and that we must go far back into the Palaeozoic for the origin of the Endopterygota. In this view we are confirmed by the impossibility of deriving the Endopterygota from any living order of Exopterygota. We conclude, therefore, that the primitive stock of the former subclass became early differentiated from that of the latter. So widely have most of the higher orders of the Hexapoda now diverged from each other, that it is exceedingly difficult in most cases to trace their relationships with any confidence. The Neuroptera, with their similar fore- and hind-wings and their campodeiform larvae, seem to stand nearest to the presumed isopteroid ancestry, but the imago and larva are often specialized. The campodeiform larvae of many Coleoptera are indeed far more primitive than the neuropteran larvae, and suggest to us that the Coleoptera—modified as their wing-structure has become—arose very early from the primitive metamorphic stock. The antiquity of the Coleoptera is further shown by the great diversity of larval form and habit that has arisen in the order, and the proof afforded by the hypermetamorphic beetles that the campodeiform preceded the eucriniform larva has already been emphasized.

In all the remaining orders of the Endopterygota the larva is eucriniform or vermiciform. The Mecaptera, with their predominantly longitudinal wing-nervation, serve as a link between the Neuroptera and the Trichoptera, their retention of small cerci being an archaic character which stamps them as
HEXAPODA

synthetic in type, but does not necessarily remove them from orders which agree with them in most points of structure but which have lost the cerci. The standing of the Trichoptera in a position almost ancestral to the Lepidoptera is one of the assured results of recent morphological study, the mobile mandibulate pupa and the imperfectly suctorial maxillae of the Trichoptera reappearing in the lowest families of the Lepidoptera. This latter order, which is not certainly known to have existed before Tertiary times, has become the most highly specialized of all insects in the structure of the pupa. Diptera of the sub-order Orthorrhapha occur in the Lias and Cyclorrhapha in the Kimmeridgian. The order must therefore be assigned to the classes which have already reached the height of the hind-wings, nor as to the stages by which the suctorial mouth-organs became specialized, it is difficult to trace the exact relationship of the group, but the presence of cerci and a degree of correspondence in the nervuration of the fore-wings suggest the Mecaptera as possible allies. There seems no doubt that the suctorial mouth-organs of the Diptera have arisen quite independently from those of the Lepidoptera, for in the former order the sucker is formed from the second maxillae, in the latter from the first. The cruciform larva of the former order has at least a superficial resemblance to the headless vermiform larva of the Cyclorrhapha, and in the latter sub-order we find metamorphosis carried to its extreme point, the muscid flies being the most highly specialized of all the structure, while their maggots are the most grotesque of all insect larvae. The Siphonaptera appear by the form of the larva and the nature of the metamorphosis to be akin to the Orthorrhapha—in which division they have indeed been included by many students. They differ from the Diptera, however, in the general presence of palps to both pairs of maxillae, and in the absence of a hypopharynx, so that it is possible they have no such relationship to the Diptera as is less close than has been supposed. The affinities of the Hymenoptera afford another problem of much difficulty. They differ from other Endopterygota in the multiplication of their Malpighian tubes, and from all other Hexapoda in the union of the first abdominal segment with the thorax. Specialized as they are in form, development and habit, they retain mandibles for biting, and in their lower sub-order—the Symphyta—the maxillae are hardly more modified than those of the Orthoptera. From the evidence of fossil material, the higher specialization of Hemiptera seems to have traced back to the Lepidoptera, so that we believe the Hymenoptera to be more ancient than the Diptera, and far more ancient than the Lepidoptera. They afford an example—paralleled in other classes of the animal kingdom—of an order which, though specialized in some respects, retains many primitive characters, and has won its way to dominance rather by per-fection of behaviour, and specially by the development of family life and helpful socialism, than by excessive elaboration of structure. We would trace the Hymenoptera back therefore to the primitive endopterygote stock. The specialization of form in the constructed abdomen and in the suctorial "tongue" that characterizes the higher families of the order is correlated with the habit of careful egg-laying and provision of food for the young. In some way it is assured among the highest of the Hexapoda—the Lepidoptera, Diptera and Hymenoptera— that the larva finds itself amid a rich food-supply. And thus per-fection of structure and instinct in the image has been accompanied by degradation in the larva, and by an increase in the extent of transformation and in the degree of reconstruction before and during the pupal stage. The fascinating difficulties presented to students by the metamorphosis of the Hexapoda are to some extent explained, as he ponders over the evolutions of the class.

BIBLIOGRAPHY.—References to the older classical writings on the Hexapoda are given in the article on Entomology. At present about a thousand works and papers are published annually, and in this place it is possible to enumerate only a few of the most important among (mostly) recent memoirs that bear upon the Hexapoda generally. Further references will be found appended to the special articles on the orders (Aptera, Coleoptera, &c).
HEXASTYLE—HEYDEN

(D.S.†; G.H.C.)

HEXASTYLE (Gr. ἕξ, six, and στῦλος, column), an architectural term given to a temple in the portico of which there are six columns in front.

HEXATEUCH, the name given to the first six books of the Old Testament (the Pentateuch and Joshua), to mark the fact that these form one literary whole, describing the early traditional history of the Israelites from the creation of the world to the conquest of Palestine and the origin of their national institutions. These books are the result of an intricate literary process, on which see Bible (Old Testament: Canon), and the articles on the separate books (Genesis, Exodus, Leviticus, Numbers, Deuteronomy and Joshua).

HEXHAM, a market town in the Hexham parliamentary division of Northumberland, England, 21 m. W. from Newcastle by rail and a little farther by road in the Northern county, served also from Scotland by a branch of the North British railway, Pop. of urban district (1901) 7107. It is pleasantly situated beneath the hills on the S. bank of the Tyne, and its market square and narrow streets bear many marks of antiquity. It is famous for its great abbey church of St Andrew. This building, as renovated in the 12th century, was to consist of nave and transept, choir and aisles, and massive central tower. The Scots are believed to have destroyed the nave in 1296, but it may be doubted if it was ever completed. In 1536 the last prior was hanged for being concerned in the insurrection called the Pilgrimage of Grace. The church as it stands is a fine monument of Early English work, with Transitional details. Within, although it suffered much during the revolution c. 1536, there are several objects of interest. Among these are a Roman slab, carved with figures of a horseman trampling upon an enemy, several fine tombs and stones of the 13th and 14th centuries, the frith or fristool of stone, believed to be the original bishop's throne, and the fine Perpendicular roodscreen of oak, retaining its loft. The crypt, discovered in 1726, is part of the Saxon church, and a noteworthy example of architecture of the period. Its material is Roman, some of the stones having Roman inscriptions. These were brought from the Roman settlement at Corbridge, 4 m. E. of Hexham on the N. bank of the Tyne; for Hexham itself was not a Roman station. In 1832 a vessel containing about 8000 Saxon coins was discovered in the churchyard. Fragments of the monastic buildings remain, and west of the churchyard is the monks' park, known as the Seal, and now a pleasure-ground, containing beautiful views. In the town are two strong castellated towers of the 14th century, known as the Moot Hall and the Manor Office. Their names explain their use, but they were doubtless also intended as defensive works. In the interesting and beautiful neighbourhood of Hexham there should be noticed Aydon castle near Corbridge, a fortified house of the late 13th century; and Dilsdon or Dylviston, a typical border fortress dating from Norman times, of which only a tower and small chapel remain. It is replete with memories of the last earl of Derwentwater, who was beheaded in 1716 for his part in the Stuart rising of the previous year, and was buried in the church. The present school is a Royal Grammar school. Hexham and Newcastle form a Roman Catholic bishopric with the cathedral, containing a fine castle. There are manufactures of leather gloves and other goods, and in the neighbourhood barytes and coal mines and extensive market gardens.

The church and monastery at Hexham (Hexoldesham) were founded about 673 by Wilfrid, archbishop of York, who is said to have received a grant of the whole of Hexhamshire from Æthelhryth, queen of Northumbria, and a grant of sanctuary in his church from the king. The church in 678 became the head of the new see of Bernicia, which was united to that of Lindisfarne about 821, when the bishop of Lindisfarne appears to have taken possession of the lordship which he and his successors held until it was restored to the archbishop of York by Henry II. The archbishops appear to have had almost royal power throughout the liberty, including the rights of trying all pleas of the crown in their court, of taking inquisitions and of taxation. In 1545 the archbishop exchanged Hexhamshire with the king for other property, and in 1571 all the separate privileges which had belonged to him were taken away, and the liberty was annexed to the county of Northumberland. Hexham was a borough by prescription, and governed by a bailiff at least as early as 1276, and the same form of government continued until 1853. In 1543 the men of Hexham were accused of pretending to be Scots and impropriating many people of Northumberland and Cumberland, killing some and extorting ransoms for others. The Lancastrians were defeated in 1464 near Hexham, and legend says that it was in the woods round the town that Queen Margaret and her son hid until their escape to Flanders. In 1522 the bishop of Carlisle complained to Cardinal Wolsey, then archbishop of York, that the English thieves committed more thefts than all the Scots of Scotland, the men of Hexham being worst of all, and appearing 100 strong at the markets held in Hexham, so that the men whom they robbed dared not complain or say one word to them. This state of affairs appeared to have continued until the accession of James I., and in 1595 the bailiff and constables of Hexham were removed as being "infected with combination and toleration of thieves." Hexham was at one time the market town of a large agricultural district. In 1227 a market on Monday and a fair on the vigil and day of St Luke the Evangelist were granted to the archbishop, and in 1320 Archbishop Melton obtained the right of holding two fairs on the feasts of St James the Apostle lasting five days and of SS. Simon and Jude lasting six days. The market day was altered to Tuesday in 1662, and Sir William Fenwick, then lord of the manor, received a grant of a cattle market on the Tuesday after the feast of St Cuthbert in March and every Tuesday fortnight until the feast of St Martin. The market rights were purchased from Wentworth B. Beaumont, lord of the manor, in 1886. During the 17th and 18th centuries Hexham was noted for the leather trade, especially for the manufacture of gloves, but in the 19th century the trade began to decline. Coal mines which had belonged to the archbishop, were sold to Sir John Fenwick, Kt., in 1628. Hexham has never been represented in parliament, but gives its name to one of the four parliamentary divisions of the county.

HEYDEN, JAN VAN DER (1637—1722), Dutch painter, was born at Gorcum in 1637, and died at Amsterdam on the 12th of September 1712. He was an architectural landscape painter, a contemporary of Hobbema and Jacob Ruysdael, with the advantage, which they lacked, of a certain professional versatility; for, whilst they painted admirable pictures and starred, he varied the practice of art with the study of mechanics, improved the fire engine, and died superintendent of the lighting and director of the firemen's company at Amsterdam. Till 1672 he painted in partnership with Adrian van der Velde. After Adrian's death, and probably because of the loss which that event entailed upon him, he accepted the offices to which allusion has just been made. At no period of artistic activity had the system of division of labour been more fully and more constantly applied to art than it was in Holland towards the close of the 17th century. Van der Heyden, who was perfect as an architectural draughtsman in so far as he painted the outside of buildings and thoroughly mastered linear perspective, seldom turned his hand to the delineation of anything but brick houses and churches in streets and squares, or rows along canals, or "moated grooves," common in his native country. He was a travelled man, had seen The Hague, Ghent and Brussels, and had ascended the Rhine past Xanten to
Cologne, where he copied over and over again the tower and crane of the great cathedral. But he cared nothing for hill or vale, or stream or wood. He could reproduce the rows of bricks in a square of Dutch houses sparkling in the sun, or stunted trees and lines of dwellings varied by steeples, all in light or thrown into passing shadow by moving cloud. He had the habit of pausing methodically without loss of breadth or keeping; but he could draw neither man nor beast, nor ships nor carts; and this was his disadvantage. His good genius under these circumstances was Adrian van der Velde, who enlivened his compositions with spirited figures; and the joint labour of both is a delicate, minute, transparent work, radiant with glow and atmosphere.

HELYN (or HEYN), PETER (1600–1652), English historian and controversialist, was born at Burford in Oxfordshire. Having made great progress in his studies, he entered Hart Hall, Oxford, in 1623, afterwards joining Magdalen College; and in 1628 he began to lecture on cosmography, being made fellow of Magdalen in the same year. His lectures, under the title of Μεθοδομοσύνης, were published in 1621, and many editions of this useful book, each somewhat enlarged, subsequently appeared. Having been ordained in 1624 Heylyn attracted the notice of William Laud, then bishop of Bath and Wells; and in 1628 he married Laetitia, daughter of Thomas Highgate, or Heygate, of Hayes, Middlesex; but he appears to have kept his marriage secret and did not resign his fellowship. After serving as chaplain to Danby in the Channel Islands, he was appointed chaplain to the king at Court, and was appointed by the king to the rectory of Hemingford Huntingdonshire. John Williams, bishop of Lincoln, however, refused to institute Heylyn to this living, owing to his friendship with Laud; and in return Charles appointed him a prebendary of Westminster, where he made himself very objectionable to Williams, who held the deanery in commendam. In 1633 he became rector of Alresford, soon afterwards vicar of South Warnborough, and he became treasurer of Westminster Abbey in 1637; but before this date he was widely known as one of the most prominent and able controvérsists among the high-church party. Contending with great ardour into the religious controversies of the time he disputed with John Prideaux, regius professor of divinity at Oxford, replied to the arguments of Williams in his pamphlets, "A Coal from the Altar" and "Antidoto Lincolinense," and was hostile to the Puritan element both within and without the Church of England. He assisted William Noy to prepare the case against Pryme for the publication of his Historiamatis, and made himself useful to the Royalist party in other ways. However, when the Long Parliament met he was allowed to retire to Alresford, where he remained until he was disturbed by Sir William Waller's army in 1642, when he joined the king at Oxford. At Oxford Heylyn edited Mercurius Aulicus, a vivacious but virulent news-sheet, which greatly annoyed the Parliamentarians; and consequently his house at Alresford was plundered and his library dispersed. Subsequently he led for some years a wandering life of poverty, afterwards settling at Winchester and then at Minster Lovell in Oxfordshire; and he refers to his hardships in his pamphlet "Extraneus Vapulans," the cleverest of his controversial writings, which was written in answer to Hamon J'Estrange. In 1653 he settled at Lady's Court on the Kent, and his residence was regarded by the government of the Commonwealth, and where he wrote several books and pamphlets, both against those of his own communion, like Thomas Fuller, whose opinions were less unyielding than his, and against the Presbyterian and others, like Richard Baxter.

His works, all of which are marked by political or theological rancour, number over fifty. Among the most important are: a legendary and learned History of St. George of Capadocia, written in 1631; Cypriani Anglicus, or the History of the Life and Death of William Laud, a defence of Laud and a valuable authority for his life; Ecclesia restaurata, or the History of the Reformation of the Church of England (1661; ed. J. C. Robertson, Cambridge, 1849); Ecclesia vindicata, or the Church of England justified; Aelius redivivus, or History of the Presbyterians; and Help to English History, an edition of which, with additions by P. Wright, was published in 1773. In 1636 he wrote a History of the Sabbath, by order of Charles I. to answer the Puritans; and in consequence of a journey through France in 1625 he wrote A Survey of France, a work, frequently sprinèd with the most spirited observations, which was termed by Southey "one of theliveliest books of travel in its lighter parts, and one of the wisest and most replete with information that was ever written by a young man." Some verses of merit also came from his active pen, and his poetical memorial of William of Waynwele was published by the Caxton Society in 1851.

Heylyn was a diligent writer and investigator, a good ecclesiastical lawyer, and had always learning at his command. His principles, to which he was honestly attached, were defended with ability; but his efforts to uphold the church passed unrecognized at the Restoration, probably owing to his physical infirmities. His sight had been very bad for several years; yet he rejoiced that his "bad old eyes" had seen the king's return, and upon this event he preached before a large audience in Westminster Abbey on the 29th of May 1661. He died on the 8th of May 1662 and was buried in Westminster Abbey, where he had been sub-dean for some years.

Lives of Heylyn were written by his son-in-law Dr John Barnard or Bernard, and by George Vernon (1682). Bernard's work was brought into print with Robertson's edition of Heylyn's History of the Reformation in 1849.

HEYN, PIETER PIETERZON [commonly abbreviated to PIET (1578–1629), Dutch admiral, was born at Delft in 1578, the son of Pieter Heen, who was engaged in the herring fishery. The son went early to sea. In his youth he was taken prisoner by the Spaniards, and was forced to row in the galleys during four years. Having recovered his freedom by an exchange of prisoners, he worked for several years as a merchant skipper with success. The then dangerous state of the seas at all times, and the continuous war with Spain, gave him ample opportunity to gain a reputation as a resolute fighting man. While he was made before 1623 show that he had been able to acquire considerable property. When the Dutch West India Company was formed he was Director on the Rotterdam Board, and in 1624 he served as second in command of the fleet which took San Salvador in Bahia de Todos os Santos in Brazil. Till 1628 he continued to serve the Company, both on the coast of Brazil, and in the West Indies. In the month of September of that year he made himself famous, gained immense advantage for the Company, and inflicted ruinous loss on the Spaniards, by the capture of the fleet which was bound from the Guianas. The Spanish ships were outnumbered chiefly because the convoy had become scattered by bad management and bad seamanship. The more valuable part of it, consisting of the four galleons, and eleven trading ships in which the king's share of the treasure was being carried, became separated from the rest, and on being chased by the superior force of Heyn endeavoured to take refuge at Matanzas in the island of Cuba, hoping to be able to land the bullion in the bush before the Dutchman could come up with them. But Juan de Benavides, the Spanish commander, failed to act with decision. Heyn, with his ships captured in the harbour led the silver could be discharged. The total loss was estimated by the Spaniards at four millions of ducats. Piet Heyn now returned home, and bought himself a house at Delft with the intention of retiring from the sea. In the following year, however, he was chosen at a crisis to take command of the naval force of the Republic, with the rank of Lieutenant-Admiral of Holland, in order to clear the North Sea and Channel of the Dunkirkers, who acted for the king of Spain in his possessions in the Netherlands. In June of 1629 he brought the Dunkirkers to action, and the action was so fiercely fought, but Piet Heyn did not, to enjoy his victory. He was struck early in the battle by a cannon shot on the shoulder and fell dead on the spot. His memory has been preserved by his capture of the Treasure
HEYNE, Christian Gottlob (1729-1812), German classical scholar and archaeologist, was born on the 25th of September 1729, at Chemnitz in Saxony. His father was a poor weaver, and the expenses of his early education were paid by one of his godfathers. In 1748 he entered the university of Leipzig, where he was frequently in want of the necessaries of life. His distress had almost amounted to despair, when he procured the situation of tutor in the family of a French merchant in Leipzig, which enabled him to continue his studies. After he had completed his university course, he was for many years in very straitened circumstances. An elegy written by him in Latin on the death of a friend attracted the attention of Count von Bruhl, the prime minister, who expressed a desire to see the author. Accordingly, in April 1752, Heyne journeyed to Dresden, believing that his fortune was made. He was well received, promised a secretaryship and a good salary, but nothing came of it. A second period of want followed, and it was only by persistent solicitation that Heyne was able to obtain the post of under-clerk in the count’s library, with a salary of somewhat less than twenty pounds sterling. He increased his scanty pittance by translation; in addition to some French novels, he rendered into German the Chaereas and Callirhoe of Chariton, the Greek romance writer. He published his first edition of Tibullus in 1755, and in 1756 his Epictetus. In the latter year the Seven Years’ War broke out, and Heyne was once more in a state of destitution. In 1757 he was offered a tutorship in the household of Frau von Schönberg, where he met his future wife. In January 1759 he accompanied his pupil to the university of Jena, which he entered in 1760 by the Prussian cannons. The bombardment of the city he had meanwhile returned on the 18th of July 1760, destroyed all his possessions, including an almost finished edition of Lucian, based on a valuable codex of the Dresden Library. In the summer of 1761, although still without any fixed income, he married, and for some time he found it necessary to devote himself to the duties of land-steward to the Baron von Löben in Lusatia. At the end of 1762, however, he was enabled to return to Dresden, where he was commissioned by P. D. Lippert to prepare the Latin text of the third volume of his Dyntaxiotheca (an account of a collection of gems). On the death of Johann Matthias Gesner at Göttingen in 1761, the chair of the latter was refused first by Ernsti and then by Ruhnken, who persuaded Münchhausen, the Hanoverian librarian and principal curator of the university, to bestow it on Heyne (1763). His emoluments were gradually augmented, and his growing celebrity brought him most advantageous offers from other German governments, which he persistently refused. After a long and useful career, he died on the 14th of July 1812. Unlike Gottfried Hermann, Heyne regarded the study of grammar and language only as the means to an end, not as the chief object of philology. But, although not a critical scholar, he was the first to attempt a scientific treatment of Greek mythology, and he gave an undoubted impulse to philological studies.

Of Heyne’s numerous writings, the following may be mentioned. Editions, with copious commentaries, of Tibullus (ed. E. C. Wanderlich, 1817), Virgil (ed. G. P. Wagner, 1830-1841), Pindar (3rd ed. by A. H. Schiller, 1817), Apollonius, Eumelides, Græce (1803), Homer, Iliad (1802); Opuscula academica (1785-1812), containing more than a hundred academical dissertations, of which the most valuable are those relating to the colonies of Greece and the antiquities of Etruscan art and history. His Antiquitates Asiae (1778-1779) is a valuable collection of essays connected with the history of ancient art. His contributions to the Göttingische gelehrte Anzeigen are said to have been between 7000 and 8000 in number. See biography by A. H. Heeren (1813) which forms the basis of an interesting essay by Carlyle (Misc. Essays, ii.); H. Sauppe, Göttinger Professoren (1872); C. Burian in Allgemeine deutsche Biographie, xii.; J. E. Sandys, Hist. Class. Schol. iii. 35-44.

HEYNE, Paul Johann Ludwig (1820- ), German novelist, dramatist and poet, was born at Berlin on the 15th of March 1830, the son of the distinguished philologist Karl Wilhelm Ludwig Heyse (1797-1855). After attending the Friedrich Wilhelm Gymnasium in Berlin, he went, in 1849, to Bonn University as a student of the Romance languages, and in 1852 took his doctor’s degree. He had already given proof of great literary ability in the production in 1850 of Der Jungbrunnen, Märchen eines fahrenden Schäfers and of the tragedy Francesca von Rimini, when after a year’s stay in Italy, he was summoned, early in 1854, by King Maximilian II. to Munich, where he subsequently lived. Here he turned his attention to novel-writing. He published at Munich in 1855 four short stories in one volume, one of which, at least, L’Arrabbiata, was a masterpiece of its kind. These were the precursors of a series of similar volumes, necessarily unequal at times, but on the whole constituting such a mass of highly complex miniature fiction as seldom before had proceeded from the pen of a single writer. Heyse works in the spirit of a sculptor; he seizes upon some picturesque incident or situation, and chisels and polishes until all the effect which it is capable of producing has been extracted from it. The success of the story usually depends upon the theme, for the artist’s skill is generally much the same, and the success therefore usually varies with the character of the characters. Heyse is also the author of several novels on a larger scale, all of which have gained success and provoked abundant discussion. The more important are Kinder der Welt (1873), Im Paradiese (1875)—the one dealing with the religious and social problems of its time, the other with artist-life in Munich—Der Roman der Stiftsdame (1888), and Merlin (1892), a novel directed against the modern realistic movement of which Heyse had been the leading opponent in Germany. He has also been a prolific dramatist, but his plays are deficient in theatrical qualities and are rarely seen on the stage. Among the best of them are Die Sablierturnen (1859); Hans Lange (1865), Kolberger (1866), Die Weltlichter (1886), and Maria von Magdala (1903). There are also several volumes of his poems, of Leopardi, Giusti, and other Italian poets (Italienische Dichter der Mitte des 18ten Jahrhunderts) (4 vols., 1889-1890).

Heyse’s Gesammelte Werke appeared in 20 vols. (1879-1899); there is also a popular edition of his Romane (8 vols., 1902-1904) and Novellen (10 vols., 1904-1906). See his autobiography, Jugenderinnerungen und Bekenntnisse (1901); also O. Kraus, Paul Heyse’s Novellen und Romane (1888); E. Petzet, Paul Heyse als Dramatiker (1905) and the essays by J. Ziegler (in Studien und Studienkörpfe, 1877), and G. Brandes (in Moderne Geister, 1887).

HEYSHAM, a seaport in the Lancaster parliamentary division of Lancashire, England, on the south shore of Morecambe Bay, served by the Midland railway. Pop. (1901) 3381. Under powers obtained from parliament in 1866, the Midland Railway Company constructed, and opened in 1904, a harbour, enclosed by breakwaters, for the development of traffic with Belfast and other. Irish ports, a daily passenger-service of the first class being established to Belfast. The harbour has a depth at low tide of 17 ft., and extensive accommodation for live-stock and goods of all kinds is provided. Heysham is in some favour as a watering-place. The church of St Peter is mainly Norman, and has fragments of even earlier date. Ruins of a very ancient oratory stand near it. This was dedicated to St Patrick, and is traditionally said to have been erected as a place of prayer for those at sea.

HEYWOOD, John (b. 1497), English dramatist and epigrammatist, is generally said to have been a native of North Mimmns, near St Albans, Hertfordshire, though Bale says he was born in London. A letter from a John Heywood, who may fairly be identified with him, is dated from Malines in 1575, when he called himself an old man of seventy-eight, which would fix his birth in 1497. He was a chorister of the Chapel Royal, and is said to have been educated at Broadgates Hall (Pembroke College), Oxford. From 1521 onwards his name appears in the king’s accounts as the recipient of an annuity of ten marks as player of the virginals, and in 1538 he received forty shillings for
“playing an interlude with his children” before the Princess Mary. He is said to have owed his introduction to her to Sir Thomas More, at whose seat at Gobions near St Albans he wrote his Epigrams, according to Henry Peacham. More took a keen interest in the drama, and is represented by tradition as stepping on to the stage and taking an impromptu part in the dialogue. William Rastell, the printer of four of Heywood’s plays, was the son of More’s brother-in-law, John Rastell, who organized dramatic representations, and possibly wrote plays himself. Mrs Rastell bade Rastell see in Heywood’s firm adherence to Catholicism and his free satire of legal and social abuses a reflection of the ideas of More and his friends, which counts for much in his dramatic development. His skill in music and his inextricably wit made him a favourite both with Henry VIII. and Mary. Under Edward VI. he was accused of denying the king’s supremacy over the church, and had to make a public recantation in 1554; but with the accession of Mary his prospects brightened. He made a Latin speech to her in St Paul’s Churchyard at her coronation, and wrote a poem to celebrate her marriage. Shortly before her death she granted him the lease of a manor in Yorkshire. When Elizabeth succeeded to the throne he fled to Malines, and is said to have returned in 1577. In 1587 he is spoken of as “dead and gone” in Thomas Newton’s epilogue to his works.

John Heywood is important in the history of English drama as the first writer to turn the abstract characters of the morality plays into real persons. His interludes link the morality plays to the modern drama, and were very popular in their day. They represent ludicrous incidents of a homely kind in a style of the broadest farce, and approximate to the French dramatic tender. But the subjects of the fabliaux. The fun in them still survives in spite of the long arguments between the characters and what one of their editors calls his “humour of filch.” Heywood’s name was actually attached to four interludes. The Playe called the Fourre PP; a newe and a very mery interlude of a palmer, a pardoner, a polycyary, a pedler (not dated) is a contest in lying, easily won by Palmer, who said he had never known a woman out of patience. The Playe of the Wether, a newe and a very mery interlude of all maner of Wethers (printed 1533) describes the chaotic results of Jupiter’s attempts to suit the weather to the desires of a number of different pas. The Play and Lots (printed 1537) is an extreme instance of the author’s love of wire-drawn argument. It is a double dispute between “Loving not Loved” and “Loved not Loving” as to which is the more wretched, and between “Both Loved and Loving” and “Neither Loving nor Loved” to decide which is the happier. The only action in this piece is indicated by the stage direction marking the entrance of “Neither loved nor loving,” who is to run about the audience with a huge copper tank on his head full of lighted squibs, and is to cry “Water, water! Fire! Fire!” The Dialogue of Wit and Folly is more of an academic dispute than a play. But two pieces universally assigned to Heywood, although they were printed by Rastell without any author’s name, combine action with dialogue, and are much more dramatic. In The Merry Play between the Pardoner and the Frere, the Curate and Neybour Pratte (printed 1533, but probably written much earlier) the Pardoner and the Friar both try to preach at the same time, and, coming at last to blows, are separated by the other two personages of the piece. The Merry Play between Johan Johan the Husbande, Tyb the Wye, and Syr Jhan the Preest (printed 1533) is the best constructed of all his pieces. Tyb and Syr Jhan eat the “Pye” which is the central property” of the piece, while Johan Johan is made to chafe wax at the fire to stop a hole in a pail. This incident occurs in a French Farce nouvelle très bonne et fort joyeuse de Pernet qui va au vin. Heywood has sometimes been credited with the authorship of the dialogue of Gentylines and Nohbytye printed by Rastell without date, and Mr Pollard adduces some ground for attributing to him the anonymous New Entertye called Thersytes (played 1538). Heywood’s other works are a collection of proverbs and epigrams, the earliest extant edition of which is dated 1562; some ballads, one of them being the “Willow Garland,” known to Desdemona; and a long verse allegory of over 7000 lines entitled The Spider and the Flie (1556). A contemporary writer in Holinshed’s Chronicle said that neither its author nor any one else could “reach unto the meaning thereof.” But the flies are generally taken to represent the Roman Catholics and the spiders the Protestants, while Queen Mary is represented by the household who with her broom (the sword) executes the commands of her master (Christ) and her mistress (the church). Dr A. W. Ward speaks of its “general lucidity and relative variety of treatment.” Heywood says that he laid it aside for twenty years before he finished it, and, whatever may be the final interpretation put upon it, it contains a very energetic statement of the social evils of the time, and especially of the deficiencies of English law.

The proverbs and epigrams were reprinted by the Spenser Society in 1867, the Dialogue on Wit and Folly by the Percy Society from an MS. in the British Museum in 1846, with an account of Heywood by F. W. Fairholt, and there are modern reprints of Johan Johan (Chiswick Press, 1819). The Foure PP. (Dodgson’s Old Plays, 1825, 1874), and The Pardoner and the Frere (Dodgson’s Old Plays, 1874). The Spider and the Flie was edited by A. W. Ward for the Spenser Society in 1864. For notes and stricures on that edition see J. Haber in Literarhistorische Forschungen, vol. xv. (1900). See also A. W. Pollard’s introduction to the reprint of the Play of the Wether and the Curate and the Entertye (London, 1906). The Dramatic Writings of John Heywood, edited by John S. Farmer for the Early English Drama Society (1905).

His son, Jasper Heywood (1535–1598), who translated into English three plays of Seneca, the Troas (1590), the Thyestes (1590), and Hercules Furens (1601), was a fellow of Merton College, Oxford, but was compelled to resign from that society in 1598. In the same year he was elected a fellow of All Souls College, but, refusing to conform to the changes in religion at the beginning of the reign of Elizabeth, he gave up his fellowship and went to Rome, where he was received into the Society of Jesus. For seventeen years he was professor of moral theology and philosophy in the Jesuit College at Dillingen, Bavaria. In 1581 he was sent to England as superior of the Jesuit mission, but his leniency in that position led to his recall. He was on his way back to the Continent when a violent storm drove him back to the English coast. He was arrested on the charge of being a priest, but, although extraordinary efforts were made to induce him to abjure his opinions, he remained firm. He was condemned to perpetual exile on pain of death, and died at Naples on the 9th of January 1598. His translations of Seneca were supplemented by other plays contributed by Alexander Nowell, Thomas Frere, John Studley and Thomas Nose. Nowell collected these translations in one volume, Seneca, his tenne tragedies translated into English (1581). The importance of this work in the development of English drama can hardly be over-estimated.

See Dr J. W. Cunliffe, On the Influence of Seneca upon Elizabethan Tragedy (1893).

HEYWOOD, THOMAS (d. c. 1650), English dramatist and miscellaneous author, was a native of Lincolnshire, born about 1575, and said to have been educated at Cambridge and to have become a fellow of Peterhouse. Heywood is mentioned by Philip Henslowe as having written a book or play for the Lord Admiral’s company of actors in October 1596; and in 1598 he was regularly engaged as a player in the company, in which he presumably had a share, as no wages are mentioned. He was also a member of other companies, of Lord Southampton’s, of the earl of Derby’s and of the earl of Worcester’s players, afterwards known as the Queen’s Servants. In his preface to the English Traveller (1633) he describes himself as having had “an entire hand or at least a main finger in two hundred and twenty plays.” Of this number, probably considerably increased before the close of his dramatic career, only twenty-three survive. He wrote for the stage, not for the press, and protested against the printing of his works, which he said he had no time to revise. He was, said Tickell, the “model of a light and rapid talent,” and his plays, as might be expected from his rate of production, bear little trace of artistic elaboration. Charles
HEYWOOD—HEZEKIAH

HEYWOOD, a municipal borough in the Heywood parliamentary division of Lancashire, England, 9 m. N. of Manchester on the Lancashire and Yorkshire railway. Pop. (1901) 25,458. It is of modern growth and possesses several handsome churches, chapels and public buildings. The Queen’s Park, purchased and laid out at a cost of £1,100,000 with money which devolved to Queen Victoria in right of her duchy and county palatine of Lancaster, was opened in 1879. Heywood Hall in the neighbourhood of the town was the residence of Peter Heywood, who contributed to the discovery of the Gunpowder Plot. Heywood owes its rise to the enterprise of the Peels, its first manufacturers having been introduced by the father of the first Sir Robert Peel. It is an important seat of the cotton manufacture, and the principal source of water supply is drawn from the煮水池塘小江, in the vicinity of which several manufacturing establishments have been established.

Lamb called him a “prose Shakespeare”; Professor Ward, one of Heywood’s most sympathetic editors, points out that this epigrammatic statement can only be accepted with reservations. Heywood had a keen eye for dramatic situations and great constructive skill, but his powers of characterization were not on a par with his stagecraft. He delighted in what he called “merry accidents,” that is, in coarse, broad farce; his fancy and invention were inexhaustible. It was in the domestic drama of sentiment that he won his most distinctive success. For this he was especially fitted by his genuine tenderness and his freedom from affectation, by the sweetness and gentleness for which Lamb praised him. His masterpiece, A Woman kide with kindness (acted 1603; printed 1613), is of the comicé laromoyanto, and is the other comedies: The Royall King, and the Loyall subject (acted c. 1600; printed 1637); the two parts of The Fair Maid of the West; Or, A Girls worst Gold (two parts, printed 1631); The Payne Maid of the Exchange (printed anonymously 1607); The Late Lancashire Witches (1634), written with Richard Brome, and prompted by an actual trial in the preceding year; A Pleasant Comedy, called A Mayden-Head well lost (1634); A Challenge for Beautie (1636); The Wise-Woman of Hogdon (printed 1638), the witchcraft in this case being matter for comedy, not seriously treated as in the Lancashire play; and Fortune by Land and Sea (printed 1653), with William Rowley. The five plays called respectively The Golden, The Silver, The Brazen and The Iron Age (the last in two parts), dated 1611, 1613, 1613, 1632, are of classical stories strung together with no particular connexion except that “old Homer” introduces the performers of each act in turn. Loves Miseresse: Or, The Queens Masque (printed 1636) is on the story of Cupid and Psyche as told by Apuleius; and the tragedy of the Rape of Lucrece (1608) is varied by a “merry lord,” Valerius, who lightens the gloom of the situation by singing comic songs. A series of pages, most of them devised for the City of London, or its guilds, by Heywood, were printed in 1637. In vol. iv. of his Collection of Old English Plays (1885), Mr. A.H. Bullen printed for the first time a comedy by Heywood, The Captives, or The Lost Recovered (licensed 1624), and in vol. ii. of the same series, Dicke Devonshire, which he tentatively assigns to the same hand.

Besides his dramatic works, twelve of which were reprinted by the “Shakespeare Society,” and were published by Mr John Pearson in a complete edition of six vols. with notes and illustrations in 1874, he was the author of Troia Britannica, or Great Britain’s Troy (1609), a poem in seventeen cantos “intemixed with many pleasant poetical tales” and “concluding with an universal chronicle from the creation until the present time”; An Apology for Actors, containing three brief treatments (1612) edited for the Shakespeare Society in 1841; Tuvacev or nine books of various history concerning women (1624); England’s Elizabeth, her Life and Troubles during her minority from the Cradle to the Crown (1631); The Hieroglyph of the Blessed Angels (1635), a didactic poem of seven hundred and ninety lines; and the same collection of Lucian, &c. (1637; ed. W. Bang, Louvain, 1903); and The Life of Merlin surnamed Ambrosius (1641).

See A. W. Ward, History of English Dram. Lit. ii. 550 sq. (1899); the same author’s Introduction to A woman killed with kindness (“Temple Dramatists,” 1897); J. A. Symonds in the Introduction to Thomas Heywood in the “Meredith” series (new issue, 1903).

HEZEKIAH (Heb. for “[my] strength is of Yah”), in the Bible son of Ahaz, one of the greatest of the kings of Judah. He flourished at the end of the 8th and beginning of the 7th century B.C., when Palestine passed through one of the most eventful periods of its history. There is much that is uncertain in his reign, and with the exception of the great crisis of 701 B.C. its chronology has not been unanimously fixed. Whether he came to the throne before or after the fall of Samaria (722-721 B.C.) is disputed,1 nor is it clear what sharpened the Assyrian conflicts down to 721.2 Shortly before this date the whole of western Asia was in a ferment; Sargon had died and Sennacherib had come to the throne (in 705); vassal kings plotted to recover their independence and Assyrian puppets were removed by their opponents. Judah was in touch with a general rising in S.W. Palestine, in which Ekron, Lachish, Ascalon (Ashkelon) and other towns of the Philistines were supported by the kings of Muṣri and Meluḫḫa.3 Sennacherib completely routed them at Eltekeh (a Danite city), and thence turned against Hezekiah, who had been in league with Ekron and had imprisoned its king Padi, an Assyrian vassal. In this invasion of Judah the Assyrian claims entire success; 46 towns were captured, 200,150 men and many herds of cattle were carried off among the spoil, and Jerusalem itself was closely invested. Hezekiah was imprisoned “like a bird in a cage”—to quote Sennacherib, and the Urbi (Arabian?) troops in Jerusalem laid down their arms. Thirty talents of gold, eight hundred of silver, precious stones, couches and seats of ivory—all kinds of valuable treasure”—the ladies of the court, male and female attendants (perhaps “singers”) were carried away to Nineveh. Here the Assyrian record ends somewhat abruptly, for, in the meanwhile, Babyonia had again revolted (700 B.C.) and Sennacherib’s presence was urgently needed nearer home.

At what precise period the Babylonian Merodach (i.e. Marduk)-Baladan sent his embassy to Hezekiah is disputed. Although ostensibly to congratulate the king upon his recovery from a sickness, it was really sent in the hope of enlisting his support, and the excessive courtesy and complaisance with which it was received suggest that it found a ready ally in Judah (2 Kings xx. 12 sqq; Isa. xxxix). Merodach-Baladan was overthrown by Sargon in 710 B.C., but succeeded in making a fresh revolt some years later (704-703 B.C.), and opinion is much divided whether his embassy was to secure the friendship of the

2 The chief dates are: 720, defeat of a coalition (Hamath, Gaza and Muṣri) at Karkar in north Syria and Raphia (S. Palestine); 713, Sennacherib’s conquest of the cities of Ashdod (cp. Is. xx., that Judah was invaded on this latter occasion is improbable.
3 Meluḫḫa is held by many critics to be N.W. Arabia; the identification of Muṣri is left uncertain, below.
4 The phrase was a favourite one of Rib-Addi, king of Gébal (Byblus), in the 15th century B.C.; Tell-el-Amarna Letters (ed. Kunoedzön), Nos. 74, 79, &c., Jeremiah (v. 27) uses the simile in a different way. For a discussion of Sennacherib’s record, see Wilke, Jesaja u. Assur (Leipzig, 1905), pp. 97 sqq.
Hiatus—Hibernation

Youthful Hezekiah at his succession or is associated with the later widespread attempt to remove the Assyrian yoke.1

The brief account of the Assyrian invasion, Hezekiah's submission, and the payment of tribute in 2 Kings xviii. 14-16, supplements the Assyrian record by the statement that Sen- nacherib besieged Lachish, a fact which is confirmed by a base-relief (now in the British Museum) depicting the king in the act of besieging that town.2 This thoroughly historical fragment is followed by two narratives which tell how the king sent an official from Lachish to demand the submission of Hezekiah and conclude with the unexpected deliverance of Jerusalem. Both these stories appear to belong to a biography of Isaiah, and, like the similar biographies of Elijah and Elisha, are open to the suspicion that historical facts have been subordinated to idealize the work of the prophet. See Kings, Books of.

The narratives are (a) 2 Kings xviii. 13, 17–xix. 8; cf. Isa. xxxvi. 1–xxxvii. 8, and (b) xix. 9–35; cp. Isa. xxxvi. 9–36 (2 Chron. xxxii. 9 sqq. is based on both), and Jerusalem's deliverance is attributed to a certain rumour (xix. 7), to the advance of Tirhakah, king of Ethiopia (v. 9), and to a remarkable pestilence (v. 35) which finds an echo in a famous story related, not without some confusion of essential facts, by C. Cheyne (30:1 and 1 Josephus Antig. 5:1, 15). It is difficult to decide whether xix. 99 belongs to the first or second of these narratives; and whether the "rumour," refers to the approach of Tirhakah or rather to the serious trouble with which the Babylonians were at this time confronted. It is difficult to determine whether Tirhakah actually appeared on the scene in 701, and the precise application of the term Mephit (Mizram) is much debated. Unless the two narratives are regarded as being coincident, it may be that Sennacherib's attack upon Arabia (apparently about 689) involved an invasion of Judah, by which time Egypt had a position to be of material assistance (cf. Isa. xxx. 1–5; xxxi. 1–37). This theory of a second campaign (first suggested by Sir Henry Rawlinson) has been contested, although it is pointed out that Sennacherib at all events did not invade Egypt, and that 2 Kings xix. 24 (Isa. xxxvii. 25) can only refer to his successor. The attempt to bind the history of Tirhakah and Sennacherib together (Isa. xxxvii. 36) points to the year 681, but it is uncertain to which of the above narratives it belongs. On the whole, the question must be left open, and with it both the problem of the exact history of Tirhakah and Mephit (Mizram) outside Egypt in the Assyrian and Hebrew records of this period and the true historical background of a number of the Isianian prophecies. It is quite possible that later events which belong to the time of the Egyptian supremacy and the wars of Esarhaddon have been confused with the history of Sennacherib's invasion.

It is not certain whether Hezekiah's conflict with the Philistines as far as Gaza or his preparations to secure for Jerusalem a good water supply (xviii. 8, xx. 20; 2 Chron. xxxii. 30; Eccles. xlvii. 17 sq.) should precede or follow the events which have been discussed. On the other hand, the reforms which the compiler of the book has attributed to the early part of the reign were doubtless much later (2 Kings xviii. 1–8). Not the fall of Nineveh, the crisis of 701, or the earlier crisis of 612 that could safely be chosen, and the extent of these reforms must not be overestimated. They are related in terms that imply an acquaintance with the great "Deuteronomic" movement (see Deuteronomy), and are magnified further with characteristic detail by the chronicler (2 Chron. xxix–xxxiii.). The most remarkable was the destruction of a brazen serpent, the cult of which was traditionally traced back to the time of Moses (Num. xx. 9).1 This persistence of serpent-cult, and the

The term for hibernation, in D. Hogarth's Authority and Archaeology, p. 167, n. 1.

The house of Nisroch should probably be that of the god Nusku; see also L. D. B. W. M. B. Gentile, "Hogarth, op. cit. p. 109; Winckler, op. cit. p. 192.

It is commonly supposed that the object depicted on the stone of Siloam, famous for its Hebrew inscription (see Inscriptions, Jerusalem), but Isa. viii. 6, would seem to show that the pool was already in existence, and for palæographical details, see Explor. Fund, Quart. Stat. (1909), pp. 289, 305 sqq.

The name Nehushtan (2 Kings xviii. 4, cp. nakhsh, "serpent") is obscure; see the commentaries.

Idolatry (necromancy, tree-worship) which the contemporary prophets denounce, do not support the view that the apparently radical reforms of Hezekiah were extensive or permanent, and Jer. xxvi. 17–19 (which suggests that Micah had a greater influence than Isaiah) throws another light upon the conditions during his reign. Hezekiah was succeeded by his son Manasseh (q.v.).

See further W. R. Smith, Prophecies, 335–334, and Hebrew Religion. According to Prov. xxv. 1, Hezekiah was a patron of literature (see Pseudepigrapha). The pharaoh which is ascribed to the king (Isa. xxxix. 9–20, wanting in 2 Kings) is of post-exilic origin (see Cheyne, Introdo. to Isaiah, 222 sqq.), but is further proof of the manner in which the Judaean King was idealized in subsequent ages. The account of him, perhaps, in the belief that the deliverance of Jerusalem was the reward for his piety. For special discussions, see Stade, Zeitl. d. Alttest. Wissenschaft, 1886, pp. 173 sqq.; Winckler, Alttest. Uetersuch., 26 sqq.; Schneider, Cuneiform Insr. and Old Test. (on 2 Kings, Ic.); Driver, Isaiah, his Life and Times, pp. 43–83; A. Jeremias, Alter Test. 304–310; Nagel, Zug d. Sanherib zu Jerusalem. (Leipzig, 1903, conservative); and especially Prékš, Sanherib's "Feldzüge gegen Juda" (Mitt. d. vorderasiat. Gesel., 1903, pp. 113–158), K. Fullerton, Bibliotheca sacra, 1906, pp. 577–564. A. Alt, Israel u. Ägypten (Leipzig, 1909); also the bibliography to Isaiah.

Hiatus (Lat. for gap, or gap), a break in continuity, whether in speech, thought or events, a lacuna. In anatomy the term is used for an opening or foramen, as the hiatus Fallopii, a foramen of the temporal bone. In logic a hiatus occurs when a step or link in reasoning is wanting; and in grammar it is the pause made for the sake of euphony in pronouncing two successive vowels, which are not separated by a consonant.

Hawatha ("he makes rivers"), a legendary chief (c. 1450) of the Onondaga tribe of North American Indians. The formation of the League of Six Nations, known as the Iroquois, is attributed to him. His miraculous character Hiawatha is the incarnation of human progress and civilization. He teaches agriculture, navigation, medicine and the arts, conquering by his magic all the powers of nature which war against man.

See J. N. B. Hewitt, in Amer. Anthrop. for April 1892.

Hibbing, a village of St Louis county, Minnesota, U.S.A., 75 m. N.W. of Duluth. Pop. (1900) 2481; (1905 state census) 6568, of whom 3537 were foreign-born (1169 Finns, 516 Swedes, 498 Canadians, 323 Austrians and 314 Norwegians); (1910) 8832. Hibbing is served by the Great Northern and the Duluth, Missabe & Northern railway. It lies on the line of the Mesabi iron-ore deposits of the state; in 1907 forty iron mines were operating within 10 m. of the village. Lumbering and farming are also important industries. The village owns and operates the water-works and electric-lighting plant. Hibbing was settled in 1892 and was incorporated in 1893.

Hibernaculum (Lat. for winter quarters, in botany a term for a winter bud; in botanic gardens, the winter quarters for plants; in zoology, the winter bud of a polyxan. Hibernation (winter sleep), the dormant condition in which animals pass the wintertime cold latitudes. Aestivation (summer sleep) is the similar condition in which other species pass periods of heat or drought in warm latitudes. The origins of these kindred phenomena are probably to be sought in the regularly recurrent failure of food supply or of other factors essential to existence due to the seasonal onset of cold in the one case and of excessively dry hot weather in the other. They are means whereby certain non-migratory species are enabled to live through unfavourable climatic conditions which would end fatally in starvation or desiccation were the animals to maintain their normal state of activity.

I. The Physiology of Hibernation. Hibernation and Aestivation.—The physiology of hibernation, as exemplified in mammals, has been worked out in detail by several observers in the case of some European species, notably bats, hedgehogs, dormice and marmots. Of the physiology of aestivation nothing definite appears to have been ascertained. It seems probable, however, from observations upon the dormant animals that the physiological accompaniments of winter and summer sleep are to all intents and purposes the same. The state of hibernation,
for example, in the European hedgehog (*Erinaceus europaeus*) is not distinguished by external signs from the state of aestivation of the allied Mascarene genus, the tenrec (*Centetes ecaudatus*). The lethargy in both cases appears to be directly due to fall in the temperature of the organisms; and the fall in temperature proceeds *hori passu* with the slowing down and weakening of the respiration and with retardation in the circulation of the blood. Similarity, moreover, between hibernation and aestivation is shown not only in their physiological accompaniments but also in the species of animals which become seasonally dormant. Birds neither hibernate nor aestivate. The tenrec (*Centetes*) of Madagascar, which aestivates, closely resembles the hedgehog (*Erinaceus*) in habits and belongs to the same order of mammalia. In the case of reptiles and batrachians, snakes, lizards, tortoises, frogs and toads sleep the winter through in cold countries; and some species of these groups habitually bury themselves in the sand or mud in tropical latitudes where drought is of periodical occurrence. Terrestrial molluscs lie dormant in the winter in cold and temperate latitudes and their tropical allies aestivate in districts where conditions enforce the habit. Some fresh-water molluscs bury themselves in the mud at the bottom of ponds when the surface is covered with ice; others take refuge in the same way when pools and tanks become exhausted during the dry season in the tropics. In temperate and north temperate countries insects and arachnida either die or retire to winter quarters during the cold weather, and in the tropics they similarly disappear during times of drought.

**Predisposing Causes of Hibernation.**—The likeness between hibernation and aestivation and the coincidence of the one with cold and of the other with heat arrest the conclusion that the temperature of the surrounding medium, whether atmospheric or aquatic, is the prime, much less the sole, cause of either. The effect of extreme cold is to arouse the hibernating animal from its slumber; and its continuance thereafter brings about a state of torpor which proves fatal. This at least appears to be the case with mammals, where actual freezing of the tissues is followed by death because the gases are expelled from the fluids as bubbles and the salts separate in the form of crystals. Some cold-blooded animals, however, may be cooled to °C. Fish have been resuscitated after solidification in blocks of ice, and frogs have been known to recover when ice has been formed in the blood and in the lymph of the peritoneal cavity (Landois). For the reasons given, all hibernating animals take the days and nights of the winter in the same way; frogs, for example, retire to winter quarters at about the time of the autumnal equinox, when the weather is warm and pleasant, and emerge at the vernal equinox before the snows of winter have vanished from the ground. These and other facts justify Marshall Hall's conclusion that cold is merely a predisposing cause of hibernation in the sense that it is a predisposing cause of ordinary sleep. It has also been shown that the state of hibernation cannot be forced upon snails in summer by submitting them to artificial cold even almost to freezing point; but that at the proper season they prepare for winter quarters at temperatures varying from 37° to 77° F. Again insects sometimes retire to winter quarters in the autumn, yet the temperature of the atmosphere is higher than that of preceding days during which they retain their activity.

Thus the oncoming and ceasing both of winter and summer sleep depend to a considerable extent upon conditions of existence other than those of temperature. Darwin saw scarcely a sign of a living thing on his arrival at Bahia Blanca, Argentina, on the 7th of Sept., although by digging several insects, large spiders and lizards were found in a half-torpid state. During the days of his visit when nature was dormant the mean temperature was 54°, the thermometer seldom rising above 55° at mid-day. But during the succeeding days when the mean temperature was 58° and that of the middle of the day between 60° and 70° both insect and reptilian life was in a state of activity. Nevertheless at Montevideo, lying only four degrees further north, between the 26th of July and the 10th of August when the mean temperature was 58-4° and the mean highest temperature of mid-day 65-5° almost every beetle, several genera of spiders, land molluscs, toads and lizards were all lying dormant beneath stones. Thus the animal-life at Montevideo remained dormant at a temperature which roused that at Bahia Blanca from its torpidity. Darwin unfortunately does not record whether the species observed were identical in the two localities.

The temperature of animals in a profound state of hibernation is approximately the same as that of the surrounding medium or at most a degree or two higher. If, however, the temperature of the chosen hibernaculum (winter quarters) falls as low as freezing point, life is endangered at least in the case of mammals. In most cold-blooded animals, like reptiles, the temperature is normally only a little above that of the atmosphere, the two rising and falling together. But, setting aside the young, especially of those species in which the offspring are born or hatched at a comparatively early stage of development, the majority of warm-blooded animals are able to maintain a high and approximately level temperature irrespective of decline in the temperature of the surrounding medium. This faculty of temperature adjustment, however, appears to be absent or weakened in most if not in all hibernating mammals both in their normal nocturnal or diurnal sleep and in their winter sleep. In the case of European bats it has been shown that the ordinary day sleep in summer differs only in the matter of duration from the prolonged slumber of the same animals in winter. The temperature falls with that of the atmosphere, respiration practically ceases and immersion in water for as many as eleven minutes has been known to prove innocuous. At moderate temperatures ranging from 45° to 50° F., dormice (*Muscardinus avellanarius*) and hedgehogs (*Erinaceus europaeus*) alternately wake to feed and sink into slumber. Dormice awake once in every twenty-four hours; the sleep of the hedgehogs may last for two or three days. The temperature of the hedgehog, when awake and active, rises to about 85° F., that of the dormouse to 92° or 94° F.; but during sleep the temperature of both species falls to about that of the atmosphere. In other words, all the phenomena characteristic of hibernation are exhibited in these animals during the periods of sleep interrupting their periods of wakeful activity. Sleep of this nature, for which the term "diurnation" has been proposed, because it has only been observed in nocturnal animals, lies phonemically midway between the normal sleep of non-hibernating mammals and the dormant condition in winter of hibernating species. The stimulation of this type of sleep is the result of specific physiological response. Since then the faculty of temperature adjustment is in abeyance during the ordinary diurnal summer sleep in hibernating mammals, which in this physiological particular resemble reptiles, it seems probable that hibernation can only be practised by those species in which the power to maintain, when sleeping, a permanent average high temperature has been lost or perhaps never acquired. That there is no broad line of demarcation between the ordinary sleep of these hibernating mammals in which the temperature is known to drop considerably and that of non-hibernating species is indicated by the fact that the temperature of human beings and possibly of all non-hibernating species falls to a certain, though to a limited, extent in ordinary sleep.

The relation between the internal body-temperature and the respiratory movements has been worked out in hibernating dormice, hedgehogs, marmots and bats. When the temperature
is below 12° C., the torpid animal exhibits long periods of apnoea of several minutes' duration and interrupted by a few respirations. With the temperature rising above 13° C., the periods of apnoea in the still inanimate animal become shorter, the respiration suddenly commencing and ceasing (Biot's type), or gradually waxing and waning (Wanner's syndrome) in a manner analogous to the hibernating mammal's type. When the temperature is about 16° C., the periods of apnoea in the gradually waking animal are very short and infrequent. When the temperature is about 20° and rising apace, respiration becomes continuous and rapid and the animal is awake. These stages have been especially recorded in the case of dormice. In the last stage the respiration of hedgehogs and marmots is somewhat different, there being a series of rapid respirations, often followed by a single deep sighing respiration.

Respiration appears to be totally suspended in animals in a complete state of hibernation, if life undisturbed. It may however be readily re-excited by the slightest stimulus; and to this fact may perhaps be attributed the belief that breathing does not actually cease. If a hibernating hedgehog be lightly touched it draws a deep breath, and breathing is maintained for a longer or shorter time before again ceasing; but if at the same time the temperature of the atmosphere be raised, respiration becomes continuous and lethargy is succeeded by activity (Marshall Hall). The opinion that respiration is totally suspended is supported by a number of facts. Hibernating marmots and bats, for example, have been known to be cold and undisturbed for several hours, during which time about three quarters of the oxygen in the air was utilized, and almost entirely to the state of normal activity (Spallanzani). A hedgehog which may be drowned in about three minutes when awake and active, has been removed from water uninjured when in deep winter sleep after twenty-two and a half minutes' submergence. A hibernating noctule bat, when similarly treated, survived sixteen minutes' immersion. Further proof of the suspension of respiration has been furnished by experiments upon a bat which while in a deep and undisturbed state of lethargy was kept in a pneumatometer for ten hours without appreciably affecting the percentage of oxygen in the air. The same animal, when active, removed over 5 cub. in. of oxygen in the space of one hour from the instrument.

As in the case of respiration, alimentation and excretion are suspended during hibernation. The circulation of the blood, on the other hand, continues without interruption, though its rapidity is greatly retarded. This fact may be observed by microscopic examination of the wings of bats in a state of winter sleep. Moreover, in the case of a hedgehog lethargic from hibernation, it was experimentally shown that when the spinal cord was severed in the occipital foramen, the heart continued to beat strongly and regularly for several hours, the contraction of the auricles and ventricles being quite perceptible, though feeble, even after the lapse of ten hours. After eleven hours the organ was motionless; but resumed its activity when stimulated by a knife-point. Even after twelve hours both auricles responded to the same stimulus, though the ventricles remained motionless. Shortly afterwards the auricles gave no response. On the other hand, when the spinal cord of a hedgehog in a normal state of activity was severed at the left ventricle to be sent almost at once, and the left auricle in less than fifteen minutes; the right auricle was the next to cease, whereas the right ventricle continued its contraction for about two hours. Experiments upon marmots have yielded very similar results. The heart of a marmot decapitated in a state of lethargy continued to beat for over three hours. The pulsations, at first strong and frequent and varying from 16 to 18 per minute, became gradually weaker and less frequent, until at the end of the third hour only 3 were recorded in the same length of time. Excised pieces of voluntary muscular tissue contracted vigorously three hours after death under electric stimulus. Only at the end of four hours did they cease to respond. The heart of an active marmot killed in the same way contracted about 28 times a minute at first, the number of pulsations falling to about 12 at the end of fifteen minutes, to 8 at the end of thirty minutes, and ceasing altogether at the end of fifty minutes. Similarly the response of the muscles to galvanic shock failed at a correspondingly rapid rate. It is evident, therefore, that during hibernation the irritability of the heart is augmented in a marked degree, and is greater in the case of the right side of the organ than of the left so pronounced than that of the right side. Similar reduction in the rate of the circulation has been demonstrated in certain hibernating molluscs, Mr C. Ashford having proved experimentally that the number of pulsations of the heart per minute gradually lessens with a falling temperature. At a temperature of 52° F. the number was 22 in the common garden snail (Helix hortensis), and 21 in the cellar slug (Hyalina cellaria). At a temperature of 30° F. the pulsation fell to 4 in the former and to 3 in the latter animal.

The nature of hibernation, and probably also of aestivation, and the principal physiological phenomena connected with them, may be briefly summarized as follows:

1. During hibernation death from starvation and wasting of the tissues is prevented by the absorption of fat, which, at least in the case of mammals, is stored in considerable quantities, sometimes in definite parts of the body, during the weeks of activity immediately preceding the period of winter sleep.

2. Every gradation seems to exist between ordinary sleep and hibernation. It is probable that in some cases of the former the nocturnal sleep in summer of hibernating animals and their prolonged and lethargic quiescence in winter are merely differences of degree.

3. The physiological effects of hibernation are (a) cessation of all activities associated with alimentation and excretion; (b) lowering of the body temperature to that of the surrounding medium, never more than a few degrees of it; (c) total or almost total cessation of respiration, accompanied by power to survive immersion for a considerable time in water or asphyxiating gases, which prove rapidly fatal to the same animals when normally active; (d) marked increase in the irritability of the muscles, especially of those of the side of the heart, whereby the pulsations of that organ, although retarded, are uninterruptedly maintained; (e) a slight exchange of gases in the lungs is kept up by the cardiovascular movements.

4. Amongst cold-blooded animals, both vertebrate and invertebrate, devoid of the faculty of temperature adjustment, the phenomena of hibernation or aestivation is of general occurrence wherever the conditions of existence accompanying the onset of cold or drought are inimical to active life. In hot-blooded vertebrates, on the contrary, the phenomena are non-existent so far as birds are concerned; and cold-blooded animals only in the extreme, and sometimes impracticable by a comparatively small number of species; and in these the faculty of temperature adjustment appears to be temporarily at all events in abeyance.

II. The Zoology of Hibernation and Aestivation.—Owing to the extreme difficulty of keeping wild animals under observation in their natural haunts for any lengthened time, it is almost impossible to get accurate knowledge of the details of this state of existence. In a general way it is known, or assumed from their disappearance, that certain species retire to winter quarters in particular districts, but on such important points as whether the winter sleep is continuous or interrupted, light or profound, assured information is for the most part not forthcoming. This is true even of familiar species inhabiting Europe and North America, which have been objects of study for many years. There is even more of species and regions unobserved, especially in winter, by naturalists interested in such questions. The Chiroptera (bats) furnish an illustration of this truth. It was formerly assumed that the winter sleep of these animals in north and temperate Europe was complete and uninterrupted. Marshall Hall, for example, remarked that "perhaps the bat may be the only animal which sleeps profoundly the winter through without awakening to take food." It was known, it is true, that in countries where gnats and other winged insects disappear with the first frosts of winter, bats which feed upon them retire to winter quarters in hollow trees, caves, sheds or other places likely to afford them sufficient shelter. Here they hang suspended, solitary or in companies according to the species. But a mild spell of weather in mid-winter will sometimes entice a few to take wing while it lasts, although they never appear in any numbers until crepuscular and nocturnal insects are plentiful. But Mr T. A. Coward has
HIBERNATION

recently shown in the case of the greater and lesser horseshoe bats (Rhinolophus ferrum-equinum and K. hipposiderus), that during the early period of their occupation of the winter retreat, hibernation, in the strict sense of the word, does not take place, and that even later in the season the sleep is constantly interrupted, especially when the temperature of the air rises above 46° F., and that during their wakeful intervals they crawl about and feed apparently with the same intensity with which they hibernate in the caves. This is also true of the long-eared bat (Plecotus auritus), and probably of other species of this group. At Mussorie in the Himalayas, and in other parts of northern India, insectivorous bats, such as Rhinolophus luctus and Rh. affinis, pass the winter in a semi-torpid state, and are rarely seen abroad during the cold season. The fruit-eating bats, on the contrary (Pteropodidae), which are more southern in their distribution and are restricted in the Himalayas to the warmer valleys and lower slopes of the mountains, are as active in the winter as at other times of the year (Blanford).

Although almost as exclusively insectivorous as bats, moles and shrews do not, so far as is known, hibernate. This distinction between two groups so nearly alike in diet, no doubt depends upon the difference in their habitats and in those of the creatures they live upon. By tunnelling deeper in winter than in summer, moles are still able to find worms and various insects buried in the earth beyond the reach of frost; and shrews hunt out spiders, centipedes and insects which in their larval, pupal or sexual stages have taken shelter and lie dormant in holes and crannies of the soil, beneath the leaves of ground plants or under stones and logs of wood. In view of the perennially active life of the two insectivora just mentioned, it is a singular fact that the common hedgehog (Erinaceus europaeus)—the only member of this order besides genera referable to the moles (Talpidae) and shrews (Soricidae) that inhabits temperate and north-temperate latitudes in Europe and Asia—pauses the winter in a state of torpor unsurpassed in proficiency by that of any species of mammal so far as is known. Possibly the explanation of this seeming anomaly may be found in the bionomial differences between the three animals. The subterranean feeding habits of the mole render hibernation unnecessary on his part. Therefore the shrew and the hedgehog, both surface feeders for the most part, need only be considered in this connexion. As compared with shrews, amongst the smallest of palaearctic mammals, the hedgehog is of considerable size. Moreover, in point of vivacious energy it would be difficult to find two mammals of the same order more utterly unlike. Hence in winter when insects are scarce and demand active and diligent search, it is quite intelligible that the shrews, in virtue of their smallness and rapidity of movement, are able to procure sufficient food for their needs; whereas the hedgehogs, requiring a far larger quantity and handicapped by lack of activity, would probably starve under the same conditions.

Like the common hedgehog of Europe, the long-eared hedgehog (Erinaceus megalolus) hibernates in Afghanistan from November till February. The tenrec (Centetes ecacudatus), a large insectivore from Madagascar, acclivates during the hottest weeks of the year; and specimens exhibited in the Zoological Gardens in London preserved the habit although kept at a uniform temperature and regularly supplied with food.

Amongst the Rodentia, no members of the Lagomorpha (hares, rabbits and picas) are known to hibernate, although some of the species, like the mountain hare (Lepus timidus), extend far to the north in the palaearctic region, and the picas (Ochotona) live at high altitudes in the Himalayas and Central Asia, where the cold of winter is excessive, and where the snow lies deep for many months. It is probable that the picas live in fissures and burrows beneath the snow, and feed on stores of food accumulated during the summer and autumn. The Hydrochiro-morpha also are non-hibernators. It is true that the common porcupine (Hystric cristata) of south Europe and north Africa is alleged to hibernate, but the statement cannot, however, be accepted without confirmation, because the cold is seldom excessive in the countries it frequents, and specimens exhibited in the Zoological Gardens in London remain active throughout the year, although kept in enclosures without artificial heat of any kind. Even the most northerly representative of this group, the Canadian porcupine (Erethizon dorsatum), which inhabits forest-covered tracts in the United States and Canada, may be trapped and shot in the winter. Some members of this group, like capybaras (Hydrochoerus capybarus) and coypus (Myocastor coypus) which live in tropical America, are unaffected by the winter cold of temperate countries, and live in the open all the year round in parks and zoological gardens in England. Several of the genera of Myomorpha contain species inhabiting the northern hemisphere, which habitually hibernate. The three European genera of dormice (Myoxus), namely Muscardinus, Eliomys and Glis, sleep soundly practically throughout the winter; and examples of the South African genus Graphiurus practise the same habit when imported to Europe. If a warm spell in the winter rouses dormice from their slumbers, they feed upon nuts or other food accumulated during the autumn, but do not as a rule leave the nests constructed for shelter during the winter. According to the weather, the sleep lasts from about five to seven months. In the family Muridae, the true mice and rats (Murinae) and the voles and lemmings (Arvicolinae) seem to remain active through the winter, although some species, like the lemmings, range far to the north in Europe and Asia; but the white-footed mouse (Hesperomys) of North America, belonging to the Cricetinae, spend the winter sleeping in underground burrows, where food is laid out for consumption in the early spring. The Canadian jumping mouse (Zapus hudsonicus), one of the Jaculidae, also hibernates, although the sleep is frequently interrupted by milder days. Some of the most easterly species of jerboas (Jaculidae), namely Allocotia decemana of the Kirghiz Steppes and A. indica of Afghanistan, sleep from September or October till April; and the Egyptian species (Jaculus jaculus) and the Cape jumping hare (Pedetes caper), one of the Hystricomorpha, remain in their burrows during the wet season in a state analogous to winter sleep. The sub-order Sciuromorpha also contains many hibernating species. None of the true squirrels, however, appear to sleep throughout the winter. Even the red squirrel (Sciurus hudsonianus) of North America retains its activity in spite of the sub-arctic conditions that prevail. The same is true of its European ally Sc. vulgaris. The North American grey squirrel (Sci. cinereus), although more southerly in its distribution than the red squirrel of that country, hibernates. The American flying squirrel (Sciopeterurus voluculus) and its ally Pteromys inornatus are believed to hibernate in hollow trees. All the true marmots (Arctomys), a genus of which the species live at tolerably high altitudes in Central Europe, Asia and North America, appear to spend the winter in uninterrupted slumber buried deep in their burrows. They apparently lay up no store of food, but accumulate a quantity of fat as the summer and autumn advance, and frequently, as in the case of the woodchuck (A. monax) of the Adirondacks, retire to winter quarters in the autumn long before the onset of the winter cold. The prairie marmots or prairie dogs (Cynomys ludovicianus) of North America, which live in the plains, do not hibernate to the same extent as the true marmots, although they appear to remain in their burrows during the coldest portions of the winter. Beavers (Casto), although formerly at all events extending in North America from the tropic of Cancer up to the Arctic circle, do not hibernate. When the ground
is deep in snow and the river frozen over, they are still able to feed on aquatic plants beneath the ice.

Amongst the terrestrial carnivora hibernation appears to be practised, with one possible exception, only by species belonging to the group Arctoidae. In north temperate latitudes both in Europe and Asia, as well as in the Himalayas, brown bears (Ursus arctos) hibernate, so also does the North American grizzly bear (U. horribilis), at least in the more northern districts of its range. The smaller black bear of the Himalayas (U. thibetanus) appears to lapse into a state of semi-torpor during the winter, only emerging from its retreat to hunt for food when occasional breaks in the weather occur. In the case of the American black bear (U. americanus) the female seeks winter quarters comparatively early in the season in preparation for the birth of her progeny: after the turn of the year; but the males remain active so long as plenty of food is to be found. In the case of all bears, except the Polar bear (U. maritimus), the site chosen as the hibernaculum is either a cave or hole or some sheltered spot beneath a ledge of rock, or the roots of large trees, more or less overgrown with brushwood which holds the snow until it freezes into a solid roof over the hollow where the sleeping animal lies. In the hibernating brown and black bears the intestine is blocked by a plug commonly called "tappen" and composed principally of pine leaves, which is usually not evacuated until the spring. These are very much diversions of opinion on the subject of the hibernation of Polar bears. Their absence during the winter from particular spots in the Arctic regions where ice-bound ships have spent the winter, and the occasional discovery of specimens buried beneath the snow, have led to the belief that these animals habitually retire to winter quarters through the cold sunless months of the year. This may possibly be the true explanation at least for certain districts. But it has been alleged that bears, both adult and half-grown, may be seen throughout the winter; and it is known that pregnant females bury themselves in the autumn under the snow, where they remain without feeding till the next spring. So that we have a case of the absolute hibernation of the adult bear and the semi-hibernation of the young bear. Hence the absence of bears in the winter from the neighbourhood of ice-bound ships may be explained on the supposition that the adult females alone hibernate for breeding purposes, while the full-grown males and half-grown specimens of both sexes migrate in the winter to the edges of the ice-floes and to coast lines, where the water is open. Before retiring to winter quarters the pregnant females store up sufficient quantity of fat in their tissues not only to sustain themselves but also to supply milk for their cubs. In the Adirondack region and probably in other districts of the same or more northerly latitudes in North America, the raccoons (Procyon lotor) retire in the winter to some sheltered place, such as a hollow tree-trunk, and pass the severest part of the season in sleep, emerging in February or March when the snow has begun to disappear. In the same country, the skunks (Mephitis mephitis), a member of the weasel family, also seek shelter during the coldest portion of the winter. Merriam believes that the hibernation of this animal is determined by cold, and not by failure of food-supply, for he observes that skunks may frequently be seen in numbers on snow lying 6 ft. deep at a time of the year when they feed almost entirely upon mice and shrews. In the summer, however, when the temperature registers over twelve degrees of frost, in British North America the badger (Taxidea americanus) is said to hibernate from October till April; but the duration of the period probably depends, as in the case of its European ally (Moles meles), upon the length and severity of the inclement season. In the last-named species the winter repose is not as a rule sufficiently profound to prevent a "break in the weather" rousing the animal from sleep to sally forth in search of food. This interrupted hibernation takes place at least in England and even in Scandinavia; but in countries where frost is continuous throughout the winter it is probable that the badger's sleep is unbroken.

The one exception to the general rule that hibernation in the carnivora is restricted to the Arctoidae, is supplied by the raccoon dog (Nyctereutes procyonoides) of Japan and north-eastern Asia, which is said by Radde to hibernate in burrows in Amur-land if food has been sufficiently plentiful in late summer and autumn to enable the animal to lay on enough fat to resist the cold and sustain a long period of fast. If, however, food has been scarce, this dog is compelled to remain active all through the winter. The Arctic fox (Vulpes lagopus), although migrating in the more northern in range than the raccoon dog, does not hibernate. It was long a mystery how these animals obtained food in winter, but it has been ascertained that in some districts they migrate southwards in large numbers in the late autumn, whereas in other districts apparently they lay up stores of dead lemmings or hares, for food during the winter months. In Australia the porcupine ant-eater (Echidna aculeata) hibernates; and the habit is retained by specimens imported to Europe if exposed to the cold in outdoor cages. Instances of pseudo-hibernation have been recorded in the case of man. For example, in the government of Pakow in Russia, where food is scarce throughout the year and in danger of exhaustion during the winter, the peasants are said to resort to a practice closely akin to hibernation, spending at least one-half of the cold weather in sleep. From time immemorial it has been the custom when the first snows fall for families to shut themselves up in their huts, huddle round the stove and lapse into slumber, each member taking his turn to keep the fire alight. Once a day only do the inmates rouse themselves from sleep to eat a little dry bread. Reptiles in which the body-temperature falls with that of the surrounding medium pass the winter in temperate countries in a state of lethargy; and specimens exported from the tropics into northern latitudes become dormant when exposed to cold in virtue of their inability to maintain their temperature at a higher level than that of the atmosphere. The common land tortoise (Testudo graeca) of South Europe buries itself in the soil during the winter in its natural habitat, and even when imported to England is able, in some cases at least, to withstand the more rigorous winter by practising the same habit, as Gilbert White originally recorded. In Pennsylvania the land-tortoise (Clitudo carolina) passes the winter in a burrow; and Testudo elegans, which inhabits dry hilly districts in north India, takes shelter beneath tufts of grass or bushes as the cold weather approaches and remains in a semi-lethargic state until the return of the warmth. The European pond tortoise (Emys orbicularis) also hibernates buried in the soil; and the North American salt-water terrapin (Malaclemmys concinna), abundant in the salt-marshes round Charleston, S. Carolina, retires into the muddy banks to spend the cold months of the year. In certain parts of the tropics tortoises frequently bury themselves in the refuse of the huts during the winter, and migrate towards the south when the soil which afterwards becomes indurated. When dry seasons sets in with the dry season and the tanks become exhausted and food unobtainable, crocodiles and alligators sometimes wander across country in search of water, but more commonly bury themselves in the mud and remain in a state of quiescence until the return of the rains; and according to Humboldt, large snakes, anacondas or boa constrictors are often found by the Indians in South America buried in the same: lethargic state. Snakes and lizards in all countries where there is any considerable seasonal variation in temperature become dormant or semi-dormant during the cold months of the year. Batrachians, like reptiles, hibernate in Europe and other countries situated in temperate latitudes. Frogs bury themselves in the mud at the bottom of tanks and ponds, often congregating in numbers in the same spot. Toads retire to burrows or other secluded places on the land, and newts either bury themselves in the mud of ponds, like frogs, or lie up beneath stones and pieces of wood on the land. According to Mr G. A. Boulenger, however, European frogs and toads do not pass the winter in profound torpor, but merely in a state of sluggish quiescence. In tropical countries, where wet and dry seasons alternate, frogs which, like the rest of the batrachians, are for the most part intolerant of great heat, especially when accompanied by dryness of atmosphere, bury themselves deep in the soil during the time of drought and emerge from their retreats in numbers with the breaking of the rains.
HIBERNATION

This habit of passing the dry season in the hardened mud forming the bottom of exhausted pools and rivers is practised by several species of tropical freshwater fishes, belonging principally to the family Siluridae. The members of this group are able to exist and thrive in moist mud, and can even support life for a comparatively long time out of water altogether. The instinct is exhibited by species occurring both in the eastern and western hemispheres, as is shown by its record in the case of Callisthys and Loricaria in Guiana and by Clarías lasera in Senegambia. It is also met with, according to Tennent, in a species of climbing perch (Anabas oligolepis) found in Ceylon and belonging to the family Anabontidae, all the species of which are able to live for a certain length of time out of water, and may sometimes be found crawling across land in search of fresh pools. The habit is also common to some species of mud fishes of the order Dipnoi, in which the air bladder plays the part of lungs. Freshwater fishes, for instance, burrow into the mud and remains for nearly half the year coiled up at the bottom in a slightly enlarged chamber. The walls of this are lined with a layer of slime secreted from the fish's skin, and the orifice is closed with a lid the centre of which is perforated and forms an inturned tube by means of which air is conducted to the fish's mouth. The aestivating burrow of the Brazilian mudfish (Lepidostom) is similar, except that the lid is perforated with several apertures. The Australian mudfish (Ceratodus) is not known to hibernate or aestivate.

In countries where winter frosts arrest the growth of vegetation terrestrial mollusca seek hibernacula beneath stones or fallen tree trunks, in rock crevices, holes in walls, in heaps of dry earth, and in the crevices of brick walls of houses, and pass the winter in a veined or creviced dormancy, remaining still during the winter, and, when warm, bore holes and emerge. For the most part the mud-mollusca hibernate at some depth in the earth, and are sometimes discovered after the rains have begun to fall. Many species of the land snails are said to pass the winter underground. The internaturnum (Helix, Clautus) close the mouth of the shell at this period with a membrane or calcified plate, the epiphragm. Slugs (Limax, Arion), on the contrary, lie buried in the earth encysted in a coating of slime. Similarly in the tropics members of this group, such as Achatina in tropical Africa and Orthalicus in Brazil, aestivate during the dry season, the epiphragm preserving them against desiccation; and examples of two species of Achatina from east and west Africa exhibited in the Zoological Gardens in London remained concealed in their shells during the winter, although kept in an artificially warmed house, and resumed their activity in the summer.

Freshwater Pulmonata do not appear to hibernate, such forms as Limnaea and Planorbus having been frequently seen crawling about beneath the ice of frozen ponds. During periods of drought in England, however, they commonly bury themselves in the mud, a habit which is also practised during the dry season in the tropics by species of Proscorhinobratae Gastropods belonging to the genera Ampullaria, Melania and others, which lie dormant until the first rains rouse them from their lethargy. Freshwater Pelicycypoda (Anodonta, Unio) spend the European winter buried deep in the muddy bottom of ponds and streams.

In cold and temperate latitudes a great majority of insects pass the winter in a dormant state, either in the larval, pupal or quiescent (vegetative) stages. In some the state of hibernation is complete in the sense that although the insects may be roused from their lethargy to the extent of movement by spells of warm weather, they do not leave their hibernacula to feed; in others it is incomplete in the sense that the insects emerge to feed, as in the case of the caterpillar of Ureaplia fulgina, or to take the wing as in the case of the midge Trichocera hirnalis. Others again, like Podura nivalis and Boreus nierralis, never appear to hibernate, at least in England. The insects which hibernate as larvae belong to those species which pass more than one season in that stage, such as the goat-moth (Cossus ligniperda), cockchafers (Melolontha), stagbeetles (Lucanus) and dragon-flies (Libellula), &c.; and to some species which, although they only live a few months in this immature stage, are hatched in the autumn or summer and only reach the final stage of growth in the following spring, like the butterflies of the genus Argynnis (paphia, aglaia, &c.) in England. As an instance of species which survive the winter in the pupal or ychrisal stage may be cited the swallow-tailed butterfly of Europe (Papilio machaon); while to the category of species which hibernate as perfect insects belong many of the Coleoptera (Rhynochophora, Coccinellidae), &c., as well as some Hemiptera, Hymenoptera, Diptera and Lepidoptera (Vanessa io, Lattroce, &c.). In the case of the social Hymenoptera it is only the fertilized queen wasp out of the nest that survives the frost of winter, all the workers dying with the onset of cold in the autumn; the common hive bees (Apis mellifica), although they retire to the hive, do not hibernate, the numbers and activity of the individuals within the hive being sufficient to keep up the temperature above soporific point. Ants also remain actively at work underground unless the temperature falls several degrees below zero.

Spiders, like nearly all insects, hibernate in cold temperate latitudes, living species like trap-door spiders of family Cenidae and some species of Lycosidae seal the doors of their burrows with silk or close up the orifice with a sheet of that material. Other non-burrowing species, like some species of Clubionidae and Drassidae, lie up in silken cases attached to the underside of stones or of pieces of loose bark, or buried under dead leaves or concealed in the cracks of walls. Other species, on the contrary, pass the winter in an immature state protected from the cold by the silken cocoon spun by the mother for her eggs before she dies in the late autumn, as in the "garden spider" (Aranea diadema). Commonly, however, when the cocoons are later in the making, or the cold weather sets in early, the eggs of this and of allied species do not hatch until the spring; for instance, during the cold winter of 1903, a great many spiders became adult during the summer and die in the autumn after pairing and oviposition. Some members of this family, nevertheless, like Zilla x-notata, which live in the corners of windows, or in outhouses where the habitat affords a certain degree of protection from the cold, may survive the winter in the adult stage and be roused from lethargy by breaks in the weather and tempted by the warmth to spin new webs. Typical members of the Opiliones or harvest spiders, belonging to the family Phalangidae, do not hibernate in temperate and more northern latitudes in Europe and America, but perish in the autumn, leaving their eggs buried in the soil to hatch in the succeeding spring. During the early summer, therefore, only immature individuals are found. Other species of this order, belonging to the family Trogulidae, spend the winter in a dormant state under stones or buried in the soil. False scorpions (Pseudoscorpioidea) also hibernate in temperate latitudes, passing the cold months, like many spiders, enclosed in silken cases attached to the underside of stones or loosened pieces of bark. Centipedes and millipedes bury themselves in the earth, or live in some secluded shelter such as stones or fallen tree trunks afforded during the winter; and in the tropics millipedes lie dormant during seasons of drought.

What is true of the dormant condition of arthropod life in the winter of the northern hemisphere is also true in a general way of that of the southern hemisphere at the same season of the year. This is proved—to mention no other cases—by the observations of Darwin on the hibernation of insects and spiders at Montevideo and Bahia Blanca in South America, and by Distant's account of the paucity of insect life in the winter in South Africa; by his discovery under stones of hibernating semi-torpid Coleoptera and Hemiptera at the end of August in the Transvaal, and of the gradual increase in the numbers of individuals and species of insects in that country as the spring advances and the dry season came to an end.

HIBERNIA—HICKORY

HIBERNIA, in ancient geography, one of the names by which Ireland was known to Greek and Roman writers. Other names were Ierae, Iuverna, Iberio. All these are adaptations of a stem from which also Erin is descended. The island was well known to the Romans through the reports of traders, so far at least as its coasts. But it never became part of the Roman empire. Agriculture, although very ancient, is a difficult task, but the Roman government vetoed the enterprise. During the Roman occupation of Britain, Irish pirates seem to have been an intermittent nuisance, and Irish emigrants may have settled occasionally in Wales; the best attested emigration is that of the Scots to Caledonia. It was only in post-Roman days that Roman civilization, brought perhaps by Christian missionaries like Patrick, entered the island.

HICKERINGILL (or HICKINGEILL), EDMUND (1631-1708), English divine, lived an eventful life in the days of the Commonwealth and the Restoration. After graduating at Cambridge, where he was junior fellow in 1651-1652, he joined Lilburne's regiment as chaplain, and afterwards served in the ranks in Scotland and in the Swedish service, ultimately becoming a captain in Fleetwood's regiment. He then lived for a time in Jamaica, of which he published an account in 1661. In the same year he was ordained by Robert Sanderson, bishop of Lincoln, having already passed through such shades of belief as are connote by the terms Baptist, Quaker and Deist. From 1662 until his death in 1708 he was vicar of All Saints', Colchester. He was a vigorous pamphleteer, and came into collision with Henry Compton, bishop of London, as to the right of the incumbent to give the 'order of ordination' in the Church of Rome. The Holy Office, at the convocation of 1720, a voluminous and laborious work, 712 of May 1838. He wrote Rational Psychology (1858), System of Moral Science (1853), Empirical Psychology (1854), Rational Cosmology (1858), Creator and Creation, or the Knowledge in the Reason of God and His Work (1872), Humanity Immortal (1872), Logic of Reason (1874).

HICKORY, a shortened form of the American Indian name Hickikery. Hickory trees are natives of North America, and belong to the genus Carya. They are closely allied to the walnuts (Juglans), the chief or at least one very obvious difference being that, whilst in Carya the husk which covers the shell of the nut is light and papery; and that in the chestnut of but one place which bursts irregularly. The timber is both strong and heavy, and remarkable for its extreme elasticity, but it decays rapidly when exposed to heat and moisture, and is particularly subject to the attacks of worms. It is very extensively employed in manufacturing musket stocks, axle-trees, screws, rake-tines, the bows of yokes, the wooden rings used on the rigging of vessels, chair-backs, axe-handles, whip-handles and other purposes requiring great strength and elasticity. Its principal use in America is for hoop-making; and it is the only American wood found, perfectly true, in the hoop-yoke.

The wood of the hickory is of great value as fuel, on account of the brilliancy with which it burns and the ardent heat which it
gives out, the charcoal being heavy, compact and long-lived. The species which furnish the best wood are *Carya alba* (shell-bark hickory), *C. tomentosa* (mockernut), *C. oliviformis* (pecan or pacane nut), and *C. porcina* (pig-nut), that of the last named, on account of its extreme tenacity, being preferred for axe-trees

![Fig. 1.—Shell-bark Hickory (*Carya alba*) in flower (| nat. size).](image1)

and axe-handles. The wood of *C. alba* splits very easily and is very elastic, so that it is much used for making whip-handles and baskets. The wood of this species is also used in the neighbourhood of New York and Philadelphia for making the back bows of Windsor chairs. The timber of *C. amara* and *C. aquatica* is considered of inferior quality.

Most of the hickories form fine-looking noble trees of from 60 to 90 ft. in height, with straight, symmetrical trunks, well-balanced ample heads, and bold, handsome, pinnated foliage. When confined in the forest they shoot up 50 to 60 ft. without branches, but when standing alone they expand into a fine head, and produce a lofty round-headed pyramid of foliage. They have all the qualities necessary to constitute fine graceful park trees. The most ornamental of the species are *C. oliviformis*, *C. alba* and *C. porcina*, the last two also producing delicious nuts, and being worthy of cultivation for their fruit alone.

The husk of the hickory nut, as already stated, breaks up into four equal valves or separates into four equal portions in the upper part, while the nut itself is tolerably even on the surface, but has four or more blunt angles in its transverse outline. The

![Fig. 2.—1, Fruit of *Carya alba*; 2, Hickory Nut; 3, Cross Section of Nut; 4, Vertical Section of the Seed. (All natural size.)](image2)

hickory nuts of the American markets are the produce of *C. alba*, called the shell-bark hickory because of the roughness of its bark, which becomes loosened from the trunk in long scales bending outwards at the extremities and adhering only by the middle. The nuts are much esteemed in all parts of the States, and are exported in considerable quantities to Europe. The pecan-nuts, which come from the Western States, are from 1 in. to 1½ in. long, smooth, cylindrical, pointed at the ends and thin-shelled, with the kernels full, not like those of most of the hickories divided by partitions, and of delicate and agreeable flavour. The thick-shelled fruits of the pig-nut are generally left on the ground for swine, squirrels, &c., to devour. In *C. amara* the kernel is so bitter that even squirrels refuse to eat it.

**HICKS, ELIAS** (1748–1830), American Quaker, was born in Hempstead township, Long Island, on the 19th of March 1748. His parents were Friends, but he took little interest in religion until he was about twenty; soon after that time he gave up the carpenter’s trade, to which he had been apprenticed when seventeen, and became a farmer. By 1775 he had ‘openings leading to the ministry’ and was ‘deeply engaged for the right administration of discipline and order in the church,’ and in 1779 he first set out on his itinerant preaching tours between Vermont and Maryland. He attacked slavery, even when preaching in Maryland; wrote *Observations on the Slavery of the Africans and their Descendants* (1811); and was influential in procuring the passage (in 1817) of the act declaring free after 1827 all negroes born in New York and not freed by the Act of 1799. He died at Jericho, Long Island, on the 27th of February 1830. His preaching was practical rather than doctrinal and he was heartily opposed to any set creed; hence his successful opposition at the Baltimore yearly meeting of 1817 to the proposed creed which would make the Society in America approach the position of the English Friends by definite doctrinal statements. His *Doctrinal Epistle* (1824) stated his position, and a break ensued in 1827–1828, Hicks’s followers, who call themselves the “Liberal Branch,” being called “Hicksites” by the “Orthodox” party, which they for a time outnumbered. The village of Hicksville, in Nassau County, New York, 15 m. E. of Jamaica, lies in the centre of the Quaker district of Long Island and was named in honour of Elias Hicks.

**HICKS, HENRY** (1837–1899), British physician and geologist, was born on the 26th of May 1837 at St David’s, in Pembroke-shire, where his father, Thomas Hicks, was a surgeon. He studied medicine at Guy’s Hospital, London, qualifying as M.R.C.S. in 1862. Returning to his native place he commenced a practice which he continued until 1874, when he removed to Hendon. He then devoted special attention to mental diseases, took the degree of M.D. at St Andrews in 1878, and continued his medical work until the close of his life. In Wales he had been attracted to geology by J. W. Salter (then palaeontologist to the Geological Survey), and his leisure time was given to the study of the older rocks and fossils of South Wales. In conjunction with Salter, he established in 1865 the Menynian group (Middle Cambrian) characterized by the trilobite *Pararadiosides*. Subsequently Hicks contributed a series of important papers on the Cambrian and Lower Silurian rocks, and figured and described many new species of fossils. Later he worked at the Pre-Cambrian rocks of St David’s, describing the Dimetian (granitoid rock) and the Pebidian (volcanic series), and his views, though contested, have been generally accepted. At Hendon Dr Hicks gave much attention to the local geology and also to the Pleistocene deposits of the Denbighshire caves. For a few years before his death he had laboured at the Devonian rocks. With his keen eye for fossils he detected organic remains in the Morte slates, previously regarded as un fossiliferous, and these he regarded as including representatives of Lower Devonian and Silurian. His papers were mostly published in the *Geol. Mag.* and *Quart. Journ. Geol. Soc.* He was elected F.R.S. in 1885, and president of the Geological Society of London 1896–1898. He died at Hendon on the 18th of November 1890.

**HICKS, WILLIAM** (1830–1883), British soldier, entered the Bombay army in 1849, and served through the Indian mutiny, being mentioned in despatches for good conduct at the action of Sitka Ghaut in 1859. In 1861 he became captain, and in the
HIDALGO—HIDDENITE

Abysinnian expedition of 1867–68 was a brigade major, being again mentioned in despatches and given a brevet majority. He retired with the honorary rank of colonel in 1880. After the close of the Egyptian war of 1882, he entered the khedive's service and was made a pasha. Early in 1883 he went to Khartum as chief of the staff of the army there, then commanded by Sullivan Niazi with 100,000 men, and a new force of some 8000 fighting men collected—mostly recruited from the fellahin of Arabi's disbanded troops, sent in chains from Egypt. After a month's vigorous drilling Hicks led 5000 of his men against an equal force of dervishes in Sennar, whom he defeated, and cleared the country between the towns of Sennar and Khartum of rebels. Relieved of the fear of an immediate attack by the mahdists the Egyptian officials at Khartum intrigued against Hicks, who in July tendered his resignation. This resulted in the dismissal of Sullivan Niazi and the appointment of Hicks as commander-in-chief of an expeditionary force to Kordofan with orders to crush the mahdi, who in January 1883 had captured El Obeid, the capital of that province. Hicks, aware of the worthlessness of his force for the purpose contemplated, stated his opinion that it would be best to "wait for Kordofan to settle itself" (telegram of the 9th of August). The Egyptian ministry, however, did not then believe in the power of the mahdi, and the expedition started from Khartum on the 9th of September. It was made up of 7000 infantry, 1000 cavalry and 2000 camp followers and included between Europeans. On the 29th the force left the Nile at Dzem and struck inland across the almost waterless wastes of Kordofan for Obeid. On the 5th of November the army, misled by treacherous guides and thirst-stricken, was ambuscaded in dense forest at Kashgil, 30 m. south of Obeid. With the exception of some 300 men the whole force was killed. According to the story of Hicks's cook, one of the survivors, the general was the last officer to fall, pierced by the spear of the khalfi Ahmad Mohamed Sherif. After emptying his revolver the pasha kept his assailants at bay for some time with his sword, a body of Baggara who fled before him being known afterwards as "Bagger Hicks" (the cows driven by Hicks), a play on the words baggara and bagger, the former being the herdsman and the latter the cows. Hicks's head was cut off and taken to the mahdi.

HIDALGO, an inland state of Mexico, bounded N. by San Luis Potosi and Vera Cruz, E. by Vera Cruz and Puebla, S. by Tlaxcala and Nayarit, and W. by Queretaro and San Luis Potosi. Its area was 531,517, (1900) 605,051 sq. m. The northern and eastern parts are elevated and mountainous, culminating in the Cerro de Navajas (10,258 ft.). A considerable area of this region on the eastern side of the state is arid and semi-barren, being part of the elevated tableland of Apam where the maguay (American aloe) has been grown for centuries. The southern and western parts of the state consist of rolling plains, in the midst of which is the large lake of Metztitlan. Hidalgo produces cereals in the more elevated districts, sugar, maguay, cotton, cotton and tobacco. Maguay is cultivated for the production of pulque, the national drink. The chief industry, however, is mining, the mineral districts of Pachuca, El Chico, Real del Monte, San Jose del Oro, and Zimapán being among the richest in Mexico. The mineral products include silver, gold, mercury, copper, iron, lead, zinc, antimony, manganese and plumbago. Coal, marble and opals are also found. Railway facilities are afforded by a branch of the Vera Cruz and Mexico line, which runs from Ometepec to Pachuca, the capital of the state, and by the Mexican Central. Among the principal towns are Tultepec (pop. 9000), a rich mining centre 24 m. E. of Pachuca, Ixmiquilpan (about 8000) with silver mines 80 m. N. by W. of the Federal Capital, and Actopan (2666), the chief town of the district N.N.W. of Pachuca, inhabited principally by Indians of the Othomies nation.

HIDALGO (a Spanish word, contracted from hijo d'algo or hijo de algo, son of something, or somewhat), originally a Spanish title of the lower nobility; the hidalgos being the lowest grade of nobility which was entitled to use the prefix "don." The term is now used generally to denote one of gentle birth. The Portuguese fidalgos has a similar history and meaning as in Portugal.

HIDALGO Y COSTILLA, MIGUEL (1753–1811), Mexican patriot, was born on the 8th of May 1753, on a farm at Corralejos, near Guanajuato. His mother's maiden name was Gallaga, but contrary to the usual custom of the Spaniards he used only the surname of his father, Cristobal Hidalgo y Costilla. He was educated at Valladolid in Mexico, and was ordained priest in 1779. Until 1809 he was known only as a man of pious life who exerted himself to introduce various forms of industry, including the cultivation of silk, among his parishioners at Dolores. But Napoleon's invasion of Spain in 1808 caused a widespread commotion. The colonists were induced to accept a French ruler and showed great zeal in proclaiming Ferdinand VII. as king. The societies they formed for their supposedly loyal purpose were regarded, however, by the Spanish authorities with suspicion as being designed to prepare the independence of Mexico. Hidalgo and several of his friends, among whom was Miguel Dominguez, mayor of Querétaro, engaged in consultation and preparations which the authorities considered treasonable. Dominguez was arrested, and Hidalgo fled to the United States. He returned to Mexico, and, with the help of his parishioners, and on the 16th of September 1810 threw open the prison at Dolores. This action began what was in fact a revolt against the Spanish and Creole elements of the population. With what is known as the "grito" or cry of Dolores as their rallying shout, a multitude gathered round Hidalgo, who took for his banner a wonder-working picture of the Virgin belonging to a popular shrine. At first he met with some success. A regiment of dragoons of the militia joined him, and some small posts were stormed. The whole tumultuous host moved on the city of Mexico, but here the Spaniards and Creoles were concentrated. Hidalgo lost heart and retreated. Many of his followers deserted, and on the march to Querétaro he was attacked at Aculco by General Felix Calleja on the 7th of November 1810, and routed. He endeavoured to continue the struggle, and did succeed in collecting a mob estimated at 100,000 about Guadalajara. With this ill-armed and undisciplined crowd he took up a position on the bridge of Calderon on the river Santiago. On the 17th of January 1811 he was completely beaten by Calleja and a small force of soldiers. Hidalgo was deposed by the other leaders, and soon afterwards all of them were betrayed to the Spaniards. They were tried at Chihuahua, and condemned to death. Hidalgo was first degraded from the priesthood and then shot as a rebel, on the 31st of July or the 1st of August 1811.

HIDDENITE, a green transparent variety of spodumene, is used as a gem-stone. It was discovered by William E. Hidden (1853) about 1879 at Stonypoint, Alexander county, North Carolina, and was at first taken for diopside. In 1882 J. Lawrence Smith proved it to be spodumene, and named it. Hiddenite occurs in small slender monoclinic crystals of prismatic habit, often pitted on the surface. A well-marked prismatic cleavage renders the mineral rather difficult to cut. Its colour passes from an emerald green to a greenish-yellow, and is often unevenly distributed through the stone. The mineral is dihroic in a marked degree, and shows much "fire" when properly cut. The composition of the mineral is represented by the formula LiAl(SiO3), the green colour being probably due to the presence of a small proportion of chromium. The presence of lilia in this gem mineral suggested the inappropriate name of lilia emerald, by which it is sometimes known. Hiddenite was originally found as loose crystals in the soil, but was afterwards worked in a veinstone, where it occurred in association with beryl, quartz, garnet, mica, rutile, &c.
HIDE

(Hide, hida, A.S. higd, hid or hiwisc, members of a household), a measure of land. The word was in general use in England in Anglo-Saxon and early English times, although its meaning seems to have varied somewhat from time to time. Among its Latin equivalents are terra unius familiae, terra unius cassali and manio; the first of these forms is used by Bede, who, like all early writers, gives to it no definite area. In its earliest form the hide was the typical holding of the typical family. Gradually, this typical holding came to be regarded as containing 120 acres. (not 120 acres of 4800 sq. yds. each, but rather a certain amount which a ploughteam of eight oxen could plough in a single day). This definition must have been very general in England before the Norman Conquest, and in Domesday Book 30, 40, 50 and 80 acres are repeatedly mentioned as fractions of a hide. Some historians, however, have thought that the hide only contained 30 acres or thereabouts.

"The question about the hide," says Professor Maitland in Domesday Book and Beyond, "is 'pre-judicial' to all the great questions of early English history." The main argument employed by Dr. M. Kemble (The Saxons in England) in favour of the "small hide" is that the number of hides stated to have existed in the various parts of England gives an acreage far in excess of the total acreage of these parts. He notices the absence of any allowance necessary because the hide was only that part of the land which came under the plough, and each hide must have carried with it a certain amount of pasture. Two illustrations in support of this "small hide" theory are the figures for the Isle of Wight and the Isle of Man, which each contained 1200 hides. Now 1200 hides of 120 acres each gives a total acreage of 144,000 acres, while the total acreage of the island today is only 93,000 acres. Again a document called The Tribal Hidage* of the year 877 shows that the land of the Isle of Wight alone contained 1200 hides. After 1200 hides of 120 acres each gives a total acreage of 144,000 acres, while the total acreage of the island today is only 93,000 acres. Once a document called The Tribal Hidage of the year 877 shows that the land of the Isle of Wight alone contained 1200 hides. After 1200 hides of 120 acres each gives a total acreage of 144,000 acres, while the total acreage of the island today is only 93,000 acres. But other documents show that the land was not only that part of the land which was ploughed, but also a certain amount of land which was left as woodland. On these grounds Kemble regarded the hide containing 30 or 33, certainly not more than 40 acres, and thought that each acre contained about 4000 sq. yds., i.e. that it was roughly equal to a hide of the later period. If this was the case, a hide of 30 or 40 acres was enough land for the support of the average family, in other words that it was the terra unius familiae of Bede. Another Domesday student, R. W. Eyton, puts down the hide at 48 acres.

But formidable arguments have been advanced against the "small hide". There is no doubt that at the time of Domesday the hide was equated with 120 and not with 30 acres. Then, taking the word familia in its proper sense, a household with many dependent members, and making an allowance for primitive methods of agriculture, it is questionable whether 30 or 40 acres were sufficient for its support; and again if the equation 120 hides = 120 acres is rejected there is no serious evidence in favour of any other. A possible equal division of the land, as implied by the charter of 918 with which the hides of the Isle of Wight were divided, means that the hides consisted of 30 acres or thereabouts, it had come before the time of Domesday to contain 120 acres. But no trace of such a charter has been found. Mr. H. M. Chadwick (Studies on Anglo-Saxon Institutions) says there is no evidence that the hide contained 120 acres before the 10th century. He suggests that the 120 hides of the Saxon hide have been replaced by 40 acres, while in Wessex it was regarded as containing 120 acres. Dr Stubb (Const. Hist. i.) suggests that the confusion may have arisen because the word was used "to express the whole share of one man in all the fields of the village." Thus it might refer to 30 acres, his share in one field, or to 120 acres, his share in the four fields. He adds, however, that this explanation is not adequate for all cases. But these differences about the size of the hide are not peculiar to Wessex; and in Huntingdon says, and in illustration, vocatur terra unius arati culturae sufficitios per annum, while the

Dialogue de scaccario puts its size at 100 acres, though this may be the long hundred, or 120. Perhaps, therefore, Selden is wisest when he says, "hides were of an uncertain quantity." Certainly he gives the size of the hide as a description of the early hide when he says (Titles of Honour): "Now a hide of 120 acres is the regularity of the hide, and was (as I think) as much land as might be well manured with one plough, together with pasture, meadow and wood competent for the maintenance of the family and their portion, and the support of the tithes.

The view that the size of the hide varied from district to district is supported by Professor Vinogradoff's more recent researches. In his English Society in the Eleventh Century he mentions that there was a hide of 20 acres in the Isle of Wight and another of 200 acres in the Isle of Wight. With this view some authorities distinguish between English hides and Welsh hides, and in Sussex the hide often contained 8 virgates. Sometimes again in the 11th century hides were not merely fiscal units; they were no longer acres in fact.

The fact that the hide was a unit of assessment, has been established by Mr. J. H. Round in his feudal England, and is regarded as throwing a most valuable light upon the many problems which present themselves to the student of Domesday. The process which converted the hide from a unit of measurement to a unit for assessment purposes is probably as follows. Being in general use to denote a large piece of land, and such pieces of land being roughly equal all over England, the hide was a useful unit on which to levy taxation, a use which dates back to the time of the Danelage. For some time the two meanings were kept separate. Before the Norman Conquest the hide, a unit for taxation, had its existence, but the hide, a measure of land, and this was the state of affairs when in 1086 William I. ordered his great inquest to be made. The formula used in Domesday varies from county to county, but a single illustration may be given. Huntedum Burg dedefedet se ad geldum regis pro quarta parte de Hystingestan hundred pro 1. hidis. This does not mean that the town of Huntingdon contained a certain fixed number of square yards multiplied by 50, but that for purposes of taxation Huntingdon was regarded as worth 50 times a certain fiscal unit.

This is confirmed by R. W. Eyton in A Key to Domesday and was accepted by Maitland. Its proof rests primarily upon the prevalence of the five-hide unit. By collating various documents which formed part of the Domesday inquest Mr. Round has brought together for certain parts of England, especially for Cambridgeshire and Bedfordshire, the holdings of the various lords in the different vills, and will after will shows a total of 5 hides or 10 hides or only a slight discrepancy therewith. A similar result is shown for the hundreds where multiples of 5 are almost universal, and the total hideage for the county of Worcester is very near the round figure of 1200. This arrangement is obviously impossible if it had to be computed upon the hundreds or the hideage figures are the products of local variation caused by the central authority's regulation of the size of the hide.

Another proof is found in what is called "beneficial hidation." It is shown in certain cases that the number of hides in a hundred was derived from the number of hides at the time of the Conquest; this reduction had been transferred pro rata to the vill in the hundred. Thus Mr. Round concludes that the hide was fixed "independently of area or value. Some slight criticism has been directed against the idea of "artificial hidation," but the most serious objection can be said against it is that its proof rests upon isolated cases, a reproach which further research will doubtless remove. However, Professor Vinogradoff accepts the hide primarily as a fiscal unit which corresponds only in a very rough way to the agrarian reality, and Maitland says the fiscal hide is "at its best a lame compromise between a unit of area and a unit of value."

What is the origin of the five-hide unit? Various conjectures have been hazarded, and the unit is undoubtedly older than the Danelage. Rejecting the idea that it is of Roman or of British origin, and pointing to the serious difference in the rates at which the various counties were assessed, Mr. Round thinks that it dates from the time when the various Anglo-Saxon kingdoms were divided, and each king was responsible for assessment for military service, possibly it was the recognized endowment of a Saxon thign. In Anglo-Saxon times a man's standing in society was dependent to a great extent upon the number of hides which he possessed; this statement is fully proved from the laws. Moreover, in the laws of the Wessex king, In, the value of a man's oath is expressed in hides, and that for a king's thign being probably worth 60 hides and that of a eorl 5 hides.

The usual division of the hide was into virgates, a virgate being, after the Conquest at least, the normal holding of the
villain with two oxen. Mr Round holds that in Domesday at all events the hide always consisted of four virgates; Mr F. Seebohm in *The English Village Community*, although thinking that the normal hide "consisted as a rule of four virgates of 30 acres each," says that the Hundred Rolls for Huntingdonshire show that "the hide did not always contain the same number of virgates." The virgate, it may be noted, consisted of a strip of land in each acre of the hide, and there is undoubtedly a strong case in favour of the equation 1 hide = 4 virgates.

Mr Seebohm, propounding his theory that English institutions are rooted in those of Rome, argues for some resemblance between the methods of taxation of land in Rome and in England; he sees some connexion between the Roman *centuria* and the hide, and between the Roman system of taxation called *jugatio* and the English hide. Professor Vinogradoff (*Villageinage in England*) summarizes the views of those who hold a contrary opinion thus: "The curious fact that the normal holding, the hide, was equal all over England can be explained only by its origin; it came full-formed from Germany and remained unchanged in spite of all diversities of geographical and economical conditions."

The authority of England, or rather in the district of the "Five Boroughs," the curate takes the place of the hide as the unit of value, and six supplants five, six curates being the unit of assessment. In a "shire" this is not the case, and in Lancashire the method is quite different from what is elsewhere in England. According to Mr Round the Leicestershire hide consisted of 18 curates; Mr W. H. Stevenson (English Historical Review, vol. v.) argues that it consisted of 12 and that it was divided among 3 hides. Mr Seebohm thinks there was a *solaenda* or double hide of 240 acres in Essex and other southern counties, but Mr Round does not think that this word refers to a measure or unit of assessment at all. For Kent, however, the word *sultang* or *solim*, is used in *Domesday Book* and in the charters instead of hide and curate as elsewhere, and Vinogradoff thinks that this contained from 180 to 200 acres.

Under the Norman and early Plantagenet kings a levy of two or more shillings on each hide of land was a usual and recurrent tax, and the old *hiding* continued among the royal land and some other estates, however, as is seen from Domesday, not being hidated and not paying the tax. This geld, or tax, received several names, one of the most general being *hiding* (Lat. *hidagium*). "Hiding," says Vinogradoff, "is historically connected with the old English Danegeld system," and as Danegeld and therefore hidage it was levied long after its original purpose was forgotten, and was during the 11th century "the most sweeping and the heaviest of all the taxes." Henry of Huntingdon says its usual rate was 2s. on each hide of land, and this was evidently the rate at the time of Henry II and Richard the Lionheart. It was levied on Woodstock in 1163, but it was not always kept at this figure, as in 1184 William I. had levied a tax of 6s. on each hide, an unusual extortation. The feudal aids were levied on the hide. Thus in 1100 Henry I. raised one at the rate of 3s. per hide for the marriage of his daughter Matilda with the emperor Henry V., and in 1194, when money was collected for the ransom of Richard I., some of the taxation for this purpose seems to have been assessed according to the hide given in Domesday Book.

By this time the word *hiding* as the designation of the tax was disappearing, its place being taken by the word *carucage*. The curate (Lat. *caruca*, a plough) was a measure of land which prevailed in the north of England, the district inhabited by people of Danish descent. Some authorities regard it as equivalent to the hide, others deny this identity. In 1198, however, when Richard I. imposed a tax of 5s. on each *carucata terrae sive hyda*, the two words were obviously interchangeable, and about the same time the size of the curate was fixed at 120 acres. The word *carucage* remained in use for some time longer, and then other names were given to the various taxes on land.

One or two other questions with regard to the hide still remain unsolved. What is the connexion, if any, between the hundred and a hundred hides? Again, was the size of the hide fixed at 120 acres to make the work of reckoning the amount of Danegeld, and of hidage, a simple process? 120 acres to the hide, 240 pence to the pound, makes calculation easy. Lastly, is the English hide derived from the German *hufe* or *hoba?* (A. W. H. *HIEL, EMANUEL* (1834–1899), Belgian-Dutch poet and prose writer, was born at Dendermonde, in Flanders, in May 1834. He acted in various functions, from teacher and government official to journalist and bookseller, busily writing all the time both for the theatre and the magazines of North and South Netherlands. His last posts were those of librarian at the Industrial Museum and professor of declamation at the Conservatoire in Brussels. Among his better-known poetic works may be cited *Looveren* ("Leaflets," 1857); *Nieuwe Liedebens* ("New Poessies," 1861); *Gedichten* ("Poems," 1863); *Striktjes en Oratories* ("Poems, Sayings, and Oratorios," 1869); *De Wind* (1869), an inspiring cantata, which had a large measure of success and was crowned; *De Liefde in't Leven* ("Love in Life," 1879); *Elle en Ivo* (two musical dramas, 1874); *Liederen voor Groote en Kleine Kinderen* ("Songs for Big and Small Folk," 1879); *Jacob van Beieren* ("Jacquelein of Bavaria," a poetic drama, 1880); *Mathilda van Denemarken* (a lyrical drama, 1890). His collected poetical works were published in three volumes at Rousselare in 1885. Hiel took an active and prominent part in the so-called "Flemish movement" in Belgium, and his name is constantly associated with those of some of the most eminent Belgians. Many of his poems were dedicated to Hiel's verses, notably to his oratorios *Lucifer* (performed in London at the Royal Albert Hall and elsewhere) and *De Schelde* ("The Scheldt"); whilst the Dutch composer, Richard Hol (of Utrecht), composed the music to Hiel's "Ode to Liberty," and van Gheuwe to the poet's "Songs for Big and Small Folk" (second edition, much enlarged, 1879), which has greatly contributed to their popularity in schools and among Belgian choral societies. Hiel also translated several foreign lyrics. His rendering of Tennyson's "In Memoriam," "Zanten," and "Antwerp" in 1875. For the national festival of 1880 at Brussels, to commemorate the fiftieth anniversary of Belgian independence, Hiel composed two cantatas, *Belgenland* ("The Land of the Belgians") and *Eer Belgenland* ("Honour to Belgium"), which, set to music, were much appreciated. Hiel died at Schaarbeek, near Brussels, on the 27th of August 1899. Hiel's efforts to counteract Walloon influences and bring about a *rapprochement* between the Netherlanders in the north and the Teutonic racial sympathizers across the Rhine made him very popular with both, and a volume of his best poems was in 1874 the first in a collection of Dutch authors published at Lelystad.

**HIEMPSAL** the name of the two kings of Numidia. For Hiempsal I. see under JUGURTHA. Hiempsal II. was the son of Gauda, the half-brother of Jugurtha. In 88 B.C., after the triumph of Sulla, when the younger Marius fled from Rome to Africa, Hiempsal received him with apparent friendliness, his real intention being to detain him as a prisoner. Marius discovered this intention in time and made good his escape with the assistance of the king's daughter. In 81 Hiempsal was driven from his throne by the Numidians themselves, or by Derrbas, ruler of part of the kingdom, supported by Cn. Domitius Ahenobarbus, the leader of the Marian party in Africa. Soon afterwards Pompey was sent to Africa by Sulla to reinstate Hiempsal, whose territory was subsequently increased by the addition of some land on the coast in accordance with a treaty concluded with L. Aurelius Cotta. When the tribune P. Servilius Rullus introduced his agrarian law (63), these lands, which had been originally assigned to the Roman people by Scipio Africanus, were expressly exempted from sale, which roused the indignation of Cicero (De lege agraria, i. 4, ii. 22). From Suetonius (Caesar, 71) it is evident that Hiempsal was alive in 62. According to Sallust (Jugurthana, 17), he was the author of an historical work in the Punic language.

Plutarch, Marius, 40. Pompey, 12; Appian, Bell. civ., i. 62, 80; Dio Cassius xli. 47.

**HIERAPOLIS.** 1. (Arabic Mubni or Mumbij) an ancient Syrian town occupying one of the finest sites in Northern Syria, in a fertile district about 16 m. S.W. of the confluence of the Sajur and Euphrates. There is abundant water supply from large springs. In 1879, after the Russo-Turkish war, a colony of
Circassians from Vidin (Widdin) was planted in the ruins, and the result has been the constant discovery of antiquities, which find their way into the bazaars of Aleppo and Aintab. The place first appears in Greek as Bambycse, but Pliny (v. 23) tells us its Syrian name was Mabog. It was doubtless an ancient Commagenean sanctuary; but history knows it first under the Seleucids, who made it the chief station on their main road between Antioch and Seleucia-on-Tigris; and as a centre of the worship of the Syrian Nature Goddess, Atargatis (q.v.), it became known to the Greeks as the city of the sanctuary Ιεροπόλης, and finally as the Holy City Ιεράπολις. Lucian, a native of Commagene (or some anonymous writer) has immortalized this worship in the tract De Dea Syria, wherein are described the orgiastic luxury of the shrine and the tank of sacred fish, of which Aelian also relates marvels. According to the De Dea Syria, the worship was of a phallic character, votaries offering little male figures of wood and bronze. There were also huge phalli set up like obelisks before the temple, which were climbed once a year with certain ceremonies, and decorated. For the rest the temple was of Ionic character with golden plated doors and roof and much gilt decoration. Inside was a holy chamber into which priests only were allowed to enter. Here were statues of a goddess and a god in gold, but the first seems to have been the more richly decorated with gems and other ornaments. Between them stood a gilt xoanon, which seems to have been carried outside in sacred processions. Other rich furniture is described, and a mode of divination by movements of a xoanon of Apollo. A great bronze altar stood in front, set about with statues, and in the forecourt lived numerous sacred animals and birds (but not swine) used for sacrifice. Some three hundred priests served the shrine and there were numerous minor ministers. The lake was the centre of sacred festivities and it was customary for votaries to swim out and decorate an altar standing in the middle of the water. Self-mutilation and other orgies went on in the temple precinct, and there was an elaborate ritual on entering the city and first visiting the shrine under the conduct of local guides, which reminds one of the Meccan Pilgrimage.

The temple was sacked by Crassus on his way to meet the Parthians (43 b.c.); but in the 3rd century of the empire the city was the capital of the Euphratesian province and one of the great cities of Syria. Procopius called it the greatest in that part of the world. It was, however, ruinous when Julian collected his troops there en marching to his defeat and death in Mesopotamia, and Chosroes I. held it to ransom after Justinian had failed to put it in a state of defence. Harun restored it at the end of the 8th century and it became a bone of contention between Byzantines, Arabs and Turks. The crusaders captured it from the Seljuks in the 11th century, but Saladin retook it (1175), and later it became the headquarters of Hulagu and his Mongols, who completed its ruin. The remains are extensive, but almost wholly of late date, as is to be expected in the case of a city which survived into Moslem times. The walls are Arab, and no ruins of the great temple survive. The most noteworthy relic of antiquity is the sacred lake, on two sides of which can still be seen stepped quays and water-stairs. The first modern account of the site is in a short narrative appended by H. Maundrell to his Journey from Aleppo to Jerusalem. He was at Mumbij in 1699.

The coinage of the city begins in the 4th century n.c. with an Aramaic series, showing the goddess, either as a bust with mural crown or as riding on a lion. She continues to supply the chief type even during imperial times, being generally shown seated with the lyraon in her hand. Other coins substitute the legend Θεά Σελευκος Ιεραπόλιτι and within a wreath. It is interesting to note that from Bambycse (near which much silk was produced) were derived the bombicina seistis of the Romans and, through the crusaders, the bombazine of modern commerce.

See F. R. Chesney, Ephesiae Expeditionis (1859); W. F. Ainsworth, Personal Narrative of the Ephesiae Expedition (1888); E. Sachau, Reise in Syrien, &c. (1883); D. G. Hogarth in Journal of Hellenic Studies (1909).
activity, assimilated as far as possible to the godlike, and elevated to the imitation of God proportionately to the Divine illuminations conceded to it," the author proceeds to enumerate the nine orders of the heavenly host, which are subdivided again into hierarchies or triads, in descending order, thus: Seraphim, Cherubim, Thrones; Dominations, Virtues, Powers; Principalities, Archangels, Angels. These all exist for the common object of raising men through ascending stages of purification and illumination to perfection. The ecclesiastical or earthly hierarchy is the counterpart of the other. In it the first or highest triad is formed by baptism, communion and chrism. The second triad consists of the three orders of the ministry, bishop or hierarch, priest and minister or deacon (λεγομενοι, διδαχειν, ιερουργον); this is the earliest known instance in which the title hierarch is applied to a bishop. The third or lowest triad is made up of monks, "initiated" and catechumens. To Dionysius may be traced, through Thomas Aquinas and other Catholic writers of the intervening period, the definition of the term usually given by Roman Catholic writers—"coluis seu ordo praesidum et sacrorum ministrorum ad regendam ecclesiam gignendaque in hominibus sanctitatem divinissimam institutum"—although it immediately rests upon the authority of the sixth canon of the twenty-third session of the council of Trent, in which anathema is pronounced upon all who deny the existence within the Catholic Church of a hierarchy instituted by divine appointment, and consisting of bishops, priests and ministers. See Order, Holy.

Hieratic, or Hieracian, a learned ascetic who flourished about the end of the 3rd century at Leontopolis in Egypt, where he lived to the age of ninety, supporting himself by calligraphy and devoting his leisure to scientific and literary pursuits, especially to the study of the Bible. He was the author of Biblical commentaries both in Greek and Coptic, and is said to have composed many hymns. He became leader of the so-called sect of the Hieracites, an ascetic society from which married persons were excluded, and of which one of the leading tenets was that only the celibate could enter the kingdom of heaven. He asserted that the suppression of the sexual impulse was emphatically the new revelation brought by the Logos, and appealed to 1 Cor. vii., Heb. xii. 14, and Matt. xix. 12, xxv. 21. Hierax may be called the connecting link between Origen and the Coptic monks. A man of deep learning and prodigious memory, he seems to have developed Origen's Christology in the direction of Athanasius. He held that the Son was a torch lighted at the torch of the Father, that Father and Son are a bipartite light. He repudiated the ideas of a bodily resurrection and a material paradise, and on the ground of 2 Tim. ii. 5 questioned the salvation of even baptized infants, "for without knowledge no conflict, without conflict no reward." In his insistence on virginity as the specifically Christian virtue he set up the great theme of the church of the 4th and 5th centuries.

Hiero (strictly Hieron), the name of two rulers of Syracuse.

Hiero I. was the brother of Gelo, and tyrant of Syracuse from 478 to 467 B.C. During his reign he greatly increased the power of Syracuse. He removed the inhabitants of Naxos and Catana to Leontini, peoples Catana (which he renamed Aetna) with Dorian, concluded an alliance with Acragas (Agrigentum), and espoused the cause of the Locrians against Anaxilas, tyrant of Rhegium. His most important achievement was the defeat of the Etruscans at Cumae (474), by which he saved the Greeks of Campania. A bronze helmet (now in the British Museum), with an inscription commemorating the event, was dedicated at Olympia. Though despotic in his rule Hiero was a liberal patron of literature. He died at Catana in 467.

See Diod. Sic. xi. 38-67; Xenophon, Hiero, 6, 2; E. Lübbert, Syraus zu Zeit der Gelo und Hieron (1875); for his coins see Nummus (secundum Ch. I. 19, 29).

Hiero II., tyrant of Syracuse from 270 to 216 B.C., was the illegitimate son of a Syracusan noble, Hiero, who claimed descent from Gelo. On the departure of Pyrrhus from Sicily (275) the Syracusan army and citizens appointed him commander of the troops. He materially strengthened his position by marrying the daughter of Leptines, the leading citizen. In the meantime, the Mamertines, a body of Campanian mercenaries who had been hosts, had seized the stronghold of Messana, whence they harassed the Syracusans. They were finally defeated in a pitched battle near Mylea by Hiero, who was only prevented from capturing Messana by Carthaginian interference. His grateful countrymen then chose him king (276). In 264 he again returned to the attack, and the Mamertines called in the aid of Rome. Hiero at once joined the Roman leader Hannu, who had recently landed in Sicily; but being defeated by the consul Appius Claudius, he withdrew to Syracuse. Pressed by the Roman forces, in 263 he was constrained to conclude a treaty with Rome, by which he was to rule over the south-east of Sicily and the eastern coast as far as Taurolemnium (Polybius i. 8-16; Zonaras viii. 9). From this time till his death in 216 he remained loyal to the Romans, and frequently assisted them with men and provisions during the Punic wars (Livy xxi. 49-51, xxii. 37, xxi. 21). He kept up a powerful fleet for defensive purposes, and employed his famous kinsman Archimedes in the construction of those engines that, at a later date, played so important a part during the siege of Syracuse by the Romans.

A picture of the prosperity of Syracuse during his rule is given in the sixteenth idyll of Theocritus, his favourite poet. See Diod. Sic. xxii. 24-xxv. 24; Polybius i. 8-xxii. 7; Justin xxii. 4.

Hierocles, proconsul of Bithynia and Alexandria, lived during the reign of Diocletian (A.D. 284-305). He is said to have been the instigator of the fierce persecution of the Christians under Galerius in 303. He was the author of a work (not extant) entitled Λήγοι διακαθηκέναι τον Χριστόν in two books, in which he endeavoured to persuade the Christians that their sacred books were full of contradictions, and that in moral influence and miraculous power Christ was inferior to Apollonius of Tyana. Our knowledge of this treatise is derived from Lactantius (Instit. div. v. 2) and Euschedius, who wrote a refutation entitled Ἀντιμιγήσεις πρὸς τὸ Ἱεροκλέα. Hierocles of Alexandria, Neoplatonist writer, flourished c. A.D. 430. He studied under the celebrated Neoplatonist Plutarch at Athens, and taught for some years in his native city. He seems to have been banished from Alexandria, and to have taken up his abode in Constantinople, where he gave such offence by his religious opinions that he was thrown into prison and cruelly flogged. The only complete work of his which has been preserved is the commentary on the Carmina Aurea of Pythagoras. It enjoyed a great reputation in middle age and Renaissance times, and there are numerous translations in various European languages. Several other writings, especially one on providence and fate, a consolatory treatise dedicated to his patron Olympiodorus of Thebes, author of Ιστορίαι Νέοι, are quoted or referred to by Photius and Stobaeus. A collection of some 260 witlings (epigrams) called Polybion (ed. A. Eberhard, Berlin, 1880), attributed to Hierocles and Philagrius, has no connexion with Hierocles of Alexandria, but is probably a compilation of later date, founded on two older collections. It is now agreed that the fragments of the Elements of Ethics (Πλοτικά στοιχεία) preserved in Stobaeus are from a work by a Stoic named Hierocles, contemporary of Epictetus, who has been identified with the Hierocles Stoicus vir sanctus et gravis in Aulus Gellius (ix. 5. 8). This theory is confirmed by the discovery of a papyrus (ed. H. von Arnim in Berliner Akademie, iv. 1906; see also C. Prächtler, Hierocles de Stoiker, 1901).
Hieroglyphics are the ancient Egyptian system of pictorial writing that used hieroglyphs, sacred and shaped characters. It is now used for various systems of writing in which figures of objects represent the place of conventional signs. Characters which symbolize the idea of a thing without expressing the name of it are generally styled "ideographs" (Gr. ἱερογλυφος, Sacred, and γράφω, to write, e.g., the Chinese characters. See Egypt, Language, Cuneiform; Inscriptions and Writing.

Hieronymites, a common name for three or four congregations of hermits living according to the rule of St Augustine with supplementary regulations taken from St Jerome's writings. Their habit was white, with a black cloak. (i) The Spanish Hieronymites, established near Toledo in 1374. The order soon became popular in Spain and Portugal, and in 1415 it numbered 23 houses. It possessed some of the most famous monasteries in the Peninsula, including the royal monastery of Batalha near Lisbon, and the magnificent monastery built by Philip II. at the Escorial. Though the manner of life was very austere the Hieronymites devoted themselves to studies and to the active work of the ministry, and they possessed great influence both at the Spanish and the Portuguese courts. They went to Spanish and Portuguese America and played a considerable part in Christianizing and civilizing the Indians. There were Hieronymites nun founded in 1375, who became very numerous. The order decayed during the 18th century and was completely suppressed in 1835. (ii) Hieronymites of the Observance, or of Lombardy: a reform of (i) effected by the third general in 1424; it embraced seven houses in Spain and seventeen in Italy, mostly in Lombardy. It is now extant, the vast majority of its houses. (iii) The English Hieronymite of St Jerome, established near Fiesole in 1377: it came to embrace nearly thirty houses which were only in Rome and one in Viterbo survive. (iv) Hieronymites of St Jerome of the congregation of Fiesole, established in 1465: they had forty houses but in 1668 they were united to (i).

See Helyot, Histoire de ordres religieux (1714), iii. cc. 57-60, iv. cc. 1-31 Max Heimbuch, Orden und Kriegsorganisationen (1896). i. § 70; and art. "Hieronymiten" in Herzog-Hauck, Realencyclopädie (ed. 3), and in Welte and Wetzer, Kirchenlexicon (ed. 2). (E. C. B.)

Hieronymus of Cardia, Greek general and historian, contemporary of Alexander the Great. After the death of the king he followed the fortunes of his friend and fellow-countryman Eumenes. He was wounded and taken prisoner by Antigonus, who pardoned him and appointed him superintendent of the asphalt beds in the Dead Sea. He was treated with equal friendliness by Antigonus's son Demetrius, who made him polemarch of Thessiae, and by Antigonus Gonatas, at whose court he died at the age of 104. He wrote a history of the Diadochi and their descendants, embracing the period from the death of Alexander to the war with Pyrrhus (325-272 B.C.), which is one of the chief authorities used by Diodorus Siculus (viii.-xx.) and by Plutarch in his Lives. He was also the author of several other official papers and was careful in his investigation of facts. His simplicity of his style rendered his work unpopular, but it is probable that it was on a high level as compared with that of his contemporaries. In the last part of his work he made a praiseworthy attempt to acquaint the Greeks with the character and early history of the Romans. He is reproached by Pausanias (i. 0. 8) with unfaithfulness towards all rulers with the exception of Antigonus Gonatas.

See Lucian, Macrobi, ii. 22; Plutarch, Demetrius, 39; Diod. Sic. xviii. 42. 44. 50, xix. 100; Dion. Halic. Ant. Rom. 15; F. Brückner, "De vita et scriptis Hieronymi Cardii" in Zeitschrift für die Alterthumswissenschaft (1842); F. Keuen, Hieronymus von Kardia (Leipzig, 1853); C. Wenzel, Einleitung in das Studium der alter Geschichte (1895): fragments in C. W. Müller, Frag. hist. Græc. ii. 450-461.

Hierro, or Ferro, an island in the Atlantic Ocean, forming part of the Spanish archipelago of the Canary Islands (q.v.). Pop. (1900) 6508; area 107 sq. m. Hierro, the most westerly and the smallest island of the group, is somewhat crescent-shaped. Its length is about 18 m., its greatest breadth about 17 m., and its circumference 30 m. It lies 92 m. W.S.W. of Teneriffe, while its coast is bound by high, steep rocks, which only admit of one harbor, for which the interior is tolerably level. Its hill-tops in winter are sometimes wrapped in snow. Fresh and more abundant grass grows here than on any of the other islands. Hierro is exposed to westerly gales which frequently inflict great damage. Fresh water is scarce, but there is a sulphurous spring, with a temperature of 102° Fahr. The once celebrated and almost sacred Til tree, which was reputed to be always distilling water in great abundance from its leaves, no longer exists. Only a small part of the cultivable land is under tillage, the inhabitants being principally employed in pasturage. Valverde (pop. about 3000) is the principal town. Geographers were formerly in the habit of measuring all longitudes from Ferro, the most westerly land known to them. The longitude assigned at first has, however, turned out to be erroneous; and the so-called "Longitude of Ferro" does not coincide with the actual longitude of the island.

Higdon (or Higden), Ranulf (c. 1299-c. 1363), English chronicler, was a Benedictine monk of the monastery of St Werburgh in Chester, in which he lived, it is said, for sixty-four years, and died "in a good old age," probably in 1363. Higdon was the author of a long chronicle, one of several such works based on a plan taken from Scripture, and written for the amusement and instruction of his society. It closes the long series of general chronicles, which were soon superseded by the invention of printing. It is mainly styled the Polychronicon, from the longer title Ranulfus Castrensis, cognomine Higdon, Polychronicon (see Historia Polychratica) ab initio mundi usque ad mortem regis Edwardi III. in septem libros dispositum. The work is divided into seven books, in humble imitation of the seven days of Genesis, and, with exception of the last book, is a summary of general history, a compilation made with considerable style and taste. It seems to have enjoyed no little popularity in the 15th century. It was the standard work on general history, and more than a hundred MSS. of it are known to exist. The Christ Church MS. says that Higdon wrote it down to the year 1342; the fine MS. at Christ's College, Cambridge, states that he wrote to the year 1344, after which date, with the omission of two years, John of Malvern, a monk of Worcester, carried the history on to 1357, at which date it ends. According, however, to its latest editor, Higdon's part of the work goes no farther than 1326 or 1327 at latest, after which time it was carried on by two continuators to the end. Thomas Gale, in his Hist. Brit. &c., scriptores, xv. (Oxon., 1601), published that portion of it, in the original Latin, which comes down to 1066. Three early translations of the Polychronicon exist. The first was made by John of Trevisa, chaplain to Lord Berkeley, in 1387, and was printed by Caxton in 1482; the second by an anonymous writer, was written between 1432 and 1450; the third, based on Trevisa's version, with the addition of an eighth book, was adversely criticized by Caxton. These versions are specially valuable as illustrating the change of the English language during the period they cover.

The Polychronicon, with the continuations and the English versions, was edited for the Rolls Series (No. 41) by Churchill Cuthbertson (vols. i. and ii.) and Joseph Rawson Lumby (1865-1868). This book was adversely criticized by Mandell Creighton in the Eng. Hist. Rev. for October 1888.

Higgins, Matthew James (1810–1868), British writer over the nom-de-plume "Jacob Omnium," which was the title of his first magazine article, was born in County Meath, Ireland.
HIGGINSON—HIGHLANDS

on the 4th of December 1810. His letters in The Times were instrumental in exposing many abuses. He was a frequent contributor to the Cornhill, and was a friend of Thackeray, who dedicated to him The Adventures of Philip, and one of his ballads, "Jacob Omnium's Hose," deals with an incident in Higgins's career. He died on the 14th of August 1868. Some of his articles were published in 1875 as Essays on Social Subjects. Higgins, Thomas Wentworth (1818-1902), an American author and soldier, was born in Cambridge, Massachusetts, on the 22nd of December 1833. He was a descendent of Francis Higginson (1583-1639), who emigrated from Leicester shire to the colony of Massachusetts Bay and was a minister of the church of Salem, Mass., in 1630-1630; and a grandson of Stephen Higginson (1743-1825), a Boston merchant, who was a member of the Continental Congress in 1783, took an active part in suppressing Shays's Rebellion, was the author of the "Laco" letters (1780), and rendered valuable services to the United States government as navy agent from the 11th of May to the 2nd of June 1788. Graduating from Harvard in 1845, he was a schoolmaster for two years, studied theology at the Harvard Divinity School, and was pastor in 1845-1850 of the First Religious Society (Unitarian) of Newburyport, Massachusetts, and of the Free Church at Worcester in 1852-1858. He was a Free Soil candidate for Congress (1850), but was defeated; was indicted with Wendell Phillips and Theodore Parker for participation in the attempt to release the fugitive slave, Anthony Burns, in Boston (1853); was engaged in the effort to make Kansas a free state after the passage of the Kansas-Nebraska Bill of 1854; and during the Civil War was captain in the 2nd Massachusetts Cavalry, and from November 1862 to October 1864, when he was retired because of a wound received in the preceding August, was colonel of the First South Carolina Volunteers, the first regiment recruited from former slaves for the Federal service. He described his experiences in Army Life in a Black Regiment (1875). In politics Higginson was successively a Republican, an Independent and a Democrat. His writings show a deep love of nature, art and humanity, and are marked by vigour of thought, sincerity of feeling, and grace and finish of style. In his Common Sense About Women (1881) and his Women and Men (1888) he advocated equality of opportunity and equality of rights for the two sexes.

Among his numerous books are Outdoor Papers (1863); Malbone: an Oldport Romance (1866); Life of Margaret Fuller Ossoli (in "American Men of Letters" series, 1884); A Larger History of the United States, from the Earliest Period to the Close of President Jackson's administration (1885); The Monarch of Dreams (1886); Travellers and Outlaws (1886); The Afternoon Landscape (1889), poems and travel sketches; Higginson's Kindred (1889); The Last President, Chronicles of a Time of Strange Happenings (1891); Concerning All of Us (1892): The Procession of the Flowers and Kindred Papers (1897); Henry Wadsworth Longfellow (in "American Men of Letters" series, 1902); John Greenleaf Whittier (in "English Men of Letters" series, 1902); A Reader's History of American Literature (1903), the Lowell Institute lectures for 1903, edited by Henry W. Boynton; and Life and Times of Stephen Higginson (1897). His volumes of reminiscence, Cheerful Yesterdays (1898), and Cabot (1898), and Captain Cabot was the first of Higginson's almshouses. Worthington Stone, at the foot of Highgate Hill, on which the future mayor of London is reputed to have been resting when he heard the peal of Bow bells and "turned again." Highgate grammar school was founded (1562-1565) by Sir Roger Cholmley, chief-justice. St. Joseph's Retreat is the mother-house of the Passionist Fathers in England. There is an extensive and beautiful cemetery on the slope below the church of St Michael.

HIGHLANDS, THE, that part of Scotland north-west of a line drawn from Dumfriesshire to Stonehaven, including the Inner and Outer Highlands and the county of Bute, but excluding the Orkneys and Shetlands, Caithness, the flat coastal land of the shires of Nairn, Elgin and Banff, and all East Aberdeen (see Scotland). This area is to be distinguished from the Lowlands by language and race, the preservation of the Gaelic speech being characteristic. Even in a historical sense the Highlanders were a separate people from the Lowlanders, with whom, during many centuries, they shared nothing in common. The town of Inverness is usually regarded as the capital of the Highlands. The Highlands consist of an old dissected plateau, or block, of ancient crystalline rocks with incised valleys and lochs carved by the action of mountain streams and by ice, the resulting topography being a wide area of irregularly distributed

in the widespread local industry of shoe-making. The town is governed by a mayor, 4 aldermen and 12 councillors, Area, 1945 acres.

Higham (Hecham, Heccam, Higham Ferers) was evidently a large village before the Domesday Survey. It was then held by William Peverel of the king, but on the forfeiture of the lordship by his son it was granted in 1199 to William Ferers, earl of Derby. On the outlawry of Robert his grandson it passed to Edmund, earl of Lancaster, and, reverting to the crown in 1322, was granted to Aymer de Valence, earl of Pembroke, but escheated to the crown in 1327, and was granted to Henry, earl of Lancaster. The castle, which may have been built before Henry III visited Higham in 1209, is mentioned in 1322, but had been destroyed by 1540. It appears by the confirmation of Henry III in 1251 that the borough originated in the previous year when William de Ferrers, earl of Derby, manumitted by charter ninety-two persons, granting they should have a free borough. A mayor was elected from the beginning of the reign of Richard II., while a town hall is mentioned in 1395. The revenues of Chichele's college were given to the corporation by the charter of 1566, whereby the borough returned one representative to parliament, a privilege enjoyed until 1832. James I. in 1604 gave the mayor the commission of the peace with other privileges which were confirmed by Charles II. in 1664. The old charters were surrendered in 1684 and a new grant obtained; a further charter was granted in 1887.

Highgate, a northern district of London, England, partly in the metropolitan borough of St. Pancras, but extending into Middlesex. The central area consists of detached houses and villages and the upper slopes of they elevation being 426 ft. The Great North Road passes through Highgate, which is supposed to have received its name from the toll-gate erected by the bishop of London when the road was formed through his demesne in the 14th century. It is possible, however, that "gate" is used here in its old signification, and that the name means simply high road. The road rose so steeply here that in 1812 an effort was made to lessen the slope for coaches by means of an archway, and a new way was completed in 1890. In the time of stage-coaches a custom was introduced of making ignorant persons believe that they required to be sworn and admitted to the freedom of the Highgate before being allowed to pass the gate, the fine of admission being a bottle of wine. Not a few famous names occur among the former residents of Highgate. Bacon died here in 1626; Coleridge and Andrew Marvell, the poets, were residents. Cromwell House, now a convalescent home, was presented by Oliver Cromwell to his eldest daughter Bridget on her marriage with Henry Ireton (January 15, 1646/7). Lauderdale House, now attached to the public grounds of Waterlow Park, belonged to the Duke of Lauderdale, one of the Cabals of Charles II. Among various institutions may be mentioned Whittington's almshouses, founded by John Whittington Stone, at the foot of Highgate Hill, on which the future mayor of London is reputed to have been resting when he heard the peal of Bow bells and "turned again." Highgate grammar school was founded (1562-1565) by Sir Roger Cholmley, chief-justice. St. Joseph's Retreat is the mother-house of the Passionist Fathers in England. There is an extensive and beautiful cemetery on the slope below the church of St Michael.

HIGHLANDS, THE, that part of Scotland north-west of a line drawn from Dumfriesshire to Stonehaven, including the Inner and Outer Highlands and the county of Bute, but excluding the Orkneys and Shetlands, Caithness, the flat coastal land of the shires of Nairn, Elgin and Banff, and all East Aberdeen (see Scotland). This area is to be distinguished from the Lowlands by language and race, the preservation of the Gaelic speech being characteristic. Even in a historical sense the Highlanders were a separate people from the Lowlanders, with whom, during many centuries, they shared nothing in common. The town of Inverness is usually regarded as the capital of the Highlands. The Highlands consist of an old dissected plateau, or block, of ancient crystalline rocks with incised valleys and lochs carved by the action of mountain streams and by ice, the resulting topography being a wide area of irregularly distributed
highness—high place

mountains whose summits have nearly the same height above sea-level, but whose bases depend upon the amount of denuda-
tion to which the plateau has been subjected in various places.
The term "highland" is used in physical geography for any
elevated mountainous plateau.

**Highness**, literally the quality of being lofty or high, a
term used, as are so many abstractions, as a title of dignity and
honour, to signify exalted rank or station. These abstractions
arose in great profusion in the Roman empire, both of the
East and West, and "highness" is to be directly traced to the
altitudo and celsitudo of the Latin and the ψηλότης of the
Greek emperors. Like other "exorbitant and swelling attrib-
utes" of the time, they were conferred on ruling princes
generally. In the early middle ages such titles, couched in
the second or third person, were "uncertain and much more
arbitrary (according to the fancies of secretaries) than in the
later times" (Selden, *Titles of Honour*, pt. i. ch. vii. 100).
In English usage, "Highness" alternates with "Grace" and
"Majesty," as the honorific title of the king and queen until
the time of James I. Thus in documents relating to the
reign of Henry VIII. all three titles are used indiscriminately; an
example is the king's judgment against Dr Edward Crome
(d. 1562), quoted, from the lord chamberlain's books, ser. 1,
14, "Kinges Highnes hath ordered, 16 with "Kinges Majestye," and 17 with "Kinges Grace."
In the Dedication of the Authorized Version of the Bible of 1611
James I. is still styled "Majesty" and "Highness"; thus,
in the first paragraph, "the appearance of Your Majesty, as
of the Sun in his strength, instantly dispelled those supposed
and surmised mists... especially when we behold the govern-
ment established in Your Highness and Your hopeful Seed,
by an undoubted title." It was, however, in James 1.'s
reign that "Majesty" became the official title. It may
be noted that Cromwell, as lord protector, and his wife
were styled "Highness." In present usage the following
members of the British Royal Family are addressed as "Royal
Highness" (HRH): all sons and daughters, brothers and
sisters, uncles and aunts of the reigning sovereign, grandsons
and granddaughters if children of sons, and also great grand-
children (decree of 21st of May 1808) if children of an eldest
son of any prince of Wales. Nephews, nieces and cousins and
grandchildren, offspring of daughters, are styled "Highness"
only. A change of sovereign does not entail the forfeiture
of the title "Royal Highness," once acquired, though the
father of the bearer has become a nephew and not a grandson
of the sovereign. The principal feudalatory princes of the Indian
empire are also styled "Highness."

As a general rule the members of the blood royal of an Imperial
or Royal house are addressed as "Imperial" or "Royal High-
ness" (*Altesse Impériale*, *Royale*, *Kaiserrliche*, *Königliche* *Hoheit*
respectively. In Germany the reigning heads of the Grand
Duchies bear the title of Royal or Grand Ducal Highness
(*Königliche* or *Groß-Herzoglische* *Hoheit*), while the members
of the family are addressed as *Hoheit*, Highness, simply. *Hoheit*
is borne by the reigning dukes and the princes and princesses
of their families. The title "Serene Highness" has also
an antiquity equal to that of "highness," for γαλαύρωτις and
μεσαριτις were titles borne by the Byzantine rulers, and *serenitas*
and *serenissimus* by the emperors Honorius and Arcadius.
The doge of Venice was also styled *Serenissimus*. Selden
(*op. cit.* pt. ii. ch. x. 739) calls this title "one of the greatest
that can be given to any Prince that hath not the superior
title of King." In modern times *Serene Highness* (or "seren-
stitissimo") is used as the equivalent of the German *Durchlaucht*,
a stronger form of *Erlaucht*, illustrious, represented in the
Latin honorific *superillustrius*. Thackeray's burlesque title
"Transparency" in the court at Pumpernickel very accurately
gives the meaning. The title of *Durchlaucht* was granted in
1375 by the emperor Charles IV. to the electoral princes (*Kur-
fürsten*). In the 17th century it became the general title borne
by the heads of the reigning princely states of the empire
(reichstädtische Fürsten), as *Erlaucht* by those of the county
houses (reichstädtische Grafen). In 1825 the German Diet
agreed to grant the title Durchlaucht to the heads of the media-
tized princely houses whether domiciled in Germany or Austria,
and it is now customary to use it of the members of those
houses. Further, all those who are elevated to the rank of
prince (*Fürst*) in the secondary meaning of that title (see *Prince*)
are also styled *Durchlaucht*. In 1829 the title of *Erlaucht*,
which had formerly been borne by the reigning counts of the
empire, was similarly granted to the mediatized county families
(see *Almanach de Gotha*, 1909, 107).

**High Place**, in the English version of the Old Testament,
the literal translation of the Heb. *bámah*. This rendering is
eytymologically correct, as the Hebrew was from the root *bá-
*mah* (the plural in such expressions as to ride, or stalk, or stand
on the high places of the earth, the sea, the clouds, and from the
corresponding usage in Assyrian; but in prose *bámah* is always
a place of worship. It has been surmised that it was so called
because the places of worship were originally upon hill-tops,
or that the *bámah* was an artificial platform or mound, perhaps
imitating the natural eminence which was the oldest holy
place, but neither view is historically demonstrable. The
development of the religious significance of the word took
place probably not in Israel but among the Canaanites, from
whom the Israelites, in taking possession of the holy places of
the land, adopted the name also.

In old Israel every town and village had its own place
of sacrifice, and the common name for these places was *bámah*,
which is synonymous with *níkbásh*, holy place (Amos vii.
9; Isa. xi. 12, &c.). From the Old Testament and from
existing remains a good idea may be formed of the appearance
of such a place of worship. It was often on the hill above
the town, as at Ramah (1 Sam. ix. 12-14); there was a stele
(massgabáh), the seat of the deity, and a wooden post or pole
(ashéráh), which marked the place as sacred and was itself
an object of worship; there was a stone altar, often of con-
siderable size and hewn out of the solid rock or built of unhewn
stones (Ex. xx. 24; see *Altar*), on which offerings were burnt
(mízábâh, lit. "slaughter place"); a cistern for water, and
perhaps low stone tables for dressing the victims; sometimes
also a hall (*lishkháh*) for the sacrificial feasts.

Around these places the religion of the ancient Israelite
centred; at festival seasons, or to make or fulfil a vow, he
might journey to more famous sanctuaries at a distance from
his home, but ordinarily the offerings which linked every side
of his life to religion were paid at the *bámah* of his own town.
The building of royal temples in Jerusalem or in Samaria made
no change in this respect; they simply took their place beside
the older sanctuaries, such as Bethel, Dan, Gilgal, Beersheba,
to which they were, indeed, inferior in repute.

The religious reformers of the 8th century assimilat the popular
religion as corrupt and licentious, and as fostering the mon-
strous delusion that immoral men can buy the favour of God by
worship; but they make no difference in this respect between
the high places of Israel and the temple in Jerusalem (cf. Amos
v. 21 sqq.; Hos. iv.; Isa. i. 10 sqq.); Hosea stigmatizes the whole
cultus as pure heathenism—Canaanite baal-worship adopted by
apostate Israel. The fundamental law in Deut. xii. prohibits
sacrifice at every place except the temple in Jerusalem; in ac-
cordance with this law Josiah, in 621 B.C., destroyed and desecrated
the altars (*bámoláh*) throughout his kingdom, where Yahweh had
been worshipped from time immemorial, and forcibly removed
their priests to Jerusalem, where they occupied an inferior rank
in the priesthood. From the middle of the 7th and 6th centuries
the word *bámoláh* connotes "seat of heathenish or idolatrous worship"; and the historians of the period apply the
term in this opprobrious sense not only to places sacred to other
gods but to the old holy places of Yahweh in the cities and
villages of Judah, which, in their view, had been illegitimate
from the building of Solomon's temple, and therefore not really
seats of the worship of Yahweh; even the most pious kings of

1 Several altars of this type have been preserved.
HIGH SEAS—HIGHWAY

457

Judah are censured for tolerating their existence. The reaction which followed the death of Josiah (608 B.C.) restored the old altars of Yahweh; they survived the destruction of the temple in 586, and it is probable that after its restoration (520-516 B.C.) they only slowly disappeared, in consequence partly of the natural predominance of Jerusalem in the little territory of Judaea, partly of the gradual establishment of the supremacy of the written law over custom and tradition in the Persian period.

It may not be superfluous to note that the deuteronomistic dogma that sacrifice can be offered to Yahweh only at the temple in Jerusalem was never fully established either in fact or in legal theory. The Jewish military colonists in Elephantine in the 5th century B.C. had their altar of Yahweh beside the high way; the Jews in Egypt in the Ptolemaic period had, besides many local sanctuaries, one greater temple at Leontopolis, with a priesthood whose claim to "valid orders" was much better than that of the High Priests in Jerusalem, and the legitimacy of which will be admitted even by the Palestinian rabbis. See Badíi, "Hôhendiem," Protestantische Realencyclopadie, viii. 177-195; Florenus, Le Lien des deux mondes, partie II, Études bilatérales: rituelle des Hébreux (1894); v. Gall, Allitarische Kultstätte (1898).

HIGH SEAS, an expression in international law meaning all those parts of the sea not under the sovereignty of adjacent states. Claims have at times been made to exclusive dominion over large areas of the sea as well as over wide margins, such as a 100 m., 60 m., range of vision, &c., from land. The action and reaction of the interests of navigation, however, have brought states to adopt a limitation first enunciated by Bynkershoek in the formula "terrae dominium finitum ubi finitum arborum vis." The variation in the limits which cannon-shot range became the determining factor in the fixation of the margin of sea afterwards known as "territorial waters" (p.e.). With the exception of these territorial waters, bays of certain dimensions and inland waters surrounded by territory of the same state, and serving only as a means of access to ports of the state by whose territory they are surrounded, and some waters allowed by immemorial usage to rank as territorial, all seas and oceans form part of the high sea. The usage of the high sea is free to all the nations of the world, subject only to such restrictions as result from respect for the equal rights of others, and to those which nations may contract with each other to observe. An interesting case affecting land-locked seas was that of the Emperor of Japan v. The Peninsular and Oriental Steam Navigation Company, in which a collision had taken place in the inland sea of Japan. The British Supreme Court at Shanghai declared this sea to form part of the high sea. On appeal to the privy council, the appellants were successful. Though the decision of the Shanghai court on the point in question was not dealt with by the privy council, Japan continues to treat her inland sea as under her exclusive jurisdiction.

HIGHWAY, a public road over which all persons have a full right of way—walking, riding or driving. Such roads in England for the most part either are of immemorial antiquity or have been created under the authority of an act of parliament. But a private owner may create a highway at common law by dedicating the soil to the use of the public for that purpose; and the using of a road for a number of years, without interruption, will support the presumption that the soil has been so dedicated. At common law the parish is required to maintain all highways within its bounds; but by special custom the obligation may attach to a particular township or district, and in certain cases the owner of land is bound by the conditions of his holding to keep a highway in repair. Breach of the obligation is treated as a criminal offence, and is prosecuted by indictment. Bridges, on the other hand, and so much of the highway as is immediately connected with them, are as a general rule a charge on the county; and by 22 Henry VIII. c. 5 the obligation of the county is extended to 300 yds. of the highway on either side of the bridge. A bridge, like a highway, may be a burden on neighbouring land: ratio leges lenae. Private owners so burdened may sometimes claim a special toll from passengers, called a "toll traverse."

Extensive changes in the English law of highways have been made by various highway acts, viz. the Highway Act 1835, and amending acts of 1862, 1864, 1878 and 1891. The leading principle of the Highway Act 1835 is to place the highways under the direction of parish surveyors, and to provide for the necessary expenses by a rate levied on the occupiers of land. It is the duty of the surveyor to keep the highways in repair; and if a highway is out of repair, the surveyor may be summoned before justices and convicted in a penalty not exceeding £5, and ordered to complete the repair within a limited time. The surveyor is likewise specially charged with the removal of nuisances on the highway. A highway nuisance may be abated by any person, and may be made the subject of indictment at common law. The amending acts, while not interfering with the operation of the principal act, authorize the creation of highway districts on a larger scale. The justices of a county may convert it or any portion of it into a highway district to be governed by a highway board, the powers and responsibilities of which will be the same as those of the parish surveyor under the former act. The board consists of representatives of the various parishes, called "way wardens," together with the justices for the county residing within the district. Salaries and similar expenses incurred by the board are charged on a district fund to which the several parishes contribute; but each parish remains separately responsible for the expenses of maintaining its own highways. By the Local Government Act 1888 the entire maintenance of main roads was thrown upon county councils. The Public Health Act 1875 vested the powers and duties of surveyors of highways and vestries in urban authorities, while the Local Government Act 1894 transferred to the district councils of every rural district all the powers of rural sanitary authorities and highway authorities (see England: Local Government).

The Highway Act of 1835 specified as offences for which the driver of a carriage on the public highway might be punished by a fine, in addition to any civil action that might be brought against him—riding upon the cart, or upon any horse drawing it, and not having some other person to guide it, unless there be some person driving it; negligence causing damage to person or goods being conveyed on the highway; quitting his cart, or leaving control of the horses, or leaving the cart so as to be an obstruction on the highway; not having the owner's name painted upon; refusing to give the same; and not keeping on the left or near side of the road, when meeting any other carriage or horse. This rule does not apply in the case of a carriage meeting a foot-passenger, but a driver is bound to use due care to avoid driving against any person crossing the highway on foot. At the same time a passenger crossing the highway is also bound to use due care in avoiding vehicles, and the mere fact of a driver being on the wrong side of the road would not be evidence of negligence in such a case.

The "rule of the road" given above is peculiar to the United Kingdom. Cooley's treatise on the American Law of Torts states that "the custom of the country, in some states enacted into statute law, requires that when teams approach and are about to pass on the highway, each shall keep to the right of the centre of the travelled portion of the road." This also appears to be the general rule on the continent of Europe.

By the Lights on Vehicles Act 1907, all vehicles on highways in England and Wales must display to the front a white light during the period between one hour after sunset and one hour before sunrise. Locomotives and motor cars, being dealt with by special acts, are excluded from the operation of the act, as are bicycles and tricycles (dealt with by the Local Government Act 1888), and vehicles drawn or propelled by hand, but every machine or implement drawn by animals comes within the act. There are two exceptions: (1) vehicles carrying inflammable goods in the neighbourhood of places where inflammable goods are stored, and (2) vehicles engaged in harvesting. The public have a right to pass along a highway freely, safely and conveniently, and any wrongful act or omission which prevents them doing so is a nuisance, for the prevention and abatement of which the highways and other acts contain provisions. Generally, nuisance
to highway may be caused by encroachment, by interfering with the soil of the highway, by attracting crowds, by creating danger or inconvenience on or near the highway, by placing obstacles on the highway, by unreasonable user, by offences against decency and good order, &c.

The use of locomotives, motor cars and other vehicles on highways is regulated by acts of 1861–1903.

Formerly under the Turnpike Acts many of the more important highways were placed under the management of boards of commissioners or trustees. The trustees were required and empowered to maintain, repair and improve the roads committed to their charge, and the expenses of the trust were met by tolls levied on persons using the road. The various grounds of exemption from toll on turnpike roads were all of a public character, e.g. horses and carriages attending the sovereign or royal family, or used by soldiers or volunteers in uniform, were free from toll. In general horses and carriages used in agricultural work were free from toll. By the Highways and Locomotives Act of 1878 disturnpike roads became "main roads." Ordinary highways might be declared to be "main roads," and "main roads" be reduced to the status of ordinary highways.

In Scotland the highway system is regulated by the Roads and Bridges Act 1878 and amending acts. The management and maintenance of the highways and bridges is vested in county road trustees, viz. the commissioners of supply, certain elected trustees representing ratepayers in parishes and burghs. One of the consequences of the act was the abolition of tolls, statute-labour, causeway mail and other exactions for the maintenance of bridges and highways, and all turnpike roads became highways, and all highways became open to the public free of tolls and other exactions. The county is divided into districts under district committees, and county and district officers are appointed.

The expenses of highway management in each district (or parish), together with a proportion of the general expenses of the act, are levied by the trustees by an assessment on the lands and heritages within the district (or parish).

Highway, in the law of the states of the American Union, generally means a lawful public road, over which all citizens are allowed to pass and repass on foot, on horseback, in carriages and wagons. Sometimes it is held to be restricted to county roads as opposed to town-ways. In statutes dealing with offences connected with the highway, such as gaming, negligence of carriers, &c., "highway" includes navigable rivers. But in a statute punishing with death robbery on the highway, railways were held not to be included in the term. In one case it has been held that any way is a highway which has been used as such for fifty years.

See Glen, Law Relating to Highways; Pratt, Law of Highways, Main Roads and Bridges.

HIGINBOTHAM, GEORGE (1827–1893), chief-justice of Victoria, Australia, sixth son of T. Higinbotham of Dublin, was born on the 15th of April 1827, and educated at the Royal School, Dungannon, and at Trinity College, Dublin. After entering as a law student at Lincoln's Inn, and being engaged as reporter on the Morning Chronicle in 1849, he emigrated to Victoria, where he contributed to the Melbourne Herald and practised at the bar (having been "called" in 1853) with much success. In 1850 he became editor of the Melbourne Argus, but resigned in 1859 and returned to the bar. He was elected to the legislative assembly in 1861 for Brighton as an independent Liberal, was re-elected at the general election of the same year, but was returned nine months later. In 1863 he became attorney-general. Under his influence measures were passed through the legislative assembly of a somewhat extreme character, completely ignoring the rights of the other party and the country, and the government was carried on without any Appropriation Act for more than a year.

Mr Higinbotham, by his eloquence and earnestness, obtained great influence amongst the members of the legislative assembly, but his colleagues were not prepared to follow him as far as he desired to go. He contended that in a constitutional colony like Victoria the secretary of state for the colonies had no right to fetter the discretion of the queen's representative.

Higinbotham did not return to power with his chief, Sir James M'Culloch, after the defeat of the short-lived Sladen administration; and being defeated for Brighton at the next general election by a comparatively unknown man, he devoted himself to his practice at the bar. Amongst his other labours as attorney-general he had codified all the statutes which were in force throughout the colony. In 1874 he was returned to the legislative assembly for Brunswick, but after a few months he resigned his seat. In 1880 he was appointed a puisne judge of the supreme court, and in 1886, on the retirement of Sir William Stawell, he was promoted to the office of chief justice.

Mr Higinbotham was appointed president of the International Exhibition held at Melbourne in 1880–81, but did not take any active part in its management. One of his latest public acts was to subscribe a sum of £10, ros. a week towards the funds of the strikers in the great Australian labour dispute of 1890, an act which did not meet with general approval. He died in 1893.

HILARIAN, ST (C. 200–371), abbot, the first to introduce the monastic system into Palestine. The chief source of information is a life written by St Jerome; it was based upon a letter, no longer extant, written by St Epiphanius, who had known Hilarion. The accounts in Sozomen also mainly based on Jerome's Vita; but Otto Zöcker has shown that Sozomen also had at his disposal authentic local traditions (see "Hilarius von Poitiers," in the Neuteutsche Zeitschrift: v. 1893, p. 283). The most important study on Hilarion, which is written against the hypercritical school of Weingarten and shows that Hilarion must be accepted as an historical personage and the Vita as a substantially correct account of his career. He was born of heathen parents at Tabathara near Gaza about 290; he was sent to Alexandria for his education and there became a convert to Christianity; about 306 he visited St Anthony and became his disciple, embracing the eremitical life. He returned to his native place and for many years lived as a hermit in the desert by the marshes on the Egyptian border. Many disciples put themselves under his guidance; but his influence must have been limited to south Palestine, for there is no mention of him in the acts.

Hilarion was born at Poitiers about the end of the 3rd century a.d. His parents were pagans of distinction. He received a good education, including what had even then become somewhat rare in the West, some knowledge of Greek. He studied, later on, the Old and New Testament writings, with the result that he abandoned his neo-platonism for Christianity, and with his wife and his daughter received the sacrament of baptism. So great was the respect in which he was held by the citizens of Poitiers that about 353, although still a married man, he was unanimously elected bishop. At that time Arianism was threatening to overthrust the Western Church, and the Arians were under the leadership of Constantius (son of Constantine the Great). The Emperor Valens, the Arian bishop, was defeated at the Battle of the Milvian Bridge in 312, and the Arian Church was completely ignominiously expelled from the empire. Hilarian, the bishop of Poitiers, was one of the chief reasons why the Emperor Gratian was now able to take on his shoulders the burden of the Arian Church and the Church of the Western Empire. Hilarian was summoned to the Council of Arles in 314, and it was there that he was named an orthodox father, and the Church of the Western Empire was definitely restored to orthodoxy. Hilarian was constantly opposed by the Arian Church, and he was finally deposed and exiled by the Emperor Theodosius I in 387.

Hilarian was one of the chief authors of the Arian controversy, and was one of the chief opponents of the Arian Church. His life was one of constant struggle, and he died on 29th November 390.
Constantius with the prepared purpose of settling the long-standing disputes, Hilary was by an imperial rescript banished with Rhodanus to Toulouse to Phrygia, in which exile he spent nearly four years. Hence, however, he continued to govern his diocese; while he found leisure for the preparation of two of the most notable of the compositions on dogmatic and polemical theology, the De synodos or De fide Orientalium, an epistle addressed in 358 to the Semi-Arian bishops in Gaul, Germany and Britain, expounding the true views (sometimes veiled in ambiguous words (of the Oriental bishops on the Nicene controversy, and the De trinitate libri xii, composed in 359 and 360, in which, for the first time, a successful attempt was made to express in Latin the theological subtleties elaborated in the original Greek. The former of these works was not entirely approved by some members of his own party, who thought the plan shown great error for the Arians; to their criticisms he replied in the Apologetica ad reprehensorum libri de synodis responsa. In 360 Hilary attended the convocation of bishops at Seleucia in Isauria, where, with the Egyptian Athanasians, he joined the Homoiomaios majority against the Arianizing party headed by Acacius of Caesarea, thence he went to Constantinople, and, in a petition (Ad Constantinum Augustum liber secundus) personally presented to the emperor in 360, repudiated the calumnies of his enemies and sought to vindicate his trinitarian principles. His urgent and repeated request for a public discussion with his opponents, especially with Ursacius and Valens, proved at last so inconvenient that he was sent back to his diocese, which he appears to have reached about 361, within a very short time of the accession of Julian. He was occupied for two or three years in combating Arianism within his diocese; but in 364, extending his efforts once more beyond Gaul, he impeached Auxentius, bishop of Milan, and a man high in the imperial favour, as heterodox. Summoned to appear before the emperor (Valentinian) at Milan and there maintain his charges, Hilary had the mortification of hearing the supposed heretic give satisfactory answers to all the questions proposed; nor did his (double) sincere denunciation of the metropolitan as a hypocrite save himself from an ignominious expulsion from Milan. In 365 he published the Contra Arianos vel Auxentium Mediolanensem liber, in connexion with the controversy; and also (but perhaps at a somewhat earlier date) the Contra Constantinum Augustum liber, in which he pronounced that lately deceased emperor to have been Antichrist, a rebel against God, "a tyrant whose sole object had been to make a gift to the devil of that world for which Christ had suffered." Hilary is sometimes regarded as the first Latin Christian hymn-writer, but all his compositions show a short sight and limited value. The later years of his life were spent in comparative quiet, devoted in part to the preparation of his expositions of the Psalms (Tractatus super Psalmos), for which he was largely indebted to Origen; of his Commentarius in Evangelium Matthaei, a work on allegorical lines of no exegetical value; and of his no longer extant translation of Origen's commentary on Job. While he thus closely followed the two great Alexandrians, Origen and Athanasius, in exegesis and Christology respectively, his work shows many traces of vigorous independent thought. He died in 367; no more exact date is archaeologically determinable. The later rank among the Latin writers of his century. Designated already by Augustine as 'the illustrious doctor of the church,' he by his works exerted an increasing influence in later centuries; and by Pius IX. he was formally recognized as "universae ecclesiae doctor" at the synod of Bordeaux in 1831. Hilary's day in the Roman calendar is the 13th of January.\footnote{1}

HILLARIUS—HILARIUS, ST (ARLES) 459

Literature.—The life by (Venantius) Fortunatus c. 550 is almost worthless. More trustworthy are the notices in Jerome (De vir. 100, Coloss. Severus (Chron. ii. 39–45) and in Hilary's own writings, especially his Apologiae (1846); O. Bardenbner, Pairalogie; A. Harrack, Hist. of Dogma, esp. vol. iv.; F. Loofs, in Herzog-Hauck's Realencyc. viii.

HILARIUS, or HILARY, (HILARY), bishop of Rome from 461 to 468, is known to have been a deacon and to have acted as legate of the Great at the "robber" synod of Ephesus in 449. There he so vigorously defended the conduct of Flavian in deposing Eutyches that he was thrown into prison, whence he had great difficulty in making his escape to Rome. He was chosen to succeed Leo I on the 13th of November 461, and in 465 he held at Rome a council which put a stop to some abuses, particularly to that of bishops appointing their own successors. His pontificate was also marked by a successful encroachment of the papal authority on the metropolitan rights of the French and Spanish hierarchy, and by a resistance to the toleration edict of Anemuth, which ultimately caused it to be recalled. Hilary died on the 17th of November 467, and was succeeded by Simplicius.

HILARIUS, byfl. 1125), a Latin poet who is supposed to have been Englishman. He was one of the pupils of Abelard at his oratory of Paraclete, and addressed to him a couple of verses with its refrain in the vulgar tongue, "Tort aves vos li meo", Abelard having threatened to discontinue his teaching because of certain reports made by his servant about the conduct of the scholars. Later Hilarius made his way to Angers. His poems are contained in MS. sup. lat. 1508 of the Bibliothèque Nationale, Paris, purchased in 1837 at the sale of M. de Rosny. Quotations from this MS. had appeared before, but in 1838 it was edited by Champollion Figeac as Hilarii versus et ludi. His works consist of a number of Latin and miscellaneous verses, of which none are addressed to an English nun named Eva, lines "Anx splendor puelluarum, genera domina," and another poem describes the beauties of the priory of Chalouette la Petite, in the diocese of Sens, of which the writer was then an inmate. One copy of satirical verses seems to aim at the pope himself. He also wrote three miracle plays in rhymer Latin with an admixture of French. Two of them, Suciatio Lasari and Historia de Daniel representanda, are purely liturgical type. At the end of Lazarus is a stage direction to the effect that if the performer has been given at matins, Lazarus should proceed with the Mass at Te Deum, if not. The other, Ludus super iconia Sancti Nicolai, is founded on a sufficiently foolish legend. Petit de Julleville sees in the play a satirical intention and a veiled credulity that put the piece outside the category of liturgical drama.

A rhymed Latin account of a dispute in which the nuns of Ronceray at Angers were concerned, contained in a cartulary of Ronceray, is also ascribed to the poet, who there calls himself Hilaris Canonicus. The poem is printed in the Bibliothèque de l'Ecole des Chartes (vol. xxvii. 1876), and is dated by P. Marchegay from 1121. See also a note of Ch. Pichon in the same periodical. It is implemented (in xx. 627–630), s. s. Jean Bodel, by Paulin Paris; also Wright, Biographia Britannica literaria, Anglo-Norman Period (1846); and Petit de Julleville, Les Mystères (vol. i. 1880).

HILARIUS (HILARY), ST (c. 403–445), bishop of Arles, was born about 405. In early youth he entered the abbey of Lérins, then abbot and over by his bishop Honoratus (St. Honoratus), and succeeded Honoratus in the bishopric of Arles in 429. Following the example of St. Augustine, he is said to have organized his cathedral clergy into a "congregation," devoting a great part of their time to social exercises of ascetic religion. He held the rank of metropolitan of Vienne and Narbonne, and attempted to realize the sort of primacy over the church of south Gaul Easter. In the Inns of Court, Hilary is one of the four dining titans; it begins on the 11th of January and ends on the 1st of February. It is also the name of one of the terms at the universities of Oxford (more usually "lent term") and Dublin.
which seemed implied in the vicariate granted to his predecessor Patroclus (417). Hilarus deposed the bishop of Besançon (Chelidonius), for ignoring this primacy, and for claiming a metropolitan dignity for Besançon. An appeal was made to Rome, and Leo I. used it to extinguish the Gallican vicariate (A.D. 444). Hilarus was deprived of his rights as metropolitan to consecrate bishops, call synods, or exercise ecclesiastical oversight in the province, and the pope secured the edict of Valentinian III., so important in the history of the Gallican church, “ut episcopis Gallicanis omniumbus pro lege esse quintiud quidquid apostolicæ sedis nectoritas saxissis.” The papal claims were made imperial law, and violation of them subject to legal penalties (Novellæ Valenti. iii. tit. 16). Hilarus died in 449, and his name was afterwards introduced into the Roman martyrology for commemoration on the 5th of May. He enjoyed during his lifetime a high reputation for learning and eloquence as well as for piety; his extant works (Vita S. Honoratii Ardetensis episcopi and Metrum in Geneus) compare favourably with any similar literary productions of that period.

A poem, De providentia, usually included among the writings of Prosper, is sometimes attributed to Hilary of Arles.

HILDA, ST., strictly Hilda (614–680), was the daughter of Hereric, a nephew of Edwin, king of Northumbria. She was converted to Christianity before the year 614, according to Bede she took the veil in 614, when Oswo was king of Northumbria and Aidan bishop of Lindisfarne, and spent a year in East Anglia, where her sister Hereswith had married Æthelhere, who was to succeed his brother Anna, the reigning king. In 648 or 649 Hilda was recalled to Northumbria by Aidan, and lived for a year in a small monastic community north of the Wear. She then succeeded Heiu, the foundress, as abbess of Hartlepool, where she remained several years. From Hartlepool Hilda moved to Whitby, where in 657 she founded the famous double monastery which in the time of the first abbess included among its members five future bishops, Bosa, Ætta, Ætfor, John and Wilfrid II. as well as the poet Ceddmon. Hilda exercised great influence in Northumbria, and ecclesiastics from all over Christian England and from Strathclyde and Dalriada visited her monastery. In 655 after the battle of Winwaed Oswo entrusted his daughter Ælffled to Hilda, with whom she went to Whitby. At the synod of Whitby in 664 Hilda sided with Colman and Cedd against Wilfrid. In spite of the defeat of the Celtic party she remained hostile to Wilfrid until 679 at any rate. Hilda died in 680 after a painful illness lasting for seven years.

HILDBURGAUSEN, a town of Germany, in the duchy of Saxe-Meiningen, situated in a wide and fruitful valley on the river Werra, 10 m. S.E. of Meiningen, on the railway Eisenach-Lichtenfels. Pop. (1905) 7456. The principal buildings are a ducal palace, erected 1685–1695, now used as barracks, with a park in which there is a monument to Queen Louisa of Prussia, the old town hall, two Evangelical and a Roman Catholic church and a theatre. A technical college occupies the premises in which was built the old town hall, burnt down in 1813 and restored from 1828, when it removed hither from Gotha, until 1874, when it was transferred to Leipzig. A monument has been erected to those citizens who died in the Franco-Prussian War of 1870–71. The manufactures include linen fabrics, cloth, toys, buttons, optical instruments, agricultural machines, knives, mineral waters, condensed soups and condensed milk. Hildburghausen (in records Hilpertsbutzsa and Villa Hilderbutz) belonged in the 13th century to the counts of Henneberg, from whom it passed to the landgraves of Thuringia and then to the dukes of Saxony. In 1683 it became the capital of a principality which in 1826 was united to Saxe-Meiningen.

See K. A. Human, Chronik der Stadt Hildburghausen (Hildburghausen, 1888).

HILDEBERT, Hydalbert, Gildewart or Aldbert (c. 1055–1133), French writer and ecclesiastic, was probably the poor parent of Lavardin, near Védomes, and was intended for the church. He was probably a pupil of Berengarius of Tours, and became master (scholasticus) of the school at Le Mans; in 1091 he was made archdeacon and in 1096 bishop of Le Mans. He had to face the hostility of a section of his clergy and also of the English king, William II., who captured Le Mans and carried the bishop with him to England for about a year. Hildebert then travelled to Rome and sought permission to resign his bishopric, which Pope Paschal II. refused. In 1116 his diocese was thrown into great confusion owing to the preaching of Henry of Lausanne, who was denouncing the higher clergy; especially the bishop. Hildebert compelled him to leave the neighbourhood of Le Mans, but the effects of his preaching remained. In 1125 Hildebert was translated very unwillingly to the archbishopric of Tours, and there he came into conflict with the French king Louis VI. about the rights of ecclesiastical patronage and with the bishop of Dol about the authority of his see in Brittany. He presided over the synod of Nantes, and died at Tours probably on the 18th of December 1133. Hildebert, who built part of the cathedral at Le Mans, has received from some writers the title of saint, but there appears to be no authority for this. He was not of a very strict life; his contemporaries, however, had a very high opinion of him and he was called egregius versificator.

The extant writings of Hildebert consist of letters, poems, a few sermons, two lives and one or two treatises. An edition of the works of Hildebert appeared in 1775. G. J. M. Huguet, Vie, mort, et écrits de Hildebert, évêque de Tours (1854), showed great popularity in the 12th and 13th centuries, and were frequently used as classics in the schools of France and Italy. Those which concern the struggle between the emperor Henry V. and Pope Paschal II. have been edited by E. Sackur and printed in the Monumenta Germaniae historica. Libelli de lite ii. (1893). His poems, which deal with various subjects, are disfigured by many defects of style and metre, but they too were very popular. Hildebert attained celebrity also as a preacher both in French and Latin, but only a few of his sermons are in existence, most of the 144 attributed to him by his editors being the work of Peter Lombard and others. The Vitae written by Hildebert are the lives of Hugo, abbot of Cluny, and of St. Radegunda. Undoubtedly genuine is also his Liber de guerisonet et conjunct corrilis corit et spirilis seu animae. Hildebert was an excellent Latin scholar, being acquainted with Cicero, Ovid and other authors, and his spirit is rather that of a pagan than of a Christian writer.

HILDEBRAND, LAY OF (Das Hildebrandssied), a unique example of Old German alliterative poetry, written about the year 800 on the first and last pages of a theological manuscript, by two monks of the monastery of Fulda. The fragment, or rather fragments, only extend to sixty-eight lines, and the conclusion of the poem is wanting. The theory propounded by Karl Lachmann, that the poem had been written in its present form from memory, has been discredited by later philological investigation; it is clearly a transcript of an older original,
HILDEBRANDT, E.—HILDEGARD, ST

which the copyists—or more probably the writer to whom we owe the older version—imperfectly understood. The language of the poem shows a curious mixture of Low and High German forms; as the High German elements point to the dialect of Frankonia, the inference is that the copyists were reproducing an originally Low German lay in the form in which it was sung in Franconia.

The fragment is mainly taken up with a dialogue between Hildebrand and his son Hadubrand. When Hildebrand followed his master, Theodoric the Great, who was fleeing eastwards before Odoacer, he left his young wife and an infant child behind him. At his return to his old home, after thirty years' absence among the Huns, he is met by a young warrior and challenged to single combat. Before the fight begins, Hildebrand asks for the name of his opponent, and discovering his son, tries to avert the fight, but in vain; Hadubrand only regards the old man's words as the excuse of cowardice. "In sharp showers the ashen spears fall on the shields, and then the warriors seize their swords and how vigorously at the white shields until these are beaten to pieces. . . ." With these words the fragment breaks off abruptly, giving no clue as to the issue of the combat. There is little doubt, however, that, as in the Old Norse Annundar saga, where the tale is alluded to, the fight must have been fatal to Hildebrand. But in the later traditions, both Dutch and French, the names change: in the so-called Jängere Hildebrandslied—a German popular lay, preserved in several versions from the 15th to the 17th century—Hildebrand is simply represented as defeated, and obliged to recognize his father. The Old High German Hildebrandslied is dramatically conceived, and written in a terse, vigorous style; it is the only remnant that has come down from early Germanic times of an undoubtedly extensive ballad literature, dealing with the national sagas.

The MS. of the Hildebrandslied, originally in Fulda, is now preserved in the Landesbibliothek at Cassel. The literature on the poem will be found most conveniently in K. Mühlendorf and W. Scherer, Denkmäler deutscher Poesie und Presa aus dem VIII. bis XI. Jahrh. (1856), and W. Braune, Althochdeutsches Lesebuch, 5th ed. (1902), to which authorities the reader is referred for a critical text. The poem was discovered and first printed (as pros.) by J. G. von Eckhart, Commentarii de rébus Franciae orientalis (1729), i. 864 ff.; the first scholarly edition was that of the brothers Grimm (1832). Facsimile reproductions of the MS. have been published by W. Grimm (1830), E. Sievers (1872), and F. Könecke in his Hildebrandt (1887; 2nd ed., 1895) and E. Neuner (1897).

HILDEBRANDT, EDUARD (1818-1868), German painter, was born in 1818, and served as apprentice to his father, a house-painter at Danzig. He was not twenty when he came to Berlin, where he was taken in hand by Wilhelm Krause, a painter of sea piecés. Several early exhibitions after his death—of whom it is said that, in 1838, ships in a breeze off Swinemünde (1840), and other canvases of this and the following year—show Hildebrandt to have been a careful student of nature, with inborn talents kept down by the conventionalism of the formal school to which Krause belonged. Accident made him acquainted with masterpieces of French art displayed at the Berlin Academy, and these awakened his curiosity and envy. He went to Paris, where, about 1842, he entered the atelier of Isabey and became the companion of Lepoittevin. In a short time he sent home pictures which might have been taken for copies from these artists. Gradually he mastered the mysteries of touch and the secrets of effect in which the French at this period excelled. He also acquired the necessary skill in painting figures, and returned to Germany, skilled in the rendering of many kinds of landscape forms. His pictures of French street life, done about 1843, while impressed with the stamp of the Paris school, reveal a spirit eager for novelty, quick at grasping, equally quick at rendering, momentary changes of tone and atmosphere. After 1843 Hildebrandt, under the influence of Humboldt, extended his travels, and in 1864-1865 he went round the British Isles. While his experience became more familiar with the powers of concentration broke down. He lost the taste for detail in seeking for scenic breadth, and a fatal facility of hand diminished the value of his works for all those who look for composition and harmony of hue as necessary concomitants of tone and touch. In oil he gradually produced less, in water colours more, than at first, and his fame must rest on the sketches which he made in the latter form, many of them represented by chromo-lithography. Fantasies in red, yellow and opal, sunset, sunrise and moonshine, distances of hundreds of miles like those of the Andes and the Himalaya, narrow streets in the realisers of Cairo or Suez, panoramas as seen from mastheads, wide cities like Bombay or Pekin, narrow strips of desert with measureless expanses of sky—all alike display his quality of bravura. Hildebrandt died at Berlin on the 27th of October 1868.

HILDEBRANDT, THEODOR (1804-1874), German painter, was born at Stettin. He was a disciple of the painter Schadow, and, on Schadow's appointment to the presidency of a new academy in the Rhenish provinces in 1828, followed that master to Düsseldorf. Hildebrandt began by painting pictures illustrative of the Augustan age, and early in life sought to expand the traditions of the stage rather than the laws of nature. He produced rapidly "Faust and Mephistopheles" (1824), "Faust and Margaret" (1825), and "Lear and Cordelia" (1828). He visited the Netherlands with Schadow in 1829, and wandered alone in 1830 to Italy; but travel did not alter his style, though it led him to cultivate alternately eclecticism and realism. At Düsseldorf, about 1830, he produced "Romeo and Juliet," "Tancred and Clorinda," and other works which deserved to be classed with earlier paintings; but during the same period he began to "return to Shakespeare;" but in 1832, he took his "Captain and His Infant Son," examples of an affected but kindly manner which captivated the public, and marked to a certain extent an epoch in Prussian art. The picture which made Hildebrandt's fame is the "Murder of the Children of King Edward" (1836), of which the original, afterwards frequently copied, still belongs to the Spiegel collection at Halberstadt. Comparatively late in life Hildebrandt tried his powers as an historical painter in pictures representing Wolsey and Henry VIII., but he lapsed again into the romantic "Othello and Desdemona." After 1847 Hildebrandt gave himself up to portrait-painting, and in the course of the following year he succeeded in obtaining a large practice. He died at Düsseldorf in 1874.

HILDEGARD, ST (1098-1179), German abbess and mystic, was born of noble parents at Böckenheim, in the cantonship of Sponheim, in 1098, and from her eighth year was educated at the Benedictine cloister of Disibodenberg by Jutta, sister of the count of Sponheim, whom she succeeded as abbess in 1136. From earliest childhood she was accustomed to see visions, which increased in frequency and vividness as she approached the age of womanhood; these, however, she for many years kept almost secret, nor was it until she had reached her forty-third year (1141) that she felt constrained to divulge them. Committed to writing by her intimate friend the monk Godfried, they now form the first and most important of her printed works, entitled Scivias (probably an abbreviation for "scien vias" or "noce vias Domini") s. visionum et revelationum libri iii., and completed in 1151. In 1147 St Bernard of Clairvaux, while at Bingen preaching the new crusade, heard of Hildegard's revelations, and became so convinced of their reality that he not only wrote to her a letter cordially acknowledging her as a prophetess of God; but he also declared her recognition as such by his friend and former pupil Pope Eugenius III. in the synod of Trèves (1148). In the same year Hildegard migrated along with eighteen of her nuns to a new convent on the Rupertenberg near Bingen, over which she presided during the remainder of her life. By means of voluminous correspondence, as well as by extensive journeys.
HILDEN—HILDESHEIM

in the course of which she was unwarried in the exercise of her gift of prophecy, she wielded for many years an increasing influence upon her contemporaries—an influence doubtless due to the fact that she was imbued with the most vividly diffused feelings and beliefs, fears and hopes, of her time. Amongst her correspondents were Popes Anastasius IV. and Adrian V., the emperors Conrad IV. and Frederick I., and also the theologian Guibert of Gembloux, who submitted numerous questions in dogmatic theology for her determination. She died in 1279, but has never been canonized; her name, however, was received into the Roman martyrology in the 15th century, September 17th being the day fixed for her commemoration.

Her biography, which was written by two contemporaries, Godefrey of Paris and Théodoricus, was first printed in 1502, and in the Hildegard's writings, besides the Scivias already mentioned and first printed in Paris in 1513, include the Liber divinorum operum, Explantatio regulae S. Benedicti, Physica and the Letters, &c., are contained in Migne, Patr. Lat. t. excviii., and in Cardinal Pitra's Analecta sacra episcoporum Germaniae, vol. v. (1858).

For a modern study of the saint's writings, see Sainte Hildigrard de Bingen, by Paul Denis, in the Lettres françaises (Paris, 1905); and U. Chevalier, Répertoire des sources historiques, bio.-bibl. 2153.

HILDEN, a town in the Prussian Rhine province on the Iltal, 9 m. S.E. of Düsseldorf by rail. Pop. (1905) 13,946. It possesses an Evangelical and a Roman Catholic church and a monument to the emperor William I. Its manufactures include silks, velvets, carpets, calico-printing, machinery and brick-making.

HILDESHEIM, a town and episcopal see of Germany, in the Prussian province of Hanover, beautifully situated at the north foot of the Harz Mountains, on the right bank of the river Hildes, 18 m. S.E. of Hanover by railway, and on the main line from Berlin, via Magdeburg to Cologne. Pop. (1883) 20,386, (1905) 47,060. The town consists of an old and a new part, and is surrounded by ramparts which have been converted into promenades. Its streets are for the most part narrow and irregular, and contain many old houses with overhanging upper storeys and richly and curiously adorned wooden façades. Its religious edifices are five Roman Catholic and four Evangelical churches and a synagogue. The most interesting is the Roman Catholic cathedral, which dates from the middle of the 12th century and occupies the site of a building founded by the emperor Louis the Pious early in the 9th century. It is famous for its antiquities and works of art. These include the bronze doors and windows, the marble relief from the history of Adam and of Jesus Christ; a bronzen font of the 13th century; two large candelabra of the 11th century; the sarcophagus of St Godehard; and the tomb of St Epiphanius. In the cathedral also there is a bronze column 15 ft. high, adorned with reliefs from the life of Christ and dating from 1022, and another column, at one time thought to be an Irminsul, erected in honour of the Saxon idol Irmin, but now regarded as belonging to a Roman aqueduct. On the wall of the Romanesque crypt, which was restored in 1896, is a rose-bush, alleged to be a thousand years old; this sends its branches to a height of 24 ft. and a breadth of 30 ft., and they are trained to interface one of the church towers. Before the door of the choir is the pinnacled tower of St Peter's Church, with the chapel of St Anne, erected in 1321 and restored in 1888. The Romanesque church of St Godehard was built in the 12th century and restored in the 19th. The church of St Michael, founded by Bishop Bernward early in the 11th century and restored after injury by fire in 1186, contains a unique painted ceiling of the 12th century, the sarcophagus and monument of Bishop Bernward, and a bronze font; it is now a Protestant parish church, but the crypt is used by the Roman Catholics. The church of the Magdalene possesses two candelabra, a gold cross, and various other works in metal by Bishop Bernward; and the Lutheran church of St Andrew has a choir dating from 1359 and a height of 385 ft. high. In the suburb of Moritzberg there is an abbey church founded in 1049, the only pure columnar basilica in northern Germany.

The chief secular buildings are the town-hall (Rathaus), which dates from the 13th century and was restored in 1883-1892, adorned with frescoes illustrating the history of the city; the Tempelherrenhaus, in Late Gothic erroneously said to have been built by the Knights Templars; the Knochenueramuth, formerly the guild-house of the butchers, which was restored after being damaged by fire in 1812 and is probably the finest specimen of a wooden building in Germany; the Gildhaus, a Provincial monastery, used as a lunatic asylum; and the old Carthusian monastery. The Römer museum of antiquities and natural history is housed in the former church of St Martin; the buildings of Trinity hospital, partly dating from the 14th century, are now a factory; and the Wedekindhaus (1598) is now a savings-bank. The educational establishments include a Roman Catholic and a Lutheran gymnasium, a Roman Catholic school and college and two technical institutions, the Georgstift for daughters of state servants and a conservatoire of music. Hildesheim is the seat of considerable industry. Its chief productions are sugar, tobacco and cigars, staves, machines, vehicles, agricultural implements and bricks. Other trades are brewing and tanning. It is connected with Hanover by an electric tram line, 10 m. in length.

Hildesheim owes its rise and prosperity to the fact that in 822 it was made the seat of the bishopric which Charlemagne had founded at Elze a few years before. Its importance was greatly increased by St Bernward, who was bishop from 993 to 1022 and walled the town. By his example and patronage the art of working in metals was greatly stimulated. In the 13th century Hildesheim became a free city of the Empire; in 1249 it received municipal rights and about the same time it joined the Hanseatic league. Several of its bishops belonged to one or other of the great families of Germany; and gradually they became practically independent. The citizens were frequently quarrelling with the bishops, who also carried on wars with neighbouring princes, especially with the house of Brunswick-Lüneburg, under whose protection Hildesheim placed itself several times. The most celebrated of these struggles is the one known as the Hildesheimer Stiftsfehde, which broke out early in the 16th century when John, duke of Saxen-Lauenburg, was bishop. At first the bishop and his allies were successful, but in 1521 the king of Denmark and the duke of Brunswick overran his lands and in 1523 he made peace, surrendering nearly all his possessions. Much, however, was restored when Ferdinand, prince of Bavaria, was bishop (1612-1650), as this prince knew the importance of the disturbances caused by the Thirty Years' War to seize the lost lands, and at the beginning of the 17th century the extent of the prince bishopric was 682 sq. m. In 1801 the bishopric was secularized and in 1853 was granted to Prussia; in 1807 it was incorporated with the kingdom of Westphalia and in 1813 was transferred to Hanover. In 1866, along with Hanover, it was annexed by Prussia. In 1803 a new bishopric of Hildesheim, a spiritual organization only, was established, and this has jurisdiction over all the Roman Catholic churches in the centre of north Germany.

In October 1868 a unique collection of ancient Augustan silver plate was discovered on the Galgenberg near Hildesheim by workers in the Transept of the parish church of St Petri. This collection, known as the Hildesheimersch Schatzkammer or Monatshefte Historisch Kulturgeschichtliche, was opened to the public on 15th October 1913. This Hildesheimer Säumerfond excited great interest among classical archaeologists. Some authorities think that it is the actual plate which belonged to Drusus himself. The most noteworthy pieces are a crator richly ornamented with arabesques and figures of children, a platter with a representation of Minerva, another with one of the boy Hercules and another with one of Cybele. The collection is in the Kunsthistorisches Museum in Berlin.

HILDEBRAND, RICHARD (1807—1865), American journalist and author, was born at Deerfield, Massachusetts, on the 28th of June 1807, the son of Hosea Hildreth (1782—1833), a teacher of mathematics and later a Congregational minister. He was graduated from Harvard in 1826, and after studying law at Newburyport, was admitted to the bar at Boston in 1830. He had already prepared to journalism, and in 1832 he became joint founder and editor of a daily newspaper, the Boston Atlas. Having in 1834 gone to the South for the benefit of his health, he was led by what he witnessed of the evils of slavery (chiefly in Florida) to write the anti-slavery novel The Slave; or Memoir of Archy Moore (1836; enlarged edition, 1852, The White Slave). In 1837 he wrote for the Atlas a series of articles vigorously opposing the annexation of Texas. In the same year he published a work on the education of women, which helped to promote the growth of the free banking system in America. In 1838 he resumed his editorial duties on the Atlas, but in 1840 removed, on account of his health, to British Guiana, where he lived for three years and was editor of two weekly newspapers in succession at Georgetown. He published in this year (1840) a volume in opposition to slavery, Despotism in America (2nd ed., 1834). In 1849 he published the first three volumes of his History of the United States, two more volumes of which were published in 1851 and the sixth and last in 1852. The first three volumes were important, and the series was sold with the period 1492—1789, and the second three with the period 1789—1821. The history is notable for its painstaking accuracy and candour, but the later volumes have a strong Federalist bias. Hildreth's Japan as It Was and Is (1853) was at the time a valuable digest of the information contained in other works on that country (new ed., 1906). He also wrote a campaign biography of William Henry Harrison (1839); Theory of Morals (1844), and Theory of Politics (1853), as well as Lives of Ario- \ncious Judges (1856), compiled from Lord Campbell's two works. In 1838 he was appointed United States consul at Trieste, but ill-health compelled him to resign and remove to Florence, where he died on the 11th of July 1865.

HILGENFELD, ADOLF BERNHARD CHRISTOPH (1823— 1907), German Protestant divine, was born at Stappenbeck near Salzwedel in Prussian Saxony on the 2nd of June 1823. He studied at Berlin and Halle, and in 1850 became professor ordinarius of theology at Jena. He belonged to the Tübingen school. "Fond of emphasizing his independence of Baur, he still, in all important points, followed in the footsteps of his master, his method, which he is wont to contrast as Literaturkritik with Baur's Tendenzkritik, is nevertheless essentially the same as Baur's," (Otf. Pfeiffer). On the whole, however, he modified the positions of the founder of the Tübingen school, going beyond him only in his investigations into the Fourth Gospel. In 1858 he became editor of the Zeitschrift für wissenschaftliche Theologie. He died on the 12th of January 1907.

His works include: Die elementarischen Erkenntnisse und Lösungen (1848); Die Erkenntnisse und die Briefe des Johannes nach ihrem Lehrbegriff (1849); Das Markusevangelium (1850); Die Evangelien nach ihrer Entstehung und geschichtlichen Bedeutung (1854); Das Urchristentum (1859); Jüd. Aporoklyphen (1857); Neue entdeckte Judenkanone, neuen kanonischen Kritik und ihrer, 1860 and 3rd ed., 1876—1884; Historisch-kritische Einleitung in das Neue Testament (1875); Acta Apostolorum grace et lae negligentia antiquissimae testimoniis legavit (1890); Das Goldene Testament, the life of the Shepherd of Hermes (1887); Ignatii et Polycarpi epistolae (1902).

HILL, AARON (1685—1759), English author, was born in London on the 10th of February 1685. He was the son of George Hill of Malmesbury Abbey, Wiltshire, who contrived to sell an estate entailed on his son. In his fourteenth year he left Westminster School to go to Constantinople, where William, Lord Paget de Beaudesert (1637—1713), a relative of his mother, was ambassador. Paget sent him, under care of a tutor, to travel in Palestine and Egypt, and he returned to England in 1703. He was exchanged from his position by the "envious fears and malice of a certain female," and again went abroad as companion to Sir William Wentworth. On his return home in 1709 he published A Full and Just Account of the Present State of the Ottoman Empire, a production of which he was afterwards much ashamed, and he addressed his poem of Camillus to Charles Mordaunt, earl of Peterborough. In the same year he is said to have been manager of Drury Lane theatre and in 1710 of the Haymarket. His first play, Elidrid or The Fair Inconstant (afterwards revised as Alceste), was produced at Drury Lane in 1709. In connexion with the theatrical period of his life he was also engaged in commercial enterprises, one of which was successful, and in literary pursuits. He formed a company to extract oil from beechnut, another for the colonization of the district to be known later as Georgia, a third to supply wood for naval construction from Scotland, and a fourth for the manufacture of potash. In 1730 he wrote The Progress of Wit, being a caveat for the use of an Eminent Writer. The "eminent writer" was Pope, who had introduced him into The Dunciad as one of the competitors for the prize offered by the goddess of Dullness, though Pope represented Hildreth by an oblique note. By the edition of 1729 on the obnoxious passage, in which, however, the original initial was replaced by asterisks, gave Hill great offence. He wrote to Pope complaining of his treatment, and received a reply in which Pope denied responsibility for the notes. Hill appears to have been a persistent correspondent, and inlithed on Pope a series of letters, which are printed in Elwin & Courtbophe's edition (x. 1-78). Hill died on the 8th of February 1759, and was buried in Westminster Abbey. The best of his plays were Zara (acted 1735) and Mirrilees (1744), both adaptations from Voltaire. He also published two series of periodical essays, The Prompter (1735) and, with William Bond, The Plaindealer (1724). He was generous to fellow-men of letters, and his letters to Richard Savage, whom he helped considerably, show his character in a very amiable light.

The Works of the late Aaron Hill, consisting of letters . . . . original poems . . . . With an essay on the Art of Acting appeared in 1753, and his Dramatic Works in 1760. His Poetical Works are included in Anderson's and other editions of the British poets. A full account of his life is provided by an anonymous writer in Theopilus Cibber's Lives of the Poets, vol. v.

HILL, AMBROSE POWELL (1825—1865), American Confederate soldier, was born in Culpeper county, Virginia, on the 9th of November 1825, and graduated from West Point in 1847, being appointed to the 1st U.S. artillery. He served in the Mexican and Seminole Wars, was promoted first lieutenant in September 1851, and in 1855—1866 was artillery on the United States' coast survey. In March 1861, just before the outbreak of the Civil War, he resigned his commission, and when his state seceded he was made colonel of a Virginian infantry regiment, winning promotion to the rank of brigadier-general on the field of battle. He served in the Battle of Pea Ridge, and in 1862 he was given further promotion, and as a major-general Hill was one of the most prominent and successful divisional commanders of Lee's army in the Seven Days', Second Bull Run, Antietam and Fredericksburg campaigns. His division formed part of the Stonewall Jackson's corps, and he was severely wounded in the flank attack of Chancellorsville in May 1863. After Jackson's death Hill was made a lieutenant-general and placed in command of the 3rd corps of Lee's army, which he led in the Gettysburg campaign of 1863, the autumn campaign of the same year, and the Wilderness and Petersburg operations of 1864—65. He was killed in front of the Petersburg lines on the 2nd of April 1865. His reputation as a troop leader in battle was one of the highest amongst the generals of both sides, and both Lee and Jackson, when on their death-beds their thoughts wandered in delirium to the battlefield, called for "A. P. Hill" to deliver the decisive blow.
HILL, D. H.—HILL, J.

HILL, DANIEL HARRY (1821–1889), American Confederate soldier, was born in York district, South Carolina, on the 12th of July 1821, and graduated at the United States Military Academy in 1842, being appointed to the 1st United States artillery. He distinguished himself in the Mexican War, being brevetted captain and major for bravery at Contreras and Churubusco and at Chapultepec respectively. In February 1849 he resigned his commission and became a professor of mathematics at Washington College (now Washington and Lee University), Lexington, Virginia. In 1854 he joined the faculty of Davidson College, North Carolina, and was in 1859 made superintendent of the North Carolina Military Institute of Charlotte. At the outbreak of the Civil War, D. H. Hill was made colonel of a Confederate infantry regiment, at the head of which he won the action of Big Bethel, near Fortress Monroe, Va., on the 10th of June 1861. Shortly after this he was made a brigadier-general. He took part in the Yorktown and Williamsburg operations in the spring of 1862, and as a major-general led a division with great distinction in the battle of Fair Oaks and the Seven Days. He took part in the Second Bull Run campaign in August-September 1862, and in the Antietam campaign the stubborn resistance of D. H. Hill's division in the passes of South Mountain enabled Lee to concentrate for battle. The division bore a conspicuous part in the battles of the Antietam and Fredericksburg. On the reorganization of the army of Northern Virginia after Jackson's death, D. H. Hill was not appointed to a corps command, but somewhat later in 1863 he was sent to the west as a lieutenant-general and commanded one of Bragg's corps in the brilliant victory of Chickamauga. D. H. Hill surrendered with Gen. J. E. Johnston on the 26th of April 1865. In 1866–1869 he edited a magazine, The Law's Advocate, at Charlotte, N.C., which dealt with social and historical subjects and had a great influence in the South. In 1877 he became president of the University of Arkansas, a post which he held until 1884, and in 1885 president of the Military and Agricultural College of Milledgeville, Georgia. General Hill died at Charlotte, N.C., on the 24th of September 1889.

HILL, DAVID BENNETT (1843–1910), American politician, was born at Havana, New York, on the 29th of August 1843. In 1862 he removed to Elmira, New York, where in 1864 he was admitted to the bar. He at once became active in the affairs of the Democratic party, attracting the attention of Samuel J. Tilden, one of whose shrewdest Democratic National Convention men. In 1871 and 1872 he was a member of the New York State Assembly, and in 1877 and again in 1881 presided over the Democratic State Convention. In 1882 he was elected mayor of Elmira, and in the same year was chosen lieutenant-governor of the state, having been defeated for nomination as governor by Grover Cleveland. In January 1883, however, Cleveland having resigned to become president, Hill became governor, and in November was elected for a three-year term, and subsequently re-elected. In 1891–1897 he was a member of the United States Senate. During these years, and in 1897, when he tried to get the presidential nomination, he was prominent in working against Cleveland. In 1896 he opposed the free silver plank in the platform adopted by the Democrats, arguing that it would drive away the gold out of the country, which nominated W. J. Bryan; in the National Convention of 1900, however, the free-silver issue having been subordinated to anti-imperialism, he seconded Bryan's nomination. After 1897 he devoted himself to his law practice, and in 1905 retired from politics. He died in Albany on the 30th of October 1910.

HILL, GEORGE BIRKBECK NORMAN (1835–1903), English author, son of Arthur Hill, head master of Bruce Castle school, was born at Tottenham, Middlesex, on the 7th of June 1835. Arthur Hill, with his brothers Rowland Hill, the postal reformer, and Matthew Davenport Hill, afterwards recorder of Birmingham, had worked out a system of education which was to exclude compulsion of any kind. The school at Bruce Castle, of which Arthur Hill was head master, was founded to carry into execution their theories, known as the Hazelwood system. George Birkbeck Hill was educated in his father's school and at Pembroke College, Oxford. In 1858 he began to teach at Bruce Castle school, and from 1868 to 1877 was head master. In 1869 he became a regular contributor to the Saturday Review, with which he remained in connexion until 1884. On his retirement from teaching he devoted himself to the study of English 18th-century literature, and established his reputation as the most learned commentator on the works of Samuel Johnson. He settled at Oxford in 1887, but from 1891 onwards his winters were usually spent abroad. He died at Hampstead, London, on the 27th of February 1903. His works include: Dr Johnson, his Friends and his Critics (1878); an edition of Boswell's Correspondence (1879); a laborious edition of Boswell's Life of Johnson, including Boswell's Journal of a Tour to the Hebrides, and Johnson's Diary of a Journey into North Wales (Clarendon Press, 6 vols., 1887); Wit and Wisdom of Samuel Johnson (1888); Select Essays of Dr Johnson (1888); Footsteps of Dr Johnson in Scotland (1890); Letters of Johnson (1892); Johnsonian Miscellanies (2 vols., 1897); an edition (1899) of Edward Gibbon's Autobiography; Johnson's Lives of the Poets (3 vols. 1899), and other works on the 18th-century topics. Dr Birkbeck Hill's elaborate edition of Boswell's Life is a monumental work, invaluable to the student.

See a memoir by his nephew, Harold Spencer Scott, in the edition of the Lives of the English Poets (1905), and the Letters edited by his daughter, Lucy Crump, in 1903.

HILL, JAMES J. (1838— ), American railway capitalist, was born near Guelph, Ontario, Canada, on the 16th of September 1838, and was educated at Rockwood (Ont.) Academy, a Quaker institution. In 1856 he settled in St Paul, Minnesota. Abandoning, because of his father's death, his plans to study medicine, he became a clerk in the office of a firm of river steamboat agents and shippers, and later the agent for a line of river packets; he established about 1879 transportation lines on the Mississippi and on the Red River (of the North). He effected a traffic arrangement between the St Paul Pacific Railroad and its steamboat lines; and when the railway failed in 1873 for $27,000,000, Hill interested Sir Donald A. Smith (Lord Strathcona), George Stephen (Lord Mount Stephen), and other Canadian capitalists, in the road and in the wheat country of the Red River Valley; he got control of the bonds (1878), foreclosed the mortgage, reorganized the road as the St Paul, Minneapolis & Manitoba, and began to extend the line, then only 380 m. long, toward the Pacific; and in 1883 he became its president. He was president of the Great Northern Railroad (in which he held himself, with his secondary lines) from 1893 to April 1907, when he became chairman of its board of directors. In the extension (1883–1893) of this railway westward to Puget Sound (whence it has direct steamship connexions with China and Japan), the line was built by the company itself, none of the work being handled by contractors. Subsequently his financial interests in American railways caused constant sensations in the stock-markets. The Hill interests obtained control not only of the Great-Northern system, but of the Northern Pacific and the Chicago, Burlington & Quincy, and proposed the construction of another northern line to the Pacific coast. Hill was the president of the Northern Securities Company. Out of his wealth he gave liberally, especially to Roman Catholic institutions: $275,000 to the St Paul Theological Seminary (Roman Catholic) and $1,500,000 to the new Roman Catholic cathedral in St Paul.

HILL, JOHN (c. 1716–1775), called from his Swedish honours, "Sir" John Hill, English author, son of the Rev. Theophilus Hill, is said to have been born in Peterborough in 1716. He was apprenticed to an apothecary and on the completion of his apprenticeship he set up in a small shop in St Martin's Lane, Westminster. He also travelled over the country in search of rare herbs, with a view to publishing a Hortus sicca, but the plan failed. His first publication was a translation of Theophrastus's History of Stones (1746). From this time forward he was an indefatigable writer. He edited the British Magazine (1746–1750), and for two years (1751–1753) he wrote a daily letter, "The Inspector," for the London Advertiser and Literary Gazette. He also produced novels, plays and scientific works, and was a large contributor to the supplement of Ephraim
HILL, M. D.—HILL, SIR R. 465

Chambers's Cyclopaedia. His personal and scurrilous writings involved him in many quarrels. Henry Fielding attacked him in the Country Journal, Christopher Smart wrote a mock-epic, The Hilliad, against him, and David Garrick replied to his strictures against him by two epigrams, one of which runs:

"For physics and faces, his equal there scarce is; His faces are physic, his physic a face is."

He had other literary passages at arms with John Rich, who accused him of plagiarizing his Orpheus, also with Samuel Foote and Henry Woodward. From 1770 to 1785 he engaged on a huge botanical work—the Vegetable System (26 vols. fol.)—adorned by 1600 copperplate engravings. Hill's botanical labours were undertaken at the request of his patron, Lord Bute, and he was rewarded by the order of Vasa from the king of Sweden. He had a medical degree from Edinburgh, and he now practised as a quack doctor, making considerable sums by the preparation of vegetable medicines. He died in London on the 21st of November 1775.

Of the seventy-six separate works with which he is credited in the Dictionary of National Biography, only the most notable are those that deal with botany. He is said to have been the author of the second part of The Oeconomy of Human Life (1751), the first part of which is by Lord Kames, and of an English translation of the first part of the earlier work of Georg Dionysius. He had been generally ascribed to him (see Boswell, ed. Hill, iii. 285). Dr Johnson said of him that he was "an ingenious man, but had no vcracity."

See A Short Account of the Life, Writings and Character of the late Sir John Hill (1779), which is chiefly occupied with a descriptive catalogue of his works; also Temple Bar (1872, xxxvi. 261-266).

HILL, MATTHEW DAVENPORT (1792-1872), English lawyer and penologist, was born on the 6th of August 1792, at Birmingham, where his father, T. W. Hill, for long conducted a private school. He was a brother of Sir Rowland Hill. He early acted as assistant in his father's school, and in 1810 was called to the bar at Lincoln's Inn. He went the midland circuit. In 1832 he was elected one of the Liberal members for Kingston-upon-Hull, but he lost his seat at the next election in 1834. On the incorporation of Birmingham in 1839 he was chosen recorder; and in 1851 he was appointed commissioner in bankruptcy for the Bristol district. Having had his interest excited in questions relating to the treatment of criminal offenders, he ventilated in his charges to the grand juries, as well as in special pamphlets, opinions which were the means of introducing many important reforms in the methods of dealing with crime. One of his principal coadjutors in these reforms was his brother Frederick Hill (1803-1896), whose Amount, Causes and Remedies of Crime, the result of his experience as inspector of prisons for Scotland, marked an era in the methods of prison discipline. Hill was one of the chief promoters of the Society for the Diffusion of Useful Knowledge, and the originator of the Penny Magazine. He died at Stapleton, near Bristol, on the 7th of June 1872.

His principal works are Practical Suggestions to the Founders of Reformatory Schools (1855); Suggestions for the Repression of Crime (1857), consisting of charges addressed to the grand juries of Birmingham; Meltray (1855); Papers on the Penal Servitude Acts (1864); Journal of a Third Visit to the Convict Goals, Refuges and Reformatory of the Dublin, 1864; Address to the Scientific and Midland Institute (1867). See Memoir of Matthew Davenport Hill, by his daughters Rosamond and Florence Davenport Hill (1878).

HILL, OCTAVIA (1838— ) and MIRANDA (1836-1910), English philanthropic workers, were born in London, being daughters of Mr James Hill and granddaughters of Dr Southwood Smith, the pioneer of sanitary reform. Miss Octavia Hill's attention was early drawn to the evils of London housing, and the habits of indolence and lethargy induced in many of the lower classes by degrading surroundings. In 1872 she conceived the idea of trying to free a few poor people from such influences, and Mr Ruskin, who sympathized with her plans, supplied the money for starting the work. For £750 Miss Hill purchased the 56 years' lease of three houses in one of the poorest courts of Marylebone. Another £78 was spent in building a large room at the back of her own house where she could meet the tenants. The houses were put in repair, and let out in sets of two rooms. At the end of eighteen months it was possible to pay 5% interest, to repay £48 of the capital, as well as meet all expenses for taxes, ground rent and insurance. What specially distinguished this scheme was that Miss Hill herself collected the rents, thus coming into contact with the tenants and helping to enforce regular and self-respecting habits. The success of her first attempt encouraged her to continue. Six more houses were bought and treated in a similar manner. A yearly sum was set aside for the repairs of each house, and whatever remained over was spent on such additional appliances as the tenants themselves desired. This encouraged them to keep their tenements in good repair. By the aid of friends Miss Hill was now enabled to enlarge the scope of her work. In 1869 twelve more houses were bought. The plan was to set a visitor over a small court or block of buildings to do whatever work in the way of rent-collecting, visiting for the School Board, &c., was required. As years went on Miss Octavia Hill's work was largely increased. Numbers of her friends bought and placed under her care small groups of houses, over which she fulfilled the duties of a conscientious landlord. Several large owners of tenement houses, notably the Ecclesiastical Commissioners, entrusted to her the management of such property, and consulted her about plans of rehousing tenants. Miss Hill (who died on the 31st of May 1910) did admirable work in Marylebone as a member of the Board of Guardians.

HILL, ROWLAND (1744-1833), English preacher, sixth son of Sir Rowland Hill, Bart. (d. 1783), was born at Hawkstone, Shropshire, on the 23rd of August 1744. He was educated at Shrewsbury, Eton and St John's College, Cambridge. Stimulated by George Whitefield's example, he scandalized the university authorities and his own friends by preaching and visiting the sick before he had taken orders. In 1775 he was appointed to the parish of Kingston, Staffordshire, where he soon attracted a large congregation. Having inherited considerable property, he built for his own use Surrey Chapel, in the Blackfriars Road, London (1783). Hill conducted his services in accordance with the forms of the Church of England, in whose communion he always remained. Both at Surrey Chapel and in his provincial "gospel tours" he had great success. His oratory was specially adapted for rude and uncultivated audiences. He possessed a voice of great power, and according to Southey "his manner" was "that of a performer as great in his own line as Kean or Kemble." His earnest and pure sermons more than made up for his occasional lapses from good taste and the eccentricity of his wit. He helped to found the Religious Tract Society, the British and Foreign Bible Society, and the London Missionary Society, and was a stout advocate of vaccination. His best-known work is the Village Dialogues, which first appeared in 1810, and reached a 34th edition in 1839. He died on the 11th of April 1833. See Life by E. Sidney (1833); Memoirs, by William Jones (1834); and Memorials, by Jas. Sherman (1837).

HILL, SIR ROWLAND (1795-1879), English administrator, author, and newspaper editor, was the younger brother of Matthew Davenport Hill, and third son of T. W. Hill, who named him after Rowland Hill the preacher, was born on the 3rd of December 1795 at Kidderminster. As a young child he had, on account of an affection of the spine, to maintain a recumbent position, and his principal method of relieving the irksomeness of his situation was to repeat figures aloud consecutively until he had reached very high totals. A similar bent of mind was manifested when he entered school in 1802, his aptitude for mathematics
being quite exceptional. But he was indebted for the direction of his abilities in no small degree to the guidance of his father, a man of advanced political and social views, which were qualified and balanced by the strong practical tendency of his mind. At the age of twelve Rowland began to assist in teaching mathematics in his father's school at Hilltop, Birmingham, and latterly he had the chief management of the school. On his suggestion the establishment was removed in 1819 to Hazelwood, a more commodious building in the Hagley Road, in order to have the advantages of a large body of boys, for the purpose of properly carrying out an improved system of education. That system, which was devised principally by Rowland, was expounded in a pamphlet entitled Plans for the Government and Education of Boys in Large Numbers, the first edition of which appeared in 1822, and a second with additions in 1827. The principal feature of the system was "to leave as much as possible all power in the hands of the boys themselves"; and it was so successful that, in a circular issued six years after the experiment had been in operation, it was announced that "the head master had never once exercised his right of veto on their proceedings."

It may be said that Rowland Hill, as an educationalist, is entitled to a place side by side with Arnold of Rugby, and was equally successful with him in making moral influence of the highest kind the predominant power in school discipline. After his marriage in 1827 Hill removed to a new school at Bruce Castle, Tottenham, which he conducted until failing health compelled him to retire in 1833. About this time he became secretary of Gibbon Wakefield's scheme for colonizing South Australia, the objects of which he explained in 1832 in a pamphlet on Home Colonies, afterwards partly reprinted during the Irish famine under the title Home Colonies for Ireland. It was in 1835 that his zeal as an administrative reformer was first directed to the postal system. The discovery which resulted from these investigations is that the state of easy of comprehension that there is great danger of losing sight of its originality and thoroughness. A fact which enhances its merit was that he was not a post-office official, and possessed no practical experience of the details of the old system. After a laborious collection of statistics he succeeded in demonstrating that the principal expense of letter carriage was in receiving and distributing, and that the cost of conveyance differed so little with the distance that a uniform rate of postage was in reality the fairest to all parties that could be adopted. Trusting also that the deficiency in the postal rate would be made up by the immense increase of correspondence, and by the saving which would be obtained from prepayment, from improved methods of keeping accounts, and from lessening the expense of distribution, he in his famous pamphlet published in 1837 recommended that within the United Kingdom the rate for letters not exceeding half an ounce in weight should be only one penny. The employment of postage stamps is mentioned only as a suggestion, and in the following words: "Perhaps the difficulties might be obviated by using a bit of paper just large enough to bear the stamp, and covered at the back with a glutinous wash by applying a little moisture might be attached to the back of the letter." Proposals so striking and novel in regard to a subject in which every one had a personal interest commanded immediate and general attention. So great became the pressure of public opinion against the opposition offered to the measure by official prepossessions and prejudices that in 1838 the House of Commons appointed a committee to examine the subject. The committee having reported favourably, a bill to carry out Hill's recommendations was brought in by the government. The act received the royal assent in 1840, and after an intermediate rate of fourpence had been in operation from the 5th of December of that year, the penny rate commenced on the 10th of January 1840. Hill received an appointment in the Treasury in order to superintend the introduction of his reforms, but he was compelled to retire when the Liberal government resigned office in 1841. In consideration of the loss he thus sustained, and to mark the public appreciation of his services, he was in 1846 presented with the sum of £1,536. On the Liberals returning to office in the same year he was appointed secretary to the postmaster-general and in 1854 he was made chief secretary. His ability as a practical administrator enabled him to supplement his original discovery by measures realizing its benefits in a degree commensurate with continually improving facilities of communication, and in a manner best combining cheapness with efficiency. In 1860 his services were rewarded with the honour of knighthood; and when failing health compelled him to resign his office in 1864, he received from parliament a grant of £20,000 and was also allowed to retain his full salary of £2,000 a year as retiring pension. In 1864 the university of Oxford conferred on him the degree of D.C.L., and on the 6th of June 1879 he was presented with the freedom of the city of London. The presentation, on account of his infirm health, took place at his residence at Hampstead, and he died on the 27th of August following. He was buried in Westminster Abbey.

He wrote, in conjunction with his brother, Arthur Hill, a History of Penny Postage, published in 1860, with an introductory memoir by his nephew, G. Birkbeck Hill. See also Sir Rowland Hill, the Story of a Great Reform, told by his daughter (1907). To commemorate his birthday-general. During his regimental command he introduced a regimentsal school and a regimental magazine. He had held commissions as brigadier, and after 1805 as major-general, in Ireland. In 1805 he commanded a brigade in the abortive Hanover expedition. In 1808 he was appointed to a brigade in the force sent to Portugal, and from Vimeira to Vittoria, in advance or retreat, he proved himself Wellington's ablest and most indefatigable coadjutor. He led a brigade at Vimeira, at Corunna and at Oporto, and a division at Talavera (see Peninsular War). His capacity for independent command was fully demonstrated in the campaigns of 1810, 1811 and 1812. In 1811 he annihilated a French detachment under Girard at Arroyo-dos-Molinos, and early in 1812, having now attained a rank of lieutenant-general (January 1812) and become with a K.B. (March), he carried by assault the important works of Almaraz on the Tagus. Hill led the right wing of Wellington's army in the Salamanca campaign in 1812 and at the battle of Vittoria in 1813. Later in this year he conducted the investment of Pampeluna and fought with the greatest distinction at the Nivelle and the Nive. In the invasion of France in 1814 his corps was victoriousy engaged both at Orthez and at Toulouse. Hill was one of the general officers rewarded for their services by peerages, his title being at first Baron Hill of Almaraz and Hawkstone, and he received a pension, the thanks of parliament and the freedom of the city of London. For about two years previous to his elevation to the peerage, he had been M.P. for Shrewsbury. In 1815 the news of Napoleon's return from Elba was followed by the assembly of an Anglo-Allied army (see Waterloo Campaign) in the Netherlands, and Hill was appointed to one of the two corps commands in this army. At Waterloo he led the famous charge of Sir Frederick Adam's brigade against the Imperial Guard, and for some time it was thought that he
had fallen in the mêlée. He escaped, however, without a wound, and continued with the army in France until its withdrawal in 1818. Hill lived in retirement for some years at his estate of Hardwick Grange. He carried the royal standard at the coronation of George IV and became general in 1835. When Wellington became premier in 1828, he received the appointment of general commanding-in-chief, and on resigning this office in 1842 he was created a viscount. He died on the 10th of December of the same year. Lord Hill was, next to Wellington, the most popular and able soldier of his time in the British service, and was so much beloved by the troops, especially those under his immediate command, that he gained from them the title of "the soldier's friend." He was a G.C.B. and G.C.I., and held the grand crosses of various foreign orders, amongst them the Russian St. George and the Austrian Maria Theresa.

HILL, (O. Eng. hull; cf. Low Ger. hull, Mid. Dutch hui, allied to Lat. celsus, high, colis, hill, &c.), a natural elevation of the earth's surface. The term is now usually confined to elevations above the level of a plain, but formerly was used for all such elevations, high or low.

HILLAH, a town of Asiatic Turkey, in the pashalik of Bagdad, 60 m. S. of the city of Bagdad, in 32° 28' 35" N., 44° 48' 40" E., formerly the capital of a sanjak and the residence of a mutassalif, who in 1803 was transferred to Diwaniah. It is situated on both banks of the Euphrates, the two parts of the town being connected by a floating bridge, 450 ft. in length, in the midst of a very fertile district. The estimated population, which includes a large number of Jews, varies from 6000 to 12,000. The town has suffered much from the periodical breaking of the Hinduch dam and the consequent deflection of the waters of the Euphrates to the westward, as a result of which at times the Euphrates at this point has been entirely dry. This deflection of water has also seriously interfered with the palm groves, the cultivation of which constitutes a large part of the industry of the surrounding country along the river. The bazaars of Hillah are relatively large and well supplied. Many of the houses in the town are built of brick, not a few bearing an inscription of Nebuchadrezzar, obtained from the ruins of Babylon, which lies less than an hour away to the north.

HILLARD, GEORGE STILLMAN (1808-1879), American lawyer, was born at Northampton, Mass., and graduated at Harvard College in September 1828. After graduating at Harvard College in 1828, he taught in the Round Hill School at Northampton, Massachusetts. He graduated at the Harvard Law School in 1832, and in 1833 he was admitted to the bar in Boston, where he entered into partnership with Charles Sumner. He was a member of the state House of Representatives in 1836, of the state Senate in 1850, and of the state constitutional convention of 1853, and in 1866-70 was United States district attorney for Massachusetts. He devoted a large portion of his time to literature. He became a member of the editorial staff of the Christian Register, a Unitarian weekly, in 1833; in 1834 he became editor of The American Jurist (1829-1843), a legal journal to which Sumner, Simon Greenleaf and Theron Metcalf contributed; and from 1856 to 1861 he was an associate editor of the Boston Courier. His publications include an edition of Edmund Spenser's works (in 5 vols., 1839); Selections from the Writings of Walter Savage Landor (1856); Six Months in Italy (2 vols., 1853); Life and Campaigns of George B. McClellan (1864); a part of the Life, Letters, and Journals of George Ticknor (1876); besides a series of school readers and many articles in periodicals and encyclopaedias. He died in Boston on the 21st of January 1879.

HILLBRAND, KARL (1829-1884), German author, was born at Giessen on the 17th of September 1829, his father, Joseph Hillebrand (1788-1871) being a literary historian and writer on philosophic subjects. Karl Hillebrand became involved, as a student in Heidelberg, in the Baden revolutionary movement, and was imprisoned in Rastatt. He succeeded in escaping and lived for a time in Strassburg, Paris—where for several months he was Heine's secretary—and Berdeaux. He continued his studies, and after obtaining the doctor's degree at the Sorbonne, he was appointed teacher of German in the École militaire at St Cyr, and shortly afterwards, professor of foreign literatures at Douai. On the outbreak of the Franco-German War he resigned his professorship and acted for a time as correspondent to The Times in Italy. He then settled in Florence, where he died on the 10th of October 1884. Hillebrand wrote with facility and elegance in French, English and Italian, besides his own language. His essays, collected under the title Zeiten, Völker und Menschen (Berlin, 1874-1885), show clear discernment, a finely balanced cosmopolitan judgment, and grace of style. He undertook to write the Geschichte Frankreichts von der Thronbesteigung Ludwig Philippis bis zum Fall Napoleons III., but only two volumes were completed (to 1848) (2nd ed., 1851-1852). In French he published Des conditions de la bonne comédie (1863), La Prusse contemporaine (1867), Études italiennes (1868), and a translation of O. Müller's Griechische Literaturgeschichte (3rd ed., 1883). In English he published his Royal Institution Lectures on German Thought during the Last Two Hundred Years (1886). He also edited a collection of essays dealing with Italy, under the title Italia (4 vols., Leipsic, 1874-1877).

See H. Homberger, Karl Hillebrand (Berlin, 1884).

HILLEL, Jewish rabbi, of Babylonian origin, lived at Jerusalem in the time of King Herod. Though hard pressed by poverty, he applied himself to study in the schools of Shammai and Abtalion (Samaes and Pollion in Josephus). On account of his comprehensive learning and his rare qualities he was numbered among the recognized leaders of the Pharisaic scribes. Tradition assigns him the highest dignity of the Sanhedrin, under the title of nasi ('the prince'), about a hundred years before the death of Jesus, and the appended name Jesus nasi or nasi ha-dor ("the prince of the generation") is generally considered at least can be recognized as historic; the fact that Hillel took a leading position in the council can also be established. The epithet ha-ta'en ("the elder"), which usually accompanies his name, proves him to have been a member of the Sanhedrin, and according to a trustworthy authority Hillel filled his leading position for forty years, dying, therefore, about A.D. 10. His descendants remained, with few exceptions, at the head of Judaism in Palestine until the beginning of the 5th century, two of them, his grandson Gamaliel I. and the latter's son Simon, dominating the whole of Palestine and Damascus, until the year 70 A.D. The fact that Josephus (Vita 38) ascribes to Simon descent from a very distinguished stock (γένους σύνθρονος λαμπρόν), shows in what degree of estimation Hillel's descendants stood. When the dignity of nasi became afterwards hereditary among them, Hillel's ancestry, perhaps on the ground of old family traditions, was traced back to David. Hillel is especially noted for the fact that he gave a definite form to the Jewish traditional learning, as it had been developed and made into the ruling and conserving factor of Judaism in the latter days of the second Temple, and particularly in the centuries following the destruction of the Temple. He laid down seven rules for the interpretation of the Scriptures, and these became the foundation of rabbinical hermeneutics; and the ordering of the traditional doctrines into a whole, effected in the Mishna by his successor Judah I., two hundred years after Hillel's death, was probably likewise due to his instigation. The tendency of his theory and practice in matters pertaining to the Law is evidenced by the fact that in general he advanced milder and more lenient views in opposition to his colleague Shammai, a contrast which after the death of the two masters, but not until after the destruction of the Temple, was maintained in the strife kept up between the two schools named the House of Hillel and the House of Shammai. The well-known institution of the Prosbol (προσβολή), introduced by Hillel, was intended to avert the evil consequences of the scriptural law of release in the seventh year (Deut. xv. 1). He was led to this, as is expressly set forth (M. Gigin, iv. 3), by a regard for the welfare of the community. Hillel lived in the
memory of posterity chiefly as the great teacher who enjoined and practised the virtues of charity, humility and true piety. His proverbial sayings, in particular, a great number of which were written down partly in Aramaic, partly in Hebrew, strongly affected the spirit both of his contemporaries and of the succeeding generations. In his Maxims (Aboth, i. 12) he recommends the love of peace and the love of mankind beyond all else, and his own love of peace sprang from the tenderness and deep humility which were essential features in his character, as has been illustrated by many anecdotes. Hillel's piety has become proverbial. One of his sayings is familiar in the following parable: "My abasement is my exaltation."

His charity towards men is given its finest expression in the answer which he made to a proselyte who asked to be taught the commandments of the Torah in the shortest possible form: "What is unpleasant to thyself that do not to thy neighbour; this is the whole Law, all else is but its exposition." This allusion to the scriptural injunction to love one's neighbour (Lev. xix. 18) as the fundamental law of religious morals, became in a certain sense a commonplace of Pharisaic scholasticism. For the Pharisee who accepts the answer of Jesus regarding that fundamental doctrine which ranks the love of one's neighbour as the highest duty after the love of God (Mark xii. 31), does so because of his familiar with Hillel's saying, and Paul also (Gal. v. 14) doubtless learned this in the school of Gamaliel. Hillel emphasized the connexion between duty towards one's neighbour and duty towards oneself in the epigrammatic saying: "If I am not for myself, who is for me? And if I am for myself alone, what then am I? And if not now, then when?" (Aboth, i. 14). The duty of working both with and for men he teaches in the sentence: "Separate not thyself from the congregation" (ib. ii. 4). The duty of considering oneself part of common humanity, of not differing from others by any peculiarity of behaviour, he sums up in the words: "Appear neither naked nor clothed, neither sitting nor standing, neither laughing nor weeping." (Joseph. Bar. c. ii.). The command to love one's neighbour inspired also Hillel's injunction (Aboth, ii. 4): "Judge not thy neighbour until thou art in his place." (cf. Matt. vii. 1). The disinterested pursuit of learning, study for study's sake, is commended in many of Hillel's sayings as being what is best in life: "He who wishes to make a name for himself loses his name; he who does not increase his knowledge decreases it; he who does not learn is worthy of death; he who works for the sake of a crown is lost" (Aboth, i. 13). "He who occupies himself much with learning makes his life" (ib. ii. 7). "He who has acquired the words of doctrine has acquired the life of the world to come" (ib.). "Say not: When I am free from this world all will be well; for thou shalt never, all will be free" (ib. iv. 4). One of his strings of proverbs runs as follows: "The uncultivated man is not innocent; the ignorant man is not devout; the bashful man learns not; the wrathful man teaches not; he who is much absorbed in trade cannot become wise; where no men are, there strive thyself to be a man" (ib. v). The almost mystical profundity of Hillel's consciousness of God is shown in the words spoken by him on the occasion of a feast in the Temple—words alluding to the throng of people gathered there which he puts into the mouth of God Himself: "If I am here every one is here; if I am not here no one is here" (Sukkah 53a). In like manner Hillel makes God say to Israel, referring to Exodus xx. 24: "Whither I please, thither will I go; if thou come into my house I come into thy house; if thou come not into my house, I come not into thine" (ib.).

It is noteworthy that no miraculous legends are connected with Hillel's life. A scholastic tradition, however, tells of a voice from heaven which made itself heard when the wise men who had assembled in Jericho, saying: "Among those here present is one who would have deserved the Holy Spirit to rest upon him, if his time had been worthy of it." And all eyes turned towards Hillel (Tos. Soketh, xiii. 3). When he died lamentation was made for him as follows: "Woe for the humble, woe for the pious, woe for the disciple of Ezra!" (ib.)

Hillel II., one of the patriarchs belonging to the family of Hillel I., lived in Tiberias about the middle of the 4th century, and introduced the arrangement of the calendar through which the Jews of the Diaspora became independent of Palestine in the uniform fixation of the new moons and fasts.

The Rabbi Hillel, who in the 4th century made the remarkable declaration that Israel need not expect a Messiah, because the promise of a Messiah had already been fulfilled in the days of the life of Hillel (Babli, Sanhedrin, 90a), is probably Hillel, the son of Samuel ben Nahman, a well-known expounder of the scriptures. (W. Ba.)

HILLEL, FERDINAND (1811–1885), German composer, was born at Frankfort-on-Main, on the 24th of October 1811. His first master was Aloys Schmitt, and when he was of age his compositions and talent led his father, a well-to-do man, to send him to Hummel in Weimar. There he devoted himself to composition, among his work being the ensembles for Maria Stuart, through which he made Goethe's acquaintance. Under Hummel, Hiller made great strides as a pianist, so much so that early in 1827 he went on a tour to Vienna, where he met Beethoven and produced his first quartet. After a brief visit home Hiller went to Paris in 1830, where he lived till 1836. His father's death necessitated his return to Frankfort for a time, but on the 8th of January 1839 he produced at Milan his opera La Romilda, and began to write his oratorio Die Zerstörung Jerusalems, one of his finest works. Later he went to Leipzig, to his friend Mendelssohn, when in 1834–1835 he conducted a number of the Gewandhaus concerts and produced his oratorio. After a further visit to Italy to study sacred music, Hiller produced two operas, Ein Traum und Coronadin, at Dresden in 1845 and 1847 respectively; he went as conductor to Düsseldorf in 1847 and Cologne in 1850, and conducted at the Opéra Italian in Paris in 1851 and 1852.

At Cologne he became a power as conductor of the Gürzenich concerts and head of the Conservatorium. In 1884 he retired, and died on the 12th of May in the following year. Hillel frequently visited England. He composed a work for the opening of the Royal Albert Hall, his Nala and Domayamenti was performed at Birmingham, and he gave a series of pianoforte recitals of his own compositions at the Hanover Square Rooms in 1871. He had a perfect mastery over technique and form in musical composition, but his works are generally dry. He was a sound pianist and teacher, and occasionally a brilliant writer on musical matters. His compositions, numbering about two hundred, include six operas, two oratorios, six or seven cantatas, much chamber music and a once-popular pianoforte concerto.

HILLER, JOHANN ADAM (1728–1804), German musical composer, was born at Wendisch-Ossig near Görlitz in Silesia on the 25th of December 1728. By the death of his father in 1734 he was left dependent to a large extent on the charity of friends. Entering in 1747 the Kreuzschule in Dresden, the school attended many years afterwards by Richard Wagner, he subsequently went to the university of Leipzig, where he studied jurisprudence, supporting himself by giving music lessons, and also by performing at concerts both on the flute and as a vocalist. Gradually he adopted music as his sole profession, and devoted himself more especially to the permanent establishment of a concert institute at Leipzig. It was he who in 1781 originated the celebrated Gewandhaus concerts which still flourish at Leipzig. In 1789 he became "cantor" of the Thomas school there, a position previously held by John Sebastian Bach. He died in Leipzig on the 16th of June 1804. Two of his pupils placed a monument to his memory in front of the Thomas school. Hillel's compositions comprise almost every kind of church music, from the cantata to the simple chorale. But much more important are his operettas, 14 in number, which for a long time retained their place on the boards, and had considerable influence on the development of light dramatic music in Germany. The Jolly Cobbler, Love in the Country and the Village Barber were amongst the most popular of his works. Hiller also excelled in sentimental songs and ballads. With great simplicity of structure his music combines a considerable amount of genuine melodic invention. Although an admirer and imitator of the Italian school, Hiller fully appreciated the greatness of Handel, and did much for the appreciation of his music in Germany. It was under his direction that the Messiah
HILLSDALE, a city and the county-seat of Hillsdale county, Michigan, U.S.A., about 87 m. W. by S. of Detroit. Pop. (1900) 4,150; of whom 300 were foreign-born; (1910) 4,656; (1920) 5,001. Hillsdale is served by the Lake Shore & Michigan Southern railway. It has a public library, and is the seat of Hillsdale College (co-educational, Free Baptist), which was opened as Michigan Central College, at Spring Arbor, Michigan, in 1844, was removed to Hillsdale and received its present name in 1853 and was re-opened here in 1855. The college in 1907-1908 had 22 instructors and 345 students. The city is a centre for a rich farming region; among its manufactures are gasoline and gas engines, screen doors, wagons, barrels, boxes, fur-costs and flour. Hillsdale was first settled in 1837, was incorporated as a village in 1843, and was chartered as a city in 1860.

HILL TIPPERA, or Tripera, a native state of India, adjoining the British district of Tippera, in Eastern Bengal and Assam. Area, 4086 sq. m.; pop. (1901) 173,325; estimated revenue $55,000. Six parallel ranges of hill cross it from north to south, at an average distance of 12 m. apart. The hills are covered for the most part with bamboo jungle, while the low ground abounds with trees of various kinds, canebreaks and swamps. The principal crop and food staple is rice. The other articles of produce are cotton, chillies and vegetables. The chief exports are cotton, timber, oilseeds, bamboo canes, thatching-grass and firewood, on all of which tolls are levied. The chief rivers are the Gumti, Haora, Khoiay, Dalui, Manu and Fenny (Pheni). During the heavy rains the people in the plains use boats as almost the sole means of conveyance.

The history of the state includes two distinct periods—the traditional period described in the Rajmala, or "Chronicles of the Kings of Tippera," and the period since A.D. 1407. The name of the state is derived from that of the Brahman family of the court of Tippera. In the early history of the state, the rajas were in a state of chronic feud with all the neighbouring countries. The worship of Siva was here, as elsewhere in India, associated with the practice of human sacrifice, and in no part of India were more victims offered. It was not until the beginning of the 17th century that the Moguls obtained any footing in this country. When the East India Company obtained the dwarf or financial administration of Bengal in 1765, so much of Tippera as had been placed on the Mahommedan rent-roll came under British rule. Since 1808, each successive ruler has received investment from the British government. In October 1905 the state was attached to the new province of Eastern Bengal and Assam. It has a chronological era of its own, adopted by Raja Birraj, from whom the present raja is 93rd in descent. The year 1875 corresponded with 1285 of the Tippera era.

Besides being the ruler of Hill Tippera, the raja holds an estate in the British district of Tippera, called chakla Roshnabad, which is far the most valuable of his possessions. The capital is Agartala (pop. 9513), where there is an Arts College. The present ruler, J. C. Raja Birraj, was severely damaged by the earthquake of the 12th of June 1897. The late raja, who died from the result of a motor-car accident in 1909, succeeded his father in 1896, but he had taken a large share in the administration of the state for some years previously. The principle of succession, which had often caused serious disputes, was defined in 1904, to the effect that the chief may nominate any male descendant through males from himself or from any male ancestor, but falling such nomination, then the rule of primogeniture applies.

HILTON, JOHN (1864-1978), British surgeon, was born at Castle Hedingham, in Essex, in 1864. He entered Guy's Hospital in 1824. He was appointed demonstrator of anatomy in 1828, assistant-surgeon in 1845, surgeon 1849. In 1867 he was president of the Royal College of Surgeons, of which he became member in 1827 and fellow in 1843, and he also delivered the Hunterian oration in 1867. As Arris and Gale professor (1859-1862) he delivered a course of lectures on "Rest and Pain," which have become classics. He was also surgeon-extraordinary to Queen Victoria. Hilton was the greatest anatomist of his time, and Dr. Frank Macintosh named "Anatomical Theatre."

HILL, PHILIP J.—HILTON, D. L. 

HILTON, DR. A. S., a native of London, received Queen Anne's warrant in 1749, and was appointed curator of the Royal College of Physicians. He was admitted a member of the College in 1744, and was elected president in 1783. He was a member of the Royal Society, and was elected a fellow of the Royal College of Physicians in 1744. He was a fellow of the Royal Society, and was elected a fellow of the Royal College of Physicians in 1744. He was a Fellow of the Royal Society, and was elected a fellow of the Royal College of Physicians in 1744.
spinal cord he was far in advance of his contemporaries. As an operator he was more cautious than brilliant. This was doubtless due partly to his living in the pre-anaesthetics period, and partly to his own consummate anatomical knowledge, as is indicated by the method for opening deep abscesses which is known by his name. But he could be bold when necessary; he was the first to reduce a case of obturator hernia by abdominal section, and one of the first to practise lumbar colostomy. He died at Clapham on the 14th of September 1878.

HILTON, WILLIAM (1786-1839), English painter, was born in Lincoln on the 3rd of June 1786, son of a portrait-painter. In 1800 he was placed with the engraver J. R. Smith, and about the same time began studying in the Royal Academy school. He first exhibited in this institution in 1803, sending a "Group of Banditti"; and he soon established a reputation for choice of subject, and qualities of design and colour superior to the great mass of his contemporaries. He made a tour in Italy with Thomas Phillips, the portrait-painter. In 1813, having exhibited "Miranda and Ferdinand with the Logs of Wood," he was elected an associate of the Academy, and in 1820 a full academician, his diploma-picture representing "Ganymede." In 1823 he produced "Christ crowned with Thorns," a large and important work, subsequently bought out of the Chantrey Fund; this may be regarded as his masterpiece. In 1827 he succeeded Henry Thomson as keeper of the Academy. He died in London on the 30th of December 1839.

Some of his best pictures remained on his hands at his decease—such as the "Angel releasing Peter from Prison" (life-size), painted in 1821, "Una with the Lion entering Correca's Cave" (1832), the "Murder of the Innocents," his last exhibited work (1838), "Comus," and "Amphiitrite." The National Gallery now owns "Edith finding the Body of Harold" (1834), "Cupid Disarmed," "Rebecca and Abraham's Servant" (1829), "Nature blowing Bubbles for her Children" (1821), and "Sir Calepine rescuing Serena" (from the Faerie Queen) (1831). In the National Portrait Gallery is his likeness of John Keats, with whom he was acquainted. In a great school or period Hilton could not count as more than a respectable subordinate; but in the British school of the earlier part of the 19th century he had sufficient elevation of aim and width of attainment to stand conspicuous.

HILVERSUM, a town in the province of North Holland, finally settled in 1314, and a seat of arms in 1428. It is connected with Amsterdam by a steam tramway, passing by way of the small fortified towns of Naarden and Muiden on the Zuider Zee. Pop. (1900) 20,238. It is situated in the middle of the Gooi, a stretch of hilly country extending from the Zuider Zee to about 5 m. south of Hilversum, and composed of pine woods and sandy heaths. A convalvescent home, the Trompenberg, was established here in 1874, and there are a town hall, middle-class and technical schools, and various places of worship, including a synagogue. Hilversum manufactures large quantities of floor-cloths and horse-blankets.

HIMALAYA, the name given to the mountains which form the northern boundary of India. The word is Sanskrit and literally means "snow-abode," from him, snow, and abode, and might be translated "snowy-range," although that expression is perhaps more nearly the equivalent of Himachal, another Sanskrit word derived from him, snow, and achal, mountain, which is practically synonymous with Himalaya and is often used by natives of northern India. The name was converted by the Greeks into Eumodos and Imaos.

Modern geographers restrict the term Himalaya to that portion of the mountain region between India and Tibet enclosed within the arms of the Indus and the Brahmaputra. From the bend of the Indus southwards to the plains of the Punjab to the bend of the Brahmaputra southwards to the plains of Assam, through a length of 1,500 m., is Himalchál or Himalaya. Beyond the Indus, to the north-west, the region of mountain ranges which stretches to a junction with the Hindu Kush south of the Pamirs, is usually known as Trans-Himalaya. Thus the Himalaya represents the southern face of the great central upheaval—the plateau of Tibet—the northern face of which is buttershed by the Kuen Lun. Throughout this vast space of elevated plateau and mountain face geologists now trace a system of main chains, or axes, extending from the Hindu Kush to Assam, arranged in approximately parallel lines, and traversed at intervals by main lines of drainage obliquely. Godwin-Austen indicates six of these geological axes as follows:

1. The main Central Asian axis, the Kuen Lun forming the northern edge or ridge of the Tibetan plateau.

2. The Trans-Himalayan chain of Muztagh (or Karakoram), which is lost in the Tibetan uplands, passing to the north of the sources of the Indus.

3. The Ladakh chain, partly north and partly south of the Indus—for that river breaks across it about 100 m. above Leh. This chain continues south of the Tsanpo (or Upper Brahmaputra), and becomes part of the Himalayan system.

4. The Zaskar, or main chain of the Himalaya, i.e. the "snowy range" par excellence which is indicated by Nanga Parbat (overlooking the Indus), and passes in a south-east direction to the southern side of the Deseai plains. Thence, bending slightly south, it extends in the line of snowy peaks which are seen from Simla to the famous peaks of Gangotri and Nanda Devi. This is the best known range of the Himalaya.

5. The outer Himalaya or Pir Panjal-Dhooladhar ridge.

6. The Trans-Himalaya or of Hindoo-Kush (or Indo-Himalaya) which is "easily defined by the fringing lines of hills, more or less broad, and in places very distinctly marked off from the main chain by open valleys (dhuns) or narrow valleys, parallel to the main axis of the chain." These include the Siwaliks.

Interspersed between these main geological axes are many other minor ridges, on some of which are peaks of great elevation. In fact, the geological axis seldom coincides with the line of highest elevation, nor must it be confused with the main lines of water-divide of the Himalaya.

On the north and north-west of Kashmir the great water divide which separates the Indus drainage area from that of the Yarkand and other rivers of Chinese Turkestan has been explored by Sir F. Younghusband, and subsequently by H. H. P. Deasy. The general result of their investigations has been to prove that the Muztagh range, as it trends south-eastwards and finally forms a continuous mountain barrier together with the Karakoram, is the true water-divide west of the Tibetan plateau. Shifting off the sources of the Indus affluents from those of the Central Asian system of hydrography, this great water-parting is displaced by a group of peaks of which the altitude is hardly less than that of the Eastern Himalaya. Mount Godwin-Austen (28,250 ft. high), only 750 ft. lower than Everest, affords an excellent example in Asiatic geography of a dominating, peak-crowned water-parting or divide. From Kailas on the far west to the extreme north-eastern sources of the Brahmaputra, the great northern water-parting of the Indo-Tibetan highlands has only been occasionally touched. Littelde, du Rhins and Bonvalot may have stood on it as they looked southwards towards Lhasa, but for some 500 or 600 m. east of Kailas it appears to be lost in the mazes of the minor ranges and ridges of the Tibetan plateau. Nor can it be said to be as yet well defined to the east of Lhasa.

The Tibetan plateau, or Chang, breaks up about the meridian of 92° E., and to the east of this meridian the affluents of the Tsanpo (the same river as the Dihong and subsequently as the Brahmaputra) drain no longer from the elevated plateau, but from the rugged slopes of a wild region of mountains which assumes a systematic conformation where its successive ridges are arranged in concentric curves around the great bend of the Brahmaputra, wherein are hidden the sources of all the great rivers of Burma and China. Neither immediately beyond this great bend, nor within it in the Himalayan regions lying north of Assam and east of Blutan, have scientific investigations yet been systematically carried out; but it is known that the largest of the Himalayan affluents of the Brahmaputra west of the bend derive their sources from the Tibetan plateau, and break down through the containing bands of hills, carrying deposits of gold from their sources to the plains, as do all the rivers of Tibet.
Although the northern limits of the Tsanpo basin are not sufficiently well known to locate the Indo-Tibetan watershed even approximately, there exists some scattered evidence of the nature of that strip of Northern Himalaya on the Tibet-Nepalese border which lies between the line of greatest elevation and the trough of the Tsanpo. Recent investigations show that all the chief rivers of Nepal flowing southwards to the Tarai take their rise north of the line of highest crests, the "main range" of the Himalaya; and that some of them drain long lateral high-level valleys enclosed between minor ridges whose strike is parallel to the axis of the Himalaya and, occasionally, almost at right angles to the course of the main drainage channels breaking down to the plains. This formation brings the southern edge of the Tsanpo basin to the immediate neighbourhood of the banks of that river, which runs at its foot like a drain flanking a wall. It also affords material evidence of that wrinkling or folding action which accompanied the process of upheaval, when the Central Asian highlands were raised, which is more or less marked throughout the whole of the north-west Indian borderland. North of Bhutan, between the Himalayan crest and Lhasa, this formation is approximately maintained; farther east, although the same natural forces first resulted in the same effect of successive folds of the earth's crust, forming extensive curves of ridge and furrow, the abundant rainfall and the totally distinct climatic conditions which govern the line of greatest elevation subsequently led to the erosion of deeper valleys enclosed between forest-covered ranges which rise steeply from the river banks.

Although suggestions have been made of the existence of higher peaks north of the Himalaya than that which dominates the Everest group, no evidence has been adduced to support such a contention. On the other hand the observations of Major Ryder and other surveyors who explored from Lhasa to the sources of the Brahmaputra and Indus, at the conclusion of the Tibetan mission in 1904, conclusively proved that Mount Everest, which appears at the height of the Tibetan plateau as a single dominating peak, has no rival amongst Himalayan altitudes, whilst the very remarkable investigations made by permission of the Nepali durbar from peaks near Kathmandu in 1903, by Captain Wood, R.E., not only place the Everest group apart from other peaks with which they have been confused by scientists, isolating them in the topographical system of Nepal, but clearly show that there is no one dominating and continuous range indicating a main Himalayan chain which includes both Everest and Kinchhilinga. The main features of Nepalese topography are now fairly well defined. So much controversy has been aroused and the controversy has been settled on the subject of Himalayan altitudes that the present position of scientific analysis in relation to them may be shortly stated. The heights of peaks determined by exact processes of trigonometrical observation are bound to be more or less in error for three reasons: (1) the extraordinary geoidal deformation of the level surface at the observing stations in submontane regions; (2) ignorance of the laws of refraction when rays traverse rarefied air in snow-covered regions; (3) ignorance of the variations in the actual height of peaks due to the increase, or decrease, of snow on the higher altitudes of the highest mountains in the world are, for these reasons, adjudged by Colonel S. G. Burrard, the Supt. Trigonometrical Surveys in India, to be in probable error to the following extent:

These determinations have the effect of placing Kinchhilinga second and K2 third on the list.

(T. H. H.*

Geology.—The Himalaya have been formed by violent crumpling of the earth's crust along the southern margin of the great tableland of Central Asia. Outside the arc of the mountain chain no sign of this crumpling is to be detected except in the Salt Range, and the very highest peaks of the Himalaya are found in the very eastern China from which they have separated in importance since early Palaeozoic times, if not since the Archean period itself. But the contrast between the Himalaya and the Peninsula is not confined to their structure: the difference in the rock sequences is equally marked. The Himalayan sequence, from the Ordovician to the Eocene, is almost entirely marine; there are indeed occasional breaks in the series, but during most of the whole of the long period in which the thickest part of its northern part, must have been beneath the sea—the Central Mediterranean Sea of Neumayer or Tethys of Sue. In the peninsula, however, no marine fossils have yet been found of earlier date than the Tertiary, and these Tertiary formations are continuous to the cretaceous, and the cretaceous is continuous to the terminal period of the coasts; the principal fossiliferous deposits are the plant-bearing beds of the Gondwana series, and there can be no doubt that, at least since the Carboniferous period, nearly the whole of the Peninsula have been beneath the sea. The Himalaya and the nearly horizontal strata of the peninsula lies the Indo-Gangetic plain, covered by an enormous thickness of alluvial and wind-blown deposits, and this plain has been, since 1904, now passed through 1363 ft. of sands—reaching nearly to 1000 ft. below sea-level—without any sign of approaching the base of the alluvial series. It is clear, then, that in front of the Himalaya there is a great depression, but as yet there is no indication that this depression was ever beneath the sea.

In the light thrown by recent researches on the structure and origin of mountain chains the explanation of these facts no longer need be sought in repeated applications of the hypothesis of the first orogeny. The general view that Mesozoic times extended across the Indian Ocean towards South Africa. Its furrows were in the same direction as those of the Southern Hemisphere, and the evidence points to the Jurassic and Cretaceous times, stretched across the Old World from west to east, and in this sea were laid down the marine deposits of the Himalaya. The tangential pressures which are known to be set up in the earth's crust—either by the contraction of the interior or in some other way—cause the deposits of this sea to be crushed up against the rigid granites and other old rocks of the peninsula and the whole of the higher range of the Himalaya, against which the part of which did not crumple. The Indo-Gangetic depression was formed by the weight of the over-riding mass bending down the edge over which it rode, or else it is the lower limb of the S-shaped fold which is necessarily result if there were no fracture—the Himalaya representing the upper limb of the S.

Geologically, the Himalaya may be divided into three zones which correspond more or less with orographical divisions. The northernmost is the Tibetan zone, extending from the Middle or Siwalik to the Himalayan zone and coexisting and mesozoic age are largely developed—excepting in the north-west no such rocks are known on the southern flanks. The second is the zone of the snowy peaks and of the lower Himalaya, and is composed chiefly of crystalline and metamorphic rocks together with unfossiliferous sedimentary beds supposed to be of Palaeozoic age. The southern zone comprises the Sub-Himalaya and consists entirely of sedimentary rocks, and are, in the upper levels of the mountains, beds which have hitherto yielded fossils, belong to the Ordovician system, but it is highly probable that the underlying " Haimanta of the central Himalaya are of Cambrian age. Further the group the Cambrian beds and the Carboniferous beds to the east of the Himalaya is made up by conglomerate beds which are, in fact, the product of the sub-Himalaya of the Carboniferous beds, which are the upper beds of the Miocene series, which is raised, which is, however, of the Miocene beds of the Eocene Nummulitic formation. The next succeeding deposit is a sandstone, often highly inclined, which rests unconformably upon the Nummulitic beds and resembles the Lias beds of the Tertiary. This sandstone is now yielding no fossils of any kind. The whole is overlaid unconformably by the younger Tertiaries of the Huned, which are perfectly horizontal and have been quite untouched by any of the foregoing processes. From the absence of any well-marked unconformity it is evident that in the northern part of the Himalayan belt, at least in the sparsely treeless country, in may cases, there has been no post-Archean folding of any magnitude until after the deposition of the beds; but in the south, where the folding was completed before the later Tertiaries of Huned were laid down. It was, therefore, during the Miocene period that the elevation of this part of the chain began. The Siwalik and the Huned sandstones indicate that the folding continued into the Pliocene period. Along the southern flanks of the Himalaya the history of the chain is still more clearly shown. The sub-Himalaya are formed of Tertiary beds which generally Siwalk of Upper Tertiary, while the lower Himalaya consist of pre-Tertiary rocks.
without fossils. Throughout the whole length of the chain, wherever the river has cut through the debris of the pre-Tertiary rocks has been seen, it is a great reversed fault. West of the Blas river a similar reversed fault forms the boundary between the lower Tertiaries and the pre-Tertiary rocks of the Himalaya, while between the Sutlej and the upper Siwaliks, the boundary is made out by a great reversed fault in the Himalaya, the fault lies between them and the Siwaliks. The hade of the fault is constantly inwards, towards the centre of the chain, and the latter rocks which form the Himalaya proper, have been pushed forward over the lower beds of the sub-Himalaya. But the latter fault is not an ordinary reversed fault; it was, nearly everywhere, the northern boundary of deposition of the Siwalik-beds, and only in a few instances do any of the Siwalik deposits extend even to a short distance beyond it. The Siwaliks are arranged in a circular, one.

The Jhelum, Indus, Sutlej, and their tributaries, have all been reversed during the deposition of the Siwalik beds, and as the beds were laid down, the Himalaya were pushed forward over them, the Siwaliks then being forced up like a long inclined plane. In this manner, in some places the Siwaliks now form a continuous and conformable series from base to summit, in places other middle places are absent and the upper beds of the series rest upon the upturned and denuded edges of the lower beds. The Siwaliks are fluviatile and torrential deposits similar to those which are now being formed at the foot of the mountains, in the Indo-Gangetic plain; and their relation to the older rocks of the Himalaya proper were very similar to those which now exist between the deposits of the plain and the Siwaliks themselves. But the great fault just described is not the only one of this character. There is a series of such faults, approximately parallel to one another, and although they have not been traced throughout the whole chain, yet they occur seems to have formed the northern boundary of deposition of the deposits immediately to the south of them. It appears, therefore, that the Himalaya grew southwards in a series of stages. A reversed fault was formed at the foot of the chain, and

arranged between the same parallel system of folds as we see on the western frontier, connected by short transverse gaps where the rivers cross the folds, frequently to resume a course parallel to that originally held. An instance of this occurs where the Indus suddenly breaks through the well-defined Ladakh range in the North-west Himalaya; and the Jhelum, after passing through the exposed valley of the Indus, resumes its course nearly parallel to the northern side of the range. The reason assigned for these extraordinary diversions of the drainage right across the general strike of the ridges is that it is antecedent.—i.e., that the lines of drainage were formed ere the folds or anticlines were well advanced; that the drainage has merely maintained the course originally held, by the power of erosion during the gradual process of upheaval.

In the outer valleys of the Himalaya the sides are generally steep, so steep as to be liable to landslip, yet the streams are still coming down the river beds and have not yet reached the stage of equilibrium. Here and there a valley has become filled with alluvial detritus owing to the cutting of the stream of the folds of the rocks, and the valley occurs there is usually to found a fertile and productive field for agriculture. The straits of the Jhelum, below Baramulla, probably account for the lovely vale of Kashmir, which is in form (if not in principles of construction) a repetition on grand scale of the Maidan of the Afsir Tahir, where the drainage from the slopes of a great amphitheatre of hills is collected and then arrested by the gorge which marks the outlet to the Bara.

Other rivers besides the Indus and the Brahmaputra begin by draining a considerable area north of the snowy range—the Sutlej, the Kosi, the Gandak and the Subansiri, for example. General Himalayan formation is typical. All these rivers break through the more resistant rocks and flow down towards the plains of India. Here the "antecedent" theory will not suffice, for there is no sufficient catchment area north of the Indus to support it. Their formation is explained by a process of "cutting back," by which the heads of these streams are gradually

upon this fault the mountains were pushed forward over the beds deposited at their base, crumpling and folding them in the process, and forming a sub-Himalayan ridge in front of the main chain. After a time a new fault originated at the foot of the sub-Himalayan zone thus raised, which now became part of the Himalaya themselves, and a new sub-Himalayan chain was formed in front of the previous one. The folding and thrusting developed to the west, and the process is still in operation, and in time the deposits of the present Indo-Gangetic plain will be involved in the folds.

The regular form of the Himalaya, constituting an arc of a true circle, has been pushed forward nearly to the middle of the whole chain has been pushed forward as one mass upon a gigantic thrust-plane; but, if so, the dip of the plane must be low, for a line drawn along the southern face of the Himalaya would coincide with the outcrop of a plane inclined to the surface at an angle of about 14°. The thrust-plane, then, does not coincide with any of the boundary faults already mentioned, which are usually inclined at angles of 50° or 60°. The latter are due to the fact that, although, perhaps, the whole mass above the thrust-plane may move, yet the pressure which pushes it forwards necessarily proceeds from behind. The back, accordingly, moves faster than the front, and the whole is packed together; as when an ice-berg floated against the shore, the ice breaks and the outer fragments ride over those within. The great thrust-plane which is thus imagined to exist at the base of the Himalaya, corresponds with the "major thrusts" of the N.W. Highlands of Scotland, and the "reversed faults which appear at the surface with the thrusts." (P. L.A.)

Such is the general outline of Himalayan evolution as now understood, and the process of it has led to certain marked features of the scenery. Although we generally think of the Indus mountains we have beds of hard limestone or sandstone alternating with soft shales, which leads to the scooping out by erosion of long narrow valleys where the shales are exposed, and the passage down the streams through deep rifts or gorges across the hard limestone anticlines, which stand in irregular series of parallel ridges with the eroded valleys between, is a great natural feature. This is due to the difference in resistance between the rocks; but quite as important is the fact that the cold climate acting for longer periods and on a much larger scale; but the structure is varied in the eastern portions of the mountains by the effect of different climatic conditions, and especially by the greater rainfall. Instead of wide, barren, wind-swept valleys, here are found fertile alluvial plains—such as Manipur—but for the most part the erosive action of the river has been able to keep pace with the rise of the river bed, and we have deep, steep-sided valleys

eating their way northwards owing to the greater rainfall on the southern than on the northern slopes. The result of this process is well exhibited in the relative steepness of slope on the Indian and Tibetan sides of the passes to the Indus plateau. On the southern or Indus side the routes to Tibetan and Ladakh follow the levels of Himalayan valleys with no remarkably steep gradients till they near their summits; while on the Indus side they pass across the ascending curve to the summit of the pass, from which point it falls with a comparatively gentle gradient to the general level of the Jhelum, and the Indus drainage system. It is evident from the Kumaon and Garhwal hills into Tibet exhibit this formation in a marked degree. Taking the average elevation of the central axial line of snowy peaks as 19,000 ft., the average height of the passes is not more than 10,000 owing to this process of cutting down by erosion and gradual encroachment into the northern basin.

Meteorology.—Independently of the enormous variety of topographical conformation contained in the Himalayan system, the vast altitude of the mountains alone is sufficient to cause modifications of climate in ascending over their slopes such as are not surpassed by those observed in moving from the equator to the poles. One half of the time mass of the atmosphere and the three-fourths of the water suspended in it in the form of vapour lie below the average altitude of the Himalaya; and of the residue, one-half of the air and virtually all the vapour come within the influence of the highest peaks. One remarkable characteristic of the Himalayan climate is its great annual range of temperature, and the annual and diurnal oscillations are as well marked in the Himalaya as elsewhere, but the amount of vapour held in suspension diminishes so rapidly with the altitude that not more than one-half of the annual precipitation sometimes only one-tenth of that observed at the foot of the mountains is found at the greatest heights. This is dependent on the temperature of the air which rapidly decreases with altitude. On the mountains evaporation is extremely slight, even at an elevation of 1000 ft. producing a fall of 3½°, or about 1° to each 300 ft. The mean winter temperature at 7000 ft. (which is about the average height of Himalayan hill stations) 14°; the mean summer temperature at 12,000 ft. the thermometer never falls below freezing-point from the end of May to the middle of October, and at 15,000 ft. it is seldom below that point even in the height of summer. It should be noted that the thermometrical conditions Tibet vary considerably from those of the Himalaya. At 12,000 ft. in Tibet the mean of the hottest month is about 60°F. and of the coldest about 10°F. whilst, at 15,000 ft. the frost is only permanent

Section across the sub-Himalayan zone.
from the end of October to the end of April. The distribution of vegetation and topographical conformation largely influence the question of local temperature. For instance it may be found that the difference of temperature between forest-clad ranges and the ice-covered heights is in May 76°, in August 106°, in December 25°, and in January; and the difference between the temperature of a well-wooded hill top and the open valley below may vary from 9° to 24° within twenty-four hours. The general relations of temperature along the main Himalayan ranges are, however, apt to become anomalous when applied to elevated zones with a dense covering of forest and a great quantity of cloud and open and unclothy regions both above and below the forest-clad troughs.

The chief rainfall occurs in the summer months between May and October (i.e. the period of the monsoon rains of India) the remainder falling during the winter months. The rainfall over the great plain of northern India gradually diminishes in quantity, and begins later, as we pass from east to west. At the same time, the rain is heavier as we approach the Himalaya and the greatest falls are measured in its outer ranges; but the quantity again diminishes as we pass onward across the chain, and on arriving at the border of Tibet, behind the great line of snowly peaks, the rain falls in such small quantities as to be altogether impracticable. The rainfall in the west is doubtless diminished by the film of snow which are established from the plains to the mountains during the day, and from the hills to the plains during the night, are impenetrable to rain. The vapour from the ascending currents and their gradual exhaustion as they are precipitated on successive ranges is very obvious in the cloud effects produced during the monsoon, the southern or winter, currents, when carrying moisture between the two white crests of cloud whilst the northern slopes are often left entirely free. This shows how large a proportion of the vapour is absorbed and how it is only by drifting through the deeper gorges can any moisture find its way to the Tibet basin tableland.

The yearly rainfall, which amounts to 60 and 70 in. in the delta of the Ganges, is reduced to about 40 in. when that river is crossed, and in the west is not to be found. Yet in the western ranges the amount of rainwater which is not on or below the ground is immense, the rainfall is by far larger than that required for the sustenance of the Indus into the plains. At Darjeeling (7000 ft. altitude) on the outer ranges of the eastern Himalaya it amounts to about 20 in. At Naini Tal north of the United Provinces it is about 90 in. ; and in the most westerly part of the range, the rainfall is much larger. All the inner ranges of the north-western hills. All these stations are above the same altitude.

In the eastern Himalaya the ordinary winter limit of snow is 6000 ft. and it never lies for many days even at 7000 ft. Kumaon, on the west, it usually reaches down to the 5000 ft. level, and occasionally up to 2500 ft. Snow has been known to fall at Peshawar. At Leh, in western Tibet, hardly 2 ft. of snow are known to fall, and the gey snow-list except that the snow on the plains of India.

Snowfall. The level to which the Himalayan glaciers extend is greatly dependent on local conditions, principally the extent and elevation of the snow basins which feed them, and the slope and position of the mountain on which they are formed. Glaciers on the outer slopes of the mountains, fed by the common source of snow, descend in the course of the year, ranges from 15,000 to 16,000 ft. on the southern exposures of the Himalaya that carry perpetual snow, also from the same kind of mountain. On the Indus it is not till December that the snow begins to descend for the winter, although after September light falls occur which cover the mountain sides down to 12,000 ft., but these soon disappear. On the snow range the snow-line is not lower than 18,500 ft. and on the summit of the table-land it reaches to 20,000 ft. On all the passes into Tibet vegetation reaches to about 17,500 ft., and in August they may be crossed in ordinary years up to 18,400 ft. without finding any snow upon them; and it is as impossible to find snow in the summer in Tibet at 15,500 ft. above the sea as on the plains of India.

On the eastern side the case in Tibet, or in the most elevated valleys near the snowly range. The glaciers of Sikkim and the eastern mountains are believed to reach a lower level than 13,500 or 14,300 ft. Kumaon and many of them descend to between 15,500 and 12,500 ft.

In the higher valleys and Tibet 15,000 and 16,000 ft. is the ordinary level at which they end, but there are exceptions which descend far lower and higher above the snow-line, and the glaciers of Sikkim usually descend below the snow-line, and in the Himalaya and Tibet about the same holds good. The summer temperatures of the points where the glaciers end on the Himalaya also correspond fairly with those of the colder heights of Europe. The boundary of rainfall, viz. for July a little below 60° F., August 58° and September 55°.

Measurements of the movement of Himalayan glaciers give results according closely with those obtained under analogous conditions in the Alps, viz. rates from 91 to 141 in. in twenty-four hours. The motion of one glacier from the middle of May to the middle of October averaged 8 in. in the twenty-four hours. The dimensions of the glaciers on the outer Himalaya, where, as before remarked, the valleys descend rapidly to lower levels, are fairly comparable with those of Alpine glaciers, though frequently much exceeding them in length—another single glacier has been surveyed 56. A mountain tributary of the Indus, which joins the Indus near its south-western bend towards the Punjab, take their rise from a glacier system which is probably unequalled in the world for its extent and magnitude and proportion. Chief amongst them are the Chhumbung which in the south-western part of Tibet, where the destructive action of the summer heat is far less, the development of the glaciers is enormous. At one locality in Ladakh there is a continuous mass of snow and ice extending across a wide valley. The dimensions of the limits of the two glaciers at its opposite ends. Another single glacier larccum 26. A mountain tributary of the Indus, which joins the Indus near its south-western bend towards the Punjab, take their rise from a glacier system which is probably unequalled in the world for its extent and magnitude and proportion. Chief amongst them are the Chhumbung which in the south-western part of Tibet, where the destructive action of the summer heat is far less, the development of the glaciers is enormous. At one locality in Ladakh there is a continuous mass of snow and ice extending across a wide valley. The dimensions of the limits of the two glaciers at its opposite ends. Another single glacier larccum 26.

In connection with almost all the Himalayan glaciers of which precise accounts are forthcoming are ancient moraines indicating some previous condition in which their extent was much larger than now. In the east these moraines are very remarkable, extending from the Himalaya as far as the British territory, and they have been observed on the summit of the table-land as well as on the Himalayan slope. The explanation suggested to account for their existence is different from the true explanation of such moraines. Any modification of the coast-line which should submerge the area now occupied by the North Indian plain, or any considerable part of it, would be accompanied by a much wetter and more humid climate, with a larger proportion of the rain from the highest ranges, and less summer heat would be brought to bear on the destruction of the glaciers, which would receive larger supplies and be less low.

Botany. Speaking broadly, the general type of the flora of the lower, hotter and wetter regions, which extend along the great line at the foot of the Himalaya, and include the valleys of the larger rivers, with the range of the lower subtropical mountains, does not differ essentially from that of the contiguous peninsula and islands, though the tropical and insular character gradually becomes less marked going east from west, where, with a greater elevation and distance from the sea and consequent fall of temperature, the climate is more humid, and the cold increases. The vegetation of the western part of the plain and of the hottest zone of the western mountains thus becomes closely allied to that of the East Indies, and of the higher plains of the Indian peninsula, more especially of its hilly portions; and, while a general tropical character is preserved, forms are observed which indicate the addition of an Afghan as well as of an African element, and which, though not new, are frequently of great interest. The Alps is an example, pointing to some previous connexion with Africa.

The European flora, which is diffused from the Mediterranean along the high lands of Asia, extends to the Himalaya; many European genera and species extend to the eastern Himalaya, while genus common to Europe and the Himalaya are abundant throughout and at all elevations. From the opposite borders of the Indian flora, the Chinese, Tibetan, and Himalayan, and the flora of the African and from the very rich and varied component of the flora, the eastern Himalaya and Tibet are specially rich, with the tea plant, Ascula, Healing, Sinning, Adamia, Goughia and others, has taken place, these being more numerous in the east and gradually disappearing in the west. On the higher and therefore cooler and less rainy ranges of the Himalaya the conditions of temperature requisite for the preservation of the various species are readily found by ascending or descending the mountain slopes, and therefore a greater uniformity of character in the vegetation is maintained along the whole chain. At the greater elevations the species identical with those of Europe become more frequent, and in the alpine regions many plants are found identical with species of the Alps.

On the eastern side of the continent, where the climate is a Siberian type is established, with many true Siberian species and more genera, and some of the Siberian forms are further disseminated, even to the plains of Upper India. The total absence of a few of the common northern European and Asia should have been noticed, among which may be named Tilia, Fagus, Arborus, Erica, Azalea and Cistaceae.

In the more humid regions of the west the mountains are almost everywhere covered with a dense forest which reaches up to 12,000 or 13,000 ft. Many tropical types here ascend to 7000 ft. or more. To the west the upper limit of forest is somewhat lower, from 11,000 to 12,000 ft. The vegetation is not very different from that of the high parts of the Himalaya, and the vegetation of the eastern provinces are, larch, various other coniferous trees, and many small shrubs. In Sikkim the mountains are covered with dense forest of tall umbreageous trees, commonly accompanied by a luxuriat growth of under shrubs, and adorned with climbing and epiphyll plants in great variety. The vine-like lianas, like Rafflesia, Shorea (sul), laurels, many Leguminosae, Bombax, Arotcorpus, bamboo and several palms, among which species of Calamus are remarkable, climb the largest trees; and this is the western limit of Cyca and Myriectis (nutmeg). Plantains ascend to 7000 ft. and tree-cerns abound. Other ferns, Selacticornia, orchids
HIMALAYA

and climbing Aroidae are very numerous, the last named profusely adorning the forests with their splendid dark-green foliage. Various oaks descend within a few hundred feet of the sea-level, increasing in numbers at greater altitudes, and becoming very frequent at 4000 ft., at 10,000 ft. Quercus, Castanea, and Lithocarpus, and among the evergreens, Picea, Pinus, Abies, and many Coniferae, occur. Ascending higher, at 12,000 ft., the alpine flora also becomes prominently marked by Picea, Betula, Rhododendrons, and various species of Empetrum, Vaccinium, Cassiope, Lysimachia, and others of the Rosaceae, and to these are added the range of flowers of the Primula, Oxyccoccus, Delphinium, Daphne, Myrmine, Symplocos and Rubus. Rhododendrons begin at about 6000 ft. and become abundant at 8000 ft., from 10,000 to 14,000 ft. the mass of Rhododendrons and species of Viburnum is so dense that it extends some 2000 ft. above the forest. Epiphyllous orchids are extremely numerous between 6000 and 8000 ft. Of the Coniferae, Podocarpus and Pinus longifolia alone descend to the tropical zone; all the species in this region (which a genus now recognizes in the western mountains) are found at 8000, and the yew and Picea Webiana at 10,000 ft., Pinus excel; which occurs in Bhatuan, is abundant in the higher ranges of the Silkiang mountains.

On the drier and higher mountains of the interior of the chain, the forests become more open, and are spread less uniformly over the hill-sides, a luxuriant herbaceous vegetation, and the number of shrubby Leguminosae, Rubiaceae, Rosaceae, Umbelliferae, Labiatae, Gramineae, Cyperaceae and other European genera.

Passing to the westward, and viewing the flora of Kumaon, which province holds a central position on the chain, on the north, meridian, we find that the gradual decrease of moisture and increase of high summer heat are accompanied by a marked change of the vegetation. The tropical forest is characterized by the trees of the hotter and drier regions, and by the shrubs such as Urtica, Rubus, Alnus, Corylus, Corylus, and other cul-tivated species. Ferns are more rare, and the tree-ferns have disappeared. The species of palm are also reduced to two or three, and bamboos, though abundant, are confined to a few species.

The ranges of the Himalaya which are mainly covered with forests of Pinus longifolia, rhododendron, oak and Piers. At Nain Tal, however, is abundant. The shrubby vegetation comprises Rosa, Rubus, Indigofera, Desmodium, Berberis, Boehmeria, Viburnum, Clematis, with various species of these genera, Potentilla, Geranium, Thalictrum, Primula, Genista, and many other European forms are common. In the less exposed localities, on northern slopes and high heights, the European forms become more common, and here, if we find species of alder, birch, asilm, holly, hornbeam, Pyrus, &c. At greater elevations in the interior, besides the above are met Corylus, the common walnut, found wild throughout the Himalaya, chestnut, oak, beech, alder, birch, and sycamore. The north-western regions, however, though covered with the ordinary horned cattle of India, many wild sheep, and two antelopes, as well as the musk-deer; several hares and some burrowers, (such as Sable, Vulpes, Pallas's cat, Felis sylvestris, &c.) might be added. Certain arctic forms of carnivora—fox, wolf, lynx, ounce, marten and ermine; also wild ass. Among birds are found bustard and species of sand-grouse and partridge; water-fowl in the marshes, and innumerable butterflies. The forests of the western side of the Kumaun range extend a few miles inland from the plains of India in winter; the raven, hawks, eagles and owls, a magpie, and two kinds of crows; and many smaller birds of the passerine order, amongst which are several finches. Reptiles, as might be anticipated, are far from numerous, but a few lizards are found, belonging for the most part to types, such as Phrynocephalus, characteristic of the Central-Asian area. The fishes from the headwaters of the Indus also belong, for the most part, to Central-Asiatic genera. Almost all the smaller species of fish are introduced, and the form of several peculiar small-scale carps, belonging to the genus Schizothorax and its allies.

The ranges of the Himalaya, from the border of Tibet to the peninsular region, is that part of the world which is one of the richest of the world, particularly in respect to birds, to which the forest-clad mountains offer almost every range of temperature. Only twice the forms of duck, enter the mountains, the langur species of Semnopithecus, ranging up to 12,000 ft. No lemmur occurs, although a species is found in Assam, and another in southern India. Bats are numerous, but the species are for the most part peculiar to the area; several European forms are found at the higher elevations. Males, which are unknown in the Indian peninsula, abound in the forest regions of the eastern Himalayas at a moderate altitude, and shrews of several species are found almost everywhere in these forests. A plentiful species of hedgehog, of which one, however, Nectogale, is probably Tibetan rather than Himalayan. Bears are common, and so are marten, several weasels and otters, and cats of various kinds and sizes, from the little spotted Falsi bengalensis, smaller than the domestic cat, to animals like the clouded leopard rivaling a leopard in size. Leopards are common, and the tiger wanders to a considerable elevation, but can hardly be considered a permanent inhabitant, except in the lower valleys. The pikas (Ochotona) are of considerable importance, being only found at the lower elevations. Wild dogs (Cyon) are common, but neither foxes nor wolves occur in the forest area. Besides these, the wide range of various small mammals and birds, the forms of which is Aelurus, sometimes called the cat-bear, a type akin to the American racoon. Two other genera, Heliulis, an aberrant badger, and Lisang, an aberrant civet, are representatives of Malayan types. Mice and rats, mice are common, and are represented by several species. Squirrels are represented by several species. Rats and mice swarm, both kinds and individuals being numerous, but few present much peculiarity, a bamboo rat (Riotomys) from the base of the eastern Himalaya, being perhaps most worthy of notice. Two or three species of vole (Arniola) have been detected, and porcupines are
common. The elephant is found in the outer forests as far as the Jumna, and the rhinoceros as far as the Sarda; the spread of both these animals as far as the Indus and into the plains of India, far beyond the limits of our present knowledge, and the bears and leopards are said to range as far as the Brahmaputra and on into Tibet. Bear and deer are to be found in the forests of the northwestern Himalayas, and near the Indus they have probably retreated before the advance of cultivists.

Wild pigs are common in the lower ranges, and one peculiar species of pigmy-hog (Sus salvanius) of very small size inhabits the higher ridges of the eastern Himalayas in Bhutan and Assam. Deer of several kinds are met with, but do not ascend very high on the hillsides, and belong exclusively to Indian forms. The musk deer keeps to the greater elevations. Three chamois, the Himalayan, the blue, and the wall, are found throughout the range. There is also a wild ox, found at the base of the hills. Three very characteristic ruminants, having some affinities with goats, inhabit the Himalaya; these are the musk ox (Ovibos moschatus), the 'pika' (Ochotona), and the pangolin (Manis), the last-named ranging to rather higher elevations. Lastly, the pangolin (Manis) is represented by two species in the eastern Himalaya. A dolphin (Platanista) living in the Ganges ascends that river and affluents to its issue from the mountains. Almost all the orders of birds are well represented, and the marvellous variety of forms found in the eastern Himalaya is only rivaled by those of Central and South America. Eagles, vultures and other birds of prey are seen soaring high over the highest of the forest-land ranges. Owls are numerous, and a small species, Glaucidium, is conspicuous, breaking the stillness of the night by its monotonous threnodies. Genera of swifts and martins, and rollers, and beautiful kingfishers and barbets are common. Several large hornbills inhabit the highest trees in the forest. The parrots are represented by the white parrots, of which there are several species, and a single small lory. The number of woodpeckers is very great and the variety of plumage remarkable, and the voice of the woodpecker is heard everywhere during the spring as in Europe. The number of passerine birds is immense. Amongst them the sun-birds resemble in appearance and almost rival in beauty the humming-birds of the New Continent. Creepers, nuthatches, shrikes, and their allied forms, flycatchers and swallows, thrushes, pipits and babbler (about fifty species), bulbul and orioles, peculiar types of redstart, various sylviads, wrens, tits, cisticolas, jays and magpies, wrens, crows, chaffinches, and many finch-like species, including the exquisitely coloured rosefinches, may also be mentioned. The pigeons are represented by several wood-pigeons, doves and green pigeons. The gallinaceous birds are regarded as part of the peacock, which everywhere in the forest has footing on the plains, jungle fowl and several pheasants; partridges, of which the chikor may be named as most abundant, and snow-pheasants and partridges, found only at the greatest elevations. Waders and waterfowl are far less abundant, and those occurring are nearly all migratory forms which visit the peninsula of India—the only important exception being two kinds of solitary snipe and the red-billed curlew.

Of the reptiles found in these mountains many are peculiar. Some of the snakes of India are to be seen in the hotter regions, including the python and some of the venomous species, the cobra being found as far as the Indus. In the mountains, the serpents are more numerous, and as well as frogs are found at all elevations from the plains to the upper Himalayan valleys, and even extend to Tibet. The lizards are very common. There is a great similarity in the genera and species appear to be organized for a maritime, torrent-like life, being almost all furnished with suckers to enable them to maintain their positions in the rapid streams which they inhabit. A few Siguridae have been found in Tibet, but the carps constitute the larger part of the species. Many of the Himalayan forms are Indian fish which appear to go up to the higher streams to deposit their ova, and the Tibetan species as a rule are confined to the rivers on the higher elevations. The highest elevations are characterized by the new genus of freshwater fish described by Mr. H. K. Xiufu, "Aus dem westlichen Himalaya (Leipzig, 1884); H. C. B. Tanner, "Our Present Knowledge of the Himalaya," vol. xiv. Proc. R. G. S. (1891); R. D. Oldham, "The Evolution of Indian Geology," Proc. R. G. S. (1895); and W. M. Conway, "The Himalayas," vol. i. (London, 1895); Sir W. M. Conway, "Climbing and Exploring in the Karakoram," vol. i. (London, 1898); F. E. Bullock, "The Ice World of Himalaya," vol. ii. (London, 1898); H. K. Xiufu, "Zoological Exploration of the Muhtah," vol. i. (London, 1908); and W. M. Freshfield, "Round Kanchenjunga." It will be observed from this table that it is not often that a great slope of snow-covered mountain is observable in the Himalaya than is afforded by the familiar view of Mont Blanc from Chamonix. For geography see R. Lydekker, "The Geology of Kashmir," etc.; Memor. Geol. Surv. India, vol. xxix. (1885); C. S. Middlemiss, Physical Geology of the Sub-Himalaya of Cashmer and Kumaon, ibid., vol. xxiv. pt. 2 (1880); C. L. Griesbach, Geology of the Central Himalayas, vol. xix. (1881); R. D. Oldham, Manual of the Geology of India, chap. xviii. (2nd ed., 1893). Descriptions of the fossiliferous strata will be found in several of the volumes of the Palaeontologia Indica, published by the Geological Survey of India, Calcutta.

HIMERA, a city on the north coast of Sicily, on a hill above the east bank of the Eimeran Septentrionalis. It was founded in 648 B.C. by the Chalcidian inhabitants of Zancle, in company with many Syracusan exiles. Early in the 5th century the tyrant Terrilas, son-in-law of Anaxilas of Rhegium and Zancle, appealed to the Carthaginians, who came to his assistance, but lessoned the power of Gelo of Syracuse in 480 B.C. on the same day, it is said, as the battle of Salamis. Thrasylus, son of Theron of Agrigentum, seems to have ruled the city oppressively, but an appeal made to Hiero of Syracuse, Gelo's brother, was betrayed by him to Theron; the latter massacred all his enemies and in the following year resettled the town. In 415 it refused to admit the Athenian fleet and remained an ally of Syracuse. In 408 the Carthaginian invading army under Hannibal, after capturing Selinus, invested and took Himera.
and razed the city to the ground, founding a new town close to the hot springs (Thermae Himeraeae), 8 m. to the west. The only relic of the ancient town now visible above ground is a small portion (four columns, lower diameter 7 ft.) of a Doric temple, the date of which (whether before or after 480 B.C.) is uncertain.

HIMERIUS (c. A.D. 315–386), Greek sophist and rhetorician, was born at Prusa in Bithynia. He completed his education at Athens, whence he was summoned to Antioch in 362 by the emperor Julian to act as his private secretary. After the death of Julian in the following year Himerius returned to Athens, where he established a school of rhetoric, which he compared with that of Isocrates and the Delphic oracle, owing to the number of those who flocked from all parts of the world to hear him. Amongst his pupils were Gregory of Nazianzus and Basil the Great, bishop of Caesarea. In recognition of his merits, civic rights and the membership of the Areopagus were conferred upon him. The death of his son Rufinus (his lament for whom, called monodia, is extant) and that of a favourite daughter greatly affected his health; in his later years he became blind and he died of epilepsy. Although a heathen, who had been initiated into the mysteries of Mithra by Julian, he shows no prejudice against the Christians. Himerius is a typical representative of the later rhetorical schools. Photius (cod. 165, 243 Bekker) had recorded speeches by him, of which 36 have come down to us complete and fragments of 10 or 12 others. They consist of epideictic or "display" speeches after the style of Aristides, the majority of which having been delivered on special occasions, such as the arrival of a new governor, visits to different cities (Thessalonica, Constantinople), or the death of friends or well-known personages. The Polemarchicus, like the Menexenus of Plato and the Epitaphios Logos of Hypereides, is a panegyric of those who had given their lives for their country; it is so called because it was originally the duty of the polemarch to arrange the funeral games in honour of those who had fallen in battle. Other declamations, only known from the excerpts in Photius, were imaginary orations put into the mouth of famous persons—Demosthenes advocating the recall of Aeschines from banishment; Hypereides supporting the policy of Demosthenes, Themistocles inveighing against the king of Persia, an orator unnamed attacking Epicurus for atheism before Julian at Constantinople. Himerius is more of a poet than a rhetorician, and his declamations are valuable as giving prose versions or even the actual words of lost poems by Greek lyric writers. The prose poem on the marriage of Sevurus and his greeting to Basil at the beginning of spring are quite in the spirit of the old lyric. Himerius possesses vigour of language and descriptive powers, though his productions are spilt by too frequent use of imagery, allegorical and metaphorical obscurities, many of which are due to the influence of rapaciously learned men. They are valuable for the history and social conditions of the time, although lacking the sincerity characteristic of Lianhus.

See Kunapius, Vitae sophistarum; Suidas, s.v.; editions by G. Wenndorf (1790), with valuable introduction and commentaries, and by F. Dübner (1849) in the Didot series; C. Teuber, Quaestiones Himerienses (Breslau, 1882); on the style, E. Norden, Die antike Kunstprosa (1898).

HIMLY (LOUIS), AUGUSTE (1823–1906), French historian and geographer, was born at Strasbourg on the 28th of March 1823. After studying in his native town and taking the university course in Berlin (1842–1843) he went to Paris, and passed first in the examination for fellowship (agrégation) of the lycées (1849), and first in the examinations on leaving the École des Chartes, and first in the examination for fellowship of the faculties (1849). In 1849 he took the degree of doctor of letters with two theses, one of which, Vale et Louis le Dénobnaire (published in Paris in 1848), placed him in the front rank of French scholars in the province of Carolingian history. Soon, however, he turned his attention to the study of geography. In 1852 he obtained an appointment as teacher of geography at the Sorbonne, and henceforth devoted himself to that subject. It was not till 1876 that he published, in two volumes, his remarkable Histoire de la formation territoriale des états de l'Europe centrale, in which he showed with a firm, but sometimes slightly heavy touch, the reciprocal influence exerted by geography and history. While the work gives evidence throughout of wide and well-directed research, he preferred to write it in the form of a student's manual; but it was a manual so original that it gained him admission to the Institute in 1881. In that year he was appointed dean of the faculty of letters, and for ten years he directed the intellectual life of that great educational centre during its development into a great scientific body. He died at Sèvres on the 6th of October 1906.

HIMMEL, FREDERICK HENRY (1765–1814), German composer, was born on the 20th of November 1765 at Treuenbrietzen in Brandenburg, Prussia, and originally studied theology at Halle. During a temporary stay at Potsdam he had an opportunity of showing his self-acquired skill as a pianist before King Frederick William II., who thereupon made him a yearly allowance to enable him to complete his musical studies. This he did under Naumann, a German composer of the Italian school, and the style of that school Himmel himself adopted in his serious operas. The first of these, a pastoral opera, Il Primo Navigatore, was produced at Venice in 1794 with great success. In 1792 he went to Berlin, where his oratorio Isaaco was produced, in consequence of which he was made court Kapellmeister to the king of Prussia, and in that capacity wrote a great deal of official court music. The first work of his to become known in Italy, however, was a German opera, Successi, composed for the Stockhom, St Petersburg, and Berlin, were all received with great favour in their day. Of much greater importance than these is an operetta to German words by Kotzebue, called Fanjon, an admirable specimen of the primitive form of the musical drama known in Germany as the Singspiel. Himmel's gift of writing genuine simple melody is also observable in his songs, amongst which one called "To Alexis" is the best. He died in Berlin on the 8th of June 1814.

HINCKLEY, a market town in the Bosworth parliamentary division of Leicestershire, England, 141 m. S.W. from Leicester on the Nuneaton-Leicester branch of the Great North-Western railway, and near the Ashby-de-la-Zouch canal. Pop. of urban district (1901), 11,304. The town is well situated on a considerable eminence. Among the principal buildings are the church of St Mary, a Decorated and Perpendicular structure, with lofty tower and spire; the Roman Catholic academy named St Peter's Priory, and a grammar school. The ditch of a castle erected by Hugh de Grentesmennil in the time of William Rufus is still to be traced. Hinckley is the centre of a stocking-weaving district, and its specialty is circular hose. It also possesses a boot-making industry, brick and tile works, and lime works. There are mineral springs in the neighbourhood.

HINCHES, EDWARD (1792–1866), British arystologist, was born in Ireland, the son of Edward Hichen of Ireland, and educated at Trinity College, Dublin. He took orders in the Protestant Church of Ireland, and was rector of Killyleagh, Down, from 1823 till his death on the 3rd of December 1866. Hitchens devoted his spare time to the study of hieroglyphics, and to the deciphering of the cuneiform script (see CUNEIFORM), in which he was a pioneer, working out contemporaneously with Sir H. Rawlinson, and independently of him, the ancient Persian vowel system. He published a number of original and scholarly papers on assyriological questions of the highest value, chiefly in the Transactions of the Royal Irish Academy.

HINCKS, SIR FRANCIS (1807–1858), Canadian statesman, was born at Cork, Ireland, the son of an Irish Presbyterian minister. In 1832 he engaged in business in Toronto, became a friend of Robert Baldwin, and in 1835 was chosen to examine the accounts of the Welland Canal, the management of which was being attacked by W. L. Mackenzie. This turned his attention to political life and in 1838 he founded the Examiner, a weekly paper in the Liberal interest. In 1841 he was elected M.P. for the county of Oxford, and in the following year was appointed inspector-general, the title then borne by the finance minister, but in 1843 resigned with Baldwin and the other ministers on the question of responsible government. In 1848 he again became inspector-general in the Baldwin-Lafontaine
ministry, and on their retirement in 1851 became premier of Canada, his chief colleague being A. N. Morin (1805–1865). While premier he was prominent in the negotiations which led to the construction of the Grand Trunk railway, and in cooperation with Lord Elgin negotiated with the United States the reciprocity treaty of 1854. In the same year the bitter hostility of the “Clear Grits” under George Brown compelled his resignation, and he was prominent in the formation of the Liberal-Conservative Party. In 1855 he was chosen governor of New Brunswick, which was then the Windward Islands, and subsequently governor of British Guiana. In 1869 he was created K.C.M.G. and returned to Canada, becoming till 1873 finance minister in the cabinet of Sir John Macdonald. In February of that year he resigned, but continued to take an active part in public life. In 1879 the failure of the Consolidated Bank of Canada, of which he was president, led to his being tried for issuing false statements. Though found guilty on a technicality (see Journal of the Canadian Bankers’ Association, April 1906) judgment was suspended, his personal credit remained unimpaired, and he continued to take part in the discussion of public questions till his death on the 18th of August 1885.

His writings include: The Political History of Canada between 1840 and 1855 (1877); The Political Destiny of Canada (1879), and his Reminiscences (1884).

HINCMAR (c. 805–882), archbishop of Reims, one of the most remarkable figures in the ecclesiastical history of France, belonged to a noble family of the north or north-east of Gaul. Destined, doubtless, to the monastic life, he was brought up at St Denis under the direction of the abbot Hilduin (d. 844), who brought him in 822 to the court of the young Louis the Stammerer of Saxony, and when Hilduin was disgraced in 830 for having joined the party of Lothair, Hincmar accompanied him into exile at Corvey in Saxony, but returned with him to St Denis when the abbot was reconciled with the emperor, and remained faithful to the emperor during his struggle with his sons. After the death of Louis the Pious (840) Hincmar supported Charles the Bald, and received from him the abbeys of Notre-Dame at Compiegne and St Germer deFly. In 845 he obtained through the king’s support the archbishopric of Reims, and this choice was confirmed at the synod of Beauvais (April 845). Archbishop Ebbo, whom he replaced, had been deposed in 835 at the synod of Thionville (Diedenhofen) for having broken his oath of fidelity to the emperor Louis, whom he had deserted to join the party of Lothair. After the death of Louis, Ebbo succeeded in regaining possession of his see for some years (840–844), but in 844 Pope Sergius II. confirmed his deposition. It was in these circumstances that Hincmar succeeded, and in 847 Pope Leo IV. sent him the pallium.

One of the first cares of the new prelate was the restitution to his metropolitan see of the domains that had been alienated under Ebbo and given as benefices to laymen. From the beginning of his episcopate Hincmar was in constant conflict with the clerks who had been ordained by Ebbo during his reappearance. These clerks, whose ordination was regarded as invalid by Hincmar and his adherents, were condemned in 853 at the council of Soissons, and the decisions of that council were confirmed in 855 by Pope Benedict III. This conflict, however, bred an antagonism of which Hincmar was later to feel the effects. During the next thirty years the archbishop of Reims played a very prominent part in church and state. His authoritative and energetic will inspired, and in great measure directed, the policy of the west Frankish kingdom until his death. He took an active part in all the great political and religious affairs of his time, and was especially energetic in defending and extending the rights of the church and of the metropolitans in general, and of the metropolitan of the church of Reims in particular. In the resulting conflicts, in which his personal interest was in question, he displayed great activity and a wide knowledge of canon law, but did not scruple to resort to disingenuous interpretation of texts. His first encounter was with the heresiarch Gottschalk, whose predestinarian doctrines claimed to be modelled on those of St Augustine. Hincmar placed himself at the head of the party that regarded Gottschalk’s doctrines as heretical, and succeeded in procuring the arrest and imprisonment of his adversary (849). For a part at least of his doctrines Gottschalk found ardent defenders, such as Lupus of Ferrières, the deacon Florus and Amolo of Lyons. Through the energy and activity of Hincmar the theories of Gottschalk were condemned at Quierzy (853) and Valence (855), and the decisions of these two synods were confirmed at the synods of Langres and Savonnières, near Toul (854 and 855). But the prelate hesitated. Hincmar’s desire was his De presbyteriatis Dei et liber arbitrio, and against certain propositions advanced by Gottschalk on the Trinity he wrote a treatise called De una et non trina deitate. Gottschalk died in prison in 868. The question of the divorce of Lothair II., king of Lorraine, who had repudiated his wife Theutberga to marry his concubine Waldrada, engaged Hincmar’s literary activities in another direction. At the request of a number of great personages in Lorraine he composed in 866 his De divortio Lotharii et Theutberge, in which he vigorously attacked, both from the moral and the legal standpoint, the condemnation against the queen by the synod of Aix-la-Chapelle (February 866). Hincmar energetically supported the policy of Charles the Bald in Lorraine, less perhaps from devotion to the king’s interests than from a desire to see the whole of the ecclesiastical province of Reims united under the authority of a single sovereign, and in 869 it was he who consecrated Charles at Metz as king of Lorraine.

In the middle of the 9th century there appeared in Gaul the collection of false decreals commonly known as the Pseudo-Isidorian Decretals. The exact date and the circumstances of the composition of the collection are still an open question, but it is certain that Hincmar was one of the first to know of their existence, and apparently he was not aware that the documents were forged. The importance assigned by these decreals to the bishops and the provincial councils, as well as to the direct intervention of the Holy See, tended to curtail the rights of the metropolitans, of which Hincmar was so jealous. Rothard, bishop of Soissons, one of the most active members of the party in favour of the pseudo-Isidorian theories, immediately came into collision with his archbishop. Deposited in 863 at the council of Soissons, presided over by Hincmar, Rothard appealed to Rome. Pope Nicholas I. supported him zealously, and in 865, in spite of the protests of the archbishop of Reims, Arnesium, bishop of Orta and legate of the Holy See, was instructed to restore Rothard to his episcopal see. Hincmar experienced another check when he endeavoured to prevent Wulfad, one of the clerks deposed by Ebbo, from obtaining the archbishopric of Bourges with the support of Charles the Bald. After a synod held at Soissons, Nicholas I. pronounced himself in favour of the deposed clerks, and Hincmar was constrained to make submission (866). He was more successful in his contest with his nephew, the archbishop of Laon, who had been at first supported both by the king and by his uncle, the archbishop of Reims, but soon quarelled with both. Hincmar of Laon refused to recognize the authority of his metropolitan, and entered into an open struggle with his uncle, who exposed his errors in a treatise called Opusculum LV. capitulorum, and procured his condemnation and deposition at the synod of Douzy (871). The bishop of Laon was sent into exile, probably to Aquitaine, where his eyes were put out by order of Count Boso. Pope Adrian protested against his deposition, but it was confirmed in 876 by Pope John VIII., and it was not until 878, at the council of Tours, that the unfortunate prelate was reconciled with the Church. A serious conflict arose between Hincmar on the one side and Charles and the pope on the other in 876, when Pope John VIII., at the king’s request, entrusted Ansegisus, archbishop of Sens, with the primacy of the Gauls and of Germany, and created him vicar apostolic. In Hincmar’s eyes this was an encroachment on the jurisdiction of the archbishops, and it was against this primacy that he directed his treatise De jure metropolitanorum. At the same time he wrote a life of St Remigius, in which he endeavoured by audacious falsifications to prove the supremacy of the church of Reims over the other churches. Charles the Bald, however, upheld the rights of the...
Ansegisus at the synod of Ponthion. Although Hincmar had been very hostile to Charles's expedition into Italy, he figured among his testamentary executors and helped to secure the nomination of the nobles to Louis the Stammerer, whom he crowned at Compiegne (8th of December 877).

During the reign of Louis, Hincmar played an obscure part. He supported the accession of Louis III. and Carloman, but had a dispute with Louis, who wished to install a candidate in the episcopal see of Beauvais without the archbishop's assent. To Carloman, on his accession in 882, Hincmar addressed his De ordine palati, partly based on a treatise (now lost) by Adalard, abbot of Corbie (c. 814), in which he set forth his system of government and his opinion of the duties of a sovereign, a subject he had frequently treated in his De regia persona et regio intersticio, dedicated to Charles the Bald at an unknown date, and in his Instructio ad Ludovicum regem, addressed to Louis the Stammerer on his accession in 877.

In the autumn of 882 an irruption of the Normans forced the old archbishop to take refuge at Epernay, where he died on the 21st of December 882. Hincmar was a prolific writer. Besides the works already mentioned, he was the author of several theological tracts; of the De villa Noviliaco, concerning the claim of a domain of his church; and he continued from 861 the Annales Beroliniani, of which the first part was written by Prudentius, bishop of Troyes, the best source for the history of letters, some of which is extant, and others embodied in the chronicles of Flosdaurn's works, which are the principal source for the history of his life, were collected by Jacques Sirauné (Paris, 1645), and reprinted by Migne, Patrolog. Latina, vol. 1xxv. and 1xxvi. See also C. von Noorden, Hinkmar, Erzbischof von Reims (Bonn, 1863), and, especially, H. Schrörs, Hinkmar, Erzbischof von Reims (Freiburg, 1865). For Hincmar's political and ecclesiastical theories see preface to Maurice Prun's edition of the De ordine palati (Paris, 1885), and the abbé Lesne, La Hiéarchie épiscopale en Gaule et en Germanie (Paris, 1906). (R. Po.)

HIND, the female of the red-deer, usually taken as being three years old and over, the male being known as a "hart. It is sometimes also applied to the female of other species of deer. The word appears in several Teutonic languages, cf. Dutch and Ger. Hinde, and has been connected with the Goth. hinjan (kinthun), to seize, which may be connected ultimately with "hand" and "hunt."

"Hart," from the O.E. heart, may be in origin connected with the root of Gr. kägos, horn. "Hind" (O.E. hine, probably from the O.E. hina, members of a family or household), meaning a servant, especially a labourer on a farm, is another word. In Scotland the "hind" is a farm servant, with a cottage on the farm, and duties and responsibilities that make him superior to the rest of the labourers. Similarly "hind" is used in certain parts of northern England as equivalent to "ballif."

HINDERSIN, GUSTAV EDUARD VON (1804-1872), Prussian general, was born at Wernigerode near Halberstadt on the 18th of July 1804. He was the son of a priest and received a good education. His earlier life was spent in great poverty, and the struggle for existence developed in him an iron strength of character. Entering the Prussian artillery in 1828 he became an officer in 1825. From 1830 to 1837 he attended the Allgemeine Kriegsschule at Berlin, and in 1841, while still a subaltern, he was posted to the great General Staff, in which he afterwards directed the topographical section. In 1849 he served with the rank of major on the staff of General Peucker, who commanded a federal corps in the suppression of the Baden insurrection. He fell into the hands of the insurgents at the action of Ladenburg, but was released just before the fall of Rastadt. In the Danish war of 1864 Hindersin, now lieutenant-general, directed the artillery operations against the lines of Düppel, and for his service in the Campaign of Prussia he was made a knight of the Pour le Mérite. In the Saxon-Prussian War he became inspector-general of artillery. His experience at Düppel had convinced him that the days of the smooth-bore gun were past, and he now devoted himself with unremitting zeal to the rearmament and reorganization of the Prussian artillery. The available funds were small, and grudgingly voted by the parliament. There was a strong feeling moreover that the smooth-bore was still tactically superior to its rival (see Artillery, § 19). There was no practical training for war in either the field or the fortress artillery units. The latter had made scarcely any progress since the days of Frederick the Great, and before von Hindersin's appointment had practised with the same guns in the same bastion year after year. All this was altered, the whole "foot-artillery" was reorganized, manoeuvres were instituted, and the smooth-bore were, except for ditch defence, eliminated from the armament of the Prussian fortresses. But far more important was his work in connexion with the field and horse batteries. In 1864 only one battery in four had rifled guns, but by the unrelenting energy of von Hindersin the proportion of such batteries with Austria one and a half years later found the Prussians with ten in every sixteen batteries armed with the new weapon. But the battles of 1866 showed, besides the superiority of the rifled gun, a very marked absence of tactical efficiency in the Prussian artillery, which was almost always outmatched by that of the enemy. Von Hindersin had pleaded, in season and out of season, for the establishment of a school of gunnery; and in spite of want of funds, such a school had already been established. After 1866, however, more support was obtained, and the improvement in the Prussian field artillery between 1866 and 1870 was extraordinary, even though there had not been time for the work of the school to lenen the whole arm. Indeed, the German artillery played by far the most important part in the subsequent Franco-German war. Von Hindersin accompanied the king's headquarters as chief of artillery, as he had done in 1866, and was present at Gravelotte, Sedan and the siege of Paris. But his work, which was now accomplished, had worn out his physical powers, and he died on the 23rd of January 1872 at Berlin.

See Bartholomäus, Der General der Infanterie von Hindersin (Berlin, 1895), and Prince Kraft zu Hohenlohe-Ingelungen, Letters on Artillery (translated by Major Walford, R.A.), No. xi.

HINDI, EASTERN, one of the "intermediate" Indo-Aryan languages (see Hindostani). It is spoken in Oudh, Baghelkhand and Chhattisgarh by over 22,000,000 people. It is derived from the Aapabhārāṇa form of Ardhamāgadhī Prakrit (see Prakrit), and possesses a large and important literature. Its most famous writer was Tulst Dās, the poet and reformer, who died early in the 17th century, and since his time it has been the North-Indian language employed for epic poetry.

HINDI, WESTERN, the Indo-Aryan language of the middle and upper Gangetic Doab, and of the country to the north and south. It is the vernacular of over 40,000,000 people. Its standard dialect is Braj Bhāshā, spoken near Muttra, which has a considerable literature mainly devoted to the religion founded on devotion to Krishna. Another dialect spoken near Delhi and in the upper Gangetic Doab is the original from which Hindostani, the great lingua franca of India, has developed (see Hindostani). Western Hindi, like Punjabi, its neighbour to the west, is descended from the Aapabhārāṇa form of Saurāṣṭrī Prakrit (see Prakrit), and represents the language of the Madhyadēśā or Mīldān, as distinct from the intermediate and outer Indo-Aryan languages.

HINDKI, the name given to the Hindis who inhabit Afghanistan. They are of the Khatri class, and are found all over the country even amongst the wildest tribes. Bellows in his Races of Afghanistan estimates their number at about 300,000. The name Hindiki is also loosely used on the upper Indus, in Dir, Bajour, &c., to denote the speakers of Punjabi or any of its dialects. It is sometimes applied in a historical sense to the Buddhist inhabitants of the Peshawar Valley north of the Kabul river, who were driven thence about the 5th or 6th century and settled in the neighbourhood of Kandahar.

HINDLEY, a small district in the Ince parliamentary division of Lancashire, England, 2 m. E.S.E. of Wigan, on the Lancashire & Yorkshire and Great Central railways. Pop. (1901) 23,504. Cotton spinning and the manufacture of cotton goods are the principal industries, and there are extensive coal-mines in the neighbourhood. It is recorded that in the time of the
HINDOSTANI

Puritan revolution Hindley church was entered by the Cavaliers, who played at cards in the pews, pulled down the pulpit and tore the Bible in pieces.

HINDOSTANI (properly Hindīstāni, or belonging to Hindostan?), the name given by Europeans to an Indo-Aryan dialect (whose home is in the upper Gangetic Doab and near the city of Delhi), which, owing to political causes, has become the great lingua franca of modern India. The name is not employed by Indians, except as an imitation of the English. There is a dialect, spoken in the Central Punjab and in the Upper Doab, of Western Hindi and it is first of all necessary to explain what we mean by the term “Hindi” as applied to language. Modern Indo-Aryan languages fall into three groups—an outer band, the language of the Midland and an intermediate band. The Midland consists of the Gangetic Doab and of the country to its immediate northern and south, extending, roughly speaking, from the Eastern Punjab on the west, to Cawnpore on its east. The language of this tract is called “Western Hindi”; to its west we have Panjabi (of the Central Punjab), and to the east, reaching as far as Benares, Eastern Hindi and its prolongations, all of which are to be dealt with in the present article. Panjabi and Western Hindi are derived from Sāurāsaṅī, and Eastern Hindi from Ardham gadhā Prakrit, through the corresponding Apabhraṃśas (see Prakrit). Eastern Hindi differs in many respects from the two others, but it is customary to consider it together with the language of the Midland, and this will be followed on the present occasion. In 1901 the speakers of these three languages numbered: Panjabi, 17,070,961; Western Hindi, 40,714,025; Eastern Hindi, 22,136,338.

Linguistic Boundaries.—Taking the tract covered by those three forms of speech, it has to be noted that the soil occupied by the Western Punjab, Lahndā (see Sindhi), a language of the Outer band. The parent of Lahndā once no doubt covered the whole of the Punjab, but, in the process of expansion of the tribes of the Midland described in the article Indo-Aryan Languages, it was gradually driven back, leaving traces of its former existence which grow stronger as we proceed westwards, until at about the 74th degree of east longitude there is a mixed, transitional dialect. To the west of that degree Lahndā may be said to be established, the deserts of the west-central Punjab forming a barrier and protecting it, just as, farther south, a continuation of the same speech is protected Sindhi from Rajasthani. It is the old traces of Lahndā which mainly differentiate Panjabi from Hindustani. To the south of Panjabi and Western Hindi lies Rajasthani. This language arose in much the same way as Panjabi. The expanding Midland language was stopped by the desert from reaching Sindhi, but to the south-west it found an unobstructed way into Gujarat, where, under the form of Gujarati, “Hindīstāni” is a Persian word, and in modern Persian is pronounced “Hindīstānī.” It means the country of the Hindis. In medieval Persian the word was “Hindīstānī,” with an ă, but in the modern language the distinctions between e and i and between o and u have been lost. Indian languages have borrowed Persian words in their medieval form. Thus in India we have shār, a tiger, as compared with modern Persian shēr; gū, but modern Pers. gō; ḍāstān, but modern Pers. bāstān, the word Hindū “is in medieval Persian ḍāstān” representing the ancient Avesta hēndōm (Sandhitī saqīnāhō), a dweller on the Sindī or India. Owing to the influence of scholars in modern Persian the word Hindū “is now established in India in the English, in the Indian literary languages; but “Hindū” is also often heard in India. “Hindustan” with o is much more common both in English and in Indian languages, although “Hindustan” is also employed. Up to the days of Persian supremacy inaugurated in Calcutta by Gilchrist and his friends, every traveller in India spoke of “Indostan” or some such word, thus bearing testimony to the current pronunciation. Gilchrist introduced “Hindooostan,” which became Hindostan in modern speech, and this word is not Indian one, and both pronunciations, with o and with ū, are current in India at the present day, but that with ū is unquestionably the one demanded by the history of the word. And no doubt orders take on the soil. On the other hand “Hindu” is too firmly established in English for us to suggest the spelling “Hindo.” The word “Hindu” has another derivation, being formed from the Persian Hindū, Hind (Avesta hēndōm, Sandhitī saqīnāhō), the Hindū or belonging to India, while “Hindu” now means “a person of the Hindu religion.” (Cf. Sir C. J. Lyall, A Sketch of the Hindustani Language, p. 1).

it broke the continuity of the Outer band. Eastern Hindi, as an Intermediate form of speech, is of much older lineage. It has been an Intermediate language since, at least, the institution of Jainism (say, 500 B.C.), and is much less subject to the influence of the Midland than is Panjabi. To its east it has Bhīrāi, and, stretching far to the south, it has Marathi as its neighbour in that direction, both of these being outer languages.

Dialects.—The only important dialect of Eastern Hindi is Awadhī, spoken in Oudh, and possessing a large literature of its own. Chhattisgarhi and Bagheli, the other dialects, have scanty literatures of small value. Western Hindi has four main dialects, Bundelī of Bundelkhand, Brah Bhāṣa (properly “Brah Bhāṣā”) of the country round Mathura (Muttra), Kanauji of the central Doab and the country to its north, and vernacular Hindustani of Delhi and the Upper Doab. West of the Upper Doab, across the Jumna, another dialect, Bāṅgārā, is also found. It possesses no literature. Kanauji is very closely allied to Brah Bhāṣa, and these two share with Awadhī the honour of being the great literary speeches of northern India. Nearly the same language literature of India remains in circulation, and we may say that, as a broad rule, Awadhī literature is devoted to the Ramaite religion and the epic poetry connected with it, while that of Brah Bhāṣa is concerned with the religion of Krishna. Vernacular Hindostani has no literature of its own, but as the lingua franca now to be described it has a large one. Panjabi has one dialect, Dōṛī, spoken in the Himalayas.

Hindustani as a Lingua Franca.—It has often been said that Hindostani is a mongrel “pigeon” form of speech made up of contributions from the various languages which met in Delhi bazaar, but this is purely unfounded, as first observed by Gilchrist, owing to the discovery of the fact that it is an actual living dialect of Western Hindi, existing for centuries in its present habitat, and the direct descendant of Sāurāsaṅī Prakrit. It is not a typical dialect of that language, for, situated where it is, it represents Western Hindi merging into Panjabi (Brah Bhāṣa being admitted the standard of the language), but to say that it is a mongrel tongue thrown together in the market is to reverse the order of events. It was the natural language of the people in the neighbourhood of Delhi, who formed the bulk of those who resorted to the bazaar, and hence it became the bazaar language. From here it became the lingua franca of the Mogul camp and was carried everywhere in India by the lieutenants of the empire. It has several recognized varieties, amongst which we may mention Dakhini, Urdu, Rekhta and Hindi. Dakhini or “southern,” is the form current in the south of India, and was the first to be employed for literature. It contains many archaic expressions now extinct in the standard dialect. Urdu, or Urdu zabān, “the language of the camp,” is the name usually employed for Hindustani by natives, and is now the standard form of speech used by Musalmans. All the early Hindustani literature was in poetry, and this literary form of speech was named “Rekhta,” or “scattered,” from the way in which words borrowed from Persian were “scattered” through it. The name is now reserved for the dialect used in poetry. Urdu being the dialect of prose and of conversation. The introduction of these borrowed words, which has been carried to a much greater extent in Urdu, was facilitated by the facts that the latter was by origin a “camp” language, and that Persian was the official language of the Mogul court. In this way Persian (and, with Persian, Arabic) words came into current use, and, though the language remained Indo-Aryan in its essential characteristics, it soon became unintelligible to any one who had not at least a moderate acquaintance with the vocabulary of Iran. This extreme Persianization of Urdu was due rather to Hindi than to Persian influence. Although Urdu literature was Musalmān in its origin, the Persian element was first introduced in excess by the pliant Hindu officials employed in the Mogul administration, and acquainted with Persian, rather than by Persians and Persianized Moguls, who for many centuries used only their own languages for literary purposes.

4 Sir C. J. Lyall, op. cit. p. 9.
HINDOSTANI

origin in the English occupation of India and the need for textbooks for the college of Fort William. It has had a prosperous career since the commencement of the 19th century, but some writers, especially those of Lucknow, have so overloaded it with Persian and Arabic that little of the original Indo-Aryan character remains, except, perhaps, an occasional pronoun or auxiliary verb. The Hindi form of Hindostani was invented simultaneously with Urdu prose by the teachers at Fort William. It was intended to be a Hindostani for the use of Hindus, and was derived from Urdu by ejection all words of Persian or Arabic birth, and substituting for them words either borrowed from Sanskrit (tatsamas) or derived from the old primary Prakrit (tadbharas) (see Indo-Aryan Languages). Owing to the popularity of the Persianized Urdu, need of which is intelligible except to persons of high education.

Not only has Urdu adopted a Persian vocabulary, but even a few peculiarities of Persian construction, such as reversing the positions of the governing and the governed word (e.g. bāp mērā for mērā bāp), or of the adjective and the substantive it qualifies, or such as the use of Persian phrases with the preposition ba instead of the native postposition of the ablative case (e.g. ba-kushi for kushi-se, or ba-lāum sarkār-ke instead of sarkār-ke lāum-se) are to be met with in many writings; and these, perhaps, combined with the too free indulgence on the part of some authors in the use of high-flown and pedantic Persian and Arabic words in place of common and yet chaste Indian words, and the general use of the Persian instead of the Nāgari character, have induced some to regard Hindostani or Urdu as a language distinct from Hindi. But such a view betrays a radical misunderstanding of the whole question. We must define Urdu as the Persianized Hindostani of educated Musulmans, while Hindi is the Sanskritized Hindostani of educated Hindus. As for the written character, Urdu, from the number of Persian words which it contains, can only be written conveniently in the Persian character, while Hindi, for a parallel reason, can only be written in the Nāgari or one of its related alphabets (see Sanskrit). On the other hand, “Hindustani” implies the great lingua franca of India, capable of being written in either character, and, without paroxysms, avoiding the excessive use of either Persian or Sanskrit words when employed for literature. It is easy to write this Hindostani, for it has an opulent vocabulary of tadbharas words understood everywhere by both Musulmans and Hindus. While “Hindustani,” “Urdu” and “Hindi” are thus names of dialects, it should be remembered that the terms “Western Hindi” and “Eastern Hindi” connote, not dialects, but languages.

The epoch of Akbar, which first saw a regular revenue system established, with toleration and the free use of their religion to the Hindus, was, there can be little doubt, the period of the formation of the language. But its final consolidation did not take place till the reign of Shah Jahan. After the date of the book written in it, and to its supplanting the medium through which the was comparatively commercial until we come to the time when European sources began to mingle with those of the East. Of the contributions from these sources there is little to say. Like the greater part of those from Arabic and Persian, they are chiefly nouns, and may be regarded rather as excrescences which have sprung up casually and have attached themselves to the original trunk than as ingredients duly incorporated in the body. In the case of the Persian and Arabic element, indeed, we do find not a few instances in which nouns have been furnished with a Hindi termination, e.g. bhārindā, badalā, gauñān, dāgān, bākkhān, kamlāpan, etc.; but the European element cannot be said to have at all woven itself into the grammar of the language. It consists, as has been observed, solely of nouns, principally substantive nouns, which on their admission into the language are spelt phonetically, or according to the correct pronunciation they receive in the mouths of the natives, and are declined like the indigenous nouns by means of the usual postpositions or case-affixes. A few examples will suffice. The Portuguese, the first in order of seniority, contributes a few words, as kamār or kamār (camera), a room; mārīl (marriage), a hammer; nilām (leedoo), an auction, Ke &c. Of French and Dutch influence scarcely a trace exists. English has contributed a number of words, some of which we even found a place in the literature of the language; e.g. kamishnar (commissioner); jāf (judge); dākār (doctor); dākārī, “the science of medicine”; or “the profession of physicians”; intrēktor (inspector); īstānt (assistant); sācāyti (society); āpāl (appeal); āpāl kārnā, “to appeal”; āḏīrī or āḏīrī (decree); āḏīrī (degree); īnc (inch); fūt (foot); and many more, are now words commonly used. Some borrowed words are distorted into the shape of genuine Hindostani words familiar to the speakers; e.g. the English railway term “signal” has become sikādur, the native name for Alexander the Great, and “signal-man” is sikādur-mān, or “the pride of Alexander.” How the free use of Anglicism will be adopted as the language progresses is a question upon which it would be hazardous to pronounce an opinion, but of late years it has greatly increased in the language of the educated, especially in the case of technical terms. A native veterinary surgeon once said to the present writer, “kuttē-kā saalīva bahūt antiseptic hai” for “a dog’s saliva is very antiseptic,” and this is not an extravagant example.

The vocabulary of Panjabi and Eastern Hindi is very similar to that of Western Hindi. Panjabi has no literature to speak of and is free from the burden of words borrowed from Persian or Sanskrit, only the commonest and simplest of such being found in it. Its vocabulary is thus almost entirely tadbharas, and, while capable of expressing all ideas, it has a charming rustic flavour, like the Lowland Scotch of Burns, indicative of the national character of the sturdy peasantry that employs it. Eastern Hindi is very like Panjabi in this respect, but for a different reason. In it were written the works of Tulsi Dīś, one of the greatest writers that India has produced, and his influence on the language has been as great as that of Shakespeare on English. The peasantry are continually quoting him without knowing it, and his style, simple and yet vigorous, thoroughly Indian and yet free from purism, has set a model which is everywhere followed except in the large towns where Urdu or Sanskritized Hindi prevails. Eastern Hindi is written in the Nagari alphabet, or in the current character related to it called “Kaithi” (see Bharat). The indigenous alphabet of the Punjabi is called Lāyḍā or “clipped.” It is related to Nāgari, but is hardly legible to any one except the original writer, and sometimes not even to him. To remedy this defect an improved form of the alphabet was devised in the 16th century by Angad, the fifth Sikh Guru, for the purpose of recording the Sikh scriptures. It was named Gurmukhi, “proceeding from the mouth of the Guru,” and is now generally used for writing the language.

Grammar.—In the following account we use these contractions: Skr. = Sanskrit; Pr. = Prakrit; Ap. = Panjabi; W.H. = Western Hindi; E.H. = Eastern Hindi; H. = Hindostani; Br. = Brj Bhasha; P. = Panjabi.

(A) Phonetics.—The phonetic system of all three languages is nearly the same; some slight differences only have been derived. With a few exceptions, to be noted below, the letters of the alphabets of the three languages are the same as in Sanskrit. Panjabi, and the western dialects of Western Hindi, have preserved these. As the use of Angad’s alphabet will be adopted as the language runs to run into each other, and for the semi-vowels u and v to become vowels. Thus, Skr. cāṁkātras, Ap. cammātrs, a leather-worker,
becomes H. samy; Skr. rojanī, Ap. ra(y)va, H. rain; night; Skr. dhauvakasa, Ap. dhuanalu, H. dhanål, white. Sometimes the semi-vowel is retained, as in Skr. kātāras, Ap. kā(y)aru, H. kāyar, a coward. Almost the only compound consonants which survived were dharm- and dharma-. The long e is now shortened, and E.H. it is usually simplified, the preceding vowel being lengthened and sometimes nasalized, in compensation. P., on the other hand, prefers to retain the double consonant. Thus, Skr. karmā, Ap. kamma, W. H. karmā-, W. H. and E. H. sācr, but P. sace, true (H., being the W. H. dialect, which lies nearest to P., often follows that language, and in this instance we have sācrites, and娘家, and in P. and Skr. kāthava, W. H. and E. H. sāth, but P. sath, a hand. The nasalization of vowels is very frequent in all three languages, and is here represented by the sign -ov or -ov. Sometimes it is compensatory, as in skā, but in others it is a surviving form from Sanskrit, as in skār, a lotus. Final short vowels quiesce in prosaic pronunciation, and are usually not written in transliteration; thus the final o or u has been lost in all the examples given above, and other tatsama examples are skār, hātr, sār, vār, tādā, hā, prāhā, āvāhā, half, a hand.

In tadbhava words an original long vowel in any syllable earlier than the penultimate is shortened. In P. and H. when the long vowel e or d is shortened to i or a respectively, but in other W. H. dialects to o or u, in many cases a nasal d is pronounced. Also, in many cases the long form H. bhīṣṭ, E. H. bhīṣṭa, mār, long form H. bhūṣṭi, E. H. bhūṣṭya. The short vowels e and o are very rare in P. and H., but are used when the unstressed vowels in the nominative form of a strong declension, or in the oblique case of a weak declension.

In the article Prakrit attention is drawn to the nominative form of a tadbhava word is derived from the nominative form in Sanskrit and Prakrit, but tatsaṃs are usually borrowed in the form of the Skr. crude base; thus, Skr. hasām-, nom. hasi, Ap. nom. hasī, H. hāthi, an elephant, Skr. base mat-, nom. mati, H. (tatsaṃs) mati, or, with elision of the final -i, Skr. base has-, nom. hasi, H. has, an arrow. These forms are, however, borrowed in the nominative form, as in Skr. hāsin-, nom. hāsini, H. hāsni, a rich man. As another example of a tadbhava word, we may take the Skr. nom. ghūṣa, Ap. ghūṣa, H. ghōr, a horse. Here again the final short vowel has been elided, but, in old poetry, we should find ghūra and corresponding forms in u are occasionally met with at the present day.

In the article Prakrit attention is drawn to the nominative form of a tadbhava word is derived from the nominative form in Sanskrit and Prakrit, but tadsaṃs are usually borrowed in the form of the Skr. crude base; thus, Skr. hasām-, nom. hasi, Ap. nom. hasī, H. hāthi, an elephant, Skr. base mat-, nom. mati, H. (tatsaṃs) mati, or, with elision of the final -i, Skr. base has-, nom. hasi, H. has, an arrow. These forms are, however, borrowed in the nominative form, as in Skr. hāsin-, nom. hāsini, H. hāsni, a rich man. As another example of a tadbhava word, we may take the Skr. nom. ghūṣa, Ap. ghūṣa, H. ghōr, a horse. Here again the final short vowel has been elided, but, in old poetry, we should find ghūra and corresponding forms in u are occasionally met with at the present day.

In the article Prakrit attention is drawn to the nominative form of a tadbhava word is derived from the nominative form in Sanskrit and Prakrit, but tadsaṃs are usually borrowed in the form of the Skr. crude base; thus, Skr. hasām-, nom. hasi, Ap. nom. hasī, H. hāthi, an elephant, Skr. base mat-, nom. mati, H. (tatsaṃs) mati, or, with elision of the final -i, Skr. base has-, nom. hasi, H. has, an arrow. These forms are, however, borrowed in the nominative form, as in Skr. hāsin-, nom. hāsini, H. hāsni, a rich man. As another example of a tadbhava word, we may take the Skr. nom. ghūṣa, Ap. ghūṣa, H. ghōr, a horse. Here again the final short vowel has been elided, but, in old poetry, we should find ghūra and corresponding forms in u are occasionally met with at the present day.

In the article Prakrit attention is drawn to the nominative form of a tadbhava word is derived from the nominative form in Sanskrit and Prakrit, but tadsaṃs are usually borrowed in the form of the Skr. crude base; thus, Skr. hasām-, nom. hasi, Ap. nom. hasī, H. hāthi, an elephant, Skr. base mat-, nom. mati, H. We have seen that the oblique form is the resultant of a general melting down of all the oblique cases of Sanskrit and Prakrit, and that in consequence it can be used for any oblique case. It is now more common to use the oblique form in i, if it were in the oblique case, the feminine and the nominative. Thus, in H. "and," in Prakrit "and." In some dialects of W. H. weak forms have masculars ending in in and corresponding feminines in i, but these are nowadays rarely used, though it is still possible in dialect. In Brāj Bhasa they have survived in the present participle.

XIII. 16

1 In some dialects of W. H. weak forms have masculars ending in i and corresponding feminines in i, but these are nowadays rarely used, though it is still possible in dialect. In Brāj Bhasa they have survived in the present participle.
The pronouns closely follow the Prakrit originals. This will be evident from the preceding table of the first two personal pronouns compared with Apabhraṃśa.

It will be observed that in most of the nominatives of the first person, and in the E.H. nominative of the second person, the old nominative has disappeared, and its place has been supplied by an oblique form, exactly as we have observed in the nominative plural of nouns substantive. The P. aśi, tuṣṭ, &c., are survivals from the Old Indo-Aryan vocabulary, above which the genitives of these two pronouns are rarely used, possessive pronouns (in H. mēra, my; hamārā, our; terā, thy; tumhārā, your) being employed instead. They can all (except P. aśadā, our; tuṣtadā, your, which are (ā)dhā) be referred to corresponding Ap. forms.

There is no pronoun of the third person, the demonstrative pronouns being used instead. The following table shows the principal remaining inflectional forms, with their derivation from Ap.:

The origin of the first person given above (that, he; those, they) cannot be referred to Sanskrit. It is derived from an Indo-Aryan base which was not admitted to the classical literary language, and of which we find sporadic traces in Apabhraṃśa. The existence of this base is further vouched for by its occurrence in the Iranian language of the Avesta under the form a-ša-. The base of the second pronoun is the same as the base of the first syllable in the Ap. kāsā, that is, a corresponding connective, and also occurs in the Avesta. Ap. ṣū is directly derived from ṣ-as.

There are other pronominal forms upon which, except perhaps kātu, kāta, Skr. kād, kādī, and āt, which it is necessary to dwell.

The phrase kē hāt? Is any one (there)? Is the usual formula for calling a servant in upper India, and is the origin of the Anglo-Indian word "Qui-hi." The reflexive pronoun is dō (Ap. aṭṭu, Skr. aṭṭam), self, something, like the Latin unius (Sing. or Plural), always refers to the subject of the sentence, but to all persons, not only to the third. Thus mā aṭṭu (not mere) dō-kō dék̐h-hā, I see my father.

C. Conjugation.—The synthetic conjugation was already commencing to disappear in Prakrit, and in the modern languages, both in the singular and plural cases, the present tense is retained, and there is a future tense, the imperative, and here and there the future. The first is now generally employed as a present subjunctive. In the accompanying table we have the conjugation of this tense, and also the three participles, present active, and past and future passive, compared with Apabhraṃśa, the verb being selected as the intransitive root cail or caill, go. In Ap. the word may be spelled either with or without the ā, which accounts for the variations of spelling in the modern languages.

The imperative closely resembles the old present, except that it drops all terminations and adds a singular ending -ā. In P. and H. a future is formed by adding the syllable gā (lum gā) to the simple present. Thus, H. cail-ā, I shall go. The gā is commonly said to be a Sanskrit suffix, but this suggestion is not altogether acceptable to the present writer, although he is now at length able to propose a better. Under the form -gā the same termination is in Br., but the form gā is in the old future has also survived, as in calaṅha (Ap. calāṅha, Skr. cālāṅyam), I shall go, which is conjugated like the simple present. The E.H. formation of the future is analogous to what we find in Bihari (q.v.). The third person is formed as in Braj Bhasha, but the first and second persons are formed by adding pronominal suffixes, meaning by me, by thee, &c., to the future passive participle.
Thus, *calab-* it is-to-be-gone by-me, I shall go. We thus get the following forms. It will be observed that as in many other Indo-Aryan languages, the first person plural has no suffix:—

<table>
<thead>
<tr>
<th>SIng.</th>

</tr>
</tbody>
</table>

In old E.H. the future participle passive, *calab*, takes no suffix for any person, and is used for all persons.

The last remark leads us to a class of tenses in P. and W.H., in which a participle, by itself, can be employed for any person of a finite tense. A few examples of the use of the present and past participles will show the construction. They are all taken from Hindustani. *Woh calab, he goes; such calab, she goes; matt calab, I went; wah calab, she went; wa calab, they went.* The present participle in this construction, though it may be used to signify the present, is more commonly employed to signify a past condition. It may have been observed that in the above examples, in all of which the verb is intransitive, the past as well as the present participle agrees with the subject in gender and number; but, if the verb be transitive, the passive meaning of the past participle comes into force. The subject must be put into the case of the agent, and the participle inflects to agree with the object. If the object be not expressed, or, as sometimes happens, be expressed in the dative case, the participle is construed impersonally, and takes the masculine (for want of a neuter) form. Thus, *mai-nē khād, by-me it-was-said, i.e., I said; us-nē citiṭhī līkī, by-him a-letter (fem.) was-written, he wrote a letter; rādū-nē sṭāvītī mārū, the king killed the tigress, lit., by-the-king, with-reference-to-the-tigress, it (impersonal) was-killed.* In the article *Prakrit* it is shown that the same construction obtained in that language.

In E.H. the construction is the same, but is obscured by the fact that (as in the future) pronominal suffixes are added to the participle to indicate the person of the subject or of the agent, as in *dā (I) had gone; dā (II) had gone; mārya (transitive), struck, lit., struck-by-me; mārya (transitive), struck, lit., struck-by-him, he struck.* If the participle has to be feminine, it (although a weak form) takes the nominative case: *I, as mārīyī, I struck her; calab-ī, (II) if (fem.) had gone; calab (fem.) went.* Further tenses are formed by adding the verb substantive to these participles, as in *H. māt calab-ā, I am going; māt calab-ā, he is going; māt calab-ā, we are going.* These and other auxiliary verbs need not detain us long. They differ in the various languages. For "*I am" we have P. hā, H. hā, Br. hā, E.H. bāyētī or aheī. For "*I was" we have P. sī or sā, H. thī, Br. hau or hauan, E.H. rahētī. The H. hā is thus conjugated:—

The derivation of *hā, hā, hā*, and *aheī* is uncertain. They are usually derived from the Skr. *sam*, ith. but this presents many difficulties. An old form of the third person singular is *khu*, and this points to the Pr. *kasī, he is, equivalent to the Skr. bhavīti, he becomes.* On the other hand this does not account for the initial *a* of aheī. This last word is in the form of a past tense, and it may be a secondary formation from *asmi.* The *s* is not a feminine of *sā, as usually stated, but is a survival of the Skr. *dīs* (transitive) as in *dīs-ā, to break.* In Hindustani, as in both genders, both numbers and all persons. *Sā* is a secondary formation from this, on the analogy of the H. *thā*, which is from the Skr. *sthitas, Pr. thī, stood, and is a participial form like *calab; thus, woh thī, he was; uso thī, she was.* The Br. *hau* is a modern form of *hā*, while *hauan* is probably by origin a present participle of the Skr. *dhī, be, Pr. hauatī.* The E.H. *bāyētī, is the Skr. vartā, Ap. suffix.* This is the past tense of the root *rah*, remain.

The future participle passive is everywhere freely used as an infinitive or verbal noun; thus, H. *calab, E.H. calab, the act of going, to go.* There is a whole series of derivative verbal forms, making potential passives and transitive verbs from intransitives, and causals (and even double causals) from transitives. Thus *dhābhī, to be seen; potential passive, dhābhī, to be visible*; *dhābhī, to show; causals, dhābhābhī, to show.*

D. Literature.—The literatures of Western and Eastern Hindī form the subject of a separate article (see *Hindū*). In *Hindū* literature, the term is used for the whole literary work. *Pāñjābī* has no formal literature. Even the *Graṅth,* the sacred book of the Sikhs, is mainly in archaic Western Hindī, and contains a small portion being in Pāñjābī. On the other hand, the language is peculiarly rich in folk songs and ballads, *rākhit.* Rākhit is a considerable length of epic poetry. The most famous is the *Bāvbī* of *Hīrnītā bābī* by Wāris Shāh.

The making of potential passives and transitive verbs from intransitives, and causals (and even double causals) from transitives is considered to be a model of pure Pāñjābī. Colonel Sir Richard Temple has published an important collection of these songs under the title of *The Legends of the Punjab* (5 vols., Bombay and London, 1884-1900), in which both texts and translations of nearly all the favourite ones are to be found.

HINDÖSTĀṆĪ LITERATURE

the indigenous speech is more strictly adhered to than in Urdu, which under the influence of Persian constructions has admitted many inversions.

As in many other countries, nearly all the early vernacular literature of Hindostan is in verse, and works in prose are a modern growth. Both Hindi and Urdu are, in their application to literary purposes, at first intruders upon the ground already occupied by the learned languages Sanskrit and Persian, the former representing Hindā and the latter Musalmān culture.

But there is this difference between them, that, whereas Hindi has been raised to the dignity of a literary speech chiefly by impulses of revolt against the monopoly of the Brahmanas, Urdu has been cultivated with goodwill by authors who have themselves highly valued and dexterously used the polished Persian. Both Sanskrit and Persian continue to be employed occasionally for composition by Indian writers, though much fallen from their former estate; but for popular purposes it may be said that their vernacular rivals are now almost in sole possession of the field.

The subject may be conveniently divided as follows:—

1. Early Hindi. Our knowledge of the ancient metrical chronicles of Rajpūtnā is still very imperfect, and is chiefly derived from the monumental work of Colonel James Tod, called The Annals and Antiquities of Rājāstān (published in 1829—31), which is the chief authority for the beginning of the period during which the language was being fashioned as a literary medium out of the ancient Prākrit, represented by the old heroic poems of Rajpūtanā and the literature of the early Bhāgats or Vaishnavā reformers, and extending from about A.D. 1100 to the 13th century.

2. Middle Hindi, representing the best age of Hindi poetry, and reaching from about 1550 to the end of the 18th century;

3. The rise and development of literary Urdu, beginning about the end of the 17th century, and reaching its height during the 18th;

4. The modern period, marked by the growth of a prose literature in both dialects, and dating from the beginning of the 19th century.

Early Hindi.—Our knowledge of the ancient metrical chronicles of Rajpūtnā is still very imperfect, and is chiefly derived from the monumental work of Colonel James Tod, called The Annals and Antiquities of Rājāstān (published in 1829—31), which is the chief authority for the beginning of the period during which the language was being fashioned as a literary medium out of the ancient Prākrit, represented by the old heroic poems of Rajpūtanā and the literature of the early Bhāgats or Vaishnavā reformers, and extending from about A.D. 1100 to the 13th century.

The materials used by Tod are nearly all still unprinted; his manuscripts are now deposited by the Asiatic Society of Bengal, and some of the tasks which, on linguistic and historical grounds, should first be undertaken by the investigator of early Hindi literature is the examination and sifting, and the publication in their original form, of these important texts.

Omitting a few fragments of more ancient bards given by compilers of accounts of Hindi literature, the earliest author of whose portion has as yet been published in the original text is Chand Bārdā, the court bard of Pṛithvī-Rāj, the last Hindu sovereign of Delhi. His poem, entitled Pṛithvī-Rāj Rāṣā (or Rāṣā), is a vast chronicle in 69 books or cantos, comprising a general history of the period when he wrote. Of this a small portion has been printed, partly under the editorship of the late Mr John Beames and partly under that of Dr Rudolf Hoernle, by the Asiatic Society of Bengal; but the excessively difficult nature of the task prevented both scholars from making much progress.

Chand, who came of a family of bards, was a native of Lahore, which had for nearly 170 years (since 1023) been under Muslim rule when he flourished, and the language of the poem exhibits a considerable leaven of Persian words. In its present form the work is a redaction made by Amar Singh of Mewār, about the beginning of the 17th century, and therefore more than 400 years after Chand’s death, with his patron Pṛithvī-Rāj, in 1103. There is, therefore, considerable reason to doubt whether we have in it much of Chand’s composition in its original shape; and the nature of the incidents described enhances this doubt. The detailed dates contained in the Chronicle have been shown by Kabirāj Syāmal Dās to be in every case about ninety years astray. It tells of repeated conflicts between the hero Pṛithvī-Rāj and Sultan Shāhābuddin, of Ghōr (Muhammad Ghōrī), in which the latter always, except in the last great battle, comes off the worst, is taken prisoner and is released on payment of a ransom; these seem to be entirely unhistorical, our contemporary Persian authorities knowing of only one encounter (that of Tiraufī (Tirawāri) near Thēnēsār, fought in 1151) in which the Sultan was defeated, and even then he escaped uncaptured to Lahore. The Mongols (Book XV.) are brought on the stage more than thirty years before they actually set foot in India, and are related to have been vanquished by the redoubtable Pṛithvī-Rāj. It is evident that such a record cannot possibly be, in its entirety, a contemporary chronicle; but nevertheless it appears to contain a considerable element which, from its language, may belong to Chand’s own age, and represents such as the simplest and most purely the life of the bard. We possess the actual text of Chand, we have certainly in his writings some of the oldest known specimens of Gaudian literature, abounding in pure Apabhramśa Saurasenī Prākrit forms (Grierson).

It is very difficult now to form a just estimate of the poem as literature. The language, essentially transitional in character, consists largely of words which have long since died out of the vernacular speech. Even the most learned Hindus of the present day are unable to interpret it with confidence; and the meaning of the verses must be sought by investigating the processes by which Sanskrit and Prākrit forms have been transformed in their progress into Hindi. Chand appears, on the whole, to exhibit the merits and defects of ballad chroniclers in general. There is much that is lively and spirited in his descriptions of fight or council; and the characters of the Rājpūt warriors who surround his hero are often sketched in their utterances with skill and animation. The sound, however, frequently predominates over the sense; the narrative is carried on with the wearisome iteration and tedious, unfolding of familiar themes and images which characterize all such poetry in India; and its value, for us at least, is linguistic rather than literary.

Chand may be taken as the representative of a long line of successors, continued even to the present day in the Rājpūt states. Many of their compositions are still widely popular as ballad literature, but are known only in oral versions sung in Hindostan by professional singers. One of the most famous of these is the Adab, a poem in the Rājpūt language of the last century, the most important of Chand called Jagātik or Jagānyaik, of Mahābā in Bundelkhand, who sang the praises of Rājā-Parmāl, a ruler whose wars with Pṛithvī-Rāj are recorded in the Mahābā-Khānd of Chand’s work. Ālāḥ and Īlād, the heroes of the poem, are famous warriors in popular legend, and the stories connected with them exist in an eastern recension, current in Bihār, as well as in the Bundelkhandī or western form which is best known. Two versions of the latter have been printed, having been taken down as recited by illiterate professional rhapsodists. Another celebrated bard was Sārāngadhār of Rantambhār, who flourished in 1563, and sang the praises of Hālādā Ālād, a Rājpūt warrior who fell in a heroic struggle against Sultan ‘Alā’uddīn Khilji in 1300. He wrote the Hammātī Kāśīya and Hammātī Rāṣā, of which an account is given by Tod; he was also a poet in Sanskrit, in which language he compiled, in 1563, the anthology called Sārāngadhara-Paddhāti. Another work which may be mentioned (though much more modern) is the long chronicle entitled Chhōṭara-Prakōś, or the history of Rājā Chhatarsāl, the Bundelā rāj of Pānnā, who was killed, fighting on behalf of Prince Dārā-Shukoh, in the battle of Dholpur won by Aurangzēb in 1658. The author, Lāl Kābī, has given in this work a history of the valiant Bundelā nation, which is typical of the style which was written by Captain W. R. Pontoppidan in 1828, and printed at Calcutta.

Before passing on to the more important branch of early

HINDOSTANI LITERATURE

Hindi literature, the works of the Bhagats, mention may be made here of a remarkable composition, a poem entitled the Padmavat, the materials of which are derived from the heroic legends of Rajputana, but which is not the work of a bard nor even of a Hindu. The author, Malik Muḥammad of Jālī, in Oudh, was a venerated Muslim devotee, to whom the Hindu rāja of Amēṣhī was greatly attached. Malik Muḥammad wrote the Padmavat in 1540, the year in which Shāh Shāh Sūr ousted Padmāyān from the throne of Delhi. The poem is composed in the purest vernacular Awadhī, with no admixture of traditional Hindu learning, and is generally to be found written in the Persian character, though the metres and language are thoroughly Indian. It professes to tell the tale of Padmawati or Padmīnī, a princess celebrated for her beauty who was the wife of the Chauhān rāja of Chitāor in Mewār. The historical Padmīni's husband was named Bhīm Singh, but Malik Muḥammad calls him Ratan Sēn; and the story turns upon the attempts of Aḥṣuddin Khāliji, the sovereign of Delhi, to gain possession of her person. The tale of the siege of Chitāor in 1303 by Aḥṣuddīn, the heroic stand made by its defenders, who perished to the last man in fight with the Sultan's army, and the self-immolation of Padmīnī and the other women, the wives and daughters of the warriors, by the fiery death called ūhār, will be found related in Tod's Rajasthān, i. 262 sqq. Malik Muḥammad takes great liberties with the history, and explains at the end of the poem that all is an allegory, and that the personages represent the human soul, Divine wisdom, Satan, delusion, and the characters.

Both on account of its interest as a true vernacular work, and as a composition of a Musalman who has taken the incidents of his morality from the legends of his country and not from an exotic source, the poem is memorable. It has often been illustrated and expounded. Its narrative is very popular; a translation has even been made into Sanskrit. A critical edition has been prepared by Dr G. A. Grierson and Paṅgīt Sudhākīrd Dwivīdī.

The other class of composition which is characteristic of the period of early Hindi, the literature of the Bhagats, or Vaishnava saints, who propagated the doctrine of bhakti, or faith in Vishnu, as the popular religion of Hindostān, has exercised a much more powerful influence both upon the national speech and upon the themes chosen for poetical treatment. It is also, as a body of literature, of high intrinsic interest for its form and content. Nearly the whole of subsequent poetical composition in Hindi has been done in one or other type of the bhakti doctrine, which, like Buddhism many centuries before, was essentially a reaction against Brahmanical influence and the chains of caste, a claim for the rights of humanity in face of the monopoly which the "twice-born" asserted of learning, of worship, of righteousness. A large proportion of the writers were non-Brahmans, and many of them of the lowest castes. As Śīva was the popular deity of the Brahmans, so was Vishnu of the people; and while the literature of the Saivas and Śaktas is almost entirely in Sanskrit, and exercised little or no influence on the popular mind in northern India, that of the Vaishnavas is largely in Hindī, and in itself constitutes the great bulk of what has been written in that language.

The Vaishnava doctrine is commonly carried back to Rāmānūja, a Brahman who was born about the end of the 11th century, at Perambur in the neighbourhood of the modern Madras, and spent his life in southern India. His works, which are in Sanskrit and consist of commentaries on the Vēdānta Sūtras, are devoted to establishing "the personal existence of a Supreme Deity, possessing every gracious attribute, full of love and pity for the sinful beings who adore him, and granting the released soul a home of eternal bliss near him—a home where each soul never loses its identity, and whose state is one of perfect peace." 1 In the Deity's infinite love and pity he has on several occasions become incarnate for the salvation of mankind, and of these incarnations two, Rāmachandra, the prince of Ayōdhīya, and Kṛṣṇa, the chief of the Yādava clan and son of Vasudeva, are pre-eminent. These two are, however, different from those which Vishnu is said to become; for in Vishnu's case an incarnation of the body, a "rākṣa"—a demon spirit, or "bhakti"—ardent faith and personal devotion addressed to the Supreme. The adherents of Rāmānūja were, however, all Brahmans, and observed very strict rules in respect of food, bathing and dress; the new doctrine had not yet penetrated to the people.

Whether Rāmānūja himself gave the preference to Rāma against Krishna as the form of Vishnu most worthy of worship is uncertain. He dealt mainly with philosophic conceptions of the Divine Nature, and probably busied himself little with mythological legend. His mantra, or formula of initiation, if Wilson 2 is correctly informed, implies devotion to Rāma; but Vāsudēva (Krishna) is also mentioned as a principal object of adoration, and Rāmānūja himself dwelt for several years in Mysore, at a temple erected by the rāja at Yādavagiri in honour of Krishna in his form Raṅghār. 3 It is stated that in his worship of Krishna he joined with that god as his Śākty, or Energy, his wife Rukminī; while the later varieties of Krishna-worship prefer to honour his mistress Rādhā. The great difference, in temper and influence upon life, between the two forms of faith appears to be a development subsequent to Rāmānūja; but by the time of Jaiśō (about 1250) it is clear that the theme of Krishna and Rādhā, and the use of passionate language drawn from the relations of the sexes to express the longings of the soul for God, had become fully established; and from that time onwards the two types of Vaishnava religious emotion diverged more and more from one another.

The cult of Rāma is founded on family life, and the relation of the worshipper to the Deity is that of a child to a father. The morality it inculcates springs from the sacred sources of human piety which in all religions have wrought most in favour of pureness of life, of fraternal helpfulness, and of humble devotion to a loving and tender Parent, who desires the good of mankind, His children, and hates violence and wrong. That of Krishna, on the other hand, had for its basis the legendary career of a less estimable human hero, whose exploits are marked by a kind of elvish and fantastic wantonness; it has more and more spent its energy in developing that side of devotion which is perilously near to sensuality thought, and has allowed the imagination and ingenuity of poets to dwell on things unmeet for verse or even for speech. It is claimed for those who first opened this way to faith that their hearts were pure and their thoughts innocent, and that the language of erotic passion which they use as the vehicle of their religious emotion is merely mystical and allegorical. This is probable; but that these beginnings were followed by corruption in the multitude, and that the fervent impulses of adoration made way in later times for those of lust and lasciviousness, seems beyond dispute. The worship of Krishna, especially in his infant and youthful form (which appeals chiefly to women), is widely popular in the neighbourhood of Mathurā, the capital of that land of Braj where as a boy he lived. Its literature is mainly composed in the dialect of this region, called Brajbhāshā. That of Rāma, 4

---

1 The worship of Krishna is as old as Megasthenes (about 300 B.C.), who calls him Herakles, and was then, as now, located at Mathurā on the Jumna river. That of Rāma is probably still more ancient; the name occurs in stories of the Buddha.

2 The Bakti Sects of the Hindus, p. 40.

3 This name of Krishna, which means "He who quits the battle," is connected with the story of the transfer of the Yādava clan from Mathurā to the new capital on the coast of the peninsula of Kāthīwār, the city of Dvārakā. This migration was the result of an invasion of Braj by Jarāsandha, king of Magadhā, before whom Krishna resolved to retreat. As his path southwards took him through Raṇghār and Gujarāt, it is in these regions that his form Raṅghār is most generally worshipped as a symbol of the shifting of the centre of divine life from Gangetic to southern India.

4 Quoted from G. A. Grierson, chapter on "Literature," in the India Gazetteer (ed. 1907).
though general throughout Hindostān, has since the time of Tulsī Dās adopted for poetic use the language of Oudh, called Awadhī or Baiswāri, a form of Eastern Hindī easily understood throughout the whole of the Ganges valley. Thus these two districts came to be, what they are to this day, the standard vehicles of poetic expression.

Subsequently to Rāmañjula his doctrine appears to have been set forth, about 1250, in the vernacular of the people by Jaiđē, a Brahman born at Kinduvilva, the modern Kenduli, in the Birbhum district of Bengal, author of the Sanskrit Gitā Gīvinda, and by Nāmēdo or Nāmā, a tailor of Mahārāstrā, of both of whom verses in the popular speech are preserved in the Aḍī Granth of the Sikhs. But it was not until the beginning of the 15th century that the Brahman Rāmañand, a prominent Gūḍā of the sect of Rāmañjula, having had a dispute with the mathematician and astrologer Bhārdd-ballabh, who were advocates of the form of Vaishnavism where devotion is specially addressed to Rāma, who is regarded not only as an incarnation, but as himself identical with the Deity. A contemporary of Rāmañand, Bīḍāyati Thākur, is celebrated as the author of numerous lyrics in the Maithil dialect of Bihār, expressive of the other side of Vaishnavism, the passionate adoration of the Deity in the person of Krishna, the aspirations of the worshipper being mystically conveyed in the character of Rādhā, the cowherdess of Braj and the beloved of the son of Vasudeva. These stanzas of Bīḍāyati (who was a Brahman and author of several works in Sanskrit) afterwards inspired the Vaishnava literature of Bengal, whose most celebrated exponent was Chaitanya (b. 1484). Another famous adherent of the same cult was Mīrā Bāī, "the one great poetess of northern India" (Grierson). This lady, daughter of Rājā Ratīyā Rānā, Rāthōr, of Mīrā in Rajpūtānā, must have been born about the beginning of the 15th century; she was married in 1413 to Rājā Kumbhikaran of Mēwār, who was killed by his son Uday Rānā in 1426. She was devoted to Krishna in the form of Raṇchhōr, and her songs have a wide currency in northern India.

An important compilation of the utterances of the early Vaishnava sāṅgīt was contained in a sacred book, or Aḍī Granth, of the Sikh Gursa. Nānak, the founder of this sect (1469–1538), though a native of the Punjab (born at Talvandi on the Rāvi near Lahore), took his doctrine from the Bhagātī (see Kāṅḍā) and each of the thirty-one rāgā, forming the body of the Granth, is followed by a compilation of texts from the utterances of Vaishnava saints, chiefly of Kabir, in confirmation of the teaching of the Gursa, while the whole book is closed by a bād Bh or conclusion, containing more verses by the same authors, as well as by a celebrated Indian Svīrī, Śhīkha Parīl of Pākāṭaṇ. The body of the Granth (q.v.), being in old Panjabi, falls outside the scope of this article; but the extracts included in it from the original poetic form, before it assumed the militant character which afterwards distinguished it under the five Gursa which succeeded him.

2. Middle Hindī.—The second period, that of middle Hindī, begins with the reign of the Emperor Akbar (1556–1605), and it is not improbable that the broad and liberal views of this great monarch, his active sympathy with his Hindī subjects, the interest which he took in their religion and literature, and the peace which his organization of the empire secured for Hindo-

In the Granth Nāmēlo is called a calico-printer, Chāṭīja. The Maithili tradition is that he was a tailor. Sāṅgīt it is probable that the latter word, being unknown in northern India, has been wrongly rendered by the former.

stan, had an important effect on the great development of Hindi poetry which now set in.2 Akbar’s court was itself a centre of poetical composition. The court musician Tān Sēn (who was also a poet) is still renowned, and many verses composed by him in the Emperor’s name live to this day in the memory of the people. Akbar’s favourite minister and companion, Rājā Birbāl (who fell in battle on the north-western frontier in 1583), was a musician and a poet as well as a politician, and held the title, conferred by the Emperor, of Kabī-ṛay, or poet laureate; his verses and witty sayings are still extremely popular in northern India, though no complete work by him is known to exist. Other nobles of the court were also poets, among them the Khān-khānān ‘Abdur-Rahim, son of Bairam Khān, whose Hindī dūḥas and kabītās are still held in high estimation, and Fażīl, brother of the celebrated Abul-Fażīl, the Emperor’s ambassador to Persia.

By this time the worship of Krishna as the lover of Rādhā (Rādhā-ballāhh) had been systematized, and a local habitation found for it at Gokul, opposite Mathurā on the Jumna, some 30 m. upstream from Agra, Akbar’s capital, by Vallabhāchārya, a Tailunga Brahman from Madras. Born in 1478, in 1497 he chose the land of Braj as his headquarters, thence making missionary tours throughout India. He wrote chiefly, if not entirely, in Sanskrit; but among his immediate followers, and those of his son Bīṭhālnāth (who succeeded his father on the latter’s death in 1530), were some of the most eminent poets in Hindi. Four disciples of Vallabhāchārya and four of Bīṭhālnāth, who flourished between 1550 and 1750, are known as the Aṣṭa Chhāp, or "Eight Seals," and are the acknowledged masters of the literature of Braj-bhāṣā, in which dialect they all wrote. Their names are Krishna-Dās Pay-āhārī, Sūr Dās (the Bhātī), Parmānand Dās, Kumbhān Dās, Chaturbhuj Dās, Chhī Swāmī, Nand Dās and Gōbind Dās. Of these much the most celebrated, and the only one whose verses are still popular, is Sūr Dās. The son of Bābā Rām Dās, who was a singer at Akbar’s court, Sūr Dās was descended, according to his own statement, from the bard of Prithwī-Rāj, Chand Bardāt. A tradition gives the date of his birth as 1483, and that of his death as 1573; but both seem to be placed too early, and in Abul-Fażīl’s Ain-i Akbār he is mentioned as living when that work was completed (1597/8). He was blind, and entirely devoted to the worship of Krishna, to whose address he composed a great number of hymns (bhajān), which have been collected in a compilation entitled the Sūr Sāgar, said to contain 60,000 verses; this work is very highly esteemed as the high-water mark of Braj devotional poetry, and has been repeatedly printed in India. Other compositions by him were a translation in verse of the Bhdgavata Purāṇa, and a poem dealing with the famous story of Nāla and Dama-ya (q.v.); of the latter no copies are known to exist.

The glory of the literature of the period of Tulsī Dās (q.v.) He and Sūr Dās between them are held to have exhausted the possibilities of the poetic art. It is somewhat remarkable that the time of their appearance coincided with the Elizabethan age of English literature.

To these great masters succeeded a period of artifice and reflection, when many works were composed dealing with the rules of poetry and the analysis and the appropriate language of sentiment. Of their writers the most famous is Kāśīb Dās, a Brahman of Bundelkhand, who flourished during the latter part of Akbar’s reign and the beginning of that of Jahāngīr. His works are the Rasik-priyā, on composition (1591), the Kavi-priyā, on the laws of poetry (1601), a highly esteemed poem dedicated to Parbān Rāi Pāṭūrī, a celebrated courtesy of Orcha in Bundelkhand, the Rambhāndrikā, dealing with the history of Rāma, (1610), and the Vīṣyān-gītā (1610). The fruit of this elaboration of the poetic art reached its highest perfection in Bmārī Lāt, whose Satsāl, or “seven centuries” (1662), is the most remarkable example in Hindī of the rhetorical style in poetry (see separate article).

It will be remembered that Akbar’s reign was remarkable for the translation into Persian of a large number of Sanskrit works of religion and philosophy, most of the versions being made by, or in the names of, members of his court.
Side by side with this cultivation of the literary use of the themes of Rama and Krishna, there grew up a class of compositions dealing, in a devotional spirit, with the lives and doings of the holy men from whose utterances and example the development of the popular religion proceed. The most famous of these is the Bhaka-māla, or "Roll of the Bhagats," by Nārāyana Dās, otherwise called Nāhā Dās, or Nāhāhī. This author, who belonged to the despised caste of Dōms and was a native of the Deccan, had in his youth seen Tulāśī Dās at Mathurā, and himself flourished in the first half of the 17th century. His work consists of 108 stanzas in chhappāṭā metre, each setting forth the characteristics of some holy personage, and expressed in a style which is extremely brief and obscure. Its exact date is unknown, but it falls between 1651 and 1655. The book was furnished with a kādī (supplemental gloss) to the kābītā metre, by Priyā Dās in 1713, gathering up, in an allusive and disjointed fashion, all the legendary stories related of each saint. This again was expanded about a century later by a modern author named Lachhman into a detailed work of biography, called the Bhakta-

sindhu. From these nearly all our knowledge (such as it is) of the lives of the Vaishnava authors, both of the Rama and the Krishna cults, is derived, and much of it is of a very legendary and untrustworthy character. Another work, somewhat earlier in date than Bhaka-māla, and called Chausta or Vṛtta, was devoted exclusively to stories of the followers of Vallabhāchārya. It is reputed to have been written by Gōkulnāth, son of Bīmtimehā, son of Vallabhāchārya, and is dated in 1551.

The matter of these tales is justly characterized by Professor Wilson1 (who gives some translated specimens as "marvellous and insipid adultery"); but the book is remarkable for being in very artless prose, and, though written more than 300 years ago, shows that the current language of Brāj was then almost perfectly identical with that now spoken in that region. A specimen of the text will be found at p. 296 of Mr. F. S. Growse's Mathurā, a District Memoir (3rd ed., 1883).

It would be tedious to enumerate the many authors who succeeded the great period of Hind poetical composition which extended through the reigns of Akbar, Jahāngīr and Shāh Jahān. None of them attained to the fame of Sūr Dās, Tulāśī Dās or Bihārī Lāl. Their themes exhibit no novelty, and they repeat with a wearisome monotony the sentiments of their predecessors. The list of Hindī authors drawn up by Dr. G. A. Grierson, and printed in the journal of the Asiatic Society of Bengal in 1889, may be consulted for the names and works of these epigoni. The courts of Chhattarāś, rājā of Pannā in Bundelkhānp, who was killed in battle with Aurangzhēb in 1658, and of several rājās of Bāndhā (now called Rīwān or Rewah) in Baghelkhānp, were famous for their patronage of poets; and the Mogul court itself kept up the office of Kabīr-Rāy or poet laureat even during the fanatical reign of Aurangzhēb.

Such, in the briefest outline, is the character of Hindī literature during the period when it grew and flourished through its own original forces. Founded by a popular and religious impulse in many respects comparable to that which, nearly 1600 years before, had produced the doctrine and literature, in the vernacular tongue, of Jainism and Buddhism, and cultivated largely (though by no means exclusively) by authors not belonging to the Brahmanical order, it was the legitimate descendant in spirit, as Hindi is the legitimate descendant in speech, of the Prākrit literature which preceded it. Entirely in verse, it adopted and elaborated the Prākrit metrical forms, and carried them to a pitch of perfection too often overlooked by those who concern themselves rather with the substance than with the form of the works they read. It covers a wide range of style, and expresses, in the works of its greatest masters, a rich variety of human feeling. Little studied by Europeans in the past, it deserves much more attention than it has received. The few who have explored it speak of it as an "enchanted garden" (Grierson), abounding in beauties of thought and phrase. Above all it is to be remembered that it is genuinely popular, and has reached strata of society scarcely touched by literature in Europe. The ballads of Rajput prowess, the aphorisms of Kabīr, Tulāśi Dās's Rāmāyana, and the bhajans of

Stūr Dās are to this day carried about everywhere by wandering minstrels, and have found their way, throughout the great plains of northern India and the uplands of the Vindhāya plateau, to the hearts of the people. There is no surer key to unlock the con-

cept of Hindī society, the villager than an apt quotation from one of these inspired singers.

3. Literary Urdu.—The origins of Urdu as a literary language are somewhat obscure. The popular account refers its rise to the time of Timur's invasion (1398). Some authors even claim for it a higher antiquity, asserting that a dawān, or collection of poems, was composed in Rēkhta by Mas'ūd, son of Sa'dī, in the last half of the 11th or beginning of the 12th century, and that Sa'dī of Shirāz and his friend Amir Khusrāw of Dehli likewise made verses in that dialect before the end of the 13th century. This, however, is very improbable. It has already been seen that during the early centuries of Muslim rule in India adherents of that faith used the language and metrical forms of the country for their compositions. Persian words early made their way into the popular speech; they are common in Chand, and in Kabīr's verses (which are nevertheless unquestionable Hindī) they are in many places used as freely as in the modern dialect. Much of the confusion which besets the subject is due to the want of a clear understanding of what Urdu, as opposed to Hindī, really is.

Urdu, as a literary language, differs from Hindī rather in its form than in its substance. The grammar, and to a large extent the vocabulary, of both are the same. The really vital point of difference, that in which Hindī and Urdu are incommensurable, is the prosody. Hardly one of the metres taken over by Urdu poets from Persian agrees with those used in Hindī. In the latter language it is the rule to give the short a inherent in every con-

sonant or nēksis of consonants its full value in scansion (though in prose it is no longer heard), except occasionally at the metrical pause; in Urdu this is never done, the words being scanned generally as pronounced in prose, with a few exceptions which need not be mentioned here. The great majority of Hindi metres are scanned by the number of mātrās or syllabic instants—

the value in time of a short syllable—of which the lines consist; in Urdu, as in Persian, the metre follows a special order of long and short syllables.

The question, then, is not When did Persian first become intermingled with Hindī in the literary speech—for this process began with the first entry of Muslim conquerors into India, as is well known—而是 whether a line of Urdu verse was composed; nor when was the Persian character first employed to write Hindī—for the written form is but a subordinate matter; as already mentioned, the MSS. of Malik Muhammad's purely Hindī poem, the Padmāvat, are ordinarily found to be written in the Persian character; and copies lithographed in Dēvānāgari of the popular compositions of the Urdu poet Nağr are commonly procurable in the bazar. We must ask When was the first verse composed in Hindī, whether with or without foreign admixture, according to the forms of Persian prosody, and not in those of the indigenous metrical system? Then, and not till then, did Urdu poetry come into being. This appears to have happened, as already mentioned, about the end of the 16th century. Meantime the vernacular speech had been gradually permeated with Persian words and phrases. The impulse which Akbar's interest in his Hindī subjects had given to the translation of Sanskrit works into Persian had brought the indigenous and the foreign literatures into contact. The current language of the neighbourhood of the capital, the Hindī spoken about Delhi and thence northwards to the Hīma-

layas, is naturally more or less contaminated with Persian; but it is subject to foreign influences; and with the extension of Mogul

many strange countries and through many wonderful adventures, ending in a happy marriage.

1810. Urdu was no less distinguished in literature. Ikhwān-‘Alī Shāh (1579–1626) was the author of a work in verse on music entitled the Nawawr or "Nine Savours," which, however, appears to have been in Hindi rather than Urdu; the three prefaces prefixed to his poems were written in Urdu. The name of Nūr-Allah Qūhūrī, and, under the name of the Sīh nasīr-i-Qūhūrī, are well-known models of style. A successor of this prince, ‘Alī ‘Alī Shāh, had as his court poet a Brahman known poetically as Naṣūrī, who in 1657 published a translation of the Dīwān of Mirsād-i-Khurāsānī (about 1629–1720) and his contemporary and fellow-townsmen Siyāh. The former of these is commonly called "the Father of Kāthkāh"—Dīwān-e-Kāthkāh—and all accounts agree that the immense development attained by Urdu poetry in northern India durst 18th century was due to his example and initiative.

Very little is known of Wall's life; he is believed to have visited Delhi towards the end of the reign of Aurangzeb, and is said to have there received a letter from Shah Jahan congratulating him on his accession and addressing the ideas of the Persian poets. His Kuṭlūyat or complete works have been published by M. Garcín de Tassy, with notes and a translation of selected passages (Paris, 1843–56), and may be commended to readers desirous of consulting in the original a favourable specimen of Urdu poetical composition.

The first of the Delhi school of poets was Zuhūrūddin Hādīm, who was born in 1590 and died in 1678. In the first quarter of the 17th century the poet named by Shāh (1719), the dīwān of Wall reached Delhi, and excited the emulation of scholars there. Hādīm was the first to imitate it in the Urdu of the north, and was followed by his friends Nājī, Māzmūn and Ābrū. These three were the most marked of the poets of this school. One of his pupils was Raqīṣ-ud-Dīn, the most distinguished poet of northern India. Khān Arūzī (1689–1756) was another of the fathers of Urdu poetry in the north. This author is chiefly renowned as a Persianiser, he employed it as the language of his poetry in preference to the original medium, and expressed his skill in the art of versification. He was a man of letters, and made a complete translation of the Koran into Urdu. A third poet of this school was Mir Arūzī, the most celebrated of all. He became a dārūsh of the Naqshbandī order, followed the active life of a courtier, and died in Lucknow in 1756, at the age of 92. Another who Mīr Dard, pupil of the same Shāh Gulshan who said he intended Wali; his dīwān is not long, but extremely popular, and especially esteemed for its purity of expression. Mir Dard and Mir Taqī were of a school which flourished in the reign of Shah Jahan. In this old age he became a dārūsh of the Naqshbandī order, and died in 1793.

Shajihuddin Nārī, a native of Gūjārāt, a friend of Fāizi and contemporary of Akbar, is mentioned by the native biographers as the most ancient Urdu poet after Amīr Khursān. He was tutor to the son of Akbar, the future Humāyun, and several ghazals by him are said to survive. Kūlī Khūṭ Shāh of Golkonda, who reigned from 1581, and his successor ‘Abdullāh Khūṭ Shāh, who came to the throne in 1611, have both left collections of love-lay, or shayari, under the epithet, and with the skill and cleverness of conceit. Pleasing hyperbole, ingenion comparison, antithesis, alliteration, carefully arranged gradation of noun and epithet, are the means employed to obtain variety; and few of the most eloquent passages of later Persian verse admit of translation into any other language without losing that which in the original makes their whole charm. What is true of Persian is likewise true of Urdu poetry. Until quite modern times, there is scarcely anything in it which can be called original. Differences of school, which are made much of by native critics, are to us hardly perceptible; they consist in the use of one or other range of metaphor or comparison, classified, according as they repeat that well-worn poetical stock-in-trade of the Persians, or seek a slightly fresher and more Indian field of sentiment, as the old or the new style of composition.

Haidarî died in 1828. He composed the Tâfic-Kohânî (1801), a prose redaction of the Tâfic-nâmâ which has already been mentioned. Ajmaid composed Namâ Mahfûrî ('Ornament of the Assembly'), detailing the adventures of the prophet. He also composed the Gul-i-Mahârat or Dâk Mâjî, an account of the holy persons of the Muhammadan faith; the Gul-i-Dânhî, a translation of the Firdausî, a Persian poet, and the work of the famous Shah Isâik ãsâfî, a Persian poet, was called the 'Mufarrîl-ûqâlî ('The Delighter of Hearts') self version of the Hîfâpadrâ. Mir Amman was a native of Delhi, which he left in the chapter of Ajmaid Shâh Durrânî for Patna, and in 1801 repaired to Calcutta. To him we owe the Bâf-i Bâhrî (1801-1802), an adaptation of Amîr Khusrua's famous Persian romance entitled the Chahdîr Dârshân, or 'Story of the Four Derivishes.' Amman's work is not itself directly modelled on the Persian but handled in an almost contemporary rendering by Tahsîn of the Naurîs-e Murâsî. The style of this composition is much more adapted by natives of India, and editions of it are very numerous. Amman's work is an imitation of Husain Wâzîr Khasbî's Akhhtê Mukinsî under the name of the Gânî-i Khâtîb ('Treasure of Virtue'), produced in 1802. Haifuddin Ajmaid was a professor at the Fort William College; in 1802 a edition of Abu'i-Fazîl's 'Jyâr-i Dânhî, under the name of the Khurâsânî Bâfî, so admired.

Thus Delhi was deserted by its brightest lights of literature, it did not altogether cease to cultivate the poetic art. Among the last Mohguls, and the most natural and fit survivors of the Alîama (1761-1806) wrote under the name of Atâbî, and was the author of a romance entitled Mângûm-i Agdâs, besides a diwân. His son Sulâman-shukh, brother of Atâbî, Shâh 'Ali, was the first, like his brother authors, repaired to Lucknow, returned to Delhi in 1815, and died in 1838; he also has left a diwân. Lastly, his nephew Bahâdur Shâh 'Ali, the last titular emperor of Delhi (1862), wrote under the name of Zafar, and was a considerable poet; Ibrâhîm Zauq, a distinguished writer; he has left a voluminous diwân, which has been printed at Delhi, Maşjâbî (Ghulâm-i Hamdî), whose diwân was one of the most elegant and celebrated of the revived poetic school of Delhi, and was himself one of its founders. Originally of Lucknow, he left that city for Delhi in 1777, and held conferences of poets, at which several authors who afterwards acquired repute formed their style; he has left five diwâns, a Taghîrî or biography of Shâh 'Ali, and a Shâh-nâmâ or account of the kings of Delhi down to Shâh 'Alâm. Qânîn (Qâyûmuddîn 'Ali) was one of his society, and died in 1792; he has left several works of poetry, Ghalîbî, otherwise Mirzâ Asâdullâh Khân Nasrûtâlî, laureate of the last Mogul, who died in 1860, was undoubtedly the most eminent of the modern Delhi poets. He wrote chiefly in Persian, of which language he was very fond; he formed the Firdâsî, and was himself the master; the intermixture of Arabic words, he was a master; but his Urdû diwân, though short, is excellent in its way, and his reputation spread far and wide. This work is entitled Diwân-e Shâh Shâh, and was printed in 1832; his magânis entitled Jojî-nâmâ, Kaukân-nâmâ, Banjârâ-nâmâ, and Bughshâb-e-nâmâ, as well as his diwân, have been frequently reprinted, and are extremely popular. His language is less artificial than that of the generality of Urdu poets, and some of his poems have been printed in Nîgarî, and are as well known and as much esteemed by Hindus as by Mahommedans. His verse is defaced by much obscurity.

Modern Period.—While such, in outline, is the history of the literary schools of the Deccan, Delhi and Lucknow, a fourth, that of the Fort William College at Calcutta, was being formed, and was destined to give no less an impulse to the cultivation of Urdu prose than had a hundred years before been bestowed upon that of poetry by Wall. At the commencement of the 19th century, John (Hinni) the foremost institution, and his efforts were directed towards getting together a body of literature suitable as text-books for the study of the Urdu language by the European officers of the administration. To his exertions we owe the elaboration of the vernacular as an official speech, and the possibility of substituting it for the previously current Persian as the language of the courts and the government. He gathered together at Calcutta the most eminent vernacular scholars of the time, and their works, due to his influence, were a source of elegant and serviceable prose composition, not only in Urdu but also in Hindi. The chief authors of this school are Haiadrî (Sayyid Muhammad Haider-bakhs), Husainî (Mîr Bahâdur 'Ali), Mir Amman Luîf, Haifuddin Ajmaid, Shër 'Ali Afso, Nihil Chand of Lahore, Kâjim 'Ali Jawân, Lallô Lâl Kavi, Majhar 'Ali Wîlân and Irkâm 'Ali. Sri Lallô Lâl was a Brahman, whose family, originally of Gujûrât, had long been settled in northern India. What was done by the other Fort William authors for Urdu prose was done by Lallô Lâl alone for Hindi. He indeed was said to have created "High Hindi" as a literary language. His Prem Sîgar and Râjîlî, the former a version in pure Hindi of the prem Raghibâm, the latter a version in the language of the Brahmin Braj bhashâ, and the latter an adaptation in Brah-bhashâ prose of the Hîfâpadrâ and part of the Panch-a-lanja, are unquestionably the most important works of the period. The Prema and the Râjîlî, printed in 1804 and ended in 1810; it enjoys immense popularity in northern India, has been frequently reproduced in a lithographed form, and were sold at several times. Further, the Prem was in 1809; it is much admired for its sentiments brevity and the purity of its language. Besides these two works, Lallô Lâl was the author of a collection of a hundred anecdotes in Hindi and Urdu entitled Lallô Lâl's Hindi, an anthology of Hindi verse called the Sabdâ-lîs.
of Western learning, for which text-books (many of them translations from English) were required, not only greatly enlarged the repertory of the educational curriculum, but also brought the official language of the courts and the acts of the legislature, and this at once led to the transfer to the former of a mass of technical and forensic terms which had previously been only to a limited degree a part of the vernacular use. This was a preliminary step leading to the recognition of Western learning, for which text-books (many of them translations from English) were required, not only greatly enlarged the repertory of the educational curriculum, but also brought the official language of the courts and the acts of the legislature, and this at once led to the transfer to the former of a mass of technical and forensic terms which had previously been only to a limited degree a part of the vernacular use.

The works of these authors, though compiled and published under the superintendence of Dr Gilchrist, Captain Abraham Lockett, Press in 1830. Hindi literature appears to have been the earliest of the vernaculars to receive the character and dignity of a written form, and to have been the first to be translated into the English language. A few years after the publication of the first volume of the Indian Language Series, the college of Fort William, and originally intended for the instruction of the Company’s officers in the vernacular, are essentially Indian in style and taste, and, until superseded by the more recent development of the language, in the public mind took the place of the language of the author’s own country. The reputation and popularity. They may, indeed, be said to have set the standard of prose composition in Urdu and Hindi, and for the first half of the 19th century the influence of this respect continued almost unchallenged. Side by side with them, among the Musalman population of northern India, another almost contemporaneous impulse did much for the expansion of the Urdu language, and the work of the Valashana reformers, who were led by a similar impulse, gave an impetus to composition which might otherwise have been lacking. This was the result of the effort in Urdu by Sayyid Ahmad and his followers. In all Eastern countries religion is the first and chief subject of composition; and here it was that the greatest revolution in the language was first noticed. The force of the new preaching aroused in India at once afforded abundant material for authorship in Urdu, and interested deeply the people to whom the religion was new.

Sayyid Ahmad was born in 1782, and received his early education at Delhi; his instructors were two learned Muslims, Shāh ‘Abdu-l-‘Azīz, author of a celebrated commentary on the Qurān (the Taṣfīr-i ‘Āmīrī) and ‘Abdu-l-Qādir, a disciple of the latter. Sayyid Ahmad was the translated from the original volume into Urdu. Under their guidance Sayyid Ahmad embraced the doctrines of the Wahhābīs, a sect whose preachers appears at this time to have first reached India. However, it is only a large number of the sect’s adherents that returned to Delhi. The religious degradation and coldness which he found in his native country strongly impressed him after his sojourn in lands where the life of Islamic is stronger, and he and his disciples established a propaganda throughout northern India, repudiating the superstitions which had crept into the faith from contact with Hindus, and preaching a jihād or holy war against the Sikhs. In 1828 he started for Peshawar, attended by, it is said, upwards of 100,000 followers, who accompanied him. He was received with much enthusiasm by his sect. ‘Abdu-l-‘Aziz, the chief author of the sect. After a course of preaching and apostleship at Delhi, Sayyid Ahmad set out in 1820 for Calcutta, attended by numerous followers. He was however, a few weeks later than himself master of Peshawar. The Afghanis, however, with whom he had allied himself in the contest, were soon disgraced, and the reformation of the sect was soon defeated by the rigours of the climate, and the sect itself disappeared. Sayyid Ahmad and his sects, however, by no means extinct; the Wahhābī doctrines have continued to gain ground in India, and to give rise to much controversial writing, down to our own day.

The translation of the Quran by ‘Abdu-l-Qādir was finished in 1821, and it was published in 1825. Sayyid Ahmad, a fervent disciple of Sayyid Ahmad, at Ḥāgilā in 1829. The Ṭambūl-i-ghalāfīn, or Awakeners of the Heedless,” a work in Persian by Sayyid Ahmad, was rendered into Urdu by ‘Abdūlīlīf, and published at the same press in 1823, and a revised edition in 1831; in its turn was the author of two translations of the Quran, the first entitled Taqāyat-ul-‘Imān (“Confirmation of the Faith”), which had great vogue among the following of the Sayyid. Other works by him, which were above all his greatest contribution to Urdu prose composition were the Tarbhīr-i jihād (“Incitement to Holy War”), Ḥidāyat-ul-Mā’ṣūmin (“Guide of the Believers”), ‘Manẓūr-ul-Kabīr wa-l-Bī‘ut (“Exposition of Mortal Sins and Heresy”), Naqṣ-e-maṣūlī (“The Prejudices of Muslims”), and the Mā‘ṣūlī, or Hundred Questions.

Printing was first used for vernacular works by the College Press at Fort William, at the end of the 18th and the beginning of the 19th century. The most notable of these was the translation of the Holy Quran and his successors which have been mentioned were thus given to the public. But the expense of this method of reproduction long precluded its extensive use in India, and movable types, though well suited for alphabets derived from the Sanskrit, were not equally applicable to the accents and phonetic peculiarities of the Persian. Lithography was introduced about 1837, when the first press was set up at Delhi, and immediately gave a powerful stimulus to the multiplication of literature, both original and editions of older works. The English press had already introduced the special, and had published the official language of the courts and the acts of the legislature, and this at once led to the transfer to the former of a mass of technical and forensic terms which had previously been only to a limited degree a part of the vernacular use.

The use of Western learning, for which text-books (many of them translations from English) were required, not only greatly enlarged the repertory of the educational curriculum, but also brought the official language of the courts and the acts of the legislature, and this at once led to the transfer to the former of a mass of technical and forensic terms which had previously been only to a limited degree a part of the vernacular use.
HINDU CHRONOLOGY

explains how the poem came to be written—after a youth spent in heedlessness and unsetlement, at the instigation of Sir Sayyid Ahmad Khan, and in the cause of that great reformer. The poem is still recited and imitated by Muslims in the Punjab and United Provinces. The further work with the Dari of Aligarh, of which a manuscript is in the library of the university, is no longer wholly applicable to the community. Hali has recently completed a life of Sir Sayyid Ahmad Khan in two volumes, entitled Hayyati-i Javed ("eternal life"), a work of great merit.

Another writer whose work, though chiefly in prose, deals with poetry and poetic style, is Maulavi Muhammad Husain Azad, lately professor of Urdu, and now resident at Lahore. He has himself composed much verse, but his biographies of Urdu poets, with criticisms of their works, entitled Ab-i Hayati ("Water of Life," Lahore, 1883), is by far the best book dealing with the subject. His style is not impermeated with love, but, with the public, so was Azad that of Zaau, of whose poems he has published a revised and annotated edition. His other works in prose are Qasat-i Hayat, episodes of Indian history arranged for schools; Narangi-i Khayal, an allegory dealing with human life; and Darbar-i Akbarr, an account of the reign of Akbar.

Sir Sayyid Ahmad Khan's life and work are dealt with elsewhere. Among his literary achievements may be mentioned the Ayrga-Sandad ("Vestiges of Princes"), an excellent account of Delhi and its monuments, which has passed through several editions since it was first lithographed in 1847. His essays and occasional papers, collected in the Aurangzebe (stamped "of his time," and afterwards (from 1870 onwards) in a periodical entitled Tahqabul-Aklaq (or "Muhammadan Social Reformer"), handle all the problems that affect the race and other questions of academic and social advancement in Indian Musalmans—the cause with which his life was identified. His great Commentary on the Qur'an, in seven volumes, the last finished only a few days before his death in 1889, is carried to the end and has been read in more than one language. His prose found its most powerful wielder for the diffusion of modern ideas, and the movement which he set on foot has been the spring of the best language during recent years.

Another excellent writer of Urdu is Shams-ul-Ulama Maulavi Nazir Abmad of Delhi, who is the author of a series of novels describing domestic life, of a somewhat didactic character, which have been immensely popular and whose admirers have been specially serviceable in the education of Indian women. These are entitled the Mirat-ul-Aris (or "Brides' Mirror"); Translations from the English, and other works on the subject of Urdu, have been to the best of our knowledge, never translated into Hindoostani, a fact which has been regrettable, and the present production of this kind in Urdu is a work entitled Fisana-e Azad, by Paqdil Raman-nath Sashrsh of Lucknow. The story, which is very long, is remarkable for the faithful and vivid pictures of Lucknow society which it presents, and its exact and lifelike delineation of character; it appeared originally as a feuilleton of the Awadh Akhbar, of which paper the author was at the time editor. Another good writer in the same branch of literature is Maulavi Abdul-Halim Sharar, also a native of the neighbourhood of Lucknow, but settled at Hyderabad. He was editor of a monthly periodical called the Dukhade, of which he consulted his old age even venturing papers in European style, and in it his novels, which are all of an historical character, in the style of Sir Walter Scott, originally appeared. The first two are Asis and Virpada, a tale of the Crusades, and Mustaaf Momin, a story similar to Ahmad Khan's, a story is narrated in India at the time of the invasions of Sultan Mahmud of Ghazni.

Although Urdu chiefly represents Musalmun culture, its use is by no means exclusively limited, as it has been mentioned that the most popular Urdu novelist is a Hindoo (a Brahman from Kashmir); and the statistics of the vernacular press show that this form of the language is widely used by Hindus as well as Muslims. Periodicals of Hindoo type are published in the United Provinces, twenty-nine are conducted by Hindus; similarly, in the Punjab, of forty-eight Urdu journals, twenty-five are printed in Hindi.

"High Hindi" has scarcely adapted itself to modern requirements with the thoroughness displayed by Urdu. It is taught in the schools where the population is mainly Hindu, and books of science have been written from Sanskrit to take the place of the Persian terms used in the other language. But Sanskrit is far removed from the daily life of the people, and the majority of works in this style are read only by Paqdilts, the great bulk of them dealing

with religion, philosophy and the ancient literature. There are thirty-seven Hindi and four Hindi-Urdu journals in the United Provinces; but many of them are exclusively religious in their character, and several, though written in Devanagari, employ a Hindoo-Urdu that is distant from the language of the prose of Urdu. The diglossia of Hindi-Urdu is no longer only used for poetry; High Hindi has been a complete failure for this purpose.

The most noticeable authors in Hindi since the middle of the 19th century have been Bbâr Harischandra and Rajá Siva Prasad, both of Benares. The former, during his short life (1850-1885), was an enthusiastic cultivator of the Hindoo style; using the dialects of literature, Awadhli and Braj-bhâshâ, are now only used for poetry; High Hindi has been a complete failure for this purpose.

The civil solar year is determined by the astronomical solar year. The latter professes to begin at the vernal equinox, but the actual position is as follows. In our Western astronomy the signs of the zodiac have, in consequence of the precession of the equinoxes, drawn away to a large extent from the constellations from which they derived their names; with the result that the sun now comes to the vernal equinox, at the first point of the sign Aries, not in the constellation Aries, but at a point in Pisces, about 28 degrees before the beginning of Aries. The Hindus, however, have disregarded precession in connexion with their calendar from the time (a.d. 499, 522, or 527, according to different schools) when, by their system, the signs coincided with the constellations; and their sign Aries, called Mēsha by them, is still their chief fixed point. The change was first made by one of the Gauda, in the star ζ Pisces. Their astronomical solar year is, in fact, not the tropical year, in the course of which the sun really passes from one vernal equinox to the next, but a sidereal year, the period during which the earth makes one revolution in its orbit round the sun with reference to the first point of Mēsha; its beginning is the moment of the Mēsha-saṅkranti, the entrance of the sun into the sidereal sign Mēsha, instead of the tropical sign Aries; and it begins, not with the true equinox, but with an artificial or nominal equinox.

The length of this sidereal solar year was determined in the following manner. The astronomers selected what the Greeks termed an ephemeris, the Romans an annus magnus or mundanus, a period in the course of which a given order of things is completed by the sun, moon, and planets returning to a state of conjunction from which they have started. The usual Hindu ephemeris has been the Great Age of 4,320,000 sidereal solar years, the aggregate of the Krita or golden age, the Trētā or silver age, the Dwāpara or bronze age, and the Kali or iron age, in which we now are; but it has sometimes been the Kalpa or æon, consisting according to one view of 1000, according to another view of 1008, Great Ages. He then laid down the number of revolutions, in the period of his ephemeris, of the nakṣatras, certain stars and groups of stars which will be noticed more definitely in our account of the lunar year; that is, the number of rotations of the earth on its axis, or, in other words, the number of sidereal days. A deduction of the number of the years from the number of the sidereal days gave, as remainder, the number of civil days in the ephemeris. And, this remainder being divided by the number of the years, the quotient gave the length of the sidereal solar year: refinements, suggested by experience, inference, or extraneous information, were made by increasing or decreasing the number of sidereal days assigned to the ephemeris. The Hindus now recognize three standard sidereal solar years determined in that manner. (1) A year of 365 days 6 hrs. 12 min. 30 sec. according to the Aryabhātīya, otherwise called the First Aṛya-Saṅkranti, which was written by the astronomer Aryabhāta (b. a.d. 475): this year is used in the Tamil and Malayāḷam districts, and, we may add, in Ceylon. (2) A year of 365 days 6 hrs. 12 min. 30-91 sec. according to the Rājāmiśra ka, a treatise based on the Brāhma- Saṅkranti of Brahmagupta (b. a.d. 598) and attributed to king Bhūja, of which the epoch, the point of time used in it for calculations, falls in a.d. 1042: this year is used in parts of Gujarāt (Bombay) and in Rājputāna and other western parts of Northern India. (3) A year of 365 days 6 hrs. 12 min. 36-56 sec. according to the present Śrīvatsa-Saṅkranti, a work of unknown authorship which dates from probably about A.D. 1000: this year is used in almost all the other parts of India. It may be remarked that, according to modern science, the true mean sidereal solar year measures 365 days 6 hrs. 9 min. 9-6 sec., and the mean tropical solar year measures 365 days 5 hrs. 48 min. 46-054440 sec.

The result of the use of this sidereal solar year is that the beginning of the Hindu astronomical solar year, and with it the civil solar year and the lunar year and the nominal incidence of the seasons, has always been, and still is, travelling slowly forward in our calendar year by an amount which varies accord-

The disregard of precession, and the consequent travelling forward of the year through the natural seasons, is, of course, a serious defect in the Hindu calendar, the principles of which are the saṃkranti. Accurate, while an attempt of ours to rectify this state of things by introducing a precessional calendar, taking as the first lunar month the synodic function in which the sun enters the tropical Aries, instead of the sidereal Aries; and that the Sun was subst. a. 1886, of the Saiva-Paṭṭikārā and "Precessional Almanac." Further, the Hindu sidereal solar year is in excess of the true mean solar year by (if we use Aryabhāta’s value) 3 min. 20-4 sec. We must take this, for convenience, at 3 min. 20 sec. The excess amounts to exactly one day in 1232 years. And even the sidereal Mēsha-saṅkranti is found to occur three or four days later than the day on which it should occur. Accordingly, another reform began, in about 1865, to publish the Nāvin avadhāna Ālambhāna Pātwardhanī Paṭṭikārā, the “New or Paṭwardhanī Almanac,” in which he determined the details of the year according to the proper Mēsha-saṅkranti.
longest is Mithuna. The civil solar month begins with its first civil day, which is determined, in different localities, in the same manner with the first civil day of the Mēshāyūi; as indicated above, by the crossing of the Sun's path; partly because of the variation in the length of the astronomical month. No exact equivalents of the civil months, therefore, can be stated to the day of the month, we may say, while the month Mēsha now begins on or about 12th April, the beginning of a subsequent month may come as late as the 16th day of the English month in which it falls.

The seasons.
The solar year is divided into six seasons, the Sanskrit names of which are Vasanta, spring; Grishma, the hot weather; Varsha, the rainy season; Sarad, autumn; Hemanta, the cold weather; and the winter, Shinayana, at the Mina-sankranti; the other seasons begin at each successive second sankranti from that. Originally, this scheme was laid out with reference to the true course of the Sun, and the starting-point was chosen at the Winter Solstice, as the first January. Beginning again, now, owing partly to the disregard of precession, partly to our introduction of New Style, each season comes about three weeks late; Vasanta begins on or about 12th March, instead of 19th or 20th February, and so on with the rest.

It may be added that in early times the year was also divided into three or four, and even into five or seven seasons; and there appears to have been also a practice of reckoning the seasons according to the lunar months, which, however, would only give a very varying arrangement, in addition to neglecting the point that the seasons are naturally determined by the course of the Sun, not of the Moon. The Hindu calendar is now reckoned only the division into six seasons, determined as stated above.

The solar year is also divided into two parts called Uttarayana, the period of the Sun's ascension, or the northern solstice, and Dakshagayana, the period during which it is moving to the south. The Uttarayana begins at the nominal winter solstice, as marked by the Makara-sankranti; and the day on which the Sun reaches this point and begins the descent, by about 12th December, is still a special occasion of festivity and rejoicing; the Dakshagayana begins at the nominal summer solstice, as marked by the Šarka-sankranti. It may be added here that, while the Hindu disregard precession in the actual computation of their years and the regulation of their calendar, they pay attention to it in certain other respects, and notably as regards the precessional solstices and equinoxes, which are looked upon as auspicious occasions, as well as the non-precessional solstices, and are customarily shown in the almanacs; and some of the almanacs show also the other precessional sankranti of the Sun.

The civil days of the solar month begin at sunrise. They are numbered 1, 2, 3, &c., in unbroken succession to the end of the month. And, the length of the month being variable for the reasons stated above, the number of the civil days may range from twenty-nine to thirty-two.

The civil days are named after the weekdays, of which the usual appellations (there are various synonyms in each case, and sometimes the same name is given to several weekdays) are Adi, the first day, Adi, the day of the sun, sometimes called Adi, the beginning of the day (Sunday); Soma, the second day, the day of the moon or the Tuesday); Budhava, the day of Mercury (Wednesday); Bṛhaspatiava or Guruvāra, the day of Jupiter (Thursday); Sukravāra, the day of Venus (Friday); and Sani, the day of Saturn (Saturday).

The week—Beginning of the month.

The week—Or the month.

As their civil day begins at sunrise, the Hindus naturally count all their times, in ghātakas and palas, from that moment. But the argument of the month, or lunar month, is not expressed in any way similar to the extent to which it is so in European latitude; and under the British Government the Hindus have recognized the advantage, and in fact the necessity, especially in connection with the changes in the calendar involved in having a calendar of referring their own times to the time which prevails officially. Consequently, some of the almanacs have adopted the European practice of giving the time of sunrise, in hours, minutes, and seconds, from midnight; and some of them use the time of sunset from noon.

The lunar year consists primarily of twelve lunations or lunar months, of which the present Sanskrit names, generally used in more or less corrupted forms, are Chaithra, Vaśākha, &c., to Phālguna, as given above in connexion with the solar months.

The lunar year.

It is of two principal varieties, according as it begins with a certain day in the month Chaithra, or with the corresponding day in Kārttika: the former variety is conveniently known as the Chaitrāyūi; the latter as the Kārttikāyūi. For religious purposes the lunar year begins with its first lunar day; for civil purposes it begins with its first civil day, the relation of which to the lunar month will be explained below. And the month, in which, as we shall explain, the beginning of the lunar year is shifting backwards and forwards, it is not practicable to lay down any close equivalents for comparison: but an indication may be given as follows. The first civil day of the Chaitrāyūi is the day after the new-moon conjunction which occurs next after the entrance of the Sun into Mīna, and it now falls from about 12th March to about 11th April: the first civil day of the Kārttikāyūi is the day after the new-moon conjunction which occurs next after the entrance of the Sun into Tiḷā, and it now falls from about 17th October to about 15th November.

The present names of the lunar months, indicated above, were derived from the nakṣatras, which are certain conspicuous stars and groups of stars lying more or less along the north-south

plain text
each occasion, and would in course of time recede entirely through the solar year, as it does in the Mahommcdian calendar. The Hindus prefer that in the following manner. The length of the Hindu astronomical solar month, measured by the "saka," is virtually the time the sun enters the same sign of the zodiac, but is modified by the intervention of two intercalary months, in accordance with periodical variations in the speed of the moon, and the sun, from about 29 days 7 hours 35 min. up to about 31 days 15 hrs. 28 min. The amount of variation is more than that which is necessary, in order to make up the difference between the solar and the lunar cycle of the sun, and there is a condition of the present rule, that Pausha begins while the sun is in Dhanus, is not satisfied.

The well-known Metonic cycle, whereby we have by rearrangement of the days of each month, and the numbers Natural usage, and we have been told sometimes that that cycle was adopted by the Hindus, and elsewhere that the intercalation of a month by them generally takes place in the years 3, 5, 8, 11, 14, 16, and 19 of each cycle, differing only in respect of the 14th year, instead of the 13th, from the arrangement which is said to have been fixed by Meton. As regards the first point, however, there is no evidence that a special period of 19 years was ever actually used by the Hindus during the Kali-yuga, for it has been shown that the term 19, to which it figures as a component of the number of years, 19×150 = 2850, forming the lunisolar cycle of an early work entitled Romakā-Śīršaśūla. As regards the second, not less than the time of Meton himself, the Metonic cycle has not, for any length of time, the closeness of results which has been sometimes supposed to attach to it; it requires to be readjusted periodically. As regards the third, the age of the present Gregorian solar months depend upon, and vary with, the year that we may select as the apparent first year of a set of 19 years, and it is not easy to arrange the Hindu years in sets answering to a direct continuation of the Metonic cycle.

5 It might also be called Pausha, because the sun enters Makara in the course of it; and it may be observed that, in accordance with a second rule which formerly existed, it would have been named Pausha because it ends while the sun is in Makara, and the omitted name would have been Mārgha. The suppression of a month in the civil year, in the condition of the present rule, that Pausha begins while the sun is in Dhanus, is not satisfied.

The solar year, may be illustrated as follows. In A.D. 1815 the Mārgha-rātrikūr occurred on 11th April; and the first civil day of the Chaitrārī yera was 10th April. In A.D. 1816 and 1817 the first civil day of the Chaitrārī yera fell back to 29th March and 18th March respectively. This was caused by the entrance of the sun into Mārgha, the first month, and the present rule being in operation. Among the Nāgas, the month Šravāṇa, with which the corresponding month of Pausāṇa begins, was considered the New Year; and the first civil day of the Chaitrārī yera had fallen back to 13th March, by an intercalation of Chaitra itself—in A.D. 1834, when the Mārgha-rātrikūr occurred on 14th April, the first civil day of the Chaitrārī yera was again 10th April. The lunar month is divided into two fortnights (pakṣaka), called bright and dark, or, in Indian terms, sūkla and śukla, śuḍi, suḍi, śukla and śukla, or kṛṣṇa and pūrṇima, in the month of Vaisakha, the period of the waxing moon, ending at the full-moon; the dark fortnight, kṛṣṇa-pakṣa, is the period of the waning moon, ending at the new-moon. In the amāsya or śukla-bhūtri month, the bright fortnight precedes the dark; in the pūrṇimaṇḍa or kṛṣṇādhi month, the dark fortnight comes first; and the result is that, whereas, for instance, in the amāsya or śukla-bhūtri month, the bright fortnight precedes the dark; in the pūrṇimaṇḍa or kṛṣṇādhi month, the dark fortnight comes first; and the result is that, whereas, for instance, in the amāsya or śukla-bhūtri month, the bright fortnight precedes the dark; in the pūrṇimaṇḍa or kṛṣṇādhi month, the dark fortnight comes first; and the result is that, whereas, for instance, in the amāsya or śukla-bhūtri month, the bright fortnight precedes the dark; in the pūrṇimaṇḍa or kṛṣṇādhi month, the dark fortnight comes first; and the result is that, whereas, for instance, in the amāsya or śukla-bhūtri month, the bright fortnight precedes the dark; in the pūrṇimaṇḍa or kṛṣṇādhi month, the dark fortnight comes first; and the result is that, whereas, for instance, in the amāsya or śukla-bhūtri month, the bright fortnight precedes the dark; in the pūrṇimaṇḍa or kṛṣṇādhi month, the dark fortnight comes first; and the result is that, whereas, for instance, in the amāsya or śukla-bhūtri month, the bright fortnight precedes the dark; in the pūrṇimaṇḍa or kṛṣṇādhi month, the dark fortnight comes first; and the result is that, whereas, for instance, in the amāsya or śukla-bhūtri month, the bright fortnight precedes the dark; in the pūrṇimaṇḍa or kṛṣṇādhi month, the dark fortnight comes first; and the result is that, whereas, for instance, in the amāsya or śukla-bhūtri month, the bright fortnight precedes the dark; in the pūrṇimaṇḍa or kṛṣṇādhi month, the dark fortnight comes first; and the result is that, whereas, for instance, in the amāsya or śukla-bhūtri month, the bright fortnight precedes the dark; in the pūrṇimaṇḍa or kṛṣṇādhi month, the dark fortnight comes first; and the result is that, whereas, for instance, in the amāsya or śukla-bhūtri month, the bright fortnight precedes the dark; in the pūrṇimaṇḍa or kṛṣṇādhi month, the dark fortnight comes first; and the result is that, whereas, for instance, in the amāsya or śukla-bhūtri month, the bright fortnight precedes the dark; in the pūrṇimaṇḍa or kṛṣṇādhi month, the dark fortnight comes first; and the result is that, whereas, for instance, in the amāsya or śukla-bhūtri month, the bright
HINDU CHRONOLOGY

The Hindu calendar is based on the solar and lunar cycles, and it has been in use for several centuries. The most prominent features of the Hindu calendar are the tithis (days), and the months which are based on the lunar cycle. The month is divided into two twenty-day periods, called the Fortnight. The new moon occurs at the beginning of the first fortnight, and the full moon at the beginning of the second. The number of days between two consecutive new moons is 29.5, which is the average length of a lunar month. The number of days between two consecutive full moons is 30, but this length varies depending on the time of the year.

easily have been set back to 528 B.C. in circumstances, attending a determination of the reckoning long after the occurrence, analogous to that to which the Ceylonese Buddhavarma set up the erroneous date of 544 B.C. for the death of Buddha.

In the class of eras of royal origin, brought into existence in the manner indicated above, the Hindus have had various reckonings which have now mostly fallen into disuse. We may mention them, without giving them the detailed treatment which the more important of the still existing reckonings require.

The Kalachuri or Chéudi era, commencing in A.D. 248 or 249, is known best from inscriptional records, bearing dates which are quoted below, but the name was also used in the reign of the kings of the Chéudi country in Central India; and it is from them that it derived the name under which it is known. In earlier times, however, we find this era well established, without any appellation, in Western India, in Gujarat and the Western district of the Deccan, where it was used by kings and princes of the Chalukya, Gurjara, Sëndraka, and Shaïchchrury Trakautika families. It is traced back to BD. 457, at which time there was reigning a Trakautika king named Dahrasena. Beyond that point, we have no certain knowledge about it. But it seems probable that the founder of it may be recognized in an Athira king Iavarsena, or else in his father Sivadatta, who was reigning in Nasik in or closely about A.D. 249.

The Gupta era, commencing in A.D. 320, was founded by Chandra-gupta I., the first paramount king in the great Gupta dynasty of Northern India. The reign of the Gupta kings, when reckoned from the Gupta era, was taken over by the Maitraka kings of Valabhi, who succeeded them in Kathiawar and some of the neighbouring territories; and it became also known as the Valabhi era.

In Chénas and the districts beyond the Ganges, we have a record of the Kadambas king Këkutchanhvarman, which was framed during the time when he was the Yuvaraja or anointed successor to the sovereignty, and may be referred to the year about 500. It is dated in the 4th regnal year of his reign, and hence the first inscription of a reckoning or the foundation of the Kadamba dynasty by Mayéravarmen, the great-grandfather of Këkutchanhvarman, but no other evidence of the existence of this era has been obtained.

The records of the Ganga kings of Kalinga, which is the modern Mukhalingam-Nagarkatavakam in the Gajapati district, Madras, in the 4th regnal year of the Ganga king, date 254 years. And various details in the inscriptions enable us to trace the origin of the Ganga kings to Western India, and to place the initial point of their reckoning in A.D. 590, where a certain Satydravasa-Dhurusvamis, an ancestor, is named; and possibly the grandfather of the first Ganga king Ràjasinha-Indrankarnam I., commenced to govern a large province in the Konkan under the Chalukya king Kértvarman I., in 591.

The Harsha era, commencing in A.D. 605 or 606 was founded in Northern India by the great king Harshavardhana, who reigned first at Théguasar and then at Kanaouj, and who was the third sovereign in the dynasty, and whose reign is said to have lasted 37 years. A peculiarity about this era is that it continued in use for apparently four centuries after Harshavardhana, in spite of the fact that his line ended with him.

The Saka era, which was founded by the Këkutchanhvarman, who reigned from A.D. 1076 to 1128, abolished the use of the Saka era in his dominions in favour of an era named after himself. When his successors, or his ministers did was to adopt, for the first time in that dynasty, the system of regnal years, according to which, while the Saka era also remained in use, most of the records of his time are dated, not in that era, but in the year so-and-so of the Chalukya-Vikramanka or Chalukya-Vikrama-varsha, "the time or years of the Chalukya Vikrama." There is some evidence that this reckoning survived Vikramaditya VI. for a short time. But his successors introduced these regnal reckonings; and that prevented it from acquiring permanence.

In Tïruth, there is still used a reckoning which is known as the Lakshmasêna era from the name of the king of Bengal by whom it was founded. In the difference of opinion as to the initial point of this reckoning; but the best conclusion appears to be that which places it in A.D. 1119. This era prevailed at one time throughout Bengal; but the eldest known from this passage in the A Këkurchakam, which was in A.D. 1564, which specifies the Saka era as the reckoning of Gujarât and the Dekkan, the Vikrama era as the reckoning of Mâlêvâ, Dêli, and those parts, and the Lakshmasêna era as that of the Bengal.

The last reckoning that we have to mention here is one known as the Râjyabhushêka-Saka, "the era of the anointing of the sovereignty," which was in use for a time in Western India. It dates 212 years after the death of Buddha, according to the ten year period of the 12th century, to the year 6 June, A.D. 1674, when Sivaji, the founder of the Marâthâ kingdom, had himself enthroned.

There are four reckonings which it is difficult at present to class exactly. Two inscriptions of the 15th and 17th centuries, recently brought to notice from Jêsalâr in Râyputâna, present a reckoning which postulates an initial point in A.D. 624 or in the preceding or the following year, and bears an appellation, Bhâtâka, which is usually given as a mere name or designation, to which the rulers of Jêsalâr belong. No historical event is known, referable to that time, which can have given rise to an era. It is possible that the apparent initial date represents an epoch which is commonly called "this year," and which is a period of the sun's, or of the moon's, cycle, about laid down in some astronomical work composed then or soon afterwards and used in the Jêsalâr territory. But it seems more probable that it is a purely fictitious date, set up by an attempt to continue early historical records.

In the Tinnevelly district of Madras, and in the territories of the same presidency in which the Malayalam language prevails, namely, Cochin and Travancore, the very name of the first (or Këkurchakam) of the Cochin and Travancore states, there is used a reckoning which is known sometimes as the Kollam or Kolâma reckoning, sometimes as the era of Parâsuráma. The years of it are solat; in the southern parts of the territory of which it is current, they begin with the month Sënûha; in the northern parts, they begin with the next month, Kanyâ. The initial point of the reckoning is in A.D. 825; and the year 1076 commenced in A.D. 1600. The popular view about this reckoning is that it consists of cycles of 1000 years; that we are now in the fourth cycle; and that the reckoning originated in 1716 B.C. with the mythical Parâsurâma, who exterminated the Kshatriya or warrior caste, and reigned the Kolâma, Western India below the Ganges, from the year 825 date, known date in it, of the year 1495, falls in A.D. 973; and the reckoning has run in continuation of the thousand, instead of beginning after 825. But it is probable that this reckoning was one of the 1068 reckoning, occurring in A.D. 825, connected with one or other of the towns and ports named Kollam, on the Malabar coast; perhaps Northern Kollam in the Malabar district, perhaps Southern Kollam, the name known as Quilon, in Travancore. But the introduction of Parâsurâma into the matter, which would carry back (let us say) the foundation of Kollam to legendary times, may indicate, rather, a purpose in imitative origin. Or, again, since each century of the Kollam reckoning begins in the same year A.D. with a century of the Sapîrashi reckoning (see below under III. Other Reckonings), it is not impossible that this reckoning may be a southern offshoot of the Sapaîrashi reckoning, or at least may have had some astrological origin.

In Nâpol there is a reckoning, known as the Nëwr era and commencing in A.D. 879, which superseded the Gupta and Harsha eras there. One tradition attributes the foundation of it to a king Râghavadêva; another says that, in the time and with the permission of a king Jâyâdevamâla, a merchant named Sëkhauj palm, used the means of wealth derived from sand which turned into gold, all the debts then existing in the country, and introduced the new era in commemoration of the occurrence. It is possible that the era may have been founded by some ruler of Nâpol; but nothing authentic has been known to the author of this book in connexion with it. This era appears to have been discarded for state and official purposes, in favour of the Saka era, in A.D. 1768, when the Gûrâkus became masters of Nâpol; but manuscripts show that in circles it is still used as a reckoning. Inscriptions disclose the use in Kathiâwar and Gujarât, in the 12th and 13th centuries, of a reckoning, commencing in A.D. 1114, which is known as the Siûña-sêchêva, and which appears to have been restricted to the dominions of the Gûrâkus.

The eras mentioned above have for the most part served their purposes and died out. But there are three great reckonings, dating from a very respectable antiquity, which have held their own and survived to the present day. Of these, the first is the Kaliyuga reckoning. It will be convenient to treat the Kaliyuga first, though, in spite of having the greatest apparent antiquity, it is the latest of the three in respect of actual date of origin.

The Kaliyuga era is the principal astronomical reckoning of the Hindus. It is frequently, if not generally, shown in the almanacs: but it can hardly be looked upon as being now in practical use for civil purposes; and, as regards the custom of previous times as far as we can judge it from the inscriptional use, which furnishes a good guide, the position is as follows: From Southern India we have one such instance as far back as A.D. 624, and then, from the 13th century onwards, but more particularly from the 14th, a certain number of instances, not exactly very small in itself, but extremely so in comparison.
HINDU CHRONOLOGY

497

with the number of cases of the use of the Vikrama and Śaka eras and other reckonings: from Northern India the earliest known instance is of A.D. 1120 or 1127, and the later ones number only four. Its years are by nature sidereal solar years, commencing with the Mēṣḥā-saṅkṛttāṇi, the entrance of the sun into the Hindu constellation and sign Mēṣḥā, i.e. Aries (for this and other technical details, see above, under the Calendar); but they were probably cited as lunar years in the inscriptive records which present the reckoning; and the almanacs appear to treat them either as Mēṣḥālī or solar years. The intercalary month (with the new-moon) or pārṣvaṁanta (ending with the full-moon) as the case may be, according to the locality. Its initial point lies in 3102 B.C.; and the year 5002 began in A.D. 1900.

This reckoning is not an historical era, actually running from 3102 B.C. It was devised for astronomical purposes at some time about A.D. 400, when the Hindu astronomers, having taken over the principles of the Greek astronomy, recognized that they required for purposes of computation a specific reckoning with a definite initial occasion. They found that occasion in a conjunction of the sun, the moon, and the five planets which were then known, at the first point of their sign Mēṣḥā. There was not really such a conjunction; nor, apparently, is it even the case that the sun was actually in this moment of conjunction at the time of the supposed birth of the Vedic age. There was an approach to such a conjunction, which was turned into an actual conjunction by taking the mean instead of the true positions of the sun, the moon, and the planets. And, partly from the Vedic period, partly from the astronomical books, we know that the moment assigned to the assumed conjunction was according to one school the midnight between Thursday and Friday, according to another school the sunrise of the Friday. The reckoning thus devised was subsequently identified with the Kaliyuga as the iron age, the last and shortest, with a duration of 432,000 years, each of the four ages in each of the cycles of the Mēṣḥā-saṅkṛttāṇi. Another school, however, placed the Pāṇḍavas and the Kuruś 653 years later, in 2449 B.C. A third school places in 3102 B.C. the ascension of Yudhishthīra to the sovereignty, and treats that event as the commencement of the Kali age; but from this point no less than 3044 years of the Kaliyuga—the period from its commencement in 3102 B.C. to the commencement of the first historical era, the so-called Vikrama era, in 58 B.C.—are also known as the "era of Yudhishthīra." The Vikrama era, which is the earliest of all the Hindu eras in respect of origin of foundation, is the dominant era and the great historical reckoning of Northern India—that is, of the territory on the north of the rivers Narbāḍa and Mahānīla—to which part of the country its use has always been practically confined. Like, indeed, the Kaliyuga and Śaka eras, it is freely cited in almanacs in any part of India; and it is sometimes used in the south by immigrants from the north: but it is, by nature, so essentially foreign to the south that the earliest known inscriptive instance of the use of it in Southern India only dates from A.D. 1218, and the very few later instances that have been obtained, prior to the 15th century A.D., come, along with the instance of A.D. 1218, from the close neighbourhood of the dividing-line between the north and the south. The Vikrama era has never been used for astronomical purposes. Its years are lunar, with lunar months, but seem liable to be sometimes regarded as solar, with solar months, when they are cited in almanacs of Southern India which present the solar calendar. Originally they were Kārttīkā, with pārṣvaṁanta months (ending with the full-moon). They now exist in the following three varieties: in Kāthāśāvar and Gujarāt, they are chiefly Kārttīkā, with amānta months (ending with the new-moon); and they are shown in this form in almanacs for the other parts of the Bombay Presidency: but there is also found in Kāthāśāvar and that neighbourhood an Āśāñhādī variety, commencing with Āśāñhā śukla 1, similarly with amānta months; in the rest of Northern India, they are Chaitrādi, with pārṣvaṁanta months. The era has its initial point in 58 B.C., and its first civil day, Kārttīkā śukla 1, is 10th September in that year if we determine it with reference to the Hindu Tula-saṅkṛttāṇi, or 18th October if we determine it with reference to the tropical equinox. The years of the three varieties, Chaitrādi, Āśāñhādi, and Kārttīkādi, all begin in the same year A.D.; and the year 1938 began in A.D. 1900.

Hindu legend connects the foundation of this era with a king Vikrama or Vikramādītiya of Ujijāin in Mālāvī, Central India; one version has that he began it reign in 58 B.C. and that his death in that year, and that the reckoning commemorates his death. Modern research, however, based largely on the inscriptive records, has shown that there was no such king, and that the real founder of the era was a king of the dynasty of Kānaḷīka, a foreign invader, who established himself in Northern India and commenced to reign there in B.C. 58. He was the founder of it, in the sense that the opening years were the years of his reign. He was established and set going as an era by his successor, who continued the reckoning so started, instead of breaking it by introducing another according to his own regnal years, and it was perpetuated as an era, and transmitted as such to posterity by the Mālavas, the people from whom the modern territory of Mālāvī derived its name, who were an important section of the "subjects of Kaṇalīka and his successors. In consonance with various records ranging from the date of his "reign," the "reckoning of the Mālavas, the years of the Mālavas lords, the Mālava time or era. Prior to that, it had no specific name; the years of it were simply cited, in ordinary Hindu fashion, by the term "svayamvarā, "the year of (such-and-such a number)," or by its abbreviations "śvāmi" and "śāni;" and the same was frequently done in later times also, and is habitually done in the present day; and so, in modern times, this era has often been loosely styled "the "Śvāhari era." The idea of a king Vikrama in connexion with it appears to date from only the 9th or 10th century A.D.

The Śaka era, though it actually had its origin in the south-west corner of Northern India, is the dominant era and the great historical reckoning of Southern India; that is, the territory on the south of the rivers Narbāḍa, Mahānīla, and Mahāndī; it is the supplementary astronomical reckoning, largely used, from the 6th century A.D. onwards, in the Kāraṇas, the works dealing with practical details of the calendar, for laying down epochs or points of time furnishing convenient bases for computation. As a result of that, it came to be used in past times for general purposes also, to a limited extent, in parts of Northern India where it was not indigenous. And it is now used more or less freely, and is found in almanacs everywhere. Its years are solar, lunar, Chaitrādi, and its months are pārṣvaṁanta (ending with the full-moon) in Northern India, and amānta (ending with the new-moon) in Southern India; but in times gone by it was sometimes treated for purposes of calculation as having astronomical solar years, and it is now treated as having Mēṣḥī solar years and solar months in those parts of India where that form of the solar calendar prevails. It has its initial point in A.D. 78; and its first civil day, Chaitra śukla 1, is 3rd March

We select A.D. 1900 as a gauge-year, in preference to the year in which we are writing, because its figures are more convenient for transmission in a code. In a code, the generation of the Hindus to cite expired years, the almanacs would mostly show 5001 (instead of 5002) as the number for the Kaliyuga year answering to A.D. 1900-1901. And, for the same reason, this reckoning is based on the Kaliyuga era of 301 B.C. There is, perhaps, no particular objection to that, provided that we then deal with the Vikrama and Śaka eras on the same lines, and bear in mind that the Kaliyuga had its initial point in 3102 B.C. Therefore we prefer to treat these reckonings with exact correctness.
in that year, as determined with reference either to the Hindu M'na-saṅkṛānti or to the entrance of the sun into the tropical Pisces. The year 1523 began in A.D. 1900.

Regarding the origin of the Śaka era, there was current in the 10th and 11th centuries A.D. a belief which, ignoring the difference of a hundred and thirty-five years between the two reckonings, connected the legendary king Vikrāmādiyāta of Ujjain, mentioned above under the Vikrama era, with the foundation of this era also. The story runs, from this point of view, that the Śakas were a barbarous people who established themselves in the western and north-western dominions of that king, but were met in battle and destroyed by him, and that the era was established in celebration of the event. This belief, however, ascribes the foundation of this era to a king Śaivāhāna of Pratisāhāna, which is the modern Paṭhānpur, on the Gódāvāri, in the Nizam's dominions. But in this case, again, research has shown that the facts are very different. Like the Vikrama era, the Śaka era owes its existence to foreign invaders. It was founded by the Chhāharāta or Kshahārāta king Naḥapāna, who appears to have been a Pahlava or Palaḥva, i.e. of Parthian extraction, and who reigned from A.D. 78 to about 125. He established himself first in Kāthāḥāva, but subsequently removed his seat to a new site, near the modern city of Ujjain, known later as Naḥarj, Nāśk and probably Kāthān. His capital seems to have been Dēhād, in the Paṭhā Mahāls. And he had two viceroyes: one, named Bhūmakā, of the same family with himself, in Kāthāhāva; and another, Chāṣṭhāna, son of Ghasamotikā, at Ujjain. Soon after A.D. 125, Naḥapāna was overthrown, and his family was wiped out, by the Sāṭṭāvāhāna-Sāṭṭakārpi king Gautamiputra-Śrī-Sāṭṭakārpi, who thereby recovered the territories on the south of the Narbādā, and perhaps secured for a time Kāthāḥāva and some other parts on the north of that river. Very soon, however, Chāṣṭhāna, or else his son Jayadāman, established his capital at the same place which had belonged to Naḥapāna on the north of the Narbādā; founded a line of Hinduized foreign kings, who ruled there for more than three centuries; and, continuing Naḥapāna's regnal reckoning, established the era to which the name Śaka eventually became attached. Inscriptions and coins show that, up to at least the second decade of its fourth century, this reckoning had no specific appellation; its years were simply cited, in the usual fashion, as varṣa, "the year (of such-and-such a number)." The reckoning was then taken up by the astronomers. And we find it first called Sākakāla, "the time or era of the Śakas," in an epocheal date, the first day of the year 427, falling in A.D. 905, which was used by the astronomer Vaiṣṇava Charu-bhāṣa (907) in his Pāṭhasāḍhitikā.

That this name came to be attached to the era and its appellation, is due to the points that, along with some of the Pahlavas or Palhavas and the Yavanas or descendants of the Asiatic Greeks, some of the Śakas, the Scythians, had made their way into Kāthāhāva and neighbouring parts by about A.D. 100, and that the Śakas incidentally came to acquire prominence in the memory of the Hindus regarding these occurrences, in such a manner that their name was selected when the occasion arose to devise an appellation for an era the exact origin of which had been forgotten. The name of the imaginary king Śaivāhāna first figures in connection with the era in a record of A.D. 1272, and seems plainly to have been introduced in imitation of the coupling of the name Vikrama, Vikramādiyāta, with the era of B.C. 58.

That the Śaka era, though it had its origin in the south-west corner of Northern India, is essentially an era of Southern India, is proved by its inscriptions and numismatic history. During the period before the time when it was adopted, and by the ancient position it is found only in the inscriptions of Naḥapāna, and in the similar records and on the coins of the descendants of Chāṣṭhāna. After that time, however, the Śaka era is first in a record of the Chaddha king Kṛtiviraṁ 1, at Bāḍāmi in the Bijāpēr district. Bombay, which is dated on the full-moon day of the month Pāṭhasāḍhikā, falling in A.D. 578; "when there had elapsed five centuries of the years of the ancestor-days, it is said that this Śaka era is given in the modern date onwards the records of a large part of Southern India are mostly dated in this era, by various expressions all of which include the term Śaka or Śaka. In Northern India the case is very different. We have a record dated in the month Kṛtiviraṁ the Śaka year 631 (expired), falling in A.D. 709; it comes from Mūlaṇa in the Bīṭāl district, Central Provinces, that is, from the south of the Narbādā; but it belongs to Gujarāt (Bombay) somewhat perhaps to the north, though more probably to the south, of that. But, setting aside, the earliest inscriptive instance of the use of this era in Northern India, outside Kāthāhāva and Gujarāt, is found in a record of A.D. 582, at Dēghbār near Lalitpūr, the headquarters town of the Lalitpūra district, United Provinces of Agra and Oude; here, however, the record is primarily dated, with the full details of its own date, A.D. 1137, and to only a very small extent in comparison with the Western and other northern eras; and the cases in which it was used exclusively there, without being coupled with one or other of the northern reckonings, are still more conspicuously few. In short, the general position that the Śaka era has been essentially foreign to Northern India until recent times; it was used there quite exceptionally and sporadically, and in very few cases indeed at any appreciable distance from the dividing-line between the north and the south. That it found its way into Northern India, outside Kāthāhāva and northern Gujarāt at all, is unquestionably due to its use by the astronomers.

And this, however, persisted, according to the 7th century A.D. to Cambodia, and somewhat later to Java; to which place it is probably given in almanacs, or in invoices, statements of account, &c., by the persons engaged in the trade between Brouch and the far east via Tagara (Tāgara, the east coast capital of the dynasty of Tagara). It was shown subsequently times to Assam and Ceylon, and more recently still to Java.

III. OTHER RECKONINGS

We come now to certain reckonings consisting of cycles, and will take first the cycles of Guru or Brihaspati, Jupiter. This planet, a very conspicuous object in eastern skies, requires a period of 4332½ days, or 12 years and 87 days, to make a circuit of the heavens, and has provided the Hindus with two reckonings, each in more or less a variety; a cycle of twelve years, the kāthūkā, which Jupiter, in all their varieties, are usually styled saṁvatsarā; and it is in the same way that this term has been used here, in order to preserve the clearest distinction between them and the solar and lunar years. The saṁvatsarās have no divisions of their own; the months, days, &c., cited with them are those of the ordinary solar or lunar calendar, as the case may be.

The older reckoning of Jupiter appears to be that of the 12-years cycle, which is found in two varieties; in both of them the saṁvatsarā bear, according to certain rules which need not be explained here, the same names with the lunar months, Chaitra, Vaiśākha, &c. In one variety, each saṁvatsara runs from one of the planet's bellacal risings—that is, from the day on which it becomes visible as a morning star on the eastern horizon—to the next such rising; and the length of such a saṁvatsara, according to the Hindu data, is from 392 to 405 days, with an average of 390 days. Inscriptional instances of the use of this cycle are found in six of the Gupta records of Northern India, ranging from A.D. 475 to 528.

In the other variety of the 12-years cycle, which is mentioned in astronomical works from the time of Arjuna bhāṣa onwards (b. A.D. 479), the saṁvatsarās are regulated by Jupiter's course with respect to his mean motion and mean longitude: a cycle of twelve years, allowing for the planet's heliacal risings—that is, from the day on which it becomes visible as a morning star on the eastern horizon—to the next such rising; and the period taken by him to do that—that is, the duration of such a saṁvatsara—is slightly in excess, according to the Hindu data, of 361-02 days, which amount is very close to the actual fact, 361-05 days. Inscriptional instances of the use of this cycle are perhaps found in two records of Southern India of the Kadamba series, belonging to about A.D. 575.

The 12-years mean-sign cycle seems to be still used in some parts. And the heliacal risings of Jupiter, as also, indeed, those of the other planets, are shown in almanacs for astrological purposes. In either variety, however, the 12-years cycle is now chiefly of antiquarian interest.

\[1\] See the preceding note.
The cycle of Jupiter now in general use is a cycle of sixty years, the samvatsaras of which bear certain special names, Prabha, Vilabha, Sukla, Pramoda, &c., in accordance with certain rules which we need not explain here. This cycle exists in three varieties.

According to the original constitution of this cycle, the samvatsaras are determined as in the second or mean-sign variety of the 12-years cycle: each samvatsara commences when Jupiter enters a sign of the zodiac with reference to his mean motion and longitude; and it lasts for slightly more than 361+02 days. This variety is traced back in inscriptions to A.D. 602, and is still used in Northern India.

Now, the samvatsaras are calculated by means of the astronomical solar year commencing with the MṛŚa-saṅkṛānti, the entrance of the sun into the sign Mṛśa (Aries). The process gives the name of the samvatsara last expired before any particular MṛŚa-saṅkṛānti, with a remainder denoting the portion of the current samvatsara elapsed up to the same time; and the remainder, reduced to months, &c., gives the moment of the commencement of the current samvatsara, by reckoning back from the MṛŚa-saṅkṛānti. As the result, we are naturally led not unwillingly to take the trouble to work out the full details, at some time about A.D. 800 a practice arose, in some quarters, according to which that samvatsara of the 60-years cycle which was current at any particular MṛŚa-saṅkṛānti was taken as coinciding with the astronomical solar year beginning at that saṅkṛānti, and with the Chaitrādī lunar year belonging to that same solar year. And this practice set up a lunisolar variety of the cycle, in connexion with which we have to notice the following point. While the duration of the mean-sign samvatsara is closely about 361+02 days, the length of the Hindu astronomical solar year is closely about 365+238 days. It consequently happens, after every 85 or 86 years, that a mean-sign samvatsara begins and ends between two successive MṛŚa-saṅkṛāntis. In the mean-sign cycle, such a samvatsara retains its existence unaffected; and the names Prabha, Vilabha, &c., run on without any interruption. According to the lunisolar system, however, the position is different; the samvatsara beginning and ending between the two MṛŚa-saṅkṛāntis is expunged or suppressed, in the sense that its name is omitted and is replaced by the next name on the list. The second variety of the 60-years cycle, thus started, ran on alongside of the mean-sign variety, and, being eventually transferred, with that variety, to Northern India, is now known as the northern lunisolar variety. It preserves a connexion between the samvatsaras and the movements of Jupiter: but the connexion is an imperfect one; and both in this variety, and still more markedly in the remaining one still to be described, the samvatsaras practically became mere appellations for the solar and lunar years.

Meanwhile, just after A.D. 900, another development occurred, and there was started a third variety, which is now known as the southern lunisolar variety. It preserves a connexion between the samvatsaras and the movements of Jupiter: but the connexion is an imperfect one; and both in this variety, and still more markedly in the remaining one still to be described, the samvatsaras practically became mere appellations for the solar and lunar years.

The lapse of time in the Chaitrādī year was determined, in accordance with this practice, by the occurrence of the early A.D. 1798, 1804, and so on, in the older practice. The samvatsaras next, however, which occurred in the Chaitrādī year, are generally referred to the cycles determined by the beginning of the year, and the samvatsaras next, which occurred in the Chaitrādī year, are generally referred to the cycles determined by the beginning of the year.

The treatment of the cycles of Jupiter in the Sanskrit books shows that it was primarily from the astronomical point of view that they appealed to the Hindus; it was only as a secondary consideration that they acquired anything of a chronological nature. For the practical application of any of them to historical purposes, it is now clear, necessary in the 60-year cycle, as well as in the mean-sign samvatsara, that there should always be given the year of some known era, or some other specific guide to the exact period to which that samvatsara is to be referred. But it is fortunately the case that the samvatsaras have not, as yet, rarely exceeded a century, that the inscriptions without such a guide, of some kind or another.

The Samvatshri reckoning is used in Kashmir, and in the Kangra district and some of the Hill states on the south-east of Kashmir; some nine centuries ago it was also in use in the Punjab, and apparently in Sind. In addition to being cited by such expressions as Samvatshri-saṅvat, "the year (so-and-so) of the Samvatshri," and Śaśā-saṅvat, "the year (so-and-so) of the sculptures," it is also mentioned as Lākākāla, "the time of the people," and by other terms which mark it as a vulgar reckoning. It appears that modern popular names for it are Paḥārī-śaṅvat and Kachchā-śaṅvat, which we may render by "the Hill era" and "the crude era." The years of this reckoning are lunar, Chaitrādī; and the months are pārśādvan (ending with the full-moon). As matters stand now, the reckoning has a theoretical initial point in 3077 B.C.; and the year 4976, more usually called simply 76, began in A.D. 1900; but there are some indications that the initial point was originally placed one year later.

The idea at the bottom of this reckoning is a belief that the Samvatshris, "the Seven Rishis or Saints," Marichi and others, were translated to heaven, and became the stars of the constellation (Ursa Major, in 2907 B.C. [3077]; and the year 4184, according to the independent movement of these two stars, which, referred to the ecliptic, carries them round at the rate of 100 years for each nakṣaṭra or twenty-seven division of the circle. Theoretically, therefore, the Samvatshri reckoning of cycles began in the year 4184. The numbering of the years should run from 1 to 2700, and then commences afresh. In practice, however, it has been treated quite differently. According to the general custom, which has distinctly prevailed in Kashmir from the earliest use of the reckoning for chronological purposes, and is illustrated by Kalhana in his history of Kashmir, the Rājatarangini, written in A.D. 1148-1150, the enumeration of the years has been centennial; whenever a century has been completed, the numbering has not run on 101, 102, 103, &c., but has begun again with 1, 2, 3, &c. Almanacs, indeed, show both the figures of the century and the full figures of the entire reckoning, in accordance with the Iranian practice; the cycle of 367 B.C. as the commencement of a new cycle, the second; thus, an almanac for the year beginning in A.D. 1793, describes that year as "the year 2199 according to the course of the Seven Rishis, and similarly the year 69." And elsewhere sometimes the full figures are given, sometimes the abbreviated ones; thus, while a manuscript written in A.D. 1648 is dated in "the year 1794," while A.D. 1779 is dated in "the year 2274." But, as in the Rājatarangini, so also in inscriptions, which range from A.D. 1704 onwards, only the abbreviated figures have hitherto been used.

Essentially, then, the Samvatshri reckoning becomes a centennial reckoning, by suppressed or omitted hundreds, with its earlier centuries commencing in 3076, 2976 B.C. and so on, and its later centuries commencing in A.D. 25, 125, 225, &c.; and precisely the same was adopted in the Samvatshri reckoning, as was the case in the A.D. 1798, and 57 to mean A.D. 1557, and 9 to mean A.D. 1409.

The practical difficulties attending the use of such a system for chronological purposes, are obvious; isolated dates recorded in such a fashion cannot be allocated without some explicit clue to
the centuries to which they belong. Fortunately, however, as regards Kashmir, we have the necessary guide in the facts that Kalhana recorded his own date in the Saka era as well as in this reckoning, and gave full historical details which enable us to determine unmistakably the equivalent of the first date in this reckoning cited by him, and to arrange with certainty the chronology presented by him from that time.

The belief of this reckoning according to the course of the Seven Rishis is traced back in India, as an astrological detail, to at least the 6th century A.D. But the reckoning was first adopted for chronological purposes in Kashmir and at some time about A.D. 800; the first recorded date in it is one of "the year 69," meaning 3886 = A.D. 813–814, given by Kalhana. It was introduced into India between A.D. 925 and 1025.

The Grahaparivritti cycle is a reckoning which is used in the southernmost parts of Madras, particularly in the Madura district. It consists of cycles of 90 Mêshâdi solar years, and is said, in conformity with its name, which means "the revolution of planets," to be made up by the sum of the days in 1 revolution of the sun, 22 of Mercury, 5 of Venus, 15 of Mars, 11 of Jupiter, and 29 of Saturn. The first cycle is held to have commenced in 24 B.C., the second in A.D. 671, and so on; and, in accordance with that view, the year 34, which began in A.D. 1900, was the 34th year of the 22nd cycle.

No inscripotional use of this cycle has come to notice. There seems to be no particular reason for believing that the reckoning was really started in 24 B.C. The alleged constitution of the cycle, which appears to be correct within about twelve days, and might possibly be made apparently exact, suggests an astrological origin. And, if a guess may be hazarded, we would conjecture that the reckoning is an offshoot of the southern lunisolar variety of the 60-years cycle of Jupiter, and had its real origin in some year in which a Prabhaiva somuva was drawn that year commenced, and to which the first year of a Grahaparivritti cycle can be referred: that was the case in A.D. 697 and at each subsequent 180th year.

In part of the Gânjâm district, Madras, there is a reckoning, known as the Òkko or Akka, i.e. literally "the number or numbers," consisting of lunar years, each commencing with Bhadrapâda śukla 12, which run theoretically in cycles of 59 years. But the reckoning has the peculiarity that months are not numbered, but can be explained in terms of superstition about certain numbers or in some other reason, the year 6, and any year the number of which ends with 6 or 0 (except the year 10), is omitted from the numbering; so that, for instance, the year 7 follows next after the year 5. The origin of the reckoning is not known. But the use of it seems to be traceable in records of the Gañja kings who reigned in that part of the country and in Orissa in the 12th and following centuries. And the initial day, Bhadrapâda śukla 12, which figures again in the Vilâyati and Amil reckoning of Orissa (see farther on), is perhaps to be accounted for on the view that this day was admitted, and in the 7th century, of the first Gâñja king, Râjasîtha-Indravarman, or to the year 772 of the Gâñja era.

In the Chittagong district, Bengal, there is a solar reckoning, known by the name Maghi, of which the year 1262 either began or ended in A.D. 1900; so that it has an initial point in A.D. 639 or 638. It appears that Chittagong was conquered by the king of Arakan in the 9th century, and remained usually in the possession of the Maghâ the Arakanese or a class of them—till A.D. 1666, when it was finally annexed to the Mogul empire. In these circumstances it is plain that the Magh reckoning took its name from the Maghas; its year, which is Mêshâdi, from Bengal; and its numbering from the Sakkara, the ordinary era of Arakan and Burma, which has its initial point in A.D. 638.

The Hijra (Hegira) era, the reckoning from the flight of Mahomet, which dates from the 16th of July, A.D. 662, is, of course, used by the Mahomedans in India, and is customarily shown, with the details of its calendar, in the Hindu almanacs. An account of it does not fall within the scope of this article. But we have to mention it because we come now to certain Hinduized reckonings which are hybrid offshoots of it. We need only say, however, in explanation of some of the following figures, that the years of the Hijra era are purely lunar, consisting of twelve lunar months and no more; with the result that the initial day of the year is always travelling backwards through the Julian year, and makes a complete circuit in thirty-four years. The reckonings derived from it, which we have to describe, appear initially in the Hijra year 593, which began from 16th November 1555 to 3rd November 1556. Amongst the reforms aimed at by him and his officials, one was to abolish, or at least minimize, by introducing uniformity of numbering, the confusion due to the existence of various reckonings, both Mahomedan and Hindu. And one step taken in that direction was to assign to the Hindu year the same number with the Hijra year. It is believed that this was first done by the Persian clerks of the revenue and financial offices at an early time in Akbar's reign, and that it received authoritative sanction in the Hijra year 972 (21st August 1563 to 8th August 1564). At any rate, the innovation was certainly first made in Upper India; and the numbering started there was introduced into Bengal and those parts as Akbar extended his dominions, but without interfering with local customs as to the commencement of the Hindu year. The result is that we now have the following reckonings, the years of which are used as revenue years:

The Shaurya-stan or "Bihar" reckoning, as used in the province of Bihar, is partly derived from the Hindu Hijra year, but is corrected by a fixed number of years, and is used in the districts of Chittagong, Broach, and the Central Provinces. The Shihâb-ud-Dîn or "Shah" or "Shahabad" reckoning of the year and a half, as used in the province of Shâhâb-ud-Dîn, is partly derived from the Hindu Hijra year, and is modified by a variable number of years, and is used in the districts of Jhânsi and the Central Provinces. The Mâjâhâtâr reckoning or "Madras," is partly derived from the Hindu Hijra year, and is modified by a variable number of years, and is used in the districts of Madras and the Central Provinces. The Fasli-i-râbi or "spring harvest," confirmed by Fasli B.C. 593, is partly derived from the Hindu Hijra year, and is modified by a variable number of years, and is used in the districts of Bombay and Orissa. The Fasli reckoning of the year 593 or 638, is partly derived from the Hindu Hijra year, and is modified by a variable number of years, and is used in the districts of Bombay and Madras. The Fasli reckoning of the year 593 or 638, is partly derived from the Hindu Hijra year, and is modified by a variable number of years, and is used in the districts of Bombay and Madras.
HINDUISM

The reckoning seems to have taken over this initial day from the Marathā Sūr-san (see below). The Farsi years of Madras originally began at the Karka-sankhāranti, the nominal summer solstice: under British law, the term "Sor san" fixed to 12th July, on which day the sankhāranti was then usually occurring; but it was afterwards changed to 1st July as a more convenient date. The years of the Bombay and Madras Fasli have always been used along with one or other of the real Hindu reckonings, and the details are cited according to that reckoning. And there is a patch of earlier date and not belonging to the class of Fasli reckonings, is found, in the Marathā country, in the Sor-san or Shahur-san, "the year of months," also known as Arabi-san, "the Arab year.

The Marathā Sūr-san or Arabi-San.

The year of Brahma, was used in all official documents, as, for example, in the Nanakshār Mūgaṅgāras, which now occurs on 6th or 7th June; but the months and days are those of the Hija year. The Sor-san year began in A.D. 1900; and so the reckoning has an apparent initial point in A.D. 600. A peculiarity attending this reckoning is that, whatever may be the vernacular of a clerk, he uses the Arabic numeral words in reading out the year; and the same words are given alongside of the figures in the Hindu almanacs.

Authorities.—The Hindu astronomy had already begun to attract the attention of the close of the 18th century. The first edition, however, of the calendar and the era, along with the verification of dates, was started by Warren, whose Kala Sankhārā was published in 1825. The inquiry was carried on by Prinsep in his Useful Tables (1834-1836) by Cunningham, in his Calendar of Shanks (1856), and by Cunningham in his Book of Indian Eras (1883). But Warren's processes, though mostly giving accurate results, were lengthy and troublesome; and calculations made on the lines laid down by his successors gave results which might or might not be correct, and could only be cited as approximate results. The exact calendar of the Hindu dates by easy processes was started by Shankar Balkrishna Dikshit, in an article published in the Indological Quarterly, vol. 16 (1887). This was succeeded by methods and tables devised by Jacob, which were published in the next volume of the same journal. Various other contributions in the same line by other scholars, some for exact, others for closely approximate results, and some valuable articles by Kielhorn on some of the principal Hindu eras and other reckonings, which published in the same journal, vol. 17 (1888) to 26 (1897). And the treatment of the matter culminated for the time being in the publication, in 1896, of Sewell and Dikshit's Indian Calendar, which contains an appendix by Schram on eclipses of the sun in India, and was supplemented in 1898 by Sewell's Eclipses of the Moon in India.

The present article is based on the above-mentioned and various detached writings, supplemented by original research. For the exact calculations and the derivation of the European equivalents of them, use may be made either of Sewell and Dikshit's works mentioned above, or of the improved tables by Jacob which were published in the Epigraphia Indica, voles. 11 and 12 (1892-1894).

HINDUISM, a term generally employed to comprehend the social institutions, past and present, of the Hindus who form the great majority of the people of India; as well as the multitudinous crop of their religious beliefs which has grown up, in the course of many centuries, on the foundation of the Brahmanical scriptures. The actual proportion of the total population of India (294 millions) included under the name of "Hindus" has been computed in the census report for 1901 at something like 70% (260 millions); the remaining 30% being made up partly of Jews of foreign creeds, such as Mahometans, Parsees, Christians and Jews, and partly of indigenous forms of belief which have at various times separated from the main stock, and developed into independent systems, such as Buddhism, Jainism and Sikhsim; and partly of isolated bill and jungle tribes, such as the Santals, Bhils (Bhilla) and Kols, whose crude animistic tendencies have hitherto kept them, either wholly or for the most part, outside the pale of the Brahmanical community. The name Hindu itself is of foreign origin, being derived from the Persians, by whom the river Sindhu was known. The Hindustan is the term belonging to the inhabitants of that frontier district, and gradually extended over the upper and middle reaches of the Gangetic valley, whence this whole tract of country between the Himalaya and the Vindhya mountains, west of Bengal, came to be called by the foreign conquerors "Hindustan," or the abode of the Hindus; whilst the native writers called it "Aryavarta," or the abode of the Aryas.

But whilst, in its more comprehensive acceptance, the term Hinduism would thus range over the entire historical development of Brahmanical India, it is also not infrequently used in a narrower sense, as denoting more especially the modern phase of Indian social and religious institutions—from the earlier centuries of the Christian era down to our own days—as distinguished from the period dominated by the authoritative doctrine of Brahmanism. This in its more restricted sense the term must thus practically be taken to apply to the later bewildering variety of popular sectarian forms of belief, with its social concomitant, the fully developed caste-system. But, though one may at times find it convenient to speak of "Brahmanism and Hinduism," it must be clearly understood that the distinction implied in the combination of these terms is an extremely vague one, especially from the chronological point of view. The following considerations will probably make this clear.

The characteristic tenet of orthodox Brahmanism consists in the conception of an absolute, all-embracing spirit, the Brahma (neutr.), being the one and only reality, itself unconditioned, and the original cause and ultimate goal of all individual souls (jīva, i.e. living things). Coupled with this abstract conception are two other doctrines, viz. first, the transmigration of souls (samsāra), regarded by Indian thinkers as the necessary complement of a belief in the essential sameness of all the various spiritual units, however contaminated, to a greater or less extent, they may be by their material embodiment; and in their ultimate re-union with the Parāmāmān, or Supreme Self; and second, the assumption of a triple manifestation of the ceaseless working of that Absolute Spirit as a creative, conservative and destructive principle, represented respectively by the divine personalities of Brahma (masc.), Vishnu and Śiva, forming the Trimārti or Triad. As regards this latter, purely exoteric, doctrine, there can be little doubt of its owing its origin to considerations of theological expediency, as being calculated to supply a sufficiently wide formula of belief for general acceptance; and the very fact of this divine triad including the two principal deities of the later sectarian worship, Vishnu and Śiva, goes far to show that these two gods at all events must have been already in those early days favourite objects of popular adoration to an extent sufficient to preclude their being ignored by a diplomatic priesthood bent upon the formulation of a common creed. Thus, so far from sectarianism being a mere development of Brahmanism, it goes back to the very foundations of Brahmanical creed. Nay, when, on analysing the functions and attributes of those two divine figures, each of them is found to be but a compound of several previously recognized deities, sectarian worship may well be traced right up to the Vedic age. That the theory of the triple manifestation of the deity was indeed only a compromise between Brahmanical aspirations and popular worship, probably largely influenced by the traditional sanctity of the number three, is sufficiently clear from the fact that, whilst Brahma, the creator, and at the same time the very embodiment of Brahmanical class pride, has practically remained a mere figurehead in the actual worship of the people, Śiva, on the other hand, so far from being merely the destroyer, is also the unmistakable representative of generative and reproductive power in nature. In fact, Brahma, having performed his legitimate part in the mundane evolution by his original creation of the universe, has retired into the background, being, as it were, looked upon as functus officio, like a venerable figure of a former generation, whence in epic poetry he is commonly styled pūtnakha, "the grandfader." But despite the artificial character of the Trimārti, it has retained to this day at least its theoretical validity in orthodox Hinduism, whilst it has also undoubtedly exercised considerable influence in shaping sectarian belief, in promoting feelings of toleration towards the claims
of rival deities; and in a tendency towards identifying divine figures newly sprung into popular favour with one or other of the principal deities, and thus helping to bring into vogue that notion of avatars, or periodical descents or incarnations of the deity. 

Under more favourable political conditions, the sacerdotal class might perhaps, in course of time, have succeeded in imposing something like an effective common creed on the heterogeneous medley of races and tribes scattered over the peninsula, just as they certainly did succeed in establishing the social prerogative of their own order over the length and breadth of India. They were, however, fated to fall far short of such a consummation; and at the time of the first Brahmanism has and was wont at, or ignore, all manner of gross superstitions and repulsive practices, along with the popular worship of countless hosts of godlings, demons, spirits and ghosts, and mystical objects and symbols of every description. Indeed, according to a recent account by a close observer of the religious practices prevalent in southern India, fully four-fifths of the people of the Dravidian race, whilst nominally acknowledging the spiritual guidance of the Brahmans, are to this day practically given over to the worship of their nondescript local village deities (grāma-devata), usually attended by animal sacrifices frequently involving the slaughter under revolting circumstances of innocent or vicious creatures. Considerably enough these local deities are nearly all of the female, not the male sex. In the estimation of these people Siva and Vishnu may be more dignified beings, but the village deity is regarded as a more present help in trouble, and more intimately concerned with the happiness and prosperity of the villagers. The origin of this form of Hinduism is lost in antiquity, but it is probable that it represents a pre-Aryan religion, more or less modified in various parts of south India by Brahmanical influence. At the same time, many of the deities themselves are of quite recent origin, and it is easy to observe a deity in making even at the present day. 

It is a significant fact that, whilst in the worship of Siva and Vishnu, at which no animal sacrifices are offered, the officiating priests are almost invariably Brahmans, this is practically never the case at the popular performance of those " gloomy and weird rites for the propitiation of angry deities, or the driving away of evil spirits, when the pujaris (or ministrants) are drawn from all other castes, even from the Pariahs, the out-caste section of Indian society." As from the point of view of religious belief, so also from that of social organization no clear line of demarcation can be drawn between Brahmanism and Hinduism. Though it was not till later times that the network of class divisions disclosed in society (castes) by the vengeance of the ascetic which it shows in these latter days, still in its origin the caste-system is undoubtedly coincident with the rise of Brahmanism, and may even be said to be of the very essence of it. The cardinal principle which underlies the system of caste is the preservation of purity of descent, and purity of religious belief and ceremonial usage. Now, that same principle had been operative from the very dawn of the history of Aryanized India. The social organism of the Aryan tribe did not probably differ essentially from that of most communities at that primitive stage of civilization; whilst the body of the people—the Vṛṣa (or aggregate of Vaiṣya)—would be mainly occupied with agricultural and pastoral pursuits, two professional classes—those of the warrior and the priest—had already made good their claim to social distinction. As yet, however, the tribal community would still feel one in race and traditional usage. But when the fair-coloured Aryan immigrants first came in contact with, and drove back or subdued the dark-skinned race that occupied the northern plains—doubtless the ancestors of the modern Dravidian people—the preservation of their racial type and traditional order of things would naturally become to them a matter of serious concern. In the extreme north-western districts—the Punjab and Rajputana, judging from the fairly uniform physical features of the present population of these parts—they seem to have been signally successful in their endeavour to preserve their racial purity, probably by being able to clear a sufficiently extensive area of the original occupants for themselves with their wives and children to settle upon. This was, however, very different in the adjoining valley of the Jumna and Ganges, the sacred Madra- 

desa or Middle-land of classical India. Here the Aryan invaders were not allowed to establish themselves without undergoing a considerable admixture of foreign blood. It must remain uncertain whether it was that the thickly-populated character of the land scarcely admitted of complete occupation, but only of a conquest by an army of fighting men, starting from the Aryanized region—who might, however, subsequently draw women of their own kin after them—or whether, as has been suggested, a second Aryan invasion of India took place at that time through the mountainous tracts of the upper Indus and northern Kasmir, where the nature of the road would render it impracticable for the invading bands to be accompanied by women and children. Be this as it may, the physical appearance of the population of this central region of northern India—Hindustan and Behar—clearly points to an intermixture of the tall, fair-coloured, fine-nosed Aryan with the short-sized, dark-skinned, broad-nosed Dravidian; the latter type becoming more pronounced towards the lower strata of the social order. 

Now, it was precisely in this part of India that mainly arose the body of literature which records the gradual rise of the Brahmanical hierarchy and the early development of the caste-system. 

The problem that now lay before the successful invaders was how to deal with the indigenous people, probably vastly outnumbering them, without losing their own racial identity. They dealt with them in the way the white race usually deals with the coloured race—they kept them socially apart. The land being appropriated by the conquerors, husbandry, as the most respectable industrial occupation, became the legitimate calling of the Aryan settler, the Vaiṣya; whilst handicrafts, gradually multiplying with advancing civilization and mental service, were assigned to the subject race. The generic name applied to the latter was Śūdra, originally probably the name of the conquered people. So far the social development proceeded on lines hardly differing from those with which one is familiar in the history of other nations. The Indo-Aryans, however, went a step farther. What they did was not only to keep the native race apart from social intercourse with themselves, but to shut them out from all participation in their own higher aims, and especially in their own religious convictions and ceremonial practices. So far from attempting to raise their standard of spiritual life, or even leaving it to ordinary intercourse to gradually bring about a certain community of intellectual culture and religious sentiment, they deliberately set up artificial barriers in order to prevent their own traditional modes of worship from being contaminated with the obnoxious practices of the servile race. The serf, the Śūdra, was not to worship the gods of the Aryan freemen. The result was the system of four castes (varṇa, i.e. " colour "; or jati, " gens "). Though the Brahman, who by this time had firmly secured his supremacy over the kṣatriya, or noble, in matters spiritual as well as in legislative and administrative functions, would naturally be the prime mover in this regulation of the social 

4 Thus, in Berar, " there is a strong non-Aryan leaven in the drogs of the agricultural class, derived from the primitive races which have gradually melted down into settled life, and thus become fused with the general community, while these same races are still distinct tribes in the wild tracts of hill and jungle." Sir Alfred C. Lyall, As. St., i. 6.
HINDUISM

order, there seems no reason to believe that the other two upper classes were not equally interested in seeing their hereditary privileges thus perpetuated by divine sanction. Nothing, indeed, is more remarkable in the whole development of the caste-system than the jealous pride which every caste, from the highest to the lowest, takes in its own peculiar occupation and sphere of life. The distinctive badge of a member of the three upper castes was the sacred triple cord or thread (śārā)—made of cotton, hemp or wool, according to the respective caste—with which he was invested at the sūryapujan ceremony, or initiation into the use of the sacred sāṁti, or prayer to the sun (also called gāyatrī), constituting his second birth. Whilst the Arya was thus a deva-ja, or twice-born, the Sudra remained unregenerate during his lifetime, his consolation being the hope that, on the faithful performance of his duties in this life, he might hereafter be born again into a higher grade of life. In later times, the strict adherence to caste duties would naturally receive considerable support from the belief in the transmigration of souls, already prevalent before Buddha’s time, and from the very general acceptance of the doctrine of karma (“deed”), or retribution, according to which a man’s present station and manner of life are the result of the sum-total of his actions and thoughts in his former existence; as his actions here will again, by the same automatic process of retribution, determine his status and condition in his next existence. Though this doctrine is especially insisted upon in Buddhism, and its designation as a specific term (Pali, Kamma) may be due to that creed, the notion itself was doubtless already prevalent in pre-Buddhist times. It would even seem to be necessarily and naturally implied in Brahmanical belief in metempsychosis; whilst in the doctrine of Buddha, who admits no soul, the theory of the net result or fruit of a man’s actions serving hereafter to form or condition the existence of some new individual who will have no conscious identity with himself, seems of a peculiarly artificial and mystic character. But, be this as it may, “the doctrine of karma is certainly one of the firmest beliefs of all classes of Hindus, and the fear that a man shall reap as he has sown is an appreciable element in the average morality . . . . the idea of forgiveness is absolutely wanting; evil done may indeed be outweighed by meritorious deeds so far as to ensure a better existence in the future, but it is not effaced, and must be atoned for” (Census Report, i. 364).

In spite, however, of the artificial restrictions placed on the intermarrying of the castes, the mingling of the two races seems to have proceeded at a tolerably rapid rate. Indeed, the paucity of women of the Aryan stock would probably render these mixed unions almost a necessity from the very outset; and the various rules which all caste rules were to perpetuate can scarcely have remained of more than a relative degree even in the case of the Brahman caste. Certain it is that mixed castes are found referred to at a comparatively early period; and at the time of Buddha—some five or six centuries before the Christian era—the social organization would seem to have presented an appearance not so very unlike that of modern times. It must be confessed, however, that our information regarding the development of the caste system is far from sufficient to enable us to trace its earlier stages. Thus, we are almost entirely left to conjecture on the important point as to the original social organization of the subject race. Though doubtless divided into different tribes scattered over an extensive tract of land, the subjected aborigines were slumped together under the designation of Sudras, whose duty it was to serve the upper classes in all the various departments of manual labour, save those of a downright sordid and degrading character which it was left to tractas or outcasts to perform. How, then, was the distribution of crafts and habitual occupations brought about? Was the process one of spontaneous growth adapting already existing social organization to a new order of things; or was it originated and perpetuated by regulation from above? Or was it rather that the status and duties of existing offices and trades came to be determined and made hereditary by some such artificial system as that by which the Theodosian Code succeeded for a time in organizing the Roman society in the 5th century of our era? “It is well known” (says Professor Dill) “that the tendency of the later Empire was to stereotype society, by compelling men to follow the occupation of their fathers, and preventing a free circulation among different callings and grades of life. The man who brought the grain from Africa to the public stores at Ostia, the baker who made it into loaves for distribution, the butchers who brought pigs from Samnium, Lucania or Bruttium, the purveyors of wine and oil, the men who fed the furnaces of the public baths, were bound to their callings from one generation to another. It was the principle of rural servilism applied to social functions. Every avenue of escape was closed. A man was bound to his calling not only by his father’s but also by his mother’s condition. Men were not permitted to marry out of their gild. If the daughter of one of the baker caste married a man not belonging to it, her husband was bound to her father’s calling. Not even a dispensation obtained by some means from the imperial clemency, not even the power of the Church could avail to break the chain of servitude.” It can hardly be gainsaid that these artificial arrangements bear a very striking analogy to those of the Indian caste-system; and if these class restrictions were comparatively short-lived on Italian ground, it was not perhaps so much that so strange a plant found there an ethnic soil less congenial to its permanent growth, but because it was not allowed sufficient time to become firmly rooted; for already great political events were impending which within a few decades were to lay the mighty empire in ruins. In India, on the other hand, the institution of caste even if artificially contrived and imposed by the Indo-Aryan priest and ruler—had at least ample time allowed it to become firmly established in its social habits, and even in the affections, of the people. At the same time, one could more easily understand how such a system could have found general acceptance all over the Dravidian region of southern India, with its merest sprinkling of Aryan blood, if it were possible to assume that class arrangements of a similar kind must have already been prevalent amongst the aboriginal tribes prior to the advent of the Aryan. Whether a more intimate acquaintance with the manners and customs of those rude tribes that have hitherto kept themselves comparatively free from Hindu influences may yet throw some light on this question, remains to be seen. But, by this as it may, the institution of caste, when once established, certainly appears to have gone on steadily developing; and not even the long period of Buddhist ascendency, with its uncompromising resistance to the Brahman caste and its claims to a higher station, in matters of faith, seems to have had any very appreciable retarding effect upon the progress of the movement. It was not only by the formation of ever new endogamous castes and sub-castes that the system gained in extent and intricacy, but even more so by the constant subdivision of the castes into numerous exogamous groups or septs, themselves often involving gradations of social status important enough to seriously affect the possibility of intermarriage, already hampered by various other restrictions. Thus a man wishing to marry his son or daughter either to a lower or to a higher caste, would have to look to the Hindu priest and the priest to look to his own, his son’s or his daughter’s caste; but the Hindu priest might have a lower or a higher caste, either of which, in matters of faith, seems to have had any very appreciable retarding effect upon the progress of the movement.
rules are jealously watched by the other members of the sept, and are liable—in accordance with the general custom in which communal matters are regulated in India—to be brought before a special council (panchayat), originally consisting of five (panch), but now no longer limited to that number, since it is chiefly the function of the head of the sept to determine the outcome of caste. The orthodoxy ceremonial generally that determine the status of the sept in the social scale of the caste. Whilst community of occupation was an important factor in the original formation of non-trivial castes, the practical exigencies of life have led to considerable laxity in this respect—not least so in the case of Brahmans who have often had to take to callings which would seem altogether incompatible with the proper spiritual functions of their caste. Thus, the prejudice against eating cooked food that has been touched by a man of an inferior caste is so strong that, although the Shastras do not prohibit the eating of food cooked by a Kshatriya or Vaisya, yet the Brahmans, in most parts of the country, would not eat such food. For these reasons, every Hindu household—whether Brahman, Kshatriya or Sudra—that can afford to keep a paid cook generally entertains the services of a Brahman for the performance of its cuisine—the result being that in the larger towns the very name of Brahman has suffered a strange degradation of late, so as to mean only a cook? (Jogendra Nath Bhattacharya, *Hindu Castes and Sects*).

In this caste, however, as in all others, there are certain kinds of occupation to which a member could not turn for a livelihood without incurring serious defilement. In fact, adherence to the traditional and all the more laborious and disagreeable would even go so far as to be an idiom in-hand. Thus, amongst agricultural castes, those engaged in vegetable-growing or market-gardening are inferior to the genuine peasant or yeoman, such as the Jat and Rajput; whilst of these the Jat who practises widow-marriage ranks below the Rajput who prides himself on his tradition of ceremonial orthodoxy—though racially there seems little, if any, difference between the two; and the Rajput, again, is looked down upon by the Babhan of Behar because he does not, like himself, scruple to handle the plough, instead of invariably employing low-caste men for this manual labour. So also when members of the Baidya, or physician, caste of Bengal, ranging next to that of the Brahman, farm land on tenure, “they will on no account hold the plough, or engage in any form of manual labour, and thus necessarily carry on their cultivation by means of hired servants” (H. H. Risley, *Census Report*).

The scale of social precedence as recognized by native public opinion is concisely reviewed (ib.) as revealing itself in the facts that the higher castes in modern India are supplanted by one of or other of the original castes of the theoretical Hindu system; that Brahmans will take water from certain castes; that Brahmans of high standing will not perform the part of certain castes; that certain castes are served by the best Brahmans, have nevertheless got Brahmans of their own whose rank varies according to circumstances; that certain castes are not served by Brahmans at all but have priests of their own; that the status of certain castes has been raised by their taking to infant-marriage or abandoning the remarriage of widows; that the status of others has been modified by their pursuing some occupations in a special or peculiar way; that some can claim the services of the village barber, the village palanquin-bearer, the village midwife, &c., while others cannot; that some castes may not enter the courtyards of certain temples; that some castes are subject to special tabus, such as that they do not eat beef; that they do not bow to even the images of the gods worshipped in a Sudra’s house by Brahman priests” (Jog. Nath Bh.). There are, however, not a few classes of Brahmans who, for various reasons, have become degraded from their high station, and formed separate castes with whom respectable Brahmans refuse to intermarry and consort. Chief amongst these are the Brahmans who minister for “unclean” Sudras and lower castes, including the makers and dealers in spiritual liquors; as well as those who officiate at the great public shrines or places of pilgrimage where they might be liable to accept forbidden gifts, and, as a matter of fact, often amass considerable wealth; and those who officiate as paid priests at cremations and funeral rites, when the wearing apparel and bedding of the deceased are not frequently claimed by them as their perquisites.

As regards the other two “twice-born” castes, several modern groups do indeed claim to be their direct descendants, and in vindication of their title make it a point to perform the *upanayana* ceremony and to wear the sacred thread. But though the Brahmans, too, will often acquiesce in the reasonable-ness of such claims, it is probably only as a matter of policy that they do so, whilst in reality they regard the other two higher castes as having long since disappeared and been merged by miscegenation in the Sudra mass. Hence, in the later classical Sanskrit literature, the term *deva*, or twice-born, is used simply as a synonym for a Brahman. As regards the numerous groups included under the term of Sudras, the distinction between “clean” and “unclean” Sudras is of especial importance for the upper classes, inasmuch as only the former—of whom nine distinct castes are usually recognized—are as a rule considered fit for employment in household service.

The picture thus presented by Hindu society—as made up of a confused congeries of social groups of the most varied standing, each held together and kept separate from others by a traditional body of ceremonial rules and by the notion of social gradations being due to a divinely instituted order of things—finds something like a counterpart in the religious life of the people. As in the social sphere, so also in the sphere of religious belief, we find the whole scale of types represented from the lowest to the highest; and here as there, we meet with the same failure of welding the confused mass into a well-ordered whole. In their theory of a triple manifestation of an impersonal deity, the Brahmanical theologians, as we have seen, had indeed elaborated a doctrine which might have seemed to form a responsible, authoritative creed for...
a community already strongly imbued with pantheistic notions; yet, at best, that creed could only appeal to the sympathies of a comparatively limited portion of the people. Indeed, the sacerdotal class themselves had made its universal acceptance an impossibility, seeing that their laws, by which the relations of the classes were to be regulated, aimed at permanently excluding the entire body of aboriginal tribes from the religious life of their Aryan masters. They were to be left for all time to coming to their own traditional idolatrous notions and practices. However, the two races could not, in the nature of things, be permanently kept separate from each other. Indeed, even prior to the final establishment of the caste-system, the intermingling of the lower race with the upper classes, especially with the aristocratic landowners and still more so with the yeomanry, had probably been going on to such an extent as to have resulted in two fairly well-defined intermediate types of colour between the priestly order and the servile race and to have facilitated the ultimate division into four "colours" (varnas).

In course of time the process of intermingling, as we have seen, assumed such proportions that the priestly class, in their pride of blood, felt naturally tempted to recognize, as of old, only two "colours," the Aryan Brahman and the non-Aryan Sudra. Under these conditions the religious practices of the lower race could hardly have failed in the long run to tell seriously upon the spiritual life of the body of the Brahmanical community. To what extent this may have been the case, our limited knowledge of the early phases of the sectarian worship of the people does not enable us to determine. But, on the other hand, the same process of racial intermixture also tended to gradually draw the lower race more or less under the influence of the Brahmanical forms of worship, and thus contributed towards the shaping of the religious system of modern Hinduism. The grossly idolatrous practices, however, still so largely prevalent in the Dravidian South, show how superficial, after all, that influence has been in those parts of India where the admixture of Aryan blood has been so slight as to have practically had no effect on the racial characteristics of the people. These present-day practices, and the attitude of the Brahman towards them, help at all events to explain the aversion with which the strange rites of the subjected tribes were looked upon by the worshippers of the Vedic pantheon. At the same time, in judging the apparently inhuman way in which the Sudras were treated in the caste rules, one has always to bear in mind the fact that the belief in metempsychosis was already universal at the time, and seemed to afford the only rational explanation of the apparent injustice involved in the unequal distribution of the good things in this world; and that, if the Sudra was strictly excluded from the religious rites and beliefs of the superior classes, this exclusion in no way involved the question of his ultimate emancipation and his union with the Infinite Spirit, which were as certain in his case as in that of any other sentient being. What it did make impossible for him was to attain that union immediately on the cessation of his present life, as he would first have to pass through higher and purer stages of mundane existence before reaching that goal; but in this respect he only shared the lot of all but a very few of the saintliest in the higher spheres of life, since the ordinary twice-born would be liable to sink, after his present life, to grades yet lower than that of the Sudra.

To what extent the changes, which the religious belief of the Aryan classes underwent in past-Vedic times, may have been due to aboriginal influences is a question not easily answered, though the later creeds offer only too many features in which one might feel inclined to suspect influences of that kind. The literary documents, both in Sanskrit and Pali, dating from about the time of Buddha onwards—particularly the two epic poems, the Mahabharata and Ramayana—still show us in the main the person of the old pantheon; but the character of the gods has changed, and the pantheon itself, and almost purely mythological figures. A number of the chief gods, sometimes four, but generally eight of them, now appear as lokapalas or world-guardians, having definite quarters or intermediate quarters of the compass assigned to them as their special domains. One of them, Kubera, the god of wealth, is a new figure; whilst another, Varuna, the most spiritual and ethical of Vedic deities—the king of the gods and the god of the nightly, star-spangled firmament—has become the Indian Neptune, the god of waters. Indra, their chief, is virtually a kind of superior raja, residing in surga, and as such is on visiting terms with earthly kings, driving about in mid-air with his charioteer Matali. As might happen to any earth-lord, Indra is actually defeated in battle by the son of the demon-king of Lanka (Ceylon), and kept there a prisoner till ransomed by Brahma and the gods conferring immortality on his conqueror. A quaint figure in the pantheon of the heroic age, Hanuman, the defied chief of monkeys—probably meant to represent the aboriginal tribes of southern India—which wonderful exploits as Rama's ally on the expedition to Lanka Indian audiences will never weary of hearing recounted. The Gandharvas figure already in the Veda, either as a single divinity, or as a class of genii, conceived of as the body-guard of Soma and as connected with the moon. In the later Vedic times they are represented as being fond of and dangerous to, women; the Apsaras, apparently figures in the pantheon of the heroic age, have become the heavenly minstrels plying their art at Indra's court, with the Apsaras as their wives or mistresses. These fair damsels play, however, yet another part, and one far from complimentary to the dignity of the gods. In the epics considerable merit is attached to a life of seclusion and ascetic practices by means of which man is considered capable of acquiring supernatural powers equal or even superior to those of the gods—a notion perhaps not unnatural springing from the pantheistic conception. Now, in cases of danger being threatened to their own ascendancy by such practices, the gods as a rule proceed to employ the usually successful expedient of dispatching some lovely nymph to lure the saintly men back to worldly pleasures. Seeing that the epic poems, as repeated by professional reciters, either in their original Sanskrit text, or in their vernacular versions, as well as dramatic compositions based on them, form to this day the chief source of intellectual enjoyment for most Hindus, the legendary matter contained in these epic poems, however marvellous and incredible it may appear, still enters largely into the religious convictions of the people. "These popular recitals from the Ramayana are done into Gujarati in easy, flowing narrative verse... by Premanand, the sweetest of our bards. They are read out by an intelligent Brahman to a mixed audience of all classes and both sexes. It has a perceptible influence on the Hindu character. I believe the remarkable freedom from indolency which is to be seen in most Hindu families, in spite of their strange gregarious habits, can be traced to that influence; and little wonder" (B. M. Malahari, Gujarat and the Gujarati). Hence also the universal reverence paid to the name of the once-powerful non-Aryan tribe of Nagas had something to do with it must remain doubtful. Indian myth represents them as a race of demons sprung from Kadru, the wife of the sage Kasyapa, with a jewel in their heads which gives them their sparkling look; and inhabiting one of the seven beautiful worlds below the earth (and above the hells), where they are ruled over by three chief or kings, Sesha, Vasuki and Takshaka; their fair daughters often entering into matrimonial alliances with men, like the mermaids of western legend.

In addition to such essentially mythological conceptions, we meet in the religious life of this period with an element of more serious aspect in the two gods, on one or other of whom the religious fervour of the large majority of Hindus has ever since been concentrated and sustained, Siva, and Soma. Both these great figures have grown out of Vedic conceptions—the genial Vishnu mainly out of a not very prominent solar deity of the same name; whilst the stern Siva, i.e. the kind or gracious one—doubtless a euphemistic name—has his prototype in the old fierce
storm-god Rudra, the “Roarer,” with certain additional features derived from other deities, especially Pushan, the guardian of flocks and bestower of prosperity, worked up therewith. The exact process of the evolution of the two deities and their advance in popular favour are still somewhat obscure. In the epic poems which may be assumed to have taken their final shape in the early centuries before and after the Christian era, their popular character, so strikingly illustrated by their incidents, in the Brahmanical triad, appears in full force; whilst their cult is likewise attested by the coins and inscriptions of the early centuries of our era. The co-ordination of the two gods in the Trimurti does not by any means exclude a certain rivalry between them; but, on the contrary, a supreme position as the true embodiment of the Divine Spirit is claimed for each of them by their respective votaries, without, however, an honourable, if subordinate, place being refused to the rival deity, wherever the latter, as is not infrequently the case, is not actually represented as merely another form of the favoured god. Whilst at a truly monothetical fervour manifests itself in the adoration of these two gods, the polytheistic instincts of the people did not fail to extend the pantheon by groups of new deities in connexion with them. Two of such new gods actually pass as the sons of Siva and his consort Parvati, viz. Skanda—also called Kumara (the youth), Karttikeya, or Subrahmanya (in the south)—the six-headed war-lord of the gods; and Ganese, the lord (or leader) of Siva’s troupes of attendants, being at the same time the elephant-headed, paunch-bellied god of wisdom; whilst a third, Kama (Kamadeva) or Kandarpa, the god of love, gets his popular epithet of Ananga, “the bodiless,” from his having once, in frolicsome play, tried the power of his arrows upon Siva, whilst engaged in amorous practices. But, when a single glance from the third (forehead) eye of the angry god reduced the mischievous unicorn to ashes. For his chief attendant, the great god (Mahadeva, Mahesvaran) has already with him the “holy” Nandi—presumably, though his shape is not specified, identical in form as in name with Siva’s sacred bull of later times, the appropriate symbol of the god’s reproductive power. But, in this respect, we also meet in the epics with the first clear evidence of what in after time became the prominent feature of the worship of Siva and his consort all over India, viz. the feature represented by the linga, or phallic symbol.

As regards Vishnu, the epic poems, including the supplement to the Mahabharata, the Harivamsa, supply practically the entire framework of legendary matter on which the later Vaishnava creeds are based. The theory of Avataras which makes the deity—also variously called Narayana, Purushottama, or Vasudeva—periodically assume some material form in order to rescue the world from some great calamity, is fully developed; the ten universally recognized “descents” being enumerated in the larger poem. Though Siva, too, assumes various forms, the incarnation theory is peculiarly characteristic of Vaishnavism; and the fact that the principal hero of the Ramayana (Rama), and one of the prominent worthies of the Mahabharata (Krishna) become in this way identified with the supreme god, and remain to this day the chief objects of the adoration of Vaishnava sectaries, naturally imparts to these creeds a human interest and sympathetic aspect which is wholly wanting in the worship of Siva. It is, however, unfortunately but too true that in some of these creeds the devotional ardour has developed features of a highly objectionable character.

Even granting the reasonableness of the triple manifestation of the Divine Spirit, how is one to reconcile all these idolatrous phantasies, not only with its own philosophy, but with the very idea of the one Absolute Being, the one reality that is all in all; whilst all the phenomenal existences and occurrences that crowd upon our senses are but an illusion of the individual soul estranged for a time from its divine source—an illusion only to be dispelled in the end by the soul’s fuller knowledge of its own true nature and its being one with the eternal fountain of blissful being. But to the man of ordinary understanding, unused to the rarefied atmosphere of abstract thought, this conception of a transcendent, incorporeal Spirit and the phenomenal world can have no meaning; what he requires is a deity, properly so called, with a definite relation to things material and to all that affects man’s life. Hence, the exoteric theory of manifestations of the Supreme Spirit; and that the one Absolute Being (often implied in the trimurtic) underlies, the cardinal processes of mundane existence—creation, preservation, and destruction or regeneration—but even such as would tend to supply a rational explanation for superstitious beliefs and practices. This may be accounted for the fabrication of brahmanism, which accepts and even encourages the rudest forms of idolatry, explaining everything by giving it a higher meaning. It treats all the worships as outward, visible signs of some spiritual truth, and is ready to show how each particular image or deity is the symbol of some aspect of universal divinity. The Hindus, like the pagans of antiquity, adore natural objects and forces—a mountain, a river or an animal. The Brahman holds all nature to be the venture or cloak of indwelling, divine energy, which inspires everything that produces awe or passes man’s understanding” (Sir Alfred C. Lyall, Brahminism).

During the early centuries of our era, whilst Buddhism, where countenanced by the political rulers, was still holding its own by the side of Brahmanism, sectarian belief in the Hindu gods seems to have made steady progress. The caste-system, always calculated to favour unity of religious practice within its social groups, must naturally have contributed to the advance of sectarianism. Even greater was the support it received later on from the Puranas, a class of poetical works of a partly legendary, partly discursive and controversial character, mainly composed in the interest of special deities, in which eighteen principal (maha-purana) and as many secondary ones (upa-purana) are recognized, the oldest of which may go back to about the 4th century of our era. It was probably also during this period that the female element was first definitely admitted to a prominent place amongst the divine objects of sectarian worship, in the shape of the wives of the principal gods viewed as their sakthi, or female energy, theoretically identified with the Maya, or cosmic Illusion, of the idealistic Vedanta, and the Prakriti, or plastic matter, of the materialistic Sankhya philosophy, as the primary source of mundane things. The concomitant relations of the deities may thus be considered to typify the mystical union of the two eternal principles, spirit and matter, for the production and reproduction of the universe.

But whilst this privilege of divine worship was claimed for the consorts of all the gods, it is principally to Siva’s consort, in one or other of her numerous forms, that adoration on an extensive scale came to be offered by a special sect of votaries, the Saktas.

In the midst of these conflicting tendencies, an attempt was made, about the latter part of the 8th century, by the distinguished Malabar theologian and philosopher Sankara Acharya to restore the Brahmanical creed to something like its pristine purity, and thus once more to bring about a uniform system of orthodox Hindu belief. Though himself, like most Brahmans, apparently by predilection a follower of Siva, his aim was the revival of the doctrine of the Brahmana as the one self-existent Being and the sole cause of the universe; coupled with the recognition of the practical worship of the orthodox pantheon, especially the gods of the Trimurti, as manifestations of the supreme deity. The practical result of his labours was the foundation of a new sect, the Svarasrayas, i.e. adherents of the smritis or tradition, which has a numerous following amongst southern Brahmans, and, whilst professing Sankara’s doctrines, is usually classed as one of the Saivas. The svarasraya is marked peculiar to Saivas, consisting in their keeping of a triple line, the trivundra, prepared from the ashes of burnt cow-dung and painted on the forehead. Sankara also founded four Maths, or convents, for Brahmans; the chief one being that of Sringeri in Mysore, the spiritual head (Guru) of which wields considerable power, even that of excommunication, over the Saivas of southern India. In northern India, the professed followers of Sankara are mainly limited to certain classes of mendicants
and ascetics, although the tenets of this great Vedanta teacher must be said virtually to constitute the creed of intelligent Brahmanism.

Whilst Sankara's chief title to fame rests on his philosophical works, as the upholder of the strict monistic theory of Vedanta, he doubtless played an important part in the partial remodelling of the older and more popular Brahmanism of a time when Buddhism was already losing ground in India. Not that there is any evidence of Buddhisms having ever been actually persecuted by the Brahmanas, or still less of Sankara himself ever having done so; but the traditional belief in the superiority of the Brahmanasthe principle of asceticism and the all-pervading deity, would doubtless appeal more directly to the minds and hearts of the people than the colourless ethical system promulgated by Buddha.

Notwithstanding the place of Buddha himself in the order of the all-pervading deity, they seem rather to have been taken over by them for their own religious use; at any rate there are to this day not a few Hindu shrines, especially in the old shrine-dedicated to Dharmaraj, "the prince of righteousness," as the Buddha is commonly styled. That the tenets and practices of so characteristic a faith as Buddhism, so long prevalent in India, cannot but have left their marks on Hindu life and belief may readily be assumed, though it is not so easy to lay one's finger on the precise features that might seem to betray such an influence. If the general tendency towards animals, based on the principle of akamsha, or inflicting no injury on sentient beings, be due to Buddhist teaching, that influence must have made itself felt at a comparatively early period, seeing that sentiments of a similar nature are repeatedly urged in the Code of Manu. The great Hindu poet, who doubtless strongly felt the sense of confinement and death to living beings, but desires the good of all, obtains endless bliss. He who injures no creature obtains without effort a heaven or a hell, and what he says holds him in mind on. Flesh-meat cannot be procured without injury to animals, and the slaughter of animals is not conducive to heavenly bliss: from flesh-meat, therefore, let man abstain. Moreover, in view of the fact that Buddhism, which originated about the same time as Buddhism, inculcates the same principle, even to an extravagant degree, it seems by no means improbable that the spirit of kindliness towards living beings was already widely diffused among the people when these new doctrines were promulgated. To the same tendency doubtless is due the gradual decline and ultimate discontinuance of animal sacrifices by all sects except the extreme brahmanicalists. In this respect, the venerable Brahmans, who to serpents and monkeys has, however, to be viewed in a somewhat different light, as having a mythical background; whilst quite a special significance attaches to the sacred character assigned to the cow by all classes of Hindus, even those who are not prepared to admit the claim of the Brahman to the exalted position of the earthly god usually conceded to him. In the Veda no tendency shows itself as yet towards rendering divine honour to the cow; and though the importance assigned her in an agricultural community is easily understood, still the exact process of her dedication and deification is not to be found in the most ancient of the Vedas, and the epics requires further elucidation. An idealized type of the useful quadruped—likewise often identified with the earth—presents itself in the mythical Cow of Plenty, or wis-scow (Kameswari, or Vishwakarma), already worshipped among the Atharvaveda, and in epic times assigned to Indra, or identified with Surabhi, "the fragrant," the sacred cow of the sage Vaishishtha. Possibly the growth of the legend of this being is reflected in the Gokula (cow-catering): his tender relations to the gopas, or cow-herdresses, of Vrindavana; his epistles Gopala, "the cowherd," and Govinda, "cow-finder," actually explained as "recoverer of the earth" in the great epic, and the ge-loka, or "cow-world," assigned to him as his heavenly abode—may have some connexion with the sacred character ascribed to the cow from early times.

Since the time of Sankara, or for more than a thousand years, the gods Vishnu and Siva, or Hari and Bhagwa as they are also commonly called—with their wives, especially that of the latter god—have shared between them the practical control of Hindu life. But through the people have thus been divided into two different religious camps, sectarian animosity has upon the whole kept within reasonable limits. In fact, the respectable Hindu, whilst owning special allegiance to one of the two gods as his ishta devata (favourite deity), will not withhold his tribute of adoration from the other gods of the pantheon. The high-caste Brahman will probably keep at his home a shalagram stone, the favourite symbol of Vishnu, as well as the characteristic emblems of Siva and his followers, the Linga, an object of which he has reverence in his dris-hna; and when he visits some holy place of pilgrimage, he will not fail to pay his homage at both the Saiva and the Vaishnava shrines there. Indeed, "sectarian bigotry and exclusiveness are to be found chiefly among the professional leaders of the modern brotherhoods and their low-caste followers, who are taught to believe that theirs are the only true gods, and that the others do not deserve any reverence whatever" (Jog. Nath). The same spirit of toleration shows itself in the celebration of the numerous religious festivals. Whilst some of these—e.g. the Sankranti (called Pongal, i.e. "boiled rice," in the south), which marks the entrance of the sun into the sign of Capricorn and the beginning of its northward course (uttaryana) on the 1st day of the month Marga (c. Jan. 12); the Ganapati-caturthi, or 4th day of the light fortnight of Bhadra (August—September), considered the birthday of Ganesa, the god of wisdom; and the Holi, the Indian Saturnalia in the month of Phalguna (February) (sometimes extended to March)—have nothing of a sectarian tendency about them; others again, which are of a distinctly sectarian character—such as the Krishna-janmashtami, the birthday of Krishna on the 8th day of the dark half of Bhdrâ, or (in the south) of Sivaga (July—August), the Durgapuja and the Diphali, or lamp feast, celebrating Krishna's victory over the demon Narakasura, on the last two days of Asvina (September—October)—are likewise observed and heartily joined in by the whole community irrespective of sect. Widely different, however, is the character of the two leading gods; they are also the modes of worship practised by their votaries.

Siva has at all times been the favourite god of the Brahmanas, and his worship is accordingly more widely extended than that of his rival, especially in southern India. Indeed there is hardly a village in India which cannot boast of a shrine dedicated to Siva, and containing the emblem of his reproductive power; for almost the only form in which the "Great God" is adored is the Linga, consisting usually of an upright cylindrical block of marble or other stone, mostly resting on a circular perforated slab. The mystic nature of these emblems seems, however, to be but little understood by the common people; and, as H. H. Wilson remarks, "notwithstanding the acknowledged purport of this worship, it is but justice to state that it is unattended in Upper India by any indecent or indecree ceremonies, and it requires a rather lively imagination to trace any resemblance in its symbols to the objects they are supposed to represent." In spite, however, of its wide diffusion, and the vast number of shrines dedicated to it, the worship of Siva has never assumed a really popular character, especially in northern India, being attended with scarcely any solemnity or display of emotional spirit. The temple, which usually stands in the middle of a court, is as a rule a building of very moderate dimensions, consisting either of a single square chamber, surrounded by a pyramidal structure, or of a chamber for the linga and a small vestibule. The worshipper, having first circumambulated the shrine as often as he pleases, keeping it at his right-hand side, steps up to the threshold of the linga and presents his offering of flowers or fruit, which the officiating priest receives; he then prostrates himself, or merely lifts his hands—joined so as to leave a hollow space between the palms—to his forehead, muttering a short prayer, and takes his departure. Amongst the many thousands of Lingas, twelve are usually regarded as of especial sanctity, one of which, that of Somnath in Gujarat, where Siva is worshipped as "the lord of Somas," was, however, shattered by Mahmud of Ghazni; whilst another, representing Siva as Viswarupa, "Universal," is the chief object of adoration at Benares, the great centre of Siva-worship. The Suivas of southern India, on the other hand, single out as peculiarly sacred five of their temples which are supposed to enshrine as many characteristic aspects (lings) of the god in the form of the five elements, the most holy of these being the shrine of Chidambaram (i.e. "thought-ether") in S. Arcot, supposed to contain the ether-lingga. According to Pandit S. M. Natesa (Hindu Feasts, Pasts and Ceremonies), "the several forms of the god Siva in these sacred shrines are considered to be the bodies or casements of the soul whose

---

1 Siva is said to have first appeared in the beginning of the present age as Svetâ, the White, for the purpose of benefiting the Brahmanas.
natural bases are the five elements—earth, water, fire, air and ether. The apprehension of God in the last of these five as ether is, according to the Saiva school of philosophy, the highest form of worship, for it makes the worship of God in a tangible form, but the worship of what, to ordinary minds, is a vacuum, which nevertheless leads to the attainment of a knowledge of the all-pervading without physical accessories in the shape of any linga, which is, after all, an emblem. That this is the case at Chidambaram is known to every Hindu, for if he ever asks the priests to show him the God in the temple he is pointed to an empty space in the holy of holies, which has been termed the Akasa, or ether-linga. But, however congenial this refined symbolism may be to the worshipper of a speculative turn of mind, it is difficult to see how it could ever satisfy the requirements of the common man little given to abstract conceptions of this kind.

From early times, detachment from the world and the practice of austerities have been regarded in India as peculiarly conducive to a spirit of godliness, and ultimately to a state of ecstatic communion with the deity. On these grounds it was actually laid down as a rule for a man solicitous for his spiritual welfare to pass the last two of the four stages (ārāmas) of his life in such conditions of renunciation and self-restraint. Though there is hardly a sect which has not contributed its share to the element of religious meaningless and asceticism so prevalent in India, it is in connection with the Saiva cult that the system of austerities has been most extensively cultivated. Indeed, the personality of the stern God himself exhibits this feature in a very marked degree, whence the term mahāyogī or "great ascetic" is often applied to him.

Of Saiva mendicant and ascetic orders, the members of which are considered more or less followers of Sankara Acharya, the following may be mentioned. The Ganges, clad with a piece of red cloth, containing the sacred cord, attached to it, and also wear one or more pieces of cloth of the same colour. They wear the simple dress of a Bhaiya, in which the greater proportion of this order are the Dandi Dasamis, or Dandi of ten names, which are said from their assuming one of the names of Sankara's four disciples, and six of their pupils. (2) Yogis (or popularly, Jogis), i.e. adherents of the Yoga philosophy and the system of ascetic practices enjoined by it with the view of mental abstraction and the supposed attainment of superhuman powers—practices which, when not merely pretended, but rigidly carried out, are only too apt to provide grounds of suspicion to minds unaccustomed to such degenerate days their supernatural powers consist chiefly in conjuring, sooth-saying, and feats of jugglery, by which they seldom fail of imposing upon a credulous public. (3) Sanuṣṭiṣṭis, devotees who "wear a garland of flowers," all the time of their lives, not confined to the Brahmancial caste or to the Saiva persuasion. Those of the latter are in the habit of smearing their bodies with ashes, and wearing garments made of horsehair. "Ganges" is the ordinary appellation of the Elaecoarpus Caninus, lit. "Rudra's eye," sacred to Siva, and allowing their hair to grow till it becomes matted and filthy. (4) Para-mahamsas, i.e. the supreme ascetic (or swaroopas), a term applied to the world-soul with which they claim to be identified. This is the highest order of asceticism, members of which are supposed to be solely engaged in meditating on the Brahma, and to be equally indifferent to pleasure or pain, insensible of heat or cold, and incapable of safety or want. Some of them go about naked, but the majority are clad like the Dandis. (5) Agnora Panthis, a vile and disreputable class of mendicants, now rarely met with. Their filthy habits and disgusting practices of gross promiscuous feeding, even to the extent of picking up the dead and dismembered bodies of those who have been burned, and treating them as a direct repudiation of the strict Brahmanical code of ceremonial purity and cleanliness, and of the rules regulating the matter and manner of funerals. Offending mendicants are made objects of loathing and terror wherever they are seen.

On the general effect of the manner of life led by Sādhus or "holy men," a recent observer (J. C. Oman, Mystics, Ascetics and Saints of India) remarks: "Sādhus are the type of the ascetic, as the peculiar idea of the efficiency of austerities for the acquisition of far-reaching powers over natural phenomena, or bearing its testimony to the belief in the indispensability of detachment from the world as a condition of an eternal life has existed among the Saiva mendicants with the Divine Being, has undoubtedly tended to keep before men's eyes, as the highest ideal, a life of purity, self-restraint, and contempt for the world and human affairs. It has also necessarily made the successful ascetic life a matter of the heady as well as the poor upon the charity of the more affluent members of the community. Moreover, sādhus, by the multiplicity of the independent sects which have arisen in India, has engendered and favoured a spirit of tolerance which cannot escape the notice of the most superficial observer."

An independent Saiva sect, or, indeed, the only strictly Saiva sect, are the Vīra Sāivas, more commonly called Lingayats (popularly Lingaīts) or Lingāvats, from their practice of wearing on their person a phallic emblem of Siva, made of copper or silver, and usually enclosed in a case suspended from the neck by a string. Apparently from the movable nature of their badge, their Gurus are called Jangamas ("movable"). This sect counts numerous adherents in southern India; the Census Report of 1901 recording nearly a million and a half, including some 70 or 80 different, mostly endogamous, castes. The reputed founder, or rather reformer, of the sect was Basava (or Basa), a Brahmical tramp who, according to the Saivas-purāṇas he early in life renounced his caste and went to reside at Kalyana, then the capital of the Chalukya kingdom, and later on at Sangamesvāra near Ragagiri, where he was initiated into the Vīra Saiva faith which he subsequently made it his life's work to propagate. His doctrine, which may be said to constitute a kind of reaction against the severe sacerdotalism of Sankara, has spread over all classes of the southern community, most of the priests of Saiva temples there being adherents of it; whilst in northern India its votaries are more occasionally met with, and then mostly as mendicants, leading about a neatly caparisoned bull as representing Siva's sacred bull Nandi. Though the Lingayats still show a certain animosity towards the Brahmans, and in the Census lists are accordingly classes as an independent group beside the Hindus, still they can hardly be excluded from the Hindu community, and are sure sooner or later to find their way back to the Brahmanical fold.

Vishnu, whilst less popular with Brahmans than his rival, has from early times proved to the lay mind a more attractive object of adoration on account of the genial and, apparently, more genial character of his mythical personality. It is not, however, so much the original figure of the god himself that enlists the sympathies of his adherents as the additional elements it has received through the theory of periodical "descents" (avatāras) or incarnations applied to this deity. Whilst the Saiva philosophisers do not approve of the notion of incarnations, as being derogatory to the dignity of the deity, the Brahmans have nevertheless thought fit to adopt it as a particularly convenient expedient for bringing certain tendencies of popular worship within the pale of their system, and probably also for counteracting the Buddhist doctrines; and for this purpose Vishnu would obviously offer himself as a more practicable object of adoration. The concept of incarnation theory started from the original solar nature of the god suggestive of regular visits to the world of men, or in what other way it may have originated, must remain doubtful. Certain, however, it is that at least one of his Avatāras is clearly based on the Vedic conception of the sun-god, viz. that of the dwarf who claims as much ground as he can cover by three steps, and then gains the whole universe by his three mighty strides. Of the ten or more Avatāras, assumed by different authorities, only have two entered to any considerable extent into the religious worship of the people, viz. those of Rama (or Rama-chandra) and Krishna, the favourite heroes of epic romance. That these two figures would appeal far more strongly to the hearts and feelings of the people, especially the warlike Kaha-riyas,1 from the austere Siva is only what might have been expected; and, indeed, since the time of the epics their cult seems never to have lacked numerous adherents. But, on the other hand, the essentially human nature of these two gods

1 As in the case of Siva's traditional white complexion, it may not be without significance, from a racial point of view, that Vishnu, Rama and Krishna have various darker shades of colour attributed to them, viz. blue, hyacinthine and dark purple or dark brown respectively.
would naturally tend to modify the character of the relations between worshipper and worshipped, and to impart to the modes and forms of adoration features of a more popular and more human kind. And accordingly it is exactly in connexion with these two incarnations of Vishnu, especially that of Krishna, that a new spirit was infused into the religious life of the people by the sentiment of fervent devotion to the deity, as it found expression in certain portions of the epic poems, especially the Bhagavagvita, and in the Bhagavataparwa (as against the more orthodox Vaishnava works of this class such as the Vishnu-purana), and was formulated into a regular doctrine of faith in the Sandilya-sutra, and ultimately translated into practice by the Vaishnava reformers.

The first successful Vaishnava reaction against Sankara’s reconstructed creed was led by Ramanuja, a southern Brahman of the 12th century. His followers, the Ramanujas, or Sri-Vaishnavas as they are usually called, worshipped Vishnu (Narayana) with his consort Sri or Lakshmi (the goddess of beauty and fortune), or their incarnations Rama with Sita and Krishna with Rukmini. Ramanuja’s doctrine, which is especially directed against the Linga-worship, is essentially based on the tenets of an old Vaishnava sect, the Bhagavatas or Pancharatras, who worshipped the Supreme Being under the name of Vasudeva (subsequently identified with Krishna, as the son of Vasudeva, who is indeed credited by some scholars with the foundation of that monothestic sect). The sectarian mark of the Ramanujas resembles a capital U (or, in the case of another division, a Y), painted with a white clay called gopi-chandana, between the hair and the root of the nose, with a red or yellow vertical stroke (representing the female element) between the two white lines. They also usually wear, like all Vaishnavas, a necklace of tulasi, or basil wood, and a rosary of seeds of the same shrub or of the lotus. Their most important shrines are those of Srirangam near Trichinopoly, Mailkote in Mysore, Dvarka (the city of Krishna) on the Kathiawar coast, and Jagannath in Orissa; all of them decorated with Vishnu’s emblems, the tulasi plant and salagram stone. The Ramanuja Brahmans are most punctilious in the preparation of their food and in regard to the privacy of their meals, before taking which they have to bathe and put on woollen or silk garments. Whilst Sankara’s mendicant followers were prohibited to touch fire and had to subsist entirely on the charity of Brahman householders, Ramanuja, on the contrary, not only allowed his followers to use fire, but strictly forbade their eating any food cooked, or even seen, by a stranger. On the speculative side, Ramanuja also met Sankara’s strictly monistic theory by another recognizing Vishnu as identical with Brahma as the Supreme Spirit animating the material world as well as the individual souls which have become estranged from God through unbelief, and can only attain again conscious union with him through devotion or love (bhakti). His tenets are expounded in various works, especially in his commentaries on the Vedanta-sutras and the Bhagavadgita. The followers of Ramanuja have split into two sects, a northern one, recognizing the Vedas as their chief authority, and a southern one, basing their tenets on the Narasir, a Tamil work of the Upashish order. In point of their religious influence and of their influence in the world, their most characteristic feature is their constant assertion of the unity of God Vishnu and the human soul; whilst the former sect define it by the ape theory, which makes the soul cling to God as the young ape does to its mother, the latter explain it by the cat theory, by which Vishnu himself seizes and rescues the souls as the mother cat does her young ones.

Madhva Acharya, another distinguished Vedanta teacher and founder of a Vaishnava sect, born in Kanara in A.D. 1199, was less intolerant of the Linga cult than Ramanuja, his more orthodox teacher. He seems rather to this class at a reconstitution of the Saiva and Vaishnava forms of worship. The Madinas or Madhvacarhis favour Krishna and his consort as their special objects of adoration, whilst images of Siva, Parvati, and their son Ganesa are, however, likewise admitted and worshipped in some of their temples, the most important of which is at Udipi in South Kanara, with eight monasteries connected with it.

This shrine contains an image of Krishna which is said to have been rescued from the wreck of a ship which brought it from Dvarka, where it was supposed to have been set up of old by no other than Krishna’s friend Arjuna, one of the five Pandava princes. Followers of the Madhva creed are but rarely met with in Upper India. Their sectarian mark is like the U of the Sri-Vaishnavas, except that their central line is black instead of red or yellow. Madhva—who after his initiation assumed the name Anandatirtha—composed numerous Sanskrit works, including commentaries on the Brahma sutras (i.e. the Vedanta-sutras), the Gita, the Rigveda and many Upanishads. His philosophical theory was a dualistic one, postulating distinctness of nature for the divine and the human soul, and hence independent existence, instead of absorption, after the completion of mundane existence.

The Ramanandis or Ramavats (popularly Ramats) are a numerous northern sect of similar tenets to those of the Ramanujas. Indeed its founder, Ramananda, who probably flourished in the latter part of the 14th century, according to the traditional account, was originally a Sri-Vaishnava monk, and, having come under the suspicion of laxity in observing the strict rules of food during his peregrinations, and been ordered by his superior (Mahant) to take his meals apart from his brethren, left the monastery in a huff and set up a schismatic math of his own at Benares. The sectarian mark of his sect differs but slightly from that of the parent stock. The distinctive features of their creed consist in their making Rama and Sita, either singly or conjointly, the chief objects of their adoration, instead of Vishnu and Lakshmi, and their attaching little or no importance to the observance of privacy in the cooking and eating of their food. Their mendicant members, usually known as Vairagis, are, like the general body of the sect, drawn from all castes without distinction. Thus, the founder's twelve chief disciples include, besides Brahmans, a weaver, a currier, a Rajput, a Jat and a barber—for, they argue, seeing that Bhagavan, the Holy One (Vishnu), became incarnate even in animal form, a Bhakta (believer) may be born even in the lowest of castes. Ramananda's teaching was thus of a distinctly levelling and popular character; and, in accordance therewith, the Bhakta-malai and other authoritative writings of the sect are composed, not in Sanskrit, but in the popular dialects. A follower of this creed was the distinguished poet Tulidas, the composer of the beautiful Hindi version of the Ramayana and other works which “exercise more influence upon the great body of Hindu population than the whole voluminous series of Sanskrit composition” (H. H. Wilson).

Ramananda’s immediate disciples includes the name of Kabir, the weaver, a remarkable man who would accordingly have lived in the latter part of the 15th century, and who is claimed by both Hindus and Moslems as having been born within their fold. The story goes that, having been deeply impressed by Ramananda’s teaching, he sought to attach himself to him; and, one day at Benares, in stepping down the ghat at daybreak to bathe in the Ganges, and putting himself in the way of the teacher, the latter, having inadvertently struck him with his foot, uttered the name Ram Ram, which, being also the initiatory formula of the sect, was claimed by Kabir as such, making him Ramananda's disciple. Be this as it may, Kabir's own reformatory activity lay in the direction of a compromise between the Hindu and the Mahommedan creeds, the religious practices of both of which he criticized with equal severity. His followers, the Kabir Panthis (“those following Kabir’s path”), though neither worshiping the gods of the pantheon, nor observing the rites and ceremonial of the Hindus, are nevertheless in close touch with the Vaishnava sects, especially the Ramavats, and generally worship Rama as the supreme deity, when they do not rather address their homage, in hymns and otherwise, to the founder of their creed himself. Whilst very numerous, particularly amongst the low-caste population, in western, central and northern India, resident adherents of Kabir's doctrine are rare in Bengal and the south; although

HINDUISM
"there is hardly a town in India where strolling beggars may not be found singing songs of Kabir in the original or as translated into the local dialects." The mendicants of this creed, however, never actually solici t als; and, indeed, "the quakerish spirit of the sect, their abhorrence of all violence, their regard for truth and the inobtrusiveness of their opinions render them very inoffensive members of the state" (H. H. Wilson).

The doctrines of Kabir are taught, mostly in the form of dialogues, in numerous Hindi works, composed by his disciples and adherents, who, however, usually profess to give the teacher's own words.

The peculiar conciliatory tendencies of Kabir were carried on by his chandals, from this latter part of the 15th century by one of his followers, Nanak Shah or Nanak, the founder of the Sikh religion. The sect, at first, in consequence of Mahomedan persecution, a martial spirit was infused into it by the tenth, and last, guru, Govind Shah, changing it into a political organization. Whilst originally more akin in its principles to the Moslem faith, the sect seems latterly to have shown tendencies towards drifting back to the Hindu pale.

The Vaishnava disciples and successors several others, besides Kabir, have established schismatic divisions of their own, which do not, however, offer any very marked differences of creed. The most important of these, the Dudu Panthi sect, founded by Dudu a disciple of Kabir, and centred in Ajmer, was one of the six sections of which, the Nagas, engage largely in military service, whilst the others are either householders or mendicants. The formation of these creeds is far no distinctive sectarian mark or badge, except a skull-cap or turban; for these, as with the Mahim deity, the repetition (japa) of the name of Rama being the only kind of adoration practised by them.

Although the Vaishnava sects hitherto noticed, in their adoration of Vishnu and his incarnations, Krishna and Rama, have their adherents, usually associate with these gods their wives, as their sakris, or female energies, the sexual element is, as a rule, only just allowed sufficient scope to enhance the emotional character of the rites of worship. In some of the later Vaishnava creeds, on the other hand, this element is far from being kept within the bounds of moderation and decency. The favourite object of adoration with adherents of these sects is Krishna with his mate—but not the devoted friend and counsellor of the Pandavas and defier hero of epic song, nor the ruler of Dwarka and wedded lord of Rukmini, but the juvenile Krishna, Govinda or Bala Gopala, "the cowherd lad," the foster brother of Rukmini, of Gokula, taken up with his amorous sports with the Gopis, or cows of the cowherds of Vrindavana (Brindaban, near Mathura on the Yamuna), especially his favourite mistress Radha or Radhika. This episode in the legendary life of Krishna has every appearance of being a later accretion. After barely a few allusions to it in the epics, it bursts forth full-blown in the Harivans, the Vishnu-purana, the Narad-pancharatva and the Bhagavata-purana, the tenth canto of which, dealing with the life of Krishna, has become, through vernacular versions, especially the Hindi Prem-sagar, or "ocean of love," a favourite romance of over India, and has helped largely to popularize the cult of Krishna. Strange to say, no mention is as yet made by any of these works of Krishna's favourite Radha; it is only in another Purana—though scarcely deserving that designation—that she makes her appearance, viz. in the Brahma-vaiyarta, in which Krishna's amours in Nanda's cow-station are dwelt upon in fulsome and wearisome detail; whilst the poet Jayadeva, in the 12th century, made her love for the gay and inconstant boy the theme of his beautiful, if highly voluptuous, lyrical drama, Gita-govinda.

The earliest of the sects which associate Radha with Krishna in their worship is that of the Nimavas, founded by Durbaditya or Nimarka (i.e. "the sun of the Nimb tree"), a teacher of uncertain date, said to have been a Telugu Brahman who subsequently established himself at Mathura (Mutra) on the Yamuna, where the head-quarters of his sect are still kept. He has no pantheon of his own, but has received as a gift of his monastery at Dhruva Kshetra near Mathura, who claims direct descent from Nimarka, is said to place the foundation of that establishment as far back as the 5th century—doubtless an exaggerated claim; but if Jayadeva, as is alleged, and seems by no means improbably, was really a follower of this Nimarka, his teacher must have flourished, at latest, in the early part of the 12th century. He is indeed taken by some authorities to be the same as the celebrated Nimbarka Acharya, who is known to have completed his chief work in Andhrapura in 1152. Of remark, in this respect, that—in accordance with Ramanuja's and Nimbarka's philosophical theories—Jayadeva's presentation of the world love, with its indefinite character and mystical sense, as allegorically depicting the human soul's striving for eternal love, for reunion with God, and its ultimate attainment, after many backslidings, of the longed-for goal. As the chief authority of their creed, the Nimbarkas are called by this title, and have several works, ascribed to Nimbarka—partly of a devotional character and partly expository of Vedanta topics—are still extant. Although this sect is fairly numerous in northern India, their principal centres are the usual goswami, or black, and the circulatory white lines, with, however, a circular black spot between them.

Of greater importance than the sect just noticed, because of its far larger following, are the two sects founded early in the 16th century by Vallabha (Ballabha) Acharya and Chaitanya. In the forus of worship favoured by votaries of these creeds the emotional and erotic elements are allowed yet freer scope than in their rivals, and as an effective auxiliary to these tendencies, the use of the vernacular dialects in prayers and hymns of praise takes an important part in the religious service. The sects, or, as they are usually called, from the title of their spiritual head, the Gogas or Gojawati (gosawami) residing in Gokula, are very numerous in western and central India. Vallabha, the son of a Telenga Brahman, after making an extensive tour in the holy places of India, settled in Gokula near Mathura, and set up a shrine with an image of Krishna. About the year 1673, in consequence of the fanatical persecutions of the Mogul emperor, this image was transferred to Nathdvara in the Kathiawar province, and has since been known as the "Black" image, as opposed to the original "White" image of Vishnu (i.e. Vishnu) continues to be the chief centre of worship for adherents of this creed; whilst seven other images, transferred from Mathura at the same time, are located at different places in Rajputana. Vallabha himself went to Oudh to settle a dispute with the Gogas, but died. In the doctrine of this Vaishnava prophet, the adi-dulthe theory of Sankara is resorted to as justifying a joyful and voluptuous life. Ritual is not of great importance to the practice of austerities must be discarded as discreditable, and it is rather by a free indulgence of the natural appetites and the pleasures of life that man's love for God will best be shown. The axe of his understanding is shared among these divinities, merchants and bankers, direct their worship chiefly to Gopal Lal, the boyish Krishna of Vrindavana, whose image is sedulously attended like a revered living person eight times a day—from its veryliness from its touch up to its reticence to repose at night. The sectarian mark of the adherents consists of two red perpendicular lines, meeting in a semicircle at the root of the nose, and having a round red spot painted between them. Their principal doctrinal work is the Bhagavata Tattva-vani, written by Vallabha himself, who was also the author of several other Sanksrit works highly esteemed by his followers. In this sect, children are not only permitted to take the rosary, but are thus taught from very early years, two or three, at a boys' nursery, or necklace, of 105 beads of milk (tulsi) wood is passed round their necks, and they are taught the use of the semi-sacred formula Sri-Krishnakaresam mantra, or "the name of Krishna is merciful," etc. Another distinctive feature is that their spiritual heads, the Gogas, also called Mahasahas, so far from submitting themselves to self-discipline and austere practices, adorn themselves in splendid garments, and allow themselves to be habitually regaled by their adherents with choice kinds of food; and being regarded as the living representatives of the "lord of the Gopis" himself, they claim and receive in their own persons all acts of address and worship due to the deity, even if it is alleged, to the extent of complete self-surrender. In the final judgment of the famous libel case of the Bombay Mahasahas, before the supreme Court of Bombay, in January 1862, these impressions were largely confirmed by the judge, who stated that a critic of Indian sects as Jogendra Nath seems not to believe in actual immoral practices on the part of the Mahasahas, still he admits that "the corrupting influence of a religion, that can make its adherents address amorous songs to their spiritual guides, must be very great."

A modern offshoot of Vallabha's creed, formed with the avowed object of purging it of its objectionable features, was started, in the early 19th century, by the Sahaj-dhara Mission of the Oudh country, who subsequently assumed the name of Swami Narayana. Having entered on his missionary labours at Ahmadabad, where he was introduced to the Vedanta philosophy by Bishop Heber, he subsequently settled at the village of Wateli, to the north-west of Baroda, and erected a temple to Lakshmi-Narayana, which, with another at Ahmadabad, forms the two chief seats of the sect. The spiritual head of the sect is addressed to Narayana, i.e. Vishnu, as the Supreme Being, together with Lakshmi, as well as to Krishna and Radha. The sect is said to be gaining ground in Gujarat. Chaitanya, the
founder of the great Vaishnava sect of Bengal, was the son of a high-caste Brahman of Nadiya, the famous Bengali sect of Sanskrit learning, where he was born in 1485, two years after the birth of Martin Luther, the German reformer. Having married a Brahmin girl, and after the death of his first wife, he lived as a "householder" (grihastha) till the age of 24, when he renounced his family ties and set out as a religious mendicant (asuragita), visiting the most distant places of travel in northern India, and preaching with remarkable success his doctrine of Bhakti, or passionate devotion to Krishna, as the Supreme Deity. He subsequently made over to his principal disciple, Chaitanya, the last twelve years of his life at Puri in Orissa, the great centre of the worship of Vishnu as Jagannatha, or "lord of the world," which he remodelled in its local form by changing the mystic imagery of the ocean of Jagayeda to be recited before the images in the morning and evening as part of the daily service; and, in fact, as in the other Vaishnava creeds, seeking to humanize divine adoration by bringing it into accord with the experiences of human love. To this end, music, dancing, singing-parties (sankirtan), theatricals—in short anything calculated to produce the desired impression—would prove welcome to him. This doctrine of Bhakti distinguish five grades of devotion: emotional feeling in the Bhaktas, or faithful adherents; viz. (santi) calm contemplation of the deity; (dasyu) active servitude; (sukhya) friendship or personal regard; (ausadha) tender affection as between parent and child. The full devotee, like that which the Gopis felt for Krishna. Chaitanya also seems to have done much to promote the celeration on an imposing scale of the festival of Balarama, or Balarama-yatra, or "celebration of the month of Ashadha, when, amidst multitudes of pilgrims, the image of Krishna, together with those of his brothers Balarama and his sister Subhadra, is drawn along, in a huge car, by a throng of ten thousand men. This festivity is continued and attended by people from all parts of India, without distinction of caste or sex, so also were all classes, even Mohommedans, admitted by Chaitanya to his orders. These groups, according to numerous observances are considered as more or less meritorious, the ordinary form of worship is a very simple one, consisting as it does mainly of the constant repetition of names of Krishna, or Krishna and Radha, which of itself is considered sufficient to ensure future bliss. The partaking of flesh food and spirituous liquor is strictly prohibited. By the followers of this sect, also, an extravagant degree of reverence is habitually paid these images of their godheads. Indeed, regard for anything in their worship, as well as his immediate disciples, have come to be regarded as complete or partial incarnations of the deity to whom adoration is due, as to Krishna himself; and their modern successors, the Gossains, share to the fullest extent in the devout attentions of the worshippers. Chaitanya's movement, being chiefly directed against the vile practices of the Saktas, then very prevalent in Bengal, was doubtless prompted by the last and purest of intentions; but his own doctrine of divine, though all too human, love was, like that of Vallabha, by no means free from corruptive tendencies;—yet, how far these tendencies have worked their way, when compared with those of the Gaudiya sect, is a matter for the present. It is certain, on the other hand, that the opinion that "the death of the reformer marks the beginning of the spiritual decline of Vishnu-worship," observed (Orissa, i. 111), "the most deplorable corruption which the religion of Vishnu has undergone in the present time is the temple with 'indelicate' sculptures, and filled its innermost sanctuaries with licentious rites..." it is difficult for a person not a Hindu to proportionate. None but a Hindu priest really knows the truth about their inner mysteries; whilst the well-known native scholar Babu Rajendral Mitrā points out (Argumentis of Orissa, i. 111) that "such as they are, these sculptures date from centuries before the birth of Chaitanya, and cannot, therefore, be attributed to his doctrines or to his followers. As a Hindu by birth, and a Vaishnava by family religious tradition, he had the freest access to the innermost sanctuaries and to the most secret of scriptures. I have studied the subject most extensively, and have had opportunities of judging of each no European can have; in short, that, 'the mystic songs' of Jayadeva and the 'ocean of love' notwithstanding, there is nothing in the rituals of Jagannatha which can be called licentious. Whilst in Gaudiya-Vishnuism, Krishna is the chief object of adoration, and his relations with Radha remains at least theoretically the chief partner, an almost inevitable step was taken by some minor sects in attaching the greater importance to the female element, and making her the chief object of adoration. It is admitted, indeed, by all scholars, that the Radha-Vallabhis, in the latter part of the 16th century, who worship Krishna as Radha- Vallabha, are derived from the Chaitanyas. Of these sects clearly verve upon those obtaining in the third principal division of Indian sectarians which will now be considered.

The Saktas, as we have seen, are worshippers of the sakti, or the female principle as a primary factor in the creation and reproduction of the universe. And as each of the principal gods is supposed to have associated with him in his own particular sakti, as an indispensable complement enabling him to properly perform his cosmic functions, adherents of this persuasion might be expected to be recruited from all sects. To a certain extent this is indeed the case; but though Vaishnavism, and especially the Krishna creed, with its luxuriant growth of erotic legends, might have seemed peculiarly favourable to a development in this direction, it is practically only in connexion with the Saiva system that an independent cult of the female principle has been developed; whilst in other sects, and especially in the Brahmin Saktas, the worship, even where it is at all prominent, is combined with, and subordinated to, that of the male principle. What has made this cult attach itself more especially to the Saiva creed is doubtless the character of Siva as the type of reproductive power, in addition to his function as destroyer which, as we shall see, is likewise reflected in some of the forms of his Sakti. The theory of the god and his Sakti as cosmic principles is perhaps already foreshadowed in the Vedic couple of Heaven and Earth, whilst in the speculative treatises of the later Vedic period, as well as in the post-Vedic Brahmanical writings, the assumption of the self-existent being dividing himself into a male and a female half usually forms the starting-point of cosmic evolution. 1 In the later Saiva mythology this theory finds its artistic representation in Siva's androgynous form of Artha-narisa, or "half-woman-lord," typifying the union of the male and female energies; the male half in this form of the deity occupying the right-hand, and the female the left-hand side. In accordance with this type of productive energy, the Saktas divide worship, whether the greater importance to the male or to the female principle; viz. the Dakshinacharins, or "right-hand-observers" (also called Dakshina-margis, or followers of the right-hand path "), and the Vamacharins, or "left-hand-observers" (Vama-margis, followers of the left path "). Though some of the Puranas, the chief repositories of sectarian doctrines, enter largely into Sakti topics, it is only in the numerous Tantras that these are fully and systematically developed. In these works, almost invariably composed in the form of a coloquy, Siva, as a rule, in answer to questions asked by his consort Parvati, unfolds the mysteries of this occult creed.

The principal sect of Saka worship is the north-eastern part of India—Bengal, Assam and Behar. The great majority of its adherents profess to follow the right-hand practice; and apart from the implied paroxysms of the problem of the right-hand direction, which does not seem to offer any very objectionable feature. And even amongst the adherents of the right-hand mode of worship, many of these are said to follow it as a matter of family tradition in the form of a rule of conduct; and there is no evidence that they can enter any of the larger temples, and none but a Hindu priest really knows the truth about their inner mysteries; whilst the well-known native scholar Babu Rajendral Mitrā points out (Argumentis of Orissa, i. 111) that "such as they are, these sculptures date from centuries before the birth of Chaitanya, and cannot, therefore, be attributed to his doctrines or to his followers. As a Hindu by birth, and a Vaishnava by family religious tradition, he had the freest access to the innermost sanctuaries and to the most secret of scriptures. I have studied the subject most extensively, and have had opportunities of judging of each no European can have; in short, that, 'the mystic songs' of Jayadeva and the 'ocean of love' notwithstanding, there is nothing in the rituals of Jagannatha which can be called licentious. Whilst in Gaudiya-Vishnuism, Krishna is the chief object of adoration, and his relations with Radha remains at least theoretically the chief partner, an almost inevitable step was taken by some minor sects in attaching the greater importance to the female element, and making her the chief object of adoration. It is admitted, indeed, by all scholars, that the Radha-Vallabhis, in the latter part of the 16th century, who worship Krishna as Radha- Vallabha, are derived from the Chaitanyas. Of these sects, it will suffice to mention that of the Radha-Vallabhis, started in the latter part of the 16th century, who worship Krishna as Radha- Vallabha, are derived from the Chaitanyas. Of these sects clearly verve upon those obtaining in the third principal division of Indian sectarians which will now be considered.

The divine object of the adoration of the Saktas, then, is Siva's wife—the Devi (goddess), Mahadevi (great goddess), or Jagan-mata (mother of the world)—in one or other of her numerous forms, benign or terrible. The forms in which she is worshipped in Bengal are of the latter category, viz. Durga, the unapproachable, and Kali, the black one, or, as some take it, the wife of Kala, the "time," death; others the goddess, viz. Siva. In honour of the former, the Durgo-puja is celebrated

1 This notion not improbable took its origin in the cosmic cosmogonic hymn, Rigv. vi. 80. 19, which described Siva (existent, neutr., breathless) breathed breathless by (or with) its svadha (existent, in- herent power, or nature), beyond that there was nothing whatever... (that one live (gern) which was destroyed, or itself (court) desire then first came upon it, which was the first seed of the mind... fertilizing forces there were, svadha below, prayati (? will above).
during ten days at the time of the autumnal equinox, in com-
memoration of her victory over the buffalo-headed demon
Mahishasura; when the image of the ten-armed goddess, holding
a weapon in each hand, is worshipped for nine days, and cast
into the water on the tenth day, called the Dashahara, whence
the festival itself is commonly called Dasara in western India.
Kali, on the other hand, the most terrible of the goddess’s forms,
has a special service performed to her, at the Kali-puja, during
the darkest night of the succeeding month; when she is repre-
sented as a naked black woman, four-armed, wearing a garland
of heads of giants slain by her, and a string of skulls round her
neck, dancing on the breast of her husband (Mahakala), with
gaping mouth and protruding tongue; and when she has to be
propitiated by the offering of food, sheets, and buffaloes. On
other occasions also Varamahalakshmi is commonly offered animal sacri-
cifes, usually one, or more kids; the head of the victim, which
has to be severed by a single stroke, being always placed in front
of the image of the goddess as a blood-offering (bali), with an
earthen lamp fed with ghee burning above it, whilst the flesh
is cooked and served to the guests attending the ceremony,
extcept that of buffaloes, which is given to the low-caste musicians
who perform during the service. Even some adherents of this
class have, however, discontinued animal sacrifices, and use
certain kinds of fruit, such as coco-nuts or pumpkins, instead.
The use of wine, which at one time was very common on these
occasions, has now become much more restricted; and only members of the extreme section would still seem to
adhere to the practice of the so-called five m’s prescribed by
some of the Tantras, viz. mamsa (flesh), matsya (fish), madhya
(wine), maithuna (sexual union), and mudra (mystical finger
signs)—probably the most degrading cult ever practised under
the pretext of religious worship.

In connexion with the principal object of this cult, Tantric theory
has devised an elaborate system of female figures representing either
special forms and personifications or attendants of the Great
so-calledSecondary or subsidiary gods, groups, or classes, many of
which are the Mahavidyas (great sciences), the 8 (or 9)
Mahas (mothers) or Mahamataras (great mothers), consisting of
the wives of the principal gods; the 8 Nagkas or mistressesses;
and different classes of sorceresses and ogresses, called Yoginis, Dakinis
and Sikinis. A special feature of the Sakti cult is the use of obscene
Vedic mantras, often changed so as to be quite meaningless and on
that very account deemed the more efficacious for the acquisition
of superhuman powers; as well as of mystic letters and syllables
called bija (germ), of magic circles (chakra) and diagrams (yantra),
and of amulets of various materials inscribed with formulae of
fancied mysterious import.

This survey of the Indian sects will have shown how little the
character of their divine objects of worship is calculated to exert
that elevating and spiritualizing influence, so essential to the
character of the Hindu devotees. In this respect, however, but a few of the minor groups religious fervour is
only too apt to degenerate into that very state of sexual
excitement which devotional exercises should surely tend to
repress. If the worship of Siva, despite the purport of his
chief symbol, seems on the whole less liable to produce
these undesirable effects than that of the rival deity, it is doubt-
less due partly to the real nature of that emblem being little
realized by the common people, and partly to the somewhat
repellent character of the “great god,” more favourable to
evoking feelings of awe and terror than a spirit of fervid devotion.
All the more are, however, the gross stimulants, connected with
the adoration of his consort, calculated to work up the carnal
instincts of the devotees to an extreme degree of sensual frenzy.
In the Vaishnava camp, on the other hand, the cult of Krishna, and
more especially that of the youthful Krishna, can scarcely fail to exert an influence which, if of a subtler and more in-
sinuating, is not on that account of a less demoralizing kind.
Indeed, it would be hard to find anything less consonant with
godliness and divine perfection than the pranks of this juvenile
god; and if poets and thinkers try to explain them away by
dint of allegorical interpretation, the plain man will not for
all their refinements take these amusing adventures any the less
au pied de la lettre. No fault, in this respect, can assuredly be

found with the legendary Rama, a paragon of knightly
honour and virtue, even as his consort Sita is the very model
of faithful wife and fair wife; and yet this cult has perhaps
retained even more of the character of mere hero-worship than
that of Krishna. Since by the universally accepted doctrine of
karmā (deed) or karmanvāpaka (“the maturing of deeds”) man himself—either in his present, or some, future, existence—
joins the fruit of, or has to atone for, his former good and bad
actions, there could hardly be room in Hindu pantheism for a
belief in the remission of sin by divine grace or vicarious
substitution. And accordingly the “descents” or incarnations of
the deity have for their object, not so much the spiritual regeneration
of man as the deliverance of the world from some material
calamity threatening to overwhelm it. The generally recognized
principles, Avataras, and such by-products as the only occasions of a direct intercession of the deity in worldly
affairs, but—in the same way as to this day the eclipses of
the sun and moon are ascribed by the ordinary Hindu to these
luminaries being temporarily swallowed by the dragon Rahu
(or Graha, “the seizer”)—so any uncommon occurrence would
be apt to be set down as a special manifestation of divine power;
and any man credited with exceptional merit or achievement,
or even remarkable for some strange incident connected with
his life or death, might ultimately come to be looked upon as
a veritable incarnation of the deity, capable of influencing the
destiny of the world. In this respect, the most common object of local adoration or superstitious awe and propitiatory rites is to all mankind. That the transmigration theory, which makes the spirit of the departed hover about for a time in quest of a new corporeal
abode, would naturally lend itself to superstitious notions of this
kind can scarcely be doubted. Of peculiar importance in this
respect is the worship of the Pitris (“fathers”) or deceased
ancestors, as entering largely into the everyday life and family
relations of the Hindus. At stated intervals to offer reverential
homage and oblations of food to the forefathers up to the third
degree is one of the most sacred duties the devout Hindu has to
discharge. The periodical performance of the commemorative
rite of obsequies called Sraddha—i.e., an oblation “made in faith” (sraddha, Lat. credo)—is the duty and privilege of the eldest
son of the deceased, or, failing him, of the nearest relative who thereby
establishes his right as next of kin in respect of inheritance;
and those other relations who have the right to take part in the
ceremony are called sapinda, i.e., sharing in the pindas (or balls
of cooked rice, constituting along with libations of water the usual
offering to the Manes)—such relationship being held a bar to
intermarriage. The first Sraddha takes place as soon as possible after the antyeshti (“final offering”) or funeral ceremony proper,
usually spread over ten days; being afterwards repeated once a
year, by the second year, and twice at every interval of ten years; and
otherwise voluntarily on special occasions. Moreover, a simple
libation of water should be offered to the Fathers twice daily at
the morning and evening devotion called sandhya (“twilight’’). It
is doubtless a sense of filial obligation coupled with sentiments
of piety and reverence that gave rise to this practice of offering
gifts of food and drink to the deceased ancestors. Hence also
frequent allusion is made by poets to the anxious care caused to
the Fathers by the possibility of the living head of the family
being afflicted with failure of offspring; this dire prospect com-
pelling them to use but sparingly their little store of provisions,
in case the supply should shortly cease altogether. At the same
time one also meets with frank avowals of a superstitious fear
lest any irregularity in the performance of the obsequial rites
should cause the Fathers to haunt their old home and trouble the
peace of their undutiful descendant, or even prematurely draw
him after them to the Pitri-loka or world of the Fathers, supposed
to be located in the southern region. Terminating as it usually
does with the feeding and feeding of a greater or less number of
Brahmans and the feasting of members of the performers’ own
caste, the Sradha, especially its first performance, is often
a matter of very considerable expense; and more than ordinary
benefit to the deceased is supposed to accrue from it when it takes
place at a spot of recognized sanctity, such as one of the great

HINDUISM
places of pilgrimage like Prayag (Allahabad, where the three sacred rivers, Ganga, Yamuna and Sarasvati, meet), Mathura, and especially Gaya and Kat (Benares). But indeed the tirtha-yatra, or pilgrimage to holy bathing-places, is in itself considered an act of piety conferring religious merit in proportion to the time and trouble expended upon it. The number of such places is legion and is constantly increasing. The banks of the great rivers such as the Ganga (Ganges), the Yamuna (Jumna), the Narbada, the Krishna (Kistna), are studded with them, and the water of these rivers is supposed to be imbued with the essence of sanctity, so that bathing in the pious bather of all sin and moral taint. To follow the entire course of one of these rivers from the mouth to the source on one side and back again on the other in the sun-wise (pradakshina) direction—that is, always keeping the stream on one's right-hand side—is held to be a highly meritorious undertaking which it requires years to carry through. No wonder that water from these rivers, especially the Ganges, is sent and taken in bottles to all parts of India to be used on occasion as healing medicine or for sacramental purposes. In Vedic times, at the Rajasuya, or inauguration of a king, some water from the holy river Sarasvati with the holy water used for consecrating the king. Hence also sick persons are frequently conveyed long distances to a sacred river to heal them of their maladies; and for a dying man to breathe his last at the side of the Ganges is devoutly believed to be the surest way of securing for him salvation and eternal bliss.

Such probably was the belief of the ordinary Hindu two thousand years ago, and such it remains to this day. In the light of facts such as these, who could venture to say what the future of Hinduism is likely to be? Is the regeneration of India to be brought about by the modern theistic movements, such as the Brahma-samaj and Arya-samaj, as so close and sympathetic an observer of Hindu life and thought as Sir A. Lyall seems to think? "The Hindu finds," he remarks, "is essentially speculative and transcendental; it will never consent to be shut up in the prison of sensual experience, for it is indeed at bottom the idea of the entire universe and the manifestations of some power outside phenomena. And the tendency of contemporary religious discussion in India, so far as it can be followed from a distance, is towards an ethical reform on the old foundations, towards searching for some method of reconciling their Vedic theology with the practices of religion taken as a rule of conduct and a system of moral government. One can therefore discern a movement in various quarters towards recognition of impersonal theism, and towards fixing the teaching of the philosophical schools upon some definitely authorized system of faith and morals, which may satisfy a rising ethical standard, and may thus perhaps serve as a bond for the heart to the people. This, however, is a problem for external forms and caste rules which is the characteristic of the sects that have from time to time dissented from orthodox Brahminism.
